Foreword

Corporations have an enormous impact on our lives, in multiple ways. Decisions made by business leaders modify our options, our opportunities, and our environment. Often in a positive way, but sometimes negatively. However, unlike governments, these people have not been elected, and they cannot be revoked if a large majority or people dislike their decisions. Although we are, as consumers, employees of even entrepreneurs, not totally powerless, the balance of power between individuals and corporations is not equilibrated. As a consequence, the legitimacy of business in society is an important issue. The topic is not new, but major evolutions related to digitalization, sustainability, and the multiplicity of stakeholders who challenge business activities have made it more complex.

As one of the most prolific authors in the fields of business ethics and the philosophy of management, Jacob Dahl Rendtorff has an excellent overview of the complexity of problems related to business legitimacy. For this collective initiative, he has brought together many specialists from all over the world. And yet, we observe a strong European input in this handbook. There may be different reasons for this. Jacob is currently on the board of the European Business Ethics Network (EBEN) and he has organized EBEN conferences in the past. So, it is not surprising that many people from our network have contributed to the handbook. But there is perhaps a deeper, more fundamental reason. From the start, some 40 years ago, business ethics as a discipline has been understood in Europe in a broad sense, not so much merely in terms of compliance with regulation and moral principles, but rather in terms of meeting social expectations. This handbook on business legitimacy is essential to better understand this broader and interdisciplinary conception of business ethics.

President of European Business Ethics Network (EBEN) Geert Demuijnck
Professor of Business Ethics at EDHEC Business School
Lille, France

Preface

Welcome to the *Handbook of Business Legitimacy: Responsibility, Ethics and Society*. This handbook gives a comprehensive and scholarly overview of the different dimensions of business legitimacy in theory and practice. Today, in a complex globalized world, business legitimacy is essential for business and society, business ethics, and corporate social responsibility. Concepts of legitimation of business activities are important responses to expectations and justifications of the activities of business corporations, organizations, and institutions. Indeed, business legitimacy is a growing field of research in business studies, economics and business administration, sociology, political science business strategy, public relations, and philosophy of management.

This handbook presents different theories and practical approaches to business legitimacy in an interdisciplinary perspective of the social sciences and business with focus on political, social, ethical, legal, and economic concepts of legitimacy. In the contemporary global economic market and society, legitimacy is constantly challenged, and legitimacy and legitimating concepts are constantly challenged by social and economic change. The handbook explores the different dimensions of business legitimacy with focus on corporate sustainability, ethics, and responsibility regarding the place of business in society and the engagement of business with the expectations of the various internal and external stakeholders of the business corporation.

Moreover, this handbook provides coverage of the state of the art of research and practice of business legitimacy. The handbook is a central reference work for the study of business legitimacy in an interdisciplinary perspective. With comparative integration of sociological philosophical, theological, ethical, economic, legal, political, linguistic, and communication theoretical approaches, the handbook clarifies the relation between business organizations and their social and economic environments. This research implies investigation of how relations between company and environment are formed by legitimating notions in public spaces and public relations. Thus, notions and concepts of business legitimacy are changing, and these transformations have impact on the epistemological as well as practical dimension of business research and practice at the macro, meso, and micro levels.

In addition, the handbook includes investigation of historical and classical dimensions of the development of business legitimacy, providing a comprehensive assessment of the concept's evolution and identifying the most influential authors and their works. The handbook presents systematic approaches and major themes developed in the concept of business legitimacy. The different parts of the handbook include conceptual, empirical, or case studies. The different parts of the handbook deal with the different topics to which business legitimacy has been applied, with how legitimacy is relevant in various operational areas of the firm, and with the legitimacy theory's responses to some of the most important issues that businesses and organizations currently face.

Accordingly, the handbook searches to present researchers, students, and practitioners in business and management to the theory and practice of managing legitimacy and public relation in the perspective of research in business and society, corporate social responsibility, and business ethics. The handbook presents the major theories of business legitimacy related to corporate social responsibility and business ethics – relating them to corporate practices and emerging trends and requirements of legitimacy. This includes presentation of the major schools of business legitimacy, including business legitimacy and responsibility, the strategic conception of business legitimacy, the international view of business legitimacy, corporate citizenship and business legitimacy, the communicative view of business legitimacy and ethical conception of business legitimacy, business legitimacy and human rights, and business legitimacy and stakeholder management.

Moreover, the handbook presents these theories in relation to social, cultural, and legal developments in Europe, the United States, Asia, and other parts of the world. In recent years, there has been a fast and tumultuous development in requirements of legitimacy of business in society. Changes in business legitimacy requirements imply that legitimacy has become a license to operate for a firm so that legitimacy is not only about business and society but indeed also about business for society. In many cases, reporting procedures and accountability programs for corporate and social values are introduced into an organization in order to respond to more complex and increased requirements for business legitimacy. In addition, with increased requirements for business legitimacy corporations are changing their role in society not only through new partnerships with governments but also by making ethics, social responsibility, and participation in governance processes part of their core management strategies.

Indeed, corporate boards, management, and stakeholders consider leadership and management of business legitimacy as a means to ensure not only the responsibility and integrity of the organization but also to increase sustainability, efficiency, and competitiveness of the firm in a complex democratic society. This development of business legitimacy can be summarized as an evolution towards a new economy of legitimacy and corporate citizenship that integrates business with stakeholders from civil society, labor organizations, business, government, and international bodies. With business ethics, values-driven management, and corporate citizenship, business corporations aim at contributing to governance, sustainability, and development of society and they become responsible for long-term social processes of sustainable development in collaboration and dialogue with their stakeholders.

Thus, this *Handbook of Business Legitimacy: Responsibility, Ethics and Society* is an essential reference work for students and scholars of business and society, business ethics, organizational sociology, public relations, communication corporate social responsibility, and sustainability studies. Important dimensions of the analysis of business legitimacy in the handbook are corporate social responsibility (CSR), corporate citizenship, public relations, public affairs, stakeholder engagement, globalization and trust in the framework of responsibility, ethics, and legitimacy of corporations. In this context, there is focus on the role of communication and public relations for legitimate management and leadership. In particular, the handbook focuses on how to manage ethics and responsibility in the framework of legitimate decision-making in democracy in a global and cosmopolitan society.

October 2020 Jacob Dahl Rendtorff

Introduction: Business Legitimacy in the Conflict of Interpretations

Business legitimacy is essential for business and society, business ethics, and corporate social responsibility. Concepts of legitimation of business activities coordinate expectations and justifications of business and society. Business legitimacy is an important field of research in business strategy and organization, business sociology, public relations and communication, business ethics, leadership studies, and philosophy of management. This *Handbook of Business Legitimacy: Responsibility, Ethics and Society* presents different theories and practical approaches to business legitimacy in an interdisciplinary perspective of the social sciences and business with focus on different political, social, ethical, legal, and economic concepts of legitimacy. In the contemporary global economic market and society, legitimacy is constantly challenged, and legitimacy and legitimating concepts are constantly challenged by social and economic change. Thus, it is the aim of the *Handbook of Business Legitimacy* to explore the different dimensions of business legitimacy with focus on corporate sustainability, ethics, and responsibility with regard to the place of business in society and the engagement of business with the expectations of the various internal and external stakeholders of a business corporation.

Business legitimacy implies that a company must take into consideration legitimating concepts and values to be able to exist and prosper in a society. In this sense, there is a close relation between basic ethical principles and business legitimacy (Rendtorff 1998, 2002, 2003, 2008, 2014a, 2015c; Rendtorff and Kemp 2009; Jørgensen and Rendtorff 2018; Jørgensen et al. 2018). Business legitimacy is a precondition of a company's license to operate in society and relations to the different internal and external stakeholders of the company, including investors, owners, employees, customers, suppliers, local community, state, and international society. In this context, there is an important link between business legitimacy and values in management (Pedersen and Rendtorff 2004; Mattsson and Rendtorff 2006; Rendtorff and Mattsson 2012; Rendtorff 2015b, 2016, 2017b, 2019a, b, c). However, the interrelation between a company and the rest of society changes with society's evolution and is mediated by changing legitimating concepts, values, and processes. This is expressed by the importance of business ethics for business legitimacy (Rendtorff 2009, 2010b, 2011a, b, c, 2012, 2014c, 2017a, b, c). Moreover, business legitimacy is important for the definition of reflective management, visions for authentic leadership, and for the rationality of management. Therefore, justification of business legitimacy is an important dimension of the philosophy of management (Rendtorff 2010a, 2013a, b, c, d, 2014b, 2015a, 2017c, 2019d).

The philosophy of science, epistemology, and methodological ideas presented in this handbook are based on concepts of philosophical hermeneutics of Paul Ricœur (Rendtorff 2014b). According to Ricœur, scientific truth and discovery take place in a conflict of interpretation with interaction between different approaches, positions, and concepts of a scientific develops field. Accordingly, the ontological truths and structures of business legitimacy through a dynamic confrontation between different interpretations, fields, theories, and practices of business legitimacy in this comprehensive presentation of the concept of business legitimacy.

In this introduction, we will present an overview of this *Handbook of Business Legitimacy: Responsibility, Ethics and Society*, which presents the most important dimensions of business legitimacy in the tensions and interactions between basic ethical principles, values and management, business ethics, and sociology and philosophy of management. This introduction presents short summaries of the 23 parts of the *Handbook of Business Legitimacy*: (1) Definition and Conditions of Business Legitimacy; (2) Classical Theorists of Business Legitimacy; (3) Business Legitimacy from the Point of View of Religion and Theology; (4) Organization, Business Legitimacy, and Business Ethics Theories; (5) Sociology, Societal Change, and Legitimation Paradigms; (6) Public Governance, Co-creation, Innovation, Taxation, and Business Legitimacy; (7) Law, Reflexive Law, Business Legitimacy, and Corporate Social Responsibility; (8) Public Relations, Marketing, the Public Sphere, and Business Legitimacy; (9) Communication and Public Constructions of Business Legitimacy; (10) Philosophical Dimensions of Corporate Citizenship and Business Legitimacy; (11) Business Legitimacy as Institutionalization of Responsibility; (12) Management of Corporate Social Responsibility and Business Legitimacy; (13) Accounting, Accountability, Stakeholders, and Business Legitimacy; (14) Legitimation Strategies for Business Corporations; (15) Organizational Identity, HRM, Employee Motivation, and Business Legitimacy; (16) Business Economics, Finance, Governance, and Business Legitimacy; (17) Legitimation with Different Forms of Practice of Legitimacy in Complex Societies; (18) Conflicting Notions of CSR and Business Legitimacy in Globalization; (19) Business Legitimacy, Electronic Economy, Digital Work Life, and Surveillance; (20) Business Legitimacy in Different Parts of the World; (21) Polycentric Dimensions of Business Legitimacy in Complex Societies; (22) Sustainable Development, Ecology, the Anthropocene, and Business Legitimacy; (23) Business Legitimacy and the Sustainable Development Goals (SDGs).

Definition and Conditions of Business Legitimacy

J.D. Rendtorff presents a definition of business legitimacy based on institutional theory, business ethics, and corporate social responsibility in ▶ Chap. 1, "The Concept of Business Legitimacy: Learnings from Suchman." This chapter describes the different levels and dimensions of business legitimacy, as this field of research has developed since the classical work of Mark C. Suchman. The chapter analyzes the different perspectives and stages of development of business legitimacy in terms of institutional theory, business ethics, and corporate social responsibility in a critical perspective. The content and development of the concept of business legitimacy include the rationality of legitimacy, the way of legitimization as well as the weighting of legitimacy and of legitimization, and the types of legitimacy conflicts that emerge in the relation between business and society (Rendtorff 2000a). The chapter analyzes the role of business ethics, corporate social responsibility, and corporate citizenship in the stages of cognitive, moral, and pragmatic legitimacy, where legitimacy is societal acceptance and expectations of corporations. Such research on business legitimacy with focus on responsibility, ethics, and society aims at clarifying how the interrelation between company and environment is mediated by legitimating notions in public spaces and public relations and social transformations at the macro, meso, and micro levels of business and society.

A. Suchanek analyzes the definition of business legitimacy in ▶ Chap. 2, "The Problem of Corporate Legitimacy." The chapter begins with a discussion of the problem of legitimacy and argues that this problem became relevant as the corporation was institutionalized as a political actor. In this sense, the emergence of concern for business legitimacy is closely linked to the idea of the generalized acceptability of actions as a central dimension of the ethical focal point. In this context, the starting point is increasing gap between morals and profits. The moral problem is defined as the problem of the function of rights and responsibilities of corporations in relation to their existence on markets of business economics. The chapter places legitimacy within the perspective of game theoretical approach as presented in the concept of order ethics focusing on the rules of the game of businesses. In addition, an important topic is the problem of the game theoretical approach in relation to expectations of companies. It is here that this approach focuses on the concept of focal point. The game theoretical approach to the focal point looks at the concepts of perceptions and assumptions and it looks for a constitutional focal point. Moreover, the chapter defines the ethical focal point as shared understandings of what is socially desirable with regard to expectations of behavior. Thus, the concept of ethical focal point becomes essential to understanding legitimacy in the context of the game theoretical approach as the foundation of a generalized conception of business legitimacy of corporations.

F. Lohmann discusses the anthropological basis of business ethics and work ethics for the theoretical concept of business legitimacy in ▶ Chap. 3, "Anthropological Underpinnings of Business Ethics and Work Ethics in Relation to Business Legitimacy." This chapter focuses on the human dimension behind economic theory, business, and management. In particular, the chapter discusses the anthropological dimensions of the concept of neo-classical economics, but also of other economic concepts, for example, behavioral economics. The chapter argues that homo economics must be seen in relation to other concepts like homo moralis and the intuitive agent of behavioral economics. Even though these models are at work at the descriptive and empirical level, they do apply directly to concept of legitimacy, which is a normative concept. The chapter argues that the legitimacy is dependent on the descriptive analysis based on anthropological studies of homo economics.

However, even at the normative study level, there are different models of legitimacy reflecting the different anthropological dimensions of economic activities. In addition, these models cannot be reduced to anthropological description. Thus, business legitimacy is dependent on anthropological views of humanity and conceptions of the human dimension of economic activity.

E. Grimi presents the epistemological and ontological conditions for business legitimacy in language and values in ▶ Chap. 4, "Language, Morality, and Legitimacy." The chapter provides a philosophical analysis of the principle of legitimacy as the foundation of business legitimacy. This implies the discussion of the relation between language and morality in relation to the principle of legitimacy. A focus is the role of legitimacy in philosophy of language and its consequences for concepts of responsibility and political authority. The chapter is inspired by Aristotelian philosophy and the philosophy of language of Elisabeth Anscombe. The principle of legitimacy is defined as the concept of power in society. This is related to visions of the good and just government and the legitimate political structures. On this basis, the chapter provides a historical overview of cognitive and non cognitive approaches to legitimacy from Aristotle to Hobbes and the modern contractualist tradition. We can say that we move from traditional natural law approaches to modern contractualist concepts of legitimacy. This can also be interpreted as a move from substantial to formal and democratic concepts of legitimacy. In this context, it is important to stress the complexity of the principle of legitimacy, for example, with the discussion of legality and legitimacy. At the end of the historical and conceptual analysis, the chapter stresses that legitimacy cannot be reduced to a formal legal concept. Legitimacy is a moral concept based on political authority of the common good. This position is clarified with a discussion of epistemological and metaphysical realism of J. Haldane and Anscombe. As suggested by Anscombe, practical truth is practical judgment and here we find a connection between the legitimacy of judgment and the moral basis for legitimate action. In this context, the chapter states that the premise of legitimacy is morality. Moreover, civil obedience is needed to respond to problems of legitimacy appealing to individual consciousness (H. Arendt). From this point of view, it is important to stress that legitimacy is about truth and convictions; hence, legitimacy is an element recognized by a multitude of subjects. Therefore, the result of the moral deconstruction provided by Anscombe is the reduction of legitimacy to an element of moral philosophy focusing on human virtues. Accordingly, legitimacy following Anscombe and MacIntyre is based on human flourishing and eudaimonia. In the virtue of legitimacy, language, morality, and legitimacy are intrinsically linked since virtue and happiness are essential elements of a good government. Thus, this chapter provides a corrective to social constructivist and legalist approaches to legitimacy with focus on the nuances of the principle of legitimacy.

Classical Theorists of Business Legitimacy

M. Aßländer analyzes the classical liberal concept of business legitimacy as it is developed in Adam Smith's philosophy of economics and of liberalism in ▶ Chap. 5, "Adam Smith and Business Legitimacy." The chapter shows how Adam Smith's concepts of the market and of the invisible hand as well as his concept of the moral sentiments that are behind human economic exchange can contribute to the understanding of legitimacy of business ethics at the different economic markets. In particular, when dealing with business legitimacy, it is important to understand Adam Smith's concept of the bourgeois virtues at economic markets, which is linked to his concept of moral sentiments. Dealing with virtues, trust, integrity, and accountability are concepts of business virtues that can be traced back to a virtue interpretation of Adam Smith's moral philosophy and theory of economic action. The virtues are important for just competition between nations and creation of wealth in business and society. Thus, the chapter provides foundations for business ethics research on the concept of business legitimacy from the point of view of philosophy of economics.

K. Steigleder analyzes business legitimacy from the point of view of Immanuel Kant's philosophy in ► Chap. 6, "Kantian Moral Philosophy, Universality, and Business Legitimacy." The chapter provides a presentation of the Kantian moral theory and its conception of universality applied to the right to pursue profits and the rights of affected people. Indeed, it is from the perspective of Kant's moral philosophy applied to business legitimacy, the function of sustainable national economies to protect the rights of people. Therefore, rights must be protected by the state, and business strategies should contribute to support the moral norms of society. This means to respect rights and dignity of human beings. Thus, the chapter presents the market economy in the perspective of Kantian moral theory. With Kantian moral philosophy applied to business legitimacy, it is possible to define minimum moral conditions for economic interaction. Business legitimacy from the Kantian perspective is to be taken at once as a strictly (morally) normative concept and as a minimum standard of moral rightness. The chapter stresses the normative dimensions of business legitimacy, and the Kantian approach is related to K. Homann's macro-ethical theory, based on order ethics. This perspective is further applied to financial institutions. In addition, the chapter presents the micro-ethical dimensions of Kantian moral philosophy applied to business legitimacy.

Ø. Larsen presents Max Weber's classical theory of business legitimacy in ► Chap. 7, "Max Weber's Sociological Concept of Business Legitimacy." This chapter discusses the concept of business legitimacy based on Max Weber's thought with the help of an in-depth investigation of Weber's sociology of religion. Instead of looking only at the "Protestant Ethics and the Spirit of Capitalism," this chapter is much more comprehensive and looks at Weber's analysis of Protestant business legitimacy in the perspective of his work on the sociology of religion. This perspective opens for confrontation with Weber's concept of Protestant ethics. The chapter rightly refers to the concept of legitimacy in sociology and to the concept of the legitimate social order in Weber's writings. As the chapter proposes legitimacy is related to the business ethics of a religion. Here, an important insight that it is among the world religions only in the Protestant religion that business receives the function of providing salvation, as it is suggested by the Bourgeois ethics of business as a kind of virtue of salvation. The comparison between Protestantism and Confucianism is very important and relevant for the understanding of business legitimacy. This chapter provides the basis for understanding the role of the difference between morality and religious traditions in the formation of the concept of business legitimacy. With this understanding of business legitimacy, the chapter provides the foundation for the conception of business legitimacy in the "Protestant Ethics and the Spirit of Capitalism." Thus, this is the basis for relating business legitimacy to the other forms of legitimacy in Max Weber's sociology, based on political power structures and the ideas of charismatic, rational, and tradition legitimacy. With this, the analysis of business legitimacy in the tension between Confucianism and Protestantism provides the basis for a political concept of legitimacy, which can be considered the framework for business legitimacy.

C. Sløk focuses on the Protestant tradition of business legitimacy in relation to contemporary concepts of business legitimacy in ► Chap. 8, "Guilt, Responsibility, and Leadership." This chapter discusses the relationship between responsibility and guilt. Contemporary leaders are characterized as having no ethical remorse for their actions and the chapter addresses this important question. It analyzes responsibility without guilt in an ethical perspective and also in the perspective of psychopathy. Psychopathy is action without any moral consciousness. Here, the chapter discusses psychopathy in the leadership literature and presents the dark triad of psychopathic leaders. The chapter also discusses this from the perspective of theology and philosophy of guilt, taking into account responsibility and bondage. In the analysis, the chapter both touches on the Old Testament and critical philosophy of guilt as a social technology as proposed by Nietzsche and Freud as binding between persons. Moreover, the chapter discusses Protestant ethics' conception of guilt as an original sin and a part of human nature as opposed to the dissolution of guilt by contemporary leadership. This is related to contemporary discussions of postmodernism.

Business Legitimacy from the Point of View of Religion and Theology

G. Harste presents the foundations of business legitimacy in religion and theory in ► Chap. 9, "Business Legitimacy, Modernity, and Organizational Systems: Corporate Spirit, Esprit De Corps, and Corpus Spiritus Throughout History." The chapter presents an analysis of the concept of business legitimacy and legitimation in relation to the sociological history of organizational systems. In this context, the analysis of legitimacy is based on presentation of the views of major sociologists and their conceptions of the historical and social development of business legitimacy. From this point of view, it is important to discuss different concepts of work ethics, cooperation, and organizational communication in different organizational systems. Indeed, the archeological and historical perspectives help to understand the foundations of medieval constructions of legitimacy in the historical development of Christianity's concept of organizations and organizational forms. The chapter demonstrates how different figures of legitimacy find their origins in Christian thought, theology, and religion. These forms and figures are still here as being reproduced in modern secularized society.

G. Baruchello presents in ▶ Chap. 10, "Business Legitimacy from a Catholic Perspective: Thomas Aquinas, Papal Encyclicals, and Human Rights," the concept of business legitimacy in the perspective of the Catholic tradition in economics, business, and ethics. The chapter discusses the social doctrine of the Catholic Church as the basis for understanding contemporary economic ethics and legitimacy of business. This implies analysis of the ethical history of economics and business in the perspective of the concepts of the Catholic Church. The chapter presents the market economy in relation to economic systems from the viewpoint of Thomas Aquinas' theology and philosophy with special emphasis of economic ethics and legitimacy. After this discussion of theology, ethics, and religion, Baruchello presents the market economy, economic systems, and business practices in the perspective of Thomas Aquinas' theological philosophy. Later, the chapter elaborates on the Papal Encyclical letters in relation to their conception of economics and business.

C. Sløk presents a theological theory of the foundations of business legitimacy in personal responsibility and feeling of guilt in ▶ Chap. 11, "Theology, Responsibility, and Business Legitimacy." The chapter demonstrates the theological origins of the concept of business legitimacy. This includes understanding of how the theological ideas of Protestantism and of, in particular, reformer Martin Luther and his Protestant ethics of reformation are important in the contemporary concepts of love, guilt, and responsibility behind concepts of business ethics and business legitimacy. This is important for the development of the concept of responsibility and of legitimacy of action and activities in business corporations. In addition, the analysis looks at love, responsibility, and accountability in relation to economics and business. Moreover, the chapter proposes a modern concept of justice relating to discussions of economics and the market of business organizations as the foundation of contemporary ideas of business legitimacy.

J.D. Rendtorff discusses the relationship between economics and religion in ▶ Chap. 12, "Capitalism, Religion, Business Legitimacy, and the Ethical Economy." This chapter addresses the difficult problem of legitimacy of corporations in modern society from the perspective of the relation between economics and religion. In perspective of the religious foundations of economics, the chapter discusses different approaches to economics, based on different economic theories and concepts of the economy. The debate about legitimacy of the economics of the firm represents in modern economics the place of intersection between economic values and other values. With this approach, the chapter discusses modernist economics of neoliberalism and welfare economics from the point of view of social legitimacy of economics. In addition, the chapter presents institutionalist alternatives to neoliberalism and welfare economics in the context of search for a more sustainable transformation of economics in society.

J. Fischer investigates the relationship between religious and cultural dimensions of business legitimacy in ▶ Chap. 13, "Religion, Culture, and Business Legitimacy." The chapter builds on a case study of the concept of business legitimacy with regard to religion and culture. The chapter applies the theory of Suchman as a framework of the understanding of the moral economies of religious and cultural legitimacy. The argument is that there is a changing relationship between business, culture, and legitimacy. The Danish business corporation Novozymes constitutes a case example of this. When Novozymes is acting transnationally, it has to comply with requirements of Hindu vegetarianism, Halal, and Kosher in some countries. It is in this context that the conceptualization of religion relates to the pragmatic, moral, and cognitive categories as proposed by Suchman in relation to the biotechnology business sector, which is considered as a controversial business sector. Measures of compliance, regulation, certification, and standardization are relevant to regulate the legitimacy of business on such religiously and culturally determined markets. There is moral and religious dimension to the economy when a Kosher compliance and inspection requirement is necessary to maintain and create legitimacy of a business organization. This is indeed the case of transnational corporations like Novozymes operating in controversial industries, where extra care is needed to maintain and develop business legitimacy.

Organization, Business Legitimacy, and Business Ethics Theories

G. Scalzo and K. Akrivou present the virtue ethics view and the common good conception of business legitimacy in ▶ Chap. 14, "Virtues, the Common Good, and Business Legitimacy." This chapter provides an overview of the relation between business legitimacy and virtue ethics. The chapter begins by stressing the importance of the concept of the common good in relation to virtues and trust. Moreover, the chapter discusses the concept of business legitimacy in light of institutional theory as the basis for understanding business legitimacy from the point of view of the tradition of virtue ethics. The paradigm of virtue ethics in business legitimacy creates a better relation to stakeholders with focus on sustainability and transparency. This is contributing to holding people responsible for their actions. Based on the essential dimensions of institutional theory as the framework for virtue ethics analysis, the chapter goes on to present the concept of virtues and virtue ethics strategies for the common good in relation to stakeholders. The major concepts of institutional and organizational legitimacy, including Suchman's distinction between pragmatic, cognitive, and moral legitimacy, are presented as a possible framework for application of the virtues in the tradition of humanistic management. Here, seeing business legitimacy from the virtue ethics perspective, the concepts of the common good and of ethical communication become important concepts for understanding eudemonia in business legitimacy.

P. Francés-Gómez discusses in ▶ Chap. 15, "Social Contract Theory and Business Legitimacy," different ethical dimensions of the social contract theory in relation to business legitimacy in the framework of business ethics theories. The chapter gives an overview of the role of social contract theory in relation to ethics and business legitimacy. Social contract theory in business legitimacy can be defined as use of the concept of contract to determine justification in business ethics. This use of the contract approach in business ethics is also called contractarian business ethics, since ethics is considered to be justified on a basis of a social contract between stakeholders, members of a firm, or within society. Because of the presentation of the different dimensions of social contract in business and contractarian business ethics, the chapter relates business legitimacy to the conceptualization of the basic function of business in society as based on a social contract. Thus, the chapter analyzes business legitimacy from the point of view of the most important contributors to business ethics and social contract theory, including Thomas Donaldson and Tom Dunfee, who present the concept of integrated social contract theory. The chapter also discusses John Rawls' concept of a theory of justice and the role of justice in social contract theory. Moreover, contract theory includes approaches from Kantian constructivism, which provides foundation for Rawls' social contract theory in relation to the field of business legitimacy.

A. Brink and F. Esselmann present in ▶ Chap. 16, "Value Positioning and Business Ethics: Keeping Promises as Business Legitimation," an analysis of business ethics at economic markets based on the concept of accountability and reliability of promises and promise keeping. It is essential for a good economic market that promises can be kept and that actors on economic markets can trust each other. In this sense, this chapter provides an analysis of promise keeping as an important subjective and intersubjective dimension of economic interactions at economic markets. The chapter presents the role and necessary function of keeping promises in different concepts and theories of business ethics. Thus, this is an analysis of the scope and definition of the concept of keeping promises in relation to business economic theory in the perspective of creation and maintaining business legitimacy.

K. Høyer Toft can be said to present a negative approach to the concept of business ethics in ▶ Chap. 17, "Ethical Blindness and Business Legitimacy." Ethical blindness is a concept in business ethics and business legitimacy that characterizes the lack of business ethics in corporations and business organizations. The chapter discusses ethical blindness in relation to business legitimacy. This includes a discussion of the definition of the concept of ethical blindness in the perspective of ethical theory of organizations. With this, the chapter relates ethical blindness to important concepts of organizations theory, including blindness with regard to sense-making and the social and organizational context, where individual employees follow a particular instrumental sense-making and framing of their job and role in the organization. This means that they become unable to see the moral problems of organizational action in a particular social context. Overcoming ethical blindness means to engage in ethical organizational framework that is built on a normative theory of political CSR, which can help establish a good workplace. Thus, to deal with potential ethical blindness in organizations is essential for business legitimacy.

Sociology, Societal Change, and Legitimation Paradigms

M. Green analyzes the paradigms of management and accounting research in ▶ Chap. 18, "Mainstream Management and Management Accounting Scholarship: Aspects of Legitimacy." This looks at the different aspects of legitimacy in mainstream management accounting scholarship. The chapter considers philosophy of sciences and scientific method from the point of view of legitimacy research. It therefore demonstrates how science and scientific method are subject to social evaluation and implies social normativity in the management sciences. This means that the chapter is important for discussion among researchers and students about legitimacy values of scholarship and research in management sciences. The chapter thus discusses the concepts of legitimacy in mainstream management research, going from positivism, objectivism, and functionalism towards new managerialism, neoliberalism, and new public management, including a kind of legitimacy crisis of management research. In this context, the chapter demonstrates how mainstream management research combine functionalism and positivism with mix methods and different perspectives on organizations. Thus, the chapter critically argues for more awareness of subjectivism, power, and control of research and proposes the need for emancipating strategies (Habermas) in management research and in the self-reflection of management about its own conditions of research.

S. Holmström presents in the perspective of systems theory the theoretical foundations of legitimacy in ► Chap. 19, "Society's Megatrends and Business Legitimacy: Transformations of the Legitimizing Business Paradigm," different legitimizing strategies that are in function in contemporary business management. The different legitimizing paradigms are based on the different relations between business organizations and society that are affected by the struggle for legitimacy of business corporations. The chapter implies a reconstruction of the course of history with regard to business legitimacy. Moreover, different concepts and theories of historical and social development of business legitimacy are presented in the perspective of modernization of society. In this context, the chapter provides a presentation of the different challenges of legitimacy in society, in particular, with focus on the different concepts of rationality that is at stake in different discursive formations. Theoretical basis of the historical and social development of legitimacy is that the rationality of business legitimacy has a communicative and discursive dimension. This includes a performative concept of legitimacy that moves beyond the opposition between markets and economic profit and the environment of the market external dimensions of society and nature. It is characteristic of the construction of legitimacy that business corporations relate reflectively to its environment in searching for legitimacy. Thus, business reflectivity is essential for the construction of business legitimacy.

D. Tänzler presents a theory of reflexive self-regulation of corporations in ► Chap. 20, "Corruption, Norms, and Business Legitimacy." This chapter studies corruption in the perspective of the possibility of reflexive management and the possibility of self-regulation as a new form of organizational practice leading to business legitimacy. The chapter shows how business must go beyond pure economic concerns and also include other values like transparency, accountability, responsibility, and sustainability as key concepts of new governance. In order to acquire business legitimacy, anti-corruption policies became important and necessary. The chapter presents case studies of corruption on this basis. These cases are related to non directive business legitimacy and reflexive management. On this basis, the chapter defines business legitimacy as formal and substantial. The chapter ends with the conclusion that substantial business legitimacy must have a stronger stakeholder orientation. Thus, the chapter provides a theory of how to deal with violations of norms of corruptions through active self-regulation.

R. Tapaninaho and J. Kujala present the paradigm of stakeholder value creation in ► Chap. 21, "Stakeholder Value Creation: Legitimating Business Sustainability." This chapter shows how a paradigm of value creation and stakeholders in relation to business legitimacy may be developed in order to improve business legitimacy in organizations. Indeed, the presentation of the requirements of different stakeholder conceptions in relation to legitimacy and value creation is needed to improve stakeholder management of business legitimacy. In the context of legitimacy of business sustainability, stakeholder value creation also receives importance for legitimation of sustainable management. Stakeholder orientation with a multiple value orientation complicates business sustainability, but it also points to the problems and difficulties of business legitimacy. The chapter presents different stakeholder models of the firm in relation to business legitimacy, and this documents the relevance of stakeholder perspectives for conceptualizing business legitimacy. Thus, according to the stakeholder paradigm of value creation for legitimating sustainability, business legitimacy is constructed in relation to different stakeholders at complex and differentiated economic markets with different contexts of legitimation.

Public Governance, Co-creation, Innovation, Taxation, and Business Legitimacy

A. Krogh and J. Torfing discuss the new concept of co-creating governance in relation to public governance in ► Chap. 22, "Legitimacy in Co-creating Governance Networks." This chapter presents an overview of the conception of co-creation in public governance related to the collaborative networks in governance processes. The chapter also relates this to the role of private companies as contributors to legitimacy in public governance processes. The chapter begins by describing the process from government to governance related to the contemporary reemergence of nation-state politics. Co-creation is defined as a process of creating public value in a manner in which two or more actors provide solutions to shared problems. The authors determine this as a procreative governance strategy to deal with wicked problems. These new collaborative forms of governance are then considered in different perspectives, including historical dimensions of public governance, analytical definitions of interactions of network governance, as well as in relation to legitimacy of participating private business actors. Finally, the chapter looks at meta-governance strategies for creating legitimacy of private-public collaborative networks. In all these different dimensions, co-creation is essential for successful private-public relations. The chapter gives a description of governance networks as sources of legitimacy where private companies also contribute to governance networks. In the conclusion, the chapter relates this to SDG partnerships and business networks.

L. Li Langergaard looks in ► Chap. 23, "Public Sector Innovation, Social Entrepreneurship, and Business Legitimacy," at the concept of business legitimacy in relation to social entrepreneurship and CSR. The idea of the chapter is that we can also observe legitimacy challenges in relation to social entrepreneurship and public sector innovation. The concept of business legitimacy receives a more complex application when this concept is elaborated in relation to the different elements of the public sector, private sector, and the NGO sector. The chapter studies the concept of business legitimacy as an important element for normative mediation between different sectors. These normative legitimacy requirements emerge between the different sectors of public organizations and institutions, private companies, and NGOs. In particular, the chapter applies institutional legitimacy theory, including Suchman's strategic approach to the study of the relation between public sector innovation and social entrepreneurship. In this context, the chapter proposes a critical discussion of political CSR in relation to the problem of deliberative legitimacy applied to the private sector, and the chapter is critical towards the application of a normative concept of legitimacy in the private sector.

L. Lauesen and T. Bjerre gives a presentation of the possibilities of legitimacy of public companies in ▶ Chap. 24, "Publicly Owned Company Legitimacy: Opportunities and Challenges." This chapter discusses business legitimacy of publicly owned companies with a case study of a Danish water company. The chapter provides a historical overview of business legitimacy in publicly owned companies and elaborates on dilemmas faced by Danish publicly owned companies. The challenge is that such companies tend to have natural monopolies, which give them a natural license to operate. This is for example the case with the water company that needs to distribute water among citizens. However, with discourse of neoliberalism and new public management, there has been a challenge to the traditional legitimacy of publicly owned companies that now needs to demonstrate legitimacy at markets while at the same time taking care of the common good of society. This dilemma is analyzed with the help from institutional theory. The chapter rightly states that the institutional approach to legitimacy combines strategic and cognitive approaches, and here the chapter contributes with a great new approach by moving from Mark C. Suchman to the political concept of legitimacy with focus on procedural legitimacy and social license to operate. This gives us an important framework for understanding publicly owned companies and their legitimacy challenges. This approach is applied to the case of Water and Waste in Svendborg, Denmark, with analysis of pollution of the ground water and the necessary cleanup of this water.

F. Scarpa and S. Signori discuss the essential role of taxation for business legitimacy in ▶ Chap. 25, "Ethics of Corporate Taxation: A Systematic Literature Review." Peer review: This chapter provides a systematic review of the literature of corporate taxation ethics related to ethical responsibility and the role of corporations in society. The chapter presents issues of tax behavior, corporate tax minimization strategies, and ethical responsibilities of corporate taxation related to theories of corporate taxation ethics in a philosophical perspective. The chapter documents the importance of this overview by the fact that there has been increased focus on corporate taxation ethics by a wide circle of stakeholders including states, NGOs, civil society, and other stakeholders. Indeed, extended media coverage has contributed to this focus on taxation implying increased concern about legitimacy issues in relation to business and multinational enterprises with regard to taxation. Moreover, the chapter provides a discussion of the ethical responsibilities related to taxation, including methodology, literature review, ethics of tax evasion, ethics of tax avoidance, and the general issues of ethics of tax practice. After having present the definitions of ethics of tax evasion, tax avoidance, and other corporate tax related issues, the chapter gives a very good presentation of the different moral arguments related to tax and tax avoidance. This comprehensive review includes major ethical theories like liberalism/libertarianism, utilitarianism, Kantianism (the categorical imperative), the ethics of justice (John Rawls), social contract theory, and virtue ethics theory. Thus, the chapter documents increased focus on public interest and responsibility in relation to the definition of business legitimacy.

Law, Reflexive Law, Business Legitimacy, and Corporate Social Responsibility

J. Brinkmann and M. Kochupillai provide in ▶ Chap. 26, "Law, Business, and Legitimacy," an overview of a comprehensive concept of business legitimacy in relation to law and business law. In the analysis of legitimacy and law, the chapter focuses on the importance of power in the concept of business legitimacy. In this context, the chapter emphasizes the role of eventual vulnerabilities of the firm searching for business legitimacy. These vulnerabilities are linked to other concepts like trust and recognition, which help to create and organize business. Trustworthiness is for example an important dimension of business legitimacy in this context of creating business legitimacy. The chapter then applies the developed concept of business legitimacy based on power, trust and vulnerability to selected cases of human rights, intellectual property rights, EU-organic plan regulation, etc. With the analysis of these cases of application and development of business legitimacy through the law, the chapter demonstrates interplay between different concepts of legitimacy in contribution of law to business legitimacy.

K. Buhmann presents in ▶ Chap. 27, "Business, Human Rights, and Reflexive Regulation: Multi-stakeholder Development of Standards for Responsible Business Conduct," the legitimacy of multi-stakeholder dialogue in the context of the United Nations. The chapter discusses reflexive law in a concise form with the good example of the international developments in particular in the context of the United Nations (UN) Global Compact; the UN Protect, Respect and Remedy Framework; and the UN Guiding Principles on Business and Human Rights. This chapter suggests that legitimacy of reflexive law emerges in the international community following the different efforts to create a transnational legal framework for business legitimacy.

In this context, the Buhmann demonstrates how soft law as UN norms and human rights contributes to create and construct business legitimacy. With this, we can use the concept of reflexive law to understand contemporary developments of the UN law-making on the legitimacy of human rights and business. Thus, the analysis of the UN multi-stakeholder developments draws legal philosopher Jürgen Habermas and legal theorist Günther Teubner to define and develop the concept of reflexive law as essential for contemporary developments of law and legal theory.

G. Enderle presents human rights as important dimensions of business legitimacy and corporate citizenship in ► Chap. 28, "Wealth Creation, Human Rights, and Business Legitimacy." The chapter gives an overview of the concept of human rights in business related to the idea of wealth creation of business. The chapter argues that business legitimacy in relation to fundamental wealth creation of business is fundamentally related to human rights. Business can only create wealth when it also relates to the protection and promotion of human rights. In the defense of human rights as essential for business legitimacy, the chapter refers to the UN guiding principles on business and human rights. The concept of legitimacy of business is defined as a moral concept in contrast to more pragmatic conceptions. The chapter confirms that business legitimacy research has become more important the last 20 years. Indeed, sustainability and support of human capabilities is an important dimension of wealth creation related to human rights. Human capabilities are a part of the improving of business legitimacy by respecting human rights and remedying human rights violations. Accordingly, the basic concepts of the UN guiding principles – protect, respect, remedy, and promote human rights – become essential for the wealth creation of business through human rights.

C. Malecki analyzes CSR in the law on business in ► Chap. 29, "The French PACTE Law or Two-Speed Corporate Social Responsibility (CSR)." This chapter presents the legal situation of CSR regulation in France with a detailed analysis of the French PACTE law as an example of a two-speed CSR regulation approach. The focus of the chapter can be seen to be an interaction between CSR, financial and non financial reporting, and an explanation of how this contributes to the development of CSR with the law. PACTE is an abbreviation of Action Plan for Corporate Growth and Transformation. This is a law of 22 May 2019, which aims at integrating CSR and sustainability concerns in the law and legal regulation in France. The focus of the chapter is both CSR and corporate growth. The French civil law and civil code is thus improved as a generalization of CSR. The law aims at making companies grow and be more responsible with impact on society. The law also combines concern for the environment with focus on social and environmental responsibility. Thus, the chapter gives an example of legal regulation and the legal approach to CSR in relation to business growth.

Public Relations, Marketing, the Public Sphere, and Business Legitimacy

K. Mogensen presents in the relation of the business corporation to the public sphere in ► Chap. 30, "Dialogue and Business Legitimacy." The chapter begins with the discussion of two mental models for justification of business legitimacy relating to the public arena and to the corporate legitimacy diamond. Indeed, the discussion of the corporate legitimacy diamond and its relation to human dignity constitute an extremely valuable contribution of this chapter. The chapter emphasizes how important human dignity and human rights are for corporate diplomacy and in this sense respect for human dignity is essential for the acceptance of legitimacy understood as response to social expectations in society. The definition of the concept of legitimacy diamond is based on the idea of the public arena as a point of departure, and adding a corporate diplomacy level of the dialogue of big business with public stakeholders. The chapter takes into consideration the post millennium quest for human dignity and localized trust. This focus on trust and dignity is essential to highlight dialogue and communication as dimensions of business legitimacy. The chapter goes on to analyze dialogue and public relations with help from authors like Parsons, and Boltanski and Thévenot, focusing on community and legitimizing ideology as well as orders of worth. Thus, this chapter points to the importance of respect of dignity and human rights in corporate diplomacy as a contribution to business legitimacy.

M. Haase gives a general overview of the research linking legitimacy in business and corporation in relation to marketing studies in ▶ Chap. 31, "Legitimacy-Related Research in Organization Studies, Stakeholder Theory, and Marketing Studies." Marketing studies can be considered as an important dimension of business legitimacy in relation to the external public sphere. The chapter provides an overview of the concept of business legitimacy in regard to research in marketing as related to the public sphere. This includes presentation of the most important authors with relevance for business legitimacy and marketing, including neoinstitutional theory (Suchman, Scott), philosophy, sociology (Weber, Parsons), procedualism in political theory, and other theorists like Deephouse and Epstein who have had central importance for the developments of the theoretical dimensions of business legitimacy. On this basis, the chapter presents the different levels of legitimacy in order to construct a multilevel concept of business legitimacy. With this, the chapter moves to discussion of legitimacy in management and organization theory, including taking into account stakeholder theory (Freeman and Philips). Finally, the chapter relates the different dimensions of legitimacy research in neoinstitutional theory and stakeholder theory to marketing theory and practice with a discussion of the role of Austrian economics in the section of marketing studies and marketing research.

N. Nielsen discusses ▶ Chap. 32, "Public Relations and Business Legitimacy." The chapter presents the concept of business legitimacy in relation to the field of public relations with its different theoretical, methodological, and conceptual dimensions in relation to legitimacy creation of the firm with regard to stakeholders and the public sphere. This is an important framework for proceeding with case studies of firms. Nielsen applies the concept of business legitimacy to understand the development of public relations, and the chapter shows how public relations relate to the formulation of business legitimacy in the context of strategic priorities of the firm. In particular, the chapter discusses the two-way symmetry model that is based on Jürgen Habermas' concept of the public sphere that defined the public sphere as the center of the forceless force of the good argument. Thus, this effort to achieve business legitimacy is an essential dimension of the search for public acceptance and corporate communication with stakeholders.

K. Alm and J. D. Rendtorff present an activist analysis of critical public intervention in the context of whistleblowing and business and human rights in relation to business legitimacy, journalism, and undercover investigation in ▶ Chap. 33, "Human Rights Violations at the Workplace: Uncovering and Documenting – Günter Wallraff's Activist Whistleblowing Method." The aim of this chapter is to provide a theory of activist whistleblowing for justice and dignity as the framework for detecting injustice and human rights abuses in business and organizations. This is important for trust and business legitimacy. Alm and Rendtorff suggest that whistleblowing is an important field of human rights in business and whistleblowing is essential for creating public awareness of human rights abuses and democratic engagement in promoting human rights in business. In order to develop such a theory we use the activist work and controversial life of the German journalist and writer Günter Wallraff after a confrontation with the dominant concepts of whistleblowing in relation to business and human rights. This analysis focuses on business legitimacy in the perspective of freedom of expression and employee rights in relation to human rights abuses and organizational wrongdoing.

Communication and Public Constructions of Business Legitimacy

M. Schultz and P. Seele presents in ▶ Chap. 34, "Business Legitimacy and Communication Ethics: Discussing Greenwashing and Credibility Beyond Habermasian Idealism," the important issue of the role of ethics with regard to communication, media theory, and public construction of business legitimacy. The chapter is based on a critical discussion of communication philosopher Jürgen Habermas' approach to discourse ethics and conception of communication as a discourse based on the forceless force of the better argument. Nevertheless, looking at practices of greenwashing in order to achieve business legitimacy, we can observe limits to Habermas' framework and the chapter shows how legitimation practice challenges the idea of free and open communication. The chapter presents critically the idealist dimensions of Habermas' theory and political CSR and shows the practical limits to these ideas the responsible political corporation. Accordingly, the chapter uses Habermas discourse approach to the public sphere and communication concepts of legitimacy to investigate how legitimacy is lost, found, and regained in the context of construction of business legitimacy in corporations and organizations. Moreover, the chapter discusses some of the implications of digitalization of business legitimacy in the context of corporate communication. The chapter is aware of the potential idealist dimensions of the business legitimacy approach to communication and the political corporation.

P. Aagaard discusses in ▶ Chap. 35, "Legitimacy, Political Organization, and Communication," the issue of political communication and public organizations in business and politics. The chapter analyzes political organizations in terms of institutional theory. The chapter takes up the important question of legitimacy in publicly governed organizations. Public organizations and institutions face increasing challenges of legitimate communication with stakeholders. In this context, the chapter analyzes public legitimacy in the perspective of communication theory. An important part of this problem is the question of the function of the public sphere with regard to influence and formation of the different dimensions of the legitimacy of public organizations. In particular, it is important to evaluate the different kinds of institutional forms of public-governed organizations with the focus of institutional theory. The chapter presents the different institutional forms and modes and approaches to agency in publicly governed organizations. Thus, this chapter addresses an important point of legitimacy in public organizations and it gives a good overview of communication and organization.

P. Kjær and M. Blach-Ørsten analyze in ► Chap. 36, "Journalism and Business Legitimacy," the role of business journalism in relation to business and companies. The chapter focuses on the way that journalism can improve or criticize the legitimacy of business corporations with regard to reputation of businesses in the public sphere. This issue of journalism and business legitimacy is an integrated part of the discipline of business journalism. The chapter proposes a categorization of creation, maintenance, and disruption of business legitimacy as a framework for the study of journalism of business legitimacy. This provides a theory of the form of legitimacy of journalism institutions. The theoretical framework for the study of journalism and business legitimacy is the institutional theory of Suchman, which can help to develop scholarship on journalism and business legitimacy. The chapter combines agenda-setting perspectives with the institutional approach to business legitimacy. This implies categorizations of forms of legitimacy and with an adequate typology of mediatization as well as a media organization typology.

F. Frandsen and W. Johansen discuss how to deal with business legitimacy in crisis in ► Chap. 37, "Crisis Communication and Organizational Legitimacy." The role of crisis communication in organizations is to help to maintain and restore legitimacy in organizational crisis. The chapter presents the most important dimensions of the concept of organizational legitimacy in the context of a business crisis. In this context, Suchman's theory of strategic legitimacy is a major reference for the definition of business legitimacy, which is related to the theory, and practice of crisis communication. In order to understand these theoretical aspects of business legitimacy in practice, the chapter uses the legitimacy of a large Danish company, namely the Danish Bank, as illustrative case of the theoretical developments regarding the creation and maintenance of business legitimacy. The case of the Danish Bank is illustrative since it illustrates how a bank business strives to receive legitimacy in the development of a society.

Philosophical Dimensions of Corporate Citizenship and Business Legitimacy

A. Lorch and C. Schank present in ► Chap. 38, "Business Legitimacy in the Social Market Economy: Individual and Corporate Economic Citizenship," corporate citizenship as a discussion of the different corporate responsibilities in the context of the social market economy. There is a close connection between the social market economy and the emergence of search for corporate citizenship in the context of advanced capitalism. When dealing with the concept of business legitimacy, it is important to be aware of the fact that the social market economy functions as a necessary foundation for the social political developments of capitalism. Moreover, in order to promote corporate citizenship, it is important to be aware of the social and economic conditions of search for legitimacy based on corporate citizenship. Thus, framework conditions and market boundaries contribute to definitions of corporate citizenship. In this context, the chapter looks at the economic order in the perspective of ordoliberalism as the theoretical foundation of republican business citizenship. With this, the chapter suggests a close link between ordoliberalism and business citizenship where ordoliberalism contributes to the promotion of business legitimacy.

C. Neuhäuser and S. Siebke propose in ▶ Chap. 39, "Dignity, Corporate Political Responsibility, and Business Legitimacy," an analysis of the relation between human dignity and the political responsibility of corporations. The chapter applies concepts of human dignity and human rights to corporations. This implies that human dignity should be taken seriously as an essential concept in business. Two cases are analyzed: The Volkswagen Diesel Gate and the Rana Plaza incident in Bangladesh, which is the terrible Rana Plaza building collapse. In analyzing these cases, the chapter takes seriously the concept of collective personality of transnational corporations. With this idea, the link between collective action and concepts of human rights and dignity becomes essential for understanding and conceptualizing business legitimacy. In addition, the chapter understands business legitimacy by drawing on Hegel's concept *Sittlichkeit* as ethical norm and custom or moral sensibility of a political and economic market community. Ethical norms in society are based on mutual recognition of individuals in the different spheres of society. Moreover, the chapter relates this concept of recognition to the idea of justice in relation business responsibility and legitimacy. Thus, the conceptualization of human rights of businesses is used to define strict moral duties of transnational corporations as foundation of corporate citizenship and business legitimacy.

J.D. Rendtorff discusses the philosophical foundations of the concept of corporate citizenship in ▶ Chap. 40, "Philosophical Theory of Business Legitimacy: The Political Corporation." This chapter addresses the concept of business corporation as a good citizen as a fundamental political-philosophical legitimacy strategy. Such a strategy of business legitimacy is based on a democratic-republican formulation of theory of legitimacy in business ethics. Thus, the chapter defines the concept of good citizenship in the light of a democratic corporate ethics as the basis of legitimacy. In addition, good corporate citizenship and the political firm are suggested as foundation of the definition of corporate social responsibility (CSR). The argument is that it is necessary to assume the notion of good citizenship to make sense of CSR, which can be considered as an argument for political CSR. The chapter discusses legitimacy strategies, legitimacy in the democratic-republican conception of corporations, cosmopolitan legitimacy of corporate citizenship, and examination of the role of good corporate citizenship in contemporary society.

J.D. Rendtorff proposes basic ethical principles as the foundation of philosophical theory of business legitimacy in ▶ Chap. 41, "Principles of Business Ethics and Business Legitimacy." The chapter discusses ethical principles of protection of the human person can be applied in business ethics. Basic ethical principles can be understood as the basis of protection of basic economic rights of the human person. Thus, the chapter shows how the values of autonomy, dignity, integrity, and vulnerability are foundational in business ethics as the basis for business legitimacy. The chapter suggests that these concepts can have fundamental significance both at the individual and at the organizational levels. These principles provide foundation for ethical standards of sustainability in a future global culture of human rights. The chapter gives a brief outline of the meaning of the concepts in business ethics illustrated by some examples of the uses of the concepts in different fields of business ethics as the foundation of business legitimacy.

Business Legitimacy as Institutionalization of Responsibility

M. Bonnafous-Boucher can be said to develop a stakeholder-based historically oriented legitimation paradigm of institutional analysis in ► Chap. 42, "Past Legitimacy and Legitimacy Under Construction." The chapter conceptualizes the path leading to business legitimacy by searching to understand the historical premises underpinning concepts of sustainability and responsibility in society in relation to the market. In particular, it is important to look at dimensions of legitimacy of the corporations in democracies on a historical basis. It is necessary that firms relate to their stakeholders and their environments in order to achieve, maintain, and develop business legitimacy. Here, the historical approach to business legitimacy integrates stakeholder analysis paradigms in the historical perspective. Moreover, the chapter focuses on understanding the stakeholder management and corporate institutions from the point of view of historical development. The chapter analyzes the role of representative democracy for understanding legitimacy. Moreover, stakeholders and civil society contribute to the formation of business legitimacy. Stakeholder theory and concepts of globalization and internationalization of corporations and liberal economies are required in order to understand formation of business legitimacy in contemporary economic developments.

J. D. Scheuer presents in ► Chap. 43, "Change, Institutional Theory, and Business Legitimacy," the problems of translation, change, and legitimacy in the perspective of neo-institutional theory and with regard to stakeholder management in a legitimate business organization. Translation practices are about translation of ideologies and discourses. Translation studies also concern how proposed ideas, norms, and values are translated, realized, and institutionalized in business practices and organizational practices. The chapter elaborates specifically translation and institutionalization of stakeholder concepts and stakeholder management in organizational processes of change in private business and public organizations. In particular, translation research in institutional theory can be used to approach analysis of negotiation and organizational identity with regard to the organization or institution as a boundary object in different social worlds and contexts of implementation of translation practices.

I. Jensen presents in ▶ Chap. 44, "Corporate Legitimacy and Institutionalization: From Corporate Innocence to Responsibility for Complex Impacts," a sociological analysis of the significant changes in the history of CSR and legitimation with focus on changed relation between responsibility and legitimacy in the perspective of institutionalization of different norms of social responsibility in business organizations and firms. Roughly, this development can be characterized as the development from the socially innocent company in the 1950s to global and collective responsibility of business in contemporary society. Thus, the chapter analyzes the changed values and norms that have had an impact on companies and the praxes of different agents in the last 70 years. As theoretical basis, the chapter proposes the theories of Sartre, Searle, and Habermas. These authors propose different concepts of institutionalization and of social responsibility as a result of interactions between many different agents. Moreover, we see historical development of the concept of legitimacy over this period of time. Thus, there is a change in the concept of legitimacy as acceptance of norms to collective responsibility. With this, the chapter proposes critical reflections about the foundations of institutions. Sartre contributes to understand the practice of agents behind institutional practices. Searle observes the dimension of institutionalization of social reality. Habermas provides understanding of the discursive processes justifying democratic social legitimacy. Thus, Searle talks about agentive functions, social facts, and collective intentionality institutionalization, while Habermas refers to the social coordination mechanism. Before analysis of specific historical developments, Jensen gives a summary of the concepts of the three social theorists. Sartre provides a conception of institutionalization of legitimacy as an institutionalized coordination mechanism that is realized in praxis. At another level there is a communicative coordination with discursive processes that involves normative an ethical validity criteria. At a third level this involves communicative and discursive processes that express the collective intentions and questions the legitimacy of corporate material impact, and at a fourth level we can observe communicative and discursive processes that initiate or change institutional coordination mechanisms. Based on the theoretical foundation the chapter provides a categorization of different periods of institutionalization of normative priorities, ending with the contemporary period where the Sustainable Development Goals (SDGs) have moved into the center of legitimate priorities. Thus, this approach to institutionalizations and changed conditions of legitimacy help us to understand the movement from the innocent company to the collectively and globally responsible company in the democratic process of society.

Management of Corporate Social Responsibility and Business Legitimacy

Y. Fassin, S. Liekens, and M. Buelens give an overview of the concept of social responsibility of the most important management thinkers in ▶ Chap. 45, "Major Management Thinkers on Corporate Social Responsibility." The chapter looks at a selection of the most prominent management thinkers or management prophets, including Frederick Taylor, Henri Fayol, Max Weber, Herbert Simon, Michael Hammer, James Champy, Henry Mintzberg, Geert Hofstede, Charles Handy, Elton Mayo, Douglas McGregor, Abraham Maslow, Peter Drucker, Michael Porter, Gary Hamel, C.K. Prahalad, John Kay, Tom Peters, Daniel Goleman, Rosabeth Moss Kanter, Chris Argyris, and Peter Senge. The selection is impressive although there is bias for men and for North America. The chapter makes clear that although many management thinkers did not use the concept of CSR, there may be an implicit vision of CSR in the conception of management theory. Based on the selection of management thinkers the chapter provides a systematic investigation of the concepts of CSR, business ethics, and stakeholder management in their theories. The overview is presented in some very clarifying schematic tables that give an important illustration of the scope of the concepts. With this illustration and overview, the chapter is very important for the *Handbook of Business Legitimacy* in order to understand the foundations of concept of business legitimacy in relation to the environment of the corporation. Thus, the chapter addresses the dimensions of the tension between acceptance of CSR as important and more skeptical views on CSR and business ethics. In the discussion, the chapter looks at this theme, but it also includes discussions of value and purpose, responsibility for the good, stakeholder management, and empowerment. The chapter stresses that most management thinkers are aware of the importance of good relations with the environment. Therefore, from this perspective, it can be argued that business legitimacy is essential for the views of management thinkers.

J. Delventhal gives a definition of the practice concept of legitimacy in ► Chap. 46, “Legitimacy, Institutions, and Practical Responsibility.” The chapter is a contribution to the theoretical analysis of the concept of responsibility in relation to institutional governance. The chapter presents the practice of responsibility in relation to the expectations of businesses in global governance. The problem area concerns the rationality of CSR in the different frameworks of different institutional dynamics. This relates to the concept of sustainable business legitimacy. Here, the chapter presents different concepts of sustainable legitimacy and universality of responsibility in the process of governance. Important authors like Jonas, Jaspers, and Heidbrink are discussed in the chapter as contribution to the discussion of the foundation of practical responsibility for legitimacy. The chapter also discusses the scope of universal responsibility as a means towards sustainability in the phases of reflection, prioritization, and collaboration. The chapter argues that responsibility needs to be situated and embedded in the context of sustainability in order to ensure a good practice of responsibility.

S. Carson discusses the relation between CSR and social legitimacy in ► Chap. 47, “Corporate Social Responsibility (CSR) as Social Legitimacy Management.” This chapter provides an analysis of CSR in relation to legitimacy management and business legitimacy. Such an analysis of social responsibility business can be built on social contract theory in relation to legitimacy management. An outcome to the chapter is a determination of the relation between CSR and legitimacy management. This approach follows the idea of the changed role of business in society, and it also discusses the relationship between legitimacy management and collective agency. Collective agency and responsibility is essential in a structured management of business legitimacy.

A. Ijabadeniyi discusses the perspective of reputation management on CSR in ► Chap. 48, "Transcending the Instrumental Logic of Social Responsibility: A Corporate Reputation Perspective." This chapter deals with an effort to overcome the instrumental logic of social responsibility when dealing with the problem of corporate reputation. The chapter contributes with discussion of CSR and legitimacy related to the concept of corporate reputation, which is often used in marketing and communication studies. The chapter focuses on CSR and ethical business practices in relation to the concept of corporate reputation. Accordingly, the chapter discusses strategic legitimation approaches and relates them to different concepts of reputation. Important are stakeholder's role in reputation and other dimensions of reputation than traditional market-driven concepts of reputation. Here, the chapter stresses that business ethics and responsibility overcomes the instrumental logic of CSR because reputation is dependent on stakeholders and therefore management should rely on CSR as a manner of improvement reputation. There is a social and strategic construction of reputation based on CSR, but this also has an institutional dimension following Weber and Suchman. This opens for the importance of corporate citizenship in order to improve and create business legitimacy in relation to CSR performance reputation. The chapter elaborates on the different dimensions of CSR – philanthropic, ethical, legal, and economic. Here the chapter provides a framework for CSR and corporate reputation arguing that reputation is essential for financial performance but cannot be reduced to instrumental reputation.

Accounting, Accountability, Stakeholders, and Business Legitimacy

G. Rusconi and M. Contrafatto discuss accounting and business legitimacy in ► Chap. 49, "Stakeholder Theory, Accounting, and Business Legitimacy." The chapter begins by presenting recent scandals in the business world related to accounting and finance of business. These scandals show need for developing ethical systems and concepts of accounting for business organizations in order to gain business legitimacy. In this context, business legitimacy of ethical systems of accounting can be defined with the help of Mark C. Suchman's concept of strategic management and legitimacy. The concepts of pragmatic, cognitive, and normative concepts of legitimacy can be applied to conceptualized legitimation and legitimacy strategies in business accounting. The chapter addresses a legitimacy gap in the accounting systems and argues for an ethical system's theory of accounting. In particular, the chapter presents a demonstration of the relation between stakeholder theory and legitimacy theory. With this, business economics needs the necessary ethical foundations for legitimacy of accounting and accounting theory. Thus, the chapter emphasizes the important ethical dimensions of accounting and accounting systems which are often-forgotten practical search for business legitimacy.

S. Kacanski shows the relations between social network analysis, governance, and accounting in ▶ Chap. 50, "Corporate Governance, Social Network Analysis, and Business Legitimacy." The chapter combines empirical and theoretical approaches to corporate governance and network analysis. In this context, it is relevant to focus on general methodology of corporate governance and network analysis that can be used for country analysis. This includes indication of legitimacy challenges with regard to corporate governance and network analysis which can work as a theoretical framework as a general framework for analysis of legitimacy in corporate governance networks. Thus, there is also a possible applicability of the theoretical framework for specific empirical analysis. With this approach, this chapter proposes an analysis of how social network theory can be used in relation to understanding legitimacy and corporate governance, including business legitimacy in the field of accounting research and practice.

L. San-Jose, X. Mendizabal, and J. Retolaza analyze the social dimension of accounting in relation to legitimacy in ▶ Chap. 51, "Social Accounting and Business Legitimacy." This chapter discusses the legitimacy of social accounting and this includes the problem how it is possible to monetize social value and create legitimacy on that basis. The chapter presents different financial indicators and it relates very well to the theory of legitimacy from Suchman to Suchman and Deephouse which is very important in the discussions of legitimacy. The chapter also presents very good analysis of different indicators of concepts of disclosure, stewardship, impact investment, and the common good. There is also a discussion on social return on investment and sustainability reporting in the perspective legitimacy of social accounting.

Legitimation Strategies for Business Corporations

M. Frostenson presents the multiple normative challenges of business legitimacy in complex society in ▶ Chap. 52, "Business Legitimacy and the Variety of Normative Contexts." This chapter discusses a complex problem in the discussion of legitimacy, namely how to see business legitimacy in different normative contexts. In fact, here the challenge is that the normative contexts in different systems may be very different and heterogeneous. In order to discuss this problem the chapter addresses the different dimensions of right and wrong in relation to different normative contexts with regard to the emergence of legitimacy and legitimation. Here, corporations face the complexity of legitimation processes and the normative contexts. The chapter draws on institutional theory and also on different approaches to organization theory. It is indeed a challenge for multinational companies to operate in different normative contexts. Thus, contemporary businesses need to develop strategies to deal with polycentricism and complexity of different normative contexts of strategy and business economics.

A. Hansen presents how business legitimacy has become an important concept in service marketing in an analysis of different legitimizing strategies in ▶ Chap. 53, "Legitimizing Catchwords of Service Marketing: The Role of Academia." The chapter presents the challenges to businesses and business corporations in service marketing and legitimation in relation to the academic discipline of service marketing. The chapter looks closer into some of the legitimation problems of the difference between the service academic world and the role of the customer. Looking at the confrontation between academic leadership conceptions of service marketing and specific customer logics of the practice of legitimation in service marketing, it emerges that service marketing is basically driven by economic market logics of justification. With this, the chapter argues that there is a move of legitimation and creation of social authority in academia with regard to the basic concepts of service and legitimation of service marketing.

J. Møller discusses legitimacy in business start-ups in ► Chap. 54, "Deficit of Legitimacy in Startups: Main Consequences and Strategic Solutions." The chapter presents the consequences of different strategic conclusions in business start-ups. Strategy of innovation in start-ups includes an important dimension of legitimacy. The chapter elaborates on evolutionary theory and institutional concepts of entrepreneurship and the importance of social relationships for legitimacy of innovation. An important theoretical perspective on empirical legitimacy strategies is institutional theory that can be used to understand legitimacy deficit of start-ups and innovation for business legitimacy.

K. Sund analyzes changing conditions of legitimacy in complex economies in ► Chap. 55, "From Cooperation to Competition: Changing Dominant Logics and Legitimization in Liberalizing Industries." This chapter discusses the transition from logics of cooperation to logics of competition within strategic groups in liberalizing industries. The chapter is based on institutional theory and gives a case analysis of the post offices legitimation situation from the move from cooperation to competition. The chapter includes institutional theory as an important basis for business legitimacy and in particular to the concept of legitimacy as proposed by Suchman as the basis for understanding changed logics of business legitimacy moving from cooperation to competition.

Organizational Identity, HRM, Employee Motivation, and Business Legitimacy

A. Wæraas presents in ► Chap. 56, "Organizational Identity and Corporate Social Responsibility (CSR) Legitimation," the use of business legitimacy to improve organizational identity. The chapter looks at fundamental concepts of CSR, legitimation, and organizational identity. Thus, the chapter demonstrates the role of concepts of environmentalism, CSR, sustainability, and altruism in the formation of a normative identity of organizations. This normative identity is also essential in the definition of the "who we are" of an organization. Here the chapter focuses on the fact that many organizations have a utilitarian and pragmatic approach to identity. There is also a symbolic dimension of identity contributing to the construction of business legitimacy. The chapter presents models of public organizations (municipalities in Norway) and private companies (Fortune 500 companies) that demonstrate how these companies use identity to form a mission and vision. Thus, there is a close link between moral legitimation and the concept of business legitimacy.

M. Neisig presents in ► Chap. 57, "Human Resource Management and Business Legitimacy: Changing Roles and Legitimacy-as-Process," the function of business legitimacy in human resource management. The chapter shows how business legitimacy is an integrated part of management of the people and personnel of organizations and that this is important to ensure the robustness and endurance of organizations. With current social developments towards sustainable transformation of the economy, the role of sustainability and responsibility in human resource management can also become important for business legitimacy. The chapter evaluates different paradigms of management practices with relation to the different focuses of HRM, including sustainability and legitimacy of HRM. In this context, the chapter focuses on how management contributes with strategies for legitimacy as an important dimension of different elements of HRM. In this context, the chapter demonstrates how business legitimacy is integrated in the epistemology and ontology of HRM. Thus, business legitimacy of management of human resources is based on a concept of legitimacy as emerging in a legitimizing process with regard to essential stakeholders of the HRM process.

M. Thejls Ziegler discusses the challenge of employee motivation with regard to business legitimacy in ► Chap. 58, "Motivating Employees in a Globalized Economy: The Moral Legitimacy of Applying Gamification in a Corporate Context." The chapter explores a new field of business legitimacy studies, which is the problem of using gamification in HRM for motivating employees. The chapter presents a detailed analysis of HRM and legitimacy taking into account neoliberal criticisms of gamification as management manipulation of employees. In this context, the chapter also elaborates on the big picture of development of HRM before and after the financial crisis. Gamification is defined as a more recent method applied by management for fertilizing persona commitment to work life. The chapter presents different cases of using games for training employees, for example, in Delta, General Electric, and other US companies. Thus, the chapter demonstrates how the concept of legitimacy becomes polarized in the context of HRM use of gamification.

A. Scupola discusses HRM, SMEs, and new technology in ► Chap. 59, "Business Legitimacy and Adoption of Human Resource Information Systems in Danish SMEs." This chapter presents literature review, empirical material, and a case study of business legitimacy and adoption of human resource information systems in Danish SMEs. The chapter provides a useful case study of use of new technology models in human resource management. The chapter discusses the adoption of technology in relation to human resource information systems and this is considered in the framework of technology, organizational and environmental application. The chapter demonstrates legitimacy issues and ethics and CSR concerns in relation to adoption of human resource management systems. The chapter shows how adoption of new technology can contribute to create agile organizations including improvement of business legitimacy.

Business Economics, Finance, Governance, and Business Legitimacy

G. Aras presents the contemporary challenges of sustainability for business legitimacy in ▶ Chap. 60, "Finance, Sustainability, and Business Legitimacy." The chapter demonstrates the challenges of defining business legitimacy on a close relation between finance, sustainability, and business legitimacy. The chapter provides an overview of legitimacy challenges related to the need for a new theoretical framework of sustainability facing global risks in the economic age of transition towards sustainability. The chapter defines sustainability as one of the most important issues of our time with regard to business legitimacy. Moreover, the concept of sustainability include the triple bottom-line with its environmental, social, and economic dimensions. In addition, the chapter presents a model for integrating the different societal, environmental, and organizational dimensions of sustainability integrated with the challenges of finance. The chapter suggests four dimensions of sustainability in a model of transformation of a new society of sustainability. This is documented the emphasis of the need of companies to legitimize themselves in society. Thus, in order to explore sustainability challenges of business legitimacy, we can combine legitimacy theory, institutional theory, and stakeholder theory with regard to clarification of the norms leading to legitimacy.

J. Wieland and D. Fischer present the relation between transaction cost theory and business legitimacy in ▶ Chap. 61, "Transaction Cost Theory and Business Legitimacy," by discussing the role of business legitimacy in transaction cost economics. Dealing with transaction costs economics it is important to be aware of the changed conditions of legitimacy in society and ask the question how these conditions affect economic theory and economic science. Transaction cost economics has attempted to integrate institutional conditions of economic action in economic theory and research. The chapter presents a detailed analysis of how business legitimacy has an impact on transaction costs and the institutional environment of the business corporation. The chapter discusses stakeholders in relation to economics and the distinction between ethical expectations, legality, and legitimacy in particular between economics and legal regulation. This analysis shows how transaction cost economic analysis of the firm needs to integrate ethics and ethical expectation. Thus, this chapter provides an overview of transaction costs theory and business legitimacy.

T. Talaulicar discusses in ▶ Chap. 62, "Corporate Governance and Business Legitimacy," the relation between corporate governance and business legitimacy. The chapter provides a definition of business legitimacy reaching back to Suchman's definition institutional theory. The chapter discusses codes and standards of corporate governance related to indicators, performance and in relation to the tensions between shareholders and stakeholders. Following Suchman, corporate governance is seen as a measure that can contribute to provide legitimacy. If we professionalize corporate governance, we can contribute to provide legitimacy of the business corporation. In this context, the chapter rightly emphasizes that social norms and institutions are contributing to the formality of creation of business legitimacy. In this context, the chapter discusses legitimate systems of corporate governance providing the good standards for corporate governance, and it is important to notice that this contributes to form the specificity of corporate governance systems. In addition to the discussion of the improvement of standards, the chapter also discusses the legitimation of new forms of corporate governance as contribution to business legitimacy. Thus, with this, the chapter clarifies the relations between business legitimacy and corporate governance.

E. Jonsson analyzes the role of boards in corporate governance processes for legitimacy in ▶ Chap. 63, "Corporate Governance and Corporate Legitimacy: The Role of Boards." The chapter gives an overview of corporate governance with regard to the role of the boards in achieving legitimacy. The chapter presents important aspects of compliance and performance, stakeholders, and corporate legitimacy related to the discussion of the role of the boards in corporate governance with the aim of achieving business legitimacy. The chapter addresses the dominance of the shareholder perspective in relation to the firm's license to operate in relation to the foundations of corporate governance. The discussion of agency theory and its possibilities and limits is very important in this context. Here, the chapter also includes a discussion of transaction cost scholar Williamson's economic institutionalism. One perspective here is the dimension of agency and the limits of stakeholder performance. Moreover, the chapter problematizes the role of boards in relation to legal theory and institutional theory as well as stakeholder theory. The conclusion mentions very rightly the importance of moving corporate governance towards stakeholder theory and institutional theory.

A. Prinz investigates the role of business legitimacy for economic theory of finance in ▶ Chap. 64, "Finance, Economic Theory, and Business Legitimacy." The chapter evaluates the different contributions of the different economic theories to business legitimacy. This includes an analysis of the different concepts and theories of the firm in relation to business legitimacy. The chapter moves beyond traditional theories of the firm and introduces other theories of social norms enforcement in economics that contributes to value maximization. Business legitimacy means that economic markets of finance must be open to social dimensions of economics to take into account the impact of the business environment on business legitimacy of the firm.

Legitimation with Different Forms of Practice of Legitimacy in Complex Societies

T. Gössling and T. Straub provide in ▶ Chap. 65, "NGOs, Institutions, and Legitimacy: Empirical Findings and a Research Agenda," an overview of the concept of business legitimacy in relation to NGOs and involvement of NGOs in legitimacy construction and creation of businesses legitimacy. This perspective includes an empirical focus of research questions with regard to theory and empirical applications of theory with regard to the interaction of NGOs and businesses in the creation of business legitimacy. The focus of the chapter is the use of empirical examples to illustrate theoretical points and theory development with regard to development of business and NGOs in legitimacy creation. The theoretical focus of the chapter is institutional theory with Suchman's concept of legitimacy. In this context, the concept of moral legitimacy can explain NGOs in their interaction with business. Moreover, the chapter uses the resource-dependency perspective for understanding business legitimacy and NGOs in the selected regions of Moldavia. Thus, empirical examples function as the basis for conceptualization of a general conception of business legitimacy in the relation between businesses and NGOs.

P. Beyer presents the function of values-based management for improving business legitimacy in ▶ Chap. 66, "Values, Values-Based Management, and Business Legitimacy." This chapter gives an overview of how to use value-based management for improving business legitimacy in complex societies. The chapter provides a practical guide to the dimensions of management of values in business administration and in business corporations. The chapter also presents practical guidance for business legitimacy and suggestions of how to develop business legitimacy in an organization which needs to develop and improve values-based management. Thus the chapter provides tools to understand the practical dimensions of implementing business legitimacy with values-based management in organizations.

E. Pezet and J. Poujol present in ▶ Chap. 67, "Working in the Brand Economy," the legitimacy requirements of changed conditions of work, labor, and experience in the contemporary brand economy. Moreover, the chapter discusses what happens to business legitimacy when the concept of work enters into the brand economy. A normative concept of business legitimacy in complex societies implies investigating a humanist approach to management and HRM, including a discussion of the relation between the Marxist and the Hegelian approaches to the concept of business legitimacy. From this point of view, the chapter introduces the Hegelian dialectics between master and slave as relevant for understanding the dimensions of HRM in relation to the development of legitimacy in complex societies. In order to define the concept of working in the brand economy, the chapter draws on Hannah Arendt's concept of "animal laborans" as definition of a worker that is reduced to an element in an industrial economy. The problem is that most workers are not free at work and reduced to mere instruments of their employers. Here, the new brand economy includes a huge challenge to the concept of work and expresses the need for a humanistic concept of work for this brand economy in order to deal with business legitimacy with regard to the creation of new work conditions in complex societies.

Conflicting Notions of CSR and Business Legitimacy in Globalization

K. Mogensen presents the concept of corporate public diplomacy as an essential concept of public relations of the relation of the firm to its environment in ▶ Chap. 68, "Legitimacy Issues in Corporate Public Diplomacy." The chapter clarifies the definition and content of the concept of public diplomacy in relation to the concept of business legitimacy. Corporate diplomacy can be defined as a new development of business responsibility, trust, and sustainability in the process of globalizations. The chapter emphasizes how the concept of business legitimacy includes an approach to internationalization of corporations that has to relate to state governance in areas of limited state power. The concept of corporate public legitimacy is important for the conceptualization of global responsibility of multinational corporations. Thus, the chapter proposes a historical and conceptual review of the different dimensions of corporate diplomacy in the context of globalization.

S. Azizi analyzes corporate social responsibility in relation to developing economies in ▶ Chap. 69, "Political Corporate Social Responsibility (CSR), Development, and Business Legitimacy." The chapter presents a critical interpretation of the concept of political CSR in relation to business legitimacy. Global society faces political turn in relation to CSR in developing countries. The problem is whether political CSR really can replace states as political actors for construction of society. The chapter shows how the turn in political CSR has been the focus on corporations as moral and democratic actors that assume political roles in society in order to achieve business legitimacy. The chapter argues for the necessity of case studies in relation to this application of the concept of political CSR. In particular, there is the challenge of multinational corporations that are playing an increasing political role in society. The chapter here follows Suchman's concept of legitimacy and goes on to address different concepts of the political role of corporations and indicates the necessity of criticizing the concept of political CSR and indicates the problem of political CSR becoming instrumental instead of moral. In addition, the theory of political CSR emphasizes the need of reconceptualization that is embedded in democratic mechanisms of discourse, transparency, and accountability, as suggested by Scherer and Palazzo. The chapter points to the problems of this concept of CSR and shows some problems of the political turn of CSR in the case of globalization.

U. Mulkhan develops this challenge for business in the Anthropocene in the context of human rights in ▶ Chap. 70, "Eco-justice Perspective and Human Rights-Based Approach to Responsible Business in the Indonesian Mining Industry." This chapter presents the eco-justice perspective and human rights focused discussion of responsible business in the Indonesian mining industry. This topic is an important topic as a case study of business legitimacy. Both international and domestic private companies operate in Indonesia in order to do mining. Since many stakeholders are involved in the mining industry, it is important that there is a focus on human rights and environmental justice. Although historically, there have been many problems of respect for the environment and human rights in the Indonesian mining industry, the chapter rightly addresses the need for more business concerns with social and environmental issues. In addition, it is important to be aware that this concerns all stakeholders of the company, including employees and their families, local community, customers, civil society, and the Indonesian state. While there historically were problems of human rights in this case study of business, legitimacy shows that it is necessary to develop a human rights-based approach, which is combined with eco-justice and respect for the environment. With interviews as documentation the chapter shows that a good relation between companies and communities is about to be established. Here, the UN guiding principles for human rights are integrated with the UN sustainable development goals (SDGs). In this context, the chapter gives some proposals for different aspects of good mining practices involving concerns for ethics and values of local communities and stakeholders in mining. In addition to the UN guiding principles and SDGs, we can here mention CSR standards, for example, the ISO26000 guidelines, which however may also encounter difficulties of implementation in local context. Thus, the chapter argues that the Indonesian mining industry is aware of the environment as a crucial issue. However, the approach to CSR remains instrumental rather than moral, founded on the concern to avoid the destruction of the environment. This is important to take into account when applying the eco-justice and human rights perspective in Indonesia.

Business Legitimacy, Electronic Economy, Digital Work Life, and Surveillance

W. Gonzalez presents the contemporary legitimacy challenges in ▶ Chap. 71, "Electronic Economy, Internet, and Business Legitimacy." This chapter about the electronic economy, internet, and business legitimacy gives an overview of the problems of business legitimacy in relation to the electronic economy. The chapter starts out by defining the concept of business legitimacy and then relates to the challenges of the electronic economy. The chapter relies on well-established definitions of business legitimacy and gives a presentation of business legitimacy in relation to the development of different issues in the electronic economy. The chapter shows how the configuration of the electronic economy includes an element of business legitimacy with its different elements of economic, scientific, technical, and social dimensions of the economy. From there the chapter presents an overview of the different dimensions of the electronic economy linked to the concept of business legitimacy. It is essential to this chapter to demonstrate that business legitimacy is a precondition of the electronic economy. This is illustrated by the case of copyright law, and finally the chapter contains a summary of the different dimensions of business legitimacy.

S. Wong presents the challenges for legitimacy of digital labor in ▶ Chap. 72, "The Future of Work, Digital Labor, and Business Legitimacy." The chapter discusses the future of work in the context of polycentric legitimacy requirements of an economy of digital labor and demonstrates the challenges to business legitimacy in the so-called gig economy. The chapter analyzes how the working conditions in the gig economy with new digital possibilities and challenges change and pose new ethical problems of business legitimacy. This includes the role of online labors engaging in this economy. The new gig economy changes the employee-employer relationship with increased power to the employers as the result. This leads to new form of hiring, new employment forms, and new employment paradigms, based on concepts of flexibility, but also with challenges of low payment and insecure working conditions. With these challenges of the new gig economy, contemporary legitimacy challenges face the complexities of a society with many normative dimensions.

K. Moulaï analyzes surveillance in the context of the contemporary electronic society in ▶ Chap. 73, "Video Surveillance in Working Contexts and Business Legitimacy: A Foucauldian Approach." The problem of video surveillance in the working environment can also be considered as a part of new digital society. The chapter addresses the dynamics of video surveillance as a subjectification process of the body of the worker in the context of what Foucault calls discipline and disciplinary society. The problem is to which extent it is legitimate to practice surveillance of employees in the context of the surveillance practices of society. There is an extended form of social control in the new media, and surveillance is really at the limits of moral discipline in contemporary society. The chapter discusses the potential illegitimacy of surveillance of employees in the combined perspective of philosophy and business sociology. The techniques of the body as proposed by Foucault include cyberviolence, time, production, and control of vision. The new techniques of supervision can be seen as application of the gaze of surveillance to the context of work life.

P. Bandyopadhyay and B. Pandey discuss legitimacy in the context of labor unions in ▶ Chap. 74, "Legitimacy of the Right to Form Digital Labor Union/ Association in Developing Economy." This chapter seeks to apply the concept of legitimacy in relation to aspect of the developing economy in India, focusing on the digital labor union/association. This analysis is based on the use of the concept of legitimacy in order to understand legitimacy of right to form digital labor union/ association in developing economy in the context of the struggle for free labor rights of employees of businesses in the developing countries. Business legitimacy is at the center of the analysis, and the chapter provides definition of legitimacy of rights and associations in the digital economy.

Business Legitimacy in Different Parts of the World

M. Siltaoja, C. Egri, O. Furrer, M. Haapanen, R. Alas, and K. Sinding present strategic dimensions of corporate environmental responsibility in ▶ Chap. 75, "Configurations of High Corporate Environmental Responsibility with Regard to Business Legitimacy: A Cross-National Approach." This chapter proposes an analysis of configurations of responsibility in relation to environmental responsibility as the basis for strategic business legitimacy in the Nordic countries. The chapter presents a theoretical framework of different strategies of corporate responsibility in relation to environmental responsibility. The theoretical framework based on institutional theory and stakeholder theory is applied to a large empirical framework with relevant methodology and techniques of analysis. There is focus on strategies and models for adoption of environmental responsibility in these companies in the Nordic countries. The chapter has compiled data from Nordic companies that is presented from the point of view of business legitimacy, stakeholder theory, and institutional analysis.

M. Storchevoy and K. Belousov present the aspects of business legitimacy in Russia in ▶ Chap. 76, "Evolution of the Russian Digital Media Market: Legitimacy of the Illegal." This chapter discusses the legal and illegal dimensions of business legitimacy with a case study about copyright and business legitimacy in the Russian digital market. The chapter analyzes how what is illegal may become legitimate while still being illegitimate. This is an important challenge and perspective for business legitimacy. The chapter gives a good overview of the development of media copyright law in Russia and how intellectual rights are developed. This is done with a description of the developments of the copyright protection and legal initiatives for legitimacy in the different parts of the industry of the Russian market for media products like music, films, CDs, and other digital media. The chapter illustrates how new legitimacy develops in the context of evolving markets of business and how legitimacy moves in the tension between ethics and law, ethical and non ethical, and legal and illegal, where what is legal and what is considered ethical is not always the same thing.

S. Horiguchi analyzes norms of business legitimacy in Japanese cultural tradition in ► Chap. 77, "Japan, Business Ethics, and Business Legitimacy." This chapter is a good presentation of CSR policies in Japanese companies in relation to business legitimacy. The chapter explains how Japanese companies work with CSR policies and how they relate this to management and to the concept of legitimacy. Moreover, this includes a presentation of explicit and implicit CSR and how this distinction applies in Japan. The chapter focuses in particular on the concept of Kyosei as framework of responsibility in Japan. In addition, the chapter relates to different cultures by relating the concept of business legitimacy to Hofstede's concept of business culture. Finally, the use of institutional theory provides a framework for understanding business culture and business legitimacy in Japan.

A. Hennig presents different dimensions of business legitimacy in China in ► Chap. 78, "Business Legitimacy in Asia: Focus on China." The chapter discusses business legitimacy in the Asian context with focus on China. The chapter mentions that Daoism and Confucianism are important moral and intellectual traditions that influence the social and political values of China during centuries. These doctrines have recently been accomplished by values from communism and socialism that influence perceptions and conceptions of business legitimacy. In this context, there is a close relation between traditional Chinese philosophy and conceptions of responsible business and the ethical climate in China. The chapter gives a historical overview of the liberalization of business in China in the context of these traditional values and philosophies. At the same time, the traditional values of search for a virtuous and harmonious society need to deal with contemporary problems of poverty and environmental degradation. The concept of business legitimacy in China needs to deal with these social and environmental challenges. Therefore, the concepts of organizational and institutional legitimacy need to be considered in the larger perspective of a good society. Business legitimacy is about embedding the organization in a larger social system. With this, the chapter demonstrates the move from organizational to political legitimacy in China with special focus on the concept of the institutional legitimacy of responsible business. Accordingly, in China, this institutional concept of legitimacy implies a strong compliance with the state's socio-political vision in order to deal with social and environmental problems.

Accordingly, the chapter shows how the search for harmonious society with Confucianism and Daoism has been a driver for responsible business behavior. This traditional philosophy influences the socio-political vision of government and contributes to shape the concept of business legitimacy in China.

M. Rasmussen analyzes the relation between legitimacy and leadership in Greenland in ▶ Chap. 79, "Practicing Legitimate Leadership in Territories of Interactions in Greenland." This chapter provides perspectives on business legitimacy studies in the context of leadership in Greenland, both theoretically and empirically. The chapter begins by defining leadership in Greenland as focused on collective interactions. The scope of analysis is empirically a study of legitimizing leadership practices in Greenland from the point of view of ethnographic studies based on phenomenological methods of interpretation and sense-making. Theoretically, the chapter proposes a model for studying legitimacy, based on Suchman's theory of legitimacy combined with ethnographic study of leadership practices. The chapter also touches on Stacey's concept of responsive leadership processes in organizational settings and contexts. Thus, this chapter represents an empirical application of Suchman with ethnographic methods to the study of leadership and management practices in Greenland.

Polycentric Dimensions of Business Legitimacy in Complex Societies

S. Holmström discusses the complex strategies of legitimization of business companies in differentiated societies in ▶ Chap. 80, "Legitimizing Practice Forms During Transformation of a Legitimizing Business Paradigm: Changing Strategies and Reasons." The chapter presents the changing strategies and rationalities for different legitimacy activities during the process of legitimation of business organizations. The chapter presents different ways of legitimizing that are proposed by different companies in the different contexts of management, including stakeholder management and CSR and other business and society relations. In the context of polycentric, differentiated societies, the chapter discusses different forms of analytical strategies that businesses use for achieving legitimacy. For example, the legitimizing paradigm of blindness as a defense strategy, which is just one of many ways an organization deals with legitimizing and legitimacy. Indeed, the concept of the reflective organization is important as a way to understand the different rationalities of legitimizing for business legitimacy in the context of highly complex, differentiated, and polycentric market economies.

L. Thompson provides a discussion of the necessity of a more open and complex concept of business legitimacy in polycentric contemporary society in ▶ Chap. 81, "Intersectionality and Business Legitimacy." The chapter documents the importance of intersectionality for business legitimacy. Intersectionality means expanding parameters of social justice and inclusion. Moreover, intersectional thought promotes the full development of human capabilities and freedom for all. Thus, the chapter shows the importance of intersectionality for business legitimacy. The chapter gives a precise overview of the new current of intersectionality in ethics, social studies, and philosophy and shows why this concept is important for business studies and for the research on business as a human institution. The chapter highlights the concept of intersectionality as a critical, humanist and radical activist approach that was in the beginning proposed by post colonial African American scholars who want to expand the western concept of feminism that they thought were too limited. They were critical towards arbitrary, socially constructed hierarchies based on social constructions of class, gender, ethnicity, sexual orientation, or other essentialist categorizations and classifications reifying human dignity and worth in society. The chapter suggests that the concept of intersectionality helps to be aware of the need for social justice in business performance and economic development. With this emphasis on intersectionality as an activist ethical assertion, the chapter gives a good overview of the dimensions of intersectionality as concept to ensure full flourishing of humanity and human potential with positive emphasis on human differences rather than oppression and destruction. The chapter presents shortly critical theory, critical race theory, equity and equality studies, and different waves of feminism, gender and sex, gender studies as different theoretical and practical approaches that rely on intersectionality. The roots of the concept imply human rights movements, slavery critique, and civil rights and human equality studies in the United States.

M. Thejls Ziegler analyzes the cultural and societal developments of business legitimacy in contemporary society in ▶ Chap. 82, "Cultural Contradictions of Business Legitimacy." The chapter proposes a description of the informal and formal dimensions of business legitimacy, related to the cultural contradictions of capitalism and the new left. The chapter relates stakeholder theory and order ethics to these cultural contradictions of late capitalism in order to demonstrate the difficult sociological conditions of business legitimacy. In addition, the chapter proposes a distinction between formal and informal dimensions of business legitimacy. The discussion of the new left in relation to the contemporary challenges of business legitimacy shows the difficulties of finding a relevant concept of business legitimacy, being able to overcome contradictions in the definition of business legitimacy.

Lars Fuglsang presents the vision of legitimacy for innovation in complex societies in ▶ Chap. 83, "Innovation, Bricolage, and Legitimacy." Bricolage can be said to be the important condition for innovation in contemporary economic markets. This chapter presents the literature on bricolage, innovation, and legitimacy, which is very relevant for the handbook. The chapter shows how bricolage is a practice-based ground for innovation, and this is something that is not always controlled beforehand. After presenting the concept of bricolage the chapter discusses the legitimacy of the practice of bricolage in innovation. This includes legitimacy theory on the basis of the sociological approach by Mark C. Suchman and relates this to other concepts of legitimacy. The chapter presents the concepts of pragmatic, cognitive, and moral legitimacy from Suchman's theoretical perspective and applies this to the concepts of bricolage and innovation, which are essential for business legitimacy challenges in the contemporary knowledge economy.

Sustainable Development, Ecology, the Anthropocene, and Business Legitimacy

O. Jakobsen and V. Storsletten present in the foundations of an ecological concept of sustainable economics in ▶ Chap. 84, "Ecological Economics and Business Legitimacy." The chapter provides an overview of the emerging field of ecological economy from the perspective of the tradition of ecological economy for ecological transition for sustainable development. The chapter begins with philosopher of sciences Imre Lakatos' distinction between a hard core and a protective belt in order to discuss the possibility of revolutionary change with ecological economy for a sustainable transition in society. Moreover, the chapter focuses on the need for the transition from the present capitalist economy with bad consequences for the environmental and social health of the planet towards a more sustainable and ecological economy. The fundamental question of ecological transition and ecological economy is whether we can overcome ideology and make another ecological and environmentally friendly economy possible. The chapter discusses this question in dialogue with important authors like sociologist Mannheim and philosophers Ricoeur and Levinas who present the possibility to overcome present ideology with a utopia of a better society. The discussion is important for the discussion of a new kind of business legitimacy. Indeed, the problem of transition towards ecological economy is essential in our present society. Thus, the focus of this chapter is the possibility to move towards an ecological utopia breaking with the ideology of the present system in the transition towards sustainable development.

A. Havsteen-Mikkelsen analyzes the conditions of business legitimacy in the area of the Anthropocene in ▶ Chap. 85, "Aesthetics of the Anthropocene: And How They Can Challenge Business Ethics." The chapter describes the Anthropocene challenges to business legitimacy. The chapter demonstrates the critical dimensions of the Western lifestyle with the global environmental crisis and the global climate crisis as a result. In this situation of global crisis moving towards an apocalypse, global business responsibility for economic transformation towards sustainability receives increased importance. With this background, the chapter describes how contemporary art challenges business legitimacy and puts emphasis on the responsibility of all humanity. Aesthetics of the Anthropocene is built on awareness of the Anthropocene where climate crisis is an essential challenge to business organization and capitalism because capitalism uses all resources and explores the world. Thus, the chapter argues that art combined with critical non-philosophy exploring the limits of established concepts can contribute to raise awareness about the global responsibility. The artistic project creates a community of contribution that addresses the global responsibility of humanity.

R. Torelli and F. Balluchi discuss environmental ethics and business legitimacy in ▶ Chap. 86, "Business Legitimacy, Agricultural Biodiversity, and Environmental Ethics: Insights from Sustainable Bakeries." This chapter presents analysis of the relation between biodiversity, ethics, and agriculture in relation to the agricultural industry. The focus of analysis is the bakery industry with its different stakeholders with different moral values and ethical claims. The chapter is structured as a case study of agricultural biodiversity with focus on sustainable transformation and ethical relations to nature. The chapter looks at the behavior of different stakeholders in relation to production and sales activity in order to understand the dynamics of business legitimacy in environmental business.

J.D. Rendtorff presents the relation between sustainability, innovation, and business legitimacy in ▶ Chap. 87, "Sustainability, Basic Ethical Principles, and Innovation." This chapter shows how a phenomenological ethics of the body can be integrated into an environmental philosophy of business ethics and sustainability. The chapter proposes the concepts of autonomy, dignity, integrity, and vulnerability as the foundation of sustainable development and sustainable innovation. This analysis demonstrates that environmental ethics can be regarded as an effort to go beyond anthropocentric ethics towards a broader conception of environmental ethics by incorporating stakeholder theory and ethical principles as the basis of a broader ethical concern for animals, nature, and the environment. Finally, the chapter explores the basis for innovation and organization in an ethical theory of sustainability.

Business Legitimacy and the Sustainable Development Goals (SDGs)

B. Hollstein gives a pragmatic argument for the ethical foundation of transformation to sustainability in ▶ Chap. 88, "Role of Corporations in the Great Transformation to Achieve Global Sustainable Development Goals: A Pragmatist Perspective." The chapter presents the pragmatist economic ethics in relation to corporate work with the SDGs for global development. The problem is how corporations can be change agents in the economic transformation and contribute to a more sustainable future. The chapter considers the SDGs a moral compass for the future. On this basis, the theory of Hans Joas of pragmatist action theory is applied for understanding corporate contributions to social justice in globalization. The question is whether it is possible to realize the goal sustainability in a pragmatist perspective. Here, the chapter discusses the SDGs in relation to intergenerational justice. What is important in pragmatism is that the pragmatist action theory helps us to understand how values become reasons for action. This relation between values and action is justified by the development of some of the most important concepts of pragmatist economic ethics. Hans Joas has defined this based on the work of Mead and Dewey. Pragmatism presents the relation between values and action in corporations as founded on concepts of embeddedness, understanding of the human person as a concrete embodied person, realization of the social character of norms, and ethical practices. Thus, we can develop a pragmatist economic ethics of the great transformation based on the normative claims of the relation between value and action. Here, corporations are change agents. Although they have stable economic institutions, they contribute to changes with new narratives, cultures, and balances of stakeholders for intergenerational structures. Corporations face complexity and uncertainty pragmatically modifying institutional practices with value changes. Here, corporations can act as change agents for SDGs.

O. Hustad analyzes partnerships and business legitimacy in ▶ Chap. 89, "Cross-Sector Partnerships as a Source of Business Legitimacy in the Sustainable Development Goals Era." This includes discussion of the concept of cross-sector partnership as a source of legitimacy in the era of the SDGs. From this perspective, the chapter goes deeper into the analysis of the SDGs and specifically Goal number 17 and presents how this goal requires business legitimacy through partnership to confront global challenges of the Anthropocene. The chapter introduces globalization and the Anthropocene as two drivers of legitimacy of partnerships that make partnership so important for legitimacy in the present conditions. In addition, the chapter analyzes how there may be governance gaps that partnership between business, governments, and NGOs can fill. This analysis is based on institutional theory combined with Mark C. Suchman's concept of legitimacy. This includes analysis of contemporary applications of a definition of legitimacy going beyond the initial definition of legitimacy in institutional theory. In this context, empirical developments of formation of partnerships between business and NGOs have an impact on this concept of institutional theory and legitimacy.

M. Frostenson analyzes the possibility of accounting for SDGs in ▶ Chap. 90, "Accounting Systems and Integration of Sustainable Development Goals (SDGs) into Corporate Operations." This chapter presents SDGs as a company guide for reporting SDG compass and other tools that facilitate the process of business legitimacy in society. The chapter discusses this in the perspective of important authors of accounting theory, Miller and Power. They refer to accounting roles and consider the process of accounting as a social process of institutionalization and construction of norms and subjectivities. The chapter analyzes the managerial and instrumental approach to SDGs, which is the attempt to integrate SDGs into accounting practices and scientific development of concepts. However, there may be a danger of losing ethical site of the SDGs through the transformation of the SDGs in the accounting process to become standards of accounting as governance through goals. Thus, the chapter elaborates on accounting of SDGs as this kind of business governance through goals. Here, accounting becomes a tool of integrating the SDGs in business operations. Accounting technologies are calculative instruments and accounting systems are systems that can be used to transform SDGs to quantitative accounting measures. In addition, the aim of the SDGs in accounting is to provide socially and environmentally acceptable conditions for growth and company development. The tools for this in accounting are the SDG compass and UN global compact, integrated with the global reporting initiative. As stated in the chapter, the UNDP Denmark has been important for contributing to developing an accounting scheme with the SDG-accelerator, which is a system of performance indicators aiming at integrating the SDGs in an accounting system. However, the danger of this may be SDGs become a system of meta-governance following the general idea of governance through goals in the accounting system rather than focusing on the internal dimensions of the accounting system of transparency, facilitation, control, and monitor. It seems like there is the danger that accounting for SDGs become accounting presentation of performance evaluation rather than a traditional form of accounting. This dimension of social accounting of the SDGs may be unavoidable with the dimensions of territorializing, mediating, adjudicating, and subjectivizing that shape and constitute accounting systems. Thus, with territorialization and performativity, accounting can help to give measures for mediating performance and account for it with a subjectivization of practice. This can lead to the subjectivation and responsibilization of individual actors for SDGs. However, as suggested in the chapter such integration of SDGs in accounting may also lead to potential arbitrary account of performance and loss of ethics and responsibility, since the forms of accounting as calculative technology of governance replace the ethical ideals of the SDGs. Thus, a critical ethical awareness of such processes of translation needs to be present in order not to lose sight of the importance of the ethical dimensions of the SDGs.

M. Valeva, H. Katz, and Y. Lurie present the social dimension of the relation between sustainable development and business legitimacy in ▶ Chap. 91, “Social Innovation Through Tradition: The Many Paths to Sustainable Development.” The chapter presents an analysis of social innovation in relation to tradition with regard to sustainable development. The chapter looks at sustainability in different communities and regions. This includes different concepts of communities in the comparison between Germany and Israel with regard to economic development and sustainability. The chapter also presents shortly SDGs in relation to sustainability, business, and entrepreneurships. The chapter looks at the sustainability in relation to regional/local development. The chapter introduces the concept of multiple modernities in relation to the concept of sustainability. Here, it is interesting that the chapter discusses the tension between innovation and tradition in relation to sustainability.

N. Eccles and B. van der Merwe give a critical analysis of the aim and scope of the SDGs in ▶ Chap. 92, “The 2030 Agenda for Sustainable Development, the SDGs, and Corporations: A Critical Reflection.” In the center of the critical reflection of the chapter is an analysis of the SDGs in the perspective of critical theory as a presentation of the SDGs as an expression of a neoliberal and capitalist concept of growth, which does not really change anything in the world. The chapter suggests that the SDGs do not really present a critique of the agenda of economic of modernist capitalism. Rather there is a great legitimacy risk for the environmental movement connected to the global marketing of the SDGs. Unfortunately, there is a dominant capitalist governing rationality implied in the SDG agenda. This means that there are many problems of legitimacy involved with the apparent alignment with human development of the SDGs. The problem of the role of corporations in the SDG agenda is that this does not really move beyond capitalism and business as useless. In order to really embed ethical practices in the activities of corporations, we need to be aware of the critical management approach to the agenda of the SDGs. Here the chapter mentions the problem of the unity of the SDG agenda where the agenda seems to deny all contractions. There is indeed a kind of legitimacy shroud of the

SDG agenda. The problem is that the illusion of unity makes all eventual disagreement and inherent contradictions of the SDG agenda invisible. Another problem of the SDG agenda is the concept of economic growth as a development goal. The chapter suggests that the SDG agenda still has economic growth as a kind of mathematical social science transformation of the world as a dominant dimension of the agenda. This means that a capitalist and neoliberal concept of economic growth is in the center for the agenda of the SDGs. There is no room for a dematerialization of the concept of growth and there is no deep vision of circular economy in the SDG agenda. Moreover, there is a potential value realization crisis of the agenda since many countries cannot live up to the values of the SDGs of democracy, human rights, etc. Nevertheless, this seems to be forgotten in the mechanistic concept of economic growth of the SDGs, not being open to the laws of entropy, the Anthropocene, or to the fact that there are simply planetary limits to growth of capitalist economic systems. Thus, from this point of view the chapter illustrates that SDGs are rather a legitimizing cover-up for capitalist corporations than an implication for real social change of the corporation. The irony of the SDGs may be that world businesses use SDGs as legitimation for capitalist and neoliberal activities.

Conclusion

Thus, with all these different contributions, the *Handbook of Business Legitimacy: Responsibility, Ethics and Society* attempts to propose a comprehensive coverage of state-of-the-art research and concepts, and ideas of business legitimacy that make the handbook a central reference work for the study of business legitimacy. Through an interdisciplinary perspective with comparative integration of sociological, politological, philosophical, theological, ethical, economic, legal, and linguistic and communication theoretical approaches, the handbook clarifies how the interrelation between company and environment is mediated by legitimating concepts in public spaces and public relations, communication, business strategy and organization, business ethics, leadership, and philosophy of management. In addition, the handbook provides a comprehensive assessment of the legitimacy concept's evolution, identifying the most influential authors and their works. The handbook presents systematic approaches and major themes developed in the concept of business legitimacy. The different parts of the handbook deal with the different topics to which business legitimacy has been applied, with how business legitimacy is relevant in the various operational areas of the firm, and with the legitimacy theory's responses to some of the most important issues that businesses and organizations currently face. Accordingly, the handbook is an essential reference work for students and scholars of business and society, strategy and organization, business ethics, business sociology, public relations and communication, corporate social responsibility, and sustainability studies.

Acknowledgments

Many people have in one way or another during the years contributed to the creation and improvement of this *Handbook of Business Legitimacy: Responsibility, Ethics and Society*. Associate professor Inger Jensen and adjunct professor Susanne Holmström originally focused for decades continuously on the importance of the theory and practice of legitimacy in business in teaching and research at Roskilde University. Master students at the programs of business studies and economics and business administration who took the course *Managing legitimacy and public relations* at Roskilde University have over the years contributed to improvement of the idea and framework of the book. In addition, the different reviewers of the project and drafts of chapters have been very important for the quality of the book. However, the editor in chief of the handbook has also had the opportunity to present the concept and vision of the book at important international conferences from 2015 to 2019, in particular *European Academy of Management* (EURAM), *European Business Ethics Network* (EBEN), *Social Responsibility Network* (SRRNET), *Academy of Management* (AOM), *Society of Business Ethics* (SBE), and at the *XXIV World Congress of Philosophy* (2018), organized by *International Federation of Philosophical Societies* (FISP). At these occasions, conference participants and discussants contributed with many important comments to the project of the handbook. Nevertheless, a special thanks should be given to all the enthusiastic and hardworking contributors to the *Handbook of Business Legitimacy: Responsibility, Ethics and Society*, including A Suchanek, F. Lohmann, E. Grimi, M. Aßländer, K. Steigleder, Ø. Larsen, C. Sløk, G. Harste, G. Baruchello, J. Fischer, G. Scalzo, K. Akrivou, A. Brink, F. Esselmann, K. Høyer Toft, M. Green, S. Holmström, D. Tänzler, R. Tapaninaho, J. Kujala, A. Krogh, J. Torfing, L. Lauesen, T. Bjerre, F. Scarpa, S. Signori, J. Brinkmann, M. Kochupillai, K. Buhmann, G. Enderle, C. Malecki, K. Mogensen, M. Haase, N. Nielsen, K. Alm, M. Schultz, P. Seele, P. Aagaard, P. Kjær, M. Blach-Ørsten, F. Frandsen, W. Johansen, A. Lorch, C. Schank, C. Neuhäuser, S. Siebke, M. Bonnafous-Boucher, J. Scheuer, I. Jensen, Y. Fassin, S. Liekens, M. Buelens, J. Delventhal, S. Carson, A. Ijabadeniyi, G. Rusconi, M. Contrafatto, S. Kacanski, L. San-Jose, X. Mendizabal, J. Retolaza, M. Frostenson, A. Hansen, J. Møller, K. Sund, A. Wæraas, M. Neisig, M. Thejls Ziegler, A. Scupola, G. Aras, J. Wieland, D. Fischer, T. Talaulicar, E. Jonsson, A. Prinz, T. Gössling, T. Straub, P. Beyer, E. Pezet, J. Poujol, S. Azizi,

U. Mulkhan, W. Gonzalez, S. Wong, K. Moulaï, P. Bandyopadhyay, B. Pandey, M. Siltaoja, C. Egri, O. Furrer, M. Haapanen, R. Alas, K. Sinding, M. Storchevoy, K. Belousov, S. Horiguchi, A. Hennig, M. Rasmussen, L. Thompson, L. Fuglsang, O. Jakobsen, V. Storsletten, A. Havsteen-Mikkelsen, R. Torelli, F. Balluchi, B. Hollstein, O. Hustad, M. Valeva, H. Katz, Y. Lurie, N. Eccles, and B. van der Merwe. Moreover, all contributors are indeed very grateful to the Springer editorial staff, in particular A. Raju and M. Hermann, and S. Vibin from the production team, for their work on preparing the *Handbook of Business Legitimacy: Responsibility, Ethics and Society*. We hope that this handbook will provide both a general overview and a deeper understanding and profound knowledge of the complex field of leadership and management of business legitimacy in business and society in the framework of responsibility, ethics, and legitimacy of private and public organizations, corporations, and institutions in different societies. Finally, the editor-in-chief would like to thank his wife Victoria and his children Joachim, Erik, Elias, and Arthur for all their support and help in the process of editing this *Handbook of Business Legitimacy: Responsibility, Ethics and Society*.

About the Editor

Jacob Dahl Rendtorff (born 1965), Ph.D. and Dr. Scient. Adm. (Doctor Scientiarum Administrationis), is professor of philosophy of management and head of the Research Group on Management and Organization in the Department of Social Sciences and Business, Roskilde University, Denmark. Rendtorff has a background in research in ethics, bioethics and biolaw, business ethics, philosophy of management, political theory, and philosophy of law. Rendtorff has also been doing research in phenomenology and hermeneutics, continental French and German philosophy. He is educated in philosophy and political sciences in Copenhagen, Paris, and Berlin, and he has been visiting professor in many universities (Utrecht, Rome, Freiburg, Boston, Stanford, Santa Clara, Louvain, Shanghai, Besançon, Paris, Oslo, and Tübingen). He has held more than 200 international lectures and presentations at different universities and conferences around the world. His research on philosophy of management, business ethics, stakeholder theory, and corporate social responsibility has been published in international journals and books. Rendtorff is member of the editorial board of *Society and Business Review*. Moreover, Rendtorff is coeditor of the Springer Series Ethical Economy: Studies in Economic Ethics and Philosophy. He is also associate editor of *Social Responsibility Journal* and European editor of *Journal of Business Ethics Education*. Rendtorff's most important international books are *Basic Ethical Principles in European Bioethics and Biolaw*, Center for Ethics and Law 2000; *Responsibility, Ethics and Legitimacy of Corporations*, Copenhagen Business School Press 2009; *French Philosophy and Social Theory: A Perspective* *for Ethics and Philosophy of Management*, Springer International Publishers 2014; *Stakeholder Theory: A Model for Strategic Management*, Sprinter International Publishers 2016; *Cosmopolitan Business Ethics: Towards a Global Ethos of Management*, Routledge 2017; *Sustainability and Philosophy of Management: Rethinking Business Ethics and Corporate Social Responsibility in Sustainable Development*, Emerald 2019; *Moral Blindness in Business: A Social Theory of Evil in Organizations and Institutions*, Palgrave-Macmillan 2020. Rendtorff is currently a member of the board of the Danish Philosophical Forum and is president of the Danish Association for philosophy in French language. He takes also part of the international group on reflection group *Eco-ethica* about ethics and responsibility in a global world. Rendtorff is a member of the EXCOM, which is the board of EBEN (European Business Ethics Network) and elected to the Steering Committee of FISP (International Federation of Philosophical Societies). Presently, his research interests are business legitimacy, philosophy of management, stakeholder theory, corporate social responsibility, sustainability, and cosmopolitan business ethics.

Introduction

This chapter discusses the development of the concept of business legitimacy from the work of Mark C. Suchman and beyond. This is based on research on corporate social responsibility, corporate citizenship, and corporate governance as essential elements of ethical business legitimacy (Rendtorff 2019c). This perspective develops and continues recent research on the concept of business legitimacy (Rendtorff 2019a: 45–60). In this context, the concept of business legitimacy is presented in the perspective of critical theory. Even though the chapter begins with some learnings from Suchman, it is also important to emphasize that this chapter moves beyond Suchman since it starts with institutional theory, but it integrates institutional theory into the general normative discussions of critical hermeneutics of business ethics and corporate social responsibility (Rendtorff 2019a: 45–60). With this the concept of business legitimacy aims at combining the sociological and constructivist approach from institutional theory with the normative and ethical approach from business ethics and philosophy of management (Rendtorff 2009a, b, c, 2010a, 2013a, b, c, d, 2014a).

Here the chapter searches to combine descriptive, positive concepts of legitimacy with moral and normative concepts of business legitimacy. In his article "Legitimacy" in the *Encyclopedia of Ethics*, A. John Simmons (1992/2001) writes that "[P] hilosophers have generally identified legitimacy with a certain kind of moral authority in the legal or political realm. More specifically, legitimacy is the moral property of states, regimes (rulers, governments), or laws which makes them genuine, rightful, or authoritative . . . Most conceptions of legitimacy associate the legitimate with 'the lawful' and/or with 'the accepted' or 'the acceptable' . . . Positive legality is at most a necessary condition for legitimacy . . . Legitimacy requires moral legality or positive legality within a morally justified constitutional scheme."

Seen in this perspective, the critical approach based on the concept of business legitimacy is broader than traditional approaches of descriptive sociology since it involves a normative approach to corporate social responsibility and corporate governance in relation to business legitimacy as a basic concept in philosophy of management (Rendtorff 2019a). At the same time, this critical approach does not consider business ethics and philosophy of management in isolation from the social and political context of the social embeddedness of the economy (Rendtorff 2009a, b, c, 2010a, 2013a, b, c, d, 2014a). With this critical approach, the concept of business legitimacy can be considered from both normative and descriptive perspectives, but indeed also from strategic perspectives of constructing and maintaining legitimacy. A company must take into consideration legitimating notions to be able to exist and prosper in a society: legitimacy is a precondition of the company's license to operate in society, and of the supply of necessary resources – ranging from investments, committed employees, business partners, and sales/consumption to political support and support from an increasing range of diverse stakeholders (Rendtorff 2019a). However, the interrelation between a company and the rest of society changes with society's evolution and is mediated by changing legitimating notions and processes.

In the contemporary discussions of business legitimacy, the company's ethical, social, and societal responsibility is reformulated towards broader value orientations expressed in the triple bottom line, which balances social, environmental, and economic considerations; in societal commitment where the company assumes tasks that were previously reserved the state (Rendtorff 1998, 2002, 2003, 2008, 2014c; Jørgensen and Rendtorff 2018; Jørgensen et al. 2018; Rendtorff and Kemp 2009). Formerly, the room for legitimate decision-making rested relatively stable and indisputably on notions of shared, taken-for-granted norms. Today, legitimacy has grown discursive and subject to continuous negotiation in communicative processes between a long range of positions. Therefore, critical research on business legitimacy is needed.

A company must justify itself in legitimizing processes characterized by fluid, ambiguous norms and ethics statements to an extent so that communicative competences and practices are a fundamental precondition for navigating in a society that grows increasingly dynamic and diverse (Rendtorff 2019a). The prioritization of legitimacy and legitimization has grown from the periphery and today are at the center of a company's existence and prosperity, including its ethical and political profile. Only a few decades ago, a company's legitimacy was more or less given by common norms, by control and by central regulation via law. Today, legitimacy and legitimization are basic mechanisms in fundamentally new forms of political governance that rely on mutual reflections and continuous tests of legitimacy. These can be identified in most regions characterized by the specific structures, ethics, and values of the modern society, which emerged with the social differentiation in Europe in the seventieth century and today dominate Western-oriented regions. However, different societal, political, and cultural forms foster different notions, ideas, and ideals as to the interrelation between society and company.

As globalization increases with challenges of sustainability and response to global problems, the interdependence between previously separated societal forms, conflicts between legitimating notions are activated. Globalization not only poses a challenge for companies to navigate in a diversity of inherent conflicts of legitimacy. It also requires the ability to relate to different and even conflicting perceptions of legitimacy at the same time in a globalized public space. This is a growing trend with the rise of social media, which entails global connectivity. Accordingly, the contents as well as the rationality of legitimacy, the way of legitimization as well as the weighting of legitimacy and of legitimization, and the types of legitimacy conflicts have changed and this is an important challenge for developing sustainability in the intersection between the two pillars of corporate social responsibility and corporate governance (Rendtorff 2019a). Therefore, it is necessary to clarify how the interrelation between company and environment is mediated by legitimating notions in public spaces and public relations; how and why these notions have changed radically; how these transformations strike on the epistemological as well as practical dimension of business companies; and the problems involved in these transformations at the macro-, meso-, and micro levels of organizational interactions.

The Aim of Business Legitimacy Research

The aim of this approach to legitimacy is to develop a critical theory with theoretical and practical understanding of the institutional dimension of business ethics and corporate citizenship and political CSR through the processes of legitimation where the company achieves social acceptance and recognition in society. Indeed, we can consider this in the perspective of Suchman's sociological approach to business legitimacy and propose an argument taking up some of the aspects of legitimacy from the point of view of institutional theory (Suchman 1995).

Essential research questions to ask in relation to the concept of business legitimacy are: (1) What are the challenges of business ethics confronted with increased complexity and new social expectations to corporations in an age of globalization? (2) What are the principles of strategic management business ethics and corporate social responsibility (CSR) that should be used by firms to respond to these challenges? (3) What is a theory of corporate legitimacy and how should we define the relations between good corporate citizenship and business ethics in the global process of transition towards sustainability?

The response to the problem of business legitimacy is the search for a comprehensive institutional and normative, critical theory of responsibility, ethics, and legitimacy of corporations in a globalized society. The focus is the idea of corporate citizenship as basis for reflective political responsibilities of companies (Rendtorff 2019a). This approach to strategic management and business ethics is based on a concept of reflective business ethics including the four ethical principles of protection of the human person: autonomy, dignity, integrity and vulnerability in the framework of sustainable development (Rendtorff 1998, 2002, 2003, 2008, 2009b, 2008, 2014c; Jørgensen and Rendtorff 2018; Jørgensen et al. 2018).

Such a critical normative theory of business ethics and corporate citizenship implies an approach to ethics at different levels of society, individuals, organizations, and market institutions. The idea is that business ethics and corporate social responsibility should not only be applied at the level of human personal choices. Rather it is indeed necessary to construct common values and concepts of responsibility for business organizations and institutions in order to critically scrutinize the old saying that "good ethics is good business" as a reaction to the opportunistic challenge of economic theories of individualist utility maximization.

Suchman's Institutional Perspective on Business Legitimacy

These normative dimensions of business legitimacy relate to different aspects of the general problem of the social legitimacy of corporations, which is analyzed in the perspective of institutional theory (Suchman 1995). The rise of institutional theory in 1980s and 1990s made it a very dominant approach to organization theory and this inspired Mark C. Suchman in his classical and legendary paper: *Managing Legitimacy: Strategic and Institutional Approaches* (1995). The foundation of such analysis may be the search for legitimacy in corporations was here proposed by Suchman (1995). He defines legitimacy as an effort to adapt to the internal and external environment of the organization. The discussion of legitimacy has been marked by a tension between a strategic and an institutional definition and there has been very little dialogue between the two theoretical traditions. With these forms of legitimacy, legitimacy can be conceived as a "process where the organization justifies to a peer or subordinate system its right to exist" or as a "congruence between the social values associated with or implied by (organizational) activities and the norms of acceptable behavior in the larger social system." Or it can be determined as a "generalized perception or assumption that the actions of an entity are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs and definitions" (Suchman 1995).

We can say that following Suchman legitimacy is a multilevel construct. This implies to look at legitimacy judgments at the individual and collective level. Moreover, it is important to remember that legitimacy is a concept from institutional theory. Indeed, Suchman distinguishes between three fundamental aspects of legitimacy: Cognitive, moral, and pragmatic legitimacy, where legitimacy is identified as generalized perceptions and expectations to the business firm (Suchman 1995). Here, legitimacy relates to expectations and judgments at the individual and at the collective level. As a multilevel construction, legitimacy refers to a construction of a relationship, where legitimacy is formed as a relation between and an environment of a firm.

It is important to remember that Suchman's article emerged out of a research project on the role of the nuclear industry in society. The problem was the social justification of the activities of the industry. In order to find applicable concepts of legitimacy for corporations and business systems, we can say that Suchman interpreted three forms of authority from Max Weber in a new way. Weber mentions traditional legitimacy, charismatic legitimacy, and rational legitimacy (authority). We can say that Suchman reinterprets these forms of legitimate authority in the organizational context with his three other dimensions of legitimacy of cognitive, moral, and pragmatic legitimacy. In Suchman's perspective, Weber's concepts of legitimacy are transformed into dynamic concepts of institutional developments of the organization.

Moreover, Suchman defines legitimacy from the three dimensions as a relation between cognitive, moral, and pragmatic legitimacy (Suchman 1995). Here, it is important to stress that the ontology of the social construction of business legitimacy can combine the three dimensions in a more integrated holistic concept of legitimacy where cognitive legitimacy can embed both pragmatic and moral legitimacy. Accordingly, it seems that creation and maintaining cognitive legitimacy is most advantageous for achieving legitimacy of an organization.

Thus, focusing on cognitive legitimacy, business legitimacy emerges in the relation between the beholder and the object of legitimacy. From this point of view, legitimacy becomes a relation between a legitimacy object, i.e., an organization and an audience that evaluates the legitimacy of the organization. It is in this context that cognitive legitimacy becomes the most stable kind of legitimacy, which indicates the ontology of the organization. Accordingly, cognitive legitimacy is viewed as the most fundamental dimension of legitimacy, which is very difficult to change. In contrast to this, pragmatic legitimacy is much more a construction of an image or appearance of the organization. Pragmatic legitimacy summarizes the efforts of an organization to achieve respect, trust, and acceptance even though there may be deep ontological mistrust related to the activities of such an organization. In the same sense, moral legitimacy may be less constant since moral norms and perceptions may change over time and require readjustments of the organization with regard to creation and maintaining of legitimacy (Suchman 1995). Thus, defined as an ontological fact, cognitive legitimacy may be central for defining legitimacy. However, this makes it also difficult to improve and create legitimacy as a social construction, due to the ontological stability of cognitive legitimacy.

Here, it is important to take into account that legitimacy changes over time and that there is a temporal development of legitimacy through legitimation. Legitimacy can be gained and lost over time and this is critical for sustainability of the organization. Legitimacy is a dimension of strategic management and development of the firm in order to create, maintain, and enlarge its social acceptance. The legitimacy of different organizations changes according to context and culture (Rendtorff 2019a). From the perspective of the environment of the firm corporate social responsibility and corporate governance aim at increasing business legitimacy of the firm. Legitimacy is relevant both in the internal and external environment of the organization. Internally, legitimacy is about the practices and structures that characterize the organization. Externally, it relates to the performance of companies that are dependent on the organization and its environment. The performance of companies is dependent on the organization and its environment. Organizational agency and the property perspective cannot be passively confirming to institutional perceptions. Rather, it depends on how organizations behave in activity creating legitimacy in the social, political, and environmental field in relation to the complexity of sustainable development.

This means that legitimacy can be defined as perception based on expectations. Legitimacy is not only the collective level but also a judgment at the individual level, based on social expectations. We can see different perceptions and expectations of the legitimacy in different industries and environments of firms. The expectations of legitimacy are based on a property, process and perception view of legitimacy. There is a multilevel model of expectation and perception of legitimacy in organizations. This means that perception and expectation legitimacy combine cognitive, discursive, and emotional dimensions of the different stakeholders' perceptions and expectations of organizations.

Because of Suchman's three dimensions of justification of business legitimacy, the critical question is whether the concept of legitimacy research provide an understanding of ethics, CSR, and good corporate citizenship (Rendtorff 2019a). The central challenge is whether there can be a normative and critical concept of business legitimacy that moves beyond the descriptive presentation of the legitimacy challenges of a company. Here, an epistemological and ontological tension constitute a theory-method gap in the analysis of legitimacy. This is because legitimacy research moves in the field between normative and descriptive analysis, situating normative justifications in a broader social context. Here, it is important to stress that legitimacy research looks at institutional changes within the different micro-, meso-, and macro-levels of organizational interaction with the environment. In this context, we can distinguish between different descriptive from normative approaches and levels and spheres of legitimacy, including historical, social, political, economic, and legal legitimacy.

Legitimacy, Democracy, and Deliberative Rationality

Thus, democratic justification of legitimacy seems to be an implicit assumption in Suchman's conception of legitimacy (Suchman 1995). In order to clarify this conception of legitimacy, we can turn to the concept of communicative rationality in critical theory (Raulet 2011). Legitimacy in communicative rationality and democracy is related to Jürgen Habermas political and social philosophy (Habermas 1962, 1973, 1981). This implies a combination of micro-, meso-, and macro-perspectives on the concept of business legitimacy. With his hermeneutical and critical theoretical philosophy, Habermas begins with the communicative encounter between human beings as essential for social and political normativity. In his work on the historical genealogy of the critical public sphere, Habermas emphasized that the basis of legitimacy is the free rational discussion among free and equal subjects according in free and domination free dialogue based on the willingness to listen to each other's arguments and positions.

In his work on the public sphere, Habermas also presented the structural change of the public sphere where capitalist economic systems and instrumental rationality challenged the communicative rationality of the public sphere (Habermas 1962, 1973, 1981). In the crisis of advanced capitalism, this implies increased legitimacy and legitimation problems where a social, economic, and political crisis means that it is increasingly difficult to find legitimation and justification for current political and social systems in the perspective of democratic communicative rationality (Raulet 2011). However, according to Habermas, both in political and social systems, but also in organizations, this is the only way it is possible to justify legitimacy of social and organizational systems. Therefore, the basis for legitimacy in organizations is the discourse rationality of democratic communication as presented by Habermas.

Scherer and Palazzo provides the application of Habermas' concept of deliberative and communicative rationality to the field of political CSR as an important dimension of business legitimacy in the article *Toward a Political Conception of Corporate Responsibility: Business and Society seen from a Habermasian Perspective* (Scherer and Palazzo 2007). In the framework of Habermas' critical theory, a political concept of CSR as the basis for business legitimacy is founded on Habermas' vision of the ideal speech situation, where ethical discourses are integrated parts of political and practical deliberations in democratic societies. The critical basis for ethics is the ideal speech situation where ethical consensus emerges in dialogue in order to reach consensus on universally accepted norms and values. Firms searching for business legitimacy are in this perspective actively engaging in corporate governance processes based on ideal speech situation, founded on the vision of the primacy of democracy for business legitimacy (Scherer and Palazzo 2007, 1098).

Thus, the discourse ethics conception of rationality mediated through deliberative democracy can be proposed as a basis for dialogical conception of CSR and business legitimacy (Rendtorff 2019a). Business acquires legitimacy in communicative dialogue with their stakeholders about policies and decisions (Scherer and Palazzo 2007, 1103). Legitimacy of business in a democracy implies recognition in political democracy of the norms and values of the political corporation. A corporation does not only achieve legitimacy at economic markets, but cannot avoid being considered as a democratic political actor, dependent on democratic political processes, submitting values and decisions to the democratic political processes in society (Scherer and Palazzo 2007, 1107).

Business Legitimacy, Critical Theory, and Critical Hermeneutics

The concept of methodology of business ethics for the study of business legitimacy can on the basis of institutional theory and the epistemology of communicative rationality be conceived as "critical hermeneutics," i.e., a critical theory which is combined with an interdisciplinary institutionalist approach to economics and social sciences (Rendtorff 2019a). Critical hermeneutics as form of critical theory mediates between structural and intentionalist explanations of causalities of actions in institutional theory (Rendtorff 2015b). However, it is as suggested also important to go beyond mere institutional analysis and propose a normative perspective of applied ethics integrating description of legitimacy challenges with analysis of ethical argument as basis for a legitimacy approach to business ethics and CSR (Rendtorff 2009a, c, 2011a).

Critical hermeneutics implies a critical analysis of the ideology positivist and post-positivist approaches to CSR and business legitimacy. In the perspective of Habermas' concept of critical hermeneutics, analysis of business legitimacy implies the critical normativity of the ideal speech situation (Scherer and Palazzo 2007, 1100). Positivist paradigms of business legitimacy research of business ethics and CSR can be said to focus on strategic and pragmatic legitimacy in order to describe causals relations and descriptive analysis of processes of strategic legitimacy. In this context, studies of business legitimacy and CSR are close to natural sciences (Scherer and Palazzo 2007, 1096). When we use critical hermeneutics in the study of business legitimacy, critical analysis moves beyond the positivist, instrumental, and descriptive approach by combining strategic analysis with ethical and normative conceptions of business legitimacy and CSR.

Accordingly, from the point of view of critical hermeneutics, ethics can be defined as a normative study about what norms should guide decision-making and corporate social responsibility in business and economics. In the perspective of business legitimacy, this means that critical analysis implies critique of ideology of pragmatic, performative concepts of legitimacy based on instrumental justifications (Rendtorff 2019a). The normative study of business legitimacy based on the intrinsic value of ethics applies simultaneously at the micro- and macrolevels of organizational behavior, business systems and market structures, and influences the political economy of different societies or states. Business ethics applies a critical evaluation of formulations of guidelines and codes of conduct for companies at national and international markets.

This broad approach to business legitimacy in the perspective of business ethics and deliberative rationality does imply a critical evaluation of performance management, instrumental conceptions, and neoclassical economics of efficiency and utility and it implies a broader interdisciplinary, institutional, and historical perspective on the norms and values of corporations (Rendtorff 2015a, b, c). Although it recognizes the explanatory potential of this tradition, critical hermeneutics as critical theory does not think that descriptive positivist economics is sufficient (Rendtorff 2019a). We need discussion about goals and values and business ethics emerges as a kind of normative economics to accomplish the insights of business economics. Business ethics therefore agrees in considering normative economics as a science of conversation based on theoretical arguments about ethical principles, values, and good business practice.

Business Legitimacy and Integrative Economic Ethics

Scherer and Palazzo contributes to this ethical evaluation of the economy and business practice when they emphasize that globalization and the need for global sustainability implies changed condition of legitimacy. The contemporary requirements of respect for human rights and sustainability in the global economy has put an increased emphasis on moral legitimacy in contrast to cognitive and pragmatic legitimacy (Scherer and Palazzo 2011: 914). The changed conditions of legitimacy imply that businesses are no longer only dependent on the economic market and they are no longer isolated to the economic sphere. The focus on moral legitimacy comes from the fact that business corporations are dependent on discursive processes between business and society. Businesses take part of processes where they are held morally and politically responsible (Scherer and Palazzo 2011: 914).

This means that they take part of processes of political justification where moral legitimacy is integrated with pragmatic and cognitive legitimacy. Accordingly, we can talk about integration of economic ethics with political and societal values. In this context, it is possible to adopt the concept of "integrative economic ethics" in order to mediate between ethics, political, and economic rationality (Ulrich 2008). This integrative approach can be considered as the application of political CSR, "democratic business ethics," critical theory and critical hermeneutics as the basis for ethical reflection on the foundations of economics as a truly value-creating science. In this perspective, business ethics based on legitimacy integrates the rationalities of law, economics, and politics in order to promote sustainability and the good life of humanity.

Integrative business ethics is not only about external limitations on business activity, but it also implies internal guidance for economic value-creation. It implies not only a deontology of correct business rules but also an argument for the morality of just institutions of free economic markets. Thus, integrative business ethics aims at formulating principles for corporate social responsibility of the good citizen corporation. As a response to the increased demands of political CSR and political legitimacy in deliberative democracy, business ethics is defined as a critical practical rationality integrating ethics in the disciplines of economics and the social sciences.

Such a discussion of the relation of economics and ethics in the perspective of critical hermeneutics aims at a justification of the rationality of business ethics, CSR values-driven management in business institutions (Pedersen and Rendtorff 2004; Mattsson and Rendtorff 2006). It is possible to perceive the emergence of a close link between ethics and economics in the new strategies of corporate social responsibility and values-driven management. However, there remains a tension between ethics and economics. Therefore, there is a need for external political and legal constraints on economic markets. Ethics is the foundation of economic action in the perspective of critical business legitimacy.

At the same time, we should admit that there is an ethical dimension within economic notions of utility and efficiency, which should be taken into account when dealing with the ethics of economic markets. Therefore, there may be an economic dimension to ethics, and ethics and economics are in a "dialectical relation" where they mutually shape one another (Neuman 2003). In the light of economic anthropology, this implies a critical examination of the concept of "Homo Economicus" of egoistic utility maximizing individuals in traditional economic theory (Sen 1987). Economic anthropology should rather be considered as based on interactions between individuals in complex networks of reciprocity in social community. In this perspective, economic action is based on the vision or aim of the "good life with and for the other person in Just institutions" (Ricœur 1990, 202).

So, ethics of business corporations is not restricted to the economic market, but integrated in the political and social processes of society. Therefore, Habermas' concept of deliberative democracy can be applied to the discursive participation of businesses in social processes. Business must refer to a vision of the common good of society when they try to justify their economic activities. In the perspective of discursive ethics, this vision is evaluated in the Kantian perspective of universal rules of the categorical imperative. Utilitarian welfare analysis is only possible in the perspective of this framework of deontological limitations of action. It is the task of Kantian determinate and reflective judgment as the bridge between micro and macroeconomic rationality to make the convenient application of ethical theories and principles to concrete situations of choice and decision-making in business organizations (Paine 1994).

This is the basis for the concept of the rationality of ethical decision-making, CSR and values-driven management in the perspective of critical "democratic business ethics." Therefore, as a part of discursive processes of political democracy, business ethics is not only about internal market behavior but also about finding external principles of political governance to regulate the activities of businesses on economic markets (Rendtorff 2009a, c, 2011a). In order to acquire legitimacy, businesses are in close interactions with different social and political processes in their global environment. With moral evaluation of business activities, businesses are held responsible for human rights and sustainability issues in global society far beyond their performance as economic actors in economic systems. Accordingly, with integrative economic ethics, it is necessary to adopt John Rawls' concept of "justice as fairness" and respect for basic political liberties as well as political and social rights in deliberative democracies as the ultimate horizon of democratic business ethics of political corporations (Lütz and Lux 1979; Ulrich 2008).

Business Legitimacy, Organizational Institutionalism, and Economic Rationality

With the emphasis on moral legitimacy as the core of legitimacy, it is possible to revisit organizational institutionalism (Deephouse and Suchman 2008). In fact, it can be argued that the emphasis on reputation and status as a part of organizational legitimacy emphasize that moral legitimacy has become central to business legitimacy. In general, this is underlined by the increased focus on the relationship between culture and legitimacy in institutional theory. Beginning from Weber's multifaceted account of legitimacy, Parsons focused on legitimacy as "congruence with social laws, norms and values" (Deephouse and Suchman 2008: 50). From there legitimacy has been defined with concepts like rational effectiveness, legal mandate, collectively valued purposes, means and goals with focus on the latter which suggest the importance of normative and moral legitimacy (Deephouse and Suchman 2008: 50). Moreover, from Meyer and Rowan to Scott, there is a focus on institutional theory as essential for the cultural support of the organization as basis for practical legitimacy in sociopolitical contexts.

Taking into account the classical Weberian perspective of the relation between legitimacy and economic rationality, legitimacy theory focuses on the impact of different views of the firm and economic life in different theories of management and economics in the twentieth century. These views include concepts of business legitimacy based on environmental legitimacy, normative and cultural isomorphism, professional legitimacy, taken-for-granted, and other forms of legitimation. It is important to analyze these views of legitimacy in some of the most influential theories of economics and management in order to promote an institutionalist and stakeholder-oriented view on corporate legitimacy, which is based on the idea of the good citizen corporation. This moral approach can be distinguished from other possible views on the legitimacy of the firm in modern society. From the point of view of communicative rationality, discursive processes and stakeholder dialogue can be viewed as the critical normative basis of the concept of good corporate citizenship (Habermas 1981; Scherer and Palazzo 2007).

These ideas makes it possible to escape the Weberian iron cage" of instrumental rationality opening for market regimes based on "integrative business ethics" with a broader social basis in the social and institutional dimensions of society (Rendtorff 2019a). Legitimacy is founded on the social community and the human life world based on views on justice as fairness, protection of rights, and the promotion of the common good for society (Ulrich 1998: 416). Thus, according to these moral views of the legitimacy of business in society, responsibility, integrity, trust, and accountability emerge out of the idea of democratic business ethics based on democratic political processes in society where the license of operate and good business of the firm is to be a good servant of society.

With this critical and normative approach, analytical and descriptive approaches to legitimacy must study the fact that many modern corporations have introduced ethics and compliance programs and values-driven management taking into account all the firm's stakeholders in the discursive processes in society (Rendtorff 2019a). In many cases, reporting procedures and accountability programs for corporate and social values are introduced into the organization as basis for creating a process of business legitimacy. The corporate boards see them as a means to ensure not only the responsibility and integrity of the organization but also efficient management, competitiveness, and legitimacy of the firm in a complex democratic society. However, critical management of business legitimacy implies that organizations moves from social construction of popular brand images to democratic dialogue of business legitimacy, based on communicative action.

Business Legitimacy in the Process of Business Politics

Thus, there is a close relation between the different aspects of legitimacy in the internal and external environments of the firm. There are also "macro" and "micro dimensions of legitimacy, which means that the process of creating and maintaining business legitimacy is a multilevel process between institutional stability and instability (Bitektine and Haack 2015). Taking into account the manifold of the institutional environment and participation in discursive processes corporations take part of institutional processes, which shape and transform their legitimacy as corporations and political institutions. These processes happen in processes of cognition and communication where business legitimacy is formed according to evaluations and judgment determined by different institutions in society (Bitektine and Haack 2015: 51). In particular, social institutions like media, governments, legal regulation, and juridical systems contribute to this validation and evaluation of business legitimacy of different organizations and institutions. These institutions influence the institutional stability, change, and transformation of business legitimacy and contribute to define the dynamics of institutional change in society (Rendtorff 2019a). Thus, we need to look at the sociopolitical and law-making processes in order to understanding the institutional stability, change, and developments in society.

Political and legal developments seem here to confirm the emergence of a new concept of corporate citizenship and moral and political concept of CSR. Considering the United States, we can see that the US-government and legal system, US-corporations, and researchers from the different fields of economics, law, philosophy, and political science have, in particular, contributed to the institutionalization of ethics and compliance programs in US companies and thus creating a moral and normative environment for the political corporation. In the United States, the 1991 *Federal Sentencing Guidelines for Organizations* were very important for developing a policy framework for corporate citizenship, corporate ethics, and corporate social responsibility (CSR). These guidelines have been confirmed by a lot of legislation following many scandals and the guidelines were much needed after the financial crisis (Rendtorff 2019a).

The legal requirements of the 1991 US *Federal Sentencing Guidelines for Organizations* imply a concept of responsibility where not only individuals are held responsible for their actions, but also where the board of the firm and managing directors as representatives of the firm have responsibility to institutionalize ethics and compliance programs in the corporation. The use of criminal law to make ethics regulation can be interpreted as an effort to ensure ethical behavior in the institutions of US business life so that institutional norms can support individuals in complying with the laws and custom of society (USSG 1995; USSG 2017).

In Europe, the European Community have also introduced important policy initiatives concerning corporate citizenship, for example, we can mention the ethics, politics, and legal regulation implied in the EU recommendations on CSR as have been proposed in the European Commission's Green Paper *Promoting a European Framework for Corporate Social Responsibility* published in 2001 (European Commission 2001 and later). In the policy of the European Union, it was since the beginning argued that CSR should be of a "voluntary nature" and the concept of "stakeholder" is seen as very important in the efforts to include different parties in European stakeholder forums concerning CSR decision-making. This definition has recently since 2016 been improved with the focus on "social impact" as a core element for measuring the level and validity of business legitimacy of a corporation. This has led to increased focus on business ethics and many corporations work to integrate CSR in their strategies for corporate performance, business ethics, values-driven management, and corporate governance.

These developments in the USA and Europe have had a global impact. As normative basis for international business conduct, integrative business contributes to establishment of such international regimes of good norms for values-driven management and multinational business practice. We are moving towards the creation of a critical cosmopolitan view of business ethics and CSR considering the firm as a world citizen with global political responsibilities in the post-national constellation (Rendtorff 2009a, c, 2011a). Many international organizations, business, and corporations have contributed to the establishment of such an international regime of business ethics. The Caux-Round-Table discussions with continuous updating of the ethical Caux-principles involving businesses from most continents are examples of such institutionalization of values with proposals for international guidelines for multinational business contributing to the institutionalization of business legitimacy (Caux Principles for Business 1994; Rendtorff 2014b).

The principles of UN Global Compact initiated by Kofi Annan in 1999 have been essential for setting norms of good corporate citizenship at the global arena. Today, we also have the program of business and human rights by the United Nations and the different principles find a common expression in the UN Sustainability Goals (SDGs) from 2015 (Rendtorff 2015a, b, c, 2017a, b, c, 2019a, b, c, d). In addition, most European governments and business leaders now look at developments in America in order to formulate appropriate guidelines and compliance programs for ethics and values-driven management in European business life.

Following a number of international guidelines and recommendations, the UN has with the business for human rights principles and the sustainable development goals gathered to agree about principles and rules of conduct with regard to the respect for human rights in multinational corporations. These policy developments can be interpreted as efforts to contribute to the institutionalization of corporate ethics, citizenship, and CSR as a central element in the agency and governance of the firm. We may say that these institutionalizations of norms and values at micro- and macrolevels imply that the firm is not only conceived as an economic and legal subject but also as an ethically responsible actor.

Normative and Moral Legitimacy: Business Legitimacy as Moralization of the Firm

In this process of the institutionalization of business legitimacy as political CSR, corporate citizenship and business ethics in USA, EU, and UN and the whole world – a *moralization of the firm* – it is possible to distinguish between: (1) economic responsibilities, (2) legal responsibility, and (3) ethical responsibilities (Carroll 1979; Schwartz and Carroll 2003; Carroll and Buchholtz 2002). But the critical, moral dimension of business legitimacy as implies a mutual dependencies between the different dimensions of CSR. The relation between the different kind of responsibilities should conceived not as a pyramid (Carroll 1991) but as an integrated concept (a Venn-diagram) and it should not be isolated to one single domain (Schwartz and Carroll 2003). The different responsibility should be integrated in an integrity strategy for organizational leadership and governance. With the three-dimensional perspective on business performance including economic, legal, and ethical (philanthropic) responsibilities, corporate citizenship emerges the good management of the tensions and requirements of the different kind of responsibilities.

We can illustrate the development of corporate responsibility towards corporate citizenship in political CSR by emphasizing different features of behavioral activities of business legitimacy (Carroll 1979; Schwartz and Carroll 2003, Jensen 2000; Verstraeten 2000). These dimensions illustrate the process of creating and maintain business legitimacy in a dynamic perspective. There is a development from an economically and legally sound organization towards the ethically and morally responsibly corporation that seeks to act as a good corporate citizen with a proactive attitude towards the common good in society.

Types of Business Legitimacy I: The Economically and Legally Responsible Corporation

The original economic concept of the firm, as ideal type, can here be *named the economically and legally responsible corporation*. This is a company that sees the market as the defining value of the corporation. The aim of this business is defined as economic success on the basis of minimum compliance with legal regulations. The focus of management is defined as rational strategic planning in relation to economic markets. The focus of search for legitimacy is here based on economic and legal criteria with strict reference to business economics criteria. This business model follows the ethical norms of the economic market and its values as neutral, and the business model is based on objective scientific economics.

The social understanding of this concept of the firm is that it conceives actions as limited to what stakeholders and owners can accept. This model of economic legitimacy emphasizes that the requirement of legitimacy means that the company should not go beyond the limit of action. At the level for strategy of action, the company should here seek economic profits and search to be committed to defensive adaptation by cost externalization and economic management.

With regard to social pressure, this model of legitimacy includes that the company maintains low profile if the action of the corporation is criticized, uses PR in order to improve image and avoid criticism. Information is only published, when it is legally demanded by the external environment of the firm. Moreover, the firm tries to stay away from public spotlight. In addition to this with regard to its attitude to legal and political activities, the firm that follows this model of legitimacy wants maintain status quo, and in addition, this firm is actively engaged against legislation that internalizes costs and is critical towards increased tax burden.

This firm tries to keep lobby activities secrete. With regard to the concept of corporate citizenship and the broader view of corporate citizenship, the firm that follows the model of being an economically and legally responsible corporation does not have any comprehensive social responsibility programs. This kind of firm only contributes to social responsibility, when the corporations has a direct advantage of philanthropy. And in this context, this firm is most likely to consider contributions to philanthropy not as an institutional responsibility, but rather as the responsibility of individual employees.

This kind of firm is a good example of the traditional and cognitively dominating idea of the business firm as a legal and economic institution and instrument of transaction without any cultural or institutional substantial content.

Types of Business Legitimacy II: The Ethically and Socially Responsible Corporation

The model of the *ethically and socially responsible corporation* in contrast to the ideal type of the economically and legally responsible corporation seeing both the market and the state as important agents who define the values of legitimacy of the corporation and its activities. The firm's aims and the means of the business corporation is considered to be economic success with respect for the economic market and legal regulations but also for the ethical custom of society.

The management focus is therefore broader than a pure legal and economic approach and the implied rationality is based on traditional strategic and economic methods. This involves an openness towards new methods of ethics and rationality (Rendtorff 2019a). In this model of search for business legitimacy, the company is marked by an increasing willingness to search legitimacy beyond market criteria. This involves a focus on ethical norms and this means that the company is aware of a necessity of a definition of legitimacy norms in a socially oriented perspective. This company seeks to avoid doing things that are contradictory to prevailing social norms.

This ideal type of the business corporation in search for legitimacy accepts legal and economic demands, but is also willing to go beyond those demands and related to the stakeholders that are affected by those actions. We can say that the involved strategy for action that is proposed by this company includes a strategy of reactive adaptation. This means that if possible, externalized costs are identified and there is a beginning effort to compensate for such costs (e.g., environmental costs).

With regard to acceptance of social pressure, the company accepts responsibility for solution of concrete problems (Rendtorff 2019a). Moreover, the business firm admits errors in earlier practices and makes an effort to convince the public that the corporation works to find a better practice. With regard to the concept of legal and political activities, this model of a business firm expresses willingness to work with external partners to improve legislation and adaptation to social norms and laws. Thus, the company has less secrecy with regard to pressure and lobby activities.

The company has some conception of philanthropy going beyond individual responsibility. Accordingly, the business contributes to noncontroversial and well-established aims that also employees support. In addition, the business firm has a tendency to consider philanthropy as a kind of advanced sponsorship activity.

Types of Business Legitimacy III: The Proactive Corporation Searching for Corporate Citizenship

At a more advanced level, the conception of business firm as *The proactive corporation searching for corporate citizenship* searches for corporate citizenship based on ethical and responsible political business legitimacy. This model of the firm defines the important agents who define the values of the corporation as involving democratic activities at market, state, public discussions, and institutionalization of stakeholders (Rendtorff 2019a).

The aims and means of the legitimacy strategy of this company is based on a search for economic success, legal responsibility, proactive search for legitimacy, and for respect as a good citizen in society. This requires a broad management focus going beyond rational strategic planning in relation to economic markets with use of values-driven management, CSR, business ethics, management based on the triple bottom-line, and compliance with global norms of sustainability.

In its search for legitimacy, this business model accepts its role as a good corporate citizen as it has been imposed by the social and political system. The ethical norms imply that the company uses ethics and moral thinking to have reflectively conscious opinions about social and political issues in society. Concerning the social acceptance of the actions of the corporation, it is here considered important to conceive good citizenship as willingness to be held accountable for its actions with regard to other groups than those groups that are not affected by the actions of the corporation.

The strategy for business action is proactive adaptation. The company activity takes leading positions in evaluation of products and procedures. Actions and activities of the company are evaluated from ethical perspective and the company anticipates social changes. The strategy for response to social pressure involves that the company communicates openly and self-critical with government and political publics. Moreover, the company works for improvement of existing legislation and company practice and this model involves that the proactive business firm protests critically against situations that do not serve the common good.

In its conception of legal and political activities, this model of the proactive company search for good corporate citizenship does not mix directly in politics regard laws where the corporation has direct individual interests (Rendtorff 2019a). Instead, the company helps as oriented towards good citizenship the legislator and the state to make relevant laws that contribute to the common good. Indeed, this company tries to be open and honest about lobby activities. Concerning contribution to philanthropy, this company contributes with to topics of great importance for society and supports groups and organizations that are not likely to give any benefits in return to the corporation. Considers philanthropy as an important social activity.

We see accordingly, how the business corporation can move from a pure economic instrument to a complicated and bureaucratic institution with little real content based on field experience. It is the task of critical hermeneutic theory of business legitimacy to analyze the dilemmas and tensions at each of these stages of development. From the point of view of critical historical analysis, we can get a good view of the tensions and possibilities of this development of corporations.

Business Legitimacy as Stages of Development

Such different business models of stages of development towards business legitimation show that recent developments of corporate citizenship, business ethics, and political CSR is the convergence between the different responsibilities of the firm. Arguing for a selective use of elements of different political theories as major steps towards the concept of the good citizen corporations, there is a common ethical framework for decision-making while at the same time respecting the fundamental differences between the ethical theories (Rendtorff 2019a).

The movement in business ethics as justification of business legitimacy from rational choice theory over stakeholder theory, virtue ethics, Kantian universalism, and integrated contract theory to the republican theory of business ethics may be viewed as steps towards a framework for judgment in business ethics as the basis for good corporate citizenship and political CSR in modern complex societies. This social responsibility and responsiveness are in the forefront of the license to operate of the firm (Crane and Matten 2016). Responding to expectations of different stakeholders the good citizen corporation is involved in public reasoning and deliberative public communication. Democratic and discursive business ethics aims at making democratic values the core of values-driven management of responsible corporations.

With corporate developments of values-driven management and business ethics, there is an established basis for dealing with the concept of the good citizen corporation as a politically responsible social actor. This issue concerns the ethical and legal foundations of the idea of corporate social responsibility considered in the framework of an institutional concept of corporate identity and personhood. In this context, we can propose a collectivist and constructivist concept of corporate identity as the foundation of the organizational integrity of the good citizen corporation.

At the institutional level, organizational integrity can be considered as a result of efforts to establish successful strategies of values-driven management. This is also the basis for trust and accountability of corporations and it makes it possible to formulate an institutional and communicative concept of social legitimacy of corporations. Accordingly, it is possible to propose a meditative concept of corporate intentionality finding a way to overcome the oppositions between the collectivist and the nominalist view on corporate social responsibility as based on political responsibility in deliberative democracies.

This position can be considered as a critical hermeneutical and an institutional concept of corporate social responsibility, which constitutes the theoretical foundation of the concept of the "Good Citizen Corporation." This view on corporate social responsibility represents a criticism of a concept of responsibility, where it is not possible to ascribe any institutional ethical responsibility to corporations (Laufer 1996). Such a concept of institutional responsibility can be considered as an expression of good intention and high standards of integrity.

Business Legitimacy as Organizational Integrity and Good Corporate Citizenship

Thus, from this perspective of institutionalization of business legitimacy, the notion of organizational integrity is defined on the basis of the ideas of business ethics, values-driven management, and corporate social responsibility (Rendtorff 2019a). This is conceptualized as the foundation of good corporate citizenship. The analysis can be proposed as the theoretical justification of the moral and legal professional responsibility of management.

The notion of integrity emerges as the foundation of the idea of a virtuous and responsible organization. It may be emphasized that there is a close connection between individual and organizational integrity. Integrity strategies should be distinguished from compliance strategies because they deal with values and ethics rather than rules and regulations.

Institutionalization means that instruments of values-driven management constitute an important institutional dimension of this responsibility. There should be formulated strategies for implementation of organizational values program according to specific values, histories, and contexts of specific firms. Moreover, integrity expresses organizational commitment to justice and fairness with regard to different stakeholders (Carter 1996). Indeed, there is also close link between leadership, ethical judgment, triple bottom-line management, and the evolvement of organizational integrity. Establishment of organizational integrity and managerial judgment contributes to formulate a framework for coping with organizational dilemmas in daily practice of leadership. Organizational integrity in judgment is aiming at the ideals of openness, honesty, wholeness, and thoughtfulness.

Thus, programs of values-driven management are useful tools in order to promote a culture of integrity, accountability, and trust in organizations (Rendtorff 2011b). It is important that genuine trust relations should be considered as important results of values-driven management and ethics in organizational culture. Due to globalization and greater public awareness, there has been established a stronger link between accountability, trust, and social expectations of corporations.

The need to build trustworthy business practices includes management of problems of corporate governance, accountability, and transparency as a deep crisis of public trust and social acceptance of corporations (DiPiazza Jr and Eccles 1997)˙ Therefore, it is necessary to discuss the significance of trust in order to restore corporate image, develop good corporate governance, and to get social acceptance of business in democratic society. Trust should not only be considered as an instrument of economic action but rather seen as an important social glue and informal lubricant of business organizations.

To consider business practices as based on ethical values moves trust in the center of business legitimacy as the background for accountability and integrity of corporations (Solomon and Flores 2001; Hartman and Desjardins 2008). This is due to the fact that generalized mistrust and opportunistic behavior constitutes the limits of fair business practice and cannot be considered as the basis for internal unity and external legitimacy of business corporations.

Therefore, an ethical definition of trust considering that what is trustworthy is based on the accountability and responsibility of the firm (Bidault et al. 2002). To trust someone implies means to hold that person or organization accountable over time believing that they will perform actions of integrity and honesty. Moreover, trust may be developed out of mutual expectations and promises for reciprocity and collaboration in the future. Thus, there is a close connection between integrity and the accountability of transparent business institutions.

Business Legitimacy as Self-Reflective Corporate Citizenship

An application of the critical theory of business legitimacy in relation corporate citizenship is possible in the different fields of business ethics (Rendtorff 2019a). Here, business legitimacy can be defined as self-reflective deliberation about values and ethics. In the framework of institutionalization of business legitimacy, it is possible to analyze the concepts of corporate social responsibility and sustainable development based on the triple bottom line as a framework for justice and basic ethical principles. Corporate social responsibility, business ethics, values-driven management, and social and ethical accounting were presented as strategies to include different stakeholders.

This framework can be applied in relation to internal and external constituencies of the firm. Internal constituencies include owners, investors, management, and employees. Among external constituencies emerge relations to other businesses, consumers, marketing, and public relations and to local community. Moreover, in the perspective of sustainable development and concern for a triple bottom line of economic, social, and environmental responsibility, the relations of the firm to the environment as a stakeholder need to be included into the ethics of the firm.

Concepts of corporate social responsibility, stakeholder justice, and sustainable development emerge as a practical application of the concept of the good citizen corporation in business ethics. The idea of "justice as fairness" is an appropriate framework for inclusion of stakeholders in corporate decision-making. Basic ethical principles of autonomy, dignity, integrity, and vulnerability can be seen as important expressions of the concept of justice as fairness. These basic ethical principles are directed towards protection of human persons in organizational structures in bioethics and business ethics (Rendtorff 1998, 2002, 2003; 2008, 2009b, 2014c; Jørgensen and Rendtorff 2018; Jørgensen et al. 2018; Rendtorff and Kemp 2009). Here it is emphasized that the principles of business ethics should have concrete application in corporations. Therefore, it is considered important to move from corporate social responsibility to corporate social responsiveness as based on the political responsiveness of business in society (Frederick 1994).

Corporate social responsiveness lays emphasis on the company's practical contribution to social management rather on its capacity to talk about it. Corporate social responsiveness is not only about government initiative to make incentives for social responsibility, but also proposals for corporations to make concrete contributions to social betterment. Business ethics is not only about ideal theory, but about must realize in concrete practice and make a difference for good management strategy (Rendtorff 2015a, b, 2017a, b, c, 2019a, b, c).

Implications for Legitimacy of Public Relations

Thus, the concept of legitimacy is therefore very important for understanding the ethics and practice of public relations (Rendtorff 2019a). While organizations in the classical theories were conceived as closed rational systems, the increased focus on business legitimacy implies a new conception of the corporation as in close interaction with its external environment. Corporations must be conceived as open systems, where it is not the material or technological relations, but ethical values, cultural norms, as well as symbols and epistemological conceptions in the surroundings of the corporation that are decisive for its development (Suchman 1995). The concept of business legitimacy is in this conception of organizations. As we know from Weber, in contrast to traditional, charismatic, authority-based and rational forms of legitimation, modern organizations are supposed to be based on rational strategic planning. Nevertheless, as we have discussed, legitimacy no longer only founded only on rationality, but modern society requires a broader conception of legitimacy that include ethics and democratic values. Moreover, common to the different kinds of theories of legitimacy we can see that legitimacy emerges as the process by which an organization justifies it rights to exists in relation to other organizations and in relation to society (Suchman 1995: 575). We may say that organizational legitimacy is based on values and cultural norms that constitutes the rights to existence of this particular organization.

From the point of view of public relations, business legitimacy means to create the presuppositions to conceive and judge organization according to a number of pre-given values and norms. In this sense, legitimacy related to public relation may be conceived as a cultural construction that is more or less integrated in fundamental conceptions of society. Organizations that use a pure administrative and technological concept of management and do not reflect consciously about these relations of legitimacy as relations of public relations are very vulnerable in relation to their external environment. Therefore, there is increased focus on both pragmatic moral and cognitive legitimation of the activities of the corporation. The use of ethics as a part of public relations is an important instrument to develop and influence this process of legitimation and values-driven management contains elements of practical, moral, and cognitive legitimation of the activities of the corporation in order to "naturalize" the corporations as solid elements of society.

Thus, public relations should be defined as a matter of management and an important part of business legitimacy (Rendtorff 2019a). What is needed is a public relations office as a part of the executive office of the firm. This office does not only deal with formulation of values as a part of the identity of the corporation and with communication of these values, but it is also concerned with stakeholder relations and with protecting the brand and the image of the firm in crisis situations. Moreover, public relations offices work proactively in order to promote the ethical image of the corporation with regard to the general public, to governments, local community and the civil society with consumers, nongovernmental interest organizations, and other stakeholders. In the critical perspective of business legitimacy, public relations should be based on the democratic interaction in communicative dialogue, following Jürgern Habermas' ideal of domination free-dialogue.

Moreover, a public relation is a process of communication in which the firm creates its image, profile, and identity to the general public. In this course, the firm can act defensively trying to avoid being a part of the public debate or it can act proactively trying to construct a public dialogue about its values and product. According to our emphasis of the role of the firm as political actor in society and our definition of the firm as an ethical actor searching for social responsibility relations to the public are important for democratic communication in business legitimacy. Public relations are about sustaining and enforcing the social legitimacy of the firm as a good corporate citizen.

Jürgen Habermas has in his work on the public sphere mentioned above described the function of the public sphere in modern society. The ideal of a public sphere is a place where different actors meet for open-minded and serious discussion of political issues of society. Each citizen is considered as a moral person and as such a citizen of the public sphere of society. This vision of the public sphere is inspired by the idea of the Greek Agora where citizens gathered to discuss the future of the city-state. In the age of the enlightenment emerged "public spaces of discussion" at which place citizens gathered to discuss issues of public interest (Habermas 1962). Nevertheless, in modernity this ideal of citizenship in the public sphere has been exposed to immense pressure because the economic and technical system on the one hand and the private sphere of personal interest dominate the authenticity of civic discussion in the public sphere. Habermas had the fear that citizens in late modernity are reduced to consumers and that the public sphere is so commercialized that there is no room for genuine political discussions. In mass society, there is the danger that public discussion is replaced by one-way manipulation of citizens by mass media.

Given this danger, the maintenance of dialogue in a free public sphere is of primary importance in modern societies in order to protect the democratic citizenship. The public space institutionalizes the possibility of critical discourse and this requires obligations of legitimacy for actors in community (Habermas 1962). In public relations, legitimacy is defined as the institutional dimension of honest search for truth and action based on practical rationality. Habermas argues for the ideal of communicative reason based on the respect for the better argument and willingness to listen to all voices in the debate. This view of the public sphere is opposed to an instrumental and strategic use of communication in the public sphere exclusively in order to promote self-interest and commercial gain. This view of the public defends the possibility of argumentative communication as central to public debates (Habermas 1962).

We can argue that it is an important charge of the ethics of public relations that corporations contribute to maintenance and evolvement of this public sphere. There is no real opposition between having a strategy for public relations and respecting basic principles of argumentative communication. The ethics of public relations insist on the deontological values of good corporate citizenship. This signifies respect for truth and honesty and strong moral integrity of the firm. Respect and dignity imply that the corporation is faithful to its values and that it follows the virtues of good communication when entering in to the public sphere. The rhetorical devices of ethos, pathos, and logos contribute to trustful communication in which the corporation searches to establish legitimate relations to the environment and to important stakeholders.

The public sphere is the place where business life intersects with civil society and the sphere of governmental policy. Corporations encounter actors from civil society and from the political system in this public sphere, and it is the place where different actors are promoting their general social legitimacy. Many miscellaneous civil society organizations advocate themselves as stakeholders of the firm. They are of very different type and scope and they have different activities and focus (Crane and Matten 2016). Some of them may be very critical towards corporations, constantly challenging the legitimacy of capitalist economies. Trade unions are stakeholders with strong claims in the corporations, and they are traditionally very strongly organized in solid structures. Interest organizations usually select some narrow scope of focus like the protection of the environment, workers' rights, fair trade practices, and they confront corporations with these interests. Often, they have alternative and loosely coupled organization structures based on networks and voluntary engagement by participants (Crane and Matten 2016).

According to the urgency, power and legitimacy of civil society organizations corporations are often challenged in the public sphere by these organizations, in particular in cases of crisis and when corporations do not respect legal rules or ethical custom of the society. In these cases, aggressive stakeholders can be quite painful for the corporations, that have to be respondent to their criticisms. In general, civil society organizations argue against the corporations in the name of society or the public, though in fact it is not clear whom these organizations represent. They are also confronted with problems of legitimacy and accountability, and sometimes, these organizations have difficulties who are their legitimate stakeholders. Moreover, in cases where civil society organizations work too closely with corporations in stakeholder dialogue, there is the danger that they lose their independence and function as kind of privileged consultants for the corporations.

The ethical field of business legitimacy of the public sphere of civil society is very fluid and difficult to manage. Suddenly there are new issues and the firm cannot control its image in the public debate. Indeed, there is a temptation to try to manipulate the public and follow the rhetoric of mediatization of the public by all kinds of commercial means. Although a strategy of deception in some case can be economic, it is difficult to justify from the point of view of the ethics of stakeholder dialogue, communicative interaction, and respect for good arguments. Moreover, in cases where it goes wrong such a strategy may be very risky because a bad image of not being accountable, credible and trustworthy can stay with the organization for ages. In addition, from the perspective of Habermas' critical hermeneutic philosophy, it is a moral requirement always to say the truth.

Managing Reflective Business Legitimacy in Globalization

Having developed this framework of reflective business legitimacy in the public sphere on the basis of the combination of the combination of the sociological institutionalism of Suchman with the approach to business legitimacy in the tradition of business ethics and CSR, it is possible to address the question of the strategic dimension of business legitimacy in globalization (Scherer et al. 2013). Scherer, Palazzo, and Seidl can be said to combine the framework of Suchman an approach to legitimacy based on corporate citizenship and reflective deliberation in their article: *Managing Legitimacy in Complex and Heterogeneous Environments: Sustainable Development in a Globalized World*. The authors try to argue for a reflective approach to legitimacy in the context of search for sustainable development in globalization (Rendtorff 1998, 2002, 2003, 2008, Rendtorff 2014c; Jørgensen and Rendtorff 2018; Jørgensen et al. 2018; Rendtorff and Kemp 2009). The argument fits very well with the concept of reflective corporate citizenship since corporations need to deal with sustainability problems in order to deal with the societal expectations to corporations in contemporary environments of globalization.

As society face the contemporary challenges of responding to the need of sustainable development in an area of the Anthropocene with increased challenges of climate change, environmental degradation, poverty, and inequality, businesses have to apply their business strategies to maintaining and creation legitimacy in a world economy in transition. This is in particular a challenge due to fragmentation and political and cultural differences in a global environment. Accordingly, the strategy of reflective legitimacy meets other strategies of manipulation, adaption, and moral reasoning where companies face the complexity and even contra dictionary dimensions of demands for sustainability. This is for example the case when companies need to follow the 17 SDGs (Sustainable Development Goals) of the United Nations, where different sustainable development challenges are integrated in a common framework. Here, different concerns may conflict and corporations need to find acceptable legitimacy strategies in order to increase their sustainability performance (Rendtorff 2015a, b, c, 2017a, b, c, 2019a, b, c, d).

In this context, with Scherer, Palazzo, and Seidl, it is possible to reformulate the legitimacy strategies of Suchman of pragmatic, moral, and cognitive legitimacy in the context of sustainable development and adoption of the SDGs (Rendtorff 2015a, b, c, 2017a, b, c, 2019a, b, c, d). We can follow the definition of legitimacy of as social acceptance of actions in the process of social construction of legitimacy by corporations. In the post-national constellation of globalization, corporations combine cognitive legitimacy strategies with isomorphic adaption and strategic manipulation. Isomorphic adaption means rather passively to adapt to societal pressure in order to maintain legitimacy (Scherer et al. 2013: 263). In contrast, strategic manipulation involves active intervention in order to improve political strategy of the corporation. At a third level, the moral reasoning strategy involves a process of deliberation where corporations engage in an open reflective process with stakeholders about the norms and societal expectations to be included in legitimacy contribution to sustainable development of the corporation.

Thus, following Scherer, Palazzo, and Seidl, it is important to emphasize that although not fully replacing adaption and strategic manipulation, moral reasoning and deliberation are essential part of reflective business legitimacy. The ethical dimension of corporate citizenship is becoming more important with the present developments of SDGs as guidelines for responsible business management and CSR. We need to rethink the legitimacy of business ethics and CSR in the framework of the SDGs. In the context of globalization and a cosmopolitan world order with global responsibility, business combine the different legitimacy strategies with responsible ethical reflection and deliberation. This is necessary because of the many challenges, paradoxes, and contractions that corporations face with the complexity of globalization. With complex cultural and social conditions, challenging reflective deliberation businesses need to combine different legitimacy strategies in order to improve reflection capacities. The reflective legitimacy strategy combines deep reflection with capacity of both contextual and structural solutions to sustainability challenges (Scherer et al. 2013: 277). This is a much-needed response to contemporary, global sustainability challenges.

Conclusion

To sum up, the stages of developments of different levels of corporate citizenship responsibility in firms show that the contents as well as the rationality of legitimacy, the way of legitimization as well as the weighting of legitimacy and of legitimization, and the types of legitimacy conflicts have changed. We can say that the development of the concept of political CSR with the responsible and proactive corporate citizenship includes the stages of cognitive, moral, and pragmatic legitimacy, where legitimacy is considered a generalized perception of an organization (Rendtorff 2019a).

This implies an interdisciplinary perspective with comparative integration of sociological, political, philosophical, theological, ethical, economic, legal, linguistic, and communication theoretical approaches to the changed forms of business legitimacy as moral legitimacy. Such research on business legitimacy with focus on responsibility, ethics, and society aims at clarifying how the interrelation between company and environment is mediated by legitimating notions in public spaces and public relations. Moreover, it searches to understand how and why notions of legitimacy have changed radically and how these transformations strike on the epistemological as well as practical dimension of business companies; and the problems involved in these transformations at the macro-, meso-, and microlevels.

The Problem of Corporate Legitimacy

2

Andreas Suchanek

Contents

Abstract

This chapter aims at clarifying the underlying problem which is addressed by the concept of corporate legitimacy. In a first step, it is defined as the question, what corporations can reasonably assume from society regarding the public acceptability of (value-creating) actions which put costs (risks, burdens, harm) on others? As such, legitimacy is reconstructed as a constitutional ethical focal point, where ethical focal points are defined as a shared understanding regarding societally desirable, mutually aligned behavioral expectations, constituting

an infrastructure of social cooperation. In a volatile, uncertain, complex, and ambiguous world, this shared understanding is at risk to erode. Companies are expected to contribute to it, which is, at the same time, aggravated due to the pressure of competition.

Keywords

Corporate legitimacy · Focal points · Do no harm principle

Introduction

There were times when the problem of corporate legitimacy was not existent. Obviously, this was the case when corporations as "actors," with rights and responsibilities, did not exist. And when in socialist regimes private corporations weren't allowed to operate, they had plainly no "license to operate." And corporate legitimacy was also not a topic, when corporations produced goods and services under market conditions operating under a set of regulations, provided and enforced by a government, the legitimacy of which could, in principle, be taken for granted.

The role of corporations in society was in need to be reconsidered, when due to environmental problems, and later due to globalization and digitalization, more and more problems occurred, which were no longer reliably regulated by governments. As Kofi Annan put it in the year 1999, when he initiated the Global Compact: "I propose that you, the business leaders gathered in Davos, and we, the United Nations, initiate a global compact of shared values and principles, which will give a human face to the global market. Globalization is a fact of life. But I believe we have underestimated its fragility. The problem is this. The spread of markets outpaces the ability of societies and their political systems to adjust to them, let alone to guide the course they take. History teaches us that such an imbalance between the economic, social and political realms can never be sustained for very long" (Annan 1990). Corporations were no longer perceived only as actors in the economic system, subject to market forces and oriented toward profits, thereby led by the "invisible hand"; they became a *political* actor (Scherer et al. 2014), and as a consequence, the problem of their legitimacy became a relevant topic.

In this chapter, this problem will be reconstructed from the following basic reformulation of the well-known problem of social order: *What can we (reasonably) expect from each other?* It will be argued that (an important part of) an answer to this question can theoretically be captured by the concept of focal points and that legitimacy can be seen as a *constitutional ethical focal point*. As such, legitimacy stands for societally generalizable acceptability of actions (institutions, positions, behavioral expectations, and more), *even when they cause some harm to others or ask burdensome things to do or bear*. In this way, legitimacy facilitates social cooperation and avoids or mitigates conflicts. For corporations, as well as for all other actors, the existence of which depends on social acceptability; legitimacy is a valuable resource, more precisely an asset, for their operations.

Being an (ethical) focal point, legitimacy presupposes a *shared understanding* about what is perceived as legitimate and where the boundaries of these accepted rights to act are. As a *constitutional* (ethical) focal point, legitimacy refers to an inventory of normative and empirical concepts – norms, values, ideas, interpretations, etc. – which can be used to enable social cooperation or "tame" social conflicts. The key challenge, which will be elaborated, is that this inventory is volatilizing, sort of. And this poses a fundamental problem for corporations as well as their stakeholders and society in general. Part of the "problem of corporate legitimacy" will be that corporations are in need and at the same time supposed to contribute to legitimacy as a kind of "infrastructure" for social cooperation and value creation. This is all the more challenging, since corporations are, from their functional environment, only limitedly equipped with the means to generate and maintain their legitimacy. More specifically, they operate, as a rule, under the pressure of time and competition, which restricts their room for maneuver to invest in institutional and cultural prerequisites which typically have the character of a collective good. At the same time, increased expectations combined with more transparency intensify the pressure to adhere to higher social and ecological standards. Taken together, this leads not only to a *widening gap between morals and profits* but also to the challenge to *maintain a shared understanding as to what reasonable rights and responsibilities of corporations are with regard to the maintenance of their legitimacy.*

The line of argumentation is as follows: In the next section, the metaphor of a game and the associated distinction of moves, rules, and understanding of the game will be explained as a heuristic scheme to systematize some of the following considerations. Section "Focal Points" explains the concept of focal points as a prerequisite for cooperation. Building on that, section "Legitimacy" derives a concept of legitimacy as *constitutional ethical focal point which refers to the right, and acceptability, to do some harm when it can be justified*. In a next step, the challenge of applicability of this normative concept in a complex world is discussed. Building on that, the actual question of corporate legitimacy is taken up (section "Corporate Legitimacy"). It will be argued that the crucial problem is the tension of normative expectations from society and competitive pressure combined with increasing difficulties to bridge them by public discourse – thus maintaining working focal points.

Actions, Rules, and Understanding

In his Constitutional Economics, J. Buchanan occasionally used the metaphor of a game to introduce a conceptual difference: the distinction between *moves in a game* and *rules of a game* (see, e.g., Buchanan 2008). This simple heuristic distinction helps to clarify that actions are always embedded in a framework, an order, which coordinates and aligns them. A change in the rules will imply different sets of actions; conversely, new actions may imply the need for a change in the rules.

Buchanan, and many other social philosophers, argued that the key function of rules is to structure mutual behavioral expectations, making them consistent and thus creating reliability, which is the basis for social cooperation (as well as value creation). Without laws, regulation, contracts, and other forms of social rules, social cooperation cannot take place, especially not in a society which is built on a high degree of division of labor (Brennan and Buchanan 1985).

To explain legitimacy, it is helpful to introduce a third layer, which is related to the *individuals' "mental models"*, the understanding of the game. In his book *Structure and Change in Economic History*, D. North (1981) argued that the overcoming of the free rider problem in a society cannot be explained by an economic argumentation which is based merely on the classical behavioral assumption of rational self-interested actors. To cope with this problem without abandoning completely the rational choice approach, he suggested the concept of "ideology" or "shared mental models" (Denzau and North 1994). This is the realm of beliefs, convictions, arguments, values, and also expectations. This level refers to the *interpretation* of rules but also to perceptions of and assumptions about the embedding contexts as well as to the question how the game can and should be played.

Understanding of the game	⇨	Order of expectations/communication
Rules of the game	⇨	Order of actions
Moves in the game	⇨	Actions

The importance of this distinction between rules and understanding is expressed, e.g., in the following quote from David Hume: "[I]n order to form society, 'tis requisite not only that it be advantageous, but also that men be sensible of its advantages" (Hume 2000, 3.2.2). In a similar vein, one can say: in order to form society, 'tis requisite not only to have rules but also that men understand (are familiar with) and accept these rules. Rules are bound to individual mental models; that is, the meaning and *legitimacy* of rules are dependent on the individual perceptions and interpretations: on the one hand their *subjective* understanding, including individual assumptions about how others may perceive and interpret the rules, and on the other hand, the *shared* understanding.

Therefore, the distinction between rules and understanding allows to differentiate between the order of actions (rules) and the order of communication or expectations (shared understanding). Both levels are related, but cannot be reduced to each other.

As a consequence, successful social cooperation – a good game, as it were – requires to a certain extent a shared understanding. This relates especially to shared ideas about (1) how the game *should* be played, shared goals and values, and (2) how it *can* be played, shared perceptions on reality. It will later be argued that this is one of the most fundamental challenges of legitimacy: the eroding base of a shared understanding with regard to essentials of social cooperation and the rights and responsibilities.

It should be noted that the notion of a shared understanding is not meant to be encompassing – a universally shared "comprehensive doctrine" (Rawls 2005, passim). As J. Rawls convincingly argued, in our modern society, pluralism has to be seen as a fact (Rawls 1987, 1 ff.). It would be inappropriate to ask for a completely shared understanding between all members of a society regarding societal, political, and economic values. People will, and can, have different ideas about a good life, about the world, and more and still cooperate successfully. However, some shared ideas, beliefs, perceptions, and interpretations of "the game" and its rules are strictly necessary in order to achieve cooperation. More specifically, social cooperation needs a compatible set of beliefs from which mutually consistent behavioral expectations can be derived. The "rules of the game" are, as mentioned before, a framework which are a necessary foundation for this task, but their functioning in turn builds on some shared interpretations and assumptions of these rules, especially with regard to their legitimacy. Cooperation cannot take place, if mutual behavioral expectations aren't sufficiently aligned.

To specify this challenge of aligning expectations as basis for successful cooperation, be it in concrete interactions or on a generalized, societal level, the concept of *focal points* will be explained in the next section.

Focal Points

In his book *The Strategy of Conflict*, Thomas Schelling (1980) introduced focal points as a solution to a particular problem in pure coordination games, namely, the need to coordinate the actions of different individuals, which presumes to coordinate their *expectations* about the others' behavior and, more precisely, their *expectations about the others' expectations about their behavior*. Based on Schelling's ideas, one can describe the most basic form of focal points in the following pure coordination game:

		Actor 2	
		Place A	Place B
Actor 1	Place A	I **1, 1**	II 0, 0
	Place B	III 0, 0	IV **1, 1**

Two actors, 1 and 2, want to meet at 2 pm, but they forgot to make sure whether they should meet at place A or B; put differently, there was a partial shared understanding to meet but a *lack* of a shared understanding with regard to a crucial element as prerequisite for successful cooperation. Assuming that both at least shared the perception that they'll meet at either place A or place B, the question is as to whether there exists a unique cue that *aligns their expectations*. This focal point has obviously a *value* for both since it *enables cooperation*.

Schelling describes focal points accordingly as elements "of each person's expectation of what the other expects him to expect to be expected to do" (1980, 57), that is, a "point of convergence of expectations" (Sugden and Zamarrón 2006, 610). The challenge is to have a *shared* cue on which the actors can orientate their behavior, building on the expectation that this perception itself is shared. It is worth noting that in everyday life this convergence of expectations is often taken for granted, that is, without second thoughts. Obviously, this can also lead to misunderstandings and misalignments, typically when one assumes falsely that the other share one's own interpretation of the situation.

Concrete focal points can be found everywhere: landmarks can serve as focal points, as do traffic lights. They both align expectations (also those about the others' expectations) and thus enable coordinated action. Typical focal points in companies are key performance indicators – not only do employees know that they have to take them into account; they do also know (intuitively) that the others expect them to do so. Similarly do (good) company slogans work, if they are actually referred to and substantiated by the leaders of the company?

When focal points are solutions for a pure coordination game – as it was discussed at first by Schelling – they are self-enforcing. However, there are two systematical reasons why focal points might not "automatically" lead to corresponding actions. The first is a cognitive one, namely, different mental models which lead to different interpretations of the situation and hence to different expectations; travelers may have this kind of experience when they are for the first time in a different culture; they may simply not know what others might expect from them; experiences are similar for new members in an organization when they don't know the company culture. Second, in mixed-motive games, where conflicts are prevalent, incentives exist to deviate from focal points, even if they are perceived as focal points. For example, in a business interaction, which is based on mutual trust, responsible behavior from each side is expected; however, sometimes this expectation may not be met, although both sides understand that it is mutually expected (and a *legitimate* expectation).

This second, more complex, case of focal points was elaborated by D. Kreps (1990). His basic idea was that, due to the inevitable incompleteness of rules and contracts, a relevant problem of interactions is how to deal with unforeseen contingencies, where it is not possible to specify contractually how each partner in an interaction will (have to) behave, but one party might have an opportunity to realize benefits at the others' expense (an obvious problem for behavioral expectations). This type of situation can more generally be characterized as a conflict, which is not (sufficiently) regulated, neither by formal rules nor by informal ones. According to Kreps, focal points can be interpreted as basic principles or values, which establish a *shared understanding* between the interacting partners on how to deal with this type of situation. Based on the *reputation* of the players, these focal points provide – to a certain extent – a reliable structure for behavioral expectations, thus building the basis for a mutually beneficial cooperation. Put differently, reputation serves as an incentive to act according to the others' expectations, even when it comes at a cost, because it signals reliability of the actor and increases her attractiveness as a partner of cooperation.

It is worthwhile to note that no single actor has perfect control over focal points. No one can be forced to share it, although strong reasons or incentives might exist. The relevance of this aspect will become clearer when the question of corporate legitimacy will be taken up.

Legitimacy

In the following, the concept of legitimacy is elaborated in several steps. In the first subsection, freedom and the necessity of a social order is explained as a starting point for the reflections to come. In the second subsection, legitimacy is defined as a constitutional ethical focal point. Next, the content of the concept is discussed as the generalized authority or social acceptability to act in a way which implies some potential or actual burden (costs, risks, harm) on others for justifiable reasons. In the fourth step, the challenge of making legitimacy a concept that can be used in the real world – that is to say, connecting normative and empirical assertions – is discussed.

Freedom and the Necessity of a Social Order

In this reflection on (corporate) legitimacy, the *fact of freedom* is assumed as starting point. There exists an encompassing and ongoing discussion about whether free will exists; see, e.g., Fischer et al. (2009). For the purpose at hand, it will be assumed that human beings are free; otherwise the whole context of normative deliberation would presumably need a change. According to this assumption, human actors are, in principle, gifted to develop and realize their own intentions. However, they are also *embedded* in reality, in time, and in the social dimension. Especially the last aspect is crucial for legitimacy, because it means that individuals interact with other individuals who are also free.

As a consequence, individual freedom can only be realized in cooperation with others, be it in a constructive way that some individual goals cannot be achieved alone or be it in a negative way that others do not impede or obstruct one's actions. Therefore, if an individual wants to pursue her interests, it is beneficial when this is *accepted* by others, at least to a certain extent. A fortiori, this is also true if one wants others to behave in a certain way, e.g., as a superior. The less these others accept that request, the more costly – and sometimes impossible – it will become to enforce it.

Based on this "fact of freedom," the fundamental question arises: *What can we expect from each other regarding our use of freedom?* This question can be asked empirically or in a normative way. The latter leads to the following qualification, namely: what can we reasonably, or legitimately, expect from each other?

Expectations are necessarily built on regularities, be it natural laws or, as in the case of human actions, social laws in an empirical or normative way. As for the latter, there exists a crucial difference to natural laws. Social laws are a kind of constraint of freedom which can be disregarded; these laws, the "rules of the game," can be neglected or broken, which cause a specific kind of problem unknown in the world of natural sciences. That is, it is part of the human capability of acting freely to *constrain* oneself by one's own will and to adhere to certain rules, norms, principles, etc. This willingness – and the according abilities – is a key factor regarding the social relevance of legitimacy.

In other words, society can only exist when there is some sort of alignment of individual actions as well as expectations. This idea is mirrored in the following definition of legitimacy offered by Suchman in his often quoted article, "*Legitimacy is a generalized perception or assumption that the actions of an entity are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs, and definitions*" (1995, 574; the emphasis is taken from the original).

The alignment of these "perceptions and assumptions" about the propriety of actions is done by orders, or frameworks, which were referred to in section "Actions, Rules, and Understanding" as the two levels of "rules of the game" and "understanding of the game." Furthermore, focal points were explained as concepts describing the alignment of expectations, thus enabling cooperation. Building on that, legitimacy will now be defined as a *constitutional ethical focal point*.

Legitimacy as a Constitutional Ethical Focal Point

Legitimacy as a Focal Point

Intuitively, legitimacy can be captured as an actor's *right* (entitlement, allowance) to use their freedom in certain ways which are *accepted* by those who are concerned. Reformulated using the concept of focal points, the actor has the *expectation* to have the right (allowance) to do certain things which are (should be) accepted by others, be it those who are directly concerned or be it those who are bystanders or observers, respectively. Furthermore, the latter know, maybe unconsciously, that they are expected to accept this right. This set of expectations is complemented with the expectation of the concerned or third parties that the constraints which define the boundaries of this right are observed by the actor – put differently that the legitimized actor uses her freedom *responsibly;* and again, it is expected that the legitimized party knows and respects these expectations in turn. This can be derived that responsibility means to respect legitimate expectations (cf. Suchanek 2017).

To illustrate, the government is legitimized to raise taxes, and it can expect to find acceptance from the taxpayers. The latter can expect that the government will do so only in an acceptable way without exploiting them, that is, the government will observe certain constraints on their behavior, typically in form of formal and informal rules which define their (legitimate) room for maneuver.

Another example are the rights of a manager A to request certain tasks to be done by an employee B. Assuming that these tasks are covered by the employment contract (and further background regulations), the manager can expect the employee to accept this request; would the task be beyond the legal boundaries, the employee can expect that she need not necessarily do it. Furthermore, it should be added that third parties C can expect that they will not be harmed in their legitimate rights by the request or its execution.

These examples demonstrate the elements of legitimacy: aligned expectations and a structure of – mostly legal but also informal – rules and values which enable cooperation. As will be discussed later, this alignment is especially important when one party is asked to accept some kind of burden. This "acceptance" can either refer to the individual's actual willingness to fulfill a request or to act accordingly *only* for external reasons, possibly with some reluctance. Legitimacy as focal point is only limitedly referring to the actual willingness of B but to the right of A to expect it (assuming that legitimacy is actually given or justifiable, respectively). That is, legitimacy, as a focal point, implies that B knows that A (and others) expects from him to accept the request – it is a *shared understanding*. Therefore, legitimacy has incentivizing effects, which is why it is often seen as a resource (see, e.g., Ashforth and Gibbs 1990). This incentive effect is in principle the stronger – the more B is willing to recognize the legitimacy of A's right. This is the reason why societies and also governments invest so much in forms of education and communication which aim at legitimacy and its prerequisites.

This character as a resource – mostly as an enabler for cooperation or avoidance/mitigation of conflicts – can further be clarified by extending the illustration: if B doesn't perceive A's request as legitimate, this will lead to conflicts which adversely affect social cooperation. In the case of an employment relationship, B may simply refuse to do the task or work to rule or even may sabotage. It should be noted, however, that this may also happen for other reasons than B's nonrecognition of the legitimacy of A's request. Another aspect of legitimacy – often the one which is in the focus of discussion – is the question whether A is actually entitled to request certain things from B. As explained earlier, the request may go hand in hand with some harm done to B or C, and to be legitimate, there has to be a base which offers the justification and implies acceptability.

It is key to understand that and how this justifying base needs a shared understanding – not in the way of an encompassing comprehensive shared mental model but in a way that this base can serve as a focal point which aligns the expectations and leads to mutually perceived recognition and acceptance, to reliable mutual expectations, and, as a consequence, to successful cooperation.

Legitimacy as an Ethical Focal Point

Not all focal points foster social cooperation for mutual advantage, although they might create a set of shared beliefs on how to act in particular situations. Bad leaders may create focal points which align expectations, and hence actions, but in an unfair, irresponsible, and unsustainable way. Or specific actions or events may create a focal point for members of a group which create deep and enduring mistrust.

In contrast, ethical focal points are aiming at enabling and maintaining sustainable social cooperation for mutual advantage. Examples for such focal points are moral principles, norms, or values such as the Golden Rule, the norm "do no harm," the categorical imperative, values like respect or fairness, human rights, the concept of common good, etc. These ethical focal points (should) provide tokens, which can be reasonably expected to guide mutual behavioral expectations or what to take appropriately into consideration as an actor as well as a person who is concerned by these actions.

As said before, ethical focal points are typically not an equilibrium in a coordination game but rather a (focal) principle which deals with conflicts, aiming at avoiding them or coping with them in a reasonable manner. This aspect leads to considerable complications because often do incentives exist to deviate from an ethical focal point. Ethical focal points, then, do not necessarily coordinate actions directly but express a shared understanding as to how one *should* behave (since it is expected as the "right" way) which implies a couple of theoretical as well as real challenges.

In order to reconstruct these challenges in the present context, society shall be defined as *venture for mutual advantage, which is marked by shared as well as conflicting interests, beliefs and perceptions (Rawls 2009, 84 and passim)*. In order to realize this venture, *contributions* from every member are needed, namely, to render some kind of services which create value and to follow certain norms and principles which enable or maintain a civilized way of living together – e.g., not stealing, not lying, keeping promises, etc. Later on, these norms and principles will be interpreted as elements of an *inventory* to which legitimacy refers.

The problem is that these contributions have *(opportunity) costs*: that is, in many situations one can realize (short-term) benefits or avoid burdens at the expense of others or the future. Still, it might be a focal point to realize successful cooperation – and to expect mutually that everyone should and will cooperate – but it is no longer self-enforcing like in the pure coordination game. Instead it might have the form of the well-known prisoners' dilemma, where the pareto-superior outcome of cell I can be an ethical focal point but having adverse incentives working against its realization:

		Actor 2	
		Contribution	No contribution
Actor 1	Contribution	I 1, 1	II −1, 2
	No contribution	III 2, −1	IV 0, 0

Thus, *an ethical focal point is a shared understanding regarding societally desirable, mutually aligned behavioral expectations* which are, however, not "automatically" self-enforcing but continue to be desirable *and generally expected to be shared (as an ethical focal point)*. Whether one can actually expect others to "contribute" depends on their willingness but also on the concrete empirical circumstances of the situation – *ultra posse nemo obligatur*. In the real world, various reasons can exist as to why an actor might not contribute: other values or obligations of a higher order, a lack of competencies or knowledge, external circumstances which impede a contribution, and also opportunistic behavior. Therefore, in many situations expectations have to be adapted, and various norms, claims, or values as well as empirical circumstances have to be considered to derive concrete behavioral expectations.

On the other hand, it would hardly be possible to make any strategic plans and undertake any long-term investment, if uncertainty prevails whether particular situational circumstances may lead to expected actions ("contributions") or not. Social cooperation is basically building on *reliable* expectations or behavior which is predictable. This is possibly the most basic function, or "reason" (Brennan and Buchanan 1985), of rules, especially those which specify mutual rights and obligations regarding one's use of freedom. Consequently, rules and regulations can, as long as they actually foster social cooperation, also be interpreted as ethical focal points, which are typically supported by various means – e.g., sanctions – to strengthen their reliability and hence their character as an actual focal point.

Ethical focal points can lose their function as a focal point, if they are no longer seen as an actual orientation for behavior. If individuals perceive the reference to a specific focal point only as cheap talk and neither institutions nor reactions support the further existence of this focal point, it becomes – at least for the time being and as a focal point – meaningless. A typical example is when actors in business or politics invoke values like fairness or respect, and no one perceives this as meaningful in any regard. Conversely, working focal points are embedded in routines, incentives, and generally an institutional environment that supports their function to align behavioral expectations.

The more complex a society becomes, the more complex the order of actions; the web of institutional norms and regulations have to become in order to coordinate the manifold individual interactions as well as maintaining a general consistency between these many specific rules. Furthermore, the task of "managing" these rules, which is classically the realm of politics, has itself to be well regulated, because only then one can expect that it will, in principle, find acceptance, that is, *legitimacy*. This leads to the last part of the definition of legitimacy, its character as *constitutional*.

Legitimacy as a Constitutional Ethical Focal Point

A key challenge of any social order is to maintain *consistency*. If various regulations exist which are mutually incompatible, they will not be able to fulfill their function, namely, being the base for deriving reliable behavioral expectations. In a similar vein, it is important for successful social cooperation that not only moral norms and values exist but also ways how to weigh and possibly prioritize them in case of conflicts. It deserves to be mentioned that conflicts are not always negative; they can also promote the common good, namely, in the form of performance competition. Conversely, not all forms of cooperation are desirable from the viewpoint of society, for example, cartels, organized crime, and other examples of cooperation, to the detriment of third parties. This hints at the complexity of the task to maintain consistency. A considerable part of legal sciences and ethics is dedicated to work on this consistency and provides helpful models, arguments, concepts, etc. to avoid what might be called *relevant inconsistencies* (for a systematic explication of this concept, see Suchanek 2015, 2017). With regard to the law, a constitution can be seen as a means to maintain the consistency by defining the most fundamental rights as well as procedures on how to avoid, mitigate, or reasonably cope with relevant inconsistencies.

In a somewhat similar vein, one might see legitimacy as a concept which tries to hold together various ethical focal points to the extent that the latter are related to the structure of rights and responsibilities of actors in a society which are the base of mutual behavioral expectations and a fortiori of corresponding behavior. This constitutional character means that legitimacy, howsoever indirect, refers to foundational sources of itself which *justify* it, thus generating acceptability. It should be kept in mind that this refers to *working* focal points which actually orientate behavior.

Over the course of history, various sources of legitimacy existed and partly continue to exist. Classically, religions provided this source, as long as the members of society had a *shared understanding* of the rightness of the particular religion; other sources were the natural law or the laws of history (K. Marx). With the advent of the modern society, the universal acceptance of external sources declined, and as a consequence, the ultimate source of legitimacy was located within society: *consent* became the foundation of justification. This is why legitimacy is seen here as a *constitutional* ethical focal point: it refers, at least indirectly, to the basic normative foundation of the social order.

While consent is the ultimate source of legitimacy, it needs to be operationalized for everyday use. This is done by the existing structure of laws, regulations, directives, contracts, and so on – the “rules of the game.” But legitimacy is not confined to refer to these formal institutions; it is not tantamount to legality, although its etymological root is from the Latin word for law, “lex.” Instead, it comprises *also* informal rules, social and moral norms and values, which often specify the “spirit of the law.”

In order to get a better understanding as to how legitimacy works in everyday life, it is furthermore important to see that it is plainly impossible to expect everyone to be an expert of the law or to have an encompassing – and the same – understanding of the informal norms and values of a society. Mostly, legitimacy works based on familiarity, habits, taken-for-grantedness, etc., especially as long as no deeper conflicts or crises arise, in which it turns out whether legitimacy actually works as a “reservoir of support” or of “goodwill” (Dogan 1992, 123).

Therefore, it might be helpful to assume that legitimacy draws on an *inventory* of shared beliefs, convictions, perceptions, and so on, which are “organically” coupled. This expression shall characterize that the elements of the inventory aren’t structured rigidly but relate to each other in a systematic but flexible way. If, for example, a particular action is not perceived as legitimate, it is possible to refer to another, more fundamental norm, principle, reason, etc. which builds on or creates a *shared understanding* on how to cope with this conflict.

One of the most fundamental challenges of legitimacy is the question how it is possible to represent and include all interests, thus building common ground for all individuals to be willing to contribute to social cooperation and at the same time accept the burdens that come inevitably with it. This is the point where it is important to integrate the role of the two orders into the picture again. On the one hand, the *rules of the game* provide a historically evolutionary grown structure of checks and balances as well as conflict-mitigating procedures; on the other hand, it is always necessary that individuals subjectively *understand*, or are sufficiently familiar, with these rules which demand a corresponding *(shared) understanding of the game*. In former times, the church or a ruler was in a position to represent the interests of society in a sense that they (and their decisions) were accepted in this position and hence legitimized. Modern societies do no longer have such a unique position, even if governments can be seen as a proxy, sort of. However, it has to "earn" its legitimacy typically by getting confirmed by the people – or it will eventually be substituted by another government. A prerequisite for this process to secure legitimacy is a complex institutional setting (rules of the game) and high demands with regard to the educational system (a sufficient understanding of the game).

To summarize this section, legitimacy is a generalized concept which enables and eases social cooperation and, especially, avoids or mitigates social conflicts by drawing on a shared understanding about how the game should and can be played, that is, which rights and responsibilities the members of society have, what they are allowed to do – and what accordingly should be accepted – and where, which, and why constraints should be observed, be it with regard to actions or to expectations toward others. This alignment of expectations was captured in the concept of a constitutional ethical focal point.

Criteria of Legitimacy

To function as a constitutional ethical focal point, legitimacy entails four criteria which must be (sufficiently) fulfilled:

(a) Consistency
(b) Continuity
(c) Incentive compatibility
(d) Understandability or familiarity

ad (a): *Consistency*, as the first and most general criterion, is, in an elementary sense, rooted in logic, that is, it is kind of a formal prerequisite to develop reliable expectations about the future. Basically, consistency refers to the feasible plans of individuals how to live and cooperate in society. If they are not consistent, conflicts will occur. Furthermore, these plans have also to be consistent with the empirical conditions which constrain their realization.

As discussed earlier, the presumably most relevant elements of the "inventory" of legitimacy, which form the basis and ensure consistency, are legal provisions, all the more since their consistency is continuously checked and discussed in the courts, by law scholars, etc. Other important sources, which provide (first-order) focal points for consistency checks, are moral norms, values, and principles, which also are the reason for the difference between legality and legitimacy. Some actions can be legal and yet be perceived as illegitimate, because they fulfill the letter of the law but are not in line with values such as fairness.

Perfect consistency is impossible in a contingent world, where scarcity, change, lack of knowledge, etc. prevail; presumably, it would even be detrimental to life. Nevertheless, it works as a criterion which has strong heuristic power. However, it is always dependent on what is looked at to be consistent, that is, it is also a matter of the frame, or the narrative, which assumptions, premises, beliefs, etc. are taken into consideration, especially when acceptability is at stake.

ad (b): C*ontinuity*, as consistency over time, is vital because expectations do always rest regularities in order to derive what might happen in the future; and these regularities are based on the past. Therefore continuity is important for any legitimacy-seeking actor or any institution to be accepted in that concerned persons get familiar with it and learn how to integrate its existence into their mental models. As Suchman observes, “continuity and credibility are usually mutually reinforcing” (1995, 575).

The relevance of this criterion becomes more evident by recognizing that focal points, especially more complex ones, need time to get established, that is, to be made consistent with various empirical circumstances as well as other normative orientations (norms, values, etc.) in order to function properly. This, again, demonstrates their character as an asset and implies that following (ethical) focal points, even if it is not in the immediate interest of an actor, is an investment.

ad (c): *Incentive compatibility* can also be interpreted as a specification of the first criterion, in that legitimacy has to be consistent with basic conditions of human nature. Nothing can be assumed to be (reasonably) acceptable, and hence legitimate, if it is for those, who have to accept it, against their (reasonable or itself acceptable) self-interests. It should be noted that “interests” has to be interpreted in a wide sense, that is, it includes the whole range of Maslow’s hierarchy of needs (Maslow 1943), including the individual’s capability to reflect these (own) needs and re-prioritize them, e.g., abstaining from fulfilling basic needs for a higher degree of self-actualization.

Again, it is a matter of degree, to which extent this criterion can be substantiated. Obviously, it would create deep conflicts, if this compatibility criterion would be interpreted in a way that all kinds of individual interest, or even all first-order desires, are allowed to enter the equation, so to speak. Put differently, some interests, or expectations toward others, can themselves to be said to be illegitimate. And it would be inappropriate to seek consistency with these interests, although one still has to take them into account for the simple reason, namely, because they exist. These interests are one of the main reasons why legitimacy often has to go hand in hand with some kind of power, to “convince” others that some actions are to be accepted or done. At the same time, this creates the incentive for some individuals to get this power.

ad (d): The last criterion, *understandability* or *familiarity*, clarifies that and why legitimacy is strictly related to the “understanding of the game.” If people are expected to accept something due to its legitimacy, they need to understand it, at least in a certain sense. This is not to say that individuals are conscious about the legitimizing structures or can explain it. Actually, in many cases, legitimacy relies on a more intuitive understanding, which corresponds to Weber's legitimacy by tradition (1978, Chap. I, §7). However, as soon as a tradition is no longer existent in a familiar way, rationalization and explicit communication, possibly justificatory arguments, are needed.

This is the point, where the inventory of (first-order) focal points is needed. There are many ways to "convince" others to accept some burden (in the aforementioned broad sense), but not all of them are legitimate, mostly because they might not pass the generalizability test which is tantamount to the fact that third parties might object to it.

Legitimacy as Acceptable Right to Harm Others

After having explained the formal property of legitimacy as a constitutional ethical focal point, this section serves to make a proposal with regard to the content of legitimacy, related to the question of "legitimacy for what?" (Suchman 1995, 574). Again, it starts with the idea of freedom and the implied question in a group or society of free individuals: what can we expect from each other regarding to the use of freedom?

The proposition for the most basic answer to this question is: *we can expect from each other not to get harmed by their use of freedom*. This idea refers to vulnerability as a constitutive element of being human which plays also an essential part in any trust relationship. Most definitions of the trust relationship refer to this element. For a discussion, see, e.g., Misztal (2012). Furthermore, the no harm principle is one of the most basic and universal ethical norms and can be found in many cultures. It can also often be found in elaborated systems of formal laws. For example, Article 4 of the Declaration of the Rights of Man and of the Citizen, passed by France's National Constituent Assembly in August 1789, states: "La liberté consiste à pouvoir faire tout ce qui ne nuit pas à autrui." (Liberty consists of doing anything which does not harm others.) Many laws and regulations state, mostly in their first, most general paragraphs, that certain rights are granted, provided they do not harm the rights of others.

For a better understanding of the relevance of this principle, the concept of "harm" needs to be interpreted broadly. It does not only include direct physical or psychical harm but also manifold forms of burdens, which one would prefer not to bear: doing things which one is not inclined to do, bear (additional) costs or risks, and accept constraints in one's scope of action. In the most general sense – which becomes nearly tautological – harm means the *disappointment of expectations which one claims to have rightfully (or legitimately).*

However, it would be impossible to take this no harm expectation as an unconditional norm that has always to be fulfilled. Put differently, it is inevitable that we put sometimes some burden on each other. Examples abound: the physician who cuts with a knife in a human body during an operation, the employee who is laid off, customers who have to pay higher prices, citizens who have to pay higher taxes, defendants who are sentenced to a fine or to be imprisoned, etc. This is precisely the point, where the question of legitimacy emerges: Is it acceptable to bear the burden and why? Legitimacy, then, means the *right of an actor to use her freedom in a way that harms others because there exist reasons, which are societally acceptable*. The word "acceptance" or "acceptability" itself suggests that some kind of burden is involved.

Taking as given that no external authority exists which can give this justification that differentiates legitimate from illegitimate harm, the remaining reasons for it are accepted norms and, ultimately, a *shared understanding of (the situational application of) a shared (set of) goal(s) or value(s),* which can then be said to be part of the aforementioned inventory.

In other words, the willingness of B to grant the right to act in certain ways to A (i.e., to legitimize her), even if it implies some harm to B, comes with two basic qualifications: first, this harm has to be (over-)compensated by benefits to B (or to others which B accepts as beneficiaries); second, this right is not unconditional but constrained in a way that B's legitimate rights are preserved. Again, these considerations do also, at least indirectly, refer to the fundamental role of trust in social cooperation, since B can also be seen as trustor and A as trustee.

It should be noted that it is part of this definition that expectations from B can also be improper and actually illegitimate. If a boss expresses expectations with regard to an employee, e.g., that a salesperson should make at least 25 contracts until the end of a month, and this is not possible with regular (legal and legitimate) means, this expectation may drive the employee into irresponsible behavior, thus creating harm (to customers, the salesperson, and even the company itself) in an irresponsible way. This consideration demonstrates again the character of legitimacy as a focal point.

Values and Reality

So far, legitimacy has been described as the alignment of intentions and expectations in a way that social cooperation is promoted and social conflicts are avoided or "civilized" in a constructive manner. Seen this way, legitimacy is the idea of a reasonable shared understanding or (societal) *consent*, including ways to maintain or create consent in dissent.

However, in order to *apply* this idea to the real world of social interactions, it is necessary to systematically integrate empirical conditions in this logical model of universalizability. Among the many questions, which may arise, are: How should conflicting norms or values be weighted and prioritized? How to deal with illegitimate expectations? How should benefits and costs of social value creation be distributed? How to deal with actors who misuse their rights? Or to use again the metaphor from section "Actions, Rules, and Understanding"? How to play the game, especially if basic conditions change disruptively, as it is the case with globalization, digitalization, or ecological conditions? These questions are important to consider, because one key function of legitimacy is, as said before, to deal with conflicting interests, claims, and expectations by providing a shared base on how to constructively cope with them. This, however, is not only a matter of shared ideas about the common good, basic moral norms and values, etc.; it is also necessary to find some common ground on how to *apply* them subject to given empirical constraints. It is rarely the case that someone is *against* fairness, sustainability, respect, or other moral values. Conflicts typically occur with regard to the question, what they imply concretely and, especially, what can be derived as specific behavioral expectation. Actually, it is mostly due to empirical circumstances that the question of harm comes up at all. If no constraints from reality were existent, it would be reasonable (and rational) to avoid harm in general.

One might think that ideally all members of society should have a shared understanding of a good society and its prerequisites, what empirical constraints exist and how to deal with them, what is implicated with regard to individual contributions as well as institutional structures, and which focal points coordinate these contributions and legitimize the according rights. Obviously, this picture doesn't correspond with the conditions of reality; individual mental models are rather different from each other – which, by the way, can be an important source for societal progress. Therefore, legitimacy can be seen as a regulative idea, a beacon, as it were, which needs to be maintained and updated continuously. This is holds true all the more, when society is undergoing profound changes.

Dealing with this "fact of pluralism" (Rawls 1987, 1 ff.) implies the relevance of public deliberation (cf. Palazzo and Scherer 2006). The challenge, however, is to take the aforementioned criteria appropriately into account. For example, when incentive compatibility as a key constraint for any social order (institution, rule, regulation, etc.) is neglected in a public discourse, the use of normative concepts will become more and more shallow, and these concepts may lose their function as ethical focal points as described in section "Legitimacy as an Ethical Focal Point." Likewise, abstract deliberations, which are not connected with the understanding of ordinary people, will also not support legitimacy as a focal point. These few remarks do already hint at the problems, which are discussed in the next section.

Corporate Legitimacy

In a simplified way, the question of *corporate* legitimacy might be approached with the following questions: What are the rights and responsibilities of corporations? What are the institutionalized and normative sources of those rights? What are firms allowed to do – and what should accordingly be accepted by their stakeholders and the public? And what is expected from them, that is, what are their responsibilities, where (corporate) responsibility is understood as respecting legitimate expectations of concerned parties? It is "respecting" and not "fulfilling," because in some situations it is plainly impossible to fulfill expectations even if they are, in principle, legitimate. In this case, however, "respecting" means to offer reasons as to why one did not fulfill these expectations. For an extensive elaboration of this reconstruction of corporate responsibility, its premises and implications (see Suchanek 2015).

Although these questions, in substance, were always relevant, they weren't a topic for academic discussions for a long time. Classically, legitimacy was a concept for the political discourse, and the academic discussion took place only within the realm of political science and philosophy. The question was whether a political actor or political institutions deserve legitimacy, which was drawn from sources like God, natural law, history (K. Marx), or the people (democracy) and transferred through authoritative bodies and institutionalized procedures. For corporations, there was no need to discuss their legitimacy. Rules and understanding of the game, to make again use of the metaphor, could be assumed to be taken for granted. Corporations were not seen to be involved in the political realm. In a sense, their actions were implicitly assumed to be legitimate, since they created value for "the wealth of nations" subject to given regulations and the pressure of competition. Accordingly, there was no need for an academic discourse about corporate legitimacy. In economics, for example, it was, often implicitly, assumed that the rules of the game are given as well as a background culture which accepts corporations. The standard assumption was that competition and the logic of markets would discipline them in a way as if an "invisible hand" would align their contributions to society with public and stakeholders' expectations, expressed in the demand curve and the (implicit) background assumption that other claims from stakeholders were dealt with via contracts and law. In a sense, Milton Friedman (1970) expressed this perspective pretty neatly, when he argued that in a setting where the government provides the rules of the game and markets are competitive, companies *are (and should be) expected* to strive for profits; for him it was obvious that this has to happen by adhering to the law and "without deception and fraud" (ibid., 126).

However, with globalization in the 1980s and later, and further intensifying with digitalization, the game changed substantially. These developments opened up many new opportunities for companies to change their supply chains, tapping or even creating new markets and so on; digitalization allowed to create completely new business models, thereby at the same time threatening established ones, thus creating conflicts. Hand in hand with these developments, the competitive pressure increased implying that regulations need to be adjusted. Due to the transnational character of these changes as well as their sometimes disruptive nature, national governments were no longer in a position to completely fill the role of the authoritative body which sets and enforces the "rules of the game," thus providing and enforcing an encompassing and reliable legal infrastructure for legitimacy orientations. Furthermore, various corporate scandals led to intensified regulation as well as calls for corporate responsibility. To use the metaphor of a game again, globalization and digitalization have led to a pluralization of playing fields with different sets of rules and cultures (understandings), which is a considerable challenge for companies, especially with regard to maintaining *consistency.* At the same time, a "retreat of the state" (Strange 1996) can be observed.

As a result, the classical societal division of labor, namely, that politics is responsible for the rules of the game and business for actions within the (economic) game, becomes more and more obscured; corporations are increasingly seen as political actors (Scherer et al. 2014). Mostly, this dispute focused on the question of corporate (social) *responsibility*. But the arguments made earlier suggest that the question of responsibility needs to be *embedded* in the larger picture of institutional settings which define the actors' rights and responsibilities, thus maintaining a sufficient level of consistency.

Put differently, corporations do no longer find an institutional and cultural infrastructure, which offers them a clear framework for their core business, in a way that they – and all other members of society – can take it as granted and build their mutual behavioral expectations on it. Instead, corporations are more and more expected to provide this infrastructure in part of themselves. At the same time, it becomes less clear what they are allowed to do *legitimately* and how a legitimacy check can be done. To be sure, this is not everywhere a problem. In many respects, daily business proceeds as usual. But especially the developments in the IT industry hint at the changes in the division of labor between the economic and political sector.

Referring to legitimacy as a constitutional (ethical) focal point, the problem of corporate legitimacy can be formulated as follows: *the inventory of (ethical) focal points, which serve to align specific societal expectations regarding the room for discretion of corporations and their actual orientations becomes more complex, more elusive and hence less effective.* Put differently, *functional focal points, on which corporations can build their license to operate, are eroding, get lost or need to be adapted*.

To put it in simpler terms, the society knows less what to – legitimately – expect from corporations, and corporations know less what is *legitimately* expected from them and further what they can expect from their stakeholders and society in general or, maybe more specifically, which expectations from which stakeholders should be given which weight in order to maintain legitimacy.

To use again the metaphor of the game, the teams of soccer – or another discipline – are not only expected to play against each other in a regular and fair way; they are also expected, within unclear limits, to help create, maintain, enforce, and adhere to new rules and a changing, and rather heterogeneous, understanding of their stakeholders.

While it is difficult to imagine that something like that might happen in the case of soccer, this metaphorical description seems plausible, when it is transferred to society in times of globalization and digitalization. Corporations are expected to create value; they have to make profits, subject to the pressure of competition; and at the same time they are more and more asked to invest in the infrastructure, which enables this "game." It is a key aspect of the problem of corporate legitimacy whether these investments (in the infrastructure of societal cooperation) are aligned with their incentives. This is not tantamount to reduce their responsibility to a business case. However, responsibility cannot sustainably assumed when it leads systematically to losses and competitive disadvantages.

Put differently, there is a fundamental tension between morals and profits. To a certain extent, this tension is inevitable. The degree and severity depend on the two orders of action and expectations (see section "Actions, Rules, and Understanding"). On one hand, normative expectations which are directed toward corporations are rising. They should observe higher social and environmental standards, be compliant with all rules, and maintain high levels of responsibility, sustainability, and integrity. Additionally, they are scrutinized by many – often nongovernmental – organizations, a circumstance which has many advantages but may cause a problem, if the expectations cannot be met when empirical constraints are taken into account. The latter refers to the fact that the conditions of today's business are, as a rule, characterized by a sometimes extremely high degree of competition and economic short-termism which is itself, at least partly, due to the fact that both frameworks, that of rules and of a shared understanding, can no longer be taken for granted and allow free riders to compete in an unfair way. The logic of the prisoners' dilemma in its negative dimension prevents long-term investments, the payoffs of which are uncertain and may not incur within the periods under consideration.

Furthermore, an elementary strategy to maintain and create legitimacy, (contributions to) public discourse in order to create a better foundation for a shared understanding, faces also the problem of adverse conditions. It is less the problem that the basic values are going lost. At least nominally, most moral values and principles like fairness, respect, and others are still accepted. The critical question is what they imply in concrete situations of complex supply chains, doing business in corrupt environments, and so on. There is a danger of a widening gap between those who are not familiar with the empirical constraints of business situations but request high normative standards and those who are in these situations and lose the belief in the relevance of normative concepts because they cannot see how to apply them in their situation.

This increases the odds that some corporations will contribute to actions and developments which undermine the conditions for their own future license to operate, for a fair competition, and for sustainable ways of societal value creation and that other corporations experience increased pressure to act in a similar way.

Outlook: Cultivating the Inventory of Legitimacy

In this chapter, legitimacy has been defined as a constitutional ethical focal point, that is, the core of a shared understanding in society on how to cooperate and how to cope in a reasonable way with conflicts. Building on this, the problem of corporate legitimacy has been narrowed down to a widening gap between profits and morals, more specifically, a gap between normative expectations toward corporations and the incentives for them to invest in the fulfillment of these expectations, which aggravates the maintenance of the foundation of legitimacy, a (sufficiently) shared understanding about mutual rights and responsibilities and their meaning in everyday life. Corporations are increasingly seen in a position where they get transferred societal, including political, duties without sufficient clarification whether (a) they have the resources, competencies, *and incentives* and (b) which and how checks and balances, which secure appropriate inclusiveness, participation, feedback, and, as a consequence, acceptability, might work.

It is worthwhile to remember that single actors (here corporations) cannot control legitimacy, much less than governments, although they influence various conditions to maintain it or contribute to its erosion; acceptance is ultimately always up to those from whom it is expected.

However, even if corporations cannot "produce" the infrastructure from which legitimacy expectations are drawn, they nevertheless, and inevitably, influence it. More specifically, corporations can indeed actively undermine their legitimacy by *not* fulfilling what is widely perceived as a legitimate expectation. Typical examples are noncompliance or the unjustified non-fulfillment of promises, the consequence of which is illegitimate harm to some stakeholders.

Therefore, it seems safe to say that corporations *can* do something to invest in legitimacy as a condition of their license to operate, namely, to *avoid relevant inconsistencies* of their actions with widely held societal expectations of responsible behavior (in this regard, cf. Suchanek 2015, 2017). It is then up to their stakeholders to reward and support those companies in order to prevent that corporate irresponsibility pays off. Ethical focal points, and hence legitimacy, will also erode if the corresponding behavior is punished.

3 Anthropological Underpinnings of Business Ethics and Work Ethics in Relation to Business Legitimacy

Friedrich Lohmann

Contents

Abstract

There is a strong human factor in business. Therefore, it is an important task for anyone who deals with economics – scientists as well as business people – to think about questions of anthropology: what are the important traits of human character and decision-making and how do I account for them in my own economic theory or business model? The chapter presents the understanding of human being and acting that is typical for neoclassical economics, the so-called *homo economicus* model. It then turns to various criticisms of that model and contends that there are two other significant anthropological models in current theory of economics: the other-regarding, moral person with specific interests in justice, solidarity, and integrity, and the "intuitive agent" of behavioral economics. It is argued that even though it has been tried to deduce norms and rules of business legitimacy directly from anthropological findings, anthropology cannot replace ethics. Still, observations with regard to human motivation and decision-making are an indispensable underpinning of any economic theory and policy.

Introduction

Business is done by human beings and it is addressed to human beings. Therefore, there is a strong human factor in business. This is even more the case when it comes to questions of business legitimacy. Legitimate business is defined by rules, and these rules are rules of human conduct. Hence they are dependent on certain conceptions of human behavior from which conclusions are drawn with regard to what can and should legitimately be expected from human actors in business. Or to put it otherwise: notions of legitimacy always have anthropological underpinnings, given that anthropology deals with the conceptual framework of the human being (*anthropos* is the Greek word for human being).

This is well-known both in economic theory and in business ethics. The long-stemming debates on the *homo economicus* are nothing else than debates on the anthropological underpinnings of business and its legitimacy. The following contribution tries to shed some light on these debates. It starts by giving some examples for anthropological preconceptions that can be traced in important works of economic theory (section "Economic Theory and Its Dependence on Anthropological Assumptions: Some Examples"). It then presents what is used to be called the classic model of the *homo economicus* (section "The *Homo Economicus* Hypothesis") and the criticism it has attracted because of its supposed shortcomings with regard to an evidence-based approach to human conduct and motivation (section "Criticism of the *Homo Economicus* Hypothesis"). A short conclusion (section "Conclusion") will sum up the debates and present anthropological research as an important task for economic theory as well as business ethics.

Homo Economicus and Its Discontents

Economic Theory and Its Dependence on Anthropological Assumptions: Some Examples

There are books that openly deal explicitly with the anthropological underpinnings of business. Werner Sombart published a large volume in 1913 that traces a history of the "economic man" ("Der Bourgeois: Zur Geistesgeschichte des modernen Wirtschaftsmenschen"; Sombart 2003). Pierre Bourdieu held a university course entitled "Economic Anthropology" that was published posthumously in 2017 (Bourdieu 2017). However, the impact of anthropological presuppositions on economics can be shown even more convincingly by looking into classics of economic theory that don't deal with anthropological questions explicitly.

The first example to be presented here is Murray N. Rothbard's "Man, Economy, and State" (Rothbard 2009). Following his teacher Ludwig von Mises and his highly influential book *Human Action* (Mises 1998), Rothbard begins his "Treatise on Economic Principles" with a chapter on "Fundamentals of Human Action" (Rothbard 2009: 1–77). He is very clear in stating the axiomatic character of these anthropological considerations for his theory of economics: "The present work deduces the entire corpus of economics from a few simple and apodictically true axioms: the Fundamental Axiom of *action* – that men employ means to achieve ends, and two subsidiary postulates: that there is a *variety* of human and natural resources, and that leisure is a consumers' good" (Rothbard 2009: LVI). And it could easily be shown that this is indeed the case. There is, e.g., a close connection between Rothbard's apology of a free market – which attacks, among other government actions, government intervention in favor of future generations (Rothbard 2009: 1037) – and the anthropological hypothesis that "man prefers his end to be achieved in the shortest possible time" (Rothbard 2009: 15).

Rothbard is very outspoken on the relevance of anthropological considerations for his theory of economics. This is true for Friedrich Hayek as well. Hayek, who was Mises' student and collaborator in the 1920s, states the following about his own academic journey: "Yet, though I still regard myself as mainly an economist, I have come to feel more and more that the answers to many of the pressing social questions of our time are to be found ultimately in the recognition of principles that lie outside the scope of technical economics or of any other single discipline. Though it was from an original concern with problems of economic policy that I started, I have been slowly led to the ambitious and perhaps presumptuous task of approaching them through a comprehensive restatement of the basic principles of a philosophy of freedom" (Hayek 2011: 49–50). Hayek laid down these basic principles in his landmark book *The Constitution of Liberty*, and he is very clear in saying that they are based on "assumptions [. . .] concerning individual human nature" (Hayek 2011: 120).

The relevance of such anthropological assumptions for economic theory is also very well traceable in Gary Becker's work. "The combined assumptions of maximizing behavior, market equilibrium, and stable preferences, used relentlessly and unflinchingly, form the heart of the economic approach as I see it" (Becker 1976: 5). "[A]ll human behavior can be viewed as involving participants who maximize their utility from a stable set of preferences and accumulate an optimal amount of information and other inputs in a variety of markets" (Becker 1976: 14). Becker is reluctant to speak of "human nature" (Becker 1976: 282), and he makes clear that the economic approach is only one among many others when it comes to understanding human behavior (Becker 1976: 14). Still, he contends that "the economic approach provides a valuable unified framework for understanding *all* human behavior" (Becker 1976: 14), and he tried to make a case for this all-encompassing value of the economic interpretation of human actions in many public contributions (Becker and Becker 1997) that include far-reaching statements about human motivation. For example, Becker describes love and altruism between humans as largely having an "as if" character, given that self-interest is the dominant human incentive for action (Becker 1976: 253, 286).

Becker's so-called economics imperialism was already advocated in the beginning of the twentieth century by Philip Wicksteed who claimed that the economics of utility maximization "run as a universal and vital force through the administration of *all* our resources" (quoted Lutz 1999: 151). Becker himself refers, among others, to Adam Smith and Jeremy Bentham in order to show the long tradition of interpreting human behavior this way (Becker 1976: 8, 282), and a last paragraph in this exemplary overview shall be dedicated to Smith. There is at least one of his statements that hardly any introduction into economics forgets to quote: "It is not from the benevolence of the butcher, the brewer, or the baker, that we expect our dinner, but from their regard to their own interest" (Smith 1976: 26–27 [I.2.2]). Mostly, this quote is made with the purpose of emphasizing that Smith already was making a case for the dominant place of self-interest in human thinking and acting and particularly in economic transactions. There is, however, very good reason to put this statement into the larger context of Smith's work and his thoughts on human psychology and to warn against an oversimplistic reading of Smith (cf., e.g., Sen 1987: 22–28). There is also good reason to warn against an identification of Smith's and Bentham's theories: "Smith's project was an ethical one. Bentham derailed it and brought economists to think only of *P*, Prudence" (McCloskey 2005: 30).

Within this article, the main point to be stressed is, however, that Smith indeed builds his economic theory upon general assumptions about the nature of humankind. The division of labor, as the basic principle of economic progress, is beneficial because human beings are, unlike animals and as part of their nature, in need of cooperation: "In civilized society he stands at all times in need of the cooperation and assistance of great multitudes, while his whole life is scarce sufficient to gain the friendship of a few persons. In almost every other race of animals each individual, when it is grown up to maturity, is entirely independent, and in its natural state has occasion for the assistance of no other living creature. But man has almost constant occasion for the help of his brethren, and it is in vain for him to expect it from their benevolence only" (Smith 1976: 26 [I.2.2]). This anthropological assumption is the cornerstone for Smith's entire economic theory.

The *Homo Economicus* Hypothesis

It is the task of economical science to describe and explain human behavior in order to allow a forecast of future behavior, which then enables adequate policy measures in politics and business (Kirchgässner 2008: 1–10). Forecasts require some kind of predictability and therefore the use of generalizations and rules. Economists achieve these required generalizations by using models, and arguably the most important model for standard economics in recent times has been the so-called *Homo economicus* hypothesis.

The term *homo economicus* has its own complicated history (Persky 1995; O'Boyle 2010), but we will focus here on its content. According to this hypothesis, human behavior can be generalized under the following rules: the individual agent as point of departure (methodological individualism), self-interest as dominating human motivation, utility understood as saturation of self-interest, and maximizing of utility as the standard of rationality. This is the standard model of rational economic man (REM) as it is, e.g., underlying Gary Becker's economic work, from which was quoted in the previous part of this contribution.

In response to criticism, and also in order to render the model closer to reality, REM was modified many times. Suffice it here to mention the REMM model (Jensen and Meckling 1994) and the RREEMM model (Lindenberg 1985). REMM ("resourceful, evaluative, maximizing man") adds resourcefulness, creativity, and ingenuity to REM: "Human beings are not only capable of learning about new opportunities, they also engage in resourceful, creative activities that expand their opportunities in various ways" (Jensen and Meckling 1994: 5). This is seen as a contrast to the "highly mechanical behavior posited by economists" (Jensen and Meckling 1994: 5). RREEMM ("resourceful, restricted, expecting, evaluating, maximizing man") is supposed to be a "universal model of man" way beyond economics alone (Lindenberg 1985: 100) and emphasizes in particular the influence of the evaluation of future constellations on the choice-making in the present. Both variations stick to the primacy of self-interest and maximizing and can, therefore, be considered as variations of REM, not alternatives.

Criticism of the *Homo Economicus* Hypothesis

Once the model of "economic man" was established, it quickly was criticized, either as too simplistic or downright wrong. Joseph Persky quotes John Kells Ingram in a book from 1888, criticizing that John Stuart Mill's political economy "dealt not with real but with imaginary men – 'economic men' . . . conceived as simply 'money-making animals'" (Persky 1995: 222). It took, however, several decades until criticism became widespread. This criticism is part of the current crisis of economical science and the controversy about the real-life value of its models – aptly labeled as a conflict between truth and precision (Mayer 1993). The axiomatic assumption about standard human behavior in economical science, once introduced exactly because of its supposed closeness to "real-world" human beings, is under pressure because observation and experience show a much more complex picture of human psychology and behavior, casting doubt on the predictive value of the model (Manzeschke 2010).

In the following, the main points of criticism will be enumerated, emphasizing particularly the discontent with the anthropological assumptions of the standard theory.

Historical Embeddedness

It is a claim of the adherents of the *homo economicus* hypothesis that human beings always and everywhere behave according to these assumptions. It is, therefore, a first point of critique, even before looking deeper into the assumptions themselves, to point out their historical embeddedness. *If* human behavior is universally structured as supposed, then it is at least worth mentioning that for thousands of years of human history of ideas, the dominant character of human self-interest remained undiscovered. Certainly, philosophers like the ancient sophists embraced the pursuit of self-interest as the way to happiness, but their view was not common sense in Greek antiquity (Annas 1993). Aristotle's image of the human being as an *animal sociale* was, for an antique as well as a medieval public, a much more compelling anthropological assumption. The same can be said about his specific economic theory which emphasizes the intrinsic and not extrinsic value of goods. Nature – not human desire – is, according to Aristotle, the measure of economic value (Meikle 1995). The power of desire is not neglected by him, but it must and can be tamed by the practice of virtue.

The Christian Church in its first millennium was even more critical of self-interest as the driving force of human thinking and acting, and, like Aristotle, it praised the positive effects of the community for human flourishing. Individual property was disapproved, taking instead the ascetic life of a monk as exemplary fulfilment of God's commandments. The turning point came only in the thirteenth century, when Aquinas, at a time when the Church began to lose its grip on human conscience, argued in his *Summa Theologiae* that individual property can be ethically justified. Individually owned property, he argues, assures better care and therefore more welfare due to the strengthening of responsibility that comes with personal ownership. Still, Aquinas made sure that this justification is only valid if the gain made out of personal ownership is used for the common good.

It needed the growing individualism of the Renaissance movement and its valorization of human desire to obliterate this condition (Hirschman 2013a). However, it took centuries and the "atomism" (Taylor 1985) of modern societies until self-interest was fully acknowledged as a dominant and legitimate driver of human behavior. Mandeville's "private vices, public benefits" is still closer to Aquinas than to Gary Becker.

Given this intellectual history and the complete vindication of human desire and self-interest it brought about, it is understandable that Pierre Bourdieu spoke of this shift as a "symbolic revolution" and a "radical transformation" (Bourdieu 2017: 88). Even more, he castigated the coming into power of the *homo economicus* as some kind of original sin (Bourdieu 2017: 92–93).

One may or may not agree with Bourdieu's critical evaluation of the *homo economicus*. In any case, the relatively short period since its inception (Wood 2002: 3) makes it rather difficult to believe in its universal validity and, conversely, in the obsoleteness of alternative understandings of human behavior.

Methodological Individualism

The classical *homo economicus* is an individual person, and, as such, he is the starting point of the standard model. Despite the frequent use of Robinson Crusoe analogies in neoclassical economics (Hewitson 1999: 145–167), this does not mean that a person isolated from society is thought to be the ideal incarnation of humanity. Friedrich Hayek called such an understanding of methodological individualism "the silliest of the common misunderstandings" (Hayek 2010: 52), and indeed we have seen above that, e.g., Adam Smith starts his thoughts on the importance of self-interest by reflecting on the necessity of cooperation in a human society. Hayek himself states for his "true" individualism that it is "starting from men whose whole nature and character is determined by their existence in society" (Hayek 2010: 52). Therefore, societal embeddedness is not absent from the *homo economicus*. Still, the influence of society on economic decisions is rather neglected. Hayek contends "that there is no other way towards an understanding of social phenomena but through our understanding of individual actions directed towards other people and guided by their expected behaviour" (Hayek 2010: 52) and that a human being undertakes these individual actions "by his own choice" (Hayek 2010: 58). There is a basic assumption about individual freedom and choice at the bottom of the *homo economicus* hypothesis. However, there is not much reflection about the fact that these choices, even when they are conscious and thus seemingly "free" (subconscious factors, as they are emphasized by behavioral economics, are another topic to which I will come later in this contribution), are shaped at least *also* by the surrounding society, be it in the form of belief systems, ideologies, social setting, or status (Zelizer 2011: 9). So-called holistic methodologies criticize this lack of reflection as a decisive shortcoming of neoclassical economics.

Steven Cohn, in his heterodox introduction into macroeconomics, gives an example of an unexpected outcome of an economic policy measure and then goes on: "Why has this occurred? [...] Do the answers lie in the nature of human nature or elsewhere, perhaps in the nature of society? The holist methodologies of heterodox economics invite this question, as well as attention to the broader issue of where tastes and preferences come from. The methodologically individualistic approach of neoclassical economics, on the other hand, discourages this question and rules out inquiry into the origins of tastes and preferences" (Cohn 2015: 19). This critique is brought forward in particular by feminist (Hewitson 1999; Fineman and Dougherty 2005; Fineman 2005) and Marxist (Varoufakis 1998) economists.

Self-Interest and Utility

The standard model of *homo economicus* has an individualistic bias not only with regard to the methodological priority of the individual person and her "free" choices. It is also characterized by what may be called evaluative individualism: self-interest, in addition to being the dominant motivation for each human action, supposedly is also, through the notion of utility, the currency by which each decision and each judgment is measured: will it provide a positive outcome for me or not?

It is here, with regard to evaluative individualism, that the connection between neoclassical economics and utilitarianism comes to the surface. And, hence, the criticism of the underlying anthropological assumption is the same for both. Once again, this criticism can easily be dismissed if it argues too superficially. The primacy of self-interest does not mean that *homo economicus* is by definition egoistic, selfish, and could not be interested in shaping society according to ethical principles like justice. Bentham, e.g., has quite something to say about other-regarding pleasures like benevolence, and John Stuart Mill makes a strong case for justice as a tool of social utility.

The difference to other types of morality and their underlying assumptions about human conduct comes to the fore when we ask about the justification of benevolence and justice. Benevolence may be helpful for others, but from a utilitarian point of view, this is not what produces enough motivation to take action. It is not the pleasure others may gain from my benevolence that ultimately makes me help others; it is the pleasure I take myself. Therefore, the action of helping is only a tool to make myself happy, in the pursuit of my own self-interest. As a result, benevolence is motivated extrinsically. The same is true for actions of justice and – ultimately – for Mill's advocacy for justice as a social norm: in a society governed by justice, I will prosper in the long run, and, therefore, I have a personal interest in upholding justice as a social norm. It is useful for me.

Therefore, the difference of utilitarianism – and, by affinity, of the *homo economicus* theory – to other types of morality is not a difference in content but in motivation. According to utilitarianism, the decisive factor in human moral psychology is neither the common good nor the notion of moral obligation but the notion of personal happiness, the pursuit of self-interest. This evaluative individualism is a basic anthropological assumption of neoclassical economics, and, thus, it is a main target for critique.

Are human beings really mainly motivated by their personal self-interest? This underlying assumption of the rational, economic man is contested from different sides. First of all, there are two conceptual problems: (1) If *all* human actions, even obedience to the law or personal sacrifices, supposedly are motivated by self-interest, the notion of self-interest loses its explanatory character. Actions would then be regarded as self-interested in the same way birds have wings – it is part of their definition. And it would be a tautology to emphasize it (Hirschman 2013b). (2) In addition, usefulness with regard to self-interest is highly subjective: someone may consider an action useful for herself which others may detest. This gives rise to the problem of comparing and measuring individual utility functions – a problem which was never solved by philosophical utilitarianism. Attempts to distinguish between better and worse types of self-interest and to establish categories like "enlightened self-interest" transgress the principle of methodological individualism and the utilitarian claim to approach human decision-making and acting by observation alone, without any privilege given to pre-established moral rules.

In addition to these conceptual problems, the self-interest hypothesis is criticized for its reductionism. Human psychology and conscious incentives for action are much more complex than mere self-interested reasoning. This point was already made by John Stuart Mill in his "Remarks on Bentham's Philosophy": "The prevailing error of Mr. Bentham's views of human nature appears to me to be this – he supposes mankind to be swayed by only a part of the inducements which really actuate them; but of that part he imagines them to be much cooler and more thoughtful calculators than they really are" (Mill 1985: 16–17). Mill invokes in particular "social interests" that don't get due attention in Bentham's raw variation of utilitarianism: "There are, there have been, many human beings, in whom the motives of patriotism or of benevolence have been permanent steady principles of action, superior to any ordinary, and in not a few instances, to any possible, temptations of personal interest. There are, and have been, multitudes, in whom the motive of conscience or moral obligation has been thus paramount. There is nothing in the constitution of human nature to forbid its being so in all mankind" (Mill 1985: 15).

By overstating the importance of self-interest for human decision-making, the *homo economicus* model fails its purpose to explain and therefore predict human behavior in a sufficient manner. Everyone agrees that the importance of self-interest for human motivation is not to be neglected, but current critics bring forward at least three other interests that shape human conduct: the interests in justice, in solidarity, and in integrity.

(1) The importance of justice – researchers speak of an "inequity aversion" (Fehr and Schmidt 1999) and a "justice sensitivity" (Baumert and Schmitt 2016; Schlösser et al. 2018) – for human decision-making has been shown by experimental economists in various game experiments like the ultimatum game and public goods games. The fact that test persons, all over the world and independently of their respective local culture, tend to accept monetary losses in order to show their disapproval of unjust and selfish behavior – somewhat misleadingly called "altruistic punishment" – is interpreted as a refusal of the self-interest theory in its reductionist version (Gintis et al. 2005). Based on these observations, it has been proposed to speak rather of a *homo reciprocans* than of the traditional *homo economicus* (Dohmen et al. 2009), and it has been argued that this widespread interest in reciprocity is, much more than competition, the decisive factor for human cooperation (Nowak and Highfield 2011). It is especially with regard to the justice motive that social psychologists speak of a "myth of self-interest as the cardinal human motive" (Montada and Maes 2016: 110).
The notion of justice sensitivity leads us directly from justice to solidarity. Feelings of justice or injustice presuppose imagination, "projective role-taking" (Karniol and Miller 1981: 83–84). The perception of kindness and its underlying concept, which is closely connected to reciprocity (Falk and Fischbacher 2006), "is based on interpersonal comparisons" (Falk and Fischbacher 2006: 310). Furthermore, it has been observed that "the decision to cooperate is rarely grounded in strategic considerations" and that people strive for justice in their cooperation efforts even when no sanctioning mechanism in the sense of direct reciprocity is involved (Schlösser et al. 2018, quote: p 2). On the other hand, when there is a punishment option, the sanction is triggered by the strong negative emotions caused by free riding (Fehr and Gächter 2002: 139).
(2) There is, therefore, good evidence for the importance of role-taking and empathetical emotions in human conduct. The free rider is, after all, sanctioned because I imagine myself in her place and consider her behavior inadmissible – a case of negative empathy. However, we usually speak of empathy rather in the sense of (positive) sympathy and solidarity. The universal existence of such a feeling was already postulated by the Chinese philosopher Mencius, who

claimed that nobody would passively stand by when seeing a child about to fall into a well. In more recent times, a much-quoted study claimed to show that a public health system in which people give their blood for altruistic reasons, without being paid, is superior to a market system (Titmuss 1970). Further research on blood donation has shown a more complex picture, but it still stands that humanitarian motives indeed are one of its driving factors (McLean and Poulton 1986; Ferguson 2015). Experimental economists invented the "solidarity game" in order to test the occurrence of gift-giving between humans and found out that it can be motivated by both, either self- or other-regard (Büchner et al. 2007; Bolton et al. 2010). Broader psychological research suggests that there is, indeed, convincing evidence that empathetical solidarity as other-interest can be considered to be a universal complement to self-interest when it comes to motivational sources of human behavior (Batson 2011).

It should not be forgotten that this anthropological assumption of a natural feeling of solidarity toward others has, in fact, a long history in economic thinking. The Greek *oikonomia* and the Christian common good are constructed on this anthropological foundation. It is also worth mentioning that "solidarism" (Koslowski 2000) is an important source for German "ordo-liberalism" and its success as an economic policy after World War II. Recent economic concepts like an "economics for the common good" (Lutz 1999) and a "capitalism beyond mutuality" (Rangan 2018) presuppose this universal interest in solidarity. Such concepts usually entail a critique of the traditional *homo economicus*, such as the following statement: "when self-interest is pursued without compassion for others, when interconnectedness is disregarded or when the mutuality of all humanity is forgotten, greed results" (Peralta and Mshana 2016: 9).

(3) "The market needs support from institutions it cannot create. One of these [. . .] is 'virtue': moral behavior, including telling the truth" (McLean and Poulton 1986: 440). Human interaction is impossible without trust and the corresponding interest in integrity. Likewise, the self-interest hypothesis would be self-contradictory without some element of truth and honesty: everyone who makes a statement, including the proponents of the self-interest hypothesis, wants to be believed, and this interest in credibility would be vain if there was only instrumental communication (Lutz 1999: 162).

In line with this anticipation, experimental economists and psychologists have identified "trustworthiness expectations" and "betrayal sensitivity" as characteristic traits of human interaction (Thielmann and Hilbig 2015). Even more than justice sensitivity and solidarity, their existence in human consciousness contradicts the primacy of self-interest as it is assumed by the *homo economicus* hypothesis. Someone who uses other people only as tools in his or her quest for personal gain is not considered to be trustworthy. And an "as if" trustworthiness in the sense of Gary Becker's understanding of love and altruism (see above 2.1) would be judged even worse, as a betrayal of trust. It is here that any attempt to explain moral, other-regarding behavior as camouflaged strategy of personal utility maximization falls short.

> Given the basic need for trust in any economic interaction, it is not surprising that integrity is a main requirement in any code of conduct and CSR declaration and that the "honorable merchant" in his exemplary trustworthiness is a long-standing business role model (Lütge and Strosetzki 2019).

Self-interest certainly is a driving factor in human decision-making and action. However, human consciousness is far more complex than that. In addition to the traditional *homo economicus* hypothesis, valid anthropological assumptions in economy must take into account human striving for justice, solidarity, and integrity as well.

Rationality

The *homo economicus* is considered to be a rational person: he maximizes his utility by calculating consequences and evaluating them in terms of self-interest. This part of the *homo economicus* hypothesis is criticized from two sides: (1) From a more general perspective, it is contested that rationality, even as economic rationality, should be reduced to strategies of maximization. (2) Starting from psychological observations and considerations, the idea of a *homo rationale*, as it is underlying neoclassical economics, is questioned. This is the standard objection of recent behavioral economists.

(1) The critique of understanding rationality only in terms of maximization has several facets. By asking for the historical, sociological, and intellectual roots of this understanding, a Marxist reading considers it to be "an attempt to produce a theory which will under no circumstances recommend that those who currently have social and economic power should be stripped of it" (Varoufakis 1998: 93). James C. Scott set the tone for the current revival of an "economics of subsistence" (Scott 1976: 15) by reintroducing the rationality of the peasant into economic theory: "Living close to the subsistence margin and subject to the vagaries of weather and the claims of outsiders, the peasant household has little scope for the profit maximization calculus of traditional neoclassical economics. [. . .] To begin instead with the need for a reliable subsistence as the primordial goal of the peasant cultivator and then to examine his relationships to his neighbors, to elites, and to the state in terms of whether they aid or hinder him in meeting that need, is to recast many issues" (Scott 1976: 4–5). Urged by the ecological imperative of sustainability and the growing insight into the natural limits of the earth, Scott's "economics of subsistence" has merged into the movement of "post-growth economics," which typically criticizes "the growth-based conception of utility" (Ferguson 2019: 39) in neoclassical economics.
(2) The purely instrumental understanding of rationality in terms of self-interest, as it is presupposed in the *homo economicus* hypothesis, has been criticized over and over again. Max Horkheimer famously spoke of an "Eclipse of Reason" in modernity, tying this decline to the "reduction of reason to a mere instrument" (Horkheimer 1947: 54). "It attaches little importance to the question whether the purposes as such are reasonable" (Horkheimer 1947: 3). Amartya Sen applied a similar critique to modern economics, when he called, in a lecture from the 1970s, the economic man a "rational fool" because of the narrow scope of his

mind: "A person is given *one* preference ordering, and as and when the need arises this is supposed to reflect his interests, represent his welfare, summarize his idea of what should be done, and describe his actual choices and behavior. Can one preference ordering do all these things?" (Sen 1979: 14–15). In Sen's footsteps (Hirschman 2013c: 249), Albert *Hirschman* recalled "the incredible complexity of human nature, which was disregarded by traditional theory for very good reason but which must be spoon-fed back into the traditional findings for the sake of greater realism" (Hirschman 2013c: 261). Hirschman criticizes especially that the "possible existence of wholly *noninstrumental* activities" (Hirschman 2013c: 253) is explained away by the standard economic vision of human nature. "But as economics grows more ambitious, it becomes of increasing importance to appreciate that the means-end, cost-benefit model is far from covering all aspects of human activity and experience" (Hirschman 2013c: 256).

Complementing this critique of a too narrow-minded *homo economicus*, Sen's and Hirschman's demand for greater realism also has a common positive side: by speaking of "commitment" (Sen) or "love, benevolence, and civic spirit" (Hirschman 2013c: 261), both emphasize the nonrational sources and motives of human activity. In this, they agree with behavioral economists. The nonrational constraints in decision-making were one of Daniel Kahneman's and Amos Tversky's research topics already in the 1970s. Reinhard Selten states that "rationality has limited control over behavior" (Selten 1990: 652) and that "bounded rationality is not just another kind of utility maximization or something close to it" (Selten 1990: 657). However, by speaking of a "bounded rationality," he still sticks to the traditional idea of rationality as the guiding principle of human action. The concept has been employed also by other behavioral economists (Gigerenzer and Selten 2001). Kahneman uses it as well, but he goes further than Selten. For Kahneman, intuition and reasoning are "alternative ways to solve problems" (Kahneman 2003: 1469). The human being is an "intuitive agent" (Kahneman 2003: 1470), and Kahneman brings the respective findings of empirical psychology in direct contrast to the neoclassical model of *homo economicus*: "psychological theories of intuitive thinking cannot match the elegance and precision of formal normative models of belief and choice, but this is just another way of saying that rational models are psychologically unrealistic" (Kahneman 2003: 1449). Behavioral economics, therefore, gives a double account of "misbehaving" (Thaler 2015): people "misbehave" by not functioning according to long-standing scientific assumptions, and behavioral economists "misbehave" by paying more attention to real-world psychology than their colleagues.

"What is natural and intuitive in a given situation is not the same for everyone" (Kahneman 2003: 1469): the *homo* of behavioral economics, acting rather according to intuition and emotions than on rational grounds, is a highly subjective actor. This is particularly true when we take into account happiness economics as a recent branch of behavioral economics. Happiness is understood as resolutely *individual* well-being, without any normative, "objective" framework for the choices that lead to (more) happiness. Therefore, happiness research deals a lot more with subjective preferences than neoclassical economics. "Directly measurable subjective happiness and derived 'objective' decision utility (as commonly used in economics) enter economic research from different sides" (Frey and Stutzer 2002: 173).

Despite this focus on subjectivity, behavioral economists claim that their understanding of human decision-making and acting still offers enough space for generalizations (Kahneman 2003: 1449), thereby allowing for predictions and adequate policy measures. From an ethical point of view there is, however, the problem that the "intuitive agent" is highly susceptible to manipulation, given his lack of rational, critical thinking. He can be "nudged" into decisions (Thaler and Sunstein 2008), and not all of them will stand the test of reason. It is, therefore, a notable suggestion to reintroduce the notion of autonomy into behavioral economics (Binder and Lades 2015). Speaking of human autonomy brings the methodological individualism of neoclassical economics back, and it implies a critique of the idea of behavioral economics that rationality is always bounded.

Conclusion

The preceding analysis of *homo economicus* and its discontents allows to distinguish three different concepts of human decision-making and acting that can be found in current economic theory:

(1) The neoclassical model of *homo economicus*
(2) The *homo moralis*, as it is established by a number of findings in experimental economics and psychology, with justice sensitivity, empathetical solidarity, and trustworthiness expectations as main character traits
(3) The "intuitive agent" of behavioral economics

All three concepts get at least some support on the empirical and descriptive level. There are overlaps but also sharp distinctions between them. What does this mean for the question of business legitimacy? Questions of legitimacy cannot be answered on the descriptive level. Rules and norms cannot be deduced just by looking on actual behavior. This remains true, even if fallacies like this happen over and over again. They happen also with regard to our three concepts: (1) Neoclassical economics, with its anthropological focus on self-interest and utility maximization, brought about a model of business legitimacy that understands profit-making as the main and legitimate goal of business. (2) Emphasizing the other-regarding *homo moralis* seems to offer a direct path to a business model of corporate social responsibility. (3) The focus on the "intuitive agent" has been used to justify libertarian paternalism.

Shortcuts like these should be avoided. On the other hand, notions of morality and legitimacy without any relationship to "real" human beings are worthless. Without being a direct source of legitimacy, anthropological observation and interpretation gives valuable insights and is a helpful tool when it comes to policy judgments – be it in science, in business, or in politics. Anthropological reflection is indispensable for questions of legitimacy, at the same time it has no ethical value in itself. One possibility to get over this dilemma is to look deeper into what we mean when we speak of legitimacy. A legitimate action does not need to be morally perfect. There may be other options of action that would deserve more moral praise. Still, a legitimate action has some, albeit maybe weak, justification to be done. We speak, in this sense, of "legitimate self-interest." We could also speak of "legitimate solidarity." Many people seem to think that it would be an exaggeration of solidarity, even if desirable, to follow Peter Singer's suggestion (Singer 2016) that people in the global north should give most of their income for charity in order to help those who are worse off in other regions of the earth. Still, there is a notion of legitimate solidarity: it would not be morally acceptable to keep everything for one-self, while others are suffering. It is more difficult to construct a similar notion of legitimacy with regard to the third anthropological concept. Still, "legitimate use of intuition" could, likewise, mean to recur to one's intuitions in a justifiable manner, without acting on intuition alone. In all these cases, it remains to be seen and must be decided by ethical judgment where the border lies between legitimate and illegitimate self-interest/solidarity/use of intuition. However, there wasn't any interest in asking the question of their legitimacy if they would not be observable forms of human conduct.

Put this way, each of the three anthropological concepts has its own legitimacy. All three are "legitimate" ways of thinking about the human character in their own right. Therefore, a model of business legitimacy should pay attention to all of them and to the empirical observations that stand behind them. Observe the observations! This certainly is a rather modest anthropological "foundation" for business legitimacy. But to ask for more would mean to confuse the discipline of anthropology with ethics. Ethical considerations and not anthropological observations are at the heart of each legitimacy question.

Language, Morality, and Legitimacy

Contents

Abstract

In this essay we will try to highlight the interweaving of language and morality and also the principle of legitimacy that derives from it. In her famous essay *Modern Moral Philosophy* (written in 1958 and which later became the modern manifesto of a neo-Aristotelian type of ethics), Elizabeth Anscombe highlights the need for a philosophy of psychology as well as the abandonment of a specific language in moral philosophy. Taking a position against the consequentialist conception of morality, she implicitly stands opposed to the principle that consequences define legitimacy; it is precisely when the binomial language-morality fails that the principle of legitimacy loses its substance; a political authority can lose its moral legitimacy if she/he betrays the common good. Starting from a specific language adopted, a morality is derived from it. In fact, depending on what is considered to be a good or an evil, a specific moral action follows. In this perspective, responsibility and awareness of which goods need to be shared in common play a central role, and an ontological foundation is discovered.

Language · Morality · Legitimacy · Anscombe · Wittgenstein · Consequentialism · Epistemological realism · Metaphysics of action · Virtue ethics

Introduction

In the first place, we will analyze the principle of legitimacy, where this expression originates, what it consists of, and the variations to which it is subject given the historical-social context in which it is used. Then, working from the conclusion of the logical process in order to arrive at the point of origin, we will investigate the concept of “epistemological realism” and then retrace the deconstruction with respect to the language used in the moral field proposed by Anscombe and the relative exhortation of the importance of a philosophy of psychology. Finally, we will analyze the Anscombian proposal of a virtue ethics, as an expression of human “flourishing” – a term of Aristotelian inspiration – where the same legitimacy finds its home.

On the Principle of Legitimacy

Among the many elements that mark the development of the history of a people, an essential element is the development of the power of the ruling legislator within that society. The grounds for the justice of that ruler attaining the power they possess is referred to as the principle of legitimacy. Throughout history, even granting the fact of the legitimacy of the ruler, the source of that legitimacy has been a constant point of inquiry – and when there is no longer a consensus about the fundament of power, this inquiry becomes a catalyst for political change. An ever-present example of this fact might be seen as follows: one can ask how power has been attributed to a monarch or a political party, criticize with respect to the adopted process, and then work to effect change. If there is no mechanism for effecting that change, the corporate frustration of the people may even boil over into revolt. Thus, the “legitimacy” of the conferral of power is ultimately the basis for the stability of a state and its progress.

In order to see that this is so, we need not look only at political structures. Consider a lottery winner: the win is valid if all the rules are respected, the procedure, the authenticity of the ticket, the price, the place where it was sold, etc.; if everything is in order, the victory is legitimate. Or even in sport, think of the “lawful” concession of a penalty kick; it is awarded as an act of restorative justice in order that the contest might be held legitimately. A moment’s glance to any aspect of our social interactions manifests the centrality of the existence of a “principle of legitimacy.” This principle has as its object “the justification of the work of power and, in a more general sense, the title on the basis of which a political power is accepted." (Vd. Sorgi (2006). Sorgi is the reference used for the historical analysis of the principle of legitimacy, proposed in the following paragraphs, as will be mentioned in the text.)

Giuseppe Sorgi recalls that the principle of legitimacy is to be understood in the historical context in which power tends to transform itself into a state order with a juridical-administrative structure, at the same time as the Enlightenment project of the so-called codification: that is, it passes "from a criterion of moral, theocratic and customary legitimacy, to a title of legitimacy understood formally, in which the state as a body is authorized to be the source of the law because it is legitimated in this by a hypothetical original agreement between individuals. Thus, we pass from a "cognitivist" conception of the political-juridical order (justice) to a "non-cognitivist" conception (validity) as in Hobbes' contractualism" (*Ibidem*).

How to understand the post-Enlightenment movements requires some unpacking. We overlook here the different nuances that the principle of legitimacy has assumed following the French Revolution, the Napoleonic Empire, and the Restoration. Instead, our area of inquiry is that of the emergence of the liberal-democratic system between the late nineteenth and early twentieth centuries. Here, we see in the emergence of new economic and social classes the increased gap between a legal-formal legitimacy of the liberal rule of law and a substantial legitimacy (see Marxism and sociological doctrines, elitist, and currentist). Sorgi observes that it would be necessary at this point to consider Hans Kelsen's pure doctrine of law or Carl Schmitt's theorization of a legitimacy of a "material" type as opposed to that of a "formal" type. For the purposes of our analysis, it is sufficient to recall the correction made to the formal legitimacy following the world wars of the twentieth century and the different forms of totalitarianism: with Gustav Radbruch and Hans Fritz Welzel, we witness the rebirth of natural law, and therefore we temporarily return to a reassessment of a morally founded principle of legitimacy.

Subsequent political-legal theories, however, have highlighted the risk of a legality that was merely formal, underlining the importance of a system of shared values. Consequently, critical issues are raised: those who advocated a return to the critical-rational roots of Enlightenment modernity, those who called for a contractual model, those who stressed the importance of a reference to local authorities, those who made realistic criticisms in the wake of Charles Taylor and Michael Walzer, or those who called for the integration of minorities in political decision-making. With regard to this last point, Hannah Arendt's proposal of "civil disobedience" is significant. She writes: "it would be an event of great significance to find a constitutional niche for civil disobedience – of no less significant, perhaps, than the event of the founding of the *constitutio libertatis*, nearly 200 years ago." (Vd. Arendt (1972). Also in this passage, the force of Arendt's thought emerges. As Boella points out: "Arendt loved conceptual counterpoint because it allowed her to think of reality from the contradictions that tear it apart," from the "Introduction" to the Italian edition, p. XIV.)

It is a fact that the legal-formal system became established by renouncing any prelegal legitimacy. With the progressive dissolution of the traditional seat of the principle of legitimacy, that is, the state and its passage to global or local centers of power, there are no longer any formal legal principles of a general or material nature. What happens – observes Sorgi – is therefore the emergence on the one hand of "theories that transpose on a supranational level the juridical-formal principle of the legitimacy of the work once of the individual states" and on the other hand "critical theories of such a "universalism" that propose a model of continuous negotiation between states and powers" (Sorgi 2006, p. 6305). There is also the hypothesis of a legitimacy based on nonnegotiable confessional authorities, as happens, for example, with the Muslim religion. In this regard, it is significant to note the difficulty of arriving at the definition of a human right that can be universally accepted: the history of the *Universal Declaration of Human Rights* (1948), which in fact did not find immediate consensus in many Arab states (see "Cairo Declaration", 1990) (Vd. Grimi 2019a), is such a case in point.

In outlining the complexity with which the principle of legitimacy has been understood over time, it is interesting to shed light on the comparison and related analysis of the binomial "legality-legitimacy." In *Treccani* we read as a definition of "legitimacy": "Being legitimate, that is, conforming to law, to the provisions of the juridical system" ; and according to *Treccani*, "legality" is "being conformed to the law and to what is prescribed by it" or "a situation conforming to the laws". If we want to deepen the relationship between legality and legitimacy, the analysis proposed by P. Jean-Louis Bruguès O.P. in the *Dictionnaire de morale catholique* (Bruguès 1991, pp. 203–204) is particularly interesting and already anticipates the final part of the present essay (in the analysis of the term "legitimacy," the theme of the "common good" is already included, a theme which we will come to at the end of the reflection). We read: "legality is a characteristic of law. A legal precept is considered legal when it has been adopted by the competent authority, in full respect of the constitutional forms that govern the political life of the group in question. In a democratic regime, for example, a text takes on the value of a law when it is voted on by the legislative power, promulgated by the executive power and declared in conformity with the spirit of the laws by the judicial power," (Id., p. 203) while "legitimacy is a property of law and ethics; sometimes this ambivalence can cause confusion. Political authority is said to be legitimate when it receives its power according to the forms provided for by law (an election, a designation by the higher authority, etc.). However, legitimacy means first of all conformity with moral value. In this case, authority is said to be legitimate if the measures taken by it are aimed at promoting the common good. A legal provision is morally legitimate when it respects that objective" (*Ibidem*).

Bruguès introduces a decisive variable in the definition of "legitimacy." If, in fact, legality is placed on the level of law, then when dealing with legitimacy – in addition to law – ethics must be considered. In this light, legitimacy means "conformity to moral value." Going back to the analysis, it means that if we define what is legitimate, we do it by virtue of what is considered good/bad; if legitimacy concerns the political sphere, the nature of this good will be common, that is, universal. In essence, Bruguès, in proposing a definition of "legitimacy," outlined the criterion of acting. Following his reasoning, he goes so far as to affirm: "The harmony of community life requires that a positive predisposition of moral legitimacy be recognized to what is prescribed by law. The principle is to obey the positive law. However, the individual conscience can reach the certainty that a certain legal norm can damage a moral value. In such a case, legality and legitimacy are at odds with each other." Bruguès then goes on to observe how legality and legitimacy can obviously not coincide, as in the case of a political authority, which came to power in perfectly legal forms but loses its moral legitimacy when it betrays the common good in a serious and repeated manner. Once again, the fact that there is a good that can be put in common and therefore be valid for all plays a key role in its analysis.

We must now analyze the relationship between the language we assume and morality. Let us therefore reflect on the concept of epistemological realism.

Epistemological Realism

John Haldane in his essay *Mind-World Identity Theory and the Anti-Realist Challenge* (Haldane 1993) defends epistemological and metaphysical realism. In this essay Haldane refers to Thomas Aquinas, pointing out on the one hand that the intellect is directly in tune with reality (*adaequatio rei et intellectus*) and that the forms or natures that give the world a structure and concepts that "form thought" have an identity. It is therefore possible to speak of epistemological realism – as opposed to an epistemological idealism – for which the world exists ontologically independent of thought, and the concepts and what they represent are intrinsically connected. From this perspective, there is a link between mind and reality, the latter being ontologically independent. Therefore, the mind is not needed for reality to exist; it exists in itself: it is the famous "primacy of *esse*" of this properly Thomist perspective. Haldane also underlines the irreducible character of the intention (or concept) (Vd. De Anna 2001), a theme that also recurs in the thought of G.E.M. Anscombe and which, starting with Thomas, reveals a formal identity between the mind and the world. Mario Micheletti, one of the leading scholars of philosophy of analytic religion in Italy, wrote a sharp analysis in this regard: "Aristotelian-Thomist theory [. . .] is not *exclusively* an externalist theory because "reflexive consciousness" is an internalist criterion, and it is a naturalized epistemology because it takes as its starting point the natural operations of cognition, but it is nevertheless a decidedly normative theory, because of its teleological character: the cognitive faculties function in the way they function because they are ordered to achieve the truth" (Micheletti 2017, p. 41).

And it is to this understanding in particular that Anscombe's theory of action is ordered toward. In this Aristotelian framework for action, truth is not a neutral observation of reality, but on the contrary, it judges the value of reality by evaluating what is good and what is bad, without a renunciation of the ability to know "practical truth" (that is to say, the knowledge of how things are actually) (Carli 2003, p. 175). Practical truth is a practical judgment, a judgment that ends with an action. Aristotle's practical syllogism is for Anscombe a strong area of interest for understanding practical reasoning and human action. (Vd. Aristotle, *De Anima*, III, 10, 433 a 15; *De motu amimalium*, 7, 701a. For further information, please read: Grimi

(2012a).) She says that it is "one of Aristotle's best discoveries" (Anscombe 1963, § 33). Even still, Anscombe is also critical of the practical syllogism: while for Aristotle practical syllogism also applies to cases in which the conclusion of reasoning is abstention from action, for her it is instead only that in which the conclusion is an action and it is demonstrated by the premises that are therefore so to speak "in active service" of action (*Ibidem*).

As I observed recently in my guide to reading Intention (Grimi 2019b), a practical syllogism only regards the judgment of the intellect about some action, that is, when desire arises, and it consists of the reasoning that the agent does to achieve what she/he wants. In this sense, the desired object is the principle of action that moves the agent, and the reasoning must terminate in it. One does not reason to know how to reach the desired object, but rather to actually reach it. Anscombe, referring again to Aristotle, points out that when the reason says that an action is immediately practicable and desire tends to it as it is good, the individual acts immediately. Aristotle writes: "For in the case of things produced the principle of motion (either mind or art or some kind of potency) is in the producer; and in the case of things done the will is the agent – for the thing done and the thing willed are the same" (Aristotle, *Metaphysics*, VI (E), I, 1025 b 20–30). Correct action is therefore the truth of the *phronesis*, for which the aim is to act well – and this is what desire tends to. Along with Anthony Kenny, it seems safe to conclude that the theoretical reasoning is the one that moves from "true to true," while the practical one moves from the goodness of something mentioned in the premises to a good conclusion, so it moves from "good to good" (Grimi 2019b, p. 82; Kenny 1979, p 146).

In the Anscombian analysis, therefore, one finds a criterion of action. Intentional action means a directionality and judgment of the subject on what he considers to be good. The other criterion is the choice, the decision, and the intention that moves to action. What is emphasized from the perspective of "epistemological realism" is the fact that we are faced with a reality in which it is presupposed that there is something we call good or evil in it. In such a conception, the premise of morality is likened to a language; consequently, the premise of legitimacy is morality. Language-morality-legitimacy are intrinsically connected. It should be noted, however, that the perspective of epistemological realism is far from a situation ethics which starts with a subjective feeling as the basis of legitimacy. If, in fact, we act by virtue of something that we believe to be good or bad, legitimacy is an element recognized by a multitude of subjects. Without an epistemological realism, the passage from the single to the multiple would in fact be very difficult.

In fact, reality is ontologically independent. Otherwise, legitimacy would be subject to continuous variation, while its statute is an objectively recognizable validity. Such a state would be a de facto anarchist government. In this light, Arendt's concept of "civil disobedience" deserves further consideration: paradoxically, it would propose itself as legitimate, if not even as legally necessary. It is no coincidence that an epistemological idealism generates a vision of the idealized state, for instance, the conception of the German state developed by German idealism.

Moral Deconstructionism: Anscombe and the *Modern Moral Philosophy*

Anscombe began her famous essay *Modern Moral Philosophy* (Anscombe 1958) with three theses. The first is that, considering the lack of an adequate philosophy of psychology, it does not seem fruitful to deal with moral philosophy; the second is that it would be good to abandon the concepts of "moral obligation," "moral duty," "what is morally right and wrong," and the moral sense of "duty," since the term "moral" is steeped in misleading nuances; and, finally, the third is that it suggests that moral philosophers should be omitted from Sidgwick onward as irrelevant. It can be said that for Anscombe it is necessary to return to the action itself, it is necessary in fact to provide an explanation of "why an unjust man is a bad man, or an unjust action is a bad action," and therefore "to provide such an explanation is part of ethics, but this cannot be initiated without having a solid philosophy of psychology." What is now of most interest to us is the second of the three theses. We will not be dealing with what a philosophy of psychology can consist of, which has also challenged many people, but we will be focusing on the consequence that follows necessarily from this need. (About the philosophy of psychology, read S. Cremaschi. According to his perspective, the psychology of philosophy to which Anscombe refers should not be subject to misinterpretation. He writes in this way, commenting on the first thesis put forward by Anscombe: "Even what is the "philosophy of psychology" is far from obvious. Psychology as a discipline is apparently out of the question, since it was the object of contempt on the part of Wittgenstein and his school as a form of pseudoscience. On the other hand, since the idea of mental acts was the focal point of the post-philosophical practice that Wittgenstein advocated and which he was supposed to "show" in the book he had designed and failed to write before he died, or that the secret after whose discovery philosophy as a discipline would finally disappear would be how the mind manages to grip the world was one of the main unwritten doctrines circulating among Wittgenstein's followers, the preliminary discipline proposed by Anscombe under the name of "philosophers of psychology" must not be hastily identified either with philosophical anthropology or with a "new" science of the mind, but rather should be left to its uniqueness" (Cremaschi 2010, p. 52). This is a lecture he gave in Rome during the conference "Intention di Anscombe e il rinnovamento della filosofia morale," February 28-29, 2008 – Pontifical University of the Holy Cross. This note refers to n.1 of the chapter I have dedicated to the essay "Modern Moral Philosophy," in (Grimi 2012b, pp. 250–251). The analysis I present of the following two paragraphs refers to the chapter of my book cited here.) A philosophy of psychology is preparatory to a real deconstruction of what was the moral language of the Oxonian University of that time. Anscombe succeeds in doing this, thus creating an "apparent" tabula rasa in the eyes of her colleagues, calling for an abandonment of those concepts – such as "moral," etc. – which no longer seem to have any effective content. In reality, hers is a tabula plena: on the one hand, she never ceases to be realistic, anchored in that Aristotelian-Thomist perspective that never ceases to be a reference in her pages; on the other hand, she exhorts the need for a philosophy of psychology, as if to say that the mind is certainly full of content that derives from reality and that precisely for this reason, we must abandon that language used in ethics that now turns out to be devoid of content.

Facing the second thesis, Anscombe wonders if there is any possibility of maintaining a concept of ethics centered on the notion of law without having to admit a divine legislator. To do this, she examines different perspectives. According to the first, in the wake of Kant, it would be a question of dealing with the idea of self-regulation. Anscombe excludes this hypothesis as absurd; what is done for itself can be considered as something admirable, but the concept of legislation is different. A second perspective, analyzed below by Anscombe, is that of the contractual origin. This perspective deserves to be considered specifically. With regard to this source of moral law, Anscombe examines the hypothesis that language is what guarantees that we have entered into a contract (language would be proof of our commitment to various contracts). (Cf. language as proof of commitment to a contract; see Clarence I. Lewis, who proposed, at the same time of the draft of the "Modern Moral Philosophy," the idea of "pragmatic contradiction" as a source of constraints to moral judgments; Karl-Otto Apel (1929, pp 258–260), whose theory for which the contents of moral judgments are derived from the need to avoid the "performative contradiction,"; Cf. theories that argue that using language for the purpose of making promises or fulfilling linguistic acts one is led to the knowledge of the particular circumstance; see authors such as Price, Kant, and Whewell, and for a more recent study, see Searle (1964). This note refers to n.10 of the chapter I have dedicated to the essay "Modern Moral Philosophy," in Grimi (2012b), p. 256.) To prove the validity of such a theory, it would be necessary to develop it, but it suggests to Anscombe that it would remain something approximately formal and it would be difficult to arrive at "more specific issues such as the prohibition of homicide or sodomy" (Anscombe 1958, p. 38). So the question seems to emerge that in the language used, there is already intrinsically a sort of moral orientation, precisely what is good and what is bad or rather – Anscombe will specify developing the third perspective – what is right and what is unjust. As a third hypothesis, Anscombe puts forward the idea that human virtues are the source of norms, and the "man" who possesses the complete series of virtues is the "norm," just as the fact that a "man" who has, for example, a complete series of teeth is a "norm" (*Ibidem*). In this sense, however, the term "norm" would not be very different from the "law," approaching an Aristotelian vision rather than a legalistic conception of ethics. In this Anscombe finds nothing negative, even if it would be good to recognize that she is conceiving the notion of "norm" as meaning "law not including God," which would entail the elimination of the notion of "duty." Anscombe should not use the term "duty" in an emphatic style or in a special "moral" sense; on the contrary, her proposal is to discard the term "wrong" and use notions such as "unjust" (Cf. the perspective of Anscombe, text by Foot (1978).

However, "if the term "unfair" is simply determined by facts, it is not the term "unfair" that determines whether the term "wrong" can be applied, but the decision that the injustice is wrong, together with the diagnosis of the "factual" description as implying an injustice" (Anscombe 1958, p. 40); it remains to be explained, therefore, that the man who makes the absolute decision that the injustice is "wrong" does not in fact then have the basis for stating that anyone who does not make a similar decision is making a false judgment. Anscombe finds herself in a sort of relativistic *impasse*, which, however, brings out the problem at its root when one assumes an ethical conception.

The problem must therefore be moved from the moral duty to what is considered just/unfair – and in this regard, Anscombe does not fail to recall that (common) sense for which the extermination of the Jews by Hitler must be universally recognized as an abomination. In fact, it is necessary in Anscombe's perspective to get rid of notions such as "moral obligation" or "moral duty" which, if used with audacious carelessness, can lead to the greatest disasters. It is interesting to reflect on conscientious objection. It is an example that summarizes the steps taken so far: legitimacy – epistemological realism – the problem of language used in morals. In fact, conscientious objection presupposes something that is believed to be right/wrong and that this can be recognized by another person; if not, universally, then it presupposes an objective point of view as much as a subjective one, and it concerns the principle of legitimacy precisely because if forbidden it would no longer be considered as a legitimate objection that must therefore be respected. Interesting as Brugues observes, he writes: "Conscientious objection is always a personal decision. Very dramatic cases can arise. The importance of denied moral values, the serious and repeated nature of offenses can lead to the conviction that legal authority is threatening the good of a community. The moral duty of personal resistance then becomes a duty of rebellion (cf. *Popolorum Progressio*, 31). The person must warn her/his fellow citizens and, together with them, demand the repeal of a law that clearly offends good and truth. In the most serious cases – and history gives us many examples – the right to rebellion is transformed into the right to tyranny, that is, to the elimination, even by force, of a legal authority that has lost all moral legitimacy. The upheavals that occurred in Eastern Europe in 1989–1990 highlight the moral and political strength of those who, at the cost of serious personal suffering, had become the "dissidents" of totalitarianism" (Bruguès 1991, pp. 203–204). The subject, in fact, by virtue of what she/he considers to be just, acts, in which case she/he starts from a personal consideration, from a judgment proper to her/his conscience, to reach an action such as the objection. We will now see how action is directed toward an ever-greater flourishing of the subject, so let us now analyze the decisive proposal of Anscombe for a virtue ethics.

A New Language: Metaphysics of Action and Virtue Ethics

Let us begin by recalling Anscombe's filial relationship to Ludwig Wittgenstein. For him, in fact, linguistic expression reflects thought; there are no mysterious properties of thought that language cannot express. Wittgenstein writes: "When I think in language, there aren't "meanings" going through my mind in addition to the verbal expressions: the language is itself the vehicle of thought" (Wittgenstein 1958, p. 329). Thinking is not something that can take place without language, no more than it is possible to perform a piece of music without music (Vd. Carli 2003). And it is precisely because of this loyalty that Anscombe arrives at the necessity of the elaboration of a philosophy of psychology, intent, as already mentioned, not yet fully satisfied in the philosophical disciplines, and of the abandonment of a now empty language in moral philosophy, in order to propose a new language that focuses on the importance of virtues. It is no coincidence that she is one of the initiators of the contemporary trend of virtue ethics, which certainly has its origins in classical culture (see precisely Aristotle).

Anscombe underlines the importance of the virtues, and it is no coincidence that the devotees of MacIntyre have to go back to her to understand her thought. As Mario Ricciardi observes in a targeted review on the theme of virtue ethics: “Anscombe claimed that making moral philosophy presupposes adequate moral psychology (i.e., the kind of things that Aristotle or David Hume dealt with and that many contemporary moral philosophers neglect). That this does not happen is surprising, since this is not a refined theoretical thesis, but the banal caution that should push us, before pressing the buttons of a strange device, to be certain that we have understood what it is. The work to which Anscombe alludes is a type of conceptual reconstruction, a description. The theory of virtues deals with this. Only once we have understood how the device works can we evaluate whether or not we should use it and advise our loved ones to do the same. This is the object of virtue ethics: after having understood what virtues are, to choose whether one should be virtuous” (Ricciardi 2001, p. 64). Now, as already mentioned, what exactly Anscombe meant by the philosophy of psychology is not entirely clear since she herself highlights the lack of it, and even Ricciardi’s observation does not reveal the secret. However, he does indicate the method followed by Anscombe, which is to arrive at an understanding of the origin of an action from the description of the action itself. Far from a utilitarian type of ethics, the Anscombian proposal is that of the flourishing of the subject, that is, of the exercise of virtues in order to achieve full realization. In this perspective, virtue and legitimacy are intrinsically connected. The principle of legitimacy, in fact, finds its foundation in the human flourishing, in other words, in something that unites the whole human species. Let us take here, however, the starting point from the perspective of MacIntyre (1999) for which, as Ricciardi notes, “the ethics of virtues can also be placed adequately within a vision of the world that assumes no transcendent guarantee of ethics, and considers human beings as an animal species among others, obviously endowed with its own distinctive characteristics” (Ricciardi 2001, p. 73). Anscombe in speaking of flourishing has in mind the concept of “eudaimonia,” the Aristotelian *telos* toward which the action of man desires are directed, whose essence is reason and virtue. As Ricciardi notes, it is the action of man, whose essence is the reason and virtue. In this light, it is possible to indicate a metaphysical opening in the proposed theoretic of Anscombe.

Conclusion

Language, morals, and legitimacy are therefore intrinsically linked. Acting according to virtue encapsulates a true and proper metaphysics of action. Starting from what the subject considers to be good, she/he moves to action in respect to what is legitimate. The very principle of legitimacy therefore identifies the potential of a government that places at the center a good that can be shared, put precisely in common. With regard to the nature of this good, one cannot fail to refer to the essence of man who acts according to an end, with a directionality, by virtue of a flourishing. Recalling a study (Geach 1967) by Elizabeth Anscombe's husband, the well-known philosopher and logician Peter Geach, "what is good" is not a prescriptive term but has an attributive function, that is, it always goes hand in hand with the object to which it is attached; for this reason, an analysis of the general concept of what is good would be abstract: it is formed in virtuous action, in the action that yearns for the flourishing of the subject, for her/his full happiness.

Classical Theorists of Business Legitimacy

Adam Smith and Business Legitimacy

5

Michael S. Aßländer

Contents

Abstract

Especially neoliberal economists use Adam Smith to justify laissez-faire capitalism where governments have to abstain from economic regulations and where pure profit maximization is sanctified as the only true motive in business. Smith is far away from defending such kind of capitalism. For him commerce and liberal economy are legitimized by their positive effects on individual morality, at the one hand, and by the benefits they provide for society, at the other. He believes that a system of natural liberty fosters virtues like prudence, temperance, or industriousness and thus contributes to the development of a noble character of the citizens. Furthermore, he is convinced that commerce generates independence, creates economic wealth, and improves governmental order. Nevertheless, as we will show in the following, such system depends on the morality of its citizens as well as on governmental oversight and intervention in cases where

market results are undesirable. Thus, business can only be legitimized when it is based on individual morality and appropriate governmental supervision.

Commercial society · Natural liberty · Business legitimacy

Introduction

Commonly, Adam Smith is seen as the founding father of modern economic science. With his *Wealth of Nations*, first published in 1776, Adam Smith lays the theoretical foundation of modern market economy and endorses the ideas of free enterprise and economic liberty. Although Smith' demands for economic liberty have to be seen in the historical context of mercantile economy and have been maybe less radical than contemporary liberals assume, his *Wealth of Nations*, nevertheless, opened the pathway to a liberal economic understanding as it is accepted by many economists today. By referring to Smith's writings, contemporary liberals argue that governmental oversight is obstructive for economic development and therefore has to be reduced to a minimum. By quoting that it "is not from the benevolence of the butcher, the brewer, or the baker, that we expect our dinner, but from their regard of their own interests" (Smith 1981, I.ii.2), liberals argue that enhancing one's own utility is the only legitimate motive in the economic context. And with reference to Smith's well-known metaphor of the "invisible hand", which ensures that the egoistic and utility-maximizing behavior of the single economic actors have also positive outcomes for the whole society, they try to legitimize profit maximization as the best objective in business.

Although such interpretation of Adam Smith is commonplace, it is obviously wrong (Werhane 2006). Neither did Adam Smith believe that self-interest should be the key driver of economic behavior nor did he believe that the invisible hand frees individuals from accountabilities and moral responsibilities even in the economic context. As Emma Rothschild and Amartya Sen rightly state: "The principle of the invisible hand, in its twentieth-century sense, was quite un-Smithian" (Rothschild and Sen 2006, 363).

Smith's advocacy for political and economic liberty was neither intended to release governments from their responsibility nor to legitimize pure egoistic and self-interested behavior of economic citizens. It would be a misrepresentation of Smith to present him as an advocate of an economic system which promotes "self-interest as socially productive behavior" (Sen 2011, 259; 2016, 294). Smith clearly rejects such "vices-to-virtues argumentation" as it was made popular in his times especially by Bernard Mandeville (Hühn and Dierksmeier 2016). Although Smith always argued against arbitrary governmental intervention and legal overregulation in economic life, and although he strongly opposed the mercantile doctrines in the economic theories of his time, he, nevertheless, was by no means the theorist of "laissez-faire-economy" (Sandmo 2016, 238–239). When proposing his system of "natural liberty," Smith was aware that such political and economic system has to be based on the moral integrity of the citizens and that governments have to be the guarantor of justice and legal certainty. Therefore, such "system of natural liberty was no more than a guide to policy" and had to be "implemented with the greatest circumspection" (Rothschild and Sen 2006, 363).

Economy, like other spheres of human life, for Smith was by no way a "moral-free space." As Smith outlines in his *Theory of Moral Sentiments*, also economic activities have to be judged by an "impartial spectator" to evaluate their appropriateness and to prove their social acceptability. Equally in the economic context, man has to "humble the arrogance of his self-love, and bring it down to something which other men can go along with. (...) In the race for wealth, and honors, and preferments, he may run as hard as he can, and strain every nerve and every muscle, in order to outstrip all his competitors. But if he should justle, or throw down any of them, the indulgence of the spectators is entirely at an end. It is a violation of fair play, which they cannot admit of. This man is to them, in every respect, as good as he: they do not enter into the self-love by which he prefers himself so much to this other, and cannot go along with the motive from which he hurt him" (Smith 1984, II.ii.2.1). Thus, for Smith, self-interest has to be moderated always by self-command and a sense of appropriateness of one's behavior (Coker 1990; Paganelli 2008).

Although it is not the benevolence of the butcher that we expect our dinner, but his self-love, we do expect that he neither cheats nor outsmarts his customers and that he abides by the rules of fair business practices (Werhane 2006). It is obvious that our natural ability to sympathize with others, as it is described by Smith in his *Theory of Moral Sentiments*, was not intended as a principle of benevolence (Griswold 1999, 260) but characterizes a psychological principle which allows men to judge the appropriateness of other people's behavior. And by putting oneself in the position of an impartial spectator allows an actor to judge about the propriety of his own intention and actions. This does not mean that only benevolent, considerate, and accommodating behavior is appropriate. "Within this judgements generated by the impartial spectator, there would be room for the proper pursuit of self-interest" (Mehta 2006, 246; see also Hühn and Dierksmeier 2016; Werhane 2000; 2006).

Thus, Smith's advocacy for economic liberties and legal deregulation, his belief in self-love as characteristic element of human decision-making in the economic context, and his imagination of a spontaneous order in a system of natural liberty have to be seen against the backdrop of their moral preconditions. Although Smith believes that a commercial society can help to promote virtues like precaution, prudence, frugality, or foresight, he also sees that commerce might endanger other virtues, like honesty, loyalty, sincerity, or sense of community.

If we ask the question about business legitimacy from a Smithian perspective in the following chapter, we have to ask the question about the moral preconditions of commerce and for the way of how business affects the morality of a society. In other words, asking for business legitimacy in the context of Adam Smith's writings means to ask for the legitimacy of what Smith calls a commercial society.

And indeed, as Ryan Hanley puts it, “Smith, we might say, justifies commercial society by its public effects” (Hanley 2009, 18).

To legitimize commercial society, based on the idea of natural liberty and free enterprises, Smith by and large uses two courses of argumentation. On the one hand, he is eager to show how commerce contributes to the development of character and strengthens individual virtues. In this vein, it is interesting to note that he sees virtuous behavior, on the one hand, as a precondition of a functioning commercial society but, on the other hand, also believes that market forces, economic necessities, and trade relations force individuals to act more virtuous than people in less developed economies. The second way how Smith wants to legitimize his idea of a commercial society is to show the positive effects of commerce for society. In the course of this, Smith remains fair and discusses the advantages but also the disadvantages of developed economic freedom and growing commerce. Nevertheless, he believes in the positive effects of a liberal economy when it is embedded in a system of governmental oversight and based on the morality and honesty of the economic players (Evensky 2016, 84). To elucidate this, the following chapter is structured as follows: in a first step, we will outline Smith’s conception of natural liberty as basis of a commercial society. As we will show, Adam Smith prefers a system of natural liberty not because he believes in an “invisible hand” which transforms the egoistic ambitions of the individuals to a contribution to the common wealth, but because he distrusts the “visible hand” of superior authorities to direct economic affairs more efficiently. Subsequently, we will outline how such liberal order might enhance the virtues of people living in a commercial society. In a next step, we will discuss the positive effects on society which legitimize a commercial system based on natural liberties. By and large Smith sees three positive effects of a liberal economy: it creates material opulence for the benefit of all layers in society; it encourages individual freedom, independence, and autonomy; and it promotes peace and stabilizes international relations. We will discuss these aspects in turn. However, Smith sees also negative effects of such commercial society. It tends not only to corrupt moral virtues but leads also to the intellectual impoverishment of the nation. Thus, we will discuss these negative effects of commerce in the subsequent section. In a last step, we will summarize our findings and explain Smith’s conception of a legitimized business society.

System of Natural Liberty

Smith believed in a harmonic order and – expressed in his well-known metaphor of the invisible hand – that individual efforts, undertaken for most parts in one’s own interest, may contribute to the wealth of the whole society. However, this assumption of a harmonic world order where individual liberty leads to positive outcomes for all is not a pure metaphysical one but is backed also by another line of argumentation. Smith believes “that a system in which individuals make their own choices about how to live, or where to work, or how to use their money, is more just than a system in which those choices are the objects of government regulation." He is convinced "that the liberal system is not the worst of all systems; it is less inefficient at least, than the system of regulation" (Rothschild 2002, 156).

Smith clearly expresses this understanding in his *Theory of Moral Sentiments*: "Every man is, no doubt, by nature, first and principally recommended to his own care; and as he is fitter to take care of himself than of any other person, it is fit and right that it should be so" (Smith 1984, II.ii.2.1). For Smith the right of each person to lead one's own life is a fundamental principle of justice which might be infringed only in exceptional cases. In his *Wealth of Nations* he compares this right with the right of the free practice of religion and argues that "people feel themselves so much interested in what either relates to their subsistence in this life, or to their happiness in a life to come" (Smith 1981, IV.v.b.40); therefore governments have to abstain from infringement in the regular economic affairs of their citizens. To hinder a man "from sending his goods at all times to the best markets, is evidently to sacrifice the ordinary laws of justice to an idea of public utility." Smith believes that such "act of legislative authority (. . .) can be pardoned only in cases of most urgent necessity" (Smith 1981, IV.v.b.39). In general, "law ought always to trust people with the care of their own interest, as in their local situations they must generally be able to judge better of it than the legislator can do" (Smith 1981, IV.v.b.16). This does not mean that social interests should be neglected or that private utility should rank before the common good. The argument is that legislators often know less about a specific situation than the affected parties, and therefore the affected parties are in a better position to judge their own interests and possibilities (Mehta 2006, 251).

Smith sees freedom as a fundamental right of individuals. However, for Smith freedom is not an end in itself. For him the way how freedom may be exercised is limited by moral considerations and other principles of justice. As long as such other fundamental principles are not violated, Smith sees no sound reason of why governments should interfere in the affairs of their citizens. Smith, therefore, recommends to abolish superfluous and arbitrary mercantile regulations of trade and commerce and thus to foster private initiative in business. "All systems, either of preference or of restrain, therefore, being thus completely taken away, the obvious and simple system of natural liberty establishes itself of its own accord. Every man, as long as he does not violate the laws of justice, is left perfectly free to pursue his own interest his own way, and to bring both his industry and capital into competition with those of any other man, or order of man" (Smith 1981, IV.ix.51). In that way, Smith believes, the government would be discharged from a duty it never could perform, namely, to steer economy efficiently. For the proper performance of such task "no human wisdom or knowledge ever could be sufficient" (Smith 1981, IV.ix.51). Each attempt to supervise the economic affairs of private people, even if intended to serve the interests of society, fails, due to lack of knowledge of the supervisors. In this vein, Smith is especially concerned with the free circulation of labor and capital which is unreasonably restricted by governmental regulations (Smith 1981, I.x.c.42-60). Like John Locke (2004, 17), Smith believes that labor is the original property of the poor man and thus "to hinder him from employing his strength and dexterity in what manner he thinks proper without injuring his neighbor, is a plain violation of this most sacred property. It is a manifest encroachment upon the just liberty both of the workman, and of those who might be disposed to employ him. (. . .) To judge whether he is fit to be employed, may surly be trusted to the discretion of the employers whose interest it so much concerns" (Smith 1981, I.x.c.12). Legal interventions to regulate labor markets, therefore, have to be seen as a violation of people's natural rights.

However, for Smith this does not mean that economic liberty should remain without governmental oversight (Hühn and Dierksmeier 2016). It is the primary task of each government to guarantee legal security and to protect people against the violation of their rights. As Smith has noted already in his *Lectures on Jurisprudence*: "The first and chief design of every system of government is to maintain justice; to prevent the members of a society from encroaching on one another's property, or seizing what is not their own. The design here is to give each one the secure and peaceable possession of his own property" (Smith 1982, i.1). While Smith believes that regulations concerning the circulation of labor or the employment of capital are infringements of the natural rights of the citizens, he sees other governmental regulations, especially concerning the public order or the security of people as necessary governmental tasks: "Such regulations may, no doubt, be considered as in some respect a violation of natural liberty. But those exertions of the natural liberty of a few individuals, which might endanger the security of the whole society, are, and ought to be, restrained by the laws of all governments" (Smith 1981, II.ii.94).

All in all, Smith's foundation of a system of natural liberty rests on three pillars. Firstly, he sees it as the inviolable natural right of every person to regulate one's own affairs without political paternalism insofar as she does not violate other fundamental principles of justice or the equal rights of others (Werhane 2000). Such right should be overridden only in cases of extreme emergency and in cases where higher values are at stake. Secondly, Smith distrusts the ability of the lawgiver to orchestrate the economic activities of its citizens and to judge their objectives and capabilities to reach them. Thus, he believes that leaving economic decisions to individuals, knowing best about their aims and their abilities, would be more effective than to regulate economy by governmental orders. Thirdly, Smith believes that such liberal order would not only discharge governments from tasks they never can accomplish sufficiently (Schmidtz 2016, 210) but would benefit all layers in society since it allows every individual to pursue its own goals in life and to do what fits best with his abilities and personal skills. Thus, the individual efforts to increase one's own material wealth would also contribute to the common wealth. "Smith (. . .) considered that commercial society brought enormous benefits overall that made it worth defending and improving in the direction of his 'system of natural liberty' (. . .): namely prosperity for ordinary (poor) people, as well as justice, freedom from artificial restrictions and from feudal relationships of domination, and increased scope of moral self-development" (Wells and Graafland 2012, 322).

The Commercial Society as Teacher of Virtues

In a commercial society, man strives for improving his economic conditions and his material wealth. But how can he do this best? Smith's answer is: by leading a virtuous life and making prudent decisions. The ideal of Smith is not the reckless homo economicus but the sober and industrious citizen who uses his talents prudently (Hanley 2009, 112).

Smith was firmly convinced that a system of natural liberty gives rise to specific virtues in a commercial society. Bourgeois virtues like prudence, temperance, or industriousness are not only compatible with the interests of commerce but encouraged by the demands of a commercial society (Wells and Graafland 2012). Thus, for example: "Whenever commerce is introduced into any country, probity and punctuality always accompany it. These virtues in a rude and barbarous country are almost unknown" (Smith 1982, 326; see also Smith 1982, 328). For Smith, such virtues follow from practical considerations and are a demand of prudence. In this vein, the "prudent man" for Smith becomes a kind of role model in the commercial society (Winch 1992, 105). Although Smith believes that, in opposite, e. g., to benevolence, prudence is not a noble virtue (Smith 1984, VI.1.14), he nevertheless sees several beneficial effects of prudent behavior in the business context. Thus, the prudent man strives for security and avoids to expose his health, fortune, or reputation to any sort of hazard; he studies seriously to gain the relevant knowledge in his profession and develops his talents; he is always sincere and avoids falsehood; he is capable of friendship but carefully selects his companions; he cultivates an inoffensive and polite style of conversation and avoids any kind of rudeness; he is modest and frugal in his way of life and sacrifices the enjoyment of the present moment for the greater enjoyment in the future; he lives within his income and increases his wealth by consistent industry; and he does not interfere with other people's private matters and does not take on responsibilities beyond his duties (Smith 1984, VI.1.5-13). This list of characteristics of the prudent man is hardly surprising but seems to be a common description of the "virtuous tradesman" at this time. Thus, for example, in his *Autobiography*, Benjamin Franklin describes nearly the same "virtues" as preconditions for economic success (Franklin 1998, 84–85). Smith summarizes: "The man who lives within his income, is naturally contented with his situation, which, by continual, though small accumulations, is growing better and better every day. (. . .) He (. . .) does not go in quest of new enterprises and adventures, which might endanger, but could not well increase, the secure tranquility which he actually enjoys. If he enters into any new projects or enterprises, they are likely to be well concerted and well prepared. He can never be hurried or drove into them by any necessity, but has always time and leisure to deliberate soberly and coolly concerning what are likely to be their consequences" (Smith 1984, VI.i.12).

For Smith, prudence "is both a moral and an economic virtue" (Griswold 1999, 203). He sees prudence as a virtue that allows for regarding one's own interests without being reckless or selfish (Mehta 2006, 259; Montes 2016, 144). Thus, the prudent man not only chooses an honorable route to regulate his own economic affairs by cultivating secondary virtues like industry, temperance, and probity but also cultivates virtues which are important for communal life, like sense of friendship or respect of privacy (Hanley 2009, 126). For Smith leading a virtuous life does not conflict with pursuing economic wealth. Quite the opposite, for him civic virtues are the preconditions for the economic success of the citizens of the commercial society and a precondition for exercising one's freedom responsibly. While Smith argues, on the one hand, that such virtues are necessary for succeeding in economic life and therefore required by a commercial society, he assumes, on the other hand, that such virtues are also cultivated and fostered in a commercial society. Only the thoughtful merchant, humbly listening to his customers, knows about their wishes; only the farsighted entrepreneur, carefully observing the markets, knows about his competitors and detects their strategies; and only a manager who knows about his employees, suppliers, and financial capacities can choose a right strategy for his company (Wells and Graafland 2012).

A second important virtue fostered in a system of natural liberty is temperance. If people are responsible for organizing their own lives, thus Smith believes, they will develop a sense of economy. Due to the fact that they are exposed to the scrutiny of their fellow citizens, they will avoid extravagances and idleness since such "vices" endanger their reputation in a commercial society. As good reputation is the currency in a commercial society, the individual actor is forced to avoid the appearance of laziness, negligence, or unreliability in his businesses (Wells and Graafland 2012; Sombart 1987, 162–163). The prudent man avoids civic vices "by locating himself in an identifiable community that provides a context for his pursuit of position and reputation. As a result, his love of esteem takes a more admirable and morally salutary form than the vain man's love of praise" (Hanley 2009, 122). Such man is far away from seeking admiration by any means but seeks reputation due to his professional skills and his integrity, "and though his talents may not always be very brilliant, they are always perfectly genuine" (Smith 1984, VI.i.7). The more people become dependent on each other in a developed commercial society, the more they are forced to observe the judgment of their fellow citizens concerning their reliability as a business partner. However, as Wells and Graafland (2012) observe correctly, such effect is likely only in face-to-face relations and has no moderating effect in an anonymous society.

Smith also believes that market relations in a commercial society foster tolerance, impartiality, and civility since business relations abstract from personal characteristics or believes. In business relations the focus lies on market transaction, regardless of the age, religious belief, gender, or origin of the business partner. "Everyone is equal before the market and everyone is equally a stranger" (Wells and Graafland 2012, 334).

The Moral Effects of Commerce on Society

Smith's argumentation for economic liberalism rests on the idea that free market exchange without paternalism and arbitrary infringements of the government has positive effects for the whole society. In the eyes of Adam Smith, there are three main effects which make appear a system of liberal commercial order favorable to other systems. A first point is that Smith believes that free commerce, deregulation of legal restrictions, and the abolition of trade barriers will increase the material opulence of the nation. Although he sees that the material wealth is not distributed justly, he, nevertheless, argues that the increased opulence of a civilized society benefits all layers in society. This helps to overcome poverty and enables even the average worker to attain some modest comfort. An equally convincing argument in favor of economic freedom, for Smith, is that such system would reinforce also individual liberties. It is Smith's argument that the more professional relations in a developed commercial society based on natural liberty will replace the former personal dependences of the ordinary man from his superiors by the more impersonal interdependencies of the market relations. Such "liberation" from paternalism and despotism, then, gives rise to the development of an independent character and a noble spirit of the former dependent ordinary people. A last argument which Smith makes in favor of a liberal order is that it fosters peaceful and just relations. Since people rely on the assistance of others, they have to treat them at least "professional". Furthermore, an increased frequency of market interaction reduces the likeliness of being cheated since more frequent transactions stabilize honest and trustworthy business relations. We will discuss all three aspects in the following.

Material Opulence

Smith believes that commerce by and large has positive effects and contributes to the civilization of a society. Like his friend David Hume (1987, 260–264), he believes that developed markets stimulate industry and productivity since the agricultural producers as well as the manufacturers have now the possibility to exchange their surplus produce against other products which stimulates improvements in the production process and thus benefits the whole society. Smith sees also some positive effects resulting from the "commercial spirit" of the merchants which always search for new business opportunities. In opposite to the "country gentleman", the merchant looks for profitable investments and business success and is inclined to invest his money in new projects and production improvements and, by doing so, contributes to the prosperity of the whole nation.

For Smith the division of labor, as main characteristic of a developed economy of a civilized country, creates an increase of productivity and thus leads to an overall reduction of prices for consumer goods. "It is the division of labor which increases the opulence of a country" (Smith 1982, 212). Already in his *Lectures on Jurisprudence*, Smith lists the comfort of the average worker in Great Britain which he has reached due to this increased opulence: He wears well-prepared woolen coats, has leather shoes, uses different plates and cups in his kitchen, he lives in a brick house with glass windows, he uses a coal stove to heat, and he has bread and beer for his diet (Smith 1982, 211–212; see also Smith 1981, I.i.11). Smith believes that his standard of living differs less from the luxury of the British nobles than it differs from the bare living conditions of the people in uncivilized countries, and he concludes that “a common day laborer in Britain has more luxury in his way of living than an Indian Sovereign” (Smith 1982, 211).

Although Smith believes that a liberal economic system is a means of “liberating the poor from desperate need” (Schmidtz 2016, 208) and helps to increase the standard of material comfort of the laboring class (Winch 1978, 87), he is also aware that such opulence is not shared equally, and he is “deeply concerned about the inequality and poverty that might survive in an otherwise successful market economy” (Sen 2016, 287–288): “The division of opulence is not according to the work. The opulence of the merchant is greater than that of all his clerks, tho’ he works less; and they again have six times more than an equal number of artisans, who are more employed. The artisan who works at his ease within doors has far more than the poor laborer who trudges up and down without intermission. Thus he who, as it were, bears the burthen of society has the fewest advantages” (Smith 1982, 213).

Interestingly, for Smith, the overall increase of opulence is not an argument to outweigh questions of social justice. Even if the common worker participates in the opulence of his country and even if he is better off than the Indian sovereign, for Smith this is not an argument to legitimize social inequalities. Smith takes it for granted that “[n]o society surely be flourishing and happy, of which the far greater part of the members are poor and miserable. It is but equity, besides, that they who feed, clothe and lodge the whole body of the people, should have such a share of the produce of their own labor as to be themselves tolerably well fed, clothed and lodged” (Smith 1981, I.viii.36).

But despite all his own skeptical remarks concerning the unfair distribution of wealth, he sees more advantages of a liberal economic system than disadvantages. He believes that now the “common people have better wages” and, given the increase of work opportunities in a civilized society, that nobody “will be so mad as to expose himself upon the highway, when he can make better bread in a honest and industrious manner” (Smith 1982, 205). Thus, he is convinced that a commercial system based on the principles of natural liberty leads to new chances even for the average worker and thus allows him to participate in the opulence of his nation, an “opulence which extends itself to the lowest ranks of the people” (Smith 1981, I.i.10).

Individual Freedom

In a commercial society, social relations are transformed from former hierarchical interrelations into pure market relations. In a market system, the former direct dependence of the ordinary people from the landowners and the aristocracy is replaced by buyer-supplier relations which create a system of mutual dependences of all groups in society. For Smith such mutual dependence of all groups in the society seems to be preferable since this limits the execution of arbitrary power and abolishes a highly degrading kind of dependence (Winch 1978, 78–79; Rothschild 2002, 10). Schmidtz cogently illustrates this kind of degrading dependence: “In a feudal system, you live where your lord tells you to live. You grow what the lord tells you to grow. You sell your harvest to the lord at a price of the lord's choosing. If you want to leave, you need the lord's permission. When you meet your lord, you bow. Your lord does not see you as his equal. For that matter, neither do you. As market society supplanted this system, the effect was liberating for all, especially the poor" (Schmidtz 2016, 211).

Smith argues that in the state of a "pre-market" society, the revenues of the landowners could be spent only for the maintenance of his servants. In contrast, in developed market economies, the revenues are used to purchase commodities on markets. Thus, the purchaser contributes indirectly to the maintenance of all the laborers producing his goods. However, he only contributes to a very small proportion to their maintenance. "Though he contributes, therefore, to the maintenance of them all, they are all more or less independent of him, because generally they can all be maintained without him" (Smith 1981, III.iv.11). In a market system, everybody depends on many others, but nobody depends on the mercy of one (Schmidtz 2016, 211).

In a commercial society, every man lives by exchanging the surplus part of the produce of his labor for commodities produced by others and "becomes in some measure a merchant" (Smith 1981, I.vi.1). The more people are included in this system of mutual exchange, the more the older forms of dependency and domination are abolished (Winch 1978, 80). For Smith such kind of independence is the precondition for leading a virtuous life. As he expresses in his *Lectures on Jurisprudence*, he is convinced that "[n]othing tends so much to corrupt and enervate and debase the mind as dependency, and nothing gives such noble and generous notion of probity as freedom and independency. Commerce is one great preventive of this custom. The manufacturers give the poorer sort better wages than any master can afford; besides, it gives the rich an opportunity of spending their fortunes with fewer servants, which they never fail of embracing. Hence it is that the common people of England who are altogether free and independent are the honestest of their rank anywhere to be met with" (Smith 1982, vi.6-7). And Smith goes even one step further when asserting: "The establishment of commerce and manufactures, which brings about this independency, is the best police for preventing crimes" (Smith 1982, 204–205).

However, Smith sees also the negative contribution of commerce to the moral education of the working class. One of the "inconveniences," as Smith calls it, is that the possibility to divide labor into several simple tasks which can be performed easily by low-skilled workers that facilitates child labor. If "parents find it to be their interest to set them soon to work" (Smith 1982, 330), then the education of their children is neglected, and the positive effects of independence on the formation of the character of the laboring class are annihilated. While Smith believes that humble comfort and independence foster the formation of a virtuous character and give rise to a more noble spirit, he simultaneously is aware that the one-sided orientation toward material comfort may be counterproductive to such development. The "comfortable hope of bettering his condition and of ending his days perhaps in ease and plenty" (Smith 1981, I.viii.44) bears the risk that the pursuit of material wealth counteracts education and the formation of a noble character (Evensky 1989).

Nevertheless, Smith is convinced that in an advancing economy and in a state of natural liberty, "the condition of the laboring poor, of the great body of the people, seems to be the happiest and the most comfortable" (Smith 1981, I.viii.43). For Smith a commercial society makes people more wealthy, more civilized, and more honest than other systems, given that it also guarantees liberty and a minimum of education (Streminger 1999, 143).

International Peace and Justice

Last but not least, Smith assumes that commerce and the "commercial spirit" have also positive effects for the political order since merchants are interested in legal security, liberty, and peace (Smith 1981, III.iv.2-4). Seen from the historic perspective, Smith assumes that "[c]ommerce and manufactures gradually introduced order and good government" (Rothschild 2002, 10). Expanding markets lead to an increase of the frequency and an expansion of market transactions and thus enforce honest behavior. "A dealer is afraid of losing his character, and is scrupulous in observing any engagement. When a person makes perhaps 20 contracts in a day, he cannot gain so much by endeavoring to impose on his neighbors, as the very appearance of a cheat would make him lose. Where people seldom deal with one another, we find that they are somewhat disposed to cheat, because they can gain more by a smart trick than they can lose by the injury which it does their character" (Smith 1982, 327). However, it should be mentioned that Smith sees no real moral value in such behavior. As he expresses in his *Theory of Moral Sentiments*, not defrauding, not violating another person or damaging his property or his reputation "has surely very little positive merit" (Smith 1984, II,ii,1.9).

Although Smith sees also the good influence of the commercial system on the character of the merchants since they tend to make forward-looking plans, carefully seek the best available information for their businesses, and try to invest their capital prudently, they nevertheless are also prone to extreme desires of avarice and seek their success not only by commercial means but also by influencing politics and legislation (Rothschild and Sen 2006, 345–346). Though they are interested in good order and legal security, since this facilitates stable business relations, they strive to influence government to get trade privileges and to receive monopolies in their trade. Thus, Smith warns that merchants are prone to influence legislation for their own benefit and conspire against public interests: "People of the same trade seldom meet together, even for merriment and diversion, but the conversation ends in a conspiracy against the public, or in some contrivance to raise prices" (Smith 1981, I.x.c.27). Merchants know best about their own interests, but these interests are often opposed to the interests of society (Smith 1981, I.xi.p.10; Rothschild and Sen 2006, 328–329).

Thus, Smith is in favor for the small shop owners which take care for their business themselves and distrusts big companies. Although he sees also the big companies as part of the commercial society, for Smith, such enterprises are the object of investors which are neither interested in the business itself nor in possible improvements but only calculate their return on investment. Such capitalists as owners of the big companies are not the industrious and thoughtful type of man which Smith has in mind when praising the qualities of the merchants. Such investors have handed all relevant labor, namely, inspection and direction, to their clerks and remain idle themselves and enjoy their richness (Rothschild and Sen 2006, 332–333).

Smith is more in favor of the smaller manufacturers which are unable to influence prices in a competitive market setting (Bassiry and Jones 1993). But, though he admires their professional skills and their foresightedness, he also criticizes them for always complaining about high wages or strong competitive pressure. The main vice of the merchants, which brings them in opposition to society, is their steadily striving for monopolistic protection and governmental support (Rothschild and Sen 2006, 333–334; Bassiry and Jones 1993). If merchants are able to establish a monopoly in their trade, all members of society have to bear the costs – consumers, farmers, and laborers (Bittermann 1940) – and it might happen that "the clamor and sophistry of merchants and manufacturers easily persuade them that the private interest of a part, and of a subordinate part of the society, is the general interest of the whole" (Smith 1981, I.c.c.25). Therefore, Smith warns that any "proposal of any new law or regulation of commerce which comes from this order, ought always to be listened to with great precaution, and ought never to be adopted till after having been long and carefully examined" (Smith 1981, I.xi.p.10).

Dangers of the Commercial Society

Although Smith by and large is in favor of the commercial society and praises the advantages of a system of natural liberty, enabling individual freedom, promoting opulence and wealth for all layers in society, and forming a virtuous character, he also sees some negative aspects of commerce and industrial development. While commercial society forces industriousness and economic initiative, it is, on the other hand, inimical to rest and leisure. If the struggle for material richness becomes an end in itself and is no longer seen as a means to comfort and relaxation, then the commercial passions are more likely to bring misery and anxiety instead of happiness and tranquility (Hanley 2009, 38–39). To demonstrate this, Smith uses the example of the "poor man's son" who sacrifices his tranquility for the quest for richness, who "labors night and day to acquire talents superior to all his competitors" and who "serves those whom he hates, and is obsequious to those whom he despises," and who, at the end of his life, realizes that the material wealth he has reached "be in no respect preferable to that humble security and contentment which he had abandoned for it" (Smith 1984, IV.1.8).

However, the most dangerous development which accompanies industrial development and an ever-increasing fragmentation of industrial labor Smith sees in a concomitant specialization of the laborers in a very narrow set of operations. Smith believes that specialized labor makes the laborer "as stupid and ignorant as it is possible for a human creature to become" and renders him incapable of "conceiving any generous, noble, or tender sentiment and consequently of forming any just judgement concerning many even of the ordinary duties of private life." It seems that his "dexterity at his own particular trade" is "acquired at the expense of his intellectual, social, and martial virtues" (Smith 1981, V.i.f.50). Smith sees this as a natural consequence of the division of labor and warns that "in every improved and civilized society this is the state into which the laboring poor, that is, the great body of the people, must necessarily fall, unless government takes some pains to prevent it" (Smith 1981, V.i.f.50).

Another potential danger, Smith sees in the development of big companies led by a board of directors which are not the owners of the company but only manage the capital supplied by investors. In his *Wealth of Nations*, he points out that if company directors are the managers of other people's money "it cannot well be expected that they should watch over it with the same anxious vigilance with which the partners in a private copartnery frequently watch over their own. (...) Negligence and profusion, therefore, must always prevail, more or less, in the management of the affairs of such a company" (Smith 1981, V.i.e.18). What Smith has in mind is especially the privileged trade companies of his time, like the East India, the Hudson Bay, or the South Sea Company. Since shares of such stock companies are traded anonymously, such companies are no real partnerships. No partner bears personal lability for the debts of the company but is liable only to the extent of his share. Since investors are not interested in the business of the company, and since the directors are not liable for the losses of the company, Smith fears that such types of companies are managed without care and are less competitive than private enterprises (Smith 1981, V.i.e.15-18). Thus, in his opinion, the separation of property and control fosters mismanagement and negligence of due diligence obligations from side of the hired directors. Due to their market power and their privileges, such companies distort competition and are less productive and innovative than small enterprises. Smith sees only two legitimate reasons for establishing joint-stock companies: First, the undertaking should be of greater utility than other parts of the common trade, and, second, the object of such company requires more capital than usually is required for establishing a company. Smith lists banks, insurances, or canal building as examples (Smith 1981, V.i.e.36-39). In all other branches, Smith sees the establishment of privileged joint-stock companies as counterproductive for a functioning commercial society since this reduces the liability of the owners and reduces competition. For Smith, such chartered companies were the heritage of the mercantile system and incompatible with and somehow destructive within his system of competition in a commercial society based on natural liberty (Rothschild and Sen 2006, 341–343). "Therefore, an important role for government was to design an economic system that as far as possible discouraged the creation of private cartels and monopolies" (Sandmo 2016, 239).

Conclusion

It is not easy to transfer Smith's understanding of a commercial society to the contemporary economic situation. The picture of the commercial society as outlined by Adam Smith is shaped by entrepreneurs not by enterprises. Thus, for Smith it is obvious that successful business depends not only on the economic skills of these persons but also on their personal values. When Smith talks about virtues in business, he has in mind the personal values of entrepreneurs. For Smith, the "enterprise represents the result of a decision taken by a person, (. . .) it cannot be disconnected from the entrepreneur, and hence from his/her identity and values" (Gonin 2015, 223). For Smith, entrepreneurs are more than investors. They are concerned with their daily business and dependent on some kind of public content concerning their business practices. This is quite different from nowadays practice of capital owners to make short-time investments on stock markets based on the desired profitability of an investment but without being interested in the business itself. This is contrary to Smith's understanding of free enterprise and leads to a different understanding of the task of business leaders. In modern stock companies, it is assumed that managers – not owners – bear responsibilities for the profits of the stock-owners which is a quite different understanding of "business responsibilities" than in the times of Adam Smith (Gonin 2015). For Smith, the ideal type of citizens in a commercial society "is rather frugal private individuals, with a capacity to defer their own desires, who create a fund of capital that can be employed for productive investment" (Mehta 2006, 261).

In the conception of Adam Smith, economy is bound to the morality of individuals as necessary precondition of the functioning of a commercial system. Fair play, staying within legal and moral rules, or doing no harm to others are, even if not laudable, but necessary moral preconditions without which economic liberty cannot be granted (Szmigin and Rutherford 2013). Also economic activities are subject of the judgment of an impartial spectator and have to be approved by others. Smith believes that nature has endowed man "not only with a desire of being approved of, but with a desire of being what ought to be approved of, or of being what he himself approves of in other men. The first desire could only have made him wish to appear to be fit for society. The second was necessary in order to render him anxious to be really fit" (Smith 1984, III.2.7). With other words, people not only want to be praised but they want to be praiseworthy. Thus, for Smith, this love of praiseworthiness becomes one of the remedies to overcome the most important ethical threats of the commercial society: self-preference and egoism (Hanley 2009, 150; Mehta 2006, 259; Paganelli 2008).

Furthermore, Smith is convinced that the positive effects of commerce based on the principle of natural liberty are dependent on complementary development of social and political institutions to overcome the threats of the commercial society (Evensky 2016, 67). In his conception of liberal economy, it is up to the government to take action in cases where markets disadvantage especially the less privileged or leave things undone which should be accomplished for the well-being of society, e.g., to fight poverty or to provide education (Sen 2016, 289). In such cases Smith supports governmental intervention and laws which protect, namely, the poor. He gives the advice that legal regulations should always aim at bettering the situation of the small and average people: “When the regulation, therefore, is in favor of the workman, it is always just and equitable, but it is sometimes otherwise when in favor of the masters” (Smith 1981, I.x.c.61).

Even if Smith admits that in the economic context people are mainly interested in increasing their material wealth, this is far away from being a gospel of egoism. Even the most reckless entrepreneur depends on his customers, clients, suppliers, and his workforce and is judged by other people about his probity (Sen 2016, 296). Thus, Smith believes that even business enterprises have to create some benefit for the community if they want to succeed in the marketplace (Bevan and Werhane 2015). Smith is convinced that a system of free enterprises and of economic liberty works for the benefit of the public, at least since it creates additional opportunities for laborers and consumers (Bassiry and Jones 1993). This does not mean that corporations act from benevolence or that their decisions are driven by social considerations. However, they have to fulfill to some degree the expectations of the markets and of the society for their own well-being. Thus, Bevan and Werhane (2015, 335) conclude: “Smith saw business in his time as being inextricably social, political, and moral.”

Smith is by far not an apologist of laissez-faire capitalism. For him the legitimacy of business rests on two pillars: First he is convinced that an economic system based on natural liberty only generates positive effects for the whole society when it is backed by the individual morality of the business actors. Although such system might foster several virtues, it is simultaneously destructive for some others. Thus, for Smith, the economic system is neither a moral-free space nor does he believe that a system of economic liberties might substitute individual morality. Second, Smith sees also the negative effects of commerce like increasing political influence of large companies, alienation of laborers, or unequal distribution of wealth. Thus, he believes that the economic system has to be backed by institutional arrangements to avoid or counteract such undesirable developments. Even though Smith defends economic liberties, he is far away to legitimize laissez-faire capitalism as the basis of a commercial society. “For Smith, markets can produce the best possible outcomes only if we behave with a clearly defined social awareness” (Clarke 2002, 22).

Kantian Moral Philosophy, Universality, and Business Legitimacy

6

Contents

Abstract

In this chapter business legitimacy is understood as a minimum notion of moral rightness in business. It is argued that from the standpoint of a Kantian moral theory, it can never be justified to pursue profit maximization irrespective of the rights of the affected people. Sustainably functioning national economies are of special importance for the protection of the rights of people. According to Kantian moral theory, the universal rights of persons must be effectively protected by territorially limited states. This makes all business strategies and models illegitimate which endanger the sustainable functioning of a national economy or prevents or retards its development. In order to provide the necessary normative background for these and other determinations of business legitimacy and illegitimacy, this chapter first outlines Kant's moral theory in some detail. It is

shown that Kant develops the understanding of a moral norm in contrast to the basic characteristics of conditional norms. The unconditional norms of morality are based on the absolute value of persons which derives from their ability to act for ends different from the end of their own happiness. While Kant's moral theory is dignity-based, Kantian moral theories are usually rights-based. They interpret the dignity of persons mainly in terms of their rights. A market economy is both relevant for the protection of the moral rights of persons and involves certain dangers to them. A guiding question of the chapter is how this tension should be dealt with from the perspective of Kantian moral theory.

Introduction

There is good reason to call a moral theory "Kantian" if it holds that each person possesses the same unsurpassable normative importance and that an action, a rule, or an institutional framework can only be morally right if it is not incompatible with the normative importance of any person affected. Such theories are, therefore, strikingly different from moral theories like utilitarianism which claim that the criterion of moral rightness and wrongness consists in the maximization of certain values, e.g., happiness, preference satisfaction, or utility. The difference is not, as it is often thought, that the latter theories are concerned with the consequences of actions, practical rules, or institutional frameworks while the former are not, but *how* they are concerned with the consequences. The value maximizing theories focus on cumulative or overall results, while the Kantian theories have a strictly distributive focus. Unlike theories of maximization, the incompatibility of an action with the normative importance of a single person is sufficient to make it morally wrong.

While one may consider this convincing as far as our more personal encounters are concerned (roughly speaking, many will agree that one normally must not sacrifice a person in order to increase the well-being of others and thereby maximize overall well-being), it may pose difficulties in the context of more complex institutional settings like a market economy. The importance of a market economy (and the competition which it is based on) in comparison to other economic systems seems to consist in its ability to create and increase *overall* wealth. While the market economy and competition must be regulated, it cannot simply be formed at will. This may limit what can sensibly or justifiably demanded from business and has a direct impact on the criteria of business legitimacy. It is the task of this chapter to show what problems this poses for Kantian theories and to explore the potential such theories have to solve them.

Kant's and Kantian Moral Philosophy

An Overview of Kant's Moral Philosophy

One of the most basic claims of Kant's moral philosophy is that *morality* is completely different from *prudence*. An agent acts prudently if she acts in accordance with her considered well-being. Morality is concerned with or based on the absolute value of persons. Thus, morality can demand of an agent to act in ways that go counter to the demands of her considered well-being. Now, an agent is only able to follow moral demands if she possesses a certain kind of freedom, namely, the ability to act out of reasons different from her prudential reasons. According to Kant, it is or would be exactly this kind of freedom – the ability to act out of reasons different from and limiting the pursuit of one's considered well-being – which imbues or would imbue persons with an absolute value and, therefore, with a normative importance which requires of them to restrict the pursuit of their own well-being.

Conditional Norms

Kant develops his moral theory as part of a theory of practical norms (instead of *norms* Kant speaks of *imperatives*). The fundamental question of this theory is how a norm "is possible," i.e., how it can have a binding force on its addressee(s) (cf. *GMS* 4:417). This is a question which can only be answered within the first-person perspective of an agent as Kant shows for technical norms (see *GMS* 4:417). If an agent has a certain end, say, to lose weight, she must ask herself how, by what means, she can bring this about. This is a theoretical question. Suppose the answer is that she must forgo, without substitution, eating chocolate, cookies, and cake. The *practical* question is whether she is *willing* to apply the means. She can only (consistently) want to achieve the end E if she also wants to apply the means M necessary to achieve E.

Thus, by really wanting (and not only merely considering or wishing) to achieve E, she creates the practical necessity for her to apply or pursue M. But having different or opposing incentives to act, the agent will not naturally do what is practically necessary for her to do. Again and again, she will be tempted to eat chocolate, cookies, or cake despite her end to lose weight. Therefore, in the face of these incentives to act in ways which will thwart her E, as long as the agent sticks to E, the practical necessity to apply M will take on the form of a "demand" on the agent that she *ought* to apply M.

This is a simple but interesting theory, for it is a theory of the *genesis* of norms. It answers the question how practical norms come into our world in the first place by showing that they are in a way created by the will of its addressees and can only in this way have a necessitating force on them. However, the "ought" or the norm is not created by way of a direct "self-obligation." Instead, it builds up behind the back of an agent who wants to achieve a certain end. If she is able to achieve a certain E by applying a certain M which is in her power to apply, then as long as she wants to achieve E, she (technically) *ought* (ought_T) to apply M.

Unlike the behavior of animals, the behavior of human beings is not determined by the strongest drive for the given situation. Instead, humans can reflect on their drives, suspend them, and act out of reasons. However, according to Kant, it could well be the case that the reasons on which people are able to act are ultimately all based on their sensible nature and inclinations. As sensual beings people want to achieve and preserve pleasant states and to terminate and avoid unpleasant states. As beings also endowed with reason, people form *out of necessity* the idea or ideal of happiness as a state of maximum overall pleasantness and minimal unpleasantness (cf. *KrV* B834/A806). Happiness is an end human beings all have but which they never have explicitly chosen or decided on. Kant therefore refers to happiness in a deliberately paradoxical formulation as a "natural end" [*natürlicher Zweck*] (*KU* 5:434; *Gem*. 4:430, see also *GMS* 4:430), for "nature" marks necessity, while "end" marks decision or voluntariness.

The natural end of happiness which all human beings have is inevitably indeterminate and indeterminable. "(. . .) the concept of such an indeterminate concept that, although every human being wishes to attain this, he can still never say determinately and consistently with himself what he really wishes and wills" (GMS 4:418). Therefore, the end of happiness can only function as a sort of indeterminate vanishing point. Each agent must again and again decide which overarching ends (e.g., a family, a fulfilling occupation, health, wealth) she thinks will lead or contribute to her overall well-being. Now, because the idea of happiness has the status of a *given* end, the overarching ends function as possible means to this end. However, there is, as Kant points out, no strict relation of necessity here. An agent cannot know whether the overarching ends will really be conducive to her happiness, and there are no guaranteed ways of achieving the overarching ends themselves. Nevertheless, as long as the agent holds these ends to be a part or precondition of her happiness, her natural end of happiness creates a practical necessity for her to pursue those ends, and the respective ends create again practical necessities to take what she considers suitable means to achieve these ends. As the agent will not naturally do what it is practically necessary for her to do, these practical necessities will confront her as (prudential) *oughts* (ought$_{\mathrm{P}}$).

Both technical and prudential norms are conditional norms ("hypothetical imperatives"). This is obvious in the case of technical norms. For only *if* and *as long as* an agent has a certain end, there is the practical necessity for her to employ the means. Thus, the practical necessity of technical norms is conditioned by *the contingency of the end*, which an agent may adopt or not and which that agent may sustain or not. In contrast to this, prudential norms are dependent on an end which each human being necessarily has. However, the natural end of their own happiness is an end agents have never chosen. It orients the selection of their overarching ends with which they try to specify or interpret what they consider their happiness to consist in. There is an inescapably hypothetical or conditional structure involved here. For only if and as long as an agent sees a certain overarching end as a necessary or integral part of her happiness will there be the practical necessity to her to want to try to achieve this end and to specify and to pursue the various levels of means (subordinated ends, ancillary ends, mere means) which she holds to be suitable to achieve the end. But she can give up, supplant, or redefine her overarching ends and make adjustments on the different levels of means-ends-relations governed by them.

At this point, one should note two things. First, Kant's concept of prudence and of prudential norms is more sophisticated than the current concept of economic rationality which is based on the existing preferences an agent happens to have and requires of her to try to maximize the fulfillment of her existing preferences. In contrast to this, the natural end of one's own happiness and the overarching ends dependent on it allow for the notions of one's *future* well-being and one's well-being *over time* and with this for the notion of one's *considered* well-being. One's future or considered well-being *can*, therefore, be a reason for not following certain desires or preferences one currently happens to have.

Second, while these reasons need not be felt desires and can be opposed to desires an agent currently has, they are nevertheless based on the sensual nature of agents or, as Kant says, on an agent's "interest(s) of inclination(s)" (see *Prol.* 4:381; *GMS* 4:406; *KpV* 5:120; *MSR* 4:212, 213). And it could well be the case that *all* reasons for action an agent has are based on her interests of inclination or her natural end of happiness. For since the natural end of happiness was never chosen but has only to be interpreted, it could function as a conclusive reason for action. As a consequence, all reasons for action an agent has could ultimately be confined to considerations of prudence or of her considered well-being. Thus, it is possible that there is no genuine sphere of morality and that an agent could take the interests of others into account only insofar as she considers (in the case of friends, children, etc.) their well-being as a part of her own well-being or because she tries to anticipate the possible reactions of others to her actions. Genuine moral norms can only have a binding or necessitating force on an agent if she can act out of reasons which require of her to limit the pursuit of her own happiness.

The Idea of an Unconditional (Moral) Norm

Kant explores the possible content and the possible bindingness of moral norms by developing the idea of an unconditional practical norm (or, in the parlance of Kant, of a "categorical imperative"). This can be done by denying the defining characteristics of conditional norms ("hypothetical imperatives"). As shown, in the case of conditional norms an agent generates by the ends she has the practical necessity for her to (try to) pursue further ends or to make use of the means necessary to achieve those ends. Since she does not naturally do what is necessary, this practical necessity confronts her as an *ought*. The respective *ought* is conditional on the ends the agent actually has. There is a hierarchy of conditional oughts or practical norms with prudential norms taking precedence over technical norms in the case of conflict.

In contrast to this, an unconditional practical norm would be characterized by an *unconditional practical necessity* for an agent to pursue an end or to do or omit something. Basically, there are two possible and closely connected paths to explicate what one must think if one forms the idea of an unconditional practical necessity. The first path is to explicate the formal side of the idea, the strict universality, or lawlike character of unconditional practical necessity (see *GMS* 4:420–427). The second path is to explicate the material side of the idea, namely, that it involves the idea of an unconditionally necessary end (see *GMS* 4:429–445). As conditional practical necessity depends on conditional ends, unconditional practical necessity must be the necessity of an unconditionally necessary end. It is this idea which will be sketched out in more detail in what follows.

First, an unconditionally necessary end must be an end to which any action must conform or which is binding for any action. For any action is done for an end and an unconditionally necessary end must possess a normative relevance for the pursuit of any end. Therefore, an unconditionally necessary end can be nothing which has to be brought forth, for then it would be contingent on the abilities and circumstances of an agent, whether she is able to do so or not. Instead, an unconditionally necessary end must be something which already *exists as* such an end and can therefore orient any action.

Second, to orient oneself by this end presupposes the ability of agents to act independently of their sensual inclinations. Hence, it presupposes an ability of decision-making or "practical reason(ing)" which is fundamentally different from what is required for the pursuit of the natural end of one's own happiness. While in the latter case practical reason (only) moderates, organizes, or, as Kant says, "look[s] after the interests of the inclinations" (*GMS* 4:406; see also *GMS* 4:413, 441; *KpV* 5:120), to act in accordance with an unconditionally necessary end requires the ability of practical reason (of a practical decision-making competence) to set ends independently of one's inclinations or (sensual) desires. It requires, in the parlance of Kant, the ability of *pure* practical reason.

Third, the ability of pure practical reason must be thought of as the ability to set ends strictly in accordance with the (inner, reasonable) criteria of this decision-making capacity. Three points are pertinent here. For one thing, the criterion or the criteria for setting ends must ultimately be based on the unconditionally necessary end. Thus, there must be an intimate connection between the ability of pure practical reason to set ends and the unconditionally necessary end. Furthermore, because these ends are set by reason in accordance with the unconditionally necessary end, the ends themselves are necessary ends. Finally, there is an intimate connection between the ends an agent has or must have and the evaluation of these ends. For an agent must hold the ends, she actually has chosen as being good according to some criterion. So, an overarching end an agent has chosen (say, the end of living in a fulfilling partnership or of making a lot of money) must be considered by her (at least) instrumentally good. For she has chosen it for its assumed contribution to her natural end of happiness. A necessary end set with the help of an agent's capacity of pure practical reason must considered by her (and any other agent possessing the same capacity) as being necessarily good. And an unconditionally necessary end must be considered by an agent as an unconditionally necessary good or as being absolutely valuable.

Now, fourthly, every agent who is, due to her capacity of pure practical reason, able to set necessary and necessarily good ends must consider herself to be, due to her capacity of pure practical reason, the potential source of necessary ends. Since the criterion or criteria for setting necessary ends must ultimately be the unconditionally necessary end, every agent must hold that she can only be the potential source of necessary ends if she exists due to her capacity of pure practical reason as an unconditionally necessary end. Likewise, in that case, every agent must hold that any other agent or person who possesses the capacity of pure practical reason exists as an unconditionally necessary end.

Thus, if they have the ability to act out of reasons different from and independent of the natural end of their own happiness, agents must consider themselves and any other agent to exist as an unconditionally necessary end and as such to possess an absolute value or "dignity." The capacity of pure practical reason generates the unconditional practical necessity to always act in accordance with the absolute value of one's self and of any other person. This both restricts what is permissible to do to oneself and to others and prescribes certain actions in relation to oneself and others. As agents do not naturally do what is unconditionally necessary for them to do, this practical necessity confronts them as a (moral) *ought* (ought$_{\mathrm{M}}$). There is a self-reflexive structure here (see Steigleder 2002). The capacity of pure practical reason is the capacity to act in accordance with the absolute value or dignity as which a person exists because she possesses the capacity of pure practical reason. Pure practical reason is a capacity of practical reason to follow its own law. Kant designates the self-reflexive structure of pure practical reason or the self-reflexive capacity of a person possessing the capacity of pure practical reason as *autonomy* (*GMS* 4:439) ("the will of a rational being must always be regarded as at the same time *lawgiving*, since otherwise it could not be thought as an *end in itself*", *GMS* 4:435).

Kant's own formulation of the principle of morality is: "So act that you use humanity, whether in your own person or in the person of any other, always at the same time as an end, never merely as a means" (*GMS* 4:429). "Humanity" in this so-called formula of humanity is used by Kant as a *terminus technicus* and means the genuine lawgiving capacity of persons.

Two Ways of Justifying the Universally Binding Moral Norm or Principle

It is important to note that so far only the *idea* of an unconditional moral norm was "thought" or explicated. If there is a genuine sphere of morality, the required respect of the dignity of persons will be its principle. However, it may well be the case that the idea is a mere thought entity (see *GMS* 4:445). This would be the case if human beings do not possess the capacity of pure practical reason. Thus, the justification of morality does ultimately not consist in the demonstration that the principle of morality would have a certain nonarbitrary content, but in showing that it has "reality" for human beings, i.e., that it can have a binding force on us.

The problem is that this seems to require to demonstrate that we are free in a strict sense and that we possess the ability of pure practical reason. However, as Kant has shown in the *Critique of Pure Reason*, neither the existence nor the inexistence of freedom in the strict sense can be proven. Kant deals with this problem in two different ways. In the *Groundwork for the Metaphysics of Morals* (1785), he tries to show that it is not necessary to demonstrate that we are actually free (possess the capacity of pure practical reason) in order to justify the reality of morality. It suffices to show (which Kant attempts to do in the *Groundwork*) that we necessarily must consider or hold ourselves to be free. (There is an obvious difference between [1] "X is free (possesses the capacity of pure practical reason)" and [2] "X necessarily must think, that she is free." For [2] could be true even if [1] is false, or we may be able to show that [2] is true but must leave the truth of [1] undecided.) According to Kant, it suffices to show that we necessarily must consider ourselves to be free because then we must consider the principle of morality as binding for us and must try to follow the norms of morality. So, for all practical purposes, there will be no difference to an actual demonstration of freedom (cf. *GMS* 4:448).

In the *Critique of Practical Reason* (1788), Kant argues that more can be shown. We know that we have strict obligations not to do certain things, e.g., not to kill an innocent person even if someone tries to coerce us to do this by threatening our own life. We may not be sure how we will actually act in such a situation, but we know how we ought to act (cf. *KpV* 5:30). According to Kant's analysis of practical norms, there is only one explanation for this requirement, namely, that we possess the ability of pure practical reason. Without this ability there could be no unconditional ought which will only be reinforced by closer inspection or reflection. Thus, the conviction of being strictly obligated not to do certain things must be understood as a kind of practical self-demonstration of our capacity of pure practical reason. Pure practical reason demonstrates its existence by its own deed so to say (*KpV* 5:3). The Latin word for deed is *factum*. Kant, therefore, calls this also a factum of pure practical reason (*KpV* 5:31). The argument is widely misunderstood, because *factum* can also be translated as "matter of fact."

The Two Parts of Moral Philosophy: The Doctrine of Right and the Doctrine of Virtue

It is not possible to expound here in detail the contents of Kant's moral philosophy, but it is important to note that, according to Kant, moral philosophy consists of two parts, namely, the *doctrine of right* and the *doctrine of virtue*. These are based on two different normative standpoints or perspectives justified by the principle of morality. There is, on the one hand, the standpoint of the obligations one has in view of the dignity all persons have (including oneself). This standpoint is explicated in the doctrine of virtue, which outlines the criteria of all moral obligations. Kant especially highlights two obligatory ends, i.e., ends each person must have and pursue, namely, the end of "one's own perfection" and the end of "the happiness of others" (MST 6:385). These ends come from the fact that persons exist as unconditionally necessary ends or ends in themselves.

There is, on the other hand, the standpoint of the rights persons have against others due to the dignity they possess themselves. This standpoint is explicated in the doctrine of rights. Each person has a right to the maximum freedom which is compatible with the equal maximum freedom of all other persons (cf. MSR 6:230 f.). The rights of persons constitute entitlements to certain actions of others. These entitlements are so important that the bearers of the rights are justified to use, if need be, force in order to make sure that their rights are not violated (cf. MSR 6:231). The rights pertain only to certain actions never to the motivations or intention behind those actions. According to Kant, no one possesses an enforceable right to the morality of other persons.

So, the rights involve only an especially important part of the moral obligations of other persons or of what is morally right to do. Acting in accordance with the rights of the affected persons means to act “rightful” or “in accordance with right” (recht, rechtmäßig). Since the rights are normatively backed by force, it is of the utmost importance that the content of the rights is beyond dispute (or can be the object of conclusive decisions). This is why Kant sees the rights of persons to be confined to negative rights, i.e., rights to the forbearance of others. Positive rights to provide something or to assist others can be only the consequence of special obligations one has assumed by one’s actions.

Kant distinguishes between innate rights (such as life and physical integrity) and acquired rights (rights to possessions). Since the rights to possessions are inevitably controversial (who was the first to take possession of this piece of land?), but are in the eyes of the putative right holders connected with the authority to coerce (which affects the freedom or inner rights of the putative violators of the rights), there can be no effective protection of the rights of persons in a “state of nature” (i.e., in a stateless condition). Thus, the effective protection of the rights of persons makes the institution of (territorial) states necessary, which have a monopoly on the legitimate use of force. As will be shown, the normative importance of states is also relevant in the context of business legitimacy.

There is a problem in the normative architecture of Kant’s moral theory. According to Kant, in the case of a conflict between an obligation arising from a right of another person and other reasons of obligation, the obligation corresponding to the right must take priority. However, this may lead to implausible results. Think of Peter Singer’s (1972) example of a child which is in immediate danger of drowning in a shallow pond. It is clear that one has the obligation to save the child even if this will ruin one’s suit. However, suppose the potential rescuer has promised to show up at a certain place and time in perfect attire, a promise she cannot keep if she rescues the child. Should one let the child drown in order to keep one’s promise? The problem results from the restriction of rights to negative rights which is in the case of the child highly implausible to say the least.

Kantian Moral Theories: A General Characterization

As said above, Kantian moral theories share with Kant the focus on the universal and unsurpassable normative importance of each person. This requires each agent to always restrict the pursuit of her self-interest in view of the interests of other persons. Kant’s theory can be called *dignity-based*. The dignity (i.e., absolute value) of persons forms, directly or indirectly, the basis of all moral duties. The rights of persons channel only an especially important part of the moral obligations. In contrast to this, most Kantian theories can be called *rights-based*, if this terminology is understood as the claim that (moral) rights form the central, although not necessarily the sole fundamental normative category. According to the rights-based theories, the normative importance of persons is for the most part spelled out by their universal and equal moral claim rights, and the moral obligations are typically not directly derived from the dignity of persons but are mediated by their rights, to which they correspond and by which they are justified. A direct normative orientation by the dignity of persons is only looked for at the fringes of moral theory, e.g., when dealing with the moral status of human embryos or fetuses. It is part of this focus on (other directed) claim rights that the Kantian theories are normally not (much) concerned with "duties against oneself."

While there is some variation between the Kantian theories and it is not possible to expand on them here, a case can be made that the most plausible theories have the following characteristics (the remarks are guided by the moral theory of Alan Gewirth (1978, 1982, 1996); for an exposition, elaboration, and defense of the theory, see Steigleder (1999)).

1. The (moral) rights of persons consist in the conditions necessary for being able to lead one's life. As such the rights form a hierarchy. Thus, a more fundamental right of one person can situationally take precedence over a less fundamental right of another person (e.g., the right to life or physical integrity of one person can take precedence over the right to nonessential property of another person).
2. The (moral) rights of persons are not only negative but also positive rights, i.e., rights to the assistance of others. Positive rights are *always* situationally conditioned. One can only have a right to the assistance of others if one is not able to help oneself and another person (the potential helper) is able to help at no comparable cost. For instance, a drowning person has only a right to be helped by another person if this person can help without risking her own life. Obviously, the criterion of no comparable cost presupposes a hierarchy of rights. Theories which do not acknowledge such a hierarchy, but acknowledge the fundamental normative equality of all rights-holders, cannot acknowledge the existence of original positive rights.
   The two conditions of the situational applicability of a right to assistance follow from the basic normative equality (of the rights) of persons. If a person had to help another person, even if this person could help herself, or if a person had to help another person in the protection of a right, even if this would endanger the same (level of) right of the potential helper, then the (rights of the) person to be helped would be more important than the (rights of the) potential helper. It is important to note that the conditionality of positive rights does not contradict its universality. For all persons always have a right to assistance if the two conditions are met. It is also important to note that while in the face of chronic needs an individual person may not be able to help at no comparable cost, persons may be able to do so collectively. This leads to a third and final point.
3. The (moral) rights of persons comprise the right to the effective protection of these rights. This makes certain institutions necessary and the establishment, preservation, reform (if need be), and support of these institutions obligatory. These institutions comprise the institutions of the (territorial) state, including the institutions of the welfare or supportive state, but also international and global institutions. To determine what international and global institutions are required is still a generally unfulfilled task in (Kantian) moral theory.

According to the preceding characterization, Kantian theories share with Kant the fundamental normative focus on the equal normative importance of persons but expound this more comprehensively in terms of the universal and equal moral claim rights of persons. By directly relating the absolute value or worth of persons to the necessity to lead their lives, the Kantian theories perhaps more directly relate the basic moral requirements to the human condition and to the vulnerability of persons than Kant does.

Business Legitimacy: Kantian Perspectives

On the Concept of Business Legitimacy

Kant's distinction between what is *in accord with right* (recht, rechtmäßig) and what is *morally right* or *good* suggests a certain understanding of *business legitimacy*. According to this, *legitimacy* is to be taken at once as a strictly (morally) normative concept and as a minimum standard of moral rightness. As a normative concept, it is to be distinguished from concepts of legitimacy used, for instance, in social or organizational science where the focus is on the (normative) expectations people actually have on the conduct of business or on the need of business organizations to take various expectations on their behavior into account (see, e.g., Díez-de-Castro et al. (2018)). Such a need is also often stressed on the part of business ethics (see, e.g., Buchholtz and Caroll (2012)). In contrast to this, the normative concept of legitimacy aims at binding criteria and norms of the rightfulness of the conduct of business and of business actions as well as of the institutional backgrounds and organizational settings in which companies operate.

As a minimum standard, legitimacy pertains only to the most important aspects of the (moral) rightness of actions and of the institutional and organizational framework conditions of actions. Only those actions, strategies, and framework conditions are legitimate which do not violate the (moral) rights of the affected people. As shown above, the realm of rights is much more restricted in Kant than in many Kantian theories, so that the theories differ in their respective demarcations between the set of the (morally) obligatory actions and the subset of legitimate actions. However, in all the theories, legitimacy does not pertain to the moral quality of the acting persons and so to the moral goodness of actions. While no action can be morally good which is not rightful or legitimate, actions can be legitimate without being morally good. Thus, rightfulness or legitimacy is a necessary but not sufficient condition of the moral goodness of actions.

As will be shown in more detail below, the actions and strategies of businesses can violate the rights of people by endangering or negatively affecting the economic system itself, and they can violate the rights of people on an innersystemic level by actions and strategies which the economic system makes possible and which do not directly threaten it. Thus, there are both macroethical and microethical aspects of business legitimacy. However, before turning to them, it may be advisable first to deal in more detail (from the perspective of Kantian ethics) with the more general question of what can be morally demanded of businesses. The microethical aspects of business legitimacy will then be outlined in connection with the answer to this question.

Moral Demands on Businesses: General Considerations and Microethical Requirements

As shown above, the distinction between prudential and moral norms is a characteristic of Kantian ethics. Every agent is required to always restrict the pursuit of her considered well-being in view of the normative importance and the rights of other persons. Thus, it seems directly to follow from this that all business actions and strategies are morally restricted by the rights of all affected people. Businesses, and the persons acting on their behalf, are morally required to always respect the rights of other persons. Hence, business actions or strategies cannot be legitimate if they violate the rights of the persons affected by them.

On the other hand, business actions take place within a market economy which is (ideally) characterized by fierce competition. As the German business ethicist Karl Homann points out, a market economy is a social subsystem which is constituted by certain rules and which possesses an important moral quality. A market economy is able to create unprecedented levels of wealth and with this to overcome poverty and, in principle, to enable an at least decent living for each member of a society. So, if a market economy is morally justified, then this justification seems to especially encompass competition itself. In principle, it would be inconsistent and counterproductive to directly address moral demands to individual competitors. For those who will follow the demands will lose out to those who do not and will have to leave the market. Thus, that way the specific workings of the market will not be morally improved, but the morally more sensitive people will be expelled from it. Instead of addressing moral demands on individual competitors, they must be incorporated into the general rules of the game, thus creating a level playing field for all competitors. "The systematic place of morality in a market economy is the [legal] framework of the economy" (Homann and Blome-Drees 1992, 35).

So, a consequence of this argument seems to be that rather than demanding from an individual competitor not to violate the rights of affected persons, one has to see to it that the legal framework incorporates the protection of the rights in question. What must be morally demanded of businesses and the individual agents on the markets is to play by the rules, at least as long a sufficient number of other players are prepared to do so too. And the actions and strategies of businesses are legitimate as long as they follow the *existing* rules or laws. Thus, there can be a considerable discrepancy between what is required by the rights of persons and what is required by the existing rules.

Now, Homann is not an exponent of Kantian ethics. His remarks on the content of morality are often vague (like "'solidarity between all humans' as the principle of morality" and "realizing the solidarity of all people," Homann and Blome-Drees 1992, 40, 45), and some of them betray a utilitarian bent. Above all he does not subscribe to the view that morality and prudence must be kept strictly separated. Instead he draws on the venerable tradition (already discussed in Plato's *Politeia*) that the restriction in the pursuit of one's self-interest, which morality requires, constitutes a requirement which is itself based on one's self-interest or must at least be reducible to it. So, it must be possible to reduce moral requirements to the requirements of economic rationality.

Homann is, of course, aware that the framework of rules is often incomplete and even to a large extent missing. This is an especially acute problem under conditions of economic globalization. Because of that the "paradigmatic" distinction between the rules of the game and the moves within the game becomes blurred under real-life conditions. As in this case rule following does not guarantee the legitimacy of business actions and strategies, the actors on the market must take on individual responsibility for their actions and possibly even for the rules. But what then are the criteria of business legitimacy, and what exactly are the criteria of responsible actions under real-life conditions? Due to his vague conception of morality and a pronounced skepticism against universal moral claims, Homann has difficulties to give detailed and stable answers to these questions. It seems that ultimately each business(wo)man has to find her own answers and must follow her conscience.

From a Kantian perspective, there can never be a justification of an outright violation of the moral rights of affected persons. Indeed, many Kantian theories allow for a hierarchy of rights so that situationally a more important right of one person can take precedence over a less important right of another person. As a consequence, it may be unclear whether in certain circumstances the right of one person is only (permissibly) infringed or (impermissibly) violated (to use the distinction introduced by Thomson (1986, 51–55)). However, typically no such uncertainties exist when the basic rights of people are affected like life, including the necessary material basis of existence, or physical integrity. For example, oil production in a developing country by a multinational corporation which does not take any measures to protect the environment and which thus contaminates the surrounding land on which people live and the water they use thereby making the land uninhabitable and the water undrinkable constitutes an outright violation of the basic rights of the affected people and therefore an illegitimate business operation. This is also the case if no laws are in force in the country of operation requiring the corporation to take the necessary environmental protections.

Things are considerably less clear in cases where the violation of rights is not direct but where the actions and strategies of businesses merely contribute to profoundly negative effects on the basic rights of people, for instance, by directly or indirectly contributing in a significant way to the emissions of carbon dioxide or other greenhouse gases or to precarious conditions of labor (on the mechanisms of the increasing precarization of working conditions, see, e.g., Weil (2014); Kuttner (2018), Ch. 5). Here, the negative impact may not have been foreseeable or may not be individually attributable, or it might not be possible to change at short notice one's course without negatively affecting the rights of people. However, the involved businesses must be willing to contribute to a common effort to change course. Clearly illegitimate would be all attempts to actively thwart or significantly delay such efforts or to actively influence politics or public opinion in order to prevent the necessary changes (on recent measures of systematic misinformation on global warming, see Conway and Oreskes (2011)).

As a consequence, conformity to rules as such, be it by acting in accordance with rules permitting certain actions or by not violating rules because of a lack of rules proscribing or prohibiting certain actions, does not guarantee the legitimacy of business actions and strategies. It can never be legitimate to exclusively pursue the aim of profit maximization irrespective of the rights of the affected people. That is why certain (but not necessarily all) strategies of private equity firms which are prepared to push a company into bankruptcy in order to rip it off (see, e.g., Appelbaum and Batt (2014)) are clearly illegitimate.

On the one hand, it is important to develop the criteria of business legitimacy and illegitimacy and to use them for the evaluation of concrete business actions and strategies. (In contrast to what the examples used in this chapter may suggest, this will often need detailed studies and intensive discussion.) There should be a public discourse on business legitimacy to which economic or business ethics must contribute. It is especially relevant to contribute to a common understanding on which actions and strategies are clearly illegitimate. On the other hand, contrary to its image as an ethic of good intentions, from the standpoint of a Kantian ethics, the effective protection of the rights of people must be ensured. This makes the existence and continuous development of adequate formal (legal) and informal rules necessary, which is a significant aspect of Homann's theory. Homann is also right in stressing that one must, as far as possible, ensure that the most important moral precepts are backed by motivations deriving from the economic rationality of the economic actors. (This is already a concern in Kant's doctrine of right. A rationale of the right or the law is to protect the rights of persons by sanctions which address the prudential motivations of agents.) It remains a problem to be solved how binding rules can be established in a global economy or made effective for actions within the global economy.

Business Legitimacy: Macroethical Requirements

The rights of people include a right to their effective protection. This makes certain institutions necessary, like the institutions of the state but also certain international and global institutions. It can be argued that a market economy is a part of these required institutions, but there are certain tensions and difficulties here which cannot be simply solved or eliminated. On the one hand, given certain framework conditions including certain protections of the welfare state, a market economy represents the best form of economic organization we know so far. For market economies have the potential of creating an unprecedented level of wealth in which, in principle, everyone can or could participate. Thus, at least for the time being, market economies are indispensable for the protection of the rights of people. Hence a sustainably functioning market economy possesses an utmost morally normative importance. On the other hand, market economies, as we know them, are cognizably environmentally unsustainable. They lead to the overuse of resources, the destruction of important ecosystems, and dangerous climate change. It is a matter of debate whether such unsustainability constitutes an ultimately ineliminable feature of market economies, which must therefore be overcome, or whether it is a problem which can be dealt with within a market economy. As neither a viable, sustainable alternative to a market economy is known so far nor it is known how a transition to proposed alternative systems could responsibly made, there is, at least for the time being, no other choice to trying to tackle the grave unsustainability problems as far as possible within market economies. And as the current environmental unsustainability of market economies affects and threatens the basic rights of people, it is an obligation of businesses, relevant to the legitimacy of their actions, both not to impede or even subvert this task and to be prepared to make necessary changes in their business models or in the way they conduct business.

Part of the universality of a Kantian ethics is the insistence on the basic normative equality of each person wherever she lives. However, it is important to note that this does not naturally imply a cosmopolitan political stance. For the required institutional protection of the rights of people makes territorially organized and limited states necessary. There are mainly two arguments for this. First, only limited territorial states will sufficiently insure the effective protection of the rights of their respective inhabitants and make a viable and sustainable community of rights possible. This can also be seen from the problems and potential dangers connected with a "world state" (Kant, *Frieden* 8:367). Second, the actual states exist as limited territorial states. As such they contribute, more or (unfortunately in many cases) less, to the protection of the rights of their inhabitants. Kant argues that this protection is in any case greater than in the anarchy of a stateless condition. He therefore argues for the normative relevance of any existing state. It is, of course, a matter of debate whether Kant underestimates the potential badness of certain illegitimate or unjust states or regimes. However, even if his argument does not hold in "any case," it at least appears to hold "on the whole" as current experiences of civil wars and so-called failed states seem to confirm.

If territorially limited states are of the utmost importance for the effective protection of the rights of their inhabitants, this also implies the normative importance of sustainably functioning national economies. One might consider this an outdated claim in times of widespread and pervasive economic globalization. However, even in a common market like that of the European Union, the national economies of its member states are clearly distinguishable, and their respective performances are individually measured by indicators such as gross domestic product, unemployment, and inflation. Certain policies can have positive effects on the economy of one state and harmful effects on the economies of others. Thus, the claim is not that the economies of single states should be understood as closed economies but that the economies of states can be positively and negatively affected by policies and economic actions both from inside and outside the national economies and the territory of the respective states and that those effects can have a considerable impact on the rights of the citizens or inhabitants of a state. Thus, there is an eminently important moral duty, based on the moral rights of the inhabitants of a state, not to impair or endanger the sustainable functioning of a national economy or to thwart or hold up the development of such an economy.

While it might be controversial which policies or actions will negatively affect or endanger the sustainable functioning of a national economy or thwart or hold up its development, some policies, strategies, or actions clearly do so. No business can be legitimate that pursues such policies, strategies, or actions. For such transgressions many financial institutions, instruments, and strategies are a good example, even if the following remarks must unavoidably remain sweeping.

Developed market economies cannot sustainably function without developed sustainably functioning financial markets. Be "the" financial market the aggregate of all financial markets, institutions, and instruments necessary for or conducive to a sustainably functioning national economy. Thus, if there is a right of the inhabitants of a state to a sustainably functioning economy, they have also a right to the sustainably functioning of "the" financial market. The justification of "the" financial market is *exclusively instrumental*. This is because financial markets inevitably involve systemic risks, i.e., risks that important parts of the financial system, the financial system itself, or (important parts of) the economy will stop functioning. As this will have a massive impact on the basic (moral) rights of the affected people, systemic risks are a kind of risks ("recipient-risks or R-risks") which are prohibited to impose on others without a sufficiently justifying reason (see Steigleder (2016a)). Such a justifying reason is only offered by the criterion of the normative inevitability of R-risks: An R-risk is justified if its imposition contributes to the prevention of even greater R-risks for all affected people and can only be prevented by the imposition of the R-risk in question or by a comparable R-risk (Steigleder 2018). As the lack of a functioning financial system would threaten the sustainable functioning of a developed national economy and such an economy is essential to the protection of the basic rights of the inhabitants of a state, the R-risks inherent in a financial system are justified insofar and only insofar as the financial system contributes to the sustainable functioning of a national economy.

"The" financial market can, therefore, function as a critical measure for all single financial markets, financial institutions, and financial instruments, of whether they contribute to "the" financial market or not. Financial markets, institutions, or instruments which increase the systemic risks in the system without contributing to the prevention of even greater systemic risks are illegitimate and must be discontinued, altered, broken up, or prohibited. Unfortunately, many if not most current financial markets, institutions, and instruments are illegitimate according to this criterion (see Steigleder (2016b)). Thus, financial macroethics is of the utmost importance for the determination of business legitimacy and the critique of current business models.

"The" financial market is not to be equated with the global financial market(s). Instead, global financial markets are themselves to be evaluated according to their impacts on the national economies and their respective financial markets. Of special importance in that regard is the impact of global financial markets on developing countries. It is debated whether developing countries should be more or less protected from global financial markets and the investors and agents acting on them or whether (well-done) financial globalization will spur economic development and have greater chances and hopes in store for developing countries. The latter view was fervently developed and defended by Frederic S. Mishkin (2006, 2009) if certain safety measures are implemented. He was opposed by Dani Rodrik and Arvind Subramanian (2009) who made the case that economic development is not dependent on global financial markets, that the risks of global financial markets for developing countries are much greater than the potential chances, and that it is completely unrealistic that the proposed safety measures could reliably be implemented. If this is right, many actions on the global financial markets and many business models affecting and involving developing countries will be illegitimate.

"Today's Rent-Extracting Economy, Masquerading as a Free Market" (Wolf 2018)

A basic difficulty of business or economic ethics is that while market economies are, as explained, normatively important, they are not and cannot be ideal. So, there is the constant question of what has to be tolerated or must be accepted, because any attempt to improve conditions will most likely only worsen them, and what is definitively unacceptable and must be changed. The normative concept of legitimacy as a minimum notion of moral rightness can be helpful here. It is important to find out what is illegitimate, to show why this is the case, to raise awareness for this, and to make illegitimacy claims an object of both academic and public discourse. Claims of illegitimacy are always claims that change is needed. However, one can know that something is illegitimate or intolerable without already knowing by what policies the situation can really be improved. In a complex system like a market economy, for which the workings of incentives are paramount, seemingly obvious solutions can easily turn out to be counterproductive.

However, in view of the deregulation and globalization of markets and especially of financial markets and the ensuing financialization of the economy, one has to ask how much of the image of a market economy with its ability to create, in principle, general wealth through fierce competition is able to capture the reality of the current economic system(s) in Western societies. There are many indications that the economy is increasingly "rent-extracting," i.e., increasingly used by ever new business models and forms of economic organization to reap "unproductive incomes" to the disadvantage of those who produce goods and services in sufficient quantity for the unproductive incomes to buy (see, e.g., Sayer (2016) and Standing (2017)). So, increasingly, a small wealthy elite seems to be able to enrich itself at the expense of workers and other ordinary people (see Stiglitz (2013); see also Atkinson (2015)). In this connection the increased habit of multinational corporations to use the infrastructure of the countries in which they operate but to avoid paying taxes and the formation of monopolies in the digital economy seems also to be relevant. All this requires patient normative analysis and will involve many questions of business legitimacy or illegitimacy. This area of research constitutes probably the most urgent task of contemporary business or economic ethics.

Conclusion

It is the aim of this chapter to show that Kant's and Kantian moral theories provide important criteria for the evaluation of business legitimacy both on the micro- and on the macroethical level. However, the specific evaluations require a detailed examination of the complex interrelations of normative and multiple analytically descriptive and empirical questions. Thus, the criteria cannot, of course, dispense with the need for careful normative investigation, but can hopefully make such investigations possible and promising.

All quotations of Kant's writings are from the translations in the *Cambridge Edition of the Works of Immanuel Kant*. However, I refer to the volume numbers, page numbers, and line numbers of the so-called Akademie Ausgabe (*Kants gesammelte Schriften*. ed. by the Preussische/Deutsche/Göttinger Akademie der Wissenschaften. Berlin 1900-). As the exception from this rule, I cite the *Critique of Pure Reason* by the original page numbers of the first (A) or second edition (B). I use the following abbreviations of the works of Immanuel Kant cited in this paper:

Frieden	*Zum ewigen Frieden/Toward perpetual peace* (1795)
Gem.	*Über den Gemeinspruch: Das mag in der Theorie richtig sein, taugt aber nicht für die Praxis/On the common saying: That may be correct in theory, but is of no use in practice* (1793)
GMS	*Grundlegung zur Metaphysik der Sitten/Groundwork for the metaphysics of morals* (1785, second ed. 1786)

Max Weber's Sociological Concept of Business Legitimacy

7

Øjvind Larsen

Contents

Abstract

In his famous book *The Protestant Ethics and the Spirit of Capitalism*, Max Weber presented the idea that it was the Protestant reformations and what followed that gave the basis for the creation and expansion of capitalism in Europe and later on in the whole world. However, in his less known *Gesammelte Aufsätze zur Religionssoziologie*, collected treatises on the *Sociology of Religion*, Weber has also described how other significant world religions like Hinduism and Confucianism hindered the creation of capitalism in India and China although these countries had better productive, technological, political, and cultural preconditions for a capitalist change of the material reproduction of society.

Weber's theory has not only a historical value. Weber's *Sociology of Religion* has also an actuality for the twenty-first century understanding of the relations

between politics, religion, economy, and society in a global context. Weber's theory can explain why a special form of imperial state-dominated capitalism could develop in China – and not a liberal form like in the Western world. In the same way, Weber's theory can explain why the Hindu caste system can continue to be a hindrance for the full development of a Western liberal form of capitalism in India.

Weber's Sociological Concept of Business Legitimization

Max Weber (1864–1920) was a German economist and sociologist. He is regarded as one of the founders of sociology as an academic subject and profession. Weber has still an enormous influence on all forms of sociology. Weber has especially been occupied with the relation between economy and society. His main perspective is that economy cannot be understood in itself. Economy must be understood in its religious and cultural context, which is determinate for which form it can take in a specific society.

Weber's sociological concept of business legitimacy must be considered in the framework of all Weber's work because Weber is not a systematic social scientist but a heuristic social thinker who is all the time engaged with the construction of sociology as a new way of understanding social action and life. Therefore, it is not possible just to go to the index under "business legitimacy" because this word is not found in the index of his collected works. We have to go indirectly forward through Weber's general sociological definitions to his understanding of business legitimacy.

It must also be mentioned that Weber is a German thinker, and his German language contains the significances and meanings of German culture. As an example, Weber does speak about Wirtschaft as a signification of both the activity and the institution of business. In English, business is first of all bound to the subjective perspective on an activity before it signifies the business institution. Therefore, all citations from Weber's original German texts are translated by the author to make sure that most of the German spirit is transported into the English language.

It should also be mentioned that most of Weber's writings can be found in different English translations. Some of the relevant translations will be mentioned in the list of literature (Weber 1964, 2005, 2017). However, there is not a single authoritative translation of Weber's collected works. Therefore, there is no consensus of how Weber's many concepts should be translated. Even if this had been the case, the problem would still remain that the German and the English way of thinking are very different. The two languages represent also two cultural traditions. There is always a loss in a translation.

In his *Soziologische Grundbegriffe*, §1, Weber defines sociology as a science that has the aim to interpret or understand meaning in individual and social action, thereby being able to clarify and explain in rational terms the consequences and impact of social action (Weber GAW 1988b: 542 ff).

This perspective is clarified in *Soziologische Grundbegriffe*, §5, where Weber states that from the perspective of the actors, social action and social relations can be understood in the framework of an imagination (Vorstellung) of a legitimate order (legitimen Ordnung) (Weber GAW 1988b: 573). Insofar as this is the case in the sense that the actors experience their social action as belonging to such a social order, this is the sign that the social order has "Geltung" or "validity." This could be translated as "facticity," which means that the social order factually is considered to be legitimate.

This is a pure sociological definition and perspective on a legitimate order. It is only the facticity that counts. However, the facticity is not to be considered as an objective fact in the natural scientific sense. We have to do with a facticity which has to do with a general social acceptance of a certain form of action.

According to *Soziologische Grundbegriffe*, §7, the legitimization can be based in traditions, affectual-based beliefs, value rationalities, or legality. These different forms of legitimization are all considered as factual given forms of legitimization. In that sense, there are many possible forms of justification, and there is no second-order justification in Weber's understanding of a legitimate social order. It is only the facticity that counts in Weber's sociological perspective.

This is also the case for the legitimization of Wirtschaft or business. There can be found many different forms of justification throughout history. They must all be seen and understood in their social and historical context. Moreover, some of Weber's most essential perspectives on these matters will be presented.

Maybe the modern reader would expect that the presentation would begin with the modern form of legal legitimization which has become the almost dominant form of legitimization of all social relations and institution including business relations in a modern society. However, this is not the way it goes for Weber. His perspective is first of all historical, and he has the entire world history as resource for his sociological laboratory. Weber's perspective is first of all to clarify which role world religions have played for the development of different forms of economic systems throughout history.

The reason is that Weber considers the world religions as carriers of basic horizons of social understandings, meanings, normative standards, and taboos in all societies throughout history and therefore also the basis for understanding, normative standards, legitimation, promotion, and taboos of economic activity.

The main world religions are the religions which have or have had many adherents like Confucianism, Hinduism, Buddhism, Christianity, and Islam. Jewish religions are also included because it has had a significant role for the creation of Christianity and Islam. Furthermore, it is only Weber's work on Protestantism, Confucianism, and Hinduism that will be considered.

Weber's focus is especially which forms of actions are forbidden, taboos, and which actions are promoted and rewarded with a promise of salvation. Business for profit is mostly disregarded or forbidden with a taboo in the history of religions.

Weber introduces in this context the concept of a Wirtschaftsethik einer Religion, a business ethics of a religion (Weber GAR I 1988a: 238). Weber emphasizes that a business ethics of a religion does not relate to "the ethical theories in the compendiums of the religion." On the contrary, it relates to the practical motivation to action in the psychological and pragmatic social context of the religion. Weber emphasizes here that a business ethics of a religion is not only religiously determined. In practice, the religious determination is inherited in and mixed up with geographical, political, social, national, historical, and other determiners.

However, according to Weber, it is the privilege of the religious aspect in a business ethics to present and to give a solution to the theodicy problem. The concept theodicy is a combination of the two Greek words *Theos*, God, and *dike*, justice, and combined they mean literally God's justice. Theodicy has first of all throughout history been considered from a theological, philosophical, legal, and political perspective.

The theodicy problem is concerned with how the subjective suffering in the world can be combined with the idea of an almighty, just, and good God. How can God be almighty and good when there is evil, unhappiness, and suffering in the world? This formula can be turned around: How can God permit the suffering of the single person when he is good and almighty? The theodicy problem can also be turned around. This leads to the question how a person should act to obtain God's highest reward, which is salvation. It is expected that the person who acts good or right should obtain happiness.

Weber's great contribution to the theodicy problem is that he transforms the theodicy problem to a social problem that could be considered from a sociological perspective (Weber GAR I 1988a: 242). Weber related the theodicy problem to the problem of meaning, Sinn, of social life, and in the end of society. In that sense we have here to do with the basic type of legitimization of social relations and social life. Weber differentiates from his sociological perspective between two forms of theodicies.

Weber's first form is concerned with suffering, agony, misery, and pain. This is the dominant perspective on the theodicy problem. Why can a just God accept that people suffers? The interesting thing is that Weber secondly turns the sociological perspective around and focuses on the happy people without any suffering. According to Weber, they have the need to be assured that they have the right to be happy and that there are good reasons why other people are less happy or unhappy (Weber GAR I 1988a: 242). As we see, Weber turns the theodicy problem around. It is concerned with the justification of happiness. Das Glück will "legitim" sein. Weber includes under the general term "Glück" all possible advantages, benefits, blessings, and amenities such as honor, glory, distinctions, power, wealth, and fortune. This is "the religion's legitimization service" to the personal and social interests of the sovereigns, wealthy, victorious, healthy, and shortly their happiness. Weber calls it the theodicy of happiness, Theodizee des Glückes. Sie ist die in höchst massiven (pharisäischen) Bedürfnissen Verankert und daher leicht verständlich, the theodicy of happiness is based in the enormous pharisaic human need and therefore easy to understand!

This is a good example of Weber's extreme sociological combination of a silent likely critical thinking with a cynical hermeneutics of social facticity. He turns all the theological and philosophical reflections on theodicy and the suffering in the world into a problem of the justification of all the different forms of hegemonies in personal relations and society throughout history. It is a cynical and enlightened turnaround of the sociological perspective. This is what is going on in all forms of societies. This is the perspective for Weber's following clarification of different religions' role for the justification or legitimacy of business, Wirtschaft.

Weber's mentioned sociological cynicism indicates that Weber is not an idealist but far more a form of materialist, although not in pure form. The question is therefore relevant why religions take such a big place in his sociology? Weber has one passage in his *Religionssoziologie* in which this question is shortly clarified:

> Interests (material and ideal), not: Ideas dominate spontaneously the action of human being's action. However: Worldviews (Weltbilder), which was created through Ideas, have often as a railway switchman (Weichensteller) determined the track, in which the dynamic of the interests moved the action. The worldviews determined 'from what' and 'to what' one wanted to be redeemed – and not to forget: could. (Weber GAR I 1988a: 252)

Weber's project in his *Sociology of Religion* is to clarify how the mentioned interests were guided through the religious world views. Weber has the idea that there are created different forms of dispositions for business (Wirtschaftsgesinnung) in the different world religions (Weber GAR I 1988a: 252). The study of these dispositions can contribute to the understanding of why capitalism was developed in Europe and not in other parts of the world.

Weber's Introduction to His *Sociology of Religion*

This perspective is elaborated and generalized in Weber's famous introduction to the edition of his collected papers on the *Sociology of Religion* from 1920 (Weber GAR I 1988a: 1–16). This introduction has also often been included as introduction to his *The Protestant Ethics and the Spirit of Capitalism* from 1904 to 1905 (Weber GAR I 1988a: 17–205). In the introduction, Weber presents universality and rationality as his summarizing perspective on the European cultural history. It is in the European context that rational natural sciences on the basis of experiments and mathematics have been developed. Weber gives a series of examples on how rationality and rationalization have become dominant in so different areas as theology, canonic law, philosophy, mathematics, geometry, and political science (Weber GAR I 1988a: 1–4). In Europe, universities and professional school systems were created for a rational and systematic education of scholars for politics, bureaucracy, and economy in the state system and in civil society. The state is in itself a political institution (Anstalt) with a rational constitution and a rational system of law and regulations and with a bureaucratic organization with professional educated Fachbeamte, civil servants, and is only found in Europe.

According to Weber, this form of rationalized organization is also to be found in "the most fateful power of our modern life which is capitalism" (Weber GAR I 1988a: 4 ff).

Weber emphasizes from the beginning that it is not the "Erwerbtrieb" or "Streben nach Gewinn," it is not the instinct to acquire or the pursuit of gain that especially characterizes capitalism. This instinct has always existed among waiters, doctors, coachmen, artists, prostitutes, dishonest officials, soldiers, nobles, crusaders, gamblers, and beggars. The same can be said about the rational calculation for profit. This has been known in all cultural societies in the world such as China, India, Babylonia, and Egypt and also in Europe. The same can be said about forms of economic companies, corporations for moneylending, economic speculation, and forms of adventure capitalism. However, all these forms of economic practice are signified by a simple low or absent form of rationality.

In contrast, the modern European capitalism is signified by rationality all the way through in the rational capitalistic organization of (formally) free labor or labor force, which is related to the organization through the contract (Weber GAR I 1988a: 7 ff). This organization is oriented toward the rational calculated chances at the market. The rationalization of the business organization is made possible through the outsourcing of the business organization from the family household into an independent organization that can be rationalized, what is not in the same sense possible for the family. The social relations of the organization are established through the contract. In this connection, the introduction of the rational bookkeeping and the legal-based distinction between business capital and private household property are also essential.

However, from the perspective of the universal history of culture, the rational business organization must also be driven by a bourgeois class based in a civil society with a rational calculable system of law and a rational public administration, which was only created and developed in the Western world (Weber GAR I 1988a: 10 ff). Although there may be a stimulating correlation between the developments of a rational business organization, a bourgeois class that could manage this business and finally the constitution of a rational law system, rational public organization, and bourgeois political institutions, Weber's question is still why this development took place in Europe and not in China and India? With Weber's own words, "Why did not the scientific, the artistic, the political, or the economic development there enter upon that path of rationalization which is peculiar to the Occident?" (Weber GAR I 1988a: 11 f). This is Weber's essential question for all what follows.

Weber emphasizes that there are many different forms of rationalization, and what may be considered as rational from one perspective may be considered as irrational from another perspective. The Buddhists pursue by advanced rationalized techniques of meditation the path toward liberation from the eternal reincarnation. This is the Nirvana, the absolute Nihil of the spirit. However, from another perspective this rationalization may seem to be absolutely irrational. Therefore, Weber emphasizes that from a cultural historical perspective, the essential is to clarify which departments of society are rationalized and in which direction the rationalization has taken place in the Western world.

Weber's perspective is that the economic perspective must first of all be considered because capitalism is such a driving force for the rationalization of Western world. Above, this has already been mentioned as rationalization of technology and social institutions. However, there is also the other perspective that the mentioned economic rationalization can only be realized insofar as men have the ability and disposition to adopt the practical rational life-form, which is necessary to handle the potentials in the mentioned rationalization of technology and social institutions. Weber emphasizes that when these types of rationalizations have been obstructed by resistance of mental character, the development of a rational economic life-form has met strong inner resistance (Weber GAR I 1988a: 12).

In the long historical perspective, first of all, religions have determined social norms and not at least taboos regarded as valid for specific life-forms in specific social and societal context. This is the reason why Weber turns to the sociology of the world religions.

Weber wants to understand why especially the Protestant religion could promote and determine the development of a Wirtschaftsgesinnung, an economic spirit and a mentality with a specific rational form of ethics, relevant and valid for the business life-form and the development of capitalism. This is what he did in his first religious sociological study *The Protestant Ethics and the Spirit of Capitalism*. The following articles in his collected sociology of religions (GAR I-III 1988a) are foremost occupied with the question why the other world religions, first of all Hinduism and Confucianism, were unable or directly a hindrance for the promotion of the same development.

The Protestant Ethics and the Spirit of Capitalism

It is Weber's central point that Protestantism is the first and only world religion in which business becomes a virtue and a sign of salvation. Consequently, Protestantism becomes also the sociological ideal type for the evaluation of the other world religions' significance for business. Weber's guiding sociological question is why Protestantism could promote capitalism and why the other world religions were unable or directly a hindrance for the development of capitalism. This is Weber's guiding sociological question that will be elaborated.

In this context it must be emphasized from the beginning that the promotion of business for profit and capitalism is contradictory to the basic principles in the Christian social ethical tradition. It has especially been emphasized clearly in the Aristotelian-based theology of Thomas Aquinas (1225–1274), the most famous theologian of the Middle Ages (Aquinas 1988). He emphasizes that the Christian is not permitted to take interest of loans. This is also Aristotle's (384–322 BC) perspective in his political philosophy. Martin Luther (1483–1546), the initiator of the Protestant reformations, had the same perspective. Weber explains therefore also in the *Protestant Ethics* that this was one of the reasons why the Jews were segregated to take care of moneylending in the Middle Ages. Luther saw his Reformation as a restauration of the church and Christianity – and in no way as a modernization of Christianity. There is nothing in Luther's theology or for that matter in the Christian theological tradition that indicates that Christianity in its form of Protestantism would become the promotor of capitalism. In theological terms it would not be possible to explain how this could happen.

Therefore, it is essential to remember that Weber's perspective is a sociological perspective. He gives an – surprising and contra-intuitive – interpretation of the social consequence of the new restorative Protestant theology. The essential thing is that Luther changes the basic perspective in Christianity from a meditative upturned perspective, first of all cultivated by priests and monks as the exclusive spiritual estate in the meditative unworldly cloisters, into a practical mundane perspective. Christians are all on an equal basis part of the same spiritual estate, and they should all realize their Christian life in love to their neighbors and in vocation for their profession in society. In this theological perspective, there is a basic equality between all people which has had an inestimable significance for the creation of modern society in all its aspects. This is the basic message in Luther's theology. It is also here we can find the reason why Luther in Weber's sociological sense can be considered as the mentioned railway switchman (Weichensteller) for the creation of the new social perspective which over the centuries becomes the basis for creation of the European modernity with all what that imply of change of economic and political life and institutions. The door into modernity has been opened.

In relation to the creation of capitalism, it is essential that Luther promotes a theology in which work becomes a vocation which includes all Christians, high or low, situated in society. Therefore, Luther's theology gives the basis for a new work ethics as a Christian duty.

According to Weber, it is this new understanding of work as a Christian virtue that is radicalized in the Swiss reformer Jean Calvin's theology of salvation. Calvin (1509–1564) had the idea that salvation was a matter predestination which means that God had decided beforehand whether a person was determined to salvation or damnation. Predestination is an idea that Calvin takes over from the antique philosopher and theologian Augustine (354–430). The Christian had to live in confidence, trust, and faith in God. However, in practice this idea of salvation created an insecurity in the sense that the Christian could not *know* whether he was on the right or the wrong track. Therefore, in practical religious life, the idea was created that good performance and work results could be a "sign" of being on the right track of salvation. Of course, from a Calvinistic theological perspective, this is pure nonsense. However, from Weber's sociological perspective, this is essential in the Calvinistic work ethics – and maybe the theological perspective could be considered the other way around. Weber writes that for the Calvinist, in order to attain the self-confidence of salvation, a restless work activity, rastlose Berufsarbeit, was strongly recommended. The restless work activity was the only possible way to disperse religious doubts and create "the sign" that could give certainty of salvation (Weber GAR I 1988a: 105 f).

The restless work activity enforced from a psychological perspective a rationalization of the work activity and a systematic self-control which at every moment stands before the inexorable alternative, chosen or dammed (Weber GAR I 1988a: 111).

This methodological rationalization gave even the name "Methodism" to one of the Protestant sects.

It is evident that this restless work activity led to a production of a considerable wealth and capital accumulation. However, it was only created as a "sign" of salvation and not for luxury consumption. These Protestants were ascetic, and it gave even the name "Puritanism" to one of the Protestant sects.

It is on this background evident that, in Weber's sociological perspective, Calvin can be considered as the mentioned railway switchman (Weichensteller) for the creation of the spirit of capitalism. The door is opened for the creation of the spirit of capitalism.

At the beginning, the spirit of capitalism is closely bound to the life praxis of the different Protestant sects and their religious world horizons, in which the wealth and capital accumulation in the religious perspective only are understood as a sign of salvation and not as an aim in itself. In this connection, a rational bourgeois economic life-form is developed, which opened for the constitution of "modern economic man" with a concentrated rational and professional perspective on his work for the optimization of his sign of salvation and – as an almost unintended side effect not to forget – the optimization of his fortune (Weber GAR I 1988a: 195f).

The great revival of Methodism preceded the expansion of English industry toward the end of the eighteenth century which created enormous fortunes. However, this Puritan religious praxis came under excessive pressure from the temptations of the accumulated wealth. This is clearly expressed by the minister and theologian John Wesley (1703–1791), one of the founders of Methodism, when he writes:

> I fear, wherever riches have increased, the essence of religion has decreased in the same proportion. Therefore I do not see how it is possible, in the nature of things, for any revival of true religion to continue long. For religion must necessarily produce both industry and frugality, and these cannot but produce riches. But as riches increase, so will pride, anger, and love of the world in all its branches. How then is it possible that Methodism, that is, a religion of the heart, though it flourishes now as a green bay tree, should continue in this state? For the Methodists in every place grow diligent and frugal; consequently they increase in goods. Hence they proportionately increase in pride, in anger, in the desire of the flesh, the desire of the eyes, and the pride of life. So, although the form of religion remains, the spirit is swiftly vanishing away. Is there no way to prevent this—this continual decay of pure religion? We ought not to prevent people from being diligent and frugal; we must exhort all Christians to gain all they can, and to save all they can; that is, in effect, to grow rich. (Weber GAR I 1988a: 197)

Moreover, Wesley gives the admonition that those, who gain all they can and save all they can, should also give all they can, so that they will grow in grace and lay up a treasure in heaven.

Wesley gives a perfect expression of the paradoxes in the social function of Calvinism, Methodism, Puritanism, and all the other Protestant sects based in the theology of predestination. The Puritan religious praxis had unexpected and paradoxical consequences for the change of the Protestants' whole life-form into a rationalized methodological life-form and for the change of all the economic system into a capitalism with a heavy accumulation of wealth, fortune, and capital.

Wesley's advice to the Methodists to give all they could so that they would grow in grace and lay up a treasure in heaven was in the long run not strong enough to resist the earthly temptations of wealth. Weber notices that the intensity of the search for the Kingdom of God gradually passed over into a rationalized and emotionless utilitarian worldliness.

The vocation for the Kingdom of God is transformed into the vocation for work and accumulation of wealth. In this way, the spirit of capitalism becomes the new substitute for the Protestant ethic and as such an end in itself.

Weber remarks that a specific bourgeois economic ethic, "bürgerliches Berufsethos," had grown up in which the vocation for work and the accumulation of wealth had been created as the final value for life. It was a form of utilitarianism that little by little became cleaned from its roots in the religious salvation horizon of Protestantism (Weber GAR I 1988a: 198 f).

However, this is not the end. There is still one step more. Weber writes:

> The Puritan *wanted* to work in a calling; we are *forced to* do so. For when asceticism was carried out of monastic cells into everyday life, and began to dominate worldly morality, it did its part in building the tremendous cosmos of the modern economic order. This order is now bound to the technical and economic conditions of machine production which today determine the lives of all the individuals who are born into this mechanism, *not only* those directly concerned with economic acquisition, with irresistible force. Perhaps it will so determine them until the last ton of fossilized coal is burnt, 'bis der letzte Zentner fossilen Brennstoffs verglüht ist'. In Baxter's view the care for external goods should only lie on the shoulders of the "saint like a light cloak, which can be thrown aside at any moment". But fate decreed that the cloak should become an iron cage, 'ein stahlhartes Gehäuse.' (Weber GAR I 1988a: 203)

This is the final triumph of the spirit of capitalism in which the Protestant roots have been totally dissolved. The vocation for rationalization and work has been generalized into a condition and normative standard for everyone in the modern capitalist society. No one can stand outside. However, the hope for salvation in the Protestant ethic and more general in Protestantism has not been transported over into the spirit of capitalism. On the contrary, the spirit of capitalism will be determined for everyone "until the last ton of fossilized coal is burnt." When Weber wrote these words around 1905, they may have had a relative loose futuristic character. Today, in the light of the global ecological crisis, these words sounds like having been written for today.

The scary thing of this almost eschatological perspective is that it seems to be based upon rationality and the rationalization of work and work relations in society and that there is no way out – until the last ton of fossilized coal is burnt. Therefore, there is an ambivalence in rationality and the rationalization in the sense that the rationality can be turned around into irrationality. The two Frankfurt School philosophers Max Horkheimer (1895–1973) and Theodor Adorno (1903–1969) called later on in a famous treatise this phenomenon for the dialectic of enlightenment (Horkheimer and Adorno 1988). In that sense, rationality has become the fate of what Weber calls the Occident – and later on the fate of the entire world.

Rationality and Legal Legitimization of Business

Rationality, rationalization, and the creation of a rational capitalism give basis for a new form of legal-based business legitimization. Formerly, business legitimization had predominantly been of traditional character. However, this changes with the creation of capitalism. As mentioned above, Weber makes clear in his introduction to his *Sociology of Religion* that capitalism is characterized through the rational organization of (formally) free labor force, which is connected on basis of a contract to the business organization. The other essential thing is that the business organization is outsourced from the family household into an independent organization that can be rationalized and make contract with the labor force and with other business organizations. From a sociological perspective, this is essential because it makes it possible to determine the business organization as an independent institution in society.

From a sociological perspective, every organization is characterized by a form of dominance, which in sociological terms can be determined. In *Economy and Society*, *Wirtschaft und Gesellschaft*, Weber makes a significant distinction between power and domination.

Power, "Macht," means the probability that one actor within a social relationship is able to enforce his own will, also despite resistance, regardless of the basis on which this probability rests (Weber 1972: 28).

Domination is also a form of power. However, it is a much more sophisticated and social relevant form of power. Weber gives the following definition: domination (Herrschaft) means the situation in which the manifested will (command, Befehl) of the ruler (der Herrschende) is meant to influence the conduct of one or more others (the ruled, the dominated, die Beherrschten) and actually does influence it in such a way that their conduct to a socially relevant degree occurs as if the ruled had made the content of the command into the maxim of their conduct for its very own sake. Considered from the other perspective, this situation is called obedience (Weber 1972: 544).

The essential difference between power and domination is that power is enforced or coerced, whereas domination can and should be accepted to such a degree that the command is done as it were the own will of the dominated. Dominance is therefore the social relevant form of power for the creation of stable social relations and institutions in a society.

Domination needs a justification or legitimization of the authority of the domination to be accepted by the dominated. It is in this context that Weber presents his idea about the legitimization of domination.

In his article "The Three Pure Types of Legitimate Dominance," Die drei Typen der legitimen Herrschaft, Weber determines the three pure types of dominance, each of which has its own sociological structure of staff and means of administration and organization. These three forms of dominance are, respectively, the legal, the traditional, and the charismatic form of dominance (Weber GAW 1988b: 475 ff). These three forms of dominance can be considered as independent ideal types. However, in practice, they are often mixed in different ways.

Legal domination is exercised through Satzung, by law, which is a public law given by official authorities. The business companies are regulated by Satzung as private law, the articles of association AoA. Private law is a precondition for capitalism because private business companies have to be able to make contracts. However, it is at the same time private business that gives the dynamic to the development of private law into an enormous corpus of law.

Weber gives two arguments for the occidental rationalization of law with the consequence of the formalization of law. The rationalization and formalization of law are created historically by two parallel social and institutional powers. The one is the capitalist interest in a strict, formal, and calculable system of law which could be calculated in the promotion and defense of own interests. The other is the interest of the absolutist state to have a rational bureaucracy. This implies a codified methodology and uniformity in the bureaucracy and secondly an educated staff of bureaucrats with equal chances for advancement. According to Weber, this is the two conditions for the creation of a modern rationalized and formalized system of law (Weber GAR I 1988a: 437 f).

According to Weber, the purest form of legal domination is "die bürokratische Herrschaft," the bureaucratic domination, which is also called "Verwaltung" or "administration" (Weber GAW 1988b: 475 f). Weber takes his descriptive departure in modern form of bureaucratic domination, which is known in state and communities in modern society. However, as Weber emphasizes, this is also the form of domination which is known in private capitalist companies. The basic argument is that the labor force is formally free to make a contract, a "Vertrag," and to enter into the relations of domination in the bureaucracy of the company in the same way as the citizens are considered as free to be part of the state and the political community. As Weber says, "it is the validity of the contract that makes the capitalist company to a magnificent ideal type of the legal form of domination" (Weber GAW 1988b: 477).

According to Weber, the conclusion is therefore that it is the contract in combination with the formal freedom to make the contract that forms the basis for his sociological concept of business legitimacy. This is at the same time the basic idea in liberal society.

It is interesting to see that in this free contractual form, capitalism totally loses its religious roots in Protestantism. There is nothing left of the spirit of Protestantism. The spirit of capitalism does not need the Protestant religious reference. In a sociological sense, the spirit of capitalism has the same function and power as a religion. Profit and capital accumulation are able to promote themselves. As such, capitalism has been prepared to conquer the entire world – bis der letzte Zentner fossilen Brennstoffs verglüht ist.

Confucianism and Hinduism

As mentioned, Weber's essential question in the introduction to his *Sociology of Religion* is: why the rationalization and the development of capitalism took place in Europe and not in China and India? With Weber's own words, "Why did not the scientific, the artistic, the political, and the economic development in Orient enter upon that path of rationalization which is peculiar to the Occident?" (Weber GAR I 1988a: 11 f). This question is so much more challenging as the objective material and cultural resources in many ways were much better for the development of capitalism in China and India. In the next section, Weber's answer to this question will be presented.

Confucianism, Patrimonial Empire, and Traditionalism: The Hindrances for the Development of Capitalism in China

Confucius lived in China around 500 BC. He formulated a form of basic morality for the single person and for the imperial patrimonial political system in all, which has been considered as the basic social and political philosophy in most periods until our time.

From an overall perspective, Weber's claim is that Protestantism has its almost revolutionary driving force in the spirit and the individual work for the sign of salvation which created the extreme individualization as the basis both for liberalism and capitalism. In this light, Confucianism could almost be considered as the absolute contrast. There is no spirit in Confucianism; there is no driving force for the extreme individualization as in Protestantism. On the contrary, it is a moral teaching which is focused on the moral perfection of the individual in accordance with the imperial patrimonial and bureaucratic social order. Therefore, it would also be wrong to consider Confucianism as a religion in strict sense. However, Weber's sociological argument seems to be that Confucianism has had and maybe still have the same social function as a religion in China. Literally, it could be called an inane (Geistesloss) religion, which in practice best of all serves as conservation of a given social order. Weber determines this political and social order as patrimonial, which means that the final power is concentrated in one person, the emperor. He had a bureaucracy, the Mandarin estate, (der Mandarinenstand), which was hierarchically organized in a social rank by the principle of how many examinations the Mandarin had taken in the formalized education and examination system (Weber GAR I 1988a: 404 f). The social rank of the Mandarin determined whether he could have an ancestral temple or only an ancestral plate as the illiterates and how many ancestors he was allowed to mention in the temple or in front of the plate. Weber emphasizes that although there was a cult of the ancestors in China, it was the formal education and the social rank that determined the religious determination and not the other way around. The religious determination was in that sense only a confirmation of the social rank, relations, and order. The social order was in that way sanctified in a primitive and in that sense insignificant way. This is Weber's determinate sociological argument for why there could not be found a religious spirit as in Protestantism but only a primitive religious reference to the ancestors and a conservative confirmation of the patrimonial domination and the social order in Imperial China.

Weber emphasizes the following traits in the Confucian life orientation (Weber GAR I 1988a: 430 ff). In principle, there is equality between all human beings in the Confucian social ethics. The philosophy is that the good welfare would promote a strong and general social morality. This is in fact from a sociological perspective, a very pragmatic claim. However, at the same time, it confirms that there is no spirit that could provide the morality with an autonomy. There are no natural rights, and there is no private sphere. The word "freedom" did even not exist in the Mandarin Chinese language (Weber GAR I 1988a: 436). The private did only exists as the right to have private things (Sachgüterbesitz), and these were not secured in absolute terms. Apart from this, there were no other rights of freedom.

The aim of the legal system was material justice and not a formal justice. The legal system was not formalized, without person's reputation, and therefore not rationalized. A conviction was determined by the concrete quality and situation of the case.

A development of natural rights as in the occidental world did not take place. The lawyers were not professionalized because public prosecution was not developed in China. The reason is that the patrimonial Chinese welfare state with a weak administration did not have an understanding of the formal development of the legal system. It was based in the holiness of the tradition (die Heiligkeit der Tradition) that contained all the legitimacy of the tradition (Weber GAR I 1988a: 438 f). The legal system continued therefore to be based in what Weber calls "theokratischen Wohlfahrtsjustiz," which is the same as theocratic welfare justice.

It should be clear that such a legal system is not able to be individualized, rationalized, and differentiated in a way which can promote the legal basis of capitalism. As mentioned, the contract is the basis in the development of capitalism, and the contract could not be developed because it needs a concept of subjective rights, a differentiation between private and public law, and finally a systematic rational development of law. This is not possible in a traditional theocratic framework (Weber GAR I 1988a: 438 f).

Confucianism Compared to Protestantism

Weber has a concluding chapter about the comparative relation between Confucianism and Puritanism, the most radical edition of Protestantism. In this chapter he summarizes his main points (Weber GAR I 1988a: 512 ff). Weber poses the question to which degree Confucianism has been rationalized. This question must be measured on two parameters. The one parameter is to which degree Confucianism is able to leave the magic. The other parameter is to which degree the relation between God and the world is transformed into the individual person's own ethical relation to the world.

For Weber, Protestantism and especially Puritanism are the sociological "ideal type" (die Idealtype) and the methodological standard. Protestantism is liberated from the magic. This is not the case for Confucianism. Weber writes that it was only Protestantism that could accomplish "die Entzauberung der Welt," the disenchantment of the world. This is one of the most famous formulations of Weber. It is very clear. It says simply that the world, society, and people lose the relation to the mystic, the metaphysical, and the religious as an external supranatural given dimension. This could also be called the radical formulation of secularization. In this perspective, the relation between God and the world is transformed into the individual person's own ethical relation to the world.

Confucianism had a positive consideration of the magic in its meaning of giving happiness and salvation. Contrary, Puritanism had the idea that all magic was "teuflich," diabolic. The positive was the rational ethic to act in accordance with God's commands, driven by a sanctified sentiment (Weber GAR I 1988a: 513). Everything else was considered as superstition.

Confucianism considered wealth as useful for the moral and the good life. There were written tracts about the usefulness of business. However, the economic politics (die Wirtschaftpolitik) did not create any capitalist business sentiment or character, keine kapitalistische Wirtschaftgesinnung (Weber GAR I 1988a: 514). Confucianism did not as Protestantism lead to a firmly rooted ethics as basis for a civil life methodology, eine bürgerlichen Lebensmethodik. However, this was from a sociological perspective the essential for the historical significance of Protestantism.

Protestantism created unintended Puritanism. As mentioned, John Wesley found in Puritanism a paradox between, on the one hand, piety and world rejection and, on the other hand, the virtues capacity for economic gain (Erwerbsvirtuosität) (Weber GAR I 1988a: 532 f). John Wesley recommended to be piteous – and this would inevitably lead to be rich, although the wealth was equally dangerous as it had been in the cloisters. For the Puritan, wealth was an *unintended side effect* of his piteous life.

In contrast, in Confucianism wealth in itself was considered as the most essential means to live a good life and therefore also to ameliorate a person's moral standard. It was only in this way possible to live in accordance with one's rank. Therefore, Confucius would not exclude the earning of money. On the other hand, it could disturb the dignified equilibrium of the soul. Therefore, it was banausic handicraft (Fachmenschentum). The distinguished person wanted not to be considered as a mere tool, a skilled worker, and a professional person (Fachmensch). The distinguished person was in his social conformity and personal perfection a final goal in himself and not a functional tool for other things.

Weber considers this as a key perspective in Confucianism which rejects a differentiated specialized professionalization of skills, skilled bureaucracy, and professional skilled education and not at least the economic education for profitable business. This is absolutely in contrast to Puritanism that emphasized the specialized factual aims in society and the professional life (Berufleben) as a venerable duty in itself. Therefore, in the end it is Weber's conclusion that Confucianism could not provide the personal spiritual and skilled dispositions which are necessary for a transformation into a rationalized capitalism of the Chinese society. Therefore, China had to wait many centuries for the foreign invasion of capitalism. Maybe it would even be possible to place the recent special form of Chinese-state capitalism in the Confucian tradition.

Hinduism, Eternal Reincarnation, and the Caste System: The Hindrances for the Development of Capitalism in India

Weber has dedicated a total volume of his *Sociology of Religion* to describe the significance of Hinduism as a hindrance for the development of capitalism in India. As with the case of Confucianism and China, the case of Hinduism and India is full of paradoxes. Weber's basic research question is still the same: Why could there not be developed a capitalism in India, when the material conditions as in China could seem to be much better than in Europe?

Weber describes India as a country that is and historically was a country mostly based on villages that gives the impression of a stable estate organization determined by birth (Weber GAR II 1988a: 1 ff). However, it was at the same time a country with both local and foreign trades, not at least with the Occident. In India, they had also made many scientific inventions such as the invention of the now used numerical system, which is used for all calculations. They developed scientific inventions, among others in mathematics and grammar. There were developed several philosophical schools and many different forms of religious sects. There was great religious tolerance and at least more than in the European Middle Ages. The Indian system of law had similar to the Occidental many characteristics that could have been useful for a capitalist development. The business community was as big as the Occidental in the Middle Ages. The Indian handicraft was developed with skilled specialization. There was a lively business activity, only a weak resistance against money, and wealth was high ranked. However, capitalism was not developed in the Indian period and not during the British domination. Capitalism as fully developed mode of production or economic system was imported from Britain.

It is on this background that Weber wants to understand in which way the Indian religions have been a hindrance to the invention of capitalism in India. In what follows, there will be focus on Hinduism which is the biggest and most influential religion in India.

The basic principle in Hinduism is karma, which means that the moral quality of a person's action determines in which caste he will be reborn in his next life. Therefore, the doctrine of karma is closely connected with the doctrine of reincarnation in one of the four castes. The first caste is the Brahmin caste, which are the theologians, scholars, and priests. The second caste is the Kshatriya, the rulers and warriors. The third caste is the Vaishya, the farmers, merchants, and artisans. The fourth caste is the Shudras, the laborers/service providers. In addition there is the Varna caste, which is the untouchable caste. This caste is not mentioned in the holy scriptures of Hinduism, and it is not part of traditional Hindu theology (Weber GAR II 1988a: 1 ff).

However, from a sociological perspective, the essential thing is that it is the rebirth and therefore also in the social reality the birth that determines which caste a person belongs to, because the person can only change caste in the rebirth. The social reality is therefore in a Hindu-dominated society that each person lives his life in his caste strictly separated from persons in others castes.

It follows from the religious idea of reincarnation that in principle, it is almost impossible to convert to Hinduism, for in which caste should that person be included? Therefore, Hinduism is in principle also a sect because the access to salvation, die Heilsgütern, is exclusively reserved for the people, who are born as Hindus. Contrary, Christianity and Islam are religions which in sociological sense are mass salvation institutions (Massen-Heilsanstalten). Religions are in principle all including with the possibility to exclude the included. Sects go the other way around (Weber GAR II 1988a: 6 ff). What is essential to remarks here is that the theological principles of reincarnation and the four castes are from a sociological perspective strong social exclusive principles, which in themselves are strong hindrances for social transformation. A caste can therefore also be cleaved by many reasons (Weber GAR II 1988a: 100 ff).

One reason could simply be that people move to another place. Another reason could be religious disagreements about professional and social life. This could be about rituals. It could be a change in social wealth which could have the consequence that a person wanted to follow the social habits of another caste. It could be the change in profession. It is only necessary with a small change in technique or more widely changes in technical skills. Such changes demand new religious changes. The central point is that all the common life is inscribed in religious rituals, which from a sociological perspective are exclusive. This is also the case with gender relations.

It is the caste divisions caused by economic reasons that interests Weber at most (Weber GAR II 1988a: 102 ff). Weber claims from a sociological perspective that strong caste divisions have their origin in the distinctions between different professions. These distinctions are not only based in the professions themselves but also in the interest to avoid competition between the members of a caste. The professional castes do not only have a strong traditionalism. They have also a strong ritual caste exclusivity with endogamy and commensality, which means that there are strict rules for who and how people can eat together, not only internal in the caste but also with members of higher and lower castes.

The conclusion is that in a Hindu-dominated society, every member of a caste is inscribed in a restrictive religious-based social order which includes everything in a person's life such as gender, food, family, and profession from birth to death – and according to the religion also through the reincarnation in the next life thereafter. It is on this background that the caste system appears as an extremely traditionalistic and absolutely anti-rationalistic religious system (Weber GAR II 1988a: 109 ff).

The reincarnation implies a normative system, in which the criterion is strictly to follow all religious prescribed norms in the caste and in that way from a religious perspective to get the possibility to advance and to be reborn in a higher caste. From a sociological perspective, this caste-based normative system is a strong hindrance for any social change and therefore also for the development of a form of capitalism. Therefore, according to Weber, it is not a single part of the caste system but the basic "spirit" in the caste system that hinders any change and development (Weber GAR II 1988a: 109 ff).

Therefore, it was the British colonial administration that imported capitalism and especially the factories into India. According to Weber, it would not have been possible to invent capitalism in India. The resistance against the factories was therefore also very big in India. Weber points out that after 100 years with capitalism, there was only 1/3% of the population occupied at the factories. There is no spirit of capitalism in Hinduism.

Final Perspectives

In his sociology of the world religions, Weber developed the surprising idea that business legitimacy is based in religions in the sense that modern capitalism could only have been invented and developed in the framework of Protestantism and especially in the framework of Calvinism and the other Swiss forms of Reformed Protestantism and the religious traditions they created later on, not at least in Britain and the USA. Weber's grip to focus on the religious and theological idea of predestination as the driving force for the creation of the business energy is also a fascinating and radical contra-intuitive invention which led to a totally new sociological perspective not only on Protestantism but also on other world religions' significance for the development of capitalism in China, India, and elsewhere. In this way, Weber created also a new understanding of the relation between religion, capitalism, economy, and society.

However, the question can be raised whether Weber's sociological understanding of the societal and historical significance of Protestantism for the development of capitalism is radical enough. Weber's understanding of the sociological significance of predestination for the development of capitalism is very productive. However, it can be claimed that the significance of Protestantism and more generally Christianity is much broader than what came to expression with the idea of predestination.

More generally, Christianity could have been credited much more than is the case in Weber's *Protestant Ethics*. Here should first of all be mentioned the historical constitution of the person as a free autonomous subject. This historical constitution is mediated through the religious constitution of the free autonomous subject directly in face of God. The religious free autonomous subject directly in face of God is from the beginning inherent in Christianity. The Christians had only one Lord, Jesus Christ, and therefore they could not worship the Roman emperor as was demanded of all Roman citizens. Therefore, the Christians were persecuted in the Roman Empire until Emperor Constantine's tolerance and later promotion of Christianity as the primary religion in the Roman Empire in the period 313–337. Finally, Christianity became with the Edict of Thessalonica, the Roman state religion in 380.

This historical period can from a historical philosophical perspective be considered as the beginning of the transformation of the religious principle of the free autonomous subject into a differentiated subjective, political, legal, and societal principle which should be the basic principle for the development of modern European culture and society.

The German Philosopher Hegel (1770–1831) stated in his *Philosophie des Recht*, *Philosophy of Right*, §185 that Christianity was the mediator between antiquity and modernity because Christianity was the basis for the historical constitution of the free autonomous subject (Hegel 1955, 1991). Hegel has the following condensed – and almost unreadable – historical philosophical formulation in §185:

"Das Prinzip der selbständigen in sich unendlichen Persönlichkeit des Einzelnen, der subjektiven Freiheit, das innerlich in der christlichen Religion und äußerlich, daher mit der abstrakten Allgemeinheit verknüpft, in der römischen Welt aufgegangen ist." An English translation could be: The principle of the self-sufficient and inherently infinite personality of the individual, which is the principle of subjective freedom, arose in an inward form in the Christian religion and in an external abstract general form in the Roman world.

For Hegel, the constitution of the subjective freedom was the break with antiquity and the beginning of modernity. Christianity was the Weichensteller for this historical transformation.

It was also shortly after Emperor Constantine's reign that Agustin brought the radical subjectivity on theological, philosophical, and literal form. In this context should especially be mentioned Augustine's *Confessions* (Augustinus 1977), finished 397–400. Therefore, in the Hegelian spirit, it could be a concise determination of modernity to say that modernity takes its beginning in the year 400, when Augustine finished his *Confessions*. It is not certain that all historians would sign this determination. However, Hegel and maybe also Weber would confirm this determination of modernity. Weber's alternative would be the day when Martin Luther posted his *Ninety-five Theses* on the doors of All Saints' Church in Wittenberg 31 October 1517. This day in normally mentioned as the beginning of the Protestant Reformation.

Augustine's concept of subjectivity is radicalized in the Protestant reformations in the sense that any ecclesial mediation in the Medieval Catholic Church between the subject and God is swept away. Weber's Protestant Ethics is concerned with the subject which must find its salvation in the light of Augustine's and Calvin's theological idea of predestination.

However, from a historical, political, philosophical, and sociological perspective, the same radical subjectivity in Protestantism has also played a determinate role for the formation of the bourgeoisie as a class and a driving revolutionary political force in civil society, which led to the creation of modern political institutions with parliament and a new legal system. This is first of all the case in Britain and the USA. It was a long civil war between Protestants and Catholics that finally created constitutional monarchy, parliamentarianism, and basic civil rights with the Glorious Revolution in England in 1689. These radical political and legal changes were basic preconditions for the creation of capitalism in England in the eighteenth century. It is in this context also that philosophers with Protestant background such as Thomas Hobbes (1588–1679), John Locke (1632–1704), and later on Adam Smith (1723–1790) developed the adequate liberal political, legal, and economic theories for the political, social, and economic transformation. Therefore, Protestantism has also in a broader sense contributed as an essential Weichensteller for these historical changes. However, this has not been considered in the framework of Weber's *Sociology of Religion* – although it would have been possible.

Guilt, Responsibility, and Leadership

Abstract

The world is a troubling place. Since Old Testament, we have heard the prophecies of corruption, spiritually, bodily, and/or societal. And since then, social technologies have been developed to form boarders for human behavior have been made. According to Friedrich Nietzsche and Sigmund Freud, one of the most powerful social technologies have been "guilt." Through the labelling of "guilt" as a mutual binding between two or more persons, we try to enforce responsibility and duty on and for each other, still knowing in the back of our heads, that this might actually not happen. Failed responsibility leads to guilt, or at least the surrounding's expectation of some kind of expression of guilt. This chapter looks into the three different ways of understanding guilt and responsibility in relation to leadership. First, the paper dives into contemporary understanding of leadership, it is puzzling that none of the contemporary literature in this field deals with the possibility of leaders being guilty. In contemporary society, we reject on the one side guilt when individuals in organizations openly blame themselves for wrongdoing, since we claim that any act of an organization is too complex to be reduced to one person. On the other side we call for guilt,

when responsible individuals overtly fail to express regret of their doing, though they were in fact accountable, both in position and in act. In conclusion, we are in contemporary times uncertain of how to understand guilt. But what does that do to responsibility?

Secondly, the chapter shows how the only research field that deals with the leader as guilty is in the field of psychopathy. Here, we find that a leader with psychopathic traits fall short of any sense of guilt. However, this does not inform us how ordinary leaders may actually experience guilt if not psychopaths? Thirdly, the chapter presents how the historical Protestant understanding of "guilt" as part of human nature, and how this worldview has been left all together, leaving us on the one hand with leaders as possible psychopathic when lacking guilt and on the other side ordinary leaders as incapable of expressing guilt in a contemporary Post-Christian culture that has no common understanding what guilt would possibly mean.

Guilt · Responsibility · Psychopathy · Theology

Introduction

The branding of "guilt" as irrelevant for a modern society started with Sigmund Freud in his book *Civilization and its Discontents* (1931). Sigmund Freud looks at the cultural impact of sin and states that its role is to socialize human beings through "guilt." Freud (1931) states that his purpose is "to represent the sense of guilt as the most important problem in the development of civilization and to show that the price we pay for our advance in civilization is a loss of happiness through the heightening of the sense of guilt" (p.134). Ever since, guilt has had a hard time in psychology and psychiatry. On the other side we call for guilt, when responsible individuals overtly fail to express regret of their doing, though they were in fact accountable, both in position and in act. In conclusion, we are in contemporary times uncertain of how to understand guilt. But what does that do to responsibility?

Structure of the Chapter

In the first section, the chapter defines how the literature on transformational leadership primarily views leadership in positive terms. While Bass and Riggio leaves some room for leaders who fail in their leadership, labelling this "the pseudo-transformational leadership," they do not ascribe any possibility for the real leader to fail, i.e., become guilty when things fail. This leaves lack of responsibility or failure in responsibility totally ignored.

In the second section, the chapter analyzes how the critical literature on leadership labels this "seduction" or more often "psychopathic." The object of focus for psychopathy in leadership is lack of responsibility. Among the many characteristics of failed leadership, lack of responsibility and lack of feeling of guilt is paramount. The chapter shows how the literature on psychopathic leadership indirectly turns "feeling of guilt" into an ordinary expectation. This is noticeable, since most of contemporary psychology literature attempts to make guilt go away.

In the third section, the chapter presents the theological notion of guilt. Guilt is ontological; however, the social side of guilt is intrinsic: Guilt is part of relationships with others. The chapter looks at the theological concept of guilt when connected to responsibility. After this, the chapter views the concept of responsibility and guilt in the light of John Keynes' ideas of a common responsibility for restoration of war. Keynes argued for a common understanding of responsibility after war, i.e., that it was not only the losing party that should pay war reparations, but the winning party would also have obligations to take care of the living standard of the losing party. Finally, the chapter analyzes how gift economy by Marcel Mauss sees responsibility and guilt as restrained, containing the possibility of leaving the relationship, and thus the responsibility.

The fourth section sums up the aim of the chapter, i.e., how to understand what (1) responsibility is, (2) what responsibility is not, and (3) what the failure of responsibility means.

Section 1: Leadership with No Guilt

Burns was the first to define leadership in the way we know it today, i.e., as a relationship between leaders and followers (Burns 1998, 133). Viewing leadership as relational meant a new approach to seeing the leader as dependent on the followers: not as holding power only due to formal authority (Weber 1978). Bernard Bass took Burns' ideas to another level in his book (1985) *Leadership and Performance beyond Expectations* which was dedicated to Burns. Bass here defined leadership as relational since he stated: "charisma is in the eye of the beholder" (1985, s.40; Bass og Stogdill 1990a, s.193). From now, leadership would never again be only referring to one's position as leader. The understanding of leadership was turned into an intimate relationship between leader and followers. The characteristics of a genuine leader emphasizes this: The good transformational leader is (1) charismatic, (2) intellectually inspiring, (3) motivating, and (4) shows individual consideration (Bass 1990a; Bass and Riggio 2006).

Jackson (2008, s.792) has summed up the quintessence of transformational leadership like this:

> Transformational leadership is the process whereby a leaders fosters group or organizational performance beyond expectation by virtue of the strong emotional attachment with his or her followers combined with the collective commitment to a higher moral cause.

Bass and his impact on leadership literature has been immense (see Leithwood, e.g., Leithwood 1996/2003; 2005; 2006a, b, 2008a, b). Though Burns is said to initially distinguish between transactional and transformational leadership, Bass wanted to draw to the fore is the transformational leader who motivates us to do more than we originally expected to do (Bass 1985, 20); this is the "good" transformational leader. Bass and Riggio are first of all interested in this type of leadership. However, Bass and Riggio depict two other types of leaders in order to emphasize the great leader:

Category 1: The disinterested transactional leader.
Category 2: The selfish, destructive transformational leader or power wielder.

Bass moves from the disinterested transactional type of leadership (category 1) to the difference between the good type and the poor type (category 2). How to detect the disinterested (category 1) or the selfish (category 2) is left to the organizations who have to deal with the consequences of "leadership gone wrong." It is noticeable that the good leader simply does not fail. There is no reflection what so ever in their presentation of the transformational leader on good leaders that fall guilty, whether by pure chance or because they believed they were doing the right thing, but later found that others thought they had done wrong.

The lack of nuances in transformational leadership has led other researchers to intense studies on exactly this subject: What if leadership actually make for all the wrong decisions in organizations as well as political life? In critical management studies and psychological studies, e.g., we find that Zaleznik (1977) differentiates between psychologically "healthy" and "unhealthy" leaders. Howell (1988) preferred to differentiate between socialized and personalized leaders. Bass (1985) contrasted authentic with inauthentic or pseudotransformational leaders (see also Bass and Riggio 2006), but without leaving room for good leaders to fail.

The distinction between good leadership on the one hand and 'dangerous leadership' on the other, is often reconfigured as the Hitler problem. In other words, was Hitler a transformational leader? For Burns, leadership had to be morally uplifting, which is why Hitler could not have been a true leader. Bass initially considered transformation to be any fundamental social change without regard to moral values. However, he later (e.g., Bass and Steidlmeier 1999) stated that leadership should be reserved for the forces of good, and the other terms like tyrant and despot should serve as descriptors for other normative behaviors. In the end, Bass coined the concept pseudotransformational, bringing Burns and Bass into alignment concerning a long-standing conundrum: Hitler was not a transformational leader (Burns and Sorenson 2006, vii–viii). This, of course, generates a problem. It appears to be the ethical background of the analyst, rather than the analyzed, that decides whether a leader ends up in the transformational or pseudotransformational camp (see also Bass and Riggio 2006, 235).

This, of course, is an analytical nightmare. There are plenty of allegedly egalitarian leaders who are self-serving because the interests of the collective and the leader are construed as equivalent. And if socialized leaders use established channels then woe betide the socialized leader of a marginalized group without access to established channels. Indeed, the whole point of Weber's seminal work on charisma was precisely the opposite of the assumption that charismatics use the established institutional procedures and noncharismatics do not (see, e.g., du Gay 2000).

The same issue occurs when they discuss transformational leadership, as the feature of transformational leadership that most often best distinguishes authentic from inauthentic leaders is individualized consideration. The authentic transformational leader is truly concerned with the desires and needs of followers and cares about their individual development. Followers are treated as ends not just means (Bass and Riggio 2006, 14), which is why authenticity does not appears to relate to being true to oneself but to be concerned for others. But one could easily configure a leader who has precisely this concern while simultaneously considered as immoral by those who are not followers. Both arguments are examples of the no-true-Scotsman logical fallacy – the ad hoc defense of an unreasoned argument: since leadership is essentially good, any leader who is perceived as being destructive to the greater good by antagonists cannot be a leader.

Bass and Riggio, however, have a get-out-of-jail-free card: "It is important to note that for most leaders it is not clear-cut. Being personalized or socialized is usually a matter of degree, being more or less selfless in one's actions" (2006, 13). In sum, the whole edifice that separates good from bad, personalized from socialized, altruistic from authoritarian, is simply a matter of subjective interpretation. Boring or mundane leadership turns out to be transactional and wicked power wielders carry out dangerous leadership; in other words, they seduce their followers. Bass calls them power wielders, which allows him to claim that leadership is always good (and that poor leaders are actually not leaders).

Calas and Smircich's (1991) even labelled leadership that has gone wrong as "seduction." In their paper "Voicing seduction to silence leadership," Calas and Smircich considers the way leadership – at least on the surface – has nothing to do with seduction; indeed their review of the literature implies that traditional authors perceive leadership as being the opposite of seduction but are actually able to conceal this relationship. Consequently, leadership is perceived as necessarily upright, noble, and just, but it only manages to achieve this by a sleight of hand that camouflages the necessary seduction of followers (1991, 569). Calas and Smircich propose that seduction, rather than leadership, is the dominant theme and that since leadership requires seduction, and seduction is necessarily negative, leadership bears the mark of seduction, rather like the mark of Cain: it is essentially negative and, as they state, "[a]s a form of seduction, there is nothing profound about leadership" (1991, 568). They show the juxtaposition of leadership and seduction by analyzing the sexualized, seductive effects of organizational writings, and note the poor reputation of seduction in relation to leadership (1991, 573). In effect, while researchers taking a traditional approach to leadership see it through rose-tinted glasses, where it is essentially positive, critical theorists see it through cataracts, where it is essentially negative. Researchers like Tourish (2013) and Kark (Kark and Chen 2003) has provided a coruscating critique of the dark side of transformational leadership in its potentially debilitating effects on followers. As Joanna Ciulla has pointed out (2013) there is a sad division between social sciences on the one side, and ethics of leadership on the other (see also Blodgett 1 2011; Rössner 2015). Thus, while the likes of Burns, Bass, and Zaleznik constitute leadership as necessarily productive and ethically sound (what Collinson calls "Prozac leadership" (Collinson

2012)), their opponents in the critical management school tend to suggest that leadership is equally inevitably associated with coercion and unethical authority.

Another category for leadership gone wrong is pathological, rather, psychopathy. The amount of literature on psychopath leaders in impressive. Particularly when we consider how few beings are actually psychopaths according to the statistics. In the following, the paper will describe this particular definition of leadership. After this section, the paper will investigate whether the theological definition of "guilt" is relevant for leadership gone wrong, rather than "psychopathy."

Section 2: Lack of Guilt as Psychopathy

This section describes the discussions on psychopathy in general, and its implications when brought into leadership. This category of "the psychopath leader" has become one, if not the only way, for leadership to deal legitimately with guilt as lack of responsibility. That is, lack of guilt becomes a pathological symptom. However, this is interesting since most of the twentieth and twenty-first century debates were branding "guilt" as completely irrelevant for a modern person. The psychiatrist Elliott puts it like this:

> "It is ironic, that psychiatry, which expends *so* much effort on the patient who feels guilty when most *af* us think he should not, should find itself occupied with the psychopath, who feels no guilt when most *af* us think he should". (Elliott 1991, s. 89) (from Pethman and Erlandson 1997)

The quote shows the modern dilemma on guilt/not guilt. Nobody wants to openly express that others should be guilty. At least, psychology and psychiatry have done a great effort to liberate us all from such negative emotions. At the same time, what to do when people act deliberately mean towards others, or by their actions do harm, mentally, physically, financially towards others? We expect that the harm-doing person express some kind of remorse. Since leaders have enormous impact on others, why would not these leaders also once in a while find themselves in situations of having done wrong? Leadership literature in general does not help in these situations. On the contrary, Bass and Riggio ignores that the good leader can fail. These situations are straight-forward not existing in transformational leadership. What is left for the leaders and the surroundings is either to label failing leaders as "pseudo-transformational" or "inauthentic". Another possibility when referring to contemporary literature is to view the leader as psychopath. The following describes the development of this category of the "psychopath leader."

The History of Psychopathy

The concept of "psychopathy" rests in a new approach to criminals in the late eighteenth century. A debate started in the field of medicine and law whether some are "born criminals" (Holmes 1991, 78) when a medical doctor Benjamin Rush published his book "Lectures on the mind," in 1793 (http://history.house.gov/

People/Detail/20719), taking the hitherto philosophical discussion on "evil" into a medical arena. To Rush, a "total absence of conscience" was a disease in the brain: an anomia (see Holmes 1991, p.77). From here three different strands of understanding of psychopathy as biological disorder took over (Werlinder 1978, see also Jensen 1978 and Whitlock 1987, p.653).

The three strands were the following in Europe and in the Anglo-Saxon world: (1) around 1800 as affective disorders in mental illness, by the physician, Prichard, who developed his idea from Pinell, and described "moral insanity" as "madness consisting in a morbid perversion of the natural feelings, affections, inclinations, temper, habits, moral dispositions, and natural impulses, without any remarkable disorder or defect of the interest or knowing and reasoning faculties, and particularly without any insane illusion or hallucinations" (1835) (On Prichard: https://en.wikipedia.org/wiki/Moral_insanity).

(2) Around 1860 Morel's idea of degeneration in a medical field started to take over the debate, defining psychopathy as a biological, hereditary aspects of psychiatric disorder included.

(3) The Anglo-Saxon medical scene, of American origin, discussed psychopathy as a syndrome characterized by inadequate control of impulses (https://core.ac.uk/download/pdf/3639469.pdf). The characteristics of the latter defined disease was, e.g., remorselessness, egoism, aggressiveness, etc.

The features of psychopathy were viewed as "lack of conscience, remorse and guilt." For example, Cesare Lombroso (1835–1909), the father of criminal anthropology portrays the psychopath as "devoid of any sense of personal moral responsibility, and of the commonly associated emotions such as remorse and empathy" (Holmes 1991). Such a person is not predestined to commit crimes, but is simply having a mental flaw.

Eventually, the medical discussions had impact on law making and court decisions. Now, instead of viewing "wrongdoings" (crimes) as something that some people decide by free will to do, the debate focused on whether a biological determination might actually be the condition for some persons turning into criminals and while some persons did not. Holmes himself being a medical doctor summarizes the debate in medical, biological, ethical, legal, and moral fields; however, all of these fields discussing psychopathy were conflated, when medical and legal authorities collaborated on the American "Act of 1913," turning psychopathy into an objective parameter for court decision (Holmes 1991, p.77f).

Psychiatrist Herley Cleckley in 1941 wrote about observe patients who lacked remorse and empathy, and hereby clinically describing psychopathy (Fritzon et al. 2020). Later Robert Hare was to influence the field of psychopathy and law indeed (Fritzon et al. 2020).

Robert Hare's Influence on Contemporary American Debates on Psychopathy

Robert Hare (1970, 1985and 1991) continued Cleckley's work and he made the discussion on psychopathy a general and practical issue. Hare formulated "Hare's Psychopathy Checklist."

Hare defined psychopathy as: impulsivity, thrill-seeking, low empathy, and anxiety. Those that present a psychopathic trait seek immediate gratification of their needs, lack guilt and conscience, being less prone to experience embarrassment, and failing to learn from punishment for misdeeds (Hare 1985).

Robert Hare initially studied prisoner, but according to Boddy 2011 (p. 256), "Hare would look for psychopaths in stock exchanges, if he did not already had his topic, psychopathy and prisoners." Boddy says: "Recent newspaper headlines such as 'Wall Street Shows No Remorse' do nothing to suggest that his viewpoint is incorrect."

Paulhus and Williams write that Hare's Psychopathy Check List is viewed as "the gold standard in the measurement of psychopathy" (Paulhus and Williams 2002, p.557). Recent research by Williams and Paulhus (2002) confirmed that the SRP has the same four-factor solution as the Psychopathy Check List.

Considering the development within American court on the use of the Hare's checklist (the PCL-R) (Walsh and Walsh 2006), Walsh and Walsh's review of the Westlaw legal database shows that evidentiary introduction of PCL-R assessed psychopathy has increased considerably across state and federal jurisdictions (Walsh and Walsh 2006, page 493). Robert D. Hare had already predicted in his paper in 1996 "Psychopathy: A Clinical Construct Whose Time has Come" (The debate was not only a disciplinary debate. It was also a cultural debate between Europe and the US, ending with American medical research community holding the discussion the definition of psychopathy (Werlinder (1978), while the European medical debate on psychopathy refrained from this field.).

Though "psychopathy" today, particularly in an American law context, is a legal category, critique is still going on about the adequacy of this category. Pethman and Erlandsson (1997) pointed out, the question is scientifically and conceptually whether the concept of psychopathy is necessarily a clinical or categorical one. For example, Elliott (1991) and Holmes (1991) who state "that we should cease thinking of psychopathy as a category of psychiatric diagnosis, and think of it instead as a category of moral evaluation" (Elliott 1991 p.89). Also Harris et al. (2001, p.200) point to the lack of scientific adequacy: "<. . .> scholars still disagree somewhat about the fundamental properties of psychopathy" (2001, p.200). However, they continue writing that brain research has pointed to that psychopaths "have brain function abnormalities in the ventro-lateral, orbito-frontal cortex, and amygdala" (Blair 2001; Blair and Cipolotti 2000; Dolan 2008; Howard and Mccullagh 2007; Kiehl et al. 2004).

Recently the philosophers Hirstein et al. (2018) have investigated the field of neuroscience from a philosophical point of view, with a particular focus on "responsibility" and the effect of turning wrong behavior into brain defect, thereby diminishing the question of responsibility. The authors argue convincingly that from a point of view of agency, people suffering from the brain deficiency of psychopathic features are still to be held accountable, with reference to the brain's capacity to plan and execute actions. Or to state it in other words: Brain deficiency does not withdraw responsibility from the agency of the person in question. Fritzon et al. (2020) as well challenge the way we understand psychopathy, when it comes to successful corporate managers. If we define psychopathy as “antisocial, criminal and predatory behavior,” how come that what we define as creative, visionary, and inspiring leaders also consists psychopathic traits, when measured in contemporary measure technologies? (Brooks et Fritzon 2020, p.)

They focus on the nature, behaviors, and consequences of psychopathy in executives and across the organization, offering an important contribution to the emerging body of research on psychopathy and other problematic personality constructs in the workplace.

The characteristics of psychopathy are still debated; however, lack of feelings of guilt is recurrent characteristics. Holmes states this the following way:

In fact, ”inability to experience guilt” has long been regarded by some researchers such as Maher (33) and the McCords (45) as the major single characteristic of psychopaths. Davies and Feldman (46) found that British psychiatrists demonstrated greater agreement over this than over any other of 22 key diagnostic signs, and in 1982, McCord (47) concluded after a lifetime of research that many conditions hitherto associated with psychopathy should be regarded as distinct and separate, and that once these are excised we should consider the true psychopath to be characterized by a lack or absence of conscience. Reid comes to a similar conclusion. (1991, 80). Also, in contemporary psychiatry, lack of guilt is a recurring feature of psychopathy. Thijssen and Kiehl (2017) write: “Psychopathy is a serious mental health disorder characterized by interpersonal, affective and behavioral traits such as lack of guilt and remorse, glibness, and impulsivity (Hare 2003).” We notice that once again Hare is referenced. Nübold et al. (2017), also referencing Hare, identify “guilt” as a main feature of psychopathy: “Those that present a psychopathic trait seek immediate gratification of their needs, lack guilt and conscience, being less prone to experience embarrassment and failing to learn from punishment for misdeeds (Hare 1985) (p.293).

Psychopathy in Leadership Literature

The emergence of psychopathy discussions in leadership literature takes place around the same time as Robert Hare’s list becomes well-known, leading to a far range of researchers commenting and referencing Hare (e.g., Thijssen and Kiehl 2017, Nübold et al. 2017; Boddy et al. 2011). Studies of the psychopathic personality has primarily been related to the criminal justice system and clinical assessment and treatment. Understanding psychopathic traits outside of a forensic context took off in beginning of the twenty-first century (e.g., Mullins-Nelson et al. 2006; Neumann and Hare 2008), and organizations (e.g., Babiak 1995; Babiak and Hare 2006). One of the main interest of this nonlegal approach to psychopathy was to define the “successful psychopath,” who would not necessarily get in contact with the legal system, but, however, still persist such psychopathic traits that he or she still could do harm to his or her surroundings. Also, Holmes were interested in successful psychopaths, who are not imprisoned, but succeeding in ordinary life (Holmes 79).

For leadership literature, the array of analyses of “psychopath leaders” has been huge: Not least after the financial crisis of 2008 and the common global reflections on what had gone wrong. The literature on “the leader is a psychopath” took its offspring when researchers started to study “dark” management as a subject of management research (Allio 2007; Batra 2007; Boddy 2006). Clements and Washbrush (1999) wrote: “Commentators are no longer willing to assume that all managers are working selflessly and entirely for the benefit of the organization.”

Boddy took this discussion a step further in Journal of Business Ethics, when Clive Boddy et al. (2011) in his paper “The Corporate Psychopaths Theory of the Global Financial Crisis” argued that psychopaths working in particularly financial corporations were causing the financial crisis. The subject of dysfunctional corporate management has become a topic of academic research and interest because it is increasingly recognized that dysfunctional and/or immoral leaders may cause harm to stakeholders (Allio 2007; Ferrari 2006; Lubit 2002). Within management psychology, it is widely recognized that leaders with personality disorders can have negative effects on employees and environment by means of the impact of their behavior of others in the organization (Goldman 2006; Siegel 1973, p.201). Boddy presented the idea that a particular type of leader, stating about these corporate psychopaths that: “In watching these events unfold often appears that the senior directors involved walk away with a clean conscience and huge amounts money. Further, they seem to be unaffected by corporate collapses they have created. They present themselves as glibly unbothered by the chaos around them, unconcerned about those who have lost their jobs, savings, and investments, and as lacking regrets about what they have done. They cheerfully lie about their involvement in events are very persuasive in blaming others for what has happened have no doubts about their own continued worth and value” (Boddy 2011, 256).

However, Clive R. Boddy, Richard K. Ladyshewsky, and Peter Galvin, authors of “The Influence of Corporate Psychopaths on Corporate Social Responsibility and Organizational Commitment to Employees” (Boddy et al. 2011) argued that the term “psychopathy” falls short off properly describing the problem we identify as “psychopathy.” Also Alasdair, Baden, and Guidi (2012) argue against the theory that corporate psychopathy played a significant role in causing the global financial crisis. They claim that Boddy paints a reductionist picture of what we present as the broader issue. They rather see this “psychopathic behavior” as a broader part of narcissism and Machiavellianism which engage with structures within global financial institutions. They argue that a “co-intensification” of psychopathy, narcissism, and Machiavellianism across society and in corporations calls for an ethical approach. That is, an ethical revival of prudence within prudential regulation should be an intrinsic composite of solutions. Due to the role of language in framing thoughts and behaviors, they recommend that prudence is explicitly and normatively put forward. According to his corporate psychopathy theory, such behaviors as manipulative and exploitative leadership behaviors, geared towards short-term self-aggrandizement are increasingly present at the highest echelons of financial élites. This means that the ethical and moral discussions of psychopathy vanish in favor of ethical discussions.

The Dark Triad Replacing the Psychopath Leaders

Together with psychopathy in leadership literature, we find the attention towards the so-called The Dark Triad as a constellation of undesirable personality traits, i.e., Machiavellianism, narcissism, and Psychopathy (see Savard et al. 2017; Jonason et al. 2018; Tourish 2013; Nübold et al. 2017: Spain et al. 2014; Morf and Rhodewalt 2001; (Christie and Geis 1970; Jones and Paulhus 2014). The question on what is the difference between narcissism, Machiavellianism, and psychopathy was discussed already in 1998 by McHoskey, Worzel, and Szyarto, who claimed that the three are more or less interchangeable in most samples. However, Delroy L. Paulhus and Williams have argued that there is enough behavioral, personality, and cognitive differences between the three to distinguish them as different (Paulhus and Williams 2002). This has since then been disputed, e.g., Persson et al. (2017).

The discussion on the Dark Triad seems to have gradually taken over the former discussion on psychopathy alone. For example, we find in Web of Science in the search of Dark Triad a development from 60 papers in 2013 to 280 papers in 2019 (Nübold et al. 2017), while the amount of papers on psychopath∗ and leader∗ has not proliferated the same way. We see this explicitly in the following table:

Year	Number of papers consisting of Boolean operators: dark∗ AND triad∗	Number of papers consisting of Boolean operators: psychopath∗ AND leader∗
2019	280	28
2018	228	30
2017	179	13
2016	167	31
2015	135	27
2014	82	13
2013	60	13
2012	34	11
2011	24	8
2010	23	7

It appears as if this concept “Dark Triad” has taken over the attention with regard to the dark side of human nature, and leaving psychopathy more unattended. While the Dark Triad seems to have replaced the concept of the psychopath leader, there is still no positive concept of guilt or how to perform guilt as a manager.

Section 3: A Theological Notion of Guilt

Guilt is semantically intertwined in the fields of law, moral, religion, and economy. For example, in Old English is said to mean “crime, defect, failure of duty, sin” (Online Etymology Dictionary: guilt). All of these words connect to economy, law, moral, and religion. It might actually be the case that it is guilt that makes Western society produce capitalism in the form Weber understood it in “The Protestant ethics and the spirit of society,” though Weber does not explicitly mention guilt as function in his definition of providence. However, as we will see in the following section, "guilt" is the intrinsic question when it comes to Luther's (and Calvin's) theological reflections on the role of providence. It is exactly "responsibility and guilt" that is the essential focus point in Luther's critique of Erasmus' stance on the free will. Luther critiques Erasmus for claiming that we are free to choose between good and bad. Luther says that this can't be right: What is then the role of God? A free person who is responsible for all of his own actions do not need a God to turn to. He is his own God. Therefore, Luther says, guilt must be part of our *ontological* state as a fundament for all relationships. We owe others ourselves. Our responsibility towards others is therefore deeply embedded in the guilt we have to others; and they to us.

When we look at the social side of "guilt," Smith (1978) refers "guild" to be related to the Teutonic "geld" which means "to pay." Smith's focus point is Oxford English Dictionary's definition on guild as a brotherhood where the members promises mutual aid and protection of its member (206). This means that "guilt" is first of all a social glue in between brothers of a guild. If we look at the Christian epistemology, guilt is first of all related to *sin*. Sin, according to Schröder (1929) belongs to a chain of words such as "truth – being guilty – sin" (Schröder 1929, p.108). Schröder emphasizes that there is no one original meaning of the old Nordic word "synd" (see also Müller, Christliche Lehre von der Sünde: 1839–44, S.747ff). The wording of "sin" in a German and Nordic context arises from the meaning of the Latin word: sons-sontis which is etymologically in the same family as ens: Being (German: sein) (Schröder 112). The Christian meaning of sin as negative comes from the Latin translation in the so-called Septuagenta of the Greek original texts in medieval times. The Greek word for sin is "hamartia" and in biblical Hebrev chata'a. The meaning of the two words is "missing the goal," or "mistake," both in a literal and metaphorical meaning (Wikipedia: Sünde). When Greek stopped being an international language around 400 A.D., Latin took over as the international language across the various countries involved in and by the Roman Empire. In medieval time, Latin was the main international language, and any scholarly educated as well as any power holder in position would speak Latin besides another language. Latin was a lived language.

It the reformation, Martin Luther (1483–1546) takes "sin" from (1) its original Greek understanding of "mistake" and (2) the Latin meaning of being. Luther had read St Paul's letter to the Romans, particularly Chap. 7, which states that it is the law that creates the sin. In this chapter, St Paul reflects over the paradox of law, that when "law" makes something forbidden, it at the same time constructs the object. This makes law a device that points to the human incapacity of being perfect. Thus, the law at the same time (1) asks for perfection and (2) creates the case of nonperfection. Luther uses St Paul's reflection to his own theology on sin. Luther wants to point to the radicalness of sin, i.e., of being. When failing in life becomes part of being, what the human being requires is grace. Without sin, no grace. And without sin, no need of God. Such is Luther's reckoning. Luther writes his theology as a response to Erasmus of Rotterdam (1466–1546). Erasmus and Martin Luther had a dispute in the year 1524, when Erasmus wrote: "On the free will" (De Libero Arbitrio), and 1525, when Luther wrote: "On the bondage of the will" (De Servo Arbitrio). The dispute in question was about whether the human being is born essentially (1) good by nature or (2) evil by nature. Erasmus sees the human being as good by nature and therefore responsible himself/herself to his actions. It is possible to choose between good and evil. Erasmus' view on human nature inspired for the so-called humanism, among which we see spokesmen as Jacques Rousseau. Martin Luther on the contrary explains in this book "De Servo Arbitrio" as part of human nature. Luther defends the viewpoint that the human being cannot in and by itself choose to do good. If that was the case, God's will would be obsolete. Only God has *liberum arbitrium*.

In a Lutheran context, justification of all human sins has been done through the death of Jesus Christ on the cross (The Heideberg Disputation). This means that all human errors have now been made obsolete by God. Not only has the understanding of "guilt" been debated within theology, but also in twentieth century, economic discussions on war reparation do we find debates on "guilt" in the aftermath of war. Such discussions are present at the Versailles Treaty, particularly as represented by Keynes and Marcel Mauss.

J.F. Keynes and Marcel Mauss on Responsibility and Bondage

J.F. Keynes' famous text "The economic consequences of the peace" from 1919 deals with responsibility and guilt with regard to war reparations. Keynes' main point was that "guilt" in war concerns both the defeated as well as the victor. Keynes' claim was that the negotiations on WW1 should lead to eliminate Inter-Allied indebtedness (Carabelli and Cedrini 1995 and Carabelli and Cedrini 2013). This implied the USA' giving up upon the Great Britain's war expenses to the USA (Carabelli and Cedrini 1995). If the Americans were to give up on the money GB owed the USA, GB would give up upon the money Germany owed them in war reparation. Such a logic would help GB and Germany have an economy that would allow them to buy ordinary goods for repairing of houses, streets, infrastructure, etc. from the USA.

Keynes labelled this "the shared responsibilities' plan." It was a gift with the risk of generosity: risking that the intended increase in peaceful economic exchange would not take place, instead of the ordinary risk of meanness; asking the looser to have one expenses paid by the other and thereby closing the others' possibility of advancing (Carabelli and Cedrini 1995). Washington refused to take the risk of generosity, Keynes said: "by reason of their strong desire to clear out of European responsibility without however realizing what this will mean to Europe" (Carabelli and Cedrini 1995).

When viewing the WW2 in light of Keynes' fears, it seems obvious that the conditions of poverty of the German nation in the 1920s and 1930s has been part of the reason for Hitler's national socialism to take over the country, entering the WW2. The lack of a common responsibility and placing the guilt on Germany for WW1 had severe consequences for all of Europe and Russia, leading to WW2.

Marcel Mauss are in line with Keynes, but with an anthropological approach on WW1 when it comes to discussing responsibility and guilt. On the one side, any individual or nation is born with a social debt that they need to pay back in order to maintain their existence. These social debts are both broader and more restricted than economic debts. Broader in the sense that these kinds of debts need not to be explicated in legal contracts. On the other side, these social debts are more limited, since they can be cancelled when considered odious debts. This means that debts can be forced upon the individual, and in that case, a debt should be dealt with as if both parties had debated the conditions of the contract in total freedom. This means that the solidarist (and Maussian) understanding of debt presupposes freedom.

Keynes' understanding of generosity towards the defeated rings true to a Lutheran understanding of grace. However, Mauss' understanding that social bonds can be cancelled if these are too restrictive or maybe even wrong, is in opposition to Luther's notion of sin as intrinsic part of human life. A Lutheran understanding takes social bondages, since embedded in a theological cosmology, to be unavoidable and uncancellable.

Section 4: Concluding Remarks

In this section, the chapter sums up what responsibility and guilt is in (1) leadership, (2) psychopathy, and (3) Lutheranism. It is seen how transformational leadership focuses on all the great deeds of wonderful leaders. It is noticeable how there is room for failures, whether deliberate (e.g., to one's own advantage) or undeliberate (e.g., not-intended but still happening), if you are a great leader. Or to put it another way: Great leaders are recognized by not failing.

While leadership literature leaves little room for nuances, critical management studies and literature on psychopathy can deal with situations of leadership that do not succeed. To critical management studies, leadership as such is under suspicion (Lopdrup-Hjorth and du Gay 2019). To the psychopathy literature in leadership, lack of feelings of guilt seems obvious. At the same time, we also find some uncertainty within the literature on whether "psychopathy" is the right category for leaders that do wrong.

While "the psychopath leader" seems epistemologically to have replaced the former understanding of guilt in leadership, there is still no consensus whether psychopathy is the right category for all the things that can go wrong for and due to leaders in organization. Particularly, when we consider the statistics of only 1% of corporate leaders being psychopaths in a clinical sense. What to do with the rest of leaders who still fail?

Historically we see a shift from an ontological understanding of human nature of wrongness (theological sin and guilt) to wrongness being a medical question (psychiatric disease). That a shift from a Protestant (Lutheran) understanding of leadership where responsibility and guilt has taken place is obvious to anyone concerned with the epistemology of leadership, as well as modern anthropology. What does all this mean for responsibility in leadership? If neither Bernard Bass' influential theory on transformational leadership nor "psychopath leadership" literature explains the phenomenon of the common expectations of remorse when the leader has failed, or an outdated theological understanding of guilt as present all over and in all relationships. Historically, i.e., in Protestantism, "responsibility" was viewed as a dichotomy between responsibility AND guilt. Today, "guilt" has a negative branding, leaving responsibility solely positive, and the psychopath an innocent patient due to a brain deficiency.

Part III

Business Legitimacy from the Point of View of Religion and Theology

Business Legitimacy, Modernity, and Organizational Systems: Corporate Spirit, Esprit De Corps, and Corpus Spiritus Throughout History

9

Gorm Harste

Contents

Abstract

Organizational reforms often require transformations in motivations. However, often we see old wine in new bottles. Organization studies seem to have ignored the long path dependencies of previous transformations in the ethics of work, cooperation, and organizational communication. In the form of an archeology of the conceptual and semantic layers, the chapter passes from the idea of *corporate spirit* and capitalist work ethics to the analysis of what was called *esprit de corps* in administrations and corporations in early modernity and further on into the late and high medieval constructions of the so-called *corpus spiritus* in Christianity. The chapter demonstrates how immense parts of modern organizational forms are constituted by the medieval semantics of cooperative virtues and their transformations in early modernity. The ideas of legitimacy, virtues, and ethics were most central in the organization of the Christian Church; moreover, they formed and authorized the paradigm of both state organizations and business

corporations. Then, as today, problems of delegation, representation, and decentralization appeared as problems of communication to be dealt with in decision-making and at the central levels of corporations and legitimized organization.

Introduction: The Present and the Past

Today, reforms and organizational innovation have become big business. Thousands of consultancy firms, HR directors, and huge staffs cope with the subject. Moreover, still more people in the work force try to keep up with new incentives and with an increasing reform fever. Lots of people feel stressed or become outburned while they try to stay inside the inclusion side of an accelerated society at the same time as they shall take care of children, wife or husband, elders, friends, and colleagues, of which, sometimes or even regularly, some get ill or break down and need attention (Sennett 1999; Rosa 2005). The highly esteemed "corporate spirit" and its inclusive "organizational culture" function easily as oil in the machinery of organizations when it functions. Yet it risks to become destructive when all members "shall" follow it and in a still higher and more synchronized speed develop innovations in individualized ways with still more complex rules, formal as well as informal.

Back in the 1980s, business ethics and organizational reforms were legitimized by reflections about post-bureaucratic and post-hierarchical "organizational cultures" and network organization. Often such reforms were described as new and innovative (Frost et al. 1985; Jablin 1987; Clegg 1990; Boltanski and Chiapello 1999). French Luc Boltanski was among the first to open this Pandora's box with a kind of second-order analysis, yet he too did not dig into the long-term historical decision-making premises of organizational forms. Neither did organizational sociology excavate into a history of the past to observe how motivations and organizational communication were constituted all along the formation processes that already, repeatedly, had transformed the legitimacy and virtues of work, organization, and cooperation.

The often-heard contention is that these problems describe new social forms. The acceleration in the competition on the edge between inclusion and exclusion – of firms, institutions, or persons – is told to be a recent phenomenon. It certainly is. Yet a suspicion too, is that we talk about old wine in new bottles. Therefore, we have to dig into the archeology of organizational history. We have to search for those organizational forms that so often are reformed, as if reforms never occurred before. We have to look into the past, in order to find the layers of organizational legitimacy, ethics, and virtues that already often implicitly and invisible are inherited inside the way we work and cooperate. This is a very long history. After all, we have to reflect carefully about what happens in a modern, or, as some may say, postmodern, society that experiences a revolution in communication media, like the it-revolution, the printing press revolution of the Renaissance, or the text revolution in Antiquity (Luhmann 2013, vol 1: 120–180; Eisenstein 1983).

Cooperation and virtues of work and management did not come overnight. Technical and social systems have a very long breath that developed over generations and took hundreds of years, if not thousands. Authority and the legitimacy of cooperative forms developed, with word and concepts used in organization communication way back before what we know as states and corporations. Many of the words, habits, and expectations about how to manage, operate, and cooperate has developed in layers and still more layers of semantics and learning processes. If we look into European organizational history or into Chinese forms and quarrels about centralization and decentralizations, we observe still more cellars with old wine in bricks to be filled into our new bottles.

The present chapter will begin with the quite well-known organizational storytelling about Max Weber's studies of protestant work ethics. This should be joined by an exposition of his French contemporary also highly recognized scholar, Émile Durkheim, and his analysis of conditions for modern division of labor. These conditions certainly were about the spirit of institutions developed in corporations and in particular in state administration as it is known from French state-building. Again, such administrative forms were a reaction and consequence of the broken body of late medieval conceptions about those cooperative virtues that ruled the Catholic Church and those early corporations that developed under its sway. The final sections of the chapter describe the complexities of those forms of confessional communication and their semantics, concepts, and codifications. (In this vein, semantics is broadly defined as the variance of all kind of symbols; concepts are more firm and contrasted to counter-concepts; and codes are binary forms in communication; in a combination of these forms, social meaning emerge.) If we consider that modern cooperation today is reconstructed under the impact of a still intransparent it-revolution, we have to focus those constitutive conditions, which formed our organizational ethics. Albeit some frames should be known from Max Weber's amazingly dense analyses (Weber 1922/1980), major sociologists like Niklas Luhmann, Michel Foucault, and Pierre Bourdieu have described a number of historical conditions of modern communication and its normative orders. From the point of view of organizational analysis, the frames possible to analyze on that background still needs exposure.

Protestant Ethics and the Spirit of Work: Max Weber

One of the most famous narratives about business legitimacy and ethics is German sociologist Max Weber's analysis of *Protestant Ethics and the Spirit of Capitalism* from 1904 to which he added a foreword about social forms of rationalizations in 1920 (Weber 1904/1972). His aim was to challenge Karl Marx's history of capitalism. Economics of labor and accumulation of capital was, according to Weber, not the initial strive that was the origin of capitalism. Economic incentives to work, therefore, was not the only nor the most important driver behind that kind of capitalist spirit, which is known from the eighteenth century and, for example, is observed in Benjamin Franklin's writings from 1742 about time as money. If we go back into the sixteenth century, we find another story. Reformation in theology led to uprisings and spread the idea that inclusion among the selected in heavenly life was not merely preserved to noble estates. It was not up to man but to a preselected divine order about inclusion and exclusion given by God. This was the narrative exposed by French theologian and lawyer Jean Calvin, who after Erasmus and Martin Luther, translated the Bible into vernacular language. His theology beside, the impact of Calvinism – according to Weber – was that work was about the realization of God's symbols in earthly life; eternal order should be symbolized in temporal life. Ascetic life demonstrated that strive. However, the combination of asceticism and work accumulated fortunes and capital in urban handwork, small corporations, and rural life. In particular in the United Provinces (the Netherlands), Calvinism led to what Philip Gorski (2003) recently has called a "disciplinary revolution"; in addition such discipline further developed in another form of Protestantism, Lutheran Pietism, in mainly the Prussian States. Undoubtedly, Weber is correct that this paved the way for early modern virtues of work and conducts of life.

However, Lutheran organizational ethics is conceived in a somewhat different form, not really grasped by Weber's influential explanation. Protestant work ethics is not reducible to Calvinist disciplinary forms. The Calvinist interpretation of the Bible came with the translations of the Holy text, which in deep controversies against the Catholic Church led to ideas of the individual reader. This new form of individualism fit well to active urban life and lower nobility and developed further in Anglo-Saxon countries. Yet, Lutheran interpretations developed the idea of the common procedure followed among the readers – and writers. Different interpretations could follow. Each person should – according to the younger Luther – be responsible for his faith toward God, without any intervention by an authoritarian church. Nevertheless, the text was common, words, concepts, and rules were to follow a certain procedure. Terrible quarrels and conflicts about the right interpretation followed, and a compromise had to stabilize. Hence, in the confessional compromise with the Lutheran so-called Augsburg Confession in 1530, Martin Luther and his companion Philip Melanchthon, in its article 16, issued that Protestants should be loyal to their prince and follow his confession (Harste 2018a). Obedience to the prince was primordial in this compromise, simply because it was part of the compromise with the Catholic emperor, Charles V, of the Holy Roman Empire of the German Nation.

In fact, since then, protestant work ethics divided in somewhat separate forms. For today's laymen, it is not easy to follow those past theological debates, which escalated into enormous quarrels, religious wars, and ensuing state-building among the military powers. The theological interpretations seem to be obscure, obsolete, and sophist beyond any reasonable modern mind – however this is a wrong perception. The basic point is that the Reformation quarrels were about organizational centralism versus organizational decentralism including the possibilities to find compromises in-between. Moreover, several further aspects should be added since they are still important and even decisive for organizational life today.

Durkheim's Theory of Coordination and Cooperation

In order to get to the problem of a cooperative ethics, sociology, in addition to Weber has to invite his contemporary, Émile Durkheim and his theory of division of labor in *De la division du travail social* (1893/1930). Before, we have to observe the Reformation quarrels a bit closer. Throughout the sixteenth century and even before, disputes in courts, estate assemblies, and councils were regularly about the Eucharist. This was not merely a model about how to interpret the new translations of the Bible; it was also a model about how to make meetings and organization. In Lord's Supper, Jesus was the leader, but how disciplined and centralized should the disciples find a corresponding order? Hitherto, in the Catholic Church, and in its authoritatively given order about the organization of municipalities and council meetings, often the Lord's Supper was painted on the walls. Participants and representatives could not go to management schools. Not before the end of the sixteenth century, schools of political science began to appear, as the famous Leiden school of government (Stolleis 1990). However, models about how to interpret a meeting and an organization were all over, in city halls and refectories at the monasteries. The paintings showed how Jesus, the leader, was the figure in the middle – however sometimes put a bit to the side, sometimes contemplating in his own inner reflections, or authoritatively present, quit, talking, eating, or drinking. In the most disciplined forms, the disciples sat conform to a certain standard, and it is difficult to observe any differences among them. In other paintings, a lot of disorders seem to rule. Leonardo da Vinci's painting is probably the most famous (it is easy to find on the Internet). Rightly so, and there is much to add from the perspective of organizational virtues. In this painting, we find most of what we today learn in textbooks about organizational sociology such as Gareth Morgan's (2006).

The organizational paradigm displayed is about the form of communication, and Leonardo's painting is about what will happen when the printing press, developed at the end of the fifteenth century, will be used in written communication.

What will happen with the words and commands pronounced by the leader and the participants? Will there still, authoritatively, be some kind of conformity around the followers and adherents? Leonardo's painting show four groups of disciples quarrel about the word of Jesus that one of them will betray him – and perhaps several others too. Then, what would decentralization, representatives, and delegation be about? How could hierarchy be authorized? Plenty of organizational themes appear, about inclusion and exclusion, loyalty and disrespect, subcultures and disagreements, consensus and dissent, word and text, command and interpretation, intrigues, position, membership and dismembering, and so on. Many issues from modern organization are already in focus. Moreover, often forgotten, the painting displays this scenario inside what became the compromise and solution to the quarrels, namely, the central perspective of the room, the hall, in which the supper was held, which, indeed, is at the end wall in the refectory of the monastery at Milano.

The central perspective, then recently developed in Northern Italy, was to become a model for architecture and painting, furthermore for organization too. We see it in organizational diagrams today. It is well known as an administrative form of coordination and delegation, centralization, and decentralization ever since. The central perspective was used to depict the form of state territory and state administration in medium of the gardens of Versailles, Louis 14 and Jean-Baptiste Colbert's enormous and famous palace, build between 1662 and 1683 outside Paris (Mukerji 1997). This palace, and in particular its central view on the garden, became the model for palace building in European states for centuries to come. Diplomats and managers did not go to management schools; they took a walk in the gardens and saw what order, discipline, coordination, centralized observations, and decentral perspectives were about. From that background, it was possible to get an idea of modern bureaucracies. Corresponding to this achievement, Colbert, the French first minister, made his instructions to his "commissaires" about how they should observe and command, find out who they could trust and how they could describe their territories, when they were send to their respective departments in France (Harste 2003).

The virtues among administrative elites and nobles developed according to aristocratic manners as an *esprit de corps*, which secularized the former religious and catholic virtues of communication (Richet 1973). In particular, law, public law, administrative law, private law, and law of peoples, developed and became – once again – the blackboard and measure to which manners and virtues developed. Charles Montesquieu resumed his seminal four volumes *L'esprit des lois*, published in 1748, to explain this differentiation in the functional systems of administration, law, religion, war, education, economy, agriculture, and political decision-making. In 1722 in a penetrating reform Prussian King Fredric William (Friedrich Wilhelm 1722/1997) developed differentiated administrative resorts. The Prussian federal states administration was still of a tiny size, but in 1738, French Chancellor Henri-François d'Aguesseau reformed a much larger administration and law as a structural coupling which his subordinate Montesquieu made famous as a separation of powers (Montesquieu 1749).

Yet here we have to dig further into the archeology of conceptual and semantic history. If the form of organizational architecture was so well established at the end of the fifteenth century that it needed reforms and an ensuing Reformation in the sixteenth century, what, then, was it about before?

Behind the separation of powers and the differentiation of functional systems, well-known to us since the Enlightenment of the eighteenth century, as a – if not the – form of modern society, there is a problem-solving form about communication between different entities. With Durkheim it has become known as the communication and cooperation form in a society build upon a division of labor.

Durkheim's, for sociologists, well-known description is accurate and quite simple in its basic form. If a division of labor could develop, it was because forms of cooperation, which he later focused as communication, developed. There had to emerge a series of communication virtues, norms, and morals, about how to communicate among those with different occupations, different functions, and different generations, living an urban life or a rural life. Norms and morals had to become more abstract at still higher levels; they had to be more reflexive about the differences and particularities, about commonalities and universal expectation. Moreover, they had to be more open-minded about varieties and contingencies. Norms and morals had to learn and evolve in still new, better educated and higher forms of reflexive ways to deal with those differences. This included learning languages and different manners; otherwise cooperation and coordination would fail and become subject to simple undifferentiated power, authority, and despotic tyranny.

The history of corporations is different from the one of governmental administration. Anyway, they were rather small before the sixteenth century. The conflicts between princes were organized, and their household grew immensely throughout the sixteenth century, as the French monarchial house or estate (Bourdieu 2004). The conception of the estate becoming a state took over at the end of the sixteenth century, and the entire political semantics transformed. After all, the French dynastic household grew from about 7–8,000 nominated officials to 25,000 at the end of the sixteenth century, and some 65,000 employees in the 1660s; remark the difference between part-time nominated and full-time employed civil servants.

Eventually, notions of "reason of state" became more abstract and were reflected in a more secular trans-confessional way. Thereby, new meaningful interconnectivities (Weber: "Sinnzusammenhänge") emerged between what became states. Law of peoples happened to replace the papal catholic diplomacy. This trans-confessionalist international order did not emerge simply in 1648 with the Peace of Westphalia; it took 200 years, from the German trans-confessional *Landfrieden*, between Catholic and Protestant princes, in 1555, and the modern state system, which was not in place before 1748 (the Aachen Peace).

Yet even before, the same secularization process developed in commercial relations and corporations. As with the *esprit de corps* of the state organization (Richet 1973; Mousnier 1974/1980), we observe a transition toward a *corporate spirit* inside the initially small commercial houses, which eventually emerged as the immense East Indian Companies in the Netherlands and in the UK (Hein Jessen 2016).

The Medieval Network of Societal Orders

In both cases, corporate semantics developed from virtues interpreted by the Catholic Church in the form of a *corpus spiritus* of churches and monasteries. This, indeed, is the seedbed of modern organizational semantics and not the least, the virtues inherited in organizations. Those semantics stabilized and were subject to disputes, quarrel, and conflict during a 400-year period before the Reformation.

Throughout the late medieval era in the fifteenth and fourteenth centuries as well as during the so-called high medieval era since mid-eleventh century, the Catholic Church authorized what the paradigm of rule and cooperation was about. It developed as a network of churches and five or six different monastery orders (Duby

1978; Spruyt 1994). Thus, it had to develop ideas, semantics, and concepts about how to handle cooperation at a moment when the Internet, the phone let alone a well-ordered postal service, was not invented. How was it possible, what did the church do to integrate and not fall apart? If we visualize it, the size of the problem is amazing, let me take the church organization in Denmark as an example. It was a remote and poor, scattered land placed more or less between the Baltics and the North Sea, sometimes a bit larger (even somewhat including England in the first half of the eleventh century), and with Norway and in particular Southern Sweden in close proximity. Yet in core Denmark, about 1200 stone churches were built and coordinated with the bishop of Roskilde West of Copenhagen as center. It was closely linked with Rome in order to bracket the German emperor. Several huge churches, as the cathedral of Aarhus, began their construction. All over Europe, such constructions were undertaken, albeit around Italy hundreds and thousands of churches and monasteries were already there (Duby 1984). The problem here is, how did it organize?

When the papal power later, in the fourteenth century, moved to Avignon, we know that it had an administrative staff of about 650 persons (Spruyt 1994). Yet the dispersed organization had to be organized. This is what organizational ethics, virtues, and communication is about. Nevertheless, we have to remember that the catholic orders were not the only form of more or less loosely or firm communicative and organized couplings. In the later medieval era, we find series of commercial networks and corporations, including banking services as the Florentine Medici family trading with transitions of different currencies and gaining wealth from this; later, in early sixteenth century, the Southern German Fugger family established a similar network.

Yet, beforehand, further networks of knights and noble orders prevailed in agriculture and military matters. So it was since the eighth century and the moldering of the immense Carolingian Empire in the ninth century. As described by German sociological historian Norbert Elias (1976), centrifugal processes prevailed over centripetal organization in those noble orders. However, Elias certainly underscored the role of the churchly orders and their organization. Nevertheless, the stratification between the social orders as estate orders had some important and lasting authorization, which, at least according to French Pierre Bourdieu (2012), did not completely break down with the French Revolution. Yet one thing is France, but the hierarchy between upper levels and lower levels, the included and the more excluded, does exist and rule modern business and governmental organization.

When such a social hierarchy emerged and was firmly codified in early twelfth century, the clerical orders, in their symbolic closeness to God and eternity, were authorized to have the upper hand. Then followed the military knights and nobles – who had served in the Crusades. The lower level were the commoners, although they too were somewhat stratified between urban orders and rural farmers eventually with serfs at the very bottom. Among the urban orders, an indeed very strict and firm hierarchy between different corporative orders existed and still has some impact today, albeit the virtue of "honor" is replaced by the virtues of "prestige." Antic distinctions between virtues and vices still exist, albeit mostly in transformed semantics. Imaginaries have found their way in transformed concepts and semantics all along (Chaussinand-Nogaret et al. 1989).

In the present context, the semantics developed by the clerical orders is probably decisive, in the accurate sense that it is this semantics (Luhmann 1977, 1980/1981/1989a/1995, 2013) and its authorized "conceptual systems" (Weber 1904/1985: 107–108) that more than anything else decided upon the authorized communication used in modern organization. This may occur as an obscure postulate about obsolete ideas, and it is correct that those concepts and semantics from the past has been reformed, reorganized, and even revolutionized several times (Rossum and Böckenförde 1978).

The main semantic development and conceptual codification took place in what sometimes is called the long twelfth century, that is, from the "Great schism" in 1054 between the East Roman Empire seated in Constantinople (today's Istanbul) and the Western Church, and mid-thirteenth century. The ending of this transformative period was characterized by a number of legal codes constitutionalized almost simultaneously across Europe, from the Melfi Constitution in Sicily to the Land Laws of Scandinavia in the North, the Mainz Edict in the German Empire and Magna Charta in UK. Again, the point is, how were the clerical social orders integrated. This happened in what we may call three semantic and conceptual revolutions, a revolution in theological dogmatics, a revolution in legal dogmatics, and a revolution in corporate dogmatics (Berman 1983; Quillet 1972; Morris 1991).

Authority

These three forms got power in their mutual differentiation. Initially the task for the Western Catholic Church was to develop and take the pace of the clientelism used in Byzantine network organization in the Eastern Roman Empire as well as Islamic network organization conceptualized in the *Umma* or Muslim holy spirit. The medium for such a theological reform of semantics was to reinstitutionalize religious communities and orders from a background described and authorized since Saint Paul (first letter to the Corinthians Chap. 12). This was about being member and included into a Christian community. Yet, this semantics of inclusion developed and got hierarchy, since inclusion could include itself and that means exclude others (e.g., Judas). This form was in the sixth century (Gelatius) what (as *auctoritas*) what authorized power (*potestas*). This semantic distinction between legitimized authorization and power has been and is constitutive for Western civilization and by the way, the Chinese organization of power too (Henderson 1998; Phillips 2011). Moreover, we easily see it in the architecture of power and meeting halls. The architecture and rooms of authorization are round, as domes or half circles as in most parliaments (not the British), whereas the church, still in the Roman era until late twelfth century, often builds huge square forms as in the knight's castles. This was a powerful military form of architecture. Still today, sitting in squares appear less legitimized than sitting in circles.

Theological and Legal Dogmatics

For the influential German cardinal Hildebrand, this background of power/authority and inclusion/exclusion of membership in a community appeared obvious to use in reforms in the second half of the eleventh century. He was elected as Pope Gregory VII, and immediately he began an indeed revolutionizing reform of the Catholic Church with the so-called Papal Dictate from 1075 (Berman 1983). In short, this was about the self-inclusion of the church into itself, namely, as a hierarchical order, in which the pope, settled in Rome, should be the bishop of bishops. On the heretic side of the inclusion/exclusion distinction, excommunication from Christianity was organized as an institutionalized semantics.

At the same time, Canonic Law developed and was codified as a communication form inside the church to govern communication, inclusion/exclusion, hierarchy, possessions, positions, and competences. The Bologna University formed a Law School, which was the first institutionalized university education in the Western world, somewhat after the Chinese Mandarin schools of administrators under the Tang Dynasty. In difference to China, the Church institutionalized a legal scholarship. In particular, in the twelfth century, Roman compilations of verdicts and laws, established by Emperor Justinian in Constantinople, were rediscovered in Pisa and reconstructed, interpreted, and thoroughly codified by legal scholars as Gratian. The point in the development of legal dogmatics is, that law developed as a university and courtly form of communication about what form of communication was legal, and which was illegal. Legal communication communicated about legal communication with an indeed very similar form to the theological communication, about what was included as authorized communication of religion in distinction to heretic and excommunicated forms of communication (Luhmann 1977, 1989a: 259–357). Sinn and punishment developed along with communication codes of symbolic and diabolic semantics. The church took power over what was authorized as language. Acts, behavior, and persons were judged, included, and excluded with this semantics. Lawlessness was the opposite side of honorable, virtuous, recognized, and legitimized forms.

Organizational Dogmatics

Organizational semantics developed along these lines. The idea of organization has its Christian origin in the idea of the corporal body of Jesus Christ, as well described by Saint Paul. A meeting coordinated liturgically in the form of the Eucharist could authorize a very important form of communication. This liturgical form allowed present decisions to be represented after the theological doctrines were taken in use among the integrated and indoctrinated members of such a holy community. They took part in the *corpus* of Jesus, since Jesus had spoken the words that thou shall eat this bread since it is my body and drink this wine since this is my blood. Peculiar as it is for the modern mind, nevertheless, we shall remember that this was communicated as a symbolic form with an extremely realist package about the use of communication (Kantorowicz 1957; Rossum and Böckenförde 1978; Palmer Wandel 2006). The Catholic Church was in desperate need of a medium of communication at a time, when the Internet, phones, and postal services had no reality. Metaphorically spoken, the Holy Spirit happened to be the communication medium of decisions, doctrines, indoctrinated delegation, and representation, which could "represent" a previous meeting about what was present in a certain situation. The liturgical form guaranteed the sense of communication in such a setting. It appeared as a form of social realism, authorized by nothing less than the words of Jesus Christ. As communication medium the Holy Spirit enabled a form of synchronized communication (Luhmann 2000b). These metaphors were extremely real to those submitted to such an idea of present meeting, represented later on, in delegated forms.

Indeed, this was what constitutionalized the body of the *Corpus Spiritus* that took power in the Catholic Church all across Europe for the next four centuries. Hereby integration of differentiated parts and forms of "participation" developed, and we can see it described, for example, in John of Salisbury's *Policraticus* (1159/1993). This, too, evolved as the legal and organizational semantics of "full power" (*plenitudo potestatis*). A representation delegated to the other end of Europe could be in full power to decide upon a king or duke on behalf of the pope. It functioned! For some time.

In early fourteenth century, the dispute about centralization and decentralization began to disrupt the uniformly enforced consensus of the Catholic Church. One thing was the past so-called Investiture Controversy about the autonomy of German cities and the authority to select bishops; this Controversy almost ended with the Concordat of Worms in 1122. Another was about the form of the corporate church and what was authorized as the body of the church and the kings (Kantorowicz 1957). Of course, problems emerged (Thornhill 2011). Increasingly, disputes and quarrels emerged as to the extent of decentral judgments and decisions in situations and context very remote from Rome. The church was aware about the dilemma between decentral judgment and direct heresy. Marsilius of Padua wrote a long treaty, *Defensor Pacis* (1326/2001), in defense of a certain right of delegates to autonomy inside the body of the church. Compromises ruled and controversies occurred increasingly. The papal diplomacy failed to reconciliate the conflict between the kingdom of France and the English-Norman kingdom finally settled by canons and military organization and not by negotiations (the Hundred Years' War).

Today, we often experience the same dilemma in the paradox of an organized administration that needs some form of local monopoly of autonomous decisions, albeit formal rules tell about another form of control and command. Still, the *corpus spiritus* of the Catholic Church was extremely useful and functional for centuries.

Corporate Law and the Ethics of Trust and Credit

In the late twelfth century, in particular German cities tried to find some kind of autonomy in between the Papal power in Rome and the Emperor of the Holy Roman Empire of the German Nation. This could have led to an escalation in destructive conflicts. Yet a compromise was found with the Peace of Konstanz in 1183. The cities should follow the Canonic Law used by the Church to organize and settle law, decisions, and judgment. However, they got their own courts and simply copied Canonic Law into corporate law of property, contracts, trade, punishment, and litigation. This was an authorized form, which the Emperor could not deny.

Trade and money are not simple affairs. It is easy to conflict about when a thing is handled over, when and in which situation and in which currency payment shall take place. As Luhmann conceives it, contracts are about a reduction of complexity in the communication about matter, social relation, and temporality; they fix and code what, whom, and when (Luhmann 1979). Judgments and decisions shall occur and be authorized in order not to create future conflicts. Therefore, they also have to be incorporated into existing forms of valid law in other cities, in other assemblies. Trade is in need of constitutionalized organization and law (Thornhill 2011). In fact, "constitution" referred to the bodily organic form of the Christian Church, and that word still is about organic health.

Virtues and vices developed all across Europe in this setting. In fact, Europe was deeply integrated by means of the church and its institutionalization of securitized corporations. For instance, we see this conceptual codification of semantics in the communication of credit systems. Credit developed as a trustful form of credibility and religiously authorized form of "creditere" (Latin), to believe. This was about time and trust. Loans should be paid back. Albeit of course, between family members trust was more obvious than between remote people from other cities and different confessions. Therefore, credit systems formalized much better across differences and distances, in fact eventually as international credit systems from the Arab and Jewish traders along the Silk Road to China to the Medicis and Fuggers in the fifteenth and sixteenth century and to the Rothschild network in the nineteenth century. However, we do not talk about "credit dogmatics," and banks are not churches, albeit the big trade fairs of Northern France in the thirteenth and fourteenth centuries were closely connected to merchants financing the amazing gothic cathedrals.

After its emergence in the late medieval era, credit, in particular, revolutionized in the Netherlands as a differentiated system between the banks and in particular the Amsterdam Bank, the East Indian Company, the "beurse," the equities, and the estate assemblies. The mutuality of invested trust in this complex system did not integrate formally, as one absolute authorized system (as unsuccessfully developed in France early eighteenth century). From 1689, such a financial revolution developed in London's city. Hence, civic norms about division of labor, of separated powers, and of institutions developed. Civic norms developed in a public sphere that enabled people under civilized manners to enjoy the company of each other while being protected (Habermas 1962; Sennett 1979: 264).

This financial revolution got its takeoff after the immense need of taxes and credits to pay for the supplies to the wars of religion that escalated into the Thirty Years' War. In fact, those wars were the result of the broken body of the Catholic Church. The Church integrated religious, legal, organizational, and political forms of centralization and decentralization. Yet it broke with the Printing Press Revolution (Elwood 1999). Manners and virtues had to find a form of communication and interaction across opposed partners beyond confessions, in abstract forms of coordination, reflected by new more secular forms of organization.

A first description of the new form came with Jean Bodin (Bodin 1583/1961) who in 1576 in a voluminous analysis established what was to become the new civil servant as a new professional person, who transcends individual confessions (previously called *professio fidei*).

Bodin's idea was a peculiar rearrangement of the heritage about the corporate body as a continuation of the body of Jesus Christ. Jesus, the temporal earthly individual, could die; however Christ, as the eternal person, could persist – and this was useful to describe the civil servant of the increasing princely households and estates. Offices could persist, whereas the concrete officeholders could die or be dispossessed from their office. This "professional revolution" created expectations toward professional duties, loyalties, and virtues, separated from the church, however, following a more abstract and well-reflected and reasoned normative order.

Indeed, most famous was the consequence for the monarchs; the king could die, and the kingdom, the crown, could persist. Therefore, the chief in office, the king, got sovereignty as decision-maker beyond and above the differentiated form of organization and delegation; yet of course, only to the extent that he centralized a decentralized body. Bodin's point was that this, indeed, central perspective of the estate administration was a compromise between the Catholic claim for a centralized body and the decentered Calvinist claim for decentralization and individualism. Probably, the compromise was Lutheran, since this new form was about to claim a reason of state and ensuing loyalty and obedient behavior of civil servants who might have a duty to follow the ruler while simultaneously thinking in terms of a free and independent will (Harste 2018b). "You may think whatever you want, but you have to obey" as Immanuel Kant later (1783) expressed the idea of King Fredrick the Great.

Conclusion: The Secularization and Its Implicit Results

There is still at least three major lessons to extract from the history of organizational ethics and its reflections about how to reorganize and reform. The real power of Christianity was its invention of a powerful form of cooperation as synchronization. This is a complex matter.

First, its conception of power is far ahead of normal political science concepts of the power concept. The misleading but very popular concept of power has its origin in Max Weber's idea that power is about how an actor may force another actor to aim for something different that this actor previously intended. (Weber's conception in fact derives from Carl von Clausewitz's definition of war as the violent disruption of an opponent's will; that is a definition, which again is the reversed side of Immanuel Kant's categorical imperative that thou has to will what simultaneously should be a maxim about a principle for a generalizable law. Power is to neglect the will of others.) However, power is more than a relation, and therefore Weber more discussed domination ("Herrschaft"). But "power" is a word that hides a semantics of doing, as very well expressed in the French word “pouvoir” that means power yet also “to do,” as the German verb “machen,” and German “Macht,” power, is a substantiation of “Machen” or doing. “Macht macht Macht” means power empowers power, thus referring to the self-constitutionalization of power, in particular if “Macht” gets “Acht,” that is, authority. In sum, power got the power to define itself and to include its monopolization of powerful semantics and to exclude what was not powerful, or powerless. Whether sociology takes Michel Foucault’s, Pierre Bourdieu’s, or Niklas Luhmann’s reconceptualization of power in use, this is so to say – with Max Weber’s famous words – the “prison of iron,” in which our modern semantics has closed our eyes and neglected observations from outside, for example, from past semantic developments. Modernity was constituted in such a way that social understanding and, in particular, political understanding of legitimacy were turned blind by the invisibility of power (Bourdieu 1994: 97; Luhmann 1989b: 101–137, 2000a: 33; Foucault 1975; 1976: 117; 2004 1976: 117; Harste 2017).

The second concluding point is that high medieval power empowered coordination and cooperation as a communication form that synchronized remote decisions with present decisions and therefore crosscut the distance between near presence and far away delegation (Luhmann 2000c). The medium of this form of communication was the Holy Spirit and its doctrines of presence and re-presence. It was exactly this idea of the represent form of Jesus Christ that broke down with the printing press revolution and the Reformation: The authorized center of decision-making could not anymore securitize what decisions should be about at the place of the representatives and in their context and situation, in which they had to judge about what to do. This was, indeed, a major crisis in the form of coordination, cooperation, and organization. Yet simultaneously with the printing press, not merely the print of laws and regulation, atlases, and books about administration (Erasmus, Machiavelli, Luther, Bodin, and so on), but the entire idea of a central perspective developed. This central perspective, too, is about synchronization and coordination (Harste 2018b). Indeed, it represented central decisions at remote places and coordinated synchronization among actors and offices, which got a picture about how the other remote part of an administration handled this administration. This was exactly what the absolutist power of the reason of state was about, well established in the extremely influential reforms and instructions of French prime, Jean-Baptiste Colbert in the 1660s: Organization could be reorganized as a form described with the organization chart of the bureaucracy. A bureaucracy is able to synchronize. Power is about synchronized coordination and turns it away from the non-simultaneity of life. This form of power tells us, that thou shall synchronize and forget or neglect what does not fit into such a form. It transforms simultaneous activities into a coherent plan and removes complexities and nonsimultaneous untimely matters into oblivion and neglect (Luhmann 1989b, 1990). This is the absolutism of bureaucracies and therefore they meet unrest and revolt. In France, there was even a duty to revolt against its tyrannical or despotic forms (Jouanna 1989). If we consider ethics of synchronization as similar to the Weberian ethics of work and similar to a Durkheimian cooperative ethics, we should consider how equal these Western organizational virtues are to the similar Chinese virtues. The temporal rule of situational cooperation constituted at a theological trans-confessional and transcending level is extremely productive in China (Jun 2005; Zhang et al. 2012; Poznanski 2017). In China too, there is a long tradition, dis-conceptualized as "legalism" yet rather a military enforcement, that is equivalent to the European idea of a "reason of state" (Phillips 2011).

The third and final point is, to conclude, that most of those virtues that described the explicit semantics and concepts of organizations, corporations, and business ethics, through their secularization turned implicit, if not simply unknown. Their sophisticated complexities sometimes were so differentiated and even well known, described in manner books, that it after hundreds of years of evolution became too complex to reproduce them as explicitly described manners of politeness, respect, and virtues about interaction systems. They became layers and still more layers about what to do in this or that situation, toward these people or those (different) persons. Erving Goffman's extremely penetrating sociological descriptions of *The Presentation of Self in Everyday Life* (1959) and *Interaction Ritual* (1972) displayed how such manners, described historical by Norbert Elias (1976) and Niklas Luhmann (1980), today are implicit codes of normal communication. Through their invisible monopolization of state power, and sometimes even absolutist absorption of obedience, discipline, and interaction rituals, they became norms and rules of decent organizational communication. This developed in its early stages in churches, monasteries, and courts and then in public administration and in central offices, to be followed decentered in parishes, remote departments, and regions. From that stage, the norms and expectations entered corporations and became common in business life as an ethics about what virtues and vices are. They are all over. The explicit turned implicit. Communicatively codified forms of morals and manners became our blind spot and invisible to us, as the forest we cannot observe because of all its trees.

Business Legitimacy from a Catholic Perspective: Thomas Aquinas, Papal Encyclicals, and Human Rights

Giorgio Baruchello

Contents

Abstract

Initiated by Pope Leo XIII at the close of the nineteenth century, the social doctrine of the Church of Rome has matured over longer than 100 years into a sophisticated conception of economic affairs and business life, whereby crucial theoretical as well as practical conditions are identified in order to assess the ultimate legitimacy of the market economy or, for that matter, of any given economic system and business practices thereof. It is this sophisticated conception that is summarized and explained in the present text, dealing, on the one hand, with the basic theoretical framework and background for its development, namely, the long-lived legacy of Thomism, and, on the other hand, with the technical instruments employed for its articulation and dissemination, namely, the Papal encyclical letters on social, economic, political, and environmental matters that, since 1891, have kept being issued by the Holy See.

Keywords

Leo XIII · social doctrine of the Church · Thomism · encyclical · ultramontanism · Saint Thomas Aquinas · natural law · reason · happiness

Introduction

Pope Leo XIII (born Vincenzo Gioacchino Raffaele Luigi Pecci, 1810–1903) is famous for having issued the encyclical *Rerum Novarum* (1891), which read in its first English headline: “Rights and Duties of Capital and Labor.” *Pace* the staunch refusal to embrace modernity that had characterized the official attitude of the Catholic Church after the French Revolution, here was a major doctrinal document adopting the terminology of the then much-loathed liberals (e.g., revolutionary France’s 1789 *Déclaration des droits de l’homme et du citoyen*) and socialists (e.g., Karl Marx’s 1847 “Wage Labour and Capital”).

Drafted mostly by Matteo Liberatore SJ (1810–1892), the encyclical was clearly directed to the faithful of the modern age, which was no longer condemned trenchantly but tackled as a reality in which the Catholic Church could still play an important and active role (Misner 1991). With his encyclical, Leo XIII launched the *doctrina socialis* of the Church – until then, there had been only a *doctrina civilis* (Barrera 2010) – that continues to this day, e.g., Pope Francis’ (born Jorge Maria Bergoglio, 1936) 2015 encyclical letter *Laudato si’*, outlining the official position of the Church on environmental matters.

Until *Rerum Novarum*, the official political stance of the Catholic Church had been essentially a withdrawal from liberal institutions, which in many cases had been largely established, if not even theorized, against her (the conventional use of female pronouns for the Church of Rome is adhered to hereby). The word “ultramontanism,” which had been used since the Protestant Reformation as an insult to Catholicism qua deplorable foreign interference in the affairs of independent peoples and their own churches, was reclaimed in its positive medieval meaning by eighteenth-century Catholic critics of the French revolution and its political heritage, liberalism included. These critics wished to reaffirm the philosophically natural, historically well-tested, and politically well-ordering divine right of European monarchs, as well as the superior moral authority of the Pope over them all, e.g., Joseph-Marie de Maistre (1753–1821) and Louis-Gabriel-Ambroise de Bonald (1754–1840).

For a long time, these conservative Catholics were influential, if not prevalent, within the Church, as shown by the institution in 1870 of the controversial dogma of Papal doctrinal infallibility, which made relationships with the other Christian churches even tenser (Verhoeven 2014). Ultramontanism extended its influence into the twentieth century (von Arx 1998), especially in Franco’s Spain (Payne 1984), but eventually waned and disappeared in lieu of the social doctrine initiated by Leo XIII.

Within this social doctrine, a sophisticated conception of economic affairs and business life has been presented and articulated over longer than a hundred years, whereby the theoretical and practical conditions are determined for the ultimate legitimacy of the capitalist or, for that matter, of any other economic order. It is this sophisticated conception that is summarized and explained in the present text, dealing, on the one hand, with the basic theoretical framework and background for its development, namely, the long-lived legacy of Thomism, and, on the other hand, with the technical instruments employed for its articulation and dissemination, namely, the encyclical letters on social, economic, political, and environmental matters that, since 1891, have kept being issued by the Holy See.

Thomism

Together with Luigi Taparelli d'Azeglio SJ (1793–1862), Matteo Liberatore SJ and Tommaso Cardinal Zigliara OP (1833–1893), Leo XIII's pontificate was instrumental in making the philosophy of Saint Thomas Aquinas (1225–1274) the official philosophy of the Catholic Church (Misner 1991). This was the meaning of Leo XIII's 1879 encyclical *Aeterni Patris*, in which the authoritative doctrinal sources of the Church are catalogued, summarized, analyzed succinctly, and assessed.

Before being Supreme Pontiff, Leo XIII was himself a fine Latinist and an Aquinas scholar, a brilliant student of Taparelli's, and a member of the circle of Catholic intellectuals who promoted an eventually successful campaign for the fullest rediscovery of Thomism (McInerny 2015). This enthusiastic and forceful rediscovery led to the standardization of the curricula within Catholic educational institutions and seminars along Thomist lines that, in spite of the inevitable cultural swings that may occur over long stretches of time, are still *de rigueur* today (e.g., the Congregation for Catholic Education's 2011 *Decree on the Reform of Ecclesiastical Studies of Philosophy*). It was not a revolution or a coup, intellectually speaking. The Church of Rome is an unlikely setting for sudden, radical changes: the authoritative tradition upon which she rests may be reinterpreted, but it cannot be overhauled.

To all intents and purposes, Aquinas had always been important within the Catholic Church. Back in his days, he was already a much-admired prodigious intellectual, a driving force within his monastic order and a founder of schools, and even the official Papal theologian under Clement IV (born Gui Foucois, ca.1190–1268). Despite some controversies about the orthodoxy of his philosophy, which seemed far too lenient *vis-à-vis* ancient heathen thought, Aquinas was canonized in 1323. During the Council of Trento (1545–1563), he had the singular honor of having his most famous work, the *Summa Theologiae* (completed in 1273), placed on the altar of the church where the meetings were held, alongside the Decretals, that is, the collection of authoritative papal letters on points of canon law, and the Holy Bible itself. In 1567, Pope Pius V (born Antonio Ghisleri, then Michele Ghisleri OP, 1504–1572) declared him *Doctor Angelicus* of the Church, hence making Aquinas one of the supreme interpreters of God's revelation, together with Saint Augustine of Hippo (354–430), Saint Ambrose of Milan (374–397), Pope Saint Gregory the Great (ca. 540–604) and few other noted Christian theologians. Significantly, as of 1880, Aquinas has also been the patron saint of all Catholic educational establishments.

Under Leo XIII, however, it was not Aquinas' theology that came to be adopted as the official intellectual basis for the education of the clergyman, the design of the curricula in Catholic schools and universities, and the overall approach to the interpretation of the Holy Scriptures. What was adopted via the encyclical *Aeterni Patris* was Aquinas' philosophy, that is to say, a neo-Aristotelian system of thought claiming that natural reason can grasp, unaided by faith, many truths about the world in which we live and, *a fortiori*, about ourselves qua worldly creatures.

To Aquinas, the world does not look like a valley of tears, but rather like a vast field of phenomena to be enjoyed, explored, and examined by our curious intellect, which is capable of great feats. As the renowned English novelist and Catholic apologist Gilbert Keith Chesterton (1874–1936) remarked in a 1933 book carrying the saint's own name as its title, Aquinas' philosophy shows considerable "optimism" about our fallen condition in the natural world. Instead of emphasizing our hopelessness as sinners and our much-needed reliance upon the grace of a merciful God for salvation's sake, Aquinas focuses upon the notion that a benevolent God created the world nonetheless. Aquinas claims that God sustains the same world throughout its history, so much that we human beings, albeit undeniably imperfect, possess the natural ability to comprehend much of it, including what we ought to do while we live in it. We are not lost in the dark. A light shines within us and sheds light around us: it is the light of our natural reason, or *"lumen rationis"* (Aquinas 1273: Ia, q12, a11).

As regards moral, legal and political conduct, Aquinas claims that we all have an immediate, indemonstrable and self-evident (*"per se notum"*) intellectual insight (*"intellectus"*) into the fundamental principle of just conduct, hence of law itself: "*Hoc est ergo primum praeceptum legis, quod bonum est faciendum et prosequendum, et malum vitandum.*" ("This is therefore the first principle of law: What is good is to be done and pursued; what is bad is to be avoided.") (Aquinas 1273: Ia IIae, q94, a2). The immediate corollary of this plain yet highly abstract principle is revealed in our "first inclination" to seek self-preservation and the context-specific means towards it. Anna Taitslin (2013: 53) calls this the "first order" of Aquinas' "natural law."

According to Aquinas, who regards descriptive and normative issues as two distinguishable but not separable aspects of the same reality, whatever exists does try and ought to try to endure. Persisting as ourselves through time is both an objective good and a good objective, which we share with all existing substances, in line with Aristotelian physics. As the mind can grasp the correct description of reality, so it can grasp the norms that we ought to follow.

God's world is so benevolently ordained, that we also possess further, diverse, less generic natural inclinations towards the good to be done and pursued, which human reason has little difficulty in grasping as being good and that human will, i.e., the appetitive faculty pertaining to reason, has little difficulty in pursuing. Aquinas lists several nonexhaustive examples. Some refer to goods to which we are inclined just like other animals, and that we recognize rationally as being good, e.g., "conjunction between man and woman and the upbringing of children, and similar things" (Aquinas 1273: Ia IIae, q94, a2). Others refer to goods that are peculiar to us qua rational creatures, such as knowing why the world exists and what purpose it may serve (i.e., the philosophers' natural knowledge of God), *"quod in societate vivat"* (i.e., our being quintessentially social creatures), to avoid ignorance, and not to offend other people whom we converse with (Aquinas 1273: Ia IIae, q94, a2).

The good can be had and pursued along several paths. In the Thomistic perspective, human nature comprises many components (e.g., the body, rational thought, desires); hence, the fundamental principle of law is bound to manifest itself differently through each of them, i.e., the justified principles of conduct to which rational *ergo* virtuous persons willingly submit themselves in their pursuit of what is good.

All the intuited goods are grasped by reason as sensible practical principles or maxims and by will as worthy ends, and they pertain to the second order of what Aquinas calls "natural law," namely, our participation in God's eternal law, which sustains and directs the world to its fulfillment. With little articulate reasoning and, in fact, instinctively (Aquinas does speak repeatedly of natural inclinations) and intuitively (Aquinas describes the principles above as the self-evident axioms of human conduct, akin to the indemonstrable first principles of logic), we all possess the basic awareness of what we must seek in order to attain happiness.

The ultimate goal of all life is in fact "*felicitas*" or "*beatitudo,*" in consonance with Aristotle's (384–322 BC) conception of *eudaimonia* (Aquinas 1273: Ia IIae, q90, a2). Unlike Aristotle, however, Aquinas argues that perfect happiness is not of this world and can only be attained post mortem. Yet as it was already in the philosophy of Aristotle, so it does follow for Aquinas too that the pursuit of happiness is as much an individual affair as it is a collective one:

> The ultimate aim of human life is happiness or beatitude... Therefore, the main concern of the law must be with directing towards beatitude. Once again, given that every part stands to the whole as incomplete stands to complete, and that individual human beings are each part of a complete community, the law's proper concern is necessarily to direct towards common happiness... i.e. to the common good. (Aquinas 1273: Ia IIae, q90, a2)

There is consequently a third order of the natural law that addresses the collective sphere of human life. Grasping instinctively and intuitively what is good is not the same thing as knowing how far, when and in combination with whose and which other considerations we should pursue it. Even sensing what *natura humana* consists in does not translate into immediate and obvious instructions on how to conduct ourselves in our daily lives. This deeper and more varied level of detail pertains to the third order of the natural law and it is what, according to Aquinas, Roman jurists understood as *ius gentium*, namely, the institutions that all nations, despite countless superficial differences, seem to have agreed upon, such as the punishment of crime, the regulation of ownership, or the celebration of religious festivals.

Reflection upon our natural inclinations and/or rational intuitions is required, in view of deciding how exactly to conduct ourselves together with other persons and be consistent with our innate pursuit of happiness. "Virtue," to which we are also inclined and upon which we rely "*ad bene vivendum,*" both with ourselves and in community, may require restraint, discipline, compromise, and even occasional denial of our natural inclinations (Aquinas 1273: Ia IIae, q94, a3).

Virtuous action demands practical reflection. "*[P]er rationis inquisitionem*" we can achieve a deeper and socially aware understanding of the goods that we seek and therefore move closer to eventual *felicitas* (Aquinas 1273: Ia IIae, q94, a3). As hard as it may prove at times, we can and must think rationally and reasonably in view of finding solutions to practical problems (as opposed to, for instance, the paralysis of personal agency that a skeptical line of reasoning could produce). Not any use of reason goes. We must follow instead the "*recta ratio,*" or correct reason, that is consonant to the rational order of the universe, of which we are a living part too (Aquinas 1273: Ia, q22, a2).

By means of correct reason, then, we can justify truly individual and collective agency, for we can determine which lines of conduct are the likeliest to approach genuine human happiness. For example, upon correct reflection, we come to realize: that we cannot be happy alone (cf. Aquinas' statement above on "common happiness"); that certain forms of economic life are more likely to generate widespread wellbeing (e.g., private property); and that we require a modicum of private freedom to pursue our aims virtuously (Aquinas 1273: Ia IIae, q59).

In nuce, upon further articulate reasoning about our natural inclinations and/or intuitions, involving also the study of the accumulated knowledge of past generations, the teachings of our mentors and the discussion of all such matters with our peers, we can reach clearer conclusions on more context-specific principles to be adopted, as well as the related aims to be followed. Together with other persons, we can grow in understanding and self-understanding, we can mature, and we can become wiser, hence capable of leading a more virtuous existence. We can even improve by correcting each other in a spirit of brotherly concern, like a "physician" attempting to "restore a sick person's health" by performing a painful surgery (Aquinas 1273: Ia IIae, q33, a6).

Whilst we can grasp what principles should guide human life, including social life, "human law" is going to be required in order to determine how to follow such principles under even more specific sociohistorical circumstances (Aquinas 1273: Ia IIae, q94, a5). Supplemental rational reflection is then going to be needed in order to apply these even more context-specific principles themselves to precise, particular instances. Think of our tactful use of a principle of good manners with a particularly grouchy old relative of ours on a grim day of November; or of a judge's determination of the meaning of an article of law *vis-à-vis* a given case debated in her court of law. They are examples of this final level, to which we can and must descend in our pursuit of that which is good.

Particular actions may well be understood in light of, and generalized into, abstract principles, but abstract principles are equally instantiated only in particular actions. Principles express and guide virtuous action in general, but only particular virtuous acts can embody and ground those principles. In a logical chain starting with the immediate data of consciousness (i.e., inclinations of our appetitive powers and/or intuitions of our intellectual powers), Aquinas moves from the universal and immutable "eternal law" sustaining the universe to the particular and ever-changing "human law," that is, to positive laws and the circumstantial complexities of their concrete application. Even if we can grasp the essence and purpose of human nature, Thomism duly recognizes the changing circumstances under which actual human beings lead their lives (Utz 1994).

Along this chain from universal to particular, however, all laws worthy of this name are derivations from the supreme principle whereby "What is good is to be done and pursued; what is bad is to be avoided." All truly binding principles by which to guide our behavior, individual as well as collective, originate therefrom: "*omnes leges, inquantum participant de ratione recta, intantum derivantur a lege aeterna*." (Aquinas 1273: Ia IIae, q93, a3) If the laws depart from the supreme principle, they lose their legitimacy, and resemble the arbitrary acts of tyrants: "*huiusmodi magis sunt violentiae quam leges*." (Aquinas 1273: Ia IIae, q96, a4) This is Aquinas' rendition of the canonists' motto *ius quia iustum* (as opposed to *ius quia iussum*): what is right is what is just, not what is commanded by some authority (Di Mauro 2006 and Merlo 2005).

On top of all the truths that natural reason can intuit and expand upon by means of "*recta ratio,*" God, in His infinite benevolence, gave us even more tools with which to approach partial happiness in this life and attain total happiness in the next. Like most contemporary academics do today, the heathen Aristotle had already confined himself to natural reason and the reasonable world that we can grasp with it. A man of Europe's devout medieval Christendom, Aquinas added to Aristotle's picture of the universe the revelation of divine truths (e.g., Jesus' moral teachings in the Gospels). Far from being irrational commands, Aquinas argues that these revealed divine truths more often confirm than disconfirm, and actually deepen our understanding of, the truths of reason. For example, natural reason's conclusions about happiness being possible only in community are confirmed and deepened by the New Testament's instruction to love others as we love ourselves (Aquinas 1273: IIa IIae, q22).

Nonetheless, it is also true that natural reason cannot grasp all of the available truths, since some pertain to a world beyond the earthly one and, especially, because they can refer to an otherworldly perfection to which we are destined and yet we cannot adequately fathom in this life. Thus does God reveal Himself not only within and throughout His rationally ordained creation but also by means surpassing the natural order of things, such as the Incarnation of His son Jesus Christ and the spiritual inspiration of the Prophets, of the blessed authors of the Holy Scriptures, of mystics, and individual mystical experiences.

According to his student and biographer Reginald of Piperno (ca. 1230–ca. 1290), Thomas Aquinas had one such mystical experience himself, in comparison to which he claimed that all his philosophical elucubrations seemed insignificant, or as worthy as mere straw: "*mihi videtur ut palea"* (Coleman 2015). Reason is left behind, in all of these cases, though it is never completely lost either. According to Aquinas' *Summa contra Gentiles* (completed around 1265), natural reason can still apply to the latter kind of revelation, albeit secondarily, insofar as reason can help us clarify divine truths by reflecting upon them, i.e., the discipline known as theology (Book I, Chaps. 3–6).

Pace the popular medieval doctrine of the double truth, which claimed that reason and faith attain true yet contradictory conclusions, Aquinas' philosophy displays no worry *vis-à-vis* the conclusions of either approach to God's revelation. According to Aquinas, the prolonged, careful and honest use of natural reason within the context of the learning accumulated by humankind's great minds throughout history cannot but lead to conclusions that are in harmony with those of the scriptural revelation. The world created by God may be complex and even baffling, but it is not contradictory. Both reason and faith have the same origin, the same fundamental ground of value, and the same glorious end-point, that is to say, God our Creator.

In theology, reason clarifies faith. In philosophy, both natural and moral, faith inspires reason. In the end, when all thorny issues have been studied and discussed by genuinely devoted scholars, there can only be conclusions that are consistent with God's providential plan for the wellbeing of the world and of ourselves, to whom the world was entrusted by its own Creator (Aquinas 1265: Chaps. 7–8). As a proof of this point, Aquinas makes repeated use of heathen philosophical sources, and of Aristotle in particular, whom Aquinas calls simply "the philosopher." Even pre-Christian sources, if properly understood, can help us reach conclusions that are consistent with the Christian faith. Chesterton's "optimism" is indeed a fitting descriptor of Aquinas' philosophical outlook.

Encyclicals

Encyclicals are letters on doctrinal matters addressed to all the bishops of the Catholic Church and they have played a key-role in expanding, expressing and explaining the *doctrina socialis*. In them, the popes synthesize and express the conclusions reached by past pontiffs, councils and reputed theologians, in detailed combination with Biblical, authoritative (e.g., Augustine's, John Chrysostom's, Aquinas'), pastoral and other Church documents (i.e., constitutions, decrees and declarations by ecumenical and pontifical councils, documents issued by congregations, the Holy See's charter of rights, canon law, the Catechism). References to international law are present too and they have become more and more frequent since the end of World War II, e.g., the *Charter of the United Nations* (1945) and the *Universal Declaration of Human Rights* (1948).

Several popes of the twentieth century issued encyclical letters on social matters, building upon the cornerstone set in place by Leo XIII in 1891. Prominent in this respect are Pius XI's (born Ambrogio Damiano Achille Ratti, 1857–1939) *Quadragesimo Anno* (1931), John XXIII's (born Angelo Giuseppe Roncalli, 1881–1963) *Mater et Magistra* (1961) and *Pacem in Terris* (1963), Paul VI's (born Giovanni Battista Enrico Antonio Maria Montini, 1897–1978) *Populorum Progressio* (1967), and John Paul II's (born Karol Jozef Wojtyla, 1920–2005) *Laborem Exercens* (1981), *Sollicitudo Rei Socialis* (1987), *Centesimus Annus* (1991) and *Evangelium Vitae* (1995).

In the twenty-first century, in addition to Benedict XVI's (born Joseph Aloisius Ratzinger, 1927) *Caritas in Veritate* (2009), Francis' *Laudato si'* (2015) stands out for tackling environmental issues, as mentioned above. Additionally, the Pontifical Council for Justice and Peace published in 2004 a *Compendium of the Social Doctrine of the Church*, which systematizes and reiterates the main tenets of this *doctrina socialis*.

The social doctrine of the Church has undergone many refinements, specifications and integrations over a relatively short life. Yet, a strong sense of continuity is built in each and all of the encyclicals, as also signaled by extensive cross-citations, recurrent publication dates (e.g., the 15th of May) and direct references in the titles (i.e., "on the fortieth year" and "on the hundredth year" [since the publication of *Rerum Novarum*]).

As economic considerations are concerned, there have been several recurring points of emphasis (e.g., workers' rights and dignity, the defense of private property, class cooperation) running throughout this well-established yet still-developing intellectual tradition, whose "Magna Charta" remains however "Leo's Encyclical" of 1891 (Pius XI 1931: para. 39). In this pivotal encyclical, Leo XIII describes and justifies an economic order that is alternative to both liberalism and socialism, soon to be known as "the third way" of the Church of Rome, variously undertaken by many politicians and political parties in the real world (Wilhelmsen 1978, Nuesse 1985 and Sandonà 2013).

The distinctiveness of Catholicism with regard to both liberalism and socialism had already been established in political theory by a book that had been successful among conservative Catholics after 1848, i.e., Juan Donoso Cortés' (1809–1853) *Essays on Catholicism, Liberalism, and Socialism* (1851). A progressive Catholic, Leo XIII reinforces nonetheless such distinctiveness.

On the one hand, the Pope argues that socialists are correct in their diagnosis of the ills of contemporary society. According to Leo XIII (1891: para. 3), there is no denial that "a small number of very rich men have been able to lay upon the teeming masses of the laboring poor a yoke little better than that of slavery itself," primarily by abolishing "the ancient workingmen's guilds. . . in the last century, and no other protective organization [taking] their place." Additionally, "[p]ublic institutions and the laws [have] set aside the ancient religion" in the name of an alleged individual freedom (of contract, enterprise, etc.) that, in actuality, means "the hardheartedness of employers and the greed of unchecked competition. . . increased by rapacious usury. . . practiced by covetous and grasping men" (para. 3).

On the other hand, socialists are mistaken in the remedy they wish to employ. As Leo XIII argues: "the main tenet of socialism, community of goods, must be utterly rejected, since it only injures those whom it would seem meant to benefit, is directly contrary to the natural rights of mankind, and would introduce confusion and disorder into the commonweal" (para. 15).

Leo XIII's critique of socialism is based upon the justification of private ownership as the most rational means of utilization of God's Creation for the wellbeing of humankind at large (paras. 4–14). Private ownership is deemed consonant with our natural inclination towards searching for, and deriving enjoyment from, the private possession of things beneficial to us and to our beloved ones. The institution of private property is per se a sign of natural rationality, not of sinful greed. In addition, it is said to spur industrious behavior and ingenious productivity. Finally, it is also said to facilitate the orderly organization and effective division of labor within society: "The law, therefore, should favor ownership, and its policy should be to induce as many as possible of the people to become owners" (para. 46).

Private ownership should be widespread and entrepreneurship thrive, so that persons may grow in perfection by exercising their freedom and diverse abilities responsibly (e.g., by running cooperative enterprises, which are still present in many Catholic countries). Liberty, albeit important, does not reign supreme. Responsible acceptance of good restraints to freedom is a standard feature of Catholic, if not Christian thought. Even from John Milton's (1608–1674) radically Protestant and anti-Catholic perspective, to seek freedom above all was Satan's misguided aim. As he wrote in his *Paradise Lost* (book I, verses 258–259 and 263): "…*Here at least/We shall be free… Better to reign in hell, than serve in heaven*."

Society's needs, including its internal equilibrium, and other people's needs, their dignity included, are among such restraints, *contra* the commonplace liberal emphasis on individual liberty, as exemplified by Jeremy Bentham's (1748–1832) social atomism. As Bentham writes in his 1789 *Introduction to the Principles of Morals and Legislation* (Chap. I, para. 5): "the community is a fictitious body, composed of the individual persons who is considered as constituting as it were its members. The interest of the community then is, what is it? – the sum of the interests of the several members who compose it." Nothing could be further removed from the Church's communal understanding of the human person who, along Aristotelian and Thomist lines of thought, can only flourish by way of social embeddedness and self-understanding.

Within this Aristotelian and Thomist conceptual framework, workers should seek lawful gain through lawful employment, which is a requirement for human wellbeing and personal dignity, but also a call to responsible behavior. To make sure that such a behavior occurs (e.g., no damaging strikes, no Luddite sabotage of machineries), Leo XIII does not stress top-down factory discipline, as commonplace as that theme may have been in his day. Quite the opposite, he discusses the notion that entrepreneurs and workers should come together and cooperate in as many peaceful bottom-up associations as their intelligent creativity is capable of (i.e., what will come to be known in the *doctrina socialis* as the principle of *subsidiarity*), holding things privately and pursuing profit, but always *cum grano salis*, i.e., without compromising morals, family life, general wellbeing, social cohesion and international peace.

As Catholic economist Hilaire Belloc (1870–1953) argued in his 1912 *magnum opus*, *The Servile State*, the main problem with early-twentieth-century capitalism was the concentration of wealth with, and ensuing political clout of, few super-rich, not private property per se. There were too few owners, in essence; hence, inspired by *Rerum Novarum*, Belloc joined forces with G.K. Chesterton and established an Anglo-Irish 'third way' known as "distributism."

The key-thinker cited in support of Leo XIII's justification of private ownership is "St. Thomas Aquinas," for whom "[p]rivate ownership" is "the natural right of man," and indeed one that "is not only lawful, but absolutely necessary" for the wellbeing of human societies (Leo XIII 1891: para. 22). As regards the responsible use of the privately owned goods, Leo XIII follows once more "the same holy Doctor," according to whom "Man should not consider his material possessions as his own, but as common to all, so as to share them without hesitation when others are in need. Whence the Apostle with, 'Command the rich of this world... to offer with no stint, to apportion largely'" (para. 22). One may enjoy what "is required for his own needs and those of his household; nor even to give away what is reasonably required to keep up becomingly his condition in life," but "when what necessity demands has been supplied, and one's standing fairly taken thought for, it becomes a duty to give to the indigent out of what remains over" (para. 22).

In relation to the duty to redistribute superfluous wealth lies then another critique, this time of the liberal and capitalist practices and theories, which show none of "the solicitude of the Church... [and her] preoccup[ation] with the spiritual concerns of her children as" well as "their temporal and earthly interests" (para. 28). Capitalism cares for neither. On the contrary, "the Church's desire is that the poor... should rise above poverty and wretchedness, and better their condition in life" (para 28). The poor are not the instrumental, expendable, defeated social atoms in the utilitarian, materialist, Darwinian competition for survival dictated by modern market economies. They are persons, created in the image of God Himself, whose dignity must be respected, even if doing so may reduce the entrepreneurs' pecuniary profits and the investors' return on equity ratio.

Consistently with this conception of human dignity, the Church of Rome, since her earliest history, "intervenes directly in behalf of the poor, by setting on foot and maintaining many associations which she knows to be efficient for the relief of poverty," and she exerts unswerving pressure, both direct and indirect, upon individual consciences, governments and institutions, so that the common good be truly served, not just the private good of a select few (para. 29).

Leo XIII offers even a theory of the State, so as to specify the nature, aims and modalities of the good State, i.e., the legitimacy of the fountainhead of law itself and of the sociohistorical precondition for any complex economy; and he concludes:

> The foremost duty, therefore, of the rulers of the State should be to make sure that the laws and institutions, the general character and administration of the commonwealth, shall be such as of themselves to realize public wellbeing and private prosperity. This is the proper scope of wise statesmanship and is the work of the rulers. Now a State chiefly prospers and thrives through moral rule, well-regulated family life, respect for religion and justice, the moderation and fair imposing of public taxes, the progress of the arts and of trade, the abundant yield of the land-through everything, in fact, which makes the citizens better and happier. (para. 32)

Again, Leo XIII's key-thinker of reference is "St. Thomas Aquinas" and his understanding of "justice," which:

> [D]emands that the interests of the working classes should be carefully watched over by the administration, so that they who contribute so largely to the advantage of the community may themselves share in the benefits which they create-that being housed, clothed, and bodily fit, they may find their life less hard and more endurable. It follows that whatever shall appear to prove conducive to the wellbeing of those who work should obtain favorable consideration. There is no fear that solicitude of this kind will be harmful to any interest; on the contrary, it will be to the advantage of all, for it cannot but be good for the commonwealth to shield from misery those on whom it so largely depends for the things that it needs. (para. 34)

Protecting and promoting the real human interests of the working people and their families are not a mere matter of natural or human justice. They are a matter of divine justice too: "to exercise pressure upon the indigent and the destitute for the sake of gain, and to gather one's profit out of the need of another, is condemned by all laws, human and divine. To defraud any one of wages that are his due is a great crime which cries to the avenging anger of Heaven" (para. 20).

Leo XIII's "preferential option for the poor," which has come to connote the Church of Rome's *doctrina socialis* to a unique extent, applies to the issue of rights as well (Munrion 1989: 847). Inequality in wealth translates into inequality of power, political as well as contractual, as vividly exemplified by the "harder conditions" in "wages… hours of labor… [or] sanitary precautions" that many a "working man" must accept out of "fear of a worse evil" under alleged "free agreements" (Leo XIII 1891: para. 45). The Pope wishes not to hide the "force and injustice" of such circumstances, which were far from uncommon in the liberal societies of his day (para. 45). Rights cannot be considered equal among individuals belonging to different classes just because, formally, all citizens are said to be equal. Legitimacy is no sheer matter of formal adherence to the letter of the law, but of substantive reflection in the laws of the country of that one natural law that, as humankind is concerned, constitutes our chief institutional participation in God's eternal law.

Therefore, in addition to personal conscience, trade unions and other subsidiary bodies, the State itself must make sure that abuses do not occur behind, beyond, or beneath the laws that apply at any specific point in time, taking full consideration of the concrete disparities in wealth and power characterizing historical societies:

> Rights must be religiously respected wherever they exist, and it is the duty of the public authority to prevent and to punish injury, and to protect every one in the possession of his own. Still, when there is question of defending the rights of individuals, the poor and badly off have a claim to especial consideration. The richer class have many ways of shielding themselves, and stand less in need of help from the State; whereas the mass of the poor have no resources of their own to fall back upon, and must chiefly depend upon the assistance of the State. And it is for this reason that wage earners, since they mostly belong in the mass of the needy, should be specially cared for and protected by the government. (para. 37)

Should the State fail in its protective and ameliorating duties, then violent sedition and even revolution could ensue. That is not a prospect that the Church wishes to facilitate.

In more specific formulations, the rights that Leo XIII considers the bedrock for the legitimacy of the political and economic order are those: "of God," i.e., conscience and worship (para. 40); "rest" (para. 41); health and safety on the workplace, especially when "children" and "women" are involved (para. 42); children's "education" (para. 42); forming families and "the bringing up of children" (para. 42); fair and adequate "wages" (paras. 43–46); the enjoyment of one's own remuneration via fair and light taxation (para. 47); "association" with fellow workers and other citizens in "unions" and any other intermediate bodies upon which human society rests for its prosperity (paras. 48–59); assistance in case of "sickness," injury, or "death," e.g., as "widow[s]" and "orphans" (para. 48); care for "young people, and those more advanced in years" (para. 48).

Some of these human rights are now firmly enshrined in international (e.g., the UN's International Covenant on Economic, Social and Cultural Rights) and national laws (e.g., constitutions) and praxes, but in 1891 they were by no means uncontroversial (Gayim 2016). Right-thinking liberals like Herbert Spencer (1820–1903) and his many followers, for example, had been criticizing loudly as unwarranted State "interference" in market equilibria nearly all the primeval forms of welfare provision that had been surfacing across the industrialized nations, especially in the later decades of the nineteenth century:

> [T]o administer charity, to teach children their lessons, to adjust prices of food, to inspect coal-mines., to regulate railways, to superintend house-building, to arrange cab-fares, to look into people's stink-traps, to vaccinate their children, to send out emigrants, to prescribe hours of labor, to examine lodging-houses, to test the knowledge of mercantile captains, to provide public libraries, to read and authorize dramas, to inspect passenger-ships, to see that small dwellings are supplied with water, to regulate endless things from a banker's issues down to the boat-fares on the Serpentine. (Spencer 1960: 162)

Liberal disapproval notwithstanding, none of the successive encyclical has either challenged or contradicted the statements contained in *Rerum Novarum*. Rather, sedimentation of the original claims and integration with additional remarks have gradually taken place, typically in light of specific historical phenomena calling for special attention (e.g., the Great Depression, the Cold War, postcolonialism, globalization). After all, according to his successor Pius XI (1931: paras. 2–3), the slavery-like condition of the working class during the nineteenth century was precisely what had already driven Leo XIII to tackle:

> [T]hat difficult problem of human relations called 'the social question'... [i.e.] human society was clearly becoming divided more and more into two classes. One class, very small in number, was enjoying almost all the advantages... the other, embracing the huge multitude of working people, [was] oppressed by wretched poverty.

Leo XIII's 1891 encyclical is even praised by Pius XI for having led many governments to seek long-lasting ameliorations (e.g., social insurance, old-age pensions), which had only been rare and episodic before 1891 (para. 26). Without *Rerum Novarum*, perhaps, there would be no welfare states and/or provisions, at least as we know them today.

Pius XI's own 1931 *Quadragesimo Anno* echoes Leo XIII's critique of "Socialism" and "Communism," which by that year had taken hold of much of the former Tsarist Empire (paras. 15 and 112). The encyclical restates forcefully the importance of subsidiary, bottom-up human "associations" in all forms, including "labor unions" (paras. 15 and 35). The Thomist distinction between "the right of property" and "its use" is also reaffirmed forcefully, stressing "the social character of ownership," i.e., its being meant to serve ultimately "the common good" and not exclusively someone's private good (paras. 47 and 49). Once again, "the Angelic

Doctor" is recalled as the key-thinker on the subject whereby to "deduce" viable solutions (para. 51).

Above all, class cooperation is praised and "social justice – a term that we owe to Leo XIII's mentor Taparelli (1851) as an insightful recasting of Aristotle's "general justice" and Aquinas' "legal justice" – is here elected to supreme norm of "the common good" itself, for the latter cannot be attained without the former being in place (Pius XI 1931: para. 58).

"[C]ooperation" is praised at the international level too, hence not only among different socioeconomic classes within the same nation (para. 89). Conversely, grave inequality is condemned harshly as an attack upon human dignity and verily the fuel of dangerous "agitators of revolution" (para. 62). The excessive "concentration" of wealth, especially in the hands of few "trustees and managing directors of invested funds" is condemned too, insofar as the Pope writes of "an immense power and despotic economic dictatorship" run by "competitors" who behave selfishly and where "only the strongest survive," while ethical "conscience" becomes an unknown personal experience (paras. 105 and 107).

These greedy men's "deadly and accursed internationalism of finance" and "international imperialism" cannot but corrupt souls, governments and world peace, according to the Pope, for they make all subservient to the blind pursuit of pecuniary wealth (para. 109). Then, these evils must end. In order to achieve the end of such evils, which are as much a systemic international issue as they are a matter of personal responsibility, "two things are especially necessary: reform of institutions and correction of morals" (para. 77).

A novel feature is thus introduced in *Quadragesimo Anno*, which will come to characterize the Church of Rome's "third way" most distinctively, namely, the idea that "[w]orkers and other employees" should "become sharers in ownership or management or participate in some fashion in the profits received" (para. 65). Such an arrangement would foster class cooperation, insofar as both the benefits and the risks of free competitive enterprise would then apply to the employees as well as to employers, and the legitimacy of the economic and business orders would thereby be strengthened.

Cooperation between employer and employee is also advised in "determining the amount of wage to be paid out, so that the employee is "paid a wage sufficient to support him and his family," yet without crippling the entrepreneur's enterprise, in which the employee has a significant stake too (paras. 71 and 72). Another analogous integration is the consideration of how "the wage and salary rate" must be agreed upon in order to guarantee as much employment as possible, striking a balance between decent wages and the citizens' legitimate aspiration of "getting work" (para. 74).

The core element is then cooperation between classes, each of which must accept a modicum of restraint in order for the community to prosper. Consistently, the liberals' "evil individualistic spirit" and their empirically mistaken belief in the necessarily beneficial "free competition of forces [of production]" are criticized for destroying "the unity of human society" and "the social and moral character of economic life" that any sensible economic order should actually pivot around (para. 88). Giving free rein to such spirit and unchecked forces means creating “unquenchable thirst for riches and temporal goods” (i.e., greed) and “instability,” that is, the personal and systemic conditions for the collapse of market economies, whose legitimacy is then cast into jeopardy (para. 88).

By 1931, men and women as old as Pius XI had witnessed more than abundantly the havoc that could spring from heartless individualism and the brainless invisible hand of the competitive free market, including the violent responses that they could elicit among the countless losers. Not only there had been the collapse of the liberal world order built upon the gold standard, the imperialist slaughters of World War I, the failed attempt to restore the pre-war liberal order, and the eventual crash of Wall Street with the ensuing Great Depression. There had also been revolutions and uprisings throughout the world: “let all remember that Liberalism is the father of this Socialism that is pervading morality and culture and that Bolshevism will be its heir” (paras. 122 and 132).

Pius XI writes vehemently against these doctrines as poisonous fountains of deplorable conflict and of avoidable struggle. Cooperation should be the rule instead. Exemplarily, “[s]trikes and lock-outs” should be “forbidden” and disagreeing parties pressured to “settle their dispute” or, if incapable of it, accept the intervention of “public authority” (para. 94). People’s “minds and hearts” must strive for mutual understanding and cooperation between classes and among persons, i.e., there must exist a culture of love, charity and brotherhood, which Christianity has long been cultivating (i.e., what is going to be called, as of *Mater et Magistra*, the principle of *solidarity*): “If this bond is lacking, the best of regulations come to naught” (para. 137). Morally deficient persons can squander the best institutional set-up.

Thirty years later, John XXIII’s *Mater et Magistra* will further confirm all these fundamental concepts: the morally wrongful and socially disruptive character of great inequality; the right to and the proper use of private property for the sake of both private and common good; the importance of private initiative; the importance and dignity of work as the best way for persons to lead a genuinely human existence; the justified intervention of the State, whose entire “raison d’être is the realization of the common good in the temporal order” (para. 20); the principles of subsidiarity and solidarity; the errors of rebellious socialism; the horrors of hedonistic individualism; the importance of fair and adequate wages; the necessity of class cooperation, including co-ownership and co-management of enterprises; the desirability of international cooperation; the requirement of fair taxation; the condemnation of usurious banking, especially when credit could be directed cheaply and sensibly to spurring genuine human development instead.

Once again, a society’s moral culture and interpersonal fabric is deemed an essential precondition for well-functioning institutions, including economic ones:

> First consideration must obviously be given to those values which concern man’s dignity generally, and the immense worth of each individual human life. Attention must then be turned to the need for worldwide co-operation among men, with a view to a fruitful and well-regulated interchange of useful knowledge, capital and manpower. (para. 192)

New aspects appear in this encyclical, though, and they are: the recognition of growing opportunities (e.g., in agriculture) and threats arising from modern science-technology (e.g., in weapons of mass destruction, dealt with extensively also in *Pacem in Terris*); the hopes and challenges of newly independent countries that used to be Western colonies; the pluses and minuses of fast-growing means of mass communication; the acceptability of "public ownership" of strategic resources and price controls in the name of the common good (para. 116); and the dramatic imbalance between agriculture and industry, which is given much attention in the encyclical and leads John XXIII to conclude:

> [C]onsiderable thought must be given, especially by public authorities, to the suitable development of essential facilities in country areas—such as roads; transportation; means of communication; drinking water; houseing; health services; elementary, technical and professional education; religious and recreational facilities; and the supply of modern installations and furnishings for the farm residence. Such services as these are necessary nowadays if a becoming standard of living is to be maintained. (para. 127)

The encyclical is also the first one to adopt fully the language of international human rights law, which was flourishing by then within "the International Labor Organization" and the United Nations, where Vatican and Catholic experts operated at high levels of influence (para. 103). The Pope speaks in this respect of "personal rights, especially those which we call economic and social and which pertain to the necessities of life, health care, education on a more extensive and improved basis, a more thorough professional training, housing, work, and suitable leisure and recreation" (para. 61).

Similarly, *Mater et Magistra* is also the first one to consider seriously environmental issues and the danger of humankind's much-praised economic development "destroying nature" (para. 197). Macroeconomic indicators must be taken with a pinch of salt, for they do not grasp the fundamental ground of value that legitimizes economic activities. The dignified life of persons, present and future, is the real aim, while securing the socioeconomic and environmental preconditions for such a life, as it is expressed in the language of human rights (civil, political, economic, social, and cultural), is the means to achieve it.

Even more explicit about human rights, including economic ones, qua articulations of the natural law, is John XXIII's 1963 encyclical *Pacem in Terris*, where the Church of Rome lists and defines the human being's "rights and duties, which together flow as a direct consequence from his nature," i.e., our being "person [s]... endowed with intelligence and free will" (para. 9). As economic rights are concerned, the encyclical states:

> Man has the right to live. He has the right to bodily integrity and to the means necessary for the proper development of life, particularly food, clothing, shelter, medical care, rest, and, finally, the necessary social services. In consequence, he has the right to be looked after in the event of ill-health; disability stemming from his work; widowhood; old age; enforced unemployment; or whenever through no fault of his own he is deprived of the means of livelihood. (para. 11).

Furthermore:

> In the economic sphere, it is evident that a man has the inherent right not only to be given the opportunity to work, but also to be allowed the exercise of personal initiative in the work he does. The conditions in which a man works form a necessary corollary to these rights. They must not be such as to weaken his physical or moral fibre, or militate against the proper development of adolescents to manhood. Women must be accorded such conditions of work as are consistent with their needs and responsibilities as wives and mothers. A further consequence of man's personal dignity is his right to engage in economic activities suited to his degree of responsibility. The worker is likewise entitled to a wage that is determined in accordance with the precepts of justice. This needs stressing. The amount a worker receives must be sufficient, in proportion to available funds, to allow him and his family a standard of living consistent with human dignity. (paras. 19–21)

To these human rights, upon which persons' dignity depends, the encyclical adds "The Right to Emigrate and Immigrate" qua legitimate member "in the human family" and citizen of "universal society," i.e., "the common, world-wide fellowship of men" (para. 25).

In all these cases, emphasis is not placed upon these rights being individual and the result of some hypothetical social contract, or even upon the historical horrors that led to their eventual institution (e.g., the Great Depression, fascism, World War II, Stalinism). Rather, *Pacem in Terris* asserts that they are the formal expression in our times of "the moral order" established by God, i.e., His eternal law, and "the unfailing observance of its precepts" that our rational recognition of this order commands, i.e., "in accordance with the principles of the natural law" (paras. 85 and 160). Once again, Thomas Aquinas is cited as a key-reference on the subject (paras. 38 and 51).

Paul VI's 1967 *Popolorum Progressio* opens by acknowledging its predecessors and expands upon John XXIII's remarks on the hopes and challenges of newly independent countries that used to be Western colonies: "those peoples who are trying to escape the ravages of hunger, poverty, endemic disease and ignorance; of those who are seeking a larger share in the benefits of civilization and a more active improvement of their human qualities; of those who are consciously striving for fuller growth" (para. 1).

Postcolonial development is thus addressed in light of the now firmly established notions concerning: the proper use of private property; the pursuit of full human growth; the dangers of "unbridled liberalism" (with a direct reference to Pius XI's "international imperialism of money"; para. 26); the intrinsic nobility and importance of work in cooperation with all fellow humans; the rejection of violent revolutionary solutions; and the positive role that the State can play in all of this.

Paul VI adds to the issues discussed by his predecessors an articulate analysis of the dangers arising from having too much faith in technological solutions, or "technocracy, as it is called" (para. 34). Special emphasis is then placed upon the desirability of an all-round "education" nurturing all aspects of human personality, including moral and spiritual ones, seeking "literacy" at first, then the transmission of "cultural tradition[s]," but also and above all "a full-bodied humanism" (paras. 35, 40 and 42). A highly cultured scholar, Paul VI regarded education as a fundamental precondition for true human prosperity: “Lack of education is as serious as lack of food” (para. 35).

In connection with postcolonial development, wealthy nations have obligations analogous to those that Aquinas attributed to a wealthy person *vis-à-vis* her unfortunate fellows:

> The rule, by virtue of which in times past those nearest us were to be helped in time of need, applies today to all the needy throughout the world. [. . .] [T]he human and supernatural brotherhood of man, and present a three-fold obligation: 1) mutual solidarity—the aid that the richer nations must give to developing nations; 2) social justice—the rectification of trade relations between strong and weak nations; 3) universal charity—the effort to build a more humane world community, where all can give and receive, and where the progress of some is not bought at the expense of others. (paras. 44 and 49)

The fulfilment of such duties is not a mere institutional or technical matter, or even a sheer point of self-interested convenience and foresight, but a cultural and moral one. Without such a cultural and moral component, which the Church of Rome claimed then to have kept alive for almost two millennia, the international economic system is deemed inherently incapable of putting billions of human lives and their happiness before the pecuniary interests of the wealthy few. The ultimate legitimacy of the international economic order depends on getting this axiological hierarchy right, which is not the case when the fundamental principles of legal and socioeconomic systems are socialist or liberal.

Specifically, the mistaken axiology typical of the capitalist order was exemplified in the 1960s by the desperate plight of poorer countries “overwhelmed by debts whose repayment swallows up the greater part of their gains” (para. 54). Once again, liberalism is targeted and criticized forcefully in *Popolorum Progressio*:

> [T]he principle of free trade, by itself, is no longer adequate for regulating international agreements. It certainly can work when both parties are about equal economically. . . But the case is quite different when the nations involved are far from equal. Market prices that are freely agreed upon can turn out to be most unfair. (para. 58)

The Pope’s critique is not backed by Biblical injunctions, but by Thomist reasoning upon “justice,” whereby “the rule of free consent remains subservient to the demands of the natural law” (para. 59). Equality in the freedom to enter into a contract is no real freedom, if prior gross inequality in access to means of life, income and education subsists.

When Pope John Paul II started his pontificate, the *doctrina socialis* had already taken an articulate and well-defined shape. His encyclicals deepen, rather than expand, this shape. His 1981 *Laborem Exercens*: deploys once more “the well-known arguments of the *Summa Theologiae* of Saint Thomas Aquinas”; recalls “proposals for joint ownership of the means of work, sharing by the workers in the management and/or profits of businesses, so-called shareholding by labour, etc.”; but above all stresses at length the importance of work in healthy, dignified and truly human conditions, for it is through work that persons realize much of themselves in this life (para. 14). Persons must be then "the subject of work," not its "object," as it results instead from "the various trends of *materialistic* and *economistic* thought" that reduce them to "an instrument of production" or "merchandise" to be bought and sold (para. 6).

Both "socialism" and "capitalism" are to be blamed in this perspective: persons are for the former pawns to be used by State authorities, whilst the latter acknowledges them only and insofar as they bring in profits (para. 6). "Rights" are also listed and discussed, which include: "human rights as a whole, which are connatural to man" (para. 16); fair "wages and other social benefits" facilitating in particular family life, motherhood, and the rearing of children (para. 19); and the "importance of unions" in connection with subsidiarity, "social justice," "social order," "solidarity,"and "the common good" (para. 20).

Truly novel is only the explicit inclusion of the rights "of disabled people," who "should be helped to participate in the life of society in all its aspects and at all the levels accessible to their capacities" (para. 22). Whereas the Church of Rome had been providing care to the handicapped and the mentally ill for centuries (Neugebauer 1978), this is the first encyclical in which their care is understood in terms of human rights.

John Paul II's 1987 *Sollicitudo Rei Socialis* follows the path initiated by Paul VI's *Popolorum Progressio*, and examines postcolonial, third-world or even "Fourth[-] World" reality from a Catholic perspective, lamenting the "gap" between the "developed North" and the underdeveloped "South," which suffers from "an unacceptable delay" (para. 14).

The dignity of work is stressed further, qualifying inadequate conditions also in terms of "underemployment" and not just "unemployment," exploitative employment practices, and woefully meagre wages (para. 18). "[I]nternational debt" and its discontents are analyzed as well and to a considerable extent, and so are many other socioeconomic trends of the contemporary world, some of which are condemned sternly despite prevalent views among the laity (para. 19). For instance, the encyclical discusses the many "campaigns against birth" imposed upon the poor in developing nations, i.e., de facto "racist forms of eugenics" (para. 25; an even stronger condemnation of abortion and other life-ending practices is articulated in the same Pope's 1995 *Evangelium Vitae*).

"Marxist collectivism" is deplored on the one side, while on the other side the Pope deplores "the so-called civilization of 'consumption' or 'consumerism'" typical of the late-modern capitalist economic order, "which involves so much 'throwing-away' and 'waste'" (John Paul II 1987: paras 20 and 28; *Evangelium Vitae* extends this careless destruction to embryos and the dying; *Laudato si'* to the Earth's ecosystems). Neither philosophy can bring forth the "authentic human development" that the Church's 'third way' recommends in her *doctrina socialis* and that alone can truly justify an economic order and its business activities (para. 27). Although complete perfection is not possible in this life, the Catholic doctrine assumes the possibility of progressive improvement, or at least of worthy attempts in this sense.

The 1991 encyclical *Centesimus Annus* celebrates *Rerum Novarum*, outlines its main elements, and then leads an analogous examination of "the actual condition of the working class" in light of the continuing moral collapse of liberalism and the recent political collapse of "Real socialism" (paras 12 and 13). All essential tenets of the *doctrina socialis* are reiterated and contextualized in the changing conditions of the increasingly postcommunist world of liberal "globalization" (para. 58). The prescience of *Rerum Novarum* with regard to the intrinsic contradictions of socialism is praised and appraised, the Polish pontiff almost reveling in the defeat of one of the Church's historic adversaries.

The other adversary, however, is still going strong, if not even stronger, and "the human inadequacies of capitalism and the resulting domination of things over people are far from disappearing" (para. 33). This is why the encyclical launches into a detailed reiteration of the correct understanding of private property, along Thomist lines, as well as of, inter alia, the dignity of work, "the fundamental rights of workers," the correct understanding of the final purpose of business life and entrepreneurship (i.e., "the common good"), the insufferable burden of excessive debt, the inanity of consumerism, "the irrational destruction of the natural environment," and the inability of the "free market" to satisfy "fundamental human needs" (paras. 6, 34, and 38).

John Paul II reminds the reader of the fact that "[p]rofit is a regulator of the life of a business, but it is not the only one; *other human and moral factors* must also be considered which, in the long term, are at least equally important for the life of a business" (para. 35; emphasis in the original). Novel, within this critique of liberalism, is the recognition of "the possession of know-how, technology and skill" as a "form of ownership which is becoming no less important than land" in older manifestations of capitalism (para. 32). Original is also the use of Karl Marx's (1818–1883) concept of "alienation" in connection with the senseless consumerist prioritization of "individual and secondary needs" over "principal and authentic" ones, which a modicum of education, humanistic culture, and the cultivation of the moral and spiritual aspects of the human person can easily disclose to human reason (para. 41).

Benedict XVI, in his 2009 encyclical *Caritas in Veritate*, opposes vocally the standard conception of *homo oeconomicus* of orthodox economics and argues in unsurprising Thomist fashion that "justice must be applied to every phase of economic activity, because this is always concerned with man and his needs. Locating resources, financing, production, consumption and all the other phases in the economic cycle inevitably have moral implications. Thus every economic decision has a moral consequence" (para. 37).

Francis' 2015 *Laudato si'* expands the worries and reasoned considerations of his predecessors about the lack of guiding axiological standards, and therefore genuinely good aims, for technological and economic development. Without a substantive notion of the good and, in particular, of the human good, the immense power over nature acquired by humankind is bound to spiral out of control, outside as well as inside human societies. This spiraling needs no complex demonstration: the ecological collapse of the planet and the instability caused by the virtualization of the world's capitalist economies are far too manifest not to be seen in the 2010s. People die because of them, whether hit by torrential floods and terrible draughts, or by social services denied in the name of debt repayment to vulture funds and of speculative maneuvers on national currencies.

Even the necessities of life, which the encyclical casts in terms of "rights," can be made scarcer by the combination of ecological devastation and capitalists "maximizing profits" as an end in itself (para. 109):

> Even as the quality of available water is constantly diminishing, in some places there is a growing tendency, despite its scarcity, to privatize this resource, turning it into a commodity subject to the laws of the market. Yet access to safe drinkable water is a basic and universal human right, since it is essential to human survival and, as such, is a condition for the exercise of other human rights. Our world has a grave social debt towards the poor who lack access to drinking water, because they are denied the right to a life consistent with their inalienable dignity. (para. 30)

If the political rulers do not wake up and step up to their responsibilities, this sort of ecological and economic degeneration can only but worsen. Both each present and future person's "basic and inalienable rights ordered to his or her integral development" are at stake, as well as those of "peoples and cultures" at large (paras. 144 and 157). As Pope Francis states:

> Politics must not be subject to the economy, nor should the economy be subject to the dictates of an efficiency-driven paradigm of technocracy. Today, in view of the common good, there is urgent need for politics and economics to enter into a frank dialogue in the service of life, especially human life. Saving banks at any cost, making the public pay the price, foregoing a firm commitment to reviewing and reforming the entire system, only reaffirms the absolute power of a financial system, a power which has no future and will only give rise to new crises after a slow, costly and only apparent recovery. The financial crisis of 2007–2008 provided an opportunity to develop a new economy, more attentive to ethical principles, and new ways of regulating speculative financial practices and virtual wealth. But the response to the crisis did not include rethinking the outdated criteria which continue to rule the world. Production is not always rational, and is usually tied to economic variables which assign to products a value that does not necessarily correspond to their real worth. (para. 189)

Conclusion

It is because of statements like the ones above that the current Pope has been "accused" of being a "Marxist" in the US popular press, which presumes of course that being a Marxist is something to be ashamed of (e.g., Thomas 2015). Yet, as this brief survey of the social doctrine of the Church must have made clear by now, Francis is merely reiterating an official stance – a third way – which is at least as old as *Rerum Novarum*, or perhaps Aquinas' *Summa Theologiae*, if not even as old as the founder of Christianity.

In its own way, the Catholic *doctrina socialis* replicates, at least to some extent and certainly among certain publicly heard sociopolitical groups, the ethically radical character of the Christian religion in much of its history. As a thought experiment, for one, the readers may want to consider which choice would be personally more radical and socially more transgressive today, were their own children to become religiously motivated Catholic or Anglican nuns, Christian ministers of religion or lay friars, rather than economically self-maximizing stock-brokers, tough businesspeople, or allegedly rebellious scantily clad twerking pop stars. When taken seriously, a number of Christian teachings – though not necessarily all or only Catholic ones – can still be "*scandal to the Jews* and *folly to the Gentile,"* as Saint Paul stated a long time ago (*I Cor* I: 22–24).

Theology, Responsibility, and Business Legitimacy

Contents

Abstract

We seem to know what business is, but what does "theology in business" mean? In this paper, I want to show how our contemporary understanding of "business legitimacy" can be translated to the theological concept of "love of your neighbor" which means responsibility toward other human beings. Only if you act responsibly and accountable in your relationships, including economic relationships, are you legitimate in your acts. Responsibility and accountability is a web of relationships. This paper focuses on how responsibility has been interpreted in Protestantism, particularly with regard to the reformed theologian's, Martin Luther, understanding of responsibility in economy. With the rising capitalism of the Renaissance, new politics was asked for, and intellectual discussions on

https://doi.org/10.1007/978-3-030-14622-1_47

fairness and justice were part of that. Further, I want to show how this theological understanding of business legitimacy as responsibility is both (1) an invisible underpinning of contemporary business legitimacy and (2) a concept of justice which seems to have disappeared from contemporary, neoliberal debates around economy and business legitimacy.

Keywords

Theology · Responsibility · Economy

Introduction

We seem to know what business is, but what does "theology in business" mean? In this chapter, I want to show how responsibility and accountability in business is deeply embedded in theology, particularly as a question of responsibility toward others (e.g., Jonas 1984, see also Rendtorff 2016a, 2016b, 2018; Joas 2017). Responsibility and accountability with regard to others also goes for the way we do business. Willmott has formulated it like: "Accountability is at the center of human relations and interactions" (1996).

The topic of responsibility in business was highly debated by reformed theologians like Martin Luther (1483–1546) in the sixteenth century. Still, our contemporary understanding of "business legitimacy" has roots in the theological concept of responsibility toward others, basically the love of your neighbor. In a theological epistemology, the claim is that you are only legitimate in your acts if you act responsible in your relationships, including economic relationships. The ambition of the chapter is to show the theological roots of contemporary discussions around responsibility in business today. Further, I want to illustrate how one particular dimension of responsibility, namely, justice, has disappeared in contemporary neoliberal thinking. The dimension of a higher justice used to be ordinary in reflections on economy. This particular dimension has vanished from our contemporary understanding and debate around business and economy. I will return to that in the end of the paper.

In order to show how theological reflections historically have been behind reflections on business, as well as how a theological current of justice is still implicitly present in parts of contemporary discourse, the paper is divided into four sections:

1. A presentation of theology as value system
2. A short history of economic theology
3. Martin Luther's view on economy, hence business in society
4. A conclusion that discusses what the corrective is of economy of today

Before this, a short introduction to the field of "theology" with regard to economy and social science might be helpful.

What Is "Theology"?

A recent business historian, Philipp Rössner, has shed light over the meaning of "theology" and its relevance to both economy and business economy of today (2017a). In the following quote, Rössner is comparing the times of the reformation with our own contemporary times:

> No one during Luther's time and age, however would have contemplated separating the human world and human trans- and interactions into spheres the way we do nowadays, i.e. into "politics", "private vs. public", "social", "society", or "economy" etc. This is a modernism resulting from practices and habits in the modern social sciences that, for precisely this glitch or cognitive distortion (due to the need of complexity reduction imminent in modern social science analysis), have delegated Luther's views on commerce, merchants and business into the quarantine realm of "business ethics", a marginal academic discipline that nowadays is hosted more often within Divinity faculties rather than economics departments (where it belongs, really). (2017)

The quote tells us that our (e.g. Suchman 1995) contemporary discussions on values as business responsibility and legitimacy are as a matter of fact also theological topics and values. The theologians at the time of reformation discussed the same topics as we do today. These topics can be formulated like this: Who will we as a society allow to get the more profit at the expense of others' effort and labor? And why? Further, how should the power-holders (the state) regulate businesses? All of these were debated concepts among theologians, bankers, and power-holders in reformed times, as well as today between politicians, bankers, and lawyers.

The contemporary economists Carmona and Ezzamel (2007) have shown how economy is always situated in a web of meaning like this: "(..) we see accounting as a structure of meanings through which the significance of the activities upon which accountability is centered is delineated and performance targets are defined" (2007). This tells that economy and accounting are never without meaning. There are always implicit values at stake. What we want to look for is (1) how these values are made legitimate, or debated as illegitimate, and (2) what the theoretical, actually philosophical, and theological frameworks are underneath the structures and values.

What is meant by theology in this paper is the Protestant epistemology and its thinking about values of humanity, human beings, responsibility, guilt, and justice. Though such an epistemology might seem far away in everyday life, it was still present among twentieth-century social theorists such as Walter Benjamin (1892–1940) and Carl Schmitt (1888–1985). For example, a critical theorist, Walter Benjamin (1892–1940), in spite of being in favor of a Marxist historical materialism, saw theology as a necessary corrective of historical materialism (Benjamin 1977, see also Habermas 1973). According to Benjamin, any form of economic theory, also a Marxist, would need theology, to hold its own values up against in order to keep track of itself and not distort. That theology matters to the way we think about state, business, economy, and justice can further be seen in the following quote by another important political philosopher of the twentieth century, Carl Schmitt.

Schmitt said:

> All significant concepts of the modern theory of the state are secularized theological concepts not only because of their historical development - in which they were transferred from theology to the theory of the state, whereby, for example, the omnipotent god became the omnipotent lawgiver - but also because of their systematic structure, the recognition of which is necessary for a sociological consideration of these concepts. The exception in jurisprudence is analogous to the miracle in theology. Only by being aware of this analogy can we appreciate the manner in which the philosophical ideas of the state developed in the last centuries. (Schmitt 2005 (1922))

Both the statement by Benjamin and Schmitt show how theology is viewed within twentieth-century social theorists as a backdrop of our values, even in our own modern society. Rather, Protestant theology runs as an undercurrent in our contemporary society, without our explicit knowledge.

Ad 1: A Presentation of Theology as Value System

As already stated, theology is a value system that has importance for Western society, even business as social activity. To look theologically at business indicates that "business" is never just business, but rather a social system with certain values and conflicts. Like any other social system, it is a battlefield. This is how the reformed theologians looked at the upcoming of new financial systems in the fifteenth and sixteenth century (Steinmetz 2015, 78; Martin 2014). Already in the twelfth century, the Italian maritime city-state of Genoa invented the account system as we know it today. The invention of "bank" meant that merchants would have each their account which made it possible to transfer the agreed amount from one merchant's account to another: Without the two parties physically exchanging what we call "money", i.e. coins and notes (Martin 2014, 103). A vital part of the banking system was interest which the Catholic church deemed to be usury. Steinmetz depicts the debate like this: "No one cared about the usury debate in the Dark Ages when commercial activity was just a trickle in the stream. But as trade came to life in the eleventh century and lending began to power it, the victims of usurious practices multiplied" (Steinmetz 2015, 104). By the sixteenth century, completely new powerhouses such as the commoner family Fuggers came into the financial scene and thus became part of the political and religious fights. This trigged intense theological debates around the concepts of justice and social order, without always a lot of agreement. Eventually the Catholic church breached and became divided between a Protestant and a Catholic denomination, due to these power struggles in Central Europe. Having cash flow was central for these power struggles.

The upcoming banking forms and new forms of capital exchange both changed, destroyed, gave possibilities, and sometimes devastated people's lives (Martin 2014, p. 103 and 105). It was the latter case, i.e., how new ways of organizing money that got the intellectual layers of society, i.e., theologians and policy makers, alert.

Theologians like Martin Luther were railing over the way bankers and lenders were game changing the contemporary economy and thus changing social life forms.

Before further presenting the theologians critique of business and economy, I will present at theoretical framework to understand what I meant by theology.

Niklas Luhmann on Religion as Contribution, Reflection, and Diakonia

First a definition: What is theology? And what does it has to do with business legitimacy? It is important to notice that theology in this paper is not the same as (1) religious nor (2) church as institution. Contemporary people are used to understanding "theology" as "church," and the type of church most people would think of is the Protestant church which is separated from the state. However, this is not what is meant by theology in this paper. What is meant is "epistemology in the line of the historical field of Christian thinking." Thus, epistemology is a particular way of thinking and analyzing historically how certain concepts and values have been interpreted in history. Further, how these ideas continue into our present times.

To Niklas Luhmann, the critical theory approach changes with his development of his own version of systems theory (Luhmann 1984). Luhmann breaks with the former tradition from Adorno, Horkheimer, and Habermas and instead starts viewing economy as a social system with its own logic (called autopoiesis). Luhmann defines, e.g., politics as a social system with its own logic: education, health, law, art, and religion are also social systems with their own particular logic (autopoiesis) (Sløk 2006, 2009).

Luhmann divides any social system into three subsystems (Luhmann, 1977, s.54ff):

1. Function
2. Contribution
3. Reflection

When it comes to the social system, religion, these three subsystems are to be found as the following:

1. Church
2. Pastoral care (Luhmann, 1977, 58)
3. Theology

To Luhmann, taking part in a service is to engage in a common religious activity. Here is no debate, only submission and acceptance of the activity. This is what a service about. Theology is different from a service. Theology is to be understood as a reflectory system (see, e.g., Niklas Luhmann 1977, 1992), like philosophy or art, which has a vocabulary that is intrinsic in our contemporary epistemology on, e.g., economy and business. Theology is both a reflection on its own identity, as well as the role of church and pastoral care, and a reflection in general (Luhmann 1977, s.59f). The latter involves reflection on theology's role toward other social systems.

Theology is about investigating, discussing, and finding arguments for a viewpoint on theological questions such as of humanity, society, responsibility, guilt, labor, etc. This is why theologians disagree and also the reason why we find different denominations, as well as different types of Christian societies. Theology is a debate club, not a uniform religious activity.

Ad 2: A Short History on Economic Theology

Not only sociologists as Luhmann have engaged in questions of the role of theology for economy. The anthropologists like Felix Martin and David Graeber have investigated this field, finding that theological reasonings or arguments are often underlying values of power and money. An example of the theological interpretation of economy is the accounting system of Mesopotamian. Mesopotamian clericals invented in 3100 BC an accounting system based on symbols (Martin 2014, p. 43). The accounting system was about keeping track on how much grain, dates, sesame, and cereals and how many sheeps, etc. the country had. This was necessary in order to distribute to the population, and to sell, so that no one would starve and to make prosperity possible.

Why a clerical system would care about that is rather to put the question the other way around: Since the society, the existing culture, and the power-holders of the country cared about their population, it would be the role of the clericals to 1) take care of formulating arguments, 2) methods for survival and prosperity, and 3) organize this in practice, i.e., the invention of the accounting system.

In the Old Testament, we find that the Ten Commandments from around seventh century BC also entail an economic perspective on property. Properties as wife, slave, goods, and soil are defined as "somebody's," the owners, and by law cannot be stolen with repercussions. Theology was used to justify property and the other way around.

The Christian monasteries of the eleventh until sixteenth century, were also deeply embedded in "economy" in the sense that they were innovative on agrarian and manufacturing knowledge, which was distributed to them through the international clerical system; this knowledge was important also to local nobles and merchant who have money for investment (Rössner 2017a, p. 5). The monasteries had an economic experience and expertise of handling payment for their goods, management of their organization, production decisions, strategies on new markets, keeping account over credits to customers, etc.

The big debate in the medieval ages was "interest." It had been forbidden, but became increasingly legal, also due to the interpretation of the writings of Thomas (Aquinas 2016), in which Aquinas "leave(s) so much room for interpretation as to accommodate nearly any type of financial and credit transaction as legitimate and in accordance with scriptural law" (Rössner 2017a). The fact that it is discussed implicates that interest taking was already going on. Interest taking was becoming an increasing market in the fifteenth century (Rössner 2017a). Taking loans was a unique opportunity for the risk-willing merchants to create new businesses in selling and buying with other international merchants. Paying interests became part of this new way of organizing economy. For the case of an example, in 1540, there would be as much as 40% interest on some loans (Rössner 2017a). This meant a lot of risk, and obviously also what we would call some merchants' bankruptcy and disaster, because their investment did not bear fruit.

Martin Luther stressed "fairness" just as Aquinas and that no one because of asymmetrical information, situations of hunger, or any other kind of powerlessness of the weaker side should be exploited, overcharged, and overruled and receive unjust advantage in any economic or market transaction (Rössner 2017a, p. 5). However, in the sixteenth century, the economy had become more game changing than before (Steinmetz 2015). We here find that Luther's engagement with the topic of business and how it is urged to act responsibly is more intense than any theologian before him.

Ad 3: Martin Luther's View on Economy, Hence Business in Society

Martin Luther (1483–1546) was one of the reformed theologians of the sixteenth century. To his own surprise, he became a famous man already in his own times without really wanting it (Schilling 2017). However, social order had been disrupted in sixteenth-century Europe, also in Luther's own town, by new forms of finances, namely, banking (Rössner 2017b; Steinmetz 2015; Martin 2014). Martin Luther experienced himself at close range how the local area, Saxony-Mansfeld he lived in, declined due to change of the economic thinking and change of power balances due to economy. Rössner shows how prices, wages, and living standard changed in the first three decades of the sixteenth century (Rössner 2017a). This is the 30 years when Martin Luther lived. The area Saxony-Mansfeld, including the Saxon-Bohemian Erz Mountains, as well as the copper deposits of the Harz and the Mansfeld mining deposits had been having great thrift and wealth. Also Luther's father and family lived in Mansfeld, and they had a small copper mining field, from which they grew into better life conditions. Thus, Luther's father, Hans Luther, became a member of the town hall.

Originally, Hans Luther had been a mining worker himself. This story shows not only of social climbing but also of radical changes in the period when Luther became a young man and adult, due to the change of growth in silver and copper. It started all well: During the period of 1440–1480, 18 to 19 tons of silver were mined. This changed in the late 1530s to 2 tons a year. Silver was used as monetary material (Rössner 2017a). The decline in mining spread to other sectors, e.g. influenced the decrease of the price of grain, which was the main good bought and sold in contemporary Germany. This suggests that people had declining employment and income and the other urban industries and manufacturing declined as well. Hardship caused interest rates to be increased (Rössner 2017a).

The change in the living standard of Luther's home region Saxony-Mansfeld is beyond doubt part of the reason for Luther's engagement in economic matters.

Luther's awareness about the overall transactions between countries with regard to economy is visible in the following quote:

> God has cast us Germans off. We have to throw our gold and silver into foreign lands and make the whole world rich while we ourselves remain beggars. England would have less gold if Germany let it keep its cloth; and the king of Portugal, too, would have less if we let him keep his spices. You calculate yourself how much gold is taken out of Germany, without need or reason; from a single Frankfurt fair, and you will wonder how it happens that there is a single *heller* left in German lands. Frankfurt is the gold and silver sink, through which everything that springs and grows, is minted or coined here, flows out of the German lands. If that hole were stopped up we should not now have to listen to the complaints that there are debts everywhere and no money; that all lands and cities are burdened with rent charges and ruined with interest payments. But let that pass. So it will go anyhow. We Germans must be Germans; we never stop unless we must. (Luther 2015)

It sounds almost like a complaint about EU and Brexit, if you exchange the country "Germany" with "Britain" (https://www.rte.ie/news/special-reports/2016/0622/797347-brexit-quotes/).

The quote is interesting, because it shows us how Luther was well aware of the dynamics of economy, such as increased interest rates, monetary shortage, and increased indebtedness, and first of all that this economy was not fair nor just. Whether his analysis is correct, e.g., of lack of proper investment in, e.g., his own home region due to the main focus on profit for oneself, is not to be determined. And it is not the point: The point is that Luther has an economic theory. Luther knew these macro-dynamic processes happened due to the change of capital into bank houses, who would give to those who already had a lot, while ordinary life as hitherto known, would disappear. And he was upset and worried about whether the new business men with their new ways of doing business would act responsibly toward the weak in society.

List of Luther's Critique of Uncontrolled Economy

Luther's critique of the new form of economy in his contemporary time is summarized in the following:

1. Critique of profit
2. Forestalling
3. Price dumping
4. Giving promises you cannot keep, including speculation and arbitrage, and giving insider information about where to buy goods more cheaply
5. Undercutting of competitors in the trade, e.g., having straw men
6. Price cartels
7. Selling goods at a higher price upon credit to someone from whom the seller will buy it back at a discount

8. Going bankrupt to avoid paying back loans, upon which the merchant gets into a new business with the main share of his liabilities cancelled
9. Manipulation or adulteration of merchandise
10. Violation of contracts due to changes in the outer appearances of goods put up for sale (Rössner 2017a, p. 15)

Also arguments against monopoly are part of Martin Luther's concern. In the fifteenth- and sixteenth-century Europe, super rich people were emerging. The families were the Fugger family (Steinmetz 2015), Welser family, Höchstetter family, and other family companies who got immense capital, and power, through investments in German cloth weaving, Central European mining, and global spice trades with India and China. These families got monopoly on these markets and were obviously criticized for this.

What mattered to Luther in his economic thinking was equity, in the meaning of fairness and not in the neoliberal meaning of shares in a company. Values such as fairness and respect between merchants and citizens, what we would call markets and customers, were intensely debated. These values were to a large degree embedded in the local societies in which exchange and business took place. However, these values and rules were of course regulated by the people in power, i.e., the King and his men, the nobles, and the church. This is nothing extraordinary, since markets have always somehow been regulated by the people involved. And business indeed involved the King, the nobles, and the church, since they were also depending on (1) exchange and markets and (2) a well-functioning local population who would starve or fight over disagreement and cheat (Netterstrøm 2007). Obviously there would be cheat, theft, and crimes; therefore law was made. Also laws and rules on exchange were necessary because of cheat, etc. These laws were founded on ideas of fairness and respect.

Luther's reflections on the concept of "two kingdoms doctrine" (Luther 2016) were a theological attempt to reasoning about why the emperor and clerical powerholders see a close connection between their power and the ordinary society in general. The two kingdoms doctrine has it that the emperor and the Gospel are two kingdoms who are both separated and connected, since the role of the emperor is to make laws that protect the weak against the strong, so that the evil will not destroy the weak, and the role of the Gospel is to preach justice. Luther even talks of that everybody has a calling in society to participate in society. Calling in a religious sense does not mean a call to church but a call to be part of society. Weber has defined this Protestant understanding of calling as a prerequisite of capitalism, as well as the concept of double predestination being so (Weber 2002). Luther wanted capital to be held in check by the worldly leaders, who has the power to do so (Luther 2016).

In the twentieth century, the Catholic theologian Johann Baptist Metz (Glebe-Møller 1981, 17) claimed another type of two kingdoms doctrine, namely, the theological epistemology up against the Marxist epistemology. Metz saw theology is correcting the privatizing elements of modernity, and thus theology (not the church) is standing outside society and looking critically into society (Glebe-Møller

1982). This differs from Luther's view, who saw both the worldly leaders and the leaders of the Gospel under God's judgment. This line of thinking was gone by the twentieth century, and with this disappearance it seems also the concept of a higher judgment: justice.

Luther's and Metz' viewpoints basically discuss the same fundamental dialectics between (1) on the one side the Christian community and (2) on the other side the society. These two, Christian community and society, stand in contrast, as already St Paul said in his *Letter to the Romans*. We here find a basic dialectic which is typical of Christian theology: The Christian community is set apart of the craziness of society. Both Luther and Metz discuss this *theological* matter, as a theological matter. However, Luther living in medieval times implies that the worldly leaders have a control over what happens at the local market. They can control this due to the laws of the times. Metz lived in the twentieth century. Metz did not see worldly leaders as first of all engaged with Christianity, rather the opposite. Metz lived under the discussions of Marxism, historical materialism (Marx and Engels 2012). Metz saw worldly leaders as being in the arms of capitalism. And the Christian community is standing reflexively, and due to faith, outside this society, trying to correct contemporary society.

Ad 4: CSR and the Theological Roots

In this section, I want briefly to touch upon the concept of CSR, relating it to Luther's understanding of responsibility. Even though Milton Friedman famously claimed that "The Social Responsibility of Business is to increase its profits so long as it stays within the rules" (1970), Friedman is after all still discussing responsibility and what it means. This points to the great emphasis in Western culture on exactly this concept and also in business teaching (Dunn and Burton 2006). The impact of Friedman through business schools and the neoliberal trend since the 1980s have done a lot to create one particularly understanding of responsibility, which has succeeded almost in ignoring the other. Also if we look at Archie Caroll's (1991) reflections on CSR, we find that his statement on CSR has similarities to earlier theological discussions on the concept of responsibility. Caroll (1991) defines four dimensions of a business' responsibility: economic, legal, ethical, and philanthropic (p. 4). Archie says: "Early on it was argued by some that the corporation's sole responsibility was to provide a maximum financial return to shareholders. It became quickly apparent to everyone, however, that this pursuit of financial gain had to take place within the laws of the land" (Caroll 1991). CSR implies an opposition between a firm's economic orientation and its social orientation (Caroll 1991, p. 2). Luther would agree in this opposition.

Conclusion: Who Will Preach Justice Now?

Two competing paradigms within economy have been going on since the Middle Ages and until the nineteenth century (Rössner 2017a). These are (1) a radical-liberal view, particularly dominated by a certain interpretation of Adam Smith, and (2) a coordinated capitalism that would emphasize and shape markets in a context of values such as fairness and respect between merchants and citizens, what we would call markets and customers. The two competing paradigms turn into one paradigm during the twentieth century, i.e., the all-encompassing neoliberalism, leading to, e.g., the financial crisis of 2007. Rössner suggests to look at Luther's understanding of (1) economy which must be based on a vision for a socially fairer life for all people and (2) charity (Latin, caritas) which is part of an economic life with others in society. The argument for that is that both the debates of the reformation and today are conflicts around the same questions on values and who is to make how much money and why. Much of the same debates have been seen around globalization for the past 30 years (Jones 2007). Business historians like Jones (2007) have therefore shown how there have been various periods of globalization that have changed contemporary social order. The time of the reformation was one of them. Actually you might claim that the reformation was a result of the globalization.

Today, we find that a wave of globalization has changed status quo of economy, world order, and maybe even the question of justice, when we look at the debate of the 1% and how wealth is accumulated outside national law (Harrington 2016).

It is important to focus on the fact that justice was an explicit question in former theological debates, but it disappears in contemporary debates because an implicit, hidden epistemology around economic fairness can be articulated. Philipp Rössner (2017a, b) shows (1) how theological values of collaboration (Glückseligkeit) were common in the economic thinking of cameralism, mercantilism, and Renaissance economics and (2) how economic theory since the nineteenth century has departed itself from any idea of values, obviously including theology. Investigating the theological roots, e.g., through Luther's texts and debates on the matter of economy, tells us that setting limitations to what a business can do has historically been considered more natural and necessary than today. Being legitimate in business and as business is still today about responsibility. While we debate whether it is a responsibility toward the weak or toward the shareholders, we tend to forget that it is a particular *theological* epistemology that underlies these discussions, i.e., an epistemology that defines that there is such a thing as responsibility and that taking the relation-ness of responsibility away to pure greed has always shown its ugly face many times in history, e.g., in bank scandals, financial crisis, and tax exploitation (CumExFiles and Panama Papers). What is new is that the power-holders of the modern state do not seem to recognize that these types of exploiting human beings have always been there. And they must be limited by regulations, if such a thing like "responsibility" should make sense at all.

You might claim that this approach or a renewed explicit concept of theological responsibility will make business people afraid of doing anything wrong. How dare we be innovative, if we risk to do something wrong? Another objection might be a theological approach which does not allow for gray zones in which things can turn out two ways. This critique has something right. It is true that sometimes it is only in the aftermath and, in the interpretation of things, that we see whether things are good or bad (the so-called Knobe effect (Kneer & Bourgeois-Gironde, 2017). Think of the story of Apple. Steve Jobs was forced to leave his own product in 1985 (https://en.wikipedia.org/wiki/Steve_Jobs). Butin (1997) was asked to come back, and Apple developed. Was it good he was asked to leave? Or is it only afterward interpreted as “good he left, because then he could come back in a better shape, and change the company?”

However, the value of Luther is not the field of “gray zones,” but rather how we should interpret cases of complete exploitation of tax rules and other people’s trust. Think, e.g., of the Paradise Papers, where super rich people deliberately put their money in countries that are outside the bond of the tax system of that person’s own country. Tax avoidance is not tax avoidance, when it happens in a country where the law is not formulated like that. It is “good” for the ones who place their money on Cayman Island. but “bad” for the countries where taxes from their super rich citizens are not paid. Brooke Harrington (2016) and Stausholm and Murphy (2017) have shown how so-called wealth managers in big international banks are helping not only rich people to avoid paying tax but also to exploit flaws in the banking system around return of tax (dividend tax). A recent example of the latter in 2018 is the so-called CumEx-Files (https://cumex-files.com/) where billions of Euros have been stolen from taxpayers in Western countries. This happened through bankers and lawyers helping rich people to exploit the public system. What is the legitimacy of this? And how is such an action subject to responsibility? If we look at it purely theological, as, e.g., the reformed theologians would have done, we soon realize that nobody today argues like they did. Any idea of responsibility as a matter of justice in an objective sense is gone. We only have a strong feeling of anger, but no common concept to cling to as society. This is maybe not strange, considering the development of thinking since the eighteenth century’s concept of enlightenment. The legal understanding of “responsibility” as being related to the obligation to accept punishment goes back to eighteenth century (Rendtorff 2016a). For example, Kant had a legal understanding of the human person as an attribution of action, without a necessarily moral dimension (Rendtorff 2016a, 26). Kant also viewed that there were different degrees of responsibility, depending on the level of human freedom.

Also, the Christian philosopher, Paul Ricoeur, points out (Rendtorff 2016b, 32) that the meaning of “responsibility” has changed from a legal to a social meaning, i.e., with Lévinas the responsibility of the other and with Hans Jonas the responsibility of the globe (just look at the ongoing climate discussion, also related to the way some business pollute); the meaning of responsibility is still connected to legally right or wrong. However, we find power-holders as Trump and Putin who do not care about any philosophical or former theological understanding of responsibility as being part of the game, rather, the opposite. They seem to believe they can set their own standard. And in the public media debate, which indeed is upset and angry about their more or less anarchistic behavior, we do not find anyone referring to former theological wording of responsibility when it comes to correcting them. What we have is a worldwide bunch of individuals who are upset about various things, but no strong institutions, as EU, NATO, or whatever, to postulate a correction that is heard and agreed upon. The concepts of “justice” and “fairness” are only expressed emotionally by activist movements like Occupy Wall Street and Radical Orthodoxy. But it is absent as concept in contemporary economic discourse.

This brings us back to the introductory comments by Schmitt and Benjamin that theology is always present in the background and that it is a corrective for the world as it plays itself out. There are still corrections to be made, when people transgress a border. There are still people that exploit other people's work and make their own rules. The power of a theological epistemology with regard to responsibility in business is that it implies that people have conscience, though they might not. This is our chance of arguing explicitly "what is" justice, also in contemporary economy which seems to have forgotten its own historical (theological) background.

Abstract

This chapter addresses the difficult problem of the legitimacy of the corporations in modern society from the perspective of the relation between economics and religion. In the perspective of the religious foundations of economics, the chapter discusses different approaches to economics, based on different economic theories and concepts of the economy. The debate about legitimacy of the economics of the firm represents in modern economics the place of intersection between economic values and other values. With this approach, the chapter discusses modernist economics of neoliberalism and welfare economics from the point of view of social legitimacy of economics. Moreover, the chapter presents institutionalist alternatives to neoliberalism and welfare economics in the context of postmodernism and search for a more sustainable transformation of economics in society.

Introduction

This chapter addresses the difficult problem of the legitimacy of the corporations in modern society from the perspective of the relation between economics and religion (Rendtorff 2007, p. 65–86). The chapter starts out from the work on Protestant Ethics of Max Weber and continues with a presentation of the interesting book of the economist Robert H. Nelson (2001): *Economics as Religion: From Samuelson to Chicago and Beyond*. Accordingly, this chapter is mostly a book review of Nelson's argument (Nelson 2001). The work of Nelson is an important challenge for understanding business legitimacy and social legitimacy of economics (Nelson 2001, 2017). With Nelson it is possible to introduce the viewpoint in economics known as "institutional economics" as a way that the corporation can be open to its institutional and systemic environments (Rendtorff 2015b). The final part of the chapter confronts Nelson's criticism of economics as religion, and it proposes a concept of economics based on a democratic conception of the firm conceiving the economic and social legitimacy of the firm based on the idea of the ethical economy of communicative business ethics. Thus, this chapter is a development and improvement of an earlier work of business legitimacy (Rendtorff 2007, p. 65–86). Communicative business ethics can be conceived based on a concept of the firm as an open cybernetic system as being in dialogue and interaction with its environment. This concept of the firm avoids the deadlock of economics as religion that captures most of the predominant concepts of economics and of the position of the firm in modern society in terms of ethics and ethical principles (Rendtorff and Kemp 2009; Rendtorff 2010a, 2013a, b, c, d, 2014a).

The Normative Foundations of Modern Economics

The debate about legitimacy of the economics of the firm represents in modern economics the place of intersection between economic values and other values. Max Weber emphasized the deep normative foundations of capitalist economics in his classical investigations of *The Protestant Ethics and the Spirit of Capitalism*, where he looks on the values and work ethics of modern capitalism (Weber (1930) 1987). Weber is aware of the necessity to regard business and corporate organization in the perspective of history of religion as the basis of present conceptions of the firm (Weber 1978). The relation between deep spiritual and religious values and economic organization in the emergence of capitalism is analyzed in relation to different Protestant communities, Pietism, Calvinism, Puritanism, etc. Weber is able to show how the legitimacy of basic notions in the modern market economy, of profit, property, work, and organization have religious and cultural presuppositions based on general aspects of the Western Jewish-Christian religions and cultural tradition.

Weber begins his analysis of the Protestant ethics and the spirit of capitalism by distinguishing the particularity of capitalistic organization and economic rationality (Weber 1987, p. 30). Accumulation of material wealth has existed independently of capitalism, and this is not unique about capitalism. Rather, capitalist action is characterized by rational organization of work and labor. This is the basis for profit-oriented economic exchange on economic markets. Even though there are aspects of capitalistic economies in many other historical civilizations, it is only in modern Western society that this mode of production has become fully developed. Contrary to some of his contemporary liberalist economic thinkers, Weber is aware of the significance of the corporation in rational economic organization. He emphasizes the importance of economic routines, rational bureaucracies, and calculated administration for the formation of efficient enterprises (Weber 1987, p. 24) Weber says that disciplined labor forces and regular investment of capital characterize the modern rational firm. Economic efficiency in terms of increased profits and accumulation of wealth is the ultimate goal of this rational economic organization. The center of modern capitalism is the endless accumulation of wealth. In capitalism economic growth and accumulation of material welfare is the ultimate purpose of human life on earth.

In contrast to strict determinist and materialist conceptions of economic change, Weber wants to give a historical and hermeneutic explanation of the origins of the capitalist system. Therefore, he emphasizes the fact that rational economic organization implies a specific moral attitude as social and religious legitimacy of the economic system. In this context, it is possible to observe that capitalism is based on willingness to postpone joy. The new Protestant ethics is to earn more and more money without "any eudaimonistic or hedononistic admixture" (Weber 1987, p. 53) Weber argues that capitalism requires strong moral self-discipline, because the entrepreneur is supposed to accumulate and reinvest money rather than use them for hedonistic pleasure.

Such moral and religious values are found in many of the Protestant sects that emerged after the reformation in Europe (Frey 1998). The new Lutheran, Calvinist, and Puritan sects emphasized worldly asceticism through the concept of the "calling," which was central to their religious beliefs (Weber 1987, p. 79). According to Weber, the concept of "calling" signified that it was the moral and religious task of the individual in order to be a good person to fulfill his or her duty in the daily work. This was a rather new way of legitimacy and contrary to Catholic theology, where the calling of the individual had been less significant due to emphasis on community and continuous possibility of receiving forgiveness by God. Moreover, it implied a stronger sense of duty, because only the individual was responsible to the divine for his or her actions in the world.

Weber emphasizes that Calvinism, among the many Protestant sects, in particular contained the dynamism necessary for justifying the rational capitalist organization of the economy. The Calvinist doctrine of "predestination" says that some good human beings are predetermined to be chosen by God. During life, it may be possible to receive a sign of being selected (Weber 1987, p. 98). Weber argues that this had to put pressure on the calling of individuals, giving each of us a deep feeling of "inner loneliness" implying insecurity regarding salvation. This was the legitimacy of the Protestant spirit of hard work and ascetic lifestyle where the self-interested accumulation of wealth was considered as sign of being selected by God. Even though Weber put emphasis on Calvinism and did not regard the other Puritan sects as dynamic for the duty of the calling, we may also in these religious conceptions find similar moral values in order to justify rational organization of labor and accumulation of capitals for profits and investments.

Weber's analysis of the Protestant ethics may be viewed as a multidisciplinary approach to economic organization (Swedberg 1998, p. 22). His views on capitalism are supported by his other studies of history and the sociology of economics and of religion (Rendtorff and Kemp 2009; Rendtorff 2010a, 2013a, b, c, d, 2014a). The Protestant ethics was part of a process of rationalization, which has been unique to Western societies. In Hinduism, for example, the notion of the calling could not be justified in the same manner, because religious activity rather than focusing on worldly activity was turned inward to get harmony with cosmos. Protestantism was based on human instrumental and rational interaction with the world. Nevertheless, even if the Protestant idea of the calling was a necessary condition for capitalism, many other cultural and economic factors were also important. Weber mentions the professionalization of the firm with modern bookkeeping, the development of the city, the existence of unified legal systems, and the establishment of Nation-States with rational bureaucracies as other conditions of modern economic systems (Swedberg 1998, p. 18).

However, Weber seems to stress that we should not underestimate the power of the concept of the calling in order to build modern civilization. It should not be forgotten that rationalization as well as secularization may be intrinsic dimensions of Protestantism, because mysticism and immanent religion is replaced by the belief in the inwards relation to a transcendent God and the calling of human engagement in the world. If this is the case, it is possible to understand why Weber's views were combined with pessimist skepticism to Protestant modernity (Frey 1998). Weber thought that Puritan calling created "an iron cage," a worldly asceticism, around each human being in which the new work ethics made it impossible to enjoy life. The price of modernity was "specialists without spirit, sensualists without heart" (Weber 1987, p. 192), because efficient capitalist economies are not possible without self-discipline in the "iron cage" (Weber 1987, p. 191).

Weber's economic sociology is central for understanding the legitimacy of corporations in modern societies. Even though people today live in a secular society determined by rational and scientific approaches to economic action and concepts of organization, it cannot be denied the spiritual and religious influences on corporations and their values. In addition, the multidisciplinary historical reconstruction of complex processes of development is important for considering the emergence of economic systems as a result of intersection of many different events and causal chains. However, Weber's interpretations of Protestantism and Calvinism are also controversial, and it has been argued that it may be possible to include some versions of Catholicism in the concept of the calling.

Nevertheless, even though there are many criticisms of Weber's concept of legitimacy, the idea of the close relation between economics, values, and religion cannot be denied. Therefore, the chapter will in the following use the Weberian conceptual framework as the basis for the following discussion about the legitimacy of the firm. The chapter will look at some of the most important theories of economics and relate them to Weber's concept of the Protestant Ethics.

Because of Max Weber's views, we may argue that there are two classical economic traditions in Western society. The economist Robert H. Nelson distinguishes between an optimist "Catholic" tradition and a "pessimistic" Protestant tradition (Nelson 2001). The optimist view on economic values includes names like Aristotle, Aquinas, Anglicanism, Claude Saint Simon, and John Maynard Keynes. The pessimist view on economic values is based on a sometimes very apocalyptic view, based on names like Plato, Luther, Calvin, the Puritans, and social Darwinism arguing for the alienation of humankind. Nelson argues that these two views have been shaping Western culture and that we still find them in modern economics. The important question is how the values of the different philosophical and religious traditions determine modern economic theories (Nelson 2001).

Even though many modern economists argue that they are doing value-free research, a deeper sociological and philosophical examination will show that values are built into their theories. Even though economists think of themselves as scientists, they cannot avoid being predetermined by certain value-systems. Therefore, they are more like priests or theologians, in the sense that they are preaching certain value conceptions about markets, and how to organize society (Nelson 2001). The idea of economic efficiency as being one of the most important ideas for modern capitalist societies is not value-neutral, but dependent on a deeper religious vision and concept of the world. Nelson wants to show how values are not external to modern American economic theories and consequently some of the most important representatives of modern economic science. He argues by analyzing these different views that beneath the surface we can see dimensions of these values. The influences of the two classical economic traditions can also be found in modern economics.

The relation between economic values and other values can indeed be formulated as the "market paradox." By the market paradox, the chapter refers to the fact that economic action is not situated in mathematically perfect markets. Rather economic behavior is influenced by real cultural and social aspects of human life external to purely economic reason (Knudsen 1991; Nelson 2001). This was the insight of Max Weber when he analyzed the cultural and social conditions in the Protestant ethics, which were necessary for the development of capitalism. And this tension between ideals of pure economic science and social reality is indeed also very present when it comes to global community, where different institutional arrangements, social capital and integrity and trust, are necessary to avoid for example corruption and bribery in order to provide the basis for well-functioning economic markets (Rendtorff 2009a, b, 2011a). The market paradox concerns the possibilities and limits of economic rationality emphasizing efficiency and self-interest as the basis for market behavior, confronted with the requirements of society to serve the common good and the interests of community. The problem is how to find the right place of the economic work ethic and the Protestant calling with regard to other religious and cultural values of community. According to Nelson, the problem of the market paradox is emphasized by the fact that many economists argue for opportunistic behavior on markets while they reject similar behavior in politics or in other areas of society (Nelson 2001, p. 9).

Common to most views within the Western tradition of political economy is the effort to construct a method to allocate goods and material resources in the most economically efficient and politically just way to different members of society. In this way, different economists have always been proposing their particular value conception of society. They are arguing for a specific conception of economic rationality as the foundation of society. This concept of rationality is not neutral, but it can be considered as an ethical and religious view about how to realize happiness and freedom on earth. These views cannot be separated from other conceptions of economics and society, and they are principle as value-judgment and this is what Weber describes as the Puritan or Calvinist Ethos of Capitalism. The analysis of this chapter of the values of the corporation within the framework of economics as religion can indeed be regarded as a contribution to this problem about the legitimacy and about embeddedness of economic values (Granovetter 1991). The debate according to Robert H. Nelson is about "how to reach heaven on earth," that is, how to structure economic action so that it will most efficiently increase human welfare and happiness on earth. Therefore, it is not wrong to describe economists as "worldly philosophers" (Heilbrunner 1996).

Values and Economics of the Twentieth Century

Modernist economics in the twentieth century can be considered as a scientific continuation of the projects of the Western tradition of political economy with its investigation of how to construct the ideal society with human welfare and happiness (McCloskey 1986). In this sense, Modernist economics develops the confrontation between Protestant ethics and Catholic responses or criticism to the domination of Protestants concepts of capitalist economics. In fact, it is possible to characterize the major theoretical movements in Modernist economics as a development of the optimistic and pessimistic traditions of Western economic thought. In particular, the chapter can point to some reaction to the Protestant ethos in the way that the paradoxical dimensions of economic reason are emphasized so that the problem is how to promote self-interest and at the same time serve society. Following Robert H. Nelson, the chapter argues that two major schools of modern economics, the Chicago School and the Cambridge School, promote two different interpretations of the themes of the aim of work, human welfare, the role of the state, and the relation between state and market which were major issues within earlier economic traditions inspired by the Protestant ethics (Rendtorff 2009a, b, c, 2010a, 2013a, b, c, d, 2014a).

The famous economist, Nobel Prize winner Paul A. Samuelson, who made the most popular and widely influential textbook in modern economics, represents the Cambridge School. His book *Foundations of Economic Analysis* has sold more than five million copies in more than 15 editions (Samuelson 1948; Nelson 2001). The values of Samuelson's economic project can be considered as a progressive economics in the optimist tradition from Thomas Aquinas and Keynes. This was the project of post-war welfare economics. Samuelson was accompanied by a number of other scholars and together they made up the Cambridge School of Economics (Nelson 2001).

The Chicago School of Economics can be described as a reaction to the progressive welfare economics project of the Cambridge School. They protested against the views of Samuelson and his followers of individual rationality, the state, and of the market. They promoted a radical libertarian criticism of the welfare state (Friedman 1962, 1970). Moreover, they argued for a very cynical economic view of human nature. The Chicago School includes figures like Richard Knight, Gary Becker, Milton Friedman, and Richard Posner (Nelson 2001).

Samuelson's economics of the Cambridge School can be considered as a revival of the tradition of "Catholic economic thought" as a criticism of the Protestant ethics. It was an optimistic progressive economic thinking, marked by the optimism after the Second World War. The Cambridge School was a revival and secularization of a Catholic economic project, where the investments in market developments are based on concerns for community and the common good. Accordingly, Samuelson formulated the progressive message of economics as the science of the welfare state. This was based on a combination of a belief in Keynesian ideas with a belief in market economics and the principles of scientific management. Samuelson argued that the market was very important for good economic development (Samuelson 1948). Although he was critical of a very strong interventionist government, Samuelson still believed that government should keep many of the social functions that were promoted by the Keynesians. However, the market was the central focus for the new scientific economics, based on mathematical analysis.

In this context we can perceive a close relation between the Keynesians and the Marxist message of economic values (Nelson 2001, p. 30). Marxism is based on a historical vision of the social and economic development toward a just and good society. It was argued that economic laws are replacing natural and divine laws in the development of society toward overcoming material scarcity at the end of history. The Marxist conception of the dialectics between basis and superstructure may be considered as an important inspirational idea for Weber's theses of the close relation between economic values and religious values. The values of Keynes can indeed be considered as a more modest vision of the Marxist idea of the possibility of the realization of the good society on earth. Optimistic Keynesians believed in the idea of the realization of a good society with the methods of the strong state and scientific management of society (Rendtorff 2009b, 2010a, 2013a, b, c, d, 2014a). In this way, the Keynesian economics in the beginning of the twentieth century may be considered as an optimistic reaction to the pessimism of the protestant ethics (Nelson 2001).

Accordingly, Nelson emphasizes that Samuelson took over the progressive message of Keynes for economics of the common good for humankind, while arguing for the need of an efficient and free market. Although Samuelson never directly speaks about Christian notions of salvation or calling, we may argue that optimist view of economics as science to relief humanity from sin and despair is implicit in the values behind his economic theory. We can argue that Samuelson was open to the Puritan message of the Protestant ethics of Americans and he combined the ethics of calling with the belief of welfare economics in the blessings of the common good of the welfare state combining a strong state with market economics. However, his religious message was hidden behind his efforts to develop a scientific and objective basis of economics as a science based on mathematics, objective knowledge, and technical rationality. Samuelson thought it was possible to develop a scientific understanding of modern business organizations, and in this sense, he wanted to give a scientific foundation of his religious values. This was combined with a belief in need of democratic institutions. Economic rationality and scientific management should contribute to the construction of a rich and good society, based on the greatest happiness to the largest number. According to Samuelson, this vision was not conceived as pure ideology, but relied on concepts of scientific rationality as considered as an objective way to construct a good society with economic tools.

In his economic theory, Samuelson defends the fact-value distinction and he argues that scientific economics gives us objective knowledge while ethical values represent subjective conceptions of the world. Without questioning his own value conceptions Samuelson considers him self as the one who provides the scientific basis for economic development and management of economic institutions. Samuelson defends the importance of economic markets but excludes self-interest from other social institutions like government (Nelson 2001, p. 51). The principal value is the defense of competition on the market and the idea that the creation of monopolies is fundamentally wrong. The market mechanism is essential for determining prices and what should be produced. This is regarded as the most effective way of regulating needs and wants in society. Samuelson defends a supply and demand conception of the economic system (Samuelson 1948; Nelson 2001). The basic goal of society is full employment and government should act in order to protect and facilitate the free market exchange. Samuelson works with the ideal of the perfect market with zero transaction costs as the basis for his analysis. Moreover, the calculation of economic efficiency is based on the idea of equilibriums of Pareto optimality, according to which an unregulated free market economy reaching equilibriums at many local levels is viewed as a learning system toward the highest possible stability.

This chapter argues that this view of economics was a manner of introducing a secular version of the progressive belief in “the invisible hand” as modern scientific economics. The utopia of the free market was, however, based on pure economic analysis. For Samuelson, the only acceptable rationality was economic reason. Therefore, without realizing his own normative conceptions implicit in the theoretical framework of welfare economics, he was critical toward religious influences on economics as when Thomas Aquinas regards taking interests as unethical (Nelson 2001). What society needs is economic enlightenment and scientific measurement of risk and benefits of economic action. Moreover, Samuelson rejects passionately inefficient use of resources without considering that this may represent a somewhat unperceived Protestant heritage. What is needed is scientific management in a society based on a mixed system between government and private enterprises.

These ideas emphasize that Samuelson could only count for the economic development and benefits in economic terms without realizing that his economics contained many concepts that were nothing more than scientific reinterpretation of classical political economy based on a mixture of Protestant and Catholic views of society. It is not possible to measure social, environmental, or psychic dimensions of the economic development within this conception of the market, because the only valid costs are those that contribute to economic progress. In this way, Samuelson's message differs significantly from the Puritan ethics that did not have the same materialistic and utilitarian view on life, because they viewed the economic activity and work as a means to salvation in another world. For Samuelson, on the contrary, the function of the market is to realize utopia in the present world (Nelson 2001, p. 70).

This secular dream of realizing paradise for humanity on earth should be made by the instruments of scientific management. Samuelson's political arguments were to use scientific economics to improve the welfare state with public administration for the common good. Economics could help to calculate the "logic of collective action" and describe the dangers of "free rider problems." It was indeed the task of economics as a science of the market and public administration to work for the common good. With the use of good economic methods in order to create economic growth, poverty and social problems would be eliminated and a higher standard of living for the benefit of the worst off would be created (Nelson 2001, p. 110). In this perspective, the corporation would have an important mission of being loyal to the common goals of community, even though it would have to behave strictly in accordance with scientific economic rationality. Therefore, we may say that Samuelson's economic theory represents a Catholic redirection of the Protestant ethics combining the virtues and work ethics of free market economics with the callings of a strong a beneficent welfare state.

The Chicago School of economics represents an individualistic and libertarian criticism of such a welfare state project (Nelson 2001, p. 20). While Samuelson may have had some technical economic insights, his arguments for an economic system mixing state intervention and free market competition combined with progressive democratic politics was considered as unscientific with no economic justification (Nelson 2001, p. 96). Thus, the Chicago school attacked the hidden normative foundations of welfare economics believing in the altruistic and social nature of humanity. The Chicago School draws on the arguments for the superiority of the market, which since Adam Smith have been important in economics. Combined with a defense of the virtues of laissez-faire in Social Darwinism stressing the egoistic parts of human beings and a belief in Herbert Spencer's theory of evolution as based on combat and conflict with the natural law theories of defenses of property rights, Chicago economists promote a strong criticism of Samuelson's ideas of belief in social solidarity and in the positive and productive relation between state and market.

According to Nelson, the early twentieth-century economist, Frank Knight can be considered as an important founder of the Chicago School. Contrary to the optimistic progressive views of Samuelson, Frank Knight had a much more negative conception of human beings. He saw economics as based on self-interest and human freedom. We might say that he was close to expressing "a classical Christian view of fallen human beings beset by original sin" (Nelson 2001, p. 121). Knight was pessimist and realist in the sense that he argued that the existence of the economic market and private property was an unfortunate result of the "presence of evil in the world." Knight stressed the role of individual calling and personal freedom in contrast to the belief of collective action of welfare economics. Accordingly, Knight represented a Protestant reaction to the communitarian visions of common welfare of Samuelson and Keynes. He considered the science of mainstream welfare economics as an ideological continuation of Catholic natural law beliefs in community and in the social virtues of human nature. Knight's economic ideology can be viewed as a return to the pessimistic view on human nature in Puritanism and Lutheranism. Instead of believing in the enlightenment and progression of humankind, we can say that Knight was marked by the Calvinist and Puritan assumptions of the sinful nature of human beings (Nelson 2001, p. 132). Moreover, in this perspective Knight can be said to reject optimist welfare economics as a Catholic misunderstanding of the message of capitalist economics.

On this basis, the justification of economic markets within the pessimistic tradition of Protestantism is quite different from the optimistic view on economic progress. Knight conceived the market as necessary for social cooperation, not because of the virtues of humanity, but because of the evil nature of human beings. The market has a social function of bringing people together, even though they have very different values and conceptions of life. The idea is that the market is without power relations, and therefore it is possible to interact in a situation of radical pluralism (Nelson 2001, p. 136). At the market, Christians can exchange goods with people of other religious beliefs without compromising, because the exchange is a matter of self-interest and profit. In this way, Knight was proposing a revival of the Calvinist and Puritan ethics in modern economic thinking.

Knight was the teacher of such important economists as Milton Friedman and Georges Stigler who represented a second generation of Chicago economists. Looking closely into their economic theories it appears that they were profoundly marked by concepts of sinful humanity within the Jewish-Christian tradition, but at the same time they adopted the scientific outlook of modern economics. Milton Friedman adopted concepts of individual freedom, duty, and responsibility as a major premise of his liberal thought (Friedman 1962, 1970). With this approach, he is close to Calvinist and Puritan views on economics. Friedman presented himself as an economic technician, although he was also very engaged in political debates (Friedman 1955). Moreover, Friedman seemed to have adopted the economic belief in economic progress of modernity. However, aspects of Protestant ethics can be said to underlie in the writings of Friedman in the sense that he emphasizes the importance of self-interest and freedom of economic markets. Also his criticisms of corporate social responsibility as misunderstood charity shows how committed he is to the combination of Puritan ideal and an economic conceptions of market efficiency (Rendtorff 2009a, b, 2011a). The firm should not promote other than economic values, because this would transcend the economic sphere and impose ethics on stakeholders and shareholders. As a reaction to the optimism of welfare economics, Friedman is very skeptical toward the possibilities of democratic government. Strong government is a threat to individual liberty. The market is central for economic activity, the state is only there to regulate the availability of the free market and ensure antitrust regulation. Friedman advocates heavy privatization and he is skeptical toward high taxes, although government might contribute to some redistribution of resources among the poor (Nelson 2001, p. 149).

This generalization of economic method was followed by the third generation of the Chicago School of economics (Nelson 2001). Gary Becker and Richard Posner used economic methods in the other parts of social sciences, for example, law and economics (Posner) or economic analysis of traditional sociological and anthropological problems (Gary Becker). These approaches were characterized by a provocative treatment of noneconomic values. Posner and Becker presented a secular version of the Christian concept of sinful human nature. They argued that social agents were determined by self-interest and utility-maximization (Nelson 2001, p. 167). Like the critical thinkers Marx, Nietzsche, and Freud, they thought that all kinds of non-altruistic motivations, economic motives or will to power, and sexual desire were the real basis of social interaction. Behavior is driven by egoistic self-interest and the principle of self-preservation as the most important basis of individual action.

Individuals are acting in order to maximize their personal welfare, and Becker thought that this economic behavior was ultimately present in all dimensions of social life (Nelson 2001). On this basis, he presented cynical economic analysis of the family as an economic unity, of discrimination and of stealing and argued that all these themes could be considered as economic relations, where individuals were maximizing utility in order to increase welfare. Becker, who received the Nobel Prize in 1992, wrote that polygamy in certain conditions would have a rational justification, because the value of women would increase on the market when men could have more women (Nelson 2001). Moreover, he thought that marriage was based on implicit calculations of personal gain and that love was just a romantic sentimentalism. Becker also said that even the Nazi killing of the Jews could have an economic justification increasing the economic gain of Germans. Becker believed so much in the egoistic dimensions of human nature that he wanted to explain altruism on the basis of opportunism. He therefore developed "Rotten kid Theorem," stating that there are situations where individuals help others to be better off because this action will make the other more likely to "transfer parts of the improved welfare" and give them back to you, so that the altruistic action is nothing but a modified and strategic form of modified self-preservation and egoism (Nelson 2001, p. 179).

The legal scholar, Judge Richard Posner, is one of the most important figures in the law and economics movement. Posner has advocated a pragmatic and realistic view on legal theory. He has combined this approach with an approach using economic methods to analyze legal issues. In order to accomplish this analysis, Posner draws on the methodology that has been developed by Becker, and in his work, he makes an analysis of marriage institutions from strict economic perspectives. It is argued that sex is an economic good that can be exchanged in the relations between man and women and that prostitution and the families constitute two different ways of regulating the market for this good. The only difference is that transaction costs of going to prostitutes normally are higher than having sexual relations with a partner in the family. In another work, Posner has analyzed the significance of euthanasia from an economic point of view and he has argued that voluntary euthanasia should be permitted in order to promote the rights of individuals to calculate their lives on the basis of maximization of utility.

Nelson argues that the Chicago School in the third generation represents a new secular kind of religion (Nelson 2001, p. 185). The views of the Posner and Becker are not really rational, but they are founded on an ideology of individual egoism, freedom, and rational utility, which become a new kind of religion. However, we may argue that this "religion" is characterized by a strange kind of mixture between Protestant belief in sinful humanity of egoism and self-interest with a certain "economic existentialism," where it is only material need and rational utility that is real (Arnsperger 2001). Everything else like spiritual values, emotions, family values, and sense of community is nothing but mere illusions. Becker and Posner helped to articulate the secular value of autonomy, which is fashionable in the United States and Europe. The Chicago School was suspicious to collective unities of any kind. The religion of libertarian values argued that "everything was determined be economic forces and self-interest" (Nelson 2001, p. 185). An interpretation of the Chicago School is that it did nothing else than promote the libertarian values that emerged as a criticism of the modernist economic project. In the 1970s, the culture of marriage changed into a single life style, and self-determination became the most prominent ideal in a pluralistic secular society.

The Chicago School can be said to continue the Protestant project of rational economics, while giving a way to the religious values of faith and belief in the calling of the Christian Religion. Therefore, it ends up with a radical economic existentialism, rejecting all other values than the core values of libertarian economics. The Chicago School is in conflict with the Protestant ethics, because it makes utility and personal wealth maximization into absolute values. The values of efficiency and economic progress have replaced the Christian values of respect for the divine commands. Instead of the divine natural order, Chicago economists have put the self-regulative prophecies of the market. In this perspective, Nelson argues, we might say that Becker and Posner have generalized Knight's ideas of a fallen humanity in a secular perspective (Nelson 2001, p. 199). They keep the Calvinist view of human nature without adapting the religious presupposition of revelation and devotion to the divine cause. Thus, this ends up with what can be called "economic existentialism."

Challenges and Legitimacy Crises of Modernist Economics

However, the Chicago School was not alone in criticizing modern welfare economics. It has increasingly been confronted with challenges from economic theory, but also from political movements in society. The social movements of the twentieth century, environmental movement, human rights activists, political consumers, and the corporate responsibility movements, are political movements, which have challenged the economic reason of both the welfare state project and the libertarian criticisms proposed by the Chicago School. Already in the 1960s, the modernist project of Samuelson was put into question by many forces in American society (Nelson 2001). Environmentalism is a good example of another kind of secular religion that is an ideological project presented as rational politics, which argues against the messages of capitalist economics. This is a reaction toward the protestant defense of efficiency and the primacy of human beings on earth.

However, the most serious criticism of Samuelson's ideal of the perfect market can be found in developments of economic science, which were somewhat different form the libertarian position of the Chicago School (Nelson 2001). Moreover, it might be argued that it is difficult to find justification for his defense of the free market. Many assumptions must be made in order to understand imperfect markets. Georges Stigler has in 1961 put emphasis on the problem of information and choice in complex and dynamic economies. Ronald Coase has also in the articles "The Nature of the Firm" (Coase 1937) and "The problem of social costs" (Coase 1960) drawn attention to the problem of transaction costs – which is partly an economic explanation of the existence of the firm. In both cases, the incomplete information of economic actors on real markets is emphasized (Nelson 2001, p. 60). In real, imperfect markets, information, transaction costs, and other features of bounded rationality determine economic action. Moreover, ethics and values must be taken into account in order to understand human behavior. Moreover, the uncertainty of choice and the specificity of organizational cultures constitute challenges in the real world that make the idea of the perfect market where individuals act according to optimal rationality a very utopian concept.

This criticism of Samuelson's utopia was the basis of a turn toward the study of corporations in institutional economics. Oliver Williamson therefore investigated the development of organizational structure of modern industry in *Markets and Hierarchies* (1975). He became aware of the importance of the modern corporation in order to minimize transaction costs on the market (Nelson 2001, p. 63). The study of the business organization was necessary in order to clarify problems of opportunism and limited information. Moreover, the problem was how to explain the emergence of trust relations and establishment of contracts in a situation of economic uncertainty. These problems could not be solved either by the economic systems of Samuelson or by Friedman.

This chapter therefore proposes an institutional approach to economics represented by the "New institutional economics" as the economic theory, which has been able to cope with these social changes (Nelson 2001). New institutional economics and sociology represent reinterpretations of the institutional traditions in social sciences recognizing the importance of institutions for understanding social and economic action (Hodgson 1994). This tradition is aware of the need to incorporate ethics in economic analysis. New institutional economics has understood the need for foundations of economic activity in other values than economic values (Dimaggio and Powell 1983; Powell and DiMaggio 1991). The new institutional economics may be determined as a way to overcome the opposition between the Cambridge School and the Chicago School. Among others the 1993 Nobel Prize winner Douglass North represents the institutional school (North 1990).

New institutional economics points to the basic problems of neoclassical economics, namely that it does not provide any good answer to the problem of "why firms and corporations exist"? The Cambridge and the Chicago Schools did not place the firm or the corporation in center of analysis. Moreover, they were not aware of the role of values and cultures in corporate interactions and business, because they considered economic rationality as the only appropriate measure. However, when dealing with practical issues of business and management, the importance of these problems was realized. Therefore, the new institutional school looks back to older forms of historical and cultural analysis in economics. Suddenly, Weber's framework for the study of economics and society was appropriate. Institutional economists are aware of the significance for economic progress of national culture, morality, ethics, and the relations between firms and other institutions. They have proposed concepts of "trust" and social capital in order to take into account the significance of values and ethics for economic progress.

Institutional economics does not consider economics exclusively as a natural science based on mathematic analysis. Rather economics should draw on multidisciplinary methods in order to conceive the complexity of the social world. This approach implies a complex concept of rational behavior of consumers and agents on economic markets. It argues that many different rationalities influence consumer behavior. Consumers do not have full information and therefore they are motivated by many other patterns of behavior. Price and quality uncertainty introduces other requirements in order to predict and understand consumer behavior. Moreover, economics cannot operate with the idea of individual actors on perfects markets. Social costs and other kinds of transactions costs are fundamental in order to understand the need for firms and the structure of economic institutions. In addition, as realized by the Chicago School of law and economics, property rights and legal rules must be considered as important institutional factors (Nelson 2001, p. 212). In addition, it is necessary to add other factors as culture, anthropological implications, ethics, and norms as important for the institutional structure of formalized economic organizations (Meyer and Rowan 1977).

In order to understand the role of the firm in modern society new institutional economics helps us to reintegrate the firm in its real social environment. Along with Ronald Coase and Oliver Williamson in his works on industrial organization, business legitimacy research must take into account the organization of the firm in relation to its stakeholders. This approach is justified in the perspective of the economic rationality of the institutional School. New institutional economics takes into account the importance of social institutions for economic action. This implies that no rationality of utility and self-interest is perfect, but dependent on the values and visions of individuals and institutions (Williamson 1989; North 1992). Given this reality of "bounded rationality" and asymmetric information as the basis of economic action, economics must work with a broader concept of what is relevant economic knowledge. In this context, it is possible to refer to the external and internal ethical relations of the firm as dimensions that may influence its competitive capacities. Given the emphasis of the importance of knowledge for economic progress in modern society, we can look at information and communication as important aspects for understanding economic systems.

Contrary to the views of many traditional economists, this paradigm-shift in the conception of relevant economic knowledge does not break totally with economic rationality determined as efficiency and utility maximization. The acceptance of imperfect information and bounded rationality combined with openness for cultural and historical reason may be necessary in order to have economic progress and long-term efficiency. The religion of new institutional economics may be said to combine the views of the optimist and pessimistic traditions as the basis for a direct approach to economic phenomena within their social and institutional context. It becomes important to design an ethical framework as well as an "efficient culture" for ensuring economic progress in the corporation. In this context, it is not only individuals but also corporate culture as a totality based on the idea of corporate identity and integrity that may determine the economic potential of organizations (Rendtorff 2011b). Therefore, economics cannot exclude ethical problems of business leadership and relations to important stakeholders like employees and consumers. The development of the idea of "transaction costs" has challenged traditional economic paradigm of formal economic models in such a way that economics no longer can ignore factors of ethics, norms, learning property rights, and other legal issues (Nelson 2001, p. 225).

So, from this point of view, institutional economics represents a conception of economics that has become increasingly open to explicit conceptualization of the relation between economics and religion that is the fact that economics is always conceived in relation to ethical, cultural, and religious values (Hodgson 1994; Boatright 1996). Institutional economics helps us to understand that economics is forced to include ethical and cultural dimensions as an appropriate area of research in order to achieve the traditional ideals of efficiency and progress. Firms and other institutional actors should be considered as open systems in interaction with their social environment (Scott 1995). Many of the normative presuppositions on economic markets of honest behavior of actors depend on values and cultural traditions (Putnam 2000). These traditions cannot be totally separated from their philosophical religious presuppositions as we have seen – even modern mainstream economics is not value-free, but rather dependent on certain more or less explicit value presuppositions. Today, business legitimacy research cannot discuss corporate management and economic calculations without including ideals of business ethics and corporate responsibility. Contrary to the Chicago emphasis on self-interest, there is much more emphasis on the role of collective participatory processes of organizations at markets. Traditional economic problems of opportunism, the strategic relation between actors, the necessity to deal with asymmetric information, have to be confronted from these perspectives.

The importance of understanding the relation between economics and ethics, culture, and religion is not restricted to a descriptive analysis of the role of values, but also the possibility to use values to construct "belief systems that ensures the maximum of trustworthy behavior" (Nelson 2001, p. 235). Economic theories should be more explicit about their normative presuppositions and implicit conceptions of ethical and religious values. We might say that improved values and trust in the economic system might be good for reducing transactions costs. This is indeed recognized by some of the most prominent representatives from institutional economics. Williamson argues in his organization theory that there is quasi-moral involvement of among parties in transactions of economic exchange and in the development of organizational hierarchies (Williamson 1975). Moreover, Douglass North emphasizes the function of ideological commitments, honesty and integrity in order to ensure efficient economic action and reduce transaction costs in organizations (North 1990; Nelson 2001). Institutions are determined by a certain path-dependency, where possible change is based on their history and culture (Putnam 2000). With Putnam, research can here emphasize the importance of civil society and participation in community life for the development of specific cultural traditions (Putnam et al. 1993). In this context, following Fukuyama, trust cannot be understood exclusively in terms of economic strategy but it is a richer phenomenon that is based on the basic structure of culture and history of society (Fukuyama 1995). Fukuyama argued that it is not possible to understand economic life in terms of neoclassical economic rationality. Trust is based on shared norms and patterns of participation in community (Bidault et al. 1997).

Thus, the new institutional economics represents an important challenge to the traditional paradigms of modern economic theory (Rendtorff 2015a, b, 2017a, b, c, 2019a, b, c). However, this does not mean that it implies a new value-neutral all-inclusive theory of economic efficiency. Rather, institutional economics is a value-based theory, arguing that economic development depends on social and cultural change. In this context, institutional economics accept the significance of the market and the necessity of self-interested behavior of economic organizations in fair competition. However, it does not want to avoid the market paradox of community boundaries on economic behavior. Rather, institutional economics accepts the necessity of certain values and religion in order to support the market mechanism and solve the market paradox. Moreover, this does not mean that institutional economics is a position without a religious foundation. In fact, the religious implications of institutional economics may – as indicated – be conceived as mediation between Catholic and Protestant traditions placing economic action within the boundaries of the ethics and values of cultural communities (Fort 2001). In this sense, business legitimacy research can be so courageous as to define institutional economics as implying a hermeneutic concept of religion, according to which religious values are inscribed in the social and cultural institutions of human communities.

The Economic and Social Legitimacy of the Firm

Therefore, business legitimacy research is now aware of the need for values in order to improve legitimacy of economic behavior. The new paradigm of the economic and social legitimacy of the firm implies business ethics, corporate social responsibility, and sustainable development, in particular focusing on the sustainable development goals (SDGs) (Rendtorff 2013a, e, 2017a, 2019a, b, c). In this context, institutional economics can be argued to combine the descriptive level, saying that a firm should be understood as a more or less formal nexus of contracts among its members with the hermeneutic and normative level of how to deal with values and ethics in economics. Institutional economics is aware of the fact that contracts are based on cultural and historical norms in order to avoid opportunism and keep society and the market from falling apart. However, even though there is an awareness of normative dimensions within institutional economics, institutional economics is so dependent on scientific concepts of economics, that it does not give an explicitly and well-argued answer of what values will be most appropriate for economic institutions and corporations. Moreover, given the legitimacy crisis of traditional models of legitimacy, for example, the religious Protestant and Catholic conceptions, as well the inability of their modern economic followers, we are confronted with the problem of how to conceive the new values for corporations in today's economic markets that are facing the challenges of sustainable development and transformation to a new and more sustainable economy (Rendtorff 2015a, b, c, d, 2017a, b, c, 2019a, b, c, d).

In this context, it is possible to propose a model of the "good citizen corporation" based on the ideals of integrity and corporate social responsibility as a kind of new religion for economics, which is based on the communicative rationality of ethical deliberation (Habermas 1981). However, although this model is the right one, this model is not the only and exclusive way of treating the need for new values and economic legitimacy of corporations (Rendtorff 2009a, b, c, 2010a, b, 2013a, 2014). We perceive many other views on value-driven management. In order to defend my position in the present debate, the chapter will briefly confront these positions. In addition to the progressive secular view (Samuelson), the pessimistic Protestant view, and the libertarian Puritan view (Chicago Economics), we can among others mention a religious and spiritualist conception of good values-driven management (Bovbjerg 2001). Although this model is very popular, it is possible to distinguish it clearly from what can be called the reflective-rational or communicative conception of economics as religion, which is implicit in my proposal of a theory of the social legitimacy of corporations.

According to the religious and spiritualist conception of the firm the quest for values and ethics in corporations is nothing but a new form of religion, which is an implicit ideological justification of business practice that is put forward in order to guarantee employee motivation and legitimacy of the firm. In Weber's terms it may be defined as psychosocial religious ideal type indicating that individuals are realizing themselves as good people in the workplace. This is a new modern form of "iron cage" (Bovbjerg 2001, p. 27). Even though modernity is the period of ultimate secularization, the many new kinds of management strategies should rather be analyzed as new ways of justifying the old Protestant ideal of the calling of individuals to their work. When the firms are emphasizing values and culture, they are trying to be flexible, change-oriented, and self-reflexive in order to reach a harmonious relation with their fellow employees and the stakeholders of the firm.

From the point of view of the spiritualist and religious conception of the firm, such values-driven management changes the firm into a church. Critical sociology and philosophy is not very open to this conception of good management (Rendtorff 2009b, 2010a, 2013a, b, c, d, 2014a). Newly emerging phenomena like business ethics, corporate social responsibility, and values-driven management represent new religions in democratic societies searching to replace religious worldviews in times where religion is submitted to strong criticism. Critical sociologist like Foucault, Gauchet, and Bourdieu would argue that values-driven management based on a "covenantal relation" rather than of a contract, emphasizing virtues instead of rights, and being focused on the spiritual realization of individuals at the workplace, represents a new kind of disciplinary mechanism. This is a method to increase employee productivity in a modern age. As such new methods of management, like human resource management, the learning organization, or personality-oriented visions of scientific management, based on values rather than rules do not represent any kind of rupture with the Protestant work ethics based on utility maximization (Bovbjerg 2001, p. 168). Only they are new instruments to ensure religious legitimacy of corporations, given the legitimacy crisis of Protestant and Catholic justifications of work life.

This chapter proposes to analyze many of the new kind of management methods developed as a criticism of modernist economics in this perspective. Ideas of human resource management searching for perfection and autonomy of workers can be considered as based on an "ethics of sensibility" in order to cope with change and complexity at the workplace (Bovbjerg 2001, p. 156). Applying Richard Sennett' analysis of flexibility and the new work ethos at the workplace management is in a situation where modern methods of management do not represent a liberation of individuals, but is nothing but an assimilation of the individuals to the new cultural conditions of the West after the legitimacy crisis of modernist values (Sennett 1998). Focus on personality development and values-driven management are the basis for a new Protestant concept of the calling (Pedersen and Rendtorff 2004; Mattsson and Rendtorff 2006). Here, the individual internalizes duties to the corporation through values rather than through orders. This internalization of values as a part of the personality is even more efficient than economic arguments for ensuring individual adaptability to the ideals of the corporation. Looking at the present strategies for human resource management, it is even possible to perceive different kinds of spiritual and religious arguments for personal improvement and value development.

In this context, in addition to environmentalism and different kinds of anti-capitalistic criticism of modernist economics, new legitimacy forms include the use of psychotherapy, New-Age philosophy, the concept of the learning organization, Gestalt therapy, and a number of other alternative strategies for improvement of social and human strategies in companies (Bovbjerg 2001, p. 147). These strategies, however, do not have to be conceived in opposition to the Protestant ethos of modern capitalism. The popularity of all these new kinds of strategies for empowerment and improvement of values, identity, and mission of corporations may be viewed as methods to harmonize and normalize individuals in corporations. Accordingly, new methods of human resource management have understood the necessity to focus on individual morals and values in order to be sure that individuals act in congruence with the ideals of their organizations. Consequently, an ethical concept of the corporation emphasizing personal and organizational integrity would represent a new way of promoting the discipline and power of organizations. The emphasis of the ethical worker, the need for excellence, and the virtues of the stakeholder corporation would according to this harsh criticism be nothing but a new kind of ideological justification of basic economic structures and underlying power relations in the firm and community

This challenge to the effort to find a new way of legitimizing economics and the ethics modern corporations as new kind of power instrument, a modern iron-cage, implies a very serious criticism of search for business legitimacy. Thus, it is necessary to differentiate between different theories of legitimacy of work in modern corporations. It is clear that some approaches to the field may fall for such criticism. These are for example theories based on holistic views on human nature, including very idealistic conceptions of the possible conventional harmony between employees and employers in the firm. Indeed, when such theories are used as quasi-religious legitimacy for corporate power relations we may say that an "ethics of sensibility" has replaced the Protestant ethics. However, this is not the case with all efforts of trying to justify economics from the point of view of business ethics and religion. Business ethics and ethical values in economics do not imply a method for neutralizing conflict. Rather, it should promote awareness of possible moral dilemmas in the firm. Moreover, personal realization or quest for freedom and autonomy of employees should not be considered as a new kind of religion justifying a given economic order, but rather a defense of a pluralistic and polycentric conception of rationality.

Indeed, there is a peculiar common presupposition between Modernist and Postmodernist critical sociology and the Weberian economic sociology. This is a very limited conception of rationality that is shared by the Modernist project of economics of the Cambridge and Chicago Schools and which is spelled out clearly in the radical economic existentialism of Becker and Posner. All these previous theoretical approaches and concepts of religious legitimacy of economics regard economic rationality based on utility maximizing self-interested individuals as dominant in the market system. In addition, they see no alternative rationality that can liberate capitalism from the "iron cage" The system of market economics is considered as governed by one-dimensional instrumental rationality, and it seems impossible to overcome these limitations of economic markets.

However, such a presupposition is not shared by institutional economics. It is recognized that there are institutional conditions for economic markets and that economic action is determined by these conditions. Moreover, according to the hermeneutic concept of institutions, this rationality does not have to be conceived in terms of subjective calling. As Jürgen Habermas has convincingly argued, the Weberian concept of rationality – between convictional, duty-oriented rationality on the one hand and instrumental goal-oriented rationality on the other hand – is too simple (Habermas 1981). Looking deeper into the concept of rationality we may redefine Weber's distinction in terms of "communicative rationality" versus instrumental rationality. In the article on communication ethics Habermas replaces the traditional subject-object distinction with a theory of intersubjective meaning (Habermas 1984). Rationality is based on communicative reason and criteria for validity (Habermas 1984, p. 59). This is the basis for Habermas' theory of communicative action, where he makes the idea of a domination-free dialogue where participants in the communicative dialogue on the basis of mutual recognition and understanding agree about the social and natural world. In this perspective, rationality is based on communicative interaction rather than individual convictions.

This concept of communicative action may be mobilized to contradict Weber's idea of secularization as merely instrumental rationalization. Habermas argues that history implies a development of the communicative competency in society (Habermas 1962, 1981). Because of social differentiation and development of individuality, modernity does not only lead to better technology and economic rationality but also to an increase in communicative rationality. Accordingly, we have a different theory of rationalization, which makes us escape Max Weber's "iron cage." Modern society is characterized of different spheres of validity. We may distinguish between system rationality and the communicative rationality of the life world. Due to rationalization of traditional and charismatic ways of legitimacy, modernity implies not only instrumental reason but also a possibility of a post-conventional and argumentative foundation of morality. This means that rationalization is a condition for development of critical and reflective reason. Moreover, this is what Habermas means by the idea of reinterpretation of religion in terms of the communicative symbolism of language. Habermas argues that the project of modernity is "unaccomplished" because post-conventional morality implies the need for noninstrumental legitimacy of social life (Habermas 1984). Moreover, communicative rationality is prior to instrumental rationality, because it is a condition for social interaction. In a post-conventional culture, communicative rationality represents a critical evaluation of instrumental reason and strategic interactions.

Applying this view on rationality on economic interactions, Habermas' theory of communicative action provides business legitimacy research with a new foundation of economic rationality. Systemic interactions on markets require a broader social basis. They receive legitimacy as founded in society as a social institution based on culture and the human life-world. Business legitimacy research must therefore have to be critical to the Chicago and Cambridge and the views of existentialist economics or spiritualist economics and their more or less implicit or explicit efforts to generalize economic rationality. Rules of profit maximization and self-interested behavior on markets need broader social legitimacy. The justification of profit maximization in modernity is morally conditioned and limited by community-based views on justice and the common good (Ulrich and Maak 1997; Ulrich 1998, p. 416).

Consequently, it is possible to propose an alternative view on legitimacy of corporations, which goes beyond the implicit religious justification that we find in Protestant, Catholic, Existentialist, and Spiritualist conceptions of economics. This communicative justification is not only instrumental or strategic but may be said to imply the concept of the corporation as an open cybernetic system in constant dynamic interaction with its environment. The social legitimacy of corporations cannot be limited to the idea that "good business is good ethics" from the point of view of efficiency and utility. Business ethics implies something more than marketing or use of human resources in order to improve productivity and flexibility of employees. An indication of this is the critical reaction to the use of economics for the sole purpose of improving the bottom-line within the communicative conception of economics. Nevertheless, the many conflicts between ethics and economics also indicate that there is no harmonious relation between ethics and purely instrumental economic reason (Ulrich 1998, p. 417).

In addition, this chapter rejects a surplus-based conception economic legitimacy of corporations according to which the legitimacy of corporate activities are dependent on its capacity to "give away" substantial parts of its profits and turnovers for good purposes. You cannot justify your instrumental actions ethically by giving the money away. The idea that social responsibility is something luxurious that comes along when the firm is rich and famous is not sufficient to justify the activities of the firm from the perspective of community.

Indeed, it is not possible to propose an external theory of corporate legitimacy, saying that it is enough for firms to be morally legitimate when they practice ethics as "practical corrections of specific situations of conflict." Rather, due to the challenge of post-conventional morality in modernity, business legitimacy research needs a general theory of democratic and republican legitimacy of corporation.

Such a communicative approach to business relations gives us the necessary criteria for this view on legitimacy. In this context, the German business ethicist Peter Ulrich's idea of an integrative business ethics can be proposed as a way to overcome the challenge of the Weberian concept of modernity. Ulrich argues that we cannot work with purely instrumental concepts of markets and firms and we need normative conditions for legitimacy. Business ethics is based on critical reflections on corporate values in relation to the place of the firm in a democratic society. This is indeed the case of the social legitimacy of corporations. It does not only relate to a personal calling or instrumental rationality, but considers corporate activities as a contribution to the common good of society and therefore it goes beyond the dichotomy between Protestant and Catholic conceptions of economics as religion.

The main problem of legitimacy is to determine how the values of the firm relate to society, in particular in terms of dilemmas and conflicts. At all levels of the firm, the perspective of democratic communicative rationality implies critical evaluations of processes and products. Moreover, these values are related to internal and external stakeholders of the firm. From the perspective of communicative and deliberative reason, the firm is an institution that cannot be isolated from a democratic public sphere. In order to gain social legitimacy the firm should accept this role and go into dialogue with the public in order to show its democratic concerns for the common good. Codes of ethics and values of different industries and professions are good manifestations of this concern (Ulrich 1998, p. 435).

This emphasis of business ethics as and communicative stakeholder dialogue as the foundation of social legitimacy of corporations is an important dimension of a reinterpretation of economics as religion after the legitimacy crisis of the Protestant ethics. Deliberative stakeholder dialogue of the firm as participant in a critical public sphere is a basis condition of communicative legitimacy. Stakeholder dialogue is more than strategic calculation of power and profit maximization (Freeman 1984). It is the basis for relation between the firm and society. This implies a broad concept of stakeholder dialogue including concerns for the autonomy, dignity, integrity, and vulnerability of stakeholders in the perspective of responsibility, solidarity, and trust (Rendtorff and Kemp 2000).

Conclusion

Thus, In conclusion this chapter argues that, business legitimacy research must defend an institutional view of the firm as situated in a web of stakeholder relations as the foundation of economic legitimacy. Stakeholders are critically evaluated according to communicative reason and the norms of civil society (Rendtorff and Bonnafous-Boucher 2014; Rendtorff et al. 2013). Their communicatively justified concerns are recognized as legitimate, even if they have views opposing the values of the firm. The firm evaluates critically according to the concepts of democracy that can be justified as acceptable stakeholders in relation to the basic ethical principles of autonomy, dignity, integrity, and vulnerability (Rendtorff 1998, 2002, 2003, 2008, 2014c; Jørgensen and Rendtorff 2018; Jørgensen et al. 2018, Rendtorff and Kemp 2019d). It implies recognition of the place of the firm as participant in a process of public deliberation toward the common good of society. The deliberative stakeholder concept does not reduce stakeholders to objects for instrumental improvement of profits. Rather, stakeholders are viewed as having legitimate rights, and this may include institutionalization of stakeholder claims as a part of the institutional structures of the firm (Rendtorff 2015b). In this way, communicative business ethics is not a new strategy of instrumental reason, but institutionalization of a new corporate legitimacy in times of failure of dominant economic theories (Rendtorff 2014b).

Contents

Abstract

Building on classic understandings of business legitimacy, this paper explores three moral economies, that is, human transactions characterized by noneconomic relationships and values: kosher (a Hebrew term meaning "fit" or "proper"), halal (an Arabic word that literally means "permissible" or "lawful"), and Hindu vegetarianism. In doing so, I argue for the significance of moral economies, and religious markets more specifically, to further the understanding of the complex and changing relationship between religion, culture, and business legitimacy. Over the last couple of decades or so, these moral economies/religious markets have entered a phase characterized by new forms of regulation, certification, and standardization on a global scale. This paper builds mainly on fieldwork conducted at the world's largest producer of enzymes since 2005, Novozymes,

Business · Legitimacy · Biotech · Religion · Kosher · Halal · Hindu vegetarianism

Introduction

Novozymes is the largest enzyme manufacturer globally. The company's history starts with Nordisk founded in 1923 and Novo in 1925. These were merged into Novo Nordisk in 1989, and Novozymes was founded as a result of a demerger in 2000. The company has enzyme plants in six countries, three in Denmark, two in the USA, two in China, two in India, one in Brazil, and one in Canada. Novozymes has more than 6000 employees, and in 2013 annual revenues were about US$2 billion. The company makes around 900 enzyme products purchased by many different industries manufacturing detergents, foods, beverages, textiles, biofuel, and animal feed among other things.

Encyclopaedia Britannica states that an enzyme is "a substance that acts as a catalyst in living organisms, regulating the rate at which chemical reactions proceed without itself being altered in the process" (see https://www.britannica.com/science/enzyme). Enzymes also have valuable industrial and medical applications. For example, the fermenting of wine, leavening of bread, curdling of cheese, and brewing of beer are reactions understood to be the result of the catalytic activity of enzymes. More recently, enzymes "have assumed an increasing importance in industrial processes that involve organic chemical reactions. The uses of enzymes in medicine include killing disease-causing micro- organisms, promoting wound healing, and diagnosing certain diseases" (ibid.).

Novozymes started undergoing auditing for Jewish dietary law (*kashrut*) compliance in the late 1980s and is certified by Orthodox Union, one of the global Big Five kosher certifiers. In order to comply with divergent halal requirements set by Islamic organizations globally, the company's products are certified by three different certifiers: Islamic Food and Nutrition Council of America (IFANCA), Halal Food Council of Europe (HFCE), and Majelis Ulama Indonesia or Indonesian Ulema Council (MUI). In 2011, the Indian state made it mandatory that all processed food products should bear marks to indicate whether products are vegetarian (green) or nonvegetarian (brown). The processing complex occupies a large area in a rural area outside one of South India's major cities, and the whole complex is carefully organized and managed so that green and brown production is separate according to Food Safety and Standards Authority of India (FSSAI) specifications, and FSSAI often carries out announced as well as unannounced inspections and audits to check that green/brown production compliance is properly managed.

Building on Suchman's (1995) understanding of business legitimacy, this paper explores kosher (a Hebrew term meaning "fit" or "proper"), halal (an Arabic word that literally means "permissible" or "lawful"), and Hindu vegetarianism as moral economies, that is, human transactions characterized by noneconomic relationships and values. The paper argues for the significance of moral economies, and religious markets more specifically, to further the understanding of the complex and changing relationship between religion, culture, and business legitimacy. This paper builds mainly on fieldwork conducted at the world's largest producer of enzymes since 2005, Novozymes, based in Denmark, which complies with both kosher, halal, and Hindu vegetarianism. Novozymes started undergoing auditing for kosher in the late 1980s, halal around 2000, and vegetarianism since 2011 and exploring Novozymes compliance as a case highlights the emergence, consolidation, and transformation of religion, culture, and business compliance in a globalized world. Building on fieldwork carried out in Novozymes that complies with kosher, halal, and Hindu vegetarianism, this paper answers this research question: how do kosher, halal, and Hindu vegetarianism as moral economies condition business legitimacy? Epistemologically, comparison is used as a powerful conceptual mechanism that fixes attention on kosher, halal, and vegetarian similarities and differences (Herzfeld 2001). It should be noted that as kosher was the first type of moral economy Novozymes started complying with and as there are quite a number of similarities between kosher, halal, and Hindu vegetarianism, the section on kosher is more elaborate compared to halal and Hindu vegetarianism.

Conceptualizing Religion, Culture, and Business Legitimacy

Suchman's analysis identifies three forms of legitimacy: pragmatic (based on audience self-interest), moral (based on normative approval), and cognitive (based on comprehensibility and taken for grantedness). He argues that many dynamics in the organizational environment stem from cultural norms, symbols, beliefs, and rituals. Organizational legitimacy is central to the way in which legitimacy is central to a theoretical apparatus addressing the normative and cognitive forces that constrain, construct, and empower organizational actors. Suchman synthesizes these three approaches of which the moral is of the most importance for the argument. In professional activities such as biotech production, cultural beliefs define "certain methodologies as ritual enactments of central societal organizing principles, such as science, citizenship, and free will" (Suchman 1995, p. 580). In doing so, Suchman calls for explicit scholarly attention to the existence of many distinct legitimation dynamics, and researchers who study legitimacy should clearly identify which aspect(s) they have in mind: in this case the central focus is moral economies/religious markets, conflicts and the synergies among various legitimation dynamics, legitimacy in the biotech sector, as well as constructing indicators of different types of legitimacy based on relationship to specific types of compliance/regulation/

certification/standardization. This allows for examining the incidence of particular legitimacy profiles across social locations, the dynamics of profile patterns over time, the relationship between profiles at the organizational and the industrial levels, and the impact of specific profiles on short-run performance and long-run mortality. Most importantly, perhaps, the understanding of legitimacy can benefit greatly from empirical research on the use and effectiveness of various legitimacy-management strategies.

Busch (2000) argues that standards are part of the moral economy of the modern world that set norms for behavior and create uniformity, and this point is important for the emergence and expansion of global and moral kosher, halal, and Hindu vegetarian markets. It is through standards that the moral economy is produced and reproduced (Busch 2000) and standards (in biotech production, as we will see) can standardize things or products; workers with regard to uniformity and discipline; markets in relation to fixed/uniform prices as well as the packaging of products; the way in which capitalists behave and use capital; standards themselves, that is, standardized methods that produce consistent results; the makers of standards such as scientists and technicians; consumers as a product of capitalist development and socially regulated consumption; as well as the environment. Moral and religious behaviors are subject to standards of tolerance as they work as limits of tolerable behavior in divergent settings – for example, kosher standards versus "civic" standards in the USA (Busch 2013). Likewise, Carrier (2018) argues that a moral economy can be fruitfully explored as the production and circulation of things and ways in which people engage in economic transactions with others and of how those transactions can generate a relationship with those others and an obligation to transact again in the future. These takes on moral economies or humanitarianism encouraging us to look at economic transactions in terms of relationships and their histories, and they also allow us to see some economies and some realms of life as more or less moral, depending upon the degree to which moral economic activity or humanitarianism is predominant in them.

Ferguson and Gupta's (2002) concept of transnational governmentality grasps how new practices of government and new forms of "grassroots" politics are being set up on a global scale. Examples are new strategies of discipline and regulation that are exemplified by kosher, halal, and vegetarian regulation and standards, but also transnational alliances forged by activists and grassroots organizations and the proliferation of voluntary organizations supported by complex networks of international and transnational funding and personnel. Following studies of modern forms of audit culture (Power 1999; Strathern 2000), this paper shows that transnational governmentality of religious markets seems to take on a life of its own. An example of this is not only the US kosher market as a successful private-sector regulation in an era of growing public concern over the government's ability to ensure food safety (Lytton 2013) but also more generally increasing regulation of kosher, halal, and vegetarianism globally.

Most scholarship on moral economies or religious markets focuses on the compatibility of markets and religious practices. For instance, Weber (2001) understood the origins of modern capitalism to be religious ethics and stressed that under

Western capitalism labor became an obligation and capital accumulation a virtue. More recent work explores religious moralities as formative of “market cultures” (Hefner 1998) or “spiritual economies” (Rudnyckyj 2010). The volume *Muslim Piety as Economy* (Fischer and Jammes 2019) examines specific forms of production, trade, regulation, consumption, entrepreneurship, and science that condition – and are themselves conditioned by – Islamic values, logics, and politics. Much of this research overlooks the fact that over the last couple of decades or so these markets and economies have been subjected to new forms of regulation and standardization.

Novozymes: Moral Economy and/as Business Legitimacy

In 2000 the position of Global Halal and Kosher Coordinator was created. He has been with Novozymes for many years and has been involved in quality assurance and several other areas of enzyme production. Novozymes is a good example of a company that complies with kosher and halal challenges, and this has impacted on certification, staff policies, and innovation in the company. Practically, all of the company’s food grade enzymes are kosher and halal certified. Comparatively, more enzymes are kosher certified because some of these are for the production of alcoholic beverages only, that is, halal certification is irrelevant. Novozymes started replacing the limited number of animal ingredients in production about 20 years ago due to bovine spongiform encephalopathy (BSE) and rising kosher requirements. Both factors made animal ingredients undesirable. Novozymes’ Coordinator provides a specific example of the way in which the company complies with such kosher standards: these necessitated a change in ingredients and production processes in connection with replacing porcine gelatine with fish gelatine to produce an immobilized lipase for edible oils. These transformations signify the move from localized forms of kosher standardization. The replacement of animal ingredients by other ingredients was not only resource demanding and costly; it also generated forms of innovation that benefit the company today. In many ways non-animal ingredients are more unproblematic in the globalized market in an era of food scares and rising religious requirements. Thus, over the last two decades, religious principles have played an important role in shaping knowledge, work processes, and practices in an organization such as Novozymes. Formalized standardization in the form of certification and auditing/inspections by an identifiable certifier such as OU marked the start of systematic kosher regulation.

Novozymes trains all staff involved in kosher production, that is, basic rules/regulations, approved ingredients/raw materials, as well as handling and certification procedures. These sessions start with a general introduction followed by detailed instructions about the rules that specifically apply to that audience. Occasionally, the OU rabbinic field supervisor who is also responsible for training and Novozymes’ employees around the world knows that they can contact the Coordinator if they have any questions about kosher certification and compliance. The Coordinator is responsible for such training, and he also participates in training arranged by OU, for example. Novozymes' training of staff takes place at different levels at the company's sites around the world. The Coordinator functions as the company's overall authority on kosher globally, but at each of Novozymes' sites, one member of the staff is appointed local Coordinator responsible for kosher and expertise. Worldwide, the company has seven local coordinators, one per site. Consequently, training takes place centrally in Denmark and at local sites of production in each country. This point shows that standardization is also about persons (employees and inspectors) who each in their way possess standardized skills to produce and regulate kosher products, but also transmit kosher knowledge in order to avoid divergent types of classifications globally. Training itself can be seen as a standardizing process in which learning and disciplining meet. Kosher training is a way to increase workers' employment value depending on their skills.

When kosher became more and more important in the 1990s, Novozymes' Coordinator assumed that that there would be a textbook that could tell him all he needed to know, but the only books he could find were written for Jewish housewives and not for production engineers. Consequently, he had to pick up the necessary information from frequent meetings with OU representatives including the rabbinic field supervisor or inspector. Another source of information is *Kosher Food Production* (Blech 2008) that many companies use as a handbook for kosher production. This type of manual is important in standardizing kosher principles, audits/inspections, and their translation into practice – and it's also a text that helps to shape uniform global governmentality.

Kosher

Kashrut and kosher law (*halacha*) include a number of prohibitions such as a ban on pork and the mixing of milk and meat. In addition to food, kosher is also widely used to designate the "rabbinic properness" or personalized understanding of a wide range of objects, products, activities, ideas, and institutions (Ivry 2010, p. 662). Kosher law is ultimately the application of a system of religious precepts and beliefs that governs the types of foods that people of the Jewish faith eat. This system is based on a number of verses found in the Bible, rabbinic Biblical exegesis, ordinances as presented in the Talmud (the written record of the oral law as redacted in the fifth century), and the writings and decisions of rabbinic authorities (Blech 2008). Central concepts in kosher laws are related to acceptable plants and species of animals. Other important concerns are rennin, gelatine, lactose, sodium caseinate (a protein produced from casein in skimmed milk), vitamins, eggs, grape products, fruits, vegetables, and Passover (a major Jewish festival) items (Regenstein and Regenstein 1979).

Kosher is often used as an example of not only the US kosher market as a successful private-sector regulation in an era of growing public concern over the government's ability to ensure food safety (Lytton 2013) but also more generally increasing regulation of kosher. Within the last two decades or so, the Big Five kosher certifiers have achieved global reach, Orthodox Union (OU), OK Kosher, Kof-K Kosher Supervision, Star-K, and Chicago Rabbinical Council (CRC), as well as individual rabbis who issue certificates.

Several studies show how diverse groups of Jews in the global diaspora negotiate kosher principles and practices. For example, dietary practices provide a common symbolic system through which the notions of Jewish identity can be expressed by keeping kosher (Buckser 1999; Diamond 2000; Klein 2012; Fischer 2019a). These studies demonstrate that many Jewish groups are fastidious about their everyday kosher consumption, and this point has reinforced regulation of global kosher production and regulation. The author's own research (Lever and Fischer 2018; Fischer 2019a) shows that kosher certification and logos are extremely important in the everyday lives of many Jewish groups in Europe. However, many Jewish consumers are not fastidious about kosher; together with local Jewish organizations, they feel that The Big Five kosher certifiers have become global, commercial, and powerful to such an extent that their certification of thousands of companies and products has taken on a life of its own that is detached from the everyday lives of Jewish consumers.

A glimpse into kosher compliance in Novozymes: When the author participated in a kosher inspection in 2010, the OU inspector is particularly interested to know about changes in production processes, but as Novozymes' raw materials generally are unproblematic, this is not really an issue. The OU inspector visits several times each year and has done so for many years pointing to the routinization and standardization inspections that have been undergone. Over the years the inspector and the Coordinator have developed a personal relationship, and there is mutual professional respect between them. Almost all inspections are announced, but in principle unannounced inspections are possible. The fact that inspections are announced and routinized minimizes tensions between kosher principles and practices.

The Coordinator mostly accompanies the OU inspector on the big annual inspection, while other Novozymes staff trained in kosher compliance are responsible for many of the other inspections. The kosher inspector is the only inspector to carry out inspections at Novozymes Denmark, and this helps personalize the relationship between the Novozymes Coordinator and the inspector. All Novozymes factories in India, Brazil, the USA, and China have the main kosher inspections at least once a year and frequent follow-up visits. Novozymes' Coordinator explains that even though inspections always complicate planning slightly due to the familiarity between the inspector and the coordinator, these can be "cosy" and "fun," he explains. More generally, as long as inspectors are well-qualified in the area of biotechnology and relevant areas of expertise inspections can be interesting for companies. They are an opportunity for a company such as Novozymes to demonstrate how they comply with complex religious requirements and to establish and maintain a personalized relationship between staff and inspectors. This is important because in the eyes of a company such as Novozymes, kosher compliance in the form of certification and standardization is considered value added in competition with other companies that are not kosher certified.

The OU inspector responsible for inspecting Novozymes is a Senior European rabbinic field representative, but he also does inspections in countries such as India and Japan. The inspector is in his 70s, and he grew up in the UK and holds degrees in chemical engineering from the USA where he discovered Judaism. At these sites, members of teams are ready to receive the inspection group, and they are also wearing the protective suits. Then we drive to fermentation, have lunch, and then onto environmental operations, recovery, standardization, and finally granulation. It is not only the route of the inspection that is mapped and standardized. In kosher inspections flow charts play an important role in giving inspectors a quick overview. Often during inspections, the inspector together with the Coordinator and the employee or team of employees responsible for the individual production processes looks at and discusses flow charts. If changes in production have taken place, these can be indicated on the flow chart.

During the kosher inspection, the OU inspector is thorough, inquisitive, talkative, and joking. The staff explained that they enjoyed the inspector's humor and that this made kosher inspections something special. Obviously, there is a personalized relationship between the inspector, coordinator, and team members we meet as we move along production areas and laboratories. The inspector explains about his work and purpose of the inspection and how a company such as Novozymes best complies with kosher principles. For example, in the warehouse of another company, he once found "piggy things" that are clearly prohibited from being stored among products that are designated kosher. This is a rare example of how kosher rules can be broken and the sacred can be polluted by the profane. However, as 99% of raw materials in Novozymes are already OU approved, his main focus here is on potential cross-contamination and pollution relating to the complex kosher rules in biotechnology on the one hand and auditing in connection with accompanying documents and certificates on the other.

Much of the inspection work and practices focuses on looking for proper kosher logos on products and raw materials and the trajectories of these, that is, where they are produced, by whom, and how they ended up in Novozymes' production or were stored in a warehouse. Hence, in several cases he wants to have specific files sent to him for checking at a later stage. This type of documentation and traceability is at the heart of audit culture. Another related question is about a list that covers incoming goods to the Novozymes warehouse within the last month. Many of these questions are central not only to kosher but also more broadly to issues such as quality assurance and the ways in which Novozymes plan and run production. A specific question among many others that arises in the production area we are in relates to the use of milk powder in production, as milk is traditionally a sensitive issue in kosher. Thus, milk powder is an example of a substance that is kosher as long as it is not mixed with animal ingredients.

When we stop at granulate mixing, the inspector looks at containers with OU logos and wonders about transportation details: "How do raw materials arrive? What are the delivery details? Who owns containers or are they rented? Who cleans these containers and how? Are there any papers on the tank truck?," he asks. These questions crop up in a specific part of a production area that is fully kosher; it does not produce anything that is not kosher so questions target proper handling during transportation and how this can be documented. Standardization of proper handling and transport is challenging not only for Novozymes but also for companies that supply containers, for example, and again documentation and traceability become essential in making kosher production auditable.

Thus, traceability in connection with ingredients is of particular importance during kosher inspections. These ingredients have traveled far taking complex "secular" routes, and they therefore pose a specific concern for OU. Hence, proper labeling with kosher logos by OU or one of the OU recognized certification bodies together with labels that detail contents are essential for traceability. Batch numbers and barcodes are also inspected in order to determine traceability. In general, the further a product has traveled along complex routes between suppliers, middlemen, and companies, the more they can be seen as problematic and in need of proper certification and labeling. These points also vary from raw material to raw material seen to require different kosher status – some products must be certified as kosher, while this is not essential for others, so there are grades of kosherness to consider during inspections.

The inspector notes that in many cases enzymes that should be kept separate are mixed in complex ways. This trend is also an effect of the intensified globalization of the trade of enzymes in which more and more "secular" middlemen handle kosher in divergent ways. According to the OU inspector, an example of this is "individual and unreliable rabbis" who want to make easy money without possessing the necessary knowledge or resources to handle kosher properly. In this "incestuous world of enzymes," logos and labeling are essential signs of standardization that can say something about "the other side of the logo," that is, the kosherness of products is not easily verifiable without these logos on products or certificates.

While we wait in a production area for a certificate for a particular product to be recovered from the nearby office, the inspector reasons that more and more attention is paid to how certification and proper logos on products can give producers, certifiers, and consumers assurance and the relabeling of products. Many products are relabeled one or more times as they move from production to consumption and attain new qualities. Sometimes, the inspector complains, labels are ripped off during transport, and this makes kosher status verification impossible. However, no matter how detailed the label on products may be, kosher rules cover ingredients and processes that cannot be covered by a secular declaration alone, and this point necessitates the marking of correct status with a logo.

As we move around, several less convincing kosher logos come to the attention of the inspector – for example, a big logo by a French kosher-certifying body the inspector considers reliable, but he dislikes the design. We also encounter an example of a raw material the Novozymes Coordinator is not quite sure how to document on site as kosher. The OU inspector suggests that Novozymes can have a picture taken of its batch number and barcode so that paperwork and a certificate can accompany the product. This shows that audit culture practices can determine whether a product is kosher or not. This procedure is becoming more and more common in such situations. When exploring the fermentation process, the inspector wants to know if any changes over the last 2 months and changes more generally have taken place. Potential changes in production are a concern of kosher inspectors in general, as these challenge standardized ways of practice in ways that have implications for kosher principles. If companies can provide detailed information about changes, it is easier to determine how kosher status is affected so this is often one of the first questions inspectors ask and one that companies are prepared to answer. Another specific question is about raw materials for different types of production. Other questions asked by the inspector relate to changes in particular processes since the last inspection – for example, new suppliers of raw materials. We now reach recovery, and the inspector again asks if there have been any changes in this process since his last visit. The coordinator can answer these questions to the satisfaction of the inspector, and the specialized teams we meet at different steps of production are prepared to elaborate in their particular field of expertise.

In a specific part of a production area, the inspector is enquiring into the potential risk for contamination in relation to a product that is stored in a state-of-the-art steel tank. The researcher could not help asking how a modern steel tank can be suspected of causing contamination. The inspector answers that this is "Because there were traditionally holes in metal containers and theological reasons." As noted, another example of these historical or theological aspects is the inspector's questions and concern with steam as a potential media of contamination in connection with pigs and other pollutants – steam or hot water issues pose a concern if a common steam or hot water system is used in the processing of kosher and non-kosher products. Concerns with contamination risks in steel containers and steam show the extent to which historical/theological kosher principles condition kosher production practices. However, as long as companies can comply with these requirements through standardized practices, they are not concerned. The training of staff, in particular where the OU inspector also participates, provides a framework for inspections that makes kosher compliance smoother. Even if kosher inspections are only one type of inspection among many others, employees generally consider kosher regulation different from other standards and regulations due to its divine origin. Kosher standards are also only one set of standards among many others. The ethnography shows that not only are inspections standardized and routinized, but they also serve the purpose of establishing personalized relationships between inspectors and coordinators that help to ensure smooth cooperation and the translation of kosher principles into practice. After 2 days of inspection, the inspector moves on to the next company before returning to Novozymes in due course. Kosher compliance in Novozymes shows how kosher conditions a specific form of business compliance as moral economy in biotech production.

Halal

The Koran and the Sunna (the life, actions, and teachings of the Prophet Muhammad) exhort Muslims to eat the good and lawful that God has provided for them, but there are a number of conditions and prohibitions. Muslims are expressly forbidden to consume carrion, spurting blood, pork, or foods that have been consecrated to any being other than God himself. These substances are haram and thus forbidden. Ritual slaughtering entails that the animal be killed in God's name by making a fatal incision across the throat. Another significant Islamic prohibition relates to wine and any other intoxicating drink or substance (Denny 2006, p. 279). In the modern food industry, a number of requirements have been made in relation to halal food, for example, to avoid any substances that may be contaminated with porcine residues or alcohol such as gelatine, glycerine, emulsifiers, enzymes, flavors, and flavorings (Riaz and Chaudry 2004). Moreover, aspects of context and handling are involved in determining the halalness of a product. The interpretation of these questionable areas is left open to Islamic specialists and institutions such as MUI.

For some Muslims halal sensibilities necessitate that halal commodities are produced by Muslims only and that this type of production is kept strictly separate from non-halal production. For example, in Malaysia it is a legal requirement that foreign companies set up a Muslim Committee in order to handle halal properly. In 2001, a major food scandal in Indonesia triggered a new phase of halal proliferation and regulation, that is, transnational governmentality, on a global scale leading it to cover areas such as enzyme production. The Majelis Ulama Indonesia or Indonesian Ulema Council (in English) (MUI), set up by the Indonesian state in 1975, accused a Japanese company, Ajinomoto, of using pork products in the production of the flavor enhancer monosodium glutamate and demanded that the Indonesian government take appropriate action. Although Novozymes has complied with steadily growing kosher requirements since the 1980s, enquiries about halal certification from Southeast Asia, especially Malaysia, Singapore, and Indonesia, finally culminated in new practices in 2001 following the food scandal in Indonesia. However, already before this food scandal, there was an increasing interest in halal, and Novozymes started to learn about halal and its similarities to and differences from kosher – also in terms of locating and ultimately choosing certifiers. MUI does not have the resources to carry out inspections globally, and consequently they have outsourced responsibilities to Muslim organizations around the world such as Islamic Food Council of Europe (IFCE) and Islamic Food and Nutrition Council of America (IFANCA) that, for example, carry out inspections in Novozymes. Thus, globally, companies are affected by halal transnational governmentality that to a large extent is evoked by Southeast Asian nations such as Malaysia, Singapore, Indonesia, Brunei, and Thailand.

As we saw it in the case of kosher, many Muslim consumers and consumer associations are fastidious about halal – especially in Southeast Asia where halal consumption among growing Muslim middle-class groups is inseparable from modern Muslim identities and ethnicity (Fischer 2008, 2011). However, many Muslims feel that the proliferation of halal into enzyme production, for example, is unnecessary and overly commercial. Comparing kosher and halal markets, the regulation of the former has taken place for a longer period of time, and the kosher market is more settled than that of halal in which a plethora of state and non-state certifiers struggles over authority. Another difference is that kosher requirements are more complex – for example, with regard to contamination in kosher production but also in the everyday lives of Jewish groups (Lever and Fischer 2018).

In order to comply with divergent halal requirements set by Islamic organizations globally, the company's products are certified by three different certifiers, among them HFCE. When we discuss standards and standardization, the Coordinator contends that halal standards similar to those of ISO would be desirable. It is confusing that different halal certifiers compete and have different halal understandings and practices resulting in tensions and a constant uncertainty about recognition and misrecognition between certifiers. However, despite calls for such standards by certifiers and companies, there is no sign that actual halal standardization is being institutionalized on a global scale. Such standards could ideally also include inspections, and this would perhaps smoothen different certifiers' skepticisms about the inspection qualifications, competences, and capabilities of other certifiers that can lead to a certifier being misrecognized.

The author was given the opportunity to carry out participant observation at a halal inspection in Novozymes. The halal inspector is the chairman of HFCE. He is also the vice president of the influential halal certification body Islamic Food and Nutritional Council of America (IFANCA) based in Chicago; HFCE can be seen as a kind of subsidiary organization of IFANCA in Europe. The inspector was born in Malaysia where he worked with Malaysia's state regulated form of halal certification since the early 1980s. The mission and objectives of HFCE are to promote the concept of halal globally in the interfaces between Islamic organizations and scholars, Muslim consumers and companies, research, and training.

When a company is requesting halal certification, an audit/inspection of the production facility is done to review the production processes, ingredients, and sanitation aspects of the facility, and this was also the case in Novozymes. Companies must provide necessary documentation and information pertaining to specification sheets, labels, flow charts, cleaning/sanitation procedures, and other production details. A contract is signed between HFCE and the company when there is agreement by both parties. HFCE is recognized by MUI. It is essential for Novozymes to be certified by a body that enjoys the most widely recognized type of certification. Even if HFCE and IFANCA closely cooperate, they carry out independent inspections at Novozymes. For example, Novozymes factory at its headquarters in Denmark only has inspections from HFCE, while the company's factory in China is inspected by both MUI and IFANCA. The HFCE inspector explains that kosher is a term similar to halal, but there are many differences; while Islam prohibits all intoxicants, Judaism regards alcohol, among other things, as kosher. He is fully aware that Novozymes has been fully kosher certified since the 1990s.

The regular inspections of Novozymes by HFCE take 1–2 days, during which the HFCE inspector explores the production process. The inspector does not concentrate on the biotechnological details as much as on hygiene in the production process to ensure that no cross-contamination with haram substances occurs. Similar to kosher, these inspections are resource demanding for Novozymes. However, they allow the company to develop and refine their production methods to comply with increasing religious requirements. For example, Novozymes does not introduce new ingredients or production processes without consulting its halal certifiers about the overall process of qualification. Consequently, these organizations influence the innovation process within the biotechnology industry. Unannounced inspections are allowed, but unsurprisingly Novozymes and other companies prefer announced inspections that they can prepare for and schedule. The HFCE inspector is more focused on visual aspects of the production processes as well as scrutinizing logos, certificates, and accompanying documents. The HFCE inspector is well aware that Novozymes has been fully kosher certified for many years, which limits his main concern to alcohol, and that Novozymes also has very few ingredients and production processes that can be considered problematic. Occasionally, ritual cleansing of equipment in addition to the sterilization of the company does itself is performed.

Hindu Vegetarianism

Modern vegetarianism in India is integral to Hinduism and based on the concept of *ahimsa* (noninjury to all living creatures). To Hindus, food/drink is closely related to bodily substance, health, well-being, and purity/pollution (Malamoud 1996) as well as to caste, class, gender, and kinship (Caplan 2001). Hindu food and drink practices among divergent class and caste groups have always been contentious in India, but now the country finds itself at the interface of three major transformations that are fundamentally reshaping conventional forms of vegetarianism: Hinduization (promotion of Hinduism) of state and society (Hansen 1999), an increasing number of companies such as Novozymes that are involved in and must comply with rising vegetarian forms of regulation, and the emergence of a new Hindu middle class of about 300 million consumers attentive to vegetarianism.

The global market for vegetarian food products has exploded within the last few years. Nowhere is this more visible than in India, which is one of the largest and fastest-growing markets for processed foods in the world. In 2011, the Indian state made it mandatory that vegetarian food must bear a “green mark” to indicate that products are fully vegetarian (Ministry of Health and Family Welfare 2011). Moreover, India’s new Prime Minister since 2014 from the Hindu nationalist Bharatiya Janata Party (BJP) is a strict vegetarian and promotes vegetarianism as a national project. Controversies over what Hinduism is, or ought to be, are intensifying as the practices of food consumption are increasingly being standardized in contemporary India. These problems and transformations take place in the wake of India’s programs of liberalizing its economy in the 1990s. The cornerstones were the privatization of public-sector enterprises, increased solicitation of foreign investment, and disavowal of policies aimed at import substitution. Such broad socioeconomic changes have led to a sizable expansion of the middle classes and transformed their relationship to food consumption practices.

The ever-increasing pluralization of shopping choices in urban Indian spaces is increasingly infused with Hinduized vegetarian and puritanical notions and practices (Giridhardas 2011, p. 10). The predominant literature on vegetarianism in India and South Asia (Caplan 2008; Desai 2008; Donner 2008) demonstrates new forms of vegetarianism as effects of “gastro-politics,” that is, how beliefs about food encode a complex set of social and moral propositions (Appadurai 1981) – for example, in strictly vegetarian housing estates that have emerged in urban India. Compared to kosher and halal, Hindu vegetarianism is only starting to be regulated, but right now Indian vegetarianism seems to follow many of the logics of standardization.

In 2011, the Indian state made it mandatory that all processed food products should bear marks to indicate whether products are vegetarian (green) or non-vegetarian (brown), and with the rise of consumer culture in super-/hypermarkets, these logos are ubiquitous on packagings throughout India. While the concept of *ahimsa* (noninjury to all living creatures) is central to Hinduism and Hindu vegetarianism is explored in a large literature, there is no corresponding exploration of how "green" and "brown" production is managed in contemporary India. What is more, India is a major exporter of meat and water buffalo beef in particular (Fischer 2019b). Based on fieldwork in India, this section explores how manufacturing companies such as Novozymes understand and manage "green" and "brown" standards.

A glimpse into vegetarian compliance in India: Novozymes started its operations in India in 1983, and it's the largest supplier of industrial enzymes and microorganisms in South Asia. When the author visited the Novozymes facility in Bangalore, the Senior Specialist explains that Novozymes India has more than 500 employees with three sites in Bangalore that cover research/technology, manufacturing, business functions, and a service center. Some of the key business areas for Novozymes India are household care, textiles, food/beverages, oils/fats, baking, and beverage alcohol. The Senior Specialist has been with Novozymes for 18 years, and she holds an MSc in food technology. Her main responsibility is raw materials and good manufacturing practices, including FSSAI vegetarian regulation, kosher, and halal. The author also met the Senior Specialist at Novozymes' headquarters in Denmark. Kosher and halal are not major issues in Novozymes India, whereas vegetarian regulation has a long history in the Indian context, she explains. The Prevention of Food Adulteration Act from 1954 came into existence as the first federal law to ensure safe, pure, and wholesome food to consumers. The present green/brown logos enforced by FSSAI are only the latest versions of logos that indicate whether food and ingredients in India are veg or nonveg. Novozymes India is a strictly "green" company, that is, all the company's food grade products carry the green mark. However, from 2011 onward Novozymes India had to apply for a FSSAI license. The Head of Quality Assurance explains that depending on the type, size, and income of food businesses, three types of licenses have to exist, and Novozymes falls under a "central" one in Delhi. All details can be found at the FSSAI's website. For both types of licenses, there is a fee that depends on:

> . . .the type of unit you are putting up. The FSSAI Inspectors come for inspections. They have their federal headquarters in Delhi, but inspections and audits will be at the state level. They don't inform us when they come here. They can come down whenever they want. They have inspected us in 2016. The person who came last time he was here for around four hours. We also have FSSAI requirements like how the plant should be established, what kind of activity should be conducted regarding veg and non-veg. Everything is outlined on the website. We never had any animal ingredients.

When we discuss why green regulation is so important in India, the Head of Quality Assurance argues that “In India we have populations from Rajasthan, Gujarat and Southern India where many people are vegetarian. There are different cultural backgrounds. So, these logos make it easy to choose veg or non-veg.” Most of all, she considers the logos to be symbols rather than logos of certification or standards. The green mark can be found on multitudes of Novozymes India packagings in India and elsewhere, and in Novozymes India’s formulation unit, the relevant staff team received training on the proper kind of labeling on each product. In sum, for Novozymes India green regulation in India is not very complex or challenging as long as the company only uses ingredients and products that are not of animal origin and there is no formal requirement in terms of staff being vegetarians themselves.

Conclusion

This paper shows why and how moral economies condition new forms of biotech production and business legitimacy: Kosher, halal, and most recently green/brown governmentality extends into biotech production, for example, and the company Novozymes was an example of that. Within the last couple of decades, different types of certifying institutions/organizations “discipline” companies, and in that process, they claim authority that is central to both certifier and businesses – and the legitimacy that arises from these processes. In other words, in India FSSAI is disciplining companies with regard to green/brow understanding and practice, but companies such as Novozymes have a long history of moral economy compliance so they become more skilled in negotiating standardized requirements. A central aspect of audit culture is the pushing of control and self-control further into companies to satisfy the need to connect internal organizational arrangements to public ideals. It is clear from the above that a multitude of divergent religious understandings are now being overshadowed by processes of standardization and that companies themselves are rationalized to deal with these challenges. It is clear that compliance influences the social organization of businesses, that is, how companies understand and practice requirements as social organizations. Globally, religious economies and markets are inseparable from the way in which religions more generally are regulated by the state, but religious transnational governmentality also stretches to secular settings around the globe such as Novozymes in Denmark. Even if the underlying principles behind religious economies and markets discussed remain some form of “divine order,” transnational governmentality is increasingly evoked as authoritative fields of knowledge in the way in which these markets are practiced. A very visible transformation in companies is the proliferation of religious logos on products, facades, advertisements, and certificates. These logos testify to the fact that a recognizable body certifies products and production processes between producers, sellers, buyers, and certifiers. Many companies argue that even if requirements and control have been “stepped up,” religious markets are more professionally regulated today compared to the unclear and confusing requirements of the past. However, the transnational governmentality is also a form of religious audit culture that tends to take on a life of its own. Today, religious certifiers and companies claim authority and generate profit, while many Muslims, Jews, and Hindus are unaware of or uninterested in these processes.

Organization, Business Legitimacy, and Business Ethics Theories

Virtues, the Common Good, and Business Legitimacy

Contents

Abstract

When it comes to contributing to the wider society's common good, organizations' considerable ethical failures have weakened overall trust in business firms. Mainstream legitimacy theory fails to address normative issues on the ethical responsibilities of management toward and the role of business in society. This chapter reviews the main approaches to business legitimacy linked with institutional theory in light of the virtue ethics tradition to show how a virtuous management paradigm can enable a better relationship between the firm and its stakeholders, promoting their well-being and contributing to the common good of society as a whole. To facilitate a richer and more nuanced understanding of virtue ethics' concerns, it applies key terms from Aristotelian virtue ethics to discussion of the role of management and ethical communication in the context of business legitimacy.

Virtue ethics · Business legitimacy · Common good · Stakeholders

Introduction

When it comes to contributing to the wider society's common good, organizations' considerable ethical failures have weakened the community and polis' overall trust in organizations (Pirson et al. 2019; Sethi 2002). As a result, organizations, especially among the top echelon, are expected to provide detailed accounts of their actions, decisions, and performance that goes way beyond financial performance and moves into territories that touch on (un)ethical conduct (i.e., reports on societal and stakeholder impact, environmental impact, and impact on personal well-being of key groups involved) via legal, accounting, oral, written, formal, and informal communication channels signed by executives themselves (Ferns et al. 2008). How organizations and top executives communicate on these matters corresponds to a field of research called (organizational and leadership) accountability research; the concept is understood in the literature as something that organizations owe (Swift 2001; Gray et al. 1997). Therein, organizations' license to operate involves a duty to justify their actions to society at large and to account for sustainability, transparency, and accountability strategies – or the right to hold people responsible for their actions (Bivins 2006).

One of managers' key roles includes their responsibility in terms of accountability. Organizational and management accountability has been dealt with mostly through corporate social responsibility (CSR), accounting, and legitimacy-related literature. In this chapter, we briefly review the legitimacy literature that springs from institutional theory, then juxtapose different views on legitimacy and accountability from the perspective of virtue ethics, and finally attempt to link it with the concept of the common good, the role of firms, and management. With regard to understanding business and management accountability, we aim to go beyond the current legitimacy and CSR literature, joining scholars of business ethics such as Garriga and Melé (2004), who argue that organizations have an **essential ethical responsibility** to society at large and to specific groups with which they relate inside and outside of the firm. This enables wider flourishing and the common good (Sison and Fontrodona 2012), which, in turn, goes beyond the need to legitimize others' assumptions, as well as beyond legal and economic responsibilities. In addition, we will present Aristotelian notions of *ethical communication* that emanate from a virtuous character, what it entails, and how it is part of managers' ethical accountability. We will argue that virtuous organizations and managers who act in the unity of virtue can significantly strengthen all stakeholders and groups, enabling them to mutually grow while developing their relationships (Flyverbom et al. 2019; Trevino et al. 2000).

An Overview of Business Legitimacy

Legitimacy is an established, mainstream concept in social and organizational studies (Deephouse and Suchman 2008; Hannan and Freeman 1989; Dowling and Pfeffer 1975; Hybels 1995; Suchman 1995). Legitimacy literature and its main assumptions spring from institutional theory, whereby legitimacy is the central concept that articulates and influences stakeholders to hold positive perspectives concerning a business or organization's social acceptability or credibility (Suchman 1995; Scott 2008; Deephouse and Suchman 2008). The institutional theory rationally justifies the duty of legitimacy as managerial accountability, which includes influencing beliefs that align with a positive reputation or effectively address critiques or a weakened reputation to increase stakeholders' trust, which facilitates positive reputation (and share price) for the benefit of shareholder interests.

Accordingly, key contemporary legitimacy authors argue that, in order to survive in their social environments and to maintain prosperity and a license to operate – i.e., to be "legitimate" – an organization is granted a social license when its operations, values, and underlying processes meet stakeholders' expectations and needs and satisfy societal norms (Dare et al. 2014). For that to happen, more than just technical information and material, financial, and human resources are needed. An equally key variable arises in the form of social acceptability and credibility, that is, *legitimacy* (Scott et al. 2000). Institutional theorists Meyer and Rowan (1977) argue that legitimacy is an asset that provides a reservoir of trust and support among external resource holders, enabling an organization to access scarce resources and keep afloat.

Suddaby and colleagues (2017) suggest that key theories define legitimacy as an ongoing process and not as "a state of equilibrium" that is seen (1) as an organizational resource/*property*, (2) as a *process of social interaction* (the essence of legitimation, which we explain later), or (3) as a socio-*cognitive perception* or *evaluation* (Suddaby et al. 2017). The most prevalent theory involving the concept of legitimacy is from Suchman (1995) whose understanding of it follows a tradition in organizational studies based on Max Weber's *Economy and Society* (Suchman 1995); he defines it as "a generalised perception or assumption that the actions of an entity are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs, and definitions" (Suchman 1995: 574). There are two other noteworthy definitions of organizational legitimacy in the literature that Suchman (1995) cites, conceptualizing it as follows: (1) as "the extent to which the array of established cultural accounts provide explanations for [an organization's] existence" (Meyer and Scott 1983: 201) and (2) the "congruence between the social values associated with or implied by [organizational] activities and the norms of acceptable behavior in the larger social system" (Dowling and Pfeffer 1975: 122). Whereas the former definition focuses on the cognitive nature of the concept, the latter emphasizes a cognitive-evaluative aspect, arguing that organizations do not need to be explicitly accounted for (from managers to society); rather, managerial impression management action is key for influencing evaluations that affect socio-cultural stakeholders' view(s) of an organization.

On the one hand, in this literature, legitimacy is seen as an institutional attribute, a part of a robust brand maintenance strategy. On the other hand, legitimacy equally captures the social practice of legitimation as an ongoing effort and can be extended, maintained, and defended (Ashforth and Gibbs 1990). The idea is that gaining acceptance, i.e., mastering this social practice, relies on convincing different groups to consider that what the business does/is is acceptable because it possesses distinct characteristics from established categories (Galaskiewicz and Barringer 2012). Therefore, *actively managing legitimacy* is a key strategic-cognitive aspect of management and organizational roles (Kostova and Zaheer 1999; Vaara and Tienar 2008). This *legitimation processes* involve "specific, *not always intentional or conscious*, ways of employing different discourses or discursive resources to establish legitimacy" [*emphasis added*] (Vaara et al. 2006: 794).

There are several analytic sub-constructs and dimensions of legitimacy (Deephouse and Suchman 2008); the key ones include the following: (1) **pragmatic** legitimacy, pragmatic legitimation strategies aim toward gaining the support that an organization enjoys based on "self-interested calculations" regarding its primary audiences to perceive that they enjoy individual benefit from it (Suchman 1995: 578); (2) **cognitive** legitimacy, cognitively mastering the clash of worldviews that result from relativism (cognitive legitimacy) via influencing audiences' cognition rather than their self-interests in the desired direction (Suchman 1995); and (3) **moral** legitimacy, which is based on positively influencing judgments of right or wrong in favor of an organization (Suchman 1995; Tost 2011). The latter is defined as the "positive normative evaluation of the organisation and its activities" (Suchman 1995: 579).

Subjectivity and amoral relativistic ethical assumptions underpin the key importance of these three forms and effective organizational and managerial legitimation strategies. When it comes to moral and pragmatic legitimacy, mastering management defines the ability to choose a discursive evaluation strategy to effectively manage legitimacy vis-à-vis an audience (Suchman 1995). Mastery of the open discursive process entails different key audiences (stakeholders) arriving at positive cost-benefit ethical judgments and appraisals through explicit public communication. These forms suggest that vigorous participation in such public forums allows organizations to increase moral and pragmatic legitimacy. But cognitive legitimation is seen as being less subject to discursive construction; in line with Suchman (1995: 585), it involves underlying (held) assumptions that different publics hold, which are not spoken or articulated in language. Heated (spoken, orally communicated) defenses of organizational endeavors tend to imperil the objectivity and exteriority of said taken-for-granted schema.

Therefore, based on the above, legitimacy is mainly understood as an institutional, cognitive, and/or evaluative strategy that rests on managers' mastery of reason and communication processes, which unfold as strategic action involving legitimation. However, the pursuit of legitimacy is seen as a complex way to address various stakeholders as distinct audiences (possessing distinct characteristics, with different needs and expectations) such that the organization (management) faces challenges of how to **master legitimacy**. Legitimation is seen as the process through which the legitimacy of a subject is mastered and evolves over time (Maurer 1971; Ashforth and Gibbs 1990; Walker and Zelditch Jr 1993) in the direction hoped for. Effectively managing or handling such processes is seen as involving the provision of some sort of pleasure/gain for different autonomously targeted audiences (a hedonistic or utilitarian understanding that each audience sees some benefit from an entity), which is, in turn, seen as ensuring shareholders' self-interest (and enabling managerial success in the role).

From this perspective, stakeholders (especially external ones) are seen as clearly rational and seeking to maximize their interests (Ross 1973). According to the literature, a positive increase in legitimacy is seen as an asset that enables businesses growth and survival (Bansal and Clelland 2004; Dobrev and Gotsopoulos 2010; Phillips et al. 2004; Ruef and Scott 1998; Suchman 1995; Suddaby and Greenwood 2005). These assumptions are logical within a belief system that sees the firm as an economic-legal entity whose quasi-moral agency is to be a rational profit seeker that only seeks to satisfy the needs of shareholders who managers mainly represent, aligning personal and shareholder interest fulfilment with accountability performance (Jensen and Meckling 1976).

In accordance with the above, and upon review of the legitimacy literature, it should be noted that ethical communication does not appear among the key concepts and basis of this literature. Managerial accountability and role success in legitimation process management are not linked to any notion of ethical character or to the moral maturity of managers. Even when it comes to moral legitimacy, Suchman (1995), for example, assumes that managerial capacity for effective impression management is key, while regarding morality through the lens of relativism and subjectivism. Hence, the legitimacy literature is weak in identifying an ethical basis for linking business, management, and society; instead, it sees legitimacy mostly as a cognitive act involving competent impression management over complex audiences. For example, in the literature on entrepreneurs' legitimacy management, Aldrich and Fiol (1994: 645) examine the *strategies* entrepreneurs might formulate in emerging industries where both cognitive and sociopolitical legitimacies are weak. Through this cognitive process, managers and key organizational representatives choose how best to engage in different kinds of impression management work to effectively master the (open, processual, pluralistic) legitimation process in order to influence various audiences' cognitions and feelings about an organization. However, therein, the management of legitimacy is a rather amoral task that requires technical, strategic excellence involving three key interrelated tasks: gaining, maintaining, and repairing legitimacy (Suchman 1995).

Legitimacy is therefore thought of in terms of separation, i.e., the idea that arguing economic and ethical responsibilities involves two separate domains (Freeman 1994, 2000). Supporting the critique that the literature supports an amoral techno-rational role for managers, we draw on Swanson (2018a, b), who argues that managers that excessively hold on to this notion of separation tend to develop an amoral or immoral view of business decisions, including how to go about their accountability responsibility as a moral-ethical act. Swanson suggests that a sense of separation prevents a coherent theory of ethical and responsible leadership with the assumption of the separation thesis that weakens managers' sense that they are part of a wider ethical community with a commitment to the possibility of shared flourishing through business (economy) and society more broadly. These critiques can be addressed once business (and management) legitimacy are understood from a virtue ethics perspective on the common good and managerial virtue.

A Recovery of Virtue Ethics and Its Application to Business

For its part, virtue ethics (henceforth, VE) is a long-standing Western tradition that was initiated in Greece, with eminent thinkers like Socrates, Plato, and Aristotle, and continued into the Middle Ages (especially with Thomas Aquinas) but largely lost favor in modernity (MacIntyre 1967). It regained philosophical interest in the second half of the twentieth century (Chappell 2013; MacIntyre 1981; Melé 2012; Sison and Ferrero 2015). Since then, its application to the business world has increased significantly, even gaining ground over other, more mainstream approaches, namely, Deontology and Utilitarianism (Koehn 1995; Chun 2005; Melé 2009; Ferrero and Sison 2014).

Although there are different streams among virtue ethicists – including Neo-Aristotelians, Confucians, Humeans, Smithians, Nietzscheans, etc. – its main branch focuses on a recovery of the Aristotelian tradition (Hartman 2008; Ferrero and Sison 2014) and Thomistic moral philosophy (Koehn and Wilbratte 2012). "Etymologically, 'virtue' comes from the Latin word *virtus*, which in turn originates from 'vis,' meaning 'force,' 'power,' or 'strength.' *Virtus* is the Latin translation of what was, originally, a Greek concept, *arête*, which stands for 'what is best' or 'excellence' in human beings" (Sison 2015: 241–242). Indeed, for Aristotle, virtue is an excellence that consists in "living or doing well" (Aristotle 2009, NE 1095a) in accordance with rational activity; in other words, it corresponds to what is best in human beings. This excellence is attained based on personal traits, in particular, prudence or practical wisdom (*phronesis*), which refers to the habit of acting correctly (Solomon 1992; Moberg 2008), especially in supporting the good in social matters.

Hence, the idea of virtue plays a central role in the development of man's natural capacities in community in order to attain his highest aim: happiness and excellence (*eudaimonia*, usually translated as human flourishing). For Aristotle, the focus is not on action but rather on the agent: "*Virtue ethics* tell us that what is right is *to be a certain kind of person*, a person of virtue" (Zwolinski and Schmidtz 2013: 221, *emphasis added*). A virtuous agent (a person understood as a unity of virtue) freely chooses to act fulfilling the moral accountability we have to one another as linked to the possibility of human flourishing, which is only possible in community and finds its fullest meaning when directed toward the good of the community, that is, toward the common good (Sison 2015). More specifically, personal flourishing or happiness is to be found in sharing a good life with family, friends, and fellow citizens (Aristotle 2009, NE 1097b). Human goods such as friendship, education, work, health, and religion are achieved in human communities, and only in this way do they help constitute *eudaimonia* (Sison and Ferrero 2015).

From a VE perspective, "the human good turns out to be the soul's activity that express virtue" (Aristotle 2009: 1098a). In the case of business firms, they are intermediate associations (Sison and Fontrodona 2012, 2013) whose aim is to attain a common good (Sison 2016): "[t]he common goods of those at work together are achieved in producing goods and services that contribute to the life of the community and in becoming excellent at producing them" (MacIntyre 2016: 170). In other words, the firm is defined as a community of work (Solomon 1992) whose purpose is to offer products and services to satisfy material needs and promote well-being (Kennedy 2006) in a sustainable, productive, and profitable way (Melé 2012).

Personal development among its members is more important than any other good that the firm can achieve. Therefore, when the firm establishes different forms of collaboration with its stakeholders, a common good approach identifies a socially responsible action in that the intention behind it is not so much focused on strategic advantage as it is on the development of other people and communities within the firm's regular activities. When firms are described in terms of the common good, CSR becomes a matter of personal virtue and social justice. Concerning the former, corporate responsibility to the common good is based on the moral status of persons as moral agents, in their capacity to assume responsibilities with society. As a matter of justice, a socially responsible action is a basic moral duty to other people's development and thriving when in direct or indirect relationships with them (Finnis 2011). A commitment to the common good is possible via personal virtue in terms of friendship and solidarity.

However, the still predominant economic account of the firm – inspired by neoclassical economic theory – mainly assumes that the firm is a legal entity, a quasi-moral agent that acts within a market economy as a rational profit seeker with the only end of satisfying the needs of its immediate stakeholders, i.e., the firm's shareholders (Jensen and Meckling 1976). From this perspective, shareholders and other stakeholders (internal and external) alike are understood as clearly rational and seeking to maximize their interests (Ross 1973). Accordingly, managers are seen as agents that operate to satisfy shareholders – principals' needs and interests (Davis et al. 1997). Meanwhile, the firm's human-social fabric is perceived as a *nexus of contracts*: the firm defines its relationship with its human "resources," which it sees itself as "possessing" via the power of labor contracts. In addition, it promotes a management style based on technocratic, value-neutral, and rational behavior (Hendry 2004; Akrivou and Sison 2016).

Business Legitimacy and Management Responsibility from a VE Perspective

We will now turn to business legitimacy from a VE perspective and first explain the Aristotelian notions of the common good and *ethical communication* (Meyer 2017). We will then discuss VE assumptions regarding how both emanate from a virtuous character and what it takes to link them with basic ethical accountability for managers to enable mutual growth for all stakeholders. Legitimacy, and the very choice of actions involved in legitimation, must at its core involve a moral-ethical aspect, which, in turn, must drive managers' ends and the means with which they serve. This is entirely at odds with key assumptions of legitimacy theory today.

Assumption of shareholder primacy also implicates managers, as shareholders' legitimate representatives, in responsibility for safeguarding their own and shareholders' interests; yet, this is not a proper way of understanding issues surrounding legal status, ownership, and authority responsibility. As Mansell and Sison (2019) suggest, this idea is neither premised upon long-established tradition in the professions along economic history, nor is it in line with Aristotle and virtue ethicists: "In the Aristotelian tradition, to understand what something is, we have to inquire into its reason for being, or 'final cause'. For human beings the final cause is 'the good'... This final cause is called 'common' when it can be achieved only on the condition that all the individual members of a group achieve it in a non-excludable and non-rivalrous manner" (2019:11).

Hence, in virtue ethics, the concept of the "common good" underlies the firm and assumes that the good is held in common by organizational members as a community (Sison and Fontrodona 2012; Mansell and Sison 2019). So an essential collaborative activity and the joint pursuit of a common purpose gives organizational members' continuity of identity (and not to just managers and shareholders), and this is what represents the common good of the firm, which lasts and is sustainable over time (Mansell and Sison 2019). In light of the principle of subsidiarity (Melé 2005), the good of the business and any organization or institution in the sphere of the economy needs to genuinely serve the flourishing of larger collectives tied to wider political organizations.

In addition, regarding the ownership of corporations (businesses), both virtue ethics and legal scholars explain the logic of the argument against the idea of shareholders owning the corporation and thoroughly explain why shareholders who expect managers to act as their sole agents to support their interests, including the handling of legitimacy, do not do so legitimately (Mansell and Sison 2019). Some sources explain, however, that this does not mean that employees or other stakeholders – e.g., consumers, or even the community – own the corporation; instead, all of these groups are bound by their chosen responsibility to work in common (collaborating for the common good of the firm as part of the wider professional and political institutions). In the end, the corporation owns itself as an independent legal entity, as is the case for human beings (Mansell and Sison 2019; Stout 2012).

In this sense, managerial authority comes either from the collective grouping of all who are members of a body that aims for the common good (which includes, but is not exclusive to, shareholders) or from a higher superior source outside the corporation, or from both. Legitimacy in this sense is conduct of craft, which allows for a legitimate corporation to inform and show how it sustainably pursues the common good, while management would need to demonstrate that it is acting on behalf of the good of all, essentially defining an effective legitimation. Management's role in the legitimacy process becomes enabling and facilitating processes of communication and knowledge sharing (Tsoukas and Vladimirou 2001; Nonaka et al. 2008), which would allow all members who partake in that common good to exercise their duty (or right to enjoy the prosperity and well-being made possible by the corporation) in equality and in full respect of each and every entity (and the distinct persons who are members of each group).

From a virtue ethics perspective, the managerial role in legitimation processes must enable quality dialogue among its members to enable and support one another in the common pursuit of a purpose that, in this case, only needs to be a purpose in consistency with *eudaimonia.* As Mansell and Sison (2019: 11) note – quoting Vanberg – "to speak for the group per se is not to assume a reified entity that pursues 'organizational goals' independent of its members judgements and wishes."

For ethical communication that corresponds to the notion of rhetoric to capture an Aristotelian virtue ethics conception, Meyer (2017) reminds us that the communicator or the potential leader/manager has to rely on the ethical character of the communicator or his/her moral maturity (*ethos*), the quality of what is being communicated and key arguments involved in the action of communication (*logos*), and the appropriate emotional-affective disposition for listeners (*pathos*). However, the *ethos*, or character (of the manager), is the most important of the three (Meyer 2017). He or she should convince the audience that communication comes as action from a good person, who is honest, responsible, and fair-minded. *Logos* reflects the fact that the speaker has strong, reasonable, compelling, and truthful arguments; therefore, the appearance of truth via cognitive mastery of communication or the affective mastery of audiences' needs is not proper in this case (as per Meyer 2017).

Finally, the quality of ethical communication in the Aristotelian virtue ethics tradition depends on the extent to which it can trigger appropriate and good emotions among listeners or the receiving audience, in the sense that an emotional "sensation then, turn into the triggers of choice, decision and (appropriate) action" (Meyer 2017: 123) if we understand rhetoric in the Aristotelian sense. Thus, technical mastery of the audiences' needs or feelings and the clever channelling of rhetoric to influence or stimulate them do not qualify as proper ethical communication that characterizes success in a business legitimacy process but instead constitutes psychosocial manipulation of audiences to reach the speaker's ends, something that Aristotle understood as vice or *panourgia* in terms of the quality of practical excellence involved.

Conclusions

Within the above context, and the alternatives that virtue ethics lends, legitimacy as an end goal must rely on being able to choose ethical means since proper means-ends virtuous choices are an important feature of Aristotle's understanding of virtuous action in the practical sphere (NE VI). In the case of legitimacy, this means that all action should rely on genuine, ethical communication and not on bare, technically persuasive or clever rhetoric that aims toward winning the impression management game among different audiences.

However, for all the above to come together, the key antecedent is virtue in character by all who engage in legitimate work; virtue ethics purports that ethical outcomes are not possible unless the actions involved originate in virtuous persons (Hartman 2008; Zwolinski and Schmidtz 2013). A "qualified agent" (Hursthouse 1999: 28) – a person of virtue, who displays practical wisdom or *phronimos* – uses rational principles for determining what and how to virtuously ensure business legitimacy via ethical communication in order to determine the good (correct, most appropriate, virtuous) action within a context of specific and complicated particulars. This means that, to arrive at an ethically legitimate action, choices and communication do not just aim at addressing or convincing of each audience as an autonomous actor (via persuasive or effective rhetoric, so to speak). Rather, communication in consistence with virtue ethics ought to be an act of ethical development (for the self and others) where no audience's interests would have primacy over another audience's well-being.

From a VE perspective, the moral quality of leaders' personal character is elevated to a key antecedent for both proper and effective business legitimacy outcomes and for how to choose and perform means of ethical communication. In order to effectively convey genuine organizational qualities and correctly inform and engage a business with all stakeholder concerns, a leader or organizational manager must have, in accordance with Aristotle (Meyer 2017), firstly, the cardinal virtue of practical wisdom (*phronesis*, or the excellence that practical-ethical reason can acquire)and, secondly, virtue in its widest and richest sense, which encompasses richer and wider virtues attributable to "a certain kind of person with a certain complex mindset" to allow for richer and more sensitive moral processing beyond practical wisdom (Hursthouse and Pettigrove 2016). Thirdly, good will is also required (Meyer 2017).

This includes how to enable separate entities and the community of all who partake to work well together for the good as a common pursuit, how to grow in their relations in a way that allows for personal flourishing and systemic prosperity. All of this includes moral maturity, which is key (Akrivou et al. 2018). Consequently, managers (and more widely, other moral actors involved in legitimacy related work for the common good of the business on behalf of all other members, shareholders included) should already possess a mature and stable moral character. In the midst of a sensitive, complicated context and a variety of particulars, this enables (Koehn 1995) a role for virtue ethics in the analysis of business practice, a deep respect for the human dignity of all involved (Mea and Sims 2019), and an ethical awareness of professional roles beyond a mechanistic (Dierksmeier 2015) or psychologically competent anthropology (Pérez López 2002).

Abstract

This chapter reviews the most prominent approaches to business legitimacy from a contractarian perspective. First, the contractarian business ethics approach is presented. Second, the contractarian approach to business legitimacy is compared with the analogous concept of "social license to operate." Third, the chapter discusses the use of the social contract argument at different levels: economic system and organizational levels. Fourth, the approach to the legitimacy of ethical norms in business based on the influential theory of Integrative Social Contracts, advanced by Donaldson and Dunfee, is presented in detail. Fifth, the legitimacy of corporate governance based on a hypothetical social contract of the firm is presented. Finally, a reference is made to the purportedly contractarian approach to legitimacy associated to "order ethics." The chapter ends with the proposal of a liberal legitimacy principle for corporate power, taking Rawls's liberal legitimacy principle as a model.

Keywords

Social contract · Contractarian business ethics (CBE) · ISCT · John Rawls

> Man is born free, and everywhere he is in chains. (. . .) How this change occurs? I do not know. What can make it legitimate? I believe I can resolve this question.

Jean-Jacques Rousseau, *Of the Social Contract*

> Ultimately, the social contract offers the only bridge between the consent of those who are governed and the possible or potential legitimacy of the entity that purports to exercise powers of governance.

James M. Buchanan, *Freedom in Constitutional Contract. Perspectives of a Political Economist*

Introduction

This chapter covers the use of social contract theory (SCT) as a philosophical argument to test the legitimacy of business. As a critical argument, SCT is rather used to *question* the legitimacy of accepted practices and institutions than to confirm it.

Social contract theory, as it was used in modern political philosophical thought by Hobbes, Rousseau, Kant, and Locke, is fundamentally concerned with political legitimacy, that is, with the question about the conditions under which government power should be accepted, and therefore obeyed, by rational individuals that see themselves as free and equal (cfr. Wempe 2009). After being criticized and then somehow forgotten during most of the nineteen century, the theory was brought back to life in the second half of the twentieth century by the works of John Rawls (1999; original edition 1971), John Harsanyi (1976, 1982), James M. Buchanan (1975), Robert Nozick (1974), and David P. Gauthier (1986). These more recent versions of the SCT concern themselves with the justification of social norms and institutions (including morality) so that their practical authority over us can be accepted from the point of view of each individual. Legitimacy depends therefore on the theoretical possibility of reconstructing institutional authority as the result of an agreement each could consent to. SCT is a heuristic, that is, a thought experiment for the purpose of moral self-clarification (Freeman 1990: 135). Actual consent is not usually needed in philosophical elaborations of the social contract. Now, the use of the social contract argument "as a framework for corporate morality" (Wempe 2005: 113) can be labeled contractarian business ethics (CBE).

CBE is a well-established approach to business ethics and organizational theory (Keeley 1988, 1995; Donaldson 1982 may be cited as forerunners; *cfr.* Ma et al. 2012 about the position of CBE among intellectual traditions in business ethics literature). This is due to a combination of reasons: First, the development of the neo-institutional economic theory of the firm (cfr. Williamson 2000) and the emergence of business ethics as an independent discipline – concerned with ethical issues in business *and* with the broader question of the legitimacy of business in general – partially overlapped with the revival of SCT during the twentieth century. The social contract method – in particular as developed by Rawls (1980) in "Kantian Constructivism in Moral Theory" – was very influential across disciplines (*cfr.* Norman 2015). Second, SCT is well suited for individualistic, pluralistic, and democratic societies, just the kind of society that hosts capitalistic institutions. The reason is that SCT, as opposed to other moral theories, does not assume that individuals share a common view of the good or a common theory of human nature. Most versions of the SCT are actually agnostic about these issues. SCT is therefore a powerful tool when the aim of the applied ethicist is to reach an ideologically, culturally, and religiously diverse audience, as it is the case in business (Willke and Willke 2008). Third, SCT seems applicable to human associations that, at a first blush, may look like "small societies" pervaded with hierarchical relationships and the mix of common purpose and competitive individual interests that characterizes society at large. Fourth, Edward Freeman, father of the influential stakeholder view of the corporation (Freeman 1984), has explicitly claimed that SCT may provide a normative core for stakeholder management; other scholars have followed suit. Finally, SCT is related to the empirical fact that business requires a minimum of public support. Individual industries, firms, or projects, and the socioeconomic system of business in general could not survive without the actual acquiescence of social agents at many levels. Business is kept, after all, by an underlying social agreement (cfr. Donaldson and Walsh 2015: 189). This fact on its own has no normative implication, but it is certainly related to the rise of CBE.

The CBE approach to business legitimacy hinges on the fundamental normative concept of individual consent. Whether implicit actual consent or hypothetical consent, the basic idea is that business activity is legitimate if the participants/affected can or would freely consent to it. This chapter focuses on hypothetical consent theories (for a recent clarification of hypothetical consent in ethics, *cfr.* Enoch 2017). The claim that business legitimacy depends on affected agents' actual – explicit or implicit – consent is a claim about the "social legitimacy" of business. The kind of legitimacy that SCT seeks is *rational* legitimacy. Its main concern is not the actual, measurable, level of social acceptance of a given practice or norm. Even high levels of acceptance are sometimes based on misrepresentation, deception, or coercion. The contractarian approach is expected to offer public justification for reform (cfr. Rawls 1999: 12); it will be generally critical about many social norms, fostering the collective efforts to effect a change (Shrivastava and Ivanova 2015).

Legitimacy has been argued to have empirical, social, cultural, cognitive, and normative dimensions; SCT is primarily about the *normative* dimension; in the words of the contractarian scholar M.A. Button:

> The promise and appeal of this traditional understanding of contract, taken both philosophically and practically is that, if it is possible to show what rational individuals seeking their own various ideas of the good would (or could) agree to as reasonable rules for their common association, then we would have a coherent and persuasive way of thinking about the proper ends and limits of political society, justice and morality. We would possess standards of justice and an understanding of political morality that could be applied to all kinds of contemporary practices as a test of their legitimacy. (Button 2008: 24)

It is not uncommon to identify legitimacy with *justice.* However, it is possible to distinguish a SCT of legitimate institutions and a SCT of *just* institutions, the first concept being broader than the latter: while deeply unjust institutions would be illegitimate by the standards of any SCT, it is not the case that only perfectly just institutions are legitimate by the same standards. Certain practices or norms may be considered legitimate from a contractarian point of view (they would be rationally agreed upon by all affected under specified circumstances) while falling short of realizing the contractarian ideal of justice – or, for that matter, *any* ideal of justice. SCT can be seen as a two tier theory. At one level it is a procedural theory about the justification of social norms and principles: at this level *legitimacy* is established. At a second level, it is a constructivist theory of justice – about which basic general rights and obligations are justified as the result of a hypothetical agreement reached under the right circumstances and following a fair procedure: at this level a legitimate *principle of justice* is proposed. There are many empirical reasons why institutions may not attain justice; and this does not make them necessarily illegitimate in the first, procedural, sense.

This chapter focuses on three main questions around CBE and business legitimacy: the distinction between a SCT of business legitimacy and the related business concept of a Social Licence to Operate (SLO) (section "License to Operate and Contractarian Legitimacy"); the legitimacy of business ethics norms (section "Integrative Social Contracts Theory (ISCT) and the Legitimacy of Ethical Business Norms") and the legitimacy of corporate governance (section "Legitimacy and Governance"). Section "Levels of Analysis: Legitimacy of the Economic System and Legitimacy of Corporations" is introduced to discuss further the application of the social contract to business and how it deals with different levels of analysis: societal, economic, and corporate; finally, section "Conclusion" summarizes the basic tenets of the social contact approach to business legitimacy.

License to Operate and Contractarian Legitimacy

This section will spell out the distinction between the theory of the social license to operate (SLO) and the SCT of business legitimacy. The distinction between ideal and non-ideal theory will be introduced as a way to further clarify how CBE differs from the SLO approach, despite superficial similarities.

The SLO theory is a theory of the *social* legitimacy of business. It refers to the social acceptance – mainly in the form of tacit consent – of business activities, in particular those activities that have a clear and potentially harmful impact on communities or on valued social goods. Although SLO has been dubbed a "fashionable expression" (Demuijnck and Fasterling 2016: 676) that originated in business practice, it has been argued that it is linked with the theory of the social contract. According to Demuijnck and Fasterling (2016: 679), "from the normative perspective, the SLO is in place when organizational actions are genuinely justified in the eyes of society rather than perceived as legitimate on the basis of manipulation or influenced by the demands of certain powerful groups. Moral legitimacy can be achieved by engaging with affected persons and groups and by finding solutions and compromises (. . .). This clearly follows a contractarian logic."

The problem here is twofold. First, the use of "normative." The term is used within the framework of analysis popularized by Suchman (1995). This framework is a sociological theory of organizational legitimacy, in the tradition of Weber's analysis: Suchman distinguishes pragmatic, cognitive, and moral legitimacy. Institutions may enjoy the social perception that we call "legitimacy" – the belief that their authority is justified, and their actions are desirable, acceptable, or appropriate – from their usefulness (pragmatic), from the familiarity with them (cognitive), or from their alignment with moral standards and values. This third source of legitimacy may be said to involve a "normative" perspective (Cfr. Elms and Phillips 2009). However, this is confusing. After all, utility and familiarity are also normative concepts. The fact that an institution is justified because it is perceived to be useful is no less normative than its being justified because it is perceived to be coherent with dominant social values. In both cases, justification in the eyes of society may be genuine or based on falsity or error.

The second problem is the use of the term "contractarian logic." SCT in its most common use involves the ambition to generate, through a hypothetical argument, a benchmark of justifiability independent of social perceptions (Cfr. Freeman 1990); however, in the quotation above, the contractarian logic seems to refer to an attitude to get social support in an honest way. The so-called normative perspective is proposed as a test about the moral quality of the gained SLO, but the test is not exactly contractarian, since it does not use the heuristic of a unanimous agreement but what seems to be an empirical description of a fair procedure to reach "compromises." For sure, a SLO based on good deliberative practices is the best way to legitimize a project or company under social pressure; and it may be reasonably conjectured that the purpose of a deliberative agreement is to approach the hypothetical unanimity of the social contract; but it is still social legitimacy (much in Weber's sense) what is sought. Social legitimacy is in fact defined as the alignment of business activities with social norms, values, or expectations (Suchman 1995). Policies such as stakeholder engagement and a sincere disposition to reach compromises may be the morally justified way to get it; but these policies and attitudes do not change the nature of what is obtained, namely, effective public acceptance.

The SLO has been construed in management from an instrumental point of view – a “business case” for SLO has been developed (*cfr*. Deephouse and Suchman 2008; Russell et al. 2016). From this pragmatic viewpoint, SLO is the object of the ordinary tools of strategic management. Now, this strategic approach makes it difficult to pair SLO with moral legitimacy philosophically understood (Melé and Armengou 2016; Kinderman 2013). Demuijnck and Fasterling (2016) themselves point to how easy may be for corporations to obtain SLO while ignoring weaker constituencies – precisely those whose rational and informed consent would be more unlikely (*cfr*. also Long and Driscoll 2007). Furthermore, the business case for SLO is weak: it may be convincing about individual projects, but it is much less so when applied to corporations as enduring institutions. The management of social legitimacy crises concerning particular projects – one of the skills at which any well-trained manager should excel – is useless to deal with the legitimacy crisis that arguably affects the whole system of global business (Warren 2003; Shrivastava and Ivanova 2015, Donaldson and Walsh 2015: 182). SLO is managed by corporations within the parameters of “business as usual.” Including SLO as an element of a contractarian approach to legitimacy obscures the nature of the contractarian test. The whole point of SCT is to provide a benchmark for business practices and for the economic system as a whole that can go beyond socially legitimate existing practices.

This is not to deny that a relationship between rational and social legitimacy does exist. This relationship may be clarified by bringing in the distinction between ideal and non-ideal theory that Rawls introduced in *Theory of Justice* (Rawls 1999, 2001).

Let’s remember that the goal of Kantian constructivism (the version of the social contract argument adopted by Rawls) is to dig out the principles embodied in our understanding of ourselves as free and equal people living in society, by using the heuristic of a unanimous agreement behind a veil of ignorance. The metaphor of the social contract is set up under a number of constrains that, while being realistic, try to capture our ideals of agency and practical normativity. The assumption is that, if the description of people is acceptable to all, and the right choice of principles is made, then it is possible to envision what Rawls calls a well-ordered society, a society in which there is a public conception of justice that almost everyone abide by. This kind of society is one in which disagreements among individuals are tractable because, even if interests and views about the good life differ, there is consensus about how to deal with social conflict. Such consensus represents the common understanding underlying social cooperation and, indeed, social life. In a well-ordered society, the public conception of justice guides institutions, and, through the four-stage sequence (Rawls 2001: 48), it shapes constitutional provisions, legislation, and administrative and judicial decisions.

Rawls focused on ideal theory, that is, on the justification of principles for a well-ordered society. He was well aware that “existing societies are of course seldom well-ordered in this sense, for what is just and unjust is usually in dispute” (Rawls 1999: 5). In addition, principles of justice rarely meet general compliance. And finally, past injustices might have influenced institutions so deeply that they impact even the conception that people have of themselves, making ideal theory wholly irrelevant for them. Rawls's focus on ideal theory was justified on his view that, in order to effectively deal with the empirical obstacles to justice, one needs to have a clear road map. But the fact that he did not pay much attention to non-ideal theory does not mean it is less important.

Drawing upon Simmons (2010), it can be said that non-ideal theory deals with two unavoidable existing phenomena: non-compliance and "burdened societies" – this second phenomenon refers to social conditions that do not allow the effective establishment of contractually derived rights (Simmons 2010). The way SCT deals with these phenomena is by considering how to restore or set up the conditions for justice as a long-term goal. Non-ideal theory assumes that social reform must be achieved gradually, by means of courses of action that are politically feasible and likely to be effective (Simmons 2010: 7). Non-ideal theory focuses on existing conditions and empirical data about mechanisms for social reform. Given its objective, non-ideal theory may accept that certain social arrangements that are incongruous with our conception of free and equal citizens are still provisionally legitimate from the perspective of the social contract. Those social arrangements are not coherent with a principle that all could accept as the common basis for a well-ordered society, but they might still enjoy unanimous consent by agents aware of the burdens and contingencies of their own situation, provided that they are an effective step toward a just society.

This is relevant for business legitimacy in the following way: The well-ordered society based on the two principles of justice would be, according to Rawls, a property-owning democracy. While it is not fully clear what this means, it would be probably a society with institutions significantly different from existing ones. It would feature a market economy; but it would also include property rights and contractual laws designed to make sure that concentrations of wealth would not be likely; the extreme forms of corporate power that currently exist would be prevented; basic services and a share of social wealth would be guaranteed for all; etc. Business would be legitimate, in sum, only if they passed the test of the liberal principle of legitimacy (Rawls 2001: 41).

Now, since we do not live in property-owning democracies, this ideal of legitimacy cannot be achieved in the short term. But the consequence is not that all existing business practices are straightforwardly illegitimate. The test of non-ideal SCT may be applied to elucidate how different institutional arrangements or individual organizations deal with existing injustices. This is an empirical question. We do not know in advance whether, for example, an active organizational policy of nondiscrimination – that might be unnecessary in a well-ordered society – will drive society in the desired direction or not. Social consensus based on public and honest deliberation may be the best argument for the policy, until empirical data are available. Extant social contracts may be an indication that the policy in question would be okay from the perspective of non-ideal SCT, due to the fact that actual people is experiencing the burdens and contingencies that non-ideal theory is supposed to take into account. In this indirect way, social legitimacy enters the logic of the contractarian approach.

An example framed in the Rawlsian approach adopted in the previous paragraphs may help understand this suggestion. Blanc and Al-Amoudi (2013) argue that, due to “remarkable historical changes [referring to the weakening of the welfare state] that distinguish our current societies from the society within which Rawls wrote TJ,” the range of institutions belonging to the Basic Structure of Society should now include corporate institutions (CI). They refer to empirical data in two ways: first they deploy data to prove that the welfare state has been weakened across the globe; second they accept that “the status of CIs cannot be decided entirely *a priori* but must also be informed by empirical considerations relative to each society’s political, social, and economic context” (Blanc and Al-Amoudi 2013: 498). In sum theirs is an example of the use of Rawlsian SCT to test the legitimacy of CI. Their position is that, because the historical trend has taken welfare states farther and farther away from the ideal of a Rawlsian well-ordered society, certain forms of private associations (namely, corporate actors) that might have been considered legitimate by Rawls have ceased to be so. Our context demands that CIs be – perhaps legally – constrained in their very operation and governance structure, so that they distribute basic goods, in particular the primary good of self-respect, according to the principles of justice applicable to the basic structure of society. Now, this theoretical conclusion may be confirmed by a social consensus in the same direction – public perception that CIs are failing society because of the inequality they promote or the alleged legitimacy crisis of global business. But this social consensus is strictly irrelevant to the conclusions of normative non-ideal theory, except in that it may ease the path for reform.

Let’s finally remark that the Rawlsian approach adopted to explain the difference between ideal/non-ideal SCT does not preclude its application to other conceptions of the social contract. While “property-owning democracy” may be the legitimate economic form of a well-ordered society for Rawls, Buchanan and Gauthier are generally taken to advocate laissez-faire economics as essential for justice. However, actual markets are quite far from the ideal of free competition and equal opportunity. Therefore Buchanan’s and Gauthier’s theories face exactly the same problem as Rawls’s when they set out to propose social reform.

Levels of Analysis: Legitimacy of the Economic System and Legitimacy of Corporations

SCT has been historically a theory of *political* legitimacy. At the level of the political community, agreement must be hypothetical because actual unanimity is normally unattainable. New members enter society with no consent on their part (by being born); and exit is, if not impossible, so costly that it is not a realistic option for most people. In addition, political power involves the use of coercion upon the very citizens that are supposed to constitute the sovereign. All this contributed to use hypothetical consent as a philosophical tool for the rational justification of political authority. Once the basic rule of the social game have been established, real (formal and informal) contracts among individuals may shape the business realm with no need for further hypothesizing. This is why the adaptation of the political argument to the realm of business has been considered controversial (Wempe 2009). CBE may be based on one of these assumptions:

(a) Economic institutions (from free markets to corporate institutions) take part of the political constitution of a community; therefore they should be contractually justified as an integral element of the justification of political authority.
(b) Economic and business relationships and organizations are the result of free decisions of individuals within the framework of more basic institutions and constitutional rules, such as property rights, freedom of contract, redistributive schemes, etc.; however, some business organizations involve authority relationships that require public justification *just like* political organizations do.

In Rawlsian terms, (a) may be identified with the thesis that "corporations are part of the basic structure" and (b) with the thesis that "corporations are private associations" (cfr. Heath et al. 2010: 431-433). And here lies the problem, because, private associations should not require public justification. The attempt to use Rawlsian SCT to justify schemes of corporate governance would be misguided in purely Rawlsian terms (Singer 2015). For private associations, *legality* would be very much coextensive with legitimacy: the only contractarian test on the legitimacy of business would be a test on legal compliance. It is through the legal system that society makes sure that companies and other economic agents behave within the boundaries of the principles of justice (cfr. Lütge 2012, 2012a; Pies et al. 2009, 2013). If a group of people freely decide to form an economic association and render obedience to a despotic leader without claiming any benefit for them; and they do so without violating any laws, harming the rights of anybody, or forsaking their own rights; why should the rest of us interfere? It is perfectly legitimate that they do so.

The application of SCT to individual business organizations under assumption (b) requires making a case that these organizations are *really* political communities in some sense. Witness Nèron's words: "as 'organizational regimes,' they resemble political regimes by having shared but contested goals and purposes, conflicts, chains of authority and commands, complex collective decision-making mechanisms, and relations of power" (Neron 2015: 104). The comparison with the family is often brought to bear: as feminist scholars pointed to the family as a blind spot in the theories of justice, highlighting the political meaning of family relationships, so contractarian business ethicists need to show the political nature of business corporations. Nèron (2015) is an example of this kind of argument; and he reminds us that Rawls himself came to acknowledge that treating capitalist firms as mere private associations is a mistake (*cfr*. Rawls 2001: 178 about workplace democracy; Blanc 2016; Palazzo and Scherer 2006).

This seems to bring us back to the view that corporations, and certainly the framework of corporate law in which they operate, belong to the basic structure of society. However, business ethicists tend to treat the corporation as a key institution with its own legitimacy problems. It is true, as Shrivastava and Ivanova put it, that "it is difficult to isolate legitimacy challenges of corporations; they go hand in hand with legitimacy challenges to the entire socio-political system that brought those corporations to power" (Shrivastava and Ivanova 2015: 1212-1213). But individual analyses of "isolated legitimacy challenges" are often more nuanced and more illuminating than general theories of the just society. The distinction made above between ideal and non-ideal theory is useful here: in ideal theory it may be true that the legitimacy of corporate institutions depends on their conformity with the basic principles of a just society; but in non-ideal theory, existing social institutions must be taken for granted, and corporations must be assumed to function according to rules – provisionally legitimate – that may in fact impede that they serve purposes that a theory of social justice would ideally demand from them. In this case, the legitimacy of corporate structures and actions needs to be examined within these parameters. The reflection goes from the conditions for the legitimate operation of business in "the world as it is" to the reforms that will eventually allow that business make their full potential contribution to society.

The fact is that the scholarship on CBE (cfr. Wempe 2009) proceeded to apply SCT both to what could be termed the "basic economic structure of society" and to individual industries and corporations, without a detailed discussion of the proper conception of business and the business corporation from a social-contract perspective. To make things worse, the forerunner of the tradition, Donaldson (1982), speaks of a contract *between* society and business, as if a previously established society – by an ancestral *pactum unionis,* there must be supposed – negotiates with an equally pre-existing "world of business" that includes basically large corporations with their characteristic power relationships.

At this moment, however, it is safe to say that the two levels of analysis are at least clearly distinguishable. For most Rawlsian scholars, the bearing of the SCT on business is through an original social contract or the principles derived thereof (Blanc 2016; Bishop 2008; Hsieh 2008; Moriarty 2005). CBE thus conceived operates mostly at the level of social justice. Norms internal to corporations, market institutions, and ethical norms of economic dealings would be legitimate if they are derived from or according to the principles and basic social norms established by the political social contract argument.

The level of analysis may be that of the corporation itself if its political nature is paired with its being a global actor, rather than a member of a political society (Heath et al. 2010; Palazzo and Scherer 2006; Scherer et al. 2006). In this case the organization is supposed to be a sort of self-contained society – often identified as the "stakeholder organization" or the union of all relevant constituencies of a given corporation – that needs to establish legitimacy principles for itself within a broader framework, say, that of global business, that may or may not provide justified principles (for a critique, *cfr.* Willke and Willke 2008). Here the contractarian argument may rely on the implicit contracts theory, as is the case of Dunfee (1991), or on a hypothetical version of a contract among all stakeholders (Sacconi 2000).

Finally, it must be remarked that the SCT approach does not usually focus on the legitimacy of individual business actions or decisions. At this microlevel, contractual justification is entirely possible – Scanlon (2000) famously offers a contractual formula for individual morality, and some authors have done research on social contract justifications of business ethical decisions (Robertson and Ross 1995) – but it generally relies on general acceptability of principles (or systems of rules) for social cooperation; therefore the stress is on common norms, rather than on individual attitudes, sentiments, or even reasons. This makes the contractarian judgment about individual acts somehow derivative. The fact is that CBE focus is on the social and organizational aspects of ethics.

Integrative Social Contracts Theory (ISCT) and the Legitimacy of Ethical Business Norms

Donaldson and Dunfee's book *Ties that Bind. A Social Contracts Approach to Business Ethics* (1999) is the most influential work in contractarian business ethics. In line with the tradition of the social contract, the aim of this work is to establish the moral legitimacy of norms: in this case, business ethics norms.

Applying the contractarian method to ethical, as opposed to political-legal norms, is not new. Gauthier (1986) exemplifies a kind of argument that lays the foundation of all distinctions between good and evil, starting from a pre-moral "state of nature." Donaldson and Dunfee's argument does not purport to erect the whole of morality from entirely nonmoral premises; they do not even try to build a rational business morality from a fictitious pre-moral market. They assume that the business world is a constitutive part of a global society equipped with moral and religious beliefs, as well as with ethical norms, habits, and interpretations developed over time by human communities; and this traditional morality carries over to the economic and business realm.

Their book sets out to solve the problem of how to make sure that the norms –sometimes written in legal documents and contracts, sometimes implicit – that pass for "ethical" in business are binding for a moral person immersed in the context in which the norm is generated and it is supposed to apply. They equate the binding force of ethical norms – their being morally obligatory and therefore a valid standard for moral judgment – with their legitimacy: the concept of legitimacy carries all the moral force in this theory.

Donaldson and Dunfee used SCT in two ways. First, they used it in an empirical way, to define authentic ethical norms – norms defining the range of what is proper/improper and right/wrong business conduct – as those that are generated and supported by the actual consent of a given economic community. Second, they use SCT in a hypothetical way, as a rational test on the legitimacy of those very community-generated norms. From an empirical point of view, they accept that the "unwritten agreements and unspoken promises among groups that must interact successfully in order to achieve both individual and mutual goals are the core framework for economic ethics" (Donaldson and Dunfee 1999: 37). But they refuse to accept that moral authority derives from the tacit consent of members of different groups or communities. Even if communal tacit agreements – or micro-social contracts – provide the content of business ethics norms, their normative force is argued to derive from the hypothetical agreement among fictitious macro-social contractors that represent a universal and rational point of view.

The hypothetical macro-social contract that serves as a legitimacy test draws upon Rawls's depiction of an agreement in an original position. We are asked to imagine that all of humanity "convenes to establish a moral agreement." The parties to the agreement are rational and autonomous, but the veil covering their personal circumstances is much thinner that in Rawls's theory. The parties know that economic efficiency requires the above mentioned community-generated unwritten agreements and common understandings; and they are aware of their particular economic and political preferences. The parties see themselves as moral persons, but not necessarily altruistic, so they would set up a system in which they have the best chance of achieving their own goals. Key in Donalsdon and Dunfee's reasoning is their suggestion that the parties "would realize that they must rely – at least partially – upon community-specific micro-social contracts for establishing contextually appropriate rules of economic ethics" (p. 27). The macro-social contract they envision is presided by this realization. The basic precepts of a macro-social contract for business ethics consist of four clauses: The first clause authorizes communities to freely generate their own norms; the second clause places conditions on how this freedom is to be used so that it respects individual autonomy (norms must be based on consent and buttressed by the individual rights to voice and exit); the third clause reads: "In order to become obligatory (legitimate), a microsocial contract norm must be compatible with hypernorms." Clause four is about how to prioritize in case of conflicting legitimate norms.

What we find here is that the so-called global contractors acknowledge, on the one hand, that there is no basis to establish a thick universally valid economic morality – hence they must rely on the norm-generating power of business communities and groups – and, on the other hand, that there exists a thin universal morality made of principles so fundamental that they serve to evaluate lower-order norms (cfr. p. 44). The concept of hypernorms is used to establish the boundaries of the moral free space of business communities. Hypernorms allude to moral principles that are discernible in a convergence of religious, political, and philosophical thought. One way to approach the notion of hypernorms is to think of the most basic of human rights: they are recognized by almost every political constitution, and they are at least formally adhered to by the members of the United Nations and by many large corporations.

In sum, the hypothetical macro-social contract makes norms legitimate by imposing limits on what micro-social contractors are allowed to consent to. The result of this theory is that within the boundaries of legitimacy, communities may impose diverging norms as the "ethical or right thing to do" for their members – what Hussein (2009) calls "communal authority thesis." However, norms that are marked as non-legitimate by the hypothetical reasoning of the macro-social contract would not be obligatory even if they are socially supported.

It is not clear that ISCT is *really* a contractarian theory of the legitimacy of business (cfr. Wempe 2009; Hsieh 2015). Despite the language and labels used, it is a theory that relies, after all, on either local ethical conventions (the extant micro-social contracts) or global moral conventions (hypernorms). The alleged contractarian thought experiment refers only to the hierarchy between these two sets of conventions and the safeguard of individual basic rights. The obvious question is what role is the idea of agreement really playing here. Note that this argument has been raised even against Rawls's theory (Cfr. S. Freeman 1990). S. Freeman's argument for the necessity of the notion of agreement in Rawls's theory may be adapted to argue for the contractarian nature of Donaldson and Dunfee's. The notion of agreement would play a role quite distant from the immediate interest of applied ethics: It would represent the underlying principles that allow people to establish practices of mutual public justification suited for autonomous individuals (cfr. S. Freeman 1990: 140). Accepting that defense of the contractual nature of Donaldon and Dunfee's work may imply supposing that the realm of business requires its own foundation for public justification, which is questionable. It is easier to accept that the *exercise* of *Ties that Bind* is an exercise in public justification, rather than a work on the foundations thereof. Under this assumption, ISCT may not count as a proper contractual theory.

Legitimacy and Governance

A different way to look at the contractarian test of business legitimacy is to consider any business institution and ask whether its basic rules could be the result of a rational impartial agreement among its members. Here the test applies not only to "ethical" rules but to all kinds of governance rules of the institution. If the rules can be reconstructed as a fair agreement among rational people seeking their own goals, then the institution is legitimate no matter how the rules themselves are conceived of: some may be general legal provisions (applicable to a class of institutions or to all economic agents); some may be corporate rules, policies, guides, and decision procedures; some may be ethical business rules in the narrow sense, that is, social conventions specifying accepted standards of proper conduct.

Lorenzo Sacconi (2000, 2006, 2011, 2013) proposed a test for the legitimacy of the firm that basically consists of imagining what kind of governance structure would be set up by all relevant stakeholders of a corporation if they had to draft a constitution for the firm without knowledge of the position each was going to occupy. This form of veil of ignorance assures that the constitutional draft would be fair. But the prospect of mutual gain and the knowledge that productive activity is much more efficient if it is hierarchically organized would still justify unequal distribution of power within the firm. The rational bargaining among prospective stakeholders would therefore focus on which inequalities and prerogatives are justified and how to keep them in check. And since unanimous consent about differences requires that they are perceived as justified – related with contribution and allowed for the common benefit, for example – an important component of the agreement would be the precise rules of distribution of the join benefit attained through institutional cooperation. In this way, Sacconi deduces the set of general traits that would characterize a legitimate firm: First, the objective function of the firm must be defined by the hypothetical point of agreement among all relevant stakeholders. It must be noted that this is not a chimerical objective, as defenders of the shareholder view of corporations (Jensen 2002; Mansell 2013) denounce. This is not the place to argue for that, but it is obvious that any "objective function" of the firm involves more than one measure. At the very least, it must include one measure subject to one restriction: say, shareholder value constrained by compliance with the law. So there is always more than one single element in the function, and that implies no contradiction. Sacconi, drawing upon neo-institutional cooperative views of the firm (Aoki 1984; Fia and Sacconi 2018), opposes the received wisdom that managerial decision based on multiple objectives is impossible. He simply observes that a joint function (including the goals of each stakeholder weighted in the proportion unanimously agreed upon ex ante) can work as the objective function of the firm perfectly well. This is not to deny the basic constrains of economic sustainability and legal compliance. Rational stakeholders are aware of those constrains; they would go ahead with the constitutional agreement of the firm if, given those constraints, their joint cooperative activity would still yield a surplus that is rewarding for them all.

The second trait of the legitimate firm is that it must include control mechanisms. The fact that the function of the firm assures each stakeholder a fair share in the firm's surplus may be enough in a world of angels: if each and every person could be trusted to comply with their legal and institutional obligations. However, the inequalities justified on reasons of efficiency are likely to result in abuse in partial-compliance contexts (recall again the role of non-ideal theory). Therefore, explicit and well-funded CSR policies and ethical compliance programs would surely feature in the design of a legitimate organization. The touchstone of an original contract should make us think of the guarantees that rational people would demand before joining an organization in which they could end up being subject to the discretionary decision power of others.

Still another contractarian approach is represented by Lütge's account of business ethics, drawing upon order ethics and the contractarian model of Ackerman (1980) and Buchanan (1975, 2000). Drawing upon the methodology of Buchanan and Tullock's (1962) *Constitutional Political Economy*, Ingo Pies and co-authors (Pies 2017; Pies et al. 2009, 2013) have proposed an "ordonomic" approach to business ethics. Lütge has simultaneously developed the connection of this approach to the contractarian tradition (Luetge et al. 2016). Legitimacy is built upon the rational-choice idea of mutual advantage, in mixed-motive, positive sum games. Social interaction is described as involving many social prisoner's dilemma-like situations that drive everyone to an undesired sub-optimum outcome. Overcoming sub-optimality requires agents to cooperate: they need to adopt a joint strategy that is mutually advantageous. Mutual advantage captures the underlying idea of equal respect, as opposed to the utilitarian idea of aggregate welfare, for example – although short of the Rawlsian ideal of public reason based on an understanding of people as deserving and demanding justificatory reasons. So far, these ideas are not essentially different from other contractarian justifications of social institutions. The distinctiveness of the ordonomic approach is that it does not rely on the “sense of justice” of individual actors. On the contrary, it refuses to ask individuals to make sacrifices in the name of justice. The institutional framework must make individual morality superfluous. The approach is based on the paradox that corporate Institutions are capable of forms of moral commitment that are not easy for individuals. Individuals committing themselves to act according to a joint cooperative strategy need to be ready to forsake opportunities for benefit, and this makes cooperation unstable. Corporations however have no previously defined “benefit”; they are constituted by our design; so there is no contradiction in designing them so that uncooperative actions are simply made impossible (coercively prohibited, extremely costly, easily punished, etc.). Therefore, it is easier to rely on careful institutional design and assume individuals may be free to pursue their interests within that framework. It is a matter of setting the governance structure upon the right reasons – making clear that the workings of the institution are mutually beneficial and therefore acceptable to all – and adopting rules imposing the right incentives, so that a social game is defined that conspires, so to say, for mutual benefit and Pareto optimality. That situation is legitimate because it reflects the social framework that would be rationally consented to by individuals focused on their own self-interest.

In sum, order ethics legitimizes legal and institutional schemes that turn social dilemmas into coordination games, so that individuals act in a maximizing way, while they contribute to the benefit of all. These situations are stable by their own nature. The task of ethics is moved to another level: the level of justifying before each individual the shift from the *status quo* to the proposed new game. This justification is based on the assumption that each individual will find mutualistic arguments convincing as long as optimality and maximum possible individual benefit are secured.

Conclusion

SCT is a philosophical argument directed to the question of the legitimacy of social institutions. Its basic normative idea is that submission to social norms and commands – be it the law, morality, or the directives of those in certain social roles – is justified in so far as their authority can be plausibly explained as the result of a voluntary agreement of those subject to obedience. Contractarian approaches to the legitimacy of business explore, therefore, whether explicit, tacit, or hypothetical consent is present in relation to contested authorities in business. The aim of the theory is normative: legitimate institutions and their norms have a right to demand compliance and their members or addressees a corresponding duty to obey. According to the SCT, legitimacy establishes the morality of social rules.

In business, SCT may be used as a moral check in three main contexts: in the context of the economic constitution (whether for profit organizations and the market mechanism are legitimate, etc.) (Luetge et al. 2016; Bishop 2008; Neron 2015; Donaldson 1982); in the context of the corporation (e.g., whether the stakeholders of a firm would rationally agree to the form of governance that gives priority to managers and shareholders) (Sacconi 2011; Hsieh 2008); and in the context of ethical norms of business: examining the legitimacy of different ethical norms as they prevail in business communities (Donaldson and Dunfee 1994, 1999).

At any of these levels, the SCT of business legitimacy should make us think on rational (self-interested) and reasonable (willing to publicly justify actions) individuals as sources of moral authority. SCT is a heuristic that may help solve the question whether a given institution or norm would actually obtain the consent of rational and reasonable individuals. The heuristic relies on hypothetical contract. This is to assure that consent is mutually beneficial, rather than fraudulent and exploitative, as it happens to be in many actual instances of consent-based economic relationships. In the end, the contractarian seeks to assure that legitimate business institutions and rules do work for our mutual benefit. The fictitious unanimous agreement is a heuristic device to keep us in guard against biases and specious arguments that may seem to justify unwarranted individual sacrifices.

To put an end to this chapter, and to exemplify one of the possible uses of SCT in business, we may try to adapt the principle of liberal legitimacy proposed by Rawls (2001) to the question of the legitimacy of corporate power. This is how the principle would read:

> The exercise of the prerogatives of corporate governance is proper and hence justifiable only when it is exercised in accordance with a constitution of the firm the essentials of which all internal stakeholders and economic agents directly affected by the firm's operation may reasonably be expected to endorse in the lights of principles and ideals acceptable to them as reasonable and rational economic agents.

Such principle would surely require long clarifications and developments that do not belong here. It is stated to show the potential fruitfulness of SCT as applied to the question of the moral legitimacy of business.

Acknowledgments Research for this chapter was (partially) funded by the Spanish Ministry of Economy (AEI) and FEDER Funds UE through Research Project BENEB3 (FFI2017-87953-R). Part of the work was done during a Fulbright Visiting Fellowship at the Edmond J. Safra Center for Ethics, Harvard University.

Corporate governance · Promised-based theory of the firm · Value promising · Value positioning stakeholder theory

Introduction

Imagine a world in which the consumer would really take brand promises for granted, in which the employee relies on what is presented on web pages and what is promised in job interviews, in which the supplier binds himself to the spoken word as honorable merchants did formerly, and in which environmental and human rights organizations truly believe in sustainability report statements. What would happen if all these consumers, employees, suppliers, and nongovernmental organizations ended their relationships with the company as soon as their expectations were disappointed?

In such a world, presumably, companies would think seriously about *what*, *how*, and *why* they promise. They would be wisely advised to promise only those things they could actually keep. What is basically true for a contract, *pacta sunt servanda*, applies also to a promise, *promissiones sunt servanda*. Indeed, a contract binds stronger than a promise – the mechanism, however, is similar because a contract is a special kind of promise.

This contribution strives to argue for a company's true value positioning as its value promise to its stakeholders. A company will be increasingly rewarded if it, first, admits to its values and positions them; second, communicates – i.e., to mandatory declare – them; and, third, keeps them to their stakeholders ("walk the talk"). Keeping promises means business legitimation. To explicate our thesis, we will first introduce the promised-based theory of the firm as an alternative to the traditional theory of the firm (Section "The Promised Based Theory of the Firm"). The promised-based theory of the firm further develops two prominent pieces of research: Josef Wieland's governance ethics and Michael Porter's shared value concept. We will differentiate between global and local legitimacy (Section "The Promised Based Theory of the Firm and Business Ethics"). Finally, we will provide examples of different types of value on a local level. Our management implication is to leave the red ocean of functionalities and to dive into the blue ocean of values (Section "Management Implications: Value Positioning and Value Promise").

The Promised-Based Theory of the Firm

The Basic Idea

There is a quite popular view of economics as a decision theory. For example, this is true for the neoclassically based, rational choice approach. This approach fundamentally understands the decision-maker as a rational actor. The so-called homo economicus makes decisions based on given preferences and changing restrictions (cf. Manstetten 2002, 48, comment 12).

Over the past years, the scientific community has revealed a wealth of outcome that, without exception, detects the weaknesses of the *homo economicus* model. An almost infinite number of results from experimental research demonstrate that certain assumptions of the model are indefensible. Primarily, this is true for the assumption of complete information. New institutional economics, for example, has dropped this strong assumption and has operated since then on the weaker assumption of incomplete and unequally distributed information. Further, experimental economics has shown that individuals have instable preferences, which are neither coherent nor constant. Herbert Simon's pioneering work on bounded rationality, Daniel Kahnemann's papers on framing, and Richard Thaler's contribution on nudges have been honored – as much other homo economicus critical research – by the Nobel Memorial Prize in Economic Sciences (cf. Simon 1957; Kahneman and Tversky 2000; Thaler and Sundstein 2012).

But, from a practitioner's point of view, the *homo economicus* model is also questionable for another reason. Indeed, decisions are essential within business administration. What is missing, however, is the consideration that decisions are also negotiating processes between at least two contract parties, with certain ideas of the world and different individual values. Therefore, in a strict sense, the smallest economic unit is not the individual *decision* but the contractual *transaction* between at least two parties. Reality is more complex than theory: *instead of one decision-maker in theory, there are at least two contract parties in practice*.

From Choice to Contract: The Company as an Unsecured Nexus of Contracts

In his remarkable paper "The Theory of the Firm as Governance Structure: From Choice to Contract," Oliver E. Williamson, with regard to James M. Buchanan, claimed to replace the decision-based rational choice approach of economics with a contract-based understanding – at least as an alternative to the decision model in that respect (cf. Williamson 2002; Buchanan 1969, 1975; Brink 2011a, b):

> But the science of choice is not the only lens for studying complex economic phenomena, nor is it always the most instructive lens. The other main approach is what James Buchanan [. . .] refers to as the science of contract. Indeed, Buchanan [. . .] avers that economics as a discipline went ‚wrong' in its preoccupation with the science of choice and the optimization apparatus associated therewith. Wrong or not, the parallel development of a science of contract was neglected. (Williamson 2002, 172)

On the business side, Michael C. Jensen and William H. Meckling, as well as Armen A. Alchian and Harold Demsetz, see the firm as a nexus of bilateral contracts (cf. Jensen and Meckling 1976; Alchian and Demsetz 1972). The authors focus on a contract "under which one or more persons (the principal[s]) engage another person (the agent) to perform some service on their behalf" (Jensen and Meckling 1976, 308).

Explicit contracts are secured by law, whereas implicit contracts are unsecured. On this basis, the firm can be understood as *a nexus of contracts*. To enable the firm to keep its implicit contracts, one needs appropriate *governance structures*, which have a motivational and incentivizing function to keep their implicit commitments beside the legally enforceable element (see Zingales 1998; Brink 2010b; Tirole 1999).

From Contract to Promise: The Firm as a Nexus of Promises

In the following, we will see the contract as a special form of a promise:

> The moralist of duty thus posits a general obligation to keep promises, of which the obligation of contract will be only a special case – that special case in which certain promises have attained legal as well as moral force. But since a contract is first of all a promise, the contract must be kept because a promise must be kept. (Fried 1981, 17)

There are at least four similar characteristics between a contract and a promise that allow a "*contract as promise*" view as suggested in the article. First, both are relational in that they are implicit and voluntarily accepted (cf. Kimel 2003, 80ff.; MacNeil 1985; Fried 1981; Williamson 1985). Second, both are hybrid coordination mechanisms (cf. Coase 1937; Williamson 1975; Calton and Lad 1995). Third, both are risky (cf. Fried 1981; Searle 1971; Brink 2010a). Fourth, both are empirically as well as normatively grounded (cf. Searle 1964; van Oosterhout et al. 2006).

The mutual voluntary acceptance of the promise – the first characteristic – indicates the relation to the contract: "[A]cceptance offers a further point of correspondence between the moral institution of promise and the legal institution of contract" (Fried 1981, 43). Following John R. Searle, a promise is a promise if and only if the promisee voluntarily accepts the promise the promised action intends to deliver or at least accepts the commitment of the promise (cf. Searle 1964; Fried 1981, 95ff.; Kimel 2003, 34ff.).

The second characteristic is that a promise is conventionally binding (cf. Priddat 2003, 295). The convention creates a new coordination mechanism, which stands as an equal next to market and hierarchy (cf. Coase 1937; Williamson 1975):

> If we understand conventions as solutions to co-ordination problems, then the co-ordination problem linguistic conventions of this kind (e.g. using the words 'I promise') are a solution to, is *how to communicate* such an intention. (Kimel 2003, 8f.; cf. also Lewis 1969)

Network organizations as "relations that are based on neither hierarchical authority nor market transactions" (Nohria and Eccles 1992, 288) are predisposed to a promise in our understanding as a governance mechanism.

The third characteristic implies a high degree of uncertainty which can either be interpreted as a risk, where the extent of the incident and the probability of occurrence are calculable, or as an insecurity, where the extent of the incident and the probability of occurrence are not calculable (cf. Knight 1921). The risk bearer is traditionally also the residual recipient and therefore the addressee of the profit. In fact, it is the residual risk at stake resulting from a specific investment (cf. Brink 2010b; Boatright 2002; Zingales 1998). However, there is an important difference between a decision and a contract with regard to risk. While with the decision the crucial aspect of the risk is the point of time when the decision is irreversibly made, the crucial aspect of the contract is the obligation of a future action – i.e., risks and uncertainties of future situations or convictions (cf. Fried 1981; Searle 1971). Decisions are usually made by individuals and only sometimes by groups. A contract needs at least two contract parties. In the literature, we often find the term relational contracts (cf. e.g., Kimel 2003, 80ff.; MacNeil 1985; Williamson 1985; Calton and Lad 1995, 275f.). Sociologists explain such relational contracts by determinants like social relations, amount of time invested in the relationship, emotional binding, intimacy of the relationship, or the level of reciprocity (cf. Granovetter 1973, 1992; Coleman 1990).

The individual self-binding, which is the fourth characteristic of similarities between a contract and a promise, is important for both the contract and the promise (Fried 1981; Atiyah 1981; Kimel 2003; Priddat 2003):

> The institution of promising is a way for me to bind myself to another so that the other may expect a future performance, and binding myself in this way is something that I may want to be able to do. (Fried 1981, 14; cf. also Searle 1964)

In this context, one can distinguish two distinct levels of conventions which apply for both the contract and the promise. The first level, *linguistically conventional*, means that a convention about binding oneself to the spoken word exists: "[P] romises can sometimes be said to facilitate a *form* [sic!] of co-ordination between promisor and promisee" (Kimel 2003, 9). Beside this *formal level of convention*, the *material level of convention* addresses the concrete content of the coordination problem.

By descriptively expressing a promise normatively, an obligation becomes manifest – a phenomenon, which is mentioned by Searle in his seminal paper *How to Derive "Ought" from "Is"* (cf. Searle 1964). Boatright follows Searle: "This contractual theory is both *descriptive* and *normative*" (Boatright 2002, 1838). Van Oosterhout et al. refer to "content-independent" normative commitment" (van Oosterhout et al. 2006, 522) and close to Fuller to an "internal morality of contracting" (van Oosterhout et al. 2006, 521; Fuller 1964):

> It should be clear from the start that the notion of contracting is not a morally neutral idea, since it already assumes an adherence to certain values, rights, and background institutions without which no normatively appealing understanding of contractual commitment could exist. (Van Oosterhout et al. 2006, 525)

As soon as one gets involved with a contractual situation, one has already accepted normative foundations:

> Hence, all actual contracting in business and economic organization is substantively constrained to begin with by the normative commitments imported with the adoption of a contractualist perspective. (Van Oosterhout et al. 2006, 525)

This sketched path from decision via contract to a promise is a way of developing normative standards. Fried expresses this normative turn in economics in the following words: "By promising we transform a choice that was morally neutral into one that is morally compelled" (Fried 1981, 8).

Companies that move the promise to the center of their strategy build relations with various stakeholders that transcend the binding contract clauses like product guarantees or employee contracts. Then, keeping promising becomes business legitimacy. Consequently, one has to keep promises in the same way that one has to keep a contract:

> The moralist of duty thus posits a general obligation to keep promises, of which the obligation of contract will be only a special case – that special case in which certain promises have attained legal as well as moral force. But since a contract is first of all a promise, the contract must be kept because a promise must be kept. (Fried 1981, 17)

Critics can point out differences between a contract and a promise. For example, a contract differs from a promise – according to one objection – in the strength of the binding mechanism: Violating a contract may lead to punishment, whereas violating a promise may lead to loss of friends or to remorse. But this is not a strong argument because it is just a gradual and not a structural difference. The weaker binding mechanism of the promise requires a stronger *inner controlling* (e.g., via conscience, insight, awareness, conviction) and a weaker *outer controlling* (e.g., punishment, incentives, compensation).

Our title, "Promised-Based Theory of the Firm," refers to Ronald H. Coase's paper on "The Nature of the Firm" (cf. Coase 1937). While Coase was in search of the *origins* of the firm, we are in search of the *legitimation* of the firm.

The Promised-Based Theory of the Firm and Business Ethics

Over the last years, business ethics literature has brought about a new branch called *Contractualist Business Ethics*. Following our idea, *Contractualist Business Ethics* moves the contract instead of the decision to the center of the economic transaction. In the next section, we will address the most prominent representatives on three levels:

- At the *macro level*, Donaldson and Dunfee provide an *Integrative Social Contract Theory* – one of the most important contract-based theories (cf. Donaldson and Dunfee 1994, 1999a, b). The central idea is “to put the ‘is’ and the ‘ought’ in symbiotic harmony, requiring the cooperation of both empirical and normative research in rendering ultimate value judgments” (Donaldson and Dunfee 1994, 255).
- At the *meso level*, Hill and Jones offer a *Stakeholder-Agency Theory* by which the management (agent) closes a contract with various stakeholders (principals). Consequently, the management is the agent of various stakeholders. The result is a nexus of contracts: “[E]ach stakeholder is a part of the nexus of implicit and explicit contracts that constitutes the firm” (Hill and Jones 1992, 134). Through the contractual obligation of both management and stakeholder, a balancing of stakeholder interests is possible (cf. Zingales 1998; Brink 2012, 2017).
- At the *micro level*, the *Theory of Psychological Contracts* by Denise M. Rousseau understands a psychological contract as an individual conviction or a mutual obligation between two parties (cf. Rousseau 1995, 15; Brink 2010c). As the violation of contracts is not legally enforceable, Rousseau called implicit contracts *promissory contracts* (Rousseau 1995, 15). At this level, it is important to remember that a contract is a special form of a promise.
- Furthermore, there are some minor positions: Van Oosterhout et al. focus on the internal morality of the contract (cf. van Oosterhout et al. 2006, 521). It is the contract mechanism itself which provides humans the possibility to live together: “Hence, all actual contracting in business and economic organization is substantively constrained to begin with by the normative commitments imported with the adoption of a contractualist perspective” (van Oosterhout et al. 2006). John Boatright points out the negotiation process between the various parties: “Contracts result from bargaining by these constituencies over the terms of their compensation as well as the institutional arrangements that protect this compensation from postcontractual expropriation” (Boatright 2002, 1838). Phillips offers a stakeholder concept that is based on social contract theory referring to John Rawls’ theory of justice (cf. Phillips 1997; Rawls 1971). Other business ethicists work on a reconstruction of organizations (cf. Keeley 1988) or see the contract as a trust-building action in hybrid network organizations (cf. Calton and Lad 1995).

Management Implications: Value Positioning and Value Promise

Promise und Governance Ethics

Governance ethics is the analysis and reflection of moral characteristics in governance structures (cf. Wieland 1999, 46ff.). This theory can be traced back to Josef Wieland, who understood governance ethics as the science of the comparative analysis of the morally sensitive governance arrangement and the communication of specific business transaction by cooperation (cf. Wieland 1999, 69). Values, virtues, and ethical beliefs are moral resources to initiate, execute, and control business transactions. Those business transactions are based on a contract or – in our understanding – also on a promise.

Wieland's governance ethics is a local justice approach, considering context-specific complexity. The moral codification can offer global dimensions, while the economic codification always has local reference (cf. Wieland 1993, 21). Thus, the firm is making local decisions, i.e., referring to concrete transactions. For example, human rights are universal in a global sense, but they become effective only with a special economic transaction. In terms of Wieland, it is the moral dimension of a distinct economic transaction which counts (cf. Wieland 2001, 9). Arguments are weighed between various decision logics (moral, legal, technical, economic, etc.) in this concrete situation. In some recent publications, Wieland provides a special kind of governance mechanism: so-called deliberative processes. In this, he offers the missing link between legitimation and application of norms (cf. Wieland 2007, 13; Habermas 1999, 283ff.).

Wieland's approach aims at the creation of *cooperation chances* (Wieland 1999, 34). The idea is to continually improve the ability and willingness to cooperate within a cooperation economy, which combines competition and cooperation (*co-opetition*). Morality has paid off positively in reputational capital and reduced transaction costs. Our position is very close to this. Through the acceptance of the promise, e.g., by buying a product, business transactions are local and context specifically legitimated. The cooperation rent increases, i.e., both the customer and the management win. This basic idea of a "shared value" is first provided in this clarity by Michael E. Porter, which is discussed more detailed in the next section.

Shared Value at Global Level: The Approach of Michael E. Porter and Michael R. Kramer

Shared value can be described as a management strategy in which companies find business opportunities within social problems (cf. Porter and Kramer 2002, 2003, 2006). In an ideal world, management creates economic as well as societal value. This ideal concept replaces the shareholder value concept of the early 1990s, in which the value creation for the shareholder was the main management task. Value creation is also relocated from shareholder value to shared value. Shared value is a promise from the shareholders on the one side to the customers (and other stakeholders) on the other side.

This position is a *global legitimacy point of view*: the global responsibility of a global organization toward a global stakeholder community. Porter does not provide the local responsibility of a local sub-organization toward a local stakeholder group. Furthermore, he does not provide details on how to solve possible conflicts between global and local level. From a practical point of view, this deficit needs clarification. Here is an example from the supply side: a sales agent (= local sub-organization) recommends a product to a customer (= local stakeholder) from a fairness point of view (= local responsibility). Another example would be a human resource manager (= local sub-organization) who develops a fair compensation system (= local responsibility) for his employees (local stakeholder group). In both cases, the morality is specific, i.e., temporary or locally binding and legitimate.

On the demand side, stakeholder needs have changed over time. Personal values are behind those needs. There is an intense discussion in the literature about this phenomenon. The theoretical roots can be traced back to the work of the American psychologist Abraham H. Maslow and are renascent in current research insights of ethics as well as of behavioral and psychological economics (cf. Maslow 1943, 1954; Schein 1980, 1985). The latest marketing concepts in this respect are *cultural branding* and the *value pyramid* (cf. Holt 2016; Almquist et al. 2016).

Customers challenge manufacturing methods, and employees ask for meaningful work and, in both cases, for a good purpose. Suppliers strive for reliability; critical stakeholder groups not only analyze the product and service offers but simultaneously the whole value chain. They all ask for business legitimacy. They want to know what the firm stands for, with a binding declaration of something they can rely on – a promise.

As mentioned before, morality is no more and no less than a normative convention and insight of individuals, groups, companies, or societies. The view is broadly known as *cultural relativism* or *moral relativism* (cf. Grace and Cohen 2005). There is a different level of relativism depending on how strong personal values and ethical standards vary within a group, an organization, or a society. Market transparency supports stakeholders' decision-making process. The more open an organization or a society is, the freer individuals are in the choice of values. Therefore, true value positioning including a true value promise is necessary. Stakeholders are often not able to make the decision. Since values can be interpreted differently, that there are strategic interests, that one evaluates a situation incorrectly, or that information is missing (*moral bounded rationality*, cf. Donaldson and Dunfee 1995). The reasons are uncountable, and one has to think about different options of regulative actions like laws, self-regulation, nudges, or voluntary oaths.

While Porter's vision is rather strategic (global value positioning and global value promise), our understanding is a more practical one. We will provide a local value positioning and a local value promise. Thus, in this regard, Porter reminds below his potential. In the following section, we try to close this gap by offering a local perspective and by making it compatible with the global perspective.

Value Promising at the Local Level: The Approach of Frank Esselmann and Alexander Brink

In the previous explanations, we strongly argued for a promised-based theory of the firm. Corporate responsibility (in that sense) is a promise to stakeholders, and keeping promises means business legitimacy.

The stakeholders legitimize business transactions through the acceptance of the promise. If the company positions its values transparently to the customer, and the customer appreciates these values by buying the product, this special stakeholder simultaneously legitimizes this local business transaction at a given point in time. If the customer does not buy the product, this special stakeholder does not simultaneously legitimize this local business transaction at a given point in time. The more customers legitimize the business transaction, the stronger the level of legitimacy is. The firm should position and promise their values to all their stakeholders. This is also true for the relationship with the employee. True value positioning and true value promises for the employee work if the employee himself appreciates this special value by application and – given he succeeds – stays with the company as long as the firm meets his expectations. This relationship is all about local validation and situational morality.

While a performance promise, a product promise, or a quality promise referred to the *know-what* and the *know-how*, value promising touches the *know-why*. Both Porter's global level and our local level are now explicitly driven by normative issues, in addition to strategic and operative issues (cf. Bleicher 1991). The firm explicitly or implicitly declares that it will stick to particular norms – some are formulated as a contract, while others are formulated as a promise.

Management Implications: From the Red Ocean of the Functionalities to the Blue Ocean of Values

The red and blue ocean story traces back to the seminal Harvard publication by W. Chan Kim and Renée Mauborgne (cf. Kim and Mauborgne 2004). According to the authors, the red ocean covers an existing market (mostly with overcrowded industries), in which one fights rivals for market segment, and the profit and growth perspective is shrinking. The blue ocean concept creates a new market segment, and new demand is established through acquisition: "Competing in overcrowded industries is no way to sustain high performance. The real opportunity is to create blue oceans of uncontested market space" (Kim and Mauborgne 2004, 173).

Referring to the Almquist's value pyramid, for example, we transfer this idea to values (cf. Almquist et al. 2016). The red ocean is about a competition of functionalities, covering needs, and underlying lower values like saving time, simplification, connection, or information; the blue ocean concept is about a competition of higher values like self-actualization, attractiveness, or heirloom. Red ocean investments are possible but at higher costs. For most companies, the functionality battle against the platform economy is lost. Ethics as the reflection theory of morals has a *regulating* role in the red ocean, whereas it serves an *orienting* role in the blue ocean.

A good example of the upcoming regulative power is the General Data Protection Regulation (GDPR). With this framework, politics will strongly influence the red ocean of functionalities. The discussion about transparency and privacy at social media platforms is an example of the endeavor out of the red ocean into the blue ocean (cf. Koops et al. 2017). Transparency can be defined by law, but privacy in its essential characteristics cannot. The GDPR just safeguards a minima moralia. On this basis, one needs wise decisions about how to position a firm with value toward the customer. Aristotle called these wise decisions “phronesis.” Consequently, the concept concerns gaining new markets and being aware of what the company stands for.

In general, it is all about stakeholder groups – especially customers – their values and needs have to fit with the company’s values (and vice versa: the company’s values have to fit with those of the customers’). Profit is the key for the company: sales not for any price but for a good price. That is the core idea of Porter’s shared value approach. However, the kind of exchange has changed: the customer demands a “value package” for his money, his time, and his attention.

We are facing great challenges in the search of value consensus in a growing globalized and digitized world. Laws and governmental frameworks are too slow and clumsy and especially without consent in most cases. A regulation by global company commitments does not work for most transactions. We see the firm’s local value positioning as the crucial link for a prospering society.

Ethical Blindness and Business Legitimacy 17

Kristian Høyer Toft

Contents

Abstract

Ethical blindness describes the temporary inability of a person to make moral judgments and acting morally in the context of working in an organization. Such a failure of moral judgment can be harmful and may damage the entire organization, its reputation, and public legitimacy. This chapter provides both an introductory overview and definition of the theory of "ethical blindness." The chapter proceeds by first introducing to the general social phenomenon of ethical blindness. Then it presents the specific theory of ethical blindness proposed by Palazzo et al. (J Bus Ethics 109:323–338, 2012). The structure is as follows: First, the chapter shows how the theory relies on an epistemology of individuals' cognitive propensity to be fallible in combination with a theory of individual "sensemaking" and "framing." The sensemaking process is under external pressure from social contexts within the organization and its surrounding society. The possible outcome of inflexible and too "rigid framing" is ethical blindness – an

incapacity to be sensitive to moral demands elicited by the situation. Second, the normative aspect of the theory is outlined to argue for a pluralistic democratizing of the business organization as a means to prevent ethical blindness in the organization. The theory of political CSR is suggested as a means to secure business legitimacy and counteract ethical blindness in organizations. Finally, the chapter concludes with a brief discussion of the practical usages of the theory of ethical blindness as a possible template for a tool to educate employees to withstand pressures that might lead to harmful ethical blindness in the working place.

Keywords

Ethical blindness · Framing · Sensemaking · Moral imagination · Political CSR

Introduction

When good people work in bad organizations, they tend to succumb to acting immorally. Or, so the theory of ethical blindness predicts. Organizational history is replete with examples of ethical blindness spanning atrocities during the Nazi regime of the Second World War to the morally corrupt culture predominant in financial institutions leading to the financial crisis of 2008. A spectacular example of "ethical blindness" is found in the "dieselgate" emissions scandal in 2015 (Bovens 2016; Rhodes 2016). Volkswagen and a significant part of the entire automobile industry covered up the actual emissions from cars. The scandal revealed a general culture in the car industry of denial and blindness to the wrongdoings. No particular engineer or leader could be picked out to carry all the blame for the fraud, but rather a morally defunct culture enabling the cheating to happen in the organizations seemed to make collectives and a number of individuals responsible for the scandal. However, the idea of ethical blindness sees the individual and not the culture as ethically blind, since only real persons and not organizations can feel remorse, or at least this is the assumption according to common sense. Ethics and moral theory reflect the assumption that only human individuals have the capacities needed for qualifying as moral agents. A moral agent should have a sense of what is morally at stake in the situation and have a capacity for making and acting on rational moral judgments. A proper moral agent is also a real person with intentions, feelings, commitments, and personal relations, as well as a moral conscience. Therefore, in ethics and moral theory, the assumption is that humans are autonomous moral creatures and that corporate agents like business organizations cannot to the same degree be morally capable; they are artificial moral persons (Orts and Craig Smith 2017; Pettit 2007; cf. French 1979). Hence, the morally corrupt culture revealed by the dieselgate scandal does not exempt individuals from moral responsibility and blame. And, the theory of ethical blindness presented in this chapter agrees with this (Palazzo et al. 2012, 335).

The ideal philosophical theory of moral agency therefore assumes that real human beings are born with a moral standing and through upbringing and education they acquire a mature moral judgment that makes them capable of navigating in the real world of moral conflicts, pressures, and dilemmas. However, in real life humans are also negatively affected by the social context in which they live. The social context might support the sound moral world view one has acquired, or it might suppress and reject it. Individuals often are under a "contextual pressure" to adapt to the values and hierarchies of the work place, so they cannot apply ethical norms to a situation in an impartial manner (Palazzo et al. 2012, 323). Hence, the theory of ethical blindness is about "nonideal" conditions of morality in organizational life (cf. Rawls 1994). People might be on average good from the outset, but immoral organizations tend to corrupt them.

What Is Ethical Blindness?

This chapter provides an overview and discussion of the phenomenon "ethical blindness." Since the concept has been developed and refined in the recent research literature by the authors Guido Palazzo, Franciska Krings, and Ulrich Hoffrage in their seminal article "Ethical Blindness" in the *Journal of Business Ethics* (2012), this will be considered as the key reference point for this chapter. The authors define ethical blindness thus:

> People may behave unethically without being aware of it—they may even be convinced that they are doing the right thing. It is only later that they realize the unethical dimension of their decision. We call this state ethical blindness: the decision maker's temporary inability to see the ethical dimension of a decision at stake. (p. 324)

Emphasis is here on the temporal aspect that "later they realize the unethical dimension." This aspect of the definition of ethical blindness narrows down the number of examples and cases that falls within its scope. For instance, the case of Adolf Eichmann narrated by Hannah Arendt (1963) seems on the surface to exemplify ethical blindness. Eichmann served as a leading civil servant responsible for the Nazi regime's deportation to the concentration camps during the Second World War. After the war, Eichmann was indicted at the Nuremberg Trials for crimes against humanity. Eichmann admitted responsibility for the deportations, but he considered nonetheless this as his moral responsibility being a civil servant to the state. In fact, he showed no remorse, according to Arendt, and he went as far as justifying his acts with reference to Immanuel Kant's ethics of duty. Hence, he paraphrased the categorical imperative of Kant, saying that he acted so that his actions could be justified by the will of the leader (the "Führer"). The example of Eichmann seems to be a clear-cut case for what ethical blindness is about. However, it falls short of the definition that Palazzo et al. suggest, since Eichmann shows no regret. In fact, he even rationalizes the atrocities he contributed to with a corrupt Kantian justification. Surely, Eichmann resembles a severe case of ethical blindness as he demonstrates a profound inability to relate to the very basics of right and wrong on any account. Moreover, a major reason why the theory of ethical blindness can be of more practical use compared to teaching ethical theory is due to the fact that "more ethics" need not be "better ethics." Hence, it might not be helpful to teach employees and students about ethical theory if they have no sense of the pitfalls that moral agency presents. The Eichmann case illustrates this too well, since he did not have any clue about how to read Kant and therefore could misuse Kant's ethical theory to defend his abhorrent practice. Similarly, ethics training and ethics tools are not sufficient to avoid corporate fraud. More is needed, and the theory of ethical blindness might well be a good remedy to make clear the pitfalls that practitioners meet.

The reason for constraining ethical blindness to only include cases of people showing remorse is to avoid cases of "amoralism" (socio- and psychopathy in the popular psychological literature). If a person is permanently and incurably ethically blind, it makes no sense to exert any moral pressure or blame, since he is beyond the reach of morality, being an amoral person.

This limitation of the scope of the theory suggested by Palazzo et al. (2012) therefore also gives rise to concerns about its ability to handle cases where "psychopaths" ruin the working environment of an organization (cf. Sørensen and Villadsen 2018). However, the theory does have relevant information to offer about the culture that impacts morally "normal" functioning people, since they are the victims of a corrupt moral culture, a culture possibly enacted and supported by amoral leaders and colleagues (Palazzo et al. 2012, 334).

Now, consider the case of the business graduate as a standard example of ethical blindness.

Suppose a young person goes to business school and is inculcated with the view that the profit norm is superior to other concerns such as the environment and gender equality. This view is epitomized in the headline of Milton Friedman that the "social responsibility of business is to increase its profits." Businesses are private enterprises and not social welfare institutions that provide public goods such as regulation to protect the environment or promoting gender equality. Suppose the business school graduate embarks on a career in an organization that celebrates profit maximizing as superior to other ethical concerns; there is a high likelihood that she will be confirmed in the truth and value of the overriding status of the profit motive (ibid. 329–330; Ghoshal 2005). Adding to this, assuming that the surrounding society offers little contestation to the profit motive's role in business, the graduate cannot be blamed for believing that it is morally permissible to sidestep ethical concerns for the environment and gender equality. Everything and everyone the graduate meets confirm this as a truth. However, assuming also that this particular graduate did have a good upbringing inculcating the virtues of being kind and taking into consideration other peoples' needs and the value of having a clean and unspoiled environment, the graduate arrives at business school with a moral compass in good order, but during her education and job experience, she is increasingly challenged to overrule her original moral views learned in her youth. She will also find it disturbing that the social atmosphere in the workplace is competitive to the extent that bullying and marginalization are part of the everyday interaction between colleagues. However, this is justified by the tacit assumption that only the best and toughest thrive in this "elite" organization that outcompete others on the market. As time passes she internalizes this view even though it is in tension with her prior view of the wrongness in bullying. Eventually, she tends to embrace the morally corrupt culture of the organization because over time she adjusts to what is "normal" in this organization and becomes a passive bystander or an active contributor to harms she would normally condemn (Palazzo et al. 2012, 331). Years later she works in another organization and now has returned to her original moral views and feels regret about her being part of the corrupt organizational culture.

This example of the graduate is a straightforward example of ethical blindness because the moral failure is *temporary*, it is inflicted upon the individual from the outside and made her *deviate* from her normal moral views, and she was *unconscious* about being ethically blind (ibid., 325).

However, the standard case of ethical blindness can be contested because people are also morally corrupted during upbringing at home and at schools. And, it is possible that some people from birth are less empathetic and altruistic compared to others. Moreover, people can will to be blind to ethical concerns, for instance, they can deliberately seek to avoid knowing the "facts" of an unethical industry (Gjerris 2015). And, according to Aristotle people often lack the will power to act morally as they exhibit *akrasia.* The theory of ethical blindness can accept these challenges as deviations from the standard case because individuals are also responsible for "co-creating" the moral situation they are in (Palazzo et al. (2012, 333)). Individuals are not mere victims of the social context even though the theory of ethical blindness tends to present them in this way according to what can be described as the "standard case" illustrated by the business graduate.

Furthermore, the theory of ethical blindness is not a typical ethical or moral theory about justifying the right and the good. It does not commit itself to either a deontological or a consequentialist or a virtue ethical outlook. It is neutral about what ethical theory is true, if any (ibid. 334), and is rather focused on explaining how ethical blindness is possible. However, the theory does have one ethical prescription which is that pluralism and openness in an organization are better than the opposite to prevent ethical blindness (ibid. 335). This ethical commitment can be seen as instrumental to avoiding ethical blindness. The commitment to pluralism in the organization is not to be confused with moral relativism.

It is a deep philosophical discussion in the branch of epistemology and ethics if not all knowledge and values are relative, but the theory of ethical blindness does not try to resolve these issues. Rather the theory predicts that people are carriers of a so-called rigid framing that makes them too ignorant compared to how a generally more enlightened publics would perceive the situation. Palazzo et al. (2012, 335) spell it out:

> Importantly, the insider perspective of the organizational decision maker remains the point of reference but the yardstick for normative evaluation can either be polis or cosmos.

The theory of ethical blindness is exemplary of a comprehensive theory of business ethics, since it comprises both the levels of the individual, the organization, and surrounding society at large, i.e., the micro, meso, and macro levels (cf. Gonin et al.

2012). And, it bridges the research fields of organization theory and business ethics that need to be better connected in the literature (Heugens and Scherer 2010). Therefore, the theory is cross-disciplinary as it relies on various sources from philosophy, the humanities, business studies, organization theory, the social sciences, psychology, and cognitive science. The idea to rethink the organization as a significant part of society is gaining traction currently and is witnessed by recent developments in political philosophy (Anderson 2017; Herzog 2018).

The next sections will give a more detailed understanding of the content of the theory of ethical blindness including its normative aspects. The epistemological assumptions underlying the theory as well as its sociological outlook on the significance of the social context to ethical blindness are presented. Furthermore, the temporal dimension is discussed as this is pivotal to understanding ethical blindness. Following is a discussion about the significance of a pluralist democracy surrounding organizations. This gives the cue to discuss whether a theory of deliberative democracy can be expanded to include the business organization as proponents of political CSR envisage. The aim of linking the theory of ethical blindness to political CSR is to draw the outline of how *business legitimacy* can be secured and protected. Finally, the chapter concludes with future prospects for using ethical blindness as a practical "device" in humanistic management education. How can the theory of ethical blindness help teaching ethics in business organizations in order to leverage and enhance business legitimacy?

Explaining Ethical Blindness: Cognitive Psychology and Time

Ethical blindness can be explained and the theory has its focus on description. There are explanations available from scientific sources like cognitive psychology that can shed light on why people temporarily lose their ethical compass. First of all, human beings are naturally limited in their rational capacities; they are fallible and make wrong decisions because they have limited access to evidence and are inclined to be biased. Recent experimental moral psychology conducted by Jonathan Haidt and others has documented that people tend to act on their intuitive feelings of right and wrong regardless of whether this is rational (Palazzo et al. 2012, 325). Moreover, people are easily affected by the way a situation is presented to them in terms of language, framing effects, and social pressures. Such studies show that moral agency is not as ideal and rational as ideal theory presupposes. Hence, the fact that people can be manipulated feeds into the theory of ethical blindness and explains why it is possible to temporarily dispense with one's moral sense.

Even though the normal limits to human cognition and its fallibility provide cues for ethical blindness, they are only part of the explanatory story, since individual bias can be supported by the social context as well.

Individuals use a mental "framing" of language and ideas to make sense of the social context they live in and, in particular, in this case the organizations they work for. This is the proximal context for sensemaking. Moreover, according to sociology and neo-institutional theory of organization, the distant "social context" of a particular society also has impact on how individuals make sense of their world within the organization. Hence, the organization's power structure, its hierarchies, prevalent values, and moral cultures as well as society's ideology and political culture are social contexts for individual "sensemaking" and framing of meaning when interpreting a situation (ibid, 327).

Especially, the inherent tendency to group thinking or a "tribalism" of "us vs. them" can exacerbate the risk of ethical blindness. In the Ford Pinto case, the employees at the Ford company considered the outsiders as lacking insight on what the car industry was all about, and politicians as regulators were trying to wipe out the company (ibid. 329).

The temporal aspect of the sensemaking process adds to the chance of resulting ethical blindness. Time can be a challenge for someone who wants to stick to her ethical orientation as time provides changing circumstances for interpretation of the past. Time can be a slippery slope leading to undesirable consequences. Palazzo et al. also point to several risks in regard to time because work is usually *routinized* (p. 331) and therefore tends to marginalize reflective and critical thinking. They suggest four theories of the temporal dynamic that might lead to ethical blindness: (1) temporal construal theory, (2) the concept of just noticeable differences, (3) hind-sight bias, and (4) the phenomenon of escalation of commitment (ibid.). The first regards the temporal distance between the decision and its consequences. The farther away in the future the consequences are, the easier it is to make unrealistic commitments. The example of acting on climate change serves as an example here, since we are committed to the needs of future generations but find it difficult to make the necessary adjustments here and now to fulfill such commitment. Hence, ethical blindness is a risk. The second is the "slippery slope" argument that if person P accepts A and then B, it is easier over time to also accept C and even D, even though P would be against C and D at the beginning. People can get used to evil in smaller portions so to speak. The third temporal dynamic is about interpreting the past in light of the present to make a coherent story. Hence, the past wrongs can be explained away and excused in the present context of "new knowledge." The fourth about "escalation of commitment" resembles the notion of "path dependency" known from institutional theory. Since procedures evolve over time, it is difficult and costly to move backward and change established practices. However, if such practices are harmful, they could over time lead to ethical blindness.

Similar observations about the negative impact on individuals to conform with corrupt organizations are made by Mats Alvesson and André Spicer (2016, 9):

> Functional stupidity is the inclination to reduce one's scope of thinking and focus only on the narrow, technical aspects of the job. You do the job correctly, but without reflecting on purpose or the wider context.

This critical diagnosis of a general tendency to act unreflective and without notice of the ethical aspect of the wider situation in the working place is therefore not an observation made only by the theory of ethical blindness. So, what can be done to prevent ethical blindness?

How to Avoid Ethical Blindness and Protect Business Legitimacy?

The very same factors that can be a cause of ethical blindness also present possible solutions to avoiding it. Even though ethical blindness in milder versions are part of human everyday moral life due to human fallibility and weakness of will, the more severe and harmful kinds should be avoided. Palazzo et al. do not present a clear-cut definition of the distinction between "ordinary" mild and severe harmful versions of ethical blindness. By definition ethical blindness is assumed to be potentially harmful because it creates an organizational disposition to allow for moral harm by rendering it unconscious, invisible, and silent. Perhaps the victims of moral harm can also suffer without knowing it and thus being ethically blind with regard to their own situation. This is most likely the case as can be seen in the wake of the "me too" movement and how it has changed the ideological context of organizations. What could count as flirting in the past is now considered a violation of personal integrity. In particular, this shift in perception is most evident in the creative industry where the "me too" movement started (Sørensen and Villadsen 2018).

With the aim to avoid ethical blindness in organizations, the theory moves into the normative terrain. Here, the concern is not about describing and explaining factors that could cause ethical blindness, rather the aim is normatively about that we *ought* to prevent harm. Palazzo et al. are explicitly committed to this normative aim, "Overall, we posit that flexible framing is better than rigid framing" (ibid. 335), which leads to their main advice on how to avoid ethical blindness:

> The greater the variety of beliefs in a repertoire, the more fully should any situation be seen, the more solutions that should be identified, and the more likely it should be that someone knows a great deal about what is happening. (Palazzo et al. 2012, 327)

The main remedy to avoid or diminish the risk of ethical blindness is to counteract "rigid framing" by letting as many different and opposing frames come into play within the organization. Thus, even though consensus is important to make organizations work, equally important is it to ensure a space for contestation and disagreement. For instance, securing an institution for "whistle blowing" might be a remedy though it presents reasons for skepticism as well (Brenkert 2010). At least, employees should be able to express disagreement with management; otherwise the risk of ethical blindness is lurking.

The common epistemological ideal of gaining knowledge through openness and search for evidence to back up claims holds true in counteracting ethical blindness, though Palazzo et al. emphasize Hannah Arendt's notion of *moral imagination* (ibid. 332–333; cf. Brenkert 2018; Werhane 2008; cf. Morgan 1997), what best equates to "counterfactual" thinking: Is it possible to perceive situations differently? At least, being able to do so is a remedy to avoid ethical blindness, Palazzo et al. argue. Even though they do not talk about the ability to use moral imagination as a virtue, this is one possible interpretation relevant to the readers in business ethics (cf. Solomon 1993).

Another remedy is "boundary spanning" where management keeps communication with the outside world open and in flux to counteract the tendency to create internal organizational microcosms (ibid. 334). The emphasis on the wider society's importance to the internal organizational life is pivotal in the theory of ethical blindness proposed by Palazzo el al. The macro level is a significant part of the theory. This is also where the theory becomes challenging and controversial, since it poses the normative claim of a duty to promote a culture in society (also outside the narrow realm of the organization) that counteracts ethical blindness. Such a culture is a pluralistic and democratic culture:

> To the extent that flexible framing is superior to rigid framing on the individual level, it makes sense to promote conditions in societies and organizations that foster a climate of tolerance and pluralism instead of fundamentalism and dogmatism (Habermas 1996; Popper 1995; Rorty 1991; Walzer 1997). Flexible framing is unlikely to develop if rigid definitions of what is right and wrong dominate, and if alternative opinions are suppressed and critical voices silenced. The most effective cure for ethical blindness is an atmosphere of open, democratic, and critical deliberation. (Palazzo et al. 2012, 335)

Hence, the best remedy to avoid ethical blindness involves the political level of promoting a democratic culture in which "democratic organizations" thrive. This claim is challenging because it poses political demands on states and civil societies that are often not possible to comply with. Countries led by authoritarian regimes do not provide a benevolent environment for avoiding ethical blindness. However, to what extent do allegedly democratic states live up to this requirement? As far as cases of corporate ethical blindness keep appearing in public media in the countries which qualify as democratic to some extend, there is a chance that these countries are not as democratic as Palazzo et al. would aspire to.

Business Legitimacy and Political CSR

The argument for seeking an open and democratic interaction between the organization and society to remedy and avoid ethical blindness seems to imply so-called *political CSR.* Political CSR is proposed to create business legitimacy by means of engaging in and promoting deliberative democracy (Scherer and Palazzo 2007). The move from business ethics to CSR as a token of political philosophy engaged with democratizing business corporations has been connected to the weakening of the nation-state in the process of globalization (Matten and Crane 2005). Corporations are seen as duty carriers of promoting democracy, a controversial view that has created some debate in political philosophy (Moriarty 2005). This debate invokes the deeper issue about whether and how far business corporations are purely private institutions or "franchises of the state" (Ciepley 2013). And, it invokes questions about workplace democracy, since what exempts private business organizations from the demands of democracy that are applauded in society in general (Anderson 2017; Landemore and Ferreras 2016)? Assuming in accordance with Palazzo et al.'s conception that a democratization of the organization is beneficial to avoid ethical blindness and to ensure business legitimacy, does it make sense to let business firms take active part in democratic deliberation? Academically, the theory of political CSR has had a huge impact on business ethics. In practice, it is, however, easy to dispute if corporations are successful democratic deliberators (Sabadoz and Singer 2017; cf. Cederström and Marinetto 2013). In particular, the theory of deliberative democracy relies on political consensus and tends to ignore or marginalize the voices that dissent (Young 2001). Business firms might have (financial) interests in pursuing stakeholder dialogue resembling deliberative democracy to ensure their public legitimacy, but they might not be capable of voluntarily entering the argumentative power-free space that Habermasians prefer (Scherer and Palazzo 2007).

Hence, to counteract the risk of ethical blindness, a culture of open contestation should be secured within organizations in combination with promoting a democratic culture in wider society - as far as this is possible for profit-driven corporations. Surely, organizations should not curtail democracy by lobbying for their own narrow private interest. Such a minimalist outline of a template to secure business legitimacy in society seems appealing. But it is an open question what follows from this. Is a more comprehensive approach similar to achieving deliberative democracy followed by instructions from the theory of political CSR compatible with the normative aspiration inherent to the theory of ethical blindness? This is difficult to say, but certainly the theory of ethical blindness does not exclude such an ambitious answer; rather it seems to imply it by alluding to the values of pluralism and democracy in its advice to counteract ethical blindness.

Conclusion: Future Prospects for the Theory of Ethical Blindness

The particular compelling feature of ethical blindness as theory is its ability to both diagnose the causality and propose a normative framework for counteraction. As such it provides a tool to be used in both teaching and in management consulting. The proliferation of ethics programs in business communities meant to educate professionals making them aware of unethical behavior in combination with the continually expanding agenda of sustainability and corporate responsibility create positive traction for a theory like ethical blindness. In fact, the theory should work well in tandem with a general introduction to ethical theory and business ethics. As business schools are criticized for not taking ethical issues seriously and there is a general call for humanistic management education, it is obvious to include the theory of ethical blindness into the business school curriculum. Moreover, since the theory is also suitable for practitioners to use, - maybe with some guidance from a professional business ethicist - it is obvious that the theory could also be of benefit to management consultants addressing poisonous and unethical working environments. What is needed is to convert the insights offered by the theory of ethical blindness into more practical tools to guide in a consulting process.

As an academic research question, the theory of ethical blindness also opens up new future prospects for research and practice. The question about democratizing business corporations by means of deliberative democracy to ensure business legitimacy is in need of further research and justification. The current developments to be found in the crossing-over between business ethics and political philosophy questioning the public-private distinction, the management prerogative, as well as the nature of corporate moral agency together testify to the fact that matters of ethical blindness in organizations are moving research forward towards a more comprehensive and coherent conception of business organizations and legitimacy.

Abstract

This chapter considers the legitimacy of mainstream management and management accounting scholarship. What is at issue is the recourse generally by scholars to a particular approach which is positivist and objectivist. While this approach is regarded, including by this author, as legitimate, it is argued here that the exclusive use of this approach is insufficient to cover the knowledge required to understand organizations and organizational processes, particularly in times of environmental and technological change.

Positivism's requirements that scholarship must be neutral and value-free have influenced many mainstream scholars to choose subjects such as organizational structures and systems, regarded as outside the purview of human influence. The way these subjects are researched is also intended to meet the criteria of objectivity, assumed to be scientific. Surveys, often based on Likert-type scales, with results subjected to quantitative analyses, are considered to fulfill these requirements.

Such ideas are contested on the grounds of appropriateness and feasibility. Using an example from a seminal work on organizational change, it has been shown conclusively that human agency throughout organizations is highly significant in determining the success or otherwise of managerial change strategies.

Claims that this research is scientific are also questioned. Philosophers of science have shown that science does not conform to the logical positivist cannon in terms of neutrality and the use exclusively of quantitative methodologies. This is supported by social scientists arguing for the need for a variety of approaches to avoid serious disservice to the knowledge produced.

Arguments are made for more legitimacy in management scholarship through extending research to include subjectivist, qualitative research encompassing the attitudes and intentions of organization members at all levels. This, it is argued, would constitute a more sustainable, practically useful, and more legitimate scholarship.

Legitimacy · Management · Positivism · Interpretivism · Quantitative · Qualitative · Scientific · Sustainable · Practical · Emancipatory

Introduction

This chapter will have as its focus the legitimacy of management as represented in mainstream management and management accounting scholarship. Management is used in a general sense to include management accounting scholarship. Issues around legitimacy of management more generally and the way management has been regarded during the last 100 years are touched on.

In political science legitimacy has been about the right of a government or authority to exercise power. In the seventeenth century, Locke argued that political legitimacy was based on the consent of the governed (Ashcraft 1991). The concept of consent is later applied to members of organizations – employees – with regard to their managers. Legitimacy has also been characterized as the acceptance of the claim that the political institutions that exist are those that are the best for the society they govern (Lipset 1983). This idea too will be applied to ideologies about managers and management.

Much more recently, as part of his 2019 Reith Lecture series, Lord Sumption, a recently retired Supreme Court judge, described legitimacy accorded the state as "less than law but . . . more than opinion." It depended on:

> a general acceptance of its decision-making processes, not necessarily of the decisions themselves but of the method of making them. (Sumption 2019)

Again this is relevant to managerial decisions, where there is a general acceptance of their legitimacy, at least by certain sections of the society, including many academicians, but where these decisions may be modified, if not completed flouted, by subordinate members in the organization.

Management Legitimacy

Legitimacy in this chapter is used to signify the prerogative and capability of managers to have sufficient knowledge of their organization; its structures, systems, and processes; the people working at various levels in different sections; the strengths regarding their organizations; and also the problems that might arise in them. In recent decades managers have also had to be aware of the changes in the wider environment, particularly in terms of markets and technology, and more latterly the pressures from globalization. They need to have the competence to devise strategies for appropriate changes to their organizations and for their implementation. This is no easy task, as has been attested from the early 1960s (see e.g. Burns and Stalker 1961, 1966, 1994) through to the 2010s (see e.g. Mansfield 2013).

There has been a long history, including a long controversy, over the legitimacy of management. In the 1930s Berle and Means wrote a seminal work pointing to the increasingly central and powerful role of management through the rise of corporations, which led to an important alteration in private property – the basis of capitalism. Instead of this wealth being controlled by its owners and shareholders, the rise of the modern corporation increasingly placed its control into the hands of professional managers, whom they described as the "princes of industry" (Berle and Means 1932: 2).

There are different views, of course, as to the desirability of managers having this power and control, not only over large corporations but also in the UK increasingly over organizations over which control had previously customarily been exercised by professional experts rather than by professional managers. This was because the former's expertise was required in those organizations. These include public sector organizations such as the National Health Service, where clinicians had previously had the power to make decisions (Reed and Anthony 1993); utilities such as energy companies, where engineers had traditionally been in control (Carter and Crowther 2000); and academics who had previously themselves led departments, faculties, and their universities (Farnham and Horton 1993a).

New Managerialism

However, from the late 1970s, with the coming to power of the conservative Thatcher government, substantial political, organizational, and managerial changes were introduced for various economic and political reasons. Not without fierce opposition, particularly in the health service, what was instituted was a "new managerialism," based on the way management was run in the private sector (Reed and Anthony 1993). This entailed a very different philosophy and ethos from the previous one of service. From then on it was to be based on managerialism – the idea that managers rather than professionals should run these services and that their modi operandi would be based on private sector practices, as these would provide more improved, efficient, and customer-oriented services (Carter and Crowther 2000).

There were early debates about the merits and suitability or otherwise of using private sector model managerialism for the public sector. Arguments against this type of management being appropriate for the public sector included the idea that the private sector was largely based on market principles, which meant that the "bottom line" was profitability and economic efficiency (Farnham and Horton 1993c).

These values and practices were forerunners to those evident in later full-blown neoliberalism (Green 2016). What began to be publicly valued and practiced was a path toward individualism, and with this, personal freedom and inequality, which would be realized through a free market, deregulated the economy. This went against the principles of collectivism, social rights, and the equality of a Keynesian welfare state (Farnham and Horton 1993b).

The legitimacy of transposing management based on these principles to the public sector has been queried. Although the public sector also had to be run efficiently and ensure costs did not overrun its allocated revenue, their goals and criteria for success had not been about profit. Rather, they had been about social aims such as mutual help and the interests and social and medical welfare of their communities (Reed and Anthony 1993).

Rationalism in Management

The accountability of management in private organizations has been regarded as being primary to shareholders. This has resulted in managers in these organizations basing their managerial strategies on economistic, rationalist, and generic principles, focused on economic efficiency as the ultimate criterion for success (Farnham and Horton 1993c). Rationalism is a belief that there is an objective reality uninfluenced by human agency and that this reality is knowable, through the researcher, who is regarded to be neutral and value-free. People, their attitudes, and intentions do not need to be studied as they are considered to be passive and non-influential. (Chua 1986). This reality consists of objective elements connected with each other logically, according to rules. They are able to be determined, and therefore one can have confidence in arriving at valid knowledge (Preston 1991). (See Green (2019) for further explanation.)

This again poses questions as to the appropriateness of such strategies for public service organizations. Indeed they are beginning to be queried also as exclusive goals for private organizations through concepts such as corporate social responsibility and sustainability (Aras and Crowther 2012; Crowther and Lauesen 2016).

Such questions are relevant to the main arguments in this chapter, which are based on a critique of rationalist ideas with particular reference to mainstream management scholarship. The critique given later is wider than a consideration of public service organizations and also questions the legitimacy of these managerial strategies with regard to private organizations.

Academic Foundations of Rationalism

Rationalism was grounded on certain theoretical ideas in the early part of the twentieth century. The general bases for these ideas are outlined below. They were translated into what became known as scientific management theory and classical management theory. They were both based on ideas that it was the management's prerogative and task to achieve their organizations' goals through developing and implementing appropriate strategies for planning, staffing, coordination, and budgeting. This involved full control of their organizations by managers, who were regarded as being in a position to have the knowledge and skills to determine their organizations' structures, technical systems, and divisions of work (Green 2019).

The generic nature of these skills, regarded as being solely within the purview of managers, was reinforced by both management and motivation theorists on both sides of the Atlantic, from Drucker (1954, 1974) through Herzberg et al. (1959) to Mintzberg (1973) as well as by later theorists (Farnham and Horton 1993c). A further reinforcement of rationalist, objectivist approaches to what was legitimate management was the idea that both theory and practice had to be scientific. This meant that the management had to concern itself with what were regarded as scientific principles – principles also regarded as based on objective, rationalist knowledge to do with factors not subject to subjective ideas, attitudes, and opinions – as, for example, those held by employees (Green 2017a). This is elaborated below in terms of the type of research regarded as legitimate.

The nature of what is scientific is contested later in this chapter, in particular with what has been regarded in management and management accounting mainstream academic research as scientific. This has implications both for the legitimacy of management practice and for the theoretical foundations presented in this research and in management textbooks used to educate students in various management fields (Green 2019).

Academic Scholarship

The type of academic scholarship under discussion is mainstream management and management accounting writing based on research and published in academic journals. The main journals from which examples are taken here are principally *Administrative Science Quarterly* and *Accounting, Organizations and Society.* Other management, organization, and management accounting journals are also cited.

"Mainstream" constitutes the subjects that are widely regarded as legitimate in the academic community and in its institutions. The concept is then extended to research on these topics and the research methods used. Such research is normally published in academic journals, as in those mentioned above. The higher ranked the journal, the more status and resources for the department or university, and the better the prospects of promotion and resources for the scholar (Green 2019).

In the management and management accounting fields, mainstream scholarship, along with all other scholarships, is normally based on certain principles: ontological (what is considered to be real in the world); epistemological (what counts as knowledge and therefore worth studying); and methodological (how to find this knowledge) (Green 2017b). Certain practices follow from these principles. The ramifications for the legitimacy of management resulting from its mainstream, orthodox approaches are now examined.

Functionalism

Mainstream approaches in management scholarship have been classified as functionalist (Burrell and Morgan 1979). The functionalist ideology is managerialist, in that it looks at scholarship, organizations, and management from the point of view of managers. It has a unitarist approach – that is, that all members in an organization are "on the same page." They all have the interests of the organization at heart and therefore have similar interests, values, and goals. Any problems or conflicts that may arise between members result either from poor management communication or from "troublemakers" in the organization, such as trade unionists. But although all organization members are regarded as having similar goals, they are not, according to functionalism, accorded similar powers. It is only managers who have the prerogative and abilities to make decisions and implement them (Green 2017a).

Functionalism has been carried over into mainstream management scholarship (Burrell and Morgan 1979). An extreme aspect of functionalism has been a "scientific," objectivist approach (Burrell and Morgan 1979). Such an approach has constituted the ontology, epistemology, and methodology of the work undertaken in mainstream management and management accounting research. What this has meant is that research has concentrated on objectivist rather than subjectivist objects of inquiry. (An object of inquiry which some might think of as the subject matter being investigated is used in Bourdieu's sense as an object of "observation and analysis" (Bourdieu 1990a: 27).)

Positivism

Objectivism, linked to what was regarded as scientific, had been propounded by various theorists, and particularly by those called the logical positivists, who purveyed an extreme version of these ideas. Logical positivism was a philosophy that regarded legitimate knowledge only as knowledge that was based on "objective" data, acquired in an objective manner, and verifiable through sense data (Turner 2001). This meant that what was regarded as subjective information was regarded as invalid, including ideas, values, and opinions. Moreover the way the research had to be undertaken was also to be objective, without letting the subjective ideas and attitudes of the researcher get in the way (Green 2017b).

Translated into management scholarship for the object of inquiry to be objectivist meant ruling out the understandings, attitudes, and intentions of the members of the organizations studied, as these would be subjective. This view was held particularly in terms of employees, who were regarded by some also as lacking knowledge of their organizations. One author went so far as to say that employees "may even be quite unable to comprehend the exact nature of the present organizational structure" (Donaldson 1996: 172).

Ontologically then, what were regarded as "real," valid, and legitimate objects of study were those features that were considered to be value-free and not subjective. What became popular subjects for research regarding organizations were their systems and structures, as these were regarded as objective and not prone to human subjectivities and, as Donaldson had claimed, unlikely to be comprehended by employees (Green 2017b).

Epistemologically, what has therefore counted as knowledge about organizations has been the research based on objective features such as their systems and structures. As mentioned earlier there was also a requirement for research methods to be objective in order for the work to be regarded as scientific and therefore having a claim to legitimacy in the academy. What was largely enacted as objectivist, scientific work in management and particularly management accounting research were large-scale surveys using Likert-type scales. As mentioned above, this research has often been set in the context of organizational change due to external factors such as changes in the market and in technology (Green 2017b).

Management Research

Burns and Stalker's book (1961, 1966, 1994), mentioned earlier as being about the difficulties of achieving organizational change, exerted much influence over many management and management accounting scholars. Much of their work was based on Burns and Stalker's research findings that organizations, to be successful in situations of change, had to change their structures from hierarchical or "mechanistic" to flexible or "organic" ones (see Green 2019 for a fuller analysis of Burns and Stalker's ideas). Much of the research undertaken in mainstream management research was to investigate this thesis: were organizations in stable conditions maintaining hierarchical systems and structures successful; were those in more volatile situations more successful if they changed to more flexible structures and systems (Green 2017a, 2019)?

As mentioned, the research was generally carried out using surveys based on Likert-type scales. The interviewees were normally senior managers, sometimes the senior manager of the organization on his own. (In the 1950s and early 1960s, managers were unlikely to include women.) At times the survey was preceded by an interview with some managers in order to help formulate questions for the survey (Green 2019). This research was then analyzed using statistical techniques, which were often justified at some length. This was regarded as objectivist, scientific research – an idea that is contested later in the chapter.

Legitimation of Management Scholarship

It has been claimed that mainstream management research is objectivist, scientific, and therefore legitimate. These claims have been upheld by the academy in various ways. Journal editors often preferred this type of scholarship to qualitative, subjectivist research. And theirs were the journals which often received the highest rankings, crucial for the fortunes of their university or department and for the careers of the scholars whose work was published in these journals (Green 2019).

The Cold War and McCarthyism were further stimuli in encouraging research that was empirical and quantitative (Tadajewski 2009). There were also pressures, for example, from the Ford Foundation, to do work which involved research, "stiffened" with statistics and quantitative methods (Barley and Kunda 1992: 376; Maher 2001). This was in part due to the anxiety caused in the West by the successful launch of Sputnik by the Soviet Union in 1957 (Maher 2001). This legitimation has reinforced ideas that this choice of subject matter and research methodology is a valid scholarship, to be preferred to alternative types of research, particularly qualitative, subjectivist scholarship, as in the interpretive approach (Green 2019).

The interpretive approach, often used as an umbrella terms for qualitative, subjectivist work, is outlined here to show its contrast to positivist, objectivist research. It has been developed to refute and counteract logical positivist and later neopositivist ideas (Green 2017a). According to interpretive approaches, what is real in the world and should be studied are people, their views, and actions rather than inanimate structures. It is people who create the world, and only through studying them can one gain knowledge of the world they inhabit – the social world. Appropriate research methods would be those concerned with gaining knowledge about people's understandings of their situations. Surveys and questionnaires would not be suitable for such research. Instead qualitative methods, such as participant observation and interviews giving respondents freer rein to express their views, are examples of research methods used (Green 2017a, 2019).

In mainstream research, because the choice of respondents by researchers has generally been senior managers of the companies they have studied, this legitimates managers as having the knowledge about their organizations' systems and structures and also implicitly or indeed explicitly accords these managers the authority to devise structural change strategies and the capability to implement them successfully. The absenting of employees in more subordinate positions from the research assumes that they do not have any knowledge relevant to organizational issues such as change. It also assumes that they do not need to be "in" on any discussions about such matters, probably because they are regarded as passive, loyal recipients of managerial decisions, as indeed is inherent in functionalist ideas about how organizations operate (Chua 1986).

Critic of This Approach

Employee Passivity

This critic starts with the last point – the passivity, loyalty, and acceptance of managerial decisions by employees. Burns and Stalker, in their research into 20 English and Scottish electronic companies, faced in the middle of the last century with the challenges of new technologies and new markets, found the opposite of passivity, loyalty, and acceptance of managers' strategies for change to their companies in this new environment (Green 2019).

Instead they found many failures in these strategies, particularly in the Scottish companies, which hitherto had enjoyed government custom, and had not been exposed to market competition. The failures were due to the actions of organizational members – starting from employees in more subordinate positions through managers at different levels, reaching right up to the chief executives of these companies (Burns and Stalker 1961).

Insecurities, Careers, and Conflicts

There were different reasons, all affecting the feelings, attitudes, ambitions, fears, levels of expertise, and capabilities of employees at different levels and in different departments in these organizations. Examples included insecurities about the changes; some suffered from bureaucratic inertia, not wanting to consider more flexible processes they were unused to (Burns 1966). Career ambitions were a further reason for the compromising of management strategies in some organizations. There were rivalries and conflicts between the newly appointed technical experts and longer-standing employees, including managers. Many felt threatened by the scientific experts, who often accorded privileges to themselves not enjoyed by everyone else and not sanctioned by the management (Burns and Stalker 1961). For a fuller analysis, see Green 2019.

There were departmental conflicts, for example, between salesmen and engineers for resources, policy, and patronage. Moreover, there were informal alliances between employees, often ignored by researchers, which nevertheless had a great deal of influence over organizational processes and which could modify or render inoperative decisions made through the formal structures that managers employed (Burns and Stalker 1961; Green 2019).

Chief Executives

Chief executives were also not immune from experiencing difficulties with organizational change. They, in contrast to the assumptions made by mainstream researchers about the power and prerogative of senior managers, had an almost impossible task facing them. They were expected to have detailed knowledge of their organizations; to be able to estimate the environmental challenges facing their organizations; and to have the knowledge to suggest strategies for change and the skills to be able to implement these strategies in their organizations (Burns and Stalker 1961; Green 2019).

These chief executives were hampered not only because of the huge demands made upon them but also because their knowledge of their organizations and possibly also of the environmental problems facing them were necessarily restricted by the fact that they were isolated because of their position and their subordinates did not always provide them with relevant or adequate information. In fact withholding information from superiors was seen by Burns and Stalker to be present at different levels throughout the organizations they studied (Burns and Stalker 1961; Green 2019).

These are just some examples of the problems commonly present in organizations, particularly when undergoing change. In a book republished in 2013 which was mentioned earlier, the problems of organizational change, employee resistance, and managerial challenges were shown to be no less prevalent or consequential for the success of the companies researched (Mansfield 2013, *passim*).

Choice of Respondents

Despite the careful and painstaking work done by researchers using functionalist, objectivist methods, it still puts into question the comprehensiveness and adequacy of knowledge that is based on research which avoids looking at how employees, from chief executives downward, understand, regard, and act on issues in their organizations, be they managerial strategies or other factors.

Given the difficulties Burns and Stalker found that managers faced, including their lack of knowledge about what was happening in their organizations and their vulnerabilities regarding their lack of expertise in their new technological environments, it is perhaps surprising that academic researchers did not consider throwing their research nets more widely than the solitary senior manager frequently interviewed or surveyed. There might have been political considerations to maintain the precedence of managerial prerogative, power, and legitimacy. In addition, established custom had served researchers and their institutions well. The ideology of positivism and objectivism, the basis of this type of scholarship, may also have been too strong to contest. The critique of this ideology below, however, shows serious weaknesses in its precepts.

Scientific Principles and Methods: A Critique

Objectivism in the Natural Sciences

The view of logical positivists, as mentioned, was that knowledge that was properly scientific had to be empirical, observable, acquired through sense data, and verifiable through experience. The way such data was analyzed was through quantitative methods such as sampling, scaling, and statistical analysis (Turner 2001). This was the basis of much mainstream research in the social sciences in general and, as has been claimed, in management and management accounting as well. For these subject areas to be legitimated as being "scientific," researchers were advised to engage in what were regarded as the scientific methods of inquiry above (Halfpenny 2001).

However, these claims as to what counts as scientific work have been contested by philosophers of science. Most famously, Thomas Kuhn's *The Structure of Scientific Revolutions,* originally published in 1962 and running to four editions, challenged positivist approaches. According to Kuhn, scientific methods of inquiry were much broader. The objects of inquiry were not restricted to empirical, observable data. Rather, they consisted of universally recognized achievements providing model problems and solutions. Science included "any field in which progress is marked" (Kuhn 1970: 162). It was to do with solving problems concerned with the "behaviour of nature" (Kuhn 1970: 168).

Moreover, there were various ways in which information could and should be acquired – and not only through sense data. Kuhn and another philosopher of science, Paul Feyerabend, both argued that there were no strict or unchangeable rules and standards for acquiring scientific knowledge. Nor did the methods have to be through experiment and observation (Feyerabend 1993: xi, 11).

Kuhn, whose ideas centered on the development of new paradigms, argued that the opposite was the case. The ability of scientists to develop new paradigms and therefore new knowledge involved their asking new questions, thinking of new solutions, and finding new ways of dealing with data (Kuhn 1970). Rather than being rigid imitators of "established behavioural patterns," scientists needed to be open to new ideas and new ways of looking at things (Feyerabend 1993: 159).

Other positivist cannons were challenged. The stipulation that quantitative methods of analysis had to be used was disputed. Feyerabend pointed out that quantification was not always appropriate even in subject areas where it might be assumed to be. In one of the "apparently most quantitative of all sciences, celestial mechanics," it was difficult to use quantification and much easier to use qualitative (topological) methods (Feyerabend 1993: 2).

Moreover, there was no contradiction between, nor exclusivity regarding, these different methods of analysis. For Kuhn qualitative and quantitative methods, far from being in opposition to each other, often complemented each other in research. Quantitative-based science often followed on from initial qualitative work:

> . . . so general and so close is the relation between qualitative paradigm and quantitative law that, since Galileo, such laws have often been correctly guessed with the aid of a paradigm years before apparatus could be designed for their experimental determination. (Kuhn 1970: 29)

Perhaps the most "sacred" and strongest conviction for science's superiority and sole legitimacy to knowledge, and therefore justification for the mainstream management and management accounting scholarship outlined above, was the claim that science, unlike qualitative, subjectivist research, was objectivist and neutral and not subject to the researcher's subjectivities nor to other human influences.

These claims too have been challenged. Hanson, also a philosopher of science, pointed out how a subject could be understood, interpreted, and analyzed differently according to the researcher's background and interests. One example he gave was of the different interpretations the astronomers Tycho Brahe and Kepler would give of the dawn: one would see the sun moving above the horizon; the other the earth rotating away to reveal the sun. The data was the same; the interpretations were different – "*ex post facto* interpretations" by the astronomers (Hanson 1972: 8).

Kuhn argued against science being value-free. He pointed to normative value judgments in scientific communities, which exerted considerable influence over the work of scientists in their particular community. It influenced many decisions about how scientists should go about their work: what approach should be taken; what counted as appropriate objects of inquiry – the relevant and valid scientific problems to be investigated; what were acceptable solutions; and what constituted scientific achievement (Kuhn 1970). (See Green (2019) for further analysis.)

Objectivism in the Social Sciences

The conviction that there can be objectivism in research in the social sciences is open to debate. It has been shown that there are arguments by eminent philosophers of science that, even in the natural sciences, objectivism is not necessarily a given and that there are subjective elements often present. In the social sciences, including the management fields, there are many objections to the idea that research can be objective or indeed scientific, in the senses mentioned above – value-free knowledge acquired through sense experience and analyzed through statistical techniques.

Bourdieu, writing about the social sciences in general, came down fiercely against claims that such research was scientific. He argued that much of this research had the appearance of having scientific legitimacy in terms of the instruments used:

> The mania for methodology or the thirst for the latest refinements of componential analysis, graph theory, or matrix calculus assume the same ostentatious function as recourse to prestigious labels or fascinated attachment to the instruments – questionnaires or computers – most likely to symbolise the specificity of the craft and its scientific quality. (Bourdieu et al. 1991: 70–71)

However it lacked the rigour of true scientific work. What often passed for scientific work was, according to Bourdieu, mere “scientificity.” Rather than imitating accepted scientific models and methods,

> scientific practice never takes the form of an inevitable sequence of miraculous intellectual acts, except in methodology manuals . . .. [It requires] the long effort . . . which little by little leads to the *conversion* of one’s whole view of action and the social world that is presupposed by ‘observation’ of facts that are totally new because they were totally invisible to the previous view . . .. (Bourdieu 1990a: 16) (emphasis original)

Implications for Management Scholarship

Scientific Work

If one accepts alternative, broader definitions of science, what counts as scientific research, and what is mere “scientificity,” one has to reconsider the claims for the legitimacy of the ideology and practices of mainstream management scholarship.

Firstly, it has been shown through Kuhn’s and Feyerabend’s analyses that there is not only one way to do science. In fact for them, the opposite was the case. In order for knowledge to develop, Kuhn (1970) argued that scientists (and for the purposes here – scholars) needed to think “outside the box” as to what constituted problems that were worth studying, as well as appropriate methods of research and possible solutions. Otherwise it would be difficult for new ways of thinking to arise. These ideas challenge the exclusivity of positivist, scholarship, and the full legitimacy of orthodox management scholarship based exclusively on objectivist approaches.

Neutral and Value-Free Scholarship

Challenges to scientific work being value-free and neutral by Kuhn (1970) and Hanson (1972) make management scholarship particularly vulnerable to charges of managerialism – looking at organizational features and issues only from managers' perspectives and seeing fit to interview and survey managers exclusively for information about their organizations, with a disregard for the potential value of subordinate employees as respondents and for their potential power to influence organizational outcomes.

Recourse to an analysis of organizational systems and structures as explanations for the success or otherwise of managerial change strategies needs to be justified in terms of their adequacy as an explanation. As argued above, human agency, in addition to appropriate systems and structures, was found by Burns and Stalker, among others, to be crucial in explaining successes and failures of the implementation of organizational change policies (Green 2019).

Researcher Choices

Functionalist, objectivist research methodologies have been used on the grounds of their being value-free and neutral. This can be contested in various ways. Criticism is not being made of the methods used – largely survey questionnaires. These have their value, particularly as they can reach a large number of respondents whose answers can be compared and statistically analyzed with confidence that such comparisons are sound and can produce useful findings.

What is challenged here is that these methods are neutral and value-free. Although it has been held that the subject matter is objective as it is outside the realm of human subjectivities, it can be argued that it is nevertheless a choice. It is a conscious choice to assume that organization systems and structures are sufficient to explain organizational outcomes in situations of change over, for example, the knowledge that might be gained from knowledge about the subjective responses of organizational members to such change. The choice therefore is a subjective one by the researcher and needs to be justified (Green 2019).

If one considers the respondents, a claim can be made that the choice of respondents – in this case senior managers – is also a subjective choice. As argued earlier, such a choice can be seen as a politically motivated act – legitimating and bolstering the power of managers to make decisions about organizational change strategies and their implementation.

And again, as discussed earlier, participation in this by employees lower down the organizational ladder might lead to better decisions being made and to greater acceptance of the changes by subordinate members of the organization. Dermer and Lucas (1986) showed how in large organizations senior managers did not necessarily know what was happening lower down their organizations and could be much mistaken – with consequences for the effectiveness of their decision-making.

Research Methods

While questionnaires have their uses, they are limited. Many researchers went to considerable lengths to develop questionnaires that would give them information about the control systems and structures of the companies they were researching. One example is Simons, a respected researcher, who published his research in the highest-ranked journals. He investigated companies to establish whether Burns and Stalkers findings that successful companies had to change their structures in times of environmental change were substantiated (Simons 1987).

Simons carried out lengthy semi-structured interviews with senior managers to establish the situations of their companies in terms of challenges to change, and the differences between them, in order to get ideas for his questionnaire design. Questions were developed after consulting existing literature on questions in similar areas and after they fitted with the interview data supplied by senior managers about control characteristics they considered important (Simons 1987).

This was careful, painstaking, professional research. However there were limitations. Given what was said earlier about the restricted knowledge that senior managers might have of what was happening at all levels of their companies, it was, arguably, not enough to interview only managers at the highest level. The validity of such information would be even less if only one manager per organization was interviewed. According to Van der Stede et al. (2005), scholarship is weakened in these circumstances, as one respondent's views are not verifiable and in any case cannot represent all the views in her organization.

Well-known problems with questionnaires include the fact that the questions are predetermined and respondents have to fit their answers to those questions, which may not exactly fit their own organizations' circumstances. The questions too can only elicit general answers. To use Simons' questionnaire as an example, one of the questions was about the extent to which internal audit groups were used to check financial information systems and reports in their organization (Simons 1987). All that the respondents could do using a Likert-type scale was to indicate whether this was the case to a high degree or to lower degrees. No information could be extracted about how this was done; what were the advantages, disadvantages, strengths, or weaknesses of this system; and how this affected the organization and its members (Green 2019).

Furthermore, the questions, however well-researched, are in the end devised by the researcher and therefore in the end are subjective choices (Green 2019). Stainton Rogers (1995) argued that questionnaires tell us more about the person who has constructed the questionnaire than about the respondents from whom it is designed to gather information.

Ultimately, claims that this type of research is more objective and therefore scientific, are weakened by considerations of how philosophers of science such as Kuhn and Feyerabend have described science and scientific methods. Objectivist research methods have been challenged by others too. Bourdieu also regarded objectivist research in the social sciences as being poor simulacra of serious scientific research methods, lacking the intense, constant, and persistent scrutinizing that questioned, developed, and modified the subject matter as more research was carried out.

Conclusions

Ways Forward

So what might be the way forward regarding management scholarship? The first step could be awareness of where subjectivities lie with the scholarship – the researcher's choices with regard to her general approach, including the object of inquiry, the respondents selected, and the research methods used. More serious and extensive modifications to mainstream management scholarship would be to take seriously the ideas put forward by Kuhn and Feyerabend for the need for scholarship to be more painstaking and eclectic in its questions, solutions, and research methodologies.

This would require broadening the scholarship from the functionalist approach alone to include alternative paradigms. The interpretive paradigm, along with the use of qualitative research methodologies, would address more subjective subject matter. One could go "more alternative" and use radical paradigms, which would examine organizational processes and issues from the point of view of employees lower down the ladder, and highlight questions about power and control by management and also about latent and actual resistance to managerial strategies. Postmodernist approaches might question the meaning of "management," investigate how it was practiced (and not practiced), and in that context examine the possibly artificial distinctions and bipolarities constructed between managers and the managed (see e.g. Derrida 2002 *passim*).

Holistic Research

Combining different ontological, epistemological, and methodological approaches has been advocated by various theorists writing more broadly about the social sciences. Bourdieu argued passionately against the use of an objectivist approach which excluded subjectivism. While the former was concerned with objective factors independent of human minds and wills, the latter was concerned with equally important matters as to how people experienced interactions and how they influenced the social realities in which they were situated (Bourdieu 1990a).

What Bourdieu contended was that the exclusive use of either approach could not provide adequate explanations. Such divisions were invalid and dangerous. They were the "most ruinous" of divisions in the social sciences (Bourdieu 1990a: 25). Neither approach could provide a sufficient explanation on its own, and these separate types of scholarship led to "mutilations" in sociological analysis (Bourdieu 1990b: 34).

Both approaches were needed for adequate scholarship – objective structures could influence and constrain human actions, but people could equally well influence events. Certain situations in organizations required the analysis of structural factors; others required knowledge of human factors – of people's understandings of what was happening in their worlds and the actions they intended to take or had taken (Bourdieu 1990a).

Such ideas have been supported by some scholars in the management/management accounting fields. Brown and Brignall (2007), for example, argued for a mixed method approach, where there would be mathematical techniques used for accounting relationships complemented by qualitative approaches for organizational and human issues. They themselves used a mixed approach and a triangulated methodology. Similarly Modell (2009) supported mixed methods research, basing his work on a long history of management accounting research which had combined quantitative and qualitative methods. And Davila et al. (2009) expressed interest in rich research using a cross-sectional, multi-method, multi-case research design (Green 2019).

Practical Application

As Burns and Stalker (1961, 1966, 1994) showed, outcomes resulting from organizational change strategies were mostly unsuccessful in the organizations they studied. And, as mentioned earlier, other theorists have also often found this to be the case, e.g. Mansfield (2013). The practice in mainstream management scholarship of looking only at objective factors such as organization systems and structures had omitted studies of organizational members, their attitudes to managerial strategies, their intentions, and their translation into action, be they full acceptance of these strategies, modifications, or resistance to them.

This has had repercussions in terms of "absences" (Bhaskar 2008) in management scholarship, with the danger of only partial information and ideas being imparted to scholars, students, managers, and other practitioners about systems and structures, but not about human agency and the potential effects of this, both positive and negative, on the success of managerial strategies and of organizational outcomes. These absences have included managers' vulnerabilities with regard to the extent of their knowledge about their organizations, their employees, different departments, their environments, and the potential difficulties likely to arise through their policies and strategies for the implementation of changes.

Such omissions, in conjunction with other potential difficulties in the relationships between academic scholars and professional practitioners, are not likely to serve practising managers well and could increase any existing distrust or lack of interest in what academicians have to offer (Green 2019). A critical accounting scholar, Panozzo, described management accounting scholarship as being removed from what was happening in real life in organizations through its use of highly idealized constructions, irrelevant to organizational practice (Panozzo 1997). What accountants did was to produce

> abstract models postulating the existence of idealized worlds and excluding involvements in field research . . . [which were] hardly justifiable in the social sciences. (Panozzo 1997: 459)

Toward More Legitimate Management Scholarship

Problems, including those of fuller legitimacy, it has been argued in this chapter, exist because of the mono-focused approach that mainstream management and management accounting scholarship has (with exceptions) adopted. It should be reiterated that this is not an attack on objectivist scholarship per se. Rather it is an analysis of the ontological, epistemological, and methodological limitations of using only one approach to the exclusion of others. As Bourdieu (1990a, b) said, each approach had its limitations, and both were needed for satisfactory scholarship.

The absences in the mainstream management approach have been about the majority of people in the organizations studied, including their attitudes and actions, which in some cases constituted potential threats to the successful implementation of managers' strategies. This scholarship can be faulted for downplaying the latent power that employees could have in certain situations. This, it can be argued, while being politically on the side of management, also potentially weakens it through not raising this as a problem that could arise if organizational change was mishandled.

The denial of the possibility of employee resistance modifying managers' strategies or causing them to fail entirely can be seen as de-emancipatory. Many writers have analyzed the knowledge and discourses produced by management in this light (Green 2012). Habermas' classification of the dominant type of knowledge as the technical reason, which, he argued, constituted a focus on managerial ends rather than employee interests or participation, was a way in which control was appropriated by managers (Habermas 1972).

Bhaskar, in his work on critical realism, argued that this was the case because of the absences created through these exclusions in dominant scholarship. He was for the "absenting of absences" (Bhaskar 1993: 83). What he and others wanted was a more holistic scholarship which recognized both subjective and objective factors and their interdependence. In this way a more totalizing and emancipatory scholarship could be achieved (Green 2019). It would have more sustainability – epistemologically, practically, politically – and therefore also in terms of legitimacy.

Society's Megatrends and Business Legitimacy: Transformations of the Legitimizing Business Paradigm

19

Susanne Holmström

Contents

Abstract

Recent decades have witnessed a transformation of the legitimizing paradigm that mediates the interrelation between the business community and the rest of society. The transformation is activated by a series of parallel but diverse challenges to society's cohesion driven by society's evolution at different dimensions of society. The rationality of legitimacy has grown from being given to being discursive. What was formerly seen as reciprocal opposites – such as considerations of life and nature as opposed to considerations of profit – is increasingly seen as mutual preconditions. New polycontextual forms of co-regulation have increased and changed the company's legitimizing environment. What was formerly seen as private has to a large part become of common interest and

consequently subject to public searchlight. Empirical analyses show how society tries to solve its problems produced by the blind reflexivity gradually evolving with the stabilization of modernity by activating reflective forms of coordination.

Keywords

Reflection · Reflective paradigm · Megatrends · Legitimacy

For a company to be seen as legitimate has always been decisive to its supply of resources – investments, sales, motivated employees, general support in society. However, the preconditions of legitimacy change. The interrelation between the business community and the rest of society is not constant. It follows society's evolution and is mediated by changing legitimizing notions. Today, in societies characterized by modernity, it is taken for an almost granted precondition of legitimacy that business companies take on a societal responsibility that exceeds quick profits, and that they are prepared to justify their decisions in public. However, only a few decades ago these were new and unusual demands which collided with the then prevailing notions of legitimacy within the business community and were encountered with fierce opposition and counteractive corporate strategies (cf. ► Chap. 80, "Legitimizing Practice Forms During Transformation of a Legitimizing Business Paradigm: Changing Strategies and Reasons").

Legitimizing notions establish certain patterns of expectation and contribute to social order and society's cohesion by defining what is perceived as legitimate, i.e., what is seen as right or wrong, relevant or absurd, reasonable or unfair, normal or boundary spanning – in short: What is seen as *socially acceptable*, i.e., what is suitable behavior in specific situations and contexts. Legitimizing notions coordinate our way of interacting as well as our relations to organizations and their reciprocal interrelations. They constitute a "generalised inclination to accept so far undecided decisions within certain boundaries of tolerance" (Luhmann 1993a: 28), i.e., define a frame for decision-making premises and corporate practices in return for trust, license-to-operate, and general acceptance and support in society.

Empirical observations show how different societal forms and stages of the evolution of a specific societal form activate different legitimizing notions. When the private enterprise emerged with modernity in the late seventeenth and the eighteenth century, focus was on the rights of the then new private sphere in relation to the state, and on the development of economy, politics, science, education, medicine, family, etc. as independent spheres with each their rationale. After the feudal society's violent forms of coordination, the emerging market sphere was seen as society's civilizing mainstay which via the public sphere held the then new state power accountable and warranted the dawning democracy (Habermas 1989). The business company was born as legitimate and societally responsible.

Modernity broke with the perception of legitimacy as something inherent with reference to authorities such as God, sovereign, or a moral order. The modern era's secularization and fragmentation can be seen as society's conversion from a concurrent *other-reference* to religion in the legitimizing processes to *self-reference* in a range of gradually differentiated societal areas such as economy, politics, science, etc. (Luhmann 1995: 461). Correspondingly, in the course of the development of modern society, it was legitimate that these societal areas focused narrowly on their own individual development on their own individual premises.

As society evolves, established legitimizing paradigms and practices grow outdated. They no longer contribute to provide social cohesion and are subject to repeated processes of transformation. During the latter half of the twentieth century and the start of the twenty-first, the most recent transformation has taken place. New legitimizing notions and practices have evolved to cope first with modernization's increasing strains on life and nature, second with society's accelerating complexity and diversity, and third with the growing global interdependence and modernity's clash with different types of society.

These transformations are general trends in all parts of society. In the business community, they manifest in themes and practices that, as different forms of resonance to society's evolution, have moved from the periphery into being central issues to a company's existence: social and societal responsibility, sustainability, accountability, transparency, multiple bottom lines, cross-sectoral partnerships, corporate citizenship, public relations, public affairs, corporate social innovation, governance networks, and co-regulation in interplays with an increasing range of stakeholders. Together, these notions form a new legitimizing business paradigm focusing on a more sensitive approach to life and nature, as well as to the mutual interconnectedness between society's diverging rationales and interests. (For an analysis of this transformation process and legitimizing practice forms, see ► Chap. 80, "Legitimizing Practice Forms During Transformation of a Legitimizing Business Paradigm: Changing Strategies and Reasons").

Empirically, we can observe the transformation of legitimizing notions that mediate the interrelation between the business community and the rest of society – but how can we explain them theoretically? The explanatory suggestion unfolded in this chapter is based upon the thesis that legitimizing notions support society's cohesion and change in response to challenges posed by society's evolution. To substantiate this thesis the problems that challenge society's cohesion will be identified, and an analysis of how a new legitimizing paradigm copes with these challenges will follow. In a sociological perspective, this means a focus on the sense-making social filters that constitute our notions of what is right, reasonable, relevant, and right – i.e., of what is legitimate. As approach, the sociologist Niklas Luhmann's theory of epistemology, society, and organizations is chosen, in particular because Luhmann's extensive complex of theories makes it possible to link observations at the level of society's evolution to events in organizations and in everyday practice with a stringent theoretical consistency.

Thus, the chapter's theoretical understanding of social dynamics and society's constitution is based predominantly on Luhmann's theories. However, analyses and theories on the transformations of legitimizing notions into a reflective business paradigm on six societal megatrends are based on the research and theoretical developments by the author of this chapter. First, those parts of Luhmann's theories that are applied as analytical optics are briefly presented. Second, societal megatrends are identified that have activated the transformation of the legitimizing business paradigm. Finally, as the mainstay of this paradigm, the specific second-order mode of self-observation, reflection, is identified; i.e., the ability of a company to raise its perspective so that it sees itself as if from above, in the larger societal context, instead of observing the world blindly from within from a narrow tunnel vision.

Social Cohesion

The basic contention of the research presented in this chapter is that we have to adopt a counterintuitive approach with a focus on the self-referential social dynamics if our observations are to be at level with contemporary society. So, in order to capture the complexity and diversity of the social processes constituting the interrelation between organizations and society-at-large today, the focus is on society and organizations as constituted by sense-making social processes mediated by specific social filters of recognition without which the world complexity would be an incomprehensible chaos to us.

Social processes are specific communicative elements (Luhmann 1995: Chap. 4; cf. also ▶ Chap. 80, “Legitimizing Practice Forms During Transformation of a Legitimizing Business Paradigm: Changing Strategies and Reasons”) which by constantly causing and connecting to new communications reproduce society. The basic point is that the continuation of this recursive stream of selection of meaning conditions society’s cohesion. Society’s evolution – and subsequent transformations of legitimizing notions – means processes seeking to support the continuous flows of communication.

Society differentiates in meaning systems with individual criteria of interpretation and with individual legitimizing notions in order that particular patterns of expectation are reproduced. These filters consequently determine what is seen as right and wrong, relevant and irrelevant, appropriate or absurd – in short: legitimate. In this way, communicative connection and thus social cohesion is rendered probable. The type of society framing the legitimizing paradigms upon which this chapter focuses is modern society, a functionally differentiated society (Luhmann 2012: Chap. 4, VIII). As fundamental filters for social interaction, society has differentiated in principally equal, however, incompatible societal spheres of meaning, with each their individual self-legitimizing rationale directed toward a specific function – politics, law, science, economy, medicine, religion, journalism, family, and more.

Functional differentiation is the basis of the modern welfare society – however, is not without inherent problems to its own continuation. From different theoretical positions, during the latter half of the twentieth century, analyses suggest that the modern society is in a crisis. According to Habermas (1981), a divide of legitimacy has arisen between a system rationality and a lifeworld rationality. Bauman (2000) describes the transition from solid modernity’s rigid norms and rules to liquid modernity. Beck focuses on how modernity reflexively produces risks – as "self-confrontation with the consequences of risk society that cannot be dealt with or assimilated within the frames of industrial society" (1992: 6). Luhmann suggest the risk that society "rigidify into repeated, but no longer environmentally adequate, patterns of behavior" (Luhmann 1995: 372). Functional systems have developed and stabilized to a degree of large specialization and division of society and a tendency to generating reciprocal strains in between functional rationales, as well as strains on life and nature.

Legitimizing notions of unproblematized growth and blind progress are challenged. Society activates a series of protest position in the form of social movements (Luhmann 1986, 1996), which gradually organize and contest established legitimizing paradigms. Since the problem proper – the self-containedness of functional rationales – cannot be addressed directly, turbulence strikes in society's decision-making machines, organizations, which in their decision-making premises apply the functional rationales (Luhmann 1999, 2000a). A specific focus is on the strains by the economic rationale, and on its dominance in business companies with profit maximization as their absolute criterion of success. After decades of complex co- and counterplays in between society's different positions, gradually a new legitimizing paradigm catches on. It motivates to considering life and nature and enables flexible forms of coordination in between society's sectors, while at the same protecting society's basic structures. Society absorbs the turbulence, the protests against itself in learning processes with new legitimizing noting and practices that support the social cohesion of contemporary modernity characterized by diversity, uncertainty, dynamism, and liquidity.

Society's Megatrends

The premise is that we understand the transformations of legitimizing notions as part of society's evolutionary processes that seek to hold the flows of communication going. When we endeavor to understand the new challenges to business legitimacy, we therefore have to identify the problems or society's cohesion that are activated at different dimensions of society in the transition from full (or solid) to ultra (or liquid) modernity: (1) society's relation to life and nature; (2) the organization of society's decision-making; (3) the primary differentiation of society into functional systems; (4) the political coordination of society; (5) social safety strategies; and (6) societal forms.

Each dimension activates a fundamental problem and gives rise to a distinctive evolutionary trait in society where new legitimizing notions are activated (Holmström 2008, 2010, 2018b). These megatrends interact in the transformation of the interrelation between the business community and the rest of society. However, they unfold on each their specific issue arena with each their themes, conflicts, interests, positions, perspectives, paradoxes, interrelations, and forms of practice and pose different challenges to business companies.

Insensitive Society: People, Planet, Profit

The first evolutionary trait is the most visible and, on face value, the most simple and straightforward of the six megatrends identified below. However, it relates to the probably most counterintuitive aspect of society. *The insensitive society* is produced by society's structurally determined (in)sensitivity to its environment, i.e., to non-social processes. The megatrend manifests in an extensive range of themes: from business companies' prioritization of issues such as stress, child labor, animal welfare, and climate changes to the unequal distribution of the world's resources, in confrontations between NGOs and business companies and in legitimizing notions of *the triple bottom line* (Elkington 1997; Shell 2000), of business strategies such as *Closer to Nature* and *Good Growth* (Arla Foods 2018a), and of compliance with UN's Sustainable Developments Goals (UNSDG 2018). Where the legitimate room for decision-making was formerly defined by narrow objectives of unproblematized growth and progress, today companies must endeavor to balance considerations of profit with considerations of people and planet.

The basic premise is to understand society as social processes – and society's environment as nonsocial processes, i.e., organic, chemical, biological, physical, and psychical processes. Society automatically reconstructs anything, including the well-being of nature and human beings, through its social filters, each with specific criteria for relevance and success. For organic, chemical, biological, psychic, and physical processes to be observed, interpreted, and communicated in society, they must be reconstructed into social processes according to society's meaning structures, and even then much is lost or distorted in translation. For instance, the economic rationale cannot observe its side effects such as pollution, deforestation, stress, or oppression of human rights before they affect market conditions and consequently can be seen with economic distinctions. Moreover, what is observed is reconstructed by economic distinctions. A similar (in)sensitivity applies to all societal rationales. A fundamental benchmark of politics is: will it help us gain votes? Of science: will it create new insight? Of mass media: is it new information? In their criteria of relevance, the functional rationales serve as gatekeepers which specialize society's sensitivity.

This (in)sensitivity leads to unintended strains on human beings and nature. For, as modern society stabilizes, the differentiated functional rationales generate increasing knowledge and growth. This means that nature and humans are increasingly being interpreted by functional rationales and strained by their criteria of relevance and success. Apparently, a critical mass is reached toward the latter half of the twentieth century. Social movements confront the established structures of society and gradually organize effectively in NGOs. Increasingly, demands of wider considerations of nature, animals, and human beings catch on and activate new legitimizing notions. A new business paradigm endeavors to internalize considerations of life and nature, articulated in statements such as those by Danish healthcare company Novo Nordisk: "We maximize profitability by contributing to sustainable development and balanced growth; we explore business opportunities by initiatives that address social needs or help reduce environmental impact" (Stormer 2007).

We may understand society's response to its limited resonance as a reprogramming of society's functional rationales to larger sensitivity to life and nature – without weakening these rationales. It is done by an almost paradoxical u-turn of the legitimizing notions that mediate society's interrelations with its environment. From having been seen as reciprocal opposites, the consideration of society's different criteria of relevance and success on the one hand (i.e., the generation of knowledge in a research institution, of news at an editorial office, of education at a school, of political power in a government, of profits in a business company) and on the other hand considerations of life and nature are gradually seen as mutual preconditions (Holmström 2013).

The new legitimizing notions increase society's structural resonance to its non-social environment. However, there are limits to this resonance. For society's resonance is determined by society's meaning filters. It fosters extensive limitations. It is an immanent mechanism of social processes that meaning systems can be affected by events in their environment; however, the resonance depends completely on the system's filters of interpretation. Whether anything is relevant to economy depends on whether it makes a difference to economy. Correspondingly, it goes for organizations with their primary reference to science, politics, education, health, etc. that they must be able to observe the relevance with their systematically conditioned optics to be motivated to taking considerations.

However, conversely it also means that organizations are "defenselessly exposed" (Luhmann 1986: 22) when environmental strains finally catch on to their criteria of relevance and success. This is the case when environmental considerations pay off in the business community; when stress can be made the object of the production of new knowledge in science; when focus on climate changes creates political popularity; and when lifestyle disease can be made into news. Hypersensitivity is constantly lurking and threaten to distort society's structural resonance on its strains on life and nature. Attempts of problem-solving will ultimately cause new strains – such as when climate-friendly branding and CO_2 neutral "green" products explode when in market demand; however, with extensive administration and resource demanding reports on the triple bottom line as a result.

Decision Society: Risk Versus Danger

The megatrend of *decision society* is activated by the dimension where society organizes its decision-making. The propelling problem is, first, the increasing focus on decisions, the premises of which are not given but results of contingent choices that could have been made differently, and, second, the increasing perception of the asymmetry between decision-makers and those potentially influenced by a decision without having a final say or even being involved in the decision-making (Holmström 2005; Luhmann 1993b). The notion of decision society captures the growing awareness of the inherent asymmetry between decision-maker and those potentially affected by the decision. It contributes to explaining the demand for "responsible," "accountable," "sustainable," and "transparent" decision-making.

Organizations are society's decision-making machines (Bakken and Hernes 2003; Becker and Seidl 2005; Luhmann 2000a), decision implying a *fixation of social expectations*. It is via organizations and only there that society can operate collectively. Organizations refer to more of society's functional rationales in their decision-making – however, by far most of them identify and legitimize themselves with primary reference to one functional rationale. It furthers the decision-making processes and strengthens the structures of expectation when you know whether you deal with a business company, the editorial office of a newspaper, a hospital, a school, a university, or a political party. Thus, the fundamental legitimacy to any organization is to fulfill its primary function within society. A business company must secure its economic dynamics; a hospital must be able to treat ill people; a research institution must produce new knowledge; journalistic media must publicize new information; a government must be able to govern; and so on.

Previously, as long as a company complied with these well-established norms of society, its decision-making was generally considered legitimate by the company's environment from almost blind confidence. In the late twentieth century, part of the emerging questioning of norms originating in functional rationales fueled the growing perception that the premises of decision-making are based not on given, shared norms, but on contingent choices that could have been made differently. When norms are seen as contingent (Gumbrecht 2001; Luhmann 1998), everything from fertility to obesity and climate changes are attributed to decisions. As society's decision-makers, companies and other types of organizations are held *responsible* for the consequences of their decisions. Decisions are made a question of the company's choice, and the company is made responsible for the consequences of its decisions in a wider perspective. In a globalized world, this responsibility is broadening, extending from a company's peripheral subsuppliers to the side effects of a product in a distant country. Correspondingly, *sustainability* which involves taking responsibility for the future has become a prominent issue. Even when the victim's perspective joins forces with public opinion and via social as well as conventional mass media provokes a massive front against a company, it remains illegitimate for a company to adopt the victim's perspective. The company must present itself as a responsible, dynamic decision-maker. Reference to unproblematized norms of the established society no longer automatically means responsible decision-making.

The interrelation between decision-maker and potential victim of the decision is born asymmetrical. The decision-maker is more or less prepared to take a *risk*, whereas the potential victim is hypersensitive to the *danger* to which she is exposed by decisions made by others. Because the asymmetry between decision-makers and those potentially influenced by a decision without having a final say or even being involved in the decision-making is perceived as increasing, the victim's perspective explodes and finds immediate resonance with the selection criteria of news media (Luhmann 2000b). Fear, worry, and distrust spread. The legitimacy of decisions is constantly questioned from the perspective of the potential victim. However, where organizations are forced, on the one hand, to make decisions, these decisions can, on the other hand, refer to no ultimate reason. These traits lead to public attention being continuously alerted, to the position of fear being stimulated over and over, and to prejudices and worries about the future prevailing. Consensus is not possible: partly because society is differentiated in irreconcilable perspectives; and partly because, since future consequences cannot be known in advance, there can be no unambiguously right solutions. The ultimate risk is for decision-makers to give in to the rationale of fear, give up making decisions out of fear for the consequences, or to transfer the power and responsibility of decision-making to those potentially affected by the decision.

At this dimension, legitimacy implies the delicate balancing act of performing autonomous decision-making (that is, minimizing exterior control and regulation) not in opposition to transparency and involving those influenced by the decisions, but as mutually preconditioned; of seeing the decision-making competence as being strengthened by being shared with the environment. Making autonomous decisions paradoxically requires involving those potentially affected by the decisions.

Partnership Society: Conflict and Cooperation

The notion of *partnership society* relates to the growing specialization of economics, politics, science, medicine, education, etc. This specialization is the precondition of the level of knowledge and recognition today. However, it produces increasing strains in between the functional rationales on the one hand, and on the other hand increasing interdependence.

Consequently, this megatrend manifests partly in legitimacy crises on suspicion of strains of society's fundamental structures (e.g., bribery, corruption, nepotism), partly in different forms of cooperation and partnerships across conflicting perspectives based on legitimizing notions that further cross-sectoral collaboration that respects the individual integrity of the different sectors. These are manifestations of society safeguarding its fundamental patterns of expectation.

The idea behind the transition from the former feudal, stratified society to the functionally differentiated society which took its start in Europe in the late seventeenth century is modernity's assumption that science, education, family, economy, etc. must be freed of the influence of religion in order to develop specialized knowledge and complexity on their own individual terms. These ideas constitute our modern society today and are the basic premise of legitimacy. Violations are tabooed and delegitimized as corruption, nepotism, bribery, populism, prostitution. They violate society's structures and consequently the patterns of expectation that facilitate communicative connection – i.e., they threaten society's basic idea and social cohesion.

The more specialized and closed the functional rationales grow – the more do they grow interdependent of each other's specific specialization and integrity. For example, the development of new treatments and therapies in the medical system requires the production of new knowledge in the science system, which depends on the economic system for its financing, which depends on the law system for intellectual rights, which depends on the political systems for legislation, which depends on journalism and mass media in order to mirror itself in public opinion, etc. However, at the same time – and herein lies the main challenge – they are mutually interdependent on that they *all function independently in each their way* with each their specific function, knowledge, competences, and dynamics intact. Consequently, legitimizing practices imply that decision-makers increasingly see independence and interdependence as mutual preconditions. Likewise, mutual engagement and individual integrity are inextricably linked in various forms of cross-sectoral partnerships.

The challenges to legitimizing notions are to strengthen disintegration and diversity and, at the same time, to support cooperation across society's differentiated perspectives – without their integration, for this would reduce society's level of knowledge and complexity. The features captured by the notion of partnership society imply that a company (and almost any other type of organization) must mirror its decision-making in an increasing polyphonous diversity of rationales and potential partners, and construct its legitimizing environment as an increasing range of stakeholders – without giving up its integrity primarily based in one of the diverse functional rationales. The basic driver of most organizations remains mono-functional (for example, a business company's primary rationale continues to be economic, while a research institution remains devoted to science). However, decision-making processes reflect how decisions made from the organization's own basic perspective, whether for instance economy, science, or medicine, are seen from different rationales such as education, family, politics, or mass media (Andersen 2003). In order for the organization to strengthen its own particular competence and interest it must respect the competences and interests of different perspectives. What was formerly seen as reciprocal opposites are now seen as mutual preconditions: the precondition of strengthening the individual functional rationales is the consideration of their mutual interdependence – and vice versa.

Perhaps most importantly, the partnership society activates a large sensitivity in between society's diverse perspectives. Consequently, this societal feature constitutes a central motive and a principal premise for ongoing legitimizing deliberations and practices by a company. The mutual interdependence has produced a mutual hypersensitivity and consequently a need to take into consideration the requirements of legitimacy from different perspectives – requirements rooted in the other megatrends presented in this chapter. To a certain extent, a business company can neglect the demands of an NGO. However, the situation changes when NGO criticism via mass media catches on to the increasing diversity of perspectives upon which the company depends for its continued existence.

Governance Society: Between Public and Private Interests

The megatrend of *governance society* relates to the megatrend unfolding at the dimension of society's political regulation. Problems of modern society are directed toward the political system, the function of which is to produce society's shared binding decisions (Luhmann 1990). In the late twentieth century, traditional political steering programs are strained by, first, society's accelerating degree of complexity, knowledge, and dynamism, second, the problems stemming from the other megatrends presented in this chapter, and, third, globalization's lack of global governing structures. These challenges to social cohesion can no longer be solved by the combination of unicentered other-regulation via law and control on the one hand and on the other hand decentered self-regulation via market procedures. Instead, a subtle and flexible form of societal coordination emerges, based on polycontextual legitimization processes that contribute to motivating society's members to take mutual considerations from the idea of a shared societal horizon – and, at the same time, to strengthen the individual functional dynamics.

The governance society's *polycontextual co-regulation* replaces or complements the traditional conflicts between the *multicentric self-regulation* where the differentiated dynamics – economics, health, science, education, family, etc. – increasingly strain each other, and the state's *unicentric other-regulation* which impedes the individual dynamics (Buhmann 2018; Sand 2004; Sørensen and Torfing 2005; Willke 1997; Willke and Willke 2007). With co-regulation, political initiatives intervene not only from outside by conventional law. Via promoting various forms of CSR as a precondition of legitimacy, trust, and competitiveness, national as well as supranational institutions such as UNs Global Compact and OECDs guidelines for multinational companies increasingly subtly influence companies' internal considerations of their own role and responsibility in society, acknowledging that "any system can steer itself only, with the modification that other systems can regulate it not against, but exactly through its self-regulation" (Luhmann 1997: 53). For instance, legal requirements to the effect that larger companies must account for their work with social and societal responsibility in their annual reports do not stipulate the responsibility from outside but contribute to internalize the societal horizon within companies and to the transparency and accountability that facilitate co-regulation.

To a business company, co-regulation is based on legitimizing notions characterized by three pillars: Societal responsibility, influence on society's will and way, and public accountability.

First, responsibility: Legitimizing notions imply that business companies "voluntarily" take on societal responsibility that exceeds the abidance by law and the immediate narrow task defined by the primary function – for business companies to ensure profits, employment, the material production of society, etc. The idea of a shared societal horizon and of a common interest is integrated in decision-making premises and processes. To some extent, it means taking on tasks traditionally being assigned to states – for instance, education and health initiatives, projects for clean and adequate water supplies to developing business models to improve the economic conditions for small local businesses in developing countries.

Second, societal influence implies that business companies legitimately may – or even should – partake in public deliberations about society's visions, will, and way. Societal influence extends from partaking in public debates and in often state-initiated governance networks together with other private organizations, public institutions, and a multitude of NGOs in order to solve societal problems together

– to influencing public health by inspiring to good food habits via information campaigns and cooperating with public schools on lesson plans and educational material, etc. (cf. e.g., Arla Foods 2018b).

Third, public accountability: The traditional legitimizing reference of the political system, public opinion, grows a legitimizing reference to private companies. Governance coordination relies on the regulating force of polycontextual interplays between the public perspective, news media, various NGOs, and an increasing number of stakeholder publics. Control mechanisms and sanctions take new polycontextual forms, such as mass-mediated legitimacy crises, distrust, and failing support from a diversity of stakeholders. Whistle-blowing grows legitimate. From having had to legitimize itself in relation to its inherent environment of the marketplace and in relation to the state by abiding to law, a company must legitimize itself in a larger and more complex environment.

Co-regulation implies an extensive potential for flexible decision-making as well as for legitimately influencing society's will and way, however, also a delicate balancing of what was formerly seen as reciprocal opposites as mutual preconditions: private and public perspectives; particular interests and the idea of a common interest; and economic and political rationales from the idea that "a healthy company requires a healthy society – and vice versa." The company must be able to consider the interconnectedness of society's diversity, while, at the same time, maintaining economy (or another defining rationale for different types of organizations) as its primary driver to fulfill its basic function in society. It must be able to do this without going to any extremes, in other words without growing into a semipolitical institution or straining democracy with economic power.

Trust Society: Between Authenticity and Responsiveness

The megatrend of *trust society* captures the growing need for *trust* as a safety strategy for social interaction as society grows increasingly liquid, hypercomplex, diverse, dynamic, uncertain, and chaotic. It has become increasingly unpredictable what to expect outside small circles of family, colleagues, and friends. Trust facilitates interaction, even in complex and uncertain social contexts, is the glue of contemporary society (Bentele and Seidenglanz 2008; Jalava 2003; Luhmann 1982), however, is based on a different and more demanding kind of legitimacy than was former predominant safety strategies. The manifestations of this evolutionary trait consequently range from aspirations of earning trust as apparently the most sought-after corporate resource today, frequent trust surveys, complex stakeholder webs and branding, to crises of legitimacy for companies that have not understood how blind confidence belongs to the past, or that do not live up to expectations.

All social interaction requires a safety mechanism that produces expectations to the effect that you risk entering into interaction with anyone. It goes for every social interaction, from entering into a conversation to buying a product from a company to engaging in a partnership. In recent decades, society's predominant safety strategies have changed radically. In the full (or solid) modernity of yesterday, society was relatively foreseeable, familiar, and uniform. You more or less knew what to expect. Most companies relied on a certain degree of *confidence* based on their stakeholders assuming that interaction was secure because they knew what to expect from the company. The "generalized inclination to accept so far undecided decisions within certain boundaries of tolerance" was based on the expectation that the company was being restricted from outside, by law and formal rules, and/or was restricting itself from inside, bound by shared, taken-for-granted norms determined by tradition or convention. So, confidence as a safety strategy is based not only on a conventional form of law which is to some extent outdated with recent forms of co-regulation, but also on a conventional form of legitimacy which is outdated by the transformation of the rationality of norms from given and unproblematized into the discursive rationality of ultra (or liquid) modernity.

Instead, trust has grown the glue of ultra modernity and one of the most sought-after resources by companies today. Trust is based on expectations that are based neither on control regulating the company from outside nor on shared, taken-for-granted norms regulating the company from within. Instead, trust is based on the trustee's extrapolations of information and experience that is insufficient for definite knowledge and for secure anticipations, but which establish certain expectations about the future behavior of a company. Based on these expectations, stakeholders choose whether the advantages in trusting the company – and thus making themselves vulnerable to the consequences of a company's decision-making – overshadow the possible risks. To earn trust, the company has to continuously weigh and justify decisions in ongoing discourses with the environment, and to take into consideration different stakeholders' criteria of evaluating advantages and risks in interacting with the company. So where previously, stakeholders were mainly passive, and relations rested in a well-ordered view of the world (see also ► Chap. 80, "Legitimizing Practice Forms During Transformation of a Legitimizing Business Paradigm: Changing Strategies and Reasons," Figure x), today, earning trust implies a far more active and complex environment.

Globalization adds an extra dimension to the challenges of trust society. Confidence as well as trust proves problematic when a company operates in a foreign culture. Shared norms as the basis of confidence are few. And trust is inhibited because expectations are subject to interpretation by fundamentally different societal meaning structures (Bachmann 2001).

The specific features of the trust society consequently activate the need for an organization to perform a series of three paradoxical balancing acts: first, because trust rests in a continuous test of expectations, and does so in a liquid society, the company must be seen as authentic and consistent for expectations to be stabilized, and, at the same time, as continuously changing in response to liquid norms and demands of dynamism and innovation. Second, because a stakeholder chooses to trust the organization only if her extrapolation of information about and experience with the company makes her decide that the benefits in trusting the company outweigh the risks, the company has to balance the reciprocal risks and benefits involved to create "win-win situations" (that is, to see the counterpart's benefits in interaction not as opposing one's own benefits, but as mutually preconditioned).

Third, because stakeholders' evaluation criteria of risks and benefits in trusting a company will differ considerably (for example, a patient will see the risks and benefits in trusting a pharmaceutical company differently from a politician; a scientist holds different expectations than an animal activist, and so forth), the company may have to balance the need for a stable self-presentation with the need for multiple self-presentations.

It grows a constant challenge to create and to live up to certain expectations while balancing stability and change, authenticity, and responsiveness. On the one hand, the company has to be self-contained to earn trust. On the other hand, it has to be open to different perspectives in order to continuously adjust its boundaries for legitimate decision-making. A company must continuously change in order to remain the same. On one hand, consistent images of expectations are a precondition of trust. On the other hand, society's dynamism and turbulence activate the need for a company to continuously adjust its decision-making premises in negotiations with its environment as a precondition of earning trust. At the same time, because stakeholders cannot check all decisions and operations, in order to earn trust, it grows essential to present the guiding values of decision-making premises.

Glocal Society: Between Global and Local

The final megatrend, captured by the notion of *glocal society,* presents probably the most difficult balancing act because it deals with basic, and most often tacit, assumptions. It relates to the conflicts between legitimizing notions as globalization increases the interdependence and sensitivity between regions characterized by different societal forms that were previously separated. The glocal society appears in manifold manifestations, in particular in legitimacy crises where compliance with legitimate local customs and values in one region conflicts with a company's domestic values or even with what is perceived as global values. For instance, poor labor conditions uncovered with a subsupplier in a distant country – although legitimate within a local frame of reference – may produce a legitimacy crisis in the company's home country.

Globalization intertwines with the other megatrends presented in this chapter. However, the notion of glocal society relates specifically to the way in which different types of society breed different legitimizing notions and consequently different legitimizing corporate settings (Holmström et al. 2010; Kostova and Zaheer 1999) and requires a balancing act between local considerations and the idea of a global opinion.

The megatrends and the legitimizing business paradigm unfolded in this chapter originate from norms, perceptions, and challenges related to a specific type of society with roots in Europe and dominance in what we call the West: the functionally differentiated society dominated by *rational* values. The notion of *rational* in this context does not postulate that the rational society is more reasonable, logical, or efficient than different types of society; however, relate to that fact that fundamental values and norms originate from a series of societal rationales – economy, science, politics, education, etc. Today, the values and institutions of the rational society characterize Europe and regions originally colonized by Europe, in particular the USA, Canada, Latin America, Australia, and New Zealand. This type of society has fostered ideas of pluralism, individualism, equality, freedom of expression, etc., and has led to ideals of corporate social responsibility, multiple bottom lines, sustainability, transparency, stakeholder engagement, and co-regulation.

International guidelines such as OECD's guidelines for multinational enterprises, UN's Global Compact, and the international standard for corporate responsibility, ISO 26000, are based on the ideas of the rational society. It produces conflicts and gray zones in the encounter with different types of society basically characterized by fundamentally different norms and worldviews – conflicts and gray zones left for companies to handle. For the main part of the global guidelines, standards and principles are not supported by a horizon of legal sanctions. They depend on the subtle mechanisms of co-regulation. And where conventional political institutions have had to throw in the towel, the business community is encouraged to front-line action, equipped with its strong economic arguments. A status as world citizens and global problems solvers are demanded by companies in areas which are traditionally seen as the responsibility of states. Companies are made responsible for their actions around the world to a degree which by far extends abidance by local law. Companies can no longer rely on the relatively firm ground of the law, but must operate in the swampy morass of legitimacy, in a tension field of conflicting interests and cultures with each their individual legitimizing notions and expectations. And it makes it no easier for a company to navigate when the domestic Western opinion insists on unproblematized precedence to legitimizing notions based on the values of the rational society.

There are different frames for explaining fundamental differences of legitimizing notions – not least systems of faith are an important factor (Kamali 2001; Koehn and Leung 2008; Zirkin 2007). However, based on societal forms as analytical categories, it is possible to identify consequences to the legitimizing notions with implications for the legitimate room for a company's decision-making, and for its way of legitimization (Baraldi 2006; Luhmann 1998, 2012). The conflict between different legitimizing notions can be divided into two categories.

Subtle and often neglected legitimacy conflicts are those bred by the first category of conflicts, which relates to different ways of coordinating the same type of society. As example, different forms of market economic politics in countries characterized by modern society's structures of functional differentiation are illustrative (Campbell et al. 2006). Liberal market economy, with the most prominent example being the USA, is categorized by decentered self-regulation, shareholder values, and the objective of quick profits. Coordinated market economy as in, for example, Germany is categorized by central regulation and legitimizing references to formal rules, contracts, etc. In countries such as Denmark and Holland, this type a market economy has developed into a negotiation economy categorized by flexible and polycontextual regulation in "multi stakeholder dialogues" across society's sectors and by a business community characterized by more long-term perspectives (Pedersen 2006). This diversity creates different legitimizing notions to the extent that the apparently same business ideals of stakeholder engagement, CSR, and sustainability are understood and interpreted differently – a more or less unnoticed phenomenon in everyday practice, however, a source of systematic misunderstandings.

The second category gives rise to more ultimate and visible conflicts. It relates to conflicts between fundamentally different societal forms – most often between the stratified, relational society and the functionally differentiated, rational society. For these two societal forms systematically generate a long series of conflicting values with extensive consequences to the legitimizing notions mediating the interrelation between a business company and the rest of society. Between pluralism, individualism, innovation, debate, and normative change on the one hand and on the other hand homogeneity, hierarchy, collectivism, tradition, faith, and normative stability. Between the importance of rational arguments in the West on the one hand, and on the other hand the importance of social relations in the East. The relational, stratified, status-coordinated society sees the world via strata, classes (Luhmann 2012: Chap. 4, VI). Functional rationales do not constitute society's backbone. Societal layers – ethnic and religious groups, families, etc. – trump functional rationales. Society's dominating meaning systems legitimize hierarchy, family, and group belonging, i.e., difference in relations in between people. Basic norms and values acclaim tradition, orthodoxy, and authorities. The relational society is a primary societal form in particular in Asia. It affects everything from the status, role, and responsibility of companies to labor policies, culture of negotiation, partnerships, stakeholder composition, and the validity of law.

Consequently, the legitimizing notions analyzed above as responses to challenges to social cohesion on five dimensions of modernity are not universal; they will conflict in particular with legitimizing notions in primarily relational societies. A reflective corporate practice, which implies the acknowledgement of contingency, a pluralist legitimizing environment, and a proactive attitude to political issues, will be illegitimate. Even human rights are seen fundamentally different in a rational and a relational perspective.

To navigate legitimately – and that means "glocally" – within globalization's ambiguity of societal and cultural forms and simultaneously maintain a consistent identity requires for a company that, from seeing its native country's values as universal, it must be able to see the plurality of fundamentally different values. Being "truly global" first and foremost means being local – i.e., understanding the roots of the company's worldview in order to be able to open tolerantly to different local worldviews and in order to recognize own blind spots.

It is, however, not as simple as it may sound. For it means that in order for an organization embedded in modernity's rational society to live up to domestic legitimizing ideals, it must be able to embrace conflicting legitimizing paradigms. Modernity's ideals of pluralism, inclusiveness, and tolerance ultimately amount to embracing non-pluralism, non-inclusiveness, and non-tolerance. Within companies rooted in values of modernity, this paradox still seems to feed legitimacy crises: to live up to their own legitimizing ideals of diversity, inclusiveness, pluralism, and tolerance, they have to be able to embrace different legitimizing paradigms that may advocate opposing values of collectivism, hierarchy, and tradition – a paradox that apparently has not yet been deparadoxified in the legitimizing discourses of ultra modernity.

A Reflective Paradigm

Today, the turbulence in society's legitimizing notions during the later decades of the twentieth century seems to be absorbed by society's learning processes. This does not mean that everything is in the way it used to be. The learning processes have transformed the legitimizing paradigm that mediate the interrelations between society's decision-making machines – organizations – and the rest of society. These learning processes apply to society as a whole (cf. also, e.g., Roth et al. 2018 for a broadened focus on several functional rationales instead of a political–economic gaze only); however, the focus of this handbook is the business community where a range of traversing features can be identified on the series of parallel but different megatrends.

First, the rationality of legitimacy has changed from being given to being discursive. Legitimacy is at ongoing discussion. This discursive legitimacy enables flexible and dynamic forms of coordination in ultra modernity's complex, diverse, and dynamic society – however, also makes heavy demands on a company's discursive and reflective competencies. When legitimizing notions grow problematic, from being tacit assumptions they become visible in society. Throughout the latter half of the twentieth century, the social constructions within which legitimacy rested were challenged and gradually opened up to negotiations on changes. However, this discursive legitimacy seems to be not only a transitional phenomenon in the transformation of the legitimizing business paradigm. For, where legitimacy previously rested on convention and given norms, constant negotiations in discursive processes characterized by liquid, ambiguous norms have grown the foundation of today's legitimizing notions and practices. Previously, the room for legitimate decision-making was given and legitimacy ensured when an organization abided by law and honored its functional criteria of success and relevance (i.e., profits for business companies, treating disease for hospitals, education for schools, production of knowledge for universities, etc.). Today, ongoing legitimization has grown into an existential issue. The role and responsibility of the company in society is discussed, reported, and profiled in the public sphere, in stakeholder engagement, and in pluralist fora and cross-sectoral partnerships.

Secondly, the legitimizing notions as programs for decision-making processes have changed and taken an apparent u-turn. Paradoxes systematically pop-up in the period of transformation such as "in order to consider profit we have to not consider profit"; "in order to take market considerations we have to not consider the market"; "in order to benefit our particular interest we have to disregard our particular interest"; and "in order to strengthen our autonomy we have to give up control." A paradox implies the simultaneous presence of contradictory elements and may lead to blockage of the decision-making processes in an organization. There are, however, means of “deparadoxification” (Luhmann 1993c). Accordingly, for these paradoxes to integrate into decision-making processes without blocking them, they seem to be systematically deparadoxified by legitimizing statements such as “we demonstrate financial responsibility by acknowledging social and environmental responsibility”; “we build the business by engaging in actions to benefit society”; and “we earn shareholder value by earning stakeholder trust” (Stormer 2007). What was once considered competing priorities – like economic success vs. environmental practices – is now seen more as a complete, complimentary package. In 2019, “sustainability is no longer just a trend, it’s a business imperative” (Global Fashion Agenda 2019). New legitimizing notions have turned former extra-economic themes into intra-economic themes that can more easily be digested by the decision-making processes of a business company (Table 1).

Third, a large part of what was formerly seen as private matters has been transformed into issues of public interest and is subject to public searchlight via news media and social media. What goes on in the private business sector is now seen as influencing the common good on a series of areas: From the consequences of production and products such as climate changes and lifestyle diseases to the growing influence on society’s will and way by means of societal commitment in new forms of co-regulation. With the increasing recognition that even seemingly trivial decisions by organizations can – for good or ill – affect individual well-being on a global scale, the company must be constantly prepared to legitimize its decision-making not only in the relatively unambiguous horizon of state and market, but in an ambiguity of the public perspective, mass media, and a growing range of stakeholders.

Table 1 Deparadoxification of the self-legitimizing notions of the business community

Megatrend	Formerly: reciprocal opposites	Today: mutual preconditions
Insensitive society	Profit><people, planet	Considerations of people and planet out of consideration for profit – and vice versa
Decision society	Autonomy><transparency	Transparency is a precondition of autonomy – and vice versa
Partnership society	Independent><interdependent	Independence depends on interdependence – and vice versa
Governance society	Particular interest><common interest	Considering common interest is a precondition of considering particular interests – and vice versa
Trust society	Authenticity, integrity, consistent identity><responsiveness Consistent, stable identity><change Benefits to us><benefits to stakeholders	Responsiveness is a precondition of authenticity and integrity – and vice versa Continuous change is a precondition of consistent, stable identity – and vice versa Benefits to stakeholders is a precondition of benefits to us – and vice versa (win-win)
Glocal society	Domestic values><alien values	Understanding domestic values is a precondition of understanding alien values – and vice versa

The first three features require a specific second-order self-observation by the company in relation to its environment. This type of self-observation presupposes the *fourth* feature, which can be identified as the mainstay of the new legitimizing business paradigm, as the formula for legitimacy: The ability of *reflection*, i.e., the ability of raising the company's perspective to a second-order level in order that the company sees itself as if from above in the larger societal context – instead of seeing the world from within from the narrow first-order perspective of *reflexivity* (Holmström 1997, 1998, 2007, 2008, 2018a, 2018b). (See ▶ Chap. 19, "Society's Megatrends and Business Legitimacy: Transformations of the Legitimizing Business Paradigm" for more on the specific social systemic category of reflection, and the manifestation of reflection in different forms of practice.)

Reflection on the Megatrends

Reflection (adjective: reflective) and reflexivity (adjective: reflexive) denote two fundamentally different perspectives. Full modernity was characterized by reflexivity's monocontextual, narrow, and unambiguous first-order perspective from within. Gradually, this reflexive perspective threatened social cohesion. As a countermove, ultra modernity's legitimizing ideals involve a raise of perspective to the open, polycontextual second-order level – a sociotechnological mechanism that is condensed in the notion of reflection (Luhmann 1995: Chap. 11). Reflection implies that the company sees itself in the larger context, sees itself within the socio-diversity, and sees the mutual interdependence of society's differentiated sectors and motivates the company to develop self-restrictions and balancing mechanisms in its premises and processes of decision-making. Consequently, reflection leads to decisions being made from an "enlightened self-interest," as formulated by the UN in the introduction to the principles for responsible business conduct, Global Compact (Annan 1999).

Legitimizing notions are interpreted differently by different social filters. Nevertheless, we may identify a common trait in the legitimizing notions mediating the interrelation between the business community and the rest of society today: the specific second-order level of self-reference denoted as reflection. For an organization to navigate in the complexity and diversity of contemporary society from an understanding of the delicate balancing of people, planet, and profit; of autonomy and transparency; of independence and interdependence; of market and society-at-large; of consistency and change; and of domestic and alien values requires learning processes within the organization toward raising the perspective from the self-centered, negligent first-order tunnel vision of reflexivity to the enlightened second-order perspective of reflection. Reflection allows transforming what were formerly marginalized as externalities into internalities: life and nature, potential victims of decision-making, different functional rationales, the idea of a societal horizon, the risks involved in trusting the company, and unfamiliar societal and cultural values. Externalities are still selected and reconstructed from specific social filters. Nothing else is possible, but even this inadequacy seems to allow the facilitation of flexible ways of coordination while strengthening the skeleton and structure of society, thus securing the continuation of the communicative processes constituting society – social cohesion. Reflection is not a way of escaping self-reference, but a way of handling it.

Learning processes toward the mode of reflection are theoretically probable and empirically identifiable at two fundamental, interrelated dimensions of society which both manifest in companies. First, the programs guiding the application of the individual systems' rationales in functional systems tend toward a reflective self-observation. This second-order mode of programming replaces the reflexive application prevailing during the construction period of the functionally differentiated society. Second, in organization systems which – when the level of observation is raised to reflection – on the one hand find each their specific identity and act independently, and on the other hand learn to understand themselves in relation to their environment and in an interplay with different societal sectors and perspectives and consequently integrate restrictions and mechanism of balancing different interest in their decision-making processes. In this way, reflection facilitates the company's self-understanding in relation to society-at-large. It enables flexible forms of coordination, which embrace society's growing complexity, dynamics, and diversity, and at the same time protect society's basic structures – i.e., the patterns of expectation that make communicative connection and interaction within society probable and are the fundamental precondition of social cohesion.

The function of reflection can be identified on each of the six megatrends. On the megatrend of insensible society, a reflective perspective is required in order for society to observe its effect on its environment – life and nature – as if from outside society. As explained in the section on the insensible society, this is not possible. However, a reflective perspective facilitates balancing the considerations of nature, life with profits (or knowledge, news, political power, or other of society's criteria of relevance and success) as mutual preconditions.

The decision society illustrates how a reflective perspective is required in order to make the premises and processes of decision-making sensitive to those potentially influenced by the decision in the larger perspective – and, at the same time, to acknowledge the responsibility of being in the decision-maker's position. It requires a reflective perspective to see risky decisions as unavoidable and to see the conflict between decision-maker and the potential victim of the decision-making as a consequence of society's construction. The conflict cannot be resolved – but you can learn to live with it.

In the partnership society, reflection facilitates considerations on the delicate balancing between individual integrity and mutual engagement. On the one hand, the disintegration is maintained as the foundation of the functionally differentiated society. On the other hand, as a precondition of their independence the differentiated positions endeavor to consider their reciprocal interdependence. Society manages to cohere in all its disintegration.

In the governance society, reflection facilitates the balancing of particular interests and the idea of a common interest, of political and economic rationales (or, for different types of organizations than the private business enterprise, with scientific, medical, journalistic, etc. rationales). The company sees itself in the socio-diversity as a precondition of being able to consider the mutual interconnectedness in society, and still understands how to preserve its dynamic as society's economic base – without neither growing into a semi-political institution nor straining democracy with economic power.

The paradoxical balancing of the trust society requires a reflective position for the company to counterbalance responsiveness and integrity as two sides of the same coin – i.e., to understand and respect its stakeholders' perception of the risks involved in trusting the company on the one hand, and on the other to understand and respect its own function and role in society.

The notion of glocal society contributes to explaining the legitimizing notions of a meta-reflective position. Meta refers to the level of societal form and fundamental cultural roots. Where a reflexive perspective implies a blind ethnocentric position, meta-reflection implies that the company acknowledges its worldview as basically rooted in a specific cultural and societal context instead of taking it for granted. From the company seeing its own domestic values as given and universal, a *meta-reflective* perspective uncovers a pluralist diversity of fundamentally different values (Holmström et al. 2010). It helps the company to continuously clarify its identity instead of taking it blindly for granted. The company sees that conflicts are inevitable, however, endeavors to elucidate their background instead of resorting to blind confrontation.

It applies to all megatrends that where the company in the old reflexive paradigm saw itself as the hub of the universe, the reflective perspective challenges to a more nuanced view of the world and facilitates a (world) society where the dominating coordinating mechanism is neither an attempt of monocentered other-regulation (Fig. 1 left) nor polycentered self-regulation (mid), but polycontextual co-regulation where organizations as well as individuals understand themselves as one among a multitude of different and autonomous but mutually interconnected members of society (right).

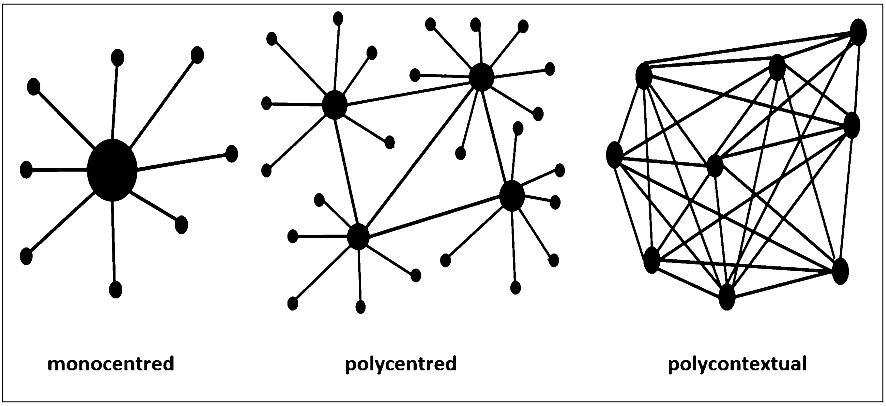

Fig. 1 Changing perspectives on society's structure implying monocentered other-regulation, polycentered self-regulation, and polycontextual co-regulation, respectively

Hyperirritation and Indifference

The reflective business paradigm is embedded in a different self-description of society than was the former, reflexive paradigm, which was attacked as illegitimate in the latter half of the twentieth century. Even though an analytical reconstruction shows how the transformation from a first-order reflexive to a second-order reflective perspective has contributed to adjust the functionally differentiated society to remain the same, i.e., to preserve the basic structures of society intact, there are distinctive differences between society then and society today and consequently between the challenges to legitimizing notions then and now.

In the overall societal perspective, the transformation of the legitimizing business paradigm is embedded in an adjustment of modern society; from a society that was based on a consensus-oriented self-description with notions of central regulation and common norms toward a society that describes itself as polycontextual. Previously, society was characterized by conflict on consensus. Today, it seems characterized by consensus on conflict. Conflict as a basic condition is acknowledged. Spin as the battle of defining reality has grown part of the societal "conversation" in acknowledgment of the fact that there is not one truth, not one perspective, no conclusive argument – but that everything depends on the perspective. The backcloth is described with concepts such as hypercomplexity, hyperirritation, diversity, flux, dynamism, co-regulation, and globalization – characteristics which define quite different challenges and consequently different legitimizing strategies than only a few decades ago.

The challenges are constituted by a world where everyone and no one steers; where norms are discursive and diverse; where the skeptical victim's perspective constantly lurks and threatens to ignite global crises of legitimacy; where trust is an existential but capricious resource; where organizations are reciprocally interdependent of cooperation and partnerships with different rationales, and must understand how to navigate between fundamentally different societal values. A company can no longer make do with legitimization based on well-defined rules, conventional law, and stable, common norm sets, but must base its legitimacy on continuous interplays with supplementary or even conflicting perspectives and positions – with no possibility of consensus or conclusive argument, with no unambiguous environment. Legitimacy is no longer given as in the former first-order reflexive paradigm. Ultra modernity is characterized by a discursive legitimacy. The legitimate room for decision-making is continuously debated and requires reflective and communicative forms of practice. Society's formal form of centralized regulation is complemented with a specific form of co-regulation where everyone contributes to regulating everyone in complex (de)legitimizing interplays. Where companies previously could plead the right of the private sphere to decide in peace and quiet without interference from outside, today they must be continuously prepared for mass media's random trust checks, the public searchlight, and the global billions of opinion declared at social media.

New Turbulence Lurking?

Following the theoretical focus on the dynamics and nature of social processes, transformations of legitimizing notions are understood as part of society's evolutionary processes of modernization. In this perspective, learning processes have no other aim but to continue themselves. With the fundamental theoretical platform upon which the research presented in this chapter is based, evolution theory is no theory of progress (Luhmann 2012: Chap. 3, I). Evolutionary learning processes do not necessarily lead to a better society, in the sense that it creates better conditions for the life of humans and the well-being of nature, but to a society that creates better conditions for itself, i.e., can embrace more social complexity and diversity.

The function of the new legitimizing notions seems to be to handle society's increasing complexity and diversity in a flexible and inclusive way. However, at the same time, the complexity of the new legitimizing notions creates new complexity which demands balancing and reflection in relation to an increasing number of issues: How develop a company's sensitivity to the rest of society – without the company drowning in hyperirritation and the diffuse complexity of the environment? How define the legitimate boundaries of a company's responsibility – when these boundaries continue to change over time and over place? How determine premises for the company's legitimate decision-making – when these premises are never given, but are developed in a continuous doubling of decision-making processes? How embrace a political rationale and consider public interest – without taking on illegitimate political power against democracy's fundamental principles? How balance financial considerations on the one hand and social and environmental considerations on the other – not as opposites, but as mutually interdependent? How ensure the company's legitimacy in the cultural and societal diversity of globalization – in between often contradictory interpretations of the company's conduct? And how maintain a trustworthy identity when the company's local response is monitored in an increasing global transparency?

In the immediate analysis, reflection as the mainstay of the new legitimizing business paradigm may seem a panacea. However, reflection is risky because the company will continuously question itself, its raison d'être, and decision-making premises. It is resource-demanding because it activates a constant doubling of decision-making processes: decision-making on decision-making premises that are no longer taken for granted, or even a multiplication of decision-making processes through the constant mirroring in different rationales. It is paradoxical because it implies that a social filter is applied to observe itself: a company must use its own decision-making premises to observe its decision-making premises. It constantly triggers attempts of deparadoxification.

The backcloth of a society characterized by the second-order self-observation of reflection is the acknowledgment of contingency and a hyperirritated state of society which apparently cannot be suspended by more knowledge, or more information. Reflection copes with contingency, however, also increases the perception of flux, and may lead to hyperirritation, feelings of powerlessness and indifference, paralyzation of decision-making processes, or distorted resonance, such as for instance extensive resources spent on social reporting and alertness to social media. This hypercomplexity can be confusing and chaotic and may lead to companies giving up when faced with the complexity produced by new legitimizing notions, losing self-confidence in the close cooperation with conflicting rationales, following public opinion and those most visible and vociferous, drowning in the cacophony of the social media, or totally surrendering to routine, symbolism, and symptom management without any recollection of the context that originally made the legitimizing notion and legitimizing practice forms make sense. So, after this adjustment of modernity, we may expect a gradual return to reflexivity, although with new perceptions of legitimacy based on ideals of reflection stabilized – upon which new evolutions and transformations of legitimizing business paradigms can take their start.

Introduction

Formal organizations in modern societies are based on contract relations that facilitate to rationalize organizational behavior according to the central norm of a functional system (economy, politics, law, religion, welfare, family, etc.). Beyond such functional regulations, business legitimacy reflects the social embeddedness of organizations and codifies the cultural norms of the organizational members' internal and external behavior. Corruption, in common understanding, is a deviant behavior that breaks the fundamental norm of modern societies, that is, undermines the strict separation between the private and the public sphere. Management theory in general treats business legitimacy as means to regulate the relation between organizations and their social environment. On the basis of two empirical case studies two concepts of business legitimacy are distinguished: the classical formal business legitimacy as reactive and the substantial business legitimacy as proactive policy. It will be demonstrated that the understanding of business legitimacy correlates with the idea of management as steering respectively as reflexive management of regulation of self-regulation. Finally, the options in management and business legitimacy are discussed in the context of the paradigmatic shift from domination to governance in the transition from the Fordist to the Flexible Production model (for an overview, see: Thompson n.d.).

Steering or Governance?

Since Plato the helmsman figures as metaphor for the political leader. In the 1960s and 1970s of the last century, cybernetics became the general model of political and social technocracy, but abruptly lost its attraction (and financial support). In the dawn of the nation-state the belief in steering people, organizations, and the society is paling. People do not feel dominated by a central power but depending on diverse forces. In philosophy and social science the concept of power shifts from a substantial (power as substance or force accumulable by an individual) to a relational (power as a form of interaction) definition, substitute hierarchical domination by heterarchical governance. Linguistically the Greek κυβερνάω was molded to the Latin *gubernare* escorted by the semantic turn from steering to administer, finally from domination to governance. Actually, in governance theory, management became a key term and a bridge concept between economics and politics, for example, in New Public Management. For a long time, management was understood as leadership, that is, steering on the basis of an exclusive expertise, what makes sense only in a hierarchical organization operating on the basis of command and control in an economy of scale and scope with a pure quantitative understanding of growth. In the prime age of modernization theory, management was a form of dominance. Nowadays, in the time of demand economy and quality production, flat organizations need leaders with high social competence and figuring as primus inter pares of a team. Knowledge is not anymore monopolized in the hands of an elite but shared as medium to coach processes of self-regulation and organizational learning. Monitoring then operates as auditing of self-regulating high-skilled team workers. The core of teamwork is a project, and in autonomous projects everybody is manager of his own. Management appears as the new utopia of self-realization, now called self-management – even in body building as well as in the therapy for mental training and the construction of intimate relationships between couples or family members.

In short, instead of imperial top-down steering in a hierarchical organization with a paternalistic bureaucratic structure, we observe a new management of contingencies and interdependencies in flat and open network organizations with temporary autonomous project groups, split authority, overlapping competences (cross-sectional tasks), influence of outsourced functionaries, and consultants. Network organizations operate in an environment with permeable and floating borders between social systems like politics, economics, and the global civil society that established itself as a new moral industry of CSOs/NGOs. In consequence, the core of modernity, the functional differentiation of society, is no longer functional for the flexible production model. The relation between functional systems or organizations and their environment becomes critical and subject of negotiations. Finally, management gets reflexive and converts into a technology of second order or observation. Reflexive management is aware of the limits of command as well as the risks of self-organization: bureaucratic overregulation produces stagnation, unregulated markets or networks as forms of spontaneous order tend to chaos, corruption, and anomia. To overcome the organizational dilemma, reflexive management initiates processes of regulation of self-regulation and, as a new form of organizational practice, changes the mode of business legitimacy. Monitoring by indicators related to a matter is supplemented by the evaluation of social behavior. Business is no longer justified exclusively by economic benchmarks like effectivity, efficiency, output, success, and profitability but by values like transparency, accountability, responsibility, and sustainability as key concepts of new governance. Traditionally following instrumental rationality, business legitimacy switches over to social engineering and morality (Kellner and Heuberger 1992). A good example for this re-setting is compliance that as a means of business legitimacy attracted attention especially in the recent anticorruption policies.

In general, compliance is the implementation and performance of best practice-rules in an organization. The nature of compliance indeed varies in accordance to the understanding of legitimacy. If legitimacy is defined as appropriateness to formal rules, then compliance is hardly more than lip service and being in conformity with official articles of the corporation without any impact on the company's performance. Actually, we observe a shift from compliance with legal norms on a contractual basis to tackling social problems. In teamwork one is not only responsible for something in relation to a job description, but also accountable to others, one's teammates in the project group, the principal, and the corporation as social unit in total. The figure of the extrinsic guided organizational man with restricted responsibility to role in a formal structure is substituted by the concept of the intrinsic motivated self-entrepreneur with full accountability to civil society. In contrast to the cognitively and ethically underequipped organizational man, the post-modern self-entrepreneur operates on the post-conventional level six or seven of Lawrence Kohlberg's model of moral development (Kohlberg 1973). This shows that effective and sustainable compliance is ridden with high-level prerequisites. If it is realistic to presume such a development of moral competences as, for example, the sociological theory of individualization (Beck 1992) and post-materialistic culture (Inglehart 1977) suggest, will be examined theoretically referring to the concept of economic culture and empirically in two case studies in the following paragraphs.

Economic Culture and Business Legitimacy

Economic culture is defined by Peter L. Berger as "the sociocultural context within which economic activities and economic institutions exist" (Berger 1991: XX), in other words, is the general frame of reference for business legitimacy. In general, legitimation is justification of someone's activity, and in contrast to planning, a process of secondary objectivation of meaning. As secondary objectivation legitimation is not simply rationalization in the sense of apology (Marx) or camouflage (Freud), but constitution of meaning, and is playing a key role in the process of the social construction of reality. As Berger and Luckmann explain, legitimation has – especially in the modern world – the fundamental function to integrate the disparate semantics of the diverse functional systems and their specific institutional orders (Berger and Luckmann 1966). Referring to Durkheim, Jürgen Habermas describes the phenomenon as verbalization of the sacred, that is, interpretation as translation of (ritual) activity into the propositional structure (argumentation) of speech-acts (Habermas 1987). Speech-acts (e.g., religious myths) are not the wrong or false repetition of the original meaning of a primordial act (ritual), but the attribution of meaning per se. For Alfred Schutz (Schutz and Luckmann 1973) human activity (German: Handeln) as outcome of planning and designing one's life-course is meaningful, but must not coincide with the motive or even rational intention of an actor. Phenomenologically, acting is the inner experience (German: "Er-Leben") of one's bodily behavior that is exposed to the cause-and-effect relationship of the natural and social world. Hence, the act (Deutsch: Handlung) as the outcome of human action is a fact in social reality and exists independent from its genitor. The act as fact in the external world might become an object of reflexion and legitimation as secondary objectivation, that is, differed attribution of meaning by any human being. Action is primarily objectivation, that is, generating a social fact and making sense. But not before legitimation as interpretation and secondary objectivation of the act is executed, the act and the outcome of action have communicative meaning and social relevance. By legitimation the product of human activity and its creator are given their place in the world order. In the concept of legitimacy as secondary objectivation of meaning in the process of the social construction of the reality of the firm as social unit (see next paragraph), compliance emerge as active involvement and personal engagement of all employees. In other words, compliance implies democratic sharing of an organizational culture and self-commitment to a code of conduct representing a common interest.

Business legitimacy codifies what is seen as appropriate economic behavior in relation to the given economic culture of the time. In this perspective the difference between entrepreneurial and managerial capitalism is pivotal. Managers belong to the academic elite as the carrier group of a democratic culture even in organizations in the so-called knowledge society (Drucker 1969; Bell 1976) that substituted the liberal doctrine of the entrepreneurial capitalism in the "long" nineteenth century. Historically, business democracy was a core concept of the Left, paradigmatically realized by the Social Democrats in Scandinavia, and copied by the German Social Democrat government under chancellor Willy Brandt. Peter L. Berger warned that the decline of the self-related and authoritarian habit of the entrepreneurs weakens the competitiveness of the Western capitalism in contrast to the Asian and South American capitalism that supports strong leadership (Berger 1991). In the following two case studies, this hypothesis will be tested.

First Case Study: New Public Management and Public Private Partnership as Sources of Corruption

The corruption case that is subject of the following analysis of the public prosecutor's files of the inquiry caused a stir in German public. Background behind the case was the public invitation to tender for the construction of a waste incineration plant. In order to carry out the project according to the Public Private Partnership model a so-called waste utilization association (Abfallverwertungsgesellschaft – AVG) was established of which 50.1% belonged to the City of Cologne, 24.8% to the City Utilities Company of Cologne, and 25.1% to a private shareholder. In order to achieve high quality for a reasonable price in the interest of the city and taxpayers, the managing director of the AVG – an administrative specialist who had resigned from his civil service status – developed an elaborate concept of tendering and carrying out the project. He divided the construction plans into several lots with separate catalogues of services and prices, so that in each case the technologically optimum and least expensive solution could be selected. The provider with the largest construction sum was supposed to be appointed as prime contractor for all construction services. After the drawing the managing director in his function as a public contracting body thus still has the possibility of influencing the assignments by means of a combination of selections by lot according to price and service aspects. From an entrepreneurial standpoint as well, the system offered him substantial possibilities for intervention. There was a large political interest in the matter for reasons of "regional business development," "location promotion," and "securing jobs in the region," and in particular for the sake of giving a plant manufacturer from the region a chance during a critical period for the branch. The managing director of the AVG was personally interested in finding a partner "with the right chemistry," because complications were expected in view of the magnitude of the project, the success of which could only be assured by means of a more or less trustful relationship between the contracting body and the contractor. Moreover, negotiations with a firm that wanted to secure its entry into a new and promising business area and thus long-term survival by taking over the "reference and prestige object" appeared to be easier than with firms already established in this area. AVG operated much more than is usual in the public sector as a project developer with entrepreneurial intentions and not exclusively as the contracting entity for the construction project. Managerialism at the interface between administration and the private sector evoked a conflict between the different rationales for action, which the managing director of AVG had to solve. The public tender procedure, which is mandatory for projects of this size in order to protect the public interest, stood in conflict with the entrepreneurial intentions and management objectives. The corrupt conduct of the previously "spotless" administrative specialist must thus be viewed within the context of the risks, which result for the executive manager from the contradictory logics of action in a Public Private Partnership.

In subjective terms, his criminal conduct was also a consequence of privatization. The top public official's switch from public administration to the management of a privately run municipal firm with private shareholding automatically led also to the privatization of services of public interest. The lifelong security of a public official was traded for the employment in the private sector, which is by principle uncertain, as future events cannot be predicted. These risks of private pension schemes, which were initially subjectively hidden by the money fetish associated with the high salaries, subsequently also became a gateway for the susceptibility to criminal acts. The private shareholder of AVG functioned as an "intervening variable." He was an entrepreneur active in the region, who – according to the President of the Administrative District – was striving to build a "little monopoly" in the regional waste management sector, which was seconded by a Social Democrat from North-Rhine-Westphalia, who was well known for his "mediation services." They approached the managing director with the bribe idea. Bribes amounting to 3% of the construction sum were purportedly standard practice in the branch and people had to "think about their future." Above all, the latter point caught on with the managing director, who suddenly seemed to realize that his future would not be entirely certain after the end of the project. Here the co-shareholder from the private sector pinpointed the soft point at which the previously "spotless" state official could be seduced. In the end the bribes amounted to the substantial sum of more than 24 million Deutsch Marks.

However, what is more important in structural terms is the fact that the managing director did not partake in corruption to enrich himself, but also to implement and optimize the management system he had designed. This ultimately led to the blending of economic and political corruption. The managing director not only secured substantial material advantages but also a significant degree of power. By manipulating the invitation to tender he enabled the regional plant constructor to become the main contractor and thus his willing accomplice. Not only did he coerce the main contractor to minimize the subcontractors' charges in order to secure and increase his own profit, but also for the sake of coming up with the bribes through fake invoices, by which the participants to the complot were to be rewarded. On the one hand, the managing director certainly had his fun with the elaborate construction of the project sequence (which only he really understood) and the resulting power. On the other hand, he created at the same time a set of lies with his construction plan, with which he was able to legitimate and justify his own conduct to himself.

The managing director may have been introduced to the practices of the construction branch by a private businessman (who took charge of transferring the bribes to Switzerland), but he came up with the management system himself, which cleverly used briberies as a regulatory instrument. In the eyes of the managing director it must have been a stroke of genius that he was not only able to reconcile the state official's commitment to the common good with the entrepreneurial logic of private economic conduct as well as his private interests, but at the same time achieve seemingly optimum results. The delicate building deal then collapsed when a politically responsible party indicted himself and the managing director was exposed as a small relay man in the large network of the notorious Cologne clique. The illustrated case of corruption is not only the best example of a misguided almost ingenious person, but also an expression of a general social trend, the neoliberal revolution, here in the concrete manifestation of New Public Managements in public administration and a structural problem inherent to it. However, the special feature of this case was how the managing director of AVG used corruption as an instrument of management, and in concrete terms as a means of cost control and quality assurance.

Second Case Study: Reflexive Management and Non-directive Business Legitimacy

A best practice example of non-directive business legitimacy and reflexive management is the case of a midsize high-tech company in the Rhine-Main area near Frankfort. The company was established as a software office in the mid-1970s when in consequence of the invention of micro chips the IT revolution in industrial process engineering started. The entrepreneur, an electronic engineer, and his team developed made-of-order solutions for optimizing process technologies in different industrial branches by microprocessor control systems. The company's success was not only a result of high expertise but also of the innovative organizational idea to combine the software office with an IT hardware production plant that was bought out by the entrepreneur after some time. By proximity to the customers and a holistic project management – the entrepreneur called them "comprehensive innovations" – comparative advantages and synergies could have been achieved in the form of matched hard- and software-solution as well as of time and costs savings. Recently the company has 365 employees of which a hundred are software developers, all together making a turnover about 60 Billion Euros. The company has been transformed in a stock corporation, led by the former entrepreneur as CEO, who as majority stockholder has still the decision-making power and exerts the dominant influence on the corporate culture.

The nature as innovative high-tech firm triggered the emergence of an advanced corporate governance structure. Engineering in autonomous project teams of high-qualified experts is incompatible with a command and control structure. Furthermore, the CEO is no longer involved in the operational work for many years. Optimal for breeding innovative high-tech solutions is a corporate culture based on self-commitment and trust. For the CEO, the fundamental principle of leadership is responsibility for the workforce and the customers what means outstanding performance of the company. The firm has a common good for the workforce and its customers, not self-interest and profit has priority for him as a leader. "In my Christmas sermon I preach every year: Folks, on top of the priority-list is the costumer, because he pays for all of us. On the second rank follows the well being of the employees, because you do the work. (. . .) And then, in the third instance, if at all, we care about the shareholders, who are demanding for profit. (. . .) Since thirty years I sermonise, 'we are not served'. (. . .) If I would like to present you our products, I would not say 'Mr Schiller, please bring me', but (to you), 'a moment please, I will go to take and bring them by my own.' (On the contrary) Mr Kessler is offering coffee, because it is part of his job. It's his duty. (. . .) A company's main objective is the creation of steady employment for the workforce and constant returns on the shareholders' assets. But this is possible only by achieving customer satisfaction, and you can get customer satisfaction only by satisfaction of the workforce. And exactly the value creation in our company, here a lot operates in the shadow. (. . .) We are not a screw plant, where you can count at the end of the day, what has been done."

The spirit of his business legitimacy is getting to the point, when he explains the difference between sponsoring and donation. For him sponsoring is a form of advertisement generating added value and, therefore, is in the firm's interest, because its brand name is brought to public. In the contrary, a philanthropic donation for the CEO has nothing to do with the economic strategy of the firm, but is simply a private affair, and if dishonestly done in the name of the company simply corruption. Making a donation is the privilege of a patron (in German "Mäzen"), who disposes of his private property, while a company leader is a trustee of other people's assets (stakeholders or shareholders). A rich patron also can accept the invitation for dinner by a bank that wants him as customer, but not a trustee. The same is true for an employee, for example, in the purchasing department, who is in contact with extern actors and exposed to a high risk for corruption, that is, the misuse of an office for private gain. The CEO defines procurement as martial art. The purchaser has to fight for the best price, what he is unable to do, if he is too familiar with the supplier or trader. Owner or employee, both have always to be aware of the difference between his role as private person and incumbent. This attitude may be considered as not at all atypical for the business legitimacy of midsize companies in Germany. Not surprisingly, the CEO is criticizing the corporate culture in big companies where leadership is alienated from the workshop and the workforce. In midsize companies, he says, the areas of responsibilities are built around the human capital. In consequence, midsize companies have patchwork organizations. In big firms they look for people who match with the organogram, hence, you have a chessboard structure with a helicopter on the top. Such a helicopter-like top manager is able to operate only, because he finds his landing place on the peak of a standardized organizational structure far away from the peculiarities of the workshop. He manages a virtual firm, making decisions on the basis of abstract parameter representing the performance of the division managers, who are controlling the operational work in their area of responsibility. In a midsize company such a helicopter manager would be absolutely isolated and forced to strike new roots in the workshop and the workforce.

The CEO realized that the core problem of organizing and managing the company is to provide for reciprocal respect between the teammates and for trust in the other's work even if one cannot understand, what the other is really doing. Here the CEO, too, found a brilliant solution, that is an ingenious example for reflexive management and non-directive business legitimacy. Everywhere in the company's building modern art is presented – not as decoration as it might look like at first glance than as an important factor of corporate culture. The CEO's intention was not to intimidate his workforce by confronting them with requisites of representative culture and superior formation. In the contrary, identifying himself with his employees, he upturned the intellectuals' (in German "Bildungsbürger") scornful view on the barbarian consumers of the entertainment culture, and proclaimed modesty: "As illiterate people in the field of arts, we have to be tolerant." He is convinced, that every day, when an employee is coming to work and is confronted with modern art that he does not understand and, may be, does not like, nevertheless learned to respect it as a masterpiece. This way, the CEO believes, the employees get aware that he has to respect and, finally, appreciate the work of his colleagues although he has no understanding of it. "After having had an intensive viewing of four, five, six paintings of this artist, I believe, when I guide them (his employees) through the aisle and ask them, 'tell me, whose artist's paintings are coming . . . then you have already discover a pattern. (. . .) If you start tolerantly studying the paintings, the fulminating moment happens that you accept the artist eye to eye and have the experience of a serious event. That does not mean that all in the firm became art lovers. But they have realised that we all respect and tolerate one another. It has a positive impact." The CEO emphasizes that tolerance is the precondition for a devote examination of the paintings and the miracle of the discovery of patterns. The perception of art helps to overcome ignorance and arrogance, finally initiates a conversion to an open-minded fellow.

In this context, the CEO's voluntary engagement as president of the regional chamber of commerce with more than 32,000 duty members is significant. His motive to be engaged in civil society work was not so much to fight for his interest as economic leader or to gain access to networks of "useful acquaintances" and new customers. Pushed by his entrepreneurial demon, he was looking for new challenges to be confronted with and to understand so far unknown social realities like politics: He characterizes his activity as "studium generale in real-time." Meanwhile, most of his duties from the engagement is done by routine, in short time (half a day) and without burden, so that he can enjoy the extraordinary moments of exciting experiences in the field of local and regional affairs. Being invited to exclusive events as guest or speaker he gains social acknowledgment by people beyond business-affairs.

Comparison of the Case Studies and General Conclusions

The case studies present the narration to excellent and moral integer persons, one as success-story of a midsize company's CEO who gains high reputation in society, the other as tragedy of a general manager of a Private Public Partnership who gets corrupt and, in consequence, failed in his business and in his total life. We can say, the one found his way, while the other lost it. The question arises, if the stories tell only individual destiny or allow understanding a historical trend.

The analysis demonstrated that the former civil servant elaborated a technocratic power play to make his proof as general manager of the Private Public Partnership under market conditions. He evinced charismatic leadership like a Svengali of a virtual system combining the apparently incommensurable: profit maximizing and fruition of a common good, utilitarism and corporatism. But in his new job, the common good by and by faded to an abstract idea beyond his rampant market and shareholder orientation. Utilitarian motives like monopolizing knowledge of domination, profit maximizing and manipulating people, began to dominate his behavior as general director, finally provoking self-seeking and manipulative behavior of the antagonists. His long-lasting bureaucratic habit as former civil servant ("sire ira et studio") obstructed the agility and softness a manager of a company in a free market needs. He underestimated the uncertainties and risks of the business, of the networks, and of a private life without lifelong alimentation by the state; hence, he got vulnerable, and at last captious for corruption. In the end, he was caught in the strings of his own puppet show that more and more resembles a spectacle of "wild capitalism."

A quite different impression conveys the second case of the midsize company's CEO, an electronic engineer, former entrepreneur and developer of a software house. Starting his career in the workshop as engineering consultant, he learned his business from scratch and constantly was in close contact with the customers and his own workforce. He combines excellent technical expertise with high social competences, finally generates forms of a reflexive management. In his relation to customers, owners, and employees, he practices a corporatist “regulated capitalism,” not primarily driven by profit maximizing. For him, the company’s main objective is creation of steady employment for the workforce and constant returns on the shareholders’ assets. In his classical stakeholder philosophy, both objectives are not seen as contradicting or conflicting forces but as complements; and, as CEO, he has to balance the different stakeholders’ interests. In his role as trustee the CEO represents the company as a common interest and figures as instance of regulation of the different stakeholders’ self-regulation (financial, technological, managerial) by implementing an esprit de corps between his teammates and all other stakeholders. Nevertheless, regulated capitalism is capitalism. The fundamental market principle of competition is still the central motive but rationalized, objectified, and tamed. The CEO made it very clear when he defines procurement as martial art. The purchaser has to fight for the best price, what he is unable to do, if he gets too familiar with the supplier or trader. What looks like pure utilitarism in fact is a categorical imperative of an intrinsic economic morality that obligate the purchaser to act in conformity to the company’s interest as a common good.

In the case of the general manager of the Private Public Partnership, business legitimacy functions as ideological justification and rationalization in the Freudian meaning, as camouflage of unprofessional and corrupt behavior. In the case of the midsize company’s CEO, business legitimacy was a consistent worldview and professional habit functioning as the moral basis of the successful performance of the firm. In this concept corruption makes no sense. In the beginning of his carrier the CEO was taken to task. Fearing for the next job, he bribed the representative of his customer. He soon realized that to schmear was not only unnecessary but caused the increasing risk to loose the trust and any business relationship to the customer at all and, finally, complicated the relation to the customer’s representative who for his own self-protection started to tease him by escalating a scrupulous order control. Corruption, he learned, destroys the prestige as a reliable partner of high expertise and, in the end, hollows his moral integrity as basis of autonomous decision-making and agency as it was the case with the general manager of the Private Public Partnership.

If we distinguish moral as a real actor’s habit in everyday life and ethics as deliberation and justification of idle norms and values, then business ethics and business legitimacy “is the theoretical and practical work to develop a well justified morality for the function of business corporations in society” (Rendtorff 2009: 14). In consequence, we have to differentiate between formal and substantial business legitimacy and compliance. Usually management theory operates with a concept of formal business legitimacy seen as “a generalized perception or assumption that the actions of an entity are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs, and definitions” (Suchman 1995: 574), or as the process “by which an organization seeks approval (or avoidance of sanction) from groups in society” (Kaplan and Ruland 1991: 370). But “this will not happen as long as” the organization, as Michael Porter pleads, “sees its social agenda as separate from its core business agenda” (Porter 2010). Formal business legitimacy is designed as the reactive process of disclosure and defending or coping strategy after a threat of the company's image provoked by an incident or misconduct like the Exxon Valdez oil spill and the Bhopal Disaster (Deegan et al. 2002; Warren 2003) respectively the corruption scandal in connection with the construction of the waste incineration plant in Cologne that was brought to court. On the contrary, substantial business legitimacy is more than a charter of extrinsic norms; it is a proactive process of the company's performance based on the value-oriented habit and intrinsic conviction of all stakeholders. In short, substantial business legitimacy and effective compliance is possible only in a corporatist organization of capitalism with strong stakeholder orientation. Peter L. Berger was right if he warned against the loss of entrepreneurial culture, but he failed when he identified the entrepreneurial habit with the authoritarian model of bourgeois dominance in the nineteenth century. Actually we realize the emergence of a generalized and – insofar – democratized entrepreneurial economic culture in the new industry and other innovative high-tech-branches of economy all over the world.

Stakeholder Value Creation: Legitimating Business Sustainability 21

Riikka Tapaninaho and Johanna Kujala

Contents

Abstract

The purpose of this chapter is to examine how business sustainability is considered and legitimated in stakeholder value creation studies. Based on a review of stakeholder value creation literature, a stakeholder value creation typology is presented. The typology consists of four categories, which are (1) focal firm orientation with economic value perspective, (2) stakeholder orientation with economic value perspective, (3) focal firm orientation with multiple value perspective, and (4) stakeholder orientation with multiple value perspective. Each category tells a somewhat different story of what the purpose of business is, who are the important stakeholders, what role does sustainability play in business, and how business sustainability is legitimated. A closer analysis reveals that the category of stakeholder orientation with a multiple value perspective shows the most potential to build the legitimacy of business sustainability on the

profound meaning of sustainability with economic, social, and environmental dimensions. In this category, business sustainability is legitimized in terms of cooperative stakeholder relationships, continual negotiations, and collective efforts, where versatile value is created for various stakeholders, including values related to sustainability. The recommendations for future research draw attention to versatile and broad understanding of value, stakeholders, and value creation and dynamic, systemic, and multilevel stakeholder relationships and collaboration as subjects to understand the legitimation of business sustainability.

Keywords

Management literature

Introduction

The ways of doing business are under increased societal scrutiny, and in order to legitimate business sustainability, firms should meet the social, environmental, and economic expectations of various stakeholders. Often the mainstream management literature, however, falls short in acknowledging the numerous stakeholder responsibilities of business. Especially, as the importance of creating versatile value beyond economic measures has become more and more important in legitimating business sustainability. As sustainability is a complex concept to incorporate into business context, management theorists seem to lack a systematic examination of the premises of business sustainability (Gallo and Christensen 2011; Starik and Kanashiro 2013).

Stakeholder theory has been suggested as a management theory of this century as it serves well in understanding and redefining the role of business, value creation, and sustainability (Freeman 2010; Hörisch et al. 2014). However, research on stakeholder value creation is still rather fragmented, and few scholars have attempted to advance a general framework for combining stakeholder theory, sustainability management, and business legitimacy. Stakeholder approach has also been criticized for not addressing true sustainability challenges, as the basis for the stakeholder approach is mainly anthropocentric and emphasizes the focal firm view (e.g., Banerjee 2000; Clifton and Amran 2011). To promote sustainability in mainstream management literature, it is essential to increase our understanding of how sustainability and stakeholder value creation are connected and how business sustainability is legitimated in stakeholder literature (Hörisch et al. 2014).

This chapter argues that recognizing stakeholder responsibilities and understanding stakeholder value creation are an important part of legitimating business sustainability. The chapter builds on an increasing amount of literature on how organizations are applying the ideas of stakeholder value creation. The purpose of this chapter is to provide a structure for current work on stakeholder value creation, to examine how business sustainability is considered and legitimated within stakeholder research, and to identify ideas for future research. By examining the linkage between stakeholder value creation, sustainability, and business legitimacy, this chapter advances a general framework on stakeholder theory and sustainability management.

The rest of the chapter is organized as follows. First, the concepts of sustainability and legitimacy as basic concepts for discussing business legitimacy will be introduced. In the next section, stakeholder value creation research is structured according to four key categories. Then the chapter discusses how business sustainability is legitimated in each of these four categories. The chapter is concluded by discussing topics for further research within the fields of stakeholder value creation and business sustainability.

The Concepts of Sustainability and Legitimacy

Sustainability in its most profound meaning refers to meeting "the needs of the present without compromising the ability of future generations to meet their own needs" and consists of environmental, economic, and social dimensions (United Nations World Commission on Environment and Development 1987). Business sustainability should consider and meet the requirements of these three dimensions, too (Bansal 2005). In a business context, however, sustainability often does not cover all dimensions and usually concerns the "economic and/or ecological and/or social aspects of the relationship between business and society" (Gallo and Christensen 2011: 316). This casts a doubt on how well business organizations consider sustainability after all.

The use of the sustainability concept varies to a great extent both in breadth and depth in stakeholder literature, and there is a difference between the explicit and implicit use of sustainability. Explicit sustainability refers to studies that mention sustainability or sustainable development explicitly, whether as the main focus or in the form of random allusions or case examples (e.g., Pinkse and Kolk 2012; Sharma and Henriques 2005; Stubbs and Cocklin 2008). Implicit sustainability, in turn, refers to the use of sustainability or sustainable development as an indirect concept, for example, by addressing social dimensions, environmental dimensions, or both (e.g., Berman et al. 1999; Jawahar and McLaughlin 2001). This chapter considers the ways by which business sustainability is argued for and legitimated both explicitly and implicitly.

The concept of **legitimacy** refers to "a generalized perception or assumption that the actions of an entity are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs, and definitions" (Suchman 1995: 574). Legitimacy is considered a central concept in management and organization studies, and many efforts have been placed in examining and explaining its effects on organizational behavior. Despite these efforts, the concept and its use remain ambiguous, and different configurations prevail to date (Suddaby et al. 2017).

Suddaby et al. (2017) recognize three distinct legitimacy configurations within the management research: legitimacy-as-property, legitimacy-as-process, and legitimacy-as-perception. The first perspective, legitimacy-as-property, perceives legitimacy as something measurable and stagnant an organization must acquire and maintain in relation to its external environment (ibid.). The second perspective, legitimacy-as-perception, concentrates on individual-level cognitive processes in legitimacy evaluations (ibid.). The third perspective, legitimacy-as-process, focuses on legitimacy construction in interaction between different parties giving agency to various actors at multiple levels and emphasizing continuous and active negotiations among social actors about what is socially legitimate within the context in question (ibid.). In the legitimacy-as-process perspective, legitimacy construction is thus perceived to occur in cooperative stakeholder networks.

Business Sustainability in Stakeholder Value Creation Research

During the recent years, stakeholder value creation has become one of the major themes in stakeholder theory. This is due to the power of stakeholder theory to discuss and explain business value creation beyond the narrow shareholder value and include the expectations and interests of a large set of different stakeholders who are affected by and can affect the actions of a business organization (Freeman 1984, 2010). To create a structure to ample of stakeholder value creation literature, this chapter examines previous research with two dimensions: (1) focal firm vs. stakeholder orientation and (2) economic value vs. multiple value perspective. This examination results to a stakeholder value creation typology that allows for examining the previous work on stakeholder value creation from both theoretical and practical viewpoints, as well as paying attention to the diverse ways of legitimating business sustainability (Fig. 1).

With the stakeholder value creation typology, this chapter will organize the most important work in the field of stakeholder value creation into four categories: (1) focal firm orientation with economic value perspective, (2) stakeholder orientation with economic value perspective, (3) focal firm orientation with multiple value perspective, and (4) stakeholder orientation with multiple value perspective. The various categories of this typology have, obviously, some intersection, and their distinction is superficial to some extent. However, each category shares similar interests and themes, telling a certain type of a story about stakeholder

	Focal firm orientation	**Stakeholder orientation**
Multiple value perspective	(3) Focal firm orientation with multiple value perspective	(4) Stakeholder orientation with multiple value perspective
Economic value perspective	(1) Focal firm orientation with economic value perspective	(2) Stakeholder orientation with economic value perspective

Fig. 1 **Stakeholder value creation typology** was constructed based on the review of stakeholder value creation articles published in the leading management and specialty journals from 1985 to 2015. The scholarly articles were examined in relation to their orientation toward stakeholders (focal firm vs. stakeholder orientation) and value (economic value vs. multiple value perspective). Finally, a sample of relevant studies was included in the analysis presented in this chapter

value creation and business sustainability. In the following, each of these categories is examined in more detail.

Focal Firm Orientation with Economic Value Perspective

The first category in the stakeholder value creation typology, focal firm orientation with economic value perspective, emphasizes economic value predominance within the current economic paradigm. In this category, economic value creation is considered as the primary function of business organizations, and basis of business legitimacy lies on financial performance, while business sustainability is treated as secondary to traditional performance measures (e.g., Choi and Wang 2009; Garcia-Castro and Francoeur 2016). The main stakeholders engaged in the negotiations about the business sustainability and legitimacy are those who profit from the firm's economic performance, such as shareholders, or are of utility for a firm, such as suppliers. Focal firm orientation combined with economic value perspective may reinforce organizational behavior that neglects broader societal values and cooperation regarding sustainability and build the legitimacy of business sustainability on economic value creation solely.

Studies representing the focal firm orientation and economic value perspective rationalize that giving primacy to economic value creation function is the most beneficial approach to all stakeholders at the end. Furthermore, stakeholder approach is criticized for being too vague a guideline in managerial decision-making, which often requires trade-offs between stakeholder interests (Jensen 2002; Sundaram and Inkpen 2004.) Therefore, the primary corporate objective function is suggested being the firm's long-term value maximization (Jensen 2002) or shareholder value maximization (Sundaram and Inkpen 2004). However, some studies examine how the interests of shareholders and stakeholders could simultaneously be met, showing evidence that it is possible to meet the expectations of different stakeholders without negative impacts on shareholder value (Ogden and Watson 1999).

Instrumentality and economic value creation emphasis are also present in this category. The focus is on how stakeholder management contributes to firm performance, showing both positive (e.g., Choi and Wang 2009; Hillman and Keim 2001) and negative effects (e.g., Garcia-Castro and Francoeur 2016). Additionally, the motivation to address stakeholder concerns is linked to positive effects on financial performance (e.g., Berman et al. 1999). Jawahar and McLaughlin (2001) argue that the motivation and interest to manage stakeholders depend on the correspondence between the firm's life cycle stage and stakeholders' utility for the firm within that stage. Rowley (1997), on the other hand, argues that the firm's stakeholder management activities (resisting or more cooperating) depend on a firm's stakeholder network density and the firm's own negotiating position within it.

To sum, the category of focal firm orientation with economic value perspective represents stakeholder research, which builds on the primacy of organizational interests and business value before other value considerations and focuses on examining instrumentally whether or not various stakeholder issues should be attended to. Hence, the efforts regarding different stakeholders are made in relation to potential benefits for the focal firm and its performance, and business sustainability is legitimated with economic values and financial performance from the focal firm's point of view.

Stakeholder Orientation with Economic Value Perspective

While still leaning on the economic or business value predominance, the category of stakeholder orientation with economic value perspective tells a story in which stakeholder relationships and cooperation are viewed necessary for value creation. By acknowledging cooperative networks as important for business success, broader interests of different stakeholders become under the organizational scrutiny. However, the focus on business performance defines the setting instrumentally, leading to a limited approach to value creation compared with a broader sustainability view.

Orientation toward a wide set of stakeholders is expressed in many ways in this category. Considering the importance of different stakeholders and their cooperation for a firm's success, Garcia-Castro and Aguilera (2015) argue that the stakeholders should profit from the created economic value proportionally related to their efforts, such as the resources and capabilities they have provided for value creation. In addition, the role of trust is discussed in many studies, especially in relation to instrumental stakeholder theory. It is argued that trusting cooperative relationships lead to organizational wealth and competitive advantage (Jones 1995; Preston and Donaldson 1999; Wicks et al. 1999) and that different dimensions of trust are important for different stakeholders (Pirson and Malhotra 2011). Coff (2010) points out that the bargaining power of certain stakeholders may influence firm performance negatively. Moreover, the theme of blurring organizational boundaries draws attention to different internal and external stakeholders, and it is argued that stakeholders should be given more attention than is usually done in the value creation processes (Henisz et al. 2014; Korschun 2015; Schneider 2002).

To sum, the main focus in the category of the stakeholder orientation with economic value perspective is on those stakeholders, who can affect business performance. Therefore, business sustainability is legitimized by creating economic value in the stakeholder network and by negotiating with those stakeholders who are important within the firm's cooperative stakeholder networks and central for the financial performance of business organizations.

Focal Firm Orientation with Multiple Value Perspective

In the category of focal firm orientation with multiple value perspective, sustainability issues are increasingly present, either explicitly or implicitly. However, there seems to be no shared conception of sustainability, as some studies discuss mainly environmental (e.g., Driscoll and Starik 2004) and others mainly social issues as sustainability matters (e.g., Jones and Felps 2013). Some scholars criticize that stakeholder theory is based on an anthropocentric, Western economic paradigm, which does not adequately consider the broader environmental and social sustainability issues such as the needs of marginalized stakeholders (Banerjee 2000; Gladwin et al. 1995). Especially, the traditional corporate social responsibility (CSR) approach is criticized, as it is regarded as something separate from a firm's value creation disconnecting the social responsibilities from the economic ones (O'Riordan and Fairbrass 2014; Sachs and Maurer 2009).

A firm-centric approach is well present in the studies interested in stakeholder identification and management. For example, Mitchell et al. (1997) contend that stakeholders are perceived important by managers based on three attributes possessed by stakeholders, that is, power, legitimacy, and urgency. Bundy et al. (2013), on the other hand, argue that stakeholder issues become salient in relation to the organizational identity and the strategic frames that managers follow. In effect, organizational aspects and managerial cognitions are seen to be affecting the stakeholder management practices firms adopt (Crilly 2013; Crilly and Sloan 2012).

Some studies are interested in reconceptualizing value creation. For example, Haksever et al. (2004) direct attention to managerial decision-making, which has potential to either create or destroy value for different stakeholders. Additionally, Jones and Felps (2013) present that firms should follow the objective function of stakeholder happiness enhancement instead of shareholder wealth maximization.

Studies focusing on environmental and sustainability management expand the view of value creation by explicitly connecting sustainability to business. Driscoll and Starik (2004) ascribe the environment status of the most important, or primordial, stakeholder. Many studies are interested in what makes firms adopt environmental or sustainability management practices. For instance, Sharma and Henriques (2005) contend that firms adapt sustainability practices in relation to the influencing capacity and resources of their social, ecological, and economic stakeholders. Industry, ownership and firm size (Gallo and Christensen 2011), and institutional factors (Bansal 2005) are seen to affect firms' sustainability performance, too. Additionally, the cognitive frames of managers are argued to have an effect on managers' sustainability sensemaking (Hahn et al. 2014).

To sum, in the category of focal firm orientation with multiple value perspective, sustainability is perceived as an essential part of business, and it is argued that sustainability should have a place on every firm's agenda. A wide variety of stakeholders are identified, and their concerns are included in managerial practices and decision-making. The main emphasis in this category is on firm-centric, managerial approaches. However, some studies shed light on the potential flaws of the firm-centric approach especially in the context of sustainability and argue that firms should improve their sustainability practices and see the environment as one of the stakeholders.

Stakeholder Orientation with Multiple Value Perspective

The category of stakeholder orientation with multiple value perspective starts to tell a new kind of story of stakeholder value creation and business sustainability. This story is built on the firm's purpose and responsibility to create value beyond economic measures with and for all stakeholders (Freeman 2010), emphasizing the importance of cooperation as well as multiple value considerations. In this category, business sustainability is related to multi-stakeholder settings tackling "wicked" socioeconomic problems, to the ecological orientation of firms, and to sustainable business models. For example, Shrivastava (1995) presents an approach of eco-centric management, in which stakeholder welfare, the quality of life, and sustainability are seen as the main goals for business organizations. More recently, Pinkse and Kolk (2012) assert that multi-stakeholder partnerships are of utmost importance addressing the complex climate change and sustainability issues. Moreover, addressing sustainability issues and especially environmental sustainability as one of the main business goals is justified with the systemic view where both the society and the firms are dependent on the environment (Marcus et al. 2010).

Studies on sustainable business models place sustainability and multi-stakeholder collaboration in the center of business organizations. Sustainable business models require correspondence of internal structures and cultural capabilities (Stubbs and Cocklin 2008) and transformational value creation logics (Schaltegger et al. 2016). Hence, complex sustainability challenges are seen to touch both business organizations and management theories to an extent that they need to adapt or transform accordingly (Derry 2012; Hahn et al. 2010).

More traditional research on stakeholder value creation presents principles and conceptions to promote stakeholder orientation and multiple value creation. One of the main principles ("The Principle of Stakeholder Cooperation") emphasizes voluntary, cooperative stakeholder networks, where all stakeholders can jointly satisfy their needs (Freeman 2010; Freeman et al. 2007). By managing the multi-attribute utility functions of stakeholders and their synergies, firms can enhance value creation possibilities and find new, innovative ways to create value for all stakeholders (Harrison et al. 2010; Tantalo and Priem 2016). Furthermore, trust and justice are seen to nurture value creation possibilities and reciprocal stakeholder relationships (Bosse et al. 2009; Harrison et al. 2010; Jones and Wicks 1999; Myllykangas et al. 2011). In effect, stakeholder theorists have devoted a lot of effort to advance responsible business, drawing attention to the inseparable pair of business and ethics (Freeman 2000).

Just recently, stakeholder theory has been strengthened regarding sustainability by Hörisch et al. (2014), who argue that firms should try to make sustainability a shared value for their stakeholders. Yet, there is no common conceptualization of value within stakeholder value creation studies. What is of value has been defined, for example, with regard to perceived utility by a stakeholder (Harrison and Wicks 2013) or with the concept of stakeholder capability, for instance, the capability of being green (Garriga 2014). Despite the lack of common conception of value, stakeholder approach serves well in addressing the economic, social, and environmental values that are important for different stakeholders due to the similarities of sustainable development and stakeholder relations management approaches (Steurer et al. 2005).

To sum, the category of stakeholder orientation with multiple value perspective goes beyond the traditional single value, focal firm perspective and perceives business inherently consisting of the collective efforts of different stakeholders and versatile value creation. While the studies within this category do not share a similar approach to sustainability, it is increasingly perceived as one of the most important values of our times (e.g., Hörisch et al. 2014). Accordingly, business sustainability becomes negotiated within stakeholder relationships and is continuously constructed and legitimized in the dialogue between different environmental, social, and economic stakeholders and the focal firm.

Legitimacy Views of Business Sustainability

The literature on stakeholder value creation has evolved considerably during the past decades both in terms of quality and quantity. The presented stakeholder value creation typology allows for showing how different stakeholder value creation approaches consider and legitimate business sustainability. Each stakeholder value creation category tells a different story of what is the purpose of business, what affects its legitimacy, which stakeholders are important, and what role sustainability plays in business. A closer examination of these categories reveals varying presumptions, worldviews, and even paradigms leading to varying sustainability considerations, too. Starting from the traditional focal firm with economic value frame, the literature is now increasingly acknowledging sustainability issues and versatile value creation beyond firm financial performance. Thus, also the ways to legitimate business sustainability are changing. Table 1 depicts how business sustainability is considered and legitimized within stakeholder research by identifying the diverse ways to legitimate business sustainability along the different categories of stakeholder value creation typology.

In the first two categories representing the economic value perspective, legitimacy is built on shareholder value maximization, firm financial performance, and creating competitive advantage. While some studies acknowledge the importance of wider stakeholder networks, the economic value is still the most important focus, and stakeholders are engaged to create competitive advantage and improve financial outcomes. In this line of thinking, there is a risk to reinforce the economic value creation function of firms at the expense of environmental and social sustainability. The requirements of three business sustainability dimensions may not be met, as economic value overrides social and environmental values. Moreover, the future orientation of sustainability thinking may be forgotten, and the short-term economic outcomes override the long-term sustainability goals. These views can be seen to represent legitimacy-as-property perspective (Suddaby et al. 2017), as they legitimize business sustainability with the end result of business actions, i.e., something quantifiable and stagnant business organizations must gain and retain in order to

Table 1 Legitimacy views of business sustainability summarize the results of the qualitative content analysis of stakeholder value creation literature and the legitimacy views they represent in relation to business sustainability

Categories of stakeholder value creation typology	Legitimacy views of business sustainability	Authors
Focal firm orientation with economic value perspective	Legitimation is built on the primacy of economic and shareholder value maximization resulting in benefits for all stakeholders	Jensen 2002; Ogden and Watson 1999; Sundaram and Inkpen 2004
	Legitimation is built on stakeholder management contributing positively to financial performance	Berman et al. 1999; Choi and Wang 2009; Garcia-Castro and Francoeur 2016; Hillman and Keim 2001
	Legitimacy is built on the changing importance and salience of stakeholders in relation to a firm's needs and situation	Jawahar and McLaughlin 2001; Rowley 1997
Stakeholder orientation with economic value perspective	Legitimacy is built on cooperative stakeholder relationships and sharing the created economic value between different stakeholders	Coff 2010; Garcia-Castro and Aguilera 2015
	Legitimacy is built on giving importance to a broader set of stakeholders	Henisz et al. 2014; Korschun 2015; Schneider 2002
	Legitimacy is built on trusting, cooperative stakeholder relationships creating competitive advantage	Jones 1995; Pirson and Malhotra 2011; Preston and Donaldson 1999; Wicks et al. 1999
Focal firm orientation with multiple value perspective	Legitimacy is built on expanding the environmental and social responsibilities of a firm	O'Riordan and Fairbrass 2014; Sachs and Maurer 2009
	Legitimacy is built on the abandonment of the anthropocentric, Western economic paradigm that serves poorly the sustainability considerations	Banerjee 2000; Gladwin et al. 1995
	Legitimacy is built on analyzing the saliency of stakeholder issues that depend on organizational structures and individual-level perceptions	Bundy et al. 2013; Crilly 2013; Crilly and Sloan 2012; Mitchell et al. 1997
	Legitimacy is built on the expanded conceptualization of value creation taking care of various stakeholders and their well-being	Haksever et al. 2004; Jones and Felps 2013

(continued)

Table 1 (continued)

Categories of stakeholder value creation typology	Legitimacy views of business sustainability	Authors
	Legitimacy is built on perceiving environmental and sustainability issues as firm responsibilities	Bansal 2005; Driscoll and Starik 2004; Gallo and Christensen 2011; Sharma and Henriques 2005
Stakeholder orientation with multiple value perspective	Legitimacy is built on placing sustainability issues in the center of business organizations and value creation	Derry 2012; Hahn et al. 2010; Marcus et al. 2010; Pinkse and Kolk 2012; Shrivastava 1995; Stubbs and Cocklin 2008
	Legitimacy is built on cooperative stakeholder networks and value creation processes, in which what is of value is negotiated and constructed continuously; focus is on creating as much as value as possible to all stakeholders	Bosse et al. 2009; Freeman 1984; Freeman 2010; Freeman et al. 2007; Garriga 2014; Harrison and Wicks 2013; Harrison et al. 2010; Hörisch et al. 2014; Jones and Wicks 1999; Myllykangas et al. 2011; Steurer et al. 2005; Tantalo and Priem 2016

survive. In this approach, the efforts to influence business organizations by stakeholder groups representing social and environmental issues become important in advancing sustainability issues.

The last two categories representing multiple value perspective combine the economic and social responsibilities of the firms more tightly together. However, there is no consistent view about what business sustainability is truly and how it should be strived for in business organizations. The category of focal firm orientation with multiple value perspective follows the idea of legitimacy-as-perception (Suddaby et al. 2017), as business sustainability is legitimized in individual of firm-level processes analyzing and conceptualizing stakeholder salience and environmental responsibilities. Again, broad stakeholder engagement and cooperation would be needed in order to reinforce sustainability views in business and to allow for different stakeholders to participate in negotiating about what is of value and how to enhance sustainable value creation.

While all the approaches presented in Table 1 have their place and rationale, the last category of stakeholder orientation with multiple value perspective is the only one to consider business sustainability and its three pillars equally. Abandoning a firm-centric, economic view leads to recognizing the broader social and environmental issues that concern all of us and requires cooperative efforts of businesses, stakeholders, and society-at-large. This approach perceives business legitimacy in terms of cooperative stakeholder relationships, which through continuous negotiations and collective efforts create versatile value for all stakeholders. While sustainability issues are not always considered explicitly, there is an increasing interest to expand stakeholder considerations to consistently include sustainability matters and to perceive sustainability as one of the main goals of business organizations. From the legitimacy point of view, business sustainability is built on addressing sustainability issues as an essential part of business organizations and their value creation processes. Moreover, legitimacy is constructed in a continuous dialogue between the firm and its stakeholders on what is of value to whom and how to develop collaborative stakeholder value creation processes. Such approach relates well to the legitimacy-as-process view (Suddaby et al. 2017), as legitimacy is constructed in interaction between different parties and in continuous and active negotiations among various stakeholders and refers to the legitimacy construction in cooperation with different social actors. The participating actors and the context in question influence how complex sustainability issues without the right answers are addressed.

Avenues for Future Research

As the premises of stakeholder value creation and legitimating business sustainability have become more explicit and clear in this chapter, some recommendations for future research can be suggested supposing that sustainability issues matter for management theories and business. Regarding the study premises, future research should make the conceptual foundations of stakeholders, value, and sustainability more visible by explicitly stating which paradigm and presumptions the research setting is built on and which discussions it wants to participate in. This is important especially regarding the lack of consistency in the use of sustainability concept within the stakeholder research. As building business sustainability requires reconsideration of the purpose and role of business in society, it would be useful to define and strengthen a shared understanding of the concept itself to start with.

Furthermore, future research could elaborate on the ideas of business sustainability presented in the category of stakeholder orientation with a multiple value perspective further. For example, examination of cooperating stakeholder networks presents itself as an interesting research avenue in order to better capture how sustainability as one value perspective is negotiated about and how value creation and value can be understood broadly. Future research could also focus on multi-stakeholder settings instead of emphasizing the focal firm activities, as business sustainability is regarded requiring collective efforts. In essence, dynamic, systemic, and multilevel stakeholder cooperation between different constituencies remains an interesting research area. Quite a recent research stream on sustainable business models, in particular, shows potential to examine current business practices and needed changes from the sustainability view. In effect, truly sustainable business models lack both real-life examples and research to date.

Conclusion

To conclude, this study examined how business sustainability is considered and legitimated in stakeholder value creation studies. Close examination revealed a great variance within stakeholder value creation studies and in their approaches to sustainability. Depending on how stakeholders and value were understood, the legitimation of business sustainability followed either the legitimacy-as-property, legitimacy-as-perception, and legitimacy-as-process views. However, studies emphasizing the importance of stakeholder cooperation and value beyond economic measures provide us with valuable conceptual constructions, where the future story of business sustainability can be built on. The recommendations for future research draw attention to versatile and broad understanding of value, stakeholders, and value creation, as well as on dynamic, systemic, and multilevel stakeholder relationships and collaboration. The conceptualization of sustainability within stakeholder value creation and the elaboration on the purpose and role of business with regard to sustainability serve as interesting focus areas for future research, too. This calls for explicit statements about the role of sustainability in our thinking, values, and consequent management theories.

Legitimacy in Co-creating Governance Networks

22

Andreas Hagedorn Krogh and Jacob Torfing

Contents

Abstract

The rise of governance networks through which public and private actors co-create public value outcomes has two important consequences for the legitimacy of private businesses. On the one hand, private companies participating in governance networks and public value co-creation get to influence political and administrative decisions in legitimate way. On the other hand, participation in public value co-creation means that private businesses are increasingly expected to legitimize their own, interest-based actions in relation to society's collective goals in order to gain access to governance networks and public–private collaboration. This chapter charts the development of new forms of interactive governance and presents an overview of the forms of networked governance in which private companies typically participate. It addresses the question of legitimacy at the levels of the network and the individual company, respectively, and discusses some of the strategies for constructing and managing the internal and external

Introduction

With the 2016 US presidential election of Donald Trump, the 2016 Brexit referendum in the UK, and the concomitant rise of right-wing populism in Europe, the nation-state has reasserted itself as a critical political construct (Anselmi 2018). The return of the nation-state in the 2010s is remarkable, precisely because it is occurring after half a century of steady decline in the capacity of the nation-state to ensure the socioeconomic regulation of its own population. While the new wave of right-wing populism has surely slowed the decades-long "hollowing-out" of the state – at least rhetorically – there is still some way to go before the continued development toward post-national, pluricentric governance is either halted or reversed (Stoker 2019).

Since the mid-1970s, political power and competence have gradually shifted *upward* to international and transnational governance institutions; *downward* to local governments and user boards; and *outward* to interactive governance networks of interdependent public and private actors who come together to solve problems of common concern (Jessop 2002). Governance networks now exist at the local, regional, national, and transnational levels and in practically all policy areas, including public health, labor, transportation, migration, education, climate change, and environmental sustainability (Scherer and Palazzo 2011). The state's gradual loss of its supposed monopoly on political governance has nurtured a notion of a shift "from government to governance" (Rhodes 1997; Sørensen and Torfing 2007; Gjaltema et al. 2019). Here, "government" refers to formal political institutions, whereas "governance" refers to both formal and informal processes through which public and private actors with various experiences, forms of knowledge and expertise, and other relevant resources formulate and realize collective goals, often through partnerships, networks, and relational contracts (see also Torfing et al. 2012).

Co-creation, defined as processes of public value creation in which two or more social and political actors develop and implement new solutions to shared problems, represents one of the most recent developments in the attempt to govern society and the economy in a shared-power world (Ansell and Torfing 2014; Fogsgaard and de Jongh 2018). In recent years, co-creation has gained ground as a proactive governance strategy for dealing with the wicked problems found in our increasingly complex, fragmented, and dynamic societies (Pestoff et al. 2012;

Ansell and Gash 2018). Researchers, politicians, and practitioners all consider - co-creation in collaborative networks to be an effective tool for distributing responsibility, mobilizing resources, spurring innovation, and creating public value outcomes (Torfing 2016).

The rise of governance networks and co-creation as a public governance strategy has two important consequences for the legitimacy of private businesses in the eyes of the public. On the one hand, private companies participating in governance networks and public value co-creation are able to influence political and administrative decisions in legitimate ways (Jessop 2002). The new collaborative forms of governance stand in stark contrast to dubious forms of lobbyism or outright corruption that have little or no legitimacy. On the other hand, participation in public value co-creation means that private businesses are increasingly expected to legitimize their own, interest-based actions in relation to society's collective goals in order to gain access to governance networks and public–private collaboration (Scherer and Palazzo 2011: 914–917). In other words, if a private company wants to join resourceful and influential governance networks, it cannot only concern itself with its own short-term, bottom-line results and the formal laws and regulations that prevail in its field of operation. It must be able to justify its actions and results in relation to political demands regarding social responsibility, job creation, skills development, social equality, climate change mitigation, and so forth, even if these requirements are not yet translated into formal legislation and regulation.

This chapter focuses on the participation of private businesses in public governance and co-creation and their legitimacy as politically and socially responsible actors. First, we review the historical development of public governance in Western liberal democracies, which culminates in the widespread use of governance networks and growing interest in co-creating public value outcomes with private companies. Second, we provide analytical definitions of network governance and co-creation with reference to the most influential theories in the field. Third, we present an overview of the forms of interactive and networked governance in which private companies typically participate. Fourth, we address the question of legitimacy at the levels of the network and the individual company, respectively. Fifth, we introduce the concept of meta-governance and discuss some of the strategies for constructing and managing the internal and external legitimacy of network actors. Finally, we conclude by summing up the main points of our argument and sketching out some future research avenues that may deepen our understanding of the legitimacy of private business participation in public governance.

A Brief History of Public Governance

Governments have always interacted with private associations, organizations, and companies that, as pressure groups, have tried to influence government policies. For a long time, scholars, journalists, and the public perceived these contacts as illegitimate forms of lobbying associated with shady business beyond democratic control. This has changed over the course of the past couple of decades, however, during which time governance networks and public–private co-creation have gained prominence as effective, legitimate, and much-needed alternatives to the traditional governance mechanisms based on hierarchy and markets.

In the postwar period, public bureaucracy was the preferred provider of public governance and public services. Public welfare systems developed and grew steadily throughout the 1950s, 1960s, and early 1970s, and the wider access to social welfare combined with persistent economic growth ensured broad support for the political-administrative system. In 1973, however, the economic crisis undermined the socioeconomic foundations for the expansion of the welfare state, which sparked a profound legitimacy crisis. The failure to secure continued economic growth and social welfare spurred neoliberal attacks on public bureaucracy. For instance, the Trilateral Commission set the agenda with its now renowned report on the so-called crisis of democracy, which was published in the wake of the economic crisis (Crozier et al. 1975). According to this report, the public sector and hierarchical systems of government were "overloaded," since the growing demands on the welfare state exceeded the available public resources. At the same time, the report asserted that society had (and would continue to) become increasingly "ungovernable" due to the growing complexity, fragmentation, and individualization that undermine the attachment of citizens to public values and their support for collective solutions. In the worst-case scenario, the population would lose trust in elected government and support anti-democratic populist movements.

In the early 1980s, neoliberal ideologues formulated a radical response to this dire diagnosis: to roll back the welfare state and privatize large parts of the public sector. Upon taking office in 1979, British Prime Minister Margaret Thatcher promoted the neoliberal agenda under the political slogan, "more market, less state." However, trimming down the state quickly proved much easier to about talk than to implement in practice. In fact, public social spending *increased* steadily in the UK over the course of the 1980s (Pierson 1994). The neoliberal attack on public welfare systems nevertheless gained foothold in several Western countries.

A more moderate and arguably more successful recipe for altering public governance in the face of the economic crisis took shape in the late 1980s. The public reform wave of New Public Management (NPM) that swept across the Western world in the late 1980s and 1990s made no attempt to do away with the social welfare systems, as such. Instead, it problematized the public monopoly on service delivery and the tendency of public service production to be of poor quality and excessively expensive (Hood 1991). The solution was to enhance competition between public and private service contractors, to strengthen public management through the introduction of performance management, and to increase the customer orientation of public bureaucracies by allowing service users to choose between service providers.

Initially, the NPM reforms enjoyed great support among public policymakers and administrators, but criticisms gradually emerged as the lack of results and unintended negative consequences became evident (Hood and Peters 2004; Hood and Dixon 2015). Outsourcing is expensive and often undermines quality in the public sector. Performance measurement is bureaucratic, crowds out public service motivation among employees, and hampers cross-sector collaboration and innovation. Free service choice schemes for citizens encourage “exit” instead of “voice,” whereby important information for the continuous improvement of public services is lost (Torfing 2009). Finally, increased competition and the fragmentation of governance seem to present an inadequate response to a growing number of wicked problems where causes and effects are unclear, complex, and interwoven, which, rather paradoxically, call for more crosscutting coordination and collaboration (Koppenjan and Klijn 2004).

At the turn of the millennium, public authorities increasingly looked to governance networks as a way of mobilizing and activating private resources, knowledge, and the self-governing capacities of private actors when realizing political objectives and developing solutions to wicked problems (Sørensen and Torfing 2007; Sørensen and Triantafillou 2009). New collaborative forms of governance, promoted as New Public Governance (NPG), gradually supplemented and supplanted NPM (Osborne 2006, 2010; Torfing and Triantafillou 2013). The 2007 financial crisis made the broad mobilization of societal resources an imperative for governments around the world. Since then, the notion of co-creation has received significant attention in public governance theory and practice. Public policymakers, administrators, managers, and employees are now increasingly inclined to involve citizens, businesses, and other private actors when developing and implementing new policies, service systems, and services (Bovaird and Löffler 2012, 2018; Torfing et al. 2019). The following two sections delve deeper into the theories behind the new trends in public governance and formulate analytical definitions of network governance and co-creation, respectively.

What Is Network Governance?

Pluralist and corporatist theories have dealt with the interactions between private and public actors in different ways. Pluralism descriptively studies – and normatively celebrates – the multiplicity of private interest groups that spontaneously organize all societal interests and compete to influence policy decisions, with the state playing the role of a neutral bystander. However, corporatist scholars soon criticized pluralist interest group theory for discounting the pivotal role of the state and its selective involvement of a few strong interest groups. Instead, corporatism focused on the merger of a few private and public actors into the dominant power elite. In turn, pluralists criticized corporatism for its tendency to overlook the competition between sociopolitical elites and to exaggerate the close and stable relationships between the state and central labor organizations (Kenis and Schneider 1991).

Policy network theory developed in the early 1990s in response to criticisms of both pluralism and corporatism. Describing various types of networks on a continuum from closed and exclusionary networks (policy communities) to loose and inclusive networks (issue networks), it expanded our understanding of state–society interactions (Marsh and Rhodes 1992). It also reconceptualized the role of the state as the designer, facilitator, and manager of multi-actor networks, which laid the foundations for later theoretical developments focusing on how governance networks are managed and meta-governed (Kickert et al. 1997; Sørensen and Torfing 2007).

Parallel to this evolution in the political sciences, organizational theory developed a similar concept of interorganizational networks, which is even more relevant for understanding the participation of businesses in governance networks. It builds on the basic assertion that researchers should not conceive of organizations as closed mechanical systems but rather as open systems operating in an environment comprised of other organizations (Aldrich 1979). Thus, the key to understanding public and private organizations is to analyze their interactions and exchanges with other organizations within their particular organizational field (Powell and DiMaggio 1983; Powell 1991).

The theoretical discovery of interorganizational governance networks soon created a need to provide a precise definition of the term. The rapidly expanding research literature generally agrees on defining governance networks as a relatively stable articulation of mutually dependent but operationally autonomous actors from the state, market, and civil society, who engage in policymaking and contribute to the production of public value in a broad sense of visions, plans, scenarios, standards, regulations, and decisions (Sørensen and Torfing 2009: 236). Empirically, we can see how some networks are self-grown "from below," whereas others are initiated by public authorities "from above;" some are formal and others are informal; and some networks are open and have a changing circle of participants, while others are closed and imply permanent membership. Moreover, governance networks can have different functions: some facilitate cooperation by which actors merely exchange information and share knowledge; others sustain coordination whereby actors seek to avoid gaps and overlaps in the provision of services; while others stimulate collaboration through which the network actors develop and implement common solutions to shared problems (Keast et al. 2007).

What Is Co-creation?

Since the late 1970s, public authorities have been inspired by private companies that enhance value production through user-driven innovation that involves end users in the design and development of new products and services (Prahalad and Ramaswamy 2002; Leadbeater and Cottam 2007; Voorberg et al. 2013; Gouillart 2014). More recently, the term "co-creation" has emerged as a label for processes in which two or more actors collaborate to create new and better solutions to common problems and challenges. Today, scholars of public administration and management use the term to denote processes in which public authorities "cross the great divide" between the public and private sectors by involving citizens, businesses, and other private actors in the development and implementation of new policies, service systems, and services (Ostrom 1996; Bovaird 2007; Alford 2014; Nabatchi et al. 2017).

While the purpose of co-creation in the private sector is ultimately to make and raise profits, the overarching goal of co-creation in the public domain is to create public value; that is, to provide solutions that are valuable for the public and valued by the public (Bovaird and Löffler 2012). In practice, however, co-creation will also create individual value for the participating actors (Nabatchi et al. 2017; Bovaird and Löffler 2018). With respect to the more specific goals and outcomes of co-creation, scholars tend to distinguish between three forms of co-creation: *co-governance* involves collaborative policy formulation, planning, and prioritization; *co-management* involves collaborative development of public service systems and processes; and *co-production* involves individual citizens in the production of their own services (Pestoff et al. 2012).

While part of the co-creation literature reserves the term co-creation for processes involving public–private collaboration in all stages of developing new policies and services – from defining the problem, generating ideas, and selecting the most promising solutions to implementing and evaluating them – others see co-creation as a matter of degree (Bovaird 2007). Thus, we can speak of a greater or lesser degree of co-creation depending on the extent to which public and private actors take on the roles of co-initiators, co-designers, co-implementers, and/or co-evaluators (Voorberg et al. 2013). In any case, co-creation always involves producing something through collaboration. Thus, cooperative and coordinating governance networks do not engage in co-creation processes. Co-creation happens in either temporary or more permanent collaborative governance networks in which public and private stakeholders develop and implement new policies or services together in response to jointly defined problems and challenges.

Public–Private Relations

There is no consensus in the research literature on how to categorize relationships between public authorities and private companies, but the following overview highlights some typical examples of such relationships. As we move through examples 1–6 in the overview, the role of companies develops from performing specified tasks to co-creating policies and solutions to current societal challenges. The degree of collaboration, the ability of companies to exert influence on public governance, and the opportunity of public authorities to engage, commit, and influence the priorities and orientations of private businesses thus increase down the list.

1. *Public–private partnerships*
   Public–private partnerships in which public authorities and private contractors share the costs, revenues, and risks associated with building and operating a particular infrastructure are becoming increasingly widespread. The partnerships establish formal, project-based relationships between limited numbers of actors linked together through contracting. Examples include major infrastructure

projects, such as the construction of bridges, tunnels, ports, hospitals, and schools. Public–private partnerships focus on task completion and have virtually no political influence.

2. *Outsourcing based on relational contracts*
   Relational contracts have gained ground in recent years. They go beyond traditional outsourcing in which a public actor purchases and finances a particular service provided by one or more private companies selected through an open tender. Involving greater degrees of cooperation than traditional transactional contracting, relational contracts replace hierarchical rules and monitoring with ongoing negotiations and cooperation between the public and private parties through which service standards are set and evaluated and objectives developed.
3. *Monitoring networks*
   Business and environmental regulation is increasingly using "soft governance" in the form of voluntary norms and standards monitored by industry-specific agencies. To create ownership and ensure compliance with the norms and standards, public authorities often delegate the task of developing the norms and standards to self-regulating networks involving private companies, government agencies, and scientific experts. One example of this is the European airlines, which define their own safety standards in close dialogue with experts and EU authorities.
4. *Advisory networks*
   National and local governments increasingly choose to establish national, regional, and local councils and committees that are charged with the task of overseeing and advising relevant public authorities on how to coordinate and organize new initiatives. We find these networks in many business-related policy areas, such as employment policy, vocational training, technology development, and tourism. Also within crime prevention, governments increasingly mandate local councils and networks, where public and private actors deliberate and discuss public crime prevention strategies.
5. *Policy networks*
   When governments invite companies and business organizations to participate in the formulation of major political reforms, we talk about policy networks. These networks sometimes also play a role in the subsequent implementation process. While government maintains a privileged position in deciding which policy options to turn into public policy, the private network actors deliver important input and feedback to public policymakers in interactive policy development.
6. *Innovative problem-solving networks*
   In innovative problem-solving networks, public and private stakeholders co-create new and innovative solutions to shared problems. The problems are often complex in nature and not easily solved through standard procedures by a single agency alone. In other words, they require the active participation of both public and private actors with different perspectives and relevant resources. In such networks, private actors will typically be involved in defining the problem, generating ideas for solutions, implementing the selected solution, and evaluating and spreading the innovation.

Having considered various forms of public–private relations in the field of public governance – ranging from contracts to co-creation – which involve various degrees of cooperation, coordination, and collaboration, we now turn to the question of legitimacy. In the following sections, we shall first consider how governance networks can enhance the legitimacy of public governance and then discuss how such networks can enhance the legitimacy of private companies.

Governance Networks as Sources of Legitimacy of Public Governance

Within politics, the notion of legitimate authority comes from John Locke (1988 [1689]), who claimed that a government was legitimate only when it had the support of the people. Similarly, we can say that public governance is legitimate only when it enjoys support from relevant and affected stakeholders as well as the population as a whole.

Political scientists and governance researchers have traditionally distinguished between two basic forms of legitimacy of public governance: input and output legitimacy (Scharpf 1999). *Input legitimacy* arises when all of the relevant and affected parties have had opportunity to provide input to the public governance and to influence the final decisions. Here, legitimacy is a function of the inclusiveness of the decision-making process and the degree of participation. For example, a high turnout in the election of a school board of parents will increase the board's legitimacy, and the governance of water management based on the active involvement of all the relevant stakeholders will tend to produce legitimate solutions. *Output legitimacy*, on the other hand, arises when relevant and affected stakeholders and the general population find the impact of public governance to be positive and desirable. Here, legitimacy is a function of the quality and effectiveness of public governance and the degree of goal attainment. For example, an employment policy that ensures a desirable combination of high employment rates and low inflation is legitimate from this point of view.

More recently, scholars have added a third form of legitimacy to the conceptual mix, namely, *throughput legitimacy*, which concerns the quality of the process that translates inputs into outputs (Schmidt 2013). Throughput legitimacy thus begs the question of whether the governance process meets a number of normative requirements regarding transparency, procedural justice, and democratic deliberation. Here, legitimacy is a function of compliance with particular normative process demands. From this perspective, public governance is less legitimate when resulting from muddy and shady negotiations between a few political parties without any thorough prior discussion in the relevant parliamentary committee than when it results from a broad-based compromise secured through open, protracted deliberation.

Ideally, public governance should obtain all three forms of legitimacy. Efficient administrative solutions based on technical expertise and expert knowledge will not suffice if public governance does not deliver what the people want (Scharpf

1999; Steffek 2018). Some claim that there might be a trade-off between the inclusion of a wide set of actors (input legitimacy) and effective goal attainment (legitimacy) (Börzel and Panke 2007; Daugbjerg and Fawcett 2017) or between the inclusion of a diverse set of private actors (input legitimacy) and transparent decision-making processes (throughput legitimacy) (Iusmen and Boswell 2017). However, others find mutually reinforcing relations between the three forms for legitimacy in networked governance settings, arguing that the involvement of all relevant and affected stakeholders in high-quality processes tends to lead to new and better outputs and higher degrees of goal attainment (Doberstein and Millar 2014).

In its early years, network governance theory was eager to point out how governance networks can strengthen all three forms of legitimacy (Grote and Gbikpi 2002). As such, it highlighted how (1) the direct participation of relevant and interested parties increases the input legitimacy of public governance; (2) the exchange of knowledge, skills, and resources enhances problem-solving capacities, broadens ownership to new policies and solutions, and hence increases the output legitimacy of public governance; and (3) the joint negotiation of procedural norms of interaction in governance networks ensures reasonable and fair processes of deliberation that increase the throughput legitimacy of public governance.

However, a second generation of network governance researchers has problematized issues of legitimacy and accountability in network governance processes (Sørensen and Torfing 2007). First, governance networks do not always include all of the relevant and affected stakeholders, and, left to themselves, they tend to become closed and exclusionary over time (Hendriks 2009). Second, conflicts and policy deadlocks may hamper their ability to deliver sound policies and solutions (Daugbjerg and Fawcett 2017). Third, the processes are often complex and not very transparent, and the shared responsibility tends to obfuscate accountability (Millar 2013). In order to ensure the legitimacy of governance networks, these second-generation network governance researchers suggest that there is an urgent need for meta-governance and network management (van Meerkerk et al. 2015). The following section addresses the question of legitimacy at the level of the individual cooperation before we move on to consider how network managers can enhance the legitimacy of both public governance and participating private companies through meta-governance.

Companies as Legitimate Actors in Governance Networks

Private companies can participate in different types of governance networks in order to gain access to economic resources, partake in innovation, or influence decision-making but far from all companies invest time and energy in such participation. Small- and medium-sized companies may think they lack the resources required to participate effectively. Some bigger companies proactively initiate governance networks, but it is more common for private companies to be invited to join new or well-consolidated networks initiated by public organizations. Whether or not they are invited to join a governance network depends on their legitimacy as network participants.

A company will not be invited to participate if it lacks legitimacy, and a network actor that suddenly loses legitimacy risks being excluded from the networks in which it participates. It is devastating for a private company that wants to become part of a public governance network with vital political influence to be portrayed as the incarnation of special interests and dismissed as an illegitimate participant. The extent to which private companies appear legitimate in the eyes of other network actors and the public network manager largely depends on discursively constructed and negotiated perceptions and identities that highlight various features of individual businesses. The remainder of this section examines some of the discursively constructed figures that make companies appear to be legitimate network participants.

1. *The Representative*
   Some private companies appear legitimate because they can claim to represent someone or something of importance to the mission or task of the governance network, for example, if they represent a relevant industry or type of business and speak from a notion of common interest of several companies or if they represent particular professional or sector-specific views or perspectives that are important to the discussion in the governance network. Their representation can be formalized through public appointment or informal through the de facto acceptance of a company as representative of a conglomerate of businesses, an industry, or a sector. Larger companies will typically have an advantage when it comes to representing other companies.
2. *The Beacon*
   Legitimacy can also stem from a perception of particular companies as beacons attracting attention and leading other businesses down the right path. Network actors have an interest in getting significant companies to join the network to the extent that they have the capacity to get other companies to follow their lead and change their practices in accordance with the network's objectives and priorities. The participation of beacon companies in governance networks is thus justified by their reputation and influence on other companies. They do not necessarily represent these companies, but there is a presumption that other companies will listen to them and follow their example.
3. *The Front-Runner*
   Network actors are likely to see companies as relevant and legitimate network participants if they have generated better and more relevant results than other companies. By virtue of their innovative approach and/or market position, such companies may well be considered strategically important actors that can inspire the network with their disruptive ideas. An example of this type of legitimacy is Danish wind turbine manufacturer Vestas and its participation in a national policy network concerned with Danish sustainable energy and climate policy.
4. *The Expert*
   Some companies will possess unique knowledge, competence, and expertise that network actors consider to be crucial for the governance network and its

ability to solve its tasks and pursue its mission. Such indispensable expertise can either be of a technical nature or concern specific insights into a key industry, which enable the company to assess the practicable workability of proposed policies and solutions. The position of the expert as a source of legitimacy provides opportunity for smaller but knowledge-based and well-connected companies.

5. *The Supplier*
   Companies can also gain legitimacy by possessing financial resources that the network needs in order to progress. Such companies can offer to finance data collection, conferences, and field trips that can shed light on problems that the network is attempting to solve. They may also offer to finance the solutions agreed upon by the network.
6. *The Creative Idea Generator*
   Companies with a reputation for being particularly creative can also obtain legitimacy in some governance networks. Unlike the front-runner, they may not have been at the forefront of major innovations, and they may not possess the resources to supply new solutions with capital. In turn, they are considered creative idea generators and able to challenge widely held assumptions and to think outside the box.
7. *The Immaculate*
   Renowned, honorable, and untainted enterprises have good chances of being perceived as legitimate network actors, especially in industries and business areas otherwise ridden by scandals, broken vessels, and untrustworthy companies. A well-run and respected company, which might even take social, environmental, or political responsibilities, will often be able to turn its good reputation into legitimacy as a participant in governance networks with political influence and decision-making power.
8. *The Accomplished Network Actor*
   Legitimacy can also depend on prior experience with collaboration. If other network participants have positive experiences with certain companies and expect them to become active, trusting, responsive, and loyal participants in the governance network, then these companies will appear legitimate. This may also explain why networks often consist of “the usual suspects.” If a company has performed well in a previous governance network, then it will build a reputation as a reliable network actor whereby it becomes more legitimate to include in another network.
9. *The Veto-Player*
   The power to block the initiatives of a governance network serves as a boundary example of possible ways for private companies to obtain the status of legitimate network participants. If the network is unable to realize a viable solution unless a specific company is onboard, then the network will have to involve that company as an active participant in the formulation of new solutions. Critical and skeptical companies with significant influence and resources can thus obtain legitimacy as a necessary network participant.

The presented examples of how companies can appear as legitimate participants in governance networks are largely moldable images created through representation, negotiation, and the acceptance of statements about companies. The other network participants, the mass media, and the private companies themselves contribute to the construction of such images. They are fragile constructs that must be constantly nurtured and may easily be challenged, problematized, and questioned. For private businesses, there is a thin line between being a legitimate network participant and an illegitimate lobbyist. The legitimacy of private companies as participants in governance networks is therefore subject to sustained negotiations influenced by the institutional context and new events.

Since the images are moldable, they are also governable. The perception of companies is an important matter for the meta-governors who govern the self-regulating networks. The following section considers the role of meta-governance in constructing the legitimacy of private companies in governance networks.

Meta-governance and Legitimacy

Meta-governance is defined as "the governance of governance" or, more specifically with respect to governance networks, "the governance of self-governance" (Jessop 2002, 2011; Kooiman 2003; Sørensen and Torfing 2009; Gjaltema et al. 2019). Meta-governance is a conscious and strategic attempt at influencing the functioning and performance of a network without receding to traditional hierarchical forms of governance based on command and control.

The literature has pointed to a number of commonly used meta-governance tools (Sørensen and Torfing 2007). First, public and private actors exercise meta-governance through institutional design, where they define the purpose and tasks of the network, decide on eligible members, and delineate decision-making procedures. Second, meta-governors may also influence the interactions in the network by formulating and defining political, economic, and discursive frameworks for network interaction. Third, meta-governance can take the form of process management whereby managers facilitate interaction, activate passive actors, mediate conflicts, initiate learning processes, and coordinate network activities. Finally, public and private actors can exercise meta-governance by directly participating in the network itself and contributing to setting the agenda, developing solutions, and discussing alternatives with the other actors in the network.

In principle, any actor can exercise meta-governance and not just public authorities. However, successful meta-governance requires that the meta-governor possesses the four basic NATO resources of *nodality*, *authority*, *treasure*, and *organization* (Hood 2007; Sørensen and Torfing 2009). Thus, meta-governors must (1) play a key role in the network; (2) possess sufficient authority and legitimacy to make the other actors listen; (3) have access to resources that can fuel the interactive processes; and (4) have an organization behind them that can service the network. In general, public authorities are more likely to meet these four criteria than private companies. Public authorities sometimes hire private companies to co-govern and co-facilitate various forms of governance networks, and in rare instances private actors meta-govern networks at lower levels of governance. In general, however, private companies find it difficult to assume the role of meta-governors, especially because they often lack the necessary authority and legitimacy.

All actors who want to participate in a governance network must enjoy a minimum level of legitimacy in the eyes of the other network actors and the outside world. As previously emphasized, legitimacy is not a given but rather something that is constantly being constructed and deconstructed in sustained negotiations between situated actors. Interests, identities, knowledge, and reputation are relational constructs within decentralized systems of meaning delimited and held together by social antagonisms (Laclau and Mouffe 1985; Torfing 1999). In other words, the legitimacy of network participants and the criteria for inclusion and exclusion are contingent.

An important focus of meta-governors is to "set the right team" that will make the network function as effectively as possible. Constructing legitimacy through narratives and the attribution of meaning thus becomes an important task and a significant tool for the meta-governor. Through the exercise of discursive power, meta-governors can play an active and central role in constructing the legitimacy of the participants, including the private companies. Thus, meta-governors must not only care for the input, output, and throughput legitimacy of the governance network as a whole but also for the internal and external legitimacy of its participants.

Conclusion

While a wave of populism has brought the nation-state back in, it does not change the fact that the state is no longer the natural and privileged focal point of public governance. This chapter has shown how public policy is increasingly being co-created and co-implemented through governance networks. Private companies participate both directly and indirectly in various forms of governance networks and the co-creation of public value, but their participation depends on their legitimacy. Their self-interested, profit-maximizing nature burdens their legitimacy, but both the private companies themselves and public meta-governors play a crucial role in portraying private companies as legitimate network participants and, more generally, in ensuring the conditions for input, output, and throughput legitimacy and network governance and public–private co-creation.

The study of corporate networks is by no means new, but the participation of private companies in governance networks is under-explored in both business studies and network governance research. Thus, there is a need for further interdisciplinary studies combining insights from business studies with insights from network governance research and the growing literature on co-creation. The UN Sustainable Development Goals (SDGs) provide interesting opportunity for studying corporate participation in collaborative governance and co-creation and the endeavor to co-create legitimate solutions to pressing problems. The 17th and final SDG states that the first 16 SDGs should be reached through public and private collaboration in networks and partnerships. This recommendation calls for studies of how private companies can participate legitimately in public governance and how governance networks can produce joint solutions with a high degree of legitimacy.

23 Public Sector Innovation, Social Entrepreneurship, and Business Legitimacy

Luise Li Langergaard

Contents

Abstract

The chapter discusses legitimacy in relation to public sector innovation, social entrepreneurship, and CSR. All three terms refer to organizing principles and managerial trends that, implicitly or explicitly, have implications not only for our understanding of organizations but also of the role and division between the three sectors of society. The chapter aims to understand legitimacy as a critical concept in relation to these three phenomena and analyzes and discusses ways to study legitimacy in relation to them. It draws on legitimacy studies in institutional theory with its sociological and empirically oriented approach and political philosophy with a normative understanding of legitimacy, and the potentials and challenges of these two approaches to legitimacy are discussed. Legitimacy in relation to public sector innovation, in a normative sense, always follows the idea about what the public sector is and should be. The study of social

entrepreneurship deploys an institutional theory conception of legitimacy to challenge economic and rationalist explanations for the emergence of social enterprise, thereby displaying its ideological and political underpinnings. The study of CSR critically discusses an example of deliberative legitimacy, which represents direct transfer of a normative political concept of legitimacy to corporate legitimacy studies. The discussion shows that the premises of such a transfer need to be further developed in order to be empirically and normatively convincing.

Keywords

Democratic legitimacy · Business legitimacy · Institutional theory · Political philosophy · Social entrepreneurship · Public sector innovation · Corporate social responsibility

Introduction

Across the board, new ways of organizing oriented toward dealing with societal challenges, whether related to social needs, sustainability, welfare state challenges, or challenges with global markets, take up a significant place in organization and management research. It seems that there is a constant pressure for organizations to demonstrate that they can keep up with societal expectations by certain ways of organizing, managing, and adapting to contemporary societal needs. Among the newest trends and keywords of organizing in the public, private, and third sectors, respectively, are public sector innovation, corporate social responsibility (CSR), and social entrepreneurship. Despite the differences between the terms, all three indicate that something new is at stake, something reflecting the conditions of contemporary society, with its modes of governance and its social and economic challenges. These organizational trends hold promises not only at the organizational level but are also associated with a more modern, socially oriented, and sometimes more democratic world. In this sense, the terms implicitly hold promises of a better society, besides suggesting that new, more legitimate modes of organizing have emerged. They can be seen as a response to a decrease (or perhaps even a crisis (Cradden 2005)) of legitimacy of older forms of organizing. Allegedly they provide alternatives to "old development," charity, nonproductiveness, and paternalism in the ways NGOs and civil society organizations have worked (Dart 2004; Dees et al. 1998; Sigalla and Carney 2012); bureaucracy, inflexibility, and clientization in the public sector (du Gay 2004; Osborne and Gaebler 1992); too narrowly profit-oriented business conduct and strategy; or practices endangering social and environmental sustainability by focusing single-mindedly on economic sustainability (Scherer et al. 2013; Dyllick and Hockerts 2002). They thereby also become fashions, or "recipes," for organizations striving to obtain legitimacy, as they become an indication of being responsive and responsible to the organizational environment by meeting the claims and needs of society.

Thus, it is no surprise that the concept of legitimacy has taken up a place in research about these phenomena. Especially, in CSR research, the idea of corporate legitimacy or business legitimacy has received vast attention. Legitimacy is seen an important resource to firms and corporations as it provides them with a "licence to operate" (Baumann-Pauly 2013; Palazzo and Scherer 2006) and thus is important for organizational survival. Business legitimacy focuses on social acceptance and the role of the corporation in society beyond its role as merely a market actor. From an instrumental or managerial perspective, there is an interest in understanding how organizations or institutions obtain, maintain, and manage legitimacy understood as social acceptance gained from stakeholder groups or society more broadly (Suchman 1995). But legitimacy studies are not only about strategically managing the relationship with the organizational environment. Looking more broadly into the field of organizational legitimacy studies, notions of legitimacy range from sociological conceptions denoting society's or stakeholders' acceptance of an organization or corporation's conduct and way of operating to normative conceptions that also focus on what certain types of organizations should do in order to earn social acceptance.

The chapter explores the implications and possibilities of such different ways of conceptualizing legitimacy by discussing examples from studies in business legitimacy, social entrepreneurship, and public sector innovation from a critical perspective. All three phenomena carry strong normative connotations, and are sometimes portrayed, here lending the phrasing from Dey and Steyaert (2012, p. 91) as "necessary, even indispensable, for tackling today's most serious ills, and framing the matter in the language of morality and rationality." By a critical perspective is meant one that explicitly reflects on the (political, normative, and practical) implications of certain ways of conceptualizing and understanding legitimacy, especially in relation to such powerful organizational trends. Doing research implies not only describing theory and practice but also at the same time shaping it. Conceptualizing legitimacy can easily not only describe but also (sometimes unintentionally) attribute legitimacy to certain ways of organizing by portraying them as key to organizational survival and societal acceptance. Thereby the concept of legitimacy can have an ideological flip side if not conceptualized carefully. In this sense, they are not merely organizational but also political phenomena, and therefore it is relevant to take into consideration not only how organizations obtain legitimacy from a empirical perspective but also whether they deserve it from a normative perspective.

From this perspective the question is not merely how organizations manage stakeholder relations in order to keep their license to operate, but rather if we should understand legitimacy as a normative concept, i.e., a conception, which also implies concerns about when legitimacy is actually valid or deserved. Legitimacy as a normative concept is known from parts of political philosophy and philosophy of law. Habermas (1998), for example, states that the legitimacy claim of the law is about more than the addressees' mere de facto acceptance of it. It also regards validity, in other words whether it is worthy of acceptance, something which is also connected to the legitimation of a government organized in the form of law.

As Habermas states, it must be possible to obey law not simply because they are compulsory but also because they are legitimate. It is not merely about whether law is accepted but also about the fact that law claims to *deserve* recognition (Habermas 1998). Although this concept of legitimacy is rather far from, and cannot immediately be translated into, a concept of organizational legitimacy relevant across all types of organizations, there may be good reasons to consider how we should understand the normative dimensions of legitimacy in relation to the three mentioned phenomena, especially in light of the ways they sometimes challenge the relationship between societal sectors.

This chapter will argue that these three organizational trends tap into issues not merely about organizational or corporate legitimacy but one about the social, economic, and political spheres or sectors themselves. Three examples of understanding legitimacy shall be presented and discussed specifically in relationship to their critical potential. The examples are taken from CSR, SE, and public sector research and draw on conceptions of legitimacy, which are either empirically oriented or somehow normatively informed. The chapter goes through them one by one and finally discusses what the challenges are of navigating between empirical and normative conceptions of legitimacy. Although the three examples are very different, they all discuss legitimacy in a broader societal perspective, in which considerations about the societal spheres or sectors, implicitly or explicitly, have a place.

Structure

In the first part, two approaches to legitimacy studies will be presented, first institutional theory and second political philosophy. The presentation of these rather different approaches serves to set the scene for the discussion of legitimacy in studies of CSR, SE, and public sector innovation, as a number of these are based on these conceptions of legitimacy. The second and main part of the chapter discusses legitimacy in relation to public sector innovation, social entrepreneurship, and CSR. The presentations and discussions of these are quite different, but all focus on legitimacy as a concept that not only regards the organization in a generic sense but something that also relates closely to the sector of society that the organization is part of. In the section about public sector innovation, the point is that there are various legitimacy claims to the public sector, and more importantly, how legitimacy is understood depends on the idea of what the public sector is and should be; in other words it has political normative implications and is about the role of the state and public sector and not merely about organization. The study from the social entrepreneurship field is an application of Suchman's institutional concept of legitimacy to explain the emergence of social enterprise as a business-like contrast to traditional nonprofit organizations. Dart (2004) argues that the emergence of a neoconservative, pro-business, and pro-market ideology has led social enterprise to predominantly be construed and practiced in commercial terms. Thereby he applies the institutional framework in a way that has a critical potential, namely, to take a step back and look at the political underpinnings of the emergence and legitimation of certain organizational forms. Thereby it also becomes possible to question the rationality and functionality of these organizational forms by showing them as contingent rather than necessary. However, a more systematic normative discussion does not seem viable from this particular institutional perspective. The study of legitimacy in relation to CSR is taken from the field of political CSR theories because these theories take the broader political perspective into consideration when conceptualizing business legitimacy (Garriga and Melé 2004). An article by Palazzo and Scherer (2006) aiming to develop a concept of business legitimacy as deliberation will be presented and discussed. This contribution is particularly interesting for this chapter, as they also present a politicized view of the firm and thereby raise a critique of what they consider to be mainstream CSR and mainstream conceptualizations of legitimacy. This section is the longest one of the analysis because the example opens up for discussing distinctions between empirical and normative conceptions of legitimacy and the possibility of transferring notions of legitimacy from one sphere or sector to another. Thereby this section also rounds off the discussion of the analysis part before the conclusion.

Concepts of Legitimacy in Institutional Theory and Political Philosophy

The concept of legitimacy has been taken up within various disciplines, such as sociology, management, and organizational theory, as well as political philosophy and legal theory. Within all these disciplines, a range of understandings of legitimacy exist, but only a selected few shall be presented here in order to set the scene for the following discussions of legitimacy in relation to public sector innovation, social entrepreneurship, and CSR.

Legitimacy in Institutional Theory

Theories of organizational legitimacy build on and further develop notions of legitimacy from sociology, for example, from Weber, who developed the concept of the legitimation of corporate and governmental power structures, and Parsons, who later broadened the focus of legitimation to a cultural-institutional perspective. According to the latter of these perspectives, goals that organizations pursue must be congruent with wider societal values in order to accord legitimacy (Ruef and Scott 1998). The concept of legitimacy has since been adopted by organizational studies, especially by resource dependence theory (Pfeffer and Salancik 1978) and institutional theory (Deephouse and Suchman 2008). On the basis of these, Suchman (1995) distinguishes between two groups of legitimacy studies in organizational theory, a strategic and an institutional. Strategic approaches adopt a managerial, instrumental perspective in order to find ways in which organizations can manipulate and deploy evocative symbols in order to garner support from society, thereby being able to manage and control these processes. Legitimacy is here perceived as an operational resource that organizations deploy in pursuit of their goals, and a high degree of control over the legitimation process is assumed, viewing it as something manageable, purposive, and calculated (Suchman 1995, p. 576).

The institutional tradition, on the other hand, adopts a more detached stance looking at ways in which sector-wide structuration dynamics generate certain cultural pressures. Their interest is in understanding how pressures in the form of cultural norms, symbols, and beliefs constrain and empower organizations and organizational actors (Suchman 1995). Suchman places himself between these two approaches and defines legitimacy as “a generalized perception or assumption that the actions of an entity are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs and definitions” (Suchman 1995, p. 574). This conception of legitimacy refers to legitimacy as a state where an organization is judged to be appropriate by its environment, either by stakeholders or by society as a whole. Legitimacy is here an indication of social acceptance and is a reflection of the role of the organization or institution in society and how it lives up to expectations and norms. In this sense it is associated with a certain taken-for-grantedness (Tost 2011) and thus indicates there is no reason for further scrutiny or questioning.

Suchman’s (1995) distinction between three types of organizational legitimacy has been applied in studies of legitimacy in relation to CSR (Palazzo and Scherer 2006; Scherer et al. 2013; Rendtorff 2009; Baumann-Pauly 2013) and social enterprise (e.g., Dart 2004; Huybrects et al. 2014). The first, pragmatic legitimacy, rests on the self-interested calculations of an organization’s stakeholders and is motivated by perceived benefits. If stakeholders believe that there are benefits for them, they will judge an arrangement legitimate. “Moral legitimacy reflects a positive normative evaluation of the organization and its activities” (Suchman 1995, p. 579). It rests on judgments of whether the activity or organization lives up certain norms or values and whether the activity seems to be the right thing to do, rather than a calculation based on narrow self-interest. Cognitive legitimacy refers to meeting a more basic taken-for-grantedness and the expected reality of stakeholders and society, at the level where it is even impossible to think that things could be otherwise (Suchman 1995; Dart 2004). The source of legitimacy is thus stakeholders or society as observers of the organization, who assess its conformity to a specific standard or model (Ruef and Scott 1998).

Thus, this is a concept of interest to organizational studies, not merely from an instrumental perspective but also for understanding the relationship between organizations and the societal environments in which they operate. Studies of legitimacy and institutional environment may have explanatory power for understanding legitimacy crisis of corporations or organizations, as well as understanding isomorphic pressures and the growth of, and myths related to, certain organizational forms or principles. These theories of legitimacy thus seek to explain why legitimacy is achieved or accorded, namely, because certain ideas of appropriate organizational conduct and cultural norms are met. These sociological/institutional conceptions thus may have explanatory power in relation to empirically observed de facto acceptance of certain phenomena, but they do not provide any broader political or normative framework to place this within. As Palazzo and Scherer (2006) state: “The self-reference of organizational legitimacy theory separates it from an appropriate analysis of societal changes” (Palazzo and Scherer 2006, p. 75). These ideas of legitimacy seem to stay within an empiricist understanding of legitimacy as social acceptance, without concerns for the acceptability or normative validity of legitimacy claims. This includes the moral legitimacy, which only says something about whether the moral expectations of society are met and not about whether these moral norms are normatively valid or desirable. Such concerns for justification are, however, found in political philosophy.

Political Philosophy and Democratic Legitimacy

In political philosophy, legitimacy is not a concept about organization but rather about institutions, especially political, legal, and democratic institutions. A concept of political legitimacy can be sociological in character in the sense that it can be a concept about when the citizenry accepts a political order or rule, and the question of when this is the case can be an empirical, rather than a conceptual, one. Gilley (2006), for example, develops a measurement of state legitimacy across 72 countries based on a definition of legitimacy as: “a state is more legitimate the more that it is treated by its citizens as rightfully holding and exercising political power” (Gilley 2006, p. 500). This particular part of the definition refers mainly to the efficacy of political power and does not say much about when a state actually also deserved that treatment. Gilley adds, however, that this relies on certain conditions, for example, that citizens are able to make autonomous judgments, the separation of political power from other types of social power, and the validity of subjective views on the basis of legitimacy (Gilley 2006). He thereby adds a normative dimension to the definition. Political and democratic legitimacy has also been linked to public sector research and to the legitimacy of reform trends in the public sector (Eriksen 1999; Langergaard 2011).

Parts of political philosophy systematically connect the concept of legitimacy to normative conceptions of democracy and autonomy. This also allows one to ask when what passes as public opinion is genuinely legitimate. Nancy Fraser (2008), for example, in her discussion of a transnational public sphere in a post-Westphalian world, distinguishes between the normative legitimacy and the efficacy of public opinion – two ideas that are essential to the concept of the public sphere in critical theory. Together they specify that in “mobilizing the considered sense of civil society, publicity is supposed to hold officials accountable and to assure that the actions of the state express the will of the citizenry” (p. 76). Fraser scrutinized the idea of “transnational public spheres,” a notion that needs further explanation as the idea of the public sphere historically emerged in a context in which the nation state was not questioned as the territorial basis of political communities that could constitute a public. The concept of the public sphere was developed not simply to understand communication flows but also to contribute to a critical theory of democracy. In this theory the public sphere is conceived as a space for the communicative generation of public opinion. Insofar as the process is inclusive and fair, publicity is supposed to discredit views that cannot withstand public scrutiny and to ensure the legitimacy of those that do. Fraser is thus concerned with a reconstruction of critical theory in the current notion of a "post-national constellation." This requires not merely referring to the public sphere in a relatively casual common sense way but ultimately to reconstruct the conceptions of normative legitimacy and political efficacy of communicative power (Fraser 2008).

It is a challenge of walking a narrow line between two equally unsatisfactory approaches: on the one hand, an empiricist approach that simply adapts the theory to existing realities, thereby risking to sacrifice its normative force, and on the other an externalist approach that invokes ideal theory to condemn social reality. The latter approach risks renunciation of a critical tradition. Her alternative is "a critical-theoretical approach that seeks to locate normative standards and emancipatory political possibilities precisely within the historically unfolding constellation" (Fraser 2008, p. 77). Her aim is to reformulate the critical theory of the public sphere in a way that can illuminate the emancipatory possibilities in the present constellation.

Habermas (1998) also works with this double dimension of legitimacy by arguing that "the validity of a legal norm means that the state guarantees both legitimate lawmaking and de facto enforcement" (p. 158). The procedure for lawmaking is pivotal to the legitimacy of law. According to Habermas (2005), political theory has given a double answer to the question of legitimacy: popular sovereignty and human rights. The principle of popular sovereignty determines a procedure which with its democratic characteristics forms a basis for legitimate results (Habermas 2005). Both Habermas and Fraser thus work with concepts of legitimacy that are also normative, rather than mainly empiricist and sociological. They can do so because they connect it to a normative concept of democracy rooted in the idea of public reason expressed through a public opinion formed under certain ideal circumstances, such as rights to communication and participation, which ensure the public autonomy of citizens (Habermas 2005). Fraser (2008) furthermore emphasizes that issues of inclusiveness and participatory parity, i.e., that all interlocutors in principle enjoy the same chances to state their views, are essential to the legitimacy of public opinion formed in a democratic public sphere (Fraser 2008, p. 93). Public opinion when it has been formed under such democratic circumstances is legitimate, because it is *reasonable*. The deliberative democracy model rests on the idea that under certain ideal conditions, the democratic procedure ensures that public opinion is informed by a public, practical reason. To Habermas practical reason resides in the rules of discourse and forms of argumentation that borrow their normative contents from the validity basis of action oriented toward reaching understanding (Habermas 1996). The legitimating force is built into the procedure of the principles of democracy.

This view also has implications for the understanding of the environment or society, which "accords" legitimacy to organizations, institutions, or laws, in a way that provides a contrast to the institutional theories of organizational legitimacy in the sense that it is concerned with justifying how public opinion can be reasonable if it is formed under certain ideal circumstances. Institutional theories work from a distinction between a technical and institutional environment, where the institutional environment is defined by generalized view or norms about appropriate conduct, norms that may not be entirely rational or reflect the most efficient or most functional ways of doing things. Rather the institutional view is a challenge to the notion of organizations as "rational systems" and an emphasis on the imperatives stemming from cultural norms, symbols, beliefs, and rituals (Suchman 1995). According to Meyer and Rowan (1977), organizations are driven to incorporate practices and procedures, which are based on "rationalized myths" of their efficiency, however without them necessarily being that (Meyer and Rowan 1977). This also suggests that legitimacy is not necessarily based on the "best," most rational, just, or functional organizational solutions.

Legitimacy in Relation to Public Sector Innovation, Social Entrepreneurship, and CSR

Social entrepreneurship, CSR, and public sector innovation are all, as mentioned in the introduction, new keywords for design and management of organizations in the public, private, and third sectors, respectively. They are sometimes described as if not quite panaceas then at least a powerful emergence (Dart 2004) that seems to have gained solid ground as organizing principles promoted by academia as well as policy makers. They work not merely as descriptions of new ways of organizing but function at the same time as imperatives of the right or best way to organize. That being said, it is important to mention that all three are broad and contested concepts, rather than monoliths. Nevertheless, they all each in their own ways represent solutions, or sometimes even seem to offer *the solution*, not only to the rational, newest way of organizing but also to the biggest social, ecological, and political problems of our time. This makes the question of legitimacy and how to understand legitimacy when researching these phenomena pertinent, especially as they rest on ideas (and have implications) that reach beyond the organizational level and also touch upon core principles of the three sectors of society. The following section will take a look at them one by one and discuss examples of ways that legitimacy has been described and discussed in relation to them.

Public Sector Innovation

The concept of legitimacy appears in various ways in relation to public sector innovation, and the way to understand it closely relates to how the public sector in itself is understood. Some researchers claim that innovation in public administration has been used to frame the necessary transformation of the public sector in order to improve its effectiveness and efficiency, and not least its legitimacy (Bekkers et al. 2013). Innovation has become an ambition for public policy and is seen as imperative for public service organizations that wish to demonstrate that they are responsive, efficient, and effective (Albury 2005; Damanpour and Schneider 2008; King and Martinelly 2005; Mulgan and Albury 2003; Moore 2005) or that they “create truly collaborative services” empowering citizens to improve their quality of life (Parker and Parker 2007; Langergaard 2011). It has in many ways become an imperative to public sector organizations, and some even claim that innovation should be a core activity of the public sector (Mulgan and Albury 2003; Considine and Lewis 2007). Still, public sector innovation is not a ubiquitous concept or a monolith. Rather, there is a myriad of ideas about how we are to understand public sector innovation that takes forms especially reflecting developments of public sector governance paradigms (Hartley 2005), moving from managerialist and business-inspired influences toward more collaborate, network-oriented understandings in which civil society plays a larger role. The first stresses the relation between innovation and efficiency gains, breaking down red tape and entrepreneurial culture (Osborne and Gaebler 1992), while the second tends to stress meeting the needs and wishes of citizens, thereby contributing to the “publicness” of the public sector in order to improve legitimacy (Bekkers et al. 2013; Newman and Clarke 2009). Common to these perspectives is the association of innovation with post-bureaucratic organizational forms and principles (du Gay 2004), and legitimacy cannot be discussed without considering the relation between organizational form as a reflection of understandings of the role of the public sector.

Legitimacy of public sector innovation thus relates closely to legitimacy of public administration and is at the same time closely related to understandings of what the public sector is and should be, something that also relates to understandings of the legitimacy of the state. As Eriksen (1999) argues, theories aiming to reform and innovate the public sector on the basis of, e.g., microeconomic thinking tend to miss out on the broader institutional perspective and work with a reduced idea of legitimacy (Eriksen 1999). The attempt here shall thus be to understand public sector innovation in a broader perspective and to view the legitimacy of the public sector as well as public sector innovation as compound of various legitimacy concerns. The point is that these dimensions of legitimacy all depend on the organizational form and role of the public sector. When, for example, market-based organization or networks provide the framework and normative principles for public sector innovation it has implications for the understanding of the public sector and its role and obligations.

One of these is administrative legitimacy, which, if the organizational form is viewed as a rational tool carrying out tasks, implies identification of a logically correct solution by interpreting rules and facts or applying expert causal knowledge (Olsen 2005). In a broader perspective, bureaucracy, as well as other forms of organization in which innovative activities take place, can also be viewed as an institution with a raison d’être and organizational and normative principles of their own. In this case legitimacy also implies concerns for a larger organizational and normative structure where government is founded on authority. In the case of bureaucracy, it is based on the belief in a legitimate, rational-legal political order and the right of the state to define and enforce the legal order. Binding authority is claimed through a fourfold rule-bound hierarchical relation: between citizens and elected representatives, democratic legislation and administration, within administration, and between administration and citizens as subjects and authors of the law (Olsen 2005). The latter of these can be conceptualized as democratic legitimacy. Administrative legitimacy is not necessarily merely a question of a narrow solution to certain public tasks but also a question of solving these within the normative and institutional framework, which implies democratic and legal concerns, e.g., rule of law, citizen rights, and due process (Langergaard 2011).

Democratic legitimacy can, as described above, be seen as relying on the autonomy of citizens. Main points about this have already been presented above, so here it shall be unfolded a bit more with Habermas' idea of the co-originality of public and private autonomy. It means that law is directed to persons who could not even assume the status of legal subjects without subjective private rights. Thus, the public and private autonomy mutually presuppose each other. There can be no law at all without actionable subjective liberties that guarantee the private autonomy of individual legal subjects. And at the same time, there can be no legitimate law without democratic lawmaking by citizens in common who as free and equal subjects are entitled to take part in this process (Habermas 1996, p. 130). The point is that individual rights and autonomy are dependent of public autonomy and citizens recognizing each other as free and equal, who together take part in the making of laws regarding the conditions for their common life. From such a perspective, we could see the public sector as accountable to the public will that ensures the legitimacy of its authority. And citizens' rights are central here. This is one conception of the "public" that constitutes the "publicness" of the public sector (Langergaard 2011). If this is redefined and viewed from a consumerist perspective or a network governance perspective, the conditions for legitimacy are also redefined. For example, a consumerist perspective could redefine the input as a market-like demand from the public understood as an aggregate of preferences, rather than as something connected to autonomy and political rights (Langergaard 2011). Legitimacy in relation to public sector innovation, in a normative sense, thus always follows the idea about what the public sector is and should be. The point is that legitimacy of public sector innovation cannot be understood independently of such concerns. It is a question of upholding a focus on the public sector as societal, political institutions, which have certain tasks and conditions for legitimacy.

Social Entrepreneurship

Social entrepreneurship and social enterprise have received increasing attention in the reorganization of the third sector, nonprofits, and NGOs but also sometimes as new ways of doing business that are more "social." There are various definitions and understandings of social entrepreneurship that all emphasize different dimensions. Often social entrepreneurship is defined as a new way of serving social needs in society (Gawell 2013) or as entrepreneurial activity undertaken with the aim of producing social, rather than commercial, value (Dees et al. 1998; Dart 2004).

Social entrepreneurship is sometimes said to be an ill-defined, fuzzy concept (Diochon and Anderson 2011), and there is not yet consensus about what social entrepreneurship is and, for example, whether it is only applicable to nonprofit organizations (Hervieux et al. 2010). The concept is stretched between forces or marketization on the one hand and forces emphasizing collective action and civil society mobilization on the other (Hulgård and Andersen 2012). Empirical studies have demonstrated that this often leads to tensions in social enterprises (e.g., Diochon and Anderson 2011; Dey and Teasdale 2013; Eikenberry 2009; Mason 2012; Froggett and Chamberlaine 2004). This ambiguity has led to a variety of ways that legitimacy has been studied within social entrepreneurship research (Dart 2004; Huybrects et al. 2014; Hervieux et al. 2010). Hervieux et al. (2010) claim that the move by social purpose organizations toward more commercial means raises legitimacy challenges for social entrepreneurs and forces them to operate in the intersection of two fields with opposed legitimacy norms (Hervieux et al. 2010). Such studies may indicate that the blurring of boundaries and principles associated with societal sectors leads to ambiguity at the internal organizational level for social enterprises in search of legitimacy. Social entrepreneurship thus can be conflicted between civil society and market-based norms of legitimacy.

From the perspective of institutional theory, Dart (2004) aims to explain the emergence of social enterprise as a new prominent form of organization in the nonprofit sector. He applies Suchman's concepts of legitimacy and connects the emergence of the social enterprise form with wider societal, ideological, and political dynamics. The typology offers explanations for the "emergence of social enterprise as a newly legitimated institution and suggests that we can as readily frame social enterprise as a 'faddish' response to changes to the socio-political environment as a rational adaptation that produces valued results" (Dart 2004, pp. 411–2). Dart thus deploys the institutional theory concepts of legitimacy to challenge economic and rationalist explanations for the emergence of social enterprise. Rationalist explanations often portray social enterprise as a superiorly rational and functional solution to public sector funding and philanthropic resource constraints. The institutional theory perspectives, according to Dart, enable us to understand the emergence of social enterprise as a response to a broader and more complex societal context. It emphasizes the nonchoice and nonrational bases for organizational forms and structures and the conformity to societal and stakeholder expectations. In the process of legitimation, things are "infused with value beyond the technical requirements at hand" (Selznick 1949, p. 17 quoted in Dart 2004, p. 416).

Dart asks the question about how we can understand social enterprise as *legitimated* in contemporary society. This question refers to the process of legitimation from an empirical perspective, and in this sense is a different question than how to understand social enterprise as legitimate from a normative perspective, in the sense of desirable. Exactly the idea that legitimacy is not granted on the basis of reason or rationality, or because the organizational form, conduct, or principles are the most efficient, functional, or ethically sound, means that organizations or organizational principles can be perceived as legitimate irrespective of their actual consequences or implications. Social enterprise is portrayed as a business-like contrast to the traditional nonprofit organization, which has gained wide acceptance in a neoconservative pro-business social environment in which pro-market ideological notions have gained broad validity (Dart 2004). Studies of legitimacy in social entrepreneurship thus revolve around the tensions experienced in the intersection and between market logics and civil society logics. Thus, again organizational legitimacy is not merely about the organization but also about defining the sector in which it works.

Dart's (2004) article works within institutional theory and with legitimacy as a state where an organization is judged as appropriate by its environment, either by stakeholders or by society as a whole. Legitimacy is here an indication of social acceptance that is also a reflection of the role of the organization or institution in society and how it lives up to expectations and norms. In this sense it is associated with a certain taken-for-grantedness (Tost 2011) and thus indicates there is no reason for further scrutiny or questioning. But, the perspective of the analysis that elucidates the political underpinnings of certain understandings of social enterprise or social entrepreneurship makes it possible to raise a critique or at least opens for a potential discussion of alternatives, which, for example, links legitimacy of social entrepreneurship more closely to civil society. It does not, however, provide any normative content in itself by which to substantially problematize the emergence of market thinking in the third sector. In the following, an attempt to merge Suchman's concept of legitimacy with a normative concept of democratic legitimacy in the field of business legitimacy will be presented and discussed.

CSR and Business Legitimacy

CSR studies have focused intensely on legitimacy, something that is hardly surprising as CSR is seen as a means to business legitimacy (Garriga and Melé 2004). Bachmann and Ingenhoff (2016) present CSR as "a way for a company to gain the license to operate and goodwill in the public eye" (Bachmann and Ingenhoff 2016, p. 386). As with social entrepreneurship and public sector innovation, the CSR field offers "a landscape of theories but also a proliferation of approaches, which are controversial, complex and unclear" (Garriga and Melé 2004, p. 51) and is composed of a large number of definitions (Dahlsrud 2008; Cradden 2005).

How CSR is understood depends on how the relationship between business and society is viewed, including the role of business in society. When Friedman, for example, in an essay from 1970, argues that the responsibility of business is to increase its profits (Friedman 2008), it rests on certain assumptions about what a firm or an enterprise is (and should be), who it serves, and what the division of labor between private sector and public governance should be (see Robé 2012 for a critique of Friedman's argument). Such assumptions have political implications, viewing the private company as an apolitical unit, and can even serve as window dressing of ideology (Robé 2012). In the literature on business legitimacy, we find an array of studies all deploying different understandings of legitimacy (e.g., Rendtorff

2009; Baumann-Pauly 2013; Scherer et al. 2013; Palazzo and Scherer 2006). An important point here is that the debates on the legitimacy of corporations or firms inevitably touch upon the question of what a market-based corporation is, not so just empirically but also from a normative perspective. In other words, these research contributions centre around the question of the normative constitutive conditions for market-based organizations, i.e., not only what they are but what should they be and what is their place in society and economy – and thereby they touch upon deeper political philosophical questions as well.

Institutional and strategic theories of legitimacy, including Suchman's, are relevant for legitimacy management and thus for understanding how to gain, maintain, and repair legitimacy (Suchman 1995). However, they seem to have their shortcomings with regard to understanding these societal and political dimensions of business legitimacy and of placing the question of legitimacy within a broader political understanding of organizations in the context of different sectors or spheres of society. Palazzo and Scherer (2006) take up such a critique and conceptualize legitimacy in relation to CSR on the basis of a development of Suchman's division between pragmatic, moral, and cognitive legitimacy. Following what they present as a new political role of corporations in light of a "loss of efficiency in national governance systems values, and lifestyles" (Palazzo and Scherer 2006, p. 71), they develop a notion of moral legitimacy as "legitimacy as deliberation" within a communicative framework.

Their aim is to re-embed the debate on corporate legitimacy in political theory and to re-embed economy in its sociopolitical context. Palazzo and Scherer (2006) claim that there has been a shift in the economic and political context in which corporations operate, one that is characterized by globalization and by a shift from liberal to deliberative democracy and from a national to a post-national, pluralist constellation that alters the role of the political institutions and the state as well as the role of business in society. Questions of legitimacy are thereby linked not only to organizational conduct but also to the overall political and economic systems, in which organizations operate. CSR studies have tended to pay more attention to cognitive and pragmatic legitimacy than to moral legitimacy, thereby stressing compliance to law and a relatively stable and homogeneous societal expectation to corporate conduct. This apolitical representation of business, they claim, does not reflect the new context that they operate in and the actual roles that corporations take in society. They redefine the corporation as a political player whose legitimacy is based on civil society discourses, although they still depend on making a profit. Furthermore, they stress that corporate activities have expanded into different countries, cultures, and legal systems and thus rarely operate in a homogeneous ethical and legal environment. This leads to a multiplicity of often contradictory moral and legal requirements making it difficult to identify which demands will define the legitimacy of organizational behavior. This challenges the taken-for-grantedness that is associated with cognitive legitimacy. On the basis of these reflections, they develop a concept of corporate legitimacy as deliberation, which implies a shift toward moral legitimacy and which is intended to better take into account the new political role of corporations in society. Management of moral legitimacy is in this perspective conceived of as deliberative communication, which aims to convince others through reasonable arguments rather than by manipulation. In their redefinition they draw on political philosophers, for example, Habermas, and define political in line with Young (2004) as activities “in which people organize collectively to regulate or transform some aspects of their shared social conditions, along with the communicative activities in which they try to persuade each other to join such collective actions or decide what direct they wish to take” (Young 2004, p. 377 in Palazzo and Scherer 2006, p. 75).

The concept of legitimacy as deliberation is more or less a direct adoption of a model of deliberative democracy (as developed by, e.g., Habermas) into the field of corporate legitimacy. Their version emphasizes the role of civil society in light of the portrayed loss of state or government power. What they describe as “globalisation from below” (Palazzo and Scherer 2006, p. 71) where the shrinking power of the political system is partly compensated for by a politicization of civil society itself where NGOs plays a larger role and where the link between economy and civil society is politicized. The new basis of legitimacy is thus organizations’ involvement in processes of active justification vis-à-vis society through engagement in public deliberation, rather than simply responding to powerful groups. They thereby not only redefine the corporation as a political actor but also fundamentally challenge a traditional view on state, market, and civil society by bringing the corporation into the political sphere, a political sphere in which the state or other traditional political institutions apparently no longer have a central place.

Scrutinizing their argument, it appears that it is based on implicit and explicit premises that have implications for the concept of legitimacy that they develop and regards the question of what happens when a concept of legitimacy developed for understanding the political and public sphere is transferred to another sphere, in this case of private corporations. Their argument is based on a claimed shift from liberal to deliberative democracy. The main point of introducing this shift seems to be the claim that the liberal understanding of economy and corporations is outdated. Especially, the separation between state, market, and civil society and the liberal idea about these spheres are criticized for contributing to a depoliticized view on the corporation, because it sees corporations and economic actors as an extension of the private self and therefore not subjected to immediate legitimacy demands beyond legal requirements and rules of common decency (p. 75). With such a strict separation between the spheres and between political and economic responsibilities, the obligations of corporations to contribute to a broader common good or to political causes are modest, even if their operations and conduct have wide consequences not only for economy but also for societies, environment, and human rights. This leads Palazzo and Scherer to conclude that corporations today have become quasi-public because of their unintended side effect and lack of global regulation (p. 77). Such unintended side effects are hardly something new. Large corporations and industry in general have always had extensive effects on societies and nature, including a variety of unintended side effects. The shift from liberal to deliberative democracy is stated as an undisputable empirical fact, but without providing any empirical evidence for such a wider political shift, besides claiming that it follows from globalization and that states have lost power (p. 75). Such a claim is not politically neutral, especially not when it leads to the reformulation of a political sphere not only encompassing corporations but also attributing them a central and powerful role. By not critically addressing this loss of power of states and political institutions, and instead apparently accepting that corporations can take a political role, they risk not only to describe the power of corporations but also to legitimate an extended power of corporations – thereby effectively expanding the power that corporations already have.

At least two premises are central here, which constitute the normative foundation for their concept of deliberative legitimacy. First, the question of what a corporation is and should be. In other words, can and do corporations take on the political responsibility that Palazzo and Scherer seem to believe? There is a conceptual as well as empirical dimension to this question. On the one hand, the narrowly economic and profit-oriented view on corporations/firms is a theoretical construct, which can be challenged and is not without problematic ideological implications. On the other hand, it is a question of whether corporations in this time and age of global capitalism are ready to and have the incentives to behave responsibly as political actors in the way portrayed by Palazzo and Scherer.

The other premise is that we have a well-functioning transnational public sphere that is capable of providing the communicative input to the discursive legitimation processes of corporations. From an empirical point of view, there may be certain instances where such a public sphere appears to be real and to have power (e.g., in cases of legitimacy crisis of multinational corporation with, e.g., boycotts and loss of profit as a consequence), but the question is if such instances reflect more or less arbitrary mobilizations or if they should be read as the existence of a public sphere in a more stable sense. From a critical theoretical and democratic perspective, the question is if there is a public sphere, which can work as a space for communicative generation of public opinion in a sense that can be conceived of as legitimate from a normative perspective, as Habermas and Fraser are concerned with. The question is relevant because it points to certain assumptions about the legitimacy-granting environment, and thus it is essential to the concept of legitimacy being developed by Palazzo and Scherer. The premise seems to be that there actually does exist a public sphere that potentially can provide a morally or publicly reasonable judgment of the conduct of corporations and furthermore that it actually does it. They further claim that: “Today, citizens look deeply into the operations of a company and they therefore enforce transparency and accountability where it is not delivered on a voluntary basis” (Palazzo and Scherer 2006, p. 81). These are the empirical premises of the argument, and the question is how accurate these are. Some studies suggest that it is sometimes very difficult for consumers to get an insight into the operations of companies, sometimes due to subcontracting or other conditions that hinder such transparency (see Labowitz and Baumann-Pauly 2014). At a normative, conceptual level, there are premises which are not addressed but nevertheless seem to be central for their concept of legitimacy to work the way they intend it to. Fraser’s (2008) discussion of a transnational public sphere presented above reflects the conditions that must be in place for public opinion to have normative legitimacy, namely, inclusiveness and participatory parity. In order for the public opinion to be informed by practical reason, certain procedural circumstances must be in place, at least from a normative political philosophical perspective. Fraser (2008) mentions this challenge and argues the idea of legitimate public opinion is not easily associated with communicative arenas in which the interlocutors are not fellow members of a political community, which gives them equal rights to participate in public life. She also argues that it is hard to associate the notion of efficacious communicative power with discursive spaces that do not correlate with sovereign states. Thus, from the perspective of critical theory, it is not clear what it means today to speak of transnational public spheres. This means that there is a need to reconstruct the conceptions of normative legitimacy and political efficacy of communicative power (Fraser 2008, p. 77). Besides, the public opinion must also have some effective authority over corporations, and without political institutions, first of all to grant political rights to citizens, or to execute the public will and also regulate effectively by law, the scenario appears less convincing. Palazzo and Scherer do not address or attempt to deal with this challenge, which means that their concept of deliberative legitimacy stands without a well-developed normative, or empirical, foundation.

The move from Suchman's concept of moral legitimacy to communicative legitimacy implies a shift that is unaccounted for in the article, namely, from a sociologically oriented to a normative concept of legitimacy. Moral legitimacy in institutional theory denotes acceptance based on certain ethical or moral standards of society, but it is concerned with morality as an empirical phenomenon and not a normative one. Democratic legitimacy in the critical theoretical tradition is also concerned with questions of normative justification, i.e., when public opinion is formed under circumstances supporting public practical reason and thereby normative validity beyond mere de facto acceptance. The normative dimension concerns the procedure for public opinion formation and the conditions ensuring this rather than at the content or substance of public opinion. The point is that the concept of democratic legitimacy cannot immediately be transferred directly to a market context without reformulating the foundation that it builds upon. In order to reformulate the concept of the corporation and develop a concept of corporate legitimacy that takes the political role of corporations into account, one must rethink the empirical and normative foundation for a concept of normative legitimacy that fits the political view on the firm, but in a way in which the premises are laid out so that the ideological implications can be openly discussed.

Conclusion

The chapter has discussed legitimacy in relation to public sector innovation, social entrepreneurship, and CSR, three trends and widely promoted organizing principles for public, private, and third sector organizations, respectively. They are not only organizational principles but also about spheres of society and the organizational forms under them, especially when they are connected to a concept of legitimacy. Questions about what a corporation is and what it should be and do seem to be mixed in with discussions of CRS and legitimacy. Similarly, questions of what is a public sector organization and how innovation supports its main functions can only be answered within a certain idea about what the public sector is and should be, and thus it will always have normative, political implications. The question is where this leaves us with research in legitimacy in relation to organizational phenomena as these.

To start with, a sociologically oriented and more or less generic concept of legitimacy, as the one we find in institutional theory, can have explanatory power regarding empirically observable processes of legitimation. It can explain why certain organizations may maintain acceptance and their license to operate, and it can also help us to understand why some organizations end up in legitimacy crises with loss of reputation and profit as consequence. Depending on the view on these processes and their predictability and manageability, such knowledge may be of interest if one wishes to manage and control an organization's legitimacy. Furthermore, as we have seen with Dart's analysis of legitimacy of social enterprise, such concepts of legitimacy can be deployed in critical analysis elucidating how certain organizational forms or principles get support on the basis of wider ideological trends, rather than because they are necessarily more efficient, functional, or in other ways normatively superior. Such concepts of legitimacy cannot, however, provide input to a more substantial normative critique or discussion of the legitimacy of organizational trends.

Another difference between the institutional and democratic concept of legitimacy as they have been presented in the chapter is the understanding of who accords legitimacy and how, in particular from the question of rationality or reason. Whereas institutional theory does not attach any necessary rationality to legitimating processes, critical theory and political philosophy shows an interest in also the justification of legitimacy based on public opinion formation and thus rationality. This also provides the foundation for a normative concept of democratic or political legitimacy, where the procedure for opinion formation is important for legitimacy. Normative concepts of legitimacy, for example, democratic legitimacy, deliberative legitimacy, and sometimes legitimacy of the state, aim to answer another set of questions regarding organizations, or institutions, and their legitimacy. They are concerned with how we can justify that democratic input to law and political institutions is normatively binding and represents a public, practical reason. Transferring such a concept to contexts, such as corporations, where first of all the empirical conditions for opinion formation are very different and it is not clear how public opinion should be legitimate, second where the type of organization is not political in the same sense that a state or public sector organizations is, is problematic. The normative constitutive conditions for the respective organizational types are different, at least if one accepts that organizational legitimacy is linked to the sectors and their roles and even if one aims to redefine the corporation in a way that breaks with a narrow economic and self-interested conception.

The discussions of the chapter have argued that legitimacy is a concept reaching beyond the organizational level, but it has also been suggested that legitimacy claims, and thus conceptions of legitimacy, may differ between organizations in different sectors of society, thereby reflecting the political idea and role of these sectors. The question following from this is if we need different concepts of legitimacy or a concept encompassing a variety of forms to match the different sectors. This is however not without challenges – as it has political implications just as much a shifting the boundaries between the sectors has. Such an approach may risk losing empirical explanatory power in light of new hybrid forms and blurring of boundaries, and normatively speaking there is a risk of cementing certain ideas about the sectors and their roles, for example, by accepting that business corporations are merely economic actors pursuing strategic goals. However, with a critical approach that reflects openly upon the empirical, normative, and political implications, it should be possible to become clearer about legitimacy. As indicated above it depends on what the concept of legitimacy is supposed to give an answer to, whether the research interest is about managing legitimacy, understanding legitimation processes, critically assessing the normative legitimacy or desirability of certain organizational forms or organizational conduct, or to understand the role of different organizational form within a broader political, economic framework of different societal spheres.

Publicly Owned Company Legitimacy: Opportunities and Challenges

24

Contents

Abstract

Business legitimacy in publicly owned companies has underwent a journey since the initiation of the New Public Management era in the late 1980s until today. Many former natural monopolies, such as the water, waste, oil/gas, transportation, electricity, and postal sectors, have during the last 30 years been privatized and have been granted a license to operate based on economic as well as environmental regulation of these sectors. However, since the first two decades have dealt with business legitimacy issues concerning the price setting of common or natural resources, now the threat is pointing more toward a quality issue, which, ultimately, can and may affect the price setting policies as well. This chapter presents a historic overview of the business legitimacy situation of publicly owned companies and shows a case study of a Danish water company that faces

dilemmas of how to deal with drinking water quality issues of pesticide pollution. The chapter concludes that the business legitimacy of publicly owned companies often consists of dilemmas, which make both the opportunities and the challenges of managing these kinds of companies.

Introduction

Publicly owned company legitimacy is often bound to special rights and duties, obligations, and expectations hinged to the public sector itself, weather such companies are formed out of former public sector estates (state, regional, or municipality) or have been constituted through public-private partnerships or privatized fully (Bakker 2003; Pollitt 1999; Lauesen 2014; Guislain and Kerf 1995).

These rights and duties, obligations, and expectations include, for instance, specific detailed specifications on service and supply, equal treatment of users, continuity of service, maintenance obligations, and perhaps investment plans to renew infrastructure. They are often connected with special resource sectors such as the water, waste, oil/gas, transportation, electricity, and postal sectors similarly (Pollitt 1999; Lauesen 2014; Fitzmaurice 2006).

In these sectors, different degrees of natural monopolies are present, and with natural monopolies – in opposition to a free market – legitimacy is often granted through a license to operate and a regulatory control system to ensure the public expectations of the behavior of the company in charge of the managing of these natural monopolies (Guislain and Kerf 1995; Majone 1996; Bakker 2003).

As an example – a publicly owned water company – can have granted its license to operate from the state and the local region or municipality in which the company operates with the control system on both state level (fx a regulatory state office) and municipal level (fx tariffs and other behavioral issues controlled by city council politicians or an elected board) (Guislain and Kerf 1995; Pollitt 1999; Bakker 2003; Lauesen 2014).

The reason as to why a publicly owned water company contains a natural monopoly status with few or no competitors, can possibly be traced back to national, international, and intergovernmental agreements regarding the resource – water – is and should be a public good and thus publicly owned and distributed evenly among citizens (Fitzmaurice 2006).

Sometimes, as for the case on water, access to the resource is so vital that states agree on that it cannot be left to the free market to profit on at the expense of those customers, who cannot afford to make a living or even to live and survive without free or cheap access to clean, fresh water. It is per se a natural monopoly (Lauesen 2014).

In the case on water, Fitzmaurice (2006) states that the access to this vital resource is connected with intergovernmental as well as national agreements on human rights, although in its early days, it was "not mentioned at all in either of the United Nations covenants on human right or in the 1948 Universal Declaration of Human Rights" (p. 540).

There are many examples of the various constellations of how natural monopolies have been managed by publicly owned companies or private companies and equally many examples on how the ideal situation as described above – ensuring human rights – is violated by both publicly and privately owned companies, which Fitzmaurice also mentions. However, this chapter will not focus on efficient versus inefficient management methods used by such companies, corruption or anti-corruption, nor any other of the very many issues attached to managing a public good.

The focus of this chapter is on the business legitimacy of publicly owned companies including its rights, duties, obligations, and expectations these companies are expected to fulfill, and which dilemmas and issues adhere to their licenses to operate.

As a showcase, we will demonstrate how a Danish small water company faces newly (2019), nationally detected issues of finding the pesticide dimethyl-sulfamide (DMS) in the groundwater, which is so difficult to remove that the best technology available for the job is based on ozone or hydrogen peroxide treatment, whose downside is that a side product, N-Nitrosodimethylamine (NDMA), which is carcinogenic, is created.

The philosophy is to deal with pollution at the source and minimize more advanced water treatment at the water utilities. This is expressed in the national groundwater policy, which states that production of drinking water should be based on clean groundwater.

How can such a dilemma be resolved?

Overview

First, we provide an overview of legitimacy perspectives for publicly owned companies, in which we highlight an institutional approach focusing on a political approach to legitimacy. Next, we show the opportunities and challenges for publicly owned companies' legitimacies with a focus on their license to operate. Then, we highlight the historic legitimacy failures in publicly owned companies as an initial result of privatizing former national monopolies, and finally, we discuss contemporary legitimacy issues with publicly owned companies with a case study of a Danish water company called Water & Waste Denmark. We conclude taking the contemporary issues into perspectives and suggest and invite to a discussion on how to protect the nature and the consumers in order to mitigate a potential legitimacy issue with the example from the Danish water sector.

Legitimacy Perspectives for Publicly Owned Companies

In the late 1980s, the legitimacy of publicly owned companies in monopolized sectors was formed due to a worldwide delegitimizing movement of state and municipality entities that was thought of as being ineffective and inefficient.

The neoliberal thought regime called New Public Management based on deregulation, marketization, privatization, and the aim to bring former state/regional/municipal resort areas to be more effective and efficient with modern business management ideologies began in the Anglo-Saxon regions (New Zealand, the UK, Australia, and the USA) and soon spread via the OECD to all member states (Pollitt 1999; Lauesen 2014; Majone 1996).

Some researchers mention various geopolitical issues initiating the delegitimization of state/regional/municipal sectors and forming the New Public Management movement, such as the oil crisis in the early 1970s followed by economic recession, high unemployment, and low GDP and productivity growth (Pollitt 1999, p. 3) in the 1980s. Others claim that opinion polls in the UK showed a majority against the privatization movement (Crewe et al. 1988; cited in Pollitt 1999, p. 7).

The privatization movement on natural monopoly sectors formerly managed by public bodies is typically established with a new regulatory state apparatus to oversee the managerial advancements and legal obligations upheld by the new – often – private companies. First, an attempt in 1989 (Bakker 2003) to create a kind of a market just by privatizing former natural monopolies failed, because tariffs skyrocketed on water, electricity, and gas (Pollitt 1999). There were de facto no competitors. Privatized natural monopolies were still monopolies. Many citizens could not pay their bills on water, electricity, and gas, and poverty escalated despite the regulatory state apparatus control from the Environment Agency, the Drinking Water Inspectorate, and the Office of Water Services (Ofwat) controlling environmental impact, controlling drinking water quality and groundwater management, and controlling tariffs and setting price caps, respectively.

Returns to shareholders of 20% in average (Miller-Bakewell 1998) and increase on so-called water poverty and water-related health issues among low-income consumers gave consumer advocacy groups success in various court cases and increased the political incentive to tighten the screws on privatized monopolies (Bakker 2001, 2003).

In the UK, a local tariff reduction scheme and price cap mechanism were established to keep costs and tariffs down. Annually, or biannually, all companies in the same sector are compared in a national benchmarking on multiple score systems, and based on average costs, earnings, assets, and so forth, all companies receive individual price caps reflecting how effective the model predicts them to be (come) (Lauesen 2014).

Competition was in the regulatory system sought after through an annual national benchmarking accounting setting the boundaries for pricing policies and tariffs in terms of price caps on the companies (Littlechild 1988; Pollitt 1999; Lauesen 2014). However, in the beginning, the regulation in the UK was regarded as light but has since become much tighter – especially in the water sector (Bakker 2003).

In the US, they used a so-called "rate of return" regulation, which allows a certain profit on their capital assets (Vickers and Yarrow 1988; cited from Pollitt 1999, p. 10). The effect, however, was that privatized monopolies sought to increase their capital assets instead of reducing costs and tariffs.

In the UK, new strong regulation dropped rates of returns to 0–2% in 2000, and tariffs dropped approximately to 12% in average. Hereafter, many UK water companies faced difficulties in maintenance and investment capacity, and alongside tremendous debt, the movement has turned from private toward public ownership and operation, multi-aggregation with less regulated sectors, or internationalization of operation (selling to overseas corporations) (Bakker 2003).

Failures that the Ofwat calls "intellectual neglect" – i.e., long-term asset deterioration due to underinvestment – caused by the pure focus on profit optimization in UK water companies (Bakker 2003) has led to an extensive outsource of operations, while asset owners are debt-financed.

The privatization movement has made multiple different company constructions from fully private companies operating a public good or resource to fully publicly owned companies doing the same – and many quasi-private companies in-between (Guislain and Kerf 1995; Bakker 2003).

In the UK, most former public monopoly sectors remain owned by private stockholders; however, the government can terminate their licenses after 25 years with a 10-year notice (Guislain and Kerf 1995).

Pollitt (1999) mentions the "wider share ownership and employee ownership" (p. 5) as a main driver for the fully privatization of UK monopolies, which – allegedly – occurred by accident. The sale of shares at a discount in Amersham International (1982), British Telecom (1984), British Gas (1986), BritOil (1982), and many more companies to come to individual shareholders and employees in order to encourage public mass participation in the privatization became very popular and gained political advantage for the Thatcher government throughout the 1980s. Many soon sold their shares with a benefit to fewer larger stockholders.

Since the beginning, UK companies have had a second movement, where some have either separated asset ownership from operation and maintenance, returned water supply to public control through a nonprofit consumer-owned corporation or community mutual, or aggregated with more unregulated sectors in large diverse conglomerates (Bakker 2003).

In other countries such as in France, the state typically owns the assets – except in special concessions, where a private operator owns the assets during the concession contract. Often, private companies operate the services in France (Guislain and Kerf 1995; Bakker 2003).

In the USA, most utility companies are fully privatized and represented in many states; other companies are still owned by the municipality. They all share a similar federal institutional setup and regulation across states; however, regulation differs very much and is not inherently as effective as it could have been (Beecher 2009; CSS 2011). In the USA the Environmental Protection Agency (EPA) regulates the law implementing environmental impact by utility companies for natural protection in general. The economic regulator is the public utility commission at state level organized by the National Association of Regulatory Utility Commissioners (Lauesen 2014, p. 161).

In South Africa, utilities are mainly privatized and regulated nationally (Lauesen 2014, p. 162).

In Asia (e.g., China, Indonesia, Pakistan, Philippines), a single, private bulk provider of power, water, and other utility services can sell it to any customer including public utilities. In this model, the private bulk provider bears the market risk, and has the right and tools to make buyers pay or cut off the supply, except for public utilities that may be protected from cutoffs, and instead provides government monetary guaranties to the bulk owner (Guislain and Kerf 1995).

In Scandinavia, some monopoly sectors are privately owned, while others are publicly owned (Lauesen 2014).

An Institutional Approach to Legitimacy

Legitimacy in institutional theory is understood from various perspectives. They vary from strategic-managerial perspectives to cultural, normative, moral, pragmatical, consequential, procedural, substantive, and cognitive organizational perspectives often found in institutional theory (e.g., Selznick 1949; Meyer and Rowan 1977; Cyert and March 1963; Weick 1969; Salancik and Pfeffer 1978; Zucker 1983; Greenwood and Hinings 1988; Scott and Meyer 1991; Meyer and Rowan 1991; DiMaggio and Powell 1991). Suchman (1995, p. 574) defines legitimacy from an institutional perspective as:

> Legitimacy is a generalized perception or assumption that the actions of an entity are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs, and definitions.

Suchman (1995) attaches to the above definition a thorough description on how managers gain, maintain, and repair legitimacy; however, this suggests a perception of legitimacy as something one can *get* and *lose*. In monopolies, legitimacy is granted through a license on a much stricter entrance level than companies on the free market. Although monopoly companies can theoretically lose their license to operate and thereby their legitimacy, there is a very different approach and rules attached to it rather than traditional stakeholder relationship and dependencies.

Stakeholders can agree or disagree on decisions made by a monopoly company, but since most decisions are made in a political arena – under democratic voting principles – stakeholders, who may disagree, have a weaker claim than toward a company on the free market. Thus, sensitivity toward stakeholder claims is different in terms of the behavior of the monopoly company in a *desirable, proper, or appropriate manner within some socially constructed system of norms, values, beliefs, and definitions*; it is to a higher degree linked toward *laws, procedures,* and *rules* rather than individual perception and claims (Majone 1996).

In such a system, which could be called a new variation of the former bureaucracy (Weber 1968), DiMaggio and Powell (1983) argued in *The Iron Cage Revisited: Institutional Isomorphism and Collective Rationality in Organizational Fields*:

> Bureaucratization and other forms of homogenization emerge, we argue, out of the structuration (Giddens 1979) of organizational fields. This process, in turn, is effected largely by the state and the professions, which have become the great rationalizers of the second half of the twentieth century. For reasons that we will explain, highly structured organizational fields provide a context in which individual efforts to deal rationally with uncertainty and constraint often lead, in the aggregate, to homogeneity in structure, culture, and output.

The legitimacy in that point of view lies in the context and the process toward homogeneity. If DiMaggio and Powell are right, legitimacy could be described in one word: *homogeneity.*

However, both Suchman's definition of legitimacy and DiMaggio and Powell's claim of collective rationality in institutional isomorphism are very broadly conceptualized aiming at any kind of organization in any kind of professional field.

Since most companies exist on the market, whose legitimacy is based on multiple stakeholder activities and freedom to adjust according to stakeholder pressure, monopoly companies are in a very special situation with a special regulation. Their legitimacy is attached to a license to operate different from actors on the free market. They need further specification than cognitive, cultural, and collective unconscious schemes. They are justified through consciously negotiated schemes based on geopolitical interests that – despite global governmental and constituency differences – are quite isomorph, not only in profession fields but down to company level (Majone 1996).

A Political Approach to Legitimacy

In political theory, legitimacy is understood as any kind of government that must rest on the consent of the governed (Näsström 2007). When a certain type of business is governed – weather it is governed on the free market or in a regulated sphere such as monopolies – the legitimacy of the regulated lies within the regulation.

Surely, businesses on the free market must also abide to various laws and rules, and they are to some extent overseen by authorities and regulations as well; however, monopolies – weather in China, the USA, the UK, Scandinavia, or South Africa – tend to be isomorph as a consequence of being governed by the regulation.

Monopolies are typically governed by a regulative legitimacy based on a set of politically decided rules and managed by ministries and public officials. Regulatory legitimacy is also referred to both political and institutional theories as *procedural legitimacy* (Berger et al. 1973; Scott 1977, 1992; Majone 1996; Suchman 1995). (Political theory includes the role of culture, religion, moral, cognitive, etc. in legitimacy issues as described under institutional approaches; however, the term used for this is in political theory called *substantive legitimacy* (see a further description of substantive legitimacy in DePaigne (2017)).) Regulators wield enormous power, yet they are neither elected nor directly responsible to elected officials (Majone 1996, p. 284)

Although the Weberian term *bureaucracy* in daily speech is often loaded with negative images of old-fashioned, rigid case management, tardiness, red tape management, and officials exercising controlling power more or less with or without a mandate, in modern times, "deregulated" societies – some call it a *new bureaucracy* (Du Gay 2000, pp. 98–99) – have emerged with the regulation of privatized monopolies.

In this new bureaucracy based on procedural legitimacy, regulation is itself legitimized through independent (typically ministerial) agencies or offices monitored by the court system (Majone 1996, p. 289). Thus, in order to insulate regulators from shifting political ideas and the destabilizing effect, new governmental trends might be issued. This, despite whether public officials are appointed by newly elected politicians in the US model or continue regardless of political shifts in government as in Scandinavia.

According to Majone, procedural legitimacy implies:

> . . .that the agencies are created by democratically enacted statutes which define the agencies' legal authority and objectives; that the regulators are appointed by elected officials; that regulatory decision-making follows formal rules, which often require public participation; that agency decisions must be justified and are open to juridical review. (Majone 1996, p. 291)

Differences in constitutional forms may have an influence and deviate from the above, especially in non-republication constituencies, where public officials are not appointed by elected officials and thus – theoretically – personally independent of the current politics in office.

Legitimacy Opportunities and Challenges for Publicly Owned Companies

Publicly owned companies that are characterized with a new bureaucratic, new institutional, and politically procedural legitimacy have been given a politically justified license to operate, which we will dig deeper into in order to understand its special rights and duties, obligations, and expectations hinged to it.

License to Operate

The basic political ideas behind the license to operate for natural monopolies – companies that formerly have state or municipality tasks – originate back to the 1980s' neoliberal movement exercised globally and distributed through the OECD into the New Public Management era (Hood 1991, 1995a, b; OECD 2005, 2006; Pollitt and Bouckaert 2004; Pedersen 2010; Pedersen 2011).

One of the major ideas in the New Public Management movement is that public management was bureaucratic, inefficient, too similar with eastern planned economy, and filled with unexploited resources (Pedersen 2010, p. 48). Instead, private business management and marked-based ideas were perceived as much more efficient, effective, involving multiple stakeholders, and thus much fairer.

To understand where those business management ideas historically come from, visiting the ideas of Frederick Winslow Taylor (1919) in *The Principles of Scientific Management* could be a place to begin:

> THE principal object of management should be to secure the maximum prosperity for the employer, coupled with the maximum prosperity for each employee. (Taylor 1919, p. 9)

A Tayloristic understanding of business-making aiming at "the greatest prosperity [that] can exist only as the result of the greatest possible productivity of the men and machines of the establishment" (Taylor 1919, p. 12) under legal and regulatory obligations contains both economic, environmental, and social responsibilities.

First, the economic responsibilities were toward shareholders, investors, suppliers, customers, and employees in terms of supplying them with returns on investments, pay- and repayments, interests, deliveries, and salaries. Second, businesses could have environmental restrictions or allowances, which public regulators would oversee. These could include land use permissions, pollution control systems, workers' health, etc.

The late Margaret Thatcher was said to be very fond of and inspired by Adam Smith, and her policymaking during the 1980s, where she and Ronald Reagan pleaded warmly for the New Deal/New Right in the UK and USA, respectively, formed some of the first steps toward the New Public Management era (Lauesen 2014).

Adam Smith (1776/2010) wrote in (*An Inquiry into the Nature and Causes of) The Wealth of Nations*, where he mentioned the *invisible hand of the market,* referring to a hidden force that drives businessmen to aim at prospering and making their capital work in home markets, which again creates jobs and security. "He argued that society would progress by removing government barriers and allowing economic actors the freedom to pursue their instincts for self betterment" leading to "society's goal of economic growth" (Smith 2010, foreword by George Osborne, p. xiv).

From the 1980s starting from New Zealand, the UK, and the USA, these neoliberal trends spread all over the world and have formed publicly owned companies, state-owned enterprises, public-private partnerships, etc. in many sectors from oil and gas companies, postal services, airports, electricity, and transportation sectors to water, wastewater, waste, city light, and many more sectors (Hood 1991, 1995a, b; Lauesen 2014).

As such, businesses on the market exist on the basis of the market in competition with peers and relying on demand and supply. However, (quasi-)privatized natural monopolies have a different background and springs out of services from the states, regions, or municipalities. In this chapter, we call these "publicly owned companies" (Lauesen 2011).

When the New Public Management had become mainstream globally in the 2000s with elements of business management focusing on privatization, business management, efficiency, effectiveness, outsourcing public services and operations, and benchmarking the results, the license to operate reflected all this, and had become the motor driving the new bureaucracy (Lauesen 2014).

In modern times, many other stakeholder groups have expectations and claims on private businesses such as neighbors, citizens, politicians, user groups, NGOs, etc. As such, a traditional business license to operate has become both economic, environmental, and not the least social at its core.

A short definition on what has now been conceptualized as a "social license to operate" (SLO) is according to Thomson and Boutilier (2011, p. 2): "a community's perceptions of the acceptability of a company and its local operations." It comprises the idea that a company is inversely related to the level of sociopolitical risk a company faces. According to Thomson and Boutilier, restricted access to essential resources (e.g., financing, legal licenses, raw material, labor, markets, public infrastructure) represents extremely high sociopolitical risk. Social acceptance establishes the company's credibility to be approved, and if trust is established, the social license could rise to the level of psychological identification, where the level of sociopolitical risk is very low.

The social license to operate for publicly owned companies share many common denominators reflected in Thomson and Boutilier's model, although they also differ sectorially and countrywise. For instance, in Scandinavia, the social license to operate in publicly owned companies implies high level of access to resources and raw materials and high levels of trust, whereas in other countries, the trust in former natural monopolies may be lower, for instance, in countries where privatization is much more explicit.

Legitimacy Failures in the Privatization of Natural Monopolies

The benchmarking and price cap model are part of the license to operate conditions for most privatized natural monopolies in Europe and elsewhere (Bakker 2003; Lauesen 2014; Pollitt 1999, p. 10). Although many privatized natural monopolies today are mergers of several local sectors, for instance, water and wastewater management, waste management, electricity, district heating, gas, etc., each division operates under the rationale of a license to operate like the other sectors.

However, despite establishing regulation and control systems, historically, natural monopolies have had their share of business legitimacy failures that have led to the reinforcement of regulation. In the UK, predatory price discrimination to drive out rivals fared multiple allegations in the 1980s and 1990s (Pollitt 2004, p. 18) in the gas, airline, and bus sectors. Initially in the water sector, there was no price cap on water bills, so the water companies could set prices according to their own expectations on profits (Bakker 2001). It was said by a minister that "investment in the public sector must earn a return comparable to investment in the private sector" (Bakker 2001, p. 149). In the 1990s, low-income consumers paid up to 14% of their income in water and wastewater bills, which was compared to a rise in dysentery rates, and in 1994, over two million households defaulted the water bills and were victims to so-called water poverty (p. 152).

Another example from the UK is the British privatization of the railways in the stock listed consortium RailTracks from 1994 ended with its bankruptcy in 2002 after four derailing disasters caused by poor maintenance of tracks (http://www.publicworld.org/docs/britrail.pdf).

In Denmark, a report from the energy authorities (2016) showed that the intended price reduction on the electricity marked foreseen in the privatization era from 2003 never came, but prices had raised to 17% from 2009 to 2016, whereas inflation had only been 10%. Other researchers have shown a similar trend in the UK, especially in sectors that nowadays are owned by private funds (see Hutchinson 1991; Bishop and Thompson 1992; Haskel and Szymanski 1993; Bishop and Green 1995; Koedijk and Kremers 1996; Martin and Parker 1997; all cited from Pollitt 1999; Table 4), whereas public enterprises have shown to outperform private companies over time (Hutchinson 1991).

In 1990, a Danish municipality's all management and operations on a wastewater plant was outsourced to a private company; however, when the municipality's water company in 2009 wanted to take the management and operations back, the private consortium went to court. It costed the municipality a clandestine amount of money, because they lost the case and had to pay amendments to the private company for lost profits Frederiksborg Amts Avis 2011.

Many other examples of legitimacy failures in monopoly companies could be described; however, the point is that the initial ideas behind the deregulation initiated in the 1980s have had many alterations since then because of failures in the privatization of former natural monopolies. Most alterations, however, has occurred in either ownership structure – from private and back to public ownership – or, and especially, in increased regulation in monopoly sectors.

The first lesson learned very early was that the greatest disasters in the privatization of natural monopolies have been seen prior to regulation, monitoring, and other control systems that were fully fleshed out. The profitability on natural monopolies has since been very little, as the case in the UK shows, and accessibility for resources has increased.

The second lesson learned was that assets should be owned by the public – i.e., the state, region, or municipality – or by some other consumer-owned constellation, that is rail tracks, electricity lines, water and wastewater infrastructure, roads, etc.

The third lesson learned was that privatization of management and operations may be a good business, if regulated justly. However, research shows that private management does not lower costs for consumers compared to public management. And trust issues tend to accumulate more in privatized monopolized sectors rather than when managed by public officials ultimately.

Contemporary Issues

Next, we will show a case study of a publicly owned water company in Denmark working with water quality issues that affect water supply companies not only in Denmark but also in many places in Europe.

Case Study: Water & Waste Denmark

Production of drinking water in Denmark is based on clean groundwater. The most common water treatment is aeration and filtration through sand filters. The philosophy is to deal with pollution at the source and minimize more advanced water treatment at the water utilities. This is expressed in the national groundwater policy, which states that production of drinking water should be based on clean groundwater.

But the groundwater resources are quite vulnerable to pollution. One of the major threats are fertilizer and pesticide pollution from agriculture since Denmark is among the most intensively cultivated countries in the world with agricultural land covering approximately 62% of the area (Ministry of Environment and Food of Denmark 2016).

Water & Waste Denmark is a water utility owned by the municipality of Svendborg. The water utility has a total production of 2.2 million m^3/year, which is a rather large utility in a Danish context. The production is based on groundwater from six wellfields. On five wellfields, the only necessary water treatment is aeration and filtration through sand filters. Advanced treatment with carbon filters has been introduced on a small wellfield (abstraction of approx. 50,000 m^3/year) with no alternatives to groundwater polluted with pesticides.

New Finds of Troublesome Pesticides in the Groundwater

Pesticide pollution of the groundwater in Denmark has been a major concern since the early 1990s. However, since the summer of 2017, new types of pesticide metabolites have been discovered in the groundwater. The new knowledge has uncovered pesticide pollution much more widespread than expected. Water & Waste Denmark is one of the water utilities facing the challenge. On the largest wellfield of the utility (Skovmølleværket), the groundwater is polluted with dimethyl-sulfamide (DMS). DMS is a metabolite from a pesticide used in fruit and berry production (tolylfluanid). Fruit and berry production is a preferred land use around the wellfield because of favorable climatic conditions with low risk of frost in the spring, where the fruit trees and berries blossom. The widespread pollution with DMS is a result of an intensive use of the parent drug from the late 1960s until a market withdrawal in 2007. Today, the parent drug causing pollution with DMS has been banned.

DMS is found in every abstraction well on the wellfield – usually in concentrations close to the drinking water standard of 0.1 μg/l. Point source pollution causes much higher concentration locally. In one of the abstraction wells, the concentration of DMS is more than 50 times the drinking water standard.

Currently, the trend of the pollution of the wellfield is hard to discern. The concentration in the groundwater fluctuates with the pumping strategy on the wellfield. Still, it is possible to mix groundwater from the abstraction wells to get a final concentration in the drinking water below the drinking water standard; however, whether this strategy will be sufficient in the long run is very uncertain.

Advanced treatment of the groundwater might be a necessity in the future to minimize the risk of not complying with the drinking water standard of 0.1 μg/l.

Technologies for Pesticide Removal

Groundwater polluted with DMS is difficult to treat. The preferred technological solution dealing with pesticide pollution is advanced treatment with carbon filters. But filtration through carbon filters has no effect on DMS. Intensive oxidation with ozone is the best option at the moment (Krüger 2019). Yet, this kind of treatment creates nitrosamine as a by-product. Nitrosamine is carcinogenic in even very low concentrations and from a health perspective a much worse compound to introduce to the water cycle than DMS. Fortunately, it is possible to remove nitrosamine from the water with a combination of intensive UV treatment and biofiltration.

Implementation

In other words, there is a technological solution to the water quality issues the water utility is facing. However, implementation of advanced treatment is not a favored option since it is not in line with the national groundwater policy. Nevertheless, production based on clean groundwater might be an impossible goal to fulfill in the forthcoming years. What are the options for the water utility? How can the water utility minimize the risk of introducing advanced treatment? And how can it legitimize introduction of advanced treatment when it is necessary?

One of the options considered is remediation at the abstraction wells with high concentrations of DMS. Abstraction wells with high concentrations of DMS are currently out of service; however, implementation of remediation pumping as a means to fixate and remediate pollution from point sources will minimize the risk of being forced to implement advanced water treatment.

The insights gained from the present situation also call for considerations concerning sustainable management of the groundwater resources in the long run. Though the present situation could be considered as *sins of the past*, it also sheds light on a present vulnerability of the aquifer that calls for precautionary actions if the risk of facing that kind of challenges in the future should be minimized. A proactive groundwater protection is thus an option to consider for the water utility. By introducing a proactive groundwater protection as a targeted measure in the catchment of the wellfield, it will be possible to maintain the visionary goal of drinking water production based on clean groundwater while introducing advanced water treatment as a temporary measure if necessary.

Conclusion

Although it seems that publicly owned companies have had solved their former business legitimacy issues regarding price setting and delivery obligations, new issues have been showed to threat the companies' legitimacies as well. In this regard, the example from the Danish water sector shows how the legitimacy has moved from being a monetary issue to being a quality issue.

The Danish national groundwater policy, which states that production of drinking water should be based on clean groundwater, could – as the case shows – be at severe risk of creating a legitimacy issue nationally facing the risk of water pollution from pesticides. This issue is not a Danish problem alone but is seen in more countries in the EU, for instance, in Germany and the Netherlands, as well.

We showed how a pesticide metabolite, dimethyl-sulfamide (DMS), in the groundwater is difficult to remove without advanced technology such as ozone treatment, whose downside is the creation of a side product, N-Nitrosodimethylamine (NDMA), which is carcinogenic.

We asked in the introduction: How can such a dilemma be resolved?

An evaluation of the health risks caused by consumption of drinking water contaminated with DMS shows that the detected concentrations in the groundwater don't pose a threat toward public health (Environmental Protection Agency 2018).

Thus, the water utility apparently does not have to worry about the consequences of consumption of DMS-contaminated drinking water. If it is necessary to introduce advanced water treatment, the purpose will mainly be for the compliance with the drinking water standard rather than consumer health issues.

This may not be the case with the next pollution find.

In addition, there may be other pesticides or metabolites in the drinking water that have not yet been detected in the screening of the drinking water quality.

This hidden threat adds significantly to the complexity of the dilemma. Maybe DMS is just the tip of the iceberg. Even though it seems that DMS is causing much trouble currently, it might be relevant so see DMS as the effect rather than the cause.

If DMS is seen as the effect, it might be possible to resolve the dilemma with a holistic approach where temporary advanced water treatment goes hand in hand with remediation pumping, intensified screening, and source protection, such as afforestation, conversion from conventional to organic farming, banned use of pesticides, etc.

The case is just one of the many new issues with metabolites from pesticides used in the near past. At the time of its use, these pesticides were allowed by the environmental authorities, so there are no scapegoats to blame.

However, there will be scapegoats to solve the problems, such as the utilities, its owners, and its customers. Since they are subject to political decisiveness, the legitimacy issue is placed in the political arena ultimately. Thus, utilities must lean on politicians to deal with legitimacy issues at stake. However, political agreement on limiting the use of pesticides and fertilizers is a derived dilemma in this discussion, and ultimately the polluter pays is not a real option.

The utilities affected by pesticide pollution fear the introduction of advanced technologies – not because technology cannot solve the problem but rather because of the bill to be paid today for the sins of the past lands on the customers' tables.

This dilemma frames both the opportunities and challenges for publicly owned companies regarding their business legitimacy.

Ethics of Corporate Taxation: A Systematic Literature Review 25

Francesco Scarpa and Silvana Signori

Contents

Abstract

In recent times, corporations have been scrutinized for their tax behavior. Various groups of stakeholders have expressed their concern over certain corporate tax strategies that allow multinationals to pay ridiculous amounts of tax in the countries where they operate. Although national governments and international institutions are developing initiatives to reform tax rules to ensure that companies pay their fair share of tax, the international tax framework still offers MNEs several opportunities for minimizing their tax burden. In order to help businesses self-regulate their behavior in those "gray areas" where the tax law is imperfect and to drive changes in legislation, corporate taxation has recently been included in the business ethics field. In other words, the ethical responsibilities associated with corporate taxation have started to be investigated and companies are increasingly expected to exhibit a morally responsible approach to tax planning, above and beyond compliance with the letter of the law. The purpose of this chapter is to present a systematic review of literature dealing with the ethical issues associated

with corporate taxation. A better understanding of the evolution, the scope and the state of the art of this academic debate is provided by the literature review. Three main topics will be critically discussed: the ethics of tax evasion, the ethics of tax avoidance and the ethics of tax practitioners. Finally, suggestions and future research paths will be offered, in order to encourage studies to foster the debate on the ethics of corporate taxation.

Keywords

Business ethics · Ethical theories · Corporate taxation · Tax avoidance · Tax evasion · Tax practitioners

Introduction

Corporate taxation has recently attracted considerable attention from a wide circle of stakeholders who have increasingly scrutinized companies for their tax behavior. International institutions, such as the OECD and the EU, are developing initiatives to reform tax laws in order to tackle tax avoidance and aggressive tax planning (e.g., the OECD/G20 BEPS Project) while prominent nongovernmental organizations (e.g., ActionAid, ChristianAid, Oxfam) and advocacy groups (e.g., the Tax Justice Network) have launched several campaigns to raise public awareness about the impact of corporate tax planning on society (see, e.g., Dallyn 2017). Furthermore, the media coverage of corporate taxation has increased significantly over recent years (Chen et al. 2019; Kanagaretnam et al. 2018). Additionally, consumers have begun to use their purchasing power to punish tax avoiders (Hardeck and Hertl 2014; Hardeck et al. 2019) and investors are interpreting this growing attention to corporate taxation as a source of increased risk and are calling for a more responsible approach to tax planning (UN PRI 2015, 2018).

As is evident from the abovementioned references, and as noted also by Radcliffe et al. (2018), recent years have been characterized by an institutional change in the "moral boundaries" of corporate taxation as stakeholders have begun to emphasize the ethical aspects of certain tax strategies, above and beyond compliance with the law. The issue of corporate taxation has been "transformed from a narrow technical discussion for specialists to one that is overtly ethical and social" (Beloe et al. 2008, p. 12). Indeed, it is now well established that corporate taxation falls within the business ethics debate (IBE 2013). Of particular concern is the discretion that multinational enterprises (MNEs) enjoy as to how to arrange their tax affairs and how much tax they pay within the legal framework. One of the greatest challenges is the inadequacy of the international tax framework which offers companies several opportunities for tax planning. Moreover, the need to stay competitive and attract investments has led both developed and developing countries to engage in a harmful tax competition known as "a race to the bottom" (Killian 2006, p. 1082). Hence there is increasing concern that MNEs are such powerful actors in the global tax system that they can shape and modify tax rules according to their own interests (Carminati 2019, p. 6).

As a consequence of this flourishing interest, in the last decade a considerable amount of literature has begun to investigate corporate tax practices through the prism of business ethics in order to address the corporate ethical responsibilities associated with taxation.

The purpose of this chapter is to systematically review literature dealing with the ethical aspects of corporate taxation in order to contribute toward a better understanding of the evolution, the scope, and the state of the art of this academic debate. In particular, the chapter offers critical insights into the philosophical approaches and the normative arguments advanced in favor of and against the morality of certain corporate tax practices (i.e., tax avoidance and tax evasion). Additionally, drawing on the results of the literature review, the chapter aims to offer paths and suggestions for future research.

The chapter is organized as follows: the first section presents the methodology (i.e., the systematic literature review) and describes how papers were collected, and analyzed. The following section offers a descriptive analysis of the literature, discussing the distribution of publications across time and journals, as well as introducing the main issues addressed by the papers (i.e., tax avoidance vs. tax evasion). Moving to the following section, the chapter discusses three main topics that have emerged from the literature: the ethics of tax evasion, the ethics of tax avoidance, and the ethics of tax practice. Finally, the last section provides a conclusion and suggestions for future research.

Collection and Analysis of Relevant Publications

A systematic literature review is adopted to ensure that all relevant publications are collected and analyzed through a replicable, transparent, accessible, and scientific process (Tranfield et al. 2003). The systematic literature review is one of the most widely adopted methods "for studying a corpus of scholarly literature, to develop insights, critical reflections, future research paths and research questions" (Massaro et al. 2016, p. 767). Relevant publications were collected using some major electronic management databases (i.e., Business Source Premier via EBSCOhost, ProQuest, Scopus, and Web of Science) and searching articles that in their titles, abstracts, and/or keywords included the words "*ethic* or "*moral*" and at least one of the following common corporate tax-related terms: "corporate tax," "corporate taxation," "tax haven," "tax planning," "tax avoidance," "tax evasion," "tax aggressiveness," and "transfer pricing."

All publications were reviewed to select only those papers which discuss a corporate tax-related issue from an ethical perspective. Moreover, additional articles were found by examining all the reference lists of resources identified through the database searches. Overall, the above-described selection process resulted in a total of 66 papers (please note that publications included in the sample are marked with an asterisk (*) in the references). These publications were analyzed to identify some basic features (e.g., name of the journal, year of publication and research question), the topic addressed, definitions of tax terms, the underlying philosophical approach/

es, and the normative arguments presented in favor of and against the morality of the corporate tax minimization activity that is addressed by the paper.

Descriptive Analysis

The starting point of this literature review is the discussion of some basic features of the publications under examination in order to gain a general understanding of the evolution of academic debate on the ethics of corporate taxation. The descriptive analysis focuses on the following aspects: (a) distribution of the publications over time; (b) distribution of the articles across journals; (c) introduction to the main topics discussed in the literature.

(a) *Distribution of publications over time*

Figure 1 reveals that the distribution of publications over the years can be divided into four phases: (1) the irrelevance phase, which lasted until the 2000s; (2) the emergence phase, lasting from 2000 to 2009; (3) the initial growth phase, which lasted from 2010 to 2015; (4) the consolidation phase, which started in 2017.

Before the year 2000, only three papers were published, indicating that corporate taxation was not considered part of the business ethics debate. During the first decade of the 2000s, the topic started to enter the academic debate even if the number of publications began to grow only in 2010. The period of initial growth (2010–2015) seems to have been driven by the financial crisis (2007–2008) that exacerbated the effects of tax minimization strategies on society. Additionally, the growth may have been fueled by the NGOs' campaigns on corporate taxation (e.g., ActionAid, Christian Aid, and Oxfam). Finally, the topic has gained greater relevance over the last 3 years (2017–2019), when 33% of the

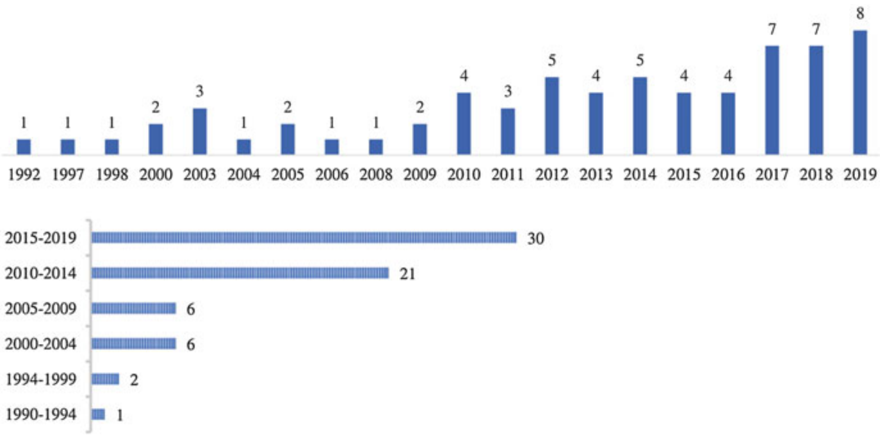

Fig. 1 Distribution of publications across the years

publications included in the sample were published. This phase may have been driven by the intense political and public debate which followed the publication in 2015 of the final package of the OECD/G20 Base Erosion and Profit Shifting (BEPS) Project, which provided governments with several solutions for closing the gaps in existing international rules that allow corporate profits to disappear or be artificially shifted to low/no tax jurisdictions.

(b) *Distribution of publications across journals*

Figure 2 lists the journals included in the study and the number of articles included from each journal. This analysis reveals that the 66 publications examined were published in 30 different outlets, while 5 of them were published as book chapters and one was a working paper (Bennett and Murphy 2017). As Fig. 2 highlights, the *Journal of Business Ethics* is by far the main outlet for articles on the ethics of corporate taxation, with 22 articles (33.33%) published. Second on the list is the *Accounting, Auditing & Accountability Journal* that published five articles (7.58%). Interestingly, they are the only journals to have published more than two articles.

As a second step, we grouped the journals by their research area. While most articles (43.94%) were published in business and society journals, articles dealing with the ethics of corporate taxation also appeared in social accounting (21.21%), law (15.15%), general management and international business (9.09%), and psychology (3.03%) journals.

(c) *Main topics discussed in the literature*

Up to now, previous business ethics literature has investigated three main topics related to corporate taxation, namely the ethics of tax evasion, the ethics of tax avoidance, and the ethics of tax practitioners.

Prior to any ethical analysis, much of the literature attempts to draw a distinction between tax avoidance and tax evasion. The most common way to distinguish these tax practices is that between legal and illegal activities. On the one hand, the term *tax evasion* is used for tax minimization activities based on illicit, criminal, dishonest, deceptive, and fraudulent actions taken outside the legal framework (Payne and Raiborn 2018, p. 470; Lenz 2018; Prebble and Prebble 2010, p. 702; Stainer et al. 1997, p. 214). On the other hand, the term *tax avoidance* is used to refer to activities aimed at reducing tax payments by legal means (Kirchler et al. 2003, p. 3; Prebble and Prebble 2010, p. 700; Dowling 2014, p. 174).

As outlined by Barker (2009, p. 242), the legal consequences are also different: while tax evasion is punished with imprisonment, judicial remedies for tax avoidance may be limited to civil penalties, the nullification of the tax position and the payment of back taxes with interest. Additionally, there are no sanctions against some legal tax minimization strategies (e.g., corporate headquarters located in a low-tax country) which may only negatively affect the relationship with stakeholders.

With respect to tax avoidance, some scholars have distinguished among different forms that are associated with various ethical issues. First of all, scholars use the term "appropriate" (Payne and Raiborn 2018, p. 470) or "State-induced" (De Colle and Bennett 2014) tax avoidance to refer to the process of reducing the amount of tax

based on enumerated provisions in the legislation, usually encouraged by the State to achieve socially desirable ends. Secondly, scholars label as "legitimate" (Barker 2009), "strategic" (De Colle and Bennett 2014), or "responsible" (Lenz 2018) those tax avoidance activities aimed at reducing corporate tax liabilities as part of a commercially sound business strategy and that comply with both the *letter* and the *spirit* of the legislation. Conversely, scholars use the term “unacceptable” (Demirbag et al. 2013, p. 101), “impermissible” (Barker 2009), “aggressive” (Lenz 2018; Payne and Raiborn 2018), or “toxic” (De Colle and Bennett 2014) to refer to tax avoidance schemes that are designed predominantly or exclusively with the intention of reducing tax and which are based on a literal interpretation of the law that places little weight on the spirit of the legislation, that is, “the legislative policy goals that inform tax law and the balance of competing social norms expressed in the tax code” (Ostas 2018, para. 20). This third form of tax avoidance raises some questions about its morality.

The importance of distinguishing between tax avoidance and tax evasion is corroborated by some empirical studies revealing that taxpayers stress the difference between legal (i.e., tax avoidance) and illegal (i.e., tax evasion) when they judge the morality of tax minimization strategies (Kirchler et al. 2003; Blaufus et al. 2016).

Although there are some contrary positions (West 2018; Prebble and Prebble 2010), this chapter follows the prevailing view that considers tax avoidance and tax evasion as two separate ethical issues, stressing the legal differences between them.

Discussion of Corporate Tax-Related Ethical Issues

As mentioned above, business ethics literature has addressed three main topics related to corporate taxation, namely the ethics of tax evasion, the ethics of tax avoidance, and the ethics of tax practitioners. In the sections that follow, the normative arguments that have been advanced in favor of and against tax evasion and tax avoidance will be investigated. Finally, the ethics of tax practitioners will be discussed.

The Ethics of Tax Evasion

There is a relatively small body of literature that deals with the ethics of corporate tax evasion, much of the literature on tax evasion having focused, in fact, on individual taxpayers (e.g., Bagus et al. 2011). Most scholars take for granted that tax evasion is “profoundly unethical” (Bagus et al. 2011, p. 376), since it is illegal and it “entails deception and concealment” (Payne and Raiborn 2018, p. 470). As argued by Stainer et al. (1997, p. 214) “by definition, evasion is illegal and hence unethical,” so that “few would dispute that. . . tax evasion is immoral” (Prebble and Prebble 2010, p. 715).

As noted by Young (2019), that illegal implies unethical is a typical assertion in the wider business ethics literature. For instance, legal responsibilities occupy a position close to the base of Carroll’s pyramids of corporate social responsibilities (1991), while according to Friedman’s (1970) popular view on corporate social responsibilities, firms’ profit maximization should be limited to what the law permits.

In his interesting review of the literature, McGee (2006) notes that three major views on the ethics of tax evasion have evolved over the last 500 years: (i) tax evasion is *always unethical* because there is a duty to God, to community, or to society to pay taxes; (ii) tax evasion is *always ethical* because the government always expropriates peoples' wealth; (iii) tax evasion is *sometimes unethical*, since there are some ethical obligations to support the government of the country where you live but that duty is less than absolute.

What emerges from McGee's (2006) review is the importance of exercising caution when interpreting the claim that companies always have an ethical obligation to pay taxes. Indeed, over the last 500 years, some theologians and philosophers have argued that tax evasion may not be unethical in cases where the government is an evil regime, where it engages in human rights abuse or in unjust wars, where tax rates are too high, or where the tax funds are wasted or wind up in the pockets of corrupt politicians or their friends (McGee 2012).

However, only few scholars argue the position that there is an ethical duty to obey tax law, so that tax evasion would be an immoral action. Ostas (2018) refers to Socrates' arguments (i.e., consent, reciprocity, fairness, and utility) to conclude that the ethical duty to pay taxes can be derived from the "general *prima facie* ethical obligation to obey reasonably just laws enacted by reasonably just societies." According to McGee (2012) it cannot be automatically concluded that individuals representing a corporation need to pay only corporate taxes that are considered to be just. Indeed, McGee (2006, p. 31) observes that it is unethical for managers or tax practitioners to help a corporation evade taxes, even if the tax itself is unjust, "because they have a fiduciary duty to the corporation's owners not to do anything that will reduce the stock price," given that evading taxes could result in fines and/or in the confiscation of corporate assets. A different approach is adopted by Avi-Yonah (2014), who contends that companies have a duty to obey the law and pay their taxes under any view of the corporation: (i) under the *artificial entity* view, companies have an implicit bargain with the State that expects companies to pay their taxes to contribute to the ability of the State to fulfill its obligations to its citizens; (ii) under the *real entity* view, the corporation should behave like an ordinary citizen and should try to comply with the tax law to the best of its ability; (iii) under the *aggregate* view, corporations have an affirmative obligation to pay their taxes to enable the State to carry out those social functions that they are barred from pursuing.

Turning now to empirical research, a number of studies have investigated the determinants of tax evasion. Inspired by the seminal theoretical models developed by Allingham and Sandmo (1972) and Srinivasan (1973), the first empirical studies were based on strictly economic determinants and a rational explanation of tax evasion, according to which the amount of tax individuals choose to pay depends only on the expected benefits of not paying taxes, compared with the risk of being caught. However, as noted by Mickiewicz et al. (2019, p. 76) one of the main conclusions from these empirical studies is that tax evasion is much lower than can be explained by expected financial utility.

Hence, as emphasized by Alm and Torgler (2011, p. 635), the real puzzle of tax compliance behavior is "to explain why people pay taxes" despite a relatively low likelihood of being caught. To explain this discrepancy, the concept of tax morale has been developed, that is, a moral obligation to pay taxes and a "belief in contributing to society by paying taxes" (Torgler and Schneider 2009, p. 230).

So, scholars have started to acknowledge that it is not possible to understand tax compliance decisions fully without considering that individuals are often motivated by factors founded on "aspects of morality, social norms, altruism, fairness, or the like, factors that we broadly – and somewhat inaccurately – classify as 'ethics'" (Alm and Torgler 2011, p. 636). However, only a few studies on tax morale are based on the business context. For instance, a series of experimental studies among self-employed business owners conducted by Maciejovsky et al. (2012) reveals that the relative effectiveness of economic determinants of tax ethics (such as audit probabilities and fines) is moderated by feelings and emotions. More recently, Mickiewicz et al. (2019, p. 89) found that the tax morale of business owners/managers is affected by the institutional system where they are embedded through three institutional mechanisms: "the normative – trust in the government and in the tax system; the cognitive – identification with the wider polity; and the regulatory – perceptions of deterrence."

The Ethics of Tax Avoidance

A large and growing body of literature has investigated the morality of (aggressive) tax avoidance. As discussed above, tax avoidance is a legal activity. Hence, we first need to discuss why companies should be morally castigated for engaging in activities that, by definition, fall within legal limits (Fisher 2014, p. 341) or, in other terms, why we need ethics to tackle tax avoidance.

This issue has been addressed by several scholars who hold the view that tax avoidance cannot be automatically considered a moral activity only because it is legal. For instance, Prebble and Prebble (2010, p. 744) note that "drawing moral conclusions from legal observations constitutes logical confusions." In the same vein, Hansen et al. (1992, p. 684) state that "legal and ethical are not always equivalent" and, thus, as pointed out by Payne and Raiborn (2018, p. 475) "abiding by legal mandates will not necessarily or always produce ethical behaviour."

As a second step, we need to clarify the role of the law in taxation. As argued by Honoré (1993, p. 5), the duty to pay tax is "in principle a moral obligation. . . to make a contribution to the expenses of meeting collective needs." Yet this moral obligation is incomplete because taxpayers cannot settle it for themselves: the role of the tax system is to translate and crystallize this moral obligation into legal norms to preclude arbitrariness and to create reciprocal trust that all taxpayers will pay their share (Gribnau 2017, p. 18). Nevertheless, once the legislature has created this legal obligation and written it in legal texts, regulations "will inevitably appear to be imperfect, ambiguous, lagging behind societal and economic developments and so on" (Gribnau 2015, p. 239). The tax regulatory framework is a matter of loopholes, inconsistencies, and imperfect laws that can be complied with in different ways, particularly in the global arena where rules are written by different, and often conflicting, sovereigns. In brief, as summarized by Gribnau (2017, p. 44) "to demand perfect legislation is to demand the impossible." Hence, the use and the interpretation of legal rules demand arbitrariness and personal evaluations (Aharony and Geva 2003), and it is here that ethical responsibilities arise. In other words, ethics in corporate taxation "may somehow involve abstaining from permitted legal ways and means to reduce tax and voluntarily going 'beyond the law' to apply some higher (undefined) ethical standards" (Demirbag et al. 2013, p. 103).

The view that companies are expected to go above and beyond compliance with tax laws is supported by anecdotal and empirical evidence revealing that MNEs which legally fail to pay their fair share of tax are increasingly considered to be unfair, immoral, and/or outrageous (West 2018, p. 1143; DeZoort et al. 2018; see also IBE's annual surveys of the attitudes of the British public to business ethics available at https://www.ibe.org.uk/).

In conclusion, tax avoidance is widely perceived at least as a morally doubtful practice, although it is legal. As a consequence, a considerable amount of literature has investigated the morality of tax avoidance using a variety of philosophical approaches, focusing on tax avoidance in general, or on specific tax avoidance strategies, like transfer pricing (Hansen et al. 1992; McGee 2010; McMahon et al. 2013; Mehafdi 2000; Ylönen and Laine 2015), tax inversion, that is, the relocation of a corporate headquarters to a different country with lower taxes, while the majority of the company's operations remain in the higher-tax country of origin (Godar et al. 2005) or the use of tax havens (Preuss 2012a, b). The following sections provide a review of the moral arguments which scholars have advanced in favor of and against the morality of corporate tax avoidance.

Moral Arguments Defending Tax Avoidance

Although most scholars question the morality of tax avoidance, a few lines of reasoning have been advanced to morally justify companies engaging in tax avoidance activities. What follows is a brief account of these positions, as summarized in Fig. 3.

(a) *Tax avoidance is a legal and not a moral issue*

A first position defends the legitimacy of tax avoidance considering its legal nature: since tax avoidance is legal it cannot be immoral. From this perspective, the payment of tax is regarded as a mandatory cost imposed by government and the only corporate responsibility is to minimize this cost within the rules of the law (Anesa et al. 2019; Friedman 1970): there cannot be any moral constraints on exploiting legal opportunities or on moral duties "to pay taxes greater than actual legal liability" (Windsor 2017, p. 156) because "even an extreme moralist could not expect the taxpayer to opt for the most costly election" (Hansen et al. 1992, p. 683).

Thus, this line of reasoning contends that if some tax activities are not considered acceptable it is the governments' task to change the legislation to make them illegal (Stainer et al. 1997, p. 214). To corroborate this position, the following tax court decisions are often cited (see Barker 2009; Prebble and Prebble 2010, pp. 714–715):

Philosophical approach	Main arguments	Sources
Tax avoidance is not a moral issue	There cannot be any moral constraints on exploiting legal opportunities or moral duties to pay taxes greater than actual legal liability	Windsor (2018)
Liberalism	Tax avoidance is a justified form of "self-defence" from a violation of natural rights	Machan (2010); McGee (2010)
Libertarian theory	Tax avoidance is an expression of the liberty to be free from an overreaching government, the freedom of property and the freedom to contract	Barker (2009)
The inefficiency of government	Companies are morally justified to legally minimize their tax burden since they are able to use tax savings to increase social welfare more efficiently than government	Davis et al. (2016); McGee (2010)
Managerial fiduciary duty	Managers have a duty to maximize shareholders' wealth by all legal means, including the minimization of the tax burden	Dowling (2014); Fallan and Fallan (2019)

Fig. 3 Moral arguments in favor of tax avoidance

> "Every man is entitled if he can to order his affairs so as that the tax attaching under the appropriate Acts is less than it otherwise would be" (Inland Revenue Commissioners v. Duke of Westminster, 1936).

> "Over and over again courts have said that there is nothing sinister in so arranging one's affairs as to keep taxes as low as possible. Everybody does so, rich or poor; and all do right, for nobody owes any public duty to pay more than the law demands: taxes are enforced exactions, not voluntary contributions. To demand more in the name of morals is mere cant" (Commissioner v. Newman, 1947).

(b) *Liberalism*
According to Locke, generally regarded as the father of liberalism, all individuals have "natural rights" (i.e., the right to life, liberty, and property) which are granted at birth. Building on Locke's doctrine, Machan (2012) considers tax avoidance as a justified form of "self-defence" from a violation of natural rights since taxation "coerces one to hand over a goodly part of one's earnings to people one has not freely chosen to receive them" (p. 75). In the same vein, McGee (2010, p. 34) draws on John Locke's concept of natural property rights to claim that taxation is an unjustified governmental interference in the natural, free-market ordering of things.

(c) *Libertarian theory*
Libertarian thinkers, such as Nozick (1974), are not only in favor of tax avoidance, but they even call for no taxation since it is seen as an interference with personal liberty and property (Gribnau and Jallay 2017, p. 73). Nozick's position is expressed in his famous statement: "taxation of earning from labor is on a par with forced labor" (Nozick 1974, p. 169). Thus, any efforts to restrict tax

avoidance would be similarly unjust (West 2018, p. 1148): individuals have the right to avoid tax as an expression of "the liberty of the subject to be free from an overreaching government, the freedom of property and the freedom to contract" (Barker 2009, p. 234).

(d) *The inefficiency of government*
This line of reasoning is based on the concept of efficiency in the redistribution of tasks among public and private actors. Scholars suggest that it is more socially acceptable to keep as many assets as legally possible in the private sector, when transferring them to an inefficient government results in a misallocation of resources (Stainer et al. 1997, p. 215). Thus, companies may be morally justified to legally minimize their tax burden if they are able to use tax savings to increase social welfare in other ways, such as through investment in infrastructure, research and development, and job creation (Davis et al. 2016, p. 49). McGee (2010, p. 35) even ventures to say that "society is actually helped if corporations have a policy of minimizing taxes."

(e) *The managerial fiduciary duty*
Consistent with agency theory, managers feel they have a duty to maximize shareholders' wealth by all legal means. This fiduciary duty implies that managers have to engage in all legal activities to minimize the corporate tax burden (Fallan and Fallan 2019, p. 2). So, if managers pay more taxes than the legal minimum, they are acting unethically because they are transferring to the governments assets and wealth that belong to shareholders (McGee 2010, p. 32) or other stakeholders.

Moral Arguments Against Tax Avoidance

As previously stated, much literature dealing with the ethics of tax avoidance has reached the conclusion that there are "good philosophical reasons... to socially ostracize this type of behaviour" (Lenz 2018).

As summarized in Fig. 4, various philosophical approaches have been used to support the immorality of tax avoidance, including *consequentialist* theories (which address right or wrong by emphasizing the outcomes of an action), *deontological* theories (which stress that what makes a choice right is its conformity with a moral norm), and *virtue ethics* (which emphasizes actors' virtues and moral character).

The following section discusses how these ethical theories have been used to reach the conclusion that corporate tax avoidance is immoral.

(a) *Utilitarianism*
Utilitarianism, a version of consequentialism, is linked particularly to the British philosophers Jeremy Bentham (1789/1996) and John Stuart Mill (1863/1998). According to utilitarianism, an action is right or wrong depending on its social consequences: an agent must act in ways that result in the greatest amount of good (variously described as happiness, pleasure, utility, or individual welfare), or the least amount of harm, for the greatest number of people affected by the action.

Philosophical approach	Main arguments	Sources
Utilitarianism	Negative social outcomes of tax avoidance outweigh the positive consequences	Hansen et al. (1992), Mehafdi (2000), Godar et al. (2005), Preuss (2012a), Fisher (2014), de Colle and Bennet (2014), Raiborn et al. (2015), Payne and Raiborn (2018)
Kantianism	Tax avoidance cannot be universalized without contradiction and without violating the principle of human dignity.	Godar et al. (2005), Prebble and Prebble (2010), Preuss (2012a), Raiborn et al. (2015), Lenz (2018)
Ethics of Rights	Tax avoidance violates basic human rights	Scheffer (2013), Darcy (2017)
Ethics of Justice	Tax avoidance violates Rawls' principles for a just society	Raiborn et al. (2015), Gribnau (2017), Payne and Raiborn (2018), Fischer and Friedman (2019)
Social Contract Theory	Tax avoidance violates the implicit social contract between business and society	Christensen and Murphy (2004), Payne and Raiborn (2018)
Virtue Ethics	Tax avoidance runs contrary to the development of virtues and moral character	Preuss (2012a), West (2018)

Fig. 4 Moral arguments against tax avoidance

Although no utilitarian analysis of tax avoidance has provided a comprehensive quantitative measurement of its consequences, there is a consensus among researchers that tax avoidance generates negative outcomes on a large number of stakeholders that are likely to outweigh the short-term financial benefits (De Colle and Bennett 2014; Godar et al. 2005; Preuss 2012a; Payne and Raiborn 2018; Raiborn et al. 2015).

On the one hand, benefits associated with tax avoidance are typically attributed to shareholders via increases in share prices and dividends and to their tax consultants via higher fees. Additionally, tax savings might potentially be used for the benefit of other stakeholders, like employees (i.e., higher wages), consumers (i.e., lower prices), and the broader community (i.e., more CSR activities).

On the other hand, negative consequences have been associated with governments (e.g., lack of revenue to fund public services, higher administrative costs to ensure tax compliance, threat to the tax system's integrity, harmful tax competition between States), management (e.g., reputational risks), and shareholders (e.g., reputational harm, risk that the management engages in other subversive and opportunistic activities, costs for tax penalties and legal experts). Additionally, tax avoidance may inflict harm on domestically based competitors, who cannot engage in cross-border tax avoidance strategies, on members of the general society, who may suffer from higher social inequalities, a greater tax burden and/or a lower level of social welfare, as well as on developing countries that rely on MNEs' tax payments for their economic and social development (Carminati 2019, p. 5; de Colle and Bennett 2014; Fisher 2014, pp. 354–359).

Finally, some scholars emphasize the negative outcomes of specific tax avoidance strategies: the use of tax havens may result in profound distortions of global foreign direct investments (FDI) to the degree that investment decisions are taken on the basis of tax and regulatory concessions (Preuss 2012a); a corporate inversion (Godar et al. 2005) might cause psychological harm to employees (e.g., fear of job loss), the current home government (e.g., feeling of betrayal), and the prospective home government (e.g., political stress within the new host); similarly, transfer pricing may generate psychologically negative outcomes at the level of the host countries, such as feelings of trust and hospitality abuse, local workforce exploitation, as well as a reinforcement of the politics of greed (Mehafdi 2000).

Although many scholars have contended that the negative outcomes of tax avoidance seem to prevail over the positive consequences, other scholars consider that these analyses are unsatisfactory and inconclusive because they fail to provide a quantitative measurement (Lenz 2018; West 2018).

(b) *Ethics of rights*

To date, only a limited number of scholars have framed tax avoidance as a critical issue from the human rights' perspective (Scheffer 2013; Darcy 2017). For this reason, Darcy (2017, p. 2) refers to tax avoidance as the "elephant in the room for business and human rights." Central to this line of reasoning is the need for governments to be financed both by individual and corporate taxes in order to facilitate and protect basic citizens' human rights (for instance, through education programs and public health care). Indeed, taxation has "a redistributive function, aimed at reducing the unequal distribution of income and wealth that results from the normal operation of a market-based economy" (Avi-Yonah 2006, p. 3).

Various leading initiatives in the development of human rights have acknowledged that tax avoidance activities "have considerable negative impacts on the enjoyment of human rights" (International Bar Association 2013, p. 93). Darcy (2017) suggests addressing the issue of corporate taxation using the three pillars of the UN Guiding Principle on Human Rights: (i) the first pillar – that is the State duty to protect human rights – requires States not to facilitate corporate tax avoidance; (ii) the second pillar – that is the corporate responsibility to respect human rights – requires companies not to engage in abusive tax avoidance and make a policy commitment on taxation; (iii) the third pillar – the need to ensure adequate remedies – requires greater engagement by the international and human rights bodies with corporate tax avoidance.

In contrast, Scheffer (2013, p. 366) suggests adding an eleventh principle to the UN Global Compact identified as "Fair Taxation": "Businesses should undertake measures to promote fair taxation of their revenues, including non-resort to tax avoidance schemes and prohibition of any tax evasion practices."

Furthermore, in 2015 over 150 organizations signed the Lima Declaration on Tax Justice and Human Rights (available at http://www.cesr.org/sites/default/

files/Lima_Declaration_Tax_Justice_Human_Rights.pdf) to call upon governments, companies, international institutions, tax lawyers, judges, and the human rights community at large to actively engage in the development of an international tax system that favors the full realization of human rights.

(c) *Kantianism*

The most famous and prominent deontological approach is the ethics of the German philosopher Immanuel Kant. He developed a theoretical framework, called the "Categorical Imperative", that is, "an objective, rationally necessary and unconditional principle" (Johnson and Cureton 2004) to derive moral duties and rules for addressing all ethical issues. The main message of the Categorical Imperative is to act only according to that maxim (principle or rule) by which you can at the same time will that it should become a universal law (Kant 1786/2012, pp. 421–429; 1797/2013, p. 231).

To determine whether tax avoidance is ethical from a Kantian perspective, the first question would be to ask if we would want everybody to engage in tax avoidance in all circumstances, without any contradiction in conception or will (*universal acceptability* and *consistency* principle). Secondly, there is the need to investigate whether by making use of tax avoidance the basic human dignity of people would be fully respected (*human dignity* principle).

The most comprehensive application of Kant's Categorical Imperative to tax avoidance is offered by Lenz (2018). He hypothesizes that managers and tax consultants pursue a twofold purpose: they aim to interpret legal norms aggressively to minimize taxes and, simultaneously, they wish for a stable, predictable, and just legal system, where judges, civil servants, and adverse parties interpret legal rules considering the letter and the spirit of the law. If these premises are accepted, Lenz comes to the conclusion that conceiving tax avoidance as a universalized maxim would lead to a contradiction of will: it is not possible to wish at the same time that all persons and corporations interpret the law up to the boundary of what is probably legally permissible to minimize taxes and that the legal system will remain fair and stable.

Furthermore, other scholars point out more logical contradictions in conceiving tax avoidance as a universal law: if everyone pursues tax avoidance schemes, the effects would be a rise in tax rates or the introduction of new taxes and, then, that no one would achieve any gains (Prebble and Prebble 2010, pp. 725–726; Bennett and Murphy 2017, p. 7); tax avoidance strategies can be effective only if they remain unnoticed (Aharony and Geva 2003, p. 388); some economic actors (like SMEs and individual taxpayers) do not have the same opportunities or resources as multinational corporations to engage in tax avoidance activities (Preuss 2012b, p. 3); with specific regard to corporate inversion, the maxim whereby all companies and individuals may change their citizenship in order to pay lower taxes would require "that no citizen be a citizen" (Godar et al. 2005, p. 3).

Finally, regarding the principle of human dignity (i.e., whether tax avoidance leads to treating humanity as an end), scholars maintain that tax avoidance does not result in a respectful treatment of human beings because general society would be damaged by the reduced ability of governments to provide public goods and services (Preuss 2012a, p. 116; Raiborn et al. 2015, p. 85).

In summary, much literature provides different arguments to conclude that tax avoidance is immoral under the Kantian philosophical approach.

(d) *Ethics of justice*

The frequent phrasing of the issue of tax avoidance in terms of (un)fairness suggests that modern theories of justice may contribute to the debate (West 2018).

One of the most popular theories founded on the concept of justice and fairness was developed by John Rawls (1971) who established a deontological framework based on three criteria which guide decision makers toward solving the ethical issues behind a "veil of ignorance" (i.e., without any knowledge of their attributes or roles in society): (i) the *principle of equal liberty*: each person is to have an equal right to the most extensive basic liberties compatible with similar liberties for all; (ii) *the difference principle*: social and economic inequalities are to be arranged so that they are to the benefit of the least advantaged; (iii) the *principle of fair equality of opportunity*: those most disadvantaged in society should have the best opportunities under conditions of fair equality of opportunity.

Payne and Raiborn (2018, p. 476) contend that tax avoidance might violate all Rawls' principles, because the "least advantaged" in society (i.e., individual taxpayers and SMEs) would not have the same opportunity as MNEs to engage in tax avoidance activities and might suffer from the lack of public assistance due to the reduction in tax revenues. Ostas and Hilling (2016, pp. 64–65) also claim that tax avoidance strategies violate Rawls' notion of justice because they "tend to erode the policy goals that support tax systems, namely fairness, simplicity, and certainty."

According to Rawls, a just society is based on reciprocity, cooperation, and mutual respect among citizens. In order to establish obligations for individuals, Rawls introduced the principle of fairness that asserts that members of society who have voluntarily accepted the benefits provided by a society and its institutions are bound by a duty of "fair play" to do their part. In other terms, benefiting from society leads to an obligation to reciprocate.

When it comes to corporate tax practices, Gribnau (2017, p. 47) contends that the duty of fair play requires companies "more than simply to follow the rules, in the sense of strictly keeping to the letter of the law. . .. and to exercise a certain restraint in taking advantage of them." Business and community are parts of a mutually beneficial cooperative scheme: companies use public goods and services (e.g., good infrastructure, a just legal system, and a well-educated workforce) while local communities can benefit from corporations' economic and social contributions. Then, tax avoidance runs contrary to the principle of fairness, resulting in companies acting as free riders.

Finally, a different approach is adopted by Fischer and Friedman (2019) who link the Rawlsian principles to Abrahamic Justice, mainly based on the dichotomy between *tzedakah* (righteousness) and *mishpat* (judgment). By doing so, they reach the conclusion that, despite the fiduciary duty toward shareholders, managers have a moral responsibility to pay a fair share of tax even if they can legally avoid doing so, and they may "operate under the assumption that shareholders aspire to a higher level of justice that is informed not just by legal compliance but also by standards of righteousness" (Fischer and Friedman 2019, p. 213).

(e) *Social contract theory*

Some scholars have framed the issue of tax avoidance with reference to the social contract tradition (Donaldson and Dunfee 1994, 1999), which maintains that responsibilities to society come from a sort of implicit social contract between business and society.

Christensen and Murphy (2004, p. 37) highlight that tax payments are "the lifeblood of the social contract" since they are vital to the development of society and its institutions. Hence, as noted by Payne and Raiborn (2018, p. 476), entering into the social contract, a business has "tacitly agreed to contribute its fair share to the tax base" and, then, to abide by both the spirit and the letter of tax law. From this perspective, tax avoidance is immoral since it breaches the social contract that binds every firm to the community in which it operates (De Colle and Bennet 2014, p. 66).

(f) *Virtue Ethics*

Virtue ethics is a major ethical theory that emphasizes the development of virtues, that is, "traits of character that constitute praiseworthy elements in a person's psychology" (Audi 2012, p. 273). The main message of virtue ethics is that a "virtuous person is a morally good, excellent or admirable person who acts and feels as she should" (Hursthouse and Pettigrove 2016).

West (2018) builds on virtue ethics to focus on the role of accountants, who are often involved in corporate tax avoidance activities. More in detail, West refers to MacIntyre's virtue ethics (2007) to reconceptualize and remove two factors (i.e., *pressure* and *rationale*) included in Cressey's (1953) fraud triangle (the third factor, i.e., opportunity, is not discussed). Firstly, the pressure factor (i.e., the motivation behind tax avoidance) is reconceptualized by stressing that a good accountant should prioritize the achievement of excellent accounting practices (e.g., the substance over form principle) over the motivation to pursue shareholder wealth. In a similar vein, an alternative rationale (i.e., the intellectual justifications to make fraud acceptable) for accounting choices is provided, emphasizing the aim to contribute to the common good of individuals and collective flourishing, rather than enhancing shareholder wealth.

Furthermore, Preuss (2012a, p. 118) contends that corporate tax avoidance clashes with the emphasis of virtue ethics on situational learning and the development of moral character. This assumption moves from the premise that ethical behavior should be uniform and related to every aspect of business (Christensen and Murphy 2004, p. 39; Stainer et al. 1997, p. 214). Nevertheless, a number of empirical studies document that some corporations engage in tax avoidance while also making public claims to being ethical and socially responsible (e.g., Col and Patel 2019; Davis et al. 2016; Fallan and Fallan 2019; Lanis and

Richardson 2012; Preuss 2012b; Sikka 2010) revealing the resistance to framing corporate taxation as a moral issue within the business community. This moral disconnect cannot live up to the principles of virtue ethics since it is clearly "inconducive to the character development of organisational members" (Preuss 2012a, p. 119).

The Ethics of Tax Practitioners

Tax practitioners represent one of the major players in the tax arena since they help individual and corporate taxpayers to comply with their tax obligations, especially in a system characterized "by the combination of self-assessment systems, complex tax codes, increased penalties for non-compliance with tax legislation and higher levels of cross border activity" (Doyle et al. 2009, p. 177).

Therefore, to complete the discussion on ethics with regard to corporate tax behavior, some brief considerations on the role of tax practitioners are now proposed.

The term "tax practitioner" is commonly used to cover a diverse range of business professionals (e.g., accountants, auditors, lawyers, barristers, tax experts working within industry) who "provide a broad range of tax services for their clients" (Marshall et al. 1998, p. 1268). Tax practitioners' services can be divided into two main categories: tax compliance, whereby practitioners prepare tax computations on behalf of taxpayers, and tax planning/avoidance advice, whereby tax practitioners attempt to devise ways of reducing the taxpayer's liability.

Tax practitioners have duties to multiple actors (Frecknall-Hughes et al. 2017, p. 731). On the one hand, they play an important role in the pursuit of the public interest and the common good, serving as intermediaries and government representatives in the tax system. On the other hand, they have a contractual obligation to serve their clients' financial interests (Shafer and Simmons 2008; Stuebs and Wilkinson 2010).

The last decades have witnessed the emergence of the "dark-side" of the tax profession (Addison and Mueller 2015) with a growing number of scandals uncovering the involvement of tax practitioners and accountancy firms in devising and mass marketing aggressive and ethically questionable tax schemes in pursuit of higher profits, bringing them into conflict with the State, the civil society, and the public interest (Sikka and Hampton 2005; Sikka 2008, 2010; Addison and Mueller 2015, p. 330). These scandals have led to problematize tax as a central moral issue within the accounting profession and, then, to debate over the ethical behavior of tax practitioners (Shafer and Simmons 2008; Carter et al. 2015). As noted by Apostol and Pop (2019), the tax consultancy has traditionally functioned as a commercial activity that generates profits by offering tax assistance to advance the interests of clients (i.e., *commercially driven* institutional logic). However, this logic has recently come under threat from an emerging *ethically oriented* institutional logic which transposes the numerous societal requests for tax practitioners to act in a way that considers the impact on the wider society rather than pursuing only the clients' interests.

Driven by the changing public expectations, a growing number of studies have investigated the ethics in tax practice, mainly exploring how tax practitioners actually balance the private and the public interests and debating how they "should make difficult discretionary decisions within the existing boundaries of what is arguably allowable" (Field 2017, p. 268).

The importance of ethics in tax practice was emphasized in the late 1980s by Finn et al. who identified ethical dilemmas involving tax issues as the most difficult problem for members of the American Institute of Certified Public Accountants (Finn et al. 1988, pp. 607–609).

In terms of thinking about "ideal ethical tax practitioners," scholars have stressed how important it is for tax practitioners to follow both the letter and the spirit of the legislation (Frecknall-Hughes et al. 2017; Ostas 2018). This requires that tax practitioners restrain from exploiting a literal interpretation of the law and that they "employ the full panoply of interpretative steps, including deference to legislative policy compromises, respect for judicial precedents, and most importantly, an application of traditionally embraced maxims of statutory construction" (Ostas 2018, para. 1).

A preliminary empirical study on the role of ethics in tax practice was conducted by Marshall et al. (1998) who reported considerable diversity among Australian tax practitioners' ethical stances. The diversity in the styles of tax practitioners is supported by Sakurai and Braithwaite (2003), who reveal that taxpayers differentiate between three types of idealized tax practitioners: (i) the creative, aggressive tax planning type; (ii) the tax practitioner who engages in the cautious minimization of tax; (iii) the low risk, no fuss practitioner who is honest and risk averse.

A significant finding of the literature is that most tax practitioners are reluctant to recognize the role of ethics in tax practice: empirical evidence suggests that they appear more concerned with reputational damage in relation to tax avoidance than any resulting ethical aspects (Doyle et al. 2009) and that they reason in a less principled manner when presented with ethical dilemmas in a tax context than in a social context (Doyle et al. 2014).

With regard to the underlying ethical framework that tax practitioners concerned with ethics use to formulate their decisions, literature provides mixed results. Cruz et al. (2000) suggest that when tax practitioners face clients' pressure to adopt aggressive reporting positions, their ethical judgment is more affected by the moral equity and contractualism approaches than philosophies of utilitarianism, relativism, and egoism. Differently, Shafer and Simmons (2011) provide evidence that relativism (i.e., judgment of what is traditionally or culturally acceptable) has the strongest influence on tax practitioners' behavioral intentions in ethically charged situations. Additionally, the experiment of Frecknall-Hughes et al. (2017) indicates that although tax practitioners show a more marked deontological orientation, also consequentialist factors play some role in their reasoning about moral dilemmas in the tax domain.

The importance of ethics in tackling the sale of aggressive tax schemes is supported by a number of studies which have investigated the influence of personal ethical beliefs and the ethical environment on tax practitioners' decision making.

Results suggest that tax practitioners are less likely to facilitate aggressive tax avoidance schemes when they believe more strongly in the importance of business ethics (Shafer and Simmons 2008; Shafer et al. 2016) and when the ethical culture of their organization is supportive of professional ethics (Shafer and Simmons 2011).

Additionally, some contextual factors can also play an important role in affecting tax practitioners' ethical judgment. Demirbag et al. (2013) reveal significant differences in tax practitioners' perceptions of corporate tax-related ethical issues between developed (proxied by the UK) and emerging (proxied by Turkey) countries while Fatemi et al. (2018) provide evidence that tax practitioners are significantly less likely to choose a tax-favorable outcome when in the communication of ethical standards the integrity standard (i.e., protecting the public interest) is presented before the client advocacy principle (i.e., pleasing the client).

Given the importance of ethical standards in constraining aggressive tax behavior, scholars highlight the need for increased training in business ethics among tax practitioners to develop their moral character and promote a culture that gives greater consideration to the impact of tax decisions on wider society, rather than the tax a client can save (Stuebs and Wilkinson 2010; Shafer and Simmons 2008; Bennett and Murphy 2017; Krupka 2019).

More recent empirical studies seem to suggest a change in tax practitioners' consideration of the public interest. Bennett and Murphy's (2017) case study reveals that when stakeholders (i.e., the tax authority and the accounting profession regulatory authority) put tax practitioners who promoted aggressive tax schemes under pressure, they responded by issuing new guidance on responsible tax practices. Furthermore, Radcliffe et al. (2018) found that tax professionals have responded to changing public expectations in a way that promotes a new understanding of tax "not merely as a practice that has moral implications, but as a practice that is more deeply imbued with morality than has hitherto been recognized" (Radcliffe et al. 2018, p. 55).

Conclusions and Suggestions for Future Research

The extended literature review presented in the previous pages reflects the lively academic debate that has been ongoing for the last few years about the ethics of corporate tax behavior. Most scholars acknowledge that, even if corporate taxation is regulated by law, there is room to include this issue within the business ethics field to help businesses self-regulate their behavior in those "gray areas" where the tax law is imperfect and to drive changes in legislation in order to bridge the gap between what is morally right and what is legally permitted. However, the presence of many different positions regarding the morality of tax minimization practices mirrors the richness but also the complexity of the question at hand. Indeed, a discussion about corporate taxation inevitably raises the complicated issue concerning the role of business in society and its interrelations with another important actor, that is, the government. On the one hand, governments are entrusted with the responsibility to act in the best interests of society. They receive consent from society (through votes) and should act to protect society's interests. On the other hand, companies are also entrusted more and more with the responsibility of advancing the interests of society, and there are no doubts that they have a “social responsibility” to carry out.

Furthermore, governments and businesses are mutually dependent on each other for pursuing their specific role. A strong government institution creates a solid foundation that allows businesses to operate and grow, while corporate income taxes are an important part of most governments’ revenue and, so, a vital source for supporting public activities. These lines of reasoning explain why most moral arguments against tax avoidance find their legitimacy in the belief that companies should contribute to society by the payment of tax.

Again, the traditional legal theories on justification for taxation (i.e., “the benefit” principle and the “ability to pay” principle) start with the consideration that a fair share of tax should be given to the State. In particular, the “benefit” principle considers an amount of taxes proportionate to the amount of benefits obtained by the State to be “fair,” while the “ability-to-pay” approach is based on the idea that the tax burden should be distributed among taxpayers in proportion to their faculty to bear the burden (e.g. Dodge 2004; Kaufman 1997). In both cases, companies must contribute to the governments’ expenditure to allow them to fulfill their responsibilities toward citizens and to carry out their public function.

On the other hand, businesses can contribute to society by providing jobs, infrastructures, investments, etc., and, therefore, the less they pay in taxes, the greater their contribution will be to society. Some moral arguments in favor of tax avoidance are justified by the presence of other rights or interests in contrast to those of the government. In other words, if managers pay more taxes than the legal minimum, they are transferring to the governments wealth or possibilities that belong to other stakeholders (not only shareholders) and, more broadly, to society.

In this sense, companies are expected to replace the State in the exercise of some public functions. This “subsidiary” or “substitutive” approach may also be observed in all those initiatives in which tax authorities introduce tax benefits to achieve a social end. In these cases, companies exercise specific social functions traditionally attributed to the State and, for that reason, they have a reduction in what they have to pay to governments. A relevant example is companies’ charitable foundations and the possibility to devote huge sums of money, deducted from taxation, to specific social causes. These initiatives often underline the idea that businesses can be more effective or efficient than the State in performing what are traditionally considered as public functions.

Discussing the delicate relationship between companies and governments and the role of power on its development falls beyond the scope of this chapter, but it is worth noticing that this aspect may influence the perception of the moral duty to pay tax in order to fund States’ activities and functions.

Future studies could investigate this aspect further. In particular, attention could be paid to how different factors – such as companies’ perception of their role in society; the role, the power, and the efficacy of governments in pursuing the public good; and the power and efficacy that businesses perceive they have in relation to the State – influence how tax avoidance practices are perceived. Relevance could be given to the role of culture, types of legislation, different levels of economic development, or other factors on shaping the perception of the morality of corporate tax strategies.

Furthermore, the growing interest demonstrated by academics, NGOs, media, etc., to tax avoidance shows how companies (in particular multinational companies) face increased scrutiny of their tax practices. The question of the amount of tax to be paid is far from being a merely "technical aspect" to be managed through a cost-reduction approach, but rather it is increasingly becoming an ethical, political, and strategical issue. Not only NGOs, but also investors and standard setters are asking for "greater transparency to evaluate companies' exposure to potential earnings, governance, reputational and broader societal and macroeconomic risks" (UN PRI 2018, p. 5). In fact, the amount of corporate income tax, tax avoidance practices, and where taxes are paid are issues that need to be managed with a specific policy, a governance, and risk-assessment structure and communication system.

As noted in this literature review, many ethical theories lead to the conclusion that managers should have a responsibility to pay a fair share of tax, even if they can legally avoid doing so, because their "principals," that is shareholders, could "aspire to a higher level of justice" (Fischer and Friedman 2019, p. 213) informed by values of righteousness and fairness. Furthermore, firm or brand reputation could be at risk due to the stakeholders' perception (and expectations) of corporate tax duties. A company tax policy, discussed and issued at board (or general meeting) level, is fundamental.

Further studies could investigate the presence of tax policies and how these reflect (or could reflect) the set of corporate values and the business and social responsibility strategy. Also, how and where tax-related issues are discussed and how decisions are taken in companies could be an interesting field of investigation to understand better if tax-related matters are considered to be ethical and political issues or if they are still handled as technical/administrative aspects. Again, the role of different stakeholders and their pressure on companies could be an interesting point of view to investigate how policies and decisions are shaped, defined, and changed over time. Research could explore how the company, through tax policy and governance systems, protects stakeholder trust and enhances the company's license to operate.

Furthermore, as noted above in the literature review, there could be a moral justification for tax avoidance. Further studies could shed light on the links (if any) between tax policies and practices and the company's overall strategy, in particular as far as corporate social responsibility is concerned.

A last point that deserves attention is the need for transparency. The rich literature review and the different positions advanced by authors and practitioners support the idea that companies are called to be accountable for their tax-related decisions. At the moment, income tax-related information published by companies appears to be largely focused on meeting regulatory requirements rather than stakeholders' claims (UN PRI 2018). A first question that scholars can raise concerns the motivations and barriers that companies face in disclosing data on income tax policies and practices. However, an ethical approach to taxation may prompt new and further demands. For example, the link between the place where the economic operations and sales take place or where customers are based – that is, where value is created – and the place where taxes are paid is an emerging and compelling issue on stakeholders' agendas (see, e.g., UN PRI 2018 and GRI 2019). Finally, cross-national transitions, international subsidiaries, and the digital economy open new and challenging avenues for addressing legal but also moral duties to pay a fair share of tax.

Abstract

The intention of this chapter is to formulate thought-provoking ideas about legitimacy and close neighbor terms. In particular, the chapter considers "legitimacy" to not only be a very relevant term for business ethics in general but also highly relevant in answering the question of how business ethics relates to law. Rather than defining legitimacy right away, the authors use the first part of this chapter to develop a comprehensive understanding of legitimacy by relating it to close neighbor terms, such as power, recognition, trust, justification, and criticism, on the one hand, and to legality in its contrast to and overlap with legitimacy, on the other. In the second part of this chapter, we offer concrete (real-world) examples and ideas of the interaction between legitimacy and law. These examples are drawn from traditional legal disciplines such as tax law and human rights law, as well as more modern legal preoccupations such as intellectual property law, laws relating to artificial intelligence and autonomous cars, the latest organic seed certification laws, etc. We envisage these examples as food-for-thought for future business ethics teaching and research at the interface of legitimacy and legality and business ethics and its legal contexts.

Keywords

Legitimacy · Law · Business ethics

Introduction/Overview

The intention of this chapter is to formulate thought-provoking ideas about legitimacy (and close neighbor terms) as a potentially fruitful term for business ethics in general and for the question of how business ethics relates to law in particular. Rather than defining legitimacy right away (e.g., departing from German authors such as M. Weber, J. Habermas, and N. Luhmann; see Brinkmann 1978), we use the first part of this chapter to develop a comprehensive understanding of legitimacy by relating it to close neighbor terms, such as power (most importantly) but also recognition, trust, justification, and criticism, and to legality in its contrast to and overlap with legitimacy. In the second part of this chapter, we offer concrete (real-world) examples and ideas of the interaction between legitimacy and law. We envisage these examples as food-for-thought for future business ethics teaching and research at the interface of legitimacy and legality and business ethics and its legal contexts.

Understanding Legitimacy

Legitimacy and Power

In a preliminary working definition, one can understand power ". . . as the ability of an actor (or a system) to realize his/her/its own interests and to hinder others from realizing theirs, based on material or immaterial resources such as sanctioning power, legitimacy and ideologies. . .” (Brinkmann 2017). Among several sociological concepts of power or approaches, the most interesting one in the context of this chapter is a “*legitimacy* or power justification-and-acceptance approach [which] focuses on how actors or systems with power *justify* themselves and their power towards weaker or powerless parties in power relationships, and to what extent such justifications are accepted by these. . .” (Brinkmann 2017, mainly inspired by the classical ideal typology of charismatic versus traditional versus legal-rational governance, see Weber 1978). Figure 1 is an attempt to visualize such a power-as-legitimacy approach, alone or combined with two other approaches. The two other approaches (mentioned in Brinkmann 2017) are:

Firstly, the so-called “second or least interest-based power” approach. This approach focuses on the net sum of two (or more) parties’ interdependent and complementary strengths and vulnerabilities. In other words, this approach studies the impact of controlled (i.e., one’s own) versus counterpart (i.e. others’) resources and interests, such as material resources (money, resilience, etc.) in negotiation situations.

Secondly, the so-called third or *model power* approach. This approach focuses on actor power as *influence*, for example, where experts or advisors can “help” more or less helpless non-experts or clients with “their” decision, but often on the model owner’s and advice giver’s terms rather than the client’s.

These three approaches can be translated into one another or combined. Legitimacy, trust, reputation, and information can be “controlled” or “needed”; simplification “models” can count as nonmaterial resources or potential vulnerabilities; or short expertise in demand can serve as a base of power as authority (Brinkmann 2017).

So far, one can say that legitimacy, as legitimate power, is a potential strengthening or reinforcement of power, which in turn makes power less dependent on force or other material or immaterial resources. However, legitimacy connotes also a

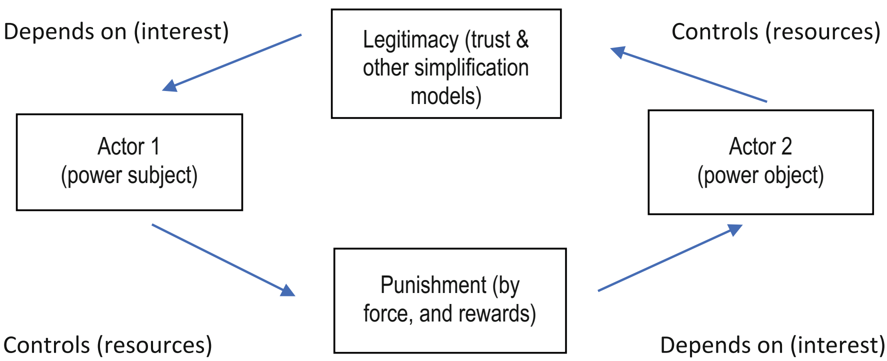

Fig. 1 Power, trying to combine W. Waller’s (least principle) and M. Weber’s concept. (A modification of exhibit #4 in Brinkmann 2017)

potential vulnerability, since the underdogs, the power objects, might also have some reciprocal power to accept, recognize, or reject power. In other words, they have at least some potential counter-power. As a corollary, therefore, claims or critical questioning of legitimacy typically triggers a follow-up question: if and where are there any powerful rulers, public bodies, business arenas, or actors, which claim and/or need legitimacy. From this it seems to follow that introducing and using legitimacy concepts in business ethics open the door for focusing on issues and impact of power in business contexts rather than overlooking them. This facilitates the demanding of similar legitimacy from actors in the business arena as one would from political ones with comparable power or else considering their power illegitimate (cf the key thoughts in Ulrich 2016/2008).

Legitimacy Equals Recognition

While legitimacy often appears as a Siamese twin or shadow of power in the double meaning of a support and a challenge, the best translation of legitimacy is most likely "recognition." If an arena or an authority or a person with authority is legitimate, this means that they are recognized (or respected, or accepted – cf also Boutilier and Thomson 2011 who try to think of recognition as a variable, with a tought-provoking visualization). Nevertheless, as mentioned above, such recognition (or respect/acceptance) is a potential asset or resource which at the same time is more or less controlled by the underdog (or the master's slave in Hegel's terms). Max Weber's concept of legitimate power (in his most important work, *Wirtschaft und Gesellschaft*, transl. Economy and Society) equates legitimacy with recognition. On the one hand, Weber suggests looking bottom-up, e.g., from the perspective of an individual citizen, with legitimacy or recognition as a property of an action-orienting order or frame of reference. On the other hand, he suggests looking top-down, with legitimacy as a claim of justified power or as a "likelihood of obedience to a given order with a given content among specifiable persons..." (1972, pp. 28, 122 ff). In addition, Weber hints at a subtle dialectic of normative aspects (what I ought to do as an individual and what *power* claims subjects ought to do) and empirical ones (since there is a reference to factual validity, understood as a likelihood of obedience, that orientations exist and trigger action or that claims of legitimacy are met by empirical conformity). In other words, expected orientation meets factual action-orientation, ought meets is.

Legitimacy Equals Trust

Legitimacy can also mean the same as a claim of trustworthiness, where rulers or companies suggest to their subjects or customers that they can trust them and where their subjects or customers do so, with or without invitation. Here, subjects or customers trust rather than control the powerful. Expectations as the key indicators in some definitions of trust (and of legitimacy) are at least as interesting as talking about trust in general (cf Luhmann 2014, in particular about the distinction between cognitive and normative expectations, originally developed by the two Norwegian sociologists J. Galtung 1959 and V. Aubert 1967). The question is if legitimacy is expected normatively (with a risk of disappointment and criticism) or cognitively (with a willingness to accept decisions after a proper procedure, within reasonable limits, not really far from resignation and cynicism: ". . . a generalised willingness to accept decisions without a specified content, within certain tolerance limitations"; see Luhmann 1969, p 28, first author's translation). Or in other words, trust or trustworthiness is basically a normative expectation, or a simplification model, where one feels that one does not need to spend time on critical questions or controls but by the same token that runs the risk of disappointment and being betrayed (cf the classical prisoner's dilemma game design, where mutual trust is rewarded but where non-mutual trust risks being exploited by the counterpart). Or, related to marketing and consumer ethics, a strong brand claims legitimacy and trustworthiness, while brand loyalty is basically risky trust. Such consumer behavior examples raise interesting follow-up questions, about the relative depth and grounding (and the again riskiness) of trust – whether trust represents a customer conviction or rather customer laziness.

Legitimacy Equals Justification

A next synonym for legitimacy is justification that power, authorities, or, e.g., corporations are able and willing to justify themselves, by providing reasons that are at least "good enough." When teaching introductory courses in business ethics, this is where references to classical moral philosophy become due – that justifications (i) are as good or as convincing as the intentions and principles guiding an action (such as in Kantianism) or (ii) are as good as the holistic analyses of actions' or rules' likely consequences for affected parties (such as in utilitarianism) or (iii) as good as the goodness of good persons, such as good or even excellent rulers (such as in virtue ethics). At least in a skeptical perspective, the judgment of "good enough" reasons should be left to the target groups or even to critical outside experts rather than to the justifier alone or to any sources referred to by the justifier. As an additional alternative, one can leave legitimacy as justification to democratic participation and to a good and fair dialogue among the addressees and owners of legitimacy (such as is proposed by discourse ethics, see Habermas 1983/1990, or as good secondary literature, see Edgar 2005, 157–164, or when it comes to trying to translate it into practice, see Brinkmann 2015 and Brinkmann et al. 2016, with a presentation of Neo-socratic dialogue design as a way of trying out discourse ethics in practice).

Legitimacy as a Critical Term?

In a business ethics context, legitimacy can help describe and understand the normative basis of, for example, corporate power. But the most interesting, perhaps, is a third possible function – if legitimacy can and should serve as a critical term, that is, for an evaluation of realities (e.g., in relation to a potential) and for any improvement suggestions. Such an evaluation depends on criteria and perhaps on the status of legitimacy as an ideal – which then can be used for critical judgment across the aspects presented above, e.g., of claims made by powerful actors or systems, if claimed recognition or claimed trustworthiness is deserved, if justifications are convincing skeptics (rather than the convinced only) or can be criticized as rationalizations or moral neutralization. A critical theory and/or a critical management studies approach would here recommend a double criticism of factual power in systems or of actors, of claims and justifications, and of (more or less positivist) theories and ideologies explaining and defending them, for example, as positive, given, in the meaning of "alternative-less."

Legitimacy and Legality

Legitimacy and legality have the same roots, in the Latin word *lex*, which means "law." Legitimacy and legality are at the same time overlapping and different. Legitimacy suggests recognition, trustworthiness, and/or justification – often unquestioned but questionable rather than unquestionable. Legality suggests that systems and actions are in accordance with the law, with a similar ambiguity. A preliminary text table draft which compares legality and legitimacy can serve as a point of departure for further reflection and elaboration (see Table 1). In addition, especially in a business ethics context, one could ask how legitimacy and legality can influence one another (reinforce one another or be in one another's way, see Table 2 as another point of departure).

The Dialectics of Business Ethics and Law, Legitimacy, and Legality: Examples and Ideas

Now and then, for example, in textbooks and at conferences, business ethics is presented and perceived as if there were neither law nor legal scholars. Tables 1 and 2 suggest that there are interesting differences and complementarities, tensions and conflicts, clear extremes, and gray zones between these two ways of thinking – which should be addressed rather than neglected. In the second part of this chapter, we offer short presentations of topics where such an interaction and collaboration between law and ethics and between legality and legitimacy could be tried out and investigated further in business ethics research and teaching, concretely rather than merely in abstract terms.

Business and Human Rights

One of the most prominent approaches in ethics and business ethics is the so-called rights and duties approaches (see for, e.g., the Stanford Encyclopedia of Philosophy

Table 1 Comparison of legality and legitimacy

	Legality	Legitimacy
Primary norm system	Positive law (correctly produced and applied, with a primary focus on the letter and a secondary focus on the spirit)	Expectations (normative and/or cognitive ones, met or not) of justice and entitlement, morality, and ethics
Possible negative and positive sanctions	Punishment (fines, imprisonment, invalidity, etc.), legal validation and implementation	Loss of respect and recognition among important stakeholders. Positive reputation, authority, loyalty among stakeholders
Ideal	Rechtsstaatlichkeit and Rechtssicherheit, predictability: outsider interference and legally irrelevant facts and thoughts don't matter. Letter = spirit of the law	Justice and transparency, enlightenment and consistency (with other ethical ideals)
Justification	Immanent/ inherent justification (and immanent-critical questioning)	Legality ("rule of law," Rechtsstaatlichkeit), and/or reference to ruler charisma and/or tradition, and/or ethical theory/principles (which all can be questioned)
Basic units	Legal persons in legal systems	Citizens and rulers, government
Academic experts	Legal scholars	Moral philosophers, psychologists, social scientists
Success	Implementation and loyalty	Reinforced power, deserved recognition and trust, listening to constructive criticism
Change processes	Verrechtlichung, growth of coverage of relationships by law, growth of compliance thinking	Increase and decrease of substantial legitimacy expectations

https://plato.stanford.edu/entries/rights-human/; or Brusseau 2011), where duties define rights and vice versa, with lower and upper boundaries and conflicts as typical issues for further investigation. One of the most prominent examples is basic human rights which are to be respected and not to be compromised even for claimed legitimate purposes, such as economic development, law and order, risk management, etc. Human rights are also among the best examples of the interface between law and ethics and legality and legitimacy, as typical key ingredients in national constitutions and international law (ibid. United Nations: Universal Declaration of Human Rights (UDHR) 1948). Human rights are those fundamental rights and freedoms to which all human beings are entitled and include civil, cultural, economic, political, and social rights (United Nations http://www.un.org/en/sections/issues-depth/human-rights). The most basic among these rights includes the right to life, liberty, and personal security (Article 3, UDHR) as well as the freedom from interference with privacy, family, home, and correspondence (Article 12, UDHR). Over time, not just states and governments but also private individuals and businesses are expected, in their speech and actions, to respect these rights and freedoms (Buhmann 2016), demonstrating the expanding legitimacy of these rights even

Table 2 A typology of how legality and legitimacy can influence (reinforce, weaken) one another

A decision or state of affairs is…	Illegitimate	Possibly	Legitimate
Legal	**Independent legal validity** (that is independently of the ethicalness of its contents). Ethical/moral criticism can potentially weaken or **neutralize** the effect of positive law		**Interdependent implementation** or realization: Just law. Consistency and mutual **reinforcement** of legal *and* ethical/ moral/ empirical **support**
Possibly…		**Gray zones**	
Illegal	**Interdependent critique-worthiness:** Consistency and mutual **reinforcement** of legal *and* ethical/ moral **rejection/ deviance**		**Independent ethical validity:** Ethically/ morally justified **critique** of positive law, **deviance** from it and **opposition** to it, **perhaps civil disobedience**

though they were rather "radical" at the time they were adopted (Hannum 2016). Nonetheless, significant challenges remain in accomplishing/implementing the ideal of human rights in diverse international economic and sociopolitical circumstances (Moore 2001). These challenges illustrate the differences highlighted in Table 1 above between legality and legitimacy on the one hand and the interactive combinations of the two (as described in Table 2) that might exist in real-world circumstances, on the other.

One real-life example could be the recent move by the Chinese government to establish an artificial intelligence-based public behavior monitoring mechanism that aims to "purify" society by rewarding people who are trustworthy and punishing those who are not. Accomplished with the help of an estimated 1.7 million surveillance cameras installed across China, reports state that "By 2020, China plans to give all its 1.4 billion citizens a personal score based on how they behave. Some with low scores are already being punished if they want to travel. Nearly 11 million Chinese are not allowed to fly and 4 million are barred from trains;" see CBS News (2018) and also Kent (1999). While those affected by this system record their unhappiness, several people from among the general population of China consider these laws to be justified and even necessary to ensure good behavior by all, at all times ("legitimacy by justification"; CBS News 2018, http://www.cbsnews.com/news/china-social-credit-system-surveillance-cameras). In democratic setups, it would have been expected that, as described in Table 2, the Chinese law would either be rejected or lead to neutralization of positive law. Notably, China is signatory to the UN Universal Declaration on Human Rights, the International Covenant on Economic, Social and Cultural Rights, as well as the International Covenant on Civil and Political Rights (although it is yet to ratify the latter two). Nevertheless, civil disobedience has been met with low levels of tolerance by the Chinese government, which considers it legitimate also to use force to suppress civil (and also student) uprisings such as the one in Tiananmen Square in 1989. The use of such force may be categorized as legal (within China) but illegitimate (in China and globally, Kent 1999).

Perhaps in large part due to the absence of democracy, all legal and governance schemes in China can be said to enjoy a kind of *de jure* legitimacy. Indeed, the legitimacy as well as the legality of the monitoring and scoring mechanism in China brings up interesting questions about the nature of "legitimacy" and its relationship with "legality." It particularly exemplifies how a legal and governance regime can, even while being illegitimate at its inception, become legitimate within a specific societal context over (long) periods of time. Indeed, China has even witnessed increasing private sector participation and at least an apparent increase in public acceptance of the laws and governance structures, evidencing increasing global legitimacy of the Chinese legal and political regime. Here, therefore, there may be a need to add a new category (vis-a-vis Table 2) of possible interaction between legality and legitimacy: a law that is originally illegitimate may acquire legitimacy over a period of time during which the law remains unchallenged and/or succeeds in changing behavior and mindsets till it (i.e., the law) becomes a given. This "acquired legitimacy" may be the result of a legitimacy based initially on power/force but influencing, over time, public opinion at a very fundamental level, thereby also becoming a legitimacy based on justification.

Intellectual Property (IP) Law

IP has become a global and commercial buzzword since the mid-1990s. The World Intellectual Property Organization (WIPO) defines "intellectual property (IP)" as "creations of the mind: inventions, literary and artistic works, symbols, names and images used in commerce" (WIPO undated, https://www.wipo.int/edocs/pubdocs/en/intproperty/450/wipo_pub_450.pdf), etc. The term includes "industrial property" such as patents, trademarks, industrial designs, trade secrets, and geographical indications, as well as copyrights and the so-called related rights, referring to rights of performers and producers of phonograms (ibid.). Each of these categories confers a specific package of "rights" and "duties" on their owners, and ownership of any IP depends on whether or not you were the first to create a product/process or, in some cases, on whether you were the first to apply for the package of exclusive rights in the proper government office after creating the product/process (in patent law, this is called the "first-to-file" system) (Ladas 1975, p. 323). Once ownership is established, each category of IP right provides a certain number of years of "exclusivity," during which time the owner is permitted to exclude others from using or selling goods or services incorporating the IP right in question (Ghosh and Calboli 2018, p. 25).

From an ethical perspective, in order for any intellectual property law to be considered "legitimate," it must be fair to all stakeholders, not least because the stakeholders have divergent interests. To illustrate, on the one hand, IP laws must be fair to inventors and creators of novel works by ensuring that they are adequately rewarded (compensated) for their efforts. This fair reward is also necessary for the benefit of the society as it is supposed (theoretically speaking, at least) to incentivize further and optimal levels of inventive/creative activity (Leslie 2011, p. 186; Ku 2003, p. 547; Gordon 1984, p. 1611). At the same time, IP laws also must ensure that they are fair to the consumers of products or services deriving from inventive/creative activities. Thus, for example, when a company obtains a patent over a life-saving drug, ethics might require that a legitimate patent law is also well equipped to ensure that the exclusive rights it confers on the company are not exploited to overprice the drug. While IP laws of most countries are extensive and detailed, most do not deal with the issue of price, considering this to be the exclusive decision of the patentee, or an issue to be dealt with by other regulatory agencies and insurances (Posner 2005, p. 58; Dratler 2018, p. 103).

In this context, it is also interesting to note that developing countries, where the system of health insurance might not be so well developed, often work provisions that disincentivize over-pricing, into the patent law itself. For example, compulsory licensing regimes under patent laws might state that if a patent owner fails to provide a patented product to the public at reasonable price (also called "access"), it can be required by law to grant a compulsory license to another company to use and work the patent, thereby creating competition in the market and ensuring a reduction in price (Basheer and Kochupillai 2005, p. 13 ff.). Absence of such provisions, as well as attempts to weaken the impact of such and similar provisions in patent law, shakes the public confidence in IP laws (legitimacy) and has often resulted in popular protests, including by not-for-profit institutions and public-funded hospitals who rely on low-cost drugs to provide their services to the poor (Hoen et al. 2001; Euro News 2013). Nevertheless, the flexibility available to individual countries to design and implement IP laws that are legitimate and accepted in their territories has changed drastically in the last two decades.

Historically, each country decided the scope and term of protection granted by various IP rights within their territory based on their own cultural understanding of the importance of "exclusivity" on one hand and their economic conditions on the other (Kur and Mizaras 2011, p. 121; Bently and Sherman 2014). This freedom was not only accepted but was understood as an integral part of any nation's sovereignty (Kobak 2005). One might also think of this flexibility as being justifiable under a broad theory of cultural relativism (Sell 2003, p. 11). Accordingly, "weak" patent systems (i.e., patent systems that do not grant strong and long periods of protection to creators and inventors) were often found to exist in countries that were in their early stages of development. Such "weak" systems were created by legal instruments and enjoyed popular legitimacy among the common people as well as the local industry. A popular example is the pharmaceutical industry of India, which, under the protection conferred by the weak Indian Patents Act of 1970, became the world's largest generic drug manufacturer, producing high-quality generic copies of drugs patented in originator (often Western) countries (Basheer and Kochupillai 2005, p. 37).

Since the early 1990s, however, concerted international efforts (especially by developed country members) made membership to the Trade-Related Intellectual

Property Rights Agreement (TRIPs) a precondition to joining the World Trade Organization (WTO), which replaced the earlier, more flexible arrangement under the General Agreement on Tariffs and Trade (GATT) (Kennedy 2016, p. 383). The TRIPs Agreement established global common minimum standards for the protection of intellectual property through, inter alia, patents, copyrights, trademarks, geographical indications, and plant variety protection methods (Xiong 2012, p. 4; Cottier and Mavroidis 2000, p. 115). The various preliminary as well as final drafts of the TRIPs agreement faced severe criticism from civil society representatives, doctors, patient groups, farmers associations, and a diverse range of private as well as non-for-profit groups (Straus 2007, p. 48; Shiva 2000, p. 505 ff.). Perhaps one of the most highly criticized provisions of TRIPs is Article 27, which mandates a "product patent regime" (McManis 2003, p. 27 ff.) for pharmaceuticals under which developing country members were required to implement much stronger patent rights for pharmaceuticals. This and other global common minimum standards established by TRIPs, while left open to interpretation by national legislations and courts, were considered an illegitimate encroachment upon national sovereignty and the right of each country to self-determine the standard of IP protection that best suited its current and planned developmental needs (Kennedy 2016, p. 158; Yamane 2011, p. 311).

To the extent that the newly established TRIPs minimum standards could be considered optional (i.e., countries could always choose to not be members of TRIPs and the WTO), its adoption by any country could, theoretically speaking, be based on the degree to which its provisions were accepted as legitimate by the country in question (as well as by its government and people, especially in democratic setups). However, by making membership to TRIPs a precondition to joining the multilateral trade regime created and facilitated by the WTO, developed country members, who held the bulk of resources needed to create and protect intellectual property, arguably exercised their economic power to make legitimate an instrument that, at the time, enjoyed little to no legitimacy, especially among developing country members. Indeed, groups such as "Doctors without Borders" also opposed the "product patent regime" for pharmaceuticals mandated by TRIPs (Heins 2008, p. 98). This regime was particularly disliked and feared (lacked legitimacy) because it radically postponed the development and marketing of cheaper generic versions of patented drugs by generic pharmaceutical companies, many of which operate in developing countries like India, thereby significantly increasing drug prices worldwide (Kiliç 2014, p. 81; Dobhal 2011, p. 241; Malhotra 2010, p. 123; Adelman and Baldia 1996, p. 507).

Therefore, despite the apparent legitimacy enjoyed by intellectual property protection laws and agreements such as TRIPs, international declarations such as the Doha Declaration (WHO 2001) as well as national and international administrative body and court rulings (Supreme Court of India 2013; WTO 2000) suggest that these laws can benefit greatly from an interaction with fundamental principles of ethics (such as fairness) and also from debates on legitimacy. Similarly, discussions within the discipline of business ethics can be greatly enriched by looking at the evolution of international and national legal landscapes of intellectual property law, which can also be considered a law/legal regime that has “acquired legitimacy” by long usage, by justification, and/or by (diplomatic) force.

Agricultural Seed Laws

In addition to intellectual property rights regimes, legally recommended, and in many cases mandatory, seed certification systems in Europe also impose strict conditions/limitations on the production and distribution of specific commodities. In so doing, these legal regimes (potentially) exclude entire segments of the population from engaging in a trade that historically constitutes their domain expertise and even exclusive terrain (Steiger 2017; Hanson 1994). This arguably makes the systems legal but illegitimate from a popular (farmers) standpoint. Starting with voluntary schemes, launched, inter alia, by the OECD as early as in 1958, that aimed to ensure varietal purity of seeds produced and sold by breeders and seed traders, in Europe the system evolved with increasingly stringent requirements for seed testing, certification, labelling, and sale, albeit not uniformly adopted by all EU countries (FAO 2001). Nonetheless, the trend in the years following the mid-1900s has been toward increased regulation of seed sales in many EU countries – these laws, together with intellectual property protection, were often opposed by farmers’ groups and NGOs, who demanded legislative authorities to carve out exceptions for farmers and peasants (Steiger and Patel 2017). In this subsection, we see how (mandatory) seed certification laws are an excellent example of how an illegitimate law can fail, in a democratic setup, to be uniformly adopted and implemented and may, over time, lead to a fundamental rethinking of the law itself.

In the domain of agriculture, laws have evolved drastically over the last few decades and become increasingly complex. Starting with the aim of ensuring “quality” aimed at ensuring “high yields” necessary to feed the growing population, discourse and discussions surrounding laws governing the production, multiplication, and sale of agricultural seeds have evolved to also require ,sustainability (Kurth et al. 2018; Kochupillai 2016). In fact, sustainability has also become an integral part of business ethics discourse, requiring that businesses conduct their daily activity not only with economic sustainability (profits) in mind but also in keeping with social and environmental sustainability (Crane and Matten 2016, p. 33 ff.). As a direct consequence of this shift in discourse, laws as well as companies can no more remain “legitimate” in the eyes of the general public unless they go beyond the bare requirements of legal mandates (such as ensuring their seeds are certified and/or registered) and must also ensure that their business models and products are in line with the triple requirements of economic, social, and environmental sustainability. Companies like Monsanto, for example, that produce weedicides such as the (in) famous Roundup and seeds that embrace “terminator technology” are severely criticized despite compliance with legal requirements (Bain et al. 2017). Further, business models of such companies, which rely heavily on exclusivity regimes established by intellectual property laws and mandatory seed certification systems to ensure high-profit levels, are increasingly losing legitimacy and public trust overall (Lamphere and East 2016, p. 11; Werhane et al. 2008). Like intellectual property and seed laws themselves, companies that rely on these laws can perhaps also be categorized as "legal" but not entirely "legitimate."

It is therefore not surprising that at the broader legislative level, the latest EU Organic Regulation (EU) 2018/848 has also evolved to more closely reflect the latest scientific understanding of sustainability, abandoning strict certification and "uniformity" requirements for the sale of seeds and permitting the use of nonuniform "heterogenous" varieties (the broad definition of which seems to suggest that it includes farmers varieties) for cultivation. This legal evolution results from acknowledging scientific findings that support the use of nonuniform, heterogenous varieties to enhance the health and diversity of seeds and soils – two of the key "ingredients" of agriculture, without which agricultural sustainability is not possible. The following provisions of the new EU Organic Regulation are particularly noteworthy:

> Article 6 of the new EU Organic Regulations (EU 2018/848): "Article 6: Specific principles applicable to agricultural activities and aquaculture - As regards agricultural activities and aquaculture, organic production shall, in particular, be based on the following specific principles:
>
> (g) the use of organic plant reproductive material, such as plant reproductive material of organic heterogeneous material and of organic varieties suitable for organic production.
>
> Article 13: Specific provisions for the marketing of plant reproductive material of organic heterogeneous material
>
> 1. Plant reproductive material of organic heterogeneous material may be marketed without complying with the requirements for registration and without complying with the certification categories of pre-basic, basic and certified material or with the requirements for other categories (. . .)
> 2. Plant reproductive material of organic heterogeneous material as referred to in paragraph 1 may be marketed following a notification of the organic heterogeneous material by the supplier to the responsible official bodies (. . .)"

In the light of the latest scientific understanding which increasingly supports long-standing "popular" views, seed laws that mandate certification/registration of seeds prior to sale can be best categorized as "legal" but not entirely "legitimate." This is so not least because such laws are considered socially and environmentally non-sustainable, increasing the costs of being in the seed business, or increasing the barriers to entry into this business, thereby preventing a large and important segment of society (i.e., small farmers) from participating in the seed sector. The new EU Organic Regulation can therefore be seen as an instance where the lack of legitimacy, when supported by latest scientific knowledge (and perhaps also ancient wisdom), can influence and force a change in law/legal provisions.

Laws Linked to Technological Development

A lot of the emerging high-tech innovations come with the promise of increased safety, comfort, convenience, efficacy, and/or efficiency. Autonomous cars are an important case in point. Although they are aimed at increasing road safety by reducing the chance of human error-based accidents, the decreasing need for human intervention itself raises important legal as well as ethical issues. The legal issues raised include questions of liability, namely, who will take the blame (and therefore pay compensation) in case of an accident. The ethical issues include more critical questions of human dignity, particularly the freedom of choice (e.g., having the right to steer the car in the direction of one's choice, including in dilemma situations) and also privacy (whether or not the autonomous vehicle has a right to transmit personal data, including current location and car usage patterns, to enhance "safety"). The rapid technological development in the field leaves much to be desired from existing and planned legal regulation (Light 2017; Claybrook and Kildare 2018). For example, until recently, when humans were in command of the maintenance and upkeep of the systems operating the car, as well as of the manner in which the car was maneuvered and driven, the primary responsibility/liability in case of accidents was that of the human actors in command (although insurance shifted the responsibility to pay compensation away from human actors and to the insurance company in most instances, BCG 2015). With increasing automation and the reduced control that human beings are expected to have over the maintenance of all/any systems linked to the car (e.g., software, Internet of Things (IoT) devices, etc.) as well as the manner in which the car is driven, the liability might also increasingly shift away from human actors/drivers to device manufacturers or systems managers.

Whether or not this shift in legal and liability regimes, as well as the technological development mandating this shift, is itself deemed "legitimate" by the consuming public is a different and more fundamentally important question. Indeed, empirical research suggests that people are hesitant to delegate tasks that affect third parties, to machines, and observers judge such delegations critically (Gogoll and Uhl 2018). This finding has significant implications for law and policy makers. More significantly, these findings have serious implications on the legitimacy of highly or completely automated vehicles (and laws legalizing their sale and use) that seek to exclude or limit the possibility of human intervention/human autonomy (Lütge 2017). Such exclusions or limitations arguably infringe upon human dignity, by eliminating freedom of choice, human autonomy, and responsibility. In this scenario, the relevance of ethical guidelines increases considerably (Gogoll and Müller 2016). Indeed, academic as well as government initiatives in this direction can also help shape legal rules (Lütge 2017).

Accordingly, before any liability or other rule/law is framed, the presumption is that the technology and the products/services incorporating the technology are themselves de facto legitimate. Absent this de facto legitimacy of the underlying technology, the success (in terms of market demand for products incorporating the technology) of the technology, and therefore its evolution can be stymied. On the other hand, however, when there is a high degree of public trust in a technology (legitimacy) and there is not enough knowledge and experience available to legally validate this legitimacy/public trust, regulations may choose to remain silent or only offer administrative warnings. In the framework of blockchain-based coin sales, for example, several regulatory authorities the world over, chose to refrain from regulating the market, instead issuing wide warnings to the public that in case of financial losses, investors would be without legal remedy (McKenna 2017; Aki 2019). Similarly, social media platforms such as Facebook emerged and took over the imagination of significant segments of the (young) world population, at a time when little to nothing was known about how or even why to regulate the sector (Obar and Wildman 2015; Bertot et al. 2012).

These platforms gained rapid legitimacy and popularity, primarily because of their utility and novelty. Later, when issues such as privacy and data collection emerged, regulatory landscapes were tightened. The EU General Data Protection Regulation is an example of such legislative tightening of ethical standards expected of corporations such as Facebook (see, e.g., Goddard 2017; Mance 2018). The interaction between legality and legitimacy, therefore, takes on yet another flavor in the case of potentially and actually useful evolving technologies and, as discussed above, provides a strong case for continuous interaction between law and ethics, legality, and legitimacy.

Tax Avoidance

Some x-large size global corporations have a reputation of being good at tax avoidance, by moving headquarters/holding company addresses, as well as profits and losses across borders to "best places" when it comes to minimizing their taxes. This is a good and almost standard example of legal but ethically disputable practices (the upper left corner and the gray zones in Table 2), often defended with "moral neutralization" arguments of the type "if it's legal it's ok" or "our competitors do it, too." Such tax avoidance practices are increasingly criticized in the media (Lord 2018; Foster Back 2013) and by organizations such as Tax Justice or Global Tax Justice (see http://taxjustice.no/english or https://www.globaltaxjustice.org/). There are also several academic discussions of these issues (see, e.g., Alm and Torgler 2011, Dowling 2014, Hess and Alexander 2015).

Workplace Ethics

Workplace and organization ethics, with employees as primary stakeholders, and environmental ethics in its interface with business ethics are among the most popular themes on the syllabi of business ethics courses. However, the ethical responsibility (in the different meanings of the word, of praiseworthiness and accountability, cf Brinkmann 2013) of any organizations or decision-maker depends on the legal context, on how heavily regulated HRM and environmental management are, by the HSE legislation that applies (see, e.g., https://www.arbeidstilsynet.no/en/laws-and-regulations/laws/the-working-environment-act in Norway). At first sight, there is often no freedom of choice (as a condition for responsibility) but no other choice than compliance with the relevant HSE rules. For such reasons, one could say that workplace and environment ethics often is a good example of *Verrechtlichung* (see Table 1) and of mandatory, to some extent mutually reinforcing, legal, and legitimate coverage of duties and rights (upper right cell in Table 2). Still, there are HRM ethics issues left, whenever the law is symbolic only and/or isn't implemented in practice – e.g., when it comes to effective whistle-blower protection and issues of formal versus informal organizational ethics, of subtle harassment, or of loophole in ethics (Kvalnes 2015).

Conclusions

Each of the disciplines, business ethics, and law has much to gain from one another through concrete and continuous interaction. This is so within classrooms as well as in actual policy discussions. The apparent lack of interaction between the disciplines is worrisome but can perhaps be explained by the distinct goals and audiences that academic research and writing emerging from the disciplines have thus far addressed. With the rapid evolution of technology and with the need for law and regulation to keep track of what is or is not legitimate vis-à-vis the adoption of this technology, there is a renewed and urgent need for a more in-depth and regular interaction between the disciplines. We hope that scholars, practitioners, and experts from both disciplines rise to the occasion.

Business, Human Rights, and Reflexive Regulation: Multi-stakeholder Development of Standards for Responsible Business Conduct

27

Karin Buhmann

Contents

Abstract

Focusing on the "how" (process) which leads to the "what" (result) this chapter applies the lens of reflexive law as a theory for multi-stakeholder regulation to understand and explain the evolution of normative guidance for businesses in regard to their human rights impacts. With an emphasis on how authorities can stimulate the co-creation with business and civil society and acceptance of norms on responsible business conduct in a context in which conventional regulatory competences or capacities are not well-suited for the objectives at hand, the chapter considers the United Nations (UN) Global Compact, the UN "Protect, Respect and Remedy" Framework, and the UN Guiding Principles on Business and Human Rights. In doing so it also demonstrates how reflexive law can be applied as a regulatory theory to help advance agreed norm-making across diverse interests. The relevance of this exceeds the field of business and human rights.

Introduction

Recent decades have witnessed a surge in concern with business legitimacy, turning on business impacts on society, business ethics, and the responsibilities of business. This has been accompanied by calls on private organizations to reduce their adverse impacts and enhance positive impacts on society, whether in regard to local communities, supply chains, environment, natural resource exploitation, climate change, or other societal concerns. With the call for change of action comes a need for norms to guide such change. In addition to private codes of conduct and guidance on sustainability, civil society and business organizations rely on national governments and international organizations, especially the United Nations (UN) to deliver normative directives in the form of guidance or law. As illustrated by the long-winded road toward the global Climate Change Accord that was finally agreed in Paris in 2015, a diversity of interests at stake often complicates such a process. Asked to write a chapter on business and human rights with an emphasis on the theory of reflexive law for a handbook on *Business Legitimacy: Responsibility, Ethics and Society*, this author reviews the road to some private sector-oriented norms brokered by the UN through broad multi-stakeholder processes by applying reflexive law as a theoretical lens. By doing so it will also become clear how reflexive law theory can provide insights for designing regulatory processes so as to stimulate reflection and learning within business organizations so that they may understand and accept external pressure for normative adaptation and changed conduct.

Debates on normative directives for responsible business conduct often focus on the substantive directives (content) inherent in the norms, or in other words: what are organizations encouraged or required to do? A norm, however, is a product of a process. Such processes are the topic of this chapter, which draws on the case of the UN’s development of norms on business and human rights (BHR). It is important to note from the outset that the term “reflexive law” as a theory refers to processes for co-creation of norms of conduct, rather than any particular type or form of law as a product of a process. A reflexive law process may lead to many types of norms, ranging from private self-regulation and public-private guidance instruments of a soft-law (non-binding) character to formal rules that are binding and may even be enforceable. (Soft law is not enforceable in front of courts of law. It may, however, be sanctioned through other means, including political, economic, or “naming-and-shaming”.) In other words, “law” in “reflexive law” should be understood as a regulatory process aiming at the development of norms of conduct. It should not be associated with a particular form of such norms, e.g., binding and enforceable or non-binding. The “reflexive” element refers to an interactive process of dialogue or communication that leads to norm-making by inducing "reflection" with the participants, as explained below.

In a context marked by a diversity of interests held by various business organizations and sectors, civil society organizations with different focal issues, and national or local governments with diverging interests, developing norms of conduct may easily become a process in which participants mainly have regard for their own interests. In order to advance the creation of norms of conduct for responsible business conduct, it is therefore expedient to consider how the process can support the creation norms with a relevant substantive content that adequately addresses the broader concerns at hand across sectors and interests. For this purpose, the processes toward the UN Global Compact, the UN "Protect, Respect and Remedy" Framework (UN 2008), as well as the operational guidance provided by the UN Guiding Principles of Business and Human Rights ("UNGP," UN 2011) serve as cases in here. Through insights on how multi-stakeholder processes can help develop normative standards of conduct for sustainability concerns that exceed the regulatory power of a single government or organization, the lessons go far beyond the human rights field.

Reflexive Law: a Framework for Co-Regulation on Responsible Business Conduct

Key Elements of the Normative Regime of Business and Human Rights

Business organizations play important roles in contemporary society. Companies create employment and pay salaries, contribute to governmental income through taxes and other fees, and develop innovative solutions to social needs. Many produce goods and services demanded by individuals, governments, other companies, and civil society organizations. Through these activities and others, such as philanthropy, companies may indirectly or directly benefit human rights. However, companies may harm human rights too. Globalization has led not only to increased flows of goods and services and extension of supply chains to procure goods from low-wage countries to higher-wage countries but also to increased knowledge about what happens in other parts of the world. Consumers, media, investors, politicians, and lawmakers around the world gain insight into human rights abuse or environmental damage caused directly or indirectly by company activities in other corners of the world. This has led to concern with the capacity of transnational as well as other companies, including small- and medium-sized enterprises (SMEs) that, for example, often function as suppliers, to cause adverse impact on society. This has been exacerbated by awareness of the limits of corporate legal accountability, especially in regard to transnational business activity. While a home state of a corporation has the legal power to regulate the corporation extraterritorially, so far international human rights law is not generally seen to entail an obligation for the state to do so. With the globalization of trade, business-related human rights abuse therefore risks escaping the reach of the company's home state. In many cases, human rights abuse occurs in host states with weak regulatory or enforcement institutions.

Although international human rights law recognizes limited international legal personality (the capacity to hold rights and duties) for some non-state actors, especially in terms of rights for individuals, duties for non-state actors remain limited, meaning that corporate entities as well as their individual managers may escape legal accountability. International criminal law as codified in the 1998 Statute of the International Criminal Court recognizes only natural persons as accountable for international crimes. In most cases, international law instruments do not address non-state actors, such as companies, directly. This also applies to the international human rights system. Coupled with the general concern with the capacity of business to harm human rights, this caused the UN to take steps around the year 2000 toward providing companies with adequate guidance for their impacts on human rights. These steps comprised a process launched in 1998 by an expert group under the UN's Commission for Human Rights (the predecessor to the Human Rights Council), a process launched in 1999 to develop what became the UN Global Compact, and a process launched in 2005 to identify and clarify business responsibilities for human rights and develop various complementary elaborations, materials, and methodologies. The first process resulted in the so-called Draft UN Norms (on Business and Human Rights), but the Draft Norms failed to gain support with the Commission for Human Rights, partly due to lobbying by business organizations. The second process resulted in the nine original principles of the UN Global Compact, of which Principles 1 and 2 refer explicitly to human rights, based on the Universal Declaration on Human Rights, while Principles 3–6 refer to core labor rights, which are at the same time human rights (the elimination of slavery and forced labor, protection against child labor, nondiscrimination in the workplace, and trade union freedoms). The formal establishment of the UN Global Compact in 2000 was a major step because the initiative explicitly encourages business organizations to consider and observe international human rights standards in their own business operations and in regard to business relations where they might be complicit in human rights abuse. The Global Compact principles are rather general and do not entail much detailed guidance as to how companies in practice turn international obligations developed for states into parts of their own policies and practices. The process launched in 2005 provided more detailed guidance, first by developing the UN "Protect, Respect and Remedy" Framework and next by developing the UNGP (UN 2011), which provides implementation guidance for companies as well as states. The UN Framework and UNGPs were adopted by the UN Human Rights Council, thereby resulting in unprecedented agreement on detailed elaborations and guidance on the responsibilities that business organizations have with regard to adverse human rights impacts, based on a broad multi-stakeholder process. This is interesting in the current context, because the process can be understood as a reflexive law process. Understanding the process therefore provides insights for other multi-stakeholder processes aiming at norms on responsible business conduct in contexts that may not be well suited to conventional regulation or conventional regulatory processes.

The UN Framework is a 30-page report condensing extensive academic studies, expert input, and consultations with a range of stakeholders around the globe. The Framework does not develop new human rights but clarifies the implications of existing human rights with regard to business impacts. In line with international law theory (see, e.g., Jägers 2002; Knox 2008), the Framework report observes that states have a duty to protect human rights. It clarifies that this duty entails for states to protect individuals or communities against human rights infringements caused by non-state actors, such as companies. This is set out in the so-called Pillar One as the State Duty to Protect human rights against abuse caused by third parties, such as companies. Next, under Pillar Two, the Corporate Responsibility to Respect, it elaborated the responsibilities that businesses have in regard to human rights. This means that they obviously must respect the law in their countries of operation but moreover ensure that they observe international human rights where national law does not offer the same level of protection. This includes for businesses to adopt a human rights policy and conduct human rights due diligence in order to identify and manage their adverse human rights impacts. Finally, under Pillar Three the Framework report sets out what states and business organizations should do to enable access to remedy when business-related human rights abuse is nevertheless perceived to occur. The UNGPs elaborate these points into operational guidance.

Reflexive Law

Context

Companies do not have default access to international lawmaking. Under the conventional international law regime, international lawmakers are states. States are the original and primary holders of legal personality under international law. States may make international rules pertaining to companies. In principle, this means that companies can be subject to international regulation in regard to their transnational conduct. States have made use of these competences in some areas (e.g., in regard to ocean pollution and, through the particular tripartite structure of the ILO, for a range of labor issues) but have been hesitant to do so in regard to business impacts on human rights. This is a political limitation to the regulation of business conduct, because the capacity to regulate exists as a matter of principle in law.

Scholars within legal philosophy and legal sociology have been debating what makes a rule relevant and adequate for the issue at hand and what makes it well received and complied with by those to whom it pertains. Several scholars have suggested that the legitimacy of a rule-making process caters for relevance, adequacy, and compliance (e.g., Franck 1990; Habermas 1996). Legitimacy in this context refers to inclusion in a process by those to whom rules are going to apply (ibid.) (hence, this conception of legitimacy does not relate to the legitimacy of private actors in taking responsibility for what are essentially public sector tasks such as in when they engage in “Political CSR” (e.g., Frynas and Stephens 2015; Scherer and Palazzo 2007) nor does it relate to how organizations such as companies seek to establish congruence between the social values associated with or implied by their activities and the norms of acceptable behavior in the larger social system – key issue of organizational legitimacy theory (Dowling and Pfeffer 1975; Suchman 1995)).

Against this backdrop it is interesting to note that some international scholars favor an enhanced formal integration of companies in international lawmaking on company conduct. They have argued that this would increase the legitimacy of both the process and its outcome through the representation of those subjected to the new rules (e.g., Friedmann 1964; Brunnée and Toope 2010) or otherwise affected by them, e.g., stakeholders at risk of adverse impacts (compare Weiss 2000). Reflexive law theory offers a way to include companies in such processes in a manner that can be framed within the persisting state-centrist structure of international law while also responding to the legitimacy concerns raised by authors concerned with normative relevance and rule compliance.

How Reflexive Law Functions as a Framework for Multi-Stakeholder Regulation

Reflexive law theory builds on the assumption that regulation is more relevant, effective, and more easily accepted if created by those directly affected by it. Reflexive law seeks to ensure a representation of a plurality of views and to stimulate system-internal reflection and responsiveness to societal needs through procedural forums providing for participation (Teubner 1992: 611; Teubner 1993: 68–69; Wilthagen 1994: 348). Reflexive law is a theory for structuring the process of negotiation and ensuring that the process enables exchanges on needs, demands, or expectations, so that involved participants may respond to such external concerns through internalizing them and adapting their own conduct (a form of self-regulation). Reflexive law thereby complements conventional formal and top-down law (Teubner 1983, 1994). Inspired by systems theory as well as discourse ethics, reflexive law theory aims to provide an option to supplement formal substantive legislation with a regulatory technique that allows greater participation of those actors whose actions were necessary in order to handle the societal challenges and demands. Reflexive law theory addresses regulation of societal concerns for which solutions require action by other legal or natural persons (typically companies).

The theory assumes reflection at three levels, or types of reflection (for details and references, see Buhmann 2017a: 79–85). The first level relates to authorities, such as public regulators at national, sub-national, or international level. When reflecting on their own regulatory competences or capacities, they may find that their competence or capacity do not lend themselves to direct regulation of companies with regard to the most effective implementation of the needs and policy objectives at hand. As a result of such reflection, authorities may set up processes (functioning as forums of interaction) to induce a second level of reflection. The second level relates to companies or other social actors in regard to their impact on society. By engaging in interaction and exchange of views with actors, participants can gain access to understanding (“learning”) on the views of other actors in regard to their societal impacts and related expectations, needs, and demands. Participants that succeed in activating the rationality of other stakeholders stand a higher chance of inducing reflection within the target organization(s), such as a company/companies. When participants in the process reflect upon their actions, on their impact on society, and on needs for adopting correctives through a change of their actions, this is reflected into the third level, the normative output. This may take the form of self-regulation within one or more organizations or joint co-regulation that in turn may support or promote self-regulation in a particular normative direction. Reflexive law forums may be physical (like a meeting) or take a virtual form (e.g. stakeholder-oriented nonfinancial reporting).

While reflexive law theory was originally developed for a national regulatory context, in the early twenty-first century, many of the pertinent issues (such as labor concerns, working conditions, environmental impacts, etc.) are also found in the context of transnational activities. This shift has resulted in expectations of international organizations like the UN to regulate business conduct. The regulatory competence of the UN is normally limited to regulating states (sometimes resulting in obligations for states to regulate companies operating in their jurisdictions). The urgency and complexity of the situation challenged the UN to consider alternative ways to regulate business activity, not least with regard to business-related human rights impacts that for national and international governance reasons often escape the formal or actual regulation of nation states. Obviously, the institutional context for use of reflexive regulatory strategies at the intergovernmental level differs from the national context, but the concerns are comparable: societal needs translate into policy objectives and require being addressed through effective regulatory action, the inability or inefficiency of conventional regulatory practices for the issue at hand, and the potential role of the private sector to contribute to solving the problems by changing their conduct.

Reflexive law theory considers the social system as made up by sub-systems. This includes the political system (comprising not just formal and informal policy makers but also executives and other implementing agencies), the economic system (companies), and the legal system. More specifically, the workings of reflexive law are based on the assumption that a social sub-system has the capacity to internally react in a reflection-based manner to demands of external sub-systems. This assumes that each of these may have an impact on other sub-systems through the recipient system's reaction to "irritants" induced from the environment. Interaction with its environment enables a system (or sub-system) to sense signals ("irritants") from outside itself and to respond to them, for example, by adapting its conduct to the needs of others. This is supported through signals made in the code or "logic" of the system with which change is desired. Signals made in such a code activate the rationality of the recipient and thereby help turn the irritant into a response (ideally, a change). Reflexive regulatory forums allow social sub-systems such as the economy (business), law (regulators and judges), and politics (implementing public organizations and civil society) to produce "irritants" with the capacity to induce change or internal adaptation to new norms of conduct. The ensuing learning may also support the co-creation of jointly agreed norms.

Accordingly, the establishment of interactive forums that provide opportunities for learning and exchanges between stakeholders is a key element in the functioning of reflexive law as a theory-based governance modality. Indeed, the terminology applied in reflexive law theory refers to learning and exchange between social sub-systems of their expectations and demands on each other as well as best practice and other modalities to support reflection within and between social sub-systems (for a detailed explanation and references, see Buhmann 2017a). In addition to establishing a virtual or actual forum for exchanges of views, needs, and expectations, authorities may guide the process by providing normative guidance. However, normative outputs are ideally made by those actors who will be subjected to the output and who represent the interests at stake.

Norm-Making on Business and Human Rights as Reflexive Law

The UN Global Compact

The UN Global Compact was created to generate business commitments to respect and promote principles based on instruments of international law. Established in 2000, the Compact is open to membership by companies. In recent years it has also been possible for other non-state actors (like civil society organizations) and public institutions to participate. Participating on a voluntary basis, Compact members commit their support to ten (originally nine) principles on environmental protection, labor rights and human rights, and anti-corruption. The principles are based on and refer directly to four international law instruments: the Universal Declaration, the International Labour Organisation's Declaration on Fundamental Principles and Rights at Work, the Rio Declaration of the United Nations Conference on Environment and Development in 1992, and the United Nations Convention against Corruption.

The UN Global Compact emerged as a spin-off from an address by (then) UN Secretary-General Kofi Annan at the 1999 World Economic Forum. In the speech, the Secretary-General called on business leaders to join the UN in "a global compact of shared values and principle, which will give a human face to the global market" (Annan 1999). That address as well as many of the statements that were made by UN staff during the process to the development of the Global Compact can be understood as parts of a reflexive law process through which a public sector actor (the UN, and more specifically the Secretary-General and his staff, who all belong to the executive arm of the UN organization) established a multi-stakeholder forum for business, civil society, the UN and other public organisations. This forum allowed participants to exchange views, needs, and demands. Enabling corporate actors to learn about external pressures, this helped them appreciate the need for normative foundations on which they can build their social responsibility policies and practices in line with external demands, thereby also feeding into internal organisational change.

The UN Global Compact functions as a response from the UN to concerns on companies' negative impact on UN goals in a regulatory context where the UN's lawmaking capacity is limited. The 1999 Davos address was an effort to engage the private sector in the realization of UN goals, that is, getting business to self-regulate around specific public policy objectives. It turned out that several companies showed such interest in responding that the potential emerged for developing concrete guidance for business action based on the universal values referred to in the Secretary-General's speech. Details of the Compact were developed by staff close to the Secretary-General and specialized UN organizations in cooperation with business and civil society.

Interestingly, the language deployed by the architects of the Global Compact already in the early stages resembled that which had been used by early reflexive law scholars in highlighting processes of learning and exchange of views, needs, and demands (Buhmann 2014). Language emphasizing "learning" and "exchanges" suggests that the Global Compact architects acted along assumptions like those on which reflexive law builds on the potential of organizational change that may follow from diverse organizations exerting pressure on each other through such activities. This is also seen in the way the Compact was set up to work. In addition to the specific and immediate internalization of the ten principles by participating organizations, during the first 10 years, the organization of the Global Compact stressed its functioning through activities intended to promote such internalization of external needs and demands through learning or exchanges with other organizations (e.g., Ruggie 2004; Ruggie 2002; Kell and Levin 2002). The operational modality and the support of the organizational setup have been described as promoting external as well as internal consultation processes and internal reflection intended to be useful for business self-regulation on human rights and other Global Compact issue areas (Leisinger 2004). In practice, many companies cooperate through country-based or regional Global Compact networks to share experience and for mutual learning.

The process toward specifying the Global Compact principles and the normatively guiding website set-up included companies as well as civil society representatives. Considering that the objective was to induce self-regulation among companies with the specific aim of making them internalize the ten UN Global Compact Principles, the Global Compact can be perceived to have been established based on a realization within the UN that there was an urgent need to regulate companies. Several early statements related to the Global Compact, including the address delivered by Kofi Annan at the 1999 World Economic Forum (Annan 1999), indicate an awareness that companies must self-regulate or come to be regulated in order to limit their adverse impacts affecting the implementation of the UN goals. These goals are broadly set out in the UN Charter (roughly, socioeconomic development, peace, and the respect and protection of human rights) and in later UN policies and legal texts. This was combined with an awareness of the difficulties of regulating companies through conventional international law, which requires state support, and of effectively regulating transnational business activities through national law. This effectively functioned as a reflexive law process at the first level, that is, the level of authorities reflecting on their own regulatory capacities. On that background the UN Secretary-General in collaboration with business launched a forum which in practice functioned as reflexive law at the second level, leading to the formulation of the original nine principles, later expanded by one. The Global Compact principles express a normative ideal to which participating companies commit. The principles are somewhat open-ended but through the Compact's website are provided with more detailed normative substance. This is done through reference to the foundational international law instruments (the UDHR, the ILO 1998 Declaration, the Rio Declaration, and the UN Convention against Corruption) as well as explanations of the business relevance of each of the principles. Through participating companies' internalization of the principles, the Global Compact serves as reflexive law at the third level. A requirement that companies must submit an annual Communication of Progress also ideally contributes to inducing reflection on the company's impact on society and, therefore, can stimulate adaptation of its conduct.

In sum, the development and normative features of the Global Compact possess reflexive law features. The Global Compact works in a way that induces reflection in companies about their actions and how to deal with them normatively through self-regulation. In terms of its development, the Global Compact was initiated by an administrative body under the UN on the basis of reflections within this body (or by its head, the UN Secretary General) on limitations of the current system of international law and international lawmaking to regulate corporate behavior with regard to human rights, labor right and the environment, and a perceived need to induce reflection among companies to self-regulate. Its normative substance, the ten principles, was developed in a multi-stakeholder public-private process with co-regulation features, aiming to promote self-regulation within companies that commit to the ten principles. Since its establishment the Global Compact functions as a forum for corporate self-regulation based on substantive normative guidance provided by the ten principles and the international instruments that inform these. Its normative objectives are clear: To make companies act in accordance with the ten principles and the informing instruments of international law. Its network structure engages companies procedurally to share best practice, in other words, to discuss how best to integrate the normative goals of the ten principles into daily business practice.

The UN Framework and Their "Operationalization" into the UNGP

The UN Framework and UNGP resulted from the work undertaken during two 3-year terms by an expert with a small team drawn from several stakeholder groups. The expert ("Special Representative") was appointed by the UN Secretary-General with the task ("mandate") of identifying and clarifying standards of corporate responsibility and accountability for transnational corporations and other business enterprises with regard to human rights, elaborating the role of states and implications for business, and developing guidance materials. The mandate was based on a resolution adopted in April 2005 by the UN's highest body on Human Rights (then the Commission on Human Rights) (UN 2005). This occurred at the backdrop of the Commission's discussions and subsequent rejection of a document referred to as the "Draft UN Norms" that had been drafted by a subsidiary expert body. That rejection was in turn followed by renewed reflection with some governments and the UN on the benefits of a normative clarification and guidance on business responsibilities for human rights (for further details see Buhmann 2017b: 42–55). The resolution recommending that the Secretary-General establish the mandate indicates reflection with the Commission on Human Rights (and/or some of its members) on the regulatory capacity of the UN to regulate companies with regard to human rights and the limitations that a variety of conflicting political priorities caused to that regulatory capacity. On this backdrop, the creating of the mandate can be understood as a reflexive law process at the first level and the process designed in the mandate text as framing a reflexive law process at the second level.

The mandate text instructed the expert to undertake a broad stakeholder-oriented approach and specifically noted that the process was to include companies as well as states, intergovernmental organizations, and civil society. Including companies in such a manner was a novelty for a UN human rights process, which conventionally limits interaction with non-state actors to civil society organizations representing victims of human rights abuse, as well as other UN expert bodies. Subsequently, consultations were undertaken with companies and business organizations and civil society in many parts of the world, governments and intergovernmental organizations, consultation and collaboration with academics, and other experts. The process also involved visits to company operations and meetings with groups from affected communities. Moreover, the Internet was used to share preliminary findings and receive feedback and input.

The inclusion of companies and business organizations, multi-stakeholder consultations, and the use of online communication created opportunities for stakeholders to express their needs and views and expectations of other stakeholders. This enabled the process to function as reflexive law, conditional on the extent to which participants activated recipients' logics so that they might integrate and process the external pressure. In addition to physical stakeholder meetings, the virtual online forum supported the learning and interaction by allowing stakeholders to exchange expectations, concerns, and needs.

Notably, the 2011 UN resolution creating the second part of the mandate by asking the expert to elaborate the Framework into the UNGP with an emphasis on operationalization explicitly instructed the mandate-holder to apply a similar multi-stakeholder process as that which had been deployed during the first 3 years. This, too, indicates that the UN's human rights authorities reflected on what would be a relevant regulatory approach given both the complexity of the subject matter, the UN's conventionally state-centrist approach, and the advantages of the approach already adopted for the Framework.

Provided with a task formulated by a body within the UN system, the mandate-holder functioned as a medium for the UN, rather than a social sub-system in its own right. (This is not to say that with a background in academia, the particular mandate holder could not be – and arguably was – influenced to some extent by his own academic background. However, he did not represent the system of academia, sometimes considered a separate social sub-system.)

The UN Framework itself is sufficiently normative to provide some basis for business self-regulation. For example, it makes clear that all human rights have relevance to companies for the purpose of avoiding abuse; and it sets out basic elements of a human rights due diligence that may be applied by companies. The UNGP developed this into much more detailed guidance, further stimulating business learning and reflection on their impacts and the need to adapt their actions to reduce adverse impacts. In particular, the “risk-based” human rights due diligence concept, introduced with the UN Framework and elaborated with the UNGP, is well suited to stimulate business understanding on its impacts and support reflection on how the company may act to limit adverse impacts caused by itself and its business relations. The risk-based due diligence approach is about identifying, preventing, and mitigating risk caused by the company to society (unlike many other risk management processed applied by companies, which primarily focus on risk to the company itself). This may support reflection at the third level, stimulating self-regulation for companies to act in accordance with the UN Framework and UNGP.

Conclusion

Like climate change negotiations and other fields within sustainability that call for transnational private, public or public-private (hybrid) regulation, the BHR field has seen examples of norm-making processes fail due to conflicting interests. The UN Global Compact was an early successful turn-around in the sense of the UN providing normative guidance on responsible business conduct, based on a process that involved the private sector in a manner unique with regard to the time, context, and topic. The adoption of the UN Framework brought about unprecedented agreement on the topic, and the UNGPs advanced this into more operational guidance. Addressing private as well as public organizations, these instruments target the conduct of economic actors in an effort to reduce adverse societal impact. Jointly, the UN Framework and UNGP provide theoretical foundations and detailed guidance to advance responsible business conduct. The Global Compact leans on this by referring to the UN Framework and UNGP since their adoption. The specificity of the UN Framework and UNGP contrasts, for example, with the 2015 Climate Change Accord, which leaves many significant issues to further detailing for their implementation. The BHR instruments are of interest to scholars, business practitioners, regulators, and civil society with an interest in business and society not only for their own normative substance but as much for the process which brought this about. Understanding the processes that lead to regulatory outcomes can help all types of stakeholders actively engage in other processes toward norms on responsible business conduct and thereby help shaping an outcome that is broadly agreed.

Focusing on the “how” which leads to the “what,” this chapter has applied the lens of reflexive law as a regulatory theory. In doing so it has also demonstrated how reflexive law can be applied as a regulatory theory to help advance agreed norm-making across diverse interests. The analysis showed that creating a process or procedural forum that allows and encourages stakeholders to express their concerns, expectations, and demands on each other is a first step. The theory of reflexive law also serves to draw attention to the importance of an exchange within such a forum to be such that it activates the logic of those with whom change is sought, by speaking to their rationalities. The cases discussed above illustrate that this can provide the foundation for acceptance of change within organizations that might otherwise be opposed to proposed new ideas.

This is a key insight which goes far beyond the fact that the Global Compact, UN Framework, and UNGP themselves provide much-needed normative guidance on business responsibilities for human rights. The cases offer insights on how multi-stakeholder processes can help develop normative standards of conduct for sustainability concerns that exceed the regulatory power of a single government or organization and which connect sometimes conflicting immediate interests by explicating the importance of change having regard to the internal logic of stakeholders.

As a regulatory theory, reflexive law builds on processes of learning and exchange between social sub-systems of their expectations and demands of each other, exchange of best practice, and other modalities to support reflection within and between social sub-systems. Reflexive law considers societal actors not in terms of institutions but the societal function, which determines the rationality and therefore core concerns, e.g., as concerned with whether something is legal or not, whether it brings or reinforces power or not, or whether it means making money or suffering an economic loss. It may appear intuitive that in order to make somebody, such as a business manager or CEO, adopt a particular position, communication should be such as to address the manager in a manner that activates her/his core concerns and thereby the rationality. However, this only becomes obvious through the theoretical lens of reflexive law (which may be unfolded further, as done in other work of this author, esp. Buhmann 2017a, b). If the insight was truly intuitive, the practice of communicating in the logic of the audience would be much more outspoken in professional contexts, including public and public-private norm-creating processes.

While reflexive law has its merits as a theoretical foundation for explaining and designing regulatory processes, the theory should be deployed with care. In particular, application should be done in such a way that consideration is made of power disparities between stakeholders. This applies both to application for analysis of regulatory processes and to design of reflexive law processes. That important but complex topic goes beyond the current chapter (but see Buhmann 2017b).

Wealth Creation, Human Rights, and Business Legitimacy

Contents

Abstract

The chapter defines business legitimacy in economic and ethical terms. Transnational corporations and other business enterprises gain legitimacy by creating wealth in a comprehensive sense while respecting human rights and remedying human rights violations. In turn, businesses lose their legitimacy when they disregard the minimal standards of wealth creation and violate the minimal ethical requirements of human rights according to the UN Guiding Principles on Business and Human Rights.

As the purpose of the economy and thus of the business enterprise, creating wealth in a comprehensive sense encompasses seven features: four types of capital (natural, economic, human, and social capital), private and public wealth, the mutual dependence of production and distribution, material and spiritual aspects, sustainability in terms of human capabilities, creating as making something new and better, and the need for self- and other-regarding motivations.

Given the globalizing economy, human rights are identified as minimal ethical standards indispensable for living and working together on Earth. They

are argued for as "global public goods." Business legitimacy has to meet the following requirements:

1. Transnational corporations and other business enterprises have to "respect" all internationally recognized human rights worldwide. This means, they must not cause directly or be involved as accomplices directly or indirectly in human rights violations.
2. Businesses have to exercise "due diligence" to examine, on a regular basis, their corporate strategies and activities with regard to all potential and actual impacts on human rights and to make sure that all human rights are "respected" and violations are "remedied" (in collaboration with states).
3. However, businesses are not responsible to "protect" human rights (which is the duty of states).

Wealth creation · Natural, economic, human and social capital · Private and public wealth · Business and human rights · Corporate legitimacy · Corporate responsibility

Introduction

At first glance, connecting wealth creation, human rights, and business legitimacy seems to be an odd undertaking. Human rights are universal standards meant to be applicable primarily to nation-states, while business is supposed to get its legitimacy from making money. Human rights are aspirational and need to be incorporated into national and international law. In turn, business has to prove its legitimacy in the marketplace.

This chapter argues that business's true task is to prove its legitimacy by creating wealth in a comprehensive sense while respecting human rights in accordance with the UN Guiding Principles on Business and Human Rights. The main line of argument is presented here, while further explications are provided in the book *Corporate Responsibility for Wealth Creation and Human Rights* (Enderle 2020).

Before addressing the topic of this chapter, some relevant literature on legitimacy is recalled, and it is briefly indicated why business legitimacy and human rights have gained so much importance in the last 20 plus years.

In his article "Legitimacy" in the *Encyclopedia of Ethics*, A. John Simmons (1992/2001) writes that "[P]hilosophers have generally identified legitimacy with a certain kind of *moral* authority in the *legal or political* realm. More specifically, legitimacy is the moral property of states, regimes (rulers, governments), or laws which makes them genuine, rightful, or authoritative . . . Most conceptions of legitimacy associate the legitimate with 'the lawful' and/or with 'the accepted' or 'the acceptable' . . . Positive legality is at most a necessary condition for legitimacy . . . Legitimacy requires *moral* legality or positive legality within a *morally* justified constitutional scheme" [emphasis by G.E.].

Marc C. Suchman's groundbreaking article (1995) focuses on *organizational* legitimacy and distinguishes three primary forms: *pragmatic*, based on audience self-interest; *moral*, based on normative approval; and *cognitive*, based on comprehensibility and taken-for-grantedness.

Guido Palazzo and Andreas G. Scherer (2006) criticize the cognitive and pragmatic forms because they are based on compliance to national law and on relatively homogeneous and stable societal expectations, while assuming that all members of society benefit from capitalist production. Therefore, a fundamental shift to moral legitimacy obtained by *deliberation* in a *communicative* framework (inspired by Jürgen Habermas) is proposed. (See also the critique by Willke and Willke 2008.)

In the context of public relations, Jacob D. Rendtorff refers to Suchman's definition of organizational legitimacy and emphasizes that it is "based on values and cultural norms that constitute the right of th[i]s particular organization to exist . . . As a part of public relations, ethics is used as an important instrument to develop and influence this process of legitimation and value-driven management" (2009, 256).

Finally, Patrick Haak (Haak et al. 2012; Haak and Scherer 2014) offers a microfoundation of legitimization of corporations by investigating the psychological and communicative bases for the attribution of social acceptance or legitimacy.

This brief list of publications on legitimacy shows that this concept can take a variety of meanings pertaining to the legal and political realms, concerning (particularly business) organizations in their institutional context, emphasizing their normative-ethical requirements, and describing various micro-foundational aspects. It is noteworthy that the question of business legitimacy has become increasingly important over the last 20 plus years, driven by the compelling forces of globalization and the relative decline of the nation-state.

At the same time, transnational corporations and other business enterprises – the terms chosen by the UN Framework for Business and Human Rights (UN 2008) – have been increasingly scrutinized about their legitimacy for multiple reasons. First, many business enterprises have become enormously powerful, surpassing in economic and political power a great number of nation-states. Second, they are operating globally and affecting numerous emerging economies with weak legal and regulatory frameworks. As the Ruggie Report of 2007 states, "fundamental institutional misalignment . . . creates the permissive environment within which blameworthy acts by corporations may occur without adequate sanctioning or reparation. For the sake of the victims of abuse, and to sustain globalization as a positive force, this must be fixed" (UN 2007, 3). Third, because of the global reach of business, there is a need for global ethical standards. Today we do have such standards, namely, human rights. The UN Guiding Principles on Business and Human Rights (UN 2011) provide clear guidance for business enterprises to "respect" human rights and "remedy" human rights violations. Therefore, I propose that business legitimacy includes two dimensions: to create wealth in a comprehensive sense and to respect human rights in accordance with the UN Guiding Principles on Business and Human Rights. Both dimensions – the economic and the ethical – are now explained in the following sections (citing in large parts from Enderle 2020).

Business Legitimacy by Creating Wealth in a Comprehensive Sense

Because business enterprises are primarily economic organizations, business legitimacy involves an economic dimension. It would be an improper shortcut to ignore that business is part of the economy and skip from "business" directly to "society" (as many advocates of "corporate social responsibility" do). If the economic dimension of business is taken seriously, the purpose of the economy greatly matters in defining the purpose and legitimacy of the business enterprise.

The chapter proposes to define the purpose of the economy and thus of the business enterprise as creating wealth in a comprehensive sense. It implies an "ethics-related approach" to economics – in the sense proposed by Amartya Sen (1987). It is broader than a "value-free" logistical (or "engineering") approach, by including human motivations and the judgment of social achievements. And it goes beyond the "creation of wealth" – in line with and beyond Adam Smith – by offering a broad and comprehensive definition of wealth that includes seven features.

This conception of wealth stands in stark contrast to the dysfunctional aspects of national and international economies. Anglo-American capitalism with its far-reaching impact on the global economy focuses heavily, if not exclusively, on the accumulation of financial wealth. As well articulated in the Encyclical *On Care for Our Common Home* by Pope Francis (2015), the dictates of maximizing shareholder value recklessly destroy the natural environment. Widespread corruption and bribery impair the economies of many countries. People still suffer from extensive illiteracy and the lack of appropriate training. They get sick and die from unhealthy working conditions, air and water pollution and other deleterious conditions, and the lack of decent health care. Trust in the financial services industry and in consumer relations with banks has been seriously undermined and hampered. All these problems indicate the loss of natural capital, economic capital, human capital, and social capital. Therefore, the comprehensive conception of wealth creation includes, as a first feature, all four types of capital which form the substantive contents of wealth.

A second feature of wealth proposes different forms of capital, meaning formal as distinct from substantive aspects of capital. It can be best understood when we look at the wealth of a nation. National wealth is not just an accumulation of private wealth, but also consists, in large part, of public wealth. Thus the wealth of a nation is a combination of private and public wealth. While private wealth is easily perceived and understood, public wealth is harder to discern and is often ignored, although it is essential for producing private wealth. For instance, we may remember how in the Great Recession of 2008–2009 the instability of the financial system seriously hurt the global economy and societies around the world. Or we recall the positive impact of a country's fair and effective rule of law on foreigners' ability to invest in this country. Using the economic distinction of private and public goods, public wealth differs from private wealth by the characteristics of non-rivalry and non-excludability. It is noteworthy that this is a formal definition which applies to "good" and "bad" public goods and to wealth and the lack thereof and therefore needs ethical evaluation (as, e.g., climate change does). Wealth in a comprehensive sense includes both private and public wealth, which has far-reaching implications. Markets are powerful for producing private wealth, but fail to generate public wealth, and motivations for public wealth need to be other-regarding, not only self-regarding.

Wealth creation is often conceived as a productive process that is separate from subsequent distribution, as illustrated in the saying that one has to bake the cake first before it can be shared. The third feature of wealth creation rejects this separation of production and distribution, claiming that the productive and the distributive dimensions of wealth creation are intrinsically interrelated. In fact, the distributive dimension permeates all stages of production from the preconditions to the generation process, the outcome, and the use for and allocation within consumption and investment. For too long, the separation between "producing the pie" and "sharing the pie" has marked the ideological struggle between "the right" and "the left," despite its flawed economic underpinning. Therefore, wealth creation is about wealth distribution as much as about wealth production.

The fourth feature of wealth creation rejects a materialistic understanding of wealth that is excessively concerned with material possessions and making money, driven by consumerism, acquisitiveness, and greed. Such a materialistic view is too narrow, if wealth consists not only of economic capital but also of human, social, and natural capital. It also cannot consider and account for other features of wealth creation to be introduced below: human capital conceived in terms of human capabilities of being healthy and educated persons; creating wealth understood as making something new and better; and other-regarding motivations for creating public wealth. While this proposed concept of wealth undoubtedly has a material aspect, it also includes a spiritual aspect by relating to the human spirit or soul (regardless religious beliefs) and/or to religion and religious belief.

Creating sustainable wealth accounts for the long-term time horizon conceptualized in terms of human capabilities or "expanding real freedoms that people enjoy" (Sen 1999) – the fifth feature of wealth creation. Given the multitude of definitions of sustainability, it is proposed to stick to the "old" proposition from the World Commission on Environment and Development which requires an intergenerational perspective, namely "to meet the needs of the present without compromising the ability of future generations to meet their own needs" (WCED 1987, 7). This perspective is further specified by using the OECD definition of sustainability of well-being over time in terms of natural, economic, human, and social capital (OECD 2013), which is congruous with the contents of wealth as defined in this chapter. This concept of human capability not only substantiates the meaning of human capital; it also helps to measure the impact of natural, economic, and social capital on human beings. Thus, creating sustainable wealth becomes a rich and concise purpose of economic life which transcends the growth of (material) resources by focusing on people and sustaining nature.

The sixth feature specifies what we mean by the "creation" of wealth. Obviously, wealth creation is more than possessing wealth and differs from acquiring wealth. Possessing adds no value and acquiring only means a change of ownership, which may occur by legal or illegal and ethical or unethical means. In the course of history, colonial powers acquired a great deal of wealth, usually with no regard for legal and ethical concerns, which, by and large, amounted to a redistribution rather than a creation of wealth. In the capitalistic system, the "acquisitive spirit," "the accumulation of capital," and the "acquisition of companies" do not entail necessarily the creation of wealth, properly speaking. In a genuine sense, to create is to make something new and better. All three characteristics are essential: (a) It is about making, not only imagining, which is feasible and successful in economic and financial terms. (b) It has to be new, be it a gradual change or an innovation (i.e., a radical change in technology, social organization, or any other field). And (c) it must be ethical which improves the well-being of people and sustains nature.

Finally, concerning the motivations for creating wealth, self-regarding motivations can be powerful for creating private wealth. But they fail in creating public wealth, as sound economic theory tells us. Exclusively self-interested behaviors make collective action (for public wealth) impossible, generate free-rider problems, and cannot be coordinated by an "invisible hand." Rather, when economic activities clearly focus on the creation of wealth as a combination of private and public wealth, other-regarding motivations are equally necessary (though not sufficient). They may take a huge variety of forms such as selfless engagement for entrepreneurial success, love for the mother country, solidarity with the poor, and the fight for any cause. In each case the other-regarding motivation transcends self-interest, be it for a good or for a bad cause. Still, like public goods or wealth, other-regarding motivations require ethical evaluation. To sum up the seventh feature, wealth creation needs not only self-regarding but also other-regarding motivations.

These seven features of wealth creation for the economy have far-reaching implications for the business enterprise and its legitimacy. Regarding the contents of wealth (i.e., natural, economic, human, and social capital), each enterprise has its special focus and must meet at least a minimal level of each capital. For example, increases of economic capital cannot be compensated for by losses of natural capital beneath the minimum. In other words, trade-offs between changes of capital are acceptable only above these minimums. As for the forms of wealth, enterprises are supposed to create private wealth. However, benefiting from public wealth in many ways, they also should "give back" and contribute to the creation of public wealth, which can occur in multiple fashions and to various extents. As the generation of wealth is assumed to be an interrelated productive and distributive process, enterprises are accountable not only for their production but also for their interrelated distribution – for example, for income inequality in their organizations. Because wealth creation includes not only material but also spiritual aspects, the culture of enterprises should not be dominated by money making and greed. Rather, through creating natural, economic, human, and social capital, wealth creation aims at a noble goal that addresses both the material and spiritual needs of employees, customers, and other stakeholders. Sustainable enterprises adopt a long-term perspective by focusing on strengthening human capabilities – not merely material resources – and sustaining the natural environment. As creating means "making new and better," enterprises strive for both gradual changes and groundbreaking innovations while considering the ethical implications and respecting the ethical demands, being well aware that innovation by itself can be either ethically praiseworthy or repugnant. Finally, the driving motivation of enterprises cannot be exclusively self-regarding because they have to help create public wealth. Other-regarding motivations are required for public wealth and for human rights.

Business Legitimacy by Respecting Human Rights and Remedying Human Rights Violations

After explaining the relevance of wealth creation for business legitimacy (i.e., from the economic, descriptive-analytical perspective), human rights are explained as public goods in wealth creation (i.e., from the normative-ethical perspective).

In order to relate human rights to wealth creation in a comprehensive sense, to begin with, four important components of the underlying human rights conception are clarified: (1) the scope, (2) the binding nature, (3) the function, and (4) the qualification of human rights as public goods.

First, in common talks about human rights, the scope is often limited to civil and political rights (such as the right to freedom of thought, conscience and religion and the right to freedom of association) or to economic, social, and cultural rights (such as the right to health and the right to an adequate standard of living) and, furthermore, often excludes certain groups of people.

Easily overlooked is the powerful idea that people have a right to be treated with dignity in all spheres of life and regardless of their nationality, place of residence, sex, national or ethnic origin, color, religion, language, or any other status. It matters therefore to emphasize that the International Bill of Rights and the International Labor Organization's core conventions contain all these 30 rights without discrimination. They apply globally and define the underlying conception of human rights in this chapter.

Second, given the wide range of human rights, one might think this term "human rights" would encompass all ethical norms and values relevant for economies and businesses. However, it commonly constitutes only minimal ethical requirements, distinct from social obligations beyond the minimum and aspirations for ethical ideals (De George 1993, 184–193). In pluralistic societies, nationally and internationally, human rights constitute the necessary common ethical ground for living and working together and are "the minimum reference point for what the Guiding Principles [on Business and Human Rights] describe as internationally recognized rights" (UN 2012, 10). As minimal requirements, however, they can open and guarantee a wide space for an immense diversity of cultural and ethical values and norms. Grounded in human dignity and specifying its basic contents, they are all interrelated, interdependent, and indivisible and thus do not allow for trade-offs between particular rights. This stipulated conception of human rights draws on philosophical reflections and supports – but is not identical with – the legal conception incorporated in the International Bill of Rights and the International Labor Organization's core conventions. It goes without saying that to date this universal ethical conception is not legally enforceable internationally; however, it provides guidance for voluntary action and soft law agreements, which may become legal requirements later on.

Third, from an economic perspective, the fulfillment of human rights (e.g., the rights to health and to an adequate standard of living) has often been considered a cost that might be too expensive to bear. On the other hand, the violation of human rights can also be very damaging. Undoubtedly, it is legitimate to ask what costs human rights fulfillments and violations may incur. But a serious cost analysis has to account for all costs, in financial and nonfinancial terms, imposed on all affected people and entities. Moreover, not only costs but also benefits should be accounted for, again in their entirety and in their distributional impact. Though not easy to conduct, one may argue that such comprehensive cost-benefit analyses of human rights would likely show beneficial results. Beyond cost-benefit analysis, human rights may be recognized as external constraints or boundaries which should not be crossed. While such recognition is commendable from the human rights perspective, it still can be interpreted as an engineering approach to economics that stipulates a value-free economic calculus of ends and means within these constraints. In contrast, the ethics-related approach, advocated here, proposes the fulfillment of human rights as ends to be achieved by public policies and corporate strategies, whereas violations signify failing policies and strategies. Moreover, human rights are also understood as means to pursue these and other ends. For example, the implemented right to education is instrumental and a strong way for creating an innovative and more productive work force.

Fourth, in order to link human rights to wealth creation, we define these rights as ethically demanded public goods or public wealth. As public goods, they are characterized by non-excludability and non-rivalry, needing ethical qualification, that is, to be ethically demanded. Applied to human rights, non-excludability means that no human being *should* be excluded from the enjoyment of any human right (i.e., no discrimination). Non-rivalry implies that the enjoyment of any human right by any person *should not* diminish the enjoyment of any other human right by oneself or any other person. In other words, no trade-offs between human rights for anybody are acceptable. For example, the right to participate in public life should not impair the right to freedom of thought, conscience and religion, nor vice versa; or the freedom of association should not negatively affect the right to nondiscrimination, nor vice versa. Beyond the exclusion of any negative impact, one can argue that the enjoyment of one right *may even reinforce* the enjoyment of another right. For instance, the implemented right to an adequate standard of living (including food, clothing, and housing) can strengthen the fulfillment of the rights to work and to education, and vice versa.

The definition of human rights as ethically demanded public goods, obviously, has far-reaching implications. Their establishment and fulfillment cannot be achieved by market institutions; rather, they need collective actions at multiple levels of society beyond the price mechanism of supply and demand. Moreover, the motivations must be other-regarding because self-regarding motivations would fail to fulfill human rights as public goods.

What are the implications for the business enterprise and its legitimacy? I propose to draw on the widely accepted universal ethical framework of human rights and apply, with an ethical underpinning, the UN Framework and the UN Guiding

Principles on Business and Human Rights. In line with Henry Shue (1996, 35–64), the UN Framework distinguishes three types of obligations to secure human rights: "To protect, to respect and to remedy." To protect human rights – the duty of States – means to demand recognition of the obligation to avoid violations of human rights and to establish "institutional" provisions that prevent, as much as possible, the violation of this obligation through appropriate incentive and punishment systems. To respect human rights – the responsibility of business enterprises – indicates the obligation to avoid violations of human rights. And to remedy – the obligation of both States and enterprises – refers to the obligation to provide the victims of human rights violations access to the remedy of their rights. In other words, business legitimacy in terms of human rights requires "respect" and "remedy" without including the States' duty to "protect."

In order to determine business legitimacy further, the notion of the "responsibility" of business enterprises or "corporate responsibility," for human rights provides a solid foundation. It draws largely on the UN Framework and Guiding Principles on Business and Human Rights and, in addition, articulates key ethical implications.

First, the subject of corporate responsibility for human rights are business enterprises, which are in need of legitimacy. They are understood as "moral actors" – to the extent that they are "corporate actors" – operating as collective entities capable of intending actions, carrying them out under their control and reflecting on their commitment. They can be held morally responsible for their acts, which do not hold for value-free organizations and mechanisms. Because business enterprises are not ends in themselves, they are not moral persons who can claim the rights of human beings. Obviously, this concept of the moral actor indicates only the moral status of business organizations without assessing their moral quality. It is, by no means, a substitute for the responsibilities which individuals and groups carry in and for their organizations. But this concept of the moral actor is necessary in order to speak of "corporate responsibility" in a meaningful way. Business legitimacy relates to the business enterprise, be it a corporate and moral actor or an entity without this status.

Second, the bipolar concept of responsibility proposed by Walter Schulz (1972) is applied to the business enterprise as a moral actor. "Self-commitment originating from freedom" signifies a moral commitment of the business enterprise that transcends its sociological role and its legal definition. This moral "anchoring" is particularly important when, in the process of globalization, the sociological and legal environment of business is changing drastically. To fix the worldwide institutional misalignment mentioned above, not only laws and regulations but also the ethical commitment of business is necessary. At the same time, self-commitment "in worldly relationships" means "to respect human rights" and to contribute to "remedying human rights violations." It is important to emphasize the independence of the responsibility of business enterprises from the duty of States. The Commentary of the Guiding Principle 11 makes clear that "[T]he responsibility to respect human rights . . . exists independently of States' ability and/or willingness to fulfill their own human rights obligations, and does not diminish those obligations. And it exists over and above compliance with national laws and regulations protecting human rights" (UN 2011, 13).

Third, in line with the UN Framework, this approach comprehends *all* businesses. “The responsibility of business enterprises to respect human rights applies to all enterprises regardless of their size, sector, operational context, ownership and structure. Nevertheless, the scale and complexity of the means through which enterprises meet that responsibility may vary according to these factors and with the severity of the enterprise’s adverse human rights impacts” (Principle 14: UN 2011, 15, and UN 2012, 18–22).

Fourth, of far-reaching importance is the *human rights due diligence* to be exercised by business enterprises (Principles 17–21: UN 2011, 17–24, and UN 2012, 31–63). It concerns corporate management in its entirety, taking seriously all actual and potential impacts on human rights. Therefore, due diligence demands: (1) to understand the human rights context of the countries in which the corporation does or intends to do business; (2) to assess the corporation’s own activities; and (3) to analyze the corporation’s relationships with business and other entities. The manner of exercising due diligence becomes an important benchmark for assessing the corporation’s commitment, credibility, and legitimacy.

Fifth, with regard to the content of corporate responsibility, we may ask whether it should be limited to a subset of internationally recognized human rights – as the UN Draft Norms (UN 2003) do – or extended, in principle, to all human rights. The UN Guiding Principles include all – not only economic and social – human rights expressed in the International Bill of Human Rights and the principles concerning fundamental rights set out in the International Labor Organization’s Declaration on Fundamental Principles and Rights at Work (Principle 12: UN 2011, 13–14, and UN 2012, 9–15). Accordingly, corporate responsibility and legitimacy include *all human rights* and, if appropriate, subject them to the due diligence exercise. If only a subset of internationally recognized human rights (say, economic, social, and cultural rights) were relevant for corporate responsibility and legitimacy, business organizations would not be accountable for their adverse impact on the other internationally recognized human rights (say, civil and political rights).

While all human rights are considered relevant in principle, the types of obligations vary and can demand to protect, respect, remedy, or promote human rights. Based on which criteria, do business enterprises have the responsibility to “respect” human rights (see Fig. 1)?

Criteria of Attributing Obligations

1. The roles of actors are strictly separated according to private and public interests: the State is responsible for public interests, the other actors for private interests.
2. *Impact of the actor on the victims of human rights violations: intentional, unintentional.*
3. *Complicity: direct, indirect*, beneficial, silent, and structural.
4. Sphere of influence of the actor on the victims and perpetrators of human rights violations: actual and potential influence.
5. Capability of the actor to respect, protect, remedy, and promote human rights, although the actor did not cause human rights violations directly or indirectly (relevant for UN framework emphasized in italics).

	Respect		Protect	Remedy	Promote
	Direct:	Indirect (no complicity):			
States					
Transnational corporations and other business enterprises					
Other organs of society					
Individuals					

Fig. 1 UN framework for business and human rights (2008): All human rights

Many criteria are discussed in the literature, a short list of which is indicated in Fig. 1. As for the UN Guiding Principles, Principle 13 requires three criteria: causation, contribution, and direct linkages without contribution, namely, *the criteria of direct and indirect impact* and *of complicity* (see point 2 and 3). While the first two criteria are relatively undisputed, the third criterion can take on multiple forms, which are sometimes very difficult to assess. Nevertheless, these criteria apply to all business enterprises. “Such attributes as companies’ size, influence, and profit margins may be relevant factors in determining the scope of their promotional CSR-activities, but they do not define the scope of the corporate responsibility to respect human rights” (UN 2010, § 58). Also, companies’ capacity, whether absolute or relative to States, should not, as a general rule, determine corporate responsibilities for human rights (UN 2010, § 64).

As for *the criterion of sphere of influence* (see point 4), it is very ambiguous and thus cannot be applied in a satisfactory manner. It encompasses two very different meanings of “influence”: the impact of the actor on the victim and the leverage of the actor on the perpetrator of human rights violations. Moreover, it includes several notions that should be distinguished: proximity (to the victim), causation, control, benefice, and political influence. Even if a powerful corporation is able to exercise the protection of human rights similarly to a governmental organ, its sphere of influence does not necessarily legitimize the exercise of its power. Due to these difficulties, the 2010 Report by John Ruggie correctly pleads for a systematic strengthening of the State duty to protect (UN 2010, §§ 16–53). Business legitimacy does not depend on this criterion.

Much more difficult is it to assess the relevance of *the criterion of the actor's capability* (see point 5) that goes beyond avoiding the causation of human rights violation. On the one hand, the capability is a necessary condition to protect against violations by third parties. On the other hand, it is not a sufficient condition because other capable actors (for instance, fairly well-functioning States) that are legitimized to exercise this protection can act as well. Admittedly, the situation is more complicated when the State actor only possesses this capability to a diminished degree or not at all. Business legitimacy does not depend on this criterion either.

Notwithstanding these difficulties, the UN Framework makes a groundbreaking and very helpful contribution to the clarification of corporate responsibility and legitimacy with regard to human rights. Business legitimacy has to meet the following requirements:

1. Transnational corporations and other business enterprises have to "respect" all internationally recognized human rights worldwide. This means, they must not cause directly or be involved as accomplices directly or indirectly in human rights violations.
2. In order to perceive and fulfill these responsibilities, companies have to exercise "due diligence" (i.e., to be committed) to examine, on a regular basis, their corporate strategies and activities with regard to all potential and actual impacts on human rights and to make sure that all human rights are "respected."
3. However, companies are not responsible for all types of human rights violations, but "only" insofar as they have to "respect" human rights and remedy their violations.

Conclusion

Connecting wealth creation, human rights, and business legitimacy hopefully turned out to be a possible and important undertaking. Transnational corporations and other business enterprises operate in a globalizing world that is characterized by a "fundamental institutional misalignment . . . between the scope and impact of economic forces and actors, on the one hand, and the capacities of societies to manage their adverse consequences, on the other" (UN 2007, 3). Given these developments of globalization, the question of legitimacy has expanded beyond the legal and political realm, having arisen in the economic realm as well. Moreover, beyond nation-states and law and regulations, it has affected and unsettled business and other organizations in multiple ways.

In this chapter business legitimacy has been defined in economic and ethical terms. More specifically, transnational corporations and other business enterprises gain legitimacy by creating wealth in the comprehensive sense while respecting human rights and remedying human rights violations. Businesses lose their legitimacy when they disregard the minimal standards of wealth creation and violate the minimal ethical requirements of human rights according to the UN Guiding Principles on Business and Human Rights (UN 2011).

The French PACTE Law or Two-Speed Corporate Social Responsibility (CSR)

29

Catherine Malecki

Contents

Abstract

The French PACTE (Action Plan for Corporate Growth and Transformation) Law of 22 May 2019 (Loi PACTE Plan d'action pour la croissance et la transformation des entreprises. Law no. 2019-486 of 22 May 2019 on Corporate Growth and Transformation, JORF no. 0119 of 23 May 2019) is the kind of far-reaching law commonly adopted in France(Loi TEPA (Law on Labour, Employment and Purchasing Power) of 17 August 2009) with major ambitions to revive corporate growth. Among its many provisions, the amendment of an emblematic article of the French Civil Code is a strong sign in favor of the generalization of CSR, but it seems to establish at two speeds: a cruising speed for the companies already concerned and a crawling speed or "snail's pace" for the companies that are newly concerned. For the first time, one article, the article 1883 al. 2 Civil Code stipulates that "The company shall be managed according to its corporate interest, taking into consideration the social and environmental issues related to its activity." Many questions arise

CSR · Nonfinancial reporting · PACTE LAW · French Law

Introduction

We are in Chap. III, Sect.2 of the PACTE bill: **"Rethinking the place of enterprises 'in society'"**: this place is not insignificant, asit is consistent with the European Commission's definition, recognized by France, that CSR concerns "*the responsibility of enterprises for the effects they have on society"*(Malecki 2018). This is of considerable symbolic importance: it is a question of affirming the social and environmental role of the enterprise and of associating the employees more closely with the results and with the body of shareholders in their enterprise, which appears in Chap. III of the "Fairer companies" bill. Quite an undertaking! The idea is to introduce CSR smoothly, flexibly (flexible law), in a nonbinding (?) manner, into a text to show that France is ahead of the game, and that it is extending the generous ideas of CSR (social and environmental benefits for all) to all companies. Nevertheless, this is a novel approach and even stronger than the amendment of Article 1832 of the Civil Code, permitting the creation of one-person companies. Indeed, CSR is protean and takes on many different forms. Casting it in stone, albeit implicitly, in such a fine article as Article 1833 of the Civil Code gives food for thought and raises questions.

The amendment of Article 1833 of the Civil Code is indeed important, with its second paragraph expected to stipulate that "The company shall be managed according to its corporate interest, taking into consideration the social and environmental issues related to its activity." The time for posing questions about wording is therefore over (Should Articles 1832 and 1833 of the Civil Code be rewritten?, Couret A., Dalloz 2017.222). It is now time to consider the practical questions to come. This brief article invites us to put these different terms and these different perspectives "under the microscope."

Observation: It is difficult to DISSOCIATE the environmental aspects from the social dimensions because these notions are very closely linked (e.g., in labor law, health and environment, environmental alerts, European sources, etc.). Combining these two types of issues could create needless complexity. But no one can naturally turn a deaf ear to the environmental concerns that are innervating society in the sociological sense (climate change, Youth Climate March, etc.). For some years now, companies (referred to here as "enterprises") have had to embrace a long-term, social, global, and inclusive approach, and cannot therefore simply ignore the environmental dimension. The EU sends out strong and consistent signals (cf. the latest Notat-Sénart report, in line with Mr Bruno Le Maire's ambitions ("There is no profit if companies do not take social and environmental issues into account").

Let's go back to the terms:

"is" (and no longer "must" as the Notat-Sénart Report advocated) "managed" according to its "corporate interest"
the "social and environmental 'issues'" relating to its "activity"
"by taking" rather than "must take" into consideration"

This is a dynamic and flexible approach.

The Scope of Article: 1883 C. CIV.: A General Scope

Before considering the many questions that are sure to arise, let us give a brief (and painless) reminder – tinged with patriotism – that France has been a European leader in CSR for 18 years (cf. Molinié and Drago's Report), we could mention the following laws: NRE (New Economic Regulations), Grenelle 1 (3 August 2009 – 10 years ago already – and Grenelle 2 of 12 July 2010, Order of 19 July 2017, etc.). Adopting an almost militant approach, the intention of the Notat-Sénart Report (8 March 2018) – to broaden the scope of CSR via this new article 1883 of the Civil Code – is a political intention to show that France is going further in these issues.

Which Companies Are Concerned? All of Them, or Almost All

Let's start with this question because this article has a general focus; certain companies are ahead of the game in this area and are already concerned.Within companies, the directors will be responsible for ensuring the concrete management of their enterprise because it is a question of "managing" the thinking "about the company's strategic orientations."

So, there will be a two-speed CSR:

- A *cruising speed* for public limited companies (*sociétés anonymes*– SA) and limited partnerships with share capital (*sociétés en commandite par actions* – SCA)because the landscape is already familiar: we have the financial performance declaration derived from the Order of 19 July 2017. Question: Regarding this declaration, what is the scope of the statement "taking these issues into consideration..."? This text is added to the nonfinancial reporting mechanism. Does this confuse the issue? No, it rather implies a greater openness towards stakeholders with opportunities for them to act.
- In a listed or unlisted public limited company, the members of the Board of Directors (BoD) can no longer ignore these issues (cf. the revision of the AFEP/MEDEF Code of November 2018, which finally specified, in the principle or recommandation 1.4. that: "if (the BoD) shall be informed of market developments, the competitive environment and the main challenges facing the company, including in the field of social and environmental responsibility.")

- Possible creation of stakeholder committees for public limited companies, but what effects? Is this really necessary and how can they be constituted when "diversity" may be present (compliance) within Boards of Directors?

The scope of Article 1833 para. 2 of the Civil Code is not insignificant because the text breaks new ground, followed by a "tidying up" of numerous articles of other Codes that are concerned.

Article L. 225-35 para. 1 of the Commercial Code will therefore be "tidied up" as follows: "…. in accordance with its corporate interest, taking into consideration the social and environmental issues related to its activity." The same applies to Article L. 225-64 of the Commercial Code. "it (the BoD) shall determine the orientations of the company's activity and ensure their implementation, in accordance with its corporate interest, while taking the social and environmental issues related to its activity into consideration…"

MutualCompanies Are Also Tidied Up

- cf. Article L. 111-1-I para. 1 of the French Mutual Code: "Their management shall take into consideration the social and environmental issues related to their activity." The same applies to the BoD, cf. Article L. 114-17 para. 1.
- cf.Article L. 931-2 para. 1 of the French Social Security Code concerning provident institutions and unions of provident institutions: "their management shall take into consideration the social and environmental issues related to their activity."
  - What about other companies? Is it a case of CSR at a "snail's pace"?
  - Simplified joint stock companies (*sociétés par actions simplifiées*– SAS): The directors will also be concerned if there is an exact copy of the structure of a public limited company (satisfaction, also see the Notat-Sénart proposal on the governance of these companies which brings them closer to public limited companies, cf. current debate: simplified joint stock companies *can be considered as they stand* as being technically outside the scope of the Duty of Reasonable Due Diligence Plan (social and environmental aspects, or indeed nonfinancial reporting) (possible Q. from the floor).

However, Article 1833 para. 2 means that simplified joint stock companies can no longer remain outside the scope of the social and environmental issues related to their activities, especially since they may also occasionally employ more than 10,000 employees (i.e., above the thresholds of the Order of 19 July 2017, Decree of 9 August 2017), but they are still not always covered by the financial performance declaration.

Therefore, there will be a substantial difference in implementation in relation to other companies such as limited companies (*sociétés à responsabilité limitée*– SARL), nonstock corporations (*sociétés civiles*), and one-person companies (*sociétés unipersonnelles,* which are numerous in France).

However, the directors will not be completely alone: employees (BoD, shareholders, whistleblowers, trade unions – co-authors of the due diligence plan, the new Economic Social Committee) will also be able to act.

The Implementation of Article 1833 Para. 2 of the Civil Code or the Spirit of This Article: Behaving, Acting, and "Managing" in CSR Terms

"The social and environmental" (precise terms, see the existing situation for public limited companies according to criteria of Art L. 225-102- 1 of the Commercial Code.) "issues" (a vaguer expression) "related to its 'activity'"

The text does not define the social and environmental "issues," which is logical, because the term "issues" is flexible and ever-changing, and we have texts derived from CSR (remember that we are not starting from scratch).

Article L.225-102-1 of the Commercial Code thus mentions the "social and environmental consequences" of the enterprise's activity, particularly respect for human rights, combating corruption, the consequences for climate change, sustainable development, the circular economy, combating food waste, collective agreements concluded within the company, employees' working conditions and actions to combat discrimination and promote diversity.

Regarding environmental issues, inspiration can be drawn from Art. L. 225-102-1 III para. 2 of the Commercial Code.

"The consequences of the company's activities, and of the use that made of the goods and services that it produces, with regard to climate change" (cf. Decree of 9 August 2017, which sets out this information).

Climate change, GHG reduction, circular economy, waste management, water, etc. are covered in the nonfinancial management report, in addition to renewable energy sources, tackling food waste (LTECV Law of 17 August, 2015) in public limited companies, and even in the report on the BoD's activities (which, it should be remembered, was supposed to disappear...); which naturally fall within the company's (enterprise's) "strategic orientations." What guidelines will there be for this scheme? Nonfinancial reporting and especially the Decree of 9 August 2017.

However, the wording is "taking into consideration" (a broad expression), which paradoxically takes us back to the early days of CSR that were so strongly criticized (cf. European recommendation of 18 July 2001, at a time when CSR was only a voluntary incentive). However, this is 18 years later when CSR has become a "major" issue. Therefore, allowing directors some flexibility is welcome, but once again, it will depend on the corporate form concerned.

It will therefore be necessary to consider the "spirit" of the PACTE law, which considers CSR to be a corporate policy in its own right – a global performance tool that is not necessarily out of step with the economic and financial interests of the enterprise. The companies concerned will be able to create a CSR policy by taking account of extra-financial parameters in the company's economic results: directly, with the improved productivity of employees working in an environment that shows greater respect for society, or indirectly, with the consideration of (or even collaboration with) all stakeholders improving the identification and prevention of the risks to which the enterprise is exposed (ethical alerts, feedback on subsidiaries' practices, etc.).

- The organization of the company to take account of environmental issues and, where appropriate, the environmental assessment or certification procedures
- The resources devoted to preventing risks and environmental pollution
- The amount of provisions and guarantees for environmental risks, provided that this information is not available

The general approach to the practical implementation of this text is to devise it and "orchestrate" it in terms of CSR, i.e., to potentially open it up to stakeholders (the enterprise must play a role in society). This means considering all potential stakeholders (NGOs, employees, environmental associations, subcontractors, consumers, etc.). This article provides flexibility and opportunities to be seized, but also poses risks.

How can we take these issues into consideration? Of course, this will not consist in producing nonfinancial reports or declarations of financial performance, but inspiration can be taken from these processes. This "taking into consideration" will indeed imply an active version either throughout the management process and most often in advance: these issues can therefore be listed according to the company's activity (environmental risk management if the company has an industrial activity, or social issues if it has a tertiary activity). Flexibility is essential, as is the choice of approach: it will be a question of determining the social *and* environmental dimensions of an enterprise's activity (environmental impact if it carries out an industrial production activity, sustainable water and waste management, etc.). The LTEC Law (Energy Transition and Green Growth) of 17 August 2015 included "the consequences of their activity and of the use of the goods and services they produce with regard to climate change"in the nonfinancial reporting of public limited companies.

Example: The sixth paragraph of Article L. 225-37 of the French Commercial Code is rounded off with a sentence worded as follows:

> It shall also report on the financial risks associated with the effects of climate change and the measures the company is taking to reduce them by implementing a low-carbon strategy in all aspects of its business.

This flexible definition is intended to encourage companies that are not subject to the nonfinancial reporting requirement to reflect on the social and environmental issues related to their activity. To some extent, a "**positive**"**compliance** could justify the failure to take a particular "issue" into consideration but also, on the contrary, why another issue (e.g., waste management) *is* taken into consideration in a concrete program, at each stage in the development of this field. This would make it an example of *positive soft law.* These issues could be considered on the fringes of nonfinancial reporting, which already provides for ethical compliance (see text here).

However, in concrete terms, it will be necessary to think in terms of the company's stakeholders: employees (health, environment, etc.), consumers (use of goods and services, circular economy), directors (remuneration based on

CSR criteria; in this case, traditional sustainable and corporate governance), subcontractors, NGOs, etc.

With regard to risk management, an example can be seen in the Law of 27 March 2017 on the "duty of reasonable due diligence."This law introduced Articles L. 225-102-4 and L. 225-102-5 into the Commercial Code, with the aim of making international enterprises more accountable for the activities of their subsidiaries and subcontractors located abroad, particularly in developing countries (existence of almost "inextricable" PIL problems).

Its main provision relates to the obligation for certain companies to establish and effectively implement a due diligence plan, including "reasonable due diligence measures to identify risks and prevent serious violations of human rights and fundamental freedoms, and grave harm to human health, safety and the environment, resulting from the company's activities and those of the companies it controls, directly or indirectly, as well as from the activities of subcontractors or suppliers with which it has an established business relationship, where these activities are related to that relationship."

The plan includes:

- Risk mapping for identifying, analyzing, and prioritizing risks
- Procedures for the regular assessment of the situations of subsidiaries, subcontractors, or suppliers with which an established commercial relationship is maintained, with regard to the risk mapping
- Appropriate actions to mitigate risks or prevent serious harm
- A mechanism for issuing alerts and collecting notifications relating to the existence or occurrence of risks, established in consultation with the representative trade union organizations in that company
- A system for monitoring the measures implemented and evaluating their effectiveness

This will include, for example:

- Identification of social and environmental risks because "issues" is a forward-looking term (currently addressed by the Law on the Duty of Reasonable Due Diligence (*Devoir de vigilance raisonnable*)).
- *Transparency*: The nonfinancial performance declaration (See Order no. 2017-1180 of 19 July 2017 on the publication of nonfinancial information by certain large enterprises and groups of enterprises, amending Article L. 225-102-1 of the Commercial Code pursuant to the new European standards. The Implementing Decree no. 2017-1265 of 9 August 2017 specified the content of this amended article. CSRreporting obligations are now covered by an "extra-financial performance declaration") which is always included in the management report that is presented annually to shareholdersmust be published on the company's website for a period of 5 years. A strong sign of openness to a broad audience.

A listed public limited company with more than 5,000 employees in France or 10,000 in France and abroad will, in any event, be required to provide a Reasonable Due Diligence Report. Admittedly, there is little consistency in the thresholds (sometimes, this is the number of employees and turnover or the balance sheet excluding tax, at other times, only the employee criterion applies).

For the Nonfinancial Report:Version with a Financial Performance Declaration

The application thresholds have changed: small and medium-sized listed companies are no longer subject to this reporting requirement. In addition, the new system exempts subsidiaries from producing such a performance statement, provided that the information concerning them is presented by the group's parent company on a consolidated basis.

- Listed public limited companies with 500 employees and €40 million in revenue or €20 on their balance sheet; therefore, major public limited companies (listed companies with more than 5,000 employees in France or 10,000 in France and abroad will, in any event, be required to provide a Reasonable Due Diligence Report).
- Unlisted public limited companies with 500 employees and €100 million in revenue or on their balance sheet.

(N.B. We have added a complication in the transposition of the CSR Directive which only retained the thresholds of the average number of employees).

For the Reasonable Due Diligence Plan

Public limited companies and limited partnerships with share capital that employ at least 5,000 employees in the company itself and in their direct or indirect subsidiaries, or at least 10,000 employees in the company itself and in their direct or indirect subsidiaries, at the close of two consecutive fiscal years, whose registered office is located in France or abroad.

Large listed and unlisted public limited companies are therefore concerned.

What about simplified joint stock companies?Is there a text covering corporate interest? Remember, however, that they will be *naturally* concerned.

The Need for a General Practice of Article 1833. C. civ.

What Indicators?

Nothing new under the sun of CSR, cf. the NRE (New Economic Regulations) Law of 15 May 2001 ("taking into consideration the social and environmental consequences of its activity"). The company's activity will therefore be the new "indicator" of any hierarchy that might exist between the different and potentially conflicting issues (the social and the environmental sectors do not always go hand-in-hand, except in a peaceable and virtuous world). Activity will therefore be the key indicator – a new business model. This is a sensitive issue, of course, as conflicts between social and environmental issues must be avoided.

Does this add needless complexity? Not exactly, because we already have a system that developed from our lead in CSR thanks to the stakeholders, because behind this sweeping term (Cf. National Assembly debates, Notat Sénart Report, which should not be taken as "gospel"), there are many stakeholders: employees, shareholders, etc., who possess the means to act (e.g., via the Reasonable Due Diligence Plan, Law of 27 March 2017). Any regrets? The Notat-Sénart report (cf. recommendation 4) proposed a "stakeholders' committee" that would be independent of the Board of Directors. It is the corporate interest that is the "repository" for these issues.

- Let us first mention the "must-haves" for CSR: international conventions (the UN's *Global Impact* initiative, OECD guidelines, ISO 26000, etc.) and European Union law.
- The "carbon" balance of greenhouse gas emissions for certain companies (Decree no. 2001-829 of 11 July 2011). This decreeadded a new section to the Environment Code (Book II, Title II, Chap. IX, Sect.4), entitled: "Greenhouse Gas Emissions Balance and Territorial Climate and Energy Plan," which introduces a Greenhouse Gas Emissions Balance (BEGES).
- This applies to: enterprises with more than 500 employees in mainland France (250 employees in French overseas departments and territories), public institutions with more than 250 employees, local authorities with more than 50,000 inhabitants, and the French State.
- This balance must be published every 4 years for the entities mentioned in (a) and every 3 years for those mentioned in (b), (c), and (d). It is accompanied by a summary of the actions planned over the next 3 years, with the expected reductions. Failure to publish this balance by those "bound" by this obligation can lead to a fine of up to €1,500 **(very poor deterrent**. . .).
- **The growing role of official labels** (reminder of existing **labels**, Eco Label, European project, TEEC (Energy and Ecological Transition for the Climate)) and the proposal to promote sectoral and territorial CSR benchmarks for SMEs (very useful for the latter because most fall "outside the scope" of nonfinancial reporting), and in line with Article 53 of Programme Law no. 2009-967 of 3 August 2009 for implementation of the "Grenelle" environmental legislation), *Article 61* quater *(new) of the PACTE bill provides for the establishment of a "structure"*to *review and evaluate corporate social responsibility labels that enhance the value of products, behaviours or strategies. This structure brings together experts and Members of Parliament, among others, and proposes ways of rationalising and harmonising the conditions for the validity, reliability and accessibility of these labels for small companies."*

- What type of "structure" could oversee and steer this implementation? A future Independent Administrative Authority (Autorité administrative indépendante – AAI)? A CSR agency dedicated to SMEs? As things stand, we have the CSR Platform. This could be a mechanism for accrediting independent third party bodies responsible for awarding these labels.
- The three focuses are specific: products, behaviors, and strategy.
- This could involve sectoral and territorial CSR benchmarks for SMEs.
- *To come*: The EU is drawing up a proposal for a regulation on the implementation of nonfinancial reporting (materiality principle) resulting from the transposition of the CSR Directive of 22 October 2014.

What Sanctions?

"Tools" Specific to CSR: Known Elements

Critics of a binding form of CSR that would be a source of potential sanctions consider that there are no specific sanctions. The fact is that, to date, there have been no sanctions based on erroneous or incomplete reporting, in other words, no known litigation. However, the scope of the new Article 1833-12 of the Civil Code should not be underestimated, because its generality leaves the opportunity for strict interpretations by judges on the basis of breaches of the duty of due vigilance, failures to take account of an "activity" that clearly violates circular economy-related issues, or failures to take the increasingly serious problem of climate change into consideration, for example. It should be added that the Law on the Duty of Reasonable Due Diligence is backed by a powerful arsenal. For example, the AMF could be given a role (naming and shaming) for the nonfinancial reports published by listed public limited companies.

The means of action open to (external) stakeholders should not be underestimated.

- *Upstream*: Different alerts (environmental, def. of whistleblower unified by Article 6 of the Sapin II Law of 9 December 2016).
- *Downstream*: Liability claims against the Board of Directors (BoD) (a collegial body, and possibly directors who are "passive" with regard to these issues, and who are accused of failing to request information). See Order no. 2017-1180 of 19 July 2017 on the publication of nonfinancial information by certain large enterprises and groups of enterprises, amending Article L. 225-102-1 of the Commercial Code pursuant to the new European standards. The Implementing Decree no. 2017-1265 of 9 August 2017 specified the content of this amended article. CSRreporting obligations are now covered by an "extra-financial performance declaration," which is always included in the management report that is presented annually to shareholders.

The definition of "interest in bringing proceedings," and the notion of "interested third party" (already widely embraced by case law) would still need to be defined.

Conventional Sanctions: The Unknown Elements or the Possible Role of the Judge

What if it were not a question of violating the corporate interest per se but of violating the corporate interest on grounds that "it fails to take these issues into consideration"? The spirit of the text is as follows: since the social and environmental issues related to the company's activity are subject to a "*very general obligation of consideration,*" they should not be grounds for the application of Article L. 242-6 of the Commercial Code (criminal law sanction for the violation of the corporate interest by directors), other than for "*disregard for the constitutional obligation for clarity and precision of the repressive provisions.*" But nothing would prevent the judge from adopting a broad interpretation of a "failure to consider" social and environmental issues. A third party could have an interest in bringing proceedings against such "disregard" if it managed to demonstrate the existence of awrongful act, harm and a causal link between the two.

Another possible indicator: The (virtuous) intent of this Article 1833 al. 2 of the Civil Code: i.e., a better society for all, an open collective vision of society (traditional mantras of CSR. . .). If a stakeholder can prove that it has suffered harm due to a failure to consider these issues or an absence of consideration thereof, then. . ..

This is the question: Is this article merely rhetorical, of purely symbolic value? Perhaps, and this article might simply be window-dressing, but nothing would prevent a judge from using this terse wording as an opportunity to create a concrete role for it. Indeed, what if this article were, in reality, "dynamite"? We are aware of a number of articles in the Civil Code whose succinct wording has given rise to landmark decisions (force majeure and custody of things in civil law; a number of decisions linked to the principle of relevance and proportionality for the application of clauses in labor law – on mobility, noncompetition, combating discrimination in recruitment, etc. In company law, there have been rulings on the voting rights of the usufructuary, and many more). Therefore, what if the new Article 1833 para. 2 of the Civil Code met with the same fate? What if this article gave the judge an opportunity – via well-informed stakeholders capable of justifying a legitimate interest, for example – to demonstrate that the failure to consider a given social or environmental issue related to the company's activity had caused harm, and propose a criterion that could prioritize the stakeholders' interests, or a definition of a responsible enterprise, etc.? A classic dismissal grounds of an insufficient legal basis could follow. For even if Article 1832 has not been amended, (Cf. Couret, D. 2017, p. 122) even if this article is now "just a token," its spirit lives on and will continue to influence the interpretation and scope that might be attributed to Art. 1833 para. 2 of the Civil Code, which has considerable symbolic weight, with the implication of opening up the company to stakeholders, even if the latter are not expressly mentioned (while the articles of the Commercial Code do mention them). There is a good chance that between General Company Law under the Civil Code, Special Company Law, and Labour Law, there will be fertile ground to nurture many principles (shared value, interest in a healthy environment, etc.).

If this article has the potential to be "dynamite," what safeguards should be considered to avoid collateral damage?

What Safeguards to Prevent This Article 1833 Para. 2 of the Civil Code from Becoming a Bugbear?

Answer: Involve high-potential stakeholders, such as employees, and encourage directors to develop means of taking environmental issues into consideration. Ultimately, on this aspect: Article 1133 para. 2. of the Civil Code is in its infancy. It is the proper implementation of this article that will make it a relative bugbear (cf. Art. 1844-10 of the Civil Code), an effective incentive for CSR, or mere window-dressing.

What does the future hold for Article 1833 para. 2?

What About Social Perspectives?

First point: in connection with Article 1833 para. 2 of the Civil Code. First and foremost, the social perspectives are related to "social issues." Corporate information can be used as a basis for the "consideration of social and environmental issues," although information should not be confused with issues.

France is ahead of the game in social matters: this includes the quality of the social dialogue and the fight against sexist behavior (Decree of 8 January 2019, for example; Order of 22 September 2017 on social dialogue). Moreover, the "family" of corporate information is the oldest and most abundant: nonfinancial reporting may be useful for listing it and retaining only those items that are relevant to the corporate interest:

- Health and safety conditions at work
- Occupational accidents, in particular their frequency and gravity, and occupational diseases
- The impact of the company's activity on employment and local development
- The impact of the company's activity on local or resident populations
- Relations with stakeholders in society and procedures for dialogue with them
- Partnership or sponsoring actions

Information relevant to combating corruption: actions undertaken to prevent corruption; Information relating to actions in favor of human rights:

> (a) Promotion and observance of the provisions of the fundamental conventions of the International Labour Organization relating to:
>
> an overview of possible social issues, cf. text with the list of corporate information.

Question: Where is the societal dimension? The societal dimension does not seem to be mentioned BUT we will see that it has its place, firstly because the text of Art. 1833 para. 2 is vague, and secondly because the second point mentions "improve the sharing of value" and above all "a fairer enterprise." This disappointment is soon overcome; it should be noted that the societal dimension does not feature in the wording of the new paragraph 2 of Article 2 1833 of the Civil Code, while it is an intrinsic part of financial reporting. Overcome? Because corporate social governance is the major focus of this reform.

Examples:

"The collective agreements reached within the company and their impact on both its economic performance and on the employees' working conditions."

"Actions that aim to fight discrimination and promote diversity."

The societal dimension exists: *Article 61* ter *(new)*: Label for enterprises adopting a policy of accessibility and inclusion for people with disabilities.

Second point: The aim of the PACTE bill is to "redefine the enterprise's place in society in order to improve the involvement of employees" and "improve the sharing of value."

This is what it all boils down to; this is the essence of the project and even of the text. To quote B. Le Maire: "There is no profit if there is no social governance." This text is consistent with the Order of 22 September 2017 on social dialogue. Like nested Russian dolls, social law is increasingly "embedded" in CSR.

The government bill breaks down into three parts: "liberated enterprises, more innovative enterprises, and fairer enterprises."Here we are in the "fairer" part; the "fair and social" dimension" needs to be defined. Even if the stakeholders are not expressly included in this Article 1833 para. 2 of the Civil Code (this was provided for in the Notat-Sénart Report's proposal, which sought to qualify employees as "constituent parties"), they are implicitly present. One of the high-potential or even super-privileged stakeholders is, of course, the employee.Nothing prevents the inclusion of employees; it is only right, and "if you can move mountains you can move molehills." In this respect, the PACTE Lawbreathes logic into the general implementation of Article 1833 para. 2 of the Civil Code because it is based on a clear desire to create a genuine form of corporate social governance with the new system promoting employee share ownership. (Bruno Le Maire, as far back as 22 October 2017, had insisted on the SOCIAL COMPONENT: "the aim is also for employees to be more involved in the running of companies.")

Employee shareholding could play an important role in this system, as it is considered virtuous for all parties: for employees (general benefits as part of their employee savings strategy), and for companies which see it as a way to associate employees with the company's performance. This concerns listed and unlisted public limited companies. Moreover, the PACTE law includes a mechanism in favor of employee share ownership.

Which companies are concerned? Simplified joint stock companies. Why? Because, as things stand, certain constraints complicate employee shareholding policies for simplified joint stock companies, firstly because the minimum threshold of €100,000 for employee share offers is too high, and secondly because the maximum threshold of 150 people is too low. Today, employee share offers are only possible for a maximum of 149 employees in simplified joint stock companies, or if a minimum ticket of €100,000 is required. This restriction will be lifted in order to develop shareholdings in these companies.

As labor law currently stands, Article L. 3332-11 of the French Labour Code provides for two types of corporate contributions to payments made by their employees and to the beneficiaries of employee savings plans (PEE, PEI, and PERCO schemes). Employee savings are not the only way to encourage employee share ownership. Enterprises can also grant free share issues (*attributions gratuites d'actions*– AGA) and issue "business creator stock subscription warrants" (*bons de souscription de parts de créateur d'entreprise*– BSPCE). The PACTE Law will enable simplified joint stock companies (SAS) to propose share offers to all employees. There will no longer be a minimum ticket of €100,000. It should be noted that in committee, the Senate added several measures, including the harmonization of the corporate contribution (*forfait social*) at 10% for payments from incentive and profit-sharing schemes or employer contributions to pension savings plans. It has also created a new early release case for pension savings: to finance work on adapting one's main residence in the event of loss of autonomy.

Public corporations are also concerned – an extension of the scope of transactions subject to the obligation to propose share offers reserved for employees (*obligation d'offres réservées aux salariés*– ORS). Share offers reserved for employees will now be mandatory for disposals of holdings by the State in unlisted companies, and disposals of holdings by the State in listed companies, on a mutually agreed basis.

Ultimately, CSR seems to be coming into effect at two speeds and the ideal situation would enable all the companies concerned to reach their cruising speeds.

Abstract

This chapter presents two mental models for justification of business legitimacy. One is the public arena, and the other is the corporate public diamond. As presented in this chapter, the imagination of a *public arena* with an agenda for societal debates is linked to developments in the modern era, including the idea of individual freedom, the acknowledgment of reason as important for building knowledge, steam-powered printing presses, and national autonomous mass media. The model makes most sense in societies, where fundamental norms and values are shared and business practices can be tested in relation to them. Mass media reports on fraud, unsanitary, and inhumane working conditions in the meat-packing industry in the twentieth century are mentioned as an example of how the public arena best works. *The corporate legitimacy diamond* reflects contemporary thinking. Using the public arena as a point of departure, it adds a corporate public diplomacy level. The model takes into consideration the post-millennium quest for human dignity and localized trust. When transnational corporations invest in many parts of the world, they are faced with many different perspectives on what constitute legitimate business behavior. They need

to balance local norms and values around the globe, because social media allow a transnational audience to discuss their legitimacy. Using diplomatic practices, corporations can build long-term relationships, share information, and make compromises with local civic society representatives. Human resource management and plans for constructions are mentioned as examples of topics to be negotiated between corporations and civic society.

Corporate legitmacy diamond · Corporate public diplomacy · Disputes · Public arena · Transnational corporations

Introduction

People generally consider transnational corporations legitimate if they act the way they are expected to. If they behave differently from what people expect, then their legitimacy is disputed (Baumann-Pauly et al. 2016: 33, referring to Deephouse and Suchman 2008; DiMaggio and Powell 1983). The concept of business legitimacy, therefore, can be studied from three main angles: (1) people's expectations regarding corporate practices, (2) corporate reactions to charges of behaving illegitimate, and (3) institutions for dispute. This chapter will concentrate on the disputes, i.e., how corporate legitimacy is traditionally being tested in democracies and what is expected in the 2020s. For corporations working internationally, the chapter suggests building diplomatic relations with community representatives, partly to improve chances of being perceived as legitimate.

While it should be straightforward for corporations to act in ways that "correspond with the social expectations of their environment" (Baumann-Pauly et al. 2016: 33), practice shows that it is far from easy, partly because norms and values are constantly being debated and regulations are questioned. The foundation for evaluation of legitimacy is fluid and constantly changing in the international society where corporations work and interact with citizens. For transnational corporations dealing with different cultures and traditions, recognizing the norms and values shared by a global public becomes a hypercomplex process. "Satisfying one demand may require violating others, thus potentially jeopardizing organizational legitimacy" (Baumann-Pauly et al. 2016: 33, referring to Pache and Santos 2010).

Scherer and Palazzo (2011: 906) write: "the question remains of how the legitimacy of corporate activities can be normatively accessed when no universal criteria of ethical behavior are available in a post-modern and post-national world." They also write that the conditions for corporate legitimacy are changing from "cognitive and pragmatic legitimacy to moral legitimacy" and that it is no longer enough for transnational corporations to "follow the nationally defined rules of the game":

> In the changing institutional context of global governance, this stable framework of law and moral custom is eroding, and corporations have to find new ways of keeping their licenses to operate. (Scherer and Palazzo 2011: 907, reference to Palazzo and Scherer 2006; Suchman 1995)

Cognitive legitimacy is based on comprehensibility, pragmatic legitimacy is based on self-interest, and moral legitimacy is based on normative approval (Suchman 1995: 571).

Scholars have analyzed how corporations are involved in relations with many different stakeholders, how socializing among these stakeholders involves ongoing sense-making, and how this sense-making serves as background for development of corporate standards that aim at correspondence with citizens' expectations. Business scholars have studied corporate efforts to handle legitimacy issues, and – in search for tools – several researchers suggest that corporations can play a political role (e.g., Ordeix-Rigo and Duarte 2009). While large international corporations have had political influence for centuries (Pigman 2015), their economic power in negotiations with nation-states has increased since the 1990s (for discussions about this issue, see, e.g., Dicken 2015), partly due to increase in foreign direct investment (World Bank 2016; Kragelund 2019).

Corporate diplomacy is a concept being used to describe the phenomenon where "multinational companies engage in societal and political issues that are directed at the key stakeholders in the company's host country aiming at gaining legitimacy" (Marschlich and Ingenhoff 2019: 172; see also Ingenhoff and Marschlich 2019). Corporate diplomacy is an umbrella concept that draws on thinking from scholars in many fields, e.g., international relations and diplomacy, CSR, peace through commerce, business management, business ethics, and corporate communication (Westermann-behaylo et al. 2015; Mogensen 2019; Ingenhoff and Marschlich 2019).

Transnational corporations are often involved in diplomatic relations with many different stakeholder groups. Their diplomatic relation with civic society representatives in their host communities is referred to as corporate public diplomacy (Mogensen 2017; ► Chap. 68, "Legitimacy Issues in Corporate Public Diplomacy"). One approach to tackle the complexity is to engage in dialogues with the local publics in host communities. Such dialogues also create an opportunity for corporations to explain and discuss their moral norms and values, to develop trust at a local level, and to show respect for the human dignity of local citizens.

This chapter presents two different mental models for how business legitimacy is publicly tested. The first is called the public arena and the second the corporate legitimacy diamond. The imagination of a *public arena* with an agenda (McCombs and Shaw 1993) for societal debates is linked to developments in the modern era, including the idea of individual freedom, the acknowledgment of reason as important for building knowledge, steam-powered printing presses, and national autonomous mass media. The model makes most sense in societies, where fundamental norms and values are shared and business practices can be tested in relation to them. The second model, the *corporate legitimacy diamond*, reflects contemporary thinking. Using the public arena as a point of departure, it adds a corporate public diplomacy level. The model takes into consideration the post-millennium quest for human dignity and localized trust. Transnational corporations are faced with many different perspectives on what constitute legitimate business behavior. They need to balance local norms and values around the globe, because social media allow a transnational audience to discuss their legitimacy. Using diplomatic practices, corporations can build long-term relationships, share information, and make compromises with local civic society representatives.

It is obvious from media reports that many corporations try to create images of being legitimate where they work, but behind the surface, some corporations behave in ways that are considered inappropriate. When double standards are uncovered, corporations lose public trust and their businesses are damaged. Norms, values, legitimacy, and trust are therefore interrelated concepts, and they are all essential for discussions about business legitimacy in the 2020s.

Norms, Values, Legitimacy, and Trust

Norms are foundations for trust, because norms guide us in determining what to expect from other people (Mogensen 2014), and – together with values – norms form the basis for perceived legitimacy. Professional trust builds partly on the perception of legitimacy, so norms, values, legitimacy, and trust are linked in a hierarchical order, with norms at the bottom and trust as the more comprehensive concept at the top. A brief introduction to these four concepts follows, starting from the bottom (Fig. 1).

According to Parsons (1937/1991), action is structured by the social and cultural systems as well as by the personality of a given actor. The cultural systems have norms for how people ought to behave in various situations depending on their

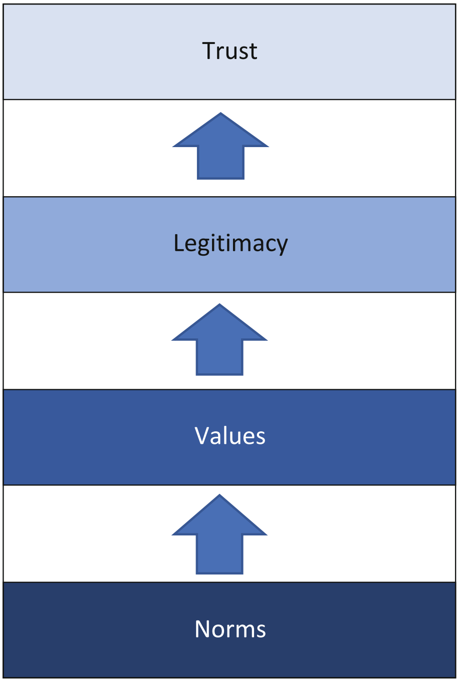

Fig. 1 Perceived legitimacy in the context of norms, values, and trust

positions in the social system. These norms are important, because they allow other citizens to have expectations to people in different roles, for example, what to expect from CEOs of transnational corporations in various situations. Norms are binding in the sense that it has social consequences to break them and they are internalized so that a person will feel a prompting to follow them even if it is not in his or her personal interest (Ross 1968: 85). Norms are said to exist if members of the society can say that people in a given situation ought to behave in this way and people generally do follow the norms (Ross 1968: 99). However, norms for different situations may conflict, and some are more important than others from the perspective of the actor, Parsons (1991: 184):

> In any at all well integrated institutional system the major decisions of precedence will be made for the individual actor through the institutionalization of norms and hence lie beyond his control [. . .] But this major settlement of the order of precedence of normative patterns, which is essential to social stability, does not go all the way. There are still areas of genuine doubt open to the decision of the individual actor, within which his own need-disposition structure may swing the balance between alternatives.

In the model, norms are placed at the bottom, because they are internalized in the process of being socialized and, in daily life, they are mostly tacit. They are followed by values which are often explicit and discussed among society members. Discussions about values are, however, usually framed by a community's belief system or ideology because this forms the basis for the value system. Parsons writes that the community's ideology is the primary basis for "the cognitive legitimation of patterns of value orientation." Legitimate ideologies aim at "the welfare of the collectivity" (Parsons 1991: 236–237). Parsons (1991: 239, emphasis in original) states:

> [I]deology is an empirical belief system held in common by the members of *any* collectivity. The focal type of case of course is the ideology which serves to legitimize the value-orientation patterns central to a stable society. These are, in the most fully institutionalized sense, the established beliefs of the social system. In any complex social system there will of course, be differentiation on the ideological level between various sub-collectives of the larger society. There is room for a considerable amount of this differentiation without any sub-ideologies being treated as explicitly deviant.

Boltanski and Thévenot (2006: 332) have in selected "manuals intended for business use" found examples of how scholars and business practitioners argue for legitimacy within different orders of worth. In their book *On Justification*, they discuss what constitute legitimate argumentation within each of the following orders of worth: inspired, domestic, fame, civic, market, and industrial. These "orders of worth" represent perspectives known to most people in the business world, and often managers will instinctively combine perspectives from different orders of worth when dealing with other people. For example, a CEO will strive to make her corporation effective (industrial), but she will also strive to build good relations with her employees (domestic) and seek public influence (fame).

Diplomatic practices can be used to create a fundamental understanding between community and firm about what constitutes legitimate corporate behavior. Derian (1987: 6, 45) consider diplomacy "a mediation between estranged individuals, groups or entities"; it is necessitated by destructive forces and connotates hope. Derian (1987: 117): "Power is, above all else, a relationship," and mutual recognition is fundamental because "people will be estranged from what and whom they fear and cannot control, from what and whom they desire and cannot acquire."

Ongoing dialogues with the host communities allow corporations to adopt their plans and practices before these create legitimacy problems. Such dialogues with publics are also referred to as corporate public diplomacy. It is defined as "collaboration with the general public in a host country through negotiations directly with civic society" (Mogensen 2017). Diplomacy requires that all parties are motivated to find nonviolent solutions to conflicts and are willing to engage in building diplomatic practices with cultural norms and rituals (Derian 1987: 112, 144). Practiced in good faith, corporate public diplomacy can give a local community increased understanding of what happens inside a corporation and thereby limit rumors and strengthen the basis for trust. It can also provide a corporation with invaluable knowledge about community affairs which will make daily life easier and give the corporation a chance to reach proactively to any hostile developments in the community.

A community may perceive a corporation as legitimate if it acts in accordance with community norms and values or if the community understands and accepts that the corporate norms contribute to "the welfare of the collectivity." The collectivity can here be understood broader than the specific community, for example, to the welfare of humanity in general. Suchman (1995: 574) defines legitimacy as:

> a generalized perception or assumption that the actions of an entity are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs, and definitions.

From a corporate perspective, legitimacy can be perceived as an asset, so corporations generally find it important to create and protect a good image, but they need to balance their responsiveness to norms and values in local communities with international norms and values to appear authentic.

Community members will usually not think of corporate legitimacy in terms of assets, but they will evaluate the corporation's conduct. Bitektine and Haack (2015) suggest that the evaluation of an organization's legitimacy is "rendered by individuals at the micro level and by collective actors at the macro level." In their model, the first level (propriety) consists of individuals' approval or disapproval of a given organization's actions and/or practices, while the second level (validity) is a collective consensus regarding the legitimacy of the corporations.

Because it is a perception, the evaluation of legitimacy is based on a projected image that may or may not reflect reality, for example, a corporation may project an image of social responsibility to the general public while – unnoticed – engage in corruption and other activities that are not accepted according to social norms.

Legitimacy is one of several factors that people evaluate when trusting others, and for corporations, public trust in them is considered an asset, because trust allows many transactions to happen smoothly. It is always, however, risky to trust others, because there is no guarantee that the trusted person will behave as expected (Luhmann 1979). In daily life, we need to trust people in many different situations, and we draw on different forms of trust (for examples of trust forms in conflicts, see Mogensen 2016). Mayer, Davis, and Schoorman (1995: 715) propose that in contexts where people interact professionally – such as transnational corporations interacting with community representatives – trust is based on the person's perception of the other person's abilities, benevolence, and integrity. Corporations cannot control community members' perception, but they can consciously demonstrate their abilities, benevolence, and integrity in ongoing diplomatic relations. Openness and transparency are some of the signs of integrity and benevolence (Mayer et al. 1995: 722). Whether the community representatives in specific situations chose to trust the corporation depends not only on corporate behavior but also on their own propensity to trust and the risk involved in trusting (Mayer et al. 1995).

Kjærbeck (2013) perceives corporate legitimacy as a socially constructed phenomenon that is constantly being negotiated and therefore changing. Corporate claim on legitimacy is challenged in the *public arena*, and transnational corporations can create a better foundation for such public tests if they engage in ongoing corporate public diplomacy with civic societies in their host communities. This perspective is integrated in the second model called the *corporate legitimacy diamond*, and it will be discussed further below.

The Public Arena

In the public arena, business legitimacy is negotiated and tested. The concept of public arena is used to describe different forums where the publics discuss, e.g., traditional journalistic media, social media, town hall meetings, and public places (e.g., Hutchins 1947; Whelan et al. 2013; Ingenhoff and Marschlich 2019). This space may also be called the court of public opinion (Stoker and Rawlins 2005; Vos 2011) or the public sphere (e.g., Habermas 1991; Toepfl and Piwoni 2015). Different concepts may be used to emphasize special perspectives on the activities taking place in the public space, and the multitude of perspectives contribute to the construction of corporate legitimacy, including the abovementioned concepts.

Back in history, print and broadcast media were important for corporate images of legitimacy, and professional journalists were proud to serve the public. Early liberal press theory was based on the idea that educated people were rational beings, and with free exchange of information and ideas in the public arena, then truth would win over falsehood (for references see Siebert et al. 1956). However, in the light of how people had been manipulated by Nazi and communist propaganda in the first part of the twentieth century, the Commission on Freedom of the Press (Hutchins 1947: 118–119) questioned this assumption about people responding rationally. The committee also wrote that while freedom of expression is a necessary condition for democracy, “the co-presence of a variety of opinions is not equivalent to debate.”

Today’s social media forums provide platforms where it is possible to nearly unhindered share opinions – also about corporations. These opinions may not be based on facts and they contribute to the public images of corporations – truth or false – but they will usually not satisfy critics because they do not constitute the public scrutiny that earlier liberal thinkers imagined. As an example of such early thinking, in the late nineteenth and early twentieth centuries, “a mix of businessmen, social reformers, and educators sought to (. . .) make business and politics more accountable to the people by using publicity to expose abuses” (Stoker and Rawlins 2005). Journalists would uncover “abuse of people,” and corporations under attacks would feel a need to “defend themselves in the court of public opinion as well as the court of law” (Vos 2011: 122, quoting Cutlip 1994).

The above brief sketch contains some of the basic ideas behind the public testing of corporate legitimacy in the public arena. Stereotypically, journalists, NGOs, politicians, and scientists are playing the roles of self-appointed prosecutors on behalf of the society, while public relations staff explain and defend the special interests of the corporations (e.g., Patriotta et al. 2011). The “testing” is coved by traditional media, researched, written, and edited by professional journalists with ethical standards (e.g., SPJ 2014).

In this old-style court of public opinion, the agenda usually focus on important issues such as criminal activities and serious misconduct, treats against public health and security, misleading statements and conduct, serious incompetence in public administration, slave-like working conditions, helplessness of people in care, and religious coercion (e.g., Protess et al. 1991; Kroeger 2012). On such issues, the public generally have an overall belief that determine what is considered legitimate in their society, but globally there are differences in perception of what is legitimate. In democracies with rule of law, people tend to be outraged, when they learn about serious misconduct. They seek solutions and may require increased regulations. If they ever had any trust in the corporations involved, they will probably lose that trust (Mogensen 2014).

Large corporations will often try to avoid the “reality of tests of worth that threaten their power” (Gond et al. 2016), and critical journalists find them little willing to create the transparency needed for a legitimacy test (Mogensen and Nordfors 2010; Vercic and Colic 2016). Public relations staff do not trust that critical journalists will help them in their effort to create perceptions of legitimacy (Schönhagen and Meißner 2016) and may, e.g., use their own media outlets to frame issues so that the corporations appear legitimate while keeping critical journalists away. On the other hand, corporations can gain legitimacy if they are scrutinized in the public arena and found to be without major fault.

An example of how the public arena in practice has been used to test legitimacy is the scandals surrounding the meat-packing industry in Chicago and its practices in the beginning of the 1900s. Writer Upton Sinclair worked undercover in the one of the factories and described his observations in articles as well as in a best-selling novel *The Jungle* (1906). The public was outraged, and his work resulted in stricter regulations of the meat-packing industry. Unfortunately, fraud in the food industry is still a problem, and more recently journalists have, e.g., written about scandals such as melamine added to milk powder, horsemeat sold as beef, and old green rice made to look fresh. The Institute for Global Food Security at Queen's University Belfast writes on its website that "Deliberate food fraud is a growing crime," and its Professor Christopher Elliott says to the Danish newspaper *Weekendavisen* that there is more money in food fraud than in drugs. It is an organized, international crime (Lottrup 2019). The legitimate food industry, obviously, has an interest in distinguishing itself from these criminals. They will want to show that their operation is legitimate and, in the public arena, the only way to do that is to join forces with trusted journalists, NGOs, politicians, and university researchers.

In the democratic part of the world, in the nineteenth and twentieth centuries, professional journalists sometimes considered themselves independent "watchdogs" for democracy, and they were proud of their struggles with public relations practitioners. Also, today some journalists are engaged in investigative reporting (e.g., ICIJ 2019), but their resources are limited compared to the resources of corporations. In the 2020s, many more people are working to protect the image of corporations than there are professional journalists to uncover, document, and question corporate practices.

The fact that corporations spend large sums on public relations is an indication that they find value in being perceived as legitimate. Boltanski and Thévenot (2006: 320–321) provide examples on the tools that they use to communicate the impression that civil society approve of them even if they have not obtained such approval.

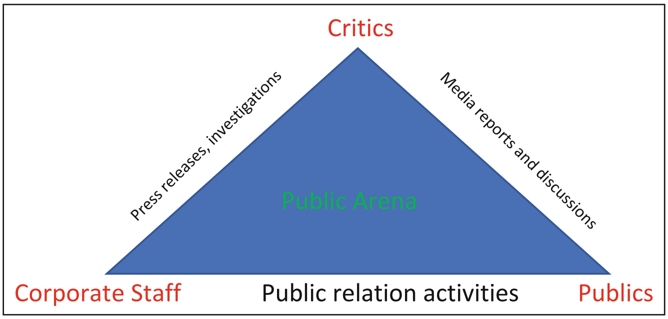

Fig. 2 The court of public opinion, where legitimacy of corporate/industry behavior is discussed and evaluated. The main actors are indicated in the angles, while some of their activities are mentioned on the sites of the triangles. In the public arena, the publics' main role is to evaluate the legitimacy of a given corporation/industry based on input from, on one hand, critical journalists, university researchers, politicians, and NGOs and, on the other hand, public relations staff serving the special interests of the corporation/industry

Boltanski and Thévenot (2006: 320, emphasis in original) writes: “In the world of fame, *appearance* and *reality* are conflated”(Fig. 2).

The public arena model is outdated as a trustworthy tool to test legitimacy for several reasons, including the following:

Firstly, it is a short-term solution to critique and therefore not able to sustain trust. Boltanski and Thévenot (2006: 155) writes that “the goal of public relations is to build a measure of worth based on fame” and that:

> [T]he world of public opinion places little value on memory. Unlike the market world, it does not even recognize the form of memory of past tests that is constituted by the durability of money beyond the moment of the test during which it was transferred. (2006: 178)

This short-term perspective distinguishes the public arena model from the long-term trust building perspective of corporate public diplomacy and the corporate diamond model discussed below.

Secondly, independent journalists and scholars can only serve this legitimacy testing system if they have the autonomy and resources needed to do a professional job, and generally speaking they have neither in the 2020s. Previously independent media have lost much of their integrity, partly because they have been bought by business conglomerates with special interests or are controlled by authoritarian governments (for types of ownership, see e.g. Mogensen 2002). Furthermore, the job as investigative reporter is dangerous. Around the world, independent journalists are being killed for trying to uncover the truth (CPJ 2019), which is an indication that powerful people – usually with business engagement – do not find their interests served by such transparency. The comparatively few independent, professional media usually suffer from lack of resources, partly due to lack of enough paying subscribers and loss of advertisement income. Similarly, much university research now depends on co-funding from big businesses/industries, and these do not support research which undermine their legitimacy. In other words, with relative few exceptions, neither journalists nor scholars have the means and autonomy to test the legitimacy of corporate behavior in a trustworthy way.

Corporations might at first have felt a relief when the watchdogs became lapdogs (for explanation of the concepts, see Franklin et al. 2005: 130). However, many top leaders have now realized that the lack of accountability has its backsides. Surveys have measured lack of trust in media, politicians, and businesses (Edelman 2019). According to Edelman, while the general public in 2019 had less “faith in traditional authority figures and institutions” than a decade earlier, people instead shifted “their trust to the relationships within their control, most notably their employers.” Edelman talks about a “shift to localized trust” (Edelman 2019).

What the surveys imply is that the legitimacy checking system which served democratic nations during the previous two centuries cannot alone manage the job in the twenty-first century. A new way of thinking is needed if corporations want citizens to trust that they behave legitimate. And such a new system must preferably be linked to peoples’ local environment.

Corporate Legitimacy Diamond

Such a localized foundation is provided by the corporate legitimacy diamond. It adds a diplomatic process to the testing of legitimacy in the public arena, so that the conduct to be tested in the public arena is grounded in values already discussed by the transnational corporation and its home community. Corporate public diplomacy creates a social room where information is shared, different interests mediated, values justified, and policies negotiated. Community and corporate representatives get to know each other as humans in a long-term relation and trust building process. Corporate public diplomacy can negotiate legitimacy problems of a different kind than the court of public opinion, e.g., norms and values to be considered, when transnational corporations plan to invest and expect to spend years in the community.

One way that corporations can build legitimacy in local communities is through its human resource strategy. When transnational corporations invest, they often bring the employees from their home countries rather than educate and hire local workers, and this practice create both hostility and suspicion.

For example, in Aceh, Indonesia, a transnational corporation was working with Indonesian state-owned companies to extract and refine natural gas in the Andaman Sea outside the town Lhokseumawe in the decades around the millennium (the case is also analyzed in Mogensen 2016, 2019). The corporation brought in trained workers because they considered the local population uneducated and unable to do the work, while the locals – despite their lack of western-style education – felt that they ought to manage production facilities in their home area (Schulze 2007: 190). The lack of appreciation that the corporation showed the local people created anger.

The core of this conflict is not unique for Aceh – in fact it has its parallel in conflicts between communities and transnational corporations many places in the world (e.g., Gruber 2014; Kragelund 2019), so corporate leaders have shared interests in possible solutions to it.

A different strategy is to engage the local community in finding a solution. Such a solution can, for example, be that for each position and at all levels, the corporation employs two people, one local citizen and one foreigner, to work together. It might be counterintuitive from the perspective of industrial leaders that value efficiency (Boltanski and Thévenot 2006), but it might be cheaper to pay double salary than to pay for security and other expenses linked to a challenging production environment and lack of legitimacy. If done respectfully, such a different strategy can also contribute to mutual cultural understanding, transparency, local development, support for the corporations, and lesser support for rebels.

To negotiate solutions that embrace different peoples' values requires empathy, a pragmatic approach, common interests in finding a working solution (Derian 1987), and diplomatic skills. In Europe, compromises between values from the industrial world and the civic world are not unusual, e.g., there are ongoing consultations between representatives for businesses and labor organizations. Boltanski and Thévenot (2006: 325 ff) write that such cooperation may lead to increased productivity, partly as a result of implied respect for the dignity of people.

When corporations negotiate with local community representatives, there are, however, legitimacy issues to consider (▶ Chap. 68, “Legitimacy Issues in Corporate Public Diplomacy”).

Another example is from Kachin State in the Northern Myanmar, where a transnational corporation wanted to build a hydropower dam. The local community was outraged partly because the dam was to be built at a place considered holy, many people was forced to leave their homes and fields, they did not trust the corporation, and they were not included in the decision process. Community actors published an invitation to negotiate the plans. A solution could, e.g., be to build more smaller dams at other places. However, their invitation was not answered, and hostility grew. An informer told Kirchherr et al. (2017: 115) that the corporation had misunderstood who was the main stakeholders. The corporation thought that it was the national governments: “they did not understand that those folks in Naypyidaw have no legitimacy whatsoever in Kachin State.” The project has been suspended since 2011 – partly due to public protests. This is a complicated case which is analyzed in more details in other publications (e.g., Mogensen 2017, 2019; ▶ Chap. 68, “Legitimacy Issues in Corporate Public Diplomacy”), but the point of this brief description is the potential in dialogues. It might have been more efficient for the corporation to build diplomatic relations with the local community and negotiate the location of the dams.

A third practice to consider is how to deal in a legitimate way with community hostility to the corporate activities. Such hostility can be dangerous. In Aceh, local frustration with corporate behavior contributed to three decades of civil war in the province (Schulze 2007: 184). The corporation chose a traditional approach in its effort to tame protesters: it hired military to provide security. Both soldiers and rebels have since been accused of an outrages large number of serious human rights abuses. The victims included both corporate workers and local villagers (Mogensen 2016, 2019). The insecure production environment was expensive for the corporation, and its choice of hard power in confrontations with the local rebels did not contribute to business legitimacy in the eyes of community members. The strategy that the corporation used in Aceh and the local reactions resembles many other cases in world. It is tempting to think that a different strategy – one that respects the “human dignity” (Fukuyama 2018: 40) of people living in the local communities where transnational corporations invest – will be both economically sound and increate business legitimacy.

Essentially, transnational corporations have three different options when it comes to dealing with the local communities where they work: (1) they can draw on hard power such as national police and company security to protect unpopular production facilities, (2) they can bribe the community leaders by investing in infrastructure and other social goods, and (3) they can solve problems in dialogue and collaboration with the community representatives. The last of these options is expected to be the preferred if corporations are seeking solutions that are perceived as legitimate by the local publics, but the impression is that corporations tend to rely on a combination of the first two (Fig. 3).

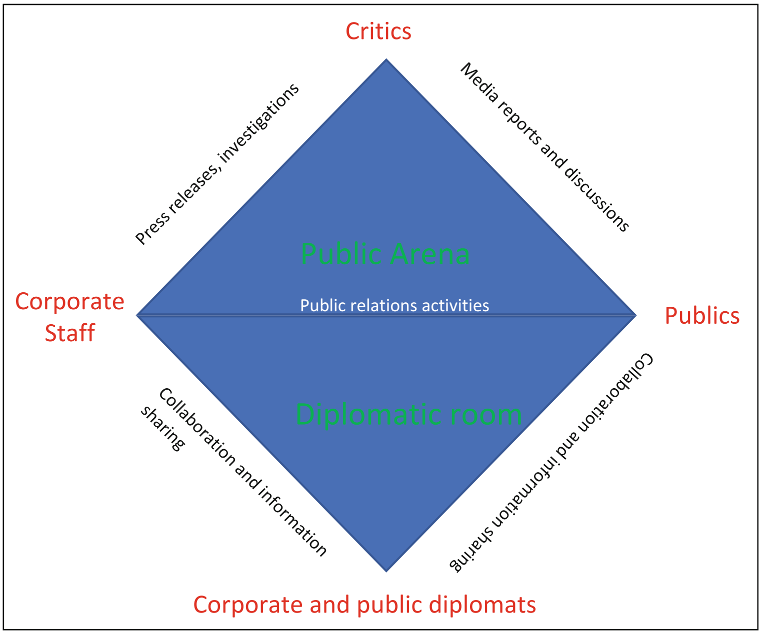

Fig. 3 The corporate public diamond. According to this model, corporations will still be confronted with critics in the public arena, but they will have a much more solid base for the scrutinizing when they collaborate with local community representatives and have their support

Conclusion

The public arena is a mental model of how business legitimacy is traditionally questioned by critics and justified by corporate staff in public. It is also called the court of public opinion, because in the imagination it seems like a judicial court with prosecutors and defenders. The public discussions about legitimacy also function as dialogue about values among citizens. People from many different social spheres present documentation, opinions, and ideas in meetings, public spaces, and public media. In countries with freedom of speech, everyone can join these exchanges of insights and views, but there is no guarantee for an audience. Some voices, such as those of famous people, have more listeners and followers than others, and in the social media age, there is hardly a shared public agenda.

Corporations use large sums on public relations activities to create images of legitimacy, but it is a hypercomplex process to learn what the publics around the globe expect and what business conduct will be accepted across borders. Print and broadcast news media have historically contributed to the development of shared norms and values in nation-states (Carey 2002: 78); however, transnational corporations work in societies with different cultures and are evaluated by people using both national and transnational media (Athique 2016). In the 2020s the public arena is not efficient as a model to structure the debate about business legitimacy across cultures, unless it is supplemented with approaches that encourage corporations to interact directly with stakeholders, including local community representatives.

As a supplement to the public arena, it is suggested in this chapter to create a localized foundation for compromises. The extended model is called the corporate legitimacy diamond. If practiced with good intentions, it may not only contribute to corporate legitimacy but also to long-term trust, and it signals that corporate employees and people living in host communities are equally humans with a right to dignity.

Legitimacy-Related Research in Organization Studies, Stakeholder Theory, and Marketing Studies

Contents

Abstract

Legitimacy, trust, and democracy are concepts developed in sociology and politics literatures. This chapter reviews understandings and conceptualizations of legitimacy in organization studies, stakeholder theory, and marketing studies. It gives particular attention to the intersections of legitimacy-related research in these fields of study. From this list, the supreme discipline in legitimacy-related social-scientific research is probably organization studies. Introduction

Legitimacy, trust, and democracy are concepts developed in sociology and politics literatures (Epstein and Votaw 1978; Friedman and Miles 2006). Legitimacy has been tied to other concepts such as the two before mentioned ones, or rationality and responsibility (Epstein and Votaw 1978), or power, authority, and order (Weber 1978 [1921]). It is for this reason, perhaps, that “legitimacy is the toughest concept in political science, one of the great unanalyzed concepts” (Epstein and Votaw 1978, p. 71; the before-mentioned quote recites Mayer Zald’s comments made in the discussion of a workshop paper). In their handbook article, Suddaby et al. (2016) quote only the second part of this statement, connecting it to organization studies. This brings us to sociological understandings of legitimacy, furthered by Epstein and Votaw (1978) as well. Drawing on Parsons, they declare, “organizations are legitimate to the extent that their activities are congruent with the goals and values of the social system” (Epstein and Votaw 1978, p. 72). This understanding is running like a golden thread through this article; it might be named the Parsonian legacy in legitimacy-related research (as there is no uncontested, discipline-overarching concept of legitimacy, the article prefers using the expression "legitimacy-related research" over "legitimacy research"). In comparison, the Weberian legacy can be seen in the emphasis put on "the intimate relation between legitimacy, on the one hand, and power and authority, on the other, and particularly in the symbolic and convoluted landscape that lies between the wielder and the wieldee of power and between the grantor and grantee of legitimacy" (Epstein and Votaw 1978, p. 71; Epstein and Votaw refer to Zald's comments).

This article reviews understandings and conceptualizations of legitimacy in organization studies, stakeholder theory, and marketing studies. It gives particular attention to the intersections of legitimacy-related research in these fields of study. From this list, the supreme discipline in legitimacy-related social-scientific research is probably organization studies. Even within single disciplines, the subject of legitimacy-related research differs a lot. Epstein and Votaw (1978, p. 71, their emphasis) ask "What *is* the subject of legitimacy about?" and answer "It is really about all social institutions (from family to corporations to governments) and their relationships" (Epstein and Votaw use the term "institution" to designate groups and organizations. For an overview of the meaning of the concept of institution in sociological, economic, and marketing theories, see Kleinaltenkamp 2018). Adapted to organization studies, then, legitimacy-related research is about interorganizational relationships in "market and nonmarket environments" (Epstein and Votaw 1978, p. 69). One would expect that it includes inter alia identifying theoretical concepts, making references to actual or desired characteristics of political or social orders, or studying perceptions, beliefs, or judgments of life-world actors.

The stakeholder approach emerged as a strategic management approach (Freeman 2010 [1984]; Freeman et al. 2018), and stakeholder relationships and stakeholder legitimacy constitute important intersections between organization studies, stakeholder theory, and marketing studies. Macromarketing and marketing ethics are the source of an extensive literature on topics connected to legitimacy-related studies including stakeholder relationships (Lusch and Webster 2011), justice (Laczniak and Murphy 2008; Laczniak and Santos 2011), vulnerability (The VOICE Group 2010), or deception (Deighton and Kent 1995).

The domain of marketing studies is, in Epstein's and Votaw's words, the "market environments." Compared with organization studies, legitimacy is not a major topic in marketing studies; works explicitly addressing legitimacy or referring to it are still quite rare. One reason for this is the – compared with organization studies – minor relevance of sociological neoinstitutionalism in marketing studies. A minor interest in some of the concepts (e.g., power or ideology) considered being important for legitimacy-related research in sociology or political philosophy has also been bemoaned (Fougère and Skålén 2012). That notwithstanding, there are literatures in marketing studies that deal with related topics, partly making use of, partly not making use of the term "legitimacy" (or related terms such as "legitimate" or "legitimation") – for example, the literatures on advertising and deception (for references, see Deighton and Kent 1995).

Markets and marketing systems, however, are more than “environments” for individual and organizational action. Selecting concepts and perspectives constitutive for both domains, this article emphasizes actual and potential links between organization and marketing studies. For Max Weber (1978 [1921]), legitimacy was a social-scientific core concept connecting meaning and order in the social world. Order is a common topoi in sociology, political science, and economics, and the micro-level theories in the before-mentioned disciplines assume actors, being able to conduct meaningful social action. Some research strands stemming from sociology and marketing studies share the use of concepts such as “action field” (Fligstein and McAdam 2012; Layton 2016) to analyze “environments.” As discipline-overarching theories, systems theories and institutional theories interconnect the disciplines as well. The systems-theorist Talcott Parsons (1960) interpreted the congruence of values, deployed to appraise actions, with values incorporated in the social environment in terms of legitimacy. Parsons’s systems theory influenced marketing-systems approaches in macromarketing (Dixon 1984) and, with it, prepared the ground for the study of the social environment of the social embeddedness of markets or marketing systems (Layton 2007, 2011) or the formal, informal, or philosophic antecedents to the heterogeneity of marketing systems (Mittelstaedt et al. 2006).

A number of reasons for the scholarly interest in intersections between organization studies and marketing studies exist. For instance, Scott’s (1995) institutional analysis and the institutional analysis of markets and marketing systems in marketing studies (Mittelstaedt et al. 2006; Haase and Kleinaltenkamp 2011; Kleinaltenkamp 2018) are translatable into each other to a great extent. Furthermore, looking from the perspective of Scott’s (1998 [1981]) system-theoretical analysis at marketing practices, one could argue that marketing-related activities presuppose the openness of the social system or the organization, respectively. Marketing studies’ units of analysis are, at least to some degree, consequences of human action and human will (Harrison and Kjellberg 2016). The same idea applies to organizations. Coase (1937) explained their existence with reference to transaction costs. While market relationships and markets are organized entities, organizations accrue from “an alternative mode of socio-economic organization” (Spender 2018, p. 101). As Spender (2018, p. 101) has put it, Coase “suggested firms were ‘able to do things markets failed to do’ – connecting firms with markets.”

Scholars advocating what Vargo and Lusch (2004) have called a *goods-dominant perspective* (Haase and Kleinaltenkamp 2013) on marketing affairs that harks back to microeconomic theory (Jones and Monieson 1990) or marketing-management approaches in line with the Four Ps (McCarthy 1960) might not be that interested in the intersections between organization studies and marketing studies. They might be convinced that economic value is a market phenomenon or results from resource transformation processes exclusively conducted or governed by the firm (Spender 2018). However, critical marketing studies, relationship marketing, services marketing, macromarketing, or the service-dominant logic all have criticized the narrow focus and scope of such approaches, which tend to neglect, inter alia, macro-level or societal phenomena, the variety of organizational entities, or value co-creation

(Hunt 1976; Brownlie and Saren 1991; Grönroos 2000; Kleinaltenkamp and Jacob 2002; Vargo and Lusch 2004; Vargo and Morgan 2005). Firm-consumer interactions, conducted – according to the marketing concept (Kotler 1967) – because firms want to fulfill consumer needs or serve customers, account only for a small portion of the number of potential research objects of marketing studies. Terms such as "resource transfer," "exchange," "resource integration," or "value creation" stand for activities conducted within networks, service-ecosystems, or marketing systems or what sociologists or organization theorists have called action fields or organizational fields (DiMaggio and Powell 1983; Meyer 2017), respectively. Consequently, it comes as no surprise that neoinstitutional legitimacy-oriented research programs have found their way into marketing studies (Humphreys 2010; Coskuner-Balli and Ertimur 2017). This strand of legitimacy-related research marketing studies echoes that of organization studies.

In the next section, the article briefly addresses how the scholarly interest in order and power has spawned legitimacy as a research subject. Then, the article discusses landmark conceptualizations of legitimacy and legitimacy-related research programs in organization studies. The development of neoinstitutional theory and the move from rational (closed) systems to open-systems approaches (Scott 1998 [1981]) have pushed legitimacy-related research in organization studies (Suchman 1995). After that, an analysis of normative and descriptive approaches to legitimacy in stakeholder theory follows, expanded by an overview of legitimacy-related topics concerning markets and marketing practices. Marketing studies is the discipline that presupposes an open-systems view with regard to customers and other stakeholders. Research on basic units of analysis in marketing studies such as exchange, markets, or marketing systems but also on certain offerings (weapons, marihuana, ivory, etc.) have been linked to legitimacy but also to freedom, wealth, and other values.

The article ends with a discussion of legitimacy-related research in organization studies, stakeholder theory, and marketing studies. It concludes – inter alia – that legitimacy-related research in organization studies has cut off the normative, political, and ethical dimensions of the concept. Stakeholder theory's normative dimensions are contested; however, it is probably right to not make legitimacy its single, normative core. From a contemporary perspective, marketing studies, especially critical marketing studies and macromarketing, seem to be equipped with the presuppositions to address legitimacy "as a virtue of political institutions" (Peter 2017, n.p.) as well as a normative principle for the appraisal of transaction arrangements and other marketing affairs.

Order, Power, and Legitimacy

Max Weber (1978 [1921]) made a distinction between three types of legitimacy: traditional, charismatic, and rational-legal legitimacy. He established a descriptive concept of legitimacy suitable to address what he considered a main problem in his research domain, namely, the need to obey authority and the acceptance of command. Parsons and Smelser (1956) connected Weber's theory of bureaucracy with Parsons's systems theory. In their view, organizations, that is, collectivities, are social systems characterized by:

> their capacity for 'action in concert.' This implies the mobilization of the collectivity's resources to attain specific and usually explicit goals; it also implies the formalization of decision-making processes on behalf of the collectivity as a whole. This explicitness applies both to the legitimization of the rights of specific units to make such decisions and the obligations of other units to accept and act upon the implications of such decisions. The formal organization . . . is the prototype of such a system. (Parsons and Smelser 1956, p. 15)

The classical sociological topoi social order has inspired the scholarly interest in gaining knowledge about the factors maintaining, destructing, or bringing order about (Scott 1995; Lawrence and Suddaby 2006; Hampel et al. 2017). Explaining or understanding these factors is a scientific objective still dominant in this discipline – a "presetting" that has influenced the conceptualizations of legitimacy and the respective research programs in organization studies and beyond. From a Weberian perspective, legitimacy is a main source of the *stability* of political and social orders "because faith in a particular social order produces social regularities that are more stable than those that result from the pursuit of self-interest or from habitual rule-following" (Peter 2017). Suddaby (2010) differentiates his sociological and neoinstitutional perspective from strategic approaches in legitimacy-related research (Suchman 1995) in that it does not draw on self-interest and rational action.

"Legitimacy" is employed to analyze the relationship between organizations and their environment on one hand and organizational access to resources on the other hand (Lounsbury and Glynn 2001). Dowling and Pfeffer (1975, p. 122), drawing on Parsons's legacy in organization studies and alluding to what Scott (1995) has discussed in terms of the normative pillar of institutions 20 years later, claim that "organizations seek to establish congruence between the social values associated with or implied by their activities and the norms of acceptable behavior in the larger social system of which they are a part." Dowling and Pfeffer (1975) equate "organizational legitimacy" with the congruence of these two value systems. Note that this stipulation leaves open who assesses the prevalence or absence of such congruencies – the scholar or the life-world actor. In any case, the presence or absence of congruence has consequences for organizations. With reference to Parsons, Suchman (1995, p. 574) claims: "Legitimacy leads to persistence because audiences are most likely to supply resources to organizations that appear desirable, proper, or appropriate." Thus, the "possession" of legitimacy is considered instrumental for the access to or the possession of resources.

Past Weber, social-scientific scholars have continued on developing descriptive conceptualizations of legitimacy, but the political dimension traceable in Weber's and Parsons's work is hard to find. Political sociology, "a broad subfield [of sociology] that straddles political science and sociology, with 'macro' and 'micro' components" (Manza 2011, n.p.), interested in, inter alia, the sources of social and political change, has faced criticism for this reason. Grafstein (1981) describes the conceptualization of legitimacy in political sociology as a combination of a stable political order and the values internalized by the public. Observable conforming behavior is assumed to express the legitimacy of this order. Grafstein criticizes this view in that a given order always influences behavior – conforming behavior cannot be conceived of as expression of the legitimacy of this order. This would amount to equating "there is an order O and people's behavior conforms with O because they consider it legitimate" with "there is order O that influences the behavior of people or people behave in a way in line with O, respectively." In other words, the conformity of behaviors with a given social order does not necessarily express that the order is legitimate – neither with regard to those conforming with it nor as a result of scholarly analysis.

Compared with the descriptive nature of legitimacy-related research prevailing in contemporary organization studies, in political philosophy, scholars have focused on the justification of orders or on the general conditions for the ascription of legitimacy to certain entities, states of affairs, or processes, respectively. The normative concept of political legitimacy helps answering questions asking for justifications of political power, or authority, or obligation. What justifies the power executed by authorities or provides them with legitimacy in this regard? What can give rise to potential complementary obligations of those ruled by the authorities? In Van der Vossen's (2012, p. 567) view, "legitimacy . . . [is] a property of institutions, in particular states. As such, I understand a state's legitimacy as denoting its status as the holder of a right to rule." According to Van der Vossen (2012, p. 565; italics in the original), "a state's internal legitimacy denotes its domestic right to rule, held *vis-à-vis* its subjects." However, the fact that states are legitimate or have the right to rule (see Van der Vossen 2012, p. 567, note 1) does not imply that they exert their power in a legitimate way. As Stanfield and Caroll (2004, p. 366) remark, the new institutional economics has ascertained that "socially imperfect rules and regulations may come into being by the exercise of power."

Philosophers, which advocate a procedural view on legitimacy (Peter 2017), might consent with this statement. Only if the procedures based on which the rules are established are legitimate as well, complementary obligations and actions (e.g., to obey the law) of the subjects can result from the legitimacy of the state to exert power (e.g., to issue and enforce laws).

Justice does not change power relationships into legitimate ones. Pettit (2012) objects tendencies equating legitimacy and justice. "According to Pettit, a state is just if it imposes a social order that promotes freedom as non-dominance of all its citizens. It is legitimate if it imposes a social order in an appropriate way" (Peter 2017, n.p.). Justice is a characteristic of an order that could have been imposed in a way appropriate (legitimate) or inappropriate (illegitimate). In pure logical terms, a state may be legitimate and just, legitimate and unjust, illegitimate and just, and illegitimate and unjust. Logic says nothing about the presence or absence of legitimacy in social reality.

Political philosophers have tended to focus on abstract conditions of justification and to neglect the empirical (historical, sociological, and political) processes related to the achievement or maintenance of legitimate orders (Peter 2017). In some sense, this amounts to Alfred Schütz's distinction between first-order theories of life-world actors and scholarly second-order theories (Schutz 1962). However, as Peter (2017, n.p., quoting Beetham), points out, people's beliefs or perceptions cannot serve as justification of legitimacy claims. Beetham (1991, p. 11; italics in the original), in the same way, has argued that a "power relationship is not legitimate because people believe in its legitimacy, but because it can *be justified in terms of* their beliefs."

This hint turns attention to a topic especially important for the social sciences: *Who* makes the legitimacy judgments or evaluates social and private orders? Is it the philosopher or social scientist entering the scenario (for the use of the term "scenario," see Deephouse et al. 2017) as an outsider or observer? Or is it an individual, organization, or governmental representative immediately involved in a state of affairs? What criteria are used for the assessments? As social actors are involved in the social construction of reality, one cannot imagine that their first-order theories don't play an essential part in the establishment, maintenance, or destruction of social orders. This is the starting point for approaches addressing the cognitive pillar of legitimacy-related research in organization studies (Scott 1995; Suddaby et al. 2016), and Meyer (2017) observed a growing impact of cognitive approaches in neoinstitutionalism.

Organization Studies

Deephouse et al. (2017, p. 27) declare, "Legitimacy is a fundamental concept of organizational institutionalism." Two scholars have built the scaffold for contemporary legitimacy-related research in management, organization studies, or sociology: Max Weber and Talcott Parsons. Parsons addressed the legitimacy of actions and organizations: actions are appraised "in terms of shared and common values in the context of the involvement of the action in the social system" (Parsons 1960, p. 175). And two things are worth keeping in mind to order to grasp Weber's impact in these disciplines: First, for Weber, as mentioned above, legitimacy is a social-scientific core concept – because of its theoretical potential to contribute to an answer to the question why bureaucratic authoritarian structures persist. Second, legitimacy-related research in organization studies preserves the Weberian view of legitimacy as a descriptive concept.

On the Legacy of Legitimacy-Related Research and Contemporary Differences

Suddaby et al. (2016, p. 451) emphasize that "legitimacy has been the subject of extensive research in organization studies." Due to the influence of Weber and Parsons (Dowling and Pfeffer 1975; Suchman 1995; Suddaby et al. 2016), organization studies are perhaps the discipline from which the majority of legitimacy-related research in the social sciences emerged. As Suddaby et al. (2016, p. 468), quoting Zald (in Epstein and Votaw 1978, p. 71), conclude, "despite, or perhaps because, of its widespread use, legitimacy remains 'one of the great unanalyzed concepts' of organization theory" (Suddaby, Bitektine, and Haack refer to Epstein and Votaw 1978, p. 71, who document a workshop/conference discussion). Forty years after Zald's comment, this assessment could still apply.

The dawn of legitimacy-related research began with the change of perspective on organizations from rational-systems theories to open-systems theories (Scott 1998 [1981]). Scott's (1995) institutional analysis including his distinction between three pillars of institutions or legitimacy, respectively, pervades legitimacy-related research until today. Distancing institutional analysis from resource-dependence and social-exchange theory, Scott (1995, p. 45) emphasizes that "legitimacy is not a commodity to be possessed or exchanged but a condition reflecting cultural alignment, normative support, or consonance with relevant rules or laws." Thus, legitimacy is interpreted as *conformity* of an entity with another entity – legal rules (associated with the regulative pillar), norms and values (associated with the normative pillar), or frameworks of reference (associated with the cognitive pillar); the respective bases of compliance are expedience (regulative pillar), social obligation (normative pillar), and "taken for granted" schemata (cognitive pillar). Note that elements subsumed under all three pillars can be in play in legitimacy-related research. Humphreys (2010, p. 492), whose study of casino gambling builds on Scott's (1995) framework of analysis, points out that "all three types of legitimacy [regulative, normative, and cognitive legitimacy] draw from the same semantic repertoires."

Differences between two research strands have coined the study of legitimacy in organization studies (Suchman 1995): management-oriented and institutional approaches. Dowling and Pfeffer (1975, p. 123), who advocate the former approach, turned legitimacy into a management objective, claiming that "organizations will take steps to ensure their legitimacy." From the perspective of scholars stemming from the social constructivist camp, the management-oriented approaches have gained too much influence while "'meaning' disappeared" from institutional analysis (Suddaby 2010, p. 15). Suddaby (2010, p. 15) promotes a research program on legitimacy in organization studies that takes into consideration:

- "why organizations are engaged in activities that are legitimate in the symbolic realm rather than in the material one"
- "why organizations adopt behaviors that conform to normative demands but conflict with the rational attainment of economic goals or how purely technical or productive objects becomes infused with meaning and significance far beyond their utility value"
- "the core concept of institutional theory: the tendency of social structures and processes to acquire meaning and stability in their own right rather than as instrumental tools for the achievement of specialized ends"

Suddaby (2010), interested in processes bringing legitimacy about, objects management-oriented perspectives and differentiates economic from sociological perspectives.

The next subsection refers to Suchman's (1995) analysis and landmark definition of "legitimacy" and two handbook articles, which both focus on the conceptualization of legitimacy, i.e., "seek to bring greater clarity and order to the somewhat confusing literature" (Deephouse et al. 2017, p. 27) or seek "to bring some construct clarity . . . and theoretical discipline to an important but misunderstood concept" (Suddaby et al. 2016, p. 451).

On the Conceptualization of Legitimacy in Organization Studies

The three articles addressed in this subsection draw not on explications of a concept or provide not themselves such explications; rather, they include comprehensive analyses of research programs and definitions. While Suddaby et al. (2016) start with Suchman's definition, Deephouse et al. (2017) modify it, taking into consideration the research conducted in the field during the last two decades. Both handbook articles try to narrow the range of legitimacy-related research down: Deephouse et al. (2017) plea for dropping the "rationalist" management-oriented or "pragmatist" strand; Suddaby et al. (2016) blow into the same horn, rejecting what they call the legitimacy-as-property perspective that they see exemplified in contingency theory, theory-guided research programs, and "essentialist" and "universalist" epistemologies and methodologies. Suddaby (2010, p. 15) had already bemoaned that "contingency theory is represented in institutional theory with the implicit understanding that the symbolic or institutional world is simply another variant of the environment to which the organization must adapt."

The Integration of Managerial and Institutional Perspectives

Suchman's (1995) landmark article is still the starting point of many articles on legitimacy (Suddaby et al. 2016). He provides a catchy definition of the concept of legitimacy:

> D1: "*Legitimacy* is a generalized perception or assumption that the actions of an entity are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs, and definitions" (Suchman 1995, p. 574; italics in the original).

As remarked by Deephouse et al. (2017, p. 28), Deephouse and Suchman (2008) removed the term "desirable" from D1 "to avoid potential confusion with status or reputation." Suddaby et al. (2016, p. 469) analyze three perspectives in legitimacy-related research (see section "Three Perspectives in Organization Studies' Legitimacy-Related Research") that address "the same phenomenon of social approval [but] focus on different actors: the object whose legitimacy is being evaluated, the social change agent who seeks to change legitimacy of the object, and evaluators who render their judgements about the legitimacy object." These three actors are the main constituents in the *reconstructions* of definitions of "legitimacy" conducted to shed light on their main structure.

D1': The actions $a_1, \ldots, a_n$ of X are legitimate if and only if
(i) X has conducted $a_1, \ldots, a_n$.
(ii) $a_1, \ldots, a_n$ is desired, proper, or appropriate because of S.
(iii) S is a system of norms, values, beliefs, and definitions.

D1 does not mention an assessing entity. For this reason, D1' is extended by variable Y, getting D2 from this procedure.

D2: The actions $a_1, \ldots, a_n$ of X are legitimate if and only if
(i) X has conducted $a_1, \ldots, a_n$.
(ii) $a_1, \ldots, a_n$ is desired, proper, or appropriate because of S.
(iii) S is a system of norms, values, beliefs, and definitions.
(iv) Y assesses $a_1, \ldots, a_n$ in the light of S.

It is not determined if Y is an individual, a group, or an organization. Both D1 and D2 harmonize with Parsons's views. Parsons emphasized the congruence of an organization's actions with elements subsumed by Scott (1995) under the normative pillar of legitimacy. D2 includes a variable Y that stands for someone who makes the assessment that a_1 or . . . or a_n is legitimate. From the perspective of Suddaby et al. (2016), the addition of Y is acceptable in case of the legitimacy-as-property approach and with qualifications in case of the legitimacy-as-perception approach (see section "Three Perspectives in Organization Studies' Legitimacy-Related Research"). Regarding the latter, as a socio-cognitive phenomenon, legitimacy results from the interplay of individual perception and social structure. Thus, Y would have to be substituted for an expression designating a number of individuals.

D2 seems to be also in accord with what Suddaby et al. (2016, p. 451) have called the legitimacy-as-property perspective or with "studies [that] focus somewhat narrowly on legitimacy as a product of two primary actors – the organization and its external environment." Note that the origin of the bemoaned narrowness of this approach resides in only two interacting actors and perhaps in one of these "actors" being the environment, a system-theoretic category.

It is not the legitimacy of X itself that is determined by D2. D1 and D2 are about action-legitimacy, not about entity-legitimacy. Regarding D1 or D2, "action-legitimacy" signifies those actions of an entity, which are considered as conforming to a system of norms, values, beliefs, and definitions. If the actions $a_1, \ldots, a_n$ of X are perceived as desirable, proper, or appropriate, then the assessment might be extended from the category of actions to that of actors. Beschorner et al. (2015, p. 273), tying together corporate responsibility and self-reflection, point to the possibility that X might also reflect on its own objectives, actions, and action consequences.

Suchman (1995) emphasizes the subjective nature of the "perception" or the "generalized perception"; it is thus Y's perception of X's performance that matters, but not principles or formal procedures. This runs counter to explications of "legitimacy" in political philosophy. The objective of legitimacy-related research is not the generation of objective knowledge employable by scholars or life-world actors to assess the legitimacy of actions or entities but the identification of perceptions or assessments of single entities somehow "generalized" in the face of a given social order.

Suchman (1995) distinguishes two perspectives in legitimacy-related research: the *strategic perspective*, expressing a managerial viewpoint, and the *institutional perspective*, addressing how a "sector-wide structuration dynamics generates cultural pressures that transcend any single organization's purposive control" (Suchman 1995, p. 572). The first perspective is teleological, the second "sociological-structuralist." The strategic perspective considers legitimacy as a resource required for organizational value-creation processes; access to or propriety of this resource can be gained through management action, for example, by means of stakeholder management. With reference to the existing literature, Suchman (1995) further distinguishes three types of organizational legitimacy, that is, pragmatic, moral, and cognitive legitimacy. The first one can be considered as an outflow from the strategic perspective; the second and third ones are connected to the institutional perspective:

- The category *pragmatic legitimacy* includes types of activities which benefit the assessor (Y): *exchange legitimacy* draws on the value expected by Y because of X's policies; *influence legitimacy* means that X is responsive to Y's "larger interests"; and *dispositional legitimacy* is the belief in an organization's good character (this amounts to the abovementioned extension of legitimacy-related assessments from actions to entities).
- *Moral legitimacy* bases on Y's judgment that a given activity "is the right thing to do" (Suchman 1995, p. 579). As Suchman (1995, p. 578) further explains, in line with Scott (1995) and Suddaby (2010), "moral legitimacy reflects a prosocial logic that differs fundamentally from self-interest." Two remarks apply. First, regarding Scott (1995), "moral legitimacy" is not assessed in terms of ethical principles or norms; morality is treated as a sociological category (Birnbacher 2013). Second, putting emphasis on the category "moral legitimacy" conforms to Suddaby's (2010, p. 15) response to a "core question of institutional theory." As Suddaby (2010, p. 15) has remarked, the "empirical reality is that organizations often behave in ways that defy economic logic or norms of rational behavior." Suchman (1995) analyzes moral legitimacy through the distinction of four subcategories, on which this article only briefly sheds light: *consequential legitimacy* (focus on outcomes, but not on negative externalities), *procedural legitimacy* (socially embraced techniques and procedures), structural legitimacy (socially constructed capacities), and *personal legitimacy* (individual charisma and entrepreneurship).
- *Cognitive legitimacy* is conceived of as "comprehensibility" that is (under the condition of a "chaotic cognitive environment") the ability of individuals "to arrange their experiences into coherent, understandable accounts" (Suchman 1995, p. 582) leading to scenarios that become taken-for-granted or "alternatives [that] become unthinkable" (Suchman 1995, p. 583).

The attempt to conciliate managerial and institutional perspectives characterizes Suchman's (1995) approach. Yet, his analysis is biased toward the management side, as expressed in the pragmatic dimension. If organizations take advantage of legitimacy ascriptions, then the management is well advised to take action in order to achieve such valuations. With reference to Parsons, Suchman (1995, p. 574) points out that “audiences are most likely to supply resources to organizations that appear desirable, proper, or appropriate.” Rasche and Gilbert (2015, p. 295), taking the same line, argue that “As emphasized by the resource-dependence theory (Pfeffer and Salancik 1978), organizations with high levels of prestige also face higher legitimacy expectations.”

However, the dominance of the strategic perspective in organizational legitimacy-related research remained not unchallenged. Suddaby et al. (2016) deny that legitimacy is something that can be gained by management action. They integrated Suchman’s (1995) analytical categories with their framework but excluded what Suchman has called “pragmatic legitimacy.” So did Deephouse et al. (2017) in their analysis.

About 20 years after the publication of Suchman (1995), the cognitive dimension of institutions has become one of the “‘trademarks’ of neoinstitutional theory” (Meyer 2017, p. 520) – a development that should have had a bearing on legitimacy-related research as well. Notice that Suchman’s (1995) “chaotic cognitive environment” and the social constructivist approach unfolded by Meyer (2017) do not resonate in all aspects.

Stakeholder Assessments of Organizational Legitimacy

Reflecting on two decades of legitimacy-related research in organization studies, Deephouse et al. (2017), reviewing a number of definitions of “legitimacy,” extend and modify Suchman’s (1995) definition. Interested in *organizational* legitimacy, not legitimacy per se or in the legitimacy of a broad range of other subjects, they equate organizational legitimacy with the perceptions of an organization by its stakeholders. Deephouse et al. (2017, p. 32) define “organizational legitimacy” as “the perceived appropriateness of an organization to a social system in terms of rules, values, norms, and definitions.” X, therefore, is an organization in D3.

Expanding on the (re-)constructions of definitions from the previous subsection, D3 mirrors the changes in legitimacy-related research that took place after 1995:

> D3: X or X’s actions or attributes are legitimate according to the evaluation of Y_1 or . . .or Y_m if and only if Y_1 or . . . or Y_m refers to Z_1 or . . . or Z_f, employs C in the assessment, and generalizes the assessment into a broader view of the overall appropriateness of the organization in its social system.

> $Y_1, \ldots, Y_m$: Assessing instances
> X: Assessed instance
> $Z_1, \ldots Z_f$: Entities or attributes
> C: Set of criteria

If one compares D3 with the previous reconstructions, one of the most important changes is that “the environment” has got a face – namely, that of the assessing instances. Deephouse et al. (2017) propose diverse interpretations of the variable Y including "source" and "evaluator." $Y_i \in \{Y_1, \ldots, Y_m\}$ is an individual, a social movement, an interest group, an investor, or, generally speaking, a stakeholder. D3 draws on the view that "evaluators are either individuals or comprised of individuals" (Deephouse et al. 2017 with reference to Tost 2011). Public opinion can result from the "reflection of social values" (Deephouse et al. 2017, p. 36), but is no evaluator from according to D3. Sources are assumed to assess information; they can interact with other sources and exchange information: "that legitimacy evaluations come from multiple sources highlights the possibility that legitimacy criteria may emerge interactively, in the interplay between the various sources evaluating a given organization and the organization itself" (Deephouse et al. 2017, p. 29).

D3 requires that the stakeholders' assessment has to have a specific characteristic to count as ascription of legitimacy to X: "the assessment must generalize into a broader view of the overall appropriateness of the organization in its social system" (Deephouse et al. 2017, p. 36) – a stipulation conforming with Suchman's (1995) "generalized perception" (see D1).

The assessed instance X is an organization. What exactly is addressed by the source(s) in the course of an assessment process? Deephouse et al. (2017, p. 30) provide a negative list, a number of subjects that do *not* fall under the category of legitimacy-related research: "organizational forms, structures, routines, practices, governance mechanisms, categories, company founders, top management teams, etc." The referenced entities or attributes $Z_1, \ldots Z_f$ are not of interest per se but only because of their relationship to the assessed instance X. Not addressed in the definition is if, in case of the determination of the legitimacy of an entity, all attributes represented by $Z_1, \ldots Z_f$ have to be present and to what degree (see Suddaby et al. 2016, p. 454).

Criteria (the elements in the set C) are not pre-given but can emerge through the interaction of sources in the course of the assessment process. This brings a dynamic perspective into play with room for debate, contest, or negotiation and, therefore, changing criteria and judgments – a view shared by Deephouse et al.'s interpretation of "legitimacy as a continually unfolding process" and the legitimization-as-process perspective advocated by Suddaby et al. (2016). The last-mentioned authors argued that "legitimation is a multi-actor and often multilevel process, legitimacy is not the outcome of a single actor, but rather a socially constructed outcome that emerges as part of the contestation and co-creation of the general social order" (Suddaby et al. 2016, p. 462).

Drawing on Scott (1995) and Suchman (1995), Deephouse et al. (2017) change what has been called the regulatory, pragmatic, moral, and cultural-cognitive *dimensions of legitimacy* into *criteria for the assessment of legitimacy* by the sources. They justify this step with the implicit and explicit standards they believe to find in there: "Sources use four basic types of criteria for evaluating organizational legitimacy: regulative, pragmatic, moral and cultural-cognitive" (Deephouse et al. 2017, p. 39). On one hand, the authors want to keep conceptual and empirical issues apart; on the other, they want to "remain consistent with past research by recognizing that different types of legitimacy (e.g., moral legitimacy) result when certain criteria (moral values) are generally agreed upon within the social system" (Deephouse et al. 2017, p. 39). The point here is that not the sources but the scholars determine the categories into which the criteria can be sorted – a second-order assessment of first-order criteria. This in clearly expressed in Deephouse et al.'s (2017, p. 40) statement "that such categories are analytic concepts, not fully separable empirical phenomena." Such a procedure cannot substitute the empirical investigation of the criteria the sources use, that is, the life-world actors or groups of life-world actors. This is in accord with Deephouse et al.'s (2017, p. 39) decision to "have positioned the types of criteria outside the box defining legitimacy."

Three Perspectives in Organization Studies' Legitimacy-Related Research

Suddaby et al. (2016) distinguish three perspectives in organization studies' legitimacy-related research (for representatives of each perspective, see Suddaby et al. (2016, p. 453, Table 1): *legitimacy as property*, *legitimacy as process*, and *legitimacy as perception*. In their overview article, they give answers to the questions *What is legitimacy? Where does legitimacy occur?* and *How does legitimacy occur?* with regard to the three distinct configurations. The authors hark the legitimacy-as-property perspective back to structural functionalism and contingency theory. From the legitimacy-as-property perspective, legitimacy is "a capacity, property, or trait possessed in some measureable quantity by an organization" (Suddaby et al. 2016, p. 458). Legitimacy is the fit between the "largely material manifestations of legitimacy in an organization (...) and the normative expectations of the environment."

The authors' objective is not to conciliate the three configurations. They criticize the legitimacy-as-property view for several reasons that apply to contingency theory as well including conceptualizing legitimacy as abstract theoretical variable and the appropriateness of empirical measurement of the construct. The main reasons for the rejection of this perspective seem to be of epistemological and methodological kind: Suddaby et al. (2016) criticize what they call the essentialist view and the universalism underlying this research. Compared to the legitimacy-as-property perspective, the legitimacy-as-process perspective is "not essentialist. That is, the characteristics or elements of legitimacy are not assumed to be fixed and universal" (Suddaby et al. 2016, p. 459).

Epstein and Votaw (1978, p. 73) make a distinction between legitimacy – a condition – and legitimation – a "process or a dynamic." According to the legitimacy-as-a-process perspective, legitimation is the product of interactions of multiple actors (typically organizations) in organizational or social fields. Quoting Berger et al. (1998, p. 380), Suddaby et al. (2016, p. 459) define "legitimation" as the "process by which cultural accounts from a larger social framework in which a social entity is nested are construed to explain and support the existence of that social entity, whether that entity be a group, a structure of inequality, a position of authority or a social practice."

This process is characterized by the communications of (individual and collective) actors, and self-interest and agency play prominent roles in the "co-creation of social order" (Suddaby et al. 2016, p. 462). Rhetoric and framing influence the social construction of meaning; constructivist/interpretive approaches prevail in this research field. Compared to the legitimacy-as-property perspective, legitimacy is nothing that is in the world and has to be explained by means of explanatory arguments; rather, it is a communicative process of meaning co-creation resulting from contested interactions between social actors. Shortcomings of the legitimacy-as-process perspective are a tendency to underexplore contextual factors and, with it, the "relatively stable and exogenous aspects of legitimacy," the appearance of "hyper muscular" entrepreneurs (see Suddaby 2010) and a "the marginalization of collective actors" (Suddaby et al. 2016, p. 462).

The legitimacy-as-perception approach distinguishes an individual level of analysis from a collective one and highlights individual or collective actors' judgments based on social evaluations. Two legitimacies result from this distinction: individual-level legitimacy and collective-level legitimacy. As Suddaby et al. (2016, p. 463) argue, this approach "retains the notion of legitimacy as property, but . . . uses the metaphor of property as taste, assessment, or judgment of the appropriateness of an organizational product, practice or characteristic." The authors distance the legitimacy-as-perception perspective from legitimacy-as-property perspective as the latter refers to "physical attributes" or manifestations of legitimacy and the former to cognitive or emotive aspects of perception and judgment. The legitimacy-as-perception perspective conceives legitimacy as a socio-cognitive phenomenon, that is, sheds light on individual perception and assessment. It conforms to D2 or D3 insofar as the assessing instances are individuals and investigates the collective level or the collective or generalized perception (Suchman 1995) as well.

The result is a multilevel conception of legitimacy. Scholars working in this stream of research investigate the formation of legitimacy judgments from perceptions of a legitimacy object (X), the actions based on the judgments, and their macro-level consequences for X. Core constructs in this analysis "are perceptions of the legitimacy object, individual's propriety judgment, collective validity judgment, and individual's validity beliefs about what the collective validity judgment is" (Suddaby et al. 2016, p. 468). For the authors, this stream of research is acceptable as long as it recognizes the "cross-level nature of legitimacy and the interactions between the macro and the micro" (Suddaby et al. 2016, p. 468).

One could imagine that at least two of the three perspectives are interconnectable, for example, in the way that an entity (Y) arrives at the judgment, after running through a multilevel legitimization process in which cognitive processes play a prominent part. As Suddaby et al. (2016) point out, the perspectives stand for different worldviews, theories, or epistemologies in legitimacy-related research – a situation that complicates things but does not make a connection impossible (at least in case of the process-and-perception perspectives).

Legitimacy and Stakeholder Theory

In contemporary organization studies, legitimacy-related research to has not much in common with the topics addressed in political sociology (Manza 2011). Beetham (1991, p. xiv), interested in the development of a social-scientific concept of legitimacy, argued that "legitimacy should be understood as a multi-dimensional concept, comprising rules, normative beliefs and appropriate actions." Power and the political order seem to have disappeared as topics from the agenda in the study of legitimacy in organization studies. The political aspect however has a bearing on corporate law – an aspect addressed by stakeholder theory in its early days – and on the design of private orders in form of transaction arrangements. Stakeholder theory is interpretable as an approach that studies aspects of both the social and the private order.

Epstein and Votaw (1978, p. 70) provide reasons for the crisis of legitimacy in America, as observed by Levitt (1973):

> Equally familiar are the common explanations for the crisis. Size and concentration of power in the large corporation play important roles, as do the separation of ownership and control ..., the meaninglessness of "ownership" in the corporate sector, the perceived absence of easily recognized and accepted forms of responsibility and accountability of managers (and the resulting inconsistency with the democratic values of society), the belief that the personal virtues of frugality and hard work are no longer correlated with the way in which power, privilege, and property are distributed in society at large and, increasingly of late, the belief that corporate promises of performance have failed.

Phillips (1997) fairness principle is the source of *mutual* moral obligations resulting from private orders and contracts. Corporate law and other regulations establish or maintain the pivotal influence of shareholders on corporations and constitute the contemporary social order which, according to Stanfield and Caroll (2004, p. 365), still has some shortcomings. After a brief appreciation of the stakeholder idea and social responsibility in their discussion of the power of corporate America, they conclude "The problem of accountability and legitimacy in a democratic market capitalist society remains unresolved."

The Stakeholder Corporation and the Normative Core of Stakeholder Theory

Stakeholder theory was initially developed as a strategic management approach (Freeman 2010 [1984]; Freeman et al. 2018) that has been extended to a business-ethics approach; however, some scholars gave voice to the view that "stakeholder theory lacks the philosophical sophistication of other models in business ethics" (Philipps 1997, p. 52). Stakeholder theory has asked general questions such as "What is the purpose of the firm?" (Freeman et al. 2010, p. 213), touching upon problems common to several disciplines including economics (Coase 1937), sociology (Weber 1978 [1921]), and business ethics (Evan and Freeman 1988). The second question, "to whom does management have an obligation?" (Freeman et al. 2010, p. 213), addresses obligations resulting from regulations being part either of the general socioeconomic order or of private orders, which, e.g., firms and their customers establish for the time period a transaction takes.

With reference to Berle and Means (1932), Evan and Freeman (1988) present stakeholder theory as approach to the modern corporation, thereby dissociating it from the shareholder view of the firm (cp. Freeman et al. 2018). The stakeholder theory of the corporation amounts to a change of the economic system resulting from a devaluation of shareholder resources if compared with stakeholder resources and a change of allocations of rights and privileges based on this devaluation or upvaluation, respectively.

Evan and Freeman (1988, p. 103) propose two stakeholder management principles, the first one being named *principle of corporate legitimacy* (P1): "The corporation should be managed for the benefit of its stakeholders ... The rights of stakeholders must be ensured, and, further, the groups must participate, in some sense, in decisions that substantially affect they welfare." Evan and Freeman doubt the legitimacy of an economic order devoted to protecting shareholder rights and resources. P1 however presupposes and does not explicate the concept of legitimacy. It implies the legitimacy of stakeholder claims toward the firm: "Any social contract that justifies the existence of the corporate form includes the notion that stakeholders are party to that contract" (Evan and Freeman 1988, p. 103). Regarding the purpose of the firm, these thoughts could mean that shareholder interests should not gain major influence on managerial decisions. If the conception of the firm changes, then its governance structure has to change as well including actual regulations that may stand in the way of the stakeholder corporation.

The majority of the stakeholder literature published after Freeman (2010 [1984]) sidestepped the legitimacy issue (Freeman et al. 2010). While the question "what is the purpose of the firm" touches upon the social or institutional order, more than 30 years after Freeman's (2010 [1984]) seminal book, the range of the "idea of legitimacy" seems to have been pared to moral aspects of corporative management decisions. According to Freeman et al. (2010, p. 209), the "idea of legitimacy" is that "certain stakeholders – or stakeholder interests – deserve consideration, regardless of whether doing so would clearly benefit the corporation." The distinction between descriptive, instrumental, and normative stakeholder theory (Donaldson and Preston 1995; Freeman et al. 2010, 2018) gained influence in stakeholder theory.

"Some interests, and some groups, may deserve to shape what firms do based on the fact that their claims are, for example, right, meritorious, or just" (Freeman et al. 2010, p. 209). While Freeman (2010 [1984]) and Freeman et al. (2010) tend to sustain the variety of ethics approaches that can substantiate the normative dimension of stakeholder theory, and downplay that a clear-cut distinction the normative and the nonnormative can be drawn at all, other authors have attempted to provide a unique basis for the normative dimension (Philipps 1997; Donaldson and Dunfee 1999). However, there is no need to narrow normative aspects of stakeholder theory down to legitimacy. In addition, Friedman and Miles (2006, p. 136) doubt that "normative theory is the core of stakeholder theory" and argue for a "descriptive/analytical stakeholder theory that is sensitive to values and norms, through explicit consideration of ideas, belief systems, and identities." Thus, these authors cast doubts on a predominance of second-order theories and principles for the analysis, emphasize the importance of first-order theories in this regard, and argue that "theories and evidence from the one sphere can inform the other" (Friedman and Miles 2006, p. 137; both quotes).

Notwithstanding, today, there seems to be no majority available among stakeholder scholars for the substitution of descriptive analysis for normative analysis. What is observed are strategic debates about the further development of stakeholder theory. A critical point is the resources spent for the development of descriptive/analytical approaches compared with the resources spent for normative analyses. There seems to a broad agreement that normative stakeholder theory is important; however, there is no agreement on the need of one normative core and that legitimacy is the main constituent of this core. Interestingly, Freeman et al. (2010) did not close their discussion of stakeholder legitimacy with a call for more conceptual preciseness but for "pragmatism" in the sense of employing different definitions for different purposes.

Normative and Derivative Legitimacy

Phillips (1997) addresses a list of three problems in stakeholder theory: first, the lack of a coherent justificatory framework; second, adjudicating between stakeholders; and third, stakeholder identification. Phillips (1997) proposes a principle of stakeholder fairness of which he believes that it is able to fill all three gaps.

Freeman (2010 [1984]) held the view that the management has to pay attention to groups that can affect the firm, independently of the appropriateness of these groups' demands. As Phillips (2003a, p. 27) remarks, Freeman (2010 [1984]) has "put aside" concern with legitimacy, which has "created ambiguity within stakeholder theory." Freeman (2010 [1984]) employed "legitimacy" in connection with management issues: he asked if it is "'legitimate to spend time and resources' on stakeholders" and if "all stakeholders have an equally 'legitimate' claim on the resources of the corporation" (Freeman 2010 [1984], p. 45). These questions are important; however, they are, as argued above, secondary to the primary question about the purpose of the firm and the socioeconomic orders in accord with the answer to this question.

While Freeman (2010 [1984]) did not elaborate on legitimacy, Phillips (2003a, p. 28; italics in the original) put a stakeholder lens on legitimacy, arguing that "moral legitimacy is the *sine qua non* of stakeholder status." If this holds true, then not all "influencers" (see Donaldson and Preston 1995) can be stakeholders; thus, stakeholder theory is not applicable to classes of relationships, which, for rational grounds, could and should be addressed by management.

In line with his view that stakeholder theory is not a theory of the "basic structure of society" (Phillips 2003a, p. 27) and drawing on, inter alia, Rawls, Phillips (1997) employed the principle of stakeholder fairness to identify the normative core of stakeholder theory. This second-order principle addresses the "obligations that are created among persons and organizations within the sphere of 'private associations'" (Phillips 2003a, p. 27); thus, Phillips changed the focus from social orders to private orders. Stakeholder obligations "arise when individuals and groups of individuals interact for mutual benefit" (Philipps 1997, p. 52). Distinct from obligations resulting from this principle are "*additional* moral obligations over and above that due simply by virtue of being human" (Philipps 1997, p. 53; italics in the original). Thus, in this narrow stakeholder concept, power did not play any role in the creation of stakeholder relationships. Stakeholders are those entities, and only those entities toward which an individual or an organization has moral obligations resulting from the fairness principle.

A half decade later, Phillips (2003a, b) extended his narrow stakeholder concept to include power-based relationships. He employed the stakeholder idea to mark those entities, which deserve managerial or organizational attention or consideration but were not subsumed under his narrow concept of stakeholder, because the constitutive core of the relationship is power but not moral obligation. Terrorist or radical activist groups can do harm to an organization, and it would be beyond managerial prudence to not pay attention to them. Phillips includes the competitors of a firm in this group. This procedure seems to neglect the welfare effects of competition. It is questionable to conceive of competitors as "harm doers"; quite the contrary, engaging in fair competition could be understood as moral obligation of business organizations (for a more balanced view, see Philipps 1997). In order to turn these entities into stakeholders, it is necessary to extend the concept of legitimacy beyond moral legitimacy. Tapping into the "the general ambiguity of the term," Phillips (2003a, b) stretched the narrow stakeholder approach beyond its moral foundation by distinguishing between normative and derivative stakeholder legitimacy. The reason for this however was not to encounter the concept's ambiguity but to account for "the pragmatic, power-based conception of legitimacy prominent in organization theory and sociology" (Phillips 2003a, p. 29). Notice that this does justice only to what Suchman (1995) called the pragmatist strand of legitimacy-related research in organization studies.

Phillips (2003a, p. 29) is convinced that stakeholder theory "can be rendered more precise and consistent – both internally and with overlapping literatures – if the central idea of legitimacy is understood in terms of normative legitimacy *and* derivative legitimacy." Normative legitimacy is maintained as the "core concept" of stakeholder theory; yet, it is questionable if Phillips has provided reasons for the alleged legitimacy of derivative stakeholders, which go beyond prudence and foresight. Phillips (2003a, p. 31) simply states, "managerial attention to these groups is legitimate, but this legitimacy is derived from their ability to affect the organization and its normative stakeholders." On the other hand, Phillips refers to a concept of legitimacy whose meaning is presupposed. In this sentence, the word "legitimate" has no other function than to extend the scope of stakeholder theory; it is not explained what, for example, is the difference between a sentence beginning with "managerial attention to these groups is legitimate" and a sentence beginning with "managerial attention to these groups is advised." Phillips (2003a, p. 31) does not block from his readers view that he thinks that taking "coercive power" for "derivative legitimacy may add value to stakeholder theory." Taking a political-philosophy lens, the idea that legitimacy flows from power is strange.

Note that this article does not aim to devaluate Philipp's contributions to the understanding of moral obligations of stakeholders. Phillips is right in stating that the content of the fairness principle is to be spelled out in the analysis of concrete stakeholder interactions. Private governance structures or the governance of the value-creation processes they are established for, respectively, have to be assessed from both economic and ethical perspectives. As Freeman et al. (2018, p. 9) have put it, "Even with partially complete contracts in place, relationships remain defined by mutually shared (or not) values and expectations." Marketing studies have highlighted the role of value propositions, mutual faith, and cooperation for the assessment of relationships (e.g., Ravald and Christian 1996; Grönroos 1997; Frow and Payne 2011). On the other hand, Philipp's (Philipps 1997, 2003a, b) analyses show that the use of the legitimacy concept in stakeholder theory is on shaky grounds. In addition, the extension of the narrow concept of stakeholder legitimacy is, at least partly, motivated by the interest in a fit of the stakeholder approach with the use of the concept in some strands in management and organization studies. Given the appropriateness of the fairness principle, one could also ask what the attribute "legitimate" adds to the relationships constituted by the fairness principle.

On the Legitimacy of Markets and Marketing Practice

Value creation, resource integration, exchange, or resource transfers are research objects of marketing studies as are markets and marketing systems as well as private orders and social orders. Boulding (1978) remarked "The legitimacy or otherwise of exchange and of the market as a social institution is a problem which has been much neglected by economists but which nevertheless is extremely important." The problem analysis requires applying a lens being much wider than those often used in marketing studies, e.g., in consumer behavior. The *Journal of Macromarketing's* cover page, showing the slogan "Examining the Interactions among Markets, Marketing, and Society," expresses such a wide lens. Does legitimacy matter because it has effects on markets, marketing systems, or marketing practice, to paraphrase Deephouse et al.'s saying quoted above? Various respondents, including economists and marketing scholars, have given answers to this question.

Marketing studies share research objects such as markets or marketing systems with other disciplines including economics and economic sociology. The legitimacy of markets and the legitimacy of the state have been compared in economics. As Chang (2003, p. 41) points out, "Defining the appropriate roles of the market and the state has been a central concern for policy-makers since the beginning of capitalism." Neoclassical and Austrian economics are recognized for their incisive positions in this debate. They consider the market as being the kingdom of freedom and wealth creation and view governmental activities with distrust. The next subsection briefly addresses some of the positions advocated by Milton Friedman, Friedrich August von Hayek, and Ludwig von Mises who connected legitimacy to freedom and wealth.

The Legitimacy of Markets and Governmental Coercion

From the perspective of Austrian economics, governmental interventionism can hamper the system of economic freedom, that is, the market system. The government interferes with the operation of business by means of orders and prohibitions" (von Mises 1998 [1949], p. 714). Adverse effects follow from a government that "does not limit its activities to the preservation of private ownership of the means of production and its protection against violent encroachments. From the perspective of Austrian economics, governmental activities are in need of legitimization, both with regard to content and amount, because of their derogative potential regarding the unfolding of market activities. Compared with this view, individuals' economic market activities are not in need of legitimization. Why? In his answer to this question, von Mises (1998 [1949]) juxtaposes government power and market power in opposition. While the government is constituted of persons, that is, identifiable entities, the market is conceived of as an impersonal mechanism, as von Mises (1998 [1949], p. 714 f.) puts it, and entrepreneurs or capitalists have to obey the "dictates of the market." Von Mises fights emphatically against governmental coercion. After the removal of this kind of coercion, the market forces can unfold. Nevertheless, von Mises's capitalists or entrepreneurs are kept in leading-strings by the market forces; they are marionettes rather than directors in the economic system. How is this approach associated with the ideas of human will and purpose-guided action? Von Mises did not provide an answer but his student von Hayek did.

As Friedman (1982 [1962], p. 16) remarks, "Because we live in a largely free society, we tend to forget how limited is the span of time and the part of the globe for which there has ever been anything like political freedom: the typical state of mankind is tyranny, servitude, and misery." Three attributes characterize wishful states of human civilization: freedom, justice, and prosperity (von Hayek 2001 [1944]). According to von Hayek, there are forces working systematically toward or against the improvement of the humanly devised states of affairs: impersonal and anonymous market forces and "collective and 'conscious' direction of all social forces to deliberately chosen goals" (von Hayek 2001 [1944], p. 21). For the understanding of the liberal perspective advocated by von Hayek, two aspects are worth mentioning: first, the lowest possible level of coercion is strived for; second, the highest possible level of individual initiative ought to be attained: "The fundamental principle [of liberalism] that in the ordering of our affairs we should make as much use as possible of the spontaneous forces of society, and resort as little as possible to coercion, is capable of an infinite variety of applications" (von Hayek 2001 [1944], p. 17).

Von Hayek, thus, did not promote a dichotomist view of the state and the market. Planning and organizing take place both in market relationships and governments. If, as von Hayek believes, restricting individual initiative is detrimental to the achievement of the wished-for attributes of human civilization, then social orders, so far they can be created at all, should find the right balance between necessary, justified coercion and individual freedom in economic affairs:

> It is a dispute about the best way of so doing. The question is whether for this purpose it is better that the holder of coercive power should confine himself in general to creating conditions under which the knowledge and the initiative of individuals is given the best scope, so that *they* can plan most successfully; or whether a rational utilization of our resources requires *central* direction and organization of all our activities according to some consciously constructed blueprint (von Hayek 2001 [1944], p. 37; italics in the original).

Von Hayek (2001 [1944], p. 37; italics in the original) adds at this point that “It is important not to confuse this kind of planning with a dogmatic *laissez-faire* attitude.”

Note that even an avowed liberal like Milton Friedman did not reject any need for governmental activity in a market economy: “The existence of a free market does not of course eliminate the need for government. On the contrary, government is essential both as a forum for determining the ‘rules of the game’ and as an umpire to interpret and enforce the rules decided on. What the market does is to reduce greatly the range of issues that must be decided through political means, and thereby to minimize the extent to which government need participate directly in the game” (Friedman 1982 [1962], p. 21). The point here is the degree to which governmental activity is allowed to unfold and the view that market activity is not substantiated or supported by it. For this reason, governmental activity has to be reduced to the lowest level possible.

According to the dichotomist view on the relationship of the state and the market, there are no legitimacy-related issues in markets, as private decisions rule the markets. Market metaphysics says that if both parties to a transaction cannot improve their condition, there were no exchanges. Friedman (1982 [1962], p. 19) puts it this way: “The possibility of co-ordination through voluntary co-operation rests on the elementary yet frequently denied proposition that both parties to an economic transaction benefit from it, provided the transaction is bi-laterally voluntary and informed.” Dixon (1990, p. 339, quoting George 1898, p. 331) addresses this topic in terms of the value created by the transaction: “In itself exchange brings about a perceptible increase in the sum of wealth. . . . Each of the two parties to an exchange aims to get, and as a rule does get, something that is more valuable to him than what he gives. . . . Thus there is in the transaction an actual increase in the sum of wealth, an actual production of wealth.” As they do not delimit individual freedom and increase the sum of wealth, all market transactions are legitimate per se. However, this does not mean that they are just or fair as well. In contrast, government decisions are not legitimate per se; the government executes control, power, or authority over individuals and restrictions to individual freedom that are in need of legitimization in any case (Dowling and Pfeffer 1975).

In the next subsections, the article illustrates that the understanding of legitimacy differs in the diverse and competing marketing approaches and their underlying philosophies. With regard to marketing studies, particular marketing practices and marketing per se have been questioned as well as marketing organizations (the advertising industry). The article begins with the former case, the questioning of marketing practice per se. This discussion is about wealth, not freedom. And it assumes that the market is not characterized by the working of impersonal mechanisms.

Questioning the Legitimacy of Marketing Practice Per se

This part of marketing history is related to the understanding of services in economic theory. Marketing practices such as the distribution of goods or retailing have been conceived of as “unproductive” services that add no value to the good once manufactured. If, as the things are seen from the perspective of objective value theory (Stavenhagen 1969), production is the source of value, and if this value is embedded in goods, then all activities which change place, assortment, or accessibility of – material – goods are unproductive or do not contribute to economic wealth, respectively. If marketing practices fall under this category, they are unproductive as well. Marketing practices, when, do not add to economic wealth but take from it. It is for this reason that Bartels (1962, p. 16) notes “In 1900 there was no clear concept of marketing as a productive activity or as a contribution to economic production.”

Dixon (1990) explains in detail how taking a different perspective solved the issue with the productivity of services and marketing practices, respectively. The combination of this insight with a wider concept of production and ideas originating from subjective value theory has spawned this perspective. On the one hand, economists beginning with Aristotle have pointed to the importance of use value accruing from the use of resources and the utility that can result from use processes. John Stewart Mill (1848, p. 24; quoted by Dixon 1990, p. 341) pointed out that human beings cannot “produce” matter but only “cause it to assume properties.” Dixon (1990, p. 341), referring to Francis A. Walker (1888), notes that “the creation of value does not imply any change in form.” From Dixon’s (1990) analysis, it can be concluded that matter can be changed but not created and that manufacturers *and* marketers conduct such changes. In light of this wide concept of production, marketing is as productive as any “change in form.” For the correctness of this conclusion, it does not matter, whether or not marketing activities or services are subsumed under a wide concept of production or under a complete different concept such as value creation (Vargo and Lusch 2004).

Dixon (1990) also presents a division-of-labor-based argumentation to substantiate the positive role marketing practice plays in a market economy: first, specialization increases efficiency, and this holds true for both the workman and the marketer. Marketing contributes to division of labor, as the workman does not need to engage in marketing activities. Second, marketing increases market size, because, ceteris paribus, more work can be done. In Shaw’s (2011, p. 104) words: “The marketing system came into existence, survives and grows because it is the most effective and efficient means of directing scarce resources to alternative uses.”

That marketing practices are not unproductive, or not wasting resources, does not imply that every kind of marketing practice is justifiable. Marketing practices have various facets including the physical distribution of resources; the exchange of information; or doing institutional work to change society’s legal order, normative orders, or taken-for-granted frameworks (Scott 1995). For von Hayek, the flow of knowledge within the market and the ability of actors to make fruitful use of information have highest priority, and the task of information transfer is assigned to the advertising industry. Yet, as Schwarzkopf (2011, p. 10) points out, since the formation of the advertising industry in the late nineteenth century, “advertising was constantly under pressure to justify its existence.” The reasons for this judgment are diverse, and one of them is that “the role of advertising in the larger societal order" is less understood (Hawkins 2009, p. 172). More concrete, the assessment of advertising practices, even of those related to ads, which are not telling the truth, was and is not thoroughly negative.

Questioning the Legitimacy of Advertising

On the on hand, the *market legitimacy claim* is transferable from markets to marketing practices that are considered as both "productive" and adding to the consumer's wealth. The advertising industry informs the consumer about his or her options; the choice remains by the sovereigns. If the consumers make the wrong choices, if they, e.g., consume the wrong things, then it is not their fault but that of the advertising industry. Countering the advertisers' strategies can partly restore the sovereignty of the consumer who shake their fists at consumer boycotts (Hutter and Hoffmann 2013) and engage in degrowth strategies (Lloveras and Quinn 2017) or anti-consumption (Lee et al. 2013).

On the other hand, the legitimacy of advertising has been questioned for three reasons at least: first, advertising does not inform but seduces or belies the customer (Deighton and Kent 1995; Godin 2009); second, advertising "supports" questionable or disputed ideologies and social orders (e.g., male breadwinner ideology and gender relations in society); and third, it plays a pivotal role in the creation or co-creation of questionable or disputed offerings (Deighton and Kent 1995). Deighton and Kent (1995) admit that consumer sovereignty and seduction are incompatible. An advertising industry that belies or coaxes consumers into purchases does not conform to the idea of consumer sovereignty. Seduction runs counter to the idea that transactions are voluntarily bilateral and well-informed and thwart the function of advertising in markets to inform customers about their options.

According to Schwarzkopf (2011, p. 8), the "scientification of market research tools through consumer interviews, panel surveys, consumer juries, program analyzer techniques, and product testing panels ... helped legitimize marketing practices." These tools promised to rebalance the power disparity between producers and consumers (Schwarzkopf 2011). Market research appeared as a channel for the democratic control of society. It nourished the illusion that a democratic control of producers based on the implementation of scientific tools is possible. Although the means the producer has voluntarily implemented are usable for controlling him or her, they would not do so if this runs counter to their objectives. Proponents of the marketing concept, that is, of "the cornerstone of the [marketing] discipline" (Brownlie and Saren 1991, p. 34), left no doubt that the marketing research techniques are a means of enhancing a firm's profitability via the information gained from the customers or the market through the application of these techniques (see Weeks and Marx 1968).

Market research tools are designed in order to improve the firm's capacity to learn about what is called *consumer needs*. At this point, the story of economists "who give utility its primary position in economic analysis, arguing that the origin of economic value lies in the needs of customers" (Dixon 1990, p. 338), meets the philosophy of the marketing concept (Kotler 1967). As “at the core of this concept is the dependence of any enterprise on the goodwill and satisfactions of its customers” (Kimery and Rinehart 1998, p. 118), the firm’s major marketing objective or task is the satisfaction of consumer needs. As Weeks and Marx (1968, p. 39) have put it, “this marketing concept can be defined as the unifying approach marshalling and directing the total resources of a business firm toward the determination and satisfaction of consumer and middleman wants and needs in a way planned to enhance the firm’s over-all profit position.”

Austrian economists and advocates of the German ordoliberal school “brought marketing-related phenomena, such as advertising and consumer behavior, and normative theories much closer together than they had been before” (Schwarzkopf 2011, p. 12). Von Mises was not against the use of market research tools, and he addressed the relationship between a firm and its customers in terms of necessity rather than information provision:

> In his capacity as a businessman a man is a servant to the consumers, bound to comply with their wishes. He cannot indulge his own whims and fancies. But his consumers’ whims and fancies are for him ultimate law, provided these consumers are ready to pay for them. He is under necessity of adjusting his conduct to the demand of the consumers. If the consumers, without taste for the beautiful, prefer things only ugly and vulgar, he must, contrary to his own convictions, supply them with such things (von Mises 1998 [1949], p. 241).

On one hand, this is coercion, but not the coercion executed by “a fellow man” but by the market forces; it is thus in accord with the liberal interpretation of political freedom: “Political freedom means the absence of coercion of a man by his fellow men” (Friedman 1982 [1962], p. 21). On the other hand, this points to the dilemma that a need-based social control might increase the wealth of the customer, but does not take into consideration those action consequences spelled out in terms of negative externalities, environmental degradation, loss of biodiversity, etc. From a legitimacy-oriented lens, neither the customers’ wants nor the firms’ activities are justified by social control through the execution of marketing practices.

Legitimacy-Related Research in the Marketing Discipline

The managerial approach to marketing is interested in stakeholder legitimacy (Santana 2012), the legitimacy of strategies and offerings (Bonsu and Polsa 2011) or of new ventures (Rao et al. 2008; Homburg et al. 2014), or the legitimacy of the advertising industry (Schwarzkopf 2011), or in organizational acceptance (Yang et al. 2012). Research in consumer behavior has addressed the legitimacy of brands (Holt 2004; Kates 2004; O’Reilly 2006; Hakala et al. 2017), hybrid cultural products (Coskuner-Balli and Ertimur 2017), or fashion (Phillips and McQuarrie 2011). Intersections of marketing studies with law and ethics become visible, if the legitimacy and the legality of a social object are addressed (Humphreys 2010; Coskuner-Balli and Ertimur 2017; Geiger-Oneto and Simkins 2018).

Marketing scholars, especially those drawing on approaches and methodologies originating from organization studies, have tended to hark back to the descriptive-analytical strand of legitimacy-related research. Building on Scott's institutional framework, Humphreys (2010, p. 492) advocates the legitimacy-as-process perspective: the regulative, normative, and cognitive pillars of institutional analysis notwithstanding, the concept of legitimacy "remains bounded to its application describing the process by which a practice or an idea becomes incorporated into the dominant, mainstream institutions of society."

The understanding and use of the concept of legitimacy in marketing studies depend on the marketing approach in question. Deighton and Kent (1995) discuss legitimacy and deception in advertising from a social-constructivist perspective that brings them close to an idea advocated in relationship marketing, services marketing, or the service-dominant logic, namely, that value is co-created by provider or customer or by dyads embedded in networks, respectively (Lusch and Vargo 2014). They conducted a case study about the "operation of a business known as the Land of Chonda-Za and the College of Love" (Deighton and Kent 1995, p. 663), a direct mail program in operation for 20 years. The mail program nurtured intense relationships between Chonda-Za and its customers; for this reason, the authors conclude that the customers were involved in creation of the offering. They argue, insofar and to the degree seduction is co-created, it is not completely illegitimate. What is of interest here is the "agreements as social consensus" (Deighton and Kent 1995, p. 661) governing the interactions of provider and customer – the private order – and the active part the "consumer" plays in their analysis (note that according to the marketing concept, the consumer is not a co-creator of value but a receiver of the value the firm has created). As Humphreys (2010, p. 492) has pointed out, the meaning of consumption is negotiated by the interactions of all stakeholders or "members of a shared social world."

Hakala et al. (2017) investigate legitimization discourses in online brand communities. These approaches oppose narrow firm- or management-centered versions of stakeholder theory (for an example, see Santana 2012). Taking a process and historical perspective, changes in the meanings of consumption practices come in sight, which can legitimize or delegitimize the practices (Humphreys 2010). Bonsu and Polsa (2011) criticize the base-of-the-pyramid (BoP) corporate strategy promoted as market-based solution to global poverty as an exercise in "governmentality" (see Fougère's and Skålén's 2012 discussion of power and managerialism). From the perspective of these authors, a "BoP-strategy mimics neocolonial incursion into heretofore inaccessible markets" (Bonsu and Polsa 2011, p. 236); the poor are constituted as "free, self-governing individuals"; and the function of BoP partnerships is to "legitimate a regime of self-regulation" (Bonsu and Polsa 2011, p. 242).

Ideas, beliefs, and shared understandings are movers in process-oriented legitimacy studies. Ideas and beliefs hark back to, e.g., political or economic philosophy, substantiating, e.g., the political legitimacy of marketing practices (Shaw 2011). As Epstein and Votaw (1978, p. 79) remark, "Congruence with prevailing ideology would seem to be as important as any other element in creating legitimacy." Critical marketing studies have linked ideology with legitimation processes. They addressed the role of marketing philosophy (or ideology) both on consumer and marketer beliefs (Marion 2006; O'Reilly 2006; Fougère and Skålén 2012) or how advertising both reflects and influences ideological shifts (Belk and Pollay 1985; Zhao and Belk 2008) in markets. Belk and Pollay (1985, p. 887), conducting an analysis of advertisements in US journals between 1900 and 1980, found "evidence that recent advertising has increasingly portrayed consumption as an end in itself rather than as a means to consumer well-being." Critical marketing scholars interpret ideology in terms of *false ideas* which help to legitimate a dominant political power, e.g., managerialism relying on sovereign power (Fougère and Skålén 2012). The point here is that legitimation processes – seen from a critical perspective – can go wrong as "ideology . . . produces legitimation to those who are in a dominant position" (Marion 2006, p. 246).

Obviously, the creation of a marketing system that allows the participation of the poor in the market process is not sufficient to legitimize both single transactions and the system in general. Compared with descriptive legitimacy according to stakeholder theory, power is not something exerted by someone (stakeholder) on the firm (corporation) but something exerted by the firm (corporation) on the customer (stakeholder) – and exerted in way detrimental to its customers.

Discussion and Conclusions

Differences in theoretical perspectives, epistemologies, or worldviews have coined legitimacy-related research in organization studies. These differences have led to two main research strands, a strategic, management-oriented strand and an institutional strand. While this article did not aim at providing a full-fledged analysis of the use of the concept of legitimacy in organization studies, the conclusions seem to be acceptable that first, a theoretical concept of legitimacy has not arisen from organization studies; second, that the political and normative dimensions of the concept of legitimacy are under-researched; and third, that conceptualizations of legitimacy in organization studies may suffer from an insufficient distinction between conceptual and empirical issues.

The question arises, why, from a theoretical perspective, legitimacy is relevant or should be made the subject of analysis. For Deephouse et al. (2017, p. 34), "Legitimacy matters because it has consequences for organizations" or because of "its many benefits to organizations" (Deephouse et al. 2017, p. 28). Survival is a major topic in legitimacy-related studies (Epstein and Votaw 1978). Deephouse et al. (2017, p. 35) confirm "institutionalists have argued that legitimacy enhances organizational survival." Is organizational survival a value per se? Epstein and Votaw (1978, p. 72) touch upon this topic, quoting Maurer (1971): "Legitimation is the process whereby an organization justifies to its peer or superordinate system its right to exist." The political, ethical, or normative question what the "right to exist" presupposes or contains seems to have disappeared from many contemporary analyses in organization studies. Epstein and Votaw (1978, p. 70) discussed legitimacy against the backdrop of a "crisis of legitimacy in America and, especially, in the corporate system." They conducted their discussion of legitimacy within a framework constituted by responsibility, rationality, and legitimacy.

From the perspective of social-constructivist approaches in organization studies, legitimacy is a phenomenon of the social world or brought into the world in the form of practices and the perceptions of life-world actors, respectively. As Deephouse et al. (2017, p. 32) have put it, "organizational legitimacy is a perception of organizations by stakeholders." Organization studies investigate processes in which the actors and their perceptions, beliefs, and understandings are involved. Scholars describe these processes and perceptions or understandings in terms of legitimacy. In this use, legitimacy is part of descriptive language, no theoretical term.

A major point in this regard is how issues related to the concept's meaning or semantics relate to its determination or "measurement" in empirical studies. What does the "extension" of theoretical categories into empirical categories mean in this context? Deephouse et al. (2017, p. 41) discuss proposals of scholars according to that the three *purposes of legitimacy* are "*Extending, Maintaining and Defending Legitimacy*" or the three *challenges of legitimacy* management are "*Gaining, Maintaining and Defining Legitimacy*." Do the languages and semantics used by scholars and those of first-order actors fall into one?

In what circumstances can the legitimacy-related semantics lead to additional insights? Consider, for instance, Deephouse et al.'s (2017, p. 34) belief that "most stakeholders will only engage with legitimate organizations." Does this mean that the majority of market transactions ("most stakeholders") has been conducted by parties, who, prior to the transaction, have perceived or assessed each other (prior to the transaction) as "legitimate"? Is this a statement thought to be subjected to empirical assessment or a variant of "market metaphysics"?

Legitimacy-related research faces a double fuzziness not sufficiently addressed yet. Both first- and second-order theories are sources of this vagueness. The discussion of advertising in subsection "Legitimacy-Related Research in the Marketing Discipline" is an example for both sources. From a pure information-economic perspective, Chonda-Za's practices were not desirable, proper, or appropriate and, therefore, illegitimate. From a services-marketing or service-dominant logic perspective, however, the customers have co-created the offering. As Deighton and Kent (1995) report, from the perspective of many customers, the co-created offerings and the value-creation process were appropriate, desired, or proper. Many of Chonda-Za's customers might not felt being betrayed but enjoyed the value gained from co-creating value with Chonda-Za. The interaction process increased their subjective wealth. As this discussion shows, valuations and judgments can vary. What can be learned from this example is that perceptions and assessments can differ, first, between life-world actors and scholars and, second, between life-world actors and law (Chonda-Za was sentenced). This example ought not to substantiate the view that the law can provide superior criteria for the assessment of legitimacy. As Epstein and Votaw (1978, p. 76) admit, "Legitimacy is not coextensive with, nor is it defined by, legality." Yet, as Epstein and Votaw (1978, p. 76) continue: "In a democracy the law is likely to be more or less consistent with social values, goals, and norms, but not perfectly so." Peter's (2017) remark applies that second-order judgments are required informed by second-order theories.

Legitimacy is a concept employed in social-scientific disciplines such as sociology, organization studies, or marketing studies on the one hand, and stakeholder theory – whose status between social-scientific and philosophic theory is under debate – on the other. Against this backdrop, one could expect that legitimacy is a concept bridging different disciplines. It is difficult to assess if this objective, if it were an objective, was achieved. At this point of time, it seems that both marketing studies and organization studies have more in common with regard to what they disregard (normative dimensions or power) than what they regard in legitimacy-related research. Legitimacy is often no exclusive topic in marketing studies but rather considered an epiphenomenon of other research objects (brands, industries, products, etc.). One reason for this is the narrow scope of marketing studies, if assessed in the light of distinctions such as for-profit/nonprofit, micro/macro, and positive/normative (Hunt 1976). Hunt characterizes the managerial approach to marketing as micro, for-profit, and normative (devoted to the objectives of firms) and, because of its normativity, as unscientific. Macromarketing does not share Hunt's strong view on the positive-normative distinction and the avoidance of value judgments in science; it is also constitutive for macromarketing that it avoids the pitfalls of managerialism (Fougère and Skålén 2012). Ethics and value orientations played an important role in macromarketing research from the beginning (Laczniak et al. 1981; Monieson 1981, 1988; Laczniak 2018). For this reason,there are points of reference for the preparation of a substantial framework for legitimacy-related studies in marketing doing justice to its various dimensions including normative or ethical ones. More concrete, the fruitfulness of legitimacy-related research seems to be limited if not connected to a value-based framework of analysis.

Public Relations and Business Legitimacy

Contents

Abstract

The vast field of public relations contains multiple theoretical, methodical, and conceptual approaches, with research spanning such disciplines as sociology, ethics, linguistics, communication studies, behavioral psychology, management theory, and many more. Upon giving an introductory overview of main developments in the field with a specific focus on the concept of business legitimacy, this chapter proposes to follow a specific path promising fruitful insights for the student, practitioner, or researcher with an interest in business legitimacy. It is argued that the two-way symmetry model of excellence benefits from being theoretically informed by a Habermasian perspective on publicity and communication when dealing specifically with issues of pragmatic, moral, and cognitive forms of legitimacy. Taking such theoretical bearings, the chapter ultimately presents a contemporary case study exemplary of a prototypical business legitimacy issue.

Public relations · Communicative action · Excellence model · Public sphere

Introduction

As Ihlen and van Ruler (2007) point out in a programmatic paper on current and future perspectives on public relations, the field of public relations is diverse, multifaceted, and interdisciplinary. Since no approach can take account of all the various perspectives, it is imperative to be highly aware of what deontological background and disciplinary roots are underlying the approach and that "…methodological roots heavily influence one's perspective on what public relations is, how it works and how it should be researched. That is why it is important to make these roots explicit" (Ihlen and van Ruler 2007: 244). Giving a coherent presentation of how business legitimacy can be managed in a public relations context thus requires making some choices of which paths to follow through the vast and diverse field of public relations.

Starting out from a general overview of the field in relation to business legitimacy, the current presentation will specifically follow a *normative* path arguing that such an approach to public relations provides fruitful perspectives on business legitimacy. The so-called excellence tradition (Grunig and IABC Research Foundation 1992) is based on the idealized norm of social symmetry in communicative relations and represents the most widely accepted, normative approach.

As argued by Ihlen and van Ruler (2007), research in the field of public relations needs to add to the field's traditions of *managerial* and *behavioral* approaches by applying *social* perspectives, exemplified by such thinkers as Bourdieu, Foucault, Weber, and Habermas, in order to enable an understanding of public relations as a societal phenomenon. Specifically, this presentation focuses on an idealized model of symmetrical communication drawing mainly on theoretical implications of Jürgen Habermas' account of the transformation of the public sphere (Habermas and Burger 2008) as they are transformed into a full theory of communication in his seminal *The Theory of Communicative Action* (Habermas 1991). Thus, the disciplinary roots of the current approach draw on a model of public relations excellence understood in terms of a critical theory of publicity and communication. The approach is aimed at bringing about an understanding of how legitimacy is maintained communicatively in public relations practices, where public relations is seen as a cocreational form of activity performed by various interactants in a social space where two-way symmetrical communication is latently possible.

Starting out by positioning such an approach in the broader field of public relations, the paper goes on to discuss legitimacy seen through a balanced understanding of how communication practices are shaped between the everyday, rhetorical and strategical action and the idealized, yet counterfactual, presuppositions that ultimately shape them. In order to exemplify, the paper will eventually present a real-life case in which the implications of this approach can be seen to be a viable way of understanding business legitimacy in public relations.

Legitimacy Through the Lens of Public Relations

Legitimacy Defined

In this paper, the central term *legitimacy* is used in the sense given in Suchman's (1995) widely held definition that combines and synthesizes evaluative (i.e., an entity's justifiability) and cognitive (i.e., an entity's understandability) approaches into a broad, comprehensible definition: "Legitimacy is a generalized perception or assumption that the actions of an entity are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs, and definitions" (Suchman 1995: 574).

Citing Weber (Weber and Roth 2013) and Parsons (1960) as the foundational works for a contemporary understanding of legitimacy, Suchman points out that a comprehensive definition needs to encompass both strategic and institutional perspectives. Whereas the strategic perspective will tend to look at the management of legitimacy as willful instrumental agency embedded in the organization, the institutionalist view will focus on symbolic dynamics and cultural contexts ultimately shaping the organization's register of possible action. The "perceptions" and "assumptions" mentioned in the definition may thus be embodied both as optics from within an organization and as the outside view looking into the organization. With this double perspective, Suchman goes on to point out that legitimacy, as defined above, may take the forms of pragmatic, moral, or cognitive legitimacy (Suchman 1995: 577ff). Pragmatic legitimacy basically rests on self-interest: An organization may achieve pragmatic legitimacy with a social audience in so far as the members generally view the organization's actions as beneficial to their interests. By contrast, moral legitimacy is achieved when the organization's actions are seen to be right on a socially accepted scale of right and wrong in a more general context. Finally, cognitive legitimacy refers to the audience's perception of being able to comprehend or make sense of the organization's actions. In a prominent understanding of the cognitive type, legitimacy is achieved when an audience perceives of the organization's actions as coherent and meaningful in an otherwise chaotic, social reality (Suchman 1995: 577–587).

In the following account, an effort is made to show how pragmatic, moral and cognitive forms of legitimacy come into play in the context of a normative public relations model and how the distinction turns out to be productive in an empirical public relations case study.

The Field of Public Relations

At first glance, the name of the discipline *public relations* seems to aptly suggest what it is about, the practice of creating or maintaining "relations" in the "public." However, as we shall see, this first superficial approximation begs the question, since what is meant by "public" is just as ambiguous as what is meant by "relations." As we shall see, the meanings of the words turn out to be dependent on both historical and theoretical contexts.

Based on a discussion of past reviews of the field of public relations, Botan and Taylor (2004: 651ff) point out that public relations research has shifted from a functional perspective to a cocreational one in the last three or four decades. Whereas the functional paradigm would tend to focus on a process where public relations is seen as instrumental in the organization's attempt to accomplish specific goals, the cocreational paradigm emerges with a shift from *goal* to *relation*. In the cocreational perspective, focus is on how meaning is negotiated in relational networks, rather than on organizational self-preservation, thus pointing to the fusion of the objectives of ethics and efficiency which is embedded in James Grunig's symmetrical/excellence model (Grunig and IABC Research Foundation 1992). Among a multitude of interpretations of the development, Botan and Taylor's point of view has become a quite influential and consensual take on the development of the field. Otherwise, the history of public relations is contested. While Grunig and Hunt's seminal *Managing Public Relations* (Grunig and Hunt 1984) recounts the field's emergence as coinciding with the advent of American commercial press agencies in the 1800s and the resulting need for entrepreneurs and business people to break through gatekeepers and become publicly heard, Cutlip, Center, and Broom (Broom and Sha 2013) argue that essential aspects of the field can in fact be traced back to antiquity, and several scholars have indeed made the point that the field's challenges and perspectives are modern reflections of similar challenges and perspectives dealt with by the field of rhetoric since antiquity (see an account of these positions in Ihlen 2010).

Without taking sides in that dispute, it can be argued that Grunig and Hunt's four models sketching out an understanding of the recent history of the field are useful for understanding the field not just diachronically but in synchronicity as well, since communicative self-understandings in organizations relating to all four models can be seen to prevail as competing views and practices when relating to the public (Grunig 2001: 11; Leichty and Springston 1993).

Consequently, we shall regard Grunig and Hunt's proposition that the emergence of public relations can be seen through four consecutive models, not just as history but as competing paradigms of communication in the contemporary market place of communicating organizations:

The Press Agentry/Publicity Model

Managing public relations under the view of the press agentry model is basically equivalent to the staging of a propaganda effort. It is a one-way form of communication where any means that are instrumental in persuading the audience of the legitimacy of some action are to be applied. Parameters such as truth or moral acceptability are of little importance in this approach. Historically, Grunig and Hunt point to the mid-1800s as the time of emergence for the press agentry/publicity model, but it can still be seen as active today, though it may be more readily observed in contexts with no clear boundaries between public relations and commercial marketing practices.

The Public Information Model

In contrast to the press agentry model, the public information model is not indifferent to communicative virtues such as truth, sincerity, or moral accountability. In fact, since public relations under this view is equivalent to the dissemination of information to the public, such communicative virtues are standards by which the effort is eventually evaluated. Yet, like the press agentry model, the public information model assumes a one-way model of communication – it is linear, and there is no formalized feedback from an audience, whose ideas, notions, and interests are largely irrelevant to the effort. Grunig and Hunt place the public information model at the early 1900s, but it is arguably not hard to find contemporary examples of this, especially when public relations activities are undertaken by the non-professional, or not too reflective, practitioner of the field.

The Two-Way Asymmetrical Model

The two-way asymmetrical model represents an important development in that a feedback function is now understood to reciprocally mediate the communicative effort. In this model, the audience is seen as an active participant in the process, yet the model's "scientific persuasion" genre of communication implies that the sender is still seen as superior in terms of both knowledge and power. That means that the message to be conveyed reflects the persuasive goals of the sender only, though the message is now tailored to match the needs and preferences of the audience by way of a channel for feedback. Most importantly, the self-interest of the organization remains a nonnegotiable parameter. This model is historically dominant in the industrial and postindustrial eras of the late twentieth century and in practice reaching into the present.

The Two-Way Symmetrical Model

By the time of the publication of *Managing Public Relations* (Grunig and Hunt 1984), the two-way symmetrical model was largely seen as a hypothetical or even utopian vision, though several scholars have since been arguing for its realism (Grunig 2001; Pearson 1989a), and Botan and Taylor go further to state that by way of the cocreational turn, new approaches are even more relational and focused on the dialogical construction of meaning than was the original excellence model (Botan and Taylor 2004: 652ff). The two-way symmetrical model departs from the two-way asymmetrical model in its crucial departure from the idea of the superior power and knowledge of the sender. In this model, the sender is seen as an equal participant on par with the receiver. The communicative goal is to reach reciprocal understanding, and the organization may only legitimately act on the basis of such understanding. The radical consequence is that the organization is at risk of abandoning parameters vital to its self-preservation yet has a chance of gaining maximal legitimacy at the same time. We shall discuss further how that process works in the exploration of legitimacy in a theoretical context of communicative action below.

The above representation of the field in terms of the four models has been contested by scholars of public relations pointing out that the models represent one outline of a historical development but that the parameters of one-way/two-way relationships and asymmetrical/symmetrical balance of intended effects are not necessarily the only or even most obvious defining criteria (Hutton 1999) and that the discrete representation of models overshadows the continuous and multifaceted development of the field (Cancel et al. 1997, 1999). Elaborating these discussions further falls outside of the scope of the present account which will be limited to noting that Grunig and Hunt's models have evolved into a normative excellence understanding of public relations (Grunig and IABC Research Foundation 1992), the normativity of which has been opposed by a descriptive approached based on a contingency model of public relations (Cancel et al. 1997) proposing a set of contingency variables relating to the organization and its context which serves to decide at which point on a continuum between advocacy and accommodation the organization should aim its actions. Also, an emerging systems theoretic paradigm (Holmström 2010) takes on a less idealistic approach.

Another distinction which we shall have to largely ignore is the often proposed distinction between American and European public relations traditions (van Ruler B, Verčič D 2004; Verčič et al. 2001; Merkelsen and Højbjerg Christensen 2014: 17), the American version allegedly being largely meta-theoretically dependent on Dewey (1991) and the European tradition depending on neo-Kantian thinkers such as Jürgen Habermas (1984a, b; 1991). Instead a distinction between normative and descriptive approaches is found to be generally more adequate in the current study, since normativity of course is by no means a European trend in public relations (cf. Pearson 1989a, b; Grunig and IABC Research Foundation 1992), and both a Dewean account of a multitude of *publics* and a Habermasean focus on the *public sphere* are theoretically useful conceptions in a normative approach to legitimacy in public relations. As it will be argued in the following, business legitimacy can be fruitfully studied in the light of a normative model of communicative action regardless of these proposed geographically founded positions.

The preferred position here, a normative excellence approach, is well suited to deal with legitimacy since the mentioned aspects of legitimacy, i.e., pragmatic, moral, and cognitive, have a normative import; while pragmatic and moral legitimacy is clearly related to perceptions of teleological and deontological normativity, respectively, even the sensemaking requirement of cognitive legitimacy is arguable most likely mediated in a symmetrical setting of normatively based dialogue. In order to expand on this insight, we shall now look more critically at the communicative conditions for maintaining business legitimacy in a normative public relations setting.

Business Legitimacy as Rhetorical Public Relations in a Destabilized Public Sphere

In a comment to Grunig's model of excellence, Ron Pearson (1989a) indicates how Habermas' thoughts on communicative action and discourse ethics are directly applicable as a meta-theoretical framework for the symmetrical model of public relations excellence. Several scholars have since taken up the task especially with regard to Habermas' generic work on communication and ethics (Leeper 1996; Burkart 2004; Meisenbach 2006; Burkart 2007), whereas the earlier work on the transformation of the public sphere (Habermas and Burger 2008) has been somewhat kept in the background. However, with its historical approach to the ideals of the public sphere, and hence dependent on a range of cultural self-understandings prevailing in communicative practices, Habermas' early theory of the public sphere can be argued to play a central role in a normative approach to public relations. As Ihlen and van Ruler point out (Ihlen and van Ruler 2007), the *Öffentlichkeit*, a word that is not readily translated into English, refers more to a context for the organization's communication than to the communication itself. However, the pre-occupation with the transformed or destabilized public sphere of the twenty-first century, i.e., the space in society for public communication, however fragmented and multi-contextual it may be, is of central concern for understanding the conditions for private organizations' efforts to achieve corporate legitimacy.

In a normative approach to business legitimacy in public relations, Jürgen Habermas' account of the transformation of the public sphere (Habermas and Burger 2008) is thus an important background work. Written in the mid-twentieth century as a contribution to neo-Marxist critical theory, the author's approach to the field of public relations in Chap. 6 is one of dismissal – PR is seen as a form of activity which runs directly against the ideals of the bourgeois public sphere. However, as Leeper notes (Leeper 1996: 145), Habermas' very critical approach toward public relations was clearly directed toward a form of public relations modeled on Grunig and Hunt's press agentry model, that is, a model that is highly strategical and instrumental in its form. By contrast, the two-way symmetrical model conforms quite closely to Habermas' general idea of communicative action as it was later laid out in the comprehensive theory of communicate action:

> Habermas's approach is dialogical, two-way symmetrical, and cooriented. The terminology used by Habermas in explaining his approach is very similar to the terminology used by Grunig and Hunt. (Leeper 1996: 134)

Whereas Habermas' universal pragmatics (Habermas 1984b) and theoretical distinctions between strategic and communicative action (Habermas 1991) were published after the theory of the transformation of the public sphere (Habermas and Burger 2008) (the treatise was originally published in 1962), these former distinctions can be seen as laying the theoretical groundwork for the public sphere model. The presupposed, yet very real, dialectical rules for arriving at the common good by way of rational argument in the public sphere can be seen as general rules of communicative action reinvoked as a public sphere ideal: Communication is oriented toward consensus as transcendental ideal; the ideal is "counterfactual" as Habermas points out, which means that it is hardly attainable in practical reality, but it explains why the strategic action of everyday communication does not degrade completely into instrumental anarchy; strategic action has a "parasitic" relationship to communicative action, according to Habermas; organizations' everyday rhetorical practices, impeded as they may be by structures of power, money, and noise, rely on the ideal of communicative virtues of being truthful, morally right, sincere, and comprehensible. As a central example, it is logically impossible to be *untruthful* without tacitly referring to an expection of truth, and consequently, the successful strategic action of being untruthful paradoxically relies on the truth-condition for the speech act in question. This interplay between counterfactual norms and factual practices is what renders an excellence-oriented model such as Burkart's *consensus-oriented public relations* model (Burkart 2007: 251f) a realistic and viable approach.

The distinction between public and private is the catalyst of public relations complexity when seen in the light of Habermas' theory of the transformation of the public sphere. Based on antiquity's ideal of the *agora* as the forum where citizens would meet in rational discussion to arrive at solutions to common (i.e., public as opposed to private) problems, the development of the bourgeois public included a similar ideal of rationality and common good. This ideal separates the public sphere from the private sphere where citizens would not need to comply with rationality in the same way. In an idealized account of this binary structure, public relations needs to undertake a challenging complexity. Insofar that the organization in question is a private corporation, it is subject to the rationale of the private sphere, being the freedom of ownership, self-preservation, restricted only by the state's demand for complying with the law. In other words, in the private sphere, the organization needs merely to be *legal*. However, in terms of the organization's *public* relations, which have less to do with its economic interests than with the emerging need to also be *legitimate*, the organization needs to be able to act and communicate in accordance with the rationality governing the public sphere, where virtues such as the common good, ethics, social responsibility, ecology, etc. become the tenets of the discourse.

Central to Habermas' presentation of the distinction between private and public, however, is that a range of historical and social changes structurally transform the public sphere causing it to lose its ideal function, a process which is arguably going on today. Habermas saw the structural change as the consequence of immediate changes in society in the industrial era, the most prominent and consequential change being the emergence of a large working class claiming its right to participate in the political process, rendering obsolete the ideal of a homogenous bourgeois set of common interests and values at the core of democracy. In the postindustrial era, structural changes commence in a further fragmented and compartmentalized public sphere with new media rapidly changing communicative conditions. The twenty-first-century public sphere is a destabilized political communication system, posing a challenging context for public relations (Dahlgren 2005; Blumler and Gurevitch 2001; Karatzogianni 2016; Pfetsch 2018).

Dahlgren (2005) condenses and updates Blumler and Gurevitch's diagnosis (Blumler and Gurevitch 2001, see also Blumler 2018) of the main themes of the destabilized public sphere as follows:

- Increased sociocultural heterogeneity and the impact that this has on the audiences/actors within political communication

- The massive growth in media outlets and channels, along with changes in the formats of media output, the blurring and hybridization of genres, and the erosion of the distinction between journalism and nonjournalism
- Today's increased number of political advocates and "political mediators," including the massive growth in the professionalization of political communication, with experts, consultants, spin doctors, and so forth sometimes playing a more decisive role than journalists
- The changing geography of political communication as the significance of traditional national borders becomes weakened
- The cacophony that emerges with this media abundance and so many political actors and mediators
- The growing cynicism and disengagement among citizens. (Dahlgren 2005: 150)

Adding to the complexity is the latent, simultaneous existence of both idealistic and realistic self-understandings for various stakeholders in the public processes; the press institution may at once harbor a classic self-understanding as an independent watchdog for democracy and as an agent in an essentially undemocratic orbit of strategic and economic power; the organization may at once see itself as a classically private organization whose only goal is economic self-preservation and mere legality, while paradoxically acknowledging the external demand for being socially and ethically responsible in a public sphere with complex conditions. The consumer markets may be heterogenous on a scale from passive objects of marketing strategies to politically conscious and activistic (Nielsen 2013). Together with Dahlgren's list above designating the themes of the destabilized public sphere, such complex self-understandings can be seen as the current instantiation of Suchman's "socially constructed system of norms, values, beliefs, and definitions" forming the context for maintaining legitimacy (Suchman 1995).

In the light of the complexity of the destabilized public sphere, it appears that the conditions for the organization's maintenance of legitimacy are ever changing, and a methodological approach to analyzing communicative activity needs to be sensitive to how symbolic representations of publicity are mediated in stakeholders' persuasive strategies to influence any given perception of legitimacy. Several scholars have emphasized rhetorical methodology as being essential for that purpose (see Kjaerbeck and Nielsen (Forthcoming) where early texts such as Toth and Heath 1992 and Elwood 1995 are discussed as well as later contributions to the rhetorical tradition in public relations such as Heath 2001, 2010), since the recipient of the communicative act must be persuaded, not by deceptive instrumentalization such as propaganda (since propagandistic communication makes the organization's legitimacy potentially vulnerable to public critique) but by exploring the potentially persuasive aspects of a case, thus invoking Aristotle's classic definition of rhetoric (see also Ihlen 2010 which explores the Aristotelian definition as a model for rhetorical public relations).

The rhetorical approach is coherent with a normative approach to public relations, insofar as it is seen as a strategic action practice suspended in a balance between the normatively inacceptable propagandistic practice (cf. Grunig and Hunt's press agentry model) and the idealized, yet counterfactual, communicative action (cf. Grunig and Hunt's two-way symmetrical model). Strategic action is not unethical per se but should be seen as the realistic, communicative practices in the "market place," drawing on, and referring to, communicative ideals as the bearings and measurements of legitimacy.

In order to make this point, we shall now proceed to look at a case study demonstrating how a normative approach can yield fruitful results, establishing the symmetry model as a more or less counterfactual theory behind the analysis of business organizations' conditions for achieving legitimacy in complex environments.

A Case Study: Coolest Monkey in the Jungle

In early January 2018, a Swedish retail clothes corporation ran an ad in several international media featuring a young black boy wearing a hoodie with the text "Coolest Monkey in the Jungle" running across the front. Critical voices soon spread on social media and eventually reached mainstream media, creating an actual legitimacy crisis for the corporation. An accusation of racism was leveled against the organization from many sides; the word "monkey" in connection with the depiction of a black child conjures up visions of past racially charged advertising and turned out to be an explosive mix. In the ensuing furor, human rights activist groups went viral with condemnation, celebrities and artists announced that they would terminate their cooperation with the organization, while the controversy was widely reported on and commented by political commentators and newspaper columnists further accelerating media diffusion. Anger went global in only a few days, and in South Africa one of the organization's retail stores was even violently raided and thrashed by activists (for further information, see under Internet Resources below).

Whereas the ad itself is part of a marketing strategy (in this case albeit a failed one), the organization's response to the widespread controversy and backlash is an instance of public relations since it addresses not the customer as such with arguments pertaining to the product itself but the public, addressing issues relating to the standard of social responsibility and moral legitimacy. The response, phrased as apologies, was widely publicized on the organization's website, on social media, and in news outlets, including the following text:

1. *We understand that many people are upset about the image. We, who work at [the organization], can only agree. We are deeply sorry that the picture was taken, and we also regret the actual print. Therefore, we have not only removed the image from our channels, but also the garment from our product offering globally. It is obvious that our routines have not been followed properly. This is without any doubt. We will thoroughly investigate why this happened to prevent this type of mistake from happening again.*

In addition, in the attempt to invoke an impression of an organization ready to engage in a dialogue with the critical voices, the organization published a brief note on its social media account stating:

2. *We are listening.*

Texts 1 and 2 are good representations of how a public relations strategy designed to repair a damaged legitimacy profile is typically expressed in the early twenty-first century. To return to our definition of legitimacy, it seems obvious that the incident has seriously compromised the publicly available, *generalized perception* of the organization's propriety within the given *socially constructed system of norms*, *values*, *beliefs*, *and definitions* (cf. Suchman 1995). The texts are designed to speak into the "cacophony" of the destabilized public sphere, with value systems and norms subject to the globalized, sociocultural heterogeneity and the complexity of the media landscape mentioned by Dahlgren (2005). Rhetorically, the two texts clearly serve different purposes within the general purpose of repairing legitimacy. Text 1 is primarily an apology in terms of its overall speech act type – which means that its main condition for being communicatively successful is that it needs to instill in the receiver a trust in its *sincerity*. It attempts to do so by:

1. Accepting responsibility ("we are deeply sorry")
2. Projecting an image of taking appropriate immediate action ("we have removed the image," etc.)
3. Maintaining that the ethical flaw is superficial ("It is obvious that our routines have not been followed properly")
4. Projecting an image of looking ahead and taking appropriate measures ("we will thoroughly investigate," etc.)

The four acts involve being apologetic (1), reactive (2), reflective (3), and proactive (4), which seems to be intended to repair the organization's damaged image; the apologetic aspect plays the main role, yet it could be argued that the apology is only viable insofar as it is counterbalanced by the assertion in (3) that the "mistake" has only happened on a superficial level by someone's *not* following the organization's *routines*, which means, by implication, that the organization itself is still ethically sound at a fundamental level. This balance between the concession of guilt and the maintenance of a general organizational ethos is an archetype of the public relations schism; being a private organization, and thus being primarily responsible to private agents such as shareholders, the organization at the same time has to demonstrate ethical virtues such as the fundamental social responsibility that would, e.g., be apparent in an unequivocal stance against any form of racism in advertising. On the organization's private face, it needs to project corporate soundness, while its public face needs to radiate social virtue. As instances of strategic action, the goals of the speech acts are to persuade the receiver that the organization is morally sound by invoking communicative speech act criteria such as:

- Sincerity (acts 1 and 4): as mentioned above, any apology's success depends on the ability to convey an image of the sender being sincere. The proactive promise of taking future action is arguable also central to reviving legitimacy in this case; it hinges on the audience accepting that the promise is meant in earnest.
- Truthfulness (acts 2 and 3): these acts are primarily statements of fact, and they will be effective only on the assumption that the audience believe them. The rhetorical task is to frame them in a way so as to achieve this goal – should, for example, evidence show up that the ad had in fact not been removed from the public space, consequences could be devastating.

This highly complex position can possibly be seen as paramount to the articulation of the disarming quality of text 2. In contrast to text 1, text 2 does not reflect the complexity of the ethical situation at hand but merely positions the organization in a receiver position: we are listening. The text conveys the image of the organization engaging in a symmetrical network with its stakeholders, opening the organization's perception to potential politically, ethically, socially, or culturally based criticisms, demands, or needs, presumably doing so in order to be able to act according to whichever systems of norms or values that might emerge as pertinent to the organization's current circumstances and options for action. Clearly, evoking a symmetry model so directly to the public is a rhetorical act; it emphatically does not mean that the organization is suspending its self-interest. What it does seem to mean is that the organization finds that this quite symmetrical codification of the organization is the right move at the present moment in order to repair legitimacy.

In terms of Suchman's categories of pragmatic, moral, and cognitive legitimacy, it appears that this particular instance is mainly focused on the *moral* variant of legitimacy. The apologetic approach encodes a focus on a socially accepted scale between right and wrong, where the aim of the textual representation is to (1) admit that the specific action of publishing the ad is at the "wrong" pole of the scale while trying to persuade the audience to accept that (2) the organization as a whole remains at the "right" end of the scale. The admission of (1) together with the assumption that publishing the ad was really in opposition to the normative register of the organization serves as premises in argumentative support of (2). However, Suchman's category of *cognitive* legitimacy also plays a role, especially in the "we are listening" approach, which encodes a focus on having the audience comprehend the organization's position as meaningful in a reality so complex that the only meaningful stance is that of the attentive listener in a symmetric relationship.

Conclusion

This chapter has proposed that a normative approach to public relations yields useful insights into the organization's conditions for maintaining business legitimacy in a complex, destabilized public sphere. Central propositions are:

- Suchman's (1995) definition of legitimacy plays well into a normative model of public relations with its heavy dependence on a socially constructed context and its distinction between pragmatic, moral, and cognitive legitimacy.
- The two-way symmetrical model is qualified by being explained in terms of Habermas' theory of communicative action when a realistic approach to strategic, rhetorical action is balanced with the theory's counterfactual presuppositions.
- Understanding the conditions for maintaining business legitimacy in a public relations context requires a nuanced view of the complexity of the twenty-first-century public sphere transformation and destabilization.
- The chapter exemplifies these findings in a contemporary case study of an organization's communicative attempts at reviving a damaged public perception of legitimacy.

Abstract

The aim of this chapter is to provide a theory of activist whistleblowing for justice and dignity as the framework for detecting injustice and human rights abuses in business and organizations. This is important for trust and business legitimacy. We suggest that whistleblowing is an important field of human rights in business and essential for creating public awareness of human rights abuses and democratic engagement in promoting human rights in business. In order to develop such a theory, we use the activist work and controversial life of the German journalist and writer Günter Wallraff based on a confrontation with the dominant concepts of whistleblowing in relation to business and human rights.

Keywords

Business and human rights · Whistleblowing · Journalism · Business ethics · Günter Wallraff · Undercover investigation · Freedom of expression · Employee rights · Human rights abuses · Organizational wrongdoing

Introduction

An important topic of business ethics is the concern for human rights and democracy in organizations. Businesses have responsibility for the welfare and well-being of their employees. At the heart of corporate social responsibility and values-driven management, we find issues of internal responsibility in business organizations such as employee motivation and routines to avoid corruption (Midttun 2013). At the one hand, businesses should ensure employee loyalty towards the management and trust in the workplace. On the other hand, there is also an obligation to ensure basic human rights, specifically such as employees' freedom of expression and whistleblowing, but also rights that protect the welfare of employees. However, such human rights are a real constraint for many companies and businesses, first because such rights often contradict their historically strong commercial rationale. Human rights challenge them to use financial resources to protect and strengthen the well-being and welfare of their employees. This is often considered as problematic expenses in a post-socialist and post-social-democratic era where pure commercial interests, values, and theories are influencing their strategies more profoundly and aggressively than before. The persons as Günter Wallraff, who promote human rights in general, and the rights supporting whistleblowing more specifically, will consequently risk to be confronted with skepticism and aggression from large parts of the business community.

Legitimacy and Human Rights in Business Organizations

This obligation of business to promote human rights in general and the rights supporting whistleblowing more specifically, even if it is expensive for business, is indeed influenced by one of its most important contexts, particular laws of many democracies throughout the world. This is an obligation internal and external to business. If we investigate the legal issue of whistleblowing, linked to constitutional rights, laws, and conventions in countries such as the UK, France, Germany, and the USA, we can see that the issue is very complex (Fasterling and Lewis 2014). Different factors of laws are interwoven into a large and bewildering structure, factors that to a different degree contribute to "an effectively promoting of public-interest whistleblowing."
