Business Legitimacy, Electronic Economy, Digital Work Life, and Surveillance

Electronic Economy, Internet, and Business Legitimacy

71

Wenceslao J. Gonzalez

Contents

Abstract

Among the central issues of the electronic economy related to the Internet is business legitimacy. Electronic economy includes scientific, technological and social aspects. These are the three realms of the Internet where the problem of the legitimacy of business firms arises. Legitimacy can be linked to human actions, social norms and ethical values, and has an internal and an external perspective.

The analysis starts with the theoretical framework of electronic economy and of legitimacy in the Internet. Then, it presents the configuration of electronic economy through the Internet and how it relates with economics – the scientific, technological and social realms – and then clarifies of the philosophico-methodological status of "electronic economy." Thereafter the attention goes to

business legitimacy as a precondition of business firms and the role concerning the Internet. Thus, the paper deals with legitimacy in the context of layers of the Internet (the network, the Web, and the cloud) and the business firms available. In addition, it makes an analysis of legitimacy in terms of action theory, law and ethics. Subsequently, it focuses on the relevant case of copyright laws, before the final reflections are offered in the coda.

Theoretical Framework of Electronic Economy and of Legitimacy in the Internet

A key feature of the Internet as the network of networks (the technological infrastructure, the Web, and the cloud and practical applications [apps]) is the presence of the *electronic economy*, which has had an extraordinary development in recent decades. The situation has grown intensely since the analysis made in Ehret et al. (2004). In this regard, it is important to highlight the transition of the Internet from its public origins as a technological platform focused on information – with pluralistic tendencies – to an increasingly commercial network of networks (see Greenstein 2015).

The phenomenon studied here is a *complex* one, because electronic economy has scientific, technological and social ramifications. These are the three main aspects of economics related to the Internet (Gonzalez forthcoming). Each aspect can be connected to business ethics, when the network of networks is considered through rationality and responsibility (Gonzalez 2019). On the one hand, the *impact of the electronic economy* on the Internet can be seen from the scientific approach, the technological facet and the social dimension of the network of networks. This economics related to the Internet receives several names, which will be discussed in this paper (this case has similarities with the communication sciences and their relation to the network of networks, see Gonzalez and Arrojo 2019). On the other hand, electronic economy can be linked to *business ethics*, where legitimacy has an important role.

This triple relevance of the electronic economy – scientific, technological and social – leads to the problem of the *legitimacy*, which can be especially important for the Internet, because it might be linked to human actions, social norms and ethical values. Initially, legitimacy is related to the kind of actions to be displayed, the task of the regulations proposed and the contributions of the values in terms of fairness. Thereafter, when the focus is on the business firms, in general, and the corporations, in particular, some issues related to the organizations are discussed. Then there is “a tension between a strategic and an institutional definition” of legitimacy (Rendtorff 2019, p. 47).

An influential definition of legitimacy as socially constructed, which seeks to integrate cognitive, evaluative and social factors, is in Marc C. Suchman: "Legitimacy is a generalized perception or assumption that the actions of an entity are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs, and definitions" (Suchman 1995, p. 574). In addition, it seems clear that legitimacy becomes more important where there are crucial changes for the society as a whole. In this regard, "economists are wary of regulation in times of considerable technological change" (Küng et al. 2008b, p. 174), which was the case during the extraordinary expansion of the network of networks.

If the focus of legitimacy is on electronic economy as related to business firms, then the analysis requires a philosophico-methodological standpoint to have an adequate theoretical framework. Thus, two aspects should be highlighted: (a) that in electronic economy is involved in economics as *applied science*, which is oriented to the solution of specific problems; and (b) electronic economy is an area of the *application of science*, which uses scientific knowledge for solving problems within a concrete context. In their methodological spheres, they require prediction of the possible future and prescription of the course of action to be taken for the solution of the problem at stake (Gonzalez 2015a, pp. 32–40).

Regarding the application of science, which is where the business firms commonly worked, legitimacy should pay a key role, especially in the case of the firms related to the diverse layers of Internet (the network, the Web, and the cloud and the apps). Legitimacy has been studied from *internal* and *external* angles of business firms related to the Internet (Wu et al. 2019; Schultz et al. 2014). There are also studies on the use of the *network* an instrument for legitimacy (Castelló et al. 2016). In addition, the governance of the Internet has been studied from the perspective of legitimacy (Collins 2007).

Moreover, legitimacy can be considered as a *precondition for central aspects* of business firms: (i) of the business license to operate in society, and (ii) of the supply of necessary resources (Rendtorff 2019, p. 45). In addition, this legitimacy in the economics connected to the Internet is twofold: internal and external. This dual character has consequences of various types for business firms related to the Internet.

On the one hand, there is an "internal" legitimacy of the *economic system in this complex* network of networks, which deals with actions, norms and values. This internal legitimacy has received enormous impact due to the recent developments of the Internet. On the other hand, there is also the "external" legitimacy of complex economic system in this artificial sphere (infosphere, whose characteristics have been analyzed by Floridi [2014]), which comes with its *relation with the environment* (natural, social or artificial). This external legitimacy was shaken by the social impact of the economic crisis which started around 2007 and became noticeable in 2008.

Undoubtedly, the intersubjective elements (the socially constructed system of norms, beliefs and definitions) are relevant in the *internal legitimacy* of a business firm (Suchman 1995, p. 574). But "it is also important to go beyond mere institutional analysis and propose a normative perspective of applied ethics" (Rendtorff 2019, p. 48). This task can be done in terms of a search for some objective basis for actions, norms and values in the sphere of business firms. This can start with a discussion about values and goals, which belong to the sphere of evaluative rationality, and thereafter discuss key elements of a rationality of means, to being able to elaborate a business ethics that can emerge "as a kind of normative economics to accomplish the insights of business economics" (Rendtorff 2019, p. 48).

Obviously, there are intersubjective elements in the *external legitimacy* of a business firm, because the environment around a company or a corporation changes over the time, especially in the social and artificial components. This leads to the presence of the historicity in at least three ways: (a) the business firms often have *variations within themselves* due to a new management, either due to new agents or to novel ways to address the problems that arise from the context (economic, social, cultural, political, ecological, etc.); (b) the business firms are in a competitive framework where mere adaptation to the environment is not good enough and *creativity* is needed in order to get innovation; and (c) the business firms are under constant pressure from *technological innovations* that can make the objectives, undertakings or products of the company or corporation complete obsolete.

The Configuration of Electronic Economy

Before the electronic economy related to the Internet, it was a previous stage in the case of electronic commerce "in sectors such as retail automotive, electronic data exchange (EDI) for application-to-application interaction is being used regularly. For defense and heavy manufacturing, electronic commerce lifecycle management concepts have been developed that aim to integrate information across larger parts of the value chain, from design to maintenance, such as CALS (Computer Assisted Lifecycle Support or Computer Aided Logistics Support)" (Timmers 1999, p. 3). Thereafter, the configuration of electronic economy changed with the network of networks. Thus, within the theoretical framework of the electronic economy and of legitimacy in the sphere of the Internet, there are two main aspects to consider.

First, the Internet is a complex system that includes the scientific approach, the technological facet, and the social dimension. Economics interacts with these constitutive elements of the Internet. Its structure and dynamics is a network of networks. According to David Clark, "as the Internet ecosystem has expanded, the creation of the global experience no longer depends solely on a single interconnected Internet. Today, there are other global networks that are based on the same Internet technology but no directly interconnected with what we think of as the public Internet. These other networks have become part of the application development ecosystem, along with cloud computing, CDNs [content delivery networks], and the like. For example, cloud providers use these networks to reach their enterprise customers, thereby shielding that traffic from various attacks and fluctuations in performance" (Clark 2018, p. 307).

Second, the status of the "electronic economy" is based mainly on the scientific approach and certainly connects to the technological facet and the social dimension. Its philosophico-methodological status includes semantic, epistemological, methodological and ontological elements. These are intertwined with the axiological and ethical elements, which are those directly related to the issue of the legitimacy of business ethics.

Semantically, a clarification of the language is needed, because there is a plethora of denominations for this area (new economics, network economics, Web economy, digital economy, etc.). Epistemologically, in an electronic economy the main features of applied science and of the application of science are available. Methodologically, there is a contribution of "electronic economy" to the sciences of the Internet (network science, Web science, Internet science, etc.), the technological support of the network, and the social dimension. Ontologically, there are differences between the business firms at the level of the infrastructure (the network), the Web and the realm of the cloud and the apps.

Internet and the Three Realms of Relation with Economics: Scientific, Technological and Social

Constitutively, there are three main realms of the Internet – scientific, technological and social – and all have a relation to economics. As regards the *scientific approach*, there are three major groups of sciences related with the network of networks: (I) the "sciences of the Internet;" (II) the disciplines that, based on the use of the layers of the Internet as instruments for their development, are focused on new objectives; and (III) the disciplines which deal with properties emerging from the Internet, such as data due to the use of the network of networks. Economics as science has a clear role in the second of the options (with the Internet as a support for the new economy, in general, and electronic economy, in particular), but it is also present in the third of the possibilities (economics due to the use of the network by individual agents, social groups, organizations, etc.).

(I) Scientific disciplines in the sphere of the "sciences of the Internet" are the first group. They are at least the network science (Börner et al. 2008), the Web Science (Berners-Lee et al. 2006; Hendler and Hall 2016), and the specific Internet Science, which is at the service of the technological platform. Each of these *sciences of the Internet* is interdisciplinary (Tiropanis et al. 2015). Thus, the presence of economics would be, in principle, as a rather collateral element. In this regard, economics may be required if economic considerations are needed insofar as the sciences of the Internet are applied sciences. This would involve attending to economic factors when predictions are made regarding the possible future or when considering the prescriptions necessary to solve the specific problems raised.

(II) In the second group of sciences are those disciplines that, wholly or in part, are sciences of the artificial. More specifically, they are design sciences, so that Artificial Intelligence and bounded rationality can play a role in these disciplines (Gonzalez 2007). Thus, it happens that economics makes use of the layers (network, the Web and the cloud) as instruments for its development. In this regard, economics is focused on new objectives, as is the case with the financial economy or the electronic economy, which lead to horizontal or longitudinal novelty (enlargement of the field) or vertical or transversal novelty (something that has no real precedents).

That economics is a design science is usually seen when considering the economics of the Internet, in particular it is noted in the denominations like digital economics, Internet economics or electronic economy. In the Internet sphere (a virtual world, different from physical reality or the social environment) economic designs – not just digital auctions with artificial adaptive agents – (Duffy and Ünver 2008) follow new processes and reach new results. Phenomena of this style are often seen in new forms of financial economics, not only in cases such as the "artificial markets" or "online auctions," but also in designs of corporations related to the network of networks, such as Amazon, Alibaba or Facebook.

(III) Another type of sciences – the third – related to the Internet are those disciplines that deal with emerging properties from the network of networks, such as data. This is also the case of the economics, which has to work with "massive data" or "big data," whether structured or still unstructured. Current economics has to deal with a huge amount of data of very different origins, to develop ordinary activity (e. g., for organizations such as the European Central Bank or the Federal Reserve of the United States). There are several aspects involved: (i) the volume of the data, (ii) its variety, (iii) the speed with which it changes, and (iv) its degree of validity or veracity (Feijóo et al. 2016, pp. 510–525; especially, p. 511).

Meanwhile, the *technological facet* of the Internet is at least dual from a structural and dynamic viewpoint. Both epistemological and ontological modes have a direct relation to economics (see Gonzalez 2015b on the role of economic values in the configuration of technology.) In addition, we need to consider an epistemological-methodological distinction between data, information and knowledge, where "knowledge" is more than "information" and "data," insofar as knowledge categorizes and organizes information and gives the context for data.

(1) There is a *background technology*, which is able to carry out the data and information through the network, using electrical signals, radio waves or pulses of light. Initially, the technological infrastructure relied on existing telephone networks. Increasingly, that kind of support was changed, making that data and information were shared through high-speed fiberoptic cables. (2) There is *information and communications technology* (ICT), which has been crucial in the development of the Internet from a network connecting a few computing centers to a global network, which carries massive amounts of data and information. This "was facilitated by continuous technological change in component technologies, including semiconductors, fixed and wireless networking technologies" (Bauer and Latzer 2016, p. 5).

Furthermore, there is the contribution of computer sciences, which are design sciences. They have facilitated the digitalization of content (data, text, music, images, etc.). In this regard, digitalization of information flows has promoted two waves of convergence between scientific and technological parts: first between computing and telecommunications, which is known as "telematics," and thereafter between telematics and media, which receives the name of "mediamatics." The joint development of the technological and the scientific aspects mentioned "have resulted in a rapid decline of the costs of transporting, processing and storing digitized information and the ability to pack increasing computing power into smaller and mobile devices" (Bauer and Latzer 2016, p. 5). Moreover, "as traffic migrates to next-generation-networks (NGNs) the legacy specialized voice, data, audio, and video networks are gradually being replaced and retired" (Bauer and Latzer 2016, p. 5).

Telematics and mediamatics are related to the economics developed through the Internet, which usually serves as a point of confluence between scientific contents and technological contributions, because the "digital economics" is precisely the type of economy based on digitalization of information and the use of the corresponding information and communication infrastructure (Zimmermann 2000, p. 729). In turn, audiovisual media can serve as an element of the marketing of the products. This commonly occurs in what is known as "electronic commerce" (e-commerce) and "electronic economy" (e-economy), which are generally used through the Web and show audiovisual support, in addition to having text.

Clearly, there is a *social dimension* in the relations between economics and the scientific approach and the technological facet of the Internet. This is very noticeable nowadays through the Web and the cloud and apps. (i) There is a bidirectional relation between the scientific approach and the social dimension of the Internet, because economics is a dual science: artificial as well as social (Gonzalez 2008, 2015a, p. v). (ii) There is a bidirectional nexus between the technological facet and the social dimension of the network of networks. It happens that "the Internet arrived at a particularly critical junction in economic history, for its exploitation is closely intertwined with the powerful force of the globalization of finance, corporate governance, and trade" (Kogut 2003, p. 2). Although the present and the future of the Internet is commonly thought of in global terms (Winter and Ono 2015), "its economic and business development was molded in the context of prevailing national institutions" (Kogut 2003, p. 2).

The Philosophico-Methodological Status of "Electronic Economy"

For the philosophico-methodological status of "electronic economy," the first approach is the semantic clarification of the denominations used about economics in its relation to the Internet. In this regard, "electronic economy" is an expression that competes with a large list of names, which includes at least new economics (Evans and Wurster 2000), Internet economics (Brousseau and Curien 2001), network economics (Economides 2006), networked economy (Schwartz and Leyden 1997), digital economy (Unold 2003, pp. 41–49), Web economy (Unold 2003, p. 42), and Internet electronic commerce (Timmers 1999, especially, Chaps. 2, 3, 4 and 7).

These denominations emphasize aspects of the economic perspective related to the network of networks, either in terms of the internal vision of the *economic activity* of the Internet or in the *external connection with other human activities*, which are interrelated with the network, the Web or the cloud and apps. These internal and external aspects are relevant epistemologically and methodologically.

Although the expressions mentioned above might be seen as synonymous of *the economics of the Internet* (mainly, new economics or Internet economics), it seems that, to some extent, they might be considered as specifications or delimitations of this broad field (such as Web economy or Internet electronic commerce). In this regard, the sense and reference of these denominations can highlight some aspects that are also important in epistemological, methodological and ontological terms. Furthermore, they can be of relevance for axiological and ethical terms and, consequently, for the issue of legitimacy.

First, there is the knowledge, methods and reality of the *specific economic activity* made through the Internet, where the electronic commerce (e-commerce) seems central and generates big data. Second, the social dimension of the task made by the *ontological subjects* – organizations or entities – related to the economy through the network, such as the innovative business firms (start-ups) with their models for doing business electronically (e-business) and a type of management different form the conventional one or previous to the Internet. Third, the contribution of the electronic component related to the *technological infrastructure* of the network, which includes the costs of design, development and maintenance (e-business infrastructure).

We might assign these main aspects to electronic economics, digital economics or Internet economics (in the case of digital economics, see Mesenbourgh 2001). However, they are commonly focused on the first endeavor – the specific economic activity in this area – or on the second (the task of organizations and management) rather than on the third, because all of them assume, in principle, the existence of the technological platform as *support* for other things as well as the *condition* for its viability, especially when they prepare the economic designs for the Internet. This leads us to think of in terms of thematic convergence.

Ontologically, these denominations commonly share features of the Internet electronic commerce, which is made through a "combination of interactivity, networking, multimedia and data processing" (Timmers 1999, p. 4). It does business electronically, which "includes electronic trading of physical goods and intangibles such as information. This encompasses all the trading steps such as online marketing, ordering, payment, and support for delivery. Electronic commerce includes the electronic provision of services, such as after-sales support or online legal service. It also includes electronic support for collaboration between companies, such as collaborative online design and engineering, or virtual business consultancy teams" (Timmers 1999, p. 4). All these tasks are included in electronic economy through the network of networks.

Generally, electronic economy and the other denominations on economics related to the Internet confer special importance to the *application of science*. This philosophico-methodological orientation can be seen in several aspects: (i) they try to improve the markets, which in this case have an important artificial component in addition to the social part; (ii) they transform organizations or generate new ones for novel economic practices, according to the contexts of use; and (iii) they redefine those organizations to adapt them to the new times due to novel aims. Through these aspects we can get what Ilkka Niiniluoto calls a "scientification" of a practice (Niiniluoto 1993, pp. 1–21; especially, p. 9), which originates applied science in the case of the design sciences.

Usually, this "scientification" consist of a fact, such as the existence of business models that emerged from the creativity of economic agents (individuals, groups or organizations). In this regard, once a practical activity is consolidated in a type of business linked to the network of networks (as has happened with Apple, Microsoft, Google [or Alphabet], Facebook or Amazon), it is then possible to extract the procedures followed to solve the problems raised in each context of use. Thus, the processes utilized to solve the problems can be systematized as procedures and methods of applied science (see Gonzalez [2015a, pp. 250–252, 255–273] on the methodological distinction between procedures and methods in science). With these procedures and methods, in addition to systematic guidelines to solve specific problems within a domain (in this case, electronic economy), progress can be made to meet new contexts of use, thus achieving the application of science in these new territories.

Normally a role of human agents is assumed for scientific creativity and technological innovation associated with *the economics of the Internet*. The link between scientific creativity and technological innovation is crucial for the Internet (Gonzalez 2018). But there is an *Internet based economy* that is proposed, in principle, apart from human agents. It is the approach that deals, among other things, with carrying out transactions in a very short time or with economic entities located at great distance. This raises some philosophico-methodological issues that are relevant from the viewpoint of the values that must accompany economic activity, which are of special interest from the perspective of the problem of legitimacy. In this regard, some authors (such as Jaron Lanier 2017, who is especially known for his work on virtual reality) consider that it is human beings and not algorithms that should be at the center of the Internet economy (and, therefore, in electronic economy).

It is important that this scientific area where electronic economy is located is human made. It is artificial in the sense of a constructed territory that enhances human dealings. Thus, economics in a science of the artificial, in the sense of Herbert Simon (1996). More explicitly, economics is a *design science* (Gonzalez 2008), which is also the case of electronic economics. This discipline is goal-oriented, because it is aimed at specific goals, which seek to expand human possibilities or to create new ones. Consequently, economic designs in the case of the Internet look towards deliberately sought goals, which give rise to new processes, in order to achieve new results.

Business Legitimacy as a Precondition and the Internet

Based on the philosophico-methodological configuration of electronic economics as a design science, within the sphere of the sciences of the artificial, the problem of business legitimacy can be better understood. In addition, electronic economics has also a side as social science, especially in the economic relations between the Internet and the social environment, which is also relevant for legitimacy. In this regard, business firms, in general, and corporations, in particular, "must take into the consideration of legitimacy to be able to exist and prosper in a society: legitimacy is a precondition of business license to operate in society, and of the supply of necessary resources –ranging from investments, committed employees, business partners, and sales/consumption, to political support and support from an increasing range of diverse stakeholders" (Rendtorff 2019, p. 45).

Legitimacy in the Context of Layers of the Internet and the Business Firms Available

Although an analysis of the legitimacy of the Internet can be made focused on the network as such, taking into account the role of economics (Sylvain 2010), it seems more reliable to address the issue considering the layers, because "the Internet was designed in a layered fashion — the goal was that the applications running on top of the packet forwarding service should not be able to affect it" (Clark 2018, p. 37; see also Schultze and Whitt 2016). These layers are the network, the Web, and the cloud computing as well as apps. From an *internal* viewpoint, they are mainly in realm of the artificial and all have connection to economics; and from an *external* perspective, they have a clear social component and are linked to the business firms, which commonly worked applying economics in each layer of the Internet.

At the bottom of the Internet are "all the protocols that allow different sorts of networks and devices to exchange information, or 'internetwork' (hence internet). At that level, it is still largely decentralised: no single company controls these protocols" (The Economist 2018, p. 5). The next layer up, because everything happens on top of the network itself, is the Web. "It has become much more concentrated. This is particularly true of the web and other internet applications, which include many consumer services, from online search to social networking. Centralisation is also rampant in what could be called the 'third layer' of the internet: all the extensions it has spawned. Most people use one of two smartphone operating systems: Apple's iOS or Google's Android. Cloud computing is a three-horse race among Amazon, Google and Microsoft" (The Economist 2018, pp. 5–6).

To some extent, each layer has different kind of problems in terms of legitimacy, where its internal and external aspects have their specific features. Thus, the issue of legitimacy can be addressed in the context of the layers of the Internet. In the case of the network is mainly related to two kinds of technologies and developed by companies and corporations of national or international character. Meanwhile, Web and Cloud computing (as well as apps) require technological support, but also a large amount of scientific contributions. Thereafter, legitimacy can be addressed regarding the business firms available in the three main layers, which includes the realm of the social dimension in a more explicit way than in the case of the network. These business firms are especially important in the case of the Web, which has had an extraordinary expansion, and have moved to the third layer in recent years.

There are some *key issues of the Internet for business*, especially in the level of the Web, which have also clear implications: (1) Availability, because it is 24 h per day and with immediate access, (2) ubiquity, insofar it is accessible from any place; (3) global, when there are no physical borders for access; (4) local, when it is a vehicle to reinforce local physical experience and personal business relationships; (5) digitization, because the Internet and the ICT connected to it process digital information ("digital information can be easily stored, transmitted, processed, mixed, transformed, [. . .] in many ways, independent of its source or carrier" [Timmers 1999, p. 15]); (6) multimedia, which provides new opportunities in design, consultancy and entertainment; (7) interactivity, which improves traditional customer service at an affordable price; (8) individualization of the customer service, insofar as it makes one-to-one marketing possible; (9) networking, which leads to network effects as well as to network externalities (network effects "are positive or negative influences of the networked market that *are* reflected in the market price" [Timmers 1999, p. 17]); "network externalities are external benefits or losses of the presence of products in the market that are *not* reflected in the market price, that is, for which there is no compensation through the price" [Timmers 1999, p. 17]); and (10) integration, which is the combination of information that increases the value chain of the business, insofar as the total is more than the sum of its parts (Timmers 1999, pp. 9–19; especially, p. 10).

Some of these key issues of the Internet for business – availability, ubiquity, global, local, digitization, multimedia and integration – are mainly based on the *scientific* design of the Web. They are mainly focused on the *internal* component of the activity itself of the Internet. Meanwhile, other features are predominately *technological*, insofar as they depend on the network, such as interactivity, individualization and networking. They are commonly worked on the second layer (the Web) or the third layer (the cloud and the apps).

Furthermore, legitimacy can be addressed from the point of view of the *external component*, which is the kind of organization considered for the network and its relations with the environment. They can be at the micro, meso and macro ontological levels. In the case of electronic economy, this leads to three main possibilities: intranets, extranets, and the public Internet. (a) Intranet is when the "business processes can happen within the company with access provided via the internal Internet" (Timmers 1999, p. 19). (b) Extranet is the relation between businesses that is "giving preferred business partners partial access to internal company information" (Timmers 1999, p. 19). (c) Public Internet is where the information regarding businesses is commonly recorded and stored electronically.

Legitimacy in Terms of Action Theory, Law and Ethics

Legitimacy as a *precondition* of business license needs to be analyzed in philosophico-methodological terms in order to make explicit what it involves for the electronic commerce and its business firms. In this regard, legitimacy can be considered regarding *the activity* itself and concerning the economic *organizations* (at the micro, meso or macro levels). It is an issue that is connected with at least with three aspects: (i) the authenticity of an activity in the sphere of the action theory, (ii) a juridical consideration based on regulations, and (iii) an ethical evaluation related to fairness. These aspects can be interconnected in corporations related to the digital economics through the Internet.

1) Legitimacy can be a feature in the epistemological side of *action theory*, which is the previous step for the acceptability of the correctness or genuine character of an activity in a given context. In this sphere, legitimacy comes from the authenticity or genuine character of an action made by an individual (a practitioner or expert), a group (like an endorsement made by professionals in a formal event or of a family regarding an heir), an organization (like a decision made by a business firm in a topic of its specific competence), etc. Thus, the activity developed should have a purpose that is not spurious, false or deceptive but rather trustworthy, proper or valid, and the agent (individual, social or institutional) should act according to that purpose.

2) From a *juridical perspective*, legitimacy is a recognition that can follow from legality. In this sense, which has a long tradition, legitimacy is the acceptability of something that is in accordance with the rules (local, regional, national or international). Thus, the novelty proposed might be accepted precisely because it follows the regulations (like a new kind of business firm, a novel economic institution, etc.) and, consequently, the novelty has some rights based on these rules.

Within the realm of business firms, if legality is understood as the mere fact of being within the existing legal framework, then legitimacy seems to be a more precise and accurate concept than legality. (The principles for regulation of the digital world considered by the House of Lords are these: parity; accountability; transparency; openness; privacy; ethical design; recognition of childhood; respect for human rights and equality; education and awareness-raising; and democratic accountability, proportionality and evidence-based approach [House of Lords 2019]).

3) From an ethical viewpoint, legitimacy certainly has a broader meaning than legality, insofar as its sense and reference go beyond the mere laws (i.e., regulations officially approved and published) to endorse some values, mainly related to justice. Within the sphere of legality, it seems clear that *regulations* are goal oriented: "Regulation is the use of laws and rules to alter economic and social behaviours and outcomes in accordance with some policy objective; regulation may be reactive or proactive, that is, it may seek to prevent something from happening or promote certain behaviour that otherwise not come about" (Küng et al. 2008a, p. 27).

Meanwhile, *legitimacy* of an activity is then *what is fair* regarding its aims, its processes or its results. From an external perspective, legitimacy involves some social acceptance in terms of validity, which is a credibility of being considered as right and it is different from a proper recognition in the public arena (e.g., of some business innovations). Thus, legitimacy is a feature of something related to a human action (individual, social, institutional, etc.), whereas recognition involves explicit support or public approval. In addition, it might be the case of something be legal (or, at least, not illegal or allegal) whose legitimacy could be questioned based on ethical grounds. When legitimacy is related to the *institutions* connected with economic matters, then the three meanings count here:

a) The legitimacy comes with the kind of ends, means and results of the activity displayed by economic agents (individual, social or institutional). This can be considered in terms of the *economic activity* itself or in the area of the *economics as activity* among other human activities (social, cultural, ecological, political, etc.). This distinction between "economic activity" and "economics as activity" among other human activities is developed in Gonzalez (2015a, pp. 179–185).

b) The legitimacy depends also on the *laws* (local, regional, national or international) concerning the activities of the business firms. Their activity in a given territory should be compatible with the regulations available. In this regard, the case of the cryptocurrencies is particularly interesting insofar as they do not depend, in principle, on laws relating to a territory. "The virtual currency and payment project Bitcoin intends to challenge the current monetary and payment system that finds itself in a legitimacy crisis in the aftermath of the financial market turmoil of 2008" (Weber 2016, p. 17).

c) There is also an ethical aspect of legitimacy, where the distinction between *potestas* and *auctoritas* applies. Because an institution (a government, a court of justice, etc.) can have the power to make some decisions on economic matters, whereas the moral authority comes from the way of how things are done (regarding the ends sought, the means used, and the expected results, with its consequences).

In this regard, some authors maintain that "the legitimacy of the European Union, and Western democracies at large, has been seriously questioned in the past years. Central to the challenge is the sentiment that decisions involving societal values are not taken sufficiently transparently and inclusively. One of the institutions participating in such societal decision-making is the Court of Justice of the European Union (CJEU), which must increasingly decide upon value-conflicts in the EU law disputes brought before it. EU copyright law is an example of a field where, in the digital age, values fundamental to individuals, diverse economic actors and cultural and societal developments are at stake" (Kalimo et al. 2018, p. 282).

The Case of Copyright Laws

An interesting case for legitimacy in electronic commerce is that of copyright laws. First, it has many theoretical and practical consequences related to the three aspects of legitimacy mentioned, which are connected to the accepted actions, the juridical factors and the ethical values. Second, "copyright law seems to be one area in which the Internet has had a notable impact" (Freedman et al. 2008, p. 120). This impact has at least two sides. On the one hand, individual or groups (authors, composers, artistic creators, film makers, etc.) receive credit, payment and protection of their works as holders of the intellectual property. On the other hand, the consumers that access the contents online are affected in their economic interest while using copyrighted works. Third, it is a key issue for electronic economy, insofar as "copyright has been a central but controversial part of the EU's digital agenda from the outset two decades ago" (Kalimo et al. 2018, p. 283).

Commonly, copyright laws are originally national regulations (Freedman et al. 2008, p. 117). This leads to variations in the contents, due to the kind of legislation according to groups of countries: "Copyright law in the Anglo Saxon tradition applies to both authors, performers and 'publishers' — the companies, such as producers of sound recordings and films. In the European civil law tradition, authors' rights pertain to human creators and neighbouring rights to the other groups" (Küng et al. 2008a, p. 29).

These laws become of a European interest when the items consider (books, music, films, etc.) have repercussions in an international level, in terms of credit, payment and/or protection for the creators (individuals, groups, organizations, etc.). The creators, the consumers and the institutions in the electronic economy linked to the Internet deal with the issue of legitimacy in a setting where previous regulations are de facto obsolete, insofar as they face a completely new economic sphere. Thus, the holders of the intellectual property (authors, composers, movie-makers, etc.) are in this digital economy in a quite different environment in comparison with the economy previous to the network of networks.

It seems clear that "the Internet has presented a strong challenge to copyright law, one it has met by extending the same principles but doing so possibly in ways that change the nature of the long-established fundamental freedom to use protected works for private purposes" (Freedman et al. 2008, p. 120). But there are variations between countries regarding the legality of some processes related to copyright. At least some years ago, "one notable difference is the treatment of exceptions and limitations to copyright with respect the legality of private use by individuals of material downloaded from the Internet, especially in the case of music and increasingly also with film. While it is illegal to upload copyright works without authorization, in many countries it is not illegal to download works for reasonable private use or to copy for one's own use items" (Freedman et al. 2008, p. 117).

Besides the variations in the national legislations on copyright laws regarding the Internet (some of them due to the technological changes [Küng et al. 2008a, pp. 30–31]) and in the style of legislation (common law jurisdiction in Anglo Saxon nations and civil law in other countries), there have been changes to copyright laws due international treaties (such as the World Copyright Treaty [WCT], the World International Property Organization Performances and Phonograms Treaty [WPPT]. . .), which were later on assumed by the European Union (Directive 2001/29/EC), . . .(Freedman et al. 2008, pp. 118–119). These regulations and more recent ones, such as the Directive on Copyright in the Digital Single Market (7 June 2019), emphasize the epistemological and methodological differences between legitimacy and legality, because the kind of knowledge needed in each case and the type of processes that follow from legitimacy and legality are not the same:

a) In addition to being in tune with the established regulation (or, at least, not be contrary to it), *legitimacy* is related to the action performed as authentic or genuine and its value assumed in terms of fairness. Certainly, it goes beyond the mere adjustment to the available legislation at every historical moment. b) Legislations can change at quite different levels (regional, national, international) and the *differences in regulations* from one nation to another can be particularly relevant, especially outside the countries of the European Union (such as in the cases of Russia or China). Thus, mere legality cannot be the key point of a business firm that deals with copyright laws.

Consequently, legitimacy adds new features to what is to be done by the business firm. These features are related to the actions to be performed and the fairness to be seek while acting within the context of the law. From an "internal" viewpoint, one of the additional factors is responsibility on behalf of the subject of the actions (individual, group, organization, etc.), because legitimacy is in the realm of human agents that can choose freely (Herbert Simon [1991 (1997)] insisted in the difference between markets and organizations). From an "external" perspective, legitimacy includes the social milieu where the persons of the business firm live. They are in a dynamic of historicity, which introduces changes over the time, some of them could be revolutionaries. (Regarding the dynamic in terms of historicity, see Gonzalez 2011; on the role of historicity in the case of Artificial Intelligence, see Gonzalez 2017.)

Both sides of the legitimacy require *ethical values* (1) as the basis for the internal and external forms of responsibility and (2) as to evaluate the rationality of the aims sought, because rationality cannot be merely instrumental, a pure rationality of the means. Thus, there are differences between the evaluative rationality, which is focused on ends, and the instrumental rationality, which is devoted to means (Rescher 1988).

These aspects that connect legitimacy to responsibility and rationality can be considered according two main *kinds of values*, which are analyzed in Rescher (1999): (i) values rooted in human *needs*, which can have then objectivity from an ethical point of view; and (ii) values related to human *preferences*, which gives them an optional character in order to consider what is "preferable" – and, therefore, rational in practical terms – instead of merely "preferred."

Corporate legitimacy includes the acceptance of actions of the social entity – a business firm – as something desirable within a system of values, which should be the basis for social norms. These actions of the economic organization should be appropriate for the aims sought, and these objectives should be according to some ethical values related to fairness. Thus, from an *internal* viewpoint, modern corporations are now aware of the "values-driven management taking all the firm's stakeholders into account" (Rendtorff 2019, p. 50). Meanwhile, from an *external* perspective, ethical should be the basis for economic actions of a corporation in any social milieu. In addition, "there is a need for external political and legal constraints on economic markets" (Rendtorff 2019, p. 49). In this regard, "legitimacy is founded on the social community and the human lifeworld based on views of justice as fairness, protection of rights, and the promotion of the common good of the society" (Rendtorff 2019, p. 50; see also Ulrich 2008, p. 416).

Therefore, the analysis of the legitimacy of the copyright laws should be based on the values rooted in human needs, where fairness has a key role, instead of being reduced to the consideration of values related to human preferences. Two sides of the legitimacy – internal and external – should be taken into account in the analysis: on the one hand, in order to deliberate on the proper actions and the suitable norms of the copyright in the sphere of the economic activity; and, on the other, to contemplate the kind of actions to be accepted and the adequate norms for the copyright in the realm of economics as activity among other activities, within the social milieu. Both sides are required to offer an approach of legitimacy to the controversial issue of the copyright laws.

Coda

According to the analysis made of the electronic economy, this is one of the denominations of the role of economics in the Internet. Semantically, it emphasizes the way of the relation – electronic – instead of the content (digital), the primary stance (the network), the second layer (the Web) or the novelty (new economics). Electronic economy shares epistemological, methodological and ontological elements with other characterizations of the kind of economics that is related to the network of networks. In this regard, when the problem of the business legitimacy is raised, there are several aspects that should be highlighted:

1) The legitimacy should be seen with the background of the Internet as a complex system, both structurally and dynamically, where the scientific approach, the technological facet and the social dimension are intertwined. 2) In the scientific approach, the problem of the legitimacy of the business firms commonly belongs to the area of application of science, which is connected to applied science. In this field, electronic economics is a science of the artificial as well as a social science. In particular, it is a design science that has enlarged human possibilities due to new aims, processes and results.

3) In the technological facet, electronic economy is related to network in two ways: a) in the technology more "traditional," insofar as information is carried through the network as electrical signal, radio waves or pulses of light; and b) in the information and communication technologies, because ICT are connected to the network of networks in the three main layers of the Internet. 4) In the social dimension, electronic economy has large range (individuals, groups, organizations, etc.), which now reaches half of the world population (Meeker 2019).

5) Business legitimacy is a precondition for a good electronic economics. It is related to proper actions, suitable norms and ethical values, which go beyond the mere adjustment to the legislation available in any given moment. 6) The values can be the ground for the business legitimacy if they are rooted in human needs, such as justice, instead of in mere human preferences (of individuals, groups or organizations). 7) The copyright laws exemplify the conflict among what is preferable – and, therefore, reasonable – and what is preferred in a social context or in historical moment. In this regard, business legitimacy should be with what is preferable and based on ethical values related to fairness.

The Future of Work, Digital Labor, and Business Legitimacy

Contents

Abstract

The increasing trend of Internet technology platforms and its offerings of digital labor have revolutionized the world of work. Companies that compete in this so-called gig economy are breaking away from traditional work arrangements and using a business model that challenges current employment and labor laws. While gig economy employers boast the benefit of work flexibility, their workers face compromised fairness in regard to compensation, working conditions, and career development. This chapter discusses how the gig economy redefines the future of work, by focusing on the current state of gig workers, and then explores opportunities for ways in which the gig economy can mutually benefit the employers and its workers.

Keywords

Digital labor · Gig economy · Working conditions · Career development

Introduction

In the past decade, there has been a rapid growth of the so-called gig economy, which refers to commercial activities where people use digital platforms to sell their labor (Taylor et al. 2017). The size of online labors engaging in the gig economy is estimated to be about 4.4% of adults in the UK (Lepanjuuri et al. 2018) and 20% in the USA (Petriglieri et al. 2018). The gig economy consists of both online- and offline-mediated work via on-demand service platforms such as Amazon Mechanical Turk, Fiverr, Upwork, or Clickwork for the online gig work and Uber, deliverwoo, or task rabbit for the offline gig work. Despite measuring the overall size of the gig economy appears to be difficult as there are loop holes in such labor market that a large number of activities fall outside of measurement tools (Duggan et al. 2019), the rise of utilization of gig work worldwide is estimated to be about 26% annually on average (Kassi and Lehdonvirta 2016).

The gig economy boasts that this new form of work offers work opportunity to individuals who want flexibility and those who are otherwise unable to achieve employment (De Stefano 2016). However, more recently the gig economy has been described less as a new form of work and more as a newly packaged version of Taylorism, in which productivity is fostered via fragmented labor and hyper-temporary microtasks on virtual assembly lines (Aloisi 2015). As employment tasks are revised and employment relationships are redefined in order to transform more and more employees into independent contractors, more and more are left with “flexibility” but no protection from labor and employment laws (Stone 2006).

One of the main advantages companies have when they are at the forefront of a trend, a market, or an entire economy, like the gig economy, is that existing regulations may be outdated, which gives companies a great deal of flexibility of what to comply to this new form of labor (Dudley et al. 2017). Particularly, with the help of technology, such as algorithmic management, firms can structure their business in a more transactional manner with limited personal interactions with the digital laborers. In addition, firms that partake in the gig economy typically experience the pressures of following tactics to drive down their costs resulting in misclassifying workers, regime shopping, and employing economically vulnerable individuals – all of which contribute to the rise of neoliberal industrial relations (Zwick 2018). By enacting on the neoliberal playbook, the gig economy operates in ways that free firms from legal responsibility of labor and employment laws, transfer risks from employers to contractors, and reduce middle-class employment at the benefit of shareholders and consumers (Zwick 2018).

Under the neoliberal playbook, firms rely on short-term and insecure employment relations, where workers can be “fired as quickly as they are hired” (Sporton 2013: 405). In exchange, contractors or subcontractors have the “freedom to choose one’s own job and negotiate one’s own conditions of work” (Cahill 2004: 73). However, due to disproportionate negotiating power between the firm and the individual, the terms and conditions of the employment contract are often non-negotiable (Zwick 2018), which is a common issue in the algorithmic-based management like platforms. That is, digital labors sign up for task assignments via a digital interface, where terms and conditions are given with no opportunities to interact with the platform management for discussion. Thus some view the gig economy as a mean to normalize precarious work relations through the discourse of capital exchange and altruistic social values (Cockayne 2016).

The New Employer-Employee Relationships

As work moves beyond the boundary of the firm, employment relationships become more flexible, and an increasing variety of alternative work arrangements have emerged (Spreitzer et al. 2017). General categories of alternative work arrangements include *direct employment*, *co-employment*, and *direct contracting* (Pfeffer and Baron 1988; Cappelli and Keller 2013), where the dimensions of flexibility range from standard employment to shorter-term work assignments (Johnson and Ashforth 2008). These types of work arrangements have varying similarities and differences in the way each impact employer-employee relationships.

Direct employment is commonly associated with standard workers, full-time employees who work on-site with a fixed or agreed schedule. Full-time employees are the "standard" employment relationships to that which researchers compare with alternative work arrangements (Spreitzer et al. 2017). However, overtime this category has also become more flexible with limited physical, temporal, and administrative attachments (Pfeffer and Baron 1988). Firms may offer flexible work schedules to full-time employees to help employees juggle work and family demands (Kossek and Michel 2011). By offering flextime, firms are more likely to attract and retain high-skill workers who reciprocate higher levels of productivity, engagement, and quality work and lower levels of absenteeism or turnover (Kossek and Michel 2011). Flextime, however, can come at a cost for full-time employees, for example, in the form of autonomy paradox (Mazmanian et al. 2013). In the case where firms view flexible schedules as burdensome, allowing workers to have the autonomy to work where and when they want can make workers feel inclined to be available all the time through electronic communication. This increased stress of being always "on" (Barley et al. 2011; Perlow 2008) may cause workers to feel pressured to intensify their work effort (Kelliher and Anderson 2010). Full-time employees who use flextime may also be stigmatized as less motivated by their employer (Rogier and Padgett 2004), and, as such, studies have shown employees may experience lower wage growth (Coltrane et al. 2013) and receive poorer performance reviews (Judiesch and Lyness 1999).

Other work classifications under direct employment include part-time workers. They often do the same work as full-time employees but receive less salary and benefits and little career advancement (Spreitzer et al. 2017). Part-time workers, for example, can be seasonal employees and on-call employees, who have the power to accept or decline work offers but have little power over the conditions in which they work in, such as when shifts are cancelled or added last minute with little advance notice. Some may prefer a part-time schedule over full-time to attend to their education and their family or to fulfill their desire to be mentally engaged while retired (Dingemans and Henkens 2014). Thus, these part-timers may exhibit similar levels of supervisor satisfaction, social integration, and affective commitment as full-time employees (Spreitzer et al. 2017). However, schedule flexibility for part-time employees tends to mean they receive less benefits compared to full-time employees (Wittmer and Martin 2010). This can negatively impact the life satisfaction of workers who are forced into part-time status or are forced to work multiple, low-paying part-time jobs to make ends meet (Sturman and Walsh 2014).

A growing alternative work arrangement is *co-employment* or agency work, where the employment relationship is between the client organization, a staffing agency, and the worker. Agency work can be in the form of temporary work on a short-term contract or a long-term contract (Barley and Kunda 2006). Firms may use co-employment to reduce administrative costs by hiring employees with specialized skills for specific projects, while individuals may work for a staffing agency to have more flexibility, to use as a mean for employment after being laid off, or to leverage the chance of finding a full-time opportunity with a client firm (Spreitzer et al. 2017). Agency workers with career development opportunities have been found to share similar levels of affective commitment to full-time employees and higher levels of satisfaction with supervisor-coworker relationships (Broschak et al. 2008). However, when agency workers see little probability for securing full-time employment, their job satisfaction and organizational commitment decrease (DeCuyper et al. 2009). While flexible employment relationship offers firms more agile business models, such flexibility can cause significant challenges for workers when it comes to fairness, well-being, and career development. These implications become more complex under the category of *direct contracting*, where employment relationships are mediated by platforms.

Considering employer-employee relationships in terms of the gig economy is challenging, because workers are labelled as independent contractors, not employees. An independent contractor is defined as a direct relationship involving just the client organization and the worker as his/her own employer controls the work process (Cappelli and Keller 2013). With the independent contractor classification, businesses utilizing the gig economy normally recruit workers with no entitlement to a fixed number of working hours, minimum wage, overtime, paid sick or annual leave, notice in case of termination, or anti-discrimination laws. Therefore, platform businesses often totally or partially do not cover Social Security costs, Medicare, Affordable Care Act, worker compensation, and unemployment insurance (Aloisi 2015; Stone 2006).

This said, some firms operating in the gig economy face strict labor and employment laws and therefore must adjust their standard practices in order to remain competitive in certain countries. Uber, for example, has faced criticism from Australian politicians regarding its meal delivery service, Uber Eats, for not providing its drivers and cyclists with appropriate gear, for not offering paid sick leave, and for having low wage rates (Brook 2018). Uber responded to this by arguing that if they were to accommodate for gear and sick leave, in addition to increased wage rates, it would have to sacrifice its flexible work arrangements – which Uber defended is an important reason why many of its drivers and cyclists work for Uber in the first place (Brook 2018). Due to Uber's deliberate choice to not improve working conditions and compensation, restaurants in Australia have banned Uber Eats (Brook 2018), rendering Uber Eats less competitive in the Australian market.

Another international meal delivery company, named Foodora, has taken a different approach. In Norway, for example, Foodora's services remain competitive due to the adjustments it made to meet certain Norwegian laws such as providing paid sick leave, health insurance, and holiday pay to its workers (Foodora 2018). On the other hand, Foodora is still criticized for its working conditions and wage levels. Foodora's operations manager responded to this by stating that the company has taken into consideration personal costs for its couriers by creating partnerships with companies to provide cheap alternatives for telephone subscription plans and bicycle maintenance services (Greenhouse 2016). The working conditions workers face from Foodora in Scandinavia can be argued as better relative to its competitors. However the question is whether or not the working conditions are good enough.

Some pointed out that the undefined employer-employee relationship is detrimental to the platform's as well as gig workers' well-being. For instance, while the digital laborers are often seen as independent contractor and are solely responsible for the task output, they on the other hand do not have direct relationship with the clients (only via the respective platforms with restricted interaction possibilities), which effectively shrink their contractual freedom, nor they have an entire control of the work process as an independent contractor would have (Aloisi 2015). These provisions are inconsistent with the declared independent contractor status of turkers (De Stefano 2016). With this being said, a bulk of business risk is shifted to workers, and potential costs such as benefits or unemployment are avoided (Aloisi 2015). Currently, most of gig workers if not all are not considered (by legal definitions) employees, and whether a worker should be considered an employee of a contractor often depends on facts emerging from the employment relationship (Stone 2006). Researchers and authors, such as claim that, in contrast to claims of platform business representatives, many platforms actually have relatively traditional employment relationships, asserting that they should therefore be treated as such. Workers are starting to confront some platform companies for inappropriately classifying them as contractors although they do not enjoy the amount of freedom that the label is supposed to entail.

These challenges virtually all reflect a seemingly unfair distribution of power between the worker and the platform (Kingsley et al. 2015; Fieseler et al. 2017). Some digital laborers have attempted to improve these challenges with additional platforms/software (Irani and Silberman 2014; Fieseler et al. 2017), such as Turkopticon, which serves as a place to pose and answer questions from peers in the same workforce (Irani and Silberman 2014), or to change the currently unequal employment dynamics (Fieseler et al. 2017). Others report that legal benchmarks should be enforced in regard to pay, such as minimum wage standards (Fieseler et al. 2017) or mechanisms that allow for negotiations between requesters and workers (Kingsley et al. 2015). Further, representation is considered necessary to ensure ethical and mutually beneficial work settings (Fieseler et al. 2017). Taken together, the complexity of employer-employee relationship due to the triangular relationships between the platform organizations, the clients (task providers), and the gig workers needs to be addressed, and modifications of the current employment practices based on traditional models are needed (Spreitzer et al. 2017).

A possible solution that has been proposed, in the USA, to fill the regulation gap affecting the gig economy is to introduce a new form of work that acts as an intermediate category between employment and independent contractors (De Stefano 2016). For instance, researchers, such as Harris and Krueger (2015), have advocated for new legal classifications for independent workers to help balance these employer-employee relationships. A so-called "dependent contractor" employment classification has been suggested in several countries to provide on-demand platform workers an intermediate status (Weber 2015). The proposal suggests that this new category of workers would be subject to certain regulations, while the employers would be responsible for certain costs, such as reimbursement of expenses and workers' compensation but not Social Security and Medicare taxes (De Stefano 2016). In countries like Germany, Canada, and France, such a proposal has already been rewritten into law, as a mean to expand on worker categories and challenge the boundaries of existing labor protection laws (De Stefano 2016). However, there is an ongoing discussion around whether the dependent contractor employment classification, which often covers those who derive all or most of their income from a single client, would be appropriate for the gig economy (Kuhn and Maleki 2017). More recently, a modification of independent worker employment classification, under which firms would be required to cover some employment benefits such as Social Security taxes, has been suggested (Harris and Krueger 2015).

Such an approach may take relatively long time to effect changes and complicate issues surrounding classification, especially in terms of legal definitions, along with changing criteria based on national regulations (De Stefano 2016).

Hence, for workers in the gig economy to be rightfully protected, the gig economy should not be woven into the law as a separate silo in the economy, but rather the gig economy should be used as a reference point in comparison with the broader trends in the labor markets "such as casualization of work, demutualization of risks, and informalization of the formal economy" (De Stefano 2016: 499). There also needs to be cooperation between regulators and labor market operators to ensure that opportunities of development and employment do not happen at the expense of decent work conditions. Yet at the forefront of advocacy for labor protection is the dire need to have jobs in this sector, first and foremost, be recognized as work, in order to prevent workers from being perceived as extensions of a mediated platform – to essentially combat dehumanization.

The Impact on Individual Career Development

In a traditional job setting, careers are seen as a process that requires deep personal investments in one's work and mark one's achievements not only through monetary gain but through advancement within a particular field or across fields (Savickas 2005). Rewards of a career often include money, benefits, healthcare, career satisfaction, and opportunity to progress (Parker et al. 2016). While we may see our career using some objective career criterion (Savickas 2013), such as the sequence and sum of positions one occupies from school through retirement, we may also see our career using a subjective lens, through which patterning job experiences into a cohesive whole to impose meaningfulness and that guides, regulates, and sustains their work behavior (Savickas 2005). Individuals repeatedly revise their identity to adaptively integrate significant new experiences into this ongoing perception (Heinz 2002).

For much of the twentieth century, the prevailing employment paradigm was that employees had a long-term relationship with a firm and enjoyed long-term job security. The gig economy somewhat sidesteps, and firm commitment to career-long relationships is relatively low, leaving employees to fend for themselves but still required to revise and constantly upgrade their skills. Workers need to retool, learn new skills, and/or reposition themselves in relation to the changing requirements of work, and when considered contractors, they are expected to do all of this themselves (Stone 2006).

The anonymity involved in many digital labor platforms has been reported to impede the development of the social capital necessary for career and skill progression (Fieseler et al. 2017). It is important to differentiate between different types of digital labor. This work can range from projects where the purpose and the scope of potential contributions are clearly communicated to projects where the laborer is unaware of the impact of his or her contributions (Zittrain 2008). When involved with the latter, which are common, critics argue that workers do not know the value or purpose of their work and have no ability to organize or appeal the decisions of employers (Horton 2010). Their anonymity hinders their ability both to network, to build work references, and to seek organizational support. The effect of gig economy participation on long-term career outcomes is particularly unclear. A defining attribute of gig economy jobs is that opportunities for advancement within the firm are limited. These jobs might therefore stagnate workers' career progression (Greenwood et al. 2017).

Flexibility is perhaps the most prominent benefit of gig work, and this flexibility may allow the worker to pursue other opportunities outside the gig economy (Greenwood et al. 2017). However, research mentioned thus far has highlighted that this alleged benefit is not entirely beneficial. Additionally, this flexibility may not be as characteristic of this work as claimed. For example, workers are not required to work regularly or to accept any particular task, but they are typically required to follow rules and guidelines and, in some cases, a certain percentage or number of tasks (De Stefano 2016). This further emphasizes the idea that gig work may not differ as much from traditional work as was once thought – the main and perhaps only difference is that the platform aspect enables organizations to redefine workers in potentially beneficial and potentially harmful ways.

The workforce engaged on digital on-demand service platforms is often characterized by commodification, low cost, minimal institutionalization, and increasing anonymity (Ashford et al. 2018). Digital workers are not paid by working hours or hierarchical position, but based on the timely completion of granular work tasks, and their working conditions are largely the responsibility of the platform provider (Fieseler et al. 2017). Theories associated with digital labor tend to fall into idealized, oppositional binaries. On the one hand are celebrations of user-generated content emerging out of the free time and willful contributions of millions of people (Fish and Srinivasan 2011). In this light, digital labor can be described as a coordinated system of collective intelligence that fosters fulfillment through work (Terranova 2000). On the other hand are accounts of exploitation that highlight the dystopic impacts of capitalist labor and outsourcing (Fish and Srinivasan 2011). These descriptions liken the digital economy to "electronic sweatshops" or "free labor" (Terranova 2000), claiming that digital labor is used as a toll for organizational profit and power (Fish and Srinivasan 2011).

Fieseler et al. (2017) explored the relationship between employers, workers, and platform providers, focusing on the power of platform providers to design settings and processes that affect workers' fairness perceptions, focusing on workers' awareness of the new institutional setting, frames applied to the mediating platform, and a differentiated analysis of distinct fairness dimensions. One of the most marketable and favorable structural features of digital work is autonomy (Kost et al. 2018). However, many other structural features of digital labor are lacking.

Researchers report worker issues with unaccountable and arbitrary rejections, low pay (Irani and Silberman 2014; Fieseler et al. 2017), uncertainty about payment, fraudulent tasks, prohibitive time limits, long pay delays, and uncommunicative requesters and administrators (Irani and Silberman 2014). Further, on many platforms, workers have limited options of seeking recourse in cases of unfair treatment. Accordingly, digital labor is held to be susceptible to a number of labor abuses (Kneese et al. 2014).

Fairness as the New Currency for the Employment Relations in the Gig Economy

Labor conditions must be fair to ensure reliable and optimal economic outcomes. Individuals remain loyal and committed to an organization, even if the outcomes are less desirable, if the process of deciding on these outcomes is perceived as fair (Fieseler et al. 2017). Platform providers exert significant influence over the quality and quantity of tasks available to microworkers as well as overall working conditions (Kingsley et al. 2015). Therefore, the perceived fairness of work facilitated by digital labor can be expected to be shaped by the features of these platforms (Fieseler et al. 2017). Variance in influence, autonomy, or voice ultimately affects the perceived fairness of the labor facilitated by these platforms (Fieseler et al. 2017). Past research has examined how contract workers' perceptions of human resource management (HRM) systems from their client and contractor organization may affect performance, intrinsic motivation, service-oriented citizenship behavior, and organizational commitment to both the client and contractor organization (Coyle-Shapiro et al. 2016; Kuvaas and Dysvik 2009; Kuvaas et al. 2012). Future research should explore to what extent digital workers are affected by the lack of training and development opportunities in the gig economy if their work outside the gig economy has better opportunities.

More specifically, does the HR architecture outside the gig economy buffer the negative effects from the absent HR architecture in the gig economy? Another important aspect is time; tasks and projects are rather short in the gig economy, while other nonstandard work arrangements are longer. The question arises regarding how long a project has to last for companies to provide HRM support and for workers to feel entitled to receive HRM support. Furthermore, we have to ask what effect incongruence, between perceptions of whether workers are entitled to HRM support, has on working relationships. Workers could feel entitled, while companies feel they do not have to provide HRM support. Time is an important factor that is independent from the workers' skill level, uniqueness, or strategic value, but will increase in importance alongside the increase of the online labor market.

There are evident differences between employees native to the platforms' home country and employees who are being "empowered" by these platforms and who are native to countries with less robust infrastructure. Fish and Srinivasan (2011) expressed concern that both of their organizations of interest tackle their social goal through scale-driven approaches that lack attention to the diverse agenda of the communities they aim to empower. Some argue that access to labor in less-developed countries promotes dignity and that an infusion of money can empower a poor society (Fish and Srinivasan 2011). Virtual work poses no physical threat to workers, has no environmental impact, and does not require robust host country institutions of local entrepreneurial talent (Horton 2010). Others argue that these platforms are based in San Francisco, one of the most expensive cities in the world, at the center of one of the densest populations of managers of digital content and venture capital. Their recruitment of global labor speaks less to empowerment and more toward a desire to evade regulation and overhead costs (Fish and Srinivasan 2011).

With these differences in mind, it is interesting to find that across studies with workers of different demographics, they all tend to view their chances of being treated fairly online as being as good or better than what they can obtain offline (Horton 2010). Most microworkers report an uncritical, even positive view of their relationship with the platform. Individuals are glad that the platform exists as a source of income (Fieseler et al. 2017; Irani and Silberman 2014). That being said, worker perceptions of fairness are not measures of actual fairness (Horton 2010). As the gig economy grows and as firms increasingly operate in a market with undefined regulations, ethical considerations can be a source of guidance for how firms assess fairness in their currently established or developing business model.

Conclusion

The emergence of a gig economy calls for our society to reevaluate and redefine current work arrangements and employment regulations. The current business model adopted by many employers within the gig economy forces a vulnerable group of individuals to accept low pay, poor working conditions, and in general unfair practices. As demand for digital labor increase, the gig economy would only sustain by ensuring higher fairness standards to combat potential mistreatment and dehumanization.

Video Surveillance in Working Contexts and Business Legitimacy: A Foucauldian Approach

73

Kamila Moulaï

Contents

Abstract

This book chapter explores the dynamics of video surveillance on the bodies of workers from the spectrum of a subjectification process. Offering a theoretical progression in line with managerial considerations, this study plunges the reader into a consideration of the *captured body* through a reading of Foucault to open a reflection on business legitimacy. Because of the visual nature of the technique of discipline at stake here, e.g., video surveillance, we mobilized Merleau-Ponty's approach to perception to serve our investigation. Far from questioning the disciplinary potential of video surveillance, this study first argues that, by nature, only an incomplete reality of the surveilled body can be captured by the camera. The study then reconstructs the logic of an electronic eye as a mediator of power participating to a limited extent in the object-subject dynamic. Our investigation

https://doi.org/10.1007/978-3-030-14622-1_92

demonstrates how video surveillance can be approached as a provocation, since it gives the worker the impetus to access a knowledge of parcels central to the individual's attention to himself, the other, and the world. It finally discusses the role of a moral legitimacy to preserve the consciousness at stake in the subjectification process that we analyze.

Introduction

Contemporary organization is characterized by a centralization of practices of evaluation and control to serve profitability (Nolan 2017). In a context of *fusion of technologies* (Schwab 2016), companies can exercise continuous control over workers, even outside the office (Tarafdar et al. 2015). If today surveillance is considered deeply unobtrusive, sophisticated, and ubiquitous (Wood and Webster 2009), 20 years ago, it was conceived of as invasive of privacy and intimacy (Rothstein 1999).

Also, if research has long discussed how employees experience a continuous pressure related to boundaryless control, the most sensitive question raised remained the extent to which workers' privacy is still respected or not (Rosenberg 1999; Andrew and Baker 2019). Unsurprisingly, the use of ICT in the form of cyber surveillance to control workers has been addressed by the law, especially in answer to governments' concerns regarding the preservation of people's rights through regulations (Bohnenberger 2016). Yet the right identification of the actors to protect remained challenging to reach (Newkirk 2018). While surveillance practices at work were subject to strong normative framework, legal disputes growingly discussed the idea of resisting surveillance at work (Clawson and Clawson 2017).

The protection of workers' privacy initiates public debate around the question: Do we control the work, the workplace, or the workers? This question is not only of interest to the law. Several disciplines – such as surveillance studies, management, and psychology – have also questioned the phenomenon of surveillance practices in the workplace. While the approaches tend to be slightly different, the starting and junction points remain related to the accepted definition as cyber surveillance – e.g., the idea of more than an *extended form of social control declined into new media* (Bennett et al. 2012). Speaking of social control undeniably places the individual at the center of the reaches of cyber surveillance and the power it may have on the one on whom it is exercised, but not only. Indeed, in a globalized context, where public morals are gaining growing importance (Willke and Willke 2008), media growingly play an important role in the assessment of what is legitimate or not from an ethical approach (Aerts and Cormier 2009). The growing extension of this legitimation process to social media and society in general is impressive (Castelló et al. 2016). Actually, the more people are connected through social media, the more they can reverse power dynamics at stake to expose any illegitimate surveillance measure adopted by companies.

Surveillance is at the frontiers of moral legitimacy, and respecting laws will not ensure companies that any measure adopted remains ethical and legitimate in the eyes of external audiences.

Research in organization studies deeply explored the concept of legitimacy (Suddaby et al. 2017). Actually, legitimacy is the result of a constructed social order (Suddaby et al. 2017). Therefore, and as the context in which the social order takes form is subject to change, legitimacy should be apprehended as a non-fixed outcome (Zimmerman and Zeitz 2002) that evolves in a complex system. And if legitimacy may appear as a quite generic term (Oliver 1991), some nuances have been marked with work realized in order to classify the different types of legitimacy. Suchman (1995) has defined a pragmatic, a cognitive, and a moral form. In the present contribution, we rather see in the rise of new technological developments, an opportunity to elaborate on moral legitimacy. The fact, for instance, that moral legitimacy is more focused on the person (Skitka et al. 2009) resonates with the new paradigm brought by surveillance in a modern work context.

Studies exploring the individual impact of cyber surveillance are flourishing (see, e.g., Akhtar and Moore 2016; Wright 2015; Jena 2016;). We believe that connecting philosophical with managerial disciplines in the present contribution may open a window on the investigation of a new form of dynamics of the surveillance on the bodies of workers. More specifically, our contribution intends to reveal the importance of exploring how the worker can actually recreate their relationship to the material environment in a context of video surveillance through their consciousness. As surveillance technologies become growingly infused in organizational routines, the traditional boundaries of business legitimacy and the cases where it applies should benefit from a fresh look. The rapid growth of new technological developments is already changing the organizational structures (Brynjolfsson and McAfee 2014). Many of these innovations are mobilized to serve the objectives of firms in most sectors (Malec et al. 2013), including the way workers are managed. Technologies deeply influence the way we apprehend both values and norms ((Cole and Banerjee 2013). Since these are at the core of moral legitimacy (Suchman, 1995), the latter will not only be more complex to define but may also be impacted in practice.

In order to structure our analysis – and since philosophy may cover various approaches and questions – we decided to mobilize the philosophy of the technique. Indeed, the latter is mainly concerned with the relationship between people and technique and may raise considerations that appear to be naturally linked to surveillance.

Philosophy of Technology and Ethics in Foucault's Work

Technology cannot be defined as ethically neutral since tools are an integral part of a system, shaping individuals to fit the norms and values of that system (Hunyadi 2015). Control is infused in the system itself, defining the flows of power relations. It is therefore not surprising that Foucault's thought, even if it considered as a "philosophy of displacement" (Bert 2016), has been mobilized to serve surveillance practices. Indeed, if Foucault is neither essentially a philosopher of technology nor of ethics, within structural analysis, the capitalist logic of the exercise of power and control is of interest to organizations (Manokha 2018; Amintas 2002).

Questions of ethics and technology are not separately thematized in Foucault's thought. Nevertheless, we find these approaches in different works he produced. For technology, we refer mainly to *Discipline and Punish* (1975) to recapture the logic of a transition to a biopower – that is to say, the appearance of specific techniques of discipline exerted on individuals. As for ethics, connecting volumes 2 and 3 of *The History of Sexuality* (1984) with lectures given during the last years of Foucault's life is of interest to our analysis. Of course, one can argue that establishing a connection between technology and ethics in Foucault raises the issue of temporality. But the diachronic approach in Foucault's work, as Donatelli remarks, renders the author not only relevant to his contemporaries but also to all those today who try to give a new form to philosophical ethics (Lorenzini et al. 2013).

The Philosophy of Technology and Governance in Foucault

Foucault does not approach the question of technology as a separate philosophical object:

> What interests me more is to focus on what the Greeks called *techne*, that is to say, a practical rationality governed by a conscious goal [. . .]. The disadvantage of this word *techne*, I realise, is its relation to the word "technology" which has a very specific meaning [. . .]. One thinks of hard technology, the technology of wood, of fire, of electricity. Whereas government is also a function of technology: the government of individuals, the government of souls, the government of the self by the self, the government of families, the government of children and so on. (Foucault 1982: 1104)

As highlighted by Willcocks (2006), this quote from Foucault from an interview with Rabinow captures his dichotomy between a restricted and material technology and an expansive technology encompassing immaterial concepts such as forms of government. However, Foucault does not dwell much longer on the concept of technology in this passage. *Discipline and Punish*, for its part, draws upon a line of thought that is particularly fertile for the philosophy of technology:

> The great book of the man-machine was written simultaneously on two registers: the first, anatomo-metaphysical, of which Descartes had written the first pages and which the doctors and philosophers have continued; and the second, technical-political, which was constituted by a whole set of military, school, hospital regulations and by empirical and thought processes to control or correct the operations of the body. (Foucault 2010a: 187)

Foucault insists on the importance of details, especially in the techniques of control and use made by people throughout the ages (Foucault 2010a). Also, bodies can be approached in their interactions and in what those can produce in a context of power relations, where power goes beyond repression, censoring, and excluding, and where its function is above all to produce reality. Power is constitutive of humanity and people's way of apprehending the world (Foucault 2010b).

As a corollary to his analysis of power, Foucault takes a closer look at the disciplinary aspect of the governance of people and bodies and their intertwining with a coercive control process of the body's operations. The constant subjugation of the body generates a docility-utility; it is precisely in this that discipline consists, according to Foucault (2010a). In this perspective, technologies can be conceived as means that allow discipline to extend to the entire society (Foucault 1977).

ICTs, NICTs, and Video Surveillance

Technique appears in the history of the individual as a tool that serves the subjugation of the body. Today, a level of disciplinarization never equaled in the past is increasingly infusing power (Holland et al. 2015). Indeed, in recent decades information and communication technologies (ICTs) and new information and communication technologies (NICTs) have profoundly transformed our world and the workplace. The power of new information and communication technologies, their variety of functionality, their speed of evolution, and the fact they are easy to implement have given them strategic importance in the economy and in contemporary management (Moraes and Michaelidou 2017). These technologies deeply refine the logics of employee monitoring (Chory et al. 2016). Companies still increasingly mobilize them to get better new business opportunities (Avadikyan et al. 2016),

However, as the organization's viability strongly relies on its ability to remain legitimate (Deephouse and Suchman 2008), these new monitoring practices cannot be apprehended as isolated practices that escape the normative system. They need to be in line with a set of normative guidance and values (Deephouse and Suchman 2008).

ICTs are a major factor of change in companies and are related to the evolutions of organizational structures (Klein and Ratier 2012). But behind these tools themselves, the nature of the surveillance internalized by workers may nurture an undermining of trust with managers (Wright 2015; Tabak and Smith 2005). Indeed, *keeping an eye* on someone reveals to the surveilled that they could be considered deviant (Staples 2013). Nevertheless, this more individual-level analysis is somewhat subdued by a more macro perspective. This leads to the focus on the fact that the uses of ICTs meet the demands of the organizational strategy to an extent: maintaining productivity, protecting company's interests, and preserving legal integrity (Ball 2018). Therefore, and as long as the measures adopted suggest that these go beyond the sole aim of protecting private interests, they remain morally legitimate and acceptable by external audiences (Díez-de-Castro et al. 2018).

In the era of the spread of ICTs (Monahan 2006a), technologies offer to prevent non-appropriate employee behaviors (Cantoni and Danowski 2015; Lee and Kleiner 2003). But this use of ICTs insists, again, on the idea that surveillance is, before all, about maintaining order and producing subjects (Monahan 2017). One cannot deny that ICTs have also transformed temporality in the control of work. ICTs do not only serve the efficiency of the organization when they offer crucial indications on the hourly turnover of a store and the placement rate of a product in real time (Klein and Ratier 2012). They also affect the way time applies to the worker, strengthening the individualization of surveillance. The traceability of all exchanges and the real-time monitoring of workers and productivity tend to generate drastic change in the management of employee failures, putting at its center a subject that is now controlled day-to-day, minute by minute.

Cyber Surveillance: Time, Production, and Vision

Disciplinarization not only runs through an organization to make monitoring both possible and optimal, it also impacts the economic and instrumental dimensions that control individuals and their performances (Pezet 2004). Disciplinary techniques are at the origin of docile bodies (Stewart 2017). The subject is therefore fabricated by the forces of subjugation and control, where different techniques of coercion act on the bodies in order to *correct* them and produce a standardized behavior (Foucault 1977).

Through his analysis of factory discipline, especially in his overall project of a history of power, Foucault establishes a link between discipline and, through capitalistic considerations, the formation of the disciplinary society (Hatchuel 2005). There are three ways of exercising discipline: surveillance, examination, and the normalizing of sanctions (Foucault 2010a). The links that can be established between discipline and the world of work can occur at three dimensions of crucial importance for organizations: time, production, and vision (Foucault 2010a).

Today each of these is served by an electronic monitoring that, as suggested by Samaranayake and Gamage (2012), allows the continuous and sometimes secret surveillance of employees. But the surveilled are not just *tracked* through space and time (Monahan 2018). ICTs directly reshape temporality to reinforce the effect of time on the pace and intensity of work. For example, workers in firms that use enterprise resource planning (ERP) software often report that their work rate is imposed by a machine (Greenan et al. 2012)

Technology also allows us to have a precise idea of productivity levels at every moment and to monitor every movement or operation performed by workers. From an organizational perspective, this could help prevent negative behaviors, leading to positive results for the company (Pierce et al. 2015), though this productivity *guidance* has a cost for workers. However, ICTs that serve the company are not constrained to the same hierarchical channels as workers. In the ultra-visibility of work, the traces left by the computer, such as messaging control, are not only a top-down control but a bottom-up one (Greenan et al. 2012). Colleagues at the same level can control each other's work. Based on Foucault's approach, and from the perspective of a logic of power relations, one can interpret it as a *microphysics of* *power* in action – that is to say, the phenomenon that power, in a society, is no longer controlled by the state but by every single stratum of society, which imposes control on the individual everywhere and by everyone (Foucault 2010a).

The appeal behind the mobilization of surveillance may lie in its bidimensional approach: producing information on a population and directing supervision of it (Monahan 2006a). Companies argue for the usefulness of surveillance data in the workplace. However, even from the sole perspective of the outcomes surveillance offers organizations, that could, for instance, be read from the *Hawtorne effect* (Stand 2000), one can argue that it does not always provide good or mitigated results but can actually lower the quality of work (O'Donnell et al. 2013). In his contribution entitled *The Transparency Paradox*, Bernstein (2012) shows that a permanent visual control of workers would be counterproductive. Workers who know they are observed adopt behavior more in line with instructions but experience a decrease in productivity of up to 15%, reinforcing the idea that working practices are undeniably compromised (Ball 2018). The explanation for such a significant loss is that without permanent control, workers tend to use personal productive techniques (Bernstein 2012). Indeed, work does not consist of programmable operations but a succession of adjustments and subjective choices. But cyber surveillance offers an entirely different perspective on work: structured, objectified, and depersonalized (Klein and Ratier 2012) leaving no space for creativity (Ball 2018).

Undeniably, reflection on subjectivity and its ways of expression can neither be absent nor disconnected from the logic of surveillance. As suggested by Foucault, "any form of subjection gives rise to a process of objectification whose task will be to diffuse and instill norms" (Rojas 2012: 11). Self-disciplined, aware that they are always scrutinized and controlled in their activity, the worker faces the company's will to normalize their working processes and that of their co-workers. They are deprived from engaging their subjectivity in the proper performance of their tasks. But power is not only about structuring; it is structure in itself (Foucault 1982). It therefore participates in an elaborate reality. Discipline cannot be limited to its acceptation as a simple modality of power – it is an art, that of shaping bodies and their actions.

While ICTs have offered several tools to serve this art, not all may appear conceptually easy to intellectualize, even to the individual who knows that they are used, in a way or another, to assess, control, evaluate, and/or discipline them. This is why we believe that legitimacy and its normative system remain underconnected with the analysis of specific forms of surveillance.

Indeed, legitimacy evokes the idea of a transparency, which is paradoxically governed by a thick impenetrability, where being *legitimate* is more apprehended as a whole. Of course, the concept covers various aspects and takes several forms (Deephouse and Suchman 2008). However, the understanding of the raison d'être of these forms really makes sense when analyzed through practices rather than just being applied as top-down logics that ensures organizations have gain the *right t*o operate (Baumann-Pauly 2017).

The Eye of the Camera: Its Reach, the Body, and the Norms

The camera as an architecture of control is considered as the most modern and performing version of the eye; it reminds the individual of a practice dated from the origins of humanity: a gaze that follows what is of interest. If a visible gaze has the power to discipline bodies, a discrete one has for its part the ability to capture the subjective tracks left by an individual who has the pretention to think *they* have drawn *them* secretly. For sure, video surveillance inspires a disciplinary power that finds its way through the internalization of standards (Lebrument and de La Robertie 2019). However, trying to elaborate or assess the extent to which an organization may remain aligned with the values and objectives encapsulated in a system – and therefore *legitimate* – (Epstein and Votaw 1978) may transpire the idea of a fixed legitimacy. Such an idea cannot in a time of technological explosion remain realistic.

Therefore, what attracts our attention is more accurately what this eye penetrates, e.g., the relation to oneself and its processes. While surveillance can be captured in three dimensions – our *perceptions of surveillance*, the *depth* of surveillance, and our *exposure* to surveillance (Wood and Webster 2009) – the analysis of (an aspect of) the depth of surveillance is the one that interests us.

Before going further, we would like to reaffirm that in a world where various constraints and forces coexist and structure the strategic objectives of companies, a Foucauldian ethics does not have the pretention of liberating the individual. Foucault did not even suggest any form of modus operandi, which would have induced normative prescriptions (Leclercq-Vandelannoitte 2019). Rather, his work can be approached as increasing the individual's understanding of how to govern oneself when shaped by external forces (Foucault 2001). Such a position leads us to the question of how, rather than whether, we want to be governed by technology.

Also, and while legitimacy brings to the table normative expectations, it also recreates at the same time a logic of power and order (Weber 1978) that reconnects with the very nature of surveillance.

In late capitalism, surveillance is about bringing order its effectiveness varying according to where it is practiced and what it targets (Wood and Webster 2009). Certain forms of technologies are better applied in specific contexts. This is the case for what Lyon (2006) calls the *voyeur gaze* within companies. In fact, this type of surveillance is so perfectly integrated, it has become almost natural within the culture, which tends to support decisions made by companies to install surveillance technologies (Lyon 2006) and solve problems related to surveillance (Koskela 2003).

While describing this disciplinary technique, Foucault connects the visibility of architecture with the economic logic of profitability (Hatchuel 2005). From an organizational perspective, the *electronic eye* (Lyon 1994) posed on workers' bodies is in line with the logic of detecting and correcting the slightest imperfections in employee performance. When repeated every day, this can harm both the profitability and stability of the company. The camera therefore is conceived as a crucial economic operator (Foucault 2010a).

Video surveillance directly touches upon different issues concerning individualism as a value for privacy, even when the aim is to protect citizen. The empirical study by Monahan found that respondents expressed uncomfortable feeling when subjected to a scrutiny (Monahan 2006b). The idea of power is always at stake. It also sounds obvious at first to say those who conduct surveillance have more power than the surveilled (Hagen et al. 2018). But what kind of power are we talking about? Or more precisely, the power to capture what?

Constant and invisible, the device that constrains by glances (Foucault 2010a) is served by highly developed cameras that improve everyday (Kolekar 2018). It serves the immaterial potential of a "generalization of panopticism" revealed at its peak in late capitalist society (Foucault 2010a). But beyond its architecture, and so behind the object itself, is its mode of penetration of power, which reveals much of interest. It specifically responds to two main characteristics. First, as suggested by Foucault, video surveillance exercises a power that is indiscreet because present in any place and in any instance. Second, it operates mainly in silence, rendering it discrete at the same time (Foucault 2010a).

The discretion-indiscretion dynamic is tinted with an interesting symbolism when exercised within the workplace. Today, one cannot reduce video surveillance to the digital information it captures. As technology allows the eye to control everything at the lowest cost (Hagen et al. 2018), it potentially allows the observer to exercise a force on the body of the observed (Huey et al. 2006). But this power is not only *disciplinary* charged. Indeed, who would deny the sensual dimension that lies behind video materials (Endrissat et al. 2019)? The camera caresses every single move of these bodies as much as it looks at them. Looking closer shows a banalization in the workplace of the manifestation of the desire to engage with that which has always driven the individual: the idea of possessing a body. As Lyon emphasizes while investigating the scopophilia dimension inside and beyond visual surveillance, what he calls the "viewer society" is driven by the pleasure of looking (Lyon 2006). However, in a workplace where the contractual relation between the worker and the employer is legally framed, bounded, and restricted – e.g., a place of prohibition – the eye and its desire embody an even more complex dimension. Such a dimension is a taboo, and as it is difficult to conceive, it is even more difficult to constraint or even assess.

As long as legitimacy is reduced to perceptions and assumptions (Suddaby et al. 2017), it leaves no space, to any analysis of what is almost unseen.

There is nevertheless a moral potential here that could be reached through approaches that seem to be more related to the silent aims pursued by video surveillance. For instance, psychoanalytical approaches reveal that since the gaze is not a vision (Lacan 1973) but a creation that finds its origins and pleasure in deeper dimensions than the optical surface, the gaze in turn emerges *in* a *field* of vision (Cowie 1997). The compulsory gaze of the company could, to a certain extent, be connected to its will to form a unity with *its* workers. Of course, video surveillance builds upon a strong culture of voyeurism (Monahan and Wood 2018). But the individualization of careers, the tendency of workers to pursue their professional development outside the structures drawn and expected by an organization, breaks for its part, the vow of solemn commitment, since it creates a loss wide enough to justify the company hosting a compulsory gaze through surveillance. Successful or not, the resulting need to recreate an osmosis through a fusion of the bodies with the electronic eye procures at least the enjoyment of a capitalistic scopic pleasure in observing employees working for the attainment of the company's objectives. It would be hard to apply any moral legitimacy if this, as suggested by Aldrich and Fiol (1994), remains focused on value judgments. The immaterial dimensions, which are part of the process of surveillance, would render any analysis useless.

As part of the immaterial dimensions, one can cite the camera's silence, for instance. It cannot be sensed; it nevertheless reinforces the diffusion of the intangible power of the *eye that nothing escapes* (Noël-Lemaître 2007). Also, since the eye seeks to reach the body (Foucault 2010b), in its process of seizing an inner grip on it and its subjectivations, power becomes operated by movements that aim at lodging into every inch of what it captures. From a Foucauldian approach, this generates a relationship between people and truth and can be captured as an objectification process in which the individual shapes themselves (Foucault 1997). But at the very moment, the individual can also host this movement drawn by power; they irreversibly become a "place," entering a ubiquitous dynamic where they are now understood as the subject of desire.

In the context of video surveillance specifically, one instinctively acknowledges that the body is more than observed and scrutinized. Questioning what this body is cannot be nonsense. Plunging into Foucault's volume *La volonté de savoir* (*The Will to Knowledge*, the first volume of *The History of Sexuality*), Potte-Bonneville emphasizes the myriad bodies, pleasures, and kinds of knowledge in Foucault, as well as the undeniable changing nature of these bodies, where the kind of body evoked at the end is not the same one found initially (Potte-Bonneville 2012).

In his analysis of Foucault, Vihalem (2011) describes a body that is considered the object neither of autonomous knowledge nor of distant power. Rather, it is a field of application of the involvements that come from both knowledge and power, revealing the body's potential to be the *place* where these intersect (Vihalem 2011). More than a point of convergence where every optical beam ends, the body is also the place from which everything begins.

We should say that we are less interested in the polymorphous definition of the body than in its potential to be, as evoked by Potte-Bonneville's reading of Foucault's *The Will to Knowledge*, the "from where" we perceive things in their place, revealing a subject that is both the "source" and the "rule" (2012:84). As recalled by Bardon and Josserand (2018), Foucault refuses the perspective of any fixed binary opposition that could exist between the subject and the object. Therefore, the body is not only the *place* enveloped by the electronic eye. Rather, behind the object, silently infused and disciplined by power, it is a subject from where *everything* starts inhabiting space(s).

Subjectification and Visual Potential: Behind the Incompleteness of Surveillance

Since technology is an operator in video surveillance, the eye of the camera, as the product of both technology and surveillance, could be approached as what mediates attention. Thinking of video surveillance as a mediator of attention makes it conceptually easier to intellectualize its potential to focus attention on specific moments and places and to conceive how this may be integrated in the subjectification process.

In *The History of Sexuality*, Foucault describes subjectification as an "opération artiste" (Foucault 1984) implying threefold attention – to oneself, to others, and to the world. What are the mechanisms at stake if this dynamic were to be transposed into the context of video surveillance? To answer this question, we should interpret subjectification's threefold attention from the perspective of the material origins of the glance, its surface of application: the vision itself.

The individual is mingled both with the world and the other (Merleau-Ponty 1964b), and our very relationship to the world comes through the flesh (Merleau-Ponty 1964a). The body thus is more than simply visible; it does not only represent "our anchorage in the world" (Merleau-Ponty 1962: 167). As suggested by Vihalem (2011), the body is where the world anchors. The body is subjectified, liberated from its corporality, and subjugated at the same time all while keeping its flexibility (Vihalem 2011).

One could therefore redefine Foucault's idea of attention as constructed around a movement where the self-seer is the embodiment of an attention to the self, the seen; an attention to the other, the seeing; and the attention to the world – all three forms of attention intertwined at the same time, since the visible is endless, nurtured by the invisible (Merleau-Ponty 1964a). Attention communicates itself with a movement from the inside to the outside and vice versa (Hoffmann 2010).

The body is at the same time flesh and place, in an intertwining that embraces the threefold nature of attention. But when the eye of the camera enters into action, it observes the body apprehended in its function, contextually situated in the working environment. The monitoring is then based on a strict frame of reference which, from its perspective, will assess what is within the norm or not. Thus, surveillance in itself is no longer simply about identifying and reporting deviant behaviors, though it still definitely does such tasks (Wood 2012). Rather, it is about imposing its dichotomic charge through its capability of evaluating whether the individual sticks to the rules or not (Lyon 1994). As Foucault indicated, the apparatus labels the subjects (Foucault 1977). From these very separations, individuals render the values and meanings of what they do (Foucault 1985). But most importantly, the camera becomes the expert in these assessments. Therefore, it will also impose a system of norms on workers, becoming a sort of black box that is external to the legitimacy system. This black box, in turn should be understood in its immaterial form, which seems to be only accessible through moral legitimacy.

Indeed, the camera is perceived as the savant gaze, the one that Merleau-Ponty (1964b) described as defining scientists who describe realities according to the acceptation of a univocal truth, leaving no space to perception or experience. In the workplace, the eye of the camera and its disciplinary project seizes from its perspective a visible body to observe unruly features and practices and to correct them, while, through its movement, infusing norms that are in turn internalized by the flesh.

But then what, in the last analysis, does such an eye capture? What it emphasizes its attention on. Thus, rather than a behavior, or a malleable body that becomes docile under the weight of the eye's movement, what is captured is the internalization *by* the worker of the sole perspective of the camera's savant eye.

However, the individual is "the principle of their own subjection" (Foucault 1977). At the same time that they are an object, they are a subject. Since they cannot only rely on their own perspective, they also cannot only rely on the perspective drawn by the electronic eye and what it suggests. The structure of the camera infuses discipline; however, from its sole perspective, it cannot really infuse power, since this power is just a movement in the world, a part and not a whole, to which the individual also draws their attention and to which they are intimately linked. As Lacan suggests, the individual is not only a punctiform being. In other words, I am in what I observe, just as what I observe is in me (Lacan 1973).

The eye of the camera is also bounded in the subject-object dynamic in which the individual is involved. However, it is a victim of the exacerbation of attention it draws on them, since it cannot capture the individual in its other places, those that both surround the individual and penetrate them at the moment when the movement of the eye is in action. While the eye of the camera is on them, other envelopments are at stake, but these are unknown by the camera.

But the permanent movement of the object within the subject (Merleau-Ponty 1964b) is not just a matter of place. It is also a matter of temporality. For Merleau-Ponty, the subject is in what precedes as it and in what follows, anchored in a before and an after (Petitdemange 2008). The eye of the camera seizes the worker at a point in a specific place, restricted to a specific time, while the subject-object relation is for its part integrative of the attention to the self, the other, and the world.

The body is therefore declined into places that are anchored in a before and an after which cannot be seized by the eye of the camera.

How can we now translate this from a visual perspective? When the eye of the camera is on the worker, what the worker sees and what contributes to their construction escapes the eye of the camera. If the camera directs its attention on the individual as an object to exercise a disciplinary effect and then generates the internalization of a control exercised on their body, the only way the camera captures them as a subject is in this place, which hosts what they can apprehend from the coercive power their body can reproduce. In other words, only the seen is captured from this perspective.

As long as the eye of the camera is on the body, it is deprived from access to the entire reality and subtleties of the individual's world, constructed around what their gaze perceives and what their eyes envelop in those places at the same time that they are impregnated by them. Visually speaking, the position of the individual's eyes determines what places these will embrace. Between the electronic eye (Lyon 1994) and their eyes – which are their point of observation – lies a gap in the eye of the camera. This space could, for its part, host the constitutive parcels of subjectification. This gap is the place of an experience beyond what is sensible, in which power cannot assert itself.

The Provocation and Its Logic

Attention to others is essential in the constitution of oneself as a subject (Brugère 2003). Self-knowledge is intrinsically linked to knowledge of the world and to the governance of others. As a matter of fact, the knowledge of the parcels the worker's eye can access, but which cannot be reached by the eye of the camera, are also part of this self-knowledge. The eye of the camera can only access the visual residue left by these unattainable parcels, and that includes what is beyond the vision of the camera.

However, if only visual residues are captured by the camera, there could be no need to warn that companies should be careful about their surveillance practices. If the extent of their practices is technically limited, companies can remain perceived as legitimate actors and get what Baumann-Pauly (2017) would refer to as social acceptance. Nevertheless, it is not the case. Video surveillance still manages to exert a certain control and discipline on a body, despite this sensitive flaw. Technical failures have already been connected with surveillance technologies. As an example, one can refer here to the case analyzed by Wood, where incorrect identification of criminal profiles occurred, showing to a certain extent the fallibility of technology (Wood et al. 2006). However, our idea of a sensitive flaw, for its part, is more interested in putting a name on that which cannot be seen by nature.

Indeed, the relationship of the individual to their world spontaneously comes through the flesh (Merleau-Ponty 1968). The worker, in fact, only conceives themselves as the object or the subject, disconnected from the dynamic movement in which they are engaged. They are thus well-involved within their flesh but not within the *place* they occupy. As a consequence, their attention to themselves, the other, and the world is articulated in a timely progression rather than anchored in a dynamic movement. Broken, the dynamic movement which is at stake in the subjectification process will allow the camera to emphasize the specific attention the latter requires for the infusion of discipline.As a condition, the self must undergo the determinations suggested by the emphasis drawn by the electronic eye's attention. As noted by Potte-Bonneville's reading of Foucault, the determinations do not only come from the outside; the self is nurtured by society but it also nurtures itself (2009).

The Eye of the Future and the Place of Moral Legitimacy

Technology is undeniably part of the world of the individual. Since the subject remains immerged in matter and cannot escape it (Merleau-Ponty 1964b), we would like to pursue this investigation with a fictional case that may be in line with what could be called the *eye of the future* in the workplace. The aim is to challenge our approach and see how still relevant (or not) the visual reading we suggested earlier may be.

The improvement of technology creates incredible ways to provide absolute surveillance at the service of an organization. From this perspective, the eye of the camera may be relocated within our eyes in the future. This would confer onto video surveillance the privileged place of our point of observation. The eye of the camera would then have access, at the same time as we do, to the reality we embrace. However, if this becomes so, several problems would occur.

One should be reminded that video surveillance, in order to control the worker and discipline their body, requires the camera to capture the individual in their *direct working environment*, for which it needs an external perspective that builds the known context. Otherwise, the visually captured worker, *deprived* from the context of their working environment, escapes the very aim drawn by the gaze of the camera. The external contextual elements are at the core of the relevant exercise of the electronic eye's power. In this context's absence, rather than being captured as a worker, the individual would only be seized as an individual.

In workplaces, the raison d'être of video surveillance (or the main one out of many) is to assess the right application of norms set in accordance to a specific guide that can only make sense in the environment it is entitled to preserve – here, the organization. As a result, the electronic eye may thus only offer a continuous monitoring without any disciplinary outcome.

Of course, one may think that in addition to the camera located into the eyes of the worker, other cameras could be located in the physical environment, connecting all of the information in real time. However, if the eye of the camera is located in the eye of the worker, it undeniably becomes part of the *place* to be surveilled, creating the paradox of a surveillance system *surveilled* itself. The interesting fact with this fictional case is that it shows that video surveillance cannot technically reach an absolute monitoring of workers. Nevertheless, one should not take for granted this practical fact, but rather think of the consequences exposed earlier and which relate more to the "internalization" of this surveillance by workers. In a context of technological developments, the pressure to control workers would be even greater. However, the legitimacy logic remains encapsulated in a system that oversees the importance of the moral dimension. Therefore, as long as companies engage in surveillance practices that do not visibly harm workers, there are great chances that insidious practices that hurt the subjectivation process remain silent as these do not have any negative *measurable* reach.

This sheds light on a crucial point: as long as the legitimization of surveillance practices depends on measurable actual facts, the values and norms to be applied to surveillance in the workplace will remain hard to conceive. However, if we extend the spectrum of moral legitimacy to immaterial aspects exacerbated by technology – for instance, human consciousness in the dynamics of subjectification – what is now considered as acceptable practices would fall out of a system of values and norms.

As a result, in order to rethink the system in itself, the immaterial impacts of practices allowed by video surveillance, new approaches to legitimacy should be applied. If moral legitimacy can only exist if the actions of the organizations are in line with social values (Suchman 1995), there is a need to think of the values induced by new surveillance technologies, to be able, in turn, to analyze new moral paradigms.

Discussion

This contribution opens a new window into the analysis of video surveillance in the workplace. Driven by philosophical as well as ethical considerations, our approach dives into the subjectification process, in a context of electronic surveillance as well as the logic and implications drawn by this. We propose a visual reading of power and its infusion, including Merleau-Ponty's philosophy of perception.

Video surveillance at work has long been approached as a managerial version of the panopticon; the idea of its ubiquitous control pushing workers to self-discipline, shaping bodies to stay in line with the organizational logic of profit, is no longer questioned. Indeed, video surveillance seems to respond perfectly to what Foucault described as the ideal of capitalistic control: allowing maximum surveillance at the lowest cost (Noël-Lemaître 2007) and reinforcing the docility of bodies for the sake of the capitalist system.

But this contribution was not interested in assessing or resisting the effective coercive control video surveillance may have on the body. We were interested in investigating the depth of surveillance through a case that offers a visual reading of the attention surveillance pays to the self, the other, and the world while an electronic eye scrutinizes the worker.

Surveillance technology cannot be limited to a threat from the sole perspective of the power infused by it. We adopted the Foucauldian approach of a technology acting as a provocation to elaborate on the role video surveillance plays. We therefore focused on the knowledge of what we identified as a gap: the constitutive parcels of subjectification that escape the electronic eye, but which remain at the core of the subjectification process even in a coercive context.

In that sense, the present contribution reconciles with the Foucauldian invitation to go further than the current acceptation of video surveillance, reiterating that the body cannot be reduced to a simple and flat materiality (Vihalem 2011). Just because video surveillance serves as a means of social control (Lyon 1994) does not mean that its extent should be limited to this function. The individual may draw from it and from the spaces of creation it enables.

As argued by Sewell (2012), there is an inconsistency behind the fact of solely distinguishing whether the surveillance is prophilactic (aiming at serving everyone) or coercive (Sewell 2012). Rather, as part of our ethical position, we questioned the technology in terms of its potential *for* the individual.

We have entered an era where the importance of a knowledge transcending the sole materiality of the flesh has been revealed, ironically, by technology.

There is still, we believe, this striking paradox in surveillance. Nothing of what it *observes* escapes it. Without a doubt, a part of the individual relationship with the world, its places, and its things, which are actively involved in our subjectification

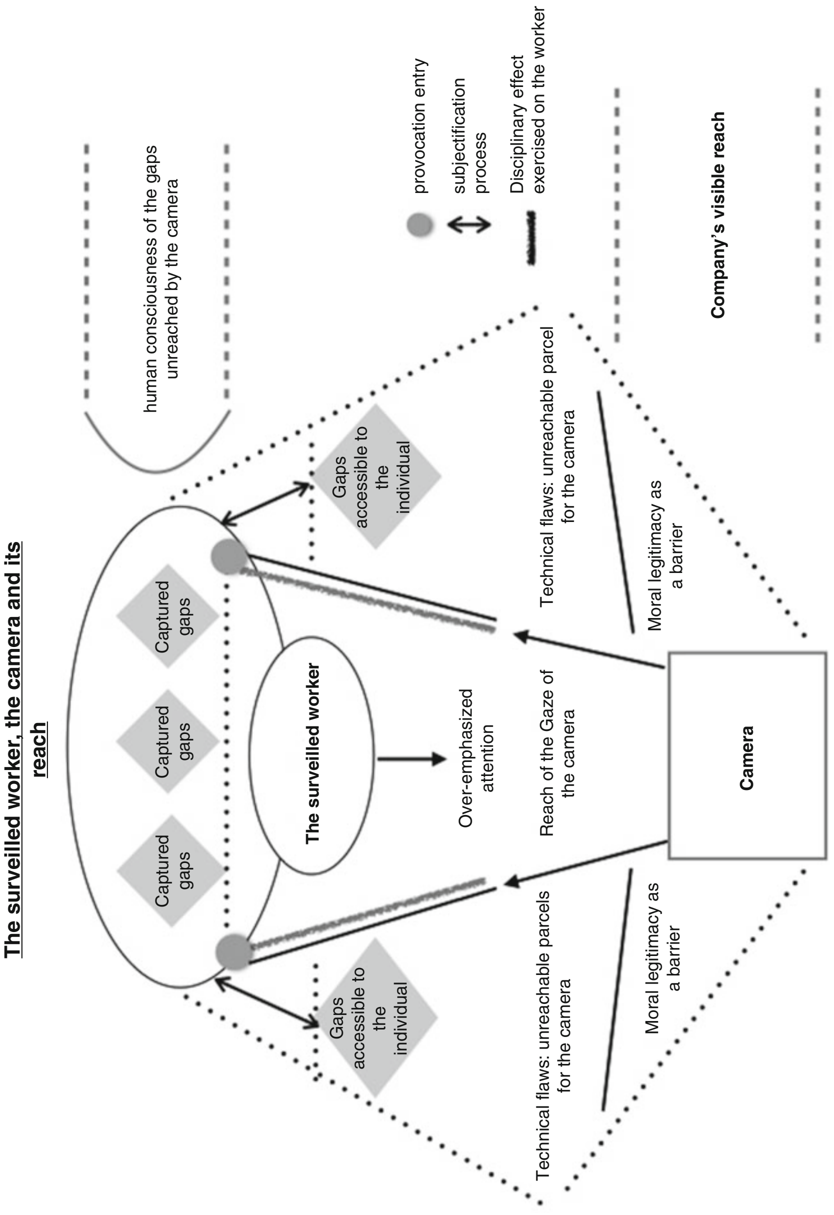

Fig. 1 Moulaï Videos Surveillance Ethics Model (MOVISEM)

process, slip between the eye of the camera and the scrutinized worker. This reveals what we called a *technical flaw* in video surveillance. The individual needs to conceive of the overattention drawn by the camera to find that it provokes the knowledge of those parcels and their dynamic. These are, in turn, constitutive of the individual's world and invites them to rethink their relationship with themselves.

It is precisely here, we believe, that moral legitimacy has a role to play. With our analysis, and the unsuspected extent of these gaps, we identify the need to offer moral legitimacy a fresh look. Under the impetus of technological developments, workers will engage in new strategies to escape their condition of surveilled bodies and reconnect with themselves in a subjectification process. While the organization cannot access these *gaps*, one of the main roles to be played by moral legitimacy in the future is to ensure that the (human) consciousness of these gaps will escape the company's control. This disambiguates moral and ethical forms of legitimacy.

While our fictional case, the "eye of the future," proves that any intrusion in workers' gaps, is technically impossible, we believe that new technologies will allow at least the internalization in workers' minds that these gaps *are* accessible. Therefore, surveillance practices and the aforementioned threat can only be refrained with moral legitimacy. The non-fixed nature of legitimacy will indeed allow to integrate new values inspired by constraints induced by new technical developments. These can make the protection of human consciousness a core prerequisite in what, as would suggest Deephouse and Carter (2005), organizations should or not do. Finally, we have created our own model in order to summarize our findings and analysis. Our analysis allowed us to develop the Moulaï Video Surveillance Ethics Model (MOVISEM) (Fig. 1).

Conclusion

The issue of surveillance is not only critical and controversial. Deeply influenced by the creation and use of some forms of technologies, especially ICTs, within corporations, it has become more than ever both a philosophical and ethical question, especially when it comes to the subjectification process. However, the project of this investigation was not to elaborate on a subjectification logic to be investigated in the margins of video surveillance. We rather approached the moral *black box* to look more closely at video surveillance in terms of its *potential* for the individual.

We conducted a theoretical investigation that starts with the invitation made by the Foucauldian approach to disciplinary power and subjectification. The conceptualization of video surveillance as an architecture of control has been progressively transcended and reconnected with a perceptual reappropriation of surveillance's intertwining threefold attention with the worker's subjectivity. Elaborating on a dynamic of *parcels* at the core of the attention to the self, the other, and the world, we demonstrated that the electronic eye can only capture an incomplete reality of the surveilled body. We then showed that technology acts, as suggested by Foucault, as a provocation for human consciousness. We finally argued that this logic which is growingly emphasized by technological developments needs more than ever to be supported and included in the matrix of moral legitimacy to be embraced by companies.

Contents

Abstract

The platform economy is the buzzword in today's world. Platform worker, particularly the transportation sector, is affecting the daily life of people in cities around the world. It started with great promise for the actors, the drivers, and there

was a rush to join. Gradually the drivers realized the power of the operators and how they control the whole business without taking much responsibility. Resentment started, across the world. The cry for an institution to raise their voices is very loud. In this context the present chapter examines the legitimacy of forming a union by the gig drivers. It is argued that while there is a need to bring the drivers under a union, a lot need to be done to gain the trust of both the drivers and the users in its value of delivering social justice.

What Is Legitimacy?

There exists no single construct or definition of legitimacy in literature. Huge amount of discussions, debate, and deliberation on legitimacy exists in extant literature. Our objective is not to derive a rational definition of legitimacy out of the literature but to find out a practical approach of establishing legitimacy in our day-to-day work. In the process we consciously avoid philosophical discourses.

According to Maurer organizational legitimacy is a process whereby the organization justifies its right to exist to its peer group and also to the larger societal institutions, which he called as superordinate system (Maurer 1971). In other words, legitimacy is an assumption that the actions of an entity are desirable and appropriate within societal norms, values, and beliefs. As different societies are having different norms, values, and beliefs, what is legitimate in one society may not and need not be legitimate in another society. Perrow has justified occasional departure from societal norms by an otherwise legitimate organization without losing legitimacy as such departures do not draw public disapproval (Suchman 1995). Thus, legitimacy is a function of collective value and belief independent of individual observer. As, for example, in India, often it is reported that the private healthcare units do not release dead body of a patient without getting the financial dues cleared (NDTV 2011). Many health workers and individuals believe that such actions are unethical but the organizations do not lose its legitimacy as such actions do not result in reprisal by regulatory authorities, though in many occasions courts and government authorities disapproved such actions. One Indian state, West Bengal, has passed a bill, which prohibits hospitals from taking such actions (Times of India 2017).

Suchman defines legitimacy as “Legitimacy is a generalized perception or assumption that the actions of an entity are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs, and definitions.” Analyzing divergent views of legitimacy, Suchman identifies three forms of legitimacy: moral legitimacy, pragmatic legitimacy, and cognitive legitimacy (Suchman 1995).

Moral Legitimacy

An activity attains moral legitimacy from its positive effect on societal welfare – from the social benefit point of view whether the activity is “the right thing to do,” and its alignment with the socially constructed value system (Aldrich and Fiol (1994) and Parsons (1960)). Suchman brought two subtypes of moral legitimacy: c*onsequential* and *procedural* moral legitimacy (Suchman 1995).

Consequential legitimacy is judged based on what an organization has accomplished in terms of the criteria that are specific to that organization. Procedural legitimacy is earned by an organization by adhering to socially formalized and accepted procedures (e.g., regulatory oversight).

Pragmatic Legitimacy

Pragmatic legitimacy concerns with the activity’s beneficial effect on its immediate audience. It boils down to the expected value of an organization’s policy to a particular set of constituents (Wood 1991). It examines whether the organization achieves its intended outcomes. In other words, pragmatic legitimacy rests on the self-interests of an organization’s constituencies.

Cognitive Legitimacy

Cognitive legitimacy is defined as the acceptance of the organization as necessary or inevitable, like schools, hospitals, and agriculture. “The antecedents of cognitive legitimacy of an organization are the history and prevalence of its particular organizational form” (Bitektine 2011). Cognitive legitimacy is defined as the acceptance of the organization as a primary requirement for the society.

Definition of Trade Union

As per the International Labour Organization (ILO), “A trade union is an organization based on membership of employees in various trades, occupations and professions, whose major focus is the representation of its members at the workplace and in the wider society. It particularly seeks to advance its interest through the process of rule-making and collective bargaining” (Robert L. Morris 2002).

Levine describes labor unions are nonprofit associations but also coercive economic agents; working-class communities but also powerful special interests; and embodiments of rights but also incompatible with certain individual freedoms (Levine et al. 2001).

At the global level, the International Labour Organization (ILO) is the only tripartite UN agency that brings together governments, employers, and worker representatives of 187 member states with an objective to develop policies and promote decent work for all. All the 187 countries which are signatory to the decent work agenda have some form of legally recognized trade union/labor union. Considering the role of ILO, we may consider ILO's definition as the standard definition of trade union. The legal definition of trade union varies from country to country, and each has set rules and code of conduct for trade unions.

By and large the main objective of a trade union is to promote the interest of its members, due to justice being paid to the interest of the total labor force maintaining the greater national interest in view.

Though the legitimacy of trade unions is both rooted in history and institutionalized by law, the legitimacy of trade union is questioned by different governments time and again. Dufour and Hege have argued that the crisis of trade unionism is more from internal legitimacy (Dufour and Hege 2010). Hence, a discussion on legitimacy of trade union in the context of business is required before we deal with issue of legitimacy of trade union in gig economy.

The Concept of Legitimacy in the Relation Between Trade Union and Business

Gary Chaison and Barbara Bigelow establish legitimacy of trade unions analyzing five case studies: the UPS strike, the organization of clerical workers at Harvard, the AFL-CIO associate membership campaign, the fight against NAFTA, and the Massachusetts Nurses Association Campaign for Safe Care (Chaison and Bigelow 2002). They argued that there exist reasons for “trade unions to move beyond pragmatic concerns and link their activities to the broader interests of their constituencies, demonstrating not only that they offer something tangible in return for support (pragmatic legitimacy) but also pursue goals of social value, which are seen that they are doing the right thing (moral legitimacy)”. The authors stressed that legitimacy is established more strongly when union plays bigger role in addressing the social cause in addition to the pragmatic concerns, while it may start from pragmatic view. They even argued that unions can loose on their pragmatic gains, but win when they “fight the good fight,” thereby gaining moral legitimacy.

There are quite a few instances from India as well, when trade unions have shown their concerns over bigger issues that the country is facing. On 23 October 2018, representatives from different trade unions discussed the challenges posed by governments' trade agenda at WTO, FTA, and bilateral investment treaties (BITs) to employment, trade union rights, and national sovereignty (psi 2018). The five unions of Coal India wanted the outsourcing policy revoked (Singh 2013). Ten lakh employees of various public sector and some of the private and foreign banks under UFBU, an umbrella organization of nine unions, including the All India Bank Officers' Confederation and the All India Bank Employees' Association went on a daylong strike in January 2019 to protest against the proposed merger of Vijaya Bank and Dena Bank with Bank of Baroda. The unions are claiming "This merger will see a large number of branches getting closed and customers will have to face hardships as already banks are burdened with the implementation of various government schemes such as Jan Dhan Yojana, Mudra, social security insurance, and Prime Minister's housing scheme, among others," and will be detrimental for both customers and bank (Economic Times 2019).

There are other parts of the story as well! Enough evidences are there in the case of India, and with the introduction of contractual workers, the quality of jobs and average wage comes down heavily. It is also a fact the trade unions are not sensitive enough toward the issues of contract workers, in India. Therefore, in quite a few instances, contract workers have fought against the trade unions, which may otherwise be interpreted as the question of legitimacy from the utilitarian and moral approach (Ness 2016). Unions' inaction against the violation of environmental rules and regulations by their respective employers is conspicuously visible (Bandyopadhyay 2019). Thus, there is a possibility of losing moral legitimacy of trade union in Indian context. Public sympathy toward trade union activities is declining (Sharma 2019).

Ambiguous Legitimacy Status of TU in India

India has 11 national-level trade union organizations, and apart from these, there are numerous trade union organizations operating at local levels as Trade Unions Act 1926 allows any 7 persons to form a trade union. There is a provision of registration of trade union, but it is not compulsory. In the absence of registration, it is not possible to get a reliable figure on the number of trade unions. We have to keep in mind that no matter a TU is legally valid or not, what matters at the micro level/unit level is the recognition of a TU by the employer organization with whom an organization may engage in negotiation on matters related to working condition or wage or terms of employment. When such is the importance of recognition of TU, there is no central legislation on recognition of TU in India even after the enactment of TU Act in 1926. In the absence of any statute toward TU recognition, recognized TU does not enjoy any legal legitimacy, and withdrawal of recognition by the management does not violate any law (Karpagam 2019). Though several commissions were constituted to examine the issue, some of the commissions have recommended that TU registration and recognition of trade union by employing organizations must be made mandatory. There are a few states of India which have brought regulation on recognition of TU, but there is no parity among the state laws, and still the process of recognition of TU is at the discretion of management. 1947 TU Amending act provided compulsory recognition of the representative unions by the employers, but this has not been brought into force as it was not notified. It is in this context ratification of ILO Conventions 151 and 154 by India is so vital, which India has not yet done.

Gandhi as a Trade Union Leader

History of trade union movement in India goes back to 1918 when M.K. Gandhi led the first worker strike in Ahmedabad Textile Mills. He examined the demands of the workers after studying the financial positions of the mills and demanded 35% wage rise. He sold the idea of tripartite arbitration, which was the first of its kind, and convinced the mill owners to agree on this arrangement. Thus, he first introduced the role of arbitration in industrial relation. But the process of arbitration failed due to noncooperation of the mill owners. At this point workers declared strike, and Gandhi agreed to lead them. When he found that workers' morales were going down, he decided to go for his first satyagraha, "fast unto death," which forced the mill owners to meet the workers' demand. Gandhi stressed that the strikes shall be nonviolent and based on "truth." Gandhi's idea was labor and capital are supplementary to each other and both are trustees of the resources including capital and both should work for the common good. He also elaborated the duties of trade union:

(a) "To make arrangement for educating both men and women. This is to be regularly undertaken through night schools.
(b) Children of the labourers should be educated.
(c) There should be a hospital and creche and a maternity home attached to every centre
(d) Labour should be able to support itself during the strikes." (Varghese (2019) and Nanda (2004))

Thus, Gandhi's views on trade union support the *pragmatic legitimacy* of trade union.

Truly speaking Gandhi's concept of trade union, though very unique, is nowhere totally followed including in India. Some of jobs, which were earlier under the purview of the Trade Union are now being taken over by the Human Relation Department of the organizations and also by NGOs. In fact, there are cases where NGOs and the unions have fought court cases to settle the matter.

Legitimacy of Trade Union in Global Context

Levine pointed out that the legitimacy of union needs to be established against the utilitarian's argument that trade union undermine social welfare as it hampers market efficiency and also libertarian' argument that unions override individual's rights of expression and contract.

People can express dissatisfaction with the organization in two ways, according to Hirschman's theory – by using "exit" or "voice." The option of exit is very limited with the working class. Working class as a whole will benefit from a strong voice when they are organized, though an individual member may lose the rights of expressing their individual opinion. Trade union as an interest group is valuable to the society as a whole as they can generate strong debate. In the absence of union, the corporation and individually wealthy persons predominate. Thus, union insures more balanced debate in a democratic society. There are ample evidences across the world that trade union may force mass media and legislators to debate issues that may otherwise be ignored. It is for the union issues like minimum wage, job security, and safety at workplace are on the national agenda. Apparently increase in inequality in the USA since 1973 is partly due to the result of shrinking unions. Levine argued that "if investors can create corporations, then perhaps ought to be able to form bargaining units." Thus, existence of unions allows workers to discuss the economic conditions of their own lives, to debate on coming to consensus on actions for bettering their situations in their mutual interest (Levine et al. 2001).

Levine concluded

> Unless one adopts radical and controversial moral principles or contentious interpretations of the empirical data, it appears that unions are at least as legitimate as other institutions are. Workers have the right to join them and to form new ones by majority vote. Indeed, unions are good for the nation because of their civic, economic, and political effects. (ibid.)

Thus, Levine justifies the legitimacy of union from morale legitimacy theory.

Onaran et al. have argued that growth in the European Union, including the UK's economy, is "wage-led," and they also claim that decline in union density has reduced UK GDP by 1.6%. Thus, the UK has paid a heavy price for anti-union policy. They suggested that trade union must be made as an essential part of sound economic policymaking body (Onaran et al. 2015). Burnett argued that the type of union activities in the USA in the twentieth century, which gave them prominency in industrial relation and even in legitimacy, will not work in the twenty-first century with decline of US labor participation in economy. Burnett also argued that trade unions should reinvent themselves with new mission of satisfying the needs of both of its members and the companies for which they work (Burnett 2015). Here we find a great semblance with Gandhi's views on trade union which he professed exactly a century ago. Though issues like unions may not benefit poor people outside of their jurisdiction when conflict arises with their own members, their apathy toward the contract workers and freedom of dissenting workers remain to be resolved. Perhaps organized union should ponder on these issues more logically and reflect on the role they play in different situations.

What Is Digital Worker

Digital worker is commonly known as "gig worker." In this chapter we will use both the terms synonymously. In order to understand digital worker/gig worker, we have to understand what is gig economy. Donovan et al. (2016) have defined gig economy as "The gig economy is the collection of markets that match providers to consumers on a job in support of on-demand commerce." As gig economy invariably uses technological platforms, we include "platform" in this definition. Thus, we define gig economy as "The gig economy is the collection of markets that match providers to consumers on a job in support of on-demand commerce using technological platforms where platforms play the role of an intermediary at some transactional cost." The nature of the job done by digital workers varies from intangible to tangible like transportation in which Uber is the most visible platform. In this chapter we will consider the issue of Uber/platform drivers as they are the largest homogeneous group of gig workers. Another reason to consider in this group is "Uber technologies Inc. does not treat its drivers expressly as external suppliers of an outcome: the control of drivers is strong even though managed by an automated system."

The companies that manage gig work opportunities are characterized by the below activities:

Collect a portion of job earnings.
Control the brand.
Control provider-client relationship.
Thus, gig work is different from freelance work as the gig worker is not building their own brand or their own "business" (ibid.).
So, gig work is not time-based employment, and profit-based self-employment makes gig work difficult to classify in traditional models.

Why Transportation Sector?

Aggregators in personal transportation sector are the most impactful platform work, and the Ola and Uber are the best-known cases in India (Rina and Anjali 2018).

Transportation is the sector, which involves largest number of gig workers. In transportation sector Uber is the most visible platform around the world. In this chapter we are focusing only on transportation sector.

Uber a ride-hailing app has contributed in a major way in disrupting conventional taxi business around the world since its start in 2009. It is the most prominent player in the gig economy. Globally 15 million Uber trips are completed each day in 65 countries including India over 600 cities. Apart from Uber there are a couple of other operators too like Lyft, Grab, Didi Chuxing, and Ola, which are quite big in market size. Uber has about 3 million drivers around the world, Lyft has 1.4 million drivers, and Didi Chuxing has 1 million drivers. In India Uber and Ola are the major players (Uber revenue and usage Statistics, 2018). In Mumbai the number of conventional taxis has come down from 55,000 to 20,000 on roads. According to the Mumbai taxi union leader, this decline is largely for two reasons: the aged taxi drivers are selling their permits to online cab operators, and young drivers are facing difficulty in getting the mandatory license badge for not having 15 years of domicile certificate. He feared that a large number of taxi licenses will be sold to the fleet cab operators. Ola and Uber control 90% of cab market in India (Chatterjee 2018). A study shows that there is a fall in income of about 10% among conventional taxi drivers, but it resulted in 50% rise in the number of platform taxi drivers in a city. Therefore, platform-based taxi services created more jobs than it has destroyed (Gaskell 2017). An interaction with Ola and Uber drivers also reveals that due to cab aggregator, the number of taxi users has gone up. The most prominent driving factor of increasing the market size may be attributed to the taxi scheduling algorithm, which facilitated better matching between demand and supply and capacity utilization, in terms of paid journey time at affordable price (ibid.).

Working Condition and Income of Platform Drivers

Initially the Uber/Ola driver's income was relatively high. There are instances where a driver has earned INR 100,000 in a month, and it varies from 20,000 to 60,000 (Rina and Anjali 2018). Discussions with a limited number of Uber/Ola drivers in Pune and Mumbai indicate that in Pune if a driver works for 12 hr and drives about 250 km, in all the days in a month, he can earn about INR 35,000 net of commission and EMI and fuel cost, while in Mumbai the net earning is INR 15,000–16,000 PM by working 6 days in a week. At Pune the anecdotal evidence suggests the net income of a gig driver is about 17,000 PM with 6 days of working. According to a driver in Delhi, his net income per day is INR 1000 per day after working 14–15 hr at present. The income was much higher earlier, he informed, and the incentive was also high (Times of India (May 2019)).

The main motivations to join aggregators are as per conversations with a few drivers and literature:

1. Easy to on-board
2. No fixed duty, no boss. Easy to log-in and log-off
3. Opportunity to work more and earn more

But just after joining, soon they realize the scenario is different, though theoretically all the above three points are valid, but in practice they have to work continuously and cannot take a break as per their wish if they want to earn the money they expect and the incentive. If they cancel trips, then their rating comes down resulting in getting less number of trips. Thus, the system destroys the flexibility of working hours and earnings, and mostly, they are pushed to work round-the-clock to meet targets and get eligibility to earn incentives (Rina and Anjali 2018).

Users' Experience

Compared to usual metered taxi services, users, particularly the young groups who do not have issue in using the apps, are largely happy – the easy availability, relatively less fare and comparatively polite drivers as most of them have bitter experience of rogue practices of auto and taxi drivers – arbitrary fares, refusal to go (ibid.). To the extent it is an issue that in Kolkata there are taxis known as no-refusal taxi, but experience suggests they also refuse. Even people are preferring Uber/Ola instead of auto. This has resulted in a lot of disputes with auto drivers and Uber and Ola are now registering auto as well and more and more auto drivers are registering with Uber/Ola in Pune. In Pune, a short survey was conducted among 25–30 years of frequent users, both male and female. Total number of respondents were 100 – 42% are in favor of forming unions of the drivers, 36% are not in favor of forming union, and 22% are neutral.

Resentment

Johnston H and Kazlauskas C have pointed out several key concerns on the quality of gig work – lack of employee protection under the existing labor law, low earnings, nonpayment, lack of social protection, and lack of voice (Johnston and Kazlauskas 2018). And there is enough evidence of unhappiness of the Uber drivers around the world including India.

Uber drivers in Qatar went on strike in 2017 to protest a 15–20% rate cut of passenger fares, which cuts the earning of the drivers. They are also unhappy over the cash payment as several passengers are skipping out on fares and Uber does not compensate. Uber taxi drivers have announced a "wildcat" strike in Rome, Turin, and Milan (Yvkoff 2017).

Uber drivers went on a 24-hour strike by not signing into the app in October 2018 in London, Birmingham, and Nottingham (Reuters 2018).

Uber drivers across several US cities had gone on strike in November 2016 demanding to be paid minimum wage. "Protests are supposed to be taking place in cities such as Denver, Boston, Miami, Chicago, Los Angeles, New York City, and San Francisco." "Uber drivers will march in solidarity with others and aim to disrupt service, thereby highlighting to riders the important roles these service people play in daily life" (OfficeChai Team 2017).

In October 2018 Ola and Uber drivers went on strike over the issue of low fare in Delhi and Mumbai. "The companies don't understand the issues drivers face . . . they have reduced fares when they should be paying a higher rate," said Sunil Borkar, secretary at Mumbai taxi drivers' union Maharashtra Rajya Rashtriya Kamgar Sangh. The strike went on for 10 days (Sen (2018) and Shah (2018)).

The key unions in Mumbai are Maharashtra Rajya Rashtriya Kamgar Sangh, Maharashtra Navnirman Kamgar Sena, and Marathi Kamgar Sena. In March 2019, Uber and Ola drivers again went on strike.

"Drivers are in huge debt," said Sanjay Naik, president of the Maharashtra Navnirman Sena political party's transportation union, which organized the strike. At the beginning Uber was asking 10% commission for each ride, which now varies from 20% to 30%. At the beginning, drivers said, companies took a 10% commission from each ride. Now, drivers say they're forced to give back up to 30% (Erickson 2018).

Global Trend of Trade Union Formation by Gig Drivers

The status of gig drivers, employee versus entrepreneur, is largely unsettled across the globe. It varies even within a country-state to state. In UK GMB, a general trade union could convince the authority the "worker" status for the platform drivers and could get a favourable ruling – "The ruling provided 30,000 drivers across the UK access to basic employment provisions including holiday pay, minimum wage, and breaks." In the USA, the New York Taxi Worker Alliance (NYTWA) could convince worker status in specific acses but the issue in general is not settled. The Independent Drivers Guild (IDG) could bring 50,000 Uber drivers under its umbrella and is pursuing the issues of the drivers except collective bargaining. Their strategy is to go in steps. It is a type of union, without collective bargaining. In Europe many unions are working around the rules to cover the unorganized workers including platform drivers under their scope and getting reasonable benefit to them. In Italy Mario Grasso of Sindacato Networkers UILTuCS is taking the sides of the drivers irrespective of their membership status. In Germany, IG Metall, a traditionally export-oriented union, is taking aggressive outreach program to cover the platform drivers under their membership (Johnston and Kazlauskas 2018).

The issue of forming union by unorganized sectors, which include gig workers, is a complex one – it depends on the history of the country, general perception of trade union by the society, and the legal structure of the country. But there is a growing consensus on the need of organizing the platform drivers across the world.

One thing which is really creating obstacle due to lack of "worker" status of the platform drivers is the right to collective bargaining. This is a worldwide phenomenon including India. Apart from the issue of status of employment, consumer interest and antitrust law are also a hindrance for implementing the right to collective bargaining.

The only country which has recognized the issue of gig economy laborers and taken action proactively is Norway. In 2016 it formed "Sharing Economy Committee" by royal decree. The Committee proposed "that service providers in the sharing economy who do not set selling prices directly, and have to comply with prices set by the platform that is used, should have the opportunity to negotiate collective agreements with platform operators, even if they cannot be deemed to be employees" (ibid.). The implementation status is not clear as on date.

Seattle, Washington, USA, passed an ordinance that would enable independent contractors working for transportation network companies (Uber and Lyft among them) to form unions with the purpose of engaging in collective bargaining. Because of multiple lawsuits, the ordinance is yet to be implemented.

In India, there is no problem in forming trade union by gig drivers, but the right to collective bargaining is a big challenge. To have the right to collective bargaining, the union must be recognized by the employer, which Ola and Uber are opposing. Their argument is, as it is anywhere in the world, the drivers are not employees and they are driver partners of business.

The definition of trade union as per the Trade Union Act Section 2(h) is as follows: "Trade Union means any combination, whether temporary or permanent, formed primarily for the purpose of regulating the relations between workmen and employers or between workmen and workmen or between employers and employers for imposing restrictive conditions on the conduct of any trade or business and includes any federation of two or more Trade Unions." As per this definition, even the employers can form trade union though there is none! There are unions of unorganized workers like domestic worker. But as mentioned in section "Ambiguous Legitimacy Status of TU in India," the right to form trade union does not automatically give the right to collective bargaining.

Examining Legitimacy of Trade Union by Gig Drivers

Looking at the work condition of the gig drivers, it is felt that a formal organization for the drivers may help their voice to be heard by the appropriate authorities. The legitimacy is derived from the moral and pragmatic legitimacy. This will help the commuters also from the chaotic strikes that often create huge problem. But legitimacy is to be gained from within and outside. Conversation with the drivers in Pune indicates that though the drivers realize that there should be a formal union for them, they do not have much trust to the so-called leaders. Quite a few drivers said that "strikes are called and we are off the road but with some promise the strikes are withdrawn-may be this is a game that both the operators and leaders play with them as no results is obtained ultimately. The only result is loss of income." They are also of the opinion that Uber is so big an organization that even a successful strike will not result in meeting their demand. They may absorb loss of revenue from one city or even one country! From the user's point of view, users are getting a good service – less rate and polite drivers with minimum refusal. Users anticipate that once they form a union, all these benefits will be gone and these drivers will start behaving like the metered taxi drivers, with whom many have a lot of issues.

Abstract

This chapter identifies configurations of CR programs associated with high environmental responsibility. The approach elaborates how institutional fields, particularly regulative and stakeholder pressures, and firms' CR orientations (employee, community, and consumer CR) influence firms to adopt high environmental CR. We present a sample of 573 firms in four European Union (EU) countries: Denmark, Estonia, Finland, and Latvia. The chapter identifies CR program configurations associated with high environmental performance and how this can vary across societal contexts. This chapter contributes to the existing literatures on corporate responsibility and business legitimacy as well as provides insights on environmental strategies adopted by firms.

Keywords

Ambidexterity · Corporate responsibility · Configurations · Environmental responsibility · Institutional approach legitimacy · Stakeholder pressure

Introduction

Since the beginning of the twenty-first century, corporate responsibility (CR) has become an issue that is actively promoted, thereby increasing pressures on firms to adopt CR. Two primary theoretical approaches have emerged to understand and explain corporate social and environmental behavior as an externally driven practice. This research stream relies on stakeholder theory which argues that firms' CR strategies are responses to pressures exerted by various stakeholder groups (Buysse and Verbeke 2003; Darnall et al. 2010; Kassinis and Vafeas 2006; Sharma and Henriques 2005). In general, this research has focused on identifying which stakeholders are perceived as salient by managers and how this then affects firm performance. However, these studies have not directly examined the conditions under which firms are likely to act in socially responsible ways in relation to their stakeholders. Such conditions have been elaborated on in studies adopting an institutional theory perspective to understand cross-national contexts that engender corporate responsibility (Campbell 2007). The institutional approach posits that firms' environment drives their commitment toward CR through formal regulative means and through informal means embedded in norms, incentives, and rules advanced by various stakeholder groups. Advocates of the institutional approach then argue that firms adopt CR strategies in order to secure their legitimacy (Campbell 2007; Gjølberg 2009, 2010; Hartmann and Uhlenbruck 2015; Jackson and Apostolakou 2010; Marano and Kostova 2016; Matten and Moon 2008). However, the institutional approach accords less weight on how different stakeholders influence and pressure firms to act according to certain norms and expectations.

Fundamentally, both institutional theory and stakeholder theory are about business legitimacy. For example, stakeholder theory links the success of companies with their ability to maintain trusting and mutually respectful relations with various stakeholders, whereas institutional theory emphasizes judgments of legitimacy as a precondition for businesses to operate and obtain resources. Because the notion of business legitimacy can be based on fluid and ambiguous norms across societies (Rendtorff 2019), the chapter argues that various configurations of high environmental CR are likely to differ between societal contexts. What remains less emphasized in the previous literature is how both institutions and stakeholders influence the CR orientations of firms, and what types of institutional/stakeholder configurations are likely to result in high environmental CR. For example, social and environmental CR build on different motivations. Even though these motivations are not necessarily conflicting (Hahn et al. 2016), these motivations and their legitimacy for business activity can vary across societies (Kuznetsov et al. 2009). In addition, the complementary effect of different practices and external pressures on firms' CR programs has rarely been examined (e.g., Ni et al. 2015). Thus, much remains to be learned about the possible configurations of external pressures and firm-level CR program orientations that support high environmental responsibility in firms.

The chapter seeks to contribute to the business legitimacy and CR literatures by combining institutional and stakeholder perspectives (Delmas and Toffel 2004; Lee 2011) with firm-level CR orientations (Hahn et al. 2016). Our study is based on a sample of 573 firms in four European Union (EU) countries: Denmark, Estonia, Finland, and Latvia. The EU has aimed to reduce disparities in environmental and social CR across member countries by imposing common legislative standards for all member states (European Commission 2003, 2004, 2013, 2014; Knopf et al. 2011). Whereas this would suggest minimal differences across EU countries, there remains considerable heterogeneity in the economic and institutional environments of these countries. Denmark and Finland have traditionally been regarded as environmentally and socially proactive developed economies, where CR is a prerequisite of business legitimacy and Scandinavian firms often ranked as corporate responsibility leaders (Campbell 2007; Gjølberg 2009; Halme et al. 2009; Koos 2012; Strand et al. 2015). In contrast, corporate responsibility has been argued to enjoy lower business legitimacy in post-socialist transitional economies such as Estonia and Latvia (see Alas and Tafel 2008; Khanna and Palepu 2006; Kuznetsov et al. 2009; Longhofer and Schofer 2010; Steurer and Konrad 2009). The chapter presents these ideas using regression analysis and fuzzy-set qualitative comparative analysis (fsQCA; Fiss 2011; Ragin 2008) to yield a more nuanced understanding regarding the CR program configurations for a high environmental CR orientation.

The chapter contributes to recent scholarly literature by identifying the CR program configurations associated with high environmental performance. Specifically, the chapter identifies how stakeholder pressures and other CR practices increase the likelihood of high environmental responsibility and the requirements for business legitimacy in various contexts.

Conceptualization of Corporate Responsibility Orientations

The conceptualization of CR practices has evolved from a social orientation which encompassed economic, legal, ethical, and philanthropic types of responsibility (Carroll 1991) toward a triple-bottom-line model of economic, environmental, and social corporate responsibilities. As a result, scholars and policy makers generally acknowledge that CR consists of corporate self-regulative activities that contribute to social and environmental welfare beyond solely economic welfare (European Commission 2003; Furrer et al. 2010; Halme et al. 2009; Koos 2012). However, what is regarded as self-regulative/voluntary activity can depend greatly on national frameworks and regulative institutions (Matten and Moon 2008) and whether CR is addressing firms' core activities or are external philanthropic initiatives (Halme and Laurila 2009). These issues have led to calls for a more nuanced theorization of the nature of CR practices and contextual factors.

One main rationale for firms to engage in CR activities is legitimacy. Legitimacy is understood as societal acceptance or the "generalized perception or assumption that the actions of an entity are desirable, proper or appropriate within some socially constructed system of norms, values, beliefs, and definitions" (Suchman 1995, p. 574). In order to respond to the needs and interests of stakeholders, firms have increasingly adopted various types of CR practices. In the early days, CR activities were considered to emerge as a reactive response to stakeholder pressures and institutional demands in order to ensure business legitimacy (Wood 1991). Currently, firms are regarded as more proactive actors who are not only actively pursuing multiple strategies for adopting CR, but who are simultaneously shaping the demands of stakeholders and institutions (Banerjee 2003).

Accordingly, research has since focused more on firms' underlying rationale for CR engagement (Aguilera et al. 2007). This approach focuses on how CR orientation can be based on either moral conviction (moral orientation), economic rationalities (instrumental orientation), or social cohesion (relational motives). A moral orientation justifies prosocial behavior as responding to stakeholder demands (Campbell 2007), whereas an instrumental orientation builds on "a business case" that demonstrates the pragmatic legitimacy and financial benefits of social initiatives (Yuan et al. 2011). Lastly, relational motives stem from the desire to promote social cohesion, and government bodies in some countries actively promote partnerships between businesses and societal groups (Aguilera et al. 2007; Campbell 2007).

A recent theoretical extension is provided by Hahn et al. (2016), who proposed a conceptual model that acknowledges the simultaneous existence of motives with the concept of ambidexterity, defined as the "ability to perform differing and often competing, strategic acts at the same time" (Simsek et al. 2009, p. 865). They also modified the model developed by Aguilera et al. (2007) by adding a combined orientation of CR, which explains how certain CR practices adopted by firms do not merely follow instrumental or moral logics but are built on both orientations. The chapter contends that Hahn et al.'s (2016) CR typology is consistent with our argumentation which posits that firms do not engage in CR only because of institutional pressures from coercive rules or shared social norms and beliefs, but also because of the demands of salient stakeholders for managerial action (see Lee 2011). Accordingly, managers can be obliged to seek a balance between demands from multiple, critical stakeholder groups (stakeholder scrutiny) as well as institutional conditions (environmental (un)certainty).

Table 1 depicts the differences and interrelations of moral, instrumental, and combined CR orientations in terms of focal stakeholder issues. This table addresses these three orientations by focusing on four CR practices: customer CR (instrumental), local community CR (moral), and environmental CR and employee CR (combined orientations). This implies that environmental CR and employee CR have embedded ambidexterity that requires a combination of both moral and instrumental logics, albeit with somewhat different emphases (Hahn et al. 2016). Environmental CR initiatives build on moral initiatives used to compensate or enable instrumental initiatives. Specifically, environmental CR combines a long-term moral orientation (e.g., addressing climate change and well-being of future generations) with shorter-term goals (e.g., reducing energy consumption and compliance with environmental standards). In contrast, employee CR initiatives mix short-term orientations and a business case rationale (e.g., reducing insurance and health-care costs) along with moral orientations (e.g., equity, fairness).

Table 1 Orientations of CR

Orientation	Logics, drivers, organizational skills, and time frame	CR orientation	Principal stakeholder groups
Instrumental orientation	Commercial logics, extrinsic drivers, strategic issue orientation and functional integration, short-time orientation	CR activity that benefits for the firm by fulfilling market expectations particularly with a short-term expectation of a payback Example: Customer CR	Primary
Moral orientation	Moral logics, intrinsic drivers, stakeholder engagement and dialogue, long-term orientation	CR activity that addresses stakeholders' well-being on a long-term basis. Example: Local community CR	Societal
Combined orientation	Combined commercial and moral logics which result in combination of extrinsic and intrinsic drivers, both long and short-term logics, link firms more tightly to their operational environments and enable links between strategic initiatives and stakeholder expectations	CR activities that mix long and short-term expectations and combine instrumental rationales (cost savings, minimizing organizational risks and hazards) and moral rationales (common good, environmental and social well-being) Moral > instrumental environmental CR Instrumental >moral employee CR	Primary and societal

Note. Adapted from Hahn et al. (2016)

However, various CR orientations or their acknowledged ambidexterity do not yet explain what leads to firms' high CR performance. The chapter therefore turns the focus to a configurational approach.

A Configurational Approach to Corporate Environmental Responsibility

Institutions are generally understood to be "comprised of regulative, normative, cultural and cognitive elements that, together with associated activities and resources, provide stability and meaning to social life" (Scott 2008, p. 48). Institutions include both formal rules (laws and regulations) and informal constraints (customs, norms, and cultures) that create different institutional pressures for firms to gain and maintain legitimacy (DiMaggio and Powell 1991). Scott (1995) identified three basic "pillars" that structure organizational behavior: regulative, normative, and cognitive. Through explicit guidance, regulations inform the rules, controls, rewards, and sanctions related to firms' behavior. The normative pillar refers to the less explicit system of standards and values, whereas the cognitive pillar includes cultural elements that govern choices often made without conscious thought. According to Scott (2005), the regulatory and normative dimensions deserve special attention from researchers considering the influence of institutional pressures on firm behavior. Research has since found that regulative pressures on firms are positively related to CR adoption (Marano and Kostova 2016). However, regulative pressure is often not enough (Sharma and Henriques 2005); normative pressures are needed for managers to acknowledge the importance of a CR practice (Park and Ghauri 2015) and to generate a common moral consensus that an issue is societally important and addresses societal well-being in the long run.

Whereas institutional theory examines the external forces that lead to organizational isomorphism (i.e., becoming more similar) and enforcement of organizations' legitimacy (i.e., exhibiting socially desired and approved qualities and actions), stakeholder theory is more concerned about firms' interactions with various entities that have the ability and capacity to influence organizational decisions and practices. In particular, managers attend to the expectations and demands of those stakeholder groups that are viewed to be more salient in terms of being powerful, legitimate, and urgent (Kassinis and Vafeas 2006; Suchman 1995). Stakeholder theory proposes that a business can only exist through the interaction, transactions, and exchanges with its stakeholders (Näsi 1995). The firm is then understood as a web of relations among stakeholders (Rowley 1997), with a business being an organizational entity through which numerous and diverse participants seek to accomplish multiple, and sometimes contradictory, purposes (Donaldson and Preston 1995). As such, a business must deliver stakeholder value. Ultimately, the more dissatisfied stakeholders are with business activities, the more likely they will exert pressures on the firm to respond to their demands (Freeman 1984; Näsi 1995). As such, according to stakeholder theory, stakeholders are the main drivers for firms to adopt CR practices.

Stakeholders are particularly important groups in activating normative pressures toward firms, as normative influences typically come from professional organizations and other focal social actors, which define appropriate behavior and standards for group members (Scott 2005). Accordingly, we see stakeholder and institutional approaches as complementary in the sense that stakeholder pressures can be used as a proxy for normative pressures faced by firms (e.g., Berrone et al. 2012). Pressures on firms to adopt various CR practices largely originate from two different stakeholder groups. *Primary stakeholders* are groups or individuals with direct influence on the organization's economic performance (Buysse and Verbeke 2003; Donaldson and Preston 1995). These include internal actors (e.g., management, employees, and shareholders) and external market actors (e.g., competitors, customers, financial institutions, and suppliers). Primary stakeholders have been found to have a positive impact on CR implementation in general (Helmig et al. 2016; Park and Ghauri 2015) and specifically on environmental CR (Darnall et al. 2010; Sharma and Henriques 2005).

Societal stakeholders (e.g., NGOs, mass media, labor unions, and trade associations) represent societal interests and mobilize public sentiment, change public norms, and influence public policy about social and environmental responsibility (Campbell 2006, 2007). Societal stakeholders are not directly involved in the economic transactions of the firm but provide information regarding actual or expected behavior of the firm and whether the firm conforms to expectations of legitimate societal behavior (Sharma and Henriques 2005). The role of societal stakeholders has been argued to be dependent on contextual and temporal issues alongside influence strategies used. For instance, media exposure has been associated with more corporate disclosures of environmental and social activities (Bansal and Clelland 2004; Marquis et al. 2016), but is less influential when media only channels environmental groups' voices instead of being active in opinion formation and agenda setting (Helmig et al. 2016; Sharma and Henriques 2005).

Environmental CR Adoption by Firms

In developing study hypotheses, we combine institutional and stakeholder approaches that highlight the compensatory dynamics in firms' environments that result in high environmental CR adoption by firms.

Regulative Pressure

Governments and regulatory pressure can play an important role in firms' CR adoption decisions by sending a clear signal of their endorsement of environmental practices and by reducing information and search costs associated with the adoption of environmental practices (Delmas and Toffel 2004). However, research on the role of regulatory pressures for environmental CR has yielded particularly mixed findings. Government and regulatory institutions have been found to have a positive relationship (Darnall et al. 2008, 2010; Henriques and Sadorsky 1999) as well as a negative relationship (Hartmann and Uhlenbruck 2015; Kassinis and Vafeas 2006) with environmental CR adoption. More specifically, previous research suggests that flexible legislation for environmental issues facilitates the strategic choice of innovative approaches to environmental protection (Majumdar and Marcus 2001). However, other research has found that regulatory pressures have a significant positive effect on the level of a firm's environmental innovation (Berrone et al. 2013), and that the government promotion of environmental action has a significant spillover effect in firms' adoption of environmental CR practices (Arimura et al. 2011). Dögl and Behnam's (2015) study further suggests that firms' responses to pressure from regulatory stakeholders to adopt environmental CR are not significantly different between developed and transitional economies.

Marano and Kostova (2015) provide a more nuanced explanation by suggesting that regulatory pressures are more consequential in countries that are recognized as CR leaders, or in homogeneous institutional fields where similar attitudes toward CR engender consistency in CR demands. Further, Gjølberg (2010) found support for the influence of regulatory pressure on the development of CR under conditions of high number of critical stakeholders. Such pressure has particularly increased in countries through governing bodies such as the European Union. For example, the recent EU non-financial reporting directive (2014/95/EU) mandates social and environmental reporting for firms with over 500 employees (European Commission 2016). Hence, CR has increasingly become a requirement of business legitimacy. The chapter therefore argues:

1. Regulatory pressures are positively related to firms' adoption of environmental CR practices across countries.

Primary Stakeholder Pressures and Environmental CR Adoption

Research shows that firms respond to the pressures of primary stakeholder groups on whom they are highly dependent (Kassinis and Vafeas 2006; Marano and Kostova 2016). Primary stakeholder pressure is vital for CR practices which are at the core of businesses' focal activities and address firms' instrumental role in yielding economic benefits. As environmental CR combines both moral and instrumental orientations, there is more complexity. For example, managers, investors, and customers tend to be influential stakeholder groups for firms in both emerging economy contexts (Park and Ghauri 2015) and in developed economies (Helmig et al. 2016: Jackson and Apostolakou 2010). In uncertain environments, firms are more likely to emphasize short-term outcomes because of situational dynamism and acquiring information can be more costly (Hitt et al. 2004; Peng 2003). Yet in the case of environmental CR, a practice can be strongly reinforced by primary stakeholders who seek to reduce uncertainty regarding the firm's behavior. Alternatively, frequent interactions between primary stakeholders and a firm can be an institutionally enforced norm and requirement of legitimacy (Campbell 2007; Hahn et al. 2016). Thus, it is possible to expect primary stakeholder pressures to exert significant influence across national contexts.

2a: Perceived primary stakeholder pressures are positively related to firms' adoption of environmental CR practices across countries.

Societal Stakeholder Pressures and CR Adoption

Research on the influence of societal stakeholder pressures on CR practices has yielded conflicting results. (Dögl and Behnam 2015 Helmig et al. 2016; Jackson and Apostolakou 2010; Park and Ghauri, 2015; Toffel et al. 2015). This suggests that the influence of societal stakeholders is often temporally and contextually bound (Bansal and Clelland 2004) and depends on the prevalence of critical stakeholders in a given institutional context (Campbell 2007). We posit that the role of societal stakeholders can be more influential for firms' CR activities that are more strongly embedded in a moral frame, such as environmental CR. This is because moral issues and firm behavior tend to become more publicly acknowledged if and when societal stakeholders deem the firm's performance as unacceptable (Suchman 1995).

We propose that there is a compensatory institutional dynamic with respect to the influence of societal stakeholders in adopting environmental CR practices. The existence of critical societal stakeholders is high in Nordic countries and their role is enforced by regulatory arrangements. It is then likely that their salience and legitimacy are significant to firm managers. However, the higher environmental uncertainty in Baltic transitional countries may result in societal stakeholders exerting more direct influence on firms, thereby increasing their salience to managers. For example, after joining the EU, environmental NGOs have gained a more solid foothold in post-communist countries due to increased funding opportunities and expansion of international networks and research on Baltic environmental activism (Agarin and Grīviņš 2016). Hence, it can be argued:

2b: Perceived societal stakeholder pressures are positively related to firms' adoption of environmental CR across countries.

CR Practices and Configurations for High Environmental CR

As previously argued, institutional fields entail compensatory dynamics, which then influence firms' responses to regulative and normative pressures to adopt environmental CR. The important question then is how environmental CR is complementary (or not) with other facets of CR programs, and how this may vary across institutional fields even though firms might perceive stakeholder pressures similarly. Accordingly, a more nuanced view is needed to understand firms' CR orientations. Although a holistic and integrative CR strategy recognizes the interconnections among various stakeholder interests (Ni et al. 2015), there can be variability in strategic configurations.

The chapter argues that similar orientations in CR programs reinforce one another. For example, institutionalized norms and rules enforce one another thereby increasing the legitimacy of an issue for managers (Agle et al. 1999). Accordingly, CR programs that emphasize a moral orientation (such as local community CR) are more likely to reinforce practices with similar dominant logics, i.e., combined logics with a foremost moral imperative such as environmental CR (see Henriques and Sadorsky 1996).

Conversely, CR practices primarily based on instrumental logics (customer CR and employee CR) are less likely to be associated with high environmental CR. This is because a strong commitment to an instrumental orientation tends to marginalize a moral orientation (Hahn et al. 2016). Although Hahn et al. (2016) further argue that compensatory fit between moral and instrumental orientation can be achieved, we suggest that there is a trade-off mechanism in corporate responsibility (Hahn et al. 2010) in terms of which orientations play a core or peripheral role in achieving high environmental CR. Accordingly, the chapter proposes:

3: High environmental CR is positively associated with the adoption of local community CR.

However, another important question is what kinds of configurations reinforce high environmental CR and how these may vary across institutional fields. In institutional fields that are more mature in promoting environmental issues, there are fewer legitimate paths for firms to achieve high environmental CR. More specifically, certain practices become more legitimate over time and this results in greater isomorphism of organizational processes and structures (DiMaggio and Powell 1991). In contrast, organizations in less mature institutional fields with respect to environmental issues are operating in stakeholder environments that are more uncertain and heterogeneous (e.g., Baltic transitional countries; Petersons and King 2009). This is then likely to result in multiple and more diverse paths for high environmental CR because it is not yet clear which stakeholders and CR issues are most important for business legitimacy (Scherer et al. 2013). As a consequence, there may be greater variability in CR programs associated with high environmental CR. Accordingly, the chapter argues:

4: There is more diversity in configurations for high environmental CR in transitional than in mature institutional contexts.

Case Example

The study sample consisted of 573 companies located in Denmark ($n = 201$), Estonia ($n = 103$), Finland ($n = 182$), and Latvia ($n = 87$). The sampling frame was a random sample of companies with 50 employees or more collected from equivalent sources: Dun and Bradstreet Million Dollar Database for Denmark (1500 companies), the Estonian Statistical Office database for Estonia (750 companies), the Balance Consulting Kauppalehti Database for Finland (1500 companies), and the Chamber of Commerce for Latvia (1200 companies). Researchers sampled medium- and large-sized companies which are more likely to have more formalized corporate policies and programs as well as resources (financial and personnel) for various CR activities included in the survey. What makes these four countries an interesting

research setting is that there remains considerable heterogeneity in the economic and institutional environments of these countries (see Table 2).

Invitations to participate in the study were sent to the firms' highest executive (Chairman, CEO) listed in the databases. The survey questionnaire packages consisted of a cover letter, self-addressed and prepaid return envelope, and a separate envelope for respondents to send their business cards in order to receive a summary of the study findings. Survey participants were assured anonymity and confidentiality of their responses and were asked not to provide any self-identifying information on the returned questionnaires. Reminder mailings were sent 2–3 weeks after the first mailing. After accounting for undeliverable surveys, response rates were 14% in Denmark, 11% in Estonia, 18% in Finland, and 7% in Latvia, which are comparable to mail survey response rates for top executive respondents (Cycyota and Harrison 2006).

The survey material was developed in English and standard translation and back translation procedures were used in each country (Brislin 1986). Survey questionnaires were pretested with samples of 20–30 managers and business academic colleagues in each country to confirm the suitability of translations.

Dependent Variables

Corporate responsibility practices were measured with 25 items developed based on a review of related instruments and the CR literature (e.g., Egri and Hornal 2002; Maignan et al. 1999). For environment CR (6 items), customer CR (5 items), local community CR (6 items), and employee CR (8 items), respondents were asked to indicate the extent to which their organization systematically implemented each CR practice (9-point Likert scale, 1 = strongly disagree to 9 = strongly agree).

Independent Variables

This measure of stakeholder pressures related to 11 stakeholder groups from previous stakeholder research (Agle et al. 1999; Darnall et al. 2010). (Surveys for the Latvia sample had 11 stakeholder pressure items, whereas surveys for the Denmark, Finland, and Estonia had 12 items including employees. Subsidiary analyses (factor analyses and regressions) with the 12 items for the three countries did not show substantively different results than analyses with the 11 items.) Respondents rated the pressures of each stakeholder group on their organizations to consider social and environmental issues using a 5-point Likert scale (1 = very high importance to 5 = very low importance, reverse-scored for analyses).

Control Variables

Control variables were organizational characteristics and business performance identified in previous research as related to the implementation of CR practices (e.g., Darnall et al. 2010; Hoogendoorn et al. 2015). Organizational characteristics were: firm size (1 = less than 100 employees, 2 = 100–499 employees, 3 = 500–999 employees, 4 = 1000–4999 employees, 5 = 5000–9999 employees, 6 = 10,000 employees or more); multinational status (1 = operating in two or more countries, 0 = domestic-only operations); ownership status (1 = publicly traded, 0 = private and other); and industry (dummy-coded manufacturing and resource-based variables; services as reference category).

Business performance was measured with a 5-item scale adapted from Samiee and Roth (1992) that asked respondents the extent to which their organization's performance (ROI, growth in market share, sales growth, profit growth, and ROA) had been substantially better than their most relevant competitors over the past 3 years (9-point Likert scale, 1 = strongly disagree to 9 = strongly agree).

To assess the convergent and discriminant validity of the CR practices and perceived stakeholder pressures sets of measures, we conducted confirmatory factor analysis (CFA) for the total sample (using counterweighted country samples) and then conducted multigroup CFAs to assess cross-cultural measurement invariance (Steenkamp and Baumgartner 1998). Assessment of model fits focused on indices (CFI, NNFI, RMSEA) that are not systematically influenced by sample size (Cheung and Rensvold 2002), with acceptable model fits indicated by CFI and NNFI values above 0.90 and RMSEA values below 0.08 (Keith 2006). We followed Cheung and Rensvold's (2002) guidelines for model fit comparisons such that a ΔCFI <0.01 indicates a nonsignificant difference and ΔCFI >0.02 indicates a significant difference.

For the CR practices measures, the initial 4-factor 25-item CFA model showed low factor loadings (< 0.40) for one customer CR item and one environmental CR item. The revised 4-factor, 23-item CFA model had a good model fit [$\chi^2_{(224)} = 930.33$, CFI = 0.953, NNFI = 0.947, RMSEA = 0.075], whereas the 1-factor model fit was not acceptable (CFI = 0.853). As shown in Table 3, the internal consistency of CR measures is indicated by the item-standardized estimates (0.49–0.77, all $p < 0.001$) and composite reliabilities higher than 0.70 (Raykov's $\rho = 0.73$ to 0.85).

In respect to cross-cultural measurement invariance, the configural (unconstrained) model had an acceptable fit [$\chi^2_{(896)} = 1592.25$, CFI = 0.949, NNFI = 0.941, RMSEA = 0.077]. The metric invariance model with factor loadings constrained was not significantly different (ΔCFI = −0.004), but the subsequent scalar invariance model was significantly different (ΔCFI = −0.044), as was the partial scalar invariance model fit with nine unconstrained intercepts (ΔCFI = −0.013). As this could be attributed to cross-cultural differences in scale response styles, we used Hanges' (2004) within-subject standardization procedure to adjust scores for analyses. The range of scale of composite reliabilities (Raykov's ρ) were: Denmark, ρ = -0.78– 0.86; Estonia, ρ = 0.60–0.80; Finland, ρ = 0.67–0.85, and Latvia, ρ = 0.80–0.91. Although two customer CR scale reliabilities were below 0.70, these are consistent with the 0.60 cutoff level reported in previous cross-cultural studies (e.g., Parboteeah et al. 2009).

For perceived stakeholder pressures, researchers first conducted principal components factor analysis, given variability in categorization of stakeholders (Buysse and Verbeke 2003; Darnall et al. 2010). This analysis showed one item (industry/trade associations) cross-loaded on the two emergent factors. Removal of this item resulted in one factor (Eigenvalue = 3.05, 30.5% variance explained) consisting of six primary stakeholders (competitors, corporate management, customers, financial institutions, owners/shareholders, and suppliers) and a second factor (Eigenvalue = 2.44, 24.4% variance explained) consisting of four societal stakeholders (government regulators/legislators, local communities, mass media, and

"conducts surveys to measure customer satisfaction and complaints"; perceived stakeholder pressures "industry/trade associations"

[a]Items not retained for analyses: Environmental CR "issues a formal report regarding corporate environmental performance"; Customer CR

[b]Composite reliability (ρ_C) is Raykov's rho

[c]AVE is average variance extracted

nongovernmental organizations/interest groups). For the two perceived stakeholder pressures measures, the 2-factor, 10-item CFA model had an acceptable fit [$\chi^2_{(34)} = 167.00$, CFI = 0.955, NNFI = 0.941, RMSEA = 0.086], whereas the 1-factor model fit was not acceptable (CFI = 0.844). As shown in Table 3, the item standardized estimates (0.53–0.77, all $p < 0.001$) and composite reliabilities (Raykov's ρ = 0.81 and 0.77) support the internal consistency of these measures.

Multigroup CFAs testing for cross-national measurement invariance showed an acceptable fit for the configural invariance model [$\chi^2_{(136)} = 288.27$, CFI = 0.930, NNFI = 0.907, RMSEA = 0.092], and the metric invariance model was not significantly different (ΔCFI = −0.004). There was a significant difference for the scalar invariance model (ΔCFI = −0.074), but not for the partial scalar invariance model with five unconstrained intercepts (ΔCFI $= -0.010$). Hence, raw scores were used in analyses for these two variables. For each country, the composite reliabilities (ρ) for the primary and societal stakeholder pressures measures were, respectively, 0.61 and 0.65 Denmark; 0.80 and 0.77 Estonia; 0.79 and 0.78 Finland; and 0.78 and 0.80 Latvia.

For the business performance covariate, the total sample CFA found that the item standardized estimates (0.63–0.84, all $p < 0.001$) and composite reliability (Raykov's $\rho = 0.87$) support the internal consistency of this measure (see Table 3). Multigroup CFAs testing for cross-national measurement invariance showed an acceptable fit for the configural invariance model [$\chi^2_{(19)} = 46.71$, CFI $= 0.985$, NNFI $= 0.975$, RMSEA $= 0.102$]. There was a significant difference for the metric invariance model (ΔCFI $= -0.019$), but not for the partial metric invariance model with two unconstrained factor loadings (ΔCFI $= -0.008$) or for the subsequent partial scalar invariance model with two unconstrained intercepts (ΔCFI $= -0.004$). Hence, raw scores were used in analyses for the business performance variable for which the composite reliabilities (ρ) were 0.87 Denmark; 0.86 Estonia; 0.86 Finland; and 0.90 Latvia.

Common Method Variance

A potential issue in self-reported survey data is common method variance (Podsakoff et al. 2012). To address this issue, we took several preventive measures, including providing confidentiality and anonymity to study participants and using different item-response formats (Podsakoff et al. 2012). As per Fornell and Larcker (1981), the discriminant validity of the seven scale measures is indicated by the square roots of the average variance explained (AVE; range of 0.62–0.76) being greater than the shared variance between constructs ($r = 0.02$–$r = 0.49$).

Researchers also assessed the presence of common method bias using the CFA marker technique (Williams et al. 2010) for the total sample. Our marker variable consisted of two personal subjective well-being items ("my life in general," "my job in general"; 1 = very dissatisfied to 10 = very satisfied; $\rho = 0.80$) from Diener et al.'s (1985) satisfaction with life scale. Subjective well-being is an indicator of affectivity or transient mood state that are sources of common rater effects (Podsakoff et al. 2012).

The baseline comparison model with the seven factors for scale measures had an acceptable fit [$\chi^2_{(720)} = 2420.50$, CFI $= 0.933$, NNFI $= 0.928$, RMSEA $= 0.063$]. Compared to the baseline model, there were nonsignificant differences in model fits for both the method-C model that tests for the presence of equal (noncongeneric) method effects (ΔCFI $= 0.005$) and the method-U model that tests for unequal (congeneric) method effects (ΔCFI $= 0.005$). The method-R model that tests for the biasing effect of the marker-based method variance on substantive factor correlations had a similar fit to both the method-C and method-U models (each ΔCFI $= 0.005$). Compared to the baseline model, factor correlations in the method-U model were very similar (average $\Delta r = 0.021$, range: -0.009 to 0.064). In sum, these analyses indicate that common method bias is not a significant issue.

Analyses

Hierarchical moderated regressions were conducted to test Hypotheses 1 and 2 regarding relationships between perceived stakeholder pressures and environmental CR practices. The first step entered the organizational characteristics control variables, and the second step entered the set of three dummy-coded country variables (Latvia was the reference group). The third step entered the primary and societal perceived stakeholder pressures variables (mean-centered), and the fourth step entered their country interaction variables to test for country differences in these relationships. For the model that included the main and interaction effect variables for both types of stakeholder pressures, the collinearity statistics were maximum VIF = 6.62 (above 4.0 cutoff) and some low tolerances (<0.20) which indicate a multicollinearity issue (O'Brien 2007). Therefore, separate analyses were conducted for primary and societal stakeholder pressures with the main effect added in the third step and the country interaction variables added in the fourth step (maximum VIF = 3.88, minimum tolerance = 0.30). To interpret the nature of significant country interactions for these relationships, we plotted country scores at high and low (+/− 1 s.d.) levels of stakeholder pressures.

Fuzzy-set qualitative comparative analysis (fsQCA; Fiss 2011; Ragin 2008) was used to test Hypotheses 3 and 4 regarding configurations of CR practices associated with high environmental CR practices adoption. In these analyses, the outcome variable was environmental CR and the explanatory variables were the other three CR practices (customer, employee, and local community), the two perceived stakeholder pressure variables (primary and societal), and significant covariates in the regression analyses (which were found to be firm size and industry).

The first step in the fsQCA analysis was the calibration of continuous variables which defines meaningful anchor points within the item distribution for cases (Ragin 2008). Variable membership scores can range from 0 (full nonmembership) to 1 (full membership). Researchers used the indirect calibration method (Ragin 2008) for continuous variables to recode cases (firms) into categories of membership (90th percentile), crossover (50th percentile), and nonmembership (tenth percentile) (see Fiss 2011; Ragin 2008). For industry category, we used a binary variable (1 = services, 0 = manufacturing/resource-based).

Because of the different country sample sizes, different frequency thresholds were set for cases to be included in a configuration to ensure that a sufficient proportion of cases (75%–80%) were included in analyses (Ragin 2008). The frequency threshold of three observations was used for Denmark and Finland which had larger sample sizes, and the frequency threshold was two observations for Estonia and Latvia which had smaller sample sizes. For consistency scores which assess the proportion of a causal configuration that is consistent with an outcome, researchers used a minimum threshold value of 0.80 (Meuer 2017; Ragin 2008). The chapter reports the results of the complex solutions (necessary and sufficient conditions) as well as the parsimonious solutions (core conditions). For a set of configurations, the solution consistency score indicates the consistency with the outcome variable, whereas the solution coverage score indicates the proportion of variance explained in the outcome variable.

Categorizations

Table 4 presents the descriptive statistics for the total sample (means, standard deviations, and correlations), and Table 5 presents the results of the regressions testing H1 and H2.

H1 proposed that perceived primary stakeholder pressures are positively related to firms' adoption of environmental CR practices across countries. As shown in Table 5, primary stakeholders were positively related to environmental CR ($\beta = 0.19$, $p < 0.001$; M3a), but there was a significant country-by-primary stakeholder pressures interaction ($\Delta R^2 = 0.014$, $p < 0.05$; M3b).

Figure 1 illustrates country differences in relationships between primary stakeholder pressures and environmental CR practices. Whereas there are significant positive relationships for firms in Finland ($p < 0.001$) and Latvia ($p < 0.01$), this relationship is not significant for firms in Denmark and Estonia. Hence, H1 was partially supported.

H2 proposed that perceived societal stakeholder pressures are positively related to firms' adoption of environmental CR practices across countries. H2 was fully supported in that societal stakeholder pressures was positively related to environmental CR ($\beta = 0.23$, $p < 0.001$; M4a), and there were no significant country differences in this relationship ($\Delta R^2 = 0.000$, $p > 0.10$; M4b).

Table 6 presents the results of the fsQCA analyses to test H3 and H4 regarding configurations for high environmental CR. The presence of a condition is indicated by a black circle (●), the absence of a condition is indicated by a crossed circle (Ø), and a blank space indicates that a causal condition may be either present or absent (i.e., irrelevant). Core elements of a configuration are denoted with large circles and peripheral elements with small circles.

The fsQCA analyses produced two solutions for Finland, three solutions for Denmark and Estonia, and six solutions for Latvia. Whereas all three solutions for Denmark related to manufacturing/resource-based firms, there were alternative solutions for both manufacturing/resource-based and services firms for the other three countries.

Hypothesis 3 proposed that high environmental CR is associated with the adoption of local community. Consistent with H3, for the total number of configurations (14) across countries, high environmental CR is most often associated with the presence of community CR (79%), with the absence of community CR in only two configurations (D1, L5) and irrelevant in one configuration (F1). In sum, strong support was found for H3, which proposed a complementarity between moral-motivated CR practices, i.e., high environmental CR with high community CR.

Hypothesis 4 proposed that configurations for high environmental CR would be more diverse in transitional contexts, i.e., Estonia and Latvia. Consistent with H4, Latvia has a diverse set of six configurations for high environmental CR that represent both the presence and absence of community, customer, and employee CR practices. The three configurations identified for manufacturing/resource-based firms in Latvia (L1, L2, L3) are similar in terms of the presence of community CR and absence of customer CR, but vary with respect to the presence/absence of

employee CR. In contrast, the three configurations for services firms in Latvia (L4, L5, L6) are similar in terms of an absence of employee CR, the presence/irrelevance of customer CR, but vary in the absence/presence of community CR. Consistent with H4, there were only two high environmental CR configurations for firms in Finland. Both configurations had low customer CR as a core condition, with an absence of employee CR for manufacturing/resource firms (F1) and a presence of community CR for services firms (F2). Inconsistent with H4, Denmark and Estonia had three configurations each with two types of CR configurations in common. Whereas both of these configurations had the presence of community and absence of customer CR, one type had the absence of employee CR as a core condition (D2, E1, E2) and the other type had the presence of employee CR (D3, E3). In addition, Denmark had a unique configuration with the absence of community CR and presence of customer CR. In sum, these findings provide mixed support for H4 with more diversity in CR configurations for high environmental CR for firms in Latvia than in Finland, and more similarities for firms in Denmark and Estonia.

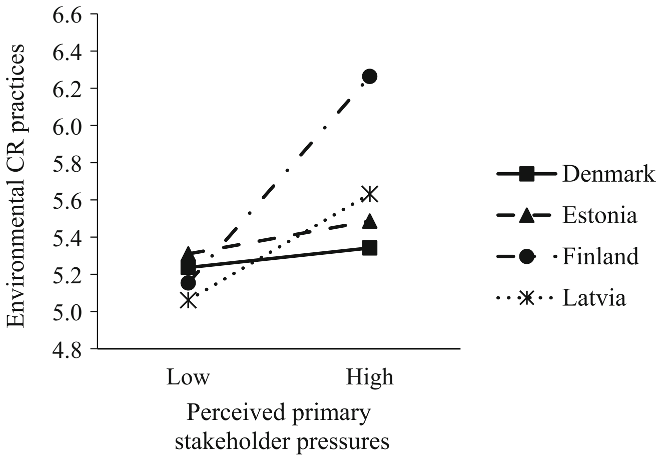

Fig. 1 Country differences in relationship between perceived primary stakeholder pressures and environmental CR practices

The fsQCA solutions also confirm the regression results for the relationships between perceived stakeholder pressures and environmental CR. As shown in Table 6, primary stakeholder pressures were core conditions for high environmental CR in both Finland solutions and in five of the six Latvia solutions. For the Denmark and Estonia solutions, the weaker relationship with high environmental CR is indicated by primary stakeholder pressures conditions being high peripheral (D3, E2), low core (D1, E3), and low peripheral (D2, E1). With respect to the positive relationship between environmental CR and societal stakeholder pressures, the found solutions indicate that societal stakeholder pressures are particularly important for firms in Estonia (core condition for three solutions) and Latvia (core condition for four solutions and peripheral condition for one solution). For both Denmark and Finland, the set of configurations for high environmental CR included both high and low societal stakeholder pressures.

Discussion and Conclusions

This chapter of corporate responsibility in four EU countries examined the adoption of high environmental performance of firms using an integrative configurational approach (Lee 2011). Specifically, our study contributes to the existing literature on corporate responsibility and business legitimacy (e.g., Buysse and Verbeke 2003; Darnall et al. 2010; Dögl and Behnam 2015: Henriques and Sadorsky 1999; Kassinis and Vafeas 2006) by identifying alternative CR program configurations associated with high environmental CR in different national contexts. First, researchers identified how stakeholder pressures increase the likelihood of firms' high environmental responsibility and how this varies across societal contexts. Across these four

Table 6 Configurations for high environmental CR

Notes: ● – core condition present; Ø – core condition absent; ● – peripheral condition present; Ø – peripheral condition absent. A blank space indicates may be either present or absent countries, perceived societal stakeholder pressures had a significant positive influence on the adoption of environmental CR practices. The influence of primary stakeholder pressures was less consistent with these being a significant positive influence for firms in Finland and Latvia, but not significant for firms in Denmark and Estonia. Further insights about the role of stakeholder pressures in advancing environment CR were provided in our analyses identifying configurations for high environmental CR. In Finland, primary stakeholders are a core condition for high environmental CR. In Latvia, researchers found that, overall, both primary and societal stakeholder pressures are core conditions for high environmental CR. Interestingly, we found more variability in the role of primary and societal stakeholder pressures being associated with high environmental CR for firms in Denmark and Estonia.

In sum, such configuration analyses indicate that firms in Finland have the most homogenous paths to high environmental CR adoption. This finding suggests that CR strategies in highly developed institutional environments are relatively similar and that there are more limited options for business legitimacy. Conversely, the most heterogeneous paths were found for firms in Latvia. This finding lends partial support to Hahn et al. (2016) in terms of how stakeholder uncertainty in transitional environments may result in heterogeneous CR strategies. However, Estonian firms had more homogeneous paths compared to Denmark. As such, our study shows that there is not one pathway to high environmental CR that fits all, but that variations in business environments require firms to both balance and combine instrumental and moral motivations for high environmental performance (Hahn et al. 2016).

Second, the chapter contributes to the literature on ambidexterity and CR (Hahn et al. 2016) by showing that pursuing instrumental and moral-motivated CR initiatives is dependent on societal context. Notably, our configuration analyses did not reveal a balanced CR program where all types of CR practices were highly emphasized. Instead, we found that the adoption of high environmental CR is most often supported by local community CR (11 of the 14 configurations across countries; only 2 configurations had low community CR). This finding is different from Ni et al. (2015) who found that local community CR and environmental CR were not complementary for firms in China. Although our study found strong evidence for morally motivated CR, researchers also found variations in motivational emphases of CR programs across countries. A strong moral motivation is evident in CR program profiles for which high environmental CR is associated with high local community CR, but low (or nonsignificant) customer CR and employee CR. This CR program profile was most prevalent across countries (one each for Denmark and Finland, two each for Estonia and Latvia). Researchers also found evidence of combined moral/instrumental CR program orientations. One such profile consists of high environmental, community, and employee CR along with low customer CR (one each for Denmark and Estonia and two in Latvia), while another profile consists of high environmental, community, and customer CR along with low employee CR (one for Latvia). These combined profiles are most indicative of a trade-off mechanism between moral and instrumental motivations in firms' strategies for high environmental responsibility. Although limited to only two configurations (one each for Denmark and Latvia), we also found evidence of instrumental orientated CR programs, wherein high environmental CR is associated with high customer CR, but low local community CR and low/nonsignificant employee CR.

The chapter also has managerial implications. Regulatory context may also impose limitations on the development of CR programs that are considered as legitimate. In contexts with stronger CR-related formal institutions, managers' situational sensitivity for CR may be lower such that managers are less responsive to CR-related issues not directly linked to existing formal institutions. That is, strong regulatory contexts may lack incentives for the adoption of new CR practices unrelated to existing and well-established regulatory institutions. For example, the homogenous paths particularly in the Finnish context can be an indication of this. Thus, the "implicit" approach to CR favored by Nordic firms may possibly be too "passive" for a global business environment where there is a multiplicity of strategic and operational requirements (Midttun et al. 2015; Vidaver-Cohen and Brønn 2015).

Conversely, there may be fewer constraints on CR strategies in less developed regulatory contexts where firms are more likely to address a wide range of CR issues but not necessarily in depth. One implication is that this approach can complicate the development of CR practices that are foundational for long-term stakeholder relationships.

The chapter provides directions for future research directions. Previous research suggests that explicit CR is likely to develop especially among large companies with extensive portfolios of foreign investors (Höllerer 2013). However, the findings do not indicate that MNCs and publicly traded firms are more or less responsible than privately held firms or those with domestic-only operations. Rather, we see the need for further CR research that focuses specifically on the role of firm size (Darnall et al. 2010; Koos 2012). Höllerer (2013) noted that explicit CR is most likely to be adopted by younger, larger, and highly profitable companies with dispersed ownership and capital-intensive product technologies. As large firms are more likely to be global actors, we would expect that more research on the CR practices of SMEs would advance the explanatory power of a configurational approach. For instance, smaller firms are more likely to be locally embedded and managed by owner-managers which affect their stakeholder salience processes (Siltaoja and Lähdesmäki 2015). Even so, it should be noted our study was based on cross-sectional data, so caution is needed regarding conclusions about causal relationships. As leading firms are more likely to participate in questionnaire surveys, sample representativeness of firm populations may be a concern, although such a bias would be consistent across the four countries.

In sum, the chapter found that CR should not be regarded as a unitary approach across contexts and multiple pressures are needed for firms to adopt a holistic CR strategy. Cross-national studies with a larger sample of countries are clearly needed to investigate how the drivers of environmental and social CR differ across and within business environments and how this corresponds to conceptions of business legitimacy.

Evolution of the Russian Digital Media Market: Legitimacy of the Illegal

76

Maxim Storchevoy and Konstantin Belousov

Contents

Abstract

The chapter explores the difficult search for legitimacy in using unlicensed media content by the Russian social network, VKontakte, and other Russian Internet companies. Russia's economy and society went through several stages, from complete negligence of intellectual rights to step-by-step shaping of new compromise principles to make consumers to pay at least something and to persuade right holder to accept at least something for music. For a better understanding of the cultural background of this story, we look back to the evolution of Russian intellectual property rights and observe similar "legitimacy of the illegal" phenomenon during several stages of its development. Two important generalizations are: (1) when deciding to act illegally, the actor wants to maximize the happiness

of its most important stakeholders, and (2) the decision to change the business model and search for new legitimacy almost never comes from moral arguments, but is always made under external pressure.

Keywords

Business ethics · Copyright · Intellectual property rights · Piracy · VKontakte

Introduction

Business legitimacy is a necessary condition for the company's license to operate in society. If all stakeholders consider a company legitimate, it can obtain necessary resources, from consumer and employee loyalty to political support (Rendtorff 2013, 2019). At the same time, business legitimacy is not the same as being legal. In many cases, business legitimacy defines *to what extent a business corporation can diverge from the law*. Although this phenomenon or discrepancy between legitimacy and legality may be found in all societies, it is especially important in traditional societies with informal cultures and rules by law (instead of rule of law).

Historically, Russia was one of these countries. In all periods of its development, it had a special regime of law, whereby legal norms were applied selectively by the state, depending on the personal political loyalty of business actors (Avtonomov 2006). Protection of property rights was always weak, which had critical influence on economic development (Pipes 1999). Business and political legitimacy in Russia always depended more on tacit agreements between people, business, and government than on written laws and formal institutions (Frye 2017).

During the transition to a market economy in 1990s–2000s, once more Russia underwent a long process of shaping new legitimacy in many areas of the economy. There is a number of academic research devoted to the search of legitimacy in various forms and markets: e.g., the search for business legitimacy of corporate social responsibility (Kuznetsov et al. 2009, Kuznetsova 2010), new legitimacy in the retail market (Radaev 2004, 2018), legitimacy for women in business (Tsetsura 2012), for legitimacy of private high education (Suspitsin 2007), legitimacy of the mafia as a security provider (Varese 2001; Volkov 2016), the role of political connections in obtaining business legitimacy in the absence of legal regulation for new pharmaceutical firms (Klarin and Ray 2019), legitimacy of illegal behavior of small firms (Mannila and Eremicheva 2018), search of legitimacy of legally questionable privatization (Frye 2006), and even legitimacy of the Russian government (Huskey 2012).

One interesting case study of this process of shaping new legitimacy is the story of intellectual property rights, especially in the online distribution of music and videos, in the Russian social network platform VKontakte (means "InContact"). VKontakte appeared 2 years later than Facebook but was able to attract the majority of Russian users and became Russia's largest social network. Its daily audience is twice larger than audience of the second largest network Odnoklassniki and five times larger than the daily Russian audience of Facebook (WEB-Index:The audience of Internet projects. October 2019. Mediascope.net). The success of VKontakte was built on several factors and one of them was possibility to share copyrighted music and video without any limitations. In this chapter, we consider the evolution of intellectual property rights policy of VKontakte, from complete denial of copyright, to the step-by-step search for a compromise between the old regime and new realities of digital society and new business models in music market.

Russian Facebook

In 2006, Pavel Durov, a young graduate from a technical university, decided to create a national student website (The story is described in Kononov (2013).). He hardly understood the business perspectives and importance of his project and was interested in creating a new forum where students would communicate under real names and could easily understand who was coming from which university. At the same time, an old friend of Pavel's returned from the United States and told him about a new social network of leading universities (Facebook), where students were identified by their university emails. Pavel decided to launch a similar project, although he had to develop its principles and architecture independently, taking into account Russian realities. The main idea was to create a website that would help students recognize each other on the Internet.

In October 2006, the main functions of the site were ready for testing. Initially, registration was by invitation only, but soon it was opened to all comers. The number of users began to snowball, and by November 2007 the number of accounts reached three million. In the following years, this phenomenal growth continued. In 2015, epythe number of VKontake users was already 64 million comparing to only eight million of Russian users of Facebook and total of 87 million of Internet users in Russia (Baran and Stock 2015).

The Factors of Success

Why was VKontakte able to outperform its competitors? In 2007, VKontakte had competitors, but they all seemed less attractive. In the English-language sector, Facebook was actively crowding out MySpace, but at the same time, both platforms were poorly understood by Russian users and could not compete with VKontakte. In 2006, Odnoklassniki was already in active development, but they aimed at a different age category – people of 40 and older years looking for their high-school and university classmates. In May 2007, one of the largest email providers Mail.ru launched their new social network My Mir@Mail.ru, which was assembled from several already existed services (photos, videos, user profiles, etc.), but it seems that the architecture of the project was less convenient than VKontakte.

How did VKontakte managed to achieve these results? There are several factors explaining its comparative attractiveness over Facebook (Baran and Stock 2015). An important factor was Pavel Durov's talented approach to interface development. VK was incredibly convenient to use: minimum information, convenient layout, and nice design. During the first years Durov even refused to allow advertising on the website, which was odd for a platform with free access. It seems that users and their satisfaction were so important for Durov that he was ready to sacrifice everything else for this sacred purpose (Kononov 2013).

However, there was another important factor for success beside a convenient interface. VKontakte users could easily upload and share all types of media content: photos, music, and videos. Uploading and sharing of images was also possible on Facebook, but there was no free exchange of music and videos, making this competitor to VKontakte much less attractive to Russian users (Kiriya and Sherstoboeva 2015). Odnoklassniki also added music sharing, but only in 2011, 4 years after VKontakte, and it was less convenient for users.

Therefore, VKontakte became a paradise of free music and movies. Users could upload, send, and download any music or video file to their computers with the help of plug-ins and third-party programs. Moreover, any user could use global search in music or video files of all users (unless they closed access to their collections, which was rare) and copy any music or video to his or her library. A survey of users supported that "free music and video sharing" was crucial factor in popularity of the network (Baran and Stock 2015, p. 579). It was a revolution in the market for music and movies that made everything literally free. In 2011–2012, the VKontakte social network became one of the world's largest music and movie repositories (Omidi 2013).

This was a flagrant violation of Russian and international copyright laws, because terabytes of commercial music and video were freely available via any smartphone or computer. If one had an account with VKontakte (which anyone can get for free in 5 min), one immediately had unlimited access to illegal audio and video that no one could prevent. Tens of millions of ordinary people enjoyed illegal music and movies without concern for intellectual property rights. Moreover, the Russian government knew about this and appeared to not care – this problem did not appear as a topic in any public speeches or statements of Russian politicians or civil officers. This could be seen as an example of the legitimacy of illegal behavior which lasted for about 10 years (2008 to 2018).

A Long Road to Adoption of Copyright Law in Russia

Historically, copyright protection in Russia was always a problem. The country went through several cycles, from denial of international copyright law to the gradual establishment of respect to copyright, and then falling back to weak enforcement of it.

Russia published its first printed book only in 1564 (a century after the invention of book printing), but for two next centuries printing was limited and controlled mostly by the state. In the beginning of the nineteenth century, the number of private printers increased the threat of unauthorized publication and distribution of works.

Soon, Russia enacted it first copyright law, the Censorship Code and Statements on the Rights of the Writer of 1828. However, this law protected only Russian authors. All Russian publishers were free to publish any foreign work, both in the original language and in translation. In 1857, the Russian government extended copyright protection to foreign authors, but only if they first published their work in Russia and left without the protection of all works published originally in Europe. The main reason for this limitation was the unwillingness to pay royalties to foreign countries. In 1886, European countries decided to switch to a multilateral agreement and signed the Berne Convention. Russia refused to sign because of the large amount of pirated translated literature being published in the country. Signing this convention would force Russia to stop its policy of free translations, but the Russian government believed that this had great social value for the population. However, Russia tried to develop bilateral agreements with some countries. In 1911, a government commission developed a new Copyright Act and foreign authors received additional protection. It was prohibited to publish their works in Russia in the original language, but there was full freedom to translate and publish works in Russian.

This step-by-step process likely would have provided full protection to foreign authors over time, but this evolution was stopped by the Bolshevik Revolution in 1917. The new regime wanted to abandon all private property, including intellectual property rights, because a key Bolshevik goal was to nationalize all property and transfer ownership to “the people.” According to Marxist ideology, all existing international agreements served capitalistic publishers at the expense of authors; therefore, the Bolsheviks cancelled all international bilateral agreements. The government decided to put the interest of public education above commercial interests of authors and to disseminate classic Russian literature and music to people as widely as possible. Therefore, the new government abandoned the 1911 law with its 50 years of protecting Russian authors. In the late 1920s, the communist regime realized that killing all private initiative was not a productive idea, as it was impossible to feed the country by expropriating all the output of all producers; expropriation, it turned out, did not provide incentives for much production of food or other output. In response and to help rebuild the country after the Civil War, the Bolsheviks announced the New Economic Policy, which include elements of market exchange and, as a part of this new program, national authors were allowed to keep the copyright for their new works and to license them to publishing houses. However, they were not allowed to sell their works, and the state retained the right to nationalize the works of any author without their consent. In this case, the state could disseminate the nationalized works as widely as needed, but the author would receive compensation according to standard rates. Further, the law denied protection to any foreign authors unless they first published their works in the Soviet Union. Paradoxically, the communist government restored the legal order of Tsarist Russia of discriminating against foreign authors.

For the next 30 years, the USSR remained isolated in respect to international intellectual property agreements. However, in the 1960s, the situation changed due to economic factors. First, the Soviet state never had shown much respect for protection of intellectual property. As for China today, Soviet enterprises before and after Second World War copied Western engineering products without permission. After some time, several large countries refused to deal further with USSR if it would not join conventions for the protection of intellectual property. In 1968, Soviet Union had to sign Paris Convention for the Protection of Industrial Property.

The copyright law required a bit more time, and here the United States played a key role. There was serious domestic political pressure on the American government from authors who lost royalties because their copyrights were not recognized in the Soviet Union. Therefore, the USA invested a good deal of effort to convince Soviet leaders to join the Universal Copyright Convention ("UCC") and to modify existing copyright laws accordingly. In 1973, the USSR did this in exchange to tax concessions. As a result, Russia abolished its freedom of translation policy for the first time. However, the problem was not completely removed – foreign authors received the same protection in Russia as Russian authors, but the scope of this protection was smaller than that which foreign authors enjoyed in their home countries.

Later, the United States continued to work with USSR to cajole them to join the Berne Convention and reached a bilateral agreement with Mikhail Gorbachev in 1990 in exchange for international trade facilitation. The USSR suddenly collapsed right before enactment of this agreement, but the new post-Soviet Russia was ready to play by rules of the global the market. In 1993, it adopted the new law on Copyright and Neighboring Rights and, 2 years later, joined the Berne Convention.

Piracy in 1990 and 2000s: Illegal but Legitimate

However, adoption of new laws did not change the behavior of ordinary people overnight. In the 1970s and 1980s, at lower levels of Soviet society, all forms of free exchange and circulation of music, books, and movies was seen as legitimate. Probably, it was again explained by the Marxist idea that all compensation should be paid for live labor, and simple copying of an intellectual product of another person was not seen as live labor which required compensation. Therefore, free unlimited copying of texts or music was not necessarily or always seen as something bad or wrong. When tape recorders became popular in 1980s, millions of Russian citizens started copying Russian or Western popular or rock music. Partly it was explained by the fact that there was real shortage of legal supply of these records, which often could be only brought from abroad by tourists. Partly it was explained by the fact that some content (songs, literature) had anti-Soviet character and so could only be distributed in private, shadow exchange to get around censors.

When Russia turned to market economy in the 1990s and adopted the law on Copyright and Neighboring Rights in 1993, the country was psychologically not ready to change attitudes about accessing music and movies in cheap and available pirated formats. Another problem was that there were no good laws protecting intellectual property rights and offering an effective mechanism for their protection. A mass market for software appeared only in 1990s but it followed the same pattern – for example, the use of pirated versions of Microsoft Windows and similar applications. Further, the digital revolution switched pirated music and movies from VHS and tapes to CDs and DVDs. An important factor in this process was appalling poverty of Russian people in the 1990s and the relatively high price for legal versions of Microsoft, Corel, Adobe, and other software. For example, in 1995, pirated versions of Windows 95 were sold on CDs for only $3, in contrast to the official recommended retail price of $200. Taking into account that the average monthly salary in Russia was about $100–150, we see one reason why many Russians accepted pirated software: they saw it as legitimate situation and did not have much doubt about it.

The absence of law enforcement, high prices for legal content, and appalling poverty led to the astronomic size of the market in pirated content in Russia in the 1990s. The International Intellectual Property Association estimated that in 1997, piracy in Russia resulted in losses of $312 million for movies; $400 million for software; $165 million for music; and $45 million for books.

The American government was not happy about this legitimate piracy, but in the 1990s the USA could not introduce sanctions out of fear that Russia would revert to communism if President Boris Yeltsin's economic policies failed. This was a battle for hearts and minds of Russian citizens, and so the American government did not want to create antagonism against Western civilization and a market economy. Therefore, the United States opted to tolerate Russian abuses of property rights for a time.

In the 2000s, the revolution of broadband access led to a different revolution in the Russian media market: people could download any software, music, or movie through the Internet. Torrents became a new common tool and even in experienced users learned how to use it to get access to pirated music, movies, and software. The culture of unlicensed media content continued to flourish.

Copyright Challenges of the Internet Era

However, even in the West, the new era of digital content and Internet required a rethinking of traditional copyright norms of the twentieth century. First, the traditional culture of copyright allowed legal sharing of previously purchased books or movies between close friends and relatives. Now, however, users had the opportunity to instantly share a media file with hundreds of friends and relatives, or even with strangers in the same internet network. Second, much more content was produced and buying all this content at usual prices were just impossible. Third, availability of free pirated content became an attractive option for people in many countries. All these changes made industry actors rethink their business models in search of more convenient, fair, and sustainable terms for using copyrighted content.

The idea of music sharing was exploited by Napster, a peer-to-peer file sharing platform created by Shawn Fanning and Sean Parker in 1999. The platform was specially oriented to sharing MP3 files. The user-friendly interface was a success and soon Napster attracted millions of users (Honigsberg 2001). Users shared not only new commercial music but also older songs, unreleased studio recordings, and bootleg concert recordings that were otherwise difficult to obtain. Soon, more than

50% of external Internet traffic in college dormitories was MP3 file transfers. However, soon the most active commercial musical projects started worrying. In March 2000, heavy metal band Metallica filed a lawsuit against Napster that was soon joined by other musicians and major record labels. However, it was not obvious to the multitudes outside the artistic world that Napster did any real harm (DeVoss and Porter 2006). In October 2000, Shawn Fanning appeared on the cover of *Time* as a person who changed the world, and Napster was compared with the invention of email or messengers. At the same time, Larry Page and Sergey Brin, the future founders of Google, met Shawn at one conference and said that they envied his success. However, court experts predicted that the music industry would almost certainly win its lawsuit. After some consideration, Napster estimated its future revenues and offered to pay record labels Sony, Warner, BMG, EMI, and Universal Music Group $150 million annually for 5 years in exchange for dropping their copyright infringement lawsuit. To collect this money, Napster planned to implement monthly subscription fees, ranging from $2.95 to $9.95. The labels were almost offended by the suggestion to license their millions of songs to a pirate and added that $150 million a year was not good enough. In April 2000 Napster started to develop a technology of "digital print" to automatically find copyrighted content. In July, they presented this technology and claimed that it could filter about 99.4% of unlicensed songs. The judge was not impressed and decided that Napster should shut down its operation until the filter could screen out 100% of unlicensed material. It was Napster's legal duty to restrict full access to infringing material. The judge made Napster to pay$26 million of damage for past, unauthorized uses of music, and $10 million as an advance against future licensing royalties. However, Napster was not able to comply with this decision (it had already about 26 million users worldwide) and had to close its operation in July, 2001.

Interestingly, that along with accusations that Napster hurt sales of commercial music, there were opposing views who saw a positive impact of file sharing. One bit of evidence was the influence of Napster on the sales of Radiohead's album Kid A (Cohen 2000). The album was widely circulated on Napster months before sales, and at the same time there were no singles released or almost no radio airplay. Three million people downloaded the album on Napster. However, after official release the album was still actively sold, and on October 2000, it reached the top position on the Billboard 200 sales chart. (Radiohead never entered the top 20 in the US before this.) Many musical artists who did not have contracts with labels or access to radio or television also suggested that Napster helped get their music heard, spread by word of mouth, and may have improved their sales in the long term.

Another factor which made Napster attractive for users was the opportunity to download only 1–2 songs from an album. This opportunity was very important because in the commercial music industry it was the norm that a typical album had only one or two good songs, and all other material was less valuable. Of course, this opportunity made the major labels angry at Napster.

However, the battle with labels for freedom to purchase separate tracks took a new turn in 2003, thanks to Steve Jobs. After the huge success of iPod, Jobs decided to launch the iTunes Store platform, which would allow users to access music content legally. Jobs saw that buying entire albums of legal music was too difficult or troublesome for Internet users, which pushed them to piracy. It was necessary to offer a more flexible and simple model. Jobs suggested buying and downloading tracks individually. Again, the major labels demonstrated their opposition, because historical music was sold by albums, and often users bought the entire album to gain access only to a few interesting compositions. However, the spread of Internet piracy was so active that the labels decided to tryout this proposition. Jobs promised that iTunes would be available only to Mac users, who accounted for only 5% of the total market, and the labels decided to take a chance. The success of iTunes was phenomenal: one million songs were bought in 6 days instead of the planned 6 months (Chen 2010). In 2011, the number of songs sold reached more than ten billion. At the end of 2012, iTunes became available in Russia as well, and users could buy or rent music or movies. Prices were adapted to Russian realities, for example 22 rubles per song (in contrast to €0.99 in Europe).

However, soon it was Jobs whose model and legitimacy were challenged by a newcomer. In 2006, young Swedish entrepreneurs Daniel Ek and Martin Lorentson came up with Spotify, whose goal was to sell *streaming music*. At first, they tried to legalize the project as a form of radio, but soon lawyers convinced them that they would have to conclude contracts with all copyright holders. Again, rights holders were reluctant to accept a fraction of a cent for each audition, but piracy in Europe was growing at an ominous pace, so in the end they agreed to the experiment. It took 2 years to develop the system and conclude all necessary contracts, and in 2008 Spotify was launched in Europe. The project began to gain popularity and provided serious competition for iTunes, as users began to switch to a more profitable model. In 2011, Spotify was launched in the USA (as it took two additional years to sign contracts). All this happened to Jobs' great displeasure, as he had made a strategic bet on downloading music and his application (one tool to compete with Android). At the same time, Spotify remained unprofitable for a long time, as payments to copyright holders significantly exceeded the income from the service, but Spotify managers firmly believed in their idea and continued to scale up.

As we can see from this overview, online platforms were already actively developing in the West, searching for new business models that suited all parties in this process, and eventually, they provided legal access to copyrighted music. It was a painful process with deaths and failures.

VKontakte and Search for New Legitimacy

What was happening in Russia during these years? Here, musical communism was built "in a single country." Russian users had access to an enormous free music library at vk.com, with which no other paid or free service could compete. Obviously, VKontakte violated copyright regime of Western countries because it offered the same copyright freedom as Napster ("Socialism in one country" was a theory put forth by Bolsheviks in 1924 (and best associated with Joseph Stalin) when it was clear that the communist revolution in European country would not follow in the nearest future. It replaced the theory of world revolution or world communism.). How did VKontakte explain its position about this problem? Did they feel wrong about it and how they were going to develop their model the future?

Pavel Durov, founder, leader, and director of VKontakte for several years, refuted all accusations of piracy and insisted on the legitimacy of his model. He claimed that the position of VKontakte was absolutely ethical and that this position should be recognized as a new legitimate business model. What arguments did he use to support this claim?

In 2012, Durov expressed his arguments in an occasional discussion about copyright issues started in VKontakte. First, he assumed that Russian users are not ready to pay for music online. He said that VKontakte conducted market research and focus groups and found that paid online music could never exist in Russia. Second, he claimed that the business model of the music industry had changed. Now, online circulation of music was used to create awareness about musicians and to generate demand for live concerts. These concerts, whether in public clubs or in special closed corporate events and venues, brought large revenues to musicians. This is why the latter are actually interested in putting their music online, and VK seemed to be the best channel for this. Durov cited various facts when Russian and foreign musicians created their public pages in VK to disseminate information about their music and to generate demand for it. He even said that musical producers in Russia were afraid that their music might become unavailable in VK. Third, he claimed that copyright holders' real desire was not to remove music and videos from VK, but to make money from the platform. However, he emphasized that they did not deserve these payments because they were "slaveholders" and collected a good deal of money from the public without compensating artists. Durov sincerely believed that he was ideologically correct and was ready for a conflict with copyright owners.

Soon, this conflict began. In December 2012, popular singer Sergey Lazarev complained that his new album was available for free download on VK immediately after it went on sale on iTunes (Pavel Durovostavil «VKontakte» bez pesen Sergeya Lazareva [Pavel Durov left VKontakte without Sergey Lazarev's songs]. BFM.ru, December 12, 2012. https://www.bfm.ru/news/202298). He publicly promised to sue VKontakte, and he invited other artists to join this motion against the illegal distribution of music on VKontakte. These statements infuriated Durov, and in response he made sure that on that same day, all of Lazarev's songs were blocked on the site; when someone tried to play any of them, the user received the message, "This song was removed from public access because of its low cultural value." Interestingly, no musician decided to join Sergey Lazarev and to sue VKontakte after this *tour de force*. It seems Durov won this round, and the majority of musicians believed that having a presence on VK was more important for their commercial success that being blocked.

It seems that many young musicians in Russia agreed with these new rules of the copyright game and built their musical careers in this new environment. They created groups in VKontakte and distributed their music free in these venues. Many popular rappers or indie rock musicians became famous in this manner. A funny fact is that for a long time, their new albums had exactly nine songs, as this was the maximum number of files that they could attach to a post. In any case, their strategy confirmed the fundamental fact that one needed to become famous first and only then could charge money for music, and now musician could obtain access to a good channel to become famous, which did not exist before the emergence of social network platforms. Therefore, they were able to become popular without relying on major labels. This created a revolution in the music industry. As a price for this opportunity, musicians agree to accept free distribution of their music on VK and build their monetization strategy through live concerts – exactly as Durov had predicted.

However, there were also opposite facts. Research has shown that Internet piracy did have a negative impact on music sales. Research by Zentner (2006) found that legal sales of CDs decreased by 14–23% because of file sharing. American market research company NPD found a similar result: a quarter (26%) of the decline in CD units in 2005 was due to music consumption via illegal file-sharing. A study by IFPI/Jupiter conducted among European Internet users in November 2005 found that more than one third (35%) of illegal file sharers were buying fewer CDs as a result of their downloading (IFPI 2006). A 2009 Jupiter study found that the net effect of illegal file-sharing was negative. “Although it is possible that file-sharing functions as some sort of discovery tool for those digital music buyers that also file-share, it is reasonable to assume that their expenditure would be higher if they were not file-sharing. The overall impact of file-sharing on music spending is negative” (IFPI 2010).

Who Is Responsible: A New Battle for Legitimacy in 2010–2013

While Pavel Durov promoted a new theory of the legitimacy of music sharing, American and European labels remained unhappy that their products were distributed via VK (Chto proiskhodit s muzykoy v kontakte[What happens to Vkontakte music?]. *Afisha Daily*, June 17, 2013.). A representative of Universal Music, Dmitry Konnov, said in 2013: “Our patience is over. VKontakte is inseparable from music, and the network owners have mastered the monetization of their audience perfectly. Tens of millions of advertising revenue would not be possible without pirated content followed by the audience on VKontakte. Now the patience of big players almost simultaneously is over. It is easy to understand why – even such piracy harbors as India and China (not to mention Brazil) demonstrate convincing growth of legal music market. Only our sales in Russia has been falling for the fourth year in a row by at least 20% a year. The reason is simple – all music is available free. Just click and listen.”

Why did these labels not use the courts to defend their rights? They tried, but the Russian judicial system was not ready to enforce copyright law and prevent unlicensed circulation of music. In 2010, there were several attempts to sue social networks, including VKontakte. First, Gala Records, representing the interests of the recording company EMI, filed a lawsuit against Mail. Ru and VKontakte for posting music by singer Maxim and the Infinity group. Russian TV-channel VGTRK sued VKontakte for posting the movie “Piranha Hunt.” As a defense the attorneys of VKontakte did not use Durov’s arguments about the new legitimacy of free music but claimed that social networks are not responsible for this content, because it was uploaded by users. This strategy was good for the courts but was morally risky. First, Durov placed the interests of his users above all, but now it looked as he wanted to put them into jail instead of himself. Second, it was an obvious lack of integrity or hypocrisy to say one thing to users and another to the courts. However, this conflict of interests resolved, luckily both for the network and its users. The litigations failed because the courts sides with the networks and decided that users should be held responsible. Punishing users was technically difficult because sometimes it was not easy to understand who owned an account, and moreover, it created enormous legal costs for record labels, who now had to sue millions of users instead of a small number of networks.

Who should be held responsible for putting licensed content online? This was not clear in the law, and in 2010, three big groups of stakeholders started to fight for establishing new legitimacy in this area (Videosayty vystupili protiv krupneyshikh ploshchadok runeta [Video sites opposed the largest sites of Runet]. *Vedomosti*, October 22, 2010). The first step was made by the five largest Internet platforms (VKontakte, Yandex, Google, Mail.ru, and Rambler), who published an open letter to legislators claiming that it was impossible to monitor the content of millions of users, and so, they asked not to be held responsible for this. Then, the three largest websites to provide paid access to licensed music and video content (Tvigle, Zoomby, and TvZavr) also published their own open letter requiring the main search engines (Yandex, Google, and Rambler) to remove pirate sources from search results, and requiring all advertisers signing the statement about the absence of their advertisements in unlicensed online content. Soon, the Association of TV and movie producers published a list of 3000 movies and TV programs protected by law, and the list of about 300 websites that violated these restrictions – which included VKontakte. The association claimed that it also cannot be responsible for monitoring all these resources and that search engines and social network platforms should be held accountable for this.

This open debate had not real consequences for the legislator’s side. After copyright holders understood that they could not sue the platforms themselves, they decided to conduct several demonstrative trials against individual users of the networks. In January 2011, the first litigation started, and a 26-year-old resident of Moscow was accused of “violation of copyright and related rights” for posting 18 audio recordings of a music group, the number of downloads of which by other users exceeded 200,000. The label estimated damages to be 108,000 rubles, and the suspect was threatened with the possibility of 6 years in prison. However, this suit was a failure. The case was dropped because the police could not identify the person who owned this account on VKontakte and thus could be prosecuted. Later, there were several other attempts to sue particular users, but they were also hindered by the same problem. Even when VKontakte agreed to disclose users’ IP-addresses, it was not possible to identify real persons with this information.

Eventually, record labels understood that a strategy of litigation would not work in the Russian judicial system and could bring more harm than good. The director general of Universal Music Russia commented: “Users are not guilty and it makes no sense to prosecute them. Moreover, after such litigation, people become very mad to copyright holders and start using pirated resources more actively.” Obviously, this was a dead end, as the Russian legal system could not effectively stop piracy (*Politsiya ne nashlapirata v. setiVKontakte* [The police did not find a pirate on the Vkontakte network]. Vedomosti, May 27, 2012.). Social networks and search engines insisted on putting responsibilities on final users, but at the same time they did not wanted to lose users’ loyalty. Record labels and legal music and video providers insisted on making search engines and social networks responsible. And around 50 million users of VK were happy with free music and video and mostly knew nothing about the legal issues.

What about the state? Maybe it was disinterested because the major right holders were foreign companies? As we remember from historical survey above, the state for centuries discriminated against foreign authors. However, there was also a good deal of *Russian* copyrighted content on VKontakte and other networks, and so this explanation is not entirely correct. A more realistic explanation could be that social networks and search engines, who did not want to lose their users, successfully lobbied the government for protections. At the very same time, in 2010 the court decided to block the domain name *torrents.ru*, the largest Russian torrent tracker service that allowed downloading almost the same musical and video content for free. The difference was that this website was a small project with no resources for influencing the government; it also allowed pirating of software produced by large and influential Russian software developers.

Conclusion

This situation of legitimate free circulation of copyrighted content could have continued, but there was another phase of change in 2013. Again, as with Tsarist Russia and Soviet Union, the main factor was international pressure of trade partners. In 2012, Russia joined the WTO and accepted obligations to harmonize its laws for protection of intellectual property. In 2013, Russia adopted a new “anti-piracy law” that gave courts the right to block an entire website even if unlicensed content was uploaded by a particular user. This marked a radical change in the behavior of social networks and search engines, who previously were talking about the impossibility of monitoring a million users but now decided to develop the technology of “digital print” to do this job automatically. Hundreds of suits were filed against VKontakte to remove copyrighted music, its top managers understood that their musical library would soon be significantly reduced (*Mail.ru Group zaymetsya legalizatsiyey muzyki* v. *sotsial’nykh setyakh* [Mail.ru Group will legalize music on social networks]. Vedomosti, October 23, 2014.). They started new negotiations with major record labels which took several years, and finally in 2016 Mail. Ru Group, the new owner of VKontakte, signed agreements with Universal, Sony Music, and Warner Music to make annual payment to each of around $2–2.5 million («V kontakte» poyet za den'gi [Vkontakte sings for money]. Vedomosti, October 2, 2017.). Without generating revenue from users, this model would be unsustainable, so in 2017 VKontakte began inserting advertisements between songs during playback and limiting the duration of playback at 30 min per day. At the same time, it introduced paid accounts for users without advertising and unlimited playback for about $3 per month.

This case illustrates an interesting phenomenon of searching a new legitimate business model by various marker actors in the situation of new technological change. This new legitimate model may contradict to laws but if everyone agrees the model may persist for years. Two important generalizations may be made. First, a company may choose illegal behavior if it maximizes happiness of its most important stakeholders (users for social network or search engine) and is viewed as legitimate by them. Second, the decision to change a legitimate business model almost never comes from moral arguments, but always made under external pressure. VKontakte used many arguments to justify piracy for many years and decided to change its strategy only after 2013 when serious external pressure was made from foreign companies and government.

While VKontakte and other Internet platforms are changing their business models under external pressure, the majority of Russians still consider free unlimited circulation of new music and movies as legitimate. According to the national public opinion pollin August 2018 (Russian Public Opinion Research Center, https://wciom.ru/index.php?id=236&uid=9243), 81% of Russians do not believe that the creators of music or movies should receive payments for every copy of their work downloaded or consumed; 47% believes that after music or movies appear on the web, the producers do not have right to prohibit their free circulation; 66% prefer to watch for free low-quality copy of movie than to pay for a licensed copy; and 71% justify piracy by the low level of incomes in Russia. Therefore, the free consumption of licensed music and video is still considered by the majority as legitimate.

Japan, Business Ethics, and Business Legitimacy

Abstract

This chapter discusses a significant gap between the apparent wholesale adoption of CSR policies by Japanese companies and their actual thinking. In the last two decades, Japanese companies have enthusiastically adopted CSR policies even though they have been skeptical about the effectiveness of such CSR policies. To explain this façade of business ethics, most of the existing academic debate tends to focus on the cultural differences between the West and Japan. In other words, these academics are of the thinking that CSR policies are ineffective in Japan because Japanese companies cannot accept the Western-oriented values associated with the idea of CSR. In this way, they have attempted to trace back to Japan's own traditions to search for a model which is more suitable to Japanese management. However, this is an oversimplification of the situation. In order to understand business ethics in Japan fully, both aspects of this gap between outward appearance and reality should be addressed: how Japanese companies have adopted CSR policies while at the same time they are skeptical about their effectiveness. It is important because it is this kind of discrepancy that

characterizes Japan's business ethics. To achieve this aim, this chapter firstly explains the development of CSR practices in Japanese companies, by utilizing the concept of "legitimacy," especially influenced by institutional theory. Secondly, this chapter reveals the reason why Japanese managers have been skeptical about their effectiveness, by reviewing the unique history of civil society in Japan. Consequently, an inconvenient fact will be revealed that Japanese companies hastily adopted CSR policies to legitimatize their businesses not for the benefit of society in Japan but for the business community in the USA.

Keywords

CSR · Japanology · Isomorphism · Civil society

Introduction

Most research on business ethics have focused on Western countries, and the theory and practice of corporate social responsibility (CSR) has often been associated with American and European management systems. Research on these topics in Asian countries, in particular their own perspectives on them, is still an emerging field (Fukukawa 2010). Although the Japanese management system has been well-studied since its glory days in the 1970s, relatively little is known about how they understand these CSR issues and what their motives to handle them are. This is partly because these issues arose from the business context in the US. Given the US origin of the term, it is not surprising that Japan has been positioned as somehow lagging behind in this development process. For that reason, the academic interest in the influence of these issues on other countries, particularly on non-Western countries, is still in its infancy. Another reason for this situation comes from the fact that Japanese CSR has been thought of as implicit. Matten and Moon (2008) classified Japanese CSR among the implicit CSR systems along with European ones, in contrast to the explicit US model of CSR. While US companies have articulated explicitly their policies, European companies, in addition to Japanese ones, had not articulated these policies at their companies' own discretion until recently.

However, in this age of globalization, the situation seems to be changing. Companies in the latter countries have also come to adopt more explicit commitment to CSR, which resembles those of the US companies. Japan is no exception. Japanese companies, especially among multinational companies, have developed such explicit CSR in the last two decades. According to a survey conducted in 2017, 95.7% of 1,413 Japanese major respondent companies articulate CSR policies (24.3% of 749 in 2006), 72.0% of respondents established a CSR section or department (25.6% in 2006), and 70.6% of respondents had appointed a director for CSR activities (35.2% in 2006) (Toyo Keizai 2018, compared with Toyo Keizai 2006). The number of companies publishing reports on CSR issues has also increased dramatically. According to KPMG domestic survey 2017, 96% of NIKKEI 225 companies published CSR reports (KPMG 2017a). KPMG global survey 2017 also revealed that Japanese companies are the second most likely to engage in sustainability reporting after US companies (KPMG 2017b).

Although the academic debate on Japanese business ethics is still in a primitive stage, some important research on the subject has appeared in recent years. These articles provide many insights into how Japanese companies have adopted these practices and adapted themselves to such new operations. However, the majority of these studies tend to focus on the cultural uniquness of Japanese practices in comparison with Western ones. For example, Wokutch and Shepard (1999) identified a unique characteristic of "micro moral unity" within the Japanese business. This characteristic implies that business activity in Japan is linked to its social moral values but only within carefully circumscribed communities of interest. And they asserted that this unique characteristic arose from several aspects of Japanese culture: the within-group/out-of-group distinction; the Confucian sense of duty to those with whom one has a specific relationship; and the strong emphasis placed on the value of loyalty (Wokutch and Shepard 1999: 532). According to them, these aspects of Japanese culture distinguish Japanese thought from those of American and European countries. Todeschini (2011) also identified the notion of "web of engagement" in order to clarify what the Japanese term "responsibility" means, through her own anthropological experience in a medium-sized Japanese company. She explained the subtle meaning of the notion based on the Japanese original concepts of "*ba*" (field) and "*kokoro*" (heart), which derive from Japanese "*Zen*" philosophy.

Moreover, some studies have emphasized the advantageous aspects of Japanese original business ethics influenced by its tradition, such as "kyosei" and "moralogy," instead of adopting the Western-oriented CSR practices uncritically. Today "kyosei" is one of the well-known concepts of business ethics; it was originally a Japanese idea. In 1987, the then chairman of Canon Inc., Kaku, introduced the idea of "kyosei" into business context to describe its vision: "individual and organizations live and work together for the common good" (Kaku 1997: 59). When the Caux Round Table developed a comprehensive set of principles for business leaders in 1994, Kaku played an important role based on the very idea of "kyosei." As Kaku noted, the roots of application of "kyosei" into business can be traced back to the Japanese house codes in the early seventeenth century. Actually, there is even an essay which revealed a connection between Confucianism, on which "kyosei" is based, and its adaptation and application to business in the sixteenth century (Boardman and Kato 2003). Another example can be observed in the introduction of a unique Japanese approach to business ethics: "moralogy." "Moralogy" is thought of as an indigenous Japanese approach to business ethics since about 100 years ago, which aims at "a comprehensive, scientific study of the transcendent qualities essential for enabling both individual and societies to achieve ultimate peace and happiness" (Taka and Dunfee 1997: 507). Taka and Dunfee (1997) argued that this "moralogy" has been particularly influential among a set of middle-sized to small business companies in Japan. As they observed, these companies prefer to conduct business ethics under this indigenous concept rather than Western

CSR influenced by ideas such as "theory of justice," "stakeholder theory," or "integrated social contracts theory."

Interestingly, the tendency to emphasize the cultural difference, or to appreciate Japanese tradition, instead of accepting Western models uncritically, has been typical for academics of Japanese management, not only in business ethics but also in management studies in general. It is well-known that Hofstede drew on the essential distinction between Western and Eastern culture based on the ideas of individualism and collectivism, and these distinctions have been often used by other scholars who compared Western and Japanese management systems (Hofstede 2001). In the field of knowledge management, Nonaka also has placed great value on tacit knowledge over explicit knowledge, based on the similar contrast between Western and Japanese cultures (Nonaka and Konno 1998).

However, as a British historian of Japanese economic thought noted, such a stark contrast between the West and Japan is not necessarily helpful. Sometimes there can be a risk of misunderstanding.

> Not so many decades ago, it still seemed plausible for a British writer to contrast a 'Western' with an 'Oriental' mode of economic thought, the latter being based on conceptions of logic which differ markedly from those of the West. . . .. . .In such contrasts between Japanese and Western thought, however, 'the West' often becomes no more than an idealized antithesis – either a heaven or a hell – which is used (according to the preconceptions of the author) to damn or glorify the existing state of affairs in Japan. (Morris-Suzuki 1989: 1)

In other words, by referring to such contrast, they have attempted to divide the Japanese system into traditional and nontraditional categories. However, it is misleading, because the Western ideas also have already been absorbed and incorporated in various ways into Japanese consciousness and have stamped their indelible mark on its culture.

Keeping these remarks from "Japanology" in mind, this chapter will shed light on the reason why Japanese management has dramatically made their business ethics explicit in the last two decades, even though they still do not place much value on these activities. As some recent research has revealed, Japanese companies appear to embrace CSR rhetoric and practice on the one hand, yet equally there is a sense in which companies find themselves uneasy about its uncritical adoption (Fukukawa and Teramoto 2009: 134). In order to understand the Japanese view on CSR fully, a clear explanation of the gap between such outward appearances and their actual thinking is necessary. Because, it can be said, it is this kind of discrepancy that characterizes current business ethics in Japan. To achieve this aim, this chapter will explain the reason why CSR has been widely adopted in Japanese companies regardless of the fact that their managers are skeptical about its effectiveness, without resorting to cultural differences, which often involve unfamiliar Japanese jargon. Instead, the concept of "legitimacy," especially influenced by new institutionalism in organization theory (Powell and DiMaggio 1991), which is more familiar to Western readers, will be utilized for this purpose. According to the theory, even if the actors themselves are skeptical about its rationality, organizational change happens when it is legitimatized for its institutional conditions. It will provide some valuable insights on the recent striking change of business ethics in Japan.

The Legitimatization of Japanese Business in Its Institutional Conditions

The concept of legitimacy has been important in analyzing the relationship between companies and the society in which they are operating. In particular, the concept has been central to new institutionalism in organization theory (Powell and DiMaggio 1991). According to this theory, an organization will change its structure to conform to the society's expectation about what form or structure is acceptable. For example, when the majority of other organizations in the same industry have a particular governance structure, there might be an institutional pressure on an organization to also have such a structure in place. Thus, organizations are under this kind of pressure from society to legitimatize their activities in order to conform to its expectations.

By using this framework, DiMaggio and Powell (1991) explained why there is a startling homogeneity of organizational forms and structures. According to them, in the initial stages of their life cycle, organizations display considerable diversity in approach and form. Once its institutional condition becomes well-established, however, there is an inexorable pressure toward homogenization. Interestingly, such organizational change occurs as the result of a process that makes organizations more similar without necessarily making them more rational. Organizations may change their goals or develop new practices. But in the long run, organizational actors who have made rational decisions construct an institutional condition that constrains their ability to change further. Early adopters of organizational innovations are commonly driven by a desire to improve their performance. However, as the innovation spreads, a threshold is reached beyond which adoption provides legitimacy rather than improves performance. Strategies that are rational for some organizations may not be rational for other organizations. Yet, the very fact that they may be normatively sanctioned increases the likelihood of their adoption. In short, once disparate organizations in the same line of business are structured into an institutional condition, powerful forces emerge that lead them to become more similar to one another.

According to them, the concept that best captures the process of this homogenization is "isomorphism" (DiMaggio and Powell 1991: 66). This is a constraining process that forces one unit in a population to resemble other units that face the same set of environmental conditions. Based on this biological concept, they identified three mechanisms through which organizational isomorphic change occurs: (1) coercive isomorphism, (2) mimetic isomorphism, and (3) normative isomorphism. Actually, it is these mechanisms that demonstrate well the process of the adoption of CSR policies by Japanese companies.

1. Coercive isomorphism results from both formal and informal pressures exerted on an organization by other organizations upon which it is dependent. Such pressures may be felt as force, as persuasion, or as invitations to join in collusion. For example, organizational change may be a direct response to government mandate. Manufacturers may adopt new pollution control technologies to conform to environmental regulations. As a result, organizations are increasingly homogeneous within given domains and increasingly organized around rituals of conformity to wider institutional conditions. Actually, this was the case in the development of CSR policies in Japanese companies. As Lewin et al. (1995) observed, the administrative guidance issued by the government was an important driver of CSR activities in Japan. For example, each of the relevant ministries was actively engaged in examining and disseminating guidance on CSR policies. The Ministry of the Environment organized a meeting to study CSR practices in 2005. Consequently, the ministry announced a definition of CSR similar to that employed by the European Commission and the World Business Council for Sustainable Development (WBCSD). Furthermore, the ministry repeatedly emphasized the importance of communication process with multiple stakeholders. The Ministry of Health, Labor and Welfare also published guidance on CSR issues, especially concerning labor issues, and encouraged companies to comply with it. The Ministry of Economy, Trade and Industry also released statements on CSR, including on issues such as sustainability, human rights, and the disclosure of nonfinancial information to stakeholders. In this way, governmental suggestion, or administrative guidance (gyosei-shido), was an important driver of the adoption of CSR activities by Japanese companies.
2. Not all institutional isomorphism, however, derives from coercive authority. Uncertainty is also a powerful force that encourages imitation. When goals are ambiguous, or when the environment creates symbolic uncertainty, an organization may model itself on other organizations. That is, modeling is a response to uncertainty. According to DiMaggio and Powell (1991), one of the most dramatic instances of modeling was the effort of Japan's modernizers in the late nineteenth century to model new governmental initiatives on apparently successful Western prototypes. The imperial government sent its officers to study the courts, army, and policies in France, the navy and postal system in Great Britain, and banking and art education in the US (for further information about the Japanese modernization, see Westney 1987). Apparently, this was also true of Japanese adoption of Western CSR. Since the substantial increase in the value of Japanese yen after the Plaza Accord in 1985, Japan's direct investment in the US surged. Consequently, through the contact of Japanese companies with local communities in the US, their interests in "philanthropy" and "good corporate citizenship" were enhanced significantly. Actually, major business associations, such as Keidanren (the Japan Federation of Economic Organizations) and Doyukai (The Japan Association of Corporate Executives), promoted a number of programs on CSR, including study groups and seminars. For example, Keidanren established the Council for Better Corporate Citizenship in 1989 as a coordinating organization for corporate contributions overseas. Keidanren also organized the 1-Percent Club (for

donations) in 1989 to promote corporate and individual philanthropic efforts (for further information about the 1-Percent Club, see Keidanren's site (https://www.keidanren.or.jp/1p-club/ Accessed Aug 20 2019), as compared with the development of 5-Percent Club in Minneapolis, St. Paul (Galaskiewicz, 1991)). Also, Doyukai published a report of Market Evolution and CSR Management in 2003 and introduced the concept of CSR by referring to the practices in the US. Not only practitioners' commentary on these CSR issues but also academic interests in such topics trailed that of the US. Since the first important publication of *Business Ethics* (De George 1982) in Japanese in 1995, several American textbooks have been translated into Japanese (Taka 1997: 1503). Due to the effort of these translations of Western ideas, business ethics has been recognized as an independent field in Japan too. Today, several technical terms, such as CSR, sustainability, and SRI, can be seen in the media without any detailed explanations. In this way, organizations tend to model themselves after similar organizations in their field, even in other countries, if they perceive them to be more legitimate.

3. A third source of isomorphic organizational change is normative and stems primarily from professionalization. Professionalization is the collective struggle of members of an occupation to define the methods of their work and to establish a cognitive base of and legitimation for their occupational autonomy. As DiMaggio and Powell (1991) pointed out, the major recent growth of such professionalization has been observable particularly in managers and specialized staff of large organizations. Apparently, the Japanese major business associations (Keidanren, Doyukai) above illustrate this process well. These associations have taken important roles in leading individual corporations in this normative direction. In order to explain this normative isomorphism in a more concrete way, DiMaggio and Powell described two aspects of the professionalization: the first is the resting of formal education and of legitimation in a cognitive base produced by university specialists and the second is the growth and elaboration of professional networks that span organizations and across which new models diffuse rapidly (DiMaggio and Powell 1991: 71). Again, these two aspects illustrate the development of CSR in Japan well. The formation of the Japan Society for Business Ethics Study (JABES) is one such encouraging development in this aspect. Reitaku University also has played important roles in advancing business ethics theory and practices in Japan. More importantly, professional businesses, such as consulting firms and auditing firms that could support the process of drawing up CSR reports, have rapidly developed to assist CSR activities during this period (Tanimoto 2010: 47). Needless to say, these are good examples of the second aspect of this normative isomorphism. Consultants and think tank researchers have been working actively to meet the needs of this CSR movement. Such professions have become vehicles for the definition and promulgation of normative rules about new organizational behaviors.

The fact that these changes may be largely ritualistic or ceremonial does not mean they are inconsequential. Rather, the important implication of this theory is that each of the institutional isomorphic processes may proceed in the absence of evidence of whether or not it increased its real rationality. Therefore, from an organizational point of view, less rational forms do persist. It is this kind of double standard that is quite useful to understand the institutional conditions in which Japanese companies have adopted CSR policies without any expectations of their effectiveness. Japanese companies just imitated the practices in the US to legitimatize their presence in the US business community. Now, the remaining question is why were Japanese companies not able to rely on CSR policies? To answer this question, it is necessary to understand another institutional condition in which Japanese companies have never been able to initiate the CSR within the Japanese context. This is the main topic in the next section.

CSR in the Absence of Society?

The notion that corporations have responsibilities with regard to society beyond only making profit has existed for a long time. However, it is generally accepted that the social unrest generated in the 1970s, particularly in the US, increased interest in CSR and pressure on firms for numerous societal demands. These demands became organized in various movements which took shape ranging from the civil rights movements, the anti-war movements, the women's movement, consumer movements, to environmental movements (Vogel 2006). Over the years, at least in the US, a kind of consensus has emerged that business should assume certain social responsibilities, for either ethical or long-term profit reasons. Now, there is much less debate whether firms have any social responsibilities other than maximizing profits. Rather, attention has been shifted to a matter of what these responsibilities are or how they should be managed (Freeman 1984; Carroll et al. 2018).

However, the development of CSR in Japan raised a question about this general understanding. It is because the social movements which had presented such formidable challenges to US companies had only weak counterparts within the Japanese context. For example, Japan did not have an organized national environmental movement comparable to that which existed in the US. Minority rights movements in Japan also have little representation because minorities comprise such a miniscule portion of the population. The women's movement in Japan has been equally ineffectual. The consumer movement in Japan has also been relatively weak even in the early postwar years when products were notoriously poor. Shareholders also pose a weak force for change in Japanese corporations. Therefore, Japanese companies could not initiate CSR because their businesses had faced a much more placid environment in Japan than businesses did in the US. However, when it came to the recent rapid growth of Japanese CSR, researchers jumped to the hasty assumption: "it is reasonable to expect that continuing increases in economic prosperity and the fulfillment of basic economic needs in Japan will bring about greater demands for CSR by the Japanese people" (Wokutch 1990: 61). In short, they thought that Japanese society had also become matured.

However, this was not the case. As mentioned above, Japanese people seem to be skeptical about the effectiveness of the Western-oriented CSR even after its successful adoption, and some managers attempted to revive their traditional ethics instead of adopting it uncritically. In addition, more importantly, Japanese people had always had a feeling of being victimized by the process of industrialization and embraced the demand to change its society long before the recent adoption of the CSR policies. Actually, in the 1960s, social demands increased such as massive lawsuits against the environmental damage caused by rapid industrialization and the intense protests against the renewal of the US-Japan Security Treaty. Therefore, it is misleading to take the view for granted that economic prosperity in Japan automatically brought about greater demand for CSR, let alone that their demands have been heard by the companies. Rather, it is this point that should be explained more precisely without using simple generalizations. This has a direct link with the development of civil society in Japan.

Civil society is a term with deep historical roots, and it generally consists of social activities that occur outside the state and the market. Such activities create a public sphere in which individuals engage in ongoing debate on matters of common good (see Habermas 1989). However, it has been repeatedly pointed out how narrow the sphere that lies outside the state and the market in Japan is. For example, Hardacre, through his observation of civil society in Japan, noted that "both [the state and the market] have shaped and molded public discourse on the public good in such a way that it is extremely difficult to discern the existence of the public sphere standing between the two" (Hardacre 1991: 219). However, this does not necessarily mean that civil society has never existed in Japan or that the Japanese people have never demanded to change their society. In fact, Japan has a unique history of citizen activism. Pekkanen (2006) characterizes it as a "dual civil society": on the one hand, there are many small local groups, and on the other hand the number of large professionalized groups is quite few.

In Japan, nearly everyone is formally a member of a neighborhood association (NHA) which is a form of civil society spreading throughout the country. It is based on residential proximity, most often comprising from 100 to 300 households. The members pay dues, choose leaders, and participate in a variety of activities, ranging from cleaning up local parks to organizing children's local festivals. The direct and indirect benefits of NHA are to produce social capital and to assist in administration by communicating local issues to and make demands on local government. However, in contrast to issue-oriented civil society organizations, NHA has constrained their advocacy functions to challenge the state. Because of its geographical limitations, NHA could not develop the professional staff needed to research issues, influence mass media, or lobby politicians. Hence, they often worked with the authorities and rarely became instruments of citizen protests. In short, Japanese civil society lacks staff and does not have the expertise and ability to make their presence felt in national debates (Pekkanen 2006).

On the other hand, Japan's legal system had had a strong bias against civil society organizations, especially those seeking to be independent from the state. At least until 1998, when the so-called NPO (nonprofit organization) Law was enacted in

Japan, access to legal status as a civil society organization, or specifically Public Interest Legal Person (PILP), had been highly restricted. This strict regulation had been based mostly on Article 34 of the Civil Code which was promulgated in 1896. Under Article 34, the category PILP had been strictly confined to organizations such as social welfare corporations, private school corporations, and religious corporations. This legal situation, however, created a blind spot. Most groups that were non-state and nonprofit but not in the "public interest" could not have a legal basis whatsoever to form. It is no surprise that there have been many such groups, especially when the meaning of "public interest" is interpreted by the bureaucracy in a narrow or arbitrary way. For such groups, there was simply no legal category for them, and as a result, they were reduced to operating as informal, voluntary groups (Pekkanen 2006: 52). The important point here is that PILP had to operate for the "public interest" and had to win permission from the state authority to gain its legal recognition. Without such support, to get the approval as a PILP was very difficult. Therefore, most PILPs were heavily dependent on public support, and they had operated as quasi-governmental organizations, subcontractors that were established to perform tasks entrusted to them by the national and local governments. Apparently, institutional barriers were higher in Japan and prevented the development of large independent civil society organizations. From this point of view, it is easily understandable that the reason why Japanese social movements in the 1960s, which were massive in scale, failed either to institutionalize or to achieve their stated objectives. In this institutional condition, only few could have professional staff capable of producing research and gain media attention for their views.

As is well-known, such a legal system changed dramatically in 1998, when the so- called NPO Law was enacted. The term NPO/NGO caught national attention, especially among political and business elites as well as in academic writings, particularly after the surge of volunteerism following the great earthquake in Kobe on January 17 in 1995, which killed 6,430 people and forced 310,000 people to evacuate their homes. At that time, approximately 1.3 million volunteers acted to aid victims of the horrific disaster. In the face of the disaster and the marvelous voluntary effort, they began to imagine the potential of civil society organizations in Japan. As a result, the NPO Law was passed on March 25 and went into effect in December of 1998. After the NPO Law, the incorporation process for NPOs became quite simple. People who want to establish an NPO have only to fill out the template for the necessary documents. As a matter of fact, since the law's enactment, more than 50,000 NPOs have been incorporated, and the number has increased dramatically, from 1,274 in 1999 to 51,605 in 2018 (https://www.npo-homepage.go.jp/uploads/kiso_ninsyou_nintei_insatu.pdf. Accessed 20 Aug 2019).

However, even if the Japanese legal system opened up space for non-state or nonprofit organizations, could civil society actors step in to fill this gap? Could civil society successfully be constructed by such a legal change? According to an anthropological research of civil society activities in Japan (Ogawa 2009), the institutionalization of NPO seems to be a success, if it is looked at from the policy makers' perspective. It is because the government could successfully take advantage of this type of civil society organization, by using the enthusiasm for volunteering, in order to streamline the social system generated in the current framework of public administration. However, if it is looked at from the grassroots point of view, it is likely believed to be a failure of civil society, because people have been just conveniently mobilized for the authorities' purpose under the name of civil society. People, labeled "shi-min" (citizen), are forced to become apolitical under the NPO Law, and they are expected to be collaborative partners with the state and co-opted as subcontractors to the government. Actually, the central government defines the boundaries of volunteer activities, the scope of their involvement, and the nature of their work environment through regulations and guidelines. That is, "a volunteer in Japan is someone who is unpaid, not necessarily someone who is independent from the state" (Schwartz 2003: 18). Today, one of the serious problems in Japan is the declining of social capital, or disappearing of the NHAs, due to a seriously aging population. The government is also encouraging people to incorporate them into NPOs to maintain the social capital by replacing the functions of NHAs (https://www.cao.go.jp/regional_management/doc/common/h_leaflet.pdf. Accessed 20 Aug 2019). There is no doubt that such encouragement of incorporation accounts for a certain percentage of the increasing numbers of NPOs. Therefore, it is said that, "the institutionalization of NPOs is a calculated reorganization of the Japanese public sphere designated to establish a small government in the postwelfare state through the transfer of social services originally delivered by the state to volunteer-driven NPOs" (Ogawa 2009: 174). From this point of view, even though the legal system has changed, Japanese civil society still limits its function as a dynamic social and political participation process.

Conclusion

Behind the ostensibly successful adoption of CSR policies by Japanese companies, there was an important real intention which cannot be ignored. As Fukukawa and Teramoto (2009) revealed, while Japanese companies successfully adopted CSR policies, it seems that they do not necessarily agree with the Western-oriented values associated with the idea of CSR. That is, Japanese companies' adoption of CSR was just a façade. Behind the façade, their actual thinking has never been addressed fully. In order to understand the Japanese perspective on CSR, a clear explanation of the gap between outward appearances and reality was necessary. It was because it is this kind of discrepancy that characterizes current business ethics in Japan. In this regard, existing research tended to attribute this façade of business ethics to the cultural differences between the West and Japan. In other words, they have thought that CSR is ineffective in Japan because the Japanese cannot accept the Western-oriented values associated with the idea of CSR. In this way, some studies have attempted to trace back to its own tradition to search for a model which is more suitable to the Japanese management systems.

Instead, this chapter has discussed this significant gap not by resorting to explanations such as cultural difference but by keeping the focus on its institutional condition. Firstly, it was demonstrated how Japanese companies have adopted

CSR policies without any expectations of them, by utilizing the concept of "legitimacy." It revealed an interesting process in which Japanese companies imitated the US model of CSR under the three types of institutional conditions. Secondly, this chapter addressed the reason why Japanese people could not rely on the effectiveness of the CSR policies, by reviewing the unique history of civil society in Japan. It revealed an inconvenient fact that civil society organizations in Japan still limit their social and political participation in public debate, even after the dramatic changes to its legal system, with the enactment of the new NPO Law in 1998.

If the current situation of civil society in Japan is accepted as such, it is unrealistic to assume that there has been a direct channel of communication from its society to corporations through which social demands are being heard. It occurs only indirectly when government policy reflects them. However, if the serious problems regarding civil society in Japan are considered, such as the decline of local associations because of its aging population and exploitation of social capital by the government in the name of volunteerism, it seems that the obstacles for civil society actors in Japan are still quite high, especially when their interests are independent from the state and the market authorities. As Hardacre (1991) attributed the reason for the narrowness of Japan's civil society to the power of such authorities, it is questionable whether or not Japanese civil society groups have been able to figure in the public debate beyond a limited number of industry or professional groups.

In fact, it was Keidanren that lobbied for the NPO Law. As Pekkanen (2006: 143) noted, Keidanren's interest in NPO began in the late 1980s. With an increase in Japanese direct investment in the US, Japanese companies were often faced with requests for donations or other support from US civil society organizations. At first, the Japanese companies were not sure how to deal with these kinds of organizations, which were not so active in Japan. Keidanren formed a study group on the NPO and then adopted the 1-Percent Club in 1989. This study group became an advocate for the views of the NPO within Keidanren; meanwhile it led it to lobby for the new law. It must be ironic that it was not civil society actors themselves but business elites who powerfully lobbied for the NPO Law in Japan, in the process of legitimatization of their activities for US business communities.

Business Legitimacy in Asia: Focus on China 78

Alicia Hennig

Contents

Abstract

China is a country with a long-standing and rich history spanning over 5000 years. Its two most prominent philosophies, Confucianism and Daoism, shaped social, political, and legal perceptions over centuries. Moreover, the introduction of Communism and Socialism further influenced these perceptions, as well as economic, legal, and political practices. All these aspects taken together differentiate China from the West and its perceptions and practices. In the context

of business legitimacy, it is thus important to identify differences and investigate how these play out under the current political regime. Furthermore, beyond aspects of compliance that constitutes an indispensable part of business legitimacy, it is vital to understand what Chinese philosophy can contribute in terms of ethical principles and practices to the concept of business legitimacy in a Chinese context.

Introduction

China is a country with a long-standing and rich history spanning over roundabout 5.000 years from the earliest dynasties built on feudal structures, over the first empire unified under emperor Qin and the collapse of China's last imperial dynasty, Qing, in 1911, to revolutions leading to the establishment of the Communist Party in 1949, which is ruling China until today (Wang 2017). What evolved in China is not just a different political system – "Socialism with Chinese characteristics" –, which doesn't know any role model. Social structures and ethics are also different, being influenced by China's most prominent indigenous philosophies Confucianism and Daoism that spread across all Asia (Hill 2007). Thus, in light of many concepts having emerged in the West, we need to question whether these also unconditionally apply to other sociocultural and political contexts such as China.

In this context, this chapter investigates the concept of business legitimacy and related aspects of responsible business and Corporate Social Responsibility (CSR) and its applicability and actual practice in China.

The chapter is structured as followed: The first section provides a brief historical overview of responsible business and CSR in China. Here, two aspects are especially important: First, to understand the "ethical climate" in China and how it became increasingly eroded. Secondly, how the Chinese government responded to this erosion by formulating its sociopolitical vision to enable more responsible conduct among businesses. By giving several examples of social and environmental challenges in China today, the second section illustrates that the government's measures could not bring back more responsible behaviour so far. The third section discusses what specifically constitutes business legitimacy in China in light of China's powerful state apparatus, the current social and environmental challenges to its stability, and its sociopolitical vision to fight against a potential instability, which – so far only on paper – required all, society and businesses alike, to contribute to the realization of this vision. The fourth section provides inspiration beyond compliance measures with regard to how to maintain business legitimacy in China by introducing values and virtues derived from Chinese philosophy. The chapter finishes with a conclusion.

Business Responsibility in China: A Brief Overview

What is driving responsible business (and in that sense also Corporate Social Responsibility (CSR)) in China? According to Matten and Moon (2005), CSR is a "cluster concept" that overlaps with "business ethics, corporate philanthropy, corporate citizenship, sustainability, and environmental responsibility" (p.335). In this paper, CSR is more concretely defined as "a concept whereby companies integrate social and environmental concerns in their business operations and in their interaction with their stakeholders on a voluntary basis" (European Commission 2011, p.3).

Emphasizing more responsible business was recognized by the Chinese government only relatively recently (Raynard et al. 2013). In 2006, a former president of the People's Republic of China (his term lasted from 2002 to 2012) called for a "harmonious society" in light of growing environmental pollution and social inequality resulting from more than 20 years of economic reform (Hofman et al. 2015; Zhao 2014). Under that president, the government enacted an amended "2006 Company Law of the People's Republic of China" and the "2008 Guide Opinion on the Social Responsibility Implementation for State-Owned Enterprises," both explicitly emphasizing responsible business and recognizing CSR (Raynard et al. 2013). Yet, in this context it is important to understand that private businesses in China did not exist until the introduction of major economic reforms after Mao's death in 1976 (ibid.). State-owned enterprises (SOEs) established by then were to serve the government's sociopolitical objectives driven by Marxist ethics and "communist morality" (Lu 1997). Accordingly, back then it was self-evident that SOEs had social responsibility since they had to serve public interests.

In the 1980s, the economic opening-up reform spurred the emergence of private businesses especially through the setup of Special Economic Zones (SEZ) in Shanghai, Shenzhen, and other cities at China's east coast (Raynard et al. 2013). Yet, this reform also led to an emphasis of profit over "serving the nation" undermining previously prevalent values anchored in "communist morality" or in prevailing traditional values (Ip 2009b; Lu 2008; Li and Zheng 2018). Although there was a first introduction of CSR measures in the mid-to-late 1990s by multinationals during the "anti-sweatshop campaign" that targeted unacceptable labor conditions in developing countries (Myllyvainio and Virkala 2006; Yin and Zhang 2012), Chinese firms were not convinced by the effectiveness of Western standards when applied to their corporate environment. This eventually led to merely symbolic action and decoupling (Yin and Zhang 2012). Generally, a reformulation of moral rules by that time was overlooked, and the environmental, social, corporate, and legal regulatory framework was insufficient due to the prioritization of economic objectives during this economic transition (Hong 2001). This negligence led to corruption, cronyism, vast environmental pollution, and increasing social inequality (Ip 2009b, Lu 2008).

Upon China's WTO entry in 2002, the country had to start complying with international norms, and some laws had to be amended, such as the mentioned Company Law (Ip 2009b, Lu 2008). In addition, the president's sociopolitical vision of a "harmonious society" was incorporated in the 11th Five-Year plan in 2006

(Ip 2009b, See 2008). Thereby, the CCP (Chinese Communist Party) sought to reinforce its social legitimacy, which was challenged by negative social and environmental impacts (Yin 2015; Li et al. 2016). This sociopolitical vision also required businesses to contribute to a harmonious society in order to gain legitimacy (Lam 2014; Hofman et al. 2015). Yet, a number of controversial issues emerging around 2008, such as diverse food scandals (e.g., melamine-tainted milk powder), product (e.g., lead contamination), service quality, and labor rights issues (e.g., Foxconn) highlighted that businesses apparently have not realized their responsibility with regard to the previous president's (2002–2012) vision of a better society. These scandals signaled prevalent corruption (Lu 2008; Raynard et al. 2013), rampant misconduct and normlessness (Zheng et al. 2014), and greed and dishonesty characterizing Chinese business behavior by that time (Lu 2008). The profit-making motif of Chinese managers, regardless of the company type that was encouraged since the economic opening-up reform, still took precedence over everything else, with minimal attention to social or environmental issues (Wang and Dou 2012). The social responsibility of businesses was viewed as only (or mainly) a philanthropic activity (ibid.), and it came with the expectation of profiting from favorable governmental policies in return (Yin and Zhang 2012). This mindset together with the unethical behavior coming with it could spread unimpeded due to a still insufficient regulatory environment with lax legal enforcement or punishment (Lu 2008).

Until today, this moral degradation expressed in money worshipping is still prevalent, implying Chinese managers are mostly concerned with advancing their self-interest and personal gains (Li and Zheng 2018), abusing their power for personal benefits (Lu and Koehn 2014). Many Chinese companies are still mostly focused on short-term gains leading to a superficial implementation of CSR (Yu and Choi 2016). Yet, some especially export-oriented SMEs have apparently realized the value of CSR to maintain their global competiveness. They finally became compliant instead of merely circumventing International Codes of Conduct and similar measures (Cheung et al. 2015; Hofman et al. 2015; Yin and Zhang 2012).

Socioenvironmental Challenges in China

Two social challenges are currently especially pressing: rising social inequality and aging demographics. The Chinese government achieved an immense reduction in poverty (86% between 1980 and 2015), which the IMF calls "the most rapid reduction in history" (Jain-Chandra et al. 2018, p.6). Yet, the fast industrialization also led to rising social inequality (Piketty et al. 2017; Xie 2016). This issue was already recognized as a problem under the previous president (2002–2012) who introduced his sociopolitical vision of a "harmonious society" back then. Besides income inequality, the IMF identified three more driving factors related to inequality of opportunity, such as inequality with regard to access to education, health, and financial services (Jain-Chandra et al. 2018). Especially social benefits such as access to education and health are tied to a person's household registration, *hukou*, and linked to the birthplace. The *hukou* system leads to nonaccess in case of moving somewhere else for work and hence inequality of access. However, the question is to what extent these inequalities are a result of mere regional disparities (ibid.) or "interregional and intergroup inequality" (Xie 2016, p.331) as a result of the still prevalent system of work units, *danwei*, and the household registration system, *hukou*. Taking a more sociocultural view, Xie (2016) highlights that inequality is accepted in China on the basis of hierarchy and therewith legitimate privileges, and as a result of propaganda promulgating inequality as the "necessary cost of economic development" (Xie 2016, p.330) since the opening up reform (Naughton 1993).

Aging demographics in China is a result of the "one-child-policy" introduced in the 1980s in the course of the opening up reform (Campbell 2019). Curtailing population growth was seen as a necessity to realize economic growth on a large scale (Johnston 2019). While this policy helped China to grow economically, eventually becoming the second largest economic power globally, it also had a dark side: a significant gender imbalance, a large proportion of elderly population, and generally a precipitous decline in population. Yet, the recent abolishment of the "one-child-policy" and the introduction of a "two-child-policy" cannot fix this demographic crisis. The latter does not seem to take off, as for most one-child couples a second child is just too costly (The Economist 2018). Aging demographics is not only a social issue, but also the biggest economic issue the Chinese government is facing. A shrinking labor force will significantly impact the economy; consumer spending will be affected too, and the younger generation will be disproportionally burdened with funding the pensions for the larger elderly population (Myers et al. 2019; Campbell 2019). The major problem is China's population will grow old before becoming rich (The Economist 2018).

Environmental issues in China are ubiquitous; water, soil, and air are all affected by pollution (World Bank 2007). Water issues due to pollution are diverse; they range from 54% of rivers being contaminated (ibid.) and roughly 70% of groundwater not suitable for consumption (Reuters 2018), over acid rain to groundwater depletion and water scarcity (World Bank 2007). Soil contamination caused by chemical production and heavy metals (sometimes with up to 14 different substances to be found in the soil) affects almost one-fifth of China's farmland (Standway 2019). Costs for full remediation are estimated at RMB 9tn (more than EUR 1.1tn) (Zhang and Lin 2018). The costs of water and soil pollution are estimated with 2.1% and 1.1% respectively of China's GDP between 2000 and 2010 (Crane and Mao 2015). Lastly, air pollution is a persistent issue and also regularly covered in the media as it also started to cause social unrest (Geitner 2019). Since China has joined the WTO, carbon dioxide emissions have been constantly on the rise, with China being the major CO_2 emitter globally since 2007, responsible for 30% of global carbon emissions (Kearns et al. 2018; Yin et al. 2019). Economic costs of all sorts of air pollution causing health impacts and reductions in labor productivity have been estimated with 6.5% of China's annual GDP between 2000 and 2010 (Crane and Mao 2015). The costs currently caused by PM2.5 pollution alone are about RMB 267bn (appr. EUR 34bn) equal to 0.7 of China's annual GDP, as resulting in premature deaths (1 million each year) and lost food production (Kao 2018). Although the Chinese government has put a number of measures in place, has improved enforcement, and is investing amounts in green and clean energy (Kearns et al. 2018), significant improvements with regard to a PM2.5 reduction have been rather erratic, with levels jumping up again in some regions recently (Geitner 2019).

Apparently, the pollution problem is pervasive and severely impacting society and the economy. Hence, fighting environmental pollution of all sorts (also waste issues) is crucial in order to maintain social and political stability and to prevent further social unrest. In this context, businesses are best advised to be compliant with all environmental regulations.

Business Legitimacy in China

What makes a business "legitimate" in China? As apparent from the first section, the Chinese government actually requires businesses to contribute to the realization of its sociopolitical vision. Yet, as the second section illustrated, China is facing a number of social and environmental challenges. And although these issues are results of the government's (insufficient) regulations, lack of enforcement, etc., businesses, through their own lack of "ethical conscience," further contributed to this situation. Hence, they play a major role here. China's sociopolitical stability depends on the government's ability to recognize, understand, and remedy those issues; and businesses are supposed to act in accordance with the government's policies to remedy demographic issues in labor and environmental pollution. Thus, what constitutes business legitimacy in China is different compared to the Western concept of business legitimacy as organizational legitimacy due to the specifics of the Chinese sociopolitical system. This section explains why the Western model of organizational legitimacy may not be fully applicable to China and introduces the concept of "political legitimacy."

In the West, companies formerly could gain and maintain legitimacy through conformity with legal rules based on Weber's concept of legitimacy,i.e., rational or legal legitimacy (Weber 1922, Chap. 3, §2–3, WG124-WG125). Today, however, legitimacy is foremost a question of adaption to external social pressures, requiring "organizational legitimacy." There are two major theories: the more strategic Resource Dependency Theory or Resource-Based View (henceforth RBV) (Dowling and Pfeffer 1975; Pfeffer and Salancik 1978; Ashforth and Gibbs 1990) and the Institutional Theory (Meyer and Rowan 1977; Powell and DiMaggio 1991). The two theories share the assumptions that an organization is facing various external pressures; that it can only survive if it responds to external expectations and demands; that obtaining legitimacy is vital for the access to resources (e.g., natural resources, human resources) and for being perceived as socially worthy (Oliver 1991; Bromley and Powell 2012). This access to resources in turn ensures business stability, continuity, and growth (Lülfs and Hahn 2013; Palazzo and Scherer 2006). RBV views an organization as a rational agent and legitimacy as a source to be extracted from its cultural environment through active management, control, and influence thereof (Suchman 1995; Palazzo and Scherer 2006). Attaining legitimacy requires adherence to the values of the larger social system the organization is embedded in, that is, a publicly perceived congruence between the organizational and societal value systems (Parsons 1964, 1956; Dowling and Pfeffer 1975). In contrast, Institutional Theory views reality as being socially constructed (Berger and Luckmann 1991). The organization is seen as an "enactment of social beliefs" (Bromley and Powell 2012, p.5), rather than as a rational agent or as a "system of coordinated and controlled activities" as under RBV (Meyer and Rowan 1977, p.340). Legitimacy in this context is attained when "the actions of an entity are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs, and definitions" (Suchman 1995, p.574), which emphasizes compliance and conformity to validated practices.

The Importance of "Political Legitimacy"

Organizational legitimacy, however, is "largely based on public judgments about whether or not certain actions can be considered socially acceptable" (Zheng et al. 2014, p.408). Yet, in China due to the absence of a civil society (Hofman et al. 2015), mechanisms of public pressure for example by peers, communities, or consumers are limited (Zheng et al. 2014; Lam 2009). The absence of a civil society is also a result of the specific political configuration in China: a centralized one-party-state that is representing the people. Correspondingly, initiatives to induce more responsible business are almost exclusively state-driven in a top-down manner with virtually no opportunities for companies to proactively engage in the development of these initiatives and measures (Zhao 2012; Lam 2014; Raynard et al. 2013). However, as illustrated by the previous section on responsible business, the government's sociopolitical vision – although requiring businesses' contribution – did not fully materialize due to a lax enforcement thereof under the previous president (2002–2012). The current president of the People's Republic of China (in power since 2013) replaced the "harmonious society" with his own sociopolitical vision of the "Chinese Dream" (Li et al. 2015). Yet, compared to his predecessor's approach, the current president planned accordingly and set up a framework to ensure the realization of his vision by implementing a so-called social credit system for both individuals and companies (Zhou and Xiao 2019). This system is supposed to measure individuals' and companies' contributions to this vision, including punishment for those who go against it.

Accordingly, under this specific political configuration of a powerful state apparatus "political legitimacy,"i.e., being in line with the articulated sociopolitical vision, is absolutely vital in order to gaining access to state resources like bank loans or property amongst others (Zhao 2012; Lau et al. 2016; Lam 2014) that are crucial for any business survival. This also indicates that in the case of China Institutional Theory seems to be more suitable, since there is a strong emphasis on compliance with the state's sociopolitical vision. Furthermore, business actors have actually no means to influence governmental decision-making; hence, the RBV view of a rational and active agent does not apply here.

The Current President's Sociopolitical Vision and Its Implications for Responsible Business and Business Legitimacy in China

Since the current president came into power in 2013 (BBC 2018), the Chinese government has introduced a number of measures to further promote sociopolitical stability. These also affect business behavior since "political legitimacy" requires companies to being compliant with government measures. The most important ones are outlined in this section.

By the end of 2012 at the 18th National Congress of the Communist Party of China, the current president first articulated the "Chinese Dream," his Socialist sociopolitical vision for a "new era" under his presidency to come (China Daily US 2014). According to China Daily US (2014), the mouthpiece of the Chinese government, "The Chinese Dream is President Xi Jinping's integrative and transformative vision for China, an overarching unifying principle for the Chinese people." The vision rests on three major objectives: building a "moderately prosperous society," "rejuvenating the nation," and "happiness for the citizens" (China Daily CN 2014; cf. the current president's speech at the 13th National People's Congress in 2018, China Daily HK 2018).

To realize his vision and maintain social and political stability, one important step was to implement more effective environmental laws after a social unrest in 2013 caused by massive air pollution (Xu and Faure 2016). The environmental protection law (EPL) implemented in early 2015 that finally included harsh penalties was perceived "as the most progressive and stringent law in the history of environmental protection in China" (Zhang and Cao 2015, n.p.). Enforcement, independent supervision, and conflict of interests with economic growth targets on the local level of implementation, however, may eventually hamper its success (ibid., Xu and Faure 2016). Yet, the current president seems to be pushing for more effectiveness regarding environmental protection with a major campaign in 2017, penalizing 30,000 companies and some 5700 officials in the course of a crackdown on environmentally irresponsible behavior (Corne and Broeways 2017) and two more laws in 2018 (Zhang 2018).

Furthermore, the government's current 13th Five-Year Plan (2016–2020), which came into effect under the current president, emphasizes a number of environmental and social measures. With regard to the environment, these are clean production and transition to a low-carbon economy, managing water resources, forest protection, promotion of e-vehicles, environmental monitoring and emission permit system for the industrial sector, and more control of officials implement and enforce environmental measures. Social measures introduced aim at reforming the household registration, *hukou*, system, improvement of urban livelihood, further poverty alleviation, and the improvement of social welfare measures, which all contribute to reducing social inequality (National Development and Reform Commission (NDRC), Peoples' Republic of China 2016).

More concretely on the economic/business level, the government made fulfilling social responsibilities a mandatory goal: "When engaging in business activities, a company shall abide by laws and administrative regulations, observe social morality and business ethics, act in good faith, accept supervision by the government and the public, and bear social responsibilities" (Article 5, Company Law of the People's Republic of China (Revised in 2013)). To further push this goal, the Chinese government will introduce a Social Credit Score for businesses in 2020 (for coverage of the Social Credit Score for individuals see, for example, Horsley (2018), Mistreanu (2018), or Matsakis (2019)) that will affect 33 million companies (Zhou and Xiao 2019). So far, the credit rating methodology has not been fully revealed but information gathered by the government will supposedly include "court rulings, tax records, environmental protection issues, government licensing, product quality and punishments by market regulators" (ibid.). However, whether this data will be centrally collected and exchanged or mainly by agencies and institutions on a provincial level remains unclear (Zhou and Xiao 2019). While compliance is said to result in incentives like tax breaks or similar, noncompliance will lead to sanctions and the blacklisting of a company, i.e., loss of market access, in the worst case (Rechtschaffen 2019).

In summary, with the latest introduction of the Social Credit Score for businesses, it becomes very clear that the Chinese government is systematically pushing for more responsible business behavior and that irresponsible behavior will be severely punished. Business behavior is supposed to be in line with the environmental and social goals set by the Chinese government, so to contribute to the "Chinese Dream." Moreover, market access in the future will depend on political compliance (Rechtschaffen 2019) as a constituent of the "political legitimacy" of businesses, domestic and foreign ones alike, in contrast to mere legal compliance as previously. The key difference to mere legal compliance is that political compliance may force companies to accept questionable prerequisites for doing business in China. Current examples are the "One China Policy" that does not recognize Taiwan's autonomy (The Economist 2017) or the "Nine-Dash-Line," which refers to China's controversial territorial claims in the South China Sea, potentially suppressing neighboring nations (Zhen 2016). Foreign companies that did not adjust their corporate maps quickly enough had to apologize publicly for the misuse (Magramo 2019; Paquette 2018).

Gaining Political Legitimacy in China

CSR presents a "legitimacy-seeking strategy vis-à-vis key resource holders" (Yin and Zhang 2012, p. 312; Hofman et al. 2015). Applied to the Chinese context, however, there is mainly one dominant resource holder: the Chinese government. Thus, the specific political configuration in China significantly impacts the operationalization of CSR in China (Li et al. 2016). "Doing good" is clearly expected by the government and needs to be visible to the public. Hence, the most popular and prevalent CSR strategy in China so far was philanthropy (Zhao 2012), where corporate resources were used for social issues (Li and Zheng 2018). Executed well, this strategy potentially led to a "value-based or affection-based relationship with government officials" (Zhao 2012, p.451), fostered "interdependent and reciprocal relationships" between the company and the government (Lam 2014), minimized public pressure, and improved the company's market reputation (Li and Zheng 2018). Yet, under the current president, mere philanthropy will not achieve political legitimacy. Besides, it was always disconnected from the actual business model without direct business benefits (Li and Zheng 2018). With the introduction of the Social Credit Score for companies, there is a strong focus on general legal compliance of companies to maintain market access. In addition, environmental compliance is essential too, as the current president is pushing for environmental regulation and enforcement thereof (Yin et al. 2019). It remains to be seen whether the latest approach, which still heavily relies on compliance only, finally achieves substantial socioenvironmental progress in China.

CSR Implementation in China: Obstacles and Drivers

When it comes to CSR implementation, system-related factors linked to China's specific political configuration that influences sociopolitical, legal, and cultural spheres are relevant. For example, on the sociopolitical level, the lack of pressure by civil society (e.g., the general public but also companies in the same sector, investors, and NGOs; Lam 2009; Zheng et al. 2014; Hofman et al. 2015), the lack of rewards by both government and consumers (Yin and Zhang 2012), and the lack of positive encouragement for businesses to engage in the CSR discussion and to advance society more proactively due to the government's strict top-down compliance-driven approach are significant obstacles regarding CSR implementation. Further legal obstacles are the prevailing incomplete legal system (Wei et al. 2017) and the difficulties of enforcing regulations (Zhao 2012; Lam 2014). Lastly, with regard to culture and mindset, there is an absence of "legal consciousness" (Wang and Dou 2012) and an "environment of moral degradation" (Li and Zheng 2018) prevalent in China that potentially discourages businesses from contributing to the larger society. This may inhibit CSR progress beyond mere window dressing in some cases and mere philanthropic activities in other cases (Lam 2014; Lu 2008).

In addition, there are factors linked to provincial, firm, and individual level to be taken into account when it comes to the implementation of CSR. *First*, although the government articulated its overarching sociopolitical vision, the actual implementation of these guidelines on the provincial level depends on the configuration of institutions on that level (Raynard et al. 2013). Yet, this configuration varies due to an East–West divide and general regional differences (Pan et al. 2018). These differences are also a result of the opening-up reform, where special economic zones were created and coastal regions were more quickly globally integrated (Raynard et al. 2013). Thus, the government's approach to CSR as government-mandated (Hofman et al. 2015; Birney 2014) allows for discretion and explains the variety of CSR activities across the country as well as regional patterns (Raynard et al. 2013). *Secondly*, the implementation of CSR varies at firm level. While some researchers differentiate on the basis of ownership (Zheng and Zhang 2016) and governance structures (Yin and Zhang 2012), others also point at the company type (private enterprise vs. SOE vs. MNE, Raynard et al. 2013) determining the scope and intensity of CSR measures. For example, private enterprises in China generally suffer from a "deep-seated unfavourable image in the eyes of the government and the public" (Yin and Zhang 2012, p.313). They also lack the great advantages SOEs enjoy with regard to financing and government support (Cheung et al. 2015). Hence, a clear and very visible demonstration of social responsibility by private businesses "may signal competency and trustworthiness" (Yin and Zhang 2012, p.313). SOEs, on the other hand, always actively participated in the government's CSR initiatives (Zhao 2014) or were pressured to do so (Hofman et al. 2015), as their institutional legacy implies serving society (Lau et al. 2016; Raynard et al. 2013) and achieving China's national objectives (Lam 2014). CSR implementation at MNEs is again different to Chinese private enterprises and SOEs, as these are supposed to adhere to both international and Chinese domestic CSR guidelines, and to be good role models in China implementing the latest technology (Lam 2014). Generally, MNEs are under more scrutiny in China (The US China Business Council 2014; Lowe 2019), and thus compliance with Chinese domestic regulations and contribution to national initiatives is key for business viability in China. *Lastly*, CSR implementation depends on whether the manager or CEO is actually convinced of this approach and promoting it within the company (Yin and Zhang 2012; Raynard et al. 2013). This is still potentially inhibited by the narrow perception of CSR being reduced to mere philanthropy and the scarcity of role models (Yin 2017).

On a more positive note, what is driving responsible business behavior in China is dispersed ownership in the sense of smaller and more diverse stakeholders; diversity of customers, i.e., low customer concentration (to avoid the spiral of price competition); international exposure (Li et al. 2016); and a generally CSR-oriented culture with a CEO leading a business based on values. All these aspects positively contribute to meaningful CSR practices (Yu and Choi 2016; Yin and Zhang 2012).

In the near future, however, under the current president's Social Credit System, we will most likely see a "streamlining" of CSR practices across China, as this system is supposed to give clear guidance on what is allowed (mere legal compliance), what actions provide extra points (CSR-related practices), and what is clearly prohibited and going to be punished.

How Chinese Philosophy Can Contribute to Solving These Challenges in the Context of Business Responsibility

China's current social and environmental challenges are all recognized by the Chinese government as illustrated by the current 13th Five-Year Plan. Its implementation includes new and tougher environmental regulations, an amended Company Law, and the Social Credit System for companies. Being compliant with these laws will be crucial in order to attain and maintain political legitimacy as a business in China. Yet, in addition to mere compliance, a lot of inspiration regarding specifically positive action can be found in Chinese philosophy, enabling an active contribution to the government's sociopolitical vision.

Introduction to Chinese Philosophy

China is a country with a long-standing and rich history. This rich history is also expressed in its cultural, religious, and philosophical diversity. The latter was especially prevalent during Zhou dynasty (1111 to 249 BCE) where a hundred schools of thought, *bai jia* 百家, were contending against each other (Liu 2009; Schwartz 1985). What is left from this diverse landscape is a retrospective categorization of schools of thought developed in Han Dynasty (206 BCE to 220 AD, Chan 1969; Kirkland 2004): Mohism, *mo* 墨, Confucianism, *ru* 儒, Daoism, *daojia* 道家, Mingjia 名家, Legalism, *fajia* 法家, and the Yin-Yang 陰陽 school of thought (Kohn 2009; Smith 2003).

As Bettignies, Ip, Bai, Habisch, and Lenssen (2011) highlight "The humanistic doctrine of Confucius, and the naturalistic ideas of Laozi, are the two towering cultural forces [...]." (p.625).

Being almost unimpeded for over two millennia, Confucianism and later Neo-Confucianism as the dominant state doctrine and religion had a significant and long-lasting influence on the way of Chinese thinking (Chan 1967).

Through Confucius, born in 551 BCE in the state of Lu in today's Shandong province in China (Slingerland 2003), emerged the most prominent way of thinking associated with *ru* 儒. Originally presenting a class of scholar-officials specializing in transmitting and preserving the ideological legacy of the previous Zhou dynasty (1111 to 249 BCE, Chan 1969), *ru* became synonymous for the Confucian way of thinking (Slingerland 2009). That is, a "philosophy of social organization" and of daily life (Fung 1958, p.22).

Daoism, as a school of thought, came into existence at roughly the same time as Confucianism with its most prominent work, the *Dao De Jing* 道德经, dating back to fourth century BCE (Kohn 2009). At its core, Daoism is concerned with harmony between heaven, earth, and the human being, which is achieved by following dao 道. Dao is primarily interpreted as the Way (Cheung and Chan 2005), the "natural way of things," which inspired the underlying concepts of the Daoist philosophy (Miller 2006). Generally, whatever we find in Chinese philosophy is ultimately a reflection of what can be observed in reality, and with specific regard to Daoism: in nature.

The "function" of Chinese philosophy is – and always was – to be pragmatic and everyday life and problems oriented, with a strong sense for realism (Chan 1967; Lin 1936; Moore 1967). There never was a concrete interest in abstract reasoning (Granet 1985) or the creation and use of abstract categories (Fung 1958). Whatever we find in Chinese philosophy is ultimately a reflection of what can be observed in reality. Chinese philosophy only became a scholarly discipline upon the importation of Western philosophy (Tang 2015).

How Chinese Philosophy Can Contribute to Solving These Challenges in the Context of Business Responsibility

There are a number of ways in which Chinese traditional values derived from Confucian and Daoist philosophy could contribute to more ethically responsible business, including the recognition of social and environmental responsibility (Li et al. 2015).

Confucian Approaches

Confucianism puts a strong emphasis on values that are instructive in a social context. Fundamental here – although by far exhaustive – are *li* 禮 (ritual/etiquette), *ren* 仁 (benevolence), and *yi* 義 (appropriateness), which were already mentioned in the earliest Confucian work, Confucius' *Lun Yu* (Ames and Rosemont 1998). Basically, *li* is every kind of societal convention or custom, which was seen as appropriate and imperative for being a good person. Through observing *li*, a society is made homogenous in a way. Therefore, a major function of *li* is to create social harmony (Tang 2015). *Ren* is commonly translated with "virtue," "benevolence," or "humanity" (Ames and Rosemont 1998) and presents an ethical ideal (Slingerland 2009). *Ren* cannot be learned in solitude but only be cultivated in human relations, since it does not present an intellectual quality or a kind of scientific knowledge (Lin 1974). *Yi* implies the capacity of having the "right" sense with regard to one's behavior and feelings (Slingerland 2009). *Yi* also means more than merely following formal rules and rigidly clinging to moral codes (ibid.). It requires a deeper understanding and internalization of what is "proper" or "right," which in turn allows for the necessary flexibility to respond to a variety of situations (ibid.; cf. LY 4.10, 15.37).

Accordingly, *li*, *ren*, and *yi* lay at the core of the Confucian foundation. Later, two more values were added, wisdom *zhi* 智 and trustworthiness *xin* 信 constituting the *wu chang* 五常 " the five regular constituents of virtues" (Thacker 2003).

Some researchers (for example Wang and Juslin 2009; Li et al. 2015; Zhao 2014) believe in the necessity of a contextual approach and thus the need to translate Confucian values into values to be applied in business. This so-called "Confucian Approach to CSR" is based on a "people-oriented management" (Zhao 2014, p.85). Today, this approach fits well with the current president's agenda of creating a harmonious and moderately prosperous society on all social levels: the business, the community, and eventually the state level. However, this Confucian approach, which is also captured under the name *ru shang* 儒商, the Confucian Entrepreneur (Woods and Lamond 2011; Niedenführ 2017), is still a niche phenomenon. Yet, its practice has been observed at SOEs (Zhao 2014; Ip 2003) and private businesses (Lee and Chung 2015; Liu and Heler 2012). By adhering to *wu chang* when running their business, the *ru shang* try to resolve the conflict between *yi* (appropriateness) and *li* 利 (profit) (Cheung and King 2004). However, despite a number of positive examples, some criticize the idea of Confucian values in business for being overly paternalist, authoritarian, hierarchical, and particularistic, and thus undermining equality and meritocracy (Ip 2009a). In particular, some stress these values are insufficient for proper ethical guidance at businesses and need to be complemented by rules and norms (ibid.; Liu and Stening 2016).

Daoist Approaches

The philosophy of Daoism, although not monolithic (Kirkland 2004), generally puts an emphasis on the "natural way of things" as opposed to the Confucian focus on the social. This, however, does not mean that neither Daoism is also covering social aspects nor that Confucianism is ignoring aspects related to the environment.

Dao is a "principle of organisation and order" (Granet 1985, p.230) and is structured by the alternating, complementary categories of *yin-yang*, which in large present a "complex network of classifications" (Moeller 2004, p.106). They are symbolic and generic, only pointing to a contrast between and in relation of two appearances (Yang 2006). Originally, these categories were derived from natural observations, as *yin* means dark (associated with the female), carrying the symbol of the moon, and *yang* means bright, carrying the symbol of the sun (associated with the male). The *yin-yang* view of things plays an important role in Daoism. Although this view implies mutuality, Daoist works such as the *Dao De Jing* articulate a clear (ethical) preference for *yin*, that is, the dark, female, weak and soft (Xu 2003, cf. Chap. 28, Waley 1958).

Water as a metaphor plays an important role in Daoism (Moeller 2004; Chan 1969). More concretely, water is associated with *yin*, being nourishing and benefiting (cf. *Laozi* Ch.8), always seeking the lowest place and flowing downward (cf. *Laozi* Ch.61), and as the soft overcoming the hard (cf. *Laozi* Ch.32) (Moeller 2004). The characteristic of nourishment can be linked with virtues such as generosity and kindness, whereas seeking a low position could be connected with the virtue of humbleness (Hennig 2017).

Lastly, there are two more important concepts: nature, *ziran* 自然 and non-action, *wuwei* 无為, which are in a way complementary (Wang 1997; Lai 2007). The concept of *ziran* implies a notion of natural "self-so-ness" (Lai 2007) and spontaneous self-transformation (Miller 2006). The concept of *ziran* emphasizes the idea that things in its natural condition, that is, not being transformed by social conventions and practices, are good. *Wuwei* is important to avoid interference with the "natural way of things" (Miller 2006) to enable things to remain in their natural condition. Eventually, adopting all these characteristics and thereby following the "natural way of things" promote harmony.

The practice of Daoist values is captured under the label *dao shang* 道商, the 'Daoist Entrepreneur'. Haier 海尔, a Chinese company producing white goods that originally was part of a German-Sino joint venture with Liebherr, presents itself as an example of *dao shang*. The company's metaphor of "Haier Is a Sea" (*hai* 海 is translated as sea) heavily draws on the Daoist water metaphor (Xing 2016). The company's leadership culture is "extolling the virtues of living a selfless, simple, intelligent, placid, tolerant, and humble existence" (Xing 2016, p.808), as well as receptiveness and flexibility. Leadership by these virtues is supposed to eliminate the employees' selfish desires. Similarly, a cooperative spirit shall be fostered by the Daoist principle of "not contending" or "not competing" (cf. *Laozi* Ch.22). In contrast to *ru shang*, *dao shang* tries to reconcile the conflict between running a successful business without too much aggressive competition and under consideration of the natural environment. However, whether Daoist concepts are the only philosophical concepts, the company utilizes to inform its leadership practices and corporate culture cannot be said with certainty. Others claimed, Haier also applies the so-called "wolf spirit," a quite aggressive theory that stands in clear opposition to

Daoist values (Zhang n.d., Corporate Rebels 2018). It is not uncommon that Chinese entrepreneurs choose values from various Chinese philosophies as a value basis.

Conclusion

This chapter identified "political legitimacy" as the major concern of businesses, domestic and foreign alike, operating in China. In contrast, "organizational legitimacy" is only of minor importance due to the absence of a civil society, although more public pressure seems to be on the rise.

The emphasis on political legitimacy comes with a number of crucial implications for businesses in China. First, it requires absolute compliance with all domestic laws and governmental regulations. Second, this compliance will be measured in the future by a social credit score assigned to each business (and employee), with severe punishments in cases of noncompliance. This social credit system serves to realize the current president's sociopolitical vision of the "Chinese Dream," where people can be "moderately prosperous" and happy. Businesses play an important role, as until today many still engage in exploitation of various kinds, for example exploitation of labor and of nature. However, compliance cannot instill proactive and reflective responsible behavior. This can only be induced by a clear set of values to be found, for example, in the two major Chinese philosophies Confucianism and Daoism.

The current president (Xi 2014) himself emphasizes Chinese traditional values next to the "core socialist values." More recently, Chinese traditional values experienced a revival, now being "redeployed as part of the communist political project in various forms" (Li et al. 2015). Thus, taking Chinese traditional values from Chinese philosophies as an inspiration for corporate ethics and value guidance for CSR practices in China seems to be conducive, both from a perspective of ethics and legitimacy. In practice, this would lead to an increase of so-called hybrids, a contextualized approach to CSR combining Eastern/Chinese and Western practices (Wang and Juslin 2009; Li et al. 2015; Zhao 2014). Implementing a Western approach alone, such as the stakeholder approach, faces significant limitations in China. The main stakeholder is still the Chinese government (Yin and Zhang 2012; Zheng and Zhang 2016), due to compliance/political legitimacy as the basis to operate in China, with every other stakeholder being clearly subordinated. This also explains why purely Western models so far could not succeed in this culturally and politically very different environment (Raynard et al. 2013; Wang and Juslin 2009).

79 Practicing Legitimate Leadership in Territories of Interactions in Greenland

Mette Apollo Rasmussen

Contents

Abstract

This chapter presents results from a project about leadership in Greenland. It discusses how leaders in Greenlandic organizations legitimize decisions in territories of interactions. The research focus on how Greenlandic leaders at times are challenged by the tight relationship in the small society but also how the tightness supports close and fruitful interactions where leaders qualify and legitimize decisions related to quality, business development, and future actions. The findings demonstrate how the leaders legitimize actions and decision in their local networks and how this relates to and develops their everyday practice.

Introduction

In May 2019, the President of the United States offered to buy Greenland. The Prime Minister of Greenland and the Prime Minister of Denmark immediately turned down this *absurd* offer (LeBlanc 2019). Before Trump's offer, Greenland, and the Arctic in general, was already getting a lot of media attention, but this episode just increased the interest. The global discussions about Greenland are often related to global warming, climate change, geopolitical issues, demand for natural resources, and the independence of Greenland (Andersen 2015; Rendtorff 2018). Within research, Greenland is also a hot topic, the same issues which has the public interest, and adding oceanography, biology, ecology, and glaciology is getting a lot of attention (Whiteman and Yumashev 2018).

What is receiving much less attention within research is organizational development in the Arctic and thus Greenland. Even though Greenland has become a hot topic globally, there is hardly any analysis on organizations and leadership that seeks to explain how organizational development takes place in Greenland and in the Arctic in general (Whiteman and Yumashev 2018). Subsequently, Whiteman and Yumashev argues, "A search using the word 'Arctic' in the archives of the Academy of Management Journal, Academy of Management Review, Organization Studies, Organization Science, Administrative Science Quarterly reveals a blank space" (Whiteman and Yumashev 2018, p. 5).

Recently the Nordic Minister Council argued, "New business opportunities are on the rise and Arctic stakeholders are playing a key role in facilitating and creating favorable conditions for boosting Arctic economic activity" (Arctic Business Analysis, Nordic Council of Ministers 2018, p. 7). This also goes for the business development in Greenland, where the growth of the business society seems to plays a large role in the general debate about developing the country (Naalakkersuisut – Govenment of Greenland 2018; Økonomisk Råd 2016). Further, Sermersooq Business Council argue that the lacking focus on leadership in Greenland is a challenge facing the development of local organizations, and in recent analysis, they argue that there is a direct link between education, training, and competencies and being able to support growth and development (Sermersooq Business Council 2017, p. 6). In 2015 the same argument was brought forth by Andersen who argued that Greenland needs to "initiate a process with a stronger economic development" and explicate that it requires a strengthening of the private sector (Andersen 2015, p. 25).

This chapter departures from an ethnographic research project about leadership in Greenland. The main research interest of the overall project is to gain insights on the neglected topic: How leadership is practiced in Greenlandic organizations. In this chapter focus is toward how strategies of legitimacy is a part of the mundane, everyday organizational activities, practiced by various actors in Greenlandic organizational settings. It is discussed how legitimate leadership emerges in the daily organizational setting where organizational actors intersubjectively problematize challenging matters.

So how and why should this topic be approached? The importance of the definition of legitimate leadership is not simply to outline a space in a language game, but a way to broaden our understanding of how legitimacy unfolds in ongoing interactions in organizations among various organizational members. Further the study adds to the range of legitimacy strategies, gaining, maintain, and repairing, formerly conceptualized by Suchman. The aim of this chapter is to qualify the understanding of how legitimate leadership is practiced in Greenlandic organizations. By this focus, the chapter follows Suchman's call from 1995, where he defined the need for "close empirical attention" (Suchman 1995, p. 603) toward processes of legitimacy. In order to grasp the ongoing, daily interactions where processes of legitimacy are practiced, the research question this chapter asks is as follows. How do processes of legitimacy emerge in daily interactions among participants in greenlandic organizations? A question like this goes beyond the normative descriptions of leadership and strategies of legitimacy and tries to grasp how actions of legitimate leadership are practiced in an interplay between various actors. It is difficult or even impossible to convey the richness and variety of the various perceptions of leadership in any generalized manner, extracting into a book chapter. Even though some empirical narratives are brought forth trying to make sense of how processes of legitimate leadership are practiced. Thus, the case methodology chosen here seeks to explain how Greenlandic leaders legitimize leadership in territories of interactions.

The rest of the chapter is organized as follows: first a brief introduction to the Greenlandic research setting; second, a theoretical discussion of leadership and legitimacy; third, a methodology section explaining how the research has been conducted, and, fourth, empirical analytical narratives highlighting how legitimate leadership unfolds in and among organizations. Finally, the chapter tries to qualify and conclude on the understanding of legitimate leadership.

Greenland

Arriving in Nuuk, the capital of Greenland, by plane on a sunny day is a breathtaking experience. From the air, you see the Fjord and the mountains. In the middle of Nuuk is the harbor, the heart of many business activities. Greenland's approximately 56,000 inhabitants live in what is the largest island in the world, covering 836,109 sq miles Hereof, 17,000 people living in Nuuk have no easy access to neighbors, since no roads connect Nuuk with other areas of Greenland. The distances are large in Greenland, north-south 2,670 km, east-west 1,050, coastline 44,087 km (Andersen 2015; Balslev 2017). Even though Greenland obtained self-governance (Selvstyre) in 2008, they remain a part of the Danish Kingdom.

Four photos (Photos 1, 2, 3, and 4): View of Nuuk – the research setting

The businesses, and thus the economy, are related to natural resources. Historically the natural resources was primarily fishing and hunting, but now with an increasing interest in mining, minerals and fossil fuels. For now, the economy is

Photo 1 Viewing Nuuk from the colonial harbor

still rather sensitive to the development in prices for fish (Andersen 2015; Økonomisk Råd 2019). The government runs many of the larger Greenlandic companies as state-owned enterprises (SOE), in order to ensure production and service in the widespread setting. Generally it is argued that business dynamics in Greenland are affected by the small population and the remote settings (Økonomisk Råd 2016). Most leaders explain how the daily leadership practice is closely related to society and how activities in the local community influence and create dilemmas. They argue that the development in society has implications for the leadership role (Rasmussen and Olsen 2019).

There is a scarceness of research on leadership in Greenland. In 2018 Whiteman and Yumashev argued that there is hardly any publications about the Arctic in relevant organizational journals (Whiteman and Yumashev 2018), and when searching for literature about leadership in Greenland, the conclusion was the same. However, a walk round Greenland University, asking colleagues for research about leadership, resulted in that some unpublished papers turned up. The material that arose added very little to the understanding of everyday leadership activities unfolding in Greenlandic organizations. Most of the literature takes a culture approach focusing primarily toward differences between Greenlandic and Danish organizational actors (Bakka 1997; Balslev 2017; Kahlig 1999; Langgaard 1986; Lyck 1998; Nooter 1976; Samuelsen 2010; Winther 2001). In Kahlig's study from 1999, he concluded that it would be useful to study how leaders engage in daily

Photo 2 Approaching Nuuk by plane. (Credits to Randi Havnen)

interactions, instead of describing the simplistic and objective categorization of, respectively, Greenlandic and Danish culture (Kahlig 1999, p. 181).

Theoretical Framework

Leadership as a Collective Activity

Leadership in organizations is attracting a lot of attention, and the field of knowledge is constantly growing (Blom and Alvesson 2015). The literature often highlights that leadership is closely related to organizational development (Alvesson 2019; Hernes 2014; Stacey and Griffin 2005; Tourish 2019; Uhl-Bien and Arena 2017; Weick 1979).

Traditionally the understanding of leadership and management has been placed in an understanding of causal relationships, where design, regularity, and control are the dominant voice. The leader is described as a heroic character, taking the position as a superior who direct employees using particular leadership skills, traits, and styles. Thus, primarily attention is paid to the leader as a figurehead of organizational actions. An example of this is clear in the discussions of situational theory of leadership where the argument is that there is a particular leadership style which

Photo 3 Viewing the industrial harbor from Qinngorput

fits a particular situation. This perspective tends to label specific leadership styles, establishing an understanding that all situations and styles can be described, leaving no room for critical reflections in the complex processes of leadership. Somehow, the same considerations are present in the discussion of transformational and charismatic leadership where the position of the leaders gets the attention (Schieffer 2006; Tourish 2019).

Generally, these former dominant theories focus on the distinct leader having the ability to influence followers, and the leaders and managers are considered as in a powerful position where they use tools and rational analysis to develop one-size-fits-all macro strategies, targets, and goals. In this perspective, organizations are considered well-structured, well-described, and well-organized entities (Alvesson and Sveningsson 2003). Alvesson argues that this way of thinking and working with leadership "fits nicely into a culture of grandiosity, where as much as possible is labelled and understood in impressive and extraordinary rather than mundane or precise ways" (Alvesson 2019, p. 27). These traditional approaches to leadership are largely static. Although incorporating variables related to leaders' behaviors, contexts, and outcomes, the emphasis is on the leadership position (Schieffer 2006; Tourish 2019).

The definition of leadership applied in this chapter is somehow different. The definition applied here turns to processes of everyday leadership practices, wanting to know about how activities of leadership engage with complexity and uncertainty

Photo 4 The colonial harbor from above Egede

that characterize the organizational setting (Crevani 2018). By this definition the focus of leadership moves away from objectivity, realism, cognitivism, and systems thinking (Stacey 2016). The leadership perspective, grounded in process thinking, seems to be valuable when researching leadership in organizations as it unfolds in everyday organizational life. The process perspective of leadership recognizes the organizational context as a pluralistic setting where actors, leaders, managers, and employees engage in dynamic and collective interactions (Crevani 2018; Hernes 2014; Weick 1979).

This is in opposition to the traditional perspective where leaders are positioned as patriarchal figures, looking at the system objectively from the outside and then designing and implementing strategies that ensure a desired outcome. Here leaders would be expected to exert control through formalization and plans. In this traditional perspective, organizations are considered rational systems (Suchman 1995).

The perspective applied defines leadership as processes of ongoing interactions unfolding among many actors in the organizations as an everyday practice. Leadership is a collective activity, and leadership takes place where and when leadership is needed. This need appears when organizational actors experience uncertainty, tension, doubt, ambiguity, and dilemmas (Hernes 2014; Weick 1995).

Legitimacy

Suchman argues that since the late 1960s, the study of organizational legitimacy has become an important topic for understanding how organizational actors engage with processes that constrain, construct, and empower (Suchman 1995, p. 571). This understanding is also apparent in Rendtorff's introduction chapter for this book, where he argues that legitimacy is considered important for organizations to function in the public space (Rendtorff 2019).

In Suchman seminal paper from 1995, he defined legitimacy as "a generalized perception that the actions of an entity are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs, and definitions" (Suchman 1995, p. 574). Institutional theory places emphasis on legitimacy processes through which organizations adapt to what is seen as "desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs, and definitions" (Suchman 1995, p. 574). He advocates for three ways to consider legitimacy: pragmatic, moral, and cognitive.

- Pragmatic legitimacy relates to a somehow cause-effect thinking of legitimacy. This way of thinking of legitimacy has a very limited perspective to it, where exchanges to some extent take a generalized or even normative experience of what is expected to take place, and legitimacy is related to "positive evaluations of specific organizational acts into generalized perceptions of organizational legitimacy" (Suchman 1995, p. 579). Pragmatic legitimacy is closely related to what the company offers, e.g., products and services.
- Moral legitimacy reflects a "positive normative evaluation" (Suchman 1995, p. 579) of the organization and its activities. Thus, the moral legitimacy rests on judgment about whether the organizational activities are "the right thing to do" (Suchman 1995, p. 579).
- Cognitive legitimacy focuses more on whether a given activity benefits its users and has importance for the relation between society and the organization.

While pragmatic legitimacy follows the rational, strategic tradition, moral and cognitive legitimacy relates to the institutional perspective. Suchman emphasizes that both "pragmatic, moral, and cognitive legitimacy co-exist in most real-world settings" (1995, p. 584), and thus interrelations among the concepts can be found.

Most research within legitimacy focuses on external legitimacy, granted to organizations by external stakeholders. Less studied is internal legitimacy, focusing toward how legitimacy is practiced within and between the organizational actors. Rendtorff takes the daily and mundane internal legitimacy activities seriously when he argues that "Establishment of organizational integrity and managerial judgement contributes to formulate a framework for coping with organizational dilemmas in the daily practice of leadership" (Rendtorff 2019, p. 57).

The rest of the chapter draws attention to the coping with dilemmas in the daily practice; thus it establishes a focus on internal legitimacy, understood and related to generalized perceptions and expectations to the daily organizing activities, enacted among multiple actors in organizations. Following Suchman there are at least three general challenges related to legitimacy management, gaining, maintaining, and repairing legitimacy (Suchman 1995, p. 586), all calling for skillful strategies. He turns rather normative when it comes to explaining and elaborating the different strategies managers can use when "seeking legitimacy for his or her organization" (Suchman 1995, p. 586).

Analytical Framework, Data Collection, and Analysis

The focus toward processes in daily leadership activities has the potential of adding to the general knowledge about the social world in organizations and, at the same time, informing the practical understanding of those involved in the activities. The perspective raises questions about everyday activities we often take for granted and contributes to a critical problematization of organizational activities (Sandberg and Alvesson 2011). The process research on organizations has expanded over the years, in particular being developed by Hernes, Weick, Stacey, Tsoukas, Langley, and Alvesson (Alvesson 2003; Hernes 2014; Langley and Tsoukas 2010; Weick 1995), just to mention a few. It is a theoretical framework, and thus research approach, which focuses toward the dynamic interactions and change of meaning. Here organizations emerge through relationships between people; thus the organizational actors create what we come to know as the organization. Organizational actors engage in responsive processes creating the organization, and the organization emerges in those local interactions (Stacey 2016). Denzin's definition of organizations is applied, and in this perspective "organizations become territories of interaction that are focused around complex spoken and unspoken languages" (Denzin 1969, p. 932). Likewise, Weick cites Czarniawska-Joerges when he pays attention toward how organizations can be thought of as frames of interactions and thus questioning "How are meanings and artifacts produced and reproduced in complex nets of collective actions?" (Weick 1995, p. 172).

By applying a process methodology, focus is on situated leadership activities, which enables explanations of how events unfold over time. Hence, process studies have the ability to "explain organizational matters in terms of practices instead of simply registering them" (Nicolini 2012, p. 13). Process data provide a rich and nuanced understanding of emerging relations and are developed by processes of inquiries that recognize the characteristics of social actions and apply approaches designed to capture these ongoing processes. Blumer argues that social life is a product of individuals' fitting their lines of action together (Blumer 1969). A central concept of symbolic interaction is ongoing processes, taking into account that empirical data are to be collected in real time for "understanding how things evolve over time and why they evolve in this way" (Langley 1999, p. 692). Thus, process theory drawing is particularly close to the phenomenon to be explained (Langley 1999). Subsequently, a case study is well suited to explore processes of leadership as they unfold in the daily practice.

The aim of the analysis is to generate a well-grounded description of the leadership processes by using sense-making strategies (Langley 1999). A narrative strategy is applied to construct a rich story from the raw data for further analysis. This perspective provides a framework where we can start "Rethinking the roles of leaders and managers" (Stacey 2016, p. 513).

To follow the implication from the process perspective, Nicolini argues that there needs to be "an observational orientation and the adoption of methods that allow an appreciation of practice as it happens" (Nicolini 2012, p. 14). Trying to grasp how leadership unfolds in Greenland, and thus to explore the field, ethnographic interviews and conversations have been held with 14 Greenlandic leaders from August 2018 to May 2019 and in addition, a leadership debate with participation of 15 leaders was held at Ilisimatusarfik on the 3rd of June 2019. The leaders are broadly employed in Greenlandic organizations and have a minimum of 3–5 years of leadership experience in Greenland. Ethnographic interviews were suitable for the study, as they opened up interactions between interviewer and interviewee (Becker 2008; Spradley 1979). The ethnographic interview is concerned with the meaning of actions and events of the people we seek to understand, and questions and answers must be discovered in the social setting being studied. Spradley argues that ethnography provides the researcher with a chance of apprehending the world from the viewpoint of the people of study (Spradley 1979). The richness in the data enables the researchers to discuss a different picture from how we previously have understood the phenomenon of study.

So even though interview guides were prepared, containing specific themes and questions, the leaders took part in shaping the interviews, which to some extent gave the interviewee the possibility of freely telling about their everyday leadership activities. The approach employed both broad and general questions (Spradley 1979) and more specific questions that probed how the leaders approached their daily leadership activities and decisions and interactions with others involved. Interviews lasted approximately 45 min. All interviews were recorded and transcribed. A written summary was made of the leadership debate held at Ilisimatusarfik.

The ethnographic interviews were helpful since the leaders took the necessary time to revisit and unfold particular leadership situation, and they shared their interpretations of these concrete situations. In this way, they participated in the interpretation of concrete events and experiences. Czarniawska (2004) argues that such accounts are useful for answering the questions of how everyday situations are experienced and interpreted because they relate to concrete, not generalized or hypothetical, events.

The search for how leadership unfolds has been an iterative and ongoing process. The work of analyzing the data is inspired by interpretative phenomenological analysis (IPA), which is a specific hermeneutic approach committed to exploring how people make sense of experiences in their lives (Smith et al. 2007). IPA research is phenomenological in its attention to a particular experience, with a hermeneutic approach to the analysis of the empirical data. The IPA approach differs from other qualitative approaches because it focuses on participants' processes of making sense of their experiences as much as it does on the experiences themselves. IPA especially focuses on understanding lived experiences and how participants make sense of their experiences (Smith et al. 2007). The researcher is required to make sense of the data by engaging in an interpretive relationship with the empirical data. It is through this process the researcher tries to imagine and understand parts of the leaders' everyday practices. This method of analysis involves careful and detailed analysis, and the researcher carries a great responsibility showing how conclusions are reached.

Analysis: Practicing Legitimate Leadership in Greenland

The narratives to follow are analytical elements describing how leadership in Greenland unfolds in ongoing conversations of problematization. Processes of problematization seem to be related to decisions and actions, and thus leadership as legitimizing actions comes into play. The empirical narratives describe leadership in Greenland as a collective activity, where collaboration is essential for what takes place in the organization.

Narrative 1 The Close Relations

One leader explained how leadership is about looking at the problem and starting with that – i.e., not the person but the issue itself – which can be a challenge since everyone is somehow closely related. When working with leadership in Greenland, there are many relationships to be considered all the time because relations are crisscrossing various activities.

How the relations are useful in Greenland is explained by a leader who argues that relations create opportunities in the country and help one along the way. Further, a leader argues that there are many relationships to be kept in mind constantly and, thus, it can be a challenge to know if relationships are enabling or restraining.

The main line of thought underlying the above empirical narrative is that processes of legitimate leadership are important as this is where organizational actors collectively make sense, problematize, and come to some preliminary decisions. The leaders seem to respond to challenges in their environments by, for instance, discussing challenging situations and thus developing and adopting new perspective believed legitimate in the organizations and society at large. They do this by practicing legitimate leadership in relations, by involving themselves with other leaders and colleagues in their organizations. The leader's stories about how they engage and enact processes of leadership in their everyday practices can be further elaborated in the frame of Mead's theory of the generalized other: "It is in the form of the generalized other that the social process influences the behavior of the individuals in it and carrying it out, i.e., that the community exercises control over the conduct of its individual members; for it is in this form that the social process or community enters as a determining factor into the individual's thinking" (Mead 1934, p. 155). By the process of role-taking, the leaders and co-workers form the relevant leadership activities and understandings of what is happening and about to happen.

Leadership is, thus, a collective activity consisting of territories of interactions, with horizontal and vertical element, where relevant knowledge is a key issue. It is considered a relational activity, where interactions in the close territories of interactions define what can be developed and take place. What is here theoretically defined as territories of interactions (Denzin 1969; Garfinkel 2006; Silverman 1970) the leaders talk about as a web of interwoven relations where they get informed, exercise influence, and make things happen. They consider their territories of interactions as mutually restraining and enabling. They realize that the territories can be restraining since they develop particular explanation of situations, where situations are agreed upon and understandings are taken for granted. Breaking with former understandings takes place when dilemmas and paradoxes emerge in the daily activities, and thus leadership is being practiced. This happens when situations are experienced as ambiguous and opposing, and the way forward is partly unclear. Situations of dilemmas and paradoxes are the situations we often hear leaders describe when they talk about leadership.

Narrative 2 Complexity, Paradoxes, and Dilemmas in the Daily Activities

The Greenlandic leaders argue that relevant problematization involves a definition of particular situations. They find that in order to do that, they have to pay careful attention, be present, and be available, to grasp what the involved actors are saying. Decision must often be made despite the fact that a situation is not well defined or that simple accounts have been made about it. For example, we hear a leader say that leadership is not about making decisions but about bringing relevant decisions forward for a discussion and then reaching an agreement and deciding. The leaders explain how they try to expand the situation in a conversation with the people involved. This experience is opposed to making a quick decision by ending the conversation. Often a situation is much more complex than formulated at first, and the complexity only emerges when extending the conversation. A leader explains this by saying that sometimes the unresolved discussions reveal new understandings and opportunities that had not been foreseen. Between them, the leaders formulate a common view about having to be brave and dare to engage and discuss what is taking place in the society and, as one leader formulated, to not take things for granted.

The gaining, maintaining, and repairing organizational legitimacy in this leadership perspective seems to be ongoing and closely related to problematization of organizational uncertainty. By engaging in various territories of interactions, leadership activities create legitimacy related to challenging decisions.

Table 1 Legitimate leadership activities

	Pragmatic legitimacy	Moral legitimacy	Cognitive legitimacy
Leadership activities	Decisions can be made on existing knowledge. Situations are recognizable. Actions are routinized. Leadership is hardly needed	Leadership is practiced in various relations, discussing possible actions for particular situations. Considering how particular actions might affect the organization	Changes and challenges in the surrounding context are ambiguous. Leaders and co-workers mutually extend decision-making in order to unfold challenging situations and create better knowledge about particular situation
Practicing legitimate leadership by problematization	Collective activity involving relevant actors in and around the organization trying to making sense of challenging paradoxes and dilemmas		

Previously it was discussed how Suchman (1995) has described the leadership strategies as activities of gaining, maintaining, and repairing. Here it is suggested a different way of describing these activities as problematization, where the three strategies are less related to thinking of gaining, maintaining, and repairing, but more related to problematizing relevant activities in an ongoing process of leadership activities. I propose to think about leadership as changing either the need is for pragmatic, moral, or cognitive legitimacy (Table 1).

In Greenland we hear how the organizational context is very closely related to what is emerging and taking place in the surrounding society. In these years, Greenland is exposed with a lot of attention, creating new dilemma-filled situations for society in general and for organizations in particular. Supposedly, this makes the organizational setting different from other places, and thus the need for moral and cognitive legitimacy calls for a great need for mutual problematization in the organizational settings.

Conclusion: How Legitimate Leadership Emerges in Territories of Interactions in Greenland

This chapter sets out to examine how legitimate leadership is practiced in everyday, mundane activities. More specifically the question asked was: *How do processes of legitimacy emerge in daily interactions among participants in Greenlandic organizations?*

The chapter contributes with some empirical narratives illustrating how organizational actors, leaders, and co-workers mutually develop new understandings of future actions and thus how they collectively legitimate their actions in a process of critical reflections understood as problematization. The chapter grasps processes of legitimate practices. In other words, what is to be analyzed is how Greenlandic leaders carry out their leadership practice and how collaborative actions are used to legitimize decisions in their everyday practices.

The empirical data reflect how legitimate leadership can be understood, through the study of organizational activities from a micro perspective. It is argued that the process perspective, where leadership, as a phenomenon, is best studied by understanding how legitimate leadership activities emerge in everyday interaction and as a collective accomplishment. The process theory establishes a strong frame for attending how legitimate understandings and actions are emerging in the daily interplay among organizational members.

It is highlighted how leaders are not controlling and planning the organizational processes of legitimacy. They might try to influence the processes of legitimacy, but how the processes appear and take place in the ongoing, daily activities is a mutual accomplishment taking place among various organizational participants. Thus, legitimacy and leadership are not a set strategy, but emerge in interactions among the involved participants.

The chapter takes the first step in developing the theoretical understanding of legitimate leadership. The position of legitimate leadership steps away from the traditional thinking of the leaders as heroic, grand, and patriarch. Legitimate leadership is a collective way to navigate in uncertainty and complexity. By engaging in mutual processes of interactions, leadership becomes a collective activity where legitimacy is practiced. In this regard both leadership and legitimacy are concerned with future actions and how various actors in the organizations mutually make sense of what is about to happen.

The focus toward problematization extends Suchman's (1995) way of describing the strategies of legitimacy with a focus toward the internal processes in organizations. Legitimate strategies are not only based on gaining, maintaining and repairing, in the Greenlandic setting, but legitimate strategies in leadership seem to be based on problematization. Based on the narrative examples of how leadership is practiced in Greenlandic organizations, it is argued that legitimate leadership is also about problematization.

There are some limitations to this study. The empirical data are based on interviews and do not show the richness of how the legitimate processes emerge over time. Observational data would allow the study to develop thick descriptions of the Greenlandic practices and thus explore in depth the legitimizing processes of interaction as they unfolded.

Polycentric Dimensions of Business Legitimacy in Complex Societies

Legitimizing Practice Forms During Transformation of a Legitimizing Business Paradigm: Changing Strategies and Reasons

Abstract

In recent decades, various legitimizing practice forms have emerged – from public affairs, issues management, and stakeholder engagement to CSR initiatives and integrated reporting. A series of analytical perspectives are unfolded in order to study these practice forms in their empirical manifestations. An analysis of the transformation of the legitimizing business paradigm illustrates how practice forms change their function, strategy, and reason over a succession of phases. The analysis also reveals risky tendencies embedded in the present phase of this transformative process.

Keywords

Legitimacy · Reflection · Reflective paradigm · Reflexivity · Transformation process

The past 50 years have witnessed a transformation of the legitimizing notions that mediate the interrelation between the business community and the rest of society (cf. ► Chap. 19, "Society's Megatrends and Business Legitimacy: Transformations of the Legitimizing Business Paradigm"). The process of transformation as well as its result, a new legitimizing business paradigm, manifest in a number of legitimizing strategies and social technologies. From, for instance, issues management, stakeholder engagement, public relations, and public affairs to partnerships, values management, and reporting on multiple bottomlines; forms of practice that within the private business sector thematize issues of public interest such as sustainability, human rights, corporate citizenship, corporate social responsibility (CSR), and corporate social innovation (CSI). In the process, alternating forms of practice emerge, boom, grow illegitimate, change, wither away, and are replaced by functionally equivalent forms of practice. In some cases, the same concept refers to quite different forms of practice, and many of these designations are characterized by uncertain semantics; i.e., the same designation means different forms of practice to different practitioners and perspectives at different periods of time, and in different types of society. Uncertainty prevails as to what a practice form "really" is about and why.

In order to understand the forms and processes of legitimizing practice, the basic suggestion of the research presented in this chapter is to understand them as resonance to problems of social cohesion. Society's cohesion is continuously threatened by society's evolution which continuously causes new challenges. When legitimizing notions no longer contribute to social cohesion, they are challenged and gradually transformed. Society absorbs the turbulence in learning processes involving changing legitimizing notions and practice forms that meet with the changing challenges to cohesion. The empirical field analyzed is embedded in the specific type of society characterized by modernity, and a specific phase of the evolution of modern society, namely, the transition from full to ultra modernity, and further, the challenges when globalization confronts modern society with the values of different societal forms.

The line of research presented in this chapter endeavors to contribute to an understanding of how different legitimizing practices gradually emerge in a specific context as legitimizing notions change, and how everyday practice is embedded in society's evolutionary processes. A perspective like this goes beyond the level of observation that sees social actors' strategic intentions manifest in interplays between different particular interests. Instead, focus is on how legitimizing practice forms are embedded within the very social communication processes and their self-referential dynamics. To that end, a frame for understanding the function and emergence of legitimizing forms of practice will be constructed, and a series of analytical lenses to study the practice forms in their empirical manifestations.

As the basic platform for the analysis, social theory is required that consistently captures the interrelation between everyday practice in organizations and society's construction and evolution. Therefore, Niklas Luhmann's epistemology (1995a), theory of society (2012), and theory of organization (2000a; Becker and Seidl 2005) are chosen (as also introduced in ► Chap. 19, "Society's Megatrends and Business Legitimacy: Transformations of the Legitimizing Business Paradigm"). In this theoretical framework any social process – a management decision, a news interview, a declaration of love, a tweet or a like, or even a payment – is seen as part of society's continuous reproduction of meaning in communicative processes and as embedded in society's filters of recognition, *social systems*. Any communicative process – communication understood as a continuous selection of meaning, a continuous interpretation of the world unfolded in human interaction – is understood as part of society's continuous reproduction. Society's building blocks are communicative elements which by constantly causing and connecting to new communications hold society going. The basic point is that the continuation of this recursive stream of connective potential and connections conditions society's cohesion. So, understanding society as a self-organizing system of communication with the sole purpose of continuing itself means understand society's evolution – and subsequent transformations of legitimizing notions – as processes seeking to support the continuation of the flows of communication.

The dimensions traditionally designated macro, meso, and micro by sociology are dissolved and replaced by three different, however, mutually interdependent types of social systems: (1) Functional systems that constitutes the primary differentiation of modern society and consequently basic clusters of expectation – systems each with their function and network of self-referential, self-legitimizing reasoning, such as the systems of economy, politics, law, medicine, care, education, science, family, religion, and journalism. Those are the fundamental societal systems constituting the structures of expectation that facilitate human interaction, whether in (2) interaction systems; meaning systems that continuously emerge and dissolve, such as for instance during a visit to the dentist or a series of tweets, or in (3) organization systems; the decision-making machines of society that determine certain courses of events which you cannot expect in exactly the same way in the rest of society. The focus of this handbook is business companies, i.e., organization systems with a primary reference to the economic system. However, the deliberations can be expanded to most types of organization systems. The analysis must then replace economy as the primary function with those primary functions that typify the organization in question.

The analytical lenses apply to

- The practice form in relation to a series of societal dimensions and transformative megatrends: Which challenge to social cohesion has fundamentally activated the form of practice?
- The basic perspective of the practice form: Is the practice form guided by the first-order perspective of reflexivity or by the second-order perspective of reflection?
- The practice form in relation to the transformation of the legitimizing paradigm: At which phase of the process is the form practiced, and on what grounds?
- The practice form as manifestation of a compulsory defense strategy: Which strategy is applied in order to defend the meaning boundaries of the organization?

Upon the introduction of the analytical lenses they are applied in an analysis of the transformation of the legitimizing paradigm that mediates the interrelation between the business community and the rest of society in regions characterized by full modernity.

Societal Megatrends and Practice Forms

The first part of the analysis implies an understanding of the practice form in relation to problems of social cohesion as introduced in ► Chap. 19, "Society's Megatrends and Business Legitimacy: Transformations of the Legitimizing Business Paradigm" Even if we may ultimately trace back problems to the functional differentiation of society, the adjustments of society mainly take place in organizations. The transformation of the legitimizing notions mediating the interrelation between the business community and the rest of society is part of a major transformation of society. Essential legitimizing forms of practice are embedded in the megatrends that fundamentally activated the problems, problems that challenge the legitimacy of an organization in their individual way, and which constitute different discursive issue arenas to a practice form.

The Insensitive Society: Between Planet, People, and Profit

Does the practice form address society's structural insensitivity to life and nature? *The insensitive society* develops practice forms that demonstrate considerations of life and nature such as balancing the triple bottom line of people, planet, and profit.

This megatrend constitutes an issue arena where the established society's positions are confronted with social movements and NGOs that see themselves as representatives of life and nature (Luhmann 1986) – such as Greenpeace, Doctors without Borders, and a long series of animal welfare organizations. With time, the function of the arena and consequently its character has changed and has consequently given rise to different legitimizing practices.

During the 1970s, 1980s, and early 1990s, the issue arena was dominated by enemy images and radical conflicts which gradually pushed the boundaries of then well-established legitimizing notions. Today, the arena is split into two symbiotic parts. One part continues to be characterized by conflicts. Protest-NGOs (Luhmann 1996) continue to irritate the established society and contribute to hold the new legitimizing business paradigm active in interplays with mass media and public opinion: Sensation, emotions, and conflicts between "the establishment" and the notion of civil society immediately catch on to the selection criteria of journalism (Luhmann 2000b). The climate of communication will often be violent, conflict-ridden, prejudiced, and characterized by sensations and emotions instead of by facts, knowledge, and reason (understood as insight into complexity). It unfolds at a far more tranquil level than formerly; however, it paradoxically contributes to generate trust and thus cohesion in society. You know that there are hunting dogs out there. They may bark a couple of times too many; however, they contribute to keep a constant irritation and self-examination alive. An organization's legitimacy is at constant risk of being questioned. The other part of the arena is characterized by constructive negotiations and partnerships between positions of the established society and NGOs that understand how to take advantage of the premises of society from a position representing society's environment.

The Decision Society: Between Risk and Danger

Does the practice form address skepticism towards an organization's premises of decision-making, based on the latent conflict between decision-maker and those potentially influenced by decisions without being involved in decision-making processes? The megatrend designated *the decision society* challenges the premises of an organization's decision-making processes and demands a practice that demonstrates responsibility of the decision-maker and at the same time makes the organization's decision-making responsive and transparent to those potentially influenced by the decision.

The legitimacy of decisions is constantly questioned by the perspective representing potential victims, increasingly organized in NGOs to build decision-making power and influence (Holmström 2005a). However, even though the asymmetry may reverse when the potential victim's perspective organizes and gains decision-making power in, e.g., NGOs, consumer organizations, etc., it grows illegitimate for a company to see and to present itself as a victim. To a company, it has grown into a constant challenge to be able to clarify, justify, and give reasons for its decisions to those potentially influenced by the decision – and to a certain extent involve the company's stakeholders in the decision-making, often represented by NGOs, patients associations, or consumer organizations. *Accountability* is wanted and *transparency* required, that is, access to or even participation in decision-making processes, often in the form of stakeholder engagement and NGO partnerships.

However, the issue arena constituted by this megatrend remains highly explosive. The victim's perspective is characterized by a feeling of powerlessness and fear and gains growing decision-making power by means of organizing the trump card: the moral of fear against which no reasoning can cope (Luhmann 1993). An interrelation can be moralized in black-and-white, prejudiced position as long as potential victims can be identified: the one with decision-making power versus the potential, principally powerless victim of the decision; David versus Goliath, the little man versus the establishment. These are circumstances that immediately link with the selection criteria of journalism and with the black-and-white meaning system of public opinion (Baecker 1996; Luhmann 1995b). From there skepticism, fear and worry spread in society and provoke crises of legitimacy. Crisis response strategies and crisis communication grow into part of a company's legitimizing repertoire.

Partnership Society: Between Independence and Interdependence

Does the practice form address co-operation across society's differentiated functional rationales – without neither reciprocal strains nor integration that would risk society's basic structures of expectation? *The partnership society* focuses on society's differentiation in functional systems and on the mutual interdependence between conflicting functional rationales. However, at the same time they are mutually interdependent on functioning independently on their own terms each with their specific function, knowledge, competences, and dynamics intact. This evolutionary megatrend activates practice forms that mirror decision-making processes in an increasingly polyphone diversity of different legitimizing functional rationales.

The social processes that reproduce this megatrend pass polycentered out of the public spotlight with constructive negotiations and stable cooperation. However, conflicts between the social dynamics are constantly lurking. If suspicion arises of strain on society's fundamental structures in the form of, e.g., corruption, bribery, or nepotism, public opinion and mass media are hyper-sensitive. The issue arena can explode in legitimacy scandals and widespread mistrust.

Governance Society: Between Public and Private Interests

Does the practice form address challenges of balancing particular interests with the idea of a common interest? The g*overnance society* focuses on the organization's active participation in endeavors of co-regulation via practice forms such as public affairs and governance networks and on the societal commitment of the organization (Buhmann 2017), often thematized CSR – "communication-based processes of coordination [. . .] formed by the need for decentered processes of mutual observation and coordination among social sub-centers [in a polycentered society] in which the stabilizing factor is not a central guiding body or social ideology," as Qvortrup (2003:4) observes.

Co-regulation implies that a company's decision-making processes become of common interest and have to be legitimized in the public perspective – the specific perspective that makes private matters public and obtains its legitimacy from thematizing what it observes as being of common interest (Baecker 1996; Habermas 1989). Conventional mass media and still more social media serve as platforms for the public perspective, the searchlight of which now constantly lurks. Are society's structures strained when organizations with a different primary function in society than the political function influence society's will and way? Are the basic principles of democracy threatened by particular interests? Organizations must be constantly prepared for random checks by the mass media. New functions as trust checkers rather than truth checkers are imposed upon mass media. They grow into hunting dogs rather than watchdogs: Do society's members comply with the more or less voluntary, more or less unwritten rules? Are they making their decisions within legitimate boundaries?

Trust Society: Between Responsiveness and Authenticity

Does the practice form address problems of stabilizing expectations? In *the trust society,* practice forms generate trust by establishing, adjusting, testing, and confirming expectations in constant interplays with dynamic and fragmented environments which apply different criteria in the evaluation of risks and advantages when choosing whether to trust the company. The company must continuously generate trust by means of a precise self-presentation of what can be expected from the company, based on a consistent and at the same time constantly changing self-observation.

Trust is based on polycontextual interplays between society's diverse positions, with distrust constantly lurking and mass media in a central role as trust checker and supplier of a steady stream of minor legitimacy crises. Because the trust checks by the mass media – conventional as well as social – take the form of random samples, they have a broad preventive effect. You never know where the searchlight strikes. Globalization extends this discursive arena and means global trust checks, i.e., checks of discrepancies between what a company says and does in different regions of the planet. Does the company live up to its promises? Is there a consistency between the company's self-presentation and self-observation?

Global Society: Between Conflicting Perceptions of Legitimacy

Does the practice form address problems of navigating in the global diversity of latent conflicts of legitimacy? *The global society* focuses on conflicts between the legitimizing notions originating from different types of society which demand practice forms that understand how to navigate the organization legitimately within the ambiguity of societal and cultural forms (Holmström et al. 2010).

This megatrend activates the need for balancing the company's generic native values with different, and even conflicting, generic values in still more societal contexts where the company's decision-making may have consequences. Since ideals of organizational legitimacy are closely interrelated with a given society's social and societal coordination processes, it follows that legitimizing business paradigms differ in different regions of the world. Moreover, globalization not only poses a general challenge for organizations navigating in a diversity of inherent conflicts of legitimacy. It also requires the ability to simultaneously relate to different and even conflicting perceptions of legitimacy in a globalized public space where local response is no longer locally confined.

Some forms of practice will focus on a specific megatrend; however, most practice forms will address challenges on a series of or on all societal megatrends and then unfold at different discursive arenas. This goes, for instance, for public relations because all societal megatrends have turned what was previously seen as *private* affairs in the *private* sector into issues of *publi*c interest. However, to contribute to productive public deliberations, distinctions between the basic problems being deliberated are required. For instance, when the megatrends of (1) decision society, (2) insensitive society, and (3) governance society respectively turn the dispositions of the private business sector into issues of public interest, then they require that public relations practice correspondingly understands how to (1) justify the organization's premises of decision-making as responsible to those potentially influenced by the decision; (2) demonstrate the organization's considerations of life and nature; and (3) prove the organization's respect of democracy's basic principles and legitimize the organization's influence on society's will and way.

Reflexivity or Reflection?

The second part of the analysis refers to the basic perspective guiding the practice form: Is it a first-order *reflexive* perspective or a second-order *reflective* perspective? The distinction between *reflexivity* and *reflection* is crucial because we, in the vast empirical complexity of legitimizing notions and practices emerging in the late twentieth century, can identify a business paradigm with reflection as the fundamental formula for legitimacy (Holmström 1997, 1998, 2002, 2004, 2005b, 2010, and 2018). In order for a practice form to meet the challenges of balancing former conflicting interests as mutual preconditions on the different megatrends requires the specific second-order perspective of reflection.

Although the words reflexive and reflective resemble one another, they imply very different legitimizing notions and practice forms. Reflexive refers to reflex: the perspective is blind, automatic. Reflective rather refers to exactly being "reflective," being engaged in reflection. The notion of reflection is often used as a kind of fluid designator for deliberations or afterthought; however, based on a focus on society and organizations as constituted by sense-making social processes mediated by specific social filters, reflection can be defined as a particular socio-techno rationale mechanism, and an analytical frame of reference can be constructed to determine whether an empirical practice form is grounded in a first-order reflexive or a second-order reflective perspective.

An organization's understanding of itself and its environment is founded in a social filter, a social system. However, an organization can apply its social filter in two ways: Reflexively, blindly – without seeing that it is the social filter that makes it understand the world, itself and its role in society. Or it can apply its social filter reflectively, "enlightened," by raising its perspective to a second-order observation and observe the way it observes – so to speak see itself as if from above. "As if" implies that no organization can see itself from a position above or outside itself; however – instead of taking its worldview, its role and its responsibility blindly for granted – it can see that it interprets the world, itself, and its role in society through this special filter and turn attentive to the premises of its observations.

In the basic first-order self-reference of reflexivity, an organization makes its decisions from premises that it realizes as obvious and automatically legitimate. It creates a tunnel vision which conflicts blindly and negligently with different ways of seeing and interpreting the world. However, when the organization raises its perspective to a second-order observation of the premises of the observation, it sees these premises as *contingent*, i.e., as results of choices that could have been made differently. It opens up to change and flexibility. It is this observation of own observation that social systems theory designates "reflection" (cf. Baraldi et al. 1999:128), and which has inspired to identify reflection as the core of the new legitimizing business paradigm. "This higher layer of control is attained by social systems' orienting themselves to themselves – to themselves as different from their environments" (Luhmann 1995a:455). Consequently, reflection is the production of self-understanding in relation to the environment. So, where the reflexive organization is inattentive to the broader context and consequently to the unintended, however often far-reaching side-effects involved in its decision-making, the reflective level of observation enables the organization to understand itself in a larger interdependent societal context and to develop self-restrictions and balancing mechanisms in its premises and processes of decision-making.

An empirical example is European dairy co-operative Arla Foods which in 2003 found itself engulfed in a major legitimacy crisis. At that time, Arla Foods was a recent result of mergers between Danish and Swedish co-operatives and was narrowly oriented towards international market expansion. In Denmark, Arla Foods was criticized for this narrow market focus, and for showing no consideration for the rest of society. At first, Arla Foods was uncomprehending. From its first-order reflexive perspective, the company could not see that economic success no longer automatically guaranteed legitimacy. The co-operative was guided by a "cowboy mentality" where the objective – international expansion – justified the means, and did not at its disposal have social lenses that made it sensitive to almost anything else but the market and the objective of good prices on milk for its owners, the dairy farmers. The organization was blind to any justification of the environment's demands (and to a certain extent to the environment) until the lengthy legitimacy crisis motivated the organization to raise its perspective to reflection and made it turn the critical perspective inwards. A negative legitimacy spiral made Arla Foods observe that “no matter what we did, then it was wrong” (Nielsen 2007), and gradually activated communication on communication, decision-making on decision-making – i.e., a second-order reflective perspective. After several years of learning processes, today Arla Foods engages in for instance public health and programs for improving conditions for dairy farmers in developing countries. The co-operative integrates considerations of life, nature, and society in its decision-making premises, encapsulated in the motto of “Good Growth” – “principles of healthy, natural, responsible and cooperative growth that help us to focus on the market opportunities with the greatest potential while caring about how we grow” (Arla Foods 2018).

Reflection does not change the fact that in order for an organization to observe the world – i.e., to exist – it has to take itself as a social filter as its point of departure. No organization can observe from a position outside itself. Reflection is not a way of avoiding blind spots, rather a way of acknowledging blind spots: not a way of breaking down meaning boundaries – but of handling them. From the second-order perspective, Arla Foods still sees the market as its primary environment even though the co-operative integrates the societal horizon in its decision-making premises. Arla Foods does not confuse itself with a political, humanitarian, or public organization even though Arla Foods engages in society, acknowledges human rights, and mirrors itself in public opinion.

Reflection on Three Dimensions of Organizational Practice

Observing an organization as a self-referentially closed system enables the identification of legitimizing practices on three fundamental dimensions of organizational practice: Self-observation, other-observation (construction and observation of environment), and self-presentation.

Self-Observation

Self-observation is about the organization’s understanding of itself, its role and responsibility in society, and consequently about the premises of decision-making processes: How is the organization closed? It is the decisive dimension which ultimately defines even other-observation and self-presentation.

In reflexivity, the organization takes itself and its way of seeing the world for natural, takes its social filter for granted. Premises of decisions are seen as resting in natural social norms, and as automatically socially responsible. In reflection, in contrast, the contingency of decision-making premises is acknowledged and the responsibility of being decision-maker is explicitly assumed. The organization continuously questions its role, identity, and responsibility in stakeholder-oriented processes. The “whys” are continuously debated instead of the “whats” of reflexivity.

In reflexivity, decision-making processes tend to be blindly and mono-contextually mediated by one primary functional reference. In reflexive business companies, the economic rationale is undisputed trump. In contrast, in reflection, although the economic rationale has to remain ultimate trump for decision-making processes to prove legitimate in a business enterprise, polycontextual sensitivity is integrated. Business companies endeavor to balance financial growth with social responsibility, short-term gains with long-term profitability, and shareholder return with other stakeholder interests – basically to strengthen their boundaries and decision-making processes (cf. also Valentinov et al. 2018).

However, an organization's self-observation is difficult to access as object of analysis – unless you are included in the organization for instance as employee or by other means can access the communicative processes constituting the organization. To some extent, the way the organization is organized indicates whether the self-observation is based on first-order reflexivity or second-order reflection. Are the specific legitimizing functions – such as public relations, strategic communication, public affairs, stakeholder engagement, and CSR – represented within top management? A prerequisite for a second-order reflective practice is that practice is organized in a way that ensures a narrow interplay between the three dimensions of self-observation, other-observation, and self-presentation. The reflective self-observation emphasizes the other-observation in order for the self-observation to continuously adjust its self-restrictions and balancing mechanisms in relation to its environment, and weights a self-presentation explicitly based on the self-observation in order to create stable and sustainable expectations.

Empirically, we can observe how the first-order reflexive organization delimits its practices of public relations, corporate communication, social engagement, CSR, etc. in departments without representation in top management; whereas, the second-order reflective top-management is responsive to a broad and diverse environment and integrates societal commitment in the core decision-making processes of the organization. Again, taking Arla Foods as an example, before the legitimacy crises which in the mid-2000s motivated the organization to raise its perspective to the second-order observation of reflection, communication departments were decoupled top-management and used only for enabling decisions already having been made, whereas later, corporate communication functioned as a staff function in close interplay with top management and contributed to constitute decision-making.

Other-Observation

The *other-observation* is about an organization's understanding of its environment: How is the organization open? To any organization, the environment will always remain a reconstruction: "As environment counts only what can be reconstructed within the organization" (Luhmann 2000a:162). However, what can be reconstructed as environment within the organization will differ decisively in a reflexive and a reflective perspective, respectively.

In reflexivity, the perspective is self-centered from within, and the reflexive organization sees only its inherent environment which to business is the markets of investment, employment, and consumption. The organization mirrors itself in itself, as a reflex. In reflection, the organization still mirrors itself in itself – it can do nothing else. However, the organization now mirrors itself as if from above, in the socio-diversity, and sees a larger and more complex environment as relevant. Linear stakeholder models are replaced by increasingly dynamic models. The organization no longer sees itself as the center, but as one of several interacting social perspectives. So, where the reflexive organization tends to see an environment to be managed, the reflective organization sees an environment to be respected.

As any other social system, an organization can observe only what makes sense within the organization. It depends not on the complexity of the world but on the complexity of the organization. The more complex the organization is, the better is it geared to realize and relate to a turbulent environment. Consequently, an organization's reconstruction of the environment helps us observe an organization's self-observation to which we otherwise have no immediate access. Danish healthcare company Novo Nordisk's changing stakeholder models (Fig. 1) illustrate the changes in companies' reconstruction of their environment: From the first-order reflexive models of the late twentieth century to the reflective models of the twenty-first century. In the stockholder model of the 1970s, the company sees only strict economic and conventional legal relations. In the 1980s and 1990s, a growing series of stakeholders appear. However, the company still sees itself as the center from a first-order reflexive self-observation. In contrast, in the reconstruction of the environment appearing around the millennium indicates a radical change of perspective: the company now sees itself as one among many different positions in polycontextual interplays – the result of a second-order reflective self-observation (Fig. 1).

Self-Presentation

Self-presentation is about an organization's more or less intentional way of presenting itself. The organization facilitates the observation by the environment and influences patterns of expectations. The dimension is pivotal to the generation of legitimacy because legitimacy is based not on the essence or being of an organization but on observations and interpretations by the environment.

The reflexive organization is characterized by blind self-presentation from within. It does not see conflicts, or try to silence them; it believes that they can be dissolved by information. The reflective organization, in contrast, is sensitive to social diversity, sees the potential of conflicts, exposes their background, and facilitates exchange of views. Conflicts are systematically identified in order to increase the dynamics of partnerships and multi-stakeholder dialogues and the sustainability of problem-solving.

The reflexive organization relies on automatic legitimacy and consequently passive confidence with the environment; whereas the reflective organization sees that it has to actively earn legitimacy in order to generate trust. When legitimacy cannot be justified in naturalness or necessity, then consistent but sensitive and consequently constantly changing self-presentation is required in order to signal what is to be expected from the organization.

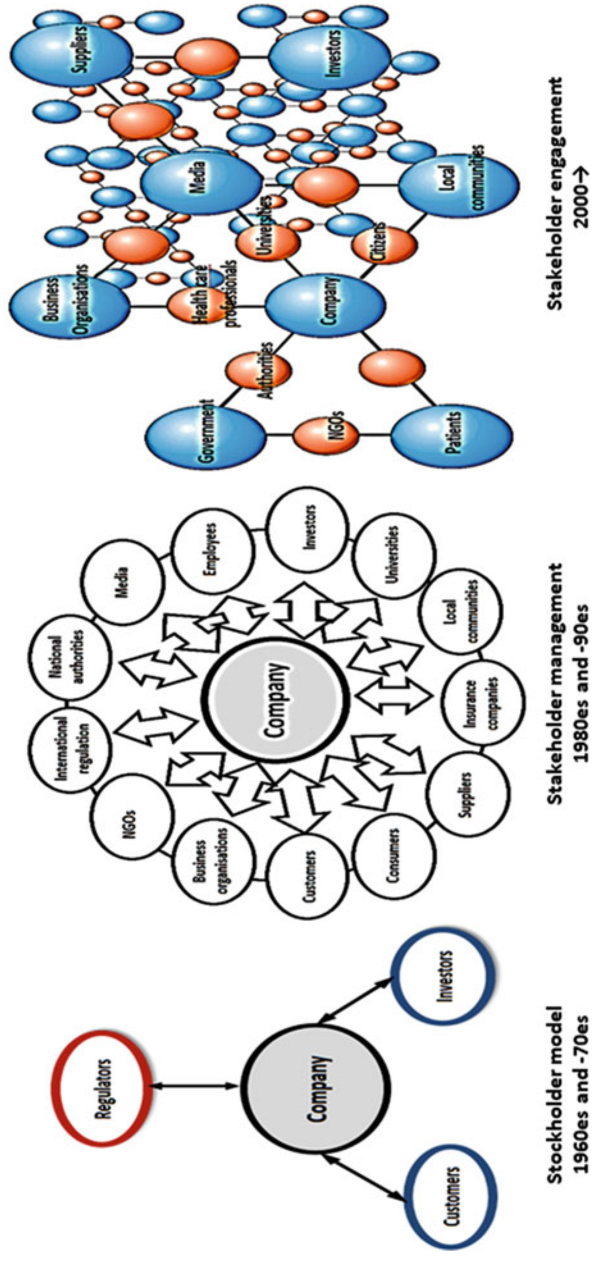

Fig. 1 Changing stakeholder models of Danish healthcare company Novo Nordisk. (Source: Novo Nordisk)

To a great extent, we have to depend on the self-presentation when we try to identify an organization's self-observation and other-observation – not only at websites, in annual reporting, interviews, etc. where text analyses may contribute to reveal the self-observation but also in other organizational manifestations, from the atmosphere in the reception to the CO_2 footprints of its packaging, and its activities: Is the organization non-committal brand sponsor or does it engage actively, for instance, in campaigns in anything from public health to global climate?

Table 1 illustrates how the first-order perspective of reflexivity and the second-order perspective of reflection respectively imply decisive differences on a series of parameters in an organization.

Evolutionary Processes

Third part of the analytical lenses is to understand the practice form as part of a particular evolutionary dynamics. Taking as the basic framework an understanding of society and organizations as self-referential sense-making social systems, the series of analytical lenses is constructed in order to observe legitimizing practice forms as part of society's endeavors to continue itself. It implies that the normativity of this approach as its benchmark takes the continuation of communicative processes. Evolutionary dynamics are driven only by the compulsion of communicative processes to continue themselves. This approach turns traditional notions of systems upside down – in relation to machine metaphors as well as to teleorationale thinking or to legitimizing or functionalist ideologies. Systems rationality is about establishing and stabilizing structures of expectation in an otherwise infinite, immense world by reducing complexity and thus rendering probable communication and facilitating human interaction.

Legitimizing notions are continuously changing in evolutionary processes, however subject to a high degree of inertia. Luhmann bases evolution on three consecutive mechanisms: (1) suggested *variation* of stabilized structures from previous evolutions; (2) *selection* of variation and *retention*, upon which follows (3) *stabilization* provided that the selected variation can be integrated into the system's structural characteristics – from where a new transformations process at some point will take its start (Luhmann 2012, ch. III). Correspondingly, in analyses of the transformation processes since the late 1960s, a series of phases with individual legitimizing practice forms are identified (Holmström 2002, 2005b, 2008, 2018). The empirical course illustrates how a first-order reflexive legitimizing paradigm is challenged and gradually transformed in successive phases, and how forms of legitimacy and reasons for legitimization change with these phases. A new legitimizing paradigm emerges with the second-order perspective of reflection as the mainstay ideal.

An increasing number of critical positions activate a successive series of defense mechanisms in society, which seem to follow a specific evolutionary pattern (cf. Table 2). Point of departure is (1) a *reflexive* paradigm, stabilized from former transformations in a conventional phase. (2) The conventional paradigm is

Table 1 Reflexivity versus reflection on the parameters of the way an organization understand itself, constructs the environment, and handles interrelations

Reflexivity	> <	Reflection
Self-observation (self-understanding)		
Decision-making premises seen as natural, necessary, and automatically legitimate	> <	Decision-making premises seen as contingent and subject to continuous adjustment
Conflicts blindly with different worldviews (even though an ideal of harmony prevails, socio-diversity is not seen)	> <	Thematizes its responsibility and role in continuous interplays with environment
Monophonic functional rationale the uncontested trump in decision-making processes from blind self-interest	> <	Polyphonic sensitivity; enlightened self-interest
Passes responsibility for decision-making premises on to society's well-established norms	> <	Acknowledges responsibility as decision maker and considers those potentially influenced by decisions
Takes the environment's confidence for granted	> <	Sees that the condition of trust is to relate reflectively to the expectations of the environment
Closed decision-making processes on autopilot	> <	Involves stakeholders in decision-making
Other-observation (construction of the environment)		
Does not distinguish between the environment as it is observed and as it is	> <	Sees how the environment is constructed via social filters
Sees a native environment only (shareholders and an unambiguous market for business companies) plus authorities/regulators	> <	Sees beyond its native environment (stakeholders, poly-contextual markets, the idea of society as a shared horizon)
Mono-contextual, narrow, self-centered perspective from within; reconstructs the environment in its own image	> <	Poly-contextual worldview; sees itself as if from outside in the conditions of socio-diversity; tries to see the world through different social filters
Does not see the consequences of decisions in the larger perspective	> <	Extensive sensitivity to consequences of decision making for those influenced by decisions
Society divided into black-and-white perspectives; prejudiced and frozen positions; "we decision-makers who make society work" versus "irresponsible anarchists"	> <	Understands socio-diversity; inquires into the social filters of stakeholders
The environment is managed	> <	The environment is respected
Self-presentation (for the observation from outside)		
Blind, enclosed self-presentation from an idea of socio-uniformity	> <	Open, adaptable self-presentation sensitive to different worldviews from an idea of socio-diversity
Relates to a native environment (markets for business companies)	> <	Commits itself in relation to a wide array of stakeholders from the idea of society as a shared horizon

(continued)

Table 1 (continued)

Reflexivity	> <	Reflection
Tries to dissolve conflict through information: "If they only knew us they would understand us"	> <	Sees the inevitability of conflicts, clarifies their background, and facilitates exchange of views
Weak or no intentional synthesis between self-understanding and self-presentation (window-dressing, white-washing, green-washing)	> <	Precise, continuous, and consistent signals about what to expect from the organizations
Presents itself as victim in crises of legitimacy	> <	Presents itself as responsible decision maker

challenged with ideas of variation which are at first met with rejection and counter-action in a counter-active phase. (3) Gradually, as the challenges do not stop, we see a selection of variation in a transition phase. (4) This selection is followed by a diffusion of the new variations in a best practice phase, and (5) finally by stabilization in a *reflective* paradigm in a new conventional phase.

Each phase is characterized by a particular reason – types of reasons which we correspondingly find in neo-institutionalism (for an overview cf. Suchman 1995), which, however, does not offer consistent explanatory power for understanding neither transformative processes nor the interrelation between organizations and society-at-large.

Despite grey zones, exceptions, and dislocations in time, general transformative processes of ideals in the business community can be identified, from first- to second-order perspectives, from reflexivity to reflection through changing practices with different forms and reasons since the late 1960s, first activated by the strains of modernization, then intensified by globalization's problems of regulation across national boundaries since the 1990s. Far from all, business companies have experienced the entire process. So have in particular companies that at an early phase have been exposed to the pressure from a turbulent environment. Other companies have not had their wake-up call until at a later date. They tend to pass through faster and more superficial learning processes and have not in quite the same way had to turn the critical look inside, to reflect, and to negotiate; however, have seen what has worked for other companies. The rest of the field follows the role models and has to a large degree adapted the new legitimizing notions and practice forms as they have diffused in what has grown into more or less indisputable norms and best practices in the process of transformation.

The evolution of a new legitimizing paradigm is a long process which proceeds chronologically displaced partly in different societal types, partly in different trades, partly in different types of companies – and even in different parts of an organization. Furthermore, smaller and more condensed processes of transformation continue to take place.

In the analysis of a practice form, the evolutionary lenses therefore ask: Which phase in the process of transformation has activated the practice form? Which reason

Table 2 Changing phases and reasons during the transformation of legitimizing paradigm

Evolutionary phase	Type of legitimacy	Realization	Reason	Empirical phase	Approx. time
Stabilized ↓	Cognitive	Legitimizing paradigm = reality	"Because that is the way it is"	1. *Conventional*: Reflexive paradigm seen as natural and necessary by business community	–1980
Variation suggested ↓	Pragmatic/ regulative	Legitimizing paradigm challenged and defended	"Because we have to"	2. *Counter-active*: Defense of reflexive paradigm	1980–1995
Selection ↓	Normative: Moral/ ethical Practical	Legitimizing paradigm negotiated and transformed	"Because we should" "Because it is practical"	3. *Transition*: Level of observation raises to second order, reflection; facilitates experiments, dialogue and change	1995–2005
Retention ↓	Normative: Isomorf/ mimetic	New legitimizing paradigm diffused	"Because that is the way you do"	4. *Best practice*: Reflective paradigm diffuses as routines, models, standards	2005–2015
Stabilized	Cognitive	New legitimizing paradigm = reality	"Because that is the way it is"	5. *Neo-conventional*: Reflective paradigm taken for granted	2015–

can be identitied for a legitimizing practice form? Is the legitimizing reference convention, naturalness, rules, necessity, moral, ethical or practical norms, or role models?

Defense Strategies as Resonance to a Critical Environment

The fourth and final analytical lens relates to the type of strategy from which the legitimizing practice form originates. Strategy in this frame of reference does not necessarily imply any intention; rather, they are compulsory defense strategies that are automatically activated when social systems see their basic legitimizing notions and consequently meaning boundaries as threatened. They are strategies that may manifest as intentional strategies which a company chooses to apply. The point is that at the root of these visible, intentional strategies, compulsory strategies as integral part of social dynamics can be identified.

When a company is observed as a social system, it is defined neither by employees, offices, factory building, or services – but by meaning, i.e., sense, ways of interpreting the world. What makes sense within a company does not make exactly the same sense outside the company. It stabilizes structures of expectation and facilitates decision-making. Consequently, the boundaries of meaning are decisive to the existence of any organization, and consequently a company will compulsorily defend itself against observations from the environment that are seen as threats to the boundaries. Accordingly, practice forms in response to the challenging environment are analyzed not as *intentional* acts but as part of self-organizing social dynamics. Their inherent urge is to protect their constitutive meaning boundaries. Just as society would deteriorate if the communicative processes slowed down, organizations depend on strong and dynamic communications in the form of decision-making processes: "Consequently, the maintenance and improvement of the competence of deciding (instead of rationality) become the actual criteria of effective organizations" (Luhmann 2000a:181).

During the evolutionary transformation process, a company is faced with changing challenges from a turbulent environment which together with the changing reasons for legitimization and the transformation of the legitimizing paradigm result in changing defense strategies. Some strategies will predominantly follow from a reflexive perspective, others from a reflective perspective – however, more interesting is it how a defense strategy will lead to different practice forms according to the level of observation. For instance, blindness as a compulsory defense strategy can never be avoided. If you see everything you will see nothing. However, a reflective organization will be able to be less blind than will a reflexive.

- *Blindness* is the prevailing compulsory defense strategy. The organization does not have lenses that make it possible to even observe the critical environment. It does not make any sense to the organization.
- *Negligence* implies that the critical environment is compulsorily marginalized as irrelevant and even illegitimate noise – as "anti-commercial forces," "revolver journalism," or "untimely intrusion."
- *Reduction* implies that the turbulent, unmanageable environment upon which the organization to some extent relies on for legitimacy is reconstructed into an environment that makes sense within the organization. The most inherently legitimate reduction to the business community is to turn environment into markets: A critical population is turned into "political consumer." The environment is reduced according to economic selection criteria into a language that the business community immediately understands, and into problems that business companies can relate to without starting to doubt their justification and the legitimacy of their decision-making premises, thus risking their boundaries.
- *Camouflage of contingency* implies that when the boundary setting observed as contingent by the environment – for instance when the legitimacy of prioritizing economic success to considerations of life and nature is questioned – in order to avoid a focus on the decision-making premises of the organization, the issue is

overlaýed with different themes, such as for instance making it a question of an ignorant population or prejudiced journalism.

- *Secrecy* implies that the organization hides what goes on inside the organization to avoid public searchlight and questioning of the legitimacy of its decision-making premises.
- *Hypocrisy* implies that an organization pretends to acknowledge the perspective of the critical environment and accepts to discuss an issue – while the organization has no intention of doing so, but continues to observe its decision-making premises as indisputably legitimate, as necessary. The self-presentation is not rooted in the self-observation. Empirically, hypocrisy is often denoted as "window-dressing," "white-washing," "green-washing," "blue-washing," about the blue UN color for UNs Global Compact, and more recently "SDG-washing" in relation to UNs sustainable development goals for 2030.
- *Necessitation* is a dominating defense strategy in response to challenges by a critical environment. The organization presents its boundary setting and the legitimacy of its decision-making premises not as contingent (i.e., as a question of choice) but as necessary. The organization intends to make the environment understand – not to understand the environment.
- *Self-victimization* implies that the organization sees itself as an innocent victim of criticism and presents its decision-making not as a question of own responsibility but of society's well-established structures: "It is not down to us."
- *Surrender* is a risky defense strategy. The organization renounces its decision-making premises and imitates those of the critical environment. Ultimately it will imply the destruction of an organization's meaning boundaries and consequently the dissolution of the organization.
- *Mirroring* means that an organization mirrors itself in the critical environment and to some extent adapts its worldviews indiscriminately. It will take different forms whether the mirroring is only part of the intended self-presentation or whether the self-observation proper endeavors to mirror itself in conflicting rationales.
- *Dialogue* implies that an organization acknowledges its decision-making premises as contingent, i.e., is ready to debate and open to adjust its meaning boundaries and the legitimacy of its decision-making premises in negotiations with representatives of a critical environment. The concept of "dialogue" has often been idealized as "symmetrical communication," and although the symmetry is disputable (Holmström 1997, 1998), dialogue demands mutual openness, sincerity, and adaptability by the parties involved. Dialogue is a risky defense strategy because it presupposes that an organization stakes its meaning boundaries, i.e., identity and decision-making premises, ultimately its existence.
- *Anticipation* means monitoring the critical environment in order to anticipate a potential critical issue and thus dismantle the risk of a legitimacy crisis. The practice of issues management may correspondingly be understood as part of this defense strategy. It implies systematic monitoring and analyses of the environment and of the public perspective to detect and understand changes in the societal agenda and develop proactive strategies to potential legitimacy crises.

- *Preparedness* implies a continuous production of "publicly defendable" information and crisis response.
- *Self-irritation* implies that the organization installs a critical internal environment for instance via stakeholder departments, internal NGOs, and corporate journalism. The perspective of various stakeholders, NGOs, and journalism is activated internally to secure continuous irritation within an organization in order to continuously renew decision-making premises, increase complexity, and in this way strengthen meaning boundaries.
- *Integration* means that the company has integrated the perspectives of the critical environment in its own decision-making premises – again: to the extent it is possible within the organization's boundaries.
- *Neutralization* is to some extent a result of several other defense strategies. Organizations are compelled to attempt to absorb and neutralize criticism by the environment, to the extent it can at all be observed and make sense within an organization. In this way, the irritating power of the critical environment is neutralized. Empirical analyses show societal learning processes during the latter half of the twentieth century where the perspectives of public, fear, moral, and protest are gradually absorbed and transformed into a new range of legitimizing structures consistent with the programs of functional systems, such as ethical codes, sustainability certification, and social reporting guidelines (cf. also Krohn 1999; Alexander and Blum 2016).
- *Ceremony* and *symbolism* are relief strategies. Response to a highly complex environment is reduced into simple rituals.
- *Routinization* relieves the pressure of the realization of the contingency of legitimizing notions and the continuous self-questioning resulting from a second-order reflective perspective. The turbulence and the criticism are forgotten, but the organization has learned legitimizing routines as response – without remembering the complex contest which originally activated the resonance. The ideals of reflection are turned into reflexive routines.

Presumably, with social systems theory as the frame of reference, it will be possible to identify more compulsory defense strategies as the fundamental driving forces behind the immediately visible legitimizing forms of practice. The present intention is not a thorough analysis but to illustrate how the compulsory forces of social processes contribute to determine legitimizing practice forms and legitimizing notions within an organization. It sharpens the focus of the social forces within which human interaction is embedded – for better or for worse. This does not mean absolute determinism, and that individuals cannot make a difference, but that certain inertia is integrated within any organization. You cannot change an organization without taking the organizational structures as starting point.

It will be shown how these legitimizing strategies change over time, partly to illustrate how we can distinguish between various compulsory defense strategies in a social systems theoretical approach and partly to illustrate how the legitimizing strategies seem to follow the particular evolutionary pattern introduced above – although we may find all strategies active even today if we analyze the empirical situation in various trades, in organizations with different cultures and histories, and in various countries.

Practice Forms over Phases

By bringing the four analytical lenses into a context in an analysis of the transformation of the legitimizing business paradigm during the past 50 years (Fig. 2), it will be demonstrated how practice forms change their compulsory function, perspective, reason, and defense strategy. The periods identified below for the phases are indicative only; partly because the phases overlap, partly because the process is chronorationally dislocated in different types of organizations and trades and in the different regions of the world. Furthermore, in a larger legitimacy crisis for an organization today, to some extent we can identify corresponding phases – although at a far smaller and more condensed scale. Thus, the transformation process identified below is not only of historical interest. Via the analysis, we gain insight into the anatomy of contemporary legitimization processes and insight into the specific situation of the overall transformation process in modern society today with the potential of better addressing current problems. Empirical object of analysis is the changing legitimizing notions around and within the business communities in particular in north-western European countries. More than any, they are characterized by modernity. The specific focus is Denmark, a country which – in spite of being a monarchy – can be characterized as one of modernity's pioneers with full functional differentiation, indicated for instance by a high sensibility to corruption, a strong focus on freedom of expression and public debates, and by primary societal values related to functional rationales instead of ethnic or cultural hierarchies and family relations.

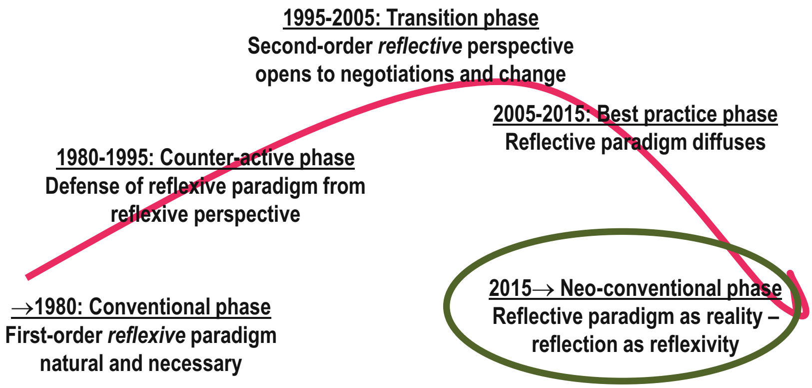

Fig. 2 The process of transformation of a legitimizing business paradigm

Conventional Phase: Blind Innocence (Approx. 1968–1980)

Towards the late twentieth century, in regions characterized by full modernity, modernity's unintended strains on human beings and nature reach a critical mass. Society's fundamental construction is put at trial. However, you cannot address society's basic building stones, the functional systems. Instead, society's turbulence strikes in society's decision machines, organizations of any kind (Luhmann 2012 ch. 4, XIV; 2000a:412f). Everything from universities to nuclear families is being picked on. However, a specific focus is on the strains by the economic rationale on life and nature and on society's other rationales, and on its dominance in business companies with profit maximization as their absolute criterion of success. Former legitimizing notions about unproblematized prosperity and blind growth threaten society's cohesion. They are rendered visible, are problematized, debated, and gradually contested by new legitimizing notions.

In this *conventional* phase, a first-order reflexive business paradigm with particular notions of legitimacy developed and stabilized in previous evolutions and solidified in taken-for-granted-ness is challenged. The prevailing self-observation in the business community is that the societal responsibility of a business company is to secure profits because it creates products and jobs and is the economic base of society; that the only variable in the company's objectives is profits, i.e., that the programs of the economic functional system take undisputed primacy in the decision-making premises of a business company.

At this phase, the legitimizing paradigm is still cognitively embedded within the business community: "Of course we are legimate and socially responsible as long as we secure profits – because that is the way it is." Companies operate quietly, innocently, and self-sufficiently in their self-legitimizing bubbles. Conventional practice forms are advertising, i.e., market relations and lobbyism to minimize increasing legislation. When it minds its own business and abides by law, the company takes its legitimacy for granted.

Blindness and *negligence* become the prevailing compulsory defense mechanisms against the new critical environment. With the growing focus on the strains of the economic system on society, nature, and human beings, the decision-making premises of the business community are increasingly seen as relevant to the rest of society and made subject to public searchlight. Major dailies gradually develop business sections. In 1975, a business journalist describes the relation with the business community as characterized by "many confrontations over what business companies often perceive as 'untimely intrusion'. Often, it takes surprisingly little before representatives of the business community apply strong words such as sensation hunt, revolver journalism and bias" (Rieks 1975). From the conventional worldview of the business community, the public perspective is not relevant. It is marginalized as noise.

Another defense strategy at this early phase of the transformation process is *camouflage of contingency*. Instead of seeing criticism as being about the nature of the company's decision-making premises – i.e., that they are not given by nature but subject to choice and consequently could be different – the business community interprets the criticism for instance as being a question of the political system's urge for control and regulation; journalism's disposition to sensation; or the ignorance of the population. In the cognitive mode of this phase, the strategy is not intended and deliberate but a compulsory reconstruction of the environmental complexity from the lenses then available to the business community. As reasons guiding the compulsory defense strategies shift, intentional strategies change their character. The conventional phase's compulsory strategy of camouflaging the boundary will in the next, counter-active phase take the form of an intended, deliberate strategy. It grows common practice for the then new public relations professionals to try to turn public focus away from themes that are critical towards the company, and to do so by outbidding with different themes for the public perspective – most often represented by journalistic news media – to focus on instead.

Counter-Active Phase: Defense and Image of the Enemy (Approx. 1980–1995)

In the 1970s, pressure on the business community increases. Management thinker Peter Drucker describes the situation: "The lack of appreciation of the business community has triggered a setting within which business companies may not survive" (Parkinson and Rowe 1979:9). The threat to the existence gradually activates a change, motivated by the growing mutual interdependence and consequently mutual sensitivity between the different sectors of society. The criticism from still more protest movements and green activists organizing as NGOs effectively influences public opinion and spreads to sectors of society upon which the business community grows increasingly dependant. It affects the economy as well as autonomy of the business community negatively. So, by circuitous routes, the critical environment gradually wins resonance within the business community.

Instead of letting "the currents drift where politicians and public opinion will take them" (Parkinson and Rowe 1979:33), the business community now tries to influence the development in order to "achieve appreciation for the company and its societal importance" (DPRK 1982). The reason for the legitimizing practice is that a company has to defend itself, in particular for the sake of reputation and trust in order to secure resources and autonomy. It continues to be an unproblematized self-observation that honoring narrow economic criteria of success automatically equals social responsibility and consequently legitimacy. New practice forms spread in defense of status quo, in defense of the conventional paradigm – for instance, public relations, issues management, and increasingly complex stakeholder models, based on a series of counter-active defense strategies: *Reduction, camouflage, secrecy, hypocrisy,* and *self-victimization*. The latter defense strategy implies that the company sees and presents itself as an innocent victim – a strategy which in later phases of the transformation process is outdated and replaced by a pronounced responsible position as competent and dynamic decision-maker. The new environmental complexity is reduced and reconstructed as "anticommercial forces" (Dolleris 1988), "pressure groups" (White 1991:8), "a hostile press" (Christensen et al. 1982:11–12), and "restrictive law" (Parkinson and Rowe 1979:33).

The most remarkable feature of the counter-active phase in the 1980s and 1990s is the defense strategy of *necessitation*, meaning that the business community with all means seeks to achieve appreciation of the conventional legitimizing paradigm characterized by the first-order worldview of reflexivity, first and foremost by arguing for the paradigm as necessary – as necessary in opposition to contingent, i.e., not subject for discussion, but also as necessary for society's well-being by creating jobs and products and serving as the economic base of society's welfare. When public relations spreads as an organizational activity, practice describes itself as "a continuous and systematic management function through which companies, private and public organizations and institutions seek to achieve appreciation and support within those parts of the public with whom they have or will be in contact" (DPRK 1982).

Public relations are to a great extent reduced to press relations. Correspondingly, the business community increasingly courts the selection criteria of the news media with pseudo events – "events that from the start are produced for triggering publicity and which would not take place if mass media did not exist" (Luhmann 1997:862). Observation schemes from the journalistic functional system are brought into business companies by hiring journalists. The production of press releases steadily rises. As the Danish state committee on media concludes in 1993, "increasingly, a layer of public relations people and information employees, many with a journalistic background, are added to companies' communication with their environment. Actors plan actions and declarations based on an awareness of the potential attention of the media" (Hjarvard 1995:21f).

As a reductive defense strategy, stakeholder models (e.g., Donaldson and Preston 1995; Pesqueux and Damak-Ayadi 2005) reconstruct the public sphere and the chaotic, complex, indefinable environment with the company as the center, a segmentation of the world from the company's worldview in order that it makes sense within the company. It is seen as "strongly controversial" when Danish academics in business economy in 1982 introduce a stakeholder model that includes more and different groups than the business community sees as relevant in a conventional paradigm, i.e., not just "owners of capital, employees, suppliers, consumers, municipal councils, parliament, public authorities," but also "mass media, pressure groups, professional organizations" (Christensen et al. 1982). And even though the arrows between stakeholders and company point in both directions in stakeholder models of the time (cf. Fig. 2) – then the widespread use of the concept of stakeholder *management* rather indicates a one-way approach, the idea that a company can "manage" its environment based on thorough research and planning. The attitude is evident from an article in the journal of the Danish Marketing Association in 1984 "Stakeholders: how do we make them love us? The fact is of course that stakeholders must be nursed according to *the role they play to the companies.* They can all be made to contribute *to the objective of the company* to a much larger degree if the company via a deliberate identification of their different needs and wishes plans and implements activities group by group. I contend that they, group by group, can be made conscious of their own role as active and interested co-players *on the field chosen by the company*" (Ranning 1984, my emphases).

Another practice as part of the attempt of gaining control of the turbulent environment is *issues management* (Heath 1990), manifesting the defense strategy of *anticipation*. It emerges as a concept and a model in 1973 in connection with the American tobacco industry's attempt to fight the then budding deligitimization of cigarettes (Pratt 2001); however, this does not spread until the end of the 1980s and in the 1990s. Issues management implies that a company continuously monitors its environment for potential legitimacy conflicts in order to react before they develop into crises. It is the hunt for problems before they arise, "a method to systematize the area in order that a company's managers can work within well-known structures" (Dolleris 1988). In this way, issues management turn "strange" themes into well-known themes, the environment is made "manageable," and decision-making processes are relieved.

In order to disarm the critical environment, issues management in its first-order, reflexive approach tries to influence public opinion and politics and to soften the pressure of "activists" before it leads to legal regulation or other sanctions. Legitimizing practices extend from "factual" information campaigns to throwing suspicion on opponents. It is not a question of listening to the critical environment, not a question of changing the company's own decision-making premises and processes. In contrast, later in the learning processes, a second-order, reflective form of issues management is a tool for companies to challenge their self-observation, i.e., to turn the criticism inwards for self-examination and take corrective measures not only because a company at an early phase has more options but also because issues monitoring can increase a company's sensitivity to changes in the environment and thus the company's complexity and adaptability.

Focus on Self-Presentation

At this counter-active phase, the self-presentation is weighted rather than the self-observation and other-observation. The self-observation is not problematized. The organization believes it possible to neutralize a conflict by information. The period is characterized by a large number of information campaigns – for "if only they knew us they would appreciate us." The environment has to change its views, the company does not, and public interest is seen as untimely intrusion.

The prevailing communication practice of the period is characterized as "asymmetric" in public relations handbooks because "it does not try to change own attitudes and behavior, only those of the environment" (Grunig and Hunt 1984:23). In the reflexive company, the self-presentation is a narcissist mirroring of the company's worldview and consequently contributes to "asymmetric communication" because the company is closed towards conflicting perspectives. In the later, reflective practice, the company strives towards a self-presentation that partly is open to the worldviews of the environment, partly is in deliberate accordance with the company's self-observation, i.e., is what you will call "truthful" and "sincere."

Even though the business community in this period develops lenses to a more complex construction of its environment, the objective is not a better understanding of stakeholders in order to adjust the self-observation, i.e., the decision-making premises, in order to gain legitimacy – but to adjust the self-presentation in order to better convince stakeholders of the legitimacy of the company. However, what a company sees in the reflexive perspective of the counter-active phase, it perceives as reality. The company does not understand that it constructs its environment, but sees the world as a mirror of itself. It produces naïve ideas of the possibility of harmony and consensus in society and consequently leads to extensive conflicts in a modern society characterized by diversity. Drucker attributes these conflicts to “the business man”: “Perhaps the reason is not that he expresses himself in a wrong way – although this is often the case (for instance when he talks about maximization of profits and profit motives). The reason simply is that he does not acknowledge that what is so obvious to him is not understood by other people” (Parkinson and Rowe 1979:9). This also entails a self-presentation that remains naïve self-mirroring. The company is not attentive to different interpretations of the company and its decision-making premises. Consequently, a first-order reflexive self-presentation tends to increase a conflict instead of dissolving it: “Probably, a large part of the evident image problems is due to the fact that the business community far too long has relied on a consensus image of the Danish society. Another unfortunate circumstance is that the Danish business community, more or less in vain, has attempted to convince the rest of society of a reality where ‘we are all in the same boat’. In this way, the seeds of a conflict have been sown, namely a divide of credibility” (Christensen et al. 1982:16–17). Later in the learning processes, when the socio-diversity is recognized in the second-order reflective perspective, conflict is acknowledged as the basic condition of society. Society’s differentiated rationales learn how to respect and use the conflict in a more constructive way.

Divides and Crises

In the counter-active decades permeated by conflicts, crises and enemy images, the so-called asymmetrical communication and confronting strategies prevail in society – in contrast to the next phase’s ideals of symmetrical communication and bridge building strategies. Correspondingly, the counter-active rhetoric is embedded in a conventional closedness and a first-order reflexive perspective: “manage relations”; “achieve appreciation of the company”; “nurse stakeholders on the battlefield chosen by the company itself”; “the company’s own influence on the formation of public opinion must be mobilized.” The rest of society must be made to understand and accept the business community. The unstable complexity of the environment must be made stable, structured, and manageable.

But before verdicts of cynicism and manipulation are introduced from a contemporary perspective, the practice forms of the counter-active phase must be understood in relation to their time. Defense strategies were compulsorily embedded in a conviction of the necessity and naturalness of the conventional, reflexive paradigm. The critical environment was seen as an illegitimate threat to the very existence of the business community. The way the business community understood itself and its legitimacy differed essentially from the way the environment saw the business community and its legitimacy, as was concluded in 1982: “Studies reveal a divide of trust between the business community on the one side and citizens and media on the other side. The image of the private business sector is far from what the business community could wish for" (Christensen et al. 1982:11–12). Slowly, the situation changes – however, inertia prevails in legitimizing notions, and the analysis seems to prove correct well into the 1990s.

To conclude as to the counter-active phase: Previously, where compliance with the well-established norms of society automatically legitimized decision-making, gradually legitimate decision-making is made a question of choice, and the company is made responsible for the consequences of decision-making in a wider perspective – still further out in supplier chains as well as user segments in faraway parts of the planet. The counter-active practices seem to be counter-productive. For rather than contributing to legitimizing the business community, they seem to increase the delegitimization of business and the series of legitimacy crises. The divide between the business community and its growing number of critics increases. It all ends with a bang.

Transition Phase: From Prejudices to Negotiations (Approx. 1995–2005)

In the 1990s, new commercial potential emerges with globalization; however, at the same time, the growing global interdependency and transparency begin to challenge the legitimacy of Western business communities and seem to tip the scales. Companies can no longer deal legitimately with anyone, anywhere, and in any way. A long series of legitimacy crises challenges Danish companies with accusations of supporting regimes that violate human rights. The CEO of a major company puts the change into words: "Previously, the choice of suppliers was made based on common, healthy business considerations. Today, a proper businessman has to relate to different and more themes than purely commercial considerations. For instance, whether the company's production is 'socially acceptable'. It implies evaluations of natural environment, human rights, and whether the company abides by the law of the country in question" (Halskov and Søndergaard 1997).

Icon of this turn-around is an internationally high-profiled legitimacy crisis which becomes the final straw. The case in question turns out to be somewhat of a mistake – however, time is ripe, the company involved is large and already in the international public searchlight and the conflict gives rise to dramatic pictures and emotional arguments. The case catches widely and vehemently on to the public opinion of the zeitgeist and leaves the business community in a state of shock.

In the spring of 1995, the Dutch-British oil company Shell, as is general practice of the company, secures the approval of authorities and experts to dumping the worn-out oil-rig Brent Spar in the North Sea. This rubber-stamping turns out to no longer suffice to legitimize the decision. The environmental organization Greenpeace starts a campaign equating the dumping with a potential environmental disaster: "The seas are not our garbage can." In close cooperation with the mass media, Greenpeace creates a sensation in the proper sense of the word – i.e., an emotionally charged atmosphere – by means of spectacular actions in the North Sea. According to mass media, extensive media coverage activates global opinion. The result is extensive boycotts against Shell, not least in UK, Germany, Holland, and Denmark.

After the initial total rejection of the criticism by Shell, the vehement reactions from wider parts of society make the oil company change its attitude. Even though a report from an independent research institution later shows that Shell's information about the oil-rig's contents of environmentally damaging substances was correct, whereas Greenpeace had exaggerated the extent, and that the original solution decided by Shell would have been more considerate to nature – then the ship has sailed. Brent Spar is dumped in a different and according to the scientific community less-suitable place. In the summer of 1995, Shell places advertisements in major dailies in several countries under the headline "We have learned...." What Shell apparently believes to have learned is to listen to public opinion.

Under the headline: "All power to the consumer" a major Danish daily captures a growing discourse: "Never before did activists and ordinary consumers succeed in forcing one of the world's large multinational giants to their knees. The decision [of giving up the dumping in the North Sea] shook not only Shell, but large parts of the international business community which until then did not think much of consumer power. Western-European consumers took on a new power of which we shall see much more in the next decade: The power of the wallet which reaches multinational companies far more effectively than the traditional political power via the ballot. What is new is that the consumer does not just buy a product without considering its origins, but starts to make demands and choices based on moral aspects" (Bech 1995). Afterwards, via a long life as prominent case at universities and business schools, the case of Brent Spar contributes to form the new legitimizing notions mediating the interrelations between the business community and the rest of society. The new Shell with the catchphrase of "People, Planet, Profit" grows a role model in the business community (Mirvis 2000).

Surrender

Shell's response illustrates the risky defense strategy that for a brief period permeates the business community: *Surrender*. Surrender implies that a company allows the environment to make the company's decisions. It is a reaction of shock that is ultimately destructive – in this case not least because the reference is public opinion with its black/white reduction of complexity (cf. also Luhmann 1995b). The surrender strategy is destructive. An organization risks a short circuit of its decision-making processes. But this reactive pattern spreads. After many years characterized by a warlike climate and an increasing number of conflicts and legitimacy crises, Brent Spar becomes the mythical shock and turning point to such a degree that parts of the business community is seized with panic. Whether anything is relevant to economy depends on whether it makes a difference to economy. For many years, this has served as an efficient gatekeeper towards most of the critical environment. However, conversely it also means that organizations are "defenselessly exposed" (Luhmann 1986:22) when the critical environment finally catches on to their criteria of relevance and success. In Denmark, in a national survey, CEOs seem to denounce economy as a legitimate motivating force. The survey concludes that "we can observe a clear shift in the business community's attitude to ethical values. Formerly, the general attitude in the business community was that companies should concentrate on doing business – i.e., earning as much money as possible" (Mandag Morgen 1997). Not so any more – but for a brief period only.

Soon, the surrender strategy is replaced by the defense strategy of *dialogue*. After decades of persistent defense, as the "power of the wallet" seems to threaten the business community, the shock and the panic that have jeopardized the otherwise well-greased decision-making machinery of the business community finally motivate pioneering business companies to raise their perspective and to observe their own decision-making premises from a self-critical position. When communicative connection fails again and again, it leads to reflection (Luhmann 1995a ch 4, II). This second-order perspective dissolves the natural legitimizing power of the old legitimizing paradigm and facilitates "dialogue." (See also Neisig 2017 for the necessity of a reflective perspective to transition.) Dialogue implies that the partners are prepared to listen and to change – an openness which is signaled for instance in Shell's Annual Report 2000 with phrasings such as "debating expectations," "searching for answers," "we really do want to hear your views" (Shell 2000).

Negotiations

Gradually, confrontation is replaced by negotiation. It entails partnerships and cooperation across society's sectors – between for instance the business community, NGOs, public institutions, academia, and mass media. Over and over, the idea of a shared faith in the diversity resounds, of considering the rest of society out of consideration for yourself. Some NGOs also seem to embrace the idea of a common faith: "Amnesty International is convinced that if you read the cards correctly, the interests of the business community and those of Amnesty International converge. Amnesty works for respect of human rights as a means to social and economic development. This is also in the interest of the business community" (Baden 1997).

A new backcloth unfolds. A new societal self-description characterized by socio-diversity takes over. Thus, the enemy images of the counter-active phase are replaced by the negotiations of the transition phase, and suddenly, a rapid development follows. As a general perspective within society, reflection facilitates the governance society (cf. ▶ Chap. 19, "Society's Megatrends and Business Legitimacy: Transformations of the Legitimizing Business Paradigm"), which basically means polycontextual co-regulation between a large number of autonomous members of society who reflect themselves in a societal horizon, see themselves as mutually interdependent and consequently are prepared to develop self-restrictions and balancing mechanisms in their interrelations. Increasingly, the idea of a unity is mirrored within organizations as an efficient internal contingency control in the form of *corporate social responsibility – CSR*. "Support and dialogue is becoming more important than control," the Danish Minister for Social Affairs states in a manifest (Jespersen 1997) for *New Partnership for Social Cohesion*, a project initiated by the Danish state but oriented towards EU as a whole. From a second-order reflective perspective, the political system connects to business-economic selection criteria: "We believe that being socially responsible and taking part in social initiatives in local communities in the long run makes sound business sense" (Frederiksen 1997:5). Correspondingly, in the introduction to Global Compact in 1999, UN argues that membership "makes good business sense" and is "an opportunity for firms to exercise leadership in their enlightened self-interest" (Annan 1999).

It is no longer a question of business community and society, but of the business community as part of society. An editorial in major Danish daily reflects how the business community is now seen as part of the solution – instead of as the problem proper: "Anyone with just a generation-long memory will remember that 30 years ago, the private business sector was seen as part of society's problems in the politically active public. Whereas today, the politically conscious consumer and investor are symptoms of the private business sector being an important co-player in the solution of society's problems" (Politiken 1997).

A Proactive Business Community

The end of 1990s witnesses a slide in the legitimizing notions within the business community as well as in the reasons for legitimizing measures. First, the reasons are morally normative from a state of shock: "we ought to" take legitimizing measures in order to be a responsible company. From the first risky panic strategies of surrender and of *mirroring*, where some companies adapt the rhetorics of NGOs in vain attempts of legitimization, the business community soon seizes the reins again with the new, effective *neutralizing* defense strategy of counter-moralization. The business community proactively enters the moral discourse of society, not in adjustment to the demands from social movements and the critical environment, rather as counter-moralization which gradually absorbs moral protests with practice forms such as ethical accounts and codices, values management, corporate citizenship, and a new semantics: *symmetrical communication, social responsibility, dialogue, empathy, ethics, sustainability* grow into positive concepts within the business community.

From having been communicated other-referentially (i.e., compulsory), once again societal responsibility is communicated self-referentially (voluntarily) within the business community. Again, the necessity of broader societal considerations is evaluated from the business community's own criteria. For not until such considerations can be thematized in the economic communication, does the business community have tools to evaluate considerations of nature, human beings, and of the societal environment of the business community at large. Not until then can a topic win broad resonance within the business community and the problems of strains be efficiently treated. The role of business in society is re-interpreted from within business. Green, social, ethical, and stakeholder accounts become means for business companies to observe the increasingly complex environment and make it "manageable" by means of quantitative data.

The line of reasoning reflects how the distinction between profits and societal responsibility dissolves within the business community. From having been seen as reciprocal opposites, societal responsibility and commercial responsibility are gradually seen as mutual preconditions. In 2002, at the trend-setting annual summit of World Economic Forum for the business community, politicians, journalists, NGOs, and academia, a survey shows that what CEOs previously saw as competing priorities – such as economic success versus environmental considerations – is now seen as a more complete, complementary package, a sustainable business model (diPiazza 2002).

The business community takes matters into its own hands, takes leadership in establishing partnerships and governance networks in order to develop new shared guidelines for legitimate decision-making. An example is Nordic Partnership, established by 14 major Nordic companies in cooperation with the NGO WWF and the think-tank Mandag Morgen in order to present a sustainable business model at the UN summit in South Africa 2002.

Focus on Self-Observation

In the transition phase, self-observation grows into focus. Practice forms – such as values leadership, CSR, triple bottom line management, social reporting, partnerships for social innovation, stakeholder engagement, and issues engagement – focus on the company's decision-making premises. The governance society's new forms of co-regulation increasingly supplement the old practice form of "lobbyism" – a manifestation of the government regulation's centralism – with "public affairs." From a reflective mode, public affairs are performed in-between a multitude of political positions. Relations to the idea of the public sphere become an important part of full modernity's' co-regulating practice forms. However, the specific concept of "public relations" seems to be stigmatized by its past in the counter-active phase, as pronounced in this statement from 2002: "The days in which the PR adviser puts forward a superficial 'gloss' for a position statement or annual report have passed. The senior communications professional's role must be the effective communication of developments and activities of genuine substance" (Langford 2002). This quote exemplifies how public relations practice – "PR" – is often equated with the reflexive perspective of the counter-active phase. Instead, the practice of public relations – handling interrelations with the public sphere and public opinion – is increasingly, although more inaccurate, known as for instance corporate communication, strategic communication, social relations, or press relations.

Practice forms mediated by the first-order perspective of reflexivity differ decisively from practice forms mediated by the second-order perspective of reflection. Practice forms such as public relations (under different names) and issues management change with the underlying defense strategies – in particular from the first-order reflexive necessitation of decision-making premises to the second-order reflective negotiation.

Transparency grows into a cue concept. Values leadership and values branding become dominant practice form. A company has always had values. Previously, however, they were invisible, taken for granted. Now, they are understood as choices, dragged into the limelight, debated and spread internally as guidelines to the communicative processes that constitute the company and presented externally in order to prove leadership in society and to earn trust by creating new expectations. For, where the company in the first-order reflexive perspective counts on an almost blind faith from a passive environment, in contrast, in the second-order reflective perspective, the company sees that the environment has a legitimate interest not only in the company's production and services but also in the values and attitude behind.

Via reflection, the company increases its sensibility by seeing how it operates in a network of structural couplings with organizations characterized by different rationales. It leads to an observation of mutual interdependence and at the same time of a legitimate diversity in society. Linear stakeholder models where the company sees itself as the hub of the universe are replaced by more dynamic models where the company tries to see itself as if from outside and no longer sees itself as a center, but as one of many polycontextual observers (see ► Chap. 19, "Society's Megatrends and Business Legitimacy: Transformations of the Legitimizing Business Paradigm" Fig. 1). Stakeholder *management*, i.e., the structuring and managing of the environment, was part of the old first-order, reflexive paradigm. In contrast, stakeholder *engagement* becomes part of the new second-order, reflective paradigm. This does not mean that relations are now free of conflicts. On the contrary, the basic condition of the ultra modern society is conflict. However, reflection entails a larger tolerance to diversity as the basic driver of society and facilitates the potential of turning conflicts into fruitful dynamics.

Most important perhaps is that still more companies now understand themselves as active co-players in society – acknowledge that continuously partaking in public debates is an existential premise for the company. Consequently, the new legitimizing practices in their different shades and shapes grow into a top management concern.

Clarification and Moral Neutralization

The transition phase is decisive to the transformation of the legitimizing paradigm mediating the interrelation between company and the rest of society. For in this phase, a new agreement is reached. In a brief period in the late 1990s, the boundaries of the business community are apparently *at* risk. The economic rationale as a legitimate driver is apparently questioned. However, if we understand the social forces driving this turbulence as society's way of shaking its rigid skeleton to make it more bendable, flexible, and strong, it is no wonder that the business community quickly gets on its feet again, recovers its economic dynamics, and self-referential legitimacy and raison d'être. It does so by raising the perspective to the reflective second-order observation and by adjusting its role and responsibility based on an updated understanding of society.

The business community retains the economic functional rationale as primary reference and driver. However, former economic externalities are turned into economic internalities. Profits are made taking wider considerations of the rest of society and of life and nature, demonstrated in watchwords such as People, Planet, Profit (Shell 2000), and the triple bottom line (Elkington 1997). During the transition phase, boundaries are shaken, however clarified, and gradually it grows legitimate for the business community to be social and societally responsible for the sake of profits.

Reflection as the second-order perspective that paves the way for change and learning processes is a precondition for a paradigmatic transformation of such distinctive character as the one which is negotiated and agreed upon in this phase. However, of even greater interest is that the perspective identified as reflection in a socio-techno rationale frame of reference becomes the basic pivot of the new legitimizing notions. In different shades and shapes, this particular self-observation that produces self-understanding in relation to the environment and facilitates flexible coordination forms to match society's increasing complexity, dynamics, and diversity becomes a common denominator, a formula for legitimacy.

Best Practice Phase: Routinization and Role Models (Approx. 2005–2015)

As negotiations resulting in a reflective business paradigm progress and gradually complete, the business community takes the lead in shaping new practice forms and notions that are compatible with the meanings systems fundamentally constituting the business community. Buzzwords such as "from religion to reality," "from attitude to action" resound. Practical and pragmatic cross-sector partnerships about innovative solutions to society's problems pop up between former vehement antagonists. It has grown possible partly because the mutual interdependence is acknowledged, but even more so because the individual partners' integrity is now respected from an understanding of the socio-diversity. Focus is no longer on attitudes from the basic reasoning of "because we should" – but on action "because we do." It is no longer a question of whether economy should be sustainable, but of how it is made sustainable.

As the wider social and societal responsibility is thematized over and again, and as elitist business companies present declarations and practices where social, societal and environmental considerations are apparently natural preconditions to profits; as these matters are thematized in mass media, at conferences and in handbooks, mainstream parts of the business community follow suit and adapt the practice forms and decision-making premises agreed upon in the transition phase. It grows into "best practice" to follow the role models, i.e., pioneering companies that stood out during the transition phase. Still more prizes for best practice cement the new paradigm: Prizes for instance for publishing the best integrated report, for being the most sustainable company, for initiating the most outstanding CSR practices. At this phase of the transformative process, the reason for adopting the legitimizing practices is: "We have to – for this is the way you do." The questions no longer are: *Where are the boundaries of the business community – is the economic rationale a legitimate trump? Does the business community show sufficient consideration of life, nature and of the rest of society?* But: *Does the organization have a CSR policy? Does it follow the GRI guidelines for sustainability reporting? Is it transparent? Is it a member of the UN Global Compact? Is it involved in parterships for corporate social innovation?* The focus is on processes and ways of organizing, measuring, controlling, and signalizing the wider responsibility and the mutual considerations, and on self-presentation rather than on the self-observation of the transition phase.

Focus on Self-Presentation

Among predominant legitimizing practice forms are value branding in order to earn trust by creating and stabilizing expectations. Green grows a favored logo color in order to signal considerations of life and nature. Corporate strategies are condensed in catchwords such as “People First,” “Closer to Nature.” References to legitimizing institutions in decision-making premises grow into best practice, such as in particular UN Global Compact and the Global Reporting Initiative.

The redefined legitimacy of the business community is firmly structured into models, accounts, verifications, certifications, and standards. They are structures that translate the former extra-economic responsibility into the economic language, contribute to reducing the uncertainty otherwise implied by the reflective ideals, to relieving the risky and resource demanding second-order observation of reflection and to stabilizing and signalizing new patterns of expectation.

By applying the defense strategy of *integration*, the company has transformed the irritating power of the environment by embedding the environment’s perspectives in the company’s own decision-making premises – i.e., the perspective has been integrated in routines and models that are compatible with the company’s self-observation and primary reference to the economic rationale. The self-observation has changed in this process; however, the point is that the company’s boundaries are not weakened in the process. Rather, they are clarified and reinforced as a flexible, vicious membrane rather than a dense, rigid shell. Former extra-economic considerations are integrated as an intra-economic part of business. The financial director automatically takes into consideration the social and environmental audit and socially responsible investors. The HR director integrates routine considerations of life/work balance in employee policies. The director of logistics checks out foreign suppliers’ attitude to child labor and human rights. The production director ensures that the production complies with sustainability certification. The CSR director integrates social and sustainability reports into the annual financial report. The communications director contributes to ensuring that decision-making processes are filtered through the perspectives of the public sphere, the common interest and a longer series of stakeholders.

The best practice phase is characterized by imitation and routinization. You do as the role models do. This does not mean that reflection is now practiced in the wider field of companies, rather that a long series of tools, networks, and standards diffuses based on the ideal of reflection. Reflection is a risky and resource demanding perspective. Risky because it may raise doubt within an organization about its own boundaries and *raison d’être*. Resource demanding because reflection doubles the communicative processes and makes decision-making processes far more ambiguous than does reflexivity. Gradually, as reflective processes diffuse, they are relieved into *best practice* routines which are adaptable to basic existing structures in the form of for instance certification, verification, sustainability accounts, and business guidelines for social responsibility. It reduces the uncertainty of decision-making and relieves the stressful recognition of contingency. The second-order reflective practice which is provoked in particular in larger and highly visible companies will in most other companies integrate as routine activities and formalized structures.

A Hyper-Irritated Present: 2015-

An evolution ends with the stabilization of new patterns of expectation. Neither sanctions nor role models are needed at this phase, for the new legitimizing notions are taken for granted. The reflective paradigm has grown into a matter-of-course. Practice forms are internalized as the natural way of legitimization. And even though the reflective mode has solidified into routines and rituals, the self-observation now rests in a new paradigm with reflection as the ideal and the source of business strategies such as in Unilever's strategy for sustainable growth based on the purpose of making sustainable living commonplace: "Our purpose has inspired innovation, new ways of doing business and purposeful brands. We are proving that responsible business is good business" (Unilever 2018).

A new social reality has developed and stabilized. What was formerly regarded as reciprocal opposites are now seen as mutual preconditions. It manifests in several ways (cf. also ▶ Chap. 19, "Society's Megatrends and Business Legitimacy: Transformations of the Legitimizing Business Paradigm"). From the idea of taking as mutual preconditions considerations of society's different criteria of relevance and success on the one hand – profits, knowledge, news, collectively binding decision, etc. – and on the other hand considerations of life and nature; of considering the market out of considerations for society and vice versa, they extend to the way the company strengthens decision-making competence by *not* withholding decision-making processes from those potentially influenced by them but by transparency and stakeholder engagement.

A large part of the legitimizing practices will have grown into symbolism and ceremony. A responsible rhetoric symbolizes resolve and leadership. Twitter and Facebook profiles are symbols of openness. CSR departments and membership of Global Compact, dialogue meetings with NGOs, and a professional discourse with notions such as sustainability and social responsibility may not necessarily add to the efficiency of the business community nor to immediate considerations of society, life, and nature; however, they may be an indispensable part of the ceremony that supports the structures of expectation.

Legitimacy crises constantly lurk in the ultra modern society. From the major, fundamental crisis in the 1980s and 1990s where the very legitimizing paradigm was the focal issue, minor crises has turned into part of the everyday grind in the form of frequent, situational conflicts. Compliance with the reflective paradigm activates a constant pressure of legitimacy. At this phase, the original critical environment with protests against the old reflexive paradigm has lost its power of irritation; however, it is replaced by new environments which at the issue arenas of all megatrends activate a constant pressure of justification. At the megatrend of the *insensitive society*, the latent accusation of prioritizing profits to considerations of life and nature lurks. The *decision society* activates a massive pressure of justification on the company's decision-making premises from the potential victim's perspective. The *partnership society* produces constant suspicion of lack of respect for society's structure – bribery, corruption, nepotism. The co-regulation forms of the *governance society* create a significant potential for legitimacy crises: does the company comply with the more or less fluid and discursive norms of co-regulation? The *trust society* means focus on whether a company delivers on its promises and lives up to expectations. The *global society* continuously produces legitimacy crises when a company has to operate from consistent norms in different societal and cultural contexts characterized by diverging legitimizing notions.

Ultra modernity's legitimizing processes mean that the public searchlight can strike anywhere, anytime – in the form of random mass media check-ups, increasingly via social media. The defense strategy of preparedness implies that it grows an ingrained routine to be constantly prepared for a potential public focus by means of a continuous production of potential scenarios and publicly defendable arguments. From a principled agreement on the legitimizing paradigm, the purpose of issues management – or issues engagement as the practice form in its second-order reflective mode is rather named – together with practice forms such as corporate journalism and internal NGOs is continuous self-irritation in order to adjust decision-making premises to the dynamism, change, and diversity of ultra modernity on the company's own terms. In the final phase of the transformation process, the new paradigm is integrated as something emerging from inside. After decades of pressure from outside, the company reestablishes its boundaries by seeing itself as "authentic," as resting on its own values and purpose.

Reflection as Reflex?

In the final, neo-conventional phase of the transformation of the legitimizing business paradigm, the new notions have stabilized in a taken-for-granted reflective paradigm which in most parts of the business community paradoxically seems to be embedded in a new reflexivity. However, before rushing to negative verdicts, social dynamics should be considered.

Reflection is a risky affair for a social system such as a company. It means exposure and sacrifice in the short term as an investment in existence in the longer term. For ultimately, boundaries are not only *in* play – they are *at* play. Social processes will strive to secure their boundaries, and that means to relieve the pressure produced by the reflective self-observation and return to the basic self-reference of reflexivity. The nature of social processes is like that of a watercourse. They flow where they find continuation, i.e., where communicative connection is most likely. Resources are being spent on the second-order observation of reflection only when connection fails over and again (such as when the legitimacy of a company is questioned time after time as in the case of Arla Foods) – and with the sole aim of revising the possibilities of connection. As soon as they connect again, communication on communication – and in organizations this equals decision-making on decision-making – ceases. Society canalizes its hyper-irritated conditions into more stable, certain patterns of expectation. When we still may characterize the new paradigm as *reflective,* the reasons are two. First, because practice forms are embedded in ideals of reflection as the outcome of the transition phase. These achievements are not betrayed, however worn by the relieving and de-paradoxifying dynamics of the social processes. Second, because the reflective paradigm implies that the company in today's fluid, hyper-irritated society has to be constantly prepared to substantiate and justify its decision-making premises from a second-order reflective perspective.

The ideal of reflection contributes to ensuring mutual considerations and social cohesion in ultra modernity's hyper-irritated, dynamic, diverse, and polycontextual society where the company must understand how to continuously justify itself in relation to its environment. However, at the same time, reflection implies several risks which open the analytical perspective to practice forms that relieve reflection into routines, models, ceremony, and symbolics.

First: Reflection is risky because it implies that the company will continuously question itself, its boundaries, identity, raison d'être, and decision-making premises. Example: When a business enterprise starts to doubt economy as its fundamental reference and instead delegates its decision-making premises to different stakeholder positions or to public opinion, the structures of expectations are weakened, decision-making processes drag on, and gradually the organization dissolves.

Second: The doubling of decision-making provoked by reflection demands resources and makes decision-making premises and processes far less unambiguous than does the simple reflexive perspective. In this way, reflection risks weakening the structures of expectation and straining the decision-making processes.

Third: Reflection increases a company's sensitivity to the environment. This, however, cannot be considered positive only since the resonance may lead to a hyper-irritated condition within the company. A vehement input of observations, manifested, for instance, in a growth of stakeholder relations, communications departments, media experts, and issues monitoring – all expressions of the build-up of internal complexity – puts a heavy pressure on the capacity of information processing. The risk of being *too* irritated lurks with the result that the decision-making processes are overloaded and get out of control. This seems a characteristic trait of contemporary, hyper-irritated society where companies are expected to consider a growing number of formerly extra-economic issues, stakeholders far out in the chain of suppliers as well as of users, society's will and way, public opinion, a long series of different cultures, and a global public which has exploded with the growth of social media.

Fourth: Reflection is characterized by paradoxical features. A paradox implies the simultaneous presence of contradictory elements. When a company by means of a decision tries to decide whether a decision is right or not; tries from existing decision-making premises to decide whether they are premises resulting in the right decision-making – then the company risks ending up in paradoxes. It may lead to blockage of the decision-making processes, i.e., a weakening and gradual dissolution of the company because it oscillates in uncertainty without a minimum of certain expectations as guidelines to the decision-making processes.

So, just as reflexive practice cannot automatically be seen as bad and dysfunctional to social cohesion, a reflective practice cannot automatically be seen as good when the problem guiding the analysis is the continuation of the decision-making processes constituting an organization – and in the overall picture the communicative processes constituting society. The risk, however, by turning reflection into simple routines, ceremony, catchwords, or role modeling is that the context originally provoking contemporary legitimizing notions and practices will be forgotten. As long as their constitutive decision-making processes proceed relatively undisturbed, organizations happily ignore their ignorance. The question from insight into social evolution and the challenges to social cohesion and society's perpetual transformation processes then is: when and how will the next transformation be provoked?

expansion, colonization, and trade from the seventeenth century onwards. Only recently have minority and alternative discourses of equality, justice, and human rights begun to challenge the structural inequities of the dominant social order to insist that considerations of institutional and regime legitimacy include the full range of human social identities and locations – women, minorities, the global south, and other communities excluded, stigmatized, and disadvantaged by normative mainstream social, political, and economic structures and practices. The concept of intersectionality emerged from emancipatory critical humanist thought as a radical, activist ethical assertion of human equality by African American women scholars who categorically rejected the embedded Eurocentric bias of feminist thought and arbitrary, socially constructed hierarchies (e.g., race, class, gender, ethnicity, sexual orientation, etc.) as determinants of a human dignity and worth. This chapter examines the development and structure of intersectional thought and its relevance as an analytical lens for understanding business legitimacy in terms of social justice, business performance, and economic development.

Keywords

Intersectionality · Equity · Human rights · Inclusion · Critical race theory · Feminism · Business legitimacy

Introduction

As the moral claims of human equality, justice, and rights have begun to challenge social disparities and inequities of institutions around the world, the structural inequities of business are subject to increasingly intense scrutiny. Like many social institutions, modern business corporations that dominate the landscape of global capitalism evolved as male-dominated institutions from male-dominated cultures of European and North American mercantilism, industrialism, and capitalism. The long history of business, however, is more diverse. Some business sectors evolved from trades and crafts, such as cobblers, potters, and weavers, originally practiced by women, men, and even children in household settings, but later restricted to men by guilds as trade flourished throughout Europe in the Renaissance and Early Modern era. Other business sectors, such as metallurgy, agriculture, textiles, and shipping, were influenced by African and Asian trading partners as well as indentured and enslaved people whose specialized skills contributed to the growth of industrial centers in Europe and the Americas. Production and trade thrived throughout the world for thousands of years before Euro-American mercantilism and corporate capitalism appeared on the world stage. Given the diversity and impact of global business, considerations of business legitimacy necessarily include the full range of human social identities and locations – women, minorities, the global south, and other communities excluded or disadvantaged by normative business structures and practices. Intersectionality is a conceptual tool for examining business legitimacy from the perspective of human values and justice.

The concept of intersectionality was developed as an activist ethical assertion of human equality by Kimberlé Crenshaw, Patricia Hill Collins, and other African American women scholars who viewed both civil rights legal discourse and second- and third-wave feminist and gender studies as gravely inadequate in conceptualizing intersecting categories of human difference and the exclusionary impact of those categorical differences on individuals and communities of color. Crenshaw was also one of the formative thinkers in the development of critical race theory, a form of oppositional legal scholarship challenging the normativity of white experience to ground the subjective social and experiential context of racial oppression as crucial to understanding and deconstructing racism (Crenshaw 1988, 1989). Intersectional theorists categorically reject the embedded Eurocentric bias of racist, feminist thought, and its derivative socially constructed hierarchies (e.g., race, class, gender, ethnicity, sexual orientation, etc.) as determinants of a human dignity, worth, and capabilities. Intersectional theory takes into account the complexity of multiple, overlapping identities, experiences, and sources of discrimination and disadvantage to examine and challenge their interconnected, interdependent structure in systems of distributed power, privilege, and opportunity.

Understanding Intersectionality

Rooted in emancipatory critical humanist thought, intersectional equity categorically rejects the validity of arbitrary socially constructed hierarchies (e.g., race, class, gender, ethnicity, sexual orientation, etc.) as determinants of a person's dignity, worth, and capabilities. The core assertions of intersectional equity can be summarized in four statements:

1. All persons are stewards of their human potential and entitled to seek the full flourishing of their humanity.
2. Human societies historically have constructed inequitable pathways of individual flourishing by distributing power, privilege, and opportunity based on categorical differences (e.g., race, class, gender, ethnicity, sexual orientation) that individuals cannot control.
3. Historically constructed social inequities of power, privilege, and opportunity are intensified at the intersections of categorical difference.
4. Human societies should foster the full flourishing of individual human potential by eliminating historically constructed social inequities based on categorical differences.

As an ethical assertion of inclusive humanism, intersectional equity is inherently activist in seeking social justice. The first statement is not very controversial, but the second and third statements can be contested based on beliefs that, for example, categorical differences constitute a natural, immutable social hierarchy or that categorical differences are a legitimate basis for socially constructed hierarchies. There is deep, wide, and vehement disagreement about the fourth statement based on how people think about social change: radical, disruptive change versus slow, incremental change; religious or cultural legitimation of categorical differences; aversion to social conflict; or preferential attachment to the current social order. These contested views offer rich opportunities for constructive and creative ethical discourse regarding both means and ends of social justice.

A Lexicon of Intersectionality

Intersectional theory is evolving as a discursive field with disciplinary approaches, methods, and terms that may be unfamiliar to some scholars but are necessary for understanding the purpose of intersectional knowledge creation.

- **Critical theory**: Critical theory is an activist social and political philosophy with a goal of understanding and overcoming dominant, oppressive social structures that unfairly constrain human identity, freedom, and agency. Drawing originally from Marx and Freud, critical theory was associated primarily with Adorno, Horkheimer, and Fromm of the Frankfurt School until critical theorists emerged in the 1970s to influence fields of law, history, literature, and social sciences by examining how science and knowledge can be used as instruments of oppression unless they are pursued with social context and transformative action for human emancipation in mind.
- **Critical race theory**: Critical race theory is a body of activist scholarship that seeks to explore and challenge the prevalence of racial inequality in society based on the understanding that race and racism are derived from social thought and power relations. Critical race theorists expose the structural continuation of racial inequality through normative assumptions about it as natural and unremarkable.
- **Equity and equality**: The concepts of equity and equality are often understood as synonymous, but intersectional theorists claim important distinctions. Equity is defined as fair and just treatment, which may include fair accounting for differences or compensating for disadvantage. Equality is defined as entitlement to the same rights, responsibilities, and freedoms in developing their human potential and making choices about their lives without constraints based on categories such as race, gender, or sexual orientation. Equity and equality are complementary principles and practices of social order in a free and just society.
- **Feminism**: Feminism is belief that women and men are equal and should be treated equally. Far from a monolithic worldview, numerous "feminisms" reflect diverse perspectives and understandings about women, their situatedness in the world, and how to achieve equality.
- **Gender and sex**: Feminist and gender theorists differentiate between gender and sex. The concept of gender roles was originally introduced in 1955 by John Money, whose clinical research disrupted conventional ideas about sexual identity and experience (Money 1955) Gender is generally defined as socially constructed feminine or masculine identities and roles, while sex is defined as

biological male or female traits. Well before scientists normalized the concept of gender fluidity, Judith Butler and others challenged the gender binary distinction, arguing that both gender and sex are cultural constructions; people experience gender in various ways; and binarism limits understanding of humanity and the world (Butler 1990). Biologists now view biological sex as a spectrum of anatomical, physiological, and neurological interactions unique to each individual rather than a simplistic bifurcation of male and female biology (Ainsworth 2015).

- **Gender studies**: Gender studies include multidisciplinary explorations of the meaning of gender as a salient social construct, applying gender as a critical lens to everything from labor conditions and healthcare access to the fashion industry and popular culture. Gender is often examined in conjunction with other factors (e.g., sexuality, race, class, ability, religion, ethnicity, citizenship status, life experiences, and access to resources) that determine an individual's social location and identity. Beyond studying gender as a category of identity, gender studies seek to illumine the structures that naturalize, normalize, and discipline gender across historical and cultural contexts (Stimpson, Burstyn, Stanton, and Whisler, *Signs* editorial, 1975).
- **Intersectionality**: Human identities are complex, based on multiple individual and social factors that are compounded in a mobile, globally interconnected society. Intersectionality emphasizes the interconnected nature of social categories such as race, class, and gender as overlapping and interdependent systems of distributed power, privilege, and opportunity in examining and accounting for the complexity of multiple, overlapping identities and experiences as vectors of discrimination and disadvantage.

Roots of Intersectional Thought

The concept of intersectionality reflects an evolution of thought and values that originated with philosophical and social movements in the west that sought to establish human rights and freedoms as the legal foundation of society. These movements emerged as a social and political force in the nineteenth and early twentieth century to abolish slavery and the slave trade in most European countries and colonies. In the United States, the slave trade was abolished in 1818; slavery was abolished after the civil war in 1865; and the Civil Rights Act established legal racial equality in 1866. Suffragist movements successfully secured voting rights for American and most European women early in the twentieth century, but establishing full legal equality was a more protracted challenge. Despite human rights achievements in much of the world, various forms of institutional slavery and subjugation of women have continued with legal protections in parts of the world along with lax law enforcement that fails to protect women and marginalized groups from exploitation, subjugation, and oppression.

Human equality, rights, and freedoms were especially important in the United States where English colonies had asserted their independence to establish a constitutional democracy enshrined in the Charters of Freedom – the Declaration of Independence, the Constitution, and the Bill of Rights – as foundational principles protecting equality, rights, and freedoms of all citizens under the law. As waves of ethnically diverse immigrants successfully asserted their constitutional rights and status as "white Americans," disparities of race and gender became glaringly evident and difficult to ignore for those who were excluded from opportunities afforded primarily to white men. Indigenous Americans, African Americans, Hispanic Americans, and Asian Americans – some of whom claimed long-standing cultural traditions of participative self-governance disrupted by colonization or slavery – organized to ensure equal treatment under the law. Throughout the twentieth century, global conversation about human values expanded and coalesced in the 1948 United Nations Declaration of Human Rights that still stands as framework for multilateral policy consensus and action. Despite these advances, full equality of persons has yet to be achieved in practice despite the rights and protections guaranteed by law in the United States, Europe, and many other nations. Intersectional theory developed as a tool for probing this troubling fact and exploring ways to align practice more closely with espoused values and law.

The Human Rights Movement

The modern era of human rights was and is a global phenomenon of activism and engagement to overcome centuries of structural hierarchies that categorically defined the status and rights of people within most societies and among societies in the community of nations. In almost every society, women have ranked lower in the hierarchy of fixed categories, such as birth order or bloodline, which cannot be easily redefined or overcome and still determine property and inheritance rights in many modern societies. Categorical hierarchies have proved to be even more sticky in cross-cultural encounters that created the contemporary global society. In the early modern era of colonization, for example, Europeans considered the enslavement of conquered peoples and confiscation of their lands as a legitimate practice following a war that could be justified unilaterally, as in the case of the Pequot War that New England colonies waged in 1636–1638 to solve a labor and land shortage (Newell 2015). Postcolonial scholars may condemn the hegemonic Eurocentric worldview questioning the humanity of colonized peoples with little appreciation of the millennia of adaptive neurochemistry and socialization predisposing humans to conflate similarity/familiarity with the good and dissimilarity/unfamiliarity with the dangerous other (Sarto-Jackson et al. 2017; Morris 2010; Guha and Spivak 1988). Such incidents form a consistent, continuous pattern in the history of humanity. Simmering beneath the surface in times of peace and prosperity, xenophobia erupts with economic and social pressures in border wars, ethnic cleansing, repressive crackdowns, and isolationism to remind postmodern champions of globalization and diversity that the struggle to make good on the promise of human equality and freedom is far from over.

Slavery, Civil Rights, and Human Equality in the United States

The struggle for human rights and equality has taken particular form in the United States where the legacy of slavery remains embedded in social norms and practices despite repeated legal affirmations of racial equality. It is unlikely that in 1482 the Portuguese envisioned the long-term consequences of their decision to establish a permanent base for their African slave-trading business on Ghana's Gold Coast. By the time Columbus arrived in the Americas, slavery was well established in Europe. The transatlantic slave trade quickly became a key economic component of European colonization from South America to New England and, subsequently, the political economy of the United States. Spanish colonies began purchasing Africans as slaves in 1510. A century later, the Jamestown colony first purchased a small group of Africans from a privateer in 1619, and in 1625 the Dutch West India Company imported a dozen enslaved Africans to New Amsterdam (Wood 2005; Eltis and Richardson 1997). American colonies also enslaved Native Americans, first in small numbers and eventually on a larger scale. Although records are far from exact, historian Linwood Fisher estimates that, from 1492 to 1880, the number of enslaved Native Americans totaled between 2 million and 5.5 million, and the number of enslaved African Americans totaled about 12.5 million (Fisher 2017).

At first the legal status of enslaved African and Native Americans in the colonies was ambiguous and sometimes considered similar to indentured servitude, a common practice for individuals who gained their freedom after a set period of service. By the mid-seventeenth century, the British colonies enacted laws that clearly differentiated the terms and temporary status of white indentured servants from the lifelong, heritable, commodified chattel slavery of Africans and the punitive or militaristic enslavement of Native Americans. Puritans and Quakers in Providence opposed slavery and enacted the first colonial antislavery statute in 1652, but economic dependence on slave labor and the slave trade weakened enforcement. The powerlessness of enslaved people and the rights of slaveholders were explicitly protected when the United States adopted its first constitution and reinforced when congress passed the Fugitive Slave Law in 1793. Early antislavery sentiment spurred state emancipation laws in the north, and congress banned the slave trade in 1808, but the agrarian Southern US economy maintained its reliance on slave labor until 1865 when the 13th amendment to the constitution banned slavery, the 14th amendment guaranteed the legal equality of former slaves, and the 15th amendment enfranchised African American men.

Constitutional guarantees could not erase two centuries of white supremacy embedded in American culture. Jim Crow laws enforced racial apartheid, disenfranchised African Americans citizens, denied and restricted African American access to public resources, professions, and economic opportunities, and turned a permissively blind eye to racial violence and terrorism against African American people and communities. While these conditions were more severe in the south, racial bias throughout the country blocked people of color from neighborhoods, schools, professions, and economic opportunities reserved for white people. Decades of protests, marches, and violent backlash brought about legislative achievements and landmark court cases culminating in the Civil Rights Act of 1964 that banned segregation on grounds of race, religion, or national origin in places of public accommodation as well as racial, religious, ethnic, and gender discrimination by employers, labor unions, and federally funded programs. The Civil Rights Act is the operating social justice framework in the continuing struggle for social justice in the United States.

Critical Theory

Contemporary discourses of human rights and equality draw heavily from critical theory usually associated with the Frankfurt School of German philosophers and social theorists who defined theory – and all knowledge – in terms of social practice and relationships with the purpose of emancipating people from the various forms of domination that have stifled and enslaved humanity throughout history. Max Horkheimer, founding director of the Frankfurt School of Critical Social Research, defined critical theory as explanatory, practical, and normative, meaning that theorizing must explain the problem of a given social situation, identify practical actions and agents to resolve the problem, and establish underlying justifying moral principles of activism social transformation (Horkheimer 1972). Horkheimer and Adorno were especially pessimistic in their critique of modern, capitalist forms of domination that have commodified culture, people, and relationships (Horkheimer and Adorno 1997). Horkheimer's relocation of the Institute to Columbia University in 1934 (and later to California) amplified the intellectual influence of critical theory to generate distinctive modes and methods of thought and discourse about race, gender, power, and politics in the United States, Europe, and the entire world.

Critical Race Theory

Critical race theory emerged among legal scholars in the 1980s as North American legal scholars began to question the persistence of racism despite vehement condemnation by public policy and thought leaders in civil society, academic disciplines, and the professions. Critical race theorists challenged the popular notion that racism was a waning vestige of less enlightened times among less educated, socially conscious members of society, asserting instead that racism is perpetuated as normal and ordinary through mainstream institutions and social practices. Primarily developed through critical investigation of legal reasoning and jurisprudence, critical race theory has spread to other disciplines in theorizing how structural racism, implicit bias, and unconscious racism interlock with other forms of oppression (Bell 1995; Delgado and Stefancic 2000). Some critical race theorists assert that racism is integral to contemporary social order, pointing out that antidiscrimination law both accommodates and facilitates racism by assuming an "objective, color-blind" perspective on race that eliminates the perspectives and narrative voices of the very people who are disadvantaged by racism (Crenshaw 1989). Other critical race theorists draw on cognitive psychology theories of implicit bias to challenge legal assumption of conscious, intentional prejudice as the foundation of racial justice jurisprudence established by the US Supreme Court in the equal protection clause of the US Constitution. Critical race theorists developed a distinctively skeptical narrative voice and hermeneutical practice in identifying subtexts and embedded bias such as labeling mass incarceration as "the new Jim Crow" or the multilateral regime of the World Bank and World Trade Organization as instrumental in perpetuating poverty and political instability in sub-Saharan Africa (Alexander 2011–2012; Gordon 2006). Critical race theory has expanded racial thought and discourse beyond the black/white paradigm within and beyond the United States to identify and examine various forms of categorical exclusion and disadvantage based on essentializing group characteristics (Harris 1990). As a body of thought, critical race theory treats race as one axis of a socially constructed system that perpetuates a social hierarchy advantage for white males with cascading, interlocking disadvantages for everyone else.

Feminism in Three Waves

The feminist movement is generally historicized as three waves. *First-wave feminism* emerged in the nineteenth century to focus on equal contract and property rights for women, opposition to chattel marriage, and ownership of married women (and their children) by their husbands. By the end of the nineteenth century, activism focused primarily on gaining political power, particularly the right of women's suffrage. *Second-wave feminism* emerged in the 1960s through the 1980s with a push for women's equality that revolutionized the legal status of women and legal framework of gender relations throughout North America, Europe, and much of the industrialized world. *Third-wave feminism* emerged in the 1990s in diverse post-modern, post-structuralist challenges to what were perceived as essentialist, white, middle-class biases and limitations of earlier feminist thought. Feminist theory emerged from these feminist movements to create feminist subdisciplines in a variety of fields such as geography, history, economics, and literary criticism.

Postfeminism

The term "post-feminism" surfaced in the 1980s to describe a backlash against second-wave feminism. While not "anti-feminist" in the belief that women have achieved second-wave goals, postfeminist thought includes a wide range of theories that take critical approaches to previous feminist discourses. Some postfeminists believe that feminism is no longer relevant to today's society; others largely agree with the goals of feminism, but do not identify as feminists. Some contemporary feminists consider feminism to hold simply that "women are people" and are therefore highly critical of views that separate the sexes rather than unite them, considering such views to be sexist rather than feminist.

Intersectional Feminism

The Merriam-Webster dictionary added the term “intersectionality” in 2017, defined as “the complex, cumulative manner in which the effects of different forms of discrimination combine, overlap, or intersect.” Legal scholar Kimberlé Crenshaw is generally credited with coining the term in a 1989 essay, asserting that “because the intersectional experience is greater than the sum of racism and sexism, any analysis that does not take intersectionality into account cannot sufficiently address the particular manner in which Black women are subordinated” (Crenshaw 1989). Crenshaw builds on the conceptual work of other African American feminists such as Patricia Hill Collins and Audre Lorde examining the “domination matrix” of interrelated vectors of subordination (Collins 1990/2002).

Gender Equity and Equality

As feminism evolved, discursive terminology was refined to reflect greater precision of thought about the nature of differences and similarities defining the roles and relationships of men and women in society. The rhetorical use of “gender” rather than “feminism” emphasizes the socially constructed, non-binary, relational context of human sexual identity and roles. In 2000, the United Nations Educational, Scientific, and Cultural Organization (UNESCO) differentiated gender equity and gender equality in summarizing global progress for women’s equality.

Intersectional Epistemologies

How do people know what it means to be human? Intersectional epistemologies challenge the premise of objectivity as a defining feature of human knowing and knowledge to insist that all human knowing is socially located. Phenomena such as skin color or hair texture are observable empirical facts, but the meaning of these phenomena in a system of knowledge is a subjective, socially contextualized interpretation of factual evidence. The salience of race, ethnicity, gender, and sexuality as categorical determinants of humanness is universal in its occurrence, but culturally specific in their interpretative patterns of social hierarchy, both in subjective knowing and in the analytic categories and epistemic practices of knowledge construction about human ontology. Humans are socialized to know themselves and others as human based on specific culturally defined characteristics and social hierarchies of humanness. Centuries of western cultural knowledge have defined women and non-Europeans as inferior to European men in the social hierarchy of humanity. Intersectional theorists assert that disciplines of law, philosophy, religion, sciences, and humanities have been – and continue to be – instrumental in confirming and perpetuating socially constructed knowledge about race and gender.

Gender epistemologies emphasize the salience of gender and sexualities as determinants of subjective knowing and analytic determinants of knowledge construction based on ways that knowers and epistemic practices of knowledge creation are enmeshed in specific culturally and historically gendered social hierarchies. Gender epistemologies challenge the premise of objectivity as a defining characterization of human knowing and knowledge to insist, rather, that all human knowing is socially located.

Intersectional Ethics

Epistemologies determine axiology and ethics. What one knows to be true about a person or group of people may be based on first-hand observation of factual evidence, but subjective interpretation and inference about the meaning of observations are largely determined by socialization processes by which all humans internalize cultural knowledge, norms, and patterns of social stratification. The notion of human equality is a modern ideal that stands in stark contrast to long-standing norms of social order in many traditional cultures. Indo-European cultures, for example, are embedded with tripartite social structure idealized in Plato's *Republic* as philosopher-kings, warriors, and merchants, in Europe's noble, bourgeois, and peasant classes, and legislative, judicial, and executive branches of US government. While not unique to Anglo-American societies, stigmatization of skin color and racial identity endures, particularly in the United States, as a legacy of slavery and slave trading. Stigmatization and marginalization of religious and ethnic minorities, homosexuals, and transgender persons are a common practice upheld in some societies through legal strictures and punitive law enforcement. Subordination of women is nearly universal in both traditional and contemporary cultures. All of these social hierarchies reflect a value system that normalizes classification and devaluation of people based on categories of attributed difference interpreted as deficiency. The ethical lens of intersectional analysis and practice, therefore, seeks to understand, deconstruct, and eliminate this type of social stratification in promoting universal human freedom.

Counter Perspectives on Intersectionality

Intersectionality challenges conventional assumptions and beliefs about business and society (e.g., biological determinism of the gender binary, race, and ethnicity; confidence that individual agency can overcome barriers to achievement; belief that market competition creates a level playing field). While the term "intersectionality" rarely appears in popular or business press, opponents of intersectional thought sometimes express their views in acerbic critiques that trivialize or ridicule the damaging effects or even the very existence of racialized and gendered social hierarchies, discount supporting evidence as misinterpretations of normal social relations, and warn (correctly) of the threat such ideas pose to long-standing religious, cultural, and intellectual traditions and the social order of modern society.

As a critical discourse and practice, intersectionality does, in fact, seek to dismantle social hierarchies that burden multiple layers of disadvantage on women of color and others whose differences – disabilities, personalities, learning styles, and physical characteristics – place them outside the normative typological range of legitimate human power and success. The structures and practices of disadvantage have evolved from the draconian scenarios of physical violence, hate speech, groundless termination, and categorical exclusion (although these still occur), but the more subtle imposition of dominant cultural norms of subjective social location that assume everyone aspires to think, act, and *be* some version of the white, privileged Eurocentric males who were the architects of western social, political, and economic institutions.

Nowhere is the drama of intersectionality more evident than on college and university campuses where students (and some young faculty) call out "microaggressions" and "structural bias," demanding "trigger warnings" and "safe spaces" that affirm and foster the legitimacy and value of diverse subjective locations in the academic community. As this renegotiation of campus social polity plays out, critics lament the disruptive threat to the vigorous intellectual tradition of free speech and debate that has been a hallmark of higher education for centuries. Frank Furedi, an emeritus professor at Kent University in England, articulates this critique but fails to acknowledge critical theory or demonstrate an understanding of intersectionality as a body of thought in claiming that students are handicapped by overprotecting them from dynamic discursive give and take that is the foundation of free speech and intellectual freedom, thus preventing them from taking their place as full agents in the community thought leaders (Furedi 2016). Given their stake in higher education as employers and colleagues, the views of business leaders are of considerable consequence for the future of business performance and workplace culture. Dozens of rancorous reader responses to Daniel Schuchman's review of Furedi's book in *The Wall Street Journal* express intense but superficially informed opposition to social dynamics of inclusion in campus life. These critics raise salient points about intellectual rigor and freedom that warrant robust discussion with a deep understanding underlying principles, methods, and practices of intersectionality.

Intersectionality and Business Legitimacy

Legitimacy is a precondition of a company's license to operate in society, but notions and processes of legitimacy evolve in relation to society (Rendtorff 2018, p. 46). Theories of business consistently emphasize its social purpose, not simply as a philanthropic agent but as an instrument of the common good. Defining the purpose of business determines its legitimacy and evaluative criteria. What purpose legitimates business as a human activity? In addressing this question, Duska captures the crux of contested shareholder versus stakeholder views by distinguishing between purpose and motive, arguing that the purpose of business is to produce goods or services and its motivating force is the reward of profits (Duska 1997). As the tide of business opinion has shifted to a stakeholder view of business purpose, the legitimating question has become "What does it mean to do a good job of providing goods and services profitably (Freeman et al. 2010)?" Asserting that "corporations are what they do," Preston, Post, and Sachs argue a stakeholder view that a business "license to operate" depends on the ability to mobilize resources to create wealth and benefits for all the diverse constituencies that contribute to making the business a success. Porter and Kramer extend the stakeholder view to define shared value creation as the purpose of the corporation to economic value that also produces value for society by addressing its challenges in three ways: reconceiving products and markets, redefining productivity in the value chain, and building local industry clusters (Porter and Kramer 2011).

In an interconnected global society, the concept of business legitimacy is fluid and sensitive to diverse local value orientations as well as growing concerns about the role of business in addressing global challenges such as climate change, wealth and income inequality, human rights, and civil unrest. Nobel Laureate Amartya Sen's capabilities approach to economics demonstrates that the development and exercise of human capabilities are both the means and the telos of human freedom (Sen 1987, 1999). Intersectional thought and values illumine key factors that legitimize business as a social and economic institution: human development, business performance, and economic development. This virtual cycle reinforces the legitimacy of business.

By expanding the parameters of social justice and inclusion, intersectional thought promotes the full development of human capabilities and freedoms for all persons. The convergence of global capitalism, urbanization, and financialization have generated unprecedented wealth by rewarding those who are most successful in acquiring and investing capital, but it has also created exclusionary economies of inequality. Historically, cities have been incubators of wealth spurred by growth in production and trade, but millions of urbanites are poor, overwhelming cities with the challenges of building and managing sustainable material, administrative, and social infrastructures for a rapidly expanding population. A risk-averse focus on short-term profitability and investment returns has created urban markets of concentrated wealth and investment while withholding capital and starving business development considered high risk – often women and racially or ethnically marginalized, low-income people, neighborhoods, and remote rural areas.

Business and management research consistently demonstrates that diverse workforces and work cultures foster innovation, creativity, and performance (deJong and van Houten 2014; Qian 2013; Herring 2009; Horwitz and Horwitz 2016; Hunt et al. 2018). Social determinants theory, on the other hand, demonstrates how bias and exclusion create functional disparities that further diminish the capabilities of people who are already disadvantaged (Marmot and Allen 2014; Flynn et al. 2018; Weil 2016). Emerging consumer, investor, and employee expectations of value integrity increasingly move beyond assurances such as fair trade and non-exploitative labor practices to include workplaces that place a high value on human talent and foster inclusion, engagement, and transparency. Intersectionality provides the intellectual framework and tools for expanding and enriching the pool of human talent at all levels and roles to optimize business performance and promote value integrity.

Improved business performance fosters a more robust, resilient economy enabling all people to participate in and enjoy the benefits of prosperity. Rather than saturating the same markets with capital, investment and business development in diverse people and communities can create new markets and prosperity that provide more and better goods to meet distinctive needs of people ill-served by or excluded from existing markets (Christensen et al. 2019). The transformative potential of a Fourth Industrial Revolution to promote business as a platform for the flourishing of humanity and the planet can only be realized by including the entire world (Schwab 2016). Intersectional ethics assert the priority of human moral claims on resources required for development and exercise of their capabilities, enabling marginalized people and communities to participate more fully in an economy that works for everyone and every place on the planet.

Conclusion

Intersectionality is a critical approach to understanding and deconstructing how power and privilege are distributed in society and social institutions. As a vital social institution, business reflects the power structures and practices of society. The power structure of an increasingly interconnected global society is changing with a steady shift in global wealth to the east, a diminishing share of global wealth in the west, and postcolonial challenges to Euro-American social and political dominance. While nationalistic retrenchment may be tempting for some, human ingenuity has created a global commons connected by technology, a planetary ecosystem, and a shared economy that makes humanity inexorably interdependent. Intersectionality provides a vision and tools for business to adapt to the unprecedented demands and opportunities of the global commons for the flourishing of humanity and the planet.

Cultural Contradictions of Business Legitimacy

82

Marianne Thejls Ziegler

Contents

Abstract

The legitimacy of business has been influenced by two parallel developments in the second half of the twentieth century. The first is the economic development of increasing welfare during the first decades after WWII. This so-called Golden Age lasted until the early 1970s and was followed by the rise of a globalized economic system. The second is the cultural development of anti-capitalist ideals during the 1960s and 1970s student movement. The students of the New Left protested against consumer society and promoted anti-capitalist intellectual ideals. These ideals have penetrated society at a cultural level, but not at the level of citizens' practical lives.

This chapter distinguishes formal from informal legitimacy as characterizing two realms of society: one of practical lives where citizens support the liberal economy and the other of culture characterized by critical attitudes toward business and consumerism. R.E. Freeman's invention of the stakeholder concept

in 1983 illustrates the attempts of business to communicate with an increasingly critical public. However, this attempt is met with resistance because the New Left has set a radical polarity between the business elites and the middle and working classes, thus undermining the possibility of dialogue across social and economic divisions. This social division has deepened owing to business taking advantage of (and occasionally abusing) the increasing freedom to operate internationally and the wages for western working and middle classes stagnating due to the increase in global labor supply. Recent political developments should serve as a warning of potential consequences of increasing social division and discourage businesspeople from misconduct in return for a wider cultural acceptance of the connection between consumer behavior and business opportunities.

Introduction: The Cultural Rejection of Business Values

Business has, in recent decades, gathered an impressive list of corporate scandals from Enron and WorldCom, privatizing profits of socializing losses of the subprime crisis and corruption cases up to the latest fraud of Dieselgate. The scandals have placed further strain on an already difficult relationship between privileged owners of means of productions and their employees. The parallel development of globalization perceived to be exclusively to the advantage of the corporate world and the misconduct of businessmen have damaged not only the image of the corporations but also increased the tension in the relationship between the elite in general and the populations of Europe and the United States. The general decrease in the legitimacy of business and the elite has fertilized the grounds for political populism, a tendency that should serve as a warning of potential consequences of losing trust between population and economic and political decision makers.

Public indignation has triggered responses at two levels. It has amplified the density and complexity of legal regulation. The financial sector in particular is suffering from the consequences of legal regulation causing excruciating workloads and reducing business opportunities. Thus, every bank in the European Union is legally required to comply with 40,000 EU regulations. The Basel III Accords, providing recommendations that G20 countries are expected to implement in their regulation of the banking sector, contained 4001 rules on 34,091 pages (Schulte-Mattler 2016). Paraphrasing the American philosopher and mathematician R. Edward Freeman, a business that does not look after its stakeholders is soon to be regulated into decline. This is happening to the banking sector at this very moment. In addition, public pressure has forced the corporate world to increase its focus on integrity and compliance, ethical conduct, and sustainability. Sustainability reporting has been a standard procedure for larger corporations for many years and since 2017 EU businesses with 500 employees or more are legally required to produce annual nonfinancial statements.

This chapter will place this development in a wider context. The corporate world's loss of legitimacy is only the latest chapter in a longer process with more complex and interconnected causal connections, including the struggle between two social forces: a moral and intellectual force on the one hand and the "propensity to truck, barter, and exchange one thing for another" to use the words of Adam Smith on the other hand. The second social force, described in this charming manner, also includes the desire to win in competitive interaction with fellow citizens and the desire to accumulate wealth and increase status by getting access to consumer goods. Thorstein Veblen's *The Theory of the Leisure Class* from 1899 promoted the concept of "conspicuous consumption" and exemplifies one of the earliest criticisms of modern consumerism. The concept describes how conspicuous luxury consumption, i.e., consumption with which the person can show off in public, is used for social differentiation by owners of the means of production.

The freedom to pursue personal gains combined with increased specialization and division of labor has caused an immense increase in wealth, but it has also created winners and losers. In spite of the overall increase in material wealth, the polarization has caused antagonism and general doubt regarding the overall justice of the system. Moral and intellectual voices in our culture have criticized social inequality, but these voices have also been an ardent critic of materialistic values of society in general. The conflict between the call for a more even distribution of wealth and the basic rejection of consumerism and capitalism in general is a central theme of this chapter. On the one hand, critics of capitalism blame businesspeople for exploiting labor, i.e., for not paying fair wages. On the other hand, materialism, i.e., the urge to possess consumer goods, is evaluated negatively. The development of this cultural conflict will be outlined in this chapter.

The criticism of materialism and the desire to accumulate wealth can be traced back to Aristotle, but the focus will be on both economic and cultural developments in the timespan between the end of the WWII and the present day. The legitimacy of business is rooted in the relationship between European employees and their employers, and this relationship has been influenced by cultural changes originating in the 1968 student movement and by the process of globalization. The corporate world's lack of legitimacy is, in my opinion, not only a consequence of its own misconduct but also a result of cultural developments in the western world since WWII. These changes include the rise of a cultural and intellectual elite with strong antipathy for consumer society and free market economy.

Formal and Informal Legitimacy

The literature on legitimacy normally distinguishes between political and moral legitimacy. Political legitimacy refers to the exercise of political power. Thus, for a person with a democratic mindset, the political legitimacy of a government is based on the acceptance of subjects who have voluntarily entered society and subjected themselves to shared laws for mutual benefit. The understanding of society as an informal agreement between free citizens is referred to as social contract theory. In the western world, political power is exercised by elected members of the parliament. The legitimacy of a country's laws is therefore derived from the legitimacy of political power to legislate in consideration of the citizens' interests. Citizens comply with the laws of the country on a voluntary basis because they trust politicians to legislate in their interest. This social contract enables societies to be ruled with minimum law enforcement and the high level of mutual recognition and trust reduces transaction costs at every level of society for the benefit of all citizens.

The chapter will distinguish between formal and informal legitimacy. The distinction has been chosen in order to detach the legitimacy of business from the world of politics. In this manner, the legal framework for conducting business can be grounded in the formal acceptance of the population in so far as this discussion is limited to western democracies. Businesspeople have formal legitimacy as long as they pursue their aim within the politically legitimate legal framework. When citizens vote for political parties in favor of a free market economy, they give business license to operate within this framework. The conduct of business is formally legitimate as long as businesspeople comply with the law. "Informal legitimacy" replaces "moral legitimacy" because the expression "moral" is perceived as a contradictory with the term business. Business is not benevolent, unselfish, or generous. The informal legitimacy is granted or perhaps more often not granted on the basis of personal moral evaluations, so in this context, the expression would neutralize the concept of legitimacy. In other words, the validity of the moral devaluation of business is exactly what will be questioned in this chapter. Business is not generous, and thus the legitimacy granted by the population in their acceptance and recognition of the endeavors of business cannot be based on it exhibiting these characteristics.

The corporate world of western societies has, in the decades up to the financial crisis in 2008, been given extended liberties in the form of reduced trade barriers and light touch regulation from the financial markets. The liberties indicate recognition of business' ability to create wealth in an increasingly competitive global environment. Business is here enjoying the benefits of formal legitimacy. At the informal level, i.e., the cultural level, business is granted less legitimacy. At the level of informal legitimacy, i.e., at the level of social values, the endeavors of business are rejected as incoherent with primary moral assumptions. A strong voice in our society rejects the moral legitimacy of the ambition to accumulate capital and the desire for income-based social status. It rejects the moral legitimacy of conspicuous consumption, a phenomenon that often follows in the trail of success in the world of business. However, at the formal level, that of the legal framework, business is allowed to work its successes and failures because alternative economic systems are yet to prove their superiority.

Formal legitimacy, i.e., the legitimacy derived from political legitimacy, does not always coincide with social values or what is here referred to as informal legitimacy. If legislation is changed with reference to a common sense of justice, the justification is invalid. Citizens' sense of justice in modern society is heterogeneous (Andersen et al. 2015), and their social values in general contradict each other as they circulate society offering themselves to different interpretations of power relations, distribution of resources, specific events, etc.

The social values and laws of a society are connected, but the causal connection between the two is mediated. Thus, citizens' perceptions of justice and fairness are represented in the parliament via the political representatives, and the general sense of justice and fairness influences the socialization of the individual. A legal system must be coherent in order to function properly, but informal legitimacy is derived from norms of society, and within all but the smallest and most homogeneous societies, a variety of different opposing moral values coexist side by side.

Formal Legitimacy in the Framework of Order Ethics

The level of business legitimacy has a set of corresponding values reflected in liberal economic theories. The philosophical theory of Order Ethics exemplifies the articulation of a set of values legitimizing the endeavors of business. In the principles of Order Ethics, one recognizes basic ideas of western European social liberalism. The productivity of free enterprise can unfold within a system of legislation ensuring that consequences are to the long-term benefit of society as a whole.

Traditional business ethics attempt to curb the greed of business people and reduce their ambition to accumulate capital. Order Ethics approach the issue differently. The theory understands the modern liberal economic system as a natural manner for citizens to interact in a globalized world. This interaction is characterized by prisoners' dilemma structures, where individuals are incentivized by self-interest. Due to prisoner's dilemma structures in modern society, traditional ethics as self-restraint or self-denial will always loose out to other more scrupulous citizens. Utopian ideals of how citizens should relate to each other are unproductive. In a society with prisoners' dilemma structures, the voluntary abstinence or "moral surplus" (Lütge 2015) will be inefficient in so far as the lost business opportunity will be used by another player. Order Ethics therefore takes a pragmatic approach; instead of lamenting the selfish nature of human beings, the theory aims at identifying what holds society together, a society of citizens incentivized by self-interest. The approach gives associations to Machiavelli's warning that he who neglects what is done for what ought to be done sooner effects his ruin than his preservation.

The criterion for good ethical principles and rules is not coherence, Christian values, or intuitive approval. Instead the criterion for ethical rules or principles is the extent to which they can be implemented in a society of citizens pursuing their own interests. The basis of Order Ethics is the social world as it is. Thus, fundamental features of modern globalized society are identified upon which ethical principles are evaluated regarding the extent to which they can be implemented, i.e., with regard to the extent to which it is possible to make them part of an order framework within which agents are incentivized to act in accordance with these ethical rules:

> Modern societies [. . .] are societies with continuous growth. This growth has only been made possible by the modern competitive market economy, which enables everyone to pursue their own interests *within a carefully devised institutional system*. (Lütge 2015)

Order Ethics accepts modern, liberal society in its fundamental nature and sets the task of politicians to create an order-framework capable of incentivizing people to pursue the goals of their business in accordance with ethical norms of society.

The inadequacy of appealing to individual restraint is particularly visible at the level of the globalized economy. The key to avoiding future financial crises is not the attempt to abolish the desire to accumulate capital, but to change legislation. Thus, the Basel Accords, mentioned in the introduction, provide recommendations on banking regulations for the purpose of reducing exposure to risks in the case of unexpected losses. The recommendations are implemented by the G20 countries plus Singapore and Hong Kong for the purpose of creating an international regulatory framework within which banks can pursue their business on equal terms and in accordance with ethical standards of the global community. A second example is the call by international oil companies for a global carbon tax. IOCs share responsibility for the emission of greenhouse gases and suffer the consequences of divestment and inability to attract talent (Stevens 2016), but the expectations of society cannot be met at the level of the individual IOC, instead they must be met at the level of global regulation. Alternatively, Shell would suffer a competitive disadvantage to the benefit of, for example, ExxonMobil or Saudi Aramco.

Order Ethics therefore returns the moral responsibility for the development of society to its citizens and their politicians. It is not the responsibility of the individual firm or business person to abstain from business opportunities for the sake of the common good. Order Ethics grants citizens the freedom to develop talents and skills in competition with others and the freedom to cooperate. When the institutional system enables citizens to pursue others to the benefit of others, then the order framework is ethical.

The next section will look into informal legitimacy. The informal legitimacy is connected to ethical norms of society. These norms are of a far more intangible and heterogeneous nature than the legal framework of a society for which reason the portrayal of these values will be embedded in a draft summary of the historical development since 1945. The purpose is to illustrate the coexistence in modern society of two radically opposing and incompatible values. These values not only characterize a division in society, they also coexist within the same people.

Informal Legitimacy and the Moral Disapproval of Business

The chapter attempts to demonstrate that that social values are incoherent in so far as business is granted formal legitimacy, but at the informal, cultural level, business is met with disapproval. The reason for this disapproval can be found in the success criteria of businesspeople which is the maximization of profit.

The “we” of society that disapproves is not every single person, but rather the substantial part of the population that can be characterized as cultural consumers. The American writer Patricia Martin describes how, contrary to prejudice of intellectual elites, a substantial part of the population is interested in art, literature, history, politics, etc. She refers to this group as cultural consumers. (Martin 2007) Business’ lack of informal legitimacy can be traced back to a century-old preference for the mind over the body exemplified in Plato’s cave allegory where the empirical world is only shadows of the truth and to St Augustin’s radical separation between the body and soul with the body as the locus of sin. In this approach to modern anti-capitalism, it will suffice to look at developments and tendencies of the second half of the twentieth century.

Inventing of the Stakeholder

R.E. Freeman published his groundbreaking book on strategic management in 1983. The book had the subtitle *A Stakeholder Approach*. A stakeholder is any group or individual who can affect or is affected by the achievement of the organization’s purpose, such as employees, consumers, creditors, local communities, NGOs, etc. Freeman initiated a fundamental change in how the role of corporations in society is perceived. Instead of the shareholder approach, propagated by Milton Friedmann in his *New York Times Magazine* article from 1970 *The Social Responsibility of Business is to Increase its Profits*, Freeman suggests taking the interests of all stakeholders into consideration. Exclusively serving the interests of shareholders is not coherent with the long-term interest of business. Thus, Freeman changes the managers’ task from maximizing profits to aligning the interests of stakeholders.

Today the stakeholder concept has become part of, if not of everyday language, then at least of the general social discourse on management and the role of corporations in society. The soundness of taking stakeholder interests into account is no longer questioned, but when looking at the concept of stakeholder management in its historical context, it becomes clear that the concept is also symptomatic of more fundamental and groundbreaking cultural changes in society in the second half of the twentieth century. These cultural developments have changed the landscapes in which businesses of the western world are performing, and they have increased the requirements of businesses to justify themselves.

At the time when Milton Friedman wrote his famous article in the *New York Times Magazine* in 1970, there were early signs that the so-called Golden Age was coming to an end. During the first decades after WWII, many European countries had succeeded in a close cooperation between employers, trade unions, and governments. These tripartite partnerships worked in particular in countries like Austria, Germany, Holland, and Scandinavia. It was a postwar bargain of wage restraint in return for retention of profits. Employees were willing to moderate their wage requirements on the condition that profits were reinvested in the corporation instead of being paid out as dividends to the shareholders. This postwar bargain combined with the need to repair wartime damages enabled almost three decades of unprecedented, sustained economic growth and paved the way for what became known as the European social model, characterized by high living standards, good working conditions, and job security. (Eichengreen 2007)

As the labor market tightened and memories of the 1930 Great Depression faded in the late 1960s, so did the willingness of workers to restrain their requirements in return for economic growth and high employment rates. Simultaneously, Japan and Taiwan experienced their own economic miracles forewarning western countries and in particular western employees that they would eventually be losing their privileged position and become exposed to fierce competition in a future globalized economy. As oil prices quadrupled in 1973 due to OPEC's oil embargo of countries supporting Israel during the Yom Kippur war, Europe and the United States had reached a turning point. From the 1970s, western economies experienced a decline in growth, unstable currencies, inflation, and unemployment.

The New Left

The economic stagnation announced the end of the postwar bargain, but around the same time, a new political and cultural movement of young students gained momentum. The rise of the student movement may have been reinforced by economic slowdown, but the protests were aiming at more fundamental features of society and culture. The seeds were laid in the early 1960s America, where young people joined the civil rights movement and protested against the Vietnam War and the Cold War. By the end of the 1960s, the movement had spread to Europe. The central aims of the protests were confrontation with authorities, anti-capitalism, anti-consumerism, sympathy for Marxism, pacifism, and sexual liberation. As the movement progressed, it was influenced by more local circumstances. In France, students occupied universities in protest against capitalism and consumerism; the unrest spread through society and initiated a general strike in which 11 million workers participated. In Germany, the movement was preoccupied with *Vergangenheitsbewältigung* (i.e., coming to terms with the past) and with the eradication of what might have been left of a totalitarian mindset among the children of murderer. As an offshoot of the German student movement, the Red Army Faction engaged in bombings, bank robberies, kidnappings, and killings.

In spite of national differences, the cultural changes initiated by the student rebellion were Pan-European. Politically, the movement was inspired by Karl Marx and current Marxist philosophers such as Herbert Marcuse and Jean-Paul Sartre, but the movement differed from more traditional class-struggle socialism of, for example, the 1930s. Until WWII, workers' movements had been fighting for higher wages and shorter working hours. In the late 1960s, though wage levels were still an issue, the workers had obtained much of what the former generation had fought for. The achievement posed a challenge for the New Left in so far as the proletariat had come to accept a materialistic, bourgeois lifestyle. The intellectuals of the student movement saw the rising standards of living as a new means of suppression and as a manner in which the ruling elite would pacify citizens with consumer goods in order to prevent them from revolting.

Business Legitimacy and the New Left

The most prominent protagonist of this interpretation of the European welfare model was Herbert Marcuse (1898–1979). In his book *One-Dimensional Man* from 1964, he interpreted capitalism as a new kind of totalitarianism and the success of capitalism in creating wealth for every one as an illusion. Thus, the New Left continues its fight for workers' rights, but the dichotomy has changed. According to the New Left, the postwar bargain is not a victory for the working classes, nor does worker representation on the corporate board of directors increase their influence over the means of production. The compromising integration of workers interests was only a new kind of domination, where false needs are superimposed by an economic elite:

> A comfortable, smooth, reasonable, democratic unfreedom prevails in advanced industrial civilization, a token of technical progress. Indeed, what could be more rational than the suppression of individuality in the mechanization of socially necessary but painful performances; the concentration of individual enterprises in more effective, more productive corporations; the regulation of free competition among unequally equipped economic subjects. (Marcuse 2002)

The loss of freedom is compensated by consumer goods and modes of relaxation which only prolong the stupefaction (Ibid.) Business interests manipulate suppressed citizens into a docile existence, meaning the subject, who has adopted a materialistic life, can no longer trust the rationality of her own judgment.

The development from traditional class struggle to this new dichotomy between manipulator and victim changes the cultural landscape of western society. The subject is no longer exploited at the material and physical level, but manipulated at the mental level. The dichotomy is set up between insight and lack of insight. The consumer believes himself to be happy, but he lacks the insight to understand that he is not; the critical intellectual understands that materialism prevents a person from developing her true potential. The worker has morphed into a helpless victim, oblivious to her own status as exploited victim manipulated by business into buying things, she has no need for. A radical version of this dichotomy is illustrated in the science fiction film Matrix, where the earth has been taken over by the very machines humans have created. Humans are enslaved and used as batteries while their brains are given the illusion of living in a real world. In the same manner, the modern citizen is exploited by the capitalist elite and made to believe that they have a good life. It is deception that enables the elite to exploit the worker. Presuming that the welfare society is not a matrix but a real, natural world, the transposition of the dichotomy to the mental level disconnects the criteria for suppression from the natural world. The claim that the consumer is being deceived becomes impossible to falsify in so far as any acceptance of consumer society is seen as a sign of intellectual deficiency.

In spite of Herbert Marcuse's revelations, western Europe did not turn Marxist. However, the student movement demonstrated courage and perseverance as they challenged authorities and values, and through their activism, they created new role models for other citizens to follow. In the years to come, the movement's followers took over positions in educational and cultural institutions, whereby their ideas and ideals permeated society. Anti-capitalism has been a faithful companion of industrialization in its different stages, but the significance of these ideas has been changed and intensified by the New Left.

Skepticism toward capitalism spreads as a general cultural assumption and as a sign of open-minded, critical, and humane intelligence. Though Marcuse's discourse may appear anachronistic, it has left permanent traces in the perception of capitalism and the role of business in society. It may not claim that consumers satisfy false needs, but the dichotomy between intellectual intelligence and insight manifests in skepticism toward business, toward the motives of business persons and the lifestyles of businesspeople on the one hand and the lack of insight associated with consumerism and identification with the endeavors of business which remains on the other hand.

The American sociologist Daniel Bell explains in his work from 1976 *The Cultural Contradictions of Capitalism* how the bourgeoisie has accepted bohemian and fundamentally anti-bourgeois values because bohemians had come to dominate the social realm of artistic expression (Bell 1996). Art is defined as that which challenges established assumptions and values. A bourgeois society can only produce anti-bourgeois art, but since art is also the utmost product of intellectual refinement, in itself a bourgeois value, the bourgeois can only be a person of intellectual refinement by becoming anti-bourgeois. Bell traces the bourgeoisie's incorporation of bohemian values back to the early twentieth century, but the suggestion here is that European culture has gone through a similar process regarding the political and moral values of the New Left. Middle classes live consumerist lives in capitalist societies while intellectually and morally identifying with anti-capitalist and anti-consumerist values originally propagated by intellectuals of the New Left. The bourgeois who identifies with his or her own consumerism is perceived as a superficial personality lacking in intelligence.

The coexistence of conflicting values, not just within society but within the people themselves, adds a dimension of complexity to the question of the legitimacy of business. Marcuse lamented the "flattening out of the antagonism between culture and social reality as a liquidation of two-dimensional culture" (Ibid., p.60). However, the question is if not the one-dimensional man should rather be described as the ambivalent man. For the ambivalent man, cultural ideals are disconnected from his factual life. At the formal level, the citizen confirms the legitimacy of business through her lifestyle and voting behavior. At the informal level, she identifies with cultural and intellectual values opposing those of business.

Marcuse's dichotomy between those who understand and those who have been manipulated and deprived of their intellectual capacity is a polarization between the powerful and the powerless. In this case the economic and political elite of the capitalist system has not only the power but also the intention to manipulate the citizens. Business is almighty but inherently morally wrong and the individual is helpless but morally superior. From this point of view, business ethics is an oxymoron, corporate social responsibility a public relation tool, stakeholder management an aspect of risk management, and moral integrity of a businessperson an absurdity. From this point of view, there can be no rational dialogue between business and population.

The portrayal of citizens as disempowered has consequences for the distribution of responsibilities in so far as the polarization releases citizens of responsibilities. The topic of consumer responsibility is only gaining significance in the recent years, as the acute challenges of global warming appear to dawn on the population, for example, in the emergence of environmental vegetarianism.

Stakeholder Management in Limbo

This historical development adds a dimension to Freeman's stakeholder concept. By the early 1980s, western European economies were still struggling. American and European businesses were operating in an increasingly hostile environment economically as well as culturally. Even though economic growth and conditions for business were set to improve during the late 1980s and 1990s, the culture had changed for good. The importance of the stakeholder concept grew because a skeptical population increased their requirements to corporations (Freeman 1983).

The disagreement between Shell and Greenpeace concerning the fate of the Brent Spar oil storage buoy was among the first prominent European cases of a corporation experiencing the consequences of not taking stakeholders seriously. In 1995 Shell had been granted permission by the British Department of Trade and Industry to sink the redundant oil storage container in the Atlantic Ocean. Greenpeace replied by organizing a consumer boycott of Shell gasoline stations across northern Europe. Shell had acted under the presumption that formal legitimacy, in terms of the legal permission, would suffice, but the presumption was wrong. For the first time, they experienced the might of a mobilized public (Jordan 2001). After an intense public struggle, Shell gave in and Brent Spar was towed off to Norway where parts of it were used to fortify the harbor of Mekjarvik. In the aftermath of the crisis, the director of Shell, Heinz Rothermund, concluded:

> Brent Spar will enter history as the symbol of our failure to establish our position and connect in a meaningful way with a wider audience. (Rothermund 1997)

The Brent Spar case illustrates the predictions of R.E. Freeman that the cultural and political environment of business was changing, but it also became clear that this was a battle business could not win. Freeman's solution presupposes that opposing interests could be reconciled in dialogue. However, in the case of Brent Spar, no scientific evidence and no appeal to proportionality could have changed the indignation of a public that perceived big business to be part of a conspiring elite. No dialogue with Greenpeace could have prevented the boycott of the Shell gasoline stations.

Freeman's concept of stakeholder management differs from the concept of social responsibility that Milton Friedman targeted in his article from 1970. Where Friedman constructed a concept of social responsibility as corporate philanthropy with the purpose detached from that of the business (a concept easy to criticize), Freeman reduces stakeholder management to serving the long-term self-interest of the corporation. He thereby aligns stakeholder management with the interests of business. Business recognized its dependency on a stable society with business-friendly policies, and Freeman constructed an idea of social responsibility that was digestible for business because it could be aligned with their aims of maximizing profit.

During the late 1980s, 1990s, and 2000s, western economies experienced a new era of growth with only minor setbacks. In the United States, technological innovation combined with deregulation of the financial sector and the free trade agreement NAFTA fueled the American economy just as European economies profited from economic integration, innovation, globalization, and international capital mobility. However, the economic gains have not been evenly distributed. Due to increase in global labor supply, the working populations of western countries have not benefited from this development to the same extent as the economic elites. The development has put strain on social cohesion in Europe as well as in the United States. At the same time, the fall of the Soviet Union deprived the workers of a viable alternative economic system. Thus, the current world order is referred to as the neoliberal hegemony: the all-encompassing dominance of globalized liberalism. Slavoj Žižek tells an anecdote where Mikhail Gorbachev pays a private visit to the former German social democratic Chancellor Willy Brandt. He refused to open the door to the former general secretary of the communist party because he blamed him for the fall of the Soviet Union. Brandt was not a communist, but had understood that:

> the disappearance of the Communist bloc would also entail the disappearance of the West European Social Democratic welfare state. That is to say, Brandt knew that the capitalist system is ready to make considerable concessions to the workers and the poor only if there is a serious threat of an alternative, of a different mode of production which promises workers their rights. (Žižek 2015)

Such is the cultural environment in which business attempts to legitimize itself. Stakeholder management has been incorporated into business processes along with risk management, sustainability reporting, and systems for integrity and compliance. As a consequence, business can obtain formal legitimacy by complying with increasing regulation, but even if the increase in regulation and self-regulation is an adequate Order Ethics reaction to the misdeeds of business, compliance does not grant business informal legitimacy, i.e., the moral acceptance of society. Since stakeholder management aligns with the interests of business, it cannot bridge the opposition between the intellectual aversion toward business and the order ethical business legitimacy. In spite of its efforts, the attempts of business to justify itself are, if not completely in vain, then at least an up-hill struggle.

This ambivalence of society leaves stakeholder management in a limbo of inability to appease its critics. Other similar concepts and initiatives risk the same fate. The New Left of the late 1960s and 1970s rejected business when it failed and exploited its workers. It also rejected business for succeeding to provide workers with a high material standard of living. The transposition of the dichotomy from physical exploitation to mental manipulation, the matrix theory of modern consumer society, is a conspiracy theory where the consumer is deprived of her rationality. The only sensible reaction of the consumer is the radical rejection of capitalism. The position thus evades dialogue as well as debate, as does the idea of an elite not only defending their position of power but also conspiring to deceive the population.

Later public battles between Shell and Greenpeace confirm this failure to communicate. According to Heinz Rothermund's reference to Brent Spar as the symbol of their "failure to establish our position and connect in a meaningful way with a wider audience," one would expect Shell to have been prepared for the next confrontation with Greenpeace. In the early 2010s, Shell initiated test drilling in the Arctic. If Shell had meant to connect in a meaningful way with a wider audience, they failed again. The controversial nature of this project is apparent, but so is the contrast between the energy consumption of the populations of western societies and the public dislike for international oil companies.

Spillover of Informal Legitimacy

After the financial crisis of 2008, governments restored a tentative economic growth; however, bound by the conditions of the globalization economy, few governments have dared to change the distribution of benefits. A significant increase in salaries would undermine competitiveness and lead to unemployment, so the argument goes. The misbehavior of business, leading to the financial crisis of 2008, has caused an increase in regulation at least as far as Europe is concerned, but it has not changed the stagnation of wages for working and middle classes of society. In this setting an intriguing change in the relationship between lordship and bondage might be taking place.

In 1969 the grand old man of the German left-wing intellectual movement, Theodor Adorno, saw his lecture interrupted by women showing their breasts. A few months earlier, students had occupied the *Institut für Socialwissenschaft*. Adorno called the police and was subsequently accused of betraying his own cause. The anecdote illustrates the manner in which even an intellectual and critical culture can undermine its own authority and credibility by insisting on a conspiring elite. The followers of the student movement developed into an elitist establishment, but the role as uncontested authority has been destabilized by the core of their own ideas. The matrix theory of the relation between elites and subjects has denied the possibility of balanced communication across social and political divisions. It has denied that a dialogue between a business elite and a skeptical population is possible. Therefore, the theory has also undermined the possibility of a dialogue between an intellectual elite appealing to global humanity and a population of hardworking subjects losing out in a world of international competition. The matrix theory of left-wing intellectuals has not just undermined the authority of a bourgeois capitalist establishment. It has undermined the authority of establishment in general. In the dangerous cocktail of globalization, decentralization of information, and anti-elitism, the stage has now been left for populists harvesting the fruits of the student rebels' ideals.

The corporate world can defend its formal legitimacy by complying with rules and expectations at the order ethical level of society. Upholding formal legitimacy is vital as a license to operate. It can only hope to keep at bay the lack of formal legitimacy. The connection between formal legitimacy reflected in legislation and informal legitimacy reflected in the values that circulate society is, as already indicated, mediated by democratic procedures. Conflicting values can coexist as long as a critical mass of voters support a consensus. However, centrifugal forces of globalization in combination with a steady supply of corporate scandals reinforce the credibility of anti-elitist ideas to the extent of undermining social consensus. Current changes in the political landscape confirm that this tendency can threaten the freedom of business people to truck, barter, and exchange one thing for another. The extent to which business succeeds in maintaining the status quo with regard to formal, as well as informal, legitimacy will be decisive for its future license to operate.

Abstract

Innovation and bricolage activities are key processes in businesses that pose challenges for business legitimacy. The paper explores the concepts of innovation and bricolage and how they relate to business legitimacy. The paper shows how legitimacy concerns both the outcome of innovation/bricolage and the process. Key findings are that bricolage activities, i.e., solving problems by available resources, can be linked with master frames such as sustainability and circular economy that render legitimacy. However, bricolage activities are also just plausible ways of coping with limited possibilities in resource-constrained environments that may be socially recognized. Yet, the very same frames that make innovation and bricolage activity legitimate also constitute cultural repertoires for criticizing innovation and bricolage activities.

Introduction

This article discusses the intertwining of three business processes: innovation, bricolage, and legitimacy. The concept of innovation has long been used to study how businesses survive; develop products, services, and experiences for customers; and create societal outcomes such as employment or sustainable solutions. The literature shows that innovation comes in various forms. It is not necessarily R&D-based, technology-driven, and linear. Rather, it can also emerge from practice, experiences, and interactions between people. Some innovations emerge from social communities, small businesses, and interactions between employees and users that seek to make use of available resources and limited possibilities. Innovations may challenge institutional structures and can have little legitimacy in an organization and beyond. To explain and exploit better the advantage of such bricolage activity and the role of the bricoleur as a problem-solver, there is a need for a conceptual clarification and underpinning of what innovation and bricolage are and how legitimacy can be achieved.

The paper starts by defining innovation in light of the literature on innovation. Then it goes on to discuss whether and how bricolage can be a way to innovation and what characterizes a bricoleur. It explains, based on the literature, how bricolage can be a practice, an epistemology, and a worldview. Then the paper discusses the legitimacy problems of bricolage and then follows a discussion of what legitimacy is and how legitimacy can be achieved, which is applied to the innovation and bricolage constructs. Actors performing bricolage activity at various levels of interaction can link practice to outcome.

Innovation

Innovation is a concept that has been used to describe development activities in the private, the public, and the social sector as well as in the economy and society at large. It is used to describe and analyze how actors create new products, services, and/or experiences. Fagerberg (2005) defines innovation as carrying out an invention in practice, i.e., innovation is more than the invention or having a new idea. It is, according to Schumpeter, the carrying out of "new combinations" of society's productive means (Schumpeter 1969 [1934]).

For a long time, innovation was mainly understood to be R&D-driven and technology-driven (Gallouj 2010), or alternatively it was seen as entrepreneur-driven yet technology focused. Hence there has been a bias toward investigating the role of science and technology for innovation. This science-and-technology-shapes-society model of innovation (Fuglsang 2001) tends to be technology determinist. The innovation process has been presumed largely to start with scientific breakthroughs that next become translated into technologies and then brought to use by private, public, and/or social organizations that adopt these technologies. Much focus has been on public and private investments in R&D as well as companies' ability to absorb knowledge by investing in R&D activities and applying this knowledge for commercial purposes (Cohen and Levinthal 1990). The need for absorbing knowledge is relative to the type of firm and product portfolio of an organization.

Also other sectors than technology-intensive sectors, such as the service sector, have been seen as technology-driven (Barras 1986; Gershuny 1983). For example, the service sector can invest in new technology. Once service companies start to use new technologies in their processes, new service innovations may follow, such as self-service in the banking sector that followed from investments in computer technology. Gershuny (1983) has claimed that households substitute technologies for services leading toward a self-service society. However, the discussion of whether and how innovation takes place in services has led to new and extended understandings of what innovation is and how it comes about (Gallouj 2010). For example, innovation can be employee-driven and represent changes in service behavior rather than in technology (Sundbo 1997). Innovations can be incrementalist and be about creating new value propositions for customers (Skålén et al. 2013).

The literature makes a distinction between product innovation and process innovation. Product innovation is a new good or service. Process innovation is renewal of the varied activities that goes into producing that product. In services, however, it can be difficult to distinguish product and process, as the product often is a process. The literature also discusses the criteria for something to count as an innovation (Drejer 2004). For example, for a new product or service to count as innovation, it should have economic impact. Yet, this definition does not capture all innovations particularly in services. In services, the outcome of an innovation can be blurred and concealed in relation to the customer and the impact fuzzy. Process criteria are also discussed, for example, whether the innovation process should be intentional to count as innovation and whether and how innovation processes can be linearized and systematized. At least three processes of innovation have been pointed out in the literature (Toivonen and Tuominen 2009): the R&D-based model of innovation, the rapid application model, and a practice-based model. In the R&D-based model, scientific research and technological change drives innovation. In the rapid application model, an innovation, emerging from R&D or contacts with customers, is quickly tested in the market and then further developed. In the practice-based model, the innovation is emerging retrospectively from practice, i.e., interactions between employees and customers and eventually developed in a more systematic way.

From these discussions, it follows that innovations are not always intentional, that the interaction with users can be taken as a source of innovation, that innovation is not always a separate function in the company such as R&D activity to which resources are allocated but can develop from everyday practice, and that the innovation process is often incrementalistic. An innovation must contain some new elements that diverge from existing practices, and these must possess some generalizable features (Toivonen and Tuominen 2009) that can be repeated over time (Sundbo 1997). An innovation is not the same as improvement but usually provides benefits to the user as well as the innovator (Toivonen and Tuominen 2009).

Bricolage as a Practice-Based Model of Innovation

A practice-based model of innovation would link innovation to everyday actions within the varied spheres of interaction of the relevant actors at a micro-, meso-, and macro-level where actors seek to cope with limited resources and possibilities. Practice as a unit of analysis implies a focus not on strategies, functions, or roles in an organization but on what people do and say. Practices have been defined as "a mode . . . of ordering heterogeneous items into a coherent set" (Gherardi 2006, p. 34) and as "bodily activities, forms of mental activities, 'things' and their use, a background knowledge in the form of understanding, know-how, states of emotion and motivational knowledge" (Reckwitz 2002, p. 249f). Thus, a practice-based approach to innovation would suggest that innovation is closely intertwined with these activities of ordering, understanding, emotions, and commitments. It would imply that everyday actions related to social worlds are "consequential in producing the structural contours of social life" (Feldman and Orlikowski 2011, p. 1241).

Practices are more than repeated ways of doing things. They are connected with worldviews and epistemologies. Warde (2005) identifies three components of practice: procedures, understandings, and engagements which is similar to Schau et al. (2009) who identify the core structures as procedures, understandings, and emotionally charged engagements (Echeverri and Skålén 2011; Schau et al. 2009). Pantzar and Shove (2010) include the material world identifying materials, skills, and images as the elements of practice. They refer to Nordic walking as an example. Innovation in practice is the integration of such elements in novel configurations. Innovators must design materials, skills, and images and linkages between them. Thus, innovation is a process of integration, designing, and ordering material, epistemological, and metaphysic structures (cf. Duymedjian and Rüling 2010). Fuglsang (2018) argues that varied practices of innovation can be identified at the micro-, meso-, and macro-level. Innovation can grow out of micro-interactions among actors such as employees and customers. These may be consolidated at the meso-level through interactions with organizational boundaries and enterprise strategies and plans and further at the macro-level in the interaction with societal structures. Service marketing research links innovation practice (development of value propositions; Skålén et al. 2011) to the user's value creation (Grönroos 2011; Grönroos and Voima 2013) which is described as embedded within a wider societal context (Edvardsson et al. 2011; Vargo and Lusch 2016).

Bricolage as a practice is usually seen as a micro strategy linked to employees' everyday work and interaction with each other and with customers. The concept of bricolage stems from Claude Levi-Strauss (1966). Levi-Strauss used the bricoleur as a metaphor to distinguish what he called "prior" science (rather than "primitive" science) from modern science. He argued that the bricoleur is someone who is able to perform diverse tasks in a closed universe of things and "the rules of his game are always to make do with 'whatever is at hand,'" i.e., with tools that have no relation to any particular project but are retained and accumulated over time on the principle that "they may always come in handy" (pp. 17-18). In this way, the bricoleur creates structures by means of events, whereas the scientist creates events by means of structures (p. 22). Baker and Nelson use the concept of "resource" to define bricolage as "making do" by applying combinations of the resources at hand to new problems and opportunities. Bricolage consists of three elements: (1) making do, (2) resources at hand, and (3) combination of resources for new purposes. Some researchers (Baker et al. 2003; Fuglsang 2014; Witell et al. 2017) also include networks as a resources or means at hand that is included in bricolage activity.

We find several applications of the concept of bricolage in research. The concept has been used, for example:

To characterize entrepreneurship, where entrepreneurs create something from nothing (Baker and Nelson 2005)
To describe improvisation in impossible situations (Weick 1993)
To describe the emergence of the wind turbine industry in Denmark (Garud and Karnoe 2003)
To describe how teachers work (Hatton 1989)
To describe how nurses work (Gobbi 2005)
To describe "emerging innovation" in public sector (Andersen 2008)
To describe how home care innovate (Fuglsang 2010; Fuglsang and Sørensen 2011)

Several authors (Baker and Nelson 2005; Fuglsang 2018; Witell et al. 2017) claim that bricolage is a relevant approach to innovation in resource-constrained environments, such as nascent firms or service firms that do not allocate resources to R&D. Senyard et al. (2014) have shown how there is a connection between bricolage activity and innovativeness in nascent firms. Based on interviews with 1186 respondents, interviewed in 2 rounds with 12 months in between, they argued that there is a connection between bricolage and 4 types of innovativeness: (1) product/service, innovativeness, (2) process innovativeness, (3) marketing methods innovativeness, and (4) target market selection innovativeness. They found that bricolage has a positive effect on the three first and a curvilinear relationship on the fourth. Bugge and Bloch (2016) found that many innovations in the public sector are bricolage type rather than systemic. Based on a qualitative evaluation of more than 1500 examples of public sector innovations in 6 countries, they suggest that almost a third of the evaluated innovations were bricolage-type innovations.

Duymedjian and Rüling (2010) argue that bricolage can be seen as ideal-typical regime of action or a practice which can be contrasted to that of the engineer. From a practice-based perspective, they describe bricolage in terms of a particular relationship between practice, epistemology, and metaphysics or worldview. As practice, it collects resources over time and maintains a dialogue with its repertoire of resources as well as other resources in the environment. As epistemology, it draws on intimate and familiar knowledge of the environment and its resources which is different from the more codified knowledge of the engineer. As worldview, it contends that everything matters and is interrelated in a complex interconnected system. Based on the work of Thévenot and his theory of engagement (see, e.g., Thévenot 2001), Duymedjian and Rüling (2010) also discuss how bricolage is a collective activity that may exist both as a regime of familiarity and as a convention-based regime. Under a regime of familiarity, the bricolage setting reminds of inhabiting a home with all the stuff one has collected over time and can bring forward if needed. Such resources may be shared with others if people develop close relations over time engaging in joint dialogues about their various repertoires. Fuglsang and Sørensen (2011) have shown how home helpers engage in dialogues about the repertoires they find in the homes of elderlies when carrying out their job as home helpers. Convention-based bricolage requires "an investment in form." It corresponds to renting one's home to another person, which requires regulation and codification enabling actors to communicate about resources at distance. It is thus a more selective and conceptual approach to the resources at hand that involves norms, standards, and procedures.

One problem of bricolage activity as based on familiarity and intimate knowledge of how to make do with resources at hand and combine them for new purposes is that this activity is hidden in everyday life. While it may be a constitutive activity that can underpin rules and regulation by innovating around them, one can never know how it relates to work procedures and protocols. Further, it can be a spontaneous problem-solving activity that ignores other more established problem-solving methods. Employees solve problems on the spot without calling in assistance from someone in the organization that might be more qualified to deal with the task. It challenges professional boundaries and specialization, regulations of work, or organizational strategies. In some cases where work is highly regulated, for example, in nursing (Krontoft et al. 2018), or home help (Fuglsang and Sørensen 2011), it may be considered cheating and may potentially entail a co-destruction of value with users if it does not lead to a satisfactory solution.

The above raises the question of the legitimacy of bricolage activity as a practice, epistemology, and worldview within an organization. Firstly, how can it be legitimate to collect resources over time and use them within a closed universe for problem-solving? This seems as a private and familiar approach to work rather than one regulated by procedures, ethics, and so forth. Secondly, how can it be legitimate to use intimate and familiar knowledge in a work situation where one would often expect the use of evidence-based expert knowledge? Thirdly, how can it be legitimate to presume that everything matters in the strategic context of an organization? In the following section, the concept of legitimacy is discussed and applied to innovation and bricolage.

Legitimacy

In his foundational article, Suchman (1995) has defined legitimacy as "a generalized perception that the actions of an entity are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs, and definitions" (Suchman 1995). Thus, legitimacy is here related to a "generalized perception" of appropriate behavior within a social system meaning that an entity may remain legitimate even if certain actions deviate from societal norms, such as bricolage activity.

Suchman makes a distinction between pragmatic, moral, and cognitive legitimacy. Pragmatic legitimacy is linked to the ability to provide benefits to an organization's stakeholders. Moral legitimacy is linked to the normative evaluation of an organizations activities, i.e., whether they fit certain socially constructed norms. Cognitive legitimacy concerns the availability of cognitive models that explains an organization, its efforts, and futures in a plausible way. Garud et al. (2014) discuss the role of storytelling in pragmatic and cognitive legitimacy. Stories are cognitive models for exploring an organization's legitimacy. Stories create expectations about certain legitimate actions; however, stories can also disappoint resulting in a loss of legitimacy.

Geels and Verhees (2011) speak of framing struggles and legitimacy. By this they mean that actions are subject to varied moral evaluations (frames of evaluation) through which their legitimacy can be confirmed or contested. Some of these frames resonate with wider audiences. Geels and Verhees call them master frames. They further argue that the salience of such frames is dependent on such factors as actor credibility, perceived empirical fit between frame and events, the centrality of a given frame, the experiential consumerability of a frame in relation to everyday experience, and the fit between frames and cultural repertoires. Hence, to create legitimacy requires a lot of effort and work to make practice consistent with frames or identifying the appropriate frames.

One type of activity that pose challenges for the legitimacy of a social system is innovation. To survive in the market, actors must often innovate, but innovations and innovative activities may come into conflict with prevailing interests, norms, and understandings. Following the above, innovative actors can address legitimacy in different ways. They can use stories or master frames that have a strong salience and legitimacy as part of their innovation strategy. They would have to argue that innovations fit such a frame. It could be a story of hero-inventors that create economic development or a story of developing sustainable technology or trust-creating technology as in the case of blockchains. Another example is the frame of the experience economy (Fuglsang and Eide) that actors have used to create trajectories of change in tourism. Stories can be told about experience activities that relate them to wider recognized patterns of outdoor life, healthy activities, or learning experiences endowing them with cognitive and pragmatic legitimacy. In health care, there is an increasing awareness of the possibility of digital health services that tend to break institutionalized norms of health care (Wallin and Fuglsang 2017). Patient- and treatment-oriented health care is a highly institutionalized frame which is contested by digital health when new entrepreneurial firms work out new types of digital health technologies and services that give patients possibilities to cope with their health and treatment in new ways. Innovators of these services create legitimacy through validation, certification, user testimonials, awards, or stories about their efficiency and relevance.

Similarly, bricolage activities can be linked to stories and frames that render legitimacy. For example, in the public sector, new public management has been a dominant master frame for several decades due to fiscal pressures. However, it is also a contested frame, as it seems to replace the way professionals hitherto have worked as independent professional in traditional public administration with new control and measurement systems. Bricolage activity can be linked to an alternative frame that repositions employees as skilled professionals which can solve many types of problems by available resources and have deep insights into clients' value creation. Social bricolage (Di Domenico et al. 2010), i.e., when communities make use of limited possibilities to create meaningful activities, can be linked to wider socially constructed frames of sustainability, mobilization of available resources, circular economy, civic activism, caring society, and more.

Weick (1995) shows that stories have the function to tie in peripheral events in causal chains in an organizational setting. Alertness toward events that are not part of the espoused practices can thereby be created. Following on from Weick, telling stories is a way to link bricolage activity to legitimate activities within an organization at the pragmatic, moral, and cognitive levels. However, some noteworthy stories can also evoke anxiety and fear, having the exact opposite effect – blaming bricolage activities for what goes wrong, for example.

Linking bricolage activity to certain outcomes is a way to make bricolage activity legitimate. The emphasis on outcomes, such as creating a sustainable business (Baker and Nelson 2005), can ensure a positive pragmatic or normative evaluation of the bricolage activity that allows for the integration of bricolage activity into work or life routines. However, stressing outcome may also immediately make certain types of bricolage activity that are not perceived to be related to outcome illegitimate. A consequence of this can have the effect of closing the door to important problem-solving activities that are crucial for maintaining organizational routines (Fuglsang and Sørensen 2011). Thus, stressing outcomes can be a double-edged sword. Further, the process toward the outcome generally needs to be legitimate; hence, it must be part of a socially recognized practice and worldview. The legitimacy of process can be a challenge in relation to bricolage as bricolage activity can be a hidden and concealed processes and sometimes can be considered as cheating (Fuglsang and Sørensen 2011).

However, bricolage activities are also inherently positive as meta-process. Energy demand can be seen as an outcome (Cass and Shove 2017) of the way we live and work, how we transport ourselves between home and work, how we consume food, and how we deal with waste. Bricolage activity, i.e., coping with limited resources and possibilities in a resilient way, presents, in this context, a way of saving, accumulating, and reusing resources in a sustainable way which can be cultivated as a legitimate lifestyle and approach to social practice. Bricolage activity in this case draws its legitimacy from being a process, epistemology, and worldview that is linked to sustainable and circular economy as a master frame. This frame will in turn become more or less legitimate along with people's attitudes to and perceptions of the current climate crisis.

In summary, innovation and bricolage activity can be linked to moral frames, stories, and benefits for stakeholders that make them legitimate. Legitimacy can concern both the outcome, i.e., sustainable business, and the process, i.e., reusing available resources. However, the very same frames that render innovation and bricolage activity legitimate also provide cultural repertoires for criticizing innovation and bricolage activities.

Table 1 Three approaches to legitimacy and bricolage activity. (Adapted from Suchman (1995) and Duymedjian and Rüling (2010))

Form of legitimacy	Practice	Epistemology	Worldview
Cognitive legitimacy of bricolage	Collect resources over time; solve problems on the spot	Draw on limited resources accumulated over time, previous knowledge, and intimate knowledge. Create plausible stories about what you are doing	All things matter
Moral legitimacy of bricolage	Collect resources over time; solve problems on the spot. Make activities visible. Design bricolage practices deliberately, i.e., configurations of materials, skills, and image	Draw on limited resources accumulated over time, previous knowledge, and intimate knowledge. Evaluate what you do with respect to consequences and processes	Specific outcomes matter
Pragmatic legitimacy of bricolage	Use bricolage activity when it provides benefit to stakeholders	Draw on limited resources accumulated over time, previous knowledge, and intimate knowledge. Calculate stakeholders' self-interest. Deploy and account for bricolage activity in relation to stakeholders' interests	Stakeholders' outcome matter

Discussion

Research shows that bricolage activity is present in many types of organizations, public, private, civic, services, and manufacturing. It can be a path to innovation and a way to solve problems for businesses, employees, clients, and communities especially in resource-constrained environments. However, bricolage also poses challenges for legitimacy due to its non-procedural, nonformal, and nonscientific character. Following on Suchman (1995) and Duymedjian and Rüling (2010), and focusing in the following bricolage, we propose tentatively to distinguish between three challenges of legitimacy and bricolage, cognitive legitimacy, moral legitimacy, and pragmatic legitimacy, and its three dimensions, practice, epistemology, and worldview (Table 1).

1. Cognitive legitimacy of bricolage activity: Cognitive legitimacy concerns whether people in a given context recognize bricolage activity as a reasonable activity. This type of legitimacy can be embedded in a professional or social context where actors share experiences, values, knowledge, and stories about everyday activity. They mutually accept the bricolage activity as part of everyday life and as a way to cope with everyday problems. They also tell plausible stories about how bricolage activity contributes to making do and solving problems that are important to the survival and efficiency of an organization. It can be turned

into a lifestyle or habit of always accumulating resources in the event that they should come in handy.

2. Moral legitimacy of bricolage activity. The moral approach goes beyond the traditional form of bricolage as defined by Lévi-Strauss by linking it to certain moral outcomes or values that are believed to be important within a particular discourse or frame. For example, bricolage activity can be linked with notions of circular economy, self-supplying activities, or coping in a resilient way with limited resources and possibilities to ensure meaningful actions and survival. Moral legitimacy would require ethical behavior and codification and therefore some design and planning of practice. Not every type of bricolage activity is legitimate, and not all resources are appropriate in relation to a given moral frame. Systems of bricolage activity can be developed in which available resources become recirculated within and across organizations and/or communities. It enables a more strategic approach to bricolage activity. In this case, attempts could be made to design and integrate bricolage activities into value chains. The moral approach requires an evaluation of bricolage activity with respect to the consequences it has in terms of outcomes and process, i.e., it requires methods of monitoring and evaluation. An investment in form is needed, through which bricolage activity becomes planned, designed, and evaluated. This format of legitimacy exposes hidden activities and excludes those that are not perceived to be chained into the desired outcomes.
3. Pragmatic legitimacy of bricolage. The core concern is how bricolage activity benefits stakeholders. It requires calculations of stakeholders' interests and the ability to sort out bricolage activities that do not seem to benefit stakeholders. This also assumes that bricolage activity is accounted for and discussed in an organization. Stakeholders can be clients and customers or collaborating partners that expect certain concrete output, such as use value of an activity, descriptions of how it works, quality, profit, or input to innovation. Research shows that firms and organizations under resource constraints stress the pragmatic approach to bricolage as a path to innovation. Baker and Nelson (2005) have shown how both parallel and selective bricolages can be important to such organizations. This approach implies that bricolage activity that does not appear to provide benefit to stakeholders is illegitimate.

In summary, we can organize the questions of bricolage and legitimacy into three general approaches that show some general rules for legitimacy work in the case of bricolage. The contribution of the discussion is to link strategies of legitimacy more specifically to the bricolage construct to clarify how bricolage activity can become a recognized but also criticized activity.

Concluding Remarks

Innovation and bricolage are key processes in business for survival and growth. Innovation has been defined as the realization of new ideas in practice. Bricolage activity is solving problems on the spot by resources at hand. Especially in a resource-constrained environment, bricolage activity can be a relevant model of creating business resilience and innovation.

The paper discussed how innovation and bricolage activity pose challenges to business legitimacy. Innovative entrepreneurs can come into conflict with existing frames in society. Bricolage activities can come into conflict with prevailing professional practices. However, innovation and bricolage activity can be made legitimate by telling plausible stories about what one is doing in relation to people's expectations and values, by evaluating innovation and bricolage activities in relation to specific outcomes, or by accounting for innovation and bricolage activity in relation to stakeholders' interests. At the same time, stories, morals, and benefits are also resources for criticizing bricolage activity for not being appropriate.

The three types of legitimacy and bricolage presented in the paper may in practice often be combined. They can represent stages of an innovation process. Innovation may emerge from the search for cognitive legitimacy when people tell stories about what they are doing in an environment with which they are familiar. It may then be taken to higher levels of innovation and legitimacy through pragmatic and normative evaluations in an organizational context through which certain acts of bricolage are selected and others rejected. Yet bricolage activities can also continue to exist under the radar and do not necessarily have to relate to higher levels of innovation in order to provide effective change. As such it can still add to innovation over time, for example, by gradually changing professional practices and adapting them to requirements of legitimacy in the environment.

While managers may be especially interested in how to make bricolage activities visible and legitimate in order to capture the value of bricolage activity and turn it into innovation, it can still be relevant to embrace the invisible, everyday bricolage activities in an organization. Managers can support and trust employees in their bricolage activity, embrace these informalities, and make use of them in everyday innovation activities. Research could be more attentive to how innovations can emerge from employees, citizens, and communities that seek to deal with existing resources and possibilities in a meaningful and legitimate way. There seems to be a large potential for investigating better how existing resources can be used and integrated to form new practices and how this is turned into legitimate ways of action.

Abstract

If we are to solve problems connected to the degradation of nature, the ever-increasing gap between rich and poor, financial crashes, and business (meso level) legitimacy, such work cannot be studied in isolation from the interplay between micro (individuals) and macro (systems) levels. To develop business legitimacy, a change process has to be implemented concurrently on the individual, practical, and systemic levels.

Change can focus on reducing negative symptoms or, on the other hand, it can be seen as a shift taking place at a deeper level in order to eliminate the causes of the

problems. On the systemic level, the hard-core principle of the dominating economy – that the market is made up of autonomous competing actors – is rejected in favor of a view of the market as an integrated network of interdependent cooperating actors. On the practical level, strategic planning is replaced by a partnership approach founded on dialogue- and network-based cooperation. On the individual level, ecological economics has significant implications for the definition of the economic actor. Instead of focusing solely on increasing profits and utility (the economic man), the economic actors put far more weight on the natural and social implications of production processes as well as products (the ecological man).

The implications of this reasoning are that economic activity is not an end in itself but a means to strengthen the life processes in nature and society. If life processes are to be strengthened, then reputation building, "greenwashing," and green economics must give way to an economy based on ecological knowledge and humanistic values.

Ideology · Utopia · Organic worldview · Cooperation · Partnership approach · Ecological man

Introduction

Ours is a world of complexity and uncertainty, as rich in positive potentials as it is rich in possible catastrophes. Modern society more than ever creates utility and welfare, but it also creates negative consequences which affect global ecosystems, including people. It is easy to feel that there is nothing but bad news, e.g., "climate chaos, species extinction, job insecurity, poverty, violent conflict" (Norberg-Hodge 2016, p. vi). As the problems are interconnected, it is impossible to tackle them individually, so we need solutions that are both systemic and sustainable in a long-term perspective. According to Fromm, a reform can be radical, that is, "going to the roots, or it can be superficial, trying to patch up symptoms without touching the causes" (Fromm 1990, p. 273).

This article considers how ecological economics can contribute solutions to the challenges currently faced by focusing on the causes more than the symptoms. Instead of developing measures to reduce negative side effects of the dominating economy, a far deeper systemic shift is needed toward an economy that nurtures sustainable communities designed in harmony with the principles of ecology and cultural values. Research aimed at giving humans power over nature is, as a consequence, replaced by an approach in harmony with nature. Such a radical transformation changes nature from being an object to being a subject.

This article puts forward a view that business (meso level) legitimacy cannot be studied in isolation from the interplay between micro (individuals) and macro (systems) levels. To develop business legitimacy, it is both necessary and possible to implement the change process simultaneously on the individual and systemic levels. The explanation refers to the symmetric relationship between economic systems, business practice, and human beings.

The article has been structured in the following way: firstly, Imre Lakatos' distinction between the "hard core" and the "protective belt" is introduced in order to develop a frame of reference for the understanding of the difference between evolutionary and revolutionary changes in theory and practice. Secondly, the extent to which the major problems of our time are results of bad people's actions, or consequences of a bad system, or maybe a combination of both, is discussed. Robert Merton's theories of unanticipated consequences are used and discussed. Thirdly, using the distinction between ideology and utopia set out and defined by Karl Mannheim (1936), Paul Ricoeur (1986), and Ruth Levitas (2013), it is argued that another system is possible. They all argue that the energy needed in all change processes is generated in the tension between what is (ideology) and what could be (utopia). Fourthly, we argue that green economics symbolizes changes in the protective belt in the dominating economic paradigm, while ecological economics is characterized by changes in the hard core. Finally, a sketch is offered of an ecological economic utopia after the change process and sum up with some reflections on business legitimacy.

Hard Core and Protective Belt

To delve deeper into the question of how science adapts to the challenges in contemporary society, the contributions of Imre Lakatos (Lakatos and Musgrave 1982) to philosophy of science are called on. Lakatos distinguished between a research program's hard core and the protective belt of flexible theories and defined a research program as a combination of hard-core theoretical assumptions that cannot be rejected or altered without falsifying the whole program and a protective belt of theories that function as a safeguard to protect the hard-core assumptions. Lakatos rejected the idea that scientific knowledge can be regarded as a cumulatively growing system of statements and theories. Instead the evolution is portrayed as long periods where the hard-core ideas are protected by a belt of theories that have been adapted to characteristics in the social and natural environment. When the challenges become too severe, critical questions are asked of the hard core, and the evolutionary period is replaced by irregular revolutionary leaps in which the fundamental presuppositions of scientific understanding are under attack and replaced.

Research programs provide a framework that is shared by those involved. When the hard core is threatened, theories in the protective belt are modified in order to save it. The adherents of the research program accept changes in theories in the protective belt in order to reduce anomalies and protect the hard core which becomes, in effect, similar to Kuhn's conception of a paradigm because research is conducted on the basis of some fundamental principles that are entirely exempt from critical discussion.

Lakatos divided the levels within a research program into negative and positive heuristics. Negative heuristics point at methods and approaches that should be avoided, and positive heuristics refer to preferable methods and approaches. While the negative heuristic protects the hard core, the positive heuristic defines principles for modification and changes in the protective belt. Lakatos defined the main concepts in his theory in the following way:

> the negative heuristic specifies 'the hard core' of the programme which is 'irrefutable' by the methodological decision of its protagonists, the positive heuristic consists of a partially articulated set of suggestions or hints on how to change, develop the 'refutable variants' of the research programme, on how to modify, sophisticate the 'refutable' protective belt. (Lakatos and Musgrave 1982, p. 135)

Not all changes of the protective belt of a research program are equally productive or acceptable. Lakatos argued that changes in the protective belt should be evaluated not just by their ability to defend the hard core by explaining anomalies but also by their ability to come up with new explanations and understanding. He defined adjustments as degenerative if they failed to accomplish anything more than the maintenance of the hard core. Lakatos' model provides for the possibility of a research program to be progressive even if it contains troublesome anomalies. He argued that it is essentially necessary to continue with a research program even if it has problems as long as there are no better alternatives. In order to falsify a research program, there must be a better one available.

When the hard-core principles change, the previous knowledge is reinterpreted, and the whole research program changes, asking new questions, introducing new methods, and implementing changes in practice. As an example, the shift from defining nature as an economic resource base to something having inherent value, represents a gestalt switch where the context of understanding changes from economics to ecology. Colin Tudge (2016) argued that all that stands between us and a glorious future is the removal of the seriously flawed strategies based on false ideas that happen to be convenient to the people with the most power: in other words, those ideas that are rooted in a debased ideology which puts short-term wealth and dominance above all else and that is the hard core of the dominating economy.

Unintended Consequences

Back in 1936, the prominent sociologist Robert Merton warned against "unanticipated consequences of purposive social action" (Merton 1936, p. 894). This can be seen in the unanticipated consequences of the main statements in the hard core of the dominating economic paradigm. Many of the challenges we face today, regarding environmental, societal, or economic crises, are due to unintended consequences of the dominating economic system embedded in the modern society. There are many explanations why negative consequences occur; short-term perspectives and limited cognitive capacity are examples of relevant explanations. But it could also be that the hard-core frame of reference is disconnected from the real-world conditions.

In terms of Merton's reasoning, it can be seen that many of the challenges in our time are the results of more than 200 years of mechanistic dominance in our culture. These problems are so complex and so integrated that it seems impossible to find significant solutions within a mechanistic ontology and it is simply not enough merely to implement changes in the protective belt if problems are to be solved. Maslow once claimed that even good people behave badly in a bad system (Maslow 1971). The greedy side of people is activated by the characteristics of the economic system. Instead of trying to solve problems by transforming reality to fit the model, it is more appropriate to change the model to fit with reality.

Although a great majority agree that something must be done straightaway to prevent the alarming catastrophes, it has proved difficult to implement action with any significant effect. The question is why are we not able to take the necessary steps to solve the problems when we, to a large extent, know the causes behind them and we know which measures we have to take. One explanation is that we are too busy and concerned with our daily activities to bother with the major long-term challenges. Another explanation is that we have confidence in technological development and are convinced that research will solve all the problems (technological optimists). The third explanation is the paralysis induced by the gravity of the situation. This chapter, in accordance with Ricoeur (1986), argues that the energy needed for implementing the necessary change process is developed in the tension field between ideology (green economy) and utopia (ecological economics). In other words, utopia is the driving force in the change processes in human societies.

Ideology and Utopia

In order to enlighten the tension between the two contrasting approaches to a socially and environmentally responsible economy, reference is made to the Hungarian sociologist Karl Mannheim (1936) who distinguished between ideology and utopia as driving forces in societal development. From this point of view, green economics merely makes changes in the protective belt of mainstream economics in order to save, protect, and preserve the hard core of the ideology; ecological economics goes far further in its criticism of the hard core and sets out utopian solutions.

Mannheim contrasted ideology and utopia on the basis of their social function. Ideologies are directed toward the past and are important to create and preserve the identity, individually and collectively. To Mannheim, ideology contains explanations and interpretations of the social reality that preserve the status quo. Utopia transforms status quo by putting forward an alternative to the existing society. Utopias are future oriented and important to define the direction and energy for change. The French philosopher Paul Ricoeur (1986) nuanced the differences between the two concepts by arguing that ideology is an attempt to legitimize the power structures in the existing society, while utopia represents an attempt to replace power by something else. "Ideology is the legitimization of present authority while utopia is the challenge to this authority" (Ricoeur 1986, p. xxi).

The tension between ideology and utopia can be described as a dialectic process with two poles, one referring to actuality and the other referring to potentiality. In reality, utopian and ideological elements are often interwoven. Without utopia, ideology becomes static, and without ideology, utopia becomes an illusion. To illustrate the distinction between ideology and utopia, ideology is defined as a picture, which describes what exists, while utopia is an imagination redescribing what exists. To understand our times, the established ideologies must be stepped outside, while a utopian position is developed from where it can be observed. Utopia provides a critique of the current ideology by providing an alternative.

Ideologies relate mainly to dominant groups and serve to comfort their collective ego. Ideologies reflect the general way in which groups determine what differentiates them from other groups and establish an identity that satisfies the interests of the entire group. In addition, ideology legitimizes authority, and it allows the authorities to convince the public that its regulations are necessary.

Utopias are naturally supported by minority groups and, therefore, more commonly by the lower strata of the society. The Brazilian pedagogue Paulo Freire argued that the elite preserves the existing ideology at all costs because "they cannot permit any basic changes which would affect their control over decision-making" (Freire 2017, p. 12). From Ricoeur's (1986) perspective, there are two explanations why the ideological mentality assumes the impossibility of change. Firstly, an ideology accepts the system of justification, explaining the non-congruence. Secondly, the non-congruence has been concealed by factors ranging from unconscious deception to conscious lie. Ricoeur concludes by observing that the correlation between ideology and utopia forms a circle, a practical circle: "the two terms are themselves practical and not theoretical concepts" (Ricoeur 1986, p. xxii). This means that utopia in one period of time could be the ideology in a later period of time. In order to make the circle a spiral it is of the greatest importance to imagine new utopias as ongoing processes. A spiral in the dialectic of ideology and utopia would occur if "the utopia of a given society challenged current ideologies at least to the point where they could be reflected on and compared to alternatives" (Steeves 2000, p. 226). The death of utopia would be the death of society. "A society without utopia would be dead, because it would no longer have any project, any prospective goals" (Ricoeur 1986, p. xxi). This is in harmony with the English philosopher Alfred North Whitehead's assertion that a society without adventure is in full decay and the conjunction of ideology and utopia typifies the social imagination. Imagination is constitutive of social reality itself (Whitehead 1967).

Green and Ecological Economics

To describe and explain ecological economics, it is relevant to contrast it to green economics. As a starting point, we accept that both perspectives are based upon a willingness to solve the environmental and social problems, such as climate change,

Table 1 Greening the economy (change in protective belt)

Hard core	Protective belt
Growth	Green growth
Competition	Business ethics/CSR
Strategy	Green strategy

the increased gap between rich and poor, financial scandals, and war and terrorism. Using Lakatos' distinction between hard core and protective belt, green economists merely make adjustments to the protective belt of mainstream economics without questioning the hard core. Green economics represent efforts to reduce the negative symptoms of the existing economic ideology by using different instruments from the market's economic toolbox. Representatives of green economics accept that in a short-term perspective, increased growth has the highest priority in order to solve the current crises in economics, ecology, and society. Its goal is to reduce the damaging effects of established economic theory and practice without making any hard-core changes. Because the methods do not depart from the established hard core (ideology), green economics helps to put up the "business as usual" sign. As long as the argumentation for changes in the protective belt does not challenge the principles in the hard core, the mere greening of business is acceptable to the elite (Table 1).

To maintain competition as one of the main postulates in the dominating economy's hard core, business ethics and CSR (corporate social responsibility) are introduced as a way to reduce the more unwelcome and criticized consequences of aggressive competition. For example, "the green shift" is put forward as a measure to deal with the serious environmental and social challenges created by capitalism. Green products, green growth, and green economics are concepts used (and abused) on an ever-growing number of occasions. It seems like everything can be environmental friendly and socially responsible if we only choose the right concepts. Green economists often argue that environmental responsibility is closely coupled to green growth because we need more resources to handle the most serious economic and social challenges. In addition, they argue that greening the economy is an efficient marketing tool to develop a reputation based on ecological and societal responsibility. So a green strategy is an effective instrument to increase a company's competitive advantage and its profits. In a long-term perspective, "greens" argue that growth should be as green as possible. Instead of exploring the problems, there is a tendency to hide the problems behind green formulations, permitting everything to go on as usual. The focus is on reducing symptoms without any criticism of the mechanistic system. To cope with the many interrelated problems, we need far more than mere "green-painting" – what we need is an organic understanding of reality.

The dominating ideology has brought us into a state characterized by organized irresponsibility, where individually and collectively, we have contributed to creating problems that have been proved very difficult to understand and solve. One part of the problem is that the focus is on objects not on relations. As a result of not being aware of society as integrated networks, we are about to lose our common cultural context for understanding and meaning. The Norwegian philosopher Viggo Rossvær comments on the situation in the following way: “The modern society is in reality caught in an inhuman specialization which have made any individual into a small wheel in the huge community machinery; on the mental level, it has led to an alienating decomposition of individuals between empathy and thinking, feeling and moral, body and spirit” (Rossvær 2012, translated from Norwegian).

Ecological economics differs from green economics by asking critical questions of the hard core of the dominating economy. Ecological economists argue that it is necessary to make changes on the ontological and systemic levels to understand and solve serious problems, and by implementing solutions based on green economics, we are trapped within the same system that caused the problems. The Canadian economist William Rees reasoned that “green economy has scarcely helped to solve the major environmental and social problems; instead green economy has contributed to hiding the real problems behind a veil of green words and concepts” (Jakobsen 2017, p. 163).

We have to go beyond the green shift and ask critical systemic questions of the hard core. The consequence of reassessing the hard core of mainstream economics is that the existing system is threatened and we have to substitute it. Whereas green economics focuses on reducing negative symptoms to save the existing economic paradigm, ecological economics claims that the hard core of the existing economic paradigm causes the problems and has to be replaced.

First of all, growth has no part in the solution; on the contrary, growth is the core problem. Ecological economists such as Herman Daly and John B. Cobb Jr. (1994) argue that it is necessary to implement a degrowth economy. In a long-term perspective, the focus ought to turn from quantitative growth to qualitative development. Secondly, ecological economists argue that competition must be exchanged for cooperation in order to handle the serious anomalies. Thirdly, strategic planning must have a partnership approach if solutions for the common good are to be found (Table 2).

It is clear that ecological economics offers a significant alternative to the hard core of the dominating economy. Ecological economics is not focused primarily on finding new answers to the old questions by making changes in the protective belt. Instead, ecological economics focuses on critical questions concerning the hard core. Only by asking these critical questions it is possible to uncover new perspectives and develop a more life enhancing economic theory and practice. Ecological economics asks how we can develop an economy and a society that are based on peaceful relations between humans and nature, between humans, and within the individual.

A Sketch of an Ecological Economic Utopia

In the international arena, the German psychologist Evelin Lindner (2011), the German economist Otto Scharmer (2009), and the Austrian/American physicist Fritjof Capra (1996) all agree that the current crises cannot be solved within the existing paradigm. According to Lindner (2011), we live in a time of great contrasts. While the problems are becoming more and more dramatic, there is, at the same

Table 2 Ecological economics (change in hard core)

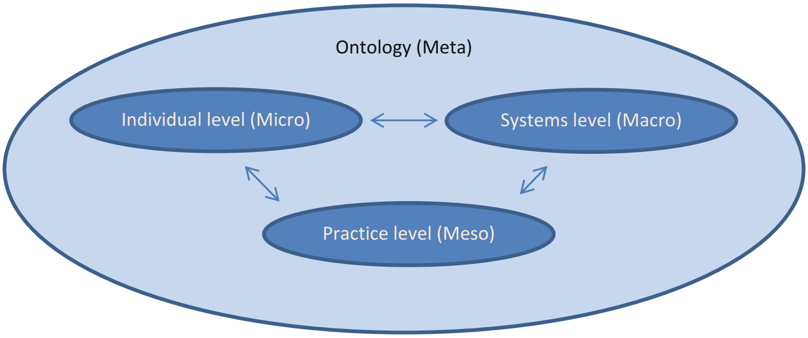

Fig. 1 Integrative business model

time, a growing attention on the search to find more realistic models that just might open up the possibility of new solutions. Scharmer (2009) believes that crises linked to finance, food, water shortage, resource scarcity, climate chaos, mass migration, terrorism, and financial oligarchies show that we have entered a time of dramatic change where the possibilities of a profound personal, societal, and global renewal have never been more real. Capra and Luisi point out that there are solutions to the great challenges of our time, and some of them are very simple, but they require “a radical shift in our perceptions, our thinking, our values” (2014, p. iii), and many clear indications are available to show that fundamental change is about to happen. It is not just about changing the individual mindset, but it is also, increasingly, about deep structural changes. Capra and Luisi are optimistic and emphasize that the change process has already started. From these contributions, it can be concluded that the convergence of crises is a birth crisis that leads toward a utopian future (Fig. 1).

In order to encourage a far deeper change, any ecological economic research program (utopia) should include changes on different levels, meta (ontology), macro (system), meso (practice), and (micro) human consciousness.

Ontology (Meta)

On the ontological level, it is a question of change from a mechanical to an organic world view, and one fundamental consequence of this change is that economics immediately becomes subordinate to ecology. To adapt economics to the limits of

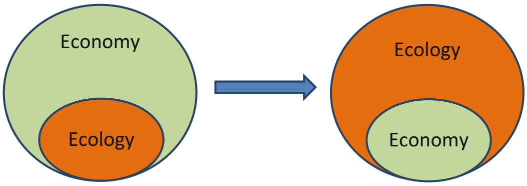

Fig. 2 Change from mechanic to organic worldview

ecosystems, organic knowledge and understanding, is essential. The ancient idea that natural science's role is to provide knowledge that gives man power over nature has to be replaced by an approach in which the goal is to learn from nature and develop knowledge that teaches us how we can best work with nature to fulfil human needs and improve quality of life. The implication of this reasoning is that economic activity is not an end in itself but rather a means to strengthen the life processes in nature and society. The only valid purpose of economics is as a servant of life processes in all kinds of social and ecological systems.

In an organic perspective, the global ecosystems and social systems are comprised of closely interacting and interdependent subsystems based upon dissipated structures. The earth itself and all its living and nonliving components are interrelated; the human being is a member of this integrated community and must find a proper role in it. Every system is connected to and depends on all the others in continually evolving processes. Ecological economics, as a heterodox tradition, "accepts the transformative power of human agency with emergent properties arising from a dynamic interconnected process of multi-layered social interactions" (Spash 2012, p. 44) (Fig. 2).

Efforts to facilitate a sustainable future are not covered well enough by the existing scientific tradition of objective disciplinary approaches. In order to appreciate the interconnections between nature and society, ecological economics is based on a transdisciplinary approach. To meet the sustainability challenges, locally, nationally, and globally, we need integrated knowledge based on transdisciplinary research in which a disciplinary cross-fertilization makes the borders between the different sciences more transparent and practice and culture become integrated.

The English/American economist and peace researcher Kenneth Boulding, one of the most influential contributors to ecological economics, once said; "the pursuit of any problem of economics draws me into some other science before I can catch it" (Kerman 1974, p. 6). This is the search for connections between different fields of knowledge, for the threads of theory that would tie together nature, society and economy on the system, business and individual levels. Today, the transdisciplinary approach is being rediscovered, unveiled, and utilized rapidly to meet the unprecedented challenges of our troubled world. In its search to understand life as life, the transdisciplinary field of ecological economics examines the relationships between ecosystems, social systems, and economic systems in the broadest sense. Because ecological economics develops theory and practice that initiates constructive interplay with the surrounding cultural and natural conditions, the practical solutions will be different depending on time and place. Future solutions will not be exactly similar to suggested solutions today, and solutions will differ depending on geographical and cultural circumstances.

Systems Level (Macro)

On the systemic level, the hard-core principle of the dominating economy which claims that the market is made up of autonomous competing actors is replaced by a view of the market as an integrated network of interdependent cooperating actors. The focus shifts away from objects toward relationships. Since the individual has to respect broad public values, a transition is required away from the egocentric economic man toward the "I-We" understanding. Although local production for local markets is the ideal, it is of course necessary to open up cooperation through international networks as well.

Ecological economics, inspired by natural growth curves, (increasing rapidly at first then stabilizing), makes it possible to initiate the continuous development of quality of life without increasing the consumption of natural resources. The focus on qualitative development points to major changes in business; many companies and, indeed, whole industries will disappear, and new ones, more in line with ecological principles and humanist values, will take over.

Practice Level (Meso)

On the practice level, strategic planning is replaced by a partnership approach founded on dialogue- and network-based cooperation. Free competition on the world market ensures that small producers in poor countries are the losers compared to powerful multinational corporations. Poor countries are forced to accept free trade in order to gain entry to the markets, and the result is that big companies gain increasingly larger proportions of the global markets. The consequence is that poor countries have to receive aid for the system to work. This results in a vicious cycle where quality of life deteriorates both among those who have too little and among those who have too high consumption. Today, the resources are distributed in such a way that the gap between rich and poor constantly increases.

In network-based cooperation, organizations and enterprises have a close connection to their local culture, and, by integrating in dynamic processes, culture becomes the source of inspiration and the glue that connects. The network includes different sectors, i.e., businesses, practitioners, artisans, and research and education institutions. A network of creative actors has better access to information when it comes to making oneself visible both locally and internationally. Development of mutual principles for peaceful coexistence between actors locally and globally helps actors to be free to develop their own solutions based on their own situational and cultural knowledge.

To reach the common good as a result of cooperation based on mutual respect and trust, it is of great importance to make room for regular reflective meetings and create

Table 3 Ideology and utopia

	Ideology	Utopia
Ontology	Mechanistic	Organic
System	Competition	Cooperation
Practice	Strategy	Partnership approach
Individual	Economic man	Ecological man

arenas for communicative action based on collaboration. When the hierarchical structures are flattened by a combination of bottom-up and top-down processes, developing an economy integrated with nature and culture is of vital importance. Ecological economics indicates that businesses have to include ecological and social values in the decision-making process. Humans are part of the ecosystem, and the ecosystem is a part of humans. By including social values, business helps to create (optimal) conditions for quality of life. As it is not possible to transform the different values into a monetary scale, policymakers have to be able to handle the three different values simultaneously (Table 3).

Individual Level (Micro)

On the individual level, ecological economics has significant implications for the definition of the economic actor. Instead of focusing solely on increasing profits and utility (the economic man), the economic actors put more weight on the natural and social implications of production processes as well as products (the ecological man). A practical consequence is that market communication must include information about the working conditions for the workers in the entire production process and the extent to which the production process meets environmental requirements, requirements for animal welfare, and health implications for all involved, the consumer included. As regards ethics, a good and moral life, according to virtue ethics, is a life responsive to the demands of the world. Central concepts are good judgment, justice, courage, and self-control. To possess a virtue is to be a person with a given complex mindset. "The most significant aspect of this mind-set is the wholehearted acceptance of a certain range of considerations as reasons for action" (Stanford Encyclopedia of Philosophy 2012). Virtue ethics focuses on the moral person's character characterized by the ability to be aware of, to identify and to handle, moral dilemmas in real-life situations.

Concluding Remarks

In this chapter, it has been argued that the solution to the major challenges confronting the modern society requires fundamental changes in economic theory and practice. Without energizing tension between ideology and utopia and the existence of some kind of shock waves, the deep change process will not come and will not be initiated. The prerequisite is a closer focus on utopian narratives and a development in consciousness giving us the ability to be aware of the bundle of shocks going on worldwide today. To prevent the change process from taking the wrong direction, it is important to develop visions (utopias) that are clear enough to serve as beacons.

To generate the necessary energy, it is of the greatest importance to develop a realistic alternative to the existing ideology, an alternative that is diverse enough to create the tension. What we need today is a focus on utopian narratives contrasting with the dominating ideology. The aim is to energize the process that strengthens the vitality of self-contained and autonomous communities by establishing collaborative networking venues for dialogue, creativity, learning, and development of common solutions. Aristotle's harmonious moderation within nature's limits as the recipe for the good life fits in well here.

The implication of this reasoning is that economic activity is not an end in itself but a means to strengthen the life processes in nature and society. "The only valid purpose of economy is two serve life processes in all kinds of social and ecological systems" (Capra 2017). To strengthen life processes, such concepts as reputation building, "greenwashing," and green economics must give way to an economy based on ecological knowledge and humanistic values.

A contrast has been drawn between two different stories (narratives) of the future. Even if both are based on a resolute intention to solve the serious environmental and social problems escalating in the world today, the major challenges in economics, environment, and society require solutions that go above and beyond the existing ideology.

Aesthetics of the Anthropocene: And How They Can Challenge Business Ethics

85

Asmund Havsteen-Mikkelsen

Contents

Abstract

This article explores the question of ethical legitimacy in light of the Anthropocene as a new age in which humans have become geological agents and thus responsible for the ecological degradation of the Earth and the current climate crisis – threatening not only humans but also all other nonhuman life-forms. For companies involved in pollution or the extraction and exploitation of natural resources – whether in the form of farmed animal products, plantations, or minerals – these activities pose an especially huge challenge to business legitimacy. Contemporary art is proposed as a way of producing awareness of the Anthropocene, as well as examining its impact and ethical consequences through making visible the hidden costs of a Western lifestyle and opening up critical thinking and imagination about other life-forms inhabiting the Earth. Various trajectories of such contemporary art production are mapped out. Lastly, some thoughts on a "community of contribution" are presented as a new way to measure ethical actions by individuals and businesses in the Anthropocene.

Introduction: Business Legitimacy in the Anthropocene

Within the space of just a few years, the climate crisis has become the central question in the public sphere due to the increasing changes in weather patterns caused by global warming. Extreme manifestations of hurricanes, droughts, flooding, melting ice caps, rising sea levels, and forest fires have become evidence that "the Earth currently operates in a state without previous analogy" (Bonneuil and Fressouz 2013). What the scientific community and the UN International Committee for climate change (IPCC) have been warning about for decades is now a reality worldwide. One concept has proved able to capture this sense that the accumulated burning of fossil fuels since the eighteenth century is the cause of the climate crisis: the Anthropocene. This designation of a new geological epoch will be explored in this chapter from the perspective of contemporary art and how an aesthetics of the Anthropocene can challenge business ethics.

The term "Anthropocene" places on humans the responsibility for what is happening to the Earth, its ecosystems, and climate. It is humans who have burnt carbon stored in the depths of the Earth to the benefit of human civilization while making the planet uninhabitable for the majority of other species that have evolved alongside us. We have "destroyed nature to the point of hijacking the Earth system into a new geological epoch" (Bonneuil and Fressouz 2013) – a hijacking involving not only nonhuman nature in all its multiplicity but also future generations of humans who will be inheriting an Earth with destroyed ecosystems.

The ethical response to this catastrophe is an attempt to reverse or bring to a halt the many destructive processes unleashed by human activity in order to protect what is still left and allow for the re-emergence of wild nature. Such actions would represent atonement for past and present crimes against nature, admitting responsibility for having endangered not only human life but the conditions for life of a wide range of other species, and thereby making good the damage done.

To be aware of the Anthropocene – and to take an ethical position with regard to it – means that modes of production requiring natural resources to produce objects or services that can circulate on the free market are no longer legitimate. The fundamental problem is that capitalism needs nature but nature does not need capitalism. In the Anthropocene this becomes an aporia in business legitimacy, depending on how many natural resources are needed for a product. Raising animal livestock (high impact on environment and suffering of sentient beings), to planned obsoleteness (waste of materials and energy), and extraction of rare Earth minerals (high degree of pollution) to the excessive burning of fossil fuels (increasing carbon dioxide to the atmosphere) are activities that are no longer ethically legitimate because they are adding to the problem, not attempting to solve it.

An extreme example of ethically illegitimate businesses is provided by those companies who actively engage in the destruction of the most fragile, biodiverse, and vital ecosystems on the planet: the tropical rainforests of Amazonas and Indonesia. Here, deforestation for the sake of growing soya, maize, coffee, or palm oil plantations means that not only are thousands of species going extinct through loss of natural habitats but the planetary benefits of the rainforests (such as carbon capture and production of oxygen) are also lost. The actions of these businesses are not ethically legitimate, because the destruction of the rainforest impacts on the natural habitat of millions of species and the stabilization of the planetary climate.

These commercial activities are all situated along an ethical spectrum where their relative legitimacy depends on how they use (or reuse) natural resources and interact with nonhuman nature. And once it is realized that the USA, China, and Europe are feeding their livestock (cattle, pigs, and poultry) on soya beans originating from previous rainforest land in Brazil and that ice cream, candy, cookies, and chocolate snacks are dependent on the widespread use of palm oil from plantations in Indonesia, it becomes obvious how the patterns of the Western industrial-agricultural-food complex are interconnected with the destruction of biodiversity and thus become ethically problematic.

The aim of this chapter is to explore the Anthropocene as a concept and as a horizon for the production of contemporary art. It will be shown that the concern of such contemporary art is to raise awareness of the Anthropocene and its impact on nature in all its dimensions. An aesthetics of the Anthropocene comes with an ethic: to allow wild nature to re-emerge and to explore new means of coexistence with nonhuman nature – in their both domesticated and wild state of being. This ethic poses a challenge to business legitimacy, because it questions the traditional view of human superiority and domination of nature as a resource to be exploited and manipulated for human needs.

The Anthropocene: A Semantic Virus or a New Responsibility?

Perhaps google.maps most clearly illustrates the meaning of Anthropocene: a new meta-awareness of global human collectivity as a geological agent. As a technology, google.maps allows its users to "spin" the planet, to zoom in and zoom out, and to go wherever they please. The stitched-together satellite images create a feeling of flying across the globe, a strange sense of being able to push the world according to our desires. Where there are blue lines or dots, the orange "streetview" man can be placed on roads to view images of the urbanized and agricultural world. Google.maps has no fixed viewpoints – users can watch the world from the position of an astronaut in space or a pedestrian walking on a buzzing New York street. They are both inside and outside a globe that at once presents itself as an infinite totality to explore and as a solitary blue marble hovering alone in a vast dark universe. The clear-cut division between nature and culture (the man-made world inside nature) collapses from within this technology, being both a global address book and a surveillance and cartographic tool. On google.maps, nature can no longer hide from the gaze or be in direct opposition to the user. Nature is still "out there," but not as an infinite wilderness. Google.maps makes this very clear: the "wild" has been limited to parks, with agriculture, extraction of resources, infrastructure, and urban activities encroaching upon it from all sides. Nature is still there, but as the effectuation of human systems "with natural ecosystems embedded within them" (Bonneuil and Fressouz 2013).

Geological ages have been defined in terms of significant changes in the atmosphere, surface temperatures, or mass extinctions. The time span between these ages is thousands to millions of years (e.g., the Miocene, Pliocene, Pleistocene, and Holocene just to mention the four periods in the 23.8 million years leading up to the Anthropocene). With the Anthropocene, we are referring to the current geological age – that of the human intervention and transformation of all eco- and Earth system trends since 1784. Within the discourse of the Anthropocene, there are disputes about where to place the starting point of the period when humans became geological agents. Some believe it was the agricultural revolution 11,000 years ago (the beginning of deforestation, rice cultivation, and stock raising), others that it was the imperial-colonial interconnection of the globe in the sixteenth century, and there are those who see the level of nuclear radioactivity from the testing of A-bombs in 1945 as the beginning. There is a strong argument, however, that the starting point was the burning of fossil fuels that began with James Watts's new patent for the steam engine in 1784. It allowed coal and later oil to become the prime movers behind the industrial revolution (Malm 2016). In this light, the Anthropocene can be seen as a new way of conceptualizing how humans enabled a specific transformation into modernity through fossil fuels and industrialization.

As a term, the "Anthropocene" is credited to atmospheric chemist and Nobel Prize winner Paul J. Crutzen, who at an international conference for Earth scientists in 2000, and in a scientific paper published in *Nature* in 2002, argued for the Anthropocene as a new geological age to signal: "that mankind had become a force of telluric amplitude" (Bonneuil and Fressouz 2013). That Crutzen is a scientist of Earth's atmosphere is important to the argument that we are currently living through a new geological age: the burning of fossil fuels (first coal and later oil and gas) has increased the amount of carbon dioxide in the air from 280 mmp (pre-industrial age) to 410 mmp (current concentration). As a consequence, the Earth has seen an increase of 1.5 °C in median temperature since 1784, leading to global warming or what is generally referred to as the climate crisis. As such, Crutzen's definition follows one of the accepted ways of defining geological ages: significant changes in the atmosphere.

After a decade of use within the scientific world, the term Anthropocene began to spread as a "semantic virus" to other cultural spheres. One of the first cultural institutions to use the term was HKW (Haus der Kulturen der Welt) in Berlin, which hosted a number of lectures and exhibitions around the Anthropocene and later published the magnum opus *Grain Vapor Ray*, consisting of theoretical and artistic material supporting the Anthropocene as a concept. Now, it is widely used in the humanities and in the broad general public but is being supplemented by other competing concepts: the Capitalocene (the effect of global capitalism) and Plantationocene (the effect of agriculture, colonialism, and capitalism). More recently, Donna Haraway has proposed the concept of the Chthulucene to designate an age in which "knotted relations" between humans and nonhuman nature can emerge. The inventor of the Gaia theory, James Lovelock, contributed with a new concept recently, stating that the future should be called the Novacene, in which super AI will solve all the problems of the climate crisis.

All these different concepts point toward various approaches and possibilities for critical assessments of the most pertinent challenges of our age. Yet the Anthropocene has the advantage of ascribing both agency and responsibility to humans. The Anthropocene acknowledges that humans, in the year 2020, are in charge. No one can escape their responsibility – even though this responsibility and the margins of actions for each individual, business, or nation-state are unevenly distributed.

The Anthropocene must be seen in relation to the generalized framework of the industrial revolution, which made it possible for the digital revolution to emerge in the twentieth century. However, the digital age did not surpass the industrial age: the world is still shaped by the aftereffects of the industrial revolution, even though most Westerners have immersed themselves in the digital realm of social media platforms, smartphones, laptops, and algorithms that govern newsfeeds and consumer habits and help find the easiest way through rush hour traffic. This reality is taken for granted because it has established itself as an infrastructure for the lives of humans, who tend to forget how the industrial revolution transformed the world.

The burning of fossil fuels, together with the scientific revolution, increased yields from crops (through fertilizers and pesticides), improved health care through vaccines and antibiotics, and enabled humankind within just 220 years to increase its population (from one billion in 1800 to 7.8 billion in 2019) and to increase its energy consumption by a factor of 40. This exponential and partly uncontrollable increase in the human population (and its energy consumption) has led to a shift in the balance between land-living vertebrates and domesticated animals and humans. The latter now make up 96% (32% humans, 64% cattle, pigs, sheep, and poultry), while the remaining 4% consists of approximately 32,000 species living in the wild. This imbalance can be seen in the fact that 84% of the ice-free land surface is under direct human influence. Thus there is the looming ecological crisis with regard to biodiversity and the sixth mass extinction (currently one million species are in severe danger of going extinct, according to the UN). In the words of philosopher Peter Sloterdijk, the Anthropocene: "Conveys a message of almost unparalleled moral and political urgency. Put explicitly the message reads: humankind has become responsible for inhabiting and managing the Earth as a whole" (Sloterdijk 2014). The following is an attempt to delineate the contours of an aesthetics of the Anthropocene and how it critically challenges business legitimacy. It is written from the position of being both a contemporary artist and a non-philosopher, terms that will be explained below.

Aesthetics, Contemporary Art, Non-philosophy

To propose an aesthetic of the Anthropocene is a complex operation. If aesthetics in its modern form is the philosophical attempt to define rules and principles for not only the creation but also the reception of artistic objects (understood as works of art presented, circulated, and archived in art institutions), an aesthetics of the Anthropocene would concern itself with the question: how does the artwork raise our awareness of the Anthropocene? Such an awareness points toward a range of critical questions in relation to the impact of human activity upon wild nature, our relation to nonhuman nature, our ethical responsibility for present and future generations, and how to inhabit the world in a different way. These critical aspects challenge business legitimacy, questioning the current hegemonic forces of neoliberal capitalism, humanism, and welfare-state ideology powered by fossil fuels – a totality of social systems through which businesses have traditionally sought (and been granted) legitimacy.

Aesthetics belongs to a philosophical discipline that began with Alexander Baumgarten in the eighteenth century (drawing upon the Greek understanding of "aisthesis" as sensation and seen as a way of knowing) and received its proper place in the critical transcendental thinking of Immanuel Kant (as the autonomous sphere mediating between the sensuous and the intellectual). After Kant, a number of philosophers of German idealism in the nineteenth century – especially Schiller and Hegel but also later Schopenhauer and Nietzsche – gave considerable attention to defining principles for art and the role it played in human cognition and education and as a life-enhancing force. During the twentieth century, thinking on art followed the division between continental and analytic philosophy and between an idealistic-inspired tradition (art as a specific access to reality, a way of being, or a heterogenic liminal space) and an institutional theory of art (partly inspired by the late Wittgenstein and the pragmatic understanding of language games). The word "aesthetics" thus comes with a whole range of understandings and preconceptions. Depending on who is speaking and who is listening, it means very different things. Some contemporary artists abstain from the use of "aesthetics" regarding their own work, because it is associated with a bourgeois ideology of art as autonomous, dependent on a genius for its creation and presupposing an elite of good taste for its judgment.

In the following approach to an aesthetics of the Anthropocene, the term will be used in a way that combines insights from both idealism and institutional theory, because it refers here to both the aesthetic dimension of the Anthropocene as a geological age (how it manifests itself as a perceptual reality, as something to be seen, felt, heard, and experienced by an individual in a phenomenological fashion) and as a condition in which to produce contemporary art (the Anthropocene as a field of exploration and ethical engagement on behalf of nonhuman nature within an institutional context). Thus, the concept of an aesthetic of the Anthropocene means a production of contemporary art that works from within an awareness of the Anthropocene with the aim of raising critical questions to the impact of the Anthropocene.

What is contemporary art as a phenomenon and institutional reality? First of all, contemporary art designates a plurality of artistic practices manifesting themselves all over the world. It can be seen as a form of "nonimalism in action": it does not have a fixed essence (in terms of the objects, experiences, or events to which it refers) but is constituted as a linguistic game by its users and those institutional frameworks that support the game of art. This philosophical condition has, since the late twentieth century and well into the twenty-first, been called "the death of art," because contemporary art only has validity as long as somebody designates "whatever" as art. This can be expressed in the following paradox: contemporary art does not exist; only the specific instances of artworks proposed by artists to institutions exist. The contemporary artwork derive its existence not from participating in an essence but from being proposed with the assumption: *this could be art*. This act of proposing becomes central to contemporary art, because it demonstrates the radical "emptiness or blankness of the aesthetic itself" (Osborne 2016). This is the core insight behind the institutional theory of art that dominates the contemporary art world today, because it allows for the greatest freedom for art and is the most stable in a systemic sense: it can allow the most critical art project to become real and still remain intact as a social system.

Here, there is at once a great freedom (everything can be designated as art) but at the same time a constraint: in order for a contemporary artwork to be real, it needs an institution, as in a community of users (most commonly, the art world) who play the game of contemporary art. In order to become a contemporary artist, the person in question must participate in the contemporary art world. Artists need other people to play the game with them: proposing, viewing, and responding to that which is perceived as contemporary artwork. Anything can in principle be proposed as an artwork: a shop, a dinner, a breath, a waterfall, or a burial site, not just traditional media such as painting, sculpture, or drawing. Within the already established discourse of the contemporary art world, a myriad of art projects have already taken place, expanding and challenging any concept of a fixed essence of what contemporary art should or could be. This would of course also hold for any ideas about contemporary art that we could ascribe to an aesthetics of the Anthropocene.

These cannot be defined by any one medium or way of doing art but must be seen as propositions made by the contemporary artist.

What does it mean to be a contemporary artist (the person who proposes works of art adhering to an aesthetics of the Anthropocene)? It means to become a *generic singularity* who thinks as a *non-philosopher*. Here, an inspiration from the idealistic tradition (phenomenology and existentialism) is at work, in an attempt to synthesize insights from both continental and analytic philosophy in the proposal for an aesthetics of the Anthropocene.

First, the contemporary artist exists, like all other humans, through the metaphysical knot defined by the dimensions of the body (own being), social (given being), and temporality (final being) (Havsteen-Mikkelsen 2014). These are transcendental aspects of being human and cannot be escaped. Each human is forced into having a relationship to them but can decide what the content of these dimensions should be. It is possible to exist and live a life in a myriad of ways. Yet a number of social categories cluster around contemporary artists, such as age, gender, nationality, interests, and social position, used as labels by artists and the art world to describe them. This is the generic aspect of being a human (e.g., being white, male, a Dane, educated, and a citizen in a democracy but also a neighbor, father, husband, painter, intellectual, etc.). Against this generalized background, a singularity stands out: the name that accompanies an artist's work, together with the interests and artistic output that give the artist a certain identity within the contemporary art world. By committing to doing art, as in proposing, showing, and circulating artwork, the artist has become known to a wider public. She/he has become a singularity upon a background of the generic, because she/he has actively transformed his/her relationship to the body, social, and time. She/he has allowed a certain talent of the body to grow, has engaged in a social context, and has attempted to respond to a certain point in time. She/he has become a generic singularity through relating to the dimensions of own, given, and final being.

But how does a generic singularity in the form of a contemporary artist think? This can best be described as non-philosophy in action, because contemporary artists think not in an academic sense of following strict rules of argumentation and verification (Havsteen-Mikkelsen 2015). They think from their embedded position in life, which means that they *invest* their own way of being into the thoughts they think. French phenomenologist Maurice Merleau-Ponty – from whom this understanding of non-philosophy is derived – expresses most clearly what non-philosophy is: "No human being can receive a heritage of ideas without transforming them through the sole act of knowing them; without injecting into them his own, always different, way of being" (Merleau-Ponty 1960). Non-philosophy is the act of transformation: to inject into a mode of thinking a personal understanding. This happens because contemporary artists allow the experiences of the world to change them, and they search for ideas and theories that resonate with them but take from them only what they can use. And this is in a very literal fashion. In the words of Witold Gombrowicz: "Theory is no problem for the artist. Theory only interests him in as much as he can make it run in his blood" (Gombrowicz 2007). To think as a non-philosopher is to displace official philosophy and to distort or even misunderstand a theory. Once it enters the mind of the contemporary artist, it is dissolved and allowed to flow in new directions. This is one of the great forces of contemporary art: the audience never knows exactly what is going to happen.

Through the artworks proposed and realized and the positions taken and developed, an artistic project arises as that "content" that is produced but also transformed through the artist. The artistic project can be seen as a system of competing interests through which the artist comes to know something about the world but also takes a position in regard to the knowledge obtained through the research. The artistic project is non-philosophical in the sense that it is private, non-institutional knowledge that is embedded into the existence of the artist: a double mode of taking a position and developing a knowledge of how to produce art in relation to a context.

After these reflections regarding the use of the aesthetic, contemporary art and the thinking of the contemporary artist as that of non-philosophy, it is time to clarify what an awareness of the Anthropocene means and how it can influence an aesthetics of the Anthropocene within the space of contemporary art.

Awareness of the Anthropocene

How can an awareness of the Anthropocene influence the making of contemporary art? The nature of this awareness is crucial in understanding the artistic positions that engage with the aesthetics of the Anthropocene as a concern for contemporary art practices. In the following, some indications of what this awareness entails will be given, as well as how it manifests itself and changes the self-perception of what it means to be human.

First of all, to become aware of the Anthropocene is to understand the Earth system trends of the last 70 years that surround a Western human existence as a generalized framework. It is to see those aspects of an individual life that are conditioned by social systems governing the production of that reality. The generalized form of what enables "me to become me" can be designated as a "Western welfare self" – referring to a mode of being produced by the Western welfare states emerging after WWII in the northern hemisphere, especially the USA, Europe, and Japan. The Western welfare self is a variance of being, a self that is based on a lifestyle of material affluence depending on a high carbon footprint (approx. 14,5 t carbon dioxide per Dane). It is a lifestyle protected and supported by the infrastructure of the welfare state in a broad sense (transportation, health care, education, leisure, food, and the availability of goods transported to the consumer from all over the world).

It is important to understand that the Western welfare self is a conceptual person, as defined by philosophers Gilles Deleuze and Félix Guattari in *What is Philosophy?* (Deleuze and Guattari 1991). It is a person who exists in a conceptual space in order to trace out dangers and possibilities, a way of creating existential movements within a space of thinking. It does not refer to a specific individual but to a life-form in which a human life becomes possible. A Western welfare self refers to a human existence that profits from the acceleration of energy consumption that took place after 1945. This acceleration is part of several exponential growth tendencies designated as the "Great Acceleration" of all Earth system trends: in primary energy use, urban population, transportation, telecommunication, international tourism, public infrastructure, and fertilizer consumption just to name a few (Bonneuil and Fressouz 2013).

Thus, to become aware of the Anthropocene means to no longer see the world as a manifestation of structured phenomena constituted through a transcendental subject but as the intertwining of both historical and systemic forces working simultaneously upon the perceptual organism of the body. Not only are all living people now dependent on these forces but also the physical urbanized worlds that we experience on a phenomenological level. Walking through the streets of Copenhagen, for example, there is evidence of the Anthropocene everywhere: the cars (in which fossil fuels explode in a combustion engine), the asphalt pavement (consisting of residue from petrochemical diffusion that is hundreds of million years old), the facades of the buildings (different historical ages intertwined), the people (a global mix of various ethnicities), and all the different shops (often presenting objects produced in Asia and transported with the help of fossil fuels).

Understanding what the Anthropocene means (as the transformation of the world through the burning of fossil fuels) alters the phenomenological mode of consciousness. The actions that a Western individual takes happen in a man-made environment that was produced through the consumption of energy – an energy whose polluting effects have accumulated in the atmosphere (leading to global warming) and the oceans (leading to ocean acidification).

The awareness of living in the Anthropocene is not the same as the awareness of living in postmodernity or a society of singularities. It is to be aware of living in a new geological age based on fossil fuels as the prime mover that effectuates a certain way of being modern (whether this modernity is socialist, democratic, liberal, or communist, it is still within the Anthropocene). Once a consciousness begins to see the effects of fossil fuels as conditioning the "givens" of its life world, it will see the Anthropocene everywhere as a force permeating all dimensions of Western life worlds. The Anthropocene is visible as a phenomenological experience.

To see oneself as an individual existence through the conceptual framework of the Anthropocene is to establish a double perspective: being positioned in the world right now at this point in life and in this specific context and yet simultaneously understanding the systemic causes behind one's own existence. Systemic causes are the already established framework of infrastructure that support traffic, telecommunications, housing, health care, education, energy supply, and food products, such as the objects needed for bodily metabolism, which are intersection points for a huge number of logistic activities coordinating production and transportation of goods so that they are available to the consumer.

When one looks into the "eatable" products that appear in shops and later on our plates, one realizes the violence against nonhuman nature that has taken place in order to put them there: firstly, the clearing of land for monocultural fields to grow (no insects or weeds that could sustain other life-forms) and, secondly, the violence exerted on the farmed animals who yield the products that most Westerners eat: milk, butter, cheese, and meat products. The reproductive cycle of the cow has to be manipulated (and violently distorted) in order to enable lactosis, and the cow is later killed to obtain its beef or skin. The pig or chicken is often kept in inhumane conditions and then slaughtered to become meat. But, for the consumer of the end product, obtaining in this way of the energy needed for the metabolism of the body, this violence is externalized to the farmer or butcher. The urban consumer has no direct contact with the growing of crops and the sentient beings or with the actual slaughtering of the animal. This externalization has made such violence invisible in ordinary city-dwelling life. It goes unnoticed and is mostly taken for granted by the Western welfare self.

Awareness of the Anthropocene is an understanding of the global impact made on the planet by humans since 1784 through fossil fuels and of how life is conditioned by these systemic transformations that took place in all areas of human society, accelerating after 1945. Awareness means seeing the other side of these Earth system trends, which have led to the destruction of natural habitats for nonhuman animals and are driving the climatic changes toward global warming and extreme weather manifestations. It is this awareness that feeds into the position of the contemporary artist working and thinking (as a non-philosopher) within an aesthetics of the Anthropocene. The awareness leads to a new positioning of the artist against the ideology of unlimited economic growth and the exploitation of nonhuman nature by the industrial-agricultural-food complex.

Artistic Trajectories Within the Anthropocene

In order to understand the complexity of an aesthetic of the Anthropocene, some indications will be given of which directions such a contemporary art could take. At least eight possible trajectories seem obvious within the space of contemporary art (as that social system to which artists propose their artwork), and they are vectors that can overlap, mix, and become hybrids (several vectors can be present within one artwork). The following is not a hierarchical list of what is most important; rather, each trajectory can be seen as a way of accessing the Anthropocene and displaying a consciousness of what is possible to do from the embedded position of a contemporary artist.

(A) Working with the "skin of the Earth." Artworks in this category incorporate, deal with, or explore minerals, vegetation, trees, microbes, insects, or water – all materials that are located within 30 m below or above the crust of the Earth. This thin layer, from which we get most of our nutrients to survive, is a huge research field for contemporary artists. Here, the central issue is to shift a human-oriented perspective toward other forms of life that coexist with humans and were around long before humans entered the historical stage. This line of work attempts to reveal the "symbiotic real," as leading ecological theorist Timothy Morton calls it, by allowing it to unfold on its own terms and interacting in ways that are indifferent to humans (Morton 2017). An example is the public art project by

Matthew Ritchie, *This Garden at This Hour* (2014), a permanent installation in front of the US Food and Drug Administration, in White Oak, Maryland, that mixes sculptural and organic elements. The latter are various kinds of invasive vegetation that enter into a competition with each other. Thus, Ritchie has created a stage for an ever-changing landscape of interaction between life-forms taking place within human-made structures.

(B) Exploring the "knotted relations" between humans and nonhuman nature, also labeled "interspecies encounters." This line of work is especially inspired by the theoretical texts of Donna Haraway such as *Staying with the Trouble: Making Kin in the Chthulucene* (Haraway 2016). Here we find engagements with animals in order to investigate the evolutionary continuity between the human mind and other forms of consciousness. As art critic and curator, Nicolas Bourriaud has stated: "Contemporary art plays host to a productive entanglement between the human and nonhuman, a presentation of coactivity as such" (Bourriaud 2019). An example is the installation *Untilled,* 2011–12. *Living entities and inanimate things, made or not made* by Pierre Huyghe for Documenta 13 in Kassel, where he established a garden of exotic and intoxicating plants, containing a dog whose leg was spray-painted pink. Centrally located was a marble sculpture of a classical nude, but with the head transformed into a humming beehive.

(C) Explicitly attempting to make visible the negative or hidden impact of the mineral extraction process connected to the digital industries or of the industrial-agricultural-food complex upon the environment and land degradation through deforestation. Within a smartphone or a laptop, there are at least nine rare Earth minerals (such as cerium, neodymium, and lanthanum) that have been dug up and transported and refined somewhere in the world. This process leaves a devastating trail of pollution and toxic radioactive waste material. Artists Anu Ramdas and Christian Danielewitz, for example, traveled to a mineral waste dump in China and exposed film negatives that when developed showed the shimmering effects of radioactivity from thorium (a waste product from rare Earth mining). Within this trajectory, we also find artists working with the negative impact of the industrial-agricultural-food complex upon the environment and land degradation through deforestation. This kind of artistic activity works along the lines of "forensic architecture" – through the extensive use of research, maps, and scientific data presented to the public as evidence of the human transformation and destruction of geographical land sites. Google.maps is an often-used tool in these projects (Fig. 1).

(D) Making artwork concerned with the catastrophes immanent to the temporal horizon of the Anthropocene. This is art that concerns itself with dystopian visions of the future, with apocalyptic images of what is going to happen when the Earth becomes uninhabitable (Wallace-Wells 2019). Here, artists stage future scenarios where civilization is a faint memory, where humans are forced to live underground or exist in environments without any relation to the world as it is known. It is human civilization as a fossil record. Much recent film production explores these imaginings of a warmer world of forests fires, droughts, and floods, where large numbers

Fig. 1 Anu Ramdas and Christian Danielewitz. *Thorium 232/Weikuang VI, Against The Grain & Black Square.* (Photo by Hannes Wiedemann)

of climate immigrants cross territorial borders. An example is the recent contribution by Larissa Sansour to the Danish Pavilion at the Venice Biennale 2019: a dystopian film of people living in the aftermath of a catastrophe, telling stories from the time before the world broke apart.

(E) In this trajectory, we also find the criticism that humanity is not doing enough or not acting fast enough to prevent the estimated climatic tipping points from taking place. This causes a mental state of being: *climate depression*, designating the awareness (especially among climate scientists) that the estimated increase of temperature will unleash a wave of unprecedented extreme weather conditions with feedback loops that no one can predict. I myself have contributed with several works to this aspect, in both painting and installation. In 2018 I presented *Flooded Modernity*, a 1:1 scale mock-up of a corner of Le Corbusier's Villa Savoye from 1929, partly submerged on the shore of a Danish fjord – a portent of the impending climate crisis where floods, hurricanes, and extreme weather will become the new normal. (The project was originally conceived as a critical response to the meddling in democratic elections in the USA and the UK through the use of psychometric profiling and targeting specific voters by Cambridge Analytica. I now see it in a different light: that of the impending climate crisis. This rewriting of my own interpretation and intention behind my artwork illustrates a future task for art history: to rethink artistic projects of the twentieth century in light of the Anthropocene and the trajectories that are proposed here.) (Fig. 2)

Fig. 2 Asmund Havsteen-Mikkelsen, *Flooded Modernity*, Vejle Floating Art Festival, 2018

(F) Creating art projects pointing toward "deep time." These are works that attempt to undo the fixation on the present and instead view human history as part of a much larger temporal horizon extending back millions of years to a geological time when humans were not even present in the world. Developing deep-time sensibility can be seen as a critical stance against an accelerated time horizon, because it forces viewers to extend their imaginations to other ways of inhabiting the earth, to see beyond the phenomenological appearance of the present toward a different time. The sculpture *A Bullet from a Shooting Star* (2015) by Alex Chinneck is an example of this type of work. The artwork, an inverted 35-meter-tall electricity pylon, appearing as if shot from deep space and pointing like an arrow toward the ground that sustains us and from where we extract its material traces, made visible how the electricity running in the power lines is produced from energy millions of years old, thereby making visible the deep time behind the present.

(G) Finding practical ways to inhabit the Earth differently, by, for example, restoring biodiversity and original megafauna to current agricultural monocultural land. Here, artists present installations featuring permaculture or hybrids of high-tech solutions and nonhuman nature as a new way of envisioning coexistence. An example is the art project *Silicon Prairie* by Matthew Darmour-Paul, who "visualises a post-agricultural midwest through the transformation of key typologies" (Darmour-Paul 2019), or the Danish art-collective N55, who present their works as "manuals" for radically inhabiting the Earth in a new way, from a walking house or floating platform to an urban free-habitat system. People are at liberty to implement these open-source projects in their own lives.

(H) Creating art projects that through their installation and material quality (such as sound) aim to bring about a new state of being within the viewer, a "cosmic consciousness," an awareness of the Anthropocene, and a new way of engaging with nature. John Luther Adams, for example, aims through his compositions to create a music "grounded in space, stillness, and elemental forces" (Adams 2019). As he states about his own art: "A deep concern for the state of the earth and the future of humanity drives me to continue composing. I believe that music can serve as a sound model for the renewal of human consciousness and culture" (Adams 2019).

(I) Exploring "other imaginations" – all the marginalized modes of inhabiting the Earth outside the dominating Western discourse of the secular scientific-capitalistic ideology. Here, artworks give voice to the imagination of indigenous and native people living on the periphery or outside the blue lines of google.maps. By doing this, they open viewers' minds to existing modes where nature is lived with and not against, as something to be domesticated and exploited. This category also includes artworks that explore the spiritual worlds of primitive religions by mixing them with technology and science fiction from Western culture. Artist Jakob Kudsk Steensen, for example, in the video animation *Terratic Animism* (2017), presents a shamanistic figure who moves between postapocalyptic landscapes of ice, snow, and sci-fi spaces.

These are themes that designate the content of an aesthetics of the Anthropocene. They do not specify any material support or way of exhibiting contemporary art. They can manifest themselves through performance, video installation, painting, text, sound, photography, found objects, land art, sculpture, guided tours, participatory actions, etc. Yet they invite both artists and viewers to rethink their own positions and attitudes toward the Anthropocene as a man-made world with devastating consequences for nonhuman nature. This rethinking through repositioning is the non-philosophical aspect that takes place in contemporary art as a thought space.

Conclusion: Community of Contribution – An Ecotopia in the Anthropocene

How to confront the challenge of the Anthropocene as a fundamental crisis affecting humankind and nature in all its evolutionary multiplicity? Is it possible to stop or even reverse the socioeconomic trends that are leading to the destruction of the planet? A solution could be to establish an ethical ground where individuals and businesses can become legitimate: a framework that could measure the ethical value of their actions. The following is a proposal for such an ethical framework, deriving from a community of contribution.

A community of contribution is a concept for thinking a community, including nonhuman nature, based on generosity as the fundamental ontological principle. The manner in which a human or a business gives itself to the world is a means of becoming a phenomenon in the world. By giving ourselves differently in the way we consume, interact, and relate to nature, it could become possible for wild nature to re-emerge. This kind giving would be an act of withdrawal: to withdraw from actions that have a negative impact on nature. This entails first and foremost a rejection of the conventional products of the industrial-agricultural-food complex (products from farmed animals and plantations in former rainforest land) thereby reducing the impact on biodiverse nature. It is estimated by scientists that a global plantbased diet could reduce the land needed for agriculture by up to 75%, thereby freeing space for wildlife parks (Poore and Nemecek 2018).

A community of contribution is based not on a territory, a religion, or an ethnic belonging but on an ethos of generosity toward nonhuman nature. In order for businesses to become ethically legitimate within a community of contribution, they must consider all the aspects of their activities and see how they can stop or minimize their interference or destruction of nonhuman nature. Ethically legitimate actions aim at the reflourishing of wild nature. It is a regulative idea in a Kantian fashion: a *focus imaginarius*.

To ensure this movement away from destruction, a new concept of the state is needed: a sustainable state instead of a welfare state, based on a different relation to nonhuman nature and a reduction of carbon emissions through the taxation of polluting activities. A sustainable state will challenge the power of the industrial-agricultural-food complex and force it to reduce its negative impact on farmed animals, the environment, and the health of the population.

The concept of the community is not without problems or conflicts. The community has, since the industrial age, been seen as a redemptive phenomenon and returned in various forms in an attempt to overcome alienation within industrialized societies. From the communist utopia to the communitarian-gated community, it was experimented with in the twentieth century based on either ethnic or universal equality and religious or nationalistic essences and failed on a disastrous and monumental scale. All the pitfalls embedded into these varieties of the community must be avoided. By grounding the ontological principle of the community on generosity, it becomes possible to avoid the excluding and violent tendencies of the community.

A community of contribution is based on the capacity of humans to give: we have been given life, and we give ourselves over to life by manifesting our presence to the world. Our way of becoming visible is a manifestation of givenness, of how a self decides to become a visible phenomenon to itself, the other, and nonhuman nature. To participate in a community of contribution is thus an ethos for a life based on generosity toward that world that has given one life. Acting from within a community of contribution is a way of giving whereby a human exists differently in the world through the gift of minimizing its destructive impact on nonhuman nature.

A community of contribution is an ecotopia within the Anthropocene: an ecstatic way of existing, intensely communicating with nonhuman nature, and seeing human existence as part of deep time inside and outside of the body. It is a way of living as atonement for the destructive impact of the Anthropocene upon animals and wild nature.

Flying through the world on google.maps, the user sees a “bleached” world where all the remaining forms of life are nonexistent. No wild animals are visible, nor bacteria or microbes, and there are no sounds of nature: no wind howling, nor water falling. The user sees a “flat” world reduced to an image without the phenomenological depth it knows from its bodily interaction with the world. In this way, google.maps also presents the natural world of the future: extinct of all forms of life except for humans and their few livestock species that have been domesticated. Thus google.maps is a warning, a wake-up call to do things differently in the world as businesses and individuals. A community of contribution is a new ethical way of taking action in the Anthropocene: to enhance life conditions for nonhuman nature by restoring present monocultural nature to wild nature. An aesthetics of the Anthropocene contains artworks that present possible steps toward the realization of the community of contribution.

Business Legitimacy, Agricultural Biodiversity, and Environmental Ethics: Insights from Sustainable Bakeries

86

Riccardo Torelli and Federica Balluchi

Contents

Abstract

The relationship between biodiversity and ethics is complex and concerns the broader *environmental ethics*. In the agricultural industry, these issues are fundamental and, in the context of agro-biodiversity, bread production activity plays a primary role. Artisanal bread and its derivatives represent basic food products and a short supply chain, with only one intermediate step between the producer of the raw material (flour) and the consumer, represented by bakery. Furthermore, bakery industry is characterized by different needs, motivations, evaluations, and ethical/moral values, as well as philosophical considerations towards nature, of producers and consumers. Through a multiple case study on four specific companies of the interesting and relevant natural and sustainable bakery industry,

our aim is to understand what are the motivations and ethical-moral drives behind specific ideological and operational choices that have an impact on nature and its biodiversity. It is also intended to investigate how the different ethical-philosophical approaches to nature lead to economic and management choices that are also very distant from each other and have different impacts on the protection and promotion of agricultural biodiversity. This study has allowed to place the positions and choices of some entrepreneurs and artisans in the different ethical approaches to nature and therefore to biodiversity. It was also possible to highlight how the different behaviors of consumers and producers arise from the ethical conceptions through which they look at reality and the consequences of their choices on production and sales activities.

Keywords

Biodiversity · Agro-Biodiversity · Ethics · Environment · Bakery · Crops · Sustainability

Introduction

Biodiversity and ethics are two very related concepts and concern the broader *environmental ethics* field. The relationship between the two concepts is linked to the multifaceted conceptual nature of biodiversity and, at the same time, to the debate on rights and value of life of animal and plant beings. For this reason, the study of the ethical perspective of biodiversity cannot disregard philosophical thinking of ancient and current scholars. The different ethical approaches to nature and, therefore, to biodiversity lead to a variety of ethical: from *anthropocentrism* to *cosmocentrism*.

The different visions of the importance of nature in relation to humans certainly concern the agricultural production industry in which the issue of biodiversity conservation is fundamental. In fact, agro-biodiversity is the subcategory of biodiversity most at risk and most relevant in European continent (Negri 2005) and it has still not very deepened and considered (Lanka et al. 2017).

In the context of agro-biodiversity, bread production activity plays a non-secondary role. Indeed, bread and its derivatives represent basic food products and a short supply chain, with only one intermediate step between the producer of the raw material (flour) and the consumer, represents bakery industry. Furthermore, bakery industry is characterized by different needs, motivations, evaluations, and ethical/moral, as well as philosophical considerations towards nature, of producers and consumers meet/conflict.

Starting with these brief considerations, through a multiple case study on four specific firms of the interesting and relevant natural and sustainable bakery industry, our aim is to understand what are the motivations and ethical-moral drives behind specific ideological and operational choices that have an impact on nature and its biodiversity. It is also intended to investigate how the different ethical-philosophical approaches to nature lead to economic and management choices that are also very distant from each other and have different impacts on the protection and promotion of agricultural biodiversity.

The chapter is composed by six main sections: the first paragraph deepens the link between biodiversity and ethics. In the second, we propose a brief analysis of the contributions in the various fields of study that, specifically, deal with the relationship between biodiversity and ethics; we then propose some reflections on the relationship between ethical duties and economic behaviors. After clarifying the methodology behind our study, we discuss evidences from case studies. We conclude the chapter with some final considerations.

Biodiversity and Ethical Approaches

Biodiversity is defined by “the number and types of plants and animals that exist in a particular area or in the world generally” (Cambridge English Dictionary 2019). In this sense, biodiversity, and its *conservation*, is fundamental for primary resources of the human being (e.g., food production, drugs, clothes), but also for the balance of natural habitats and ecosystems (e.g., climate stabilization, pollination, soil erosion) (Jones and Solomon 2013). On the other side, ethics can be defined as “moral principles that govern a person’s behaviour or the conducting of an activity” or “the study of what is morally right and wrong, or a set of beliefs about what is morally right and wrong” (Cambridge English Dictionary 2019). Ethics refers also to “general beliefs, attitudes or standards that guide customary behaviour” (des Jardins 1997: 16). It is clear, therefore, that biodiversity and ethics are closely interrelated issues and concern the broader and more philosophical concept of *environmental ethics* (e.g., Callicott 2002; Minteer and Collins 2005; Nelson 2002; Norton 1984; Rolston 1988; Taylor 1986; Tilman 2000).

The complexity of the relationship between biodiversity and ethics is linked, on the one hand, to the multifaceted conceptual nature of biodiversity and, on the other, to the broad debate on the issue of the rights and value of life of animal and plant beings. For this reason, the study of the ethical perspective of biodiversity cannot disregard the thinking of philosophers such as Aristotle and Kant; these approaches must, however, be integrated with the approaches and visions of more current scholars. The result of this analysis is the identification of different ethical approaches to nature and, therefore, to biodiversity, ranging from anthropocentrism to cosmocentrism.

A useful document for the understanding of the ethical aspects of biodiversity is the UNESCO report published in 2011 as part of the larger project “Ethics and Climate Change in Asia and the Pacific” (ECCAP) and drafted on the occasion of the International Year of Biodiversity (2010) and the International Year of Forests (2011). In particular, the aim of the project was to stimulate a discussion on environmental ethics that would lead to tangible interdisciplinary results useful to support long-term national and international policies. More specifically, “the project aim to increase awareness and discussion of the complex ethical dilemmas related to energy and the environment, and to identify scientific data, and available ethical frameworks of values and principles for policy options that have proven useful in facing the challenges in certain communities and countries" (UNESCO 2011: vi). After having deepened the concept of biodiversity ("the variability among living organisms from all sources including, inter alia, terrestrial, marine, and other aquatic ecosystems and the ecological complexes of which they are a part; this includes diversity within species and of ecosystems." UNESCO 2011: 2), its components (genetic, microbial, and ecosystem diversity), and the issues related to its measurement, the Report provides an interesting and in-depth analysis of the ethical implications with respect to biodiversity proposing, in a philosophical and multiple ethical approaches, "the ways in which ethics and biodiversity are interconnected and how the implications of decision manifest themselves based on the categorical differences between the approaches that are discussed" (UNESCO 2011: 9).

The main philosophical approaches to biodiversity are anthropocentrism, biocentrism, ecocentrism, deep ecology, and cosmocentrism; in the following, these are analyzed without pretension of exhausting the subject also in the light of the necessary skills that escape our field of study.

Anthropocentrism is a tendency (of religions, theories, or thoughts) that sees human as the most important being in the universe, therefore of every animal and vegetable being (Brian 1984). This approach is at the basis of Aristotelian philosophy, which provides for a hierarchical priority of human over nonhuman beings; in other words, the animal and plant worlds assume importance as instrumental to human's well-being. In this approach, therefore, the natural environment, and therefore, biodiversity, assumes no importance except as useful (instrumental) with respect to human beings. Still within the philosophy of anthropocentrism, a less extreme vision is that expressed by Kant (1963); according to the philosopher, the treatment of nonhumans must in any case be ethical at least for the effects on the morality of the man who makes instrumental use of them for his well-being. In this perspective, there is no explicit hierarchical position of human being in relation to animals, but it is stated that it is immoral to treat animals in such a way as to have negative effects on human morality. Therefore, in this view, human is in any case given priority over animals that have an instrumental value over the former. In other words, the protection of biodiversity is not an end in itself, but only if it is useful to humans (Kant 1963).

Another approach is *biocentrism* according to which there are no hierarchical differences between beings in the universe and human is only one of them (Schweitzer 1923). In this view all beings have an intrinsic value and human, by his work, is called to respect all other forms of life, nonhuman, and natural (for more on the concept of *intrinsic value* in environmental ethics see: Callicott 2002; Norton 2000; Rolston 1994; Russow 2002). This need for respect is typical of biocentric egalitarianism, according to which all living beings are worthy of the same respect and this respect for nature means, among other things, the integrity of natural ecosystems (Taylor 1981, 1986).

In contrast to the two previous approaches is the *ecocentrism* according to which man must work with the objective of preserving ecosystems and living species in a sustainable development perspective; the ecosphere and biosphere play a central role in this perspective (Leopold 1949). Basically, the philosophy of ecocentrism supports the importance of the value of a unitary "living complex" compared to that of the individual components of that complex: human, nonhuman beings, and plants. In this regard, UNESCO Report: "While both anthropocentric and biocentric approaches represent the value of the beings within the life bearing matrix, the ecocentric approach represents the value of the matrix in sustaining the beings" (UNESCO 2011: 14).

In the same direction but with an ecological approach is *deep ecology*. According to this philosophy or, better, movement, first introduced in the 1970s by the philosopher Arne Naess, all living beings (human and nonhuman, vegetable and animal) have an intrinsic value that is also realized by the diversity and richness of the various forms of life. From this point of view, the human work of cannot threaten such diversity, except for reasons related to vital needs (Naess 1973. For further information, see Devall and Sessions 1985; Tobias 1985). Unlike anthropocentrism, biocentrism, and ecocentrism, the theorization of deep ecology provides principles that are translated into real imperatives not present in purely philosophical approaches.

A final philosophical approach to environmental ethics is *cosmocentrism*. According to this approach, the value system is centered on the cosmos as a whole and the planet has a supreme value. Consideration of this approach, however, is particularly difficult because of its overwhelming effect on man.

Biodiversity and Ethics: Theoretical Background

The relationship between biodiversity and ethics has been analyzed from different perspectives ranging from philosophy to religion, from law to economics and to accounting. Without pretending to be exhaustive, in this paragraph we propose a brief description of some contributions whose object is specifically the analysis of the relationship between biodiversity and ethics.

From a philosophical point of view, the concept of biodiversity has recently been analyzed examining the issues related to its conservation and the consequent regulatory implications (Mathews 2016). From this perspective, the normative objective of biodiversity conservation is to ensure the survival of species and not "the abundance of species populations." In summary, however, preserving biodiversity means adapting it to the needs of human development in an anthropocentric ethic. In the light of this position, it is proposed "as an alternative basis for conservation policy, an ethic of bio-proportionality." In accordance with this principle, the goal "would be to optimize the populations of all species, relative only to the internal constraints imposed by the checks and balances inherent in ecosystems" (Mathews 2016: 146).

In the field of theological studies, an interesting perspective of biodiversity analysis is proposed through the thought of Thomas Aquinas. In particular, proposing a way of approaching the traditional (human-concerned) doctrines with a view to their environmental virtue, the author gives a careful look at the way that salvation works that can be helpful to con-temporary problems in environmental theory (Jenkins 2003). The motivation for such a deepening is rooted in the accusations that Christianity is anthropocentric and has contributed to the environmental crisis. The relationship between religion, ethics, and biodiversity is deepened with an interdisciplinary perspective in Hamilton (1993); the volume, which includes the papers presented at the symposium of the XVII Pacific Science Congress held in Honolulu (Hawaii) in 1991, is based on the belief that nonbiological aspects (religious and philosophical, for example) are at the basis of attitudes towards the conservation of biodiversity.

In the economic and managerial field, there are several points of reflection on the relationship between ethics and biodiversity. Spash et al. (2009), for example, apply a contingent valuation method introducing factors from social psychology to test the standard economic model of human behavior, while also addressing ethical motives which are excluded by standard economic models. The model contrasts standard economic variables with ethical and behavioral psychology variables to reveal the underlying reasons for the willingness to make an economic sacrifice for the conservation of biodiversity. McEwan et al. (2014), using the case study methodology, offer an analysis of how expectations regarding the use of advanced technologies and, more generally, knowledge influence the debate on sustainability, biodiversity conservation, and the ethics of economic choices. In other words, the authors "are interested in the politics of expectation that surround the use of technology, how the shift towards technology influences debates about sustainability in specific places, and how this shapes perspectives on what is ethical in such places" (McEwan et al. 2014: 206). After analyzing the problems concerning the evaluation of the influence of psychological factors of an ethical-social nature on human behavior, Butkus (2015) believes that the production activities of the pharmaceutical sector are no longer able to produce sufficient medicines to fight infections, cancers and viruses. In this perspective, author states that biodiversity is an essential condition of natural sources to replace the shortage of medicines. Therefore, failure to conserve biodiversity could threaten the treatment of diseases for current and future populations. Hence, the ethical motivation can be a crucial element for biodiversity conservation within a framework of preserving overall stability of the surrounding ecosystem. Such an approach based on the principles of sustainable biodiversity should be married to international and economic policy and the benefits derived from the latter; "should appeal to the egoist as much as the altruist—the strength of the relationship between preserving biodiversity and our ability to meet health challenges has benefits to both self and others" (Butkus 2015: 9). Namkoong (1991) analyzes the relationship between biodiversity and ethics within the broader issue of forest management. The author's starting point is to distinguish the *subjects to be dealt* from the *objects to be managed*: the subjects have an intrinsic value and must be protected, and the objects have an instrumental value and must be managed. The ethical aspect lies in identifying which "organisms have inherent values, what moral obligations are owed to them, and which can be treated strictly as instruments" (Namkoong 1991: 441) and, therefore, in the criteria to be used to divide subjects from objects. Another study that analyzes the ethical aspect of biodiversity in a specific economic-productive context is Negri (2005). In particular, the paper examines the problems inherent to the biodiversity of agro-ecosystems with the aim of soliciting a reflection on the loss of agro-biodiversity due to profound changes in the socio-economic context. The ethical aspect of agro-biodiversity lies in the identification of any values that concern it; the identification of these values would justify the demands to safeguard agro-biodiversity and the definition of more effective policies and actions. The agro-food sector is a very studied field; in general the aim is to analyze the role (positive or negative) of the productions carried out in this sector with respect to biodiversity (e.g., Engels et al. 2011; Le Coeur et al. 2002; Marshall and Moonen 2002; Paoletti 2001; Tilman 1999).

Finally, with reference to the more specific field of accounting, the analysis on biodiversity issue concerns, in particular, the problem of biodiversity assessment and its subsequent reporting. The studies will be disseminated starting in 2013 on the occasion of the first Special Issue of a high-level international magazine (AAAJ) on "Accounting for biodiversity" (Cuckston 2013; Groom and Freeman 2013; Jones and Solomon 2013; Rimmel and Jonäll 2013; Siddiqui 2013; Tregidga 2013; van Liempd and Busch 2013). Subsequently, other studies, always included in a special Issue of the same scientific journal, propose reflections on new forms of ecology-centered accounting and reporting practices for biodiversity conservation and promotion (Adler et al. 2017; Cuckston 2017; Feger and Mermet 2017; Ferreira 2017; Gaia and Jones 2017; Laine and Vinnari 2017; Lanka et al. 2017; Russell et al. 2017; Sullivan and Hannis 2017). Except contribution of van Liempd and Busch (2013), whose objective is to suggest that companies have ethical reasons to report on biodiversity issues; in these papers there is no prevailing ethical approach to biodiversity measurement.

In the light of the brief analysis of the literature, it is evident that the contributions in the business economic field are lacking; this can certainly represent a stimulus for further study.

Ethical Duties and Economic Behaviors

Through the economic choices made by economic actors (companies, consumers, associations, institutions, etc.), it is possible, at least in part, to understand the current/future choices and perspectives on ethical-moral values. Through economic choices, economic actors define explicitly or implicitly, voluntarily or involuntarily, a personal ethical vision of their activity and their role within society and the environment. The economic system is therefore potentially able to show the system of ethical-moral values of this very subject. If the system of economic considerations and evaluations manages not to conflict, both conceptually and operationally, with the choices and aspects relating to environmental protection and conservation, an interesting and useful space opens up for virtuous ethical behavior. Economic evaluations and considerations can be of help in defining a strategy of respect for the environment and its ethical aspects. This process does not only take place through national and/or international institutional choices, for example, through taxes and sanctions that discourage negative behavior, but also through the communicative aspect of economic choices, first and foremost through price, which becomes a signal and a reflecting mirror of what is being done, what is being bought/sold, and the relative impacts. In this way the economic value system does not contrast the moral value system but becomes its supporter and facilitator. In the operational reality, this positive collision and uniformity of intent does not represent normality: often the economic dimension is seen and considered separate or even adverse to the moral and environmental ethical dimension. It should also be noted that the economic aspect can have a negative effect on the respect of these principles; it is the case, for example, of too high prices that create a barrier to purchase for consumers and therefore a lack of opportunity to protect and promote environmental ethics.

The great difficulty in this process of rapprochement lies to a tendency not to consider, or to consider only partially, in economic choices, those of price but not only, the cost linked to the negative impact on the environment and in particular on biodiversity or the value (in the sense of protection, promotion, and direct/indirect relative impacts on the environment) of a product or service that takes into account the ethical-moral principles of respect and protection of the natural environment. This difficulty may increase if the motivations and drives of the consumer are different from those of the producer/company. The personal ethical-philosophical conception of nature and its protection (including the protection of agricultural biodiversity), the local cultural context with its historical-religious traditions, the personal background of the two actors of the exchange (producer-consumer), have a considerable influence on the choices made in terms of ethical/economic value system. It is evident how the different philosophical conceptions related to the vision of nature and biodiversity described in the paragraph above give rise to different ethical drives and operational choices even very far apart from each other. Usually companies adopt in their vision and mission a well-defined perspective of how to conduct their core-business and other related activities, which should permeate the entire working environment, from the founder to the final product. On the market, however, this concept inevitably clashes with a reality characterized by rules, laws, customs and common traditions, but with a multitude of ways of seeing and facing reality.

Methodology

In the light of the above considerations, our aim is to understand how biodiversity is considered in the operational and economic reality operating in bakery industry, and, in particular, how it is considered from an ethical point of view. Since this is a conceptual paper that aims to understand the dynamics present in a particular and interesting industry (the natural and sustainable bakery) and since it is still a very little studied and deepened thematic area, it was decided to combine the theoretical treatment of the theme with the use of a Multiple Case Study (Yin 2017). Through four exploratory case studies, the choice to investigate these issues in the bakery sector was taken for several reasons:

1. Agro-biodiversity is a concept that is still not very deepened and considered (Lanka et al. 2017).
2. Agro-biodiversity is the subcategory of biodiversity most at risk and most relevant for most of the European continent (Negri 2005).
3. Bread and its derivatives represent basic food products, purchased and consumed by almost all people in industrialized countries.
4. Bakery industry is represented by a short supply chain, with only one intermediate step between the producer of the raw material (flour) and the consumer, that is, the baker.
5. Bakery industry is characterized by different needs, motivations, evaluations, and ethical/moral, as well as philosophical considerations towards nature, of producers and consumers meet/conflict.

The area surveyed was selected for its vocation to produce bakery products, but more generally quality food products: Parma and Reggio Emilia (Emilia Romagna, Italy) form an area called Food-Valley, known and appreciated worldwide for food production. The exploratory case studies were conducted by the authors through the guidance of a specific Case Study Protocol that allowed to systematically and punctually investigate the subject matter of research in all the realities involved in the study. Through the inclusion also of a group of randomly selected consumers, for each bakery, it was possible to include in the analysis and discussion also the point of view of the final consumer, thus being able to compare this with the point of view of the producer. The four bakeries have been selected because they use biodiverse raw materials (in this case flours) that promote general agro-biodiversity and in particular the areas where the starting cereals are grown. They use mainly, but not exclusively, flours derived from grains of Italian origin belonging to landraces. These are nongenetically modified cereal varieties, typical of the area where they are cultivated and for this reason very resistant and less subject to treatment with chemical products. They are varieties that were in danger of disappearing because they were not used in favor of modern, genetically modified or selected and crossed cereals, with specific characteristics and better suited to intensive farming (Singh and Abhilash 2018; Thomas and Kevan 1993). The ancient grains used are: soft wheat Solina, Verna, Gentil Rosso, San Pastore, Virgo; durum wheat Perciasacchi, Saragolla, Russello; Einkorn wheat (*Triticum monococcum*). The four case studies are small companies, with a maximum of six employees and the active and constant presence of the owners. In this way, it was possible to have a good overall view of how these issues are considered and managed by both owners and staff. All bakeries studied have the point of sale directly adjacent and communicating with the production laboratory, in all cases totally or partially visible to the public. Most of the volume of sales is made in the point of sale of the headquarters, the remaining part takes place through organic supermarkets, farmers' markets, catering activities, solidarity buying groups. The activities are located in fairly central points in the cities (Parma and Reggio Emilia) and marked by a good or excellent passage of potential customers. In all bakeries, the type of product sold is clear, while the clarity on the type of raw material used and its specific characteristics varies. The item of communication and advertising is also very variable. These activities are contradicted by the production of bakery products with mother dough and local or national raw materials, mostly certified organic. These products are aesthetically different from those sold in traditional bakeries and also differ in the selling price (they have much higher prices). However, they are characterized by a higher digestibility, a higher presence of fibers, a longer duration, a clearer and more intense taste (Antognoni et al. 2017; Arzani and Ashraf 2017; Dinu et al. 2018). All the realities, apart from one that is now to be considered historical, are quite recent and have a modern and attractive sales method (furniture, counter positioning, product layout, etc.).

Evidence Discussion

"Internal" Vision: The Bakers

A first important evidence collected during the multiple case study concerns the motivations with which these realities approach biodiversity management in their production and management operations. In all four cases, the companies are small, with the active presence of the owners. This first aspect tends to ensure consistency over time and uniformity of thought within the activity, in relation to the vision before that characterizes these realities. Being small realities of the territory, it is clear that there is a strong link with the concept of local environment, local community, and protection of the place where you live and work. This commitment begins and is mainly characterized by the relationship with suppliers of raw material (flours). It is precisely in this relationship that the will to protect the environment can be implemented in practice and the principles of environmental ethics can be respected. The use by all the investigated realities of national organic flours, often produced at short or medium distance from the company headquarters, characterized by a production by small producers linked to the territory, and the use of cereals of ancient varieties represents the first and main step towards an effective protection of agricultural biodiversity by producers. What is most interesting about this study is how these small producers arrive at the choice of this particular type of supplier and raw material: the ethical values that underlie these links.

Agricultural biodiversity is understood and considered with great attention by the realities investigated, even if with some difficulties. The very concept of biodiversity is immediately and without hesitation set against the concept of economy and money. It is perceived as something quite abstract, strongly linked to business ethics and moral values of respect for the environment and the planet on which we live, but as rather disconnected from reality and difficult to fully consider. Agricultural biodiversity is considered as a synonym of wealth, not in an economic-financial sense but in a human-natural sense.

> *Biodiversity is the opposite of flattening, it is richness.*

The recognition of this wealth, and its direct connection with environmental and human health, is the basis of the choice made with regard to the pursuit of a protection and promotion of nature itself in its entirety and fullness. The concept of wealth is also contemplated with reference to a "romantic vision" of nature and biodiversity that have shown two furnaces: nature and its wealth is seen and conceived as something beautiful and precious, in a sense that transcends the economic aspect and the daily operational reality. This romantic vision that is reconnected with the ecocentric conception of nature (romantic ecocentric approach) (Tomalin 2009) represents a very subjective form of vision and approach to biodiversity and the natural world in which its aesthetic value is also considered.

> *We have to consider it* (agro-biodiversity) *to be consistent with what we produce and do. It has a very high intrinsic value, we are the repositories of enormous richness. I am amazed by nature and I feel pain if we do not preserve it.*

This aesthetic value, far from daily operations, seems to represent a sort of brake to the full consideration of the ethical-moral values connected in the company management of these ovens. If the use of a healthy and natural yeast, such as sourdough, and nonchemically treated, organic flours leads to an immediate consideration and recognition of the benefits for man and the environment, in the case of the use of biodiverse raw materials this recognition is less immediate, more impalpable, probably more filtered by the personal ethical vision and sensitivity of each individual person. The fact remains that nature and its biodiversity are seen as carriers of an intrinsic value, disconnected from any human, economic, or other evaluation.

The ecocentric vision of nature is predominant in the four case studies; the protection of biodiversity is seen as a mission, a necessity, and an ethical-moral duty. In the totality of the realities investigated, it became clear that the protection of biodiversity is linked to a greater well-being of nature and therefore indirectly or directly also of the human being. In the consideration of the raw materials to be used, in the type of products created, and also in the way they are processed, nature and its respect are fully considered, in the knowledge that the output and outcome of what has been produced will have important positive effects. Nature and living beings, including man, are considered to be part of one big house, not divisible or not partially considered. This ethical conception of nature and biodiversity that distinguishes it belongs to three out of the four realities investigated.

> *Nature is a whole. (. . .) The greater the biodiversity, the greater the well-being of the entire ecosystem. The protection and promotion of biodiversity is: a political act, an economic act, an environmental act, an agricultural act.*

Two of these companies have an ecocentric basic concept but clearly reveal aspects that can be traced back to cosmocentrism and deep ecology.

One company considers nature and its wealth not as a simple complex of plant and animal living beings but as something that goes beyond what we know and understand today. The planet's ecosystem is conceived as an abstract living entity but with tangible effects on everyday reality. This ethical view of nature implies a deep respect for biodiversity, which is clearly recognized in different areas of life on earth and to which a crucial importance is recognized.

> *We see the expressions of biodiversity. It's the only way for things to go well. Nature is our teacher.*

Nature is recognized for its potential and skills that go beyond the classic human vision of the environment and its plant and animal inhabitants. The ecosystem is considered alive and perfect in its complexity and variety. The protection of this delicate balance for this bakery also depends on the choices made in its production activity, which is inextricably linked to the nature in which it is located. This conscious protection is seen as essential and obligatory, without which one would inexorably eliminate the foundations of life itself.

Linked to the vision described here is the conception of biodiversity and nature owned by the other company, which however reveals characteristics that can be traced back to the key principles of the Deep Ecology movement. This recognition of nature and its diversity as an indispensable and vital condition is shared, but there is also a conceptual and practical attempt to resolve current problems, in a more operational and even more pessimistic vision. More drastic solutions and the recognition of a too sharp fracture in society between human beings and nature are at the basis of this bakery's approach. It is precisely the awareness of a clear divide between the modern human being and the natural environment that drives this company to consider alternatives and solutions oriented towards a more rigid and integral ecology.

> *Man must destroy himself before he can evolve. We've reached an extreme point.*

The last bakery, which cannot be traced back to an ecocentric approach to the relationship between ethics and biodiversity, adopts a vision oriented towards anthropocentrism. Nature and biodiversity are considered relevant, even if they are treated as something rather abstract and intangible, but for a human purpose, whether in health or economics. Agricultural biodiversity is considered and well known but changes the basic motivation for this consideration and the direct and indirect effects it expects to have or wants to achieve through this protection. The use of raw materials that protect and promote biodiversity is designed to produce a different, more attractive, healthier product that brings a positive economic return. In this case there is a lack of awareness or willingness to have a positive effect on the natural ecosystem, its wealth. The ethical-moral values in this case, although present, are not at the basis of the economic-managerial choices adopted by the company, but are relegated to a possible motivation for consumers and therefore an economic-commercial tool.

Meeting the "External" Vision: The Consumers

This use of ethical-moral principles as a commercial tool finds fertile ground in the consumers and buyers of these four investigated realities. They are a category of consumers on average more informed and aware of the characteristics of the product purchased, but rarely more aware of the impacts of that product on the environment and its biodiversity. The anthropocentric conception is detectable in the vast majority of consumers affected by this study. What stands out most from the analysis of the data collected in the case studies is the main basic motivation with which consumers choose to purchase this particular type of product. Personal health is almost always the driving force that brings these people closer to these products and businesses. The concept of protection and protection of the environment and biodiversity and therefore of respect for ethical-moral principles towards nature are often completely absent in this actor of commercial exchange, except for some for whom it represents a secondary and little rooted presence and for others, the minority, for whom it represents the main motivation. It is clear how this difference in motivations and basic conceptions between the two main players in this market can create friction and difficulties. On the one hand, there are consumers who are unable to understand certain choices regarding the raw materials used, the types of product created, the prices charged, and the methods of sale and distribution. On the other hand there are producers who arrive at the last and fundamental step having to surrender or adapt to logics and ethical visions completely different from those that have pushed them to do what they do and to do it as they do it. These mutual difficulties in some cases have led or risk leading to either a consumer giving up or a change on the part of the producer. The difficulties just described have as a direct consequence a reduced effectiveness of the farm practices of these producers towards a real and efficient protection and promotion of agricultural biodiversity.

Conclusion

The relationship between ethics and biodiversity is complex and involves different philosophical approaches ranging from anthropocentrism to cosmocentrism. With reference to a specific agro-food sector (Bakery), this study has allowed to place the positions and choices of some entrepreneurs in the different ethical approaches to nature and therefore to biodiversity.

It was also possible to highlight how the different behaviors of consumers and producers arise from the ethical conceptions through which they look at reality and the consequences of their choices and their production and sales activities. These are profound visions and motivations that determine extremely different operational behaviors and impact on our reality. A contribution to the academic and business community through this study is precisely to identifying, through an in-depth analysis of multiple case studies, the real motivations behind certain behaviors and what are the consequent determinants of the problems that exist today in this type of market. An important work of sensitization and divulgation of the effects on nature and its wealth through simple purchase/sale operations is desirable to try to make the majority of consumers understand the motivations of the choices adopted and applied by producers. Secondly, to avoid negative and nonproductive collisions between two market players operating with different visions. If the change in the basic ethical conception of a person or group of people towards nature and the environment is extremely complex and perhaps not even desirable, a new and ever-present consideration of the natural aspects and the possible consequences of our actions, even the simplest ones such as buying a loaf of bread, on the whole ecosystem could be of extreme importance. Like all scientific work, this contribution has some limitations: the main ones are to consider a particular industry (the natural and sustainable bread-making) and a limited geographical area (the Italian Food Valley). Future research may pose the same questions as research in other geographical areas or other market sectors. It will also be very interesting to understand, through further studies, how some specific economic disciplines, for example, marketing, management, accounting, can provide solutions or tools to overcome areas of friction between market players and to try to reconcile at least in part the motivations or practical objectives towards a common and participatory concrete attention to nature and its biodiversity.

Abstract

In order to demonstrate the relation between sustainability, innovation, and business legitimacy, this chapter shows how a phenomenological body and principle ethics can be integrated into business ethics, philosophy of management, and organizational theory by discussing some philosophical, theological, and social science dimensions of environment and bioethics. The problem is how a body ethics and the concepts of autonomy, dignity, integrity, and vulnerability can make sense to the notion of "sustainable development" as the foundation of sustainable innovation that today forms the basis of international environmental policy. This is inspired by the concept of "ecoethical innovation." The chapter shows how, in an organizational theoretical perspective, environmental ethics can be regarded as a critique of previous anthropocentric ethics, which is necessary

for sustainable innovation and business legitimacy. This is done in order to present a position in relation to the debate on the moral status of nature. This discussion makes it possible to propose a precise statement of environmental ethics by incorporating the concepts of interest and stakeholder as a specification of the ethical principles from an organizational theoretical perspective. Thus, the chapter defines the application of the principles in relation to animals, nature, and the environment. Finally, the chapter proposes to explore the importance of organizational theory for corporate ethics of sustainability.

Keywords

Sustainable development · Ethical principles · Vulnerability · Eco-ethical innovation · Anthropocene

Introduction

There has in bioethics been the development of an understanding of bioethics as body ethics, based on a phenomenological anthropology and understanding of the relationship between man and nature. In this context, the ethical principles of respect for human autonomy, dignity, integrity, and vulnerability were highlighted as central guidelines for the protection of the human person in biotechnological and biomedical ethics (Kemp et al. 1997; Rendtorff 1999, 2001: 181–209; Rendtorff and Kemp 2009, 2000; Kemp 2000; Kemp et al. 2000). However, bioethics is not only related to human reality but it must be linked to an animal and environmental ethics. The question is how phenomenological body and principle ethics can help to analyze these problems (Rendtorff 1997, 2001: 181–209). Furthermore, the environmental policy challenge means that it is necessary to include an organizational theoretical perspective on the discussion of ethical problems in relation to the environment, animals, and nature (Hoffman 1991). Here, we need to rely on the concept of eco-ethical innovation, developed by the Japanese philosopher Tomonobu Imamichi. Eco-ethical innovation means that bioethics and business ethics need to deal with the technological conjuncture of human beings and technology in the process of sustainable transitions in order to ensure sustainable innovations of corporate social responsibility (CSR) and business ethics (Rendtorff 2019b, c, d). Humanity does not relate directly to nature, but always acts as part of systems and organizations. We need to rethink CSR and business ethics in order to improve sustainability and innovation ethics (Rendtorff 2001, 2019b, c, d). An effective environmental ethics is not only individual ethics, but must involve an ethics of collective action in state and private organizations. It is important to consider the relation between bioethics, environmental ethics, and business ethics (Rendtorff 2001, 2009a, b). Moreover, business legitimacy requires the ecologically and socially balanced company (Rendtorff et al. 2013). Thus, we need to combine environmental governance with bioethics and business ethics (Levy and Newell 2005).

In what follows, this chapter will show how the phenomenological body and principle ethics can be integrated into a business ethics, philosophy of management, and organizational theory by discussing some philosophical, theological, and social science dimensions of environment and bioethics (Rendtorff 2001, 2009a, b, 2010a, 2013a, b, c, d, 2014a). The chapter will begin by examining how a body ethic and the concepts of autonomy, dignity, integrity, and vulnerability can make sense to the notion of "sustainable development" as the foundation of sustainable innovation that today forms the basis of international environmental policy. Next, the chapter will show how, in an organizational theoretical perspective, environmental ethics can be regarded as a showdown with previous anthropocentric ethics, which is necessary for sustainable innovation and business legitimacy. This is done in order to present a position in relation to the debate on the moral status of nature. This discussion makes it possible to make a precise statement of environmental ethics by incorporating the concepts of interest and stakeholder as a specification of the ethical principles from an organizational theoretical perspective (Freeman 1984; Elkington [1997] 1999). Then the chapter will define the application of the principles in relation to animals, nature, and the environment. Here it is important to analyze the ethical and legal significance of the principles in light of the judgment of the various interests involved. Finally, the chapter proposes to explore the importance of organization theory for corporate ethics of sustainability.

Sustainability, Innovation, and Capitalism

The famous report *Our Common Future*, published by the United Nations International Environment Commission in 1987, led by the Norwegian politician Gro Harlem Brundtland, has been the key to international environmental policy (WCED 1987). The report puts the concept of "Sustainable Development" at the heart of international politics. This concept has ever since been the basis of a comprehensive discussion and many different interpretations. At the same time, it serves as an ideological and political basis for global environmental policy. The need for sustainable development is due to our global predation on natural resources. Commonly mentioned are population problems, greenhouse effect, acid rain, oil spills, forest burning, global warming, etc. Sustainable development is simply necessary to ensure the survival of the globe.

Today, the concept of sustainable development has even reached the corporate ethics and business legitimacy discussion. This is not surprising, however, as the world's industrial, agricultural, and service companies bear their share of the blame for the destruction of nature. The founder of London-based consulting firm, SustainAbility, John Elkington has thus published a leading book entitled *Cannibals with Forks: The Triple Bottom Line of 21st Century Business* that looks at sustainability in relation to business and business legitimacy. Elkington believes that companies face a crucial challenge to work not only on an economic but also on an environmentally and socially sound basis.

This challenge means that companies, NGOs, States, and the international community are forced to work in much closer strategic alliances to solve the world's environmental problems and achieve business legitimacy. Instead of rejecting any outside interference with their activities, companies should engage in dialogue with the outside world to bring their production into line with the ideal of sustainable development ethics (Rendtorff 2019b, c, d).

In a situation where the liberal economic system has prevailed in the struggle of ideologies in times of environmental risk and climate change, this system should be conscious of its social responsibility and business legitimacy (Velasquez 2002). At the same time, with the development of stakeholder theory (Stakeholder-Capitalism), there has been a significant change in understanding of the company's area of responsibility (Freeman 1984; Elkington [1997] 1999). This can no longer be restricted to the owners (shareholders), but the companies should involve other groups in the community (state, local communities, customers, employees, etc.) who have an interest in their activities, in the decision-making process. Already Adam Smith looked at the moral dimensions of the economy when arguing for "the invisible hand" where the fact that every selfish follower's own interest in reality serves the common good.

Today, we cannot ignore that social capital and democratic interaction between stakeholders, based on mutual trust and recognition in communitarian, societal integration, is a fundamental criterion for profitability and success. Both internal trust between employees and management as stable external relations between the company and the outside world is a criterion for success. Companies that do not create such relationships will face major problems in surviving in the competition. Many companies do not understand that we are facing a crucial set of societal changes. They are blind to the development. They believe that sustainability is an expression of unrealistic environmental activism. They do not see the need to integrate environmental and social values into the company's strategic management programs. In addition, they do not realize that these must necessarily be equated with the firm's "hard" financial values. They do not understand that the sustainability requirement also includes claims for equality, justice, and poverty alleviation.

Many business leaders believe that they can still not interfere in political matters and that they can do business without addressing social and ethical issues. They refuse to be open about the company's internal affairs, and they refuse to inform anyone but the company's shareholders about its activities, so they are not open to public opinion until it is too late and have suffered a decisive image loss.

Furthermore, few companies have come to the attention of the need to make sustainable technology an integral part of the organization and the need to work with other sections of society to solve the serious environmental problems. This requires a completely new understanding of the company's action horizon, and sustainability ethics should be part of management's official policy (Rendtorff 2001).

The classic example of the company's survival at stake in terms of business legitimacy if these blind spots are not overcome, we can mention the transnational oil giant Royal Dutch SHELL's fatal mistakes in the cases of Brent Spar and of an agreement on oil extraction in Nigeria.

In the first case, in 1995, SHELL would lower a drilling platform in the North Sea. Greenpeace intervened by linking activists to the platform. With the world press as a spectator, SHELL forcibly attempted to remove the activists. This led to downward sales curves and very poor publicity for the company, which under pressure from the public had to have the drilling platform scrapped elsewhere.

The second case is no less fateful. In co-operation with Nigeria's military dictatorship, SHELL would be politically neutral and the company did not intervene, as the Nigerian government would fire environmental activists highlighting the huge pollution caused by SHELL's activities in Nigeria's river deltas. Here, too, SHELL had to account for the mass society, characterized by a globalized approach to information and an increased environmental, social, and political awareness among consumers and citizens. Even for the giant company SHELL, critical awareness could be felt so severely that, in order not to suffer major economic and political losses, it was considered necessary to make social and environmental responsibility, based on respect for sustainability a valuable area of priority in the future management strategy.

This sustainable economy, ecology, and social responsibility are necessary for the company not to fall behind in the competition in the end and perish. John Elkington describes sustainability-based value management as a necessary consideration of "the triple bottom line," which means that a minimum bottom line should be met in both economics, ecology, and social conditions if businesses are to succeed in the twenty-first century. Businesses should respect the threefold bottom line if they want to have stable relationships with consumers, employees, the public, and society at large. This means that the issue of sustainable development should not be viewed independently of the economic and business development of society.

The Ethical Principles and Sustainable Innovation

In this context, a discussion of the connection between the ethical principles and the concept of sustainable development concerns in what sense autonomy, dignity, integrity, and vulnerability can be used as pillars of sustainable economic, ecological, and social development. The problem is how the ethical principles, as common principles, can bridge the organizational theory, the human, and the nonhuman domain (Rendtorff 2009a, b, 2011). The following definition of the principles, which has been analyzed in more depth in other contexts, aims to show how the principles can be extended from revolving around the individual to values for animals, plants, and organizations as a basis for the behavior of organizations and companies and for business legitimacy in the entire biosphere (Rendtorff 2001).

The principle of autonomy is defined as the principle of respect for the individual's independent creation of ideas and goals for his or her life. Being autonomous expresses an ability for moral insight, "self-law," and for personal freedom. It also expresses the ability to make decisions and act without external coercion. Furthermore, it expresses an ability for political participation and personal responsibility. The principle of autonomy has often been limited to rational human beings. Today it is a basic principle of informed consent for medical treatment and trials. Recently, however, there has been a continuing criticism of the principle of autonomy, for example in connection with the structural constraints for making autonomous decisions in situations of weakness, such as human dependence on external factors, absence of information, and reduced ability for rational reflection. It is therefore a question whether the principle of autonomy can make any sense at all for protection in contexts other than the free and self-conscious human subject.

The principle of dignity originally referred to the moral significance of human beings in interpersonal relationships, especially their capacity for freedom and action, which implies – according to the Western humanist tradition, that they can be more brutal and evil than animals, but that they can also be more generous and good than any other living being. It is now the question of the principle of dignity that can also have an impact on animals and nature. A human being can violate his or her own dignity in the way it treats animals and other nonhuman living creatures. It is necessary to assume that ethical considerations are based on humans being responsible for caring and respecting the nonhuman living world.

Dignity can thus be understood as a consideration of all living nature as "the other" for the human world, that is, not outside the human perspective, but on the other hand as something that should not be treated as a mere object of human manipulation. One could say that the idea of life's dignity (e.g., using the concept of "Würde der Kreatur") is implicit in the debate on biotechnology and ethics. Here, many refer to respect for life when concerned about genetically modified food, the creation of transgenetic animals, or the destruction of the entire biosphere (Rendtorff 2001).

The principle of integrity refers to the care and protection of a whole or a life context that must not be touched or destroyed (Dworkin 1994). The principle has been applied predominantly in relation to the human person and body, especially in connection with medical trial and treatment ethics. Nevertheless, it is continually argued that the principle of integrity can also have an impact on the nonhuman nature. It is about the unity and context of a life form (plants, animals, or all of nature) that has developed its own natural history. It is therefore important to determine how the concept of integrity can be transferred from the human to the nonhuman area and how it can make sense as an ethical principle in relation to the assessment of human intervention in the nonhuman living nature (Rendtorff 2015a, b). It is important to clarify the meaning of the concept of integrity as a basis for the formulation of ethical considerations in connection with interventions in the environment, animals, and nature.

Although not always directly mentioned, the idea of the vulnerability of the living world (the principle of vulnerability) can also be regarded as a fundamental principle in the ethical debate on the protection of animals, nature, and the environment. Vulnerability can be defined as a concept that is at once descriptive and evaluative. If you say in a daily language that a living being is vulnerable, it directly expresses an ethical concern for the necessary protection of people, animals, and nature. The modern industrial society has on the program to reduce vulnerability and create better living conditions on earth. Nevertheless, there are also limits to scientific and industrial progress. Technological advances may include risks and unforeseen consequences that challenge the fragility and finality of the living world. In this way, the principle of respect for vulnerability is of great importance as a common principle for the ethical regulation of the fragile living world within both the human and the nonhuman sphere.

The principles of respect for autonomy, dignity, integrity, and vulnerability should be seen within the framework of responsibility and solidarity. Being accountable means that someone has, assumes, or is ascribed responsibility (Jonas 1979). There is someone or something that a person is responsible for, and there is someone or something that this person is responsible in relation to. Society's power over the living world is greater today than ever. Therefore, responsibility involves both responsibility toward people and nature and responsibility for social development. In this context, responsibility and solidarity are extended over time, so that these concepts also include future generations and spaces, encompassing the entire planet.

This means that the principles include animals, nature, the environment, and the entire biosphere. This is not least because, thanks to biotechnology, we have the opportunity to radically change agriculture and food production in a way that can bring about basic economic and social change. Due to modern technology and science, industrial society takes on greater risk in a way that requires more responsible distribution of benefits, disadvantages, and dangers. We need to rethink CSR and business ethics in order to deal with sustainable innovation and progress toward environmental transition (Rendtorff 2019b, c, d).

The Principles as the Ethical Premise of Sustainability

It is now the idea of this chapter that these ethical principles play a major role as the basis for an ethical interpretation of the concept of "sustainable development" which is also the basis for business legitimacy and innovation (Rendtorff 2009a, b, 2011). Although not at the forefront of the Brundtland report, the principles can be considered as the ethical premises for the report's message (WCED 1987). The point of departure is the reality of global responsibility and the threat of modern society to the survival of future generations. We borrow environmental capital from future generations. It is our common future that is at stake if we do not find a sustainable way of solving global environmental problems. It is about regulating the greenhouse effect, combatting climate change, the destruction of (rain) forests, overpopulation, global warming, poverty as a result of environmental problems, and, on the whole, helping the poor and vulnerable. The report sees no contradiction between sustainable community and nature development. It has understood that the environmental problems are socially created problems and can therefore not only be solved technologically but also socially. Human reality depends on the sustainability of nature. The life-threatening conditions in developing countries and international environmental problems are closely linked to political and economic crises.

The concept of sustainable development means that there must be limits to the growth of society. These are not absolute boundaries, but boundaries for an uncontrolled development that moves toward climate change and environmental degradation. Sustainable development involves a way of life in which population, production, social organization, and economy are brought into much closer harmony and conformity with the planet's ecological opportunities. It takes a change of social structure, economy, and politics toward sustainability for humanity to survive. Sustainability is a common ideal for society and nature that will ensure both basic human rights and ecological stability. Sustainability is not only to be understood as a utilitarian conversion calculation, but it is also based on ethical, cultural, and aesthetic resources.

The Brundtland report argues for the link between economics and ecology in the legal reality of decision-making and at the institutional level (WCED 1987). The sustainability strategy should avoid building a contradiction between the economic and ecological perspective by aiming for a symbiosis between human and nature, so that the ecological crisis is replaced by a global and cosmopolitan economy that is in harmony with ecosystems (Rendtorff 2005, 2017a, b, c, 2019a, b, c). Thus, one does not want to dissolve the growth strategies, but instead improve the quality of growth. Thus, the primary aim is to ensure sustainable population growth. This involves promoting people's essential needs for work, food, energy, water, sanitation, etc.

The Brundtland report can also be read to include an institutional and business ethical perspective on the ethical principles (WCED 1987). This applies to both state and private companies. States should ensure a sustainable economy through legislation. The industry can contribute to sustainable development by developing environmental policy and pollution control. This can be achieved through the development of pollution control systems for which there is a growing global market (Rendtorff 2010b).

Although not directly analyzed in the Brundtland Report, one can say that the notion of humanity's political and moral autonomy is the real starting point for the report (WCED 1987). It is our political autonomy and freedom that enables us to change the future. Formulating a sustainability strategy expresses humanity's endeavor to move beyond self-imposed compulsive conditions. The international community, the states, the UN organizations, the World Bank, etc. contribute to this development, and democracy and the protection of basic human rights should be fought.

The concept of dignity can therefore be regarded as central to the Brundtland report and further policies of the United Nations, for example, the Sustainable Development Goals (SDGs) from 2015, which explicitly states that it is important to ensure a dignified life. In particular, the high population density and the poverty problem in the developing world appear as a threat to human dignity, causing greater poverty. The report emphasizes that the population problem is about human dignity and not just numbers. The need to safeguard human well-being, education, and health, and the reduction of population growth, is about giving the individual a decent life, and this social sustainability is in turn linked to the sustainability of the ecosystem (Rendtorff 1997, 1998, 2002, 2003, 2008, 2014c; Jørgensen and Rendtorff 2018; Jørgensen et al. 2018; Rendtorff and Kemp (2019). Ensuring a stable social cohesion (social carrying capacity) expresses such a need for better conditions.

The concept of integrity can also be demonstrated as an underlying principle in the Brundtland report, which is the basis for the SDGs (WCED 1987). A key concern is ensuring the integrity of ecosystems (Westra 1998). Here it is about avoiding destruction of forest planting, water pollution, or some other type of destruction, such as nuclear emissions. Sustainability means that utilization of nature's resources must not violate the ecosystem as a whole. There should be respect for the integrity of the species that future generations should also be able to enjoy. The extinction of species threatens the integrity of an ecosystem.

We should therefore ensure that plant and animal species are not eradicated. Governments must be committed internationally to the conservation of species. We can still save ecosystems. Food production should be in harmony with ecosystems. This can be done by less use of chemicals and fertilizers. Society should secure the resources of nature, such as water, air, and soil. Thus, it is necessary to ensure that nature's ecosystems can maintain their "overall integrity." Sustainable development expresses harmony between nature and society, preserving the world's living resources for future generations. This integrity ideal is based on aesthetic, ethical, and cultural considerations that precede economic considerations (Westra 1998).

Thus, the idea of vulnerability is a central prerequisite for the concept of sustainable development, in the Brundtland report, but also in the SDGs, which aims to avoid exposing nature's vulnerability. Economic development is not sustainable if it creates critical vulnerability (WCED 1987). This can happen in agriculture, where the poor beans must utilize nature's resources to the utmost. Instead of creating greater vulnerability through unharmonic growth, there should be long-term security in food production. Natural resources should be preserved and improved. Sustainable growth is based on quality rather than quantity. Likewise, the Brundtland report focuses largely on vulnerable populations (WCED 1987). It talks about the power of empowering vulnerable groups. This should be a gradual integration of local communities into larger communities, and we must protect traditional cultures and lifestyles. Marginalization of vulnerable groups is a symptom of development away from sustainability (Rendtorff 2001).

Principles of responsibility and solidarity also play a role in the ideal of sustainable development (Rendtorff 2009a, b, 2011). We should not only think about the present generations, but also the people of the future (Jonas 1979). We should not ruin it for future generations. There is a common interest in development. There must be equality between nations. There must be a connection between present and future use of technology. Accountability involves a nuanced understanding of actions and unintended consequences of actions. The risk analysis should aim to uncover these relationships. This is linked to the ideal of equality and solidarity. Sustainable policy is about protecting the poor and creating a basic equality between present and future generations in the distribution of ecological resources to protect human integrity and dignity in the context of a harmonious ecosystem.

Beyond an Anthropocentric Environmental Ethics and Concept of Nature

Thus, it appears that the ethical principles of autonomy, dignity, integrity, and vulnerability play a major role in international policy on sustainable development. They help us to understand the foundations of the environmental ethics of the UN sustainable development goals, which were developed on the basis of UN environmental policy since the Brundtland report ethics (Rendtorff 2019b, c, d). In this context, the ethical principles also help to move beyond the fashionable concept of the Anthropocene, where humanity has become an independent geological and environmental force, changing our own conditions for existence (Crutzen 2002, pp. 143–145). The concept of the age of the Anthropocene is a geological concept signifying that the impact of humanity on the environment on the planet has become more serious. One of the founders of the concept of the Anthropocene, the Russian geologist Vladimir Vernadsky who visited Sorbonne in 1922–3, even cited the French philosopher Henri Bergson's concept of *l'évolution créatrice* to determine the concept of the Anthropocene in the thermo-industrial development of humanity (Grinevald 2012). It may be argued that the concept of human responsibility as an indication of what it really means to be human has become particularly important in the age of the Anthropocene, because we need to go beyond ourselves to non-anthropocentric responsibility.

Thus, the age of the Anthropocene raises the question of a bioethics, nature ethics, and ecological ethics that interprets sustainable development in light of these ethical principles, breaking with an anthropocentric (human-centered ethics) (Kemp et al. 1997). Many have criticized the ideal of sustainable development for being anthropocentric, while others argue that the principles involve a holistic view of ethics that cannot be justified in a post-metaphysical world. They perceive a total non-anthropocentric ethic as meaningless, since neither nature nor animals can act or feel moral responsibility. Others, in turn, argue for a "trans-anthropocentric-relational" or an "anthropocentrifugal" view that does not violate the anthropocentric point of view, but extends the ethics to include nature and the environment. Choosing between these justifications is not easy and a more in-depth study is needed. It is therefore important to clarify the metaphysical status of the principles as the basis for sustainable development.

Basically, there are many different arguments for a nature and environmental ethics that breaks with an anthropocentric ethics. A pervasive theme is the real threat of pollution, based on man's intensified technological knowledge. The destruction of the ozone layer, climate change, and the extinction of the species, etc. is, as shown, a common theme in international reports, such as the Brundtland Report (WCED 1987). Furthermore, modern philosophy is characterized by harsh criticism of a technological culture. Many different philosophical currents want to settle on Descartes' subject philosophy, which in modern times has defined typical attitudes to nature as "res extensa," that is, as an inanimate, mechanical object. So different philosophical paradigms such as phenomenology, post-structuralism, and anti-positivist scientific theoretical currents such as paradigm theory or Eastern inspired physics (the Tao of physics) argue for a new conception of the relationship between man and nature. Others argue for a consummate universalism that gives all living beings a moral status. This is often combined with various forms of depth ecology (Michel Serres, Arne Næss) that will give nature a unique moral status (Rendtorff 2005).

Here, it is argued that an excess of arbitrary anthropocentric boundaries of ethics is no longer to be based on individual rational subjects. One wants to include nature as part of the human life world, which is characteristic of the Brundtland report, which emphasizes a close relationship between the human life context and ethical principles (WCED 1987). Thus, it is critical for the ethical principles to be justified on the basis of a phenomenological theory of human bodily affiliation with nature. There must be a bridge between person, body, and nature. The phenomenological description tries to overcome the contradictions between subject and object, that is, an internally experienced experience versus an external natural genetic description of humans. At the same time, it is important to reconcile the contradictions between a mechanical and a teleological (purposeful) understanding of human placement in nature. Thus, to base the ethics of a phenomenological understanding of human embeddedness in nature is founded on a biological bodily description of the living world, where humanity is at once understood as a living organism participating in an ecosystem, and at the same time as the spirit of freedom and with this freedom and autonomy, humanity also transcends this affiliation.

The close connection between nature and personal and collective identity formation is thus the basis for a formulation of an ethical position. Ethics thus form the tension between biological belonging to ecosystems and its transcendence in human desire for a good life in a social context. The ethical principles come into play in this tension between the desire for the good life, the affiliation with nature, and the formulation of a vision of the good and fair society. It is the reflective judgment and ability of humanity to reconcile the individual and the general, nature and freedom, concrete action and practical ethical principles that are the driving force in this process (Rendtorff 2001).

The rationale for the ethical principles is thus based on a perception of human affiliation with nature. Nevertheless, at the same time, it is important to understand that the concept of nature can be further divided into different dimensions that require different ethical considerations. Humanity is embedded in nature but at the same time different from nature. The concept of nature does not confine itself to human nature, but extends to other living beings (animals and plants), which in turn require ethical considerations that are different from a very broad conception of nature, which also does not include living things in the world (e.g., minerals and rocks).

Nature and environmental ethics are initially anthropocentric, but at the same time transcends a natural understanding that confines itself to human reality. One can understand human relations with the rest of nature in a communication theory perspective. A deep ecologist here would argue that "nature speaks to us" and that we should be "friends with the animals" with whom we can communicate, and therefore have moral status (vd Pfordten 1986). Such a move from human language and symbolic competence to the reality of animals and nature is at the same time problematic. We do not fully understand the animals and the nature is very poor in terms of language. Although certain animals, for example, monkeys and dolphins, have some language rules, they never achieve the same language skills as humans.

On this basis, we can open ourselves to nature, but the nature of the conversation remains determined by the premises of human reality. Although only humans can communicate with each other, animals and nature may well be part of the communication community, as those humans are concerned with what you are talking about. We cannot avoid the fact that moral statements are uttered in the human language and are therefore human-oriented, but at the same time transcend the human, because one refers to the other nature and can therefore incorporate it as the object of our moral language. You could say that ethics, that is, moral responsibility and moral actions, in a communication-theoretic perspective are humanly determined, but do not necessarily have to confine themselves to humans, since animals and other nature can easily be objects of our moral actions and communication. Therefore, any justification for an ethical discipline in the form of ecological ethics must be regarded as anthropo-original or anthropocentric, but this does not preclude an extension of the ethical consideration of the whole living world and all things in nature in the broadest sense.

In this context, human embeddedness in nature and its privileged status with regard to the formulation of ethics can be seen as the theoretical (meta-ethical) basis for formulating a non-anthropocentric (normative) ethics. In this context, a number of different types of justifications are given that attempt to include the environment, nature, and animals into the ethical considerations. Reference can be made here to Immanuel Kant's philosophy in *Kritik der Urteilskraft* ([1794] 2004) and *Metaphysik der Sitten* ([1785] 1999) as a central reference for justifying the ethical principles. Kant develops on an anthropocentric basis a philosophical justification of a non-anthropocentric ethic. Kant assigns to humans as purpose in itself an inviolable moral status, and then argues that the categorical imperative and universal law of morality help to recognize man as a purpose in himself. Therefore, Kant's philosophy does not directly recognize animals and nature as moral beings. However, this does not mean, contrary to what some ethicists claim, that Kant should not assign a moral meaning to animals and nature.

In Kant's philosophy, the concept of purpose and the notion of organisms' self-organizing teleological development becomes a central aspect of the rationale for the attribution of animals and the nonhuman nature to an independent moral status. Nevertheless, this is done by virtue of human moral reason and not by nature's independent moral status. Such a reference to the self-directed movements of nature can be termed a weak anthropocentric rationale. Man's status as a moral being depends on how it treats animals and nature. The beauty of society and nature are closely related. At the same time, reference is made to nature's special position as self-organizing organism and as the object of mankind's aesthetic enjoyment, but it is still an ethical justification based on human reality, although it clearly gives a moral meaning to animals and nature. It is also such a civilized "biohumanism," a notion of civilization's humane and enlightened interplay with nature, which plays the most central role in the Brundtland Report's conception of sustainability (WCED 1987). Moreover, this biohumanism can also be seen in the developments of the SDGs from 2015.

In summary, this chapter can thus argue that the principle ethics, based on a body phenomenology, extends the anthropocentric perspective, involving nature, animals, and the environment as the object of ethical considerations (Rendtorff 1999, 2001). Therefore, it can be said that bioethics becomes anthropocentrifugal as it argues for other necessary ethical considerations than those determined by human reality. We need to include responsible eco-ethical innovation in the focus on the transition toward sustainability (Rendtorff 2019b, c, d). Therefore, the application of ethical principles is not limited to humans, and we can indeed give the ethical principles of autonomy, dignity, integrity, and vulnerability a meaning that goes beyond the narrow anthropocentric meaning.

Do Animals, Nature, and the Environment Have Interests?

In this context, this chapter finds the "interest" or "stakeholder concept" useful to justify the importance of the principles in an anthropocentrifugal perspective (Starik 1995). The question is in what sense nonhuman beings may have an interest in protecting autonomy, dignity, integrity, and vulnerability. A frequently used argument against extending ethics to encompass the environment, animals, and nature is that these things have no interests at all that can justify an ethical consideration. It is argued that for such things a good life cannot be defined, which is concretized by respect for the ethical principles. It is implicit in this view that all life and culture are man-made. Therefore, it is pointless to speak of a non-anthropocentric ethics as reality becomes more and more a human construct. Referring to aesthetics and natural beauty is rejected because it is not sufficient to extend the ethical perspective.

Therefore, it is necessary to demonstrate in what sense nature, animals, and the environment can be assigned an independent interest in life and act as stakeholders in an ethical theory that opens up for considerations other than those specifically human. Here, consequentialist ethicists (Peter Singer and others) point out that not only beings with rationality and self-consciousness but also all beings who suffer should have a moral status. This chapter agrees with this emphasis on the ethical significance of suffering, but does not want to justify this in a utilitarian calculus, but on the phenomenological idea of human physicality and the creative development of the universe. This position is based on a communication theoretical idea of an advocacy ethics (Hans Otto Apel), where those affected become subject to the moral principles that emerge in human conversation (Apel 1988).

In this regard, veterinarian philosopher Tom Regan has argued for granting all mammal rights (Rendtorff 2001). He speaks not only of interests, but also of intrinsic value that underlies inviolable rights. A living being or subject of life has a claim to intrinsic value that forms the basis for respect for its integrity and dignity. The rights could be a consequence of a discursive rationale for ethics. Here, however, it is important not to confuse the concept of rights and the concept of interest. Although it may be justified by interests, the notion of rights beyond intrinsic value presupposes moral responsibility and ability to act. The animals have not. Furthermore, the animals' experience of pain and suffering is not the same as that of humans. They do not have self-awareness and reason. Pain and suffering are thus an important consideration for protecting the integrity of animals, but that does not mean that animals have the same moral status as humans. Because they suffer, animals are involved as stakeholders, although they cannot act morally in the same way as humans. The interests of animals are closely related to the value of animals themselves, but they also have significance in relation to human life in harmony with living nature.

The question now is whether the concept of interest also applies to plants as well as the other natural creatures and objects. It seems absurd to plant and cut interests when they have neither self-awareness nor emotion. In this connection, it has been argued, from an Aristotelian and natural theological perspective, that every natural object as a self-organizing system strives for life and thus for a good in itself. Organisms can be described as teleological cybernetic systems. It is claimed that every organism follows a teleological pursuit of the good in interaction with the environment. The biosphere and ecosystem can thus be assigned an interest through the systems' continuous quest for self-preservation and life.

From an eco-functionalist perspective, the self-identity of the organism is created through the cybernetic processes. Here, it could be argued that an ecosystem has an interest in self-preservation, even if it has neither consciousness nor reason. One could say that ecosystems express a process of development toward a good that is inherently defined by systems. Therefore, plants and ecosystems can well be attributed to ethical interests. Thus, it is the teleological self-development of the systems that justifies interests in self-expression, without which these can be grounded in rationality or sense.

This does not mean that all interests must be treated at the same level. The anthropocentrifugal perspective puts people at the center, then opens the perspective to the animals, insects, species, plants, biosphere, and finally the natural environment that appears as the environment of ecosystems. There is an "ecofunctional hierarchy" in nature, where nature's creatures and objects can all be assigned a value in themselves, but where these values are not absolute. Instead, they must be weighed in relation to each other on the basis of the different interests of human reality and judgment as the center of moral philosophy (Rendtorff 2005).

Thus, the central argument for attributing living creature interests is their role as self-sustaining and self-organizing systems. Ecosystems and living creatures develop their own identity through the biological and genetic process. Thus, it can be said that, by virtue of this interest in self-preservation, ecosystems also develop a number of values that become the determinants of system maintenance. These values come into being in the creative evolution of ecosystems that define their stability and integrity. It is in this context that the principles of integrity and vulnerability can be applied. They are linked to the concept of interest and help to define the values that should be respected in a given ecosystem.

This should not be confused with a deep ecology bioethics. Consideration for the self-organizing development of organisms is central, but it does not suspend human significance as a moral being. Instead, it is about ensuring a sustainable harmony between nature's self-organizing processes and human social existence (Kemp et al. 1997). Human reality must be in harmony with ecosystems, but this does not lead to abandoning human concerns. Thus, with an understanding of the bodily organic existence of humanity, we can be integrated into nature. It is a matter of weighing and comparing the different interests that conflict with one another. The ethics here becomes a continuing openness to the other. Judgment expresses the ability to "put oneself in the plase of the other." A non-anthropocentric ethics is constantly trying to incorporate new types of concerns and interests into the ethical balancing process. It is thus important to emphasize the broad nature of the concept of interest. Sitting in one's or another's place not only includes consideration of others' self-awareness or pain, but the concept of interest can also be defined as "interest in living" or fulfilling its teleological purpose, that is, life's self-constitution, self-organization, and self-realization in the broadest sense.

The ethical trade-off thus aims to analyze and justify different types of interests in relation to each other. This is justified on the basis of Kant's universalizing principle and teleological organizing principle of life's self-expression. It is thus an extension of the categorical imperative as the golden rule, in a slightly different form understood as a principle that "it is problematic to pursue its own interests if it greatly reduces or violates the interests of others." It goes as far as possible not to violate the interests involved. One must be aware of the interests of "the other" as well as "the otherness of nature," and how different people, animals, and natural contexts are affected by certain actions. In addition to the interests that apply to the human actors involved in an intersubjective recognition space, animal, nature, and environmental ethics imply the involvement of a number of third-party interests that must be taken into account in the ethical balancing process.

Establishing the ethical principles in a comprehensive interest perspective means that an analysis of stakeholders of states, companies, and organizations (Stakeholder Management) does not limit itself to the human interests of an organization (Freeman 1984; Elkington [1997] 1999; Rendtorff 2001). Later, the concept of stakeholder has been interpreted more extensively (Starik 1995). It has gained wider social and environmental significance. Nature and the environment must be taken into account when defining the company's stakeholders in relation to sustainable innovation for business legitimacy. One must always be open to how the organization affects its outside world and, in particular, how the organization can be said to violate the interests of the outside world. Nevertheless, identifying these interests is not easy. There are many different interests at stake, and it is important to be open to these different perspectives when making decisions about the future actions of the organization. Being aware of the interests of nonhuman nature can help to strengthen the organization's actions and societal legitimacy. Organizations can broaden their decision perspectives, make more qualified decisions, and be more aware of the impact on the environment of their actions. Such enhanced ethical sensitivity and judgment in organizations can be clarified with four basic considerations: panoraminization (expanding field of view and analysis), prioritization (involving the complexity of the environment in decisions), politicization (involving nature in the organization's decisions), and aware of the environmental perspectives(Rendtorff 2001, 2009a, b).

The Concrete Application of the Ethical Principles for Sustainable Innovation

Now we can put the analysis of nature's self-organization in light of the concept of interest and the model of stakeholders in relation to the ethical principles (Rendtorff 2001). How are the principles expressing the interests of nature, animals, and the environment? It is a matter of making a fundamental determination of the principles' conceptualization of the concept of interest, as an analysis that could form the basis for the identification of interests and sound environmental action, based on the ideal of sustainable development. This applies to all forms of social and organizational intervention in animals, nature, and the living world as a whole. Here, for example, the principles can be concretized as guidelines for manipulation with microorganisms, the creation of transgenic animals, the use of animals in agriculture, interventions in ecosystems, and the natural environment of humanity. They can also be used in food and medicine assessment based on animal production. This forms the basis for judicial implementation of the ethical principles. They can be considered as alternatives to a pragmatic view of sustainable development, based on an anthropocentric view of the relationship with animals and nature. Such a notion of sustainability would mean that animals and nature have no intrinsic value, but should only be protected when it is to the benefit of man. This view, as we have seen, cannot express the true ideal of sustainability, which is based on an idea of a closer connection between animals, nature, and human reality.

Judicial regulation of animal ethical and environmental ethics should not be seen as anthropocentric, zoocentric, or ecocentric, or based on a reductionist understanding of the Anthropocene, but give the principles concrete meaning, incorporating the legal ideas of proportionality, possibility of recovery, caution, and the possibility of controlling the consequences of an intervention in living nature. In addition, risk assessment and risk management regarding interventions in nature, for example, genetically modified organisms, must be developed. Legal regulation of biotechnological conditions should have a sense for the populations' reactions to the use of biotechnology. However, as shown above, the necessary ethical considerations are different for animals and humans. Therefore, it is important to provide a separate analysis of the application of the principles in the two areas. In the following description of the importance of the principles in the nonhuman field, the chapter will focus in particular on human intervention in animals and nature.

Society's Intervention in Animals

The use of animals for biotechnological purposes is today an integral part of agriculture and medicine. All kinds of animals are involved in biological and medical experiments. Animals are used as bioreactors for the production of medicines. Biotechnology is used to breed the animal species and increase the efficiency of agricultural production. It is technically possible to clone sheep and cows, and semen and eggs can be mixed to create individuals who come from many different animals. Science has formed hybrids and chimeras between species, for example, transgenic sheep and cows. It can be said that the animals of late modernity have become much more part of industrial production and therefore may be subject to new abuses. Therefore, more awareness of ethical principles is required to protect the animal values and interests of animals (Rendtorff 1997, 1998, 2002, 2003, 2008, 2014c; Jørgensen and Rendtorff 2018; Jørgensen et al. 2018; Rendtorff and Kemp 2019).

The starting point here should be human-animal cohesion in their natural environments. In fact, animals play a major role in most human cultures. Moreover, our ability to manipulate animals in agriculture and medicine does not make us very free to decide what we want to do with animals. However, a utilitarian interpretation of animal welfare and interests as absence of pain is not sufficient to protect their integrity. Similarly, animals cannot just be made useful objects for industry, agriculture, and medicine, based on productivity and efficiency considerations.

Rather, in light of the ethical principles, it should be argued that animal ethics should recognize that evil against animals in a civilized society is in principle morally wrong. The animals cannot be reduced to production farms in factory farms. Such recognition of the interests of animals is based on the recognition that human-animal relations have an inviolable intrinsic value. Therefore, humans should respect the unique intrinsic value of wildlife as well as be aware and allocate the disadvantages and appropriate size of any intervention in the animals' lives. The need for a new ethical view of the animal-human relationship can be analyzed within the framework of animal-human solidarity.

Such a need for a new ethical understanding of human-animal relations can be seen in light of the concepts of responsibility and solidarity. It is a framework for human-animal inter-relational solidarity, where humans are responsible for animal dignity, integrity, and welfare. One may also wonder if the animals can be granted personal autonomy. If one thinks of their existence as sentient and suffering beings and self-organizing organisms in a natural teleology, it is difficult not to attribute the existence of animals to natural autonomy. Reducing animals to pure machines in the face of Cartesian soul-body dualism must be considered wrong. Although the animals cannot be attributed to moral autonomy and responsibility in the Kantian sense, they seem to have autonomous survival instincts and instincts for how to live conditioned by their natural teleology as self-organizing systems in interaction with the outside world. Another possible meaning of the principle of autonomy in relation to animals could be to claim that there are limits to human rights to intervene in the autonomous existence of animals, that they have no right to "play God" and take animal existence and life in their sovereign hands. Here, referring to the autonomy of animals would mean that humans do not have the right to change animals, but to let them follow their own self-organizing development. In this perspective, there are limits to human rights to intervene in evolution and life's own self-realization. To allow animals to develop autonomously is to enhance their right to self-realization.

Furthermore, it can be argued that human dignity depends on how it treats the animals (Rendtorff 2001). With reference to the moral freedom and responsibility of man, as mentioned, it can be said that men can descend to the lower levels and rise to the higher divine levels. This means that unworthy and brutal treatment of animals would be immoral behavior on the part of man because they would not be able to live up to their humanity and responsibility. Thus, when applying the ethical principles to animals, the more fundamental "biohumanist question" already arises, about which society we want to live in and how we can create a civilized and humane society that is based on both moral integrity and aesthetic taste and the hope of realizing the scenic in the human context.

The question, however, is whether we should go even further and introduce a concept of animal dignity or intrinsic value. This does not apply in a direct moral sense, but in principle in the sense that animals as living self-organizing organisms have an intrinsic value and thus a right to autonomous, self-organizing development. In this sense, animals that do not follow their autonomous development would not be considered worthy. It is important to understand this intrinsic value and dignity as essentially different from human dignity. It is a different kind of dignity than human dignity. This intrinsic value refers to the animal's right to live as self-organizing organisms. For example, a view of animals as nothing more than some sophisticated mechanical machinery would be considered unworthy in this perspective. Applying the concept of dignity to animals implies that they have interests and meaning in themselves that are in principle independent of human interest and meaning. For example, this view of animal dignity can be seen as a more principled approach to animal ethical problems – such as genetic engineering and zeno-transplantation – than an analysis that focuses solely on risk or cost-benefit considerations.

Such a notion of the intrinsic value of animals, which contrasts with their instrumental value, also becomes significant in relation to the integrity of the animals. Integrity can here be considered the narrative coherence of human life history with the animals. In this context, integrity refers to the intact life of animals, their ability to fulfill their natural purpose, as defined by natural theology. In short, one can talk about the animal's natural "undamaged and undisturbed stage." In this connection, the inner nature of the animals is recognized as that which opposes their external instrumentalization for the use of technological purposes. Such respect for the integrity of animals includes consideration of their physical and genetic integrity and thus allows the concept of integrity to be related to the animals' natural life. Cloning, which in the classical case of the in 1997 cloned sheep Dolly, for example, can thus be regarded as an unnecessary interference with the integrity of the animal, when comparing the infringement of integrity with the possible advantages and disadvantages of the cloning procedure. The immediate benefits of cloning are small, while the moral destruction associated with animal instrumentation is too high.

The principle of vulnerability can also be applied in relation to the ethical protection of animals. The relationship between humans and animals is asymmetric, which means that humans, by virtue of their moral autonomy and dignity, have moral responsibility for the vulnerable animals. The animals cannot express their own opinion regarding genetic interventions and experiments. This underlines the need for community awareness of the Janus face of animal biotechnology, where the use of animals to improve human welfare will in fact lead to greater suffering for the animals. Caring for the intrinsic value, integrity, and naturalness of the animals presupposes the aforementioned dependence between humans and the other living nature, enabling the ideal of sustainability to be interpreted in light of the basic ethical principles (Rendtorff and Kemp 2000).

This means that the animals, despite having no reflexive consciousness, are recognized as creatures included under the ethical principles. The animals have interests and they can feel pleasure and pain, and as instinctive creatures they relate to life. Not only does this imply an understanding that animals should not suffer, but it also includes respect for the animal's livelihood, that is, an understanding of animals' dignity (intrinsic value) in relation to their environment, physiology, psychology, social relationships, and relationships with their other species. The application of the ethical principles in relation to animals implies that they have a good life in relation to their intrinsic nature. Such respect for animals helps to strengthen human dignity, because they will live in a more humane world of life.

Society's Intervention in Living Nature

Both agriculture and industry use biotechnology to manipulate living nature (Rendtorff 2014b). These human changes in the natural cycle today include both cloning, crossing of different species and the creation of medical products to combat AIDS and cancer and other forms of disease. Furthermore, high hopes are being raised for the possibilities of genetic technology to formulate solutions to problems related to energy production and pollution. Plants and various grains can be genetically engineered to solve hunger and agricultural problems in the developing countries of the global South.

Even through human intervention in living nature, the interdependence between humans and nature remains a prerequisite for the application of the ethical principles. As a bodily incarnate being, man is constantly involved in an organic metabolism with the natural world. But at the same time, humans, by virtue of their moral autonomy and freedom, rise above the living nature, and thus become responsible for their own destruction of nature, including the destruction of the biosphere's opportunities to evolve.

In this context, it is difficult to make sense of the concepts of dignity and autonomy independently of the relationship between man and nature. The dignity of man and nature is different. Reference to the dignity of nature is not the same as human dignity (Balzer et al. 1997). The term cannot be understood as "biocentric" so that man and nature are on the same moral level. Talking about the dignity of nature means instead that nature has an intrinsic value in itself as unique and irreplaceable. The notion of "dignity of the creature" (Würde der Kreatur) can therefore be assigned legal significance (Balzer et al. 1997). It has been introduced into Switzerland's constitution on the demand of a majority in a referendum. An interpretation of the concept is that the dignity of the creature does not coincide with human dignity. The dignity of the creature is independent of human dignity. It is not just aesthetic or expressive dignity, but moral intrinsic value. It demands human respect and respect for animals and nature. The dignity of the creature must not be interpreted in depth ecological or anthropocentric. It expresses that man, as a morally higher being, has a duty to respect the moral self-worth of other creatures (both sentient beings and plants and nonliving creatures). The intrinsic value is justified by the fact that these creatures have individual good and individual goals and that they must be regarded as organic entities (Rendtorff 2001).

Integrity and vulnerability can also be applied in protecting wildlife. Interventions in the natural world are not just motivated by a human interest in living in a beautiful, civilized, and humane world of life. The concepts of integrity and vulnerability, in contrast to a utility-oriented ethic, express a need for protection of the natural world's need for self-esteem and self-organization. In this context, the concept of integrity has been emphasized as central to respect for biodiversity and for the intrinsic value of life. Integrity here refers to the integrity and health of living systems, maintaining their present and future ecological stability. One could say that a living system has integrity if it maintains its opportunity in the present and future to pursue its own teleological potentials. The system is given the opportunity to restore its wholeness and unity in a stable harmony. Integrity expresses unchanged conditions for the system's ability to evolve as a healthy ecosystem according to its own purpose. The system develops according to its own essence (with a technical term; according to its genetic program for *eidos*). It applies to the ability of an ecosystem to maintain its identity as an organism, that is, to develop its health, harmony, and stability (Rendtorff 1997, 1998, 2002, 2003, 2008, 2014c; Jørgensen and Rendtorff 2018; Jørgensen et al. 2018; Rendtorff and Kemp 2019).

The notion of life's integrity or intrinsic value as a whole must not be touched on is often implicit in the debate on biotechnology, and many people refer to the concern and respect for life in their horrific criticism of genetically modified foods, transgenic animals and plants, as well as industrial society's destruction of the biosphere. This concern for the living world can be explained not only as a pragmatic interest in the survival of humanity but also with concepts referring to a religious and cultural understanding of the holiness and "dominion" of life (Dworkin 1994).

The concept of integrity also has an impact on the protection of nature's teleology, and it has therefore been highlighted as the most important principle of nature protection. As already mentioned, teleology refers to nature's self-organization. The concept of teleological integrity applied to nature manifests itself as a self-organizing living world that must be allowed to unfold according to its own principles. As you know, teleology (telos and logos) means reason, purpose, goal, or endpoint. To refer to the teleological integrity of ecosystems expresses the autopoietic, self-organizing processes of living nature, but also the intrinsic nature of living creatures, as they are connected to an environment in which they develop their own living existence. This means that plants, microorganisms, and ecosystems have a purpose, and if that purpose is to be met, certain environmental protection requirements must be met.

A strong argument for an integrity point of view is that we are unable to completely predict the consequences of the use of different manipulation techniques. This is especially true of the lack of opportunities to determine the results of the release of genetically modified organisms into the living nature. In this context, the necessary respect for the integrity of nature is based on human responsibility toward the living world. Such use of the integrity not only implies a reluctant attitude toward the manipulation of living nature, but can also, as is the case with ordinary sustainable agriculture, but also in the many attempts to develop organic farming, contribute to a better understanding of it, living nature, where human intervention in living nature is not rejected, but instead helps cultural and natural plants to develop in a self-organizing context with other ecosystems.

Similarly, vulnerability can be referred to as a central feature of living nature. As mentioned, it expresses the fragility and finality of the ecosystems and the organic life of the living world. The various social and cultural understandings of vulnerability are associated with all types of human intervention in living nature (Rendtorff 2001).

On this basis, it can be argued that the ethical principles of autonomy, dignity, integrity, and vulnerability have a complex application in relation to living nature (Rendtorff 1997, 1998, 2002, 2003, 2008, 2014c; Jørgensen and Rendtorff 2018; Jørgensen et al. 2018; Rendtorff and Kemp 2019). They thus express a challenge to a purely anthropocentric approach to the relationship between human beings and the nonhuman living nature. The ethical principles manifest a culturally mediated understanding of life's self-organization, its natural evolution, as justified by the human community's openness to nature's otherness in the context of human meaning. It is a matter of using the technology in a way that is ecologically acceptable to the ideal of sustainability represented by the basic ethical principles (Rendtorff and Kemp 2000).

It is thus a difficult but not logically impossible task to use the ethical principles as the basis for legislation and case law regarding biotechnological interventions and other violations of nature's sustainability (Ost 1994). This can be expressed neither in a purely anthropocentric nor in depth ecological perspective. The legal status of nonhuman nature can be defined as being between the subjective and the objective. The nonhuman living nature is granted legal status without dissolving the qualitative moral differences between humans, animals, and the nonhuman living nature. This status has been illustrated by an interpretation of sustainability in light of the basic ethical principles (Rendtorff and Kemp 2000).

From Bioethics to Business Ethics and Sustainable Innovation for Business Legitimacy

However, such a demonstration of the importance of the principles for animals and nature is not complete until we move from bioethics to business ethics. As mentioned at the beginning of this article, John Elkington has in his book *Cannibals with Forks: The Triple Bottom Line of 21st Century Business* sought to make sustainability the core ethical, value theoretical, and market strategic principle of twenty-first-century management as the foundation of business legitimacy and philosophy of management (Rendtorff 2009a, b, 2010a, 2013a, b, c, d, 2014a). Likewise the chapter has been pointing out of the integrative function of the sustainability ideal in relation to the connection between the human and the non-human area, Elkington emphasizes that sustainability must be seen in light of a three-fold bottom line between economics, ecology, and social responsibility. We cannot avoid the fact that many companies in industry and agriculture are directly involved in the degrading treatment of animals and predatory behavior on nature.

Although not mentioned in the direct context, it can also be said that the ethical principles of autonomy, dignity, integrity, and vulnerability play a role in the corporate ethical understanding of the ideal of sustainable development, as recently expressed as sustainable innovation in the SDGs and the other principles of sustainability policy of the UN. Respect for autonomy can be seen in light of the requirement to involve all corporate stakeholders (interested parties) in sustainable decisions (animals and nature can also be considered as possible stakeholders). Respect for dignity is present in a persistent reference to human rights as key dimensions of social responsibility. Respect for integrity is expressed in a concern for the integrity of ecosystems and the demand for corporate respect for the entirety of nature (Rendtorff 2015a, b). Finally, the notion of respect for the vulnerability of nature can be said to be a central point of departure for Elkington's project, and it is expressed very well in the title "Cannibals with Forks" (Elkington [1997] 1999).

Cannibals with Forks can therefore be read as a defense of green capitalism, where market economy and business make the triple bottom line the basis for a sustainable economy (Elkington [1997] 1999). Elkington develops a range of ideas for managing and implementing sustainability principles in modern companies. Of particular interest is a "Sustainable Accounting" in which shareholders (investors), managers, consumers, environmental activists, and other stakeholders are involved in the assessment of the company's sustainability in order to provide innovation for business legitimacy.

In *Cannibals with Forks*, sustainability is defined, according to the Brundtland report, as an endeavor to secure the development of the present world in a way that does not destroy the possibilities of existence for future generations (Elkington [1997] 1999). Economic growth should be in harmony with ecological and social conditions. Due to the seriousness of the environmental problems, companies with major environmental problems in the longer term have less chance of survival (WCED 1987).

In a future, globalized, and intensive economy with open competition markets, it is necessary to be at the forefront, and we cannot avoid that a lack of respect for the economic, social, and ecological bottom line is dangerous for the survival of the company. It is necessary to address political, environmental, and social issues in the assessment of the company's accounts. In the face of fierce competition in open markets, companies cannot escape the threefold bottom line with economic, social, and environmental considerations. The company should consider the economic, social, and environmental considerations of the development.

Sustainable efficiency and sustainable innovation in a company should, in line with the Brundtland report and the SDGs, aim to improve the integrity of life and ecosystems. It is about maintaining the economic, ecological, and social sustainability of nature, so that it can also be available to future generations. It is important to emphasize that the ideal of sustainability is realized in close connection with both corporate intrinsic and external cultural and social conditions. It is about productively utilizing all the different types of capital of the company, that is, that physical and mental human capital also plays a role. Elkington emphasizes that societal respect for sustainability depends on the social virtues and cultural capital of the community.

Therefore, accounts that measure the company's ability to respect sustainability following the SDGs ideals must contain a wide range of social and cultural indicators. These include, for example, the company's involvement in arms trafficking, the use of nuclear energy, employment and respect for ethnic minorities, respect for human rights, dialogue with consumers and local areas, etc. in addition to the ecological considerations of animal welfare, for example, by limiting animal testing and the integrity of ecosystems. The new types of accounting and social reporting that already exist in many companies, such as Novo Nordisk and SHELL, are concrete expressions of whether companies are making progress in realizing the ideals of sustainability in practice.

It is implicit in recent bioethical and environmental ethics discussions that respect for sustainability is a requirement that cannot be escaped. In *Cannibals with Forks*, Elkington mentions a number of current trends that require companies to adapt to sustainability strategies. Globalization of the economy, trade liberalization, new investment, and restructuring opportunities are all societal factors that intensify corporate power (Elkington [1997] 1999).

The emergence of the global politically conscious environmental activist and consumer has also helped to focus on the company's values. This is the case of the struggle against climate change and the efforts to make companies comply with the SDGs (Rendtorff 2005, 2017a, b, c, 2019a, b, c). Incorporating soft values, such as respect for sustainability and human rights and awareness of CSR, has become an integral part of corporate public relations. The company's ability to listen to the public's ethical requirements and be open to criticism characterizes the modern stakeholder-based market economy (Stakeholder Capitalism). We cannot ignore the fact that social values and cultural identity relationships, as an invisible hand of morality in economic matters, play a major role in the success of companies. However, this also means that we must not forget the social dimension of sustainability. The population issue, for example, is an integral part of the struggle for a sustainable society.

At the same time, it is no longer possible for companies to keep the relationship between economy, ecology, and social responsibility secret to the public in their accounts. In a globalized information economy, the public has strong opportunities to access knowledge about the company's accounts. At the same time, the need to incorporate values into the company's activities is based on demands for transparency and openness. Management in modern companies cannot avoid being based on open disclosure by all interested stakeholders (Stakeholders). Therefore, the company cannot avoid engaging in a dialogue with stakeholders on basic values and action scenarios. This entails, for example, extended strategic cooperation with NGOs, which today have become an integral part of many companies' relationships with their stakeholders (Rendtorff 2005, 2017a, b, c, 2019a, b, c).

Elkington argues that international businesses today face openness as a key public legitimacy requirement. Where they previously kept the information to themselves, many companies today find it an advantage to engage in communication with many different stakeholders. Big companies like the biotech giant Monsanto, SHELL, or Novo Nordisk have understood the need to listen to their stakeholders. Openness gives the company improved knowledge of its surroundings.

The new willingness to be transparent shows up in a number of circumstances that go beyond traditional accounting requirements, for example, in the new social reports. Some of the new dimensions of openness have been introduced into the legislative requirements for green and social accounting, others are voluntary, while others are becoming involuntary, as in companies that have not understood the need to engage in dialogue with a wide range of stakeholders. This also involves future generations, animals, plants, and the biosphere as a whole, as relevant new stakeholders to improve sustainable innovation and business legitimacy. Such concern for future stakeholders is based on a high level of social capital in society.

The concrete realization of sustainability ethics based on the principles of autonomy, dignity, integrity, and vulnerability can thus be achieved through an intensified dialogue with the company's stakeholders (or in the case of animals and nature, dialogue with representatives thereof). There must be continuous involvement of stakeholders in management decisions (through regular meetings, introduction of sustainability accounts and reports, development of an eco-efficient management plan for the company (Eco-Efficiency and Lifecycles)) in order to achieve harmony between the economic and ecological dimensions of corporate management.

The new types of ecologically oriented perceptions of the organization's interaction with the outside world can be seen as an attempt to put the ethical principles into business planning into practice with focus on innovation for sustainability and business legitimacy. An ecological technology is based on a constant recovery of what is destroyed as well as a sustained understanding of any unintended consequences of actions. It is a matter of using the technologies in light of the company's ecological and social responsibility. There are six dimensions of such an eco-compass: understanding of health and environmental risks, resource conservation, care of energy consumption, care of material consumption, recycling of material, and ensuring long-term product use (Rendtorff 2014b). Making these dimensions an integral part of the company's creative innovations is extremely important. This is about developing products that do not violate the harmonious integrity of ecosystems.

In this context, companies should develop future-oriented planning. A shift toward sustainable production involves the involvement of future generations' interests in production. The ultimate requirement of sustainability is responsibility for future people, as well as fairness and equality between the generations.

Management based on the triple bottom line aims to avoid ecological disasters as a result of a non-future production. The principle of sustainability and sustainable innovation for the SDGs should be integrated into the day-to-day management of the company to ensure an efficient and sound use of resources.

Finally, it is important to emphasize that the sustainability strategy for business legitimacy and the SDGs is only accomplished when the company makes its ecological and social objectives part of accounting and reporting. The transition to sustainable development is linked to the development of coherent and compelling reporting procedures based on impartial analysis and audit. It is a major challenge for future accounting, how to measure the development of respect for the ethical principles of autonomy, integrity, dignity, and vulnerability in a company (Rendtorff 2001). In addition, a sound measure of sustainability should incorporate many of the above dimensions into reporting: dialogue with stakeholders, openness and transparency, sustainable technology, long-term planning, etc.

Conclusion

It is now time to summarize this long and complex argumentation, which was tasked with formulating the link between bioethics, environmental ethics, and business ethics with focus on sustainable innovation and business legitimacy. This is a cosmopolitan horizon for business ethics and business legitimacy (Rendtorff 2017a, 2019d). Here it has been a key issue to show how the principles of autonomy, dignity, integrity, and vulnerability can form the basis for a sustainable market economy, animal, and nature ethics (Rendtorff 2010b). The chapter has shown that the ideal of sustainable development is not an empty utilitarian concept, but must be understood in light of the ethical principles. At the same time, Stakeholder Capitalism's liberal stakeholder economy means that sustainability must be interpreted in light of social and economic equality and justice. The principles must be seen in light of the concepts of responsibility and solidarity. The triple bottom line here is an important precision of sustainability. It is also important to emphasize that the principles extend from the human sphere and have a different but different application in relation to plants, animals, and the entire biosphere. The ethics of sustainability is based on a symbiosis between human beings and nature. This is based on a phenomenological analysis of the bodily affinity of humanity and embeddedness of human beings in to a life world. Here, the relationship with the living nature is justified as a respect for the self-worth of self-organizing organisms. Here, the concept of interest is linked to body phenomenology as the basis for one's self-sustaining life systems self-interest. The task of the judiciary is to balance different life interests. Judgment is also put into play in organizational theory as a basis for identifying relevant stakeholders where the ethical principles apply. In this connection, the chapter has pleaded for a biohumanistic respect for the self-worth, dignity, and integrity of the living beings. At the organizational level, an ecologically oriented life cycle is developed. Here, the company's environmental and social accounting and reporting become extremely important. The sustainability ideal is thus integrated into business ethics while incorporating the triple bottom line as a basis for improving the social, environmental, and economic considerations of society for sustainable business legitimacy.

Business Legitimacy and the Sustainable Development Goals (SDGs)

Role of Corporations in the Great Transformation to Achieve Global Sustainable Development Goals: A Pragmatist Perspective

88

Bettina Hollstein

Contents

Abstract

In order to achieve the global Sustainable Development Goals (SDG), a new great transformation, reintegrating and re-embedding different spheres like the economy, society, politics, and science, is needed. This great transformation is merely a moral project including technological, economical, institutional, and cultural processes. Different actors are part of this project, such as civil society, science, and corporations. In this paper, the focus is on the role of corporations as change agents within the great transformation.

The SDG are, in this respect, the moral compass for the transformation, but the true question is what makes corporations start to go in the direction the compass shows. To answer this question, a pragmatist framework relating on Hans Joas' work on action theory is used in an interdisciplinary manner. When and how do change agents have an impact on societal change? To answer this question, a close look is taken at the interdependencies of individual and collective action, rational and emotional aspects, intended and non-intended results, etc.

Introduction

Achieving all of the different dimensions of sustainability, such as integrating welfare, social justice in a global and an intergenerational perspective, as well as respect for environmental boundaries, is much more than a technical or organizational challenge, for corporations and many other actors. Due to different rebound and causal effects, irreversibility, complexity, and real uncertainty (Schneidewind 2018: 57; Hollstein 1995: 23ff.), it is not sufficient to rely on innovative technical solutions for global problems of non-sustainable development. The vision of a green growth via an efficiency revolution (von Weizsäcker et al. 1998) seems not to be a realistic one, even if most governments appear to believe in it. In addition to such technical innovations creating more efficiency, new products, and industrial processes leading to more sustainable development, it seems obvious that the lifestyle of those living in the global north with an ecological footprint requiring more than one planet has to change in order for this to even start becoming possible (Schneidewind 2018: 60). Such a great transformation as conceptualized by Polanyi ([1944] 2001) requires both a normative goal, namely, the value of sustainability in a broad sense by combining global and intergenerational justice, and practices and actions implementing this goal.

Whether this goal of sustainability is really a goal of most people, and if it can be founded by universal ethical principles, will not be investigated in this paper. The starting point is simply the fact that most nations subscribed to this goal in the UN conference in Rio on sustainability in 1992 – creating a political statement of most nations in the world and institutionalizing it through different agreements, such as the Local Agenda, the Climate Agreement in Paris, etc. (Schneidewind 2018: 107ff.).

Meanwhile, sustainability was differentiated into 17 Sustainable Development Goals (SDGs) that came officially into force on January 1, 2016. They are part of the 2030 Agenda for Sustainable Development – adopted by world leaders in September 2015 at a historic UN Summit (United Nations 2015). Additionally, many multinational companies assented – at least formally – to this goal of sustainable development and committed themselves to negotiated agreements like the Global Compact.

On the level of so-called "ordinary" people, it can be seen that according to the World Survey, "[p]rotecting the environment should be given priority, even if it causes slower economic growth and some loss of jobs," is a proposition agreed on by 47% of the global population (Inglehart et al. 2014, V81). As Schneidewind (based on Maja Göpels investigation (2016)) argues, the implementation of sustainability requires a "Great Mindshift," that is a cultural change leading to institutional reforms and new practices (Schneidewind 2018:103). However, the fact that a cultural "mind shift" or a moral revolution is needed does not say anything about how it may come into effect.

Theories of sustainability normatively assume that a universal conception of the good life should be valuable to all peoples and should be granted to all human beings. Such a conception should consider the natural sources of life in a global way, including future generations. Sustainability, intending to combine global justice with intergenerational justice, is a normative value (Ekardt 2010). It is a second order volition that can help evaluate first order wishes. Societal norms can be derived from it, and these norms can be institutionalized through juridical and organizational frameworks. However, often nothing like this happens.

Because of this gap between proclaimed goals and realized actions, now a turn to the Pragmatist Action Theory as developed by Hans Joas (1996) is taken, a theory that has something to say about how values become reasons for action. While Hans Joas develops an action theory for individuals, the actions of corporations and how pragmatist economic ethics may help to understand which role corporations can have in a great transformation are here at the core of the analysis.

In the following, (1) the Pragmatist Action Theory is presented as a relevant framework for analysis, (2) on this founding some concepts of a pragmatist economic ethic are developed, and (3) how this can help to explain the role of corporations in the great transformation is shown.

Pragmatist Action Theory

This paper wants to show that the Pragmatist Action Theory as developed by Hans Joas (1996) based on the work of George Herbert Mead (1943 [1934]) and John Dewey (1922) is a fruitful way to conceptualize how values and actions interfere. The starting point is a critique of rational action theories. Joas is criticizing three main points in rational action theories, namely, the assumed teleological character of human actions, the assumption of corporeal control by the actor, and the conceptualization of the actor as autonomous and individual. This does not mean that rational action theories are completely wrong, but that they can only partly explain human behavior and have to be extended by specific aspects. The following points derived from this critique are crucial for a Pragmatist Action Theory:

- The embeddedness of human thinking in human practices means that people are constantly struggling in concrete situations with their natural and social environment. Ends are never fixed independently from action but are developing and changing in a creative process while persons are acting.
- The human subject is a concrete, embodied person acting both in the world and experiencing it. This means that the analysis has to start by assuming individuals are a concrete corporeality with emotions, living in concrete social structures, and a specific material lifeworld with ecological boundaries.
- Norms and ethical practices are not purely subjective or culturally relative. People cannot completely define and give reasons for their values. However, they can

discuss them in a reasonable way with others because every action has an essentially social character opening up the possibility for mutual understanding.

Pragmatists presuppose that people normally act according to routines: We use the car to go to work every morning; we eat at the canteen every day, and so on. It is only when this routine is disturbed and broken that people are obliged to reflect on it, to balance their wishes and their deeper aspirations and values. It is only then that they create a new way of acting, which can become a new routine: My car breaks down and I have to decide whether I buy a new one or start cycling. Does my daughter insist on trying an electric car? Do my colleagues laugh at people coming to work by train? Are there affordable options for using car sharing models or public transport? Do I feel uncomfortable on public transport? How much money can I budget? Do I consider myself a member of the world population? Do I feel solidarity with people far away or with future generations?

In such a situation, people do not only evaluate the pros and cons as a cost-benefit analysis but also consider implicit normative aspects. When they develop creative solutions, make decisions, and act accordingly, they may experience that this was not the right solution, and they then readjust their decisions in order to find a new, better one. When they feel comfortable with their decision, they integrate new routines, and the experiences they have with these new routines may enforce their values. Accordingly, experiences are a crucial aspect for how values become relevant for their creative actions, as well as how they arise out of experiences in actions (For an elaborated theory of the genesis of values, see Joas (2000), based on James (1902)).

What can economists learn from these pragmatist insights for economic ethics? Conceptualizing economic ethics in a pragmatist perspective means that at the beginning some sort of disturbance is needed to initiate reflection and creative action.

Pragmatist Economic Ethics

American Pragmatism is a philosophy oriented toward action and must therefore be based in an action theory as developed above. Following the first critique of Joas concerning rational theories, economic ethics cannot be reduced to rational ethics like utilitarian ethics or deontological ethics. For both types of ethics defining clear goals that have to be pursued, the critique of Joas is central. Since ethical behavior is – as all action – embedded in routines, it is necessary to take a closer look at virtue ethics or ethics focusing on models or attitudes (Mieth 1977, 1998). Ethical actions have to be taken in specific situations and in a routinized way in most cases. Since it is often impossible to derive clear goals and means from general moral norms in a concrete situation, general moral attitudes or ethical role models are important to acting correctly, as they reinforce habits. Additionally, a clear analysis of the situation and of the different options is necessary to make good decisions.

Concerning the second point – the corporality of action and the sensual perception of the world, emotions play a crucial role. A moral dimension can be found in qualitative experiences that can be articulated (Jung 2009: 507) as, “[t]he underlying pervasive quality in the last instance, when it is put in words, involves care or concern for human destiny" (Dewey 1998 [1930]: 201). The articulation of moral intuitions is necessary to motivate ethical behavior and opens up the possibility for criticism (Jung 2009: 484). Only articulated feelings and conceptions of the good can become values, and reflecting these aspects in discussions can result in the articulation of norms that are not only learned in an abstract way but also experienced in real life. For pragmatists, goals and means are not separated from each other, but in a circular relationship. In the same way, values and actions are interconnected and part of a creative process. That is why within the pragmatist framework, emotions play an important role for ethics.

Additionally, interpretative narratives are important as articulations of values generating experiences for communities. Especially historical contextualization of normative propositions can help to actualize universal validity claims (Joas 2011: 147–203). Pragmatist ethics articulate moral intuitions and argue in a narrative manner and genealogically. Genealogical formulation adds plausibility because of its role to address a biographical narration (Jung 2009: 490 f.).

The third aspect, the sociability of action, can be interpreted as a normative claim for universalism. In that sense, norms in economic ethics have to be generalizable, which means that the exclusion of human beings according to group-related criteria like sex or class is not allowed. Mead, for example, argues for ethics enforcing the impulse that helps to achieve *general* happiness or well-being (Mead 1968, 435).

In order to achieve this, ideal and real discourses in which people can debate concerning concrete norms are necessary. Through articulation, a public discourse concerning social moral intuitions is possible (Taylor 1996: 49 and 79). Public discourses also provide justifications for principles and institutions that are necessary for the implementation of a pragmatist economic ethic aiming at social issues and the economy beyond individualism. Social communication and discourse are the basis for a consistent critique of social issues (Joas 2000 [1980]: 134).

In sum, a pragmatist economic ethic is based on an actions theory that does not reduce action to rational action and therefore values virtues and models and an analysis of the situation. Articulation of qualitative experiences and emotions are important. Narrativity is an important aspect for collectives, as well as universalism justified in ideal and real discourses. Public discourses are additionally important for the justification of regulations and institutions (for more details, see Hollstein 2015: 293–307).

The Role of Corporations in the Great Transformation

Corporations, as well as individuals, are acting according to routines. Even for the development of innovations, corporations have institutionalized routines, for instance, in research labs to further creativity by using specific creativity techniques. The claim for more sustainable development may disturb these routines: either because new regulations are put in place or because existing regulations are controlled in a stricter way (an example being the Clean Air Act in cities) or because consumers protest against specific, non-sustainable products (an example being pesticides causing the death of bees) or non-sustainable processes (like using the slash-and-burn method in the rain forest).

In such a situation, corporations not only have to react, but they will have to balance different aspects and arguments of different stakeholders. Of course, the state or the consumers are important stakeholders, but other stakeholders are important, too. The shareholder or owners of the corporation want the corporation to produce revenues for them and for investments into the future of the corporation. The employees want the corporation to provide secure and well-paid jobs. The neighbors want the corporation to produce no dangerous emissions, etc. In situations in which a win-win situation can be realized by creative innovation or adaptation, everything is fine. For example, if the corporation changes the way it produces by creating a new technical process, and with this innovative technique, it can produce in a more efficient and sustainable way, realizing economic gains as well as a greater sustainability will not only be alright, but it will be optimal. In this case, markets will remunerate – at least in ideal cases – these innovative corporations, and sustainability will be attained automatically.

The case is more complicated, when the gains on the one side are connected with losses on the other. In the case of intergenerational justice, the problem that future generations cannot act themselves and give voice to their interests, while the living generation has to claim the rights of the future is significant. Problems that are difficult to describe, because they are complex, outcomes partly unknown, and the result of cumulative processes, as is the case in environmental issues, are difficult to articulate by stakeholders. It is also difficult to viably predict cultural changes with problematic outcomes like the loss of life rhythms or the erosion of family structures due to increasing demands for greater mobility (in space and time) (Maurer 2018: 129ff.).

Which kind of attitudes and models can help corporations to deal with such problems? For example, concerning problems related to uncertainty and complexity, a prudent attitude might be necessary. Which kind of institutions and processes are necessary to give a voice to future generations so that the conflicts can be articulated and produce a productive irritation leading to changes in the direction of greater sustainability? Most corporations install a CSR officer in charge of dealing with these issues, but the question remains: Which role do CSR officers or CSR departments have in a corporation? Do they really have the power to disrupt the processes of the organization, or are they the response of corporations in order to avoid substantial changes, by delegating the conflicts to the CSR officer as a sort of lightning rod? An attitude of openness and willingness to hear the claims of stakeholders is necessary instead of an attitude trying to lock up the corporation in order to prevent any change. This attitude of openness might be not only helpful in order to hear claims of future generations but may also be helpful to analyze situations and to distinguish new opportunities and chances for the corporation.

Corporations are not abstract entities but material bodies with real people acting within them, interacting with each other, with furnishers and consumers, neighbors and politicians, lobbyists, and NGOs. Emotions are part of all of these interactions and determine how situations are perceived and experienced. The communication of corporations is – especially in the realm of marketing – often related to emotions. Emotions are not only important in the communication with consumers but also with employees, especially regarding motivation. Relating the goals of the corporation to sustainability may induce positive emotions for consumers. Using green labels is one example how corporations try to use positive emotions related to nature and the environment as a selling argument. However, this may cause greater indignation for consumers and lead to consumer boycott, when such green labelling is unmasked as "green washing" without substantial commitment of the corporation.

How can corporations contribute to real experiences of sustainable engagement? For the employees of a corporation, corporate volunteering can be a way to experience engagement for sustainability in a joyful atmosphere organized by the corporation. For example, asking colleagues to help realize a sustainable project during a corporate volunteer day could procure positive experiences, emotions, and motivation. Nevertheless, these experiences have to be interpreted within a credible narration and actions relating the corporation's engagement to sustainability.

Corporations often develop codes of conduct relating it to the history of the corporation and its historical development. Traditions are important arguments in this respect, relating a narration of the corporation to embodied and sometimes ritualized practices. Traditions of family-owned corporations are a good example for this. These traditions are not fixed, but evolve in time, and the history of a corporation is interpreted in different ways in different situations. To provide a motivational basis, the narration has to adapt to new situations without losing its core message that gives the corporation a specific corporate identity.

Finally, corporations take part in global discourses concerning the relation between the economy and sustainability. However, global problems need local activities, changes in lifestyle, habits, and everyday life. Corporations act locally and globally; they have an impact on lifestyles by creating products and relating these products to specific messages that address general topics of the good life as marketing campaigns show (see, e.g., the campaign of NIKE: "to bring inspiration and innovation to every athlete in the world") (NIKE 2020).

What can corporations do to act according to the necessities of the great transformation, and what can be done to make corporations that are not interested in acting according to the necessities of the great transformation acting according to the SDGs?

How to realize the great transformation		
Ideal types of corporations	*Corporations that want to act in a sustainable way*	*Corporations that want to maximize profit*
Values	Communicate sustainability internally (codes of conduct, corporate identity, marketing use) and externally (lobbying, marketing) Develop a genealogical narrative of a sustainable firm	Comply with political agenda of sustainability to prevent negative public opinion and regulations
Institutions	Support institutionalization of strict legal regulations concerning environmental issues in order to compete in a fair manner Install stakeholder dialogues with consumers, neighbors, employees, etc.	Lobbyism for less regulations Comply with legal regulations in order to avoid higher costs or penalty fees React to consumer protests with stakeholder dialogue in order to avoid consumer boycotts

(continued)

How to realize the great transformation		
Ideal types of corporations	*Corporations that want to act in a sustainable way*	*Corporations that want to maximize profit*
	Compliance institutions within the firm	
Practices	Flat hierarchies in order to further participation and dialogue with employees Corporate volunteering	Incentives for innovations for efficient processes and products that realize win-win situations (less pollution/ waste, more profit)

One lesson that can be learned from pragmatism is that these ideal types of profit-maximizing or value-driven corporations do not exist. In fact, both aspects are constantly balanced in a creative way in situations when corporations are challenged and have to change their routines. Having this in mind, the table above provides some examples for how corporate action is influenced by the state, competitors, employees, consumers, and other stakeholders and, in turn, influences others.

In sum, corporations can play a major role as change agents for sustainability. Understanding the creative ways of corporate action may help to develop norms, attitudes, institutions, and practices in economic ethics for a more sustainable development of the world.

Conclusion

The legitimacy of business in a society facing global challenges as the great transformation toward sustainability depends not only on its ability to create economic welfare. Rather, companies must take into account their embeddedness in the world in which they live and meet their intergenerational responsibilities. A pragmatist business ethic that wants to react to this situation will pay special attention to a precise analysis of the situation, to the consideration of emotions and attitudes as well as to participatory discourses in the development of creative solutions. Additionally, it will keep in mind the level of guiding values as well as that of the regulating institutions and finally that of everyday practices.

Cross-Sector Partnerships as a Source of Business Legitimacy in the Sustainable Development Goals Era

89

Contents

Abstract

This article explores cross-sector partnerships as a source of business legitimacy in a time where the United Nations Sustainable Development Goals (UN SDGs) arguably are a leading agenda for social, economic, and environmental development. In the SDGs and their accompanying "2030 Agenda for Sustainable Development," partnerships are emphasized as an essential tool for implementing sustainable development, and more and more business firms are consequently engaging in partnerships with government and civil society actors to contribute to the SDGs. In the research literature, partnerships have mainly been studied separately from their institutional context. However, it is the overall argument of this article that the institutional context of partnerships has played an important role in shaping the idea of the legitimate partnership today. This article incorporates the institutional context of partnerships in the assessment of their legitimacy by looking at three aspects: partnerships as a

form of extended stakeholder management, partnerships as a means for corporate social responsibility (CSR) implementation in the globalized and Anthropocene era, and partnerships as a result of institutionalization and legitimation in the UN system. Finally, the article presents some current challenges to the legitimacy of partnerships and provides some concluding remarks on how these challenges should be addressed.

Introduction

We live in a time where the triadic divide between the public, private, and nonprofit sectors in society is blurring. Governments and international organizations are incorporating the private and nonprofit sectors in decision-making processes, non-governmental organizations (NGOs) are working increasingly strategic and business-like, and business firms have gone from being more or less entirely focused on profit-making toward being perceived as political actors with responsibility for the "common good" of societies. At the same time, we live in the time of the Anthropocene, in which humankind is creating major disruptions of Earth's physical and biological systems due to the massive impacts of world economy (Sachs 2015). This has put climate change and sustainable development at the forefront of the international agenda, led by the United Nations (UN). Cross-sector partnerships have become widely perceived as a critical means for addressing the complex and multilayered social and environmental problems in the Anthropocene era, creating a "partnership society" (Googins and Rochlin 2000). This comes from the acknowledgment that problems such as social inequalities and climate change do not only require addressing from governments alone but from all sectors in society (Bendell 2000; Selsky and Parker 2005). As transnational corporations are growing in size and power, the old role of the nation-state is changing, and its former sovereignty in controlling resource flows across national borders is challenged. At the same time, the nonprofit sector plays a growing role in managing the social and environmental problems that used to be the responsibility of governments (Seitanidi 2010). This has led to a new emphasis on business firms as political actors with a social and political responsibility to help fill the regulatory vacuum in global governance (Scherer and Palazzo 2011). Thus, many cross-sector partnerships involving actors from the private, public, and nonprofit sector aim to fill "governance gaps" where governments fail to successfully address social and environmental issues, by adopting governance functions that have formerly been the sole authority of governments (Schäferhoff et al. 2009).

This article explores cross-sector partnerships as a source of business legitimacy in a time where the United Nations (UN) Sustainable Development Goals (SDGs) arguably are a leading agenda for sustainability. In the SDG framework, which consists of 17 goals and 169 associated targets addressing the world's most pressing problems within environmental, social, and economic sustainability today, partnerships are emphasized as an essential tool for implementing sustainable development. Partnerships are declared as one of five building blocks for realizing the SDGs before 2030, and SDG number 17 is devoted to partnerships, stressing multi-stakeholder partnerships across sectors as important vehicles for sharing and mobilizing knowledge, expertise, technology, and financial resources to contribute to the SDGs (United Nations 2015, 2019). Where their predecessors, the Millennium Development Goals (MDGs), were manifested as a duty-based and state-centered agreement aimed at developing countries, the SDGs are expressed as a more positively framed ambition aimed at all countries and all sectors. Thus, the SDGs have been widely embraced by the private sector, and there is a growing prevalence of cross-sector partnerships involving business firms that aim to contribute to the SDGs (Scheyvens et al. 2016). Using Suchman's (1995) conceptualization of legitimacy as a point of departure, this article explores how cross-sector partnerships create new opportunities to strengthen business legitimacy in the SDG era. In the research literature, partnerships and their drivers have mainly been investigated as if they were occurring in a vacuum, and many studies have overlooked their embeddedness within the larger institutional context (Vurro et al. 2010). It is the overall argument of this article that the institutional context of partnerships has played an important role in shaping and defining the legitimate partnership. The article therefore aims to incorporate this institutional context in order to assess the legitimacy of partnerships by looking at partnerships as a form of extended stakeholder management, as a means for corporate social responsibility (CSR) implementation in a globalized society, and as a result of institutionalization and legitimation in the UN system. Finally, the article presents some current challenges to the legitimacy of partnerships and provides some concluding remarks on how these challenges should be addressed.

Scope and Structure of the Article

This article is divided into nine parts. The first part briefly explains cross-sector partnerships as a research area and the specific type of partnerships that is discussed in this article as a source of business legitimacy. Drawing on Suchman's (1995) theory of legitimacy as well as neo-institutionalist theory, the second part aims to conceptualize legitimacy, why it is important for business firms, and how it can be obtained, maintained, and repaired. The third part discusses partnerships as a form of extended stakeholder management where the legitimacy of partner organizations from the civil society and public sectors plays into the legitimacy of partnerships. The fourth and fifth part consider globalization and the Anthropocene as important drivers for partnerships as a source of business legitimacy today and outline how business firms in recent years have been given a larger space for action as legitimate environmental governance and international development agents. As the UN has been an important driver for promoting partnerships as a solution to sustainability issues for the past 20 years, special attention is given to the history of the UN's conceptualization of partnerships in the sixth part of this article. The seventh part looks more specifically at the conceptualization of partnerships in the SDG framework. In the eighth part, challenges to the legitimacy of partnerships are discussed. The article is rounded off with concluding remarks.

Cross-Sector Partnerships: A Rapidly Developing Research Area

In the last 30 years, collaborative activities between the public, private, and civil society sectors have become increasingly extensive, and cross-sector partnerships have emerged as a research area in pace with their growing prevalence in practice. During the first years, however, partnership practice and research largely took on an instrumental approach, focusing on how strategic partnerships could create benefits for the partnering organizations (Vurro et al. 2010). The millennium marked a shift in partnerships as a research and practice area, moving to a stronger emphasis on the potential of partnerships to address broader societal issues (Seitanidi 2010; Selsky and Parker 2005). The academic interest for so-called social partnerships, defined as "cross-sector projects formed explicitly to address social issues and causes that actively engage the partners on an ongoing basis" (Selsky and Parker 2005, p. 850), is rapidly increasing these years. Since 2010, more than 25 articles on social partnerships have been published every year compared to one or two published articles a year at the turn of the century. It is safe to say that we are in the middle of a rapidly expanding field in theory and practice, where social partnerships are being studied from a wide range of academic disciplines (Seitanidi and Crane 2014; Selsky and Parker 2005). As in many relatively new research areas, there is not a coherent terminology describing cross-sector partnerships formed explicitly to address societal issues. In the organizational literature, the diversity in terminology spans from "social partnerships" and "cross-sector social partnerships" to "multi-stakeholder partnerships" or "multi-stakeholder relationships," "cross-sector social interactions," and "social alliances" (Seitanidi and Crane 2014). In the political science literature, some research has been done on "sustainability partnerships" and "public-private partnerships for sustainable development," using the sustainability term in a broad sense to embrace both environmental and social sustainability (Bäckstrand and Kylsäter 2014; Biermann et al. 2012; Mert 2014). However, most researchers describe the phenomenon as "social partnerships" or "cross-sector social partnerships" (Seitanidi and Crane 2014). To keep it simple, the term "partnerships" is mainly used throughout this article, but "partnerships" in this context are understood as partnerships that explicitly aim to contribute to sustainable development and/or adressing social issues.

Defining Legitimacy

The concept of legitimacy has become increasingly important in organization theory throughout the past decades. Many scholars credit Max Weber (1978) for introducing legitimacy into sociological theory and consequently into organization studies. Weber's writings suggest that legitimacy can result from conformity with both general social norms and formal rules and laws (Weber 1978). Neo-institutional theory, which was developed from the late 1970's, was however more concerned with embracing Weber's concept than with adopting his conceptualization. According to Meyer and Rowan (1977) legitimacy can result from presumptions of "rational effectiveness," "legal mandates," and "collectively valued purposes, means, goals, etc." (Meyer and Rowan 1977). Meyer and Scott (1983) discussed legitimacy even more in depth, emphasizing legitimacy's cognitive aspects: explanation, theorization, and the incomprehensibility of alternatives. This focus is still particularly prevalent within neo-institutional sociology (Deephouse and Suchman 2008; Meyer and Scott 1983). Suchman's (1995) article represents a milestone within the legitimacy literature. Adopting a constructivist approach to legitimacy, he defines legitimacy as "a generalized perception or assumption that the actions of an entity are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs, and definitions" (Suchman 1995, p. 574). Deephouse et al.'s (2017) updated definition of legitimacy as "the perceived appropriateness of an organization to a social system in terms of rules, values, norms, and definitions" is likewise built on the assumption that the criteria for organizational legitimacy today are a result of negotiation and debate among organizations and stakeholders (Deephouse et al. 2017, p. 34). Suchman observes two basic perspectives on legitimacy within the literature: a strategic perspective, which considers legitimacy as an operational resource that organizations can extract from their cultural environments, and an institutional perspective, where legitimacy is depicted as a set of constitutive beliefs which determine how organizations are built, run, and understood and evaluated as more or less legitimate. While strategic legitimacy researchers "generally assume a high level of managerial control over the legitimation process" and "predict recurrent conflicts between managers and constituents over the form of legitimation activities," institutionalists "downplay both managerial agency and manager-stakeholder conflict" and "tend to emphasize the collective structuration of entire fields or sectors of organizational life" (Suchman 1995, p. 576). Thus, the strategic perspective largely adopts the internal viewpoint of organizational managers, while the institutional perspective looks at organizational environments and their norms and values. Taking a middle course between the strategic and institutional perspectives, Suchman addresses the dilemmas that organizations may face in managing their relationships with demanding constituents and stakeholders, as well as considering the cultural environments that constitute organizational life (Suchman 1995). In this article, Suchman's middle course perspective on legitimacy is adopted to discuss the legitimacy of partnerships, as corporate engagement in cross-sector partnerships both can be understood as a form of extended stakeholder management and as a reaction to pressure from the organizational environment.

So why is legitimacy important for businesses? Studies have shown that an organization's legitimacy has a clear effect on its social and economic exchange, as most stakeholders will only engage with legitimate organizations (Deephouse et al. 2017). Consequently, neo-institutionalist scholars suggest that an organization's survival depends on its legitimation processes as well as its ability to manage continuous legitimacy pressures and challenges (Meyer and Rowan 1977). It has also been suggested that legitimate organizations have a largely unquestioned freedom to pursue their activities, as they avoid questions or challenges from society (Deephouse et al. 2017; Meyer and Rowan 1977; Meyer and Scott 1983). From the neo-institutional perspective, a static understanding of legitimacy is rejected, and it is therefore suggested that maintaining legitimacy is equally as important as gaining it. Some scholars therefore suggest legitimacy as dichotomous, so even though an organization can find itself in the intersection between legitimate and illegitimate, it will eventually fall into one of these categories (Deephouse et al. 2017). Suchman (1995) presents several strategies to gain, maintain, and repair legitimacy. He argues that organizations can gain legitimacy through either *conforming* to the norms and values in the organizational environment, *selecting* among multiple environments in pursuit of an audience that will support the organization's activities, or trying to *manipulate* the structure of their environment by creating new audiences and legitimating beliefs. In efforts to maintain legitimacy, Suchman suggests that organizations should aim to perceive change through monitoring their cultural environment and assimilate elements of that environment into organizational decision-making. He suggests that they should protect past accomplishments by stockpiling organizational goodwill and avoiding unexpected events that might make the organization an object for scrutiny. Finally, Suchman suggests that to repair legitimacy, organizations should formulate a normalizing account that separates the legitimacy threat from larger assessments of the organization as a whole and facilitate re-legitimation through strategic structuring and avoiding panic. In cases of delegitimation, organizations must first address the immediate legitimacy threat before implementing more general legitimation activities (Suchman 1995).

Partnerships as Extended Stakeholder Management

As suggested by Suchman, organizations can gain legitimacy by trying to manipulate the structure of their environments through creating new audiences and legitimating beliefs. Moreover, they can maintain legitimacy by monitoring their cultural environment and assimilate elements of that environment into organizational decision-making. In this context, partnerships could be perceived as a new "legitimating belief" appealing to new audiences who have not previously been known for appraising business endeavors, such as organizations from the public and civil society sector. Moreover, partnerships allow businesses to strategically assimilate elements from legitimate actors in their environments, such as NGOs and governmental organizations, into their decision-making and practice. Thus, when considering partnerships as a source of business legitimacy, it is firstly relevant to look at the legitimacy of potential partner organizations as business stakeholders. When entering into cross-sector partnerships with businesses, organizations from the private and civil society sectors do not only bring their own level of legitimacy into the partnerships: as representatives from their sectors, they also have their own histories in making legitimacy claims against businesses. NGOs are business stakeholders in the sense that they are either formed by or represent groups of people who are affected by business activities, and many NGOs originally emerged as watchdogs toward the harmful societal impact caused by corporate activities. Considering this, NGOs might seem as the most surprising potential business partners. Bendell (2000) defines NGOs as “groups whose stated purpose is the promotion of environmental and/or social goals rather than the achievement or protection of economic power in the marketplace or political power through the electoral process” (Bendell 2000, p. 16). Thus, NGOs have a high level of legitimacy in the sense that they advocate the rules, values, and norms of society (Deephouse et al. 2017). This has often been in opposition to the profit-making objective of business. The relationship between business firms and NGOs has therefore historically been conflictual and antagonistic. In recent years, many NGOs have experienced an empowerment, as the Internet and social media have allowed them to communicate their messages cheaper and more effectively. This empowerment has also grown out the acknowledgment that governments are not able to address all public dissatisfactions with certain social, economic, political, or technological problems in society, whereas NGOs as social movements have been considered as relatively effective means to address some of these problems. As a result, NGOs are now being recognized as symbols of equal power with business, but a different type of power (Seitanidi 2010; Yaziji and Doh 2009). NGOs have been important actors in influencing legal and institutional structures, shaping governmental policy and practice, and a driving force for transparency and accountability in business organizations (Höllerer et al. 2017). As business stakeholders, NGOs can constitute a powerful stakeholder catalyst, as they are capable of mobilizing other powerful stakeholder groups to adopt and impose their demands on businesses. Examples include consumer boycotts, media pressure, and moral outrage (Rodgers 2000). These kinds of NGO campaigns have been described as a form of “normative delegitimation process,” making NGOs a particular threat to business legitimacy, as they are institutionally proactive agents that either hold business firms accountable to institutional norms or pursue institutional change through their campaigns against firms (Yaziji and Doh 2009). This “normative delegitimation” has made it difficult for business firms to have unquestioned freedom to pursue their interests. As a result, the increasing power and pressure of NGOs have forced companies to exercise extended stakeholder management, seeking acceptance and endorsement of their activities from other agencies than the state (Rodgers 2000). Interestingly, research has shown that businesses that engage in international partnerships mainly work with NGOs. This has been explained by the fact that NGOs do not have direct regulatory power, and that NGOs represent the company's consumers more directly than the state (Kolk et al. 2008).

State actors constitute a different type of stakeholders to business firms in the context of legitimacy. Early legitimacy research focused on the importance of the state as a source of legitimacy through its power to legislate, regulate, and sanction. Even in an era of neoliberal deregulation and "private governance," state actors remain important in conferring legitimacy, as most private and nonprofit organizations are regularly evaluated by a state agency (Deephouse et al. 2017). However, global citizen surveys have shown that governments rank lower than NGOs and business firms in terms of factors related to legitimacy, reputation, and credibility. Despite being the least trusted institution globally, governments remain the institution that is usually perceived as most responsible for helping solve global problems (Kolk 2014). With globalization, the old role of the state has changed with globalization as well as the liberalization of markets in developed economies, creating a globalized market society with a decreasing level of traditional state regulation. In the past, the state was considered to possess an ethical monopoly in providing safe, just, and trustworthy public, but today, business firms and NGOs share this responsibility in different constellations and circumstances (Rodgers 2000; Seitanidi 2010). Moreover, both NGOs and companies play an important role in shaping the agendas of governments (Matten and Crane 2005). State actors as stakeholders can constitute a legitimacy threat to business firms when posing legitimate claims on to firms. However, business firms can no longer rely on state actors' approval as the primary sources of corporate legitimacy (Grolin 1998).

Being unable to reject the claims of increasingly powerful NGOs, business firms today have an increasing tendency to seek partnerships with them, as partnerships with NGOs provide a means for linking the social- and sustainability-oriented claims of civil society with the economic- and production-oriented world of business (Waddell 2000). Moreover, business partnerships including active participation from government organizations can provide partnerships with government expertise, "supporting services, facilitating implementation, brokering, convening, delivery and outreach" (Kolk 2014, p. 18). Cross-sector partnerships also affect government regulation, as they can replace, preempt, and precede regulation by filling out governance gaps, as well as supplement regulation (ibid.).

Globalization and the Anthropocene as Drivers for New Notions of Business Legitimacy

Recent decades' fast-evolving market globalization has posed challenges to business legitimacy but has also enabled businesses to be perceived as legitimate actors in new arenas. With globalization, the criteria for business legitimacy are constantly changing, and having the unquestioned freedom to pursue business activities has become increasingly difficult. Abiding the law and increasing profits used to be the main conditions for business legitimacy, as business firms mainly operated on a national level where governments were largely able to regulate their impact on society (Holmström and Kjærbeck 2013). In the recent decades' globalization of trade and finances, however, transnational corporations have grown in power and size and are to a high extent outpacing national governments in terms of economic impact and power. Due to this empowerment of the private sector, there has been a renegotiation of the relationship between the state and the market, where traditional command and control forms have been rejected as insensitive to the transformative capacities of the market (Newell 2000; Seitanidi 2010). This has created a "moral free-space" in which transnational corporations in reality can operate under the radar of enforcement of national rules and regulations. At the same time, the globalization of governance is dragging behind, and intergovernmental organizations have been slow in delivering meaningful international regulatory systems, leaving a governance gap in addressing global problems such as social inequalities and climate change (Newell 2000). It is important to note that in parallel with this, the responsibilities and control that used to belong to the owner(s) of a corporation have increasingly been separated and dispersed among corporate shareholders and management. Even though this has contributed positively to business profitability, its interface with corporate greed has surfaced harmful impacts on wider society problems such as violation of human rights, climate change, and social and economic inequality. Consequently, much public attention has been directed toward the harmful effects of corporate activities, which has led to a general cynicism toward business (Seitanidi 2010). To obtain legitimacy and justify their practices in and toward the modern globalized society, then, business firms can no longer only focus on increasing profits and abiding the law; they also need to initiate active measures to work against society's general cynicism toward business. This involves building and sustaining a "social license to operate" according to the actions that are currently perceived as acceptable in society. Where business firms previously have been perceived as largely apolitical, there is now a growing recognition of corporate power in shaping politics (Matten and Crane 2005). Moreover, business firms are increasingly considered as important actors in filling governance gaps in global sustainability and development governance, due to the perceived failure of governments and international organizations in addressing sustainability and development issues. This has led to a perception of the firm as a political actor with political responsibilities on the same level as governments (Bendell 2000).

For business firms, corporate social responsibility (CSR) activities and communication have become the most obvious way to adhere to societal norms and values that create legitimacy. There is a vast body of literature on CSR aiming to clarify the social responsibilities of business firms and how they can implement them in their activities (Carroll 2016). CSR as a concept has developed from philanthropy and paternalism to more integration in the business, from a leadership characteristic to a corporate practice, and from focusing on the company's workforce and immediate community to focusing on its value chain and impact on larger societal issues such as climate change and human rights (Moon et al. 2017). Many interrelated and overlapping concepts describing companies' engagement in societal issues have emerged, such as corporate citizenship, corporate social performance, corporate social responsiveness, corporate governance, corporate sustainability, and creating shared value (Matten and Crane 2005; Porter and Kramer 2011). In this sense, the concept of CSR is constantly evolving, and business firms are increasingly expected to assume political responsibility that goes beyond legal requirements (Scherer and Palazzo 2011). CSR has also changed in its organizational and regulatory forms. There has been a shift from CSR being organized entirely by the company itself to reflecting shared organization with other actors, as seen in partnerships (Moon et al. 2017). In a time where global problems such as poverty, climate change, and social inequalities have grown too big for governments to solve on their own, partnerships between different sectors are hailed as the solution to these problems. This has created a new space for action for business firms, who are encouraged to engage in partnerships to serve the common good. Cross-sector partnerships have therefore been characterized as “one of the most exciting and challenging ways that organizations have been implementing CSR in recent years” (Seitanidi and Crane 2009, p. 413).

Business as a Sustainable Development Actor

Partnerships that address social and sustainability issues respond to a broad societal concern for sustainable development where all societal actors, not just governments, are called upon to solve the world’s most pressing problems. In the Anthropocene era, sustainable development is widely considered as the most pressing agenda of our time (Sachs 2015). However, the challenge of maintaining social and environmental sustainability in an economic growth context is not new and was first brought to the global agenda during the UN’s 1972 Conference on the Human Environment. Sustainable development was later popularized with the UN Commission on Environment and Development’s so-called Brundtland report from 1987, named after chairwoman Gro Harlem Brundtland. In the report, the Commission called for stronger coordinated political action and responsibility, stressing institutional and governance gaps as a main challenge for achieving sustainable development. The Brundtland report’s definition of sustainable development as “development that meets the needs of the present without compromising the ability of future generations to meet their own needs” (Brundtland 1987, p. 41) has since prevailed. However, in the aftermath of the UN World Summit of Sustainable Development (WSSD) in Johannesburg in 2002, the concept of intergenerational justice has become secondary to a more holistic approach to sustainable development, embracing economic, social, and environmental development. Sachs (2015) describes this approach to sustainable development as a “three-way normative framework” providing a normative vision of what a good society should be like. He defines sustainable development in practice as a “scientifically and morally based problem solving” (Sachs 2015, p. 43). The SDG framework, launched in 2015 with 17 goals targeting specific societal issues related to environmental, social, and economic sustainability, can be considered such a normative framework. Business strengths as innovation, responsiveness, efficiency, and provision of specific skills and resources have been hailed as important contributions to the SDGs and sustainable development in general (Blowfield 2012; Porter and Kramer 2011; Scheyvens et al. 2016). In this context, partnerships for sustainable development show an important expansion in the reach of business firms as legitimate actors. In contrast to the public and nonprofit sector, the private sector has historically been criticized for lacking the democratic mandate, legitimacy, and historic role to make socially justifiable decisions in deploying their resources to serve the common good. However, in cross-sector partnerships, nonprofit and public organizations bring in the mandates to make these socially justifiable decisions, strengthening the legitimacy of companies as actors that serve the public and exercise political responsibility (Seitanidi 2010).

The continuously expanding legitimacy of business firms as contributors to the common good is also seen in recent decades' discourse on environmental governance and international development. Throughout the 1990s, many voluntary and market-based mechanisms were adopted in environmental governance, providing an alternative to governmental regulation as the obvious policy instrument for governance in this field. This can especially be observed in the UN and its increasing promotion of voluntary, business-oriented practices and policies to deal with climate change, such as the Global Compact. According to Mert (2014), the formation of the World Trade Organization (WTO) in 1995 and intensified business involvement in the UN system has led to an influence of economic liberalism on environmental discourses in the UN. Consequently, the private sector has become increasingly encouraged to assume responsibility in environmental governance (Mert 2014). The private sector and international development have historically been separated due to a distrust of business and a reluctance to hold companies responsible for development outcomes. However, the private sector has in recent years been strongly encouraged to play an active role in international development due to the perception that governments and international institutions have failed in combatting inequalities and poverty. At all three major UN conferences on sustainable development, namely the 1992 Earth Summit, the 2002 World Summit on Sustainable Development, and the 2012 Rio + 20 conference, the UN highlighted an expanded role for the private sector as a development actor (Scheyvens et al. 2016). Consequently, business firms have moved from being perceived as a "development tool," contributing to development through its economic activities by, e.g., leading investments and creating job opportunities, toward being increasingly constructed as a consciously engaged "development agent," creating quality jobs and answering to stakeholder concerns regarding, e.g., fair employment (Blowfield 2012). This resonates well with the SDGs and their emphasis on inclusive growth to fight poverty, sustainability, and inequalities.

The Legitimation of Partnerships in the UN System

During the past 20 years, the UN has increasingly institutionalized partnerships as an implementation mechanism for sustainability goals and has thus strongly contributed to making partnerships an important norm in business firms' organizational environment. As Suchman describes, conforming to such norms and assimilating them into business practice increase organizational legitimacy (Suchman 1995). In international governance, the study of legitimation starts by looking at how international organizations legitimize their activities and create perceptions of legitimacy among communities. In international organizations such as the UN, legitimacy does not have to be created by democratic participation but can just as easily be obtained by rational justification and reason-giving (Bäckstrand and Kylsäter 2014). This corresponds, in Suchman's (1995) terms, to creating legitimacy through "manipulating" organizational environments by creating new legitimating beliefs (Suchman 1995). When discussing partnerships as a source of business legitimacy in a time where the SDGs are arguably the leading agenda for sustainable development, it is important to assess how partnerships have been institutionalized, justified, and legitimized in the UN system for the past two decades, thus making partnerships a "legitimating belief." When the Johannesburg summit in 2002 failed to agree on binding agreements and major new legislative initiatives to reduce global climate change, partnerships became a so-called type 2 outcome of the summit as a means of implementing sustainability. By this time, partnerships were already a part of the UN's mandate with the 1998 establishment of the UN Fund for International Partnerships and the 2000 launch of the eight Millennium Development Goals (MDGs). MDG number 8, to "develop a global partnership for development," was aimed at increasing official development assistance (ODA), creating a more open trading and financial system, and addressing debt problems of developing states. The MDGs, then, applied the partnership term in a broad sense, aiming it primarily at states. However, partnerships including actors from all sectors were increasingly mentioned in the run-up to the WSSD as a means to address the implementation deficit of globally agreed commitments on sustainable development, such as the Agenda 21, which was agreed upon by UN member states at the 1992 Earth Summit in Rio. Up to the WSSD, the Commission on Sustainable Development (CSD) prepared the Bali Guiding Principles for partnerships, as the CSD considered partnerships as an important implementation tool for the Agenda 21 and prospective binding agreement outcomes from the WSSD (UNDESA 2015).

When the WSSD failed to create binding international agreements, partnerships remained the only tangible outcome of the summit. It was then stressed that partnerships should not be a substitute for government responsibilities and commitments but that they were merely a means for strengthening the implementation of the MDGs and the globally agreed commitments in Agenda 21 (Mert 2014; UNDESA 2015). The conceptualization of partnerships as flexible, collaborative, and market-oriented was promoted by the USA and the business sector, and the UN consequently adopted this conceptualization. However, the conceptualization was heavily criticized by environmental NGOs and governments from the south, who feared that partnerships would lead to the retreat of the state and the privatization of sustainable development. A CSD session in 2003 confirmed that the guidelines for partnerships were non-binding and that reporting on partnership progress and results was voluntary. During the WSSD, more than 200 partnerships were registered with the CSD, and around 150 more were registered during the first 2 years after the summit. These partnerships have later proven to have limited effect on sustainability goals (Bäckstrand and Kylsäter 2014; Mert 2014). Bäckstrand and Kylsäter (2014) find that in the aftermath of the WSSD, a delegitimation and a subsequent re-legitimation of partnerships took place in the UN system. Up to the Rio+20 summit in 2012, the CSD was criticized for its lack of effectiveness and for not succeeding in reviewing the progress of the WSSD partnerships as implementation mechanisms, leading to a delegitimation of partnerships. Consequently, the UN Division for Sustainable Development (DSD) convened a Partnership Forum at the Rio+20 summit to evaluate, strengthen, and revitalize partnerships. In the aftermath of the summit, the DSD reinvented and re-legitimated the partnership model by renaming and broadening the concept of partnerships and shifting the terminology from embracing only multi-stakeholder partnerships to embracing "voluntary commitments" and "sustainable development action networks." Bäckstrand and Kylsäter (2014) describe this re-legitimation of partnerships as an effort from the UN to reinvent their own mission and legitimacy and importance in an era of private-public multilateralism (Bäckstrand and Kylsäter 2014).

The paradigm shift from binding to voluntary contributions to sustainability persists in the SDGs and their accompanying 2030 Agenda for Sustainable Development. In the 2030 Agenda, partnerships is emphasized as one out of five essential building blocks for achieving the SDGs, and SDG number 17 is devoted to partnerships, urging actors to "strengthen the means of implementation and revitalize the global partnership for sustainable development" (UNDESA 2015; United Nations 2015). Each SDG has a number of targets attached to them, which are intended as guidelines for implementing the goals. SDG 17 has two targets specifically related to cross-sector partnerships:

> ***17.16***: *Enhance the global partnership for sustainable development, complemented by multi-stakeholder partnerships that mobilize and share knowledge, expertise, technology and financial resources, to support the achievement of the sustainable development goals in all countries, in particular developing countries.*
> ***17.17***: *Encourage and promote effective public, public-private and civil society partnerships, building on the experience and resourcing strategies of partnerships.* (United Nations 2019)

These targets carry on the voluntary character of partnerships in the UN context. Under the SDG agenda, businesses, governments, and NGOs are equally called upon to pursue sustainable development until 2030. Consequently, the SDGs and their emphasis on partnerships for implementing the SDGs have been widely appraised by actors from businesses, governments, and civil society actors. As of September 2019, almost 5,000 partnerships and voluntary commitments are registered with the UN's "partnerships for the SDGs" online platform (United Nations 2019).

Challenges to the Legitimacy of Partnerships

Although the SDGs in general and their conceptualization of partnerships have been widely accepted by actors from all sectors, some remain critical toward them. SDG 17 has been caught up in an ongoing debate about the normative divide between obligation and voluntarism and between legally binding agreements and weaker, optional alternatives. Critics have pointed out its lack of accountability mechanisms and have remarked that SDG 17 pays little attention to any meaningful role for regulation, considering that partnerships invite multinational corporations to play an important part in the sustainability plans of developing countries. SDG 17 has also been criticized for being too vague in terms of defining the exact utility of partnerships in achieving the specific targets of the SDGs (Cooper and French 2018; Pogge and Sengupta 2015). A more general critique against the SDG framework is its strong emphasis on market-based approaches to sustainability and economic growth as a means for combatting inequalities. As many scholars assert that neoliberal mechanisms have led to social inequalities and increased the power imbalance between developing countries and Western capitalist countries, there is a widespread skepticism toward relying on the same mechanisms to solve inequality issues. It is relevant to mention that business firms played an important part in the development of the SDGs, as industry leaders were a designated "major party" involved in the UN Open Working Group (OWG) which was tasked with the development of the SDGs. There is therefore a general concern that the SDGs could end up as a framework for business as usual, and the term "SDG washing" has already been introduced as a new version of "greenwashing" (Pogge and Sengupta 2015; Scheyvens et al. 2016).

According to the existing partnership literature within organizational and political science, the main challenge to the legitimacy of partnerships is the question of their effectiveness on sustainability issues. Several studies of the registered partnerships from the 2002 Johannesburg summit have shown that their effectiveness in implementing international sustainability agreements and developing new norms for sustainability governance is limited (Bäckstrand and Kylsäter 2014; Pattberg et al. 2012). Moreover, existing research on partnerships has not paid much attention to the monitoring, reporting, and evaluation of partnerships' outcomes and impact on societal problems. This has been difficult due to the dynamic and evolving nature of partnerships and the fact that no existent analytical framework for impact assessment is applicable for all partnerships. There is therefore a growing pressure from organizations investing resources in partnerships, as well as from researchers questioning whether partnerships are merely a hype for solving social and sustainability problems, to develop methods for assessing the impact of partnerships on social issues. This is necessary in order to inform and support their legitimacy and credibility (van Tulder et al. 2016). A secondary challenge to the legitimacy of partnerships is that NGOs have relatively high reputational risks when collaborating with businesses, which can threaten their legitimacy. This could also pose a threat to the legitimacy of businesses engaging in partnerships with NGOs, as business draws on the legitimacy of NGOs when partnering up with them (Herlin 2015; Kolk et al. 2008). Finally, it has been argued that in order to be legitimate, partnerships should fulfill core democratic values such as participation, accountability, transparency, and deliberation, but that few partnerships succeed in fulfilling these values (Bäckstrand 2012).

Conclusion

This article has discussed partnerships as a source of business legitimacy in the SDG era. It has illustrated how market globalization and the Anthropocene's strong focus on including all sectors in sustainability efforts have created a new role for business as a legitimate actor in environmental governance and international development. Partnerships also enable business firms to create legitimacy by managing the demands of stakeholders from the public and civil society sectors who have the power to delegitimize business and integrating the demands of these stakeholders in their decision-making through collaboration. With the SDGs and the UN's institutionalization and legitimation of partnerships, businesses now have the opportunity to obtain a "UN seal of approval" on their partnership activities and thus to strengthen their legitimacy through partnerships. However, there are several challenges to the legitimacy of partnerships, among which the most important is the lacking proof of their effect on sustainability goals. Moreover, the SDGs including SDG 17 about partnerships have been critiqued for adopting a neoliberal and market-based approach to sustainable development and for their lack of accountability mechanisms. This has led critics to fear that the SDGs could end up being a framework for "SDG-washing" business as usual. Concerns have also been raised on whether partnerships are democratically legitimate and whether they negatively affect the legitimacy of NGOs. In order to strengthen and maintain partnerships as a source of business legitimacy in the SDG era, which lasts until 2030, business firms engaging in partnerships for sustainable development should take action to disprove these concerns by enhancing the accountability and transparency of partnerships and develop better impact assessment to prove the effect of partnerships on sustainability issues. When working in partnerships to contribute to the SDGs, proving impact on the SDGs can be difficult, as many of their indicators primarily are measurable at a macro level (United Nations 2019). Research is currently being conducted in order to assess and improve the methodologies and indicator systems that measure and evaluate the performance of different actors in relation to the SDGs, and to adapt methodologies of impact assessments to modern conditions and challenges (United Nations Research Institute for Social Development 2018). In the meantime, business firms engaging in partnerships to address the SDGs and sustainability issues more generally should conduct impact assessments of their own efforts. Better impact assessments of partnerships and general business engagement in sustainability and SDG efforts can contribute to strengthen these efforts and to prevent them from being delegitimized through accusations of "green-washing" or "SDG washing."

Accounting Systems and Integration of Sustainable Development Goals (SDGs) into Corporate Operations

90

Magnus Frostenson

Contents

Abstract

Following the introduction of the Sustainable Development Goals (SDGs), many companies claim to adopt them in one way or the other. Guided by the "SDG Compass" and other tools, companies are advised to go through a process of trying to understand the SDGs, defining priorities, setting goals, integrating, and reporting and communicating the results. The article points to the nature of implementing the SDGs in business, including going from macro to micro goals, managerialism, and instrumental rationality, all implicitly present in the discourse of SDGs. Such an understanding on how to implement the SDGs, however, requires a strong role of the accounting system of the firm. Based on a theoretical framework, the various roles of accounting assumed in the managerial and instrumental approach to the SDGs are discussed. These roles include the potential of the accounting system to territorialize (sustainability) issues, mediate these to other arenas or higher-order contexts, adjudicate between success and failure, and subjectivize or incentivize people within the organization. The problem of playing out these roles in relation to the SDGs is discussed, as well

Introduction

The introduction of the Sustainable Development Goals (SDGs) in late 2015 implied points of reference for social and environmental development on a worldwide scale. The support for the SDGs has been massive, at least in leading political circles as well as in other parts of society, including business. Scores of representatives of political bodies, business itself, researchers, and others contend that the SDGs are of relevance to business. It has been claimed that the SDGs "represent an unprecedented political consensus on what level of progress is desired at the global level—and this is an opportunity for companies to apply a similar approach across a wide range of sustainable development challenges" (GRI et al. 2015, p. 18).

Commonly, the SDGs are treated as distinguished points of reference through which business operations are modelled or shaped to provide specific contributions to the achievement of the goals. As argued by former UN Secretary-General Ban Ki-moon: "Business is a vital partner in achieving the Sustainable Development Goals. Companies can contribute through their core activities, and we ask companies everywhere to assess their impact, set ambitious goals and communicate transparently about the results" (GRI et al. 2015, p. 4). From a goal-setting perspective, the SDGs have been understood as "governance through goals" (Biermann et al. 2017, see also Lashitew et al. 2018). Accordingly, the SDGs can be seen as action-guiding goals that tend to be understood as something that should be integrated into business operations. From a business perspective, the entire approach builds on an outside-in perspective where companies face and try to solve sustainability challenges through applying its resources, competencies, and innovation skills (Muff et al. 2018). Through the overarching framework of the SDGs, companies steer, shape, communicate, and report their strategies, goals, and activities (GRI et al. 2015).

Some attention has been paid to *how* companies could and should integrate the SDGs into their operations. Even though many agree that business has a role to play in the achievement of the SDGs, it is not altogether clear what companies should do with regard to the SDGs, as these goals do not contain any binding framework for specific action (Biermann et al. 2017; Voegtlin and Scherer 2017). Scholars have recently argued that companies should "support" them (Bowie 2019), for example, through collaborating with NGOs and other interested parties. Others have seen the SDGs as catalysts or sources of inspiration for companies to develop sustainability strategies (Burritt et al. 2018) or for innovation (Voegtlin and Scherer 2017). However, more specifically, intellectual and practical support devices and frameworks are designed to assist companies in their work of integrating them. One example is the SDG Compass (GRI et al. 2015). An important aspect of the suggestions given in the framework(s) is the use of the *accounting system* as a tool to integrate the SDGs in business operations – through various, in particular calculative, micro-level accounting technologies (Bebbington et al. 2007; Bebbington and Unerman 2018). Significantly, PWC (2018) found that while 72% of more than 700 surveyed companies mention the SDGs in their reporting, only 28% of them disclosed "meaningful" key performance indicators (KPIs) related to the SDGs. Using the accounting system as a tool for integration is strongly recommended by practitioners and researchers.

A consequence of such recommendations is that the enactment of SDGs in business will be conditioned by the features, roles, opportunities, and limitations of the accounting system. This article focuses on the roles of the accounting systems and their relevance for the integration of the SDGs in business operations. The specific research question of the article is: "How is it possible to integrate SDGs in corporate operations through the accounting system given the acknowledged roles of this system?" Specific accounting technologies are not the focus of the article but rather the roles of the accounting system in relation to the SDGs as adopted by the firms and, in particular, as described by Miller and Power (2013).

Thus, the article first characterizes the way the SDGs are recommended to be integrated through the accounting system. Then it brings up four specific roles of the accounting system and links these to the idea of integration of SDGs into business operations from a performativity perspective. An analysis follows and conclusions are drawn. Specifically, two features of using the accounting system to integrate the SDGs will be highlighted: the aspect of "role weakness" and the issue of arbitrary presentations of success and failure through the accounting system.

Integrating the SDGs

The nature of the SDGs – global governance tools to be used, translated, and adapted at local levels – has implied a need to understand how to use and implement them in specific contexts. One such context is business. Reaching the SDGs requires economic growth under socially and environmentally acceptable conditions. Business faces expectations to act responsibly in all its operations, thereby leveraging and contributing to the fulfilment of the SDGs.

This is not just a general stance of central actors in the field. Indicators for measuring and evaluating the achievements of the SDGs are not just developed at the macro-level (Hák et al. 2016). Concretizations with regard to how business should act have been published. The SDG Compass has been developed by the UN Global Compact, the Global Reporting Initiative (GRI), and the World Business Council for Sustainable Development (GRI et al. 2015). The SDG Compass could be seen as guidelines for integrating the SDGs into business operations. Other initiatives also exist, for example, the SDG Accelerator, developed by UNDP Denmark, aimed specifically at small- and medium-sized companies.

Overall, in the SDG Compass, companies get the advice to go through a process consisting of five stages; understanding the SDGs, defining priorities, setting goals, integrating, and reporting and communicating the results. This is a process that entails an understanding of integration not only in a general sense, through an overarching strategy, but also more specifically, through integration into the *accounting system* of the companies. Through the accounting system, representing and to some extent defining the business operations to be pursued, the company gets a means through which the SDGs are not only communicated and/or decoupled from the organizational realities. Rather, the constitutive and action-guiding frames of the accounting system help to define, visualize, and measure what the company should strive for – also with regard to sustainability.

To exemplify how the SDG Compass illustrates this idea, the second stage of the process, that involves setting goals, consists of four actions: defining the scope of goals and selecting key performance indicators (KPIs), defining baseline and selecting goal type, setting the level of ambition, and announcing commitment to the SDGs. At the time of this writing, and illustratively, the online resource of the SDG Compass contains no less than 1,553 indicators relating to the SDGs, many of them GRI indicators. Clearly, the use of KPIs is considered essential when it comes to setting goals that are driving, monitoring, and communicating progress. The accounting system is not just an option to use, rather, it is understood as the way through which goals can be reached. It represents an idea of how sustainability is actually realized from a functional perspective. Using the accounting system facilitates the materialization of a corporate sustainability strategy (Adams and Frost 2008, and many others).

Such an understanding of how to integrate the SDGs – i.e., through the accounting system – is not only reflecting a practical "how to do it" approach, developed by practitioners. It has also been advocated among accounting and sustainability researchers. Corporate sustainability "requires integrative measurement and management of sustainability issues rather than isolated applications of different tools in the organization" (Maas et al. 2016, p. 237). Pointing more specifically to accounting technologies and the SDGs, Bebbington and Unerman (2018, p. 16f) claim that "the technologies of accounting, target setting and reporting are required within the UN SDG architecture of 'metagovernance' and this represents an opportunity for scholars in evaluating and advancing how accounting is used in this context." The possibility of integrating SDGs into "integrated reports" has been discussed (e.g., Adams 2017). Pointing to the participation of various actors, Bebbington and Unerman (2018, p. 10) also mention the accounting profession and its potential to "develop an important role for itself as part of the intervening process in helping translate and adapt the government-level commitments within the SDG targets into organizational-level actions and achievements." This is also congruent with the more general idea of "governance through goals" (Biermann et al. 2017), which requires from a business perspective that companies identify key areas in which they can contribute. A general control and accountability perspective entails going from awareness of macro goals to the definition of micro goals at the business level. Another way of putting it is to point to the holistic and multidimensional view of (sustainable) development that the SDGs provide (Pradhan et al. 2017) and the need to translate or reenact the overarching ambitions of the SDGs into more specific issues, within the scope of companies to grasp.

As said, establishing the SDGs, making them work in a business context, seems to presuppose the accounting system as the entity *through which* the company can define goals, targets, and objectives – and, also, through the system, measure the achievements of all these. It is rationalized into an architecture of means-ends relations, relating to sustainability (cf. Meyer 1986). In the literature and practical approaches to integrating the SDGs, it is obvious that a relatively uniform understanding of the accounting system is present. Two features stand out. First, the system is instrumental to reaching sustainable ends. Second, the application or use of the system follows more or less a managerial route, where “the company” (reasonably enough top or departmental managers) sets targets, chooses indicators, and so on. An implication is a relatively unproblematized hierarchical conception of how the accounting system works and “should” work. Little reflection, however, seems to be devoted to more deeply rooted analyses of what an accounting system is and the roles it plays out – and, as a consequence, how that conditions and challenges the possibilities of using the system to achieve relevant ends. The following section provides a theoretically grounded discussion on the topic.

The Roles of Accounting

The integration of SDGs in business operations, thus, presumes the use of the accounting system to achieve relevant ends. Considering the development of sustainability reporting, tools, and systems for sustainability control, this hardly comes as a surprise. Accounting also contributes, or may contribute, to transparency, facilitation of control, visualizing performance, evaluation, and comparisons of performance.

However, a consequence of using the accounting system to attain sustainable outcomes is that sustainability as such (or, rather, how it is dealt with and understood) becomes conditioned by the frames and roles of the system. Relevant not only to financial accounting or management accounting but also to various forms of sustainability accounting or control, the accounting system plays out a number of roles that have been identified theoretically.

The literature points to somewhat problematic roles of accounting, stretching far beyond attempts to make corporate activities transparent and manageable. From a theoretical perspective, the comprehensive account of Miller and Power (2013) offers insights into how various roles or functions of accounting play out. Behind this, one finds a recognition of the mutually constitutive nature of accounting, organizing, and economizing. Accounting is not (only) to be seen as a technical activity of instrumental kind. It is not a literal, objective representation of occurrences in the organization (Boland and Pondy 1983). Accounting is better understood as construction than representation (Mouritsen and Kreiner 2016). It is also constitutive of the practices that it is supposed to measure and visualize, that is, it has a very strong role with regard to the activities and people it is supposed to represent (see also Vosselman 2014). Relating this to the integration of sustainability issues into the accounting system also requires an understanding of how it relates to the acknowledged roles of accounting. Following Miller and Power (2013), accounting takes on four roles, in turn, *territorializing*, *mediating*, *adjudicating*, and *subjectivizing*. Through enacting such roles, accounting tends to *shape* and even *constitute* the areas that it is supposed to represent. Economic theory, in this sense, manages to shape, format, and perform reality, a belief that has been labeled the “performativity thesis” (Vosselman 2014).

Abandoning the idea of accounting as pure representation of a certain development or state of the art, Miller and Power (2013) bring up the *territorializing* role of accounting. This role implies the recursive construction of calculable spaces, inhabited by actors within organizations and society. Put in other words, accounting is not a passive representation of something that is given. Rather, it is constitutive when it comes to creating or making up the territories that it is supposed to represent. Reality is not passively mirrored or visualized. Through territorializing, spaces are constructed that accounting is claimed to represent. Mennicken and Miller (2012, p. 21) contend that the territorializing capacity of accounting is conducive to “making the previously incalculable calculable, reframing the concerns of others in ways that are amenable to its repertoire of ideas and instruments.”

Relating this to performance measured in specific ways, spaces (activities, etc.) that are measured are defined by the very fact that (and how) they are measured. Expressed somewhat differently, measures are “forms of social territorialization, that institute simultaneously a range of tools and the environments where they are deployed” (Brighenti 2018, p. 38). Territorialization entails territory-making acts, achieved through active reduction of “space” –for example, reducing the performance of a professional teacher to whether he or she communicates clearly, measured on a scale ranging from 1 to 5 (Englund et al. 2019). With regard to sustainability, this is not a denial of the fact that, for example, CO2 emissions or sick leave rates can be measured as higher or lower. But what accounting does is to shape the territory in which such measures constitute “environmentally friendly” or “sustainable.” This is usually done in quantitative terms implying a domain configuration into numbers, through which criteria for good and bad sustainability, etc. are shaped. Essentially, what is complex and vague goes through a formatting (in terms of numbers) that implies a reduction. The very activity is constructed through the accounting system.

When territorialization has taken place, a recontextualization may follow, implying that the numbers, narratives, or what has been defined as the measure of performativity have the capacity of being mediated. *Mediation*, thus, is the second role of accounting, as understood by Miller and Power (2013). Mediation can be seen as the “linking capacity” of accounting. Miller and Power (2013) talk about how accounting (instruments) links up distinct actors, aspiration, and arenas. Once the reduction into one specific format has been made (cf. territorialization), what has been reduced can be related to other contexts that have also been reduced in the same way.

The spaces that are linked to each other are frequently calculable and can, for that reason, be related to each other. Performance on different arenas are formatted in equal or comparative ways. Importantly, mediation can be done in space, but also in time, suggesting improvement or deterioration over time. And, further, such mediation may also be related to higher levels of abstraction, rationales, etc. For example, once again relating the discussion to sustainability, the comparisons of different achievements with regard to emissions, workplace incidents, etc. are linked to each other at a higher level, as "sustainability," where one company may be deemed better than another. That is, a reframing of the domain to higher (or other) discourses and narratives takes place. This also allows for links to ideologies or understandings of a higher order. Mediation, in this sense, creates links and relations to other contexts, inhabited by other actors, procedures, or activities. Polluting industries can be classified as unsustainable compared to others. Or employee satisfaction indices of blue-collar workplaces can be compared with white-collar workplaces. Essentially, what is complex and to a high degree different can be reduced into one format and transferred to other contexts.

Adjudicating constitutes a third role of the accounting system. After constructing (territorializing) and mediating activities, achievements, performances, etc. in space, time, and to higher levels of abstraction, the role of adjudicating refers to the active or even decisive role that accounting plays in evaluating performance, both of organizations and individuals. This also entails determining what should count as failure. Adjudicating, however, is not just about preferring one figure or achievement over another in a more technical sense, as visualized in the accounting systems. The process or role of adjudicating is essentially normative. Making actors (individuals, companies) responsible or holding them accountable for their visualized achievements mirrors and reproduces various norms, ideologies, or preferences concerning how to understand performance of the task at hand. Various ideas (in the literature often related to as the market, efficiency, responsibility, etc.) work and manifest themselves through accounting. The accounting instruments also convey such ideas through its technologies of accounting. They, thus, reconstitute and manifest normatively the domain that they are supposed to measure. Normativity, thus, is supported *through* the use of the accounting system. In the case of sustainability and how it is measured, normative assumptions also play an important role in constituting what good performance actually is.

Finally, Miller and Power (2013) point to how performative technologies tend to elicit particular *subjectivities*. The *subjectivizing* role, consequently, pertains to the individuals within the system. Accounting is a subjectivizing practice in the sense that individuals are subjects of control or regulation by others, while retaining the idea of the free individual, free to choose among a number of alternatives. This essentially human aspect relates to individual within the system. Mennicken and Miller (2012) point to the capacity of accounting numbers to create and constrain subjectivity. Essentially, subjectivizing can be explained by the visibility and transparency of each individual's efforts that accounting creates. When individual performance is assessed, it tends to concern the individual and affect in the sense that a "calculating self" comes into being. That is, someone fully responsible for his or her actions and achievements in relation to others or some pre-defined norm. In doing so, the individual accepts the demands of performativity and internalizes them to such an extent that external control becomes less necessary. Comparing oneself to others and to keep track of one's performance in relation to others and to normative expectations becomes part of what you are as a professional actor. This form of self-regulation ties the individual to the accounting system and makes its normative assumptions part of the individuals' self-understanding of what a good performer is.

It should be said that the analysis of these roles has been made primarily within financial or management accounting. But notably, the roles are also supported by the development of sustainability accounting standards, such as the GRI Standards. Essentially, the integration of SDGs into the accounting system requires an analysis of the ways in which the roles of the system play out and make integration possible, if it does.

Analysis: The Roles of Accounting and the Integration of the SDGs

The accounting system visualizes in particular ways, as described, a calculated notion of performance, where the "results" generated in different places and in different arenas can be linked to each other at increasingly higher levels of abstraction. A fundamental question is whether it is possible to treat sustainability in this way. Another way of asking the question is whether it is possible that vague performance objects become operational through the accounting system (Power 2015). Integrating the SDGs through the accounting system is an effort "to create new accounting and performance facts and their associated technical infrastructures" (Miller and Power 2013, p. 581). Of course, this is not unique to the SDGs, but pertains to the entire sustainability accounting/control discussion. Evidently, and also as Miller and Power (2013) argue, this is not only a macro-level phenomenon but relates to idealized action and performance within organizations. From a research perspective, the adoption of the accounting system as instrumental to behavioral changes requires a "micro-level behavioral examination of the roles of accounting within organizations and in relation to group dynamics" (Miller and Power 2013, p. 563). In modern society, accounting is fundamental to subjectivizing and responsibilizing individual actors.

However, there is a difference between a macro-level understanding of the very strong capacity of the accounting system and the micro-level organizational worlds where the roles of the system play out (or not). Once again emphasizing the linkage between integration of SDGs and the accounting system, it is worth asking which possibilities that exist to turn sustainability into a calculable space and to do so within the organizational context presumed in the discussion. And if such a thing is possible, one may wonder about the consequences thereof, and whether such integration is, given the consequences, something to aspire for.

Some researchers (e.g., Englund et al. 2019) have seen the roles of accounting as interrelated. The nature of the interrelation of the roles is worth highlighting in an analysis, in particular since one could relate the interrelation to the "functionality" of the accounting system to achieve performative outcomes. That the roles play out, more or less in relation to each other, is a fundamental explanation for the accounting system's (assumed) capacity to "work" as conducive to sustainability performance. Seeing the roles as interconnected facilitates an understanding of, and a theoretical explanation for, the potential success or failure of integrating the SDGs into the accounting system of individual firms.

Thus, let us take a closer look at the roles in relation to the SDGs and treat them in a coherent context. What Miller and Power (2013) say is that (the roles of) accounting has evident effects on how we look upon performance and ourselves. The accounting system is strong, according to such a view. If it is used in a way that makes all roles come into play, the calculable spaces will be conditioning how we look upon performance in relation to others – and ourselves as performing actors within the organization. Integrating a logic of (measurable) sustainability performance into the accounting system has been widely discussed in the literature. However, so far, it is hardly fair to say that companies have managed to achieve such performance logic through the accounting system, at least not to such levels that it has fulfils the roles possible to carve out within and through the system when it comes to performance measurement.

The issue of territorializing sustainability is probably not the most difficult one with regard to the accounting system, at least not in a more technical sense. The interpretation or translation phase of an overarching SDG requires reflection on business operations in relation to the goal(s). Indicators are chosen and/or constructed. Measurement of specific actions, events, or states related to sustainability is possible. The history of sustainability reporting and the development of standards for it prove that it is possible. Mediating, the second role, is more problematic. Mediation requires linkages in time and space and to higher levels of abstraction. One can ask whether this refers only to a measurement or comparability problem. Probably not. CO2 emissions from various industries are actually possible to compare. The mediation process is, rather, linked to the translation process of linking overall goals to specific corporate metrics, that is, a reverse procedure compared to Miller's and Power's (2013) understanding of mediation. The spaces where sustainability is territorialized are created differently, seen from the perspective of different companies. That does not undermine the possibility of creating such spaces, but due to their mutual (potential) differences or even incompatibilities, a vagueness of mediation follows. Being "better or worse" when it comes to sustainability, and with regard to the attainment of the SDGs, is difficult to establish.

The vagueness of mediation also affects the possibilities of adjudication. The normativity inherent in the system relates to understandings of better and worse achievements of sustainability. The profitable company and the high-performing individual are possible to identify, but hardly the sustainable company in relation to others.

Furthermore, embedding sustainability across all functions, as the SDG Compass suggests, involves the personalization of the duty to meet sustainability expectations. "In all cases, individual accountability for progress on individual goals and targets will help drive success" (GRI et al. 2015, p. 23). The framework of Miller and Power

(2013) sees subjectivizing as a role of accounting, as something it produces with regard to the individual that faces it. The normative understanding of the SDG Compass (and other parts of the sustainability literature) is that such subjectivizing is key to success. Such a contention (or wishful thinking) presumes that the subjectivizing force of the accounting system actually plays out in relation to sustainability (control). Do the demands of sustainability that are channeled through the accounting system affect me in any way as an employee or manager? Reasonably, this is hardly the case unless specific controls are developed that point to individual performance and a coherent understanding what it means to be a contributor to the company's sustainability goals. Subjectivizing requires, from a theoretical and practical standpoint, that individuals become performative subjects within the organization.

Considering such concerns, it is possible to single out at least two features or even problematic aspects inherent in the very idea of integrating SDGs into the accounting system of firms. First, perhaps lacking better labels, one could describe the predicament of integrating SDGs into the accounting system of business as a case of *role weakness*. Second, another issue is the potentially *arbitrary presentations of sustainability success and failure* given the use of the accounting system.

The argument of "role weakness" refers to the inability of the accounting system to enact the various roles that it usually has – even though the accounting system is actually used. Another way of putting it is to say that the logic of performativity does not operate in the same way or to the same extent as it does in quantitative performance measurement situations. In particular, the vagueness of the issue at hand, the general SDG and its translation into corporate goals, requires territorialization that becomes difficult to mediate, adjudicate, and subjectivize. Both managerial and employee responses tend to be weak or disinterested if the possibility to comparing or keeping track of performance in relation to others does not exist. The self-regulation of the accounting system does not take place since the goals are not used in a way to inform an operative self-understanding within the firm about the need to achieve sustainable ends.

The strong "productive force" of the accounting complex (Miller and Power 2013) tends not to be materialized when it comes to sustainability, since the accounting system does not allow for all the roles in a coherent and productive way. Another way of putting it is that the logic of performativity does not play out in the sense that it could (or should, but that is something that could be contested). Even though it is fair to say that companies (with the support of guidelines, etc.) are able to invent or construct calculable spaces, they are hardly able to recontextualize them through linking them to other arenas or spaces through relational linking or abstraction. Thus, the comparative contextual definition of what constitutes good sustainability never comes about. What it is to perform from a corporate (or individual, cf. subjectivization) perspective is technically possible to arrive at but lacks relevance in a wider context because such performance does not find its way into overarching mediations where it makes sense. In other words, the link between accounting, economizing, and organizing can actually be relatively weak. The accounting system does not play out its roles, which means that it fails to arrive at higher-order constructions and representations that make sense in a more concrete way.

In this, we see a paradox. Miller's and Power's (2013) exhortation to us is that we should view accounting as something that goes far beyond an instrumental and purely technical activity. That is, essentially a word of advice or even a warning against underestimating the power and consequences of accounting. Paradoxically, when assuming a strong role of the accounting system in achieving sustainable ends, such a belief in the capacities of accounting goes hand in hand with a reality where the accounting system actually fails to bring about (or at least has a tough challenge in doing it) the transformative changes of business operations that its advocates seem to suggest. Another way of putting it is that the "accounting complex" (to use the words of Miller and Power 2013) is not as productive as supposed. Its power and productive force to act as a representation for social and economic life is lesser than could be expected to judge from the critical accounting literature.

Relatedly, a second aspect of the integration of SDGs into the accounting system is the way in which it allows for arbitrary presentations of success and failure. Since it is technically fully possible to territorialize sustainability without mediating it, the experience of success (or failure) is strongly related to the achievement of a self-defined target or objective as given with the accounting system. One can relate this to the lacking role of adjudication.

The risk of this is the manifestation of less relevant action (with regard to the SDGs and responsibility in general) as successful achievements. This is not only a matter of reporting "wrong" things in the sense that there is always a risk that unsustainable companies manage to report limited or defined issues where they come out well. Rather, the arbitrary presentations of success and failure can be linked to an "atomistic" translation process of macro into micro goals, where issues that are possible to relate to the SDGs are given the status of satisfying criteria for being sustainable. That is, if the company has the possibility to identify activities of relevance to one or more of the SDGs, and the achievement of such goals follows, an understanding of success (or if the contrary prevails, failure) with regard to sustainability.

The possibility of the territorializing aspects of sustainability leads us into temptation not only to mediate and adjudicate in questionable ways but also to establish social worlds where the decision about right and wrong (related to sustainability) becomes fixed and unrelated to other normative concerns fundamental to responsible business. This is not just a question about which sustainability issues (or SDGs) that are chosen arbitrarily but also a matter of establishing the ways in which the goals (targets, objectives, etc.) are reached. Stafford-Smith et al. (2017) have pointed to the risk of "perverse outcomes" and unrealized synergies if interlinkages and interdependencies between goals are not taken into account. The argument here, though, is not so much the potential piecemeal treatment of the SDGs in relation to each other, but the paradox that "good" objectives can be promoted and strived for with questionable means and dubious intentions not necessarily in line with fundamental principles for ethical business conduct, which the accounting system is unable to "measure." The provocative thought that we can be sustainable without being ethical may be dismissed if you claim that being sustainable always implies being ethical. But considering the fact that companies that have been considered "good at CSR" or sustainable have been subject to scandals contradicts a definitional congruence between sustainability and ethicality. The point to be made here, however, should be made in relation to the accounting system. Ethicality can never be achieved through the accounting system, but must always build on fundamental convictions, values, and norms of the organization and its constituents.

One can certainly reflect on whether the problems brought up here relate typically to the SDGs or to sustainability in general. Most likely, the very same problems apply to sustainability as an issue even without the SDGs. However, the character of the SDGs, as global governance tools, create already from the outset a distance between macro and micro goals that must be overcome.

Concluding Discussion

As suggested by Bebbington and Unerman (2018), concerns about the SDGs are likely to take two routes, either focusing on the commitments inherent in the SDGs or the very execution of them (in business). Without excluding the former discussion, this article focuses on the latter concern. In particular, linking the SDGs to the technologies of control and accountability implies a use of the accounting system that does not escape the roles that the system plays out. The fact that sustainability – rather than finances – is in some way controlled and accounted for does not change the conditioning frames of the accounting system.

What the article provides is a theoretically grounded argumentation about the problems that a fully fledged integration of SDGs into the accounting systems of companies may imply, which is also an answer to the question of how it is possible (or not) to integrate SDGs in corporate operations through the accounting system. It points to two aspects: *first, the problem (or blessing) of "role weakness" and, second, the problem of arbitrary presentations of success and failure, risking to downplay other central responsibility criteria (e.g., ethical accountability) within the firm*. To sum up, technological approaches (in the sense of accounting technologies) capture only a minor aspect of the areas that the SDGs comprise. By necessity, they territorialize certain activities. This is probably not strange at all and hardly problematic in itself. All activities, for example, performance evaluations, go through such a process. More problematic, however, is that the SDGs, when introduced in the accounting system, presume managerial understandings and instrumental processes, where more or less arbitrary criteria of success and failure contribute to exposing the firm as more successful than it is. One aspect that has been pointed to is the lack of controllability the further the roles play out. It becomes increasingly more difficult to relate or attribute responsibility for sustainability performance the further the accounting system is used.

The social reality that accounting has been assumed to construct entails a close relationship between accounting and organizing. The strong belief in the accounting system as instrumental to sustainable ends goes, one could argue, even further. Through accounting, companies actually contribute to the fulfilment of the SDGs, the argument goes. Questioning such a strong interrelatedness is not intended to be a cheap remark, for example, pointing at the relative difficulty to establish processes and practices through which individuals, activities, and organizations will be constituted as economic actors and entities, a process that Miller and Power (2013) call economizing. The corresponding process or practice would, in this case, be "sustainabilitizing," through the constitution of sustainable actors and entities through the (accounting) system. If the accounting system helps producing a "Homo Economicus version 2.0" (Vosselman 2014), it seems far-fetched to believe that it actually produces a corresponding sustainable human actor, whether version 1.0 or 2.0.

A point to make, thus, is not just to contend that "this hardly works" but to reflect on through what and through which rationality sustainability works. The article questions the instrumental managerial rationality channeled through the accounting system as the necessarily "best one" in business. What is not contained within the accounting system but may be a way of promoting sustainable ends? Well, for example, the inner motivations of value rationality and a sincere ethically grounded analysis of what the company should be and do with regard to sustainability.

The article can be seen as an alert against a strong belief in the accounting system to "do the job". Drempetic et al. (2019) ask whether it is necessary to adapt all sustainability measurement systems to the SDGs. Given the issues mentioned in this paper, the answer is most likely no. At least it is not self-evident that it must go through the accounting system. One explanation for it has already been given, that the accounting system is frequently unable to play out all the roles that it usually does when sustainability issues are dealt with through it.

Are the arguments put forward in this article just a rebuttal or criticism of the possibility to report or control sustainability? Yes and no. It is correct that sustainability reporting and control suffer from the same problems if integrated into the accounting system of the firms. Sustainability can be constructed as a calculable space, although the roles of accounting described in this article do not necessarily come into play as the managerial instrumentality of accounting (based on the logic of performativity) presumes. However, on the other hand, the special thing about the SDGs is their character of macro governance mechanisms that are translated into micro-level control issues, through a process of (internal) interpretation and evaluation. Companies do not just adopt the SDGs, but co-construct selected ones among them at the micro-level through the accounting system. Thus, it is not just a matter of adopting an accounting standard (e.g., the GRI Standards) but to reconfigure business through (accounting) techniques assumed to be conducive to the achievement of the SDGs. To put it differently, the questions one could ask are – in the first case – how a company could report to fulfil legal and soft requirements on sustainability reporting and in the second case how it could assist in achieving the SDGs. The questions are not identical, and it is the second one that is relevant to this paper and "unique" to the SDG discussion.

The article contributes in a general way through pointing to and analyzing the assumption of using the accounting system as a tool to achieve the SDGs through corporate action. More specifically, it applies a theoretical understanding from the accounting literature which also provides a theoretical argument relevant to the sustainability literature and in particular the sustainability accounting tradition.

Empirical research would be very helpful not only when it comes to showing how the SDGs are integrated into the accounting systems but also the consequences of such integration. Alternatives to integrating the SDGs into the accounting system should be discussed and identified. For example, are there other alternatives than the top-down approaches suggested by practitioners and researchers? Could, for instance, the normative preferences and ambitions of individual employees be of benefit to the fulfilment of SDGs and if so, how? The relation between corporate governance, the ownership perspective, and the SDGs also remains to be examined.

Social Innovation Through Tradition: The Many Paths to Sustainable Development

Contents

Abstract

Through a thick cross-national discussion of a number of cases in both Germany and Israel, we examine how traditional-regional small- and medium-sized enterprises located in traditional communities devise and adopt socially innovative strategies, as they transform themselves into hybrid organization on the road to sustainable development. The roadmaps fleshed out provide insights for organizations seeking to bring about sustainability and development for their communities. The cases demonstrate the importance of considering the unique cultural contexts of specific regions facing economic and social challenges. They tell us how different sociocultural contexts are embedded and expressed in sustainable

solutions. Evidently, sustainability has a specific meaning within the shared values of a community. These meanings are intertwined in these societies' traditions, and it is the dialectic adaptation of tradition with innovation that allows them to develop viable solutions of their own to ecological, social, or economic problems and challenges.

Communities at Risk: Facing Crises of Sustainability and Sociocultural Change

In a time of accelerated sociocultural change and a crisis of sustainability, social innovations are direly needed in order to harmonize the tensions between economic development, community, and sustainability. This is a tricky triad to manage. Our identity as members of a community, especially in regions facing socioeconomic challenges and issues of identity politics, is under threat. These fragile identities are threatened by the social and economic challenges that globalism has brought about in our conception of place and distance and in response to the neoliberal breakdown of the thick social connectedness of regional commercial activity. To be more explicit, small- and medium-sized enterprises (SMEs) located in peripheral communities, outside of the large metropolitan centers, are experiencing both economic difficulties in the face of global changes and sociocultural challenges due to the negative migration of the younger people to the city and the aging of society, among other factors.

These sociocultural issues go in synch and are related to a growing interest in sustainability in the broad sense. Sustainable development in the broad sense refers to the three foundational pillars of sustainability, economic, social, and environmental, but also includes broader issues of cultural identity and the people's ability to live and flourish as distinct cultural communities, within the global economy, with a sense of a "we" that is tied to their shared practices and historical identities. Sustainable development is also affected by growing pressures exerted by multiple stakeholders on firms to undertake responsibilities beyond their narrow economic-financial responsibility (Delmas and Toffel 2008).

One type of organizational responses to this tension is found in the blurring of boundaries between market relations and societal values and specifically in the emergence of business-social hybrid organizations. This organizational response is of particular interest within the European context, which is comprised of small communities, with unique cultural identities and numerous small- and medium-sized enterprises. If and when these traditional SMEs succeed in adopting hybrid identities, they become more sustainable. While the mainstream academic research literature in organizational and business ethics has all too often focused on mega corporations, i.e., multinational corporations (MNC), it has neglected the SMEs which are locally embedded in their communities, who play a vital role in Europe. The contemporary challenge for these traditional SMEs is to become sustainable.

Global and socioeconomic challenges bring substantial threats to SMEs that are located in the periphery, far from the opportunities that proximity to the political and economic power offers their counterparts in large metropolitan centers. The solution to their complex socioeconomic predicament requires more than just a business plan aimed at economic value. What is required is a model of sustainable innovation. The idea behind the notion of sustainable innovation is to provide an action plan through which interrelated economic, social, cultural, and environmental actions are taken. In this sense social innovation provides not piecemeal economic patches to the global social and economic challenges facing SMEs, but rather it provides a holistic solution bringing about both a vision and coherence to the SME's actions. The outcomes of such actions, which may be performed by corporations to guarantee a safer future, is aimed at generating shared added value for all stakeholders (Porter and Kramer 2011). Social entrepreneurship and its organizational form, hybrid social-business organizations, seem to be particularly equipped to handle such challenges, as they are bottom-up, locally and regionally embedded, and focus on social innovation, aimed at sustainable development goals (Haigh and Hoffman 2011).

Hybrid organizations, aka social enterprise, have gained prominence in the development discourse and on the ground over the last 20 years. These organizations are aimed at achieving development goals (such as poverty reduction, fair employment, social integration, and more) through the application of business principles and models. They operate through manifold forms and multiple business models, such as providing employment for marginalized groups, bridging between small growers and manufacturers and customers using fair trade principles, producing goods using sustainable industrial and agricultural practices, and many more.

Seeking Insights Through a Cross-National Comparison

In order to explore this issue more in depth, we propose examining it through a cross-national study of traditional communities in different peripheral regions. An instructive analysis could be a comparison between different examples of such regions. Specifically, we explore the eastern and the western periphery of Germany and the Negev region in Israel. The challenges in the German cases include demographic challenges (decreasing population), high population homogeneity, and an untapped potential for innovation in the enterprise landscape dominated by middle-sized traditional industrial firms in the first case study and by rural environment in the second and third one. The two Israeli case challenges include marginalization, underdevelopment, and inequitable distribution of resources between communities, particularly between center and periphery. In contrast, the Negev region in Israel includes a mix of start-up firms and community-based social enterprises, even within traditional Bedouin and religious communities, coupled with economic underdevelopment, marginalization, and inequitable distribution of resources. Such a cross-national comparison is of interest because of two focal points. On the one hand, we are looking at traditional societies and traditional communities, which vary greatly between geographies; on the other hand, there is huge potential for cross-learning from socioeconomic innovation. The demonstrative cases that we present below show how traditional societies and social innovation can coexist. Not just that, it is innovation brought about through tradition.

Innovation Through Tradition: Five Demonstrative Cases

We present now five demonstrative cases, three from Germany and two from Israel.

Kleintettau, a small town in Upper Franconia (Germany), is a traditional and industrial community in the heart of a rural region. The economy of Kleintettau is dominated by one family-owned medium-sized glass manufacturer, Heinz-Glas & Plastics Group. It is almost 400 years old – founded in 1622 and is still owned by the Heinz family – operating internationally, but centered in the same region since its founding (Heinz-Glas Group 2020). With 1,500 employees, it is one of the major employers in Kleintettau and Piesau (situated in Thuringia, ca. 12 km. away from Kleintettau). The enterprise is a family-owned glassmaker (in 1955 plastic packaging production was added) with a focus on flacons for high-end perfumery and cosmetics. It is a global quality-based leader in the particular niche (Heinz-Glas Group 2019). The community of Kleintettau is predominantly catholic and belongs to the Franconian ethnic group, and it boasts a strong regional identity. However, it is facing serious challenges, including a declining and aging population, partly due to negative migration of young persons. Kleintettau is still home of the headquarters of the Heinz-Glas Group, and it can be called a family-/company-owned township. Through 15 generations of the Heinz family (there are documentary evidence from as early as 1523 about a glassmaker named Hans Hein(t)z from Thuringia), the enterprise built a strong traditional identity and has developed as a constitutive part of the identity of the region. The patriarch Carl-August Heinz is 70 years old and leads the enterprise since 1977. He recognized on time the potential of internationalization of production and acquired in 1985 his first international glass factory outside of Upper Franconia, in Belgium. After the fall of communism and the reunion of Germany, he continued with the geographical expansion to Thuringia, Poland, and also USA, China, Peru, and India (InFranken.de 2018). The corporation takes care of everything in Kleintettau, including providing an elaborate system of sustainable business and social, cultural, and educational services, leaving no space for grassroots development. For example, in 2011 Heinz-Glas established the tropical greenhouse "Klein Eden," powered by the residual heat from the glass factory in Kleintettau. This unique sustainability-oriented project aims to increase ecological utility by sustainable food production of tropical fruits and edible fish, from the region and for the region. The tradition is not only part of the formal corporate identity but also a part of the sustainability strategy, whereby the regional development is an explicit topic next to the social, ecological, and economic pillars (Heinz-

Glas Sustainability Report 2018). The firm assumes comprehensive responsibility over the town's people's lives, in an innovative business-social hybrid, which is an example of corporate intrapreneurship taking the place of social entrepreneurship.

Birkenfeld Nahe is a rural area close to the western border of Germany with France and Luxembourg. The Environmental Campus of the public Trier University of Applied Sciences – the Umwelt Campus in Birkenfeld – was established in 1996 as a flagship in terms of sustainability through environmental education. This education initiative is the foundation for a strong environmental profile of the Birkenfeld Nahe area (Trier University of Applied Sciences 2020). The Environmental Campus Umwelt-Campus Birkenfeld is ranked the most sustainable University in Germany and number six in the world in 2019 (UI Green Metric World University Rankings 2020). The Environmental Campus Birkenfeld offers different study programs whereby the environmental perspective is an integral part of all of the different study programs. Next to the specific teaching profile, different research institutes on the campus have the common denominator of sustainability. According to the general self-understanding of universities of applied sciences in Germany as institutions for education and research with practical application, the Environmental Campus Birkenfeld offers know-how for international students with clear focus on practical applications, mostly in cooperation with organizations in the region. The Campus supports real projects with impact for the region – brought through specifically manufactured citizen governance organizations and collaborations, spearheaded by local government collaborations, and supported by business, citizen participation, and collaboration building (Environmental Campus Birkenfeld 2020).

Additionally, in order to economically develop communities in this rural countryside, the regional administrative unit of Birkenfeld Nahe established in cooperation with other affected communities the Hunsrück-Hochwald National Park in 2015. This initiative harmonizes with the regional identity of Birkenfeld Nahe – "green" sustainability.

These projects promote at the same time financial growth, for example, through sustainable tourism, environmental preservation, and community building. This case is an example of manufactured community and regional identity, which is not organic, what one could call "social innovation and sustainable development by design."

Despite its small size, Israel has a strong center-periphery distinction, characterized by major differences in employment, income, access to services, education, health, and more. While the central region is home to most of Israel's industry, high-tech, cultural institutions, higher-education, the northern region (The Galilee) and the southern region (The Negev) are predominantly rural, are relatively underdeveloped, an also enjoy less government investment. Both regions have been under rocket fire for extended periods of time. Both regions suffer from negative migration, predominantly of younger persons and more affluent families. The city of Ofakim in the west of the Negev is a prime example of Israel's periphery. Located in the Negev, this peripheral "development town" has been facing multifaceted economic, social, educational, and cultural underdevelopment. It is surrounded by rural/agricultural small cooperative communities (kibbutz/moshav). Like other development towns, it is a product of failed planned regional design from the 1950s. In the large wave of Jewish immigration of the 1950s after the establishment of the State of Israel, many of the Jewish immigrants from North Africa and the Middle East were placed by the government in the periphery, in small towns or communal villages (Moshav), to bolster the Jewish presence in what then were newly acquired frontier areas. Development towns were supposed to be employment and economic hubs for the surrounding rural communities but failed to do so due to unsuccessful industrial, economic, and population planning. The original plan was to base traditional industries in these towns, such as textile industry in the case of Ofakim, and to base their economy on blue collar and services jobs. These aspirations fell short due to a crisis in the textile industry in the 1970s and a failure to attract new industries and stronger populations. Inequitable governmental allocations, lacking infrastructure, and failed local governance exacerbated the situation and left many development towns, Ofakim probably more than most, far behind. Today Ofakim is populated by mostly traditional north-African Jews, who were joined mainly by families from the lower socioeconomic strata of the wave of immigration from the Former Soviet States in the 1990s. Today Ofakim is afflicted by high poverty and unemployment, a failed education system, and negative migration of young persons and stronger families. Its educational outcomes in 2019 were at the bottom of the list nationally, only slightly better than the outcomes of the poorest and most marginalized communities in Israel (such as the Bedouin community, mentioned below). On top of that, due to its location in close proximity to the Gaza Strip, it has been under repeated rocket fire from the Gaza strip since 2001. These rocket attacks were the impetus for the founding of the organization “Community Resilience Ofakim” (Hosen Kehilaty Ofakim). Hosen Kehilaty Ofakim (or Hosen – resilience – in short) is a grassroots organization promoting personal and community resilience, through two main efforts – trauma first-response services (upon rocket fire) and a multi-age education and empowerment program. Its inception was triggered by one activist’s disillusionment by the lacking local and national government response to the needs of residents that are psychologically affected by rocker attacks. Meant at first to mobilize and train local volunteers to be first responders for such residents, the founder and her first recruits later developed a notion of resilience by which emergency resilience is reliant on developing ongoing resilience, including capacities for active citizenship. The organization mobilized hundreds of volunteers, mostly traditional women of northern African origins, with low levels of post-secondary education, and even some with no secondary education. These women also share a passive and clientelist political culture, and they and their families lack access to educational, economic, and cultural opportunities. In order to develop active citizenship in this specific group of women, without resistance borne out of fear of change and low self-esteem, the organization’s tactics involve doing so through traditional means. Thus, to promote active citizenship, encourage individual autonomy, and develop a culture of free discourse, Hosen operates Judaic studies where debates of religious scripts are done through a modern lens and are used for teaching about civic action, democratic culture, and independent thought.

Hence, the case of Hosen Kehilaty Ofakim is an example of local social entrepreneurship mobilizing traditional values and practices to promote modern ones.

The next two cases share very similar regional contexts, despite being thousands of miles apart. The two unique ethnic communities are the Sorbs in the Lusatia region, on the German-Polish and German-Czech borders, and the Bedouins in the Negev in Israel. The Bedouin community maintains a nomadic tradition and is still characterized by post-primary economies. The Sorbs community is characterized by traditional and religious identity, the local economy is post-primary, and they are peripheral in both a geographic and an economic sense, experiencing multiple marginalization, poverty, and unemployment (relative to the rest of the country). Both the Sorbs and the Bedouins are traditional communities, with at least some resistance to cultural modernization and westernization.

In the eastern part of Germany, next to Poland and Czech Republic, the ethnic minority of the Sorbs is at home. This is the only German indigenous minority. Since the early Middle Ages, these Slavic communities – there is a division between Upper and Lower Sorbs, each with their own Slavic language – are inhabiting Middle Europe and are settled nowadays in the western part of Saxony (Upper Lusatia inhabited by the Upper Sorbs) and southwestern part of Brandenburg (Lower Lusatia inhabited by the Lower Sorbs). During the ages the many dangers faced by these communities and their struggles for survival fostered the emergence of a strong tradition-based identity. Contemporarily, there are approximately 60,000 bilingual Sorbs, the predominant part of which belongs to the Upper Sorbs in Upper Lusatia in Saxony. The historical capital of the Sorbs is Bautzen, situated also in Saxony. The Upper Sorbs are Catholics. For them the active practice of the catholic religion is a vital part of the Sorbs' identity – next to their own language and traditional customs. The constitution of Saxony protects the basic rights of the Sorbs, including the protection of the culture and traditions, and since 1999 a special law covers all their special rights in detail (Saxon State Ministry of Science, Culture and Tourism 2020). The region of the Upper Sorbs in Saxony is rural and post-transitional. Saxony was part of the former German Democratic Republic and is the leading state in terms of economic development of the former socialist states of East Germany.

However, the strong economic development is focused on the western and central part of Saxony (mainly in the two biggest cities Dresden and Leipzig). The unemployment rate in Saxony is still significantly higher compared with the western German states (former Federal Republic of Germany), but it has been decreasing continuously since the beginning of the new millennium (Statista 2020). In the eastern part of Saxony (Upper Lusatia), the economic development is significantly lower. Traditionally, next to agriculture, the textile and brown coal mining industries dominate the local economy. After the fall of the Wall in 1989, the economic profile of the Sorbs was marked by farming and services – mainly SMEs in the tourism and creative industry. Within this unique German region, an untapped economic potential can be reached, based on tradition and identity. The topic of sustainability is a very promising opportunity due to current structural change in the regional economy, namely, the exit from brown coal mining (Gürtler et al. 2020). The Sorbs region in Upper Lusatia is enforced to change in terms of economy; therefore the potential of the traditional identity of the Sorbs has to be interpreted as a chance for socioeconomic change of the region (Jacobs and Nowak 2020).

Missionshof Lieske, in Lusatia, is a Work Integration Social Enterprise (WISE) (Nyssens 2007). WISE are autonomous organizations aimed at professional integration in the labor market of people experiencing serious difficulties and whose unemployment is mostly structural in nature. Despite substantial diversity between different types of WISE, they normally achieve this integration through productive activity accompanied by additional services and training programs to qualify the workers. This is done within the WISE itself or in mainstream workplaces. Missionshof Lieske is an organic bottom-up sustainable development, founded by a Sorb religious mission, as part of a comprehensive center which provides also residential and social care for the elderly and persons with disabilities. The social enterprise provides employment and economic development for Sorbs with disabilities, as part of the comprehensive service provided by the Mission. The enterprise is a business operating in traditional food manufacturing (cheese, beer) and old-fashioned carpentry, where the workers undergo training, rehabilitation, and integration in the community through their employment.

The Bedouin organization Sidreh is also a WISE, empowering women through traditional Bedouin craft businesses (weaving, embroidery) and introducing a Liberal/Muslim feminist standpoint into a strongly patriarchal society. Bedouins were nomadic Muslim tribes residing for hundreds of years in the Negev area, as well as in Jordan, the Sinai Peninsula and Saudi Arabia. This is a strongly traditional society, with considerable aversion to modernization and change. In Israel, since the 1950s, being a Muslim minority in a Jewish state, they were pushed into a limited territory, most of it in nomadic tent villages in the Negev region. Since the 1970s, they started moving into townships due to a combination of push and pull factors, including government oversight and co-optation, poverty, limited access to land, inner struggles, and more. Many of them have turned seminomadic as a result and lost their traditional way of life and sources of income. Consequently, Bedouin communities are among the poorest, most marginalized, unemployed, undereducated, and underdeveloped in Israel. Women, who are traditionally subordinate in this patriarchal society, have lost the economic roles they had in the nomadic herding economy. This has further marginalized them, and now they experience political, economic, gender, and religious discrimination simultaneously. In such circumstances, defying cultural norms of women's domestic role will lead to painful results; these women usually find themselves outside the social circle. To empower women to gain economic independence, Sidreh and similar organizations developed social businesses where women work without being exposed to men who are not in their family. The occupations and businesses that they develop in these organizations are traditional feminine Bedouin trades, such as cooking or producing traditional artefacts. The employment in Sidreh is also accompanied by an education and empowerment program.

Hence, both Sidreh and Missionshof Lieske are small/medium grassroots organizations, locally owned, locally run, and completely detached from big corporate powers. Both are also examples of local social entrepreneurships mobilizing traditional values and practices to promote modern ones.

Discussion: Multiple Modernities Through Tradition?

This project is not seeking a prescriptive model but rather a deeper thick understanding of dynamics and processes, through which we can trace out the various routes on the roadmap from traditional communities to sustainable development. The resulting roadmap will be able to provide useful insights for particular organizations seeking to bring about sustainability and development for their communities. The cases briefly described above demonstrate the significance of sustainable regional/local development innovations and social collaborations for entrepreneurs, organizations, and communities, in search of shared value for the common good. The cases also stress the importance of considering the unique cultural contexts of specific regions facing economic and social challenges. They tell us how different sociocultural contexts are embedded and expressed in sustainable solutions. Evidently, sustainability has a specific meaning within the shared values of a community. These meanings are intertwined in these societies' traditions, and it is the dialectic adaptation of tradition with innovation that allows them to develop their own to viable solutions to ecological, social, or economic problems and challenges.

The academic discourse is still dominated by a single notion of sustainable development that is linear, unidirectional, and classical modernist in nature. This means that it has a single embedded notion of progress, based on western views of development. Part and parcel in this discourse is a rejection of the so-called "authentic" cultural traditions. Yet, as Eisenstadt (2000) has argued for "multiple modernities," we suggest a similar multiplicity in sustainable development as well. Eisenstadt's concept of multiple modernities refers to a "continual constitution and reconstitution of a multiplicity of cultural programs" (Eisenstadt 2000, p. 2). Multiple modernities are engendered by a cultural plurality and diversity of identities and practices, which are promoted by a variety of actors, often from civil society and social movements, that realize an ideological and identity-driven program of modernization. While adopting ideas and practices from more powerful and institutionalized actors, they select, reinterpret, and reformulate these appropriated ideas and introduce innovative ideologies, institutional patterns, and organizational forms (Kaya 2004).

Just as Eisenstadt (2000) said about modernity: "These ongoing reconstructions of multiple institutional and ideological patterns are carried forward by specific social actors in close connection with social, political, and intellectual activists, and also by social movements pursuing different programs of modernity, holding very different views on what makes societies modern," so can be said about sustainable development. Our five demonstrative cases reveal this multiplicity well. They reflect different views on the trajectories of sustainable development that reflect and sustain identities, brought forth by social enterprises and by social collaborations that reflect local histories and cultural identities. They suggest a locally rooted contestation of single unitary hegemonic vision of how sustainable development can be achieved. This hegemonic vision is propagated by powerful institutions, like the World Bank and the OECD, which promote a singular script of modernization, and rejects the possible role of traditional views, customs, and solutions. The emphasis on local processes and dynamics and on the power of tradition that our cases propose is in stark contrast to the conception of the modernist project as portrayed by scholars such as Lerner (1958) and Inkeles and Smith (1974), who stressed wider trans-local and dynamic communities. Instead of individual autonomy, these cases reveal cultural embeddedness. They adopt the concepts of sustainability and sustainable development, but in a syncretic fashion, resulting in novel ways and organizational paths of action, deeply rooted in local identities and histories.

The points raised above suggest a new research agenda for organizational and business studies, one that incorporates an understanding of regional dynamics with an understanding of social enterprises' roles in sustainable development. Therefore, research needs to address the characteristics of the sociocultural, economic, and organizational landscapes in specific regions and explore the business models for sustainable local/regional development that emerge in the different regions from these rich and longstanding traditions. Next, it is important to explore the catalysts and obstacles that promote or hinder the emergence of these models and how these correspond to the cultural and socioeconomic factors of the regions. In parallel to this, we should attempt to understand the relevant factors and SDG indicators, how are they interrelated, and how they can be targeted with the specific strategies and business models that social enterprises implement. This can help us understand how coherent is "sustainable regional/local development" in terms of variation within diverse contexts, as well as the types of cross-cultural learning that are possible between the regions, and can possibly lead to a more formal roadmap for culturally embedded multiple sustainable developments.

These cases also bring forth a new outlook on the relations between tradition and innovation. Usually treated as opposites, evidently tradition and innovation have more nuanced and varied relations. Tradition can serve as a source for innovation, and in certain societies, particularly societies that are trying to safeguard their collective identities from change and external influences, tradition may be the only path for innovation.

This is in fact a call for scholars and economic actors to remember to situate sustainability within specific socioeconomic-cultural contexts. Also, the cases ask us to consider the dialectics between innovation and tradition, since they reveal how traditional values and practices can be effective leverages for socioeconomic innovation. We thus drag into the discourse on sustainable development the essential tension between tradition and innovation proposed by Kuhn (1977). As in Kuhn's view that both convergent (traditional) and divergent (innovative) thought are equally necessary for progress, so it is for the understanding and promotion of sustainable development. Perhaps the term to invoke here is that of "generative tradition" suggested by the Indian sociologist Dhurjati Prasad Mukerji (Madan 1978), used in his analysis of the tension between modernization and tradition in India.

As argued, tradition can be a vehicle for innovation and a concrete context for providing a specific meaning to sustainability indicators in the development process.

The 2030 Agenda for Sustainable Development, the SDGs, and Corporations: A Critical Reflection

92

Neil Eccles and Ben van der Merwe

Contents

Abstract

In this chapter, a critical reflection on the 2030 Agenda for Sustainable Development (the Agenda), on corporations, and on the nexus between these is presented. The starting point, at the risk of upsetting the popular utopian view that the key to achieving sustainable human development is simply the implementation of the Agenda, is to explore two important points of dissensus with the Agenda itself. These are (a) its framing as a singular agenda implicitly devoid of contradiction and (b) the inclusion of economic growth as an apparently legitimate end. These two points of dissensus, together with a brief exposition of the capitalist essence of corporations, then provide a clarifying context within which to contemplate the question of what corporations *have done* and *are doing* with respect to the Agenda. This scrutiny reveals how, having recognized the serious legitimacy risks posed by the rising sustainable development movement, the

immediate corporate response was doing everything within their considerable power to ensure that the Agenda did not stray materially from capitalist governing rationality. The inclusion of economic growth into the Agenda as an apparently legitimate end is an indication of the success of this effort. Finally, having rendered the Agenda business-friendly, we see how corporations have begun to engage with the Agenda and, in so doing, have ought to shroud themselves in the legitimacy of *apparent* alignment with sustainable human development.

Introduction

The 2030 Agenda for Sustainable Development (the Agenda) with its now almost universally recognized 17 Sustainable Development Goals (the SDGs) was endorsed by the United Nations in 2015 (United Nations 2015a). One of the key features of the Agenda is the dramatically increased focus on or “foregrounding” (Scheyvens et al. 2016, p. 372) of the role of corporations. When considering the role of corporations in terms of the Agenda, at least two top-level questions emerge, each of which, in their turn, spawn the whole myriad of interesting avenues of investigation. The first of these questions is the morally aspirational question of what *ought* corporations to do with respect to the Agenda. Frequently, the answers to this question settle on the conclusion that there is a “Need to Move Beyond ‘Business as Usual’” (Scheyvens et al. 2016, p. 371) or “[a] greater obligation towards embedding responsible and ethical practices across all aspects of company operations” (Scheyvens et al. 2016, p. 380).

The second top-level question arising out of a consideration of the role of corporations in relation to the Agenda is the more empirically loaded question of what corporations *have done* and *are doing* with respect to the Agenda. This latter question offers a launch pad for a critical reflection, not only on the role of corporations in relation to the Agenda but also on the Agenda itself. The prospect of such critical reflection was what originally animated this chapter, and it is out of this critical reflection that a commentary of corporate legitimacy emerges.

The chapter proceeds as follows. Firstly, a brief reflection on the emergence of the Agenda is presented together with instinctive warning bells that its popular appeal triggers. This is followed by an exploration of two points of dissensus with the Agenda: (a) its framing as a singular agenda implicitly devoid of contradiction and (b) the inclusion of economic growth as an apparently legitimate end. Finally, with these points of dissensus as clarifying context, the chapter returns to the question of what corporations *have done* and *are doing* with respect to the Agenda.

The 2030 Agenda for Sustainable Development: The SDGs

The first port of call then is the Agenda itself. Very few would dare to argue publicly against the modernist project of sustainable human development perhaps best encapsulated in the famous refrain of "development that meets the needs of the present generation without compromising the ability of future generations to meet their own needs" (United Nations 1987, Chap. 2). And it was of course this popular modernist project that ultimately legitimized and motivated the crafting of the Agenda as the successor to the earlier Millennium Development Goals (MDGs). The MDGs had been (self-) heralded as "the most successful anti-poverty movement in history" (United Nations 2015b, p. 3). To reduce matters to their essence, the task of the Agenda was to improve on this. In the imagination of the United Nations, this sought-after improvement was/is to be achieved through an expanded set of goals which "[go] far beyond the Millennium Development Goals" (United Nations 2015a, paragraph 17; see also Fukuda-Parr 2016). This expanded set of goals was rendered together in the colorful schematic of 17 squares that we are now all so intimately familiar with as the 17 SDGs.

Given the broad popular appeal of sustainable development generally, it is then hardly surprising that this colorful rendition of a set of 17 highly intuitively appealing SDGs, formulated under the banner of the Agenda, has been met with widespread approval, bordering on popular consensus. From a critical research perspective (Alvesson and Deetz 2000), however, widespread approval is the surest possible marker of a need for profound suspicion and conscious dissensus. Two dimensions of dissensus in particular are germane to the discussion here.

Dissensus 1: The Singular Agenda

The first point of dissensus is essentially linguistic in character and on the surface might seem to be rather semantic. However, it has potentially profound implications as we shall see. This is the linguistic framing of the SDGs in popular discourse as singular – "*the* Agenda." To a significant extent, the argumentative basis for this singular framing of the Agenda is the United Nations' (2015a, Preamble) definitive rather than normative assertion that the SDGs "*are* integrated and indivisible" (emphasis added). Because the SDGs "*are* integrated and indivisible," they constitute a singular "*the* Agenda." The consequence of this is a tacit suppression, even denial, of the possibility of contradictions within and between the goals.

This suppression of contradiction, in turn, lays the foundation for a rather paradoxical outcome – the divisibility (and perhaps even the disintegration) of the SDGs through a process that Fukuda-Parr (2016, p. 50) has labeled as "selectivity." Essentially, if the goals "*are* integrated and indivisible," then participating entities need no longer to concern themselves with integration. Instead, they can quite legitimately proceed with the task of prioritizing the goals in relation to either their capacities or, more often, issues that they consider most material to themselves or to their local (i.e., parochial) interests.

Somewhat more cynically, this creates conditions conducive to the appropriation of the Agenda (as a whole) as a legitimizing shroud for the pursuit of narrow special interests. An entity may opt to focus on their local priorities (their own special interests), and because the SDGs "*are* integrated and indivisible" with the insinuation that no contradictions exist within the Agenda, this pursuit of self-interest can be celebrated as an "obvious" contribution to the greater good or to the Agenda as a whole.

Dissensus 2: Economic Growth as a Development Goal

The second dimension of dissensus particularly germane to the discussion here is much more controversial and warrants significantly more argumentative effort. It relates to the far more pronounced intrusion of conventional economic indicators as goals into the Agenda as compared to its predecessor, the MDGs. While this intrusion has been celebrated by Fukuda-Parr (2016), a contrary view might well be that many economic objectives ought ideally to be seen as means to more material social and environmental (i.e., human developmental) ends rather than ends in and of themselves (Briggs et al. 2013).

The most striking instance of this "problem" of course emerges in SDG number 8. In the Agenda this is framed as "Promote sustained, inclusive and sustainable economic growth, full and productive employment and decent work for all," while in schematic representations, it is typically stripped of several comforting signifiers to "Decent work and economic growth." Economic growth is a problematic agenda, and its concatenation with comforting signifiers like "sustained, inclusive, and sustainable" goes only so far in obscuring this fact.

The problematic relationship between growth and development is by no means a new realization. This relationship has been politicized in the degrowth movement since the 1970s with the work of Georgescu-Roegen (1971) and Schumacher (1973), both influenced to some extent by the ideas of Arendt (1958). But why exactly is economic growth problematic? A good starting point in answering this question is a critical examination of why it is that economic growth has been allowed to find its way so compellingly into the "common sense" (in the Gramscian formulation) of development agendas across the world. Why is it that economic growth has been accepted as a centerpiece, if not *the* centerpiece, of just about every mainstream development plan that exists today? Two major arguments are typically advanced in support of this inclusion.

The first revolves around a set of striking empirical representations of the relationship between per capita GDP on the one hand and human development indicators such as health outcomes, or education levels, or even happiness on the other (Fig. 1a, b, and c). From representations such as these, it is argued that if development indicators are so clearly positively and linearly related with economic indicators such as per capita GDP, then increasing these economic indicators through economic growth must surely be good for development. However, a careful inspection of these representations reveals that almost universally the per capita GDP data is transformed by logging it. When this transformation is reversed, very different pictures emerge (Fig. 1d, e, and f). All of a sudden, the “lovely” linear relationships are replaced by relationships of rapidly diminishing returns above a certain per capita GDP, which, as it turns out, is quite low (less than US$ 10,000 in 2017 terms). In short, even without reference to the thorny philosophical issue of causation, these representations are fundamentally flawed. Indeed, given that they are typically advanced by orthodox economists, who pride themselves on the mathematical rigor of their discipline, they might even be seen as dishonest. That such a group would accidentally miss the implications of these mathematical transformations does not seem at all reasonable. In short, it seems that these tales of the developmental merits of unlimited economic growth are just that, tales.

The second argument popularly advanced in support of pursuing economic growth as a centerpiece of development revolves around the belief that economic growth *inevitably* brings about poverty reduction through some sort of trickle-down effect. However, even beyond abstracted theoretical critics of such an inevitability emanating particularly out of Marxist circles, empirical studies across different countries have demonstrated compellingly that the relationship between economic growth and poverty reduction is far from trivial and far from inevitable. Representing data originally contained in his 1980 book, Fields (1984) noted examples of every possible combination of high and low growth vs high and low poverty reduction. This in a sample of countries including Brazil, Costa Rica, India, the Philippines, Sri Lanka, and Taiwan. Islam (2004) reported a similar range of relationships in Bangladesh, Bolivia, Ethiopia, India, Indonesia, Uganda, and Vietnam. He went on to interrogate complex interplays between poverty, economic growth, employment efficiency, productivity, wages, and inequality both empirically and theoretically in his discussion. Striking in this discussion was his noting of an apparent inverse relationship between the employment elasticity of economic growth (the ratio of change in employment to change in GDP as a proxy for employment efficiency of growth) and labor productivity. In other words, it seems that the employment efficiency of economic growth might decrease with increasing labor productivity. This has very important implications when one considers the fact that, under the guidance of the coercive force of competition, labor productivity increase is a key capitalist impulse (Marx 1890/1990). All of this undermines the

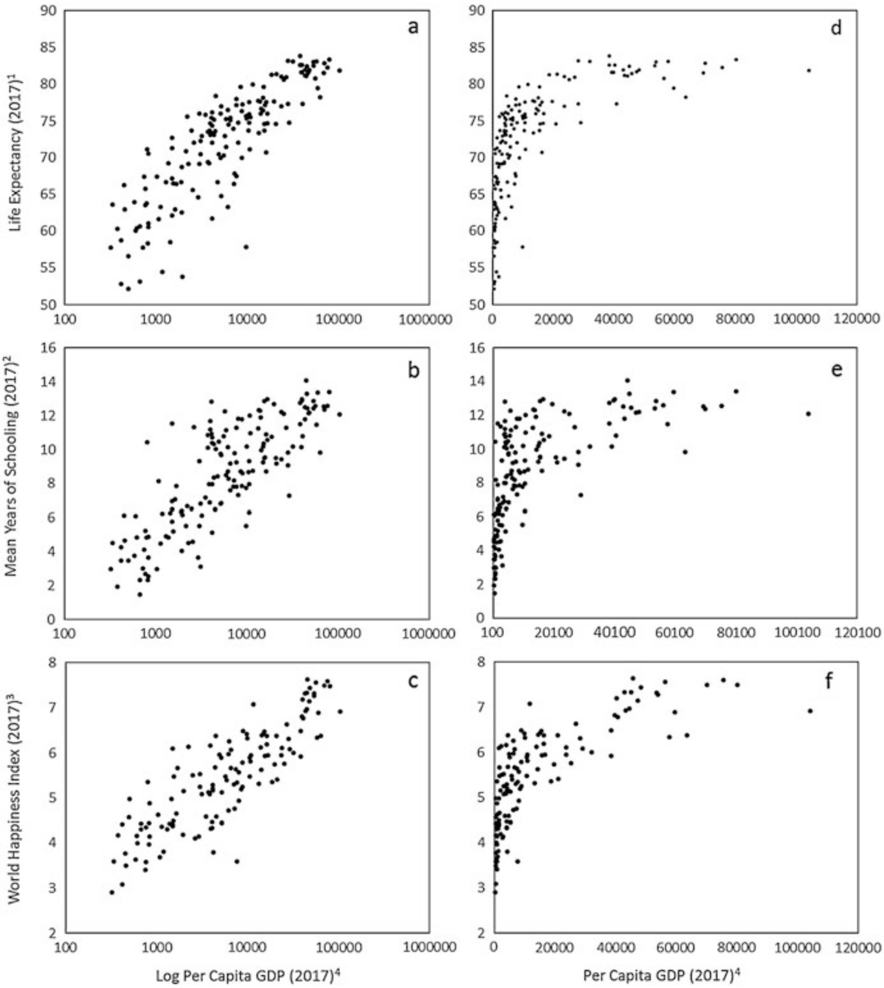

Fig. 1 Country-level development indicators vs per capita GDP on log and linear scales using 2017 data. Data sources: (1) life expectancy, UNDP http://hdr.undp.org/en/data; (2) mean years of schooling, UNDP http://hdr.undp.org/en/data; (3) world happiness index, Wikipedia HYPERLINK "https://en.wikipedia.org/wiki/World_Happiness_Report"https://en.wikipedia.org/wiki/World_Happiness_Report; and (4) per capita GDP, World Bank https://data.worldbank.org/indicator/NY.GDP.PCAP.CD

common-sense notion that economic growth inevitably leads to employment and therefore to poverty reduction. As Fields (1984, p. 75) put it, "A high rate of economic growth is neither necessary nor sufficient for poverty to decline."

Of course, the undermining of these two cases for the ideology that economic growth is good does not suggest in any way that economic growth might actually be bad. It simply suggests that economic growth might (a) not be universally good in terms of delivering development outcomes and (b) that even in the case of poverty

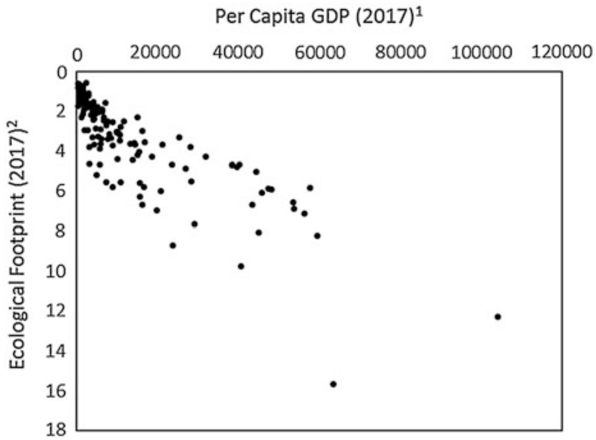

Fig. 2 Country-level ecological footprint data in hectares per capita (plotted in reverse order because increasing the ecological footprint implies decreasing environmental sustainability) vs per capita GDP using 2017 data (linear scale only). Data sources: (1) per capita GDP, World Bank HYPERLINK "https://data.worldbank.org/indicator/NY.GDP.PCAP.CD"https://data.worldbank.org/indicator/NY.GDP.PCAP.CD, and (2) Global Footprint Network, https://www.footprintnetwork.org/licenses/public-data-package-free-2018/

reduction, one would need a specific type of economic growth before any benefit accrues and that paths other than economic growth might well lead to the same result. However, when we turn to the matter of environmental sustainability, an altogether more troubling likelihood emerges. This is the likelihood that economic growth might in fact be bad (Daly 2008; Georgescu-Roegen 1971; Harvey 2014). This possibility becomes immediately apparent when one plots country-level ecological footprint data against per capita GDP (Fig. 2) and sees the almost linear negative relationship between per capita GDP and ecological footprint. No nice neat environmental Kuznets curves apparent. The reason for this strong apparent relationship is not difficult to grasp. To a significant extent, GDP is based on the consumption of stuff, or if you prefer, on material throughput. And, as a general rule, the higher the material throughput, the higher (or worse) will be the ecological footprint.

Given the level of global "investment" in propagating the economic-growth-as-good ideology (more on this later), it is hardly surprising that the debate regarding this has raged back and forth. The arguments of those clinging to the growth-as-good ideology have, in the main, revolved around the possibility of dematerialization of economic growth – the decoupling of economic growth from environmental harm alluded to in SDG target 8.4. Examples of this type of argument would include ideas such as the circular economy (Geissdoerfer et al. 2017) popularized by Ellen MacArthur. However, as Daly (2008, p. 513) so eloquently put it:

> Theoretically in the limit perhaps a dollar of value added to GDP can become "angelized," inhering in only a few molecules of resources. But then it will be of no use – except to angels

> and growth economists – certainly not to poor people who need food on the plate more than recipes on the Internet.

One might add here the fact that "recipes on the Internet" are hardly materially "angelized." Vast material flows are necessary to sustain the technology industry, particularly in its fashionized form where people change their devices almost as frequently as they change their underwear.

Harvey (2018) presented an equally striking and perhaps more concrete (if you will excuse the pun) illustration of the fragility of dematerialization arguments. He noted how, in response to the declining global demand precipitated by the 2008–2009 financial crisis, China turned to a rather large internal infrastructure program to absorb its surplus production capacity and thereby stave off a massive value realization crisis. The fact that China, of all countries, would potentially fall victim to a quintessentially capitalist crisis of value realization is a telling indication of the dominant political-economic system globally. In any event, during this period, in just 2 years, China consumed 45% more cement than the USA had consumed in the whole of the twentieth century! Confronted with this sort of empirical anecdote of what it actually takes to achieve the growth that the prevailing growth-as-good ideology demands, the theoretical discussions around dematerialization appear somewhat like a small fart in a large perfume factory when it comes to real practice.

Harvey's focus, however, in drawing attention to this striking illustration of the enormous scale of infrastructure development in China had as much, if not more, to do with the final "little" problem with economic growth that ought to be introduced here. This is the issue of the compound nature of economic growth demanded by capitalism in order to sustain itself. Harvey (2014) dealt with this issue at length in a chapter entitled "Endless Compound Growth." In this, he emphasized the profoundly misleading apparent modesty of the magical 3% global growth purportedly necessary for capitalism to sustain itself. To illustrate Harvey's concern, we might begin with 2018's global GDP that was in the order of US$ 85 trillion. To hit the 3% growth target by 2019 would mean adding a "modest" US$ 2.5 trillion to the annual GDP. The modesty of this of course falls into question when one realizes that it was only in the late twentieth century (around 1973) that the global GDP actually reached the US$ 1 trillion mark for the first time in history. Beyond this, if we keep GDP growing by 3% per annum till 2050, GDP will then be around US$ 219 trillion, and at this stage, it will take almost US$ 6.5 trillion to grow at 3%. And within 120 years, the world economy would have to grow by the total 2018 GDP of US$ 85 trillion in 1 year to hit the 3% target. By that stage the global economy would be approaching a total GDP of nearly US$ 3 quadrillion. And if the abstract numbers above are not sufficiently moving, a graphical illustration of this exponential rise in GDP that 3% growth will bring about might be (Fig. 3).

This exponential economic growth can, of course, be related back to environmental sustainability concerns with some rather crude calculations. If one assumes no changes in the material efficiency of economic activity, then the 1.7 odd planets required to sustain our economic activity of US$ 85 trillion would rise to around 4.5

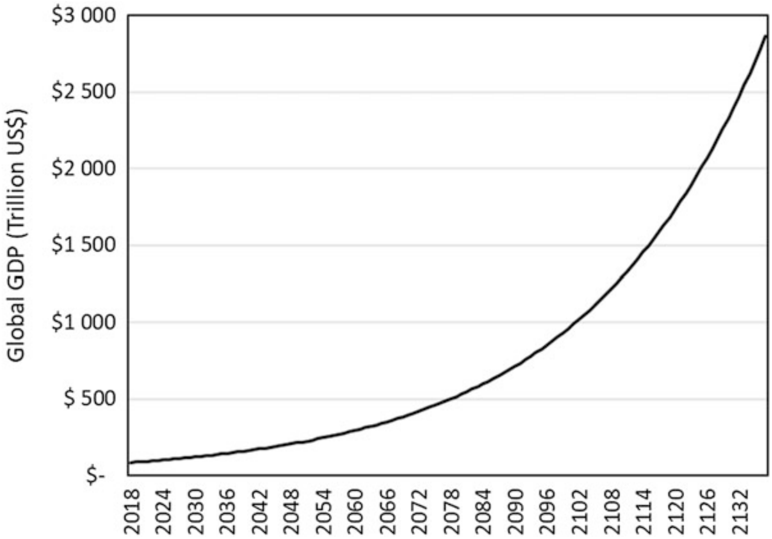

Fig. 3 The consequence of global *GDP* growth at 3% per annum

odd planets by 2050 to sustain the economic activity of around US$ 219 trillion. And within 120 years, it would have risen to an absurd 57 planets. The assumption of no changes to the material efficiency of economic activity is of course unrealistic. But so too are the techno-optimistic suggestions that we might be able to achieve a 5700% improvements in our material efficiency.

In short, apart from the fact that evidence suggests that growth is not a guarantee of current development, we are confronted with the likelihood that mechanistic conceptions of continual growth is inherently irreconcilable with basic laws of entropy and thermodynamics. As many authors point out (Cosme et al. 2017; Daly 2008; Fournier 2008), there are real planetary limits to growth and conceptions of development dependent on growth. Indeed, Bartolini and Bonatti (2002, p. 1) have gone so far as to raise the possibility of "Environmental and social degradation as the engine of economic growth." At the very least, these real problems must confront us with the question: Why was economic growth, with all of its potential contradictions, embedded in the Agenda (singular) as a legitimate end in the first place rather than just left as a potential means to be used, *where appropriate*, to achieve actual human development ends?

Corporations and the SDGs: Naming the System

With these two dissensus concerns regarding the Agenda as a backdrop, it is now possible to return to the original framing question of this chapter, which was "what corporations have done and are doing with respect to the Agenda." The first task in pursuit of answers to this is to "name the system" (Burkett 2009, p. 290). This can be done by recognizing (a) that corporations in their modern form are the primary institutional vehicles through which contemporary capitalism finds expression and (b) that capitalism is, to all intents and purposes, an economic growth junky. As Marx (1890/1990) demonstrated way back in the late nineteenth century, and as contemporary critics (e.g., Brown 2015; Harvey 2014) continue to elaborate, capitalism subsumes or subjugates all other human ends under its ultimate end of ceaseless accumulation of capital through profit appropriation. This is the essence of capitalism if you like. And it turns out that generating profit in the aggregate sense is fundamentally dependent on economic growth (Binswanger 2009). As Burkett (2009, p. 170) put it, "Any market economy in which production is motivated by profit must rely on growth, since money-making only makes sense if the amount of money made is greater than the amount of money advanced." Without economic growth, capitalism *must* collapse because corporations *en masse* will be unable to turn a profit (Harvey 2014). It is therefore structurally inevitable that corporations will seek to prioritize anything that promises to bring them their opium, economic growth.

This named essence of corporate identity provides us with a lens through which to scrutinize corporate involvement with respect to the Agenda. And the first port of call in this scrutiny is a consideration of the historical involvement of corporations in the Agenda – what *have* corporations done in relation to the Agenda? Almost inevitably, the focus here must be on the role that corporations have played in actually defining the Agenda. To do this, a brief historical caricature is useful. In this regard, the 1992 Rio World Summit on Sustainable Development represented something of a watershed event in terms of the nexus between corporations and the sustainable development discourse. Two things happened in Rio in 1992 that are particularly important here. The first was that the issue of sustainable development became a major global sociopolitical consideration. The sustainable development discourse moved from a fringe consideration to occupy a center stage in the imaginaries of multilateral organizations, governments, community groups, and ultimately your average Joe Soap. The second was that all of a sudden significant attention began to be focused on the role of corporations in relation to sustainable development (Scheyvens et al. 2016). And much of this attention was not particularly complementary. Furthermore, by the 2002 Johannesburg World Summit, it was patently clear that this attention on business was not going away. In fact, it seemed to be intensifying. The mantra in this increasingly powerful sustainable development sociopolitical movement seemed to be that, if sustainable development was to be anything more than a pipe dream, corporations would have to be made (forcibly if necessary) part of the solution.

Ultimately, these two developments confronted corporations with a very significant risk in terms of their social legitimacy. Their response was proportional to the magnitude of this risk. Vast corporate resources and power networks were mobilized with the aim of ensuring that the Post-2015 Sustainable Development Agenda (the Agenda) did not stray materially from capitalist governing rationality (Pingeot 2014). Not surprisingly, the first port of call in this campaign was to "put growth at the center of [the] vision for the future of sustainable development" (Pingeot 2014,

p. 17). This then provides at least part of the answer to the question we posed earlier regarding why it is that economic growth found itself embedded in the Agenda. And the net effect of this was to create a basis upon which an *apparent* of a convergence between corporate sustainability and sustainable development could subsequently be constructed.

Turning attention then to the question of what businesses *are* doing in relation to the Agenda, while it would be easy to speculate on the basis of the essence of corporate identity presented above, it turns out it is possible to go one better and present some actual empirical evidence. For this, the World Business Council on Sustainable Development (WBCSD) is a useful point of departure. By way of background, this organization describes itself as a "global, CEO-led organization of over 200 leading businesses working together to accelerate the transition to a sustainable world" (https://www.wbcsd.org/Overview/About-us, Accessed 24 July 2019). In this regard, many would hold that the members of the WBCSD represent the most progressive positions of corporations in relation to the role of business in contributing to the Agenda.

In 2018, they published results from a survey of their members entitled "Business and the SDGs" (WBCSD 2018). Of particular interest in terms of this chapter is the prioritization of SDGs that emerged in the survey. Armed with the preceding discussion, it is not at all surprising that SDG 8 with its controversial embedded goal of economic growth emerged as one of the three "most prioritized" goals. The other two were "13: Climate action" with its promised business opportunity of US$ 100 billion mobilized annually from 2020 under target 13.a and "12: Sustainable consumption and production" which, as argued by Gasper et al. (2019), was fundamentally constituted into a "business-friendly" set of indicators through the SDG negotiations. That this prioritization is hardly surprising was quite comfortably acknowledged by the WBCSD. As they remarked in their annotations, "it is natural that these SDGs should be key focus areas for business, given their strong connections to private sector activity" (WBCSD 2018, p. 15).

But how are we to interpret this short empirical finding? Well, lest we fall into the trap of being lulled into a sense of comfort by the WBCSD's labeling all of this as "natural," it is useful to juxtapose this structurally inevitable corporate prioritization of economic growth, against the goals that were, as the WBCSD rather euphemistically put it, "perhaps being overlooked" (WBCSD 2018, p. 15). These least prioritized goals included (1) no poverty, (2) zero hunger, (10) reduced inequalities, (14) life below water, (15) life on land, and (16) peace, justice, and strong institutions. Even on a purely intuitive level, this essential "selectivity" (Fukuda-Parr 2016, p. 50) of corporations is surely an "odd" inversion of ends when viewed from the perspective of a real sustainable human development agenda. Indeed, in the context of the SDGs, such an inversion could only be reasonably entertained under the assumption of a singular SDG agenda devoid of contradictions (recall dissensus 1). The minute that one begins to admit the possibility of contradictions between these high and low priority goals, this selectivity would surely move out of the realm of "odd," and into the realm of perverse. And as has been argued above under dissensus 2, there is a very distinct possibility that economic growth is likely to be contradictory to environmental development goals and possibly even those goals construed as social.

Conclusion

Fukuda-Parr (2016, p. 46) has argued that the MDGs, as the predecessor of the SDGs, failed to recognize "the root causes of poverty embedded in power relations and exacerbated by current economic models of neoliberal globalization that prioritize corporate profit over human rights." With Fukuda-Parr's concerns as a backdrop, Dodds et al. (2017, p. 36) noting of how, in the UN's Open Working Group deliberations around the SDGs, "Ambassador Kamau [as co-chair] regularly reminded delegations that 'sustainable development is not business as usual'" take on a particular (although probably unintended) relevance. Sadly, it seems that the SDGs that emerged out of the deliberations of this Open Working Group are, at the very least, accommodative of business as usual and more than likely even positively supportive of it. By including economic growth as an apparently legitimate end, and in the framing of the Agenda as a singular agenda (and thus apparently devoid of contradictions), the SDGs in effect paved the way for corporations to quite legitimately prioritize what has always been the priority of business – corporate profit. This in spite of vast bodies of empirical and argumentative evidence, accumulating from Marx (1890/1990) through to today, all highlighting the social alienations and human-nature metabolic rifts inherent in capitalist social production (and consumption) – i.e., in business as usual. Once again, capitalist governing rationality (Brown 2015) appears to have prevailed, and the SDGs appear to be just as vulnerable as their predecessor (the MDGs) to Fukuda-Parr's criticism regarding their potential for allowing corporate profit to take precedence over human development. And businesses response to all of this? Not surprisingly, given the central role they seem to have played in engineering this business favorable agenda, they seem to have pounced on the opportunity presented by the Agenda to obfuscate the "distinction between capitalist development and sustainable human development" (Burkett 2009, p. 288). And through this, great strides seem to have been made in weaving an "amazing technicolor dreamcoat" in which "current economic models of neoliberal globalization that prioritize corporate profit over human rights" are very comfortably shrouded in the legitimacy of alignment with the Agenda for sustainable human development.
