Do we speak about a simple leak of information or can we define the revealing of secret organizational issues as an act of whistleblowing? What is the role of whistleblowing in relation to business legitimacy? Are we talking about how the constitution protects whistleblowers through a general right of freedom of speech or about how more limited parts of the legal system protect them? In Germany and the UK, mere leaking information is not protected by constitutional rights, while in contrast whistleblowing is subject to the right of freedom of expression. However, in the USA, whistleblowing in the private sector is not very strongly protected by the constitution (Hoffman and McNulty 2011), but participants in organizations are supported by incentives to report certain violations (Hoffman and McNulty 2011), "yet only within the limited scope of existing statutory provisions." In contrast to this, we may emphasize that the principle of freedom of speech in the German constitution is applicable in both private and public sector and therefore includes protection of whistleblowers in both parts of society. In France and Germany, the "scarcity" of whistleblower laws are compensated "by a general high level of employment protection" (Fasterling and Lewis 2014).

Even if laws in those western democracies differ when it comes to how strong they protect whistleblowing, most constitutions in Europe and the USA can be said to protect the rights of whistleblower since they protect the freedom of expression. However, some of those laws could be improved, as Fasterling and Lewis correctly argue, because they only say general things about freedom of expression, and do not address particular issues of people's right to freedom of expression as employees in private or public organizations. In particular, there is legally not a sufficient clear understanding of under which condition we only deal with illegal leak of sensitive information that justifies certain precautions from management or reprisals towards a whistleblowing that is legally and ethically justified.

Consequently, employees in such democracies often have, not only their right, but also the possibility and duty to inform management or the public about negative issues in the company that are threatening the welfare and well-being of the organization by violating basic human rights at the workplace. This obligation is often registered in national labor laws and in European standards or directives. However, despite the different types of international and national legal protection (Hoffman and McNulty 2011), employee's freedom of expression is often censored by strong internal commercial and ideological forces to the degree that it is more or less impossible to inform or blow the whistle from the inside of the organization, as is focused in recent research (Trygstad and Ødegård 2016). As a necessary consequence, there is a risk that not only national laws of different democracies but also fundamental human rights violations at the workplace will expand because they stay unknown both to the internal and external audience. The picture of the types of violations that are left to silence might be complex.

The basic rights of the Universal Declaration of Human Rights adopted by the United Nations General Assembly in 1948, partly in response to the barbarism of the Second World War, that might be violated extensively are the following: offending the security of the person (Article 3), being held in servitude (Article 4), inhuman or degrading treatment (Article 5), attacks upon honor and reputation (Article 12), radical limitation of freedom of conscience (Article 18) and freedom of expression (Article 19), and offending the right to just and favorable conditions of work (Article 23). Therefore the point in question is: What is the relationship between the universal level of human right and the national level of labor laws? But this is an extremely complicated question to answer. We can consider in line with recent debate (Trygstad and Ødegård 2016) employees' freedom of speech as a fundamental right, because the success of this right is often necessary to reveal, document, and inform about the violation at the workplace of the other basic rights mentioned.

In this article however, we concentrate on whistleblowing in business ethics, in relation to the Universal Declaration of Human Rights as we consider whistleblowing a fundamental human right, following from the rights of freedom of expression in the Universal Declaration of Human Rights – meaning a right for all human beings of all nations, according to this universal vision about freedom of speech. In this context, it is important to focus on the ethical dimensions of human rights, as founded on the basic ethical principles of autonomy, dignity, integrity, and vulnerability (Rendtorff 1998, 2002; Rendtorff and Kemp 2009). The ethical principles are the basic for human freedom and moral autonomy, which justify the fundamental human rights in the framework of cosmopolitan business ethics (Rendtorff 2017). We consider whistleblowing as a concrete expression of this fundamental right.

Our research topic is this: We will explore how the German journalist and writer Günter Wallraff's work proposes a visionary contribution to whistleblowing in organizations in a post-Second World War context contributing to the development of a controversial methodology for uncovering and documenting the truth about basic human rights violations at the workplace. The method presupposes a distinction between legitimate allegations telling the truth about certain dimensions of a reality and illegitimate allegations that do not tell the truth. In contrast to most whistleblowers who are employees and face terrible unethical and unjust situations in their organizations, Wallraff's radical method of whistleblowing presents an attempt to an active effort of whistleblowing coming from the outside of the organization penetrating internally with a hidden identity in order to reveal a complex set of truths about violations of human rights at the workplace (Alm and Rendtorff 2016). In this perspective, Wallraff's approach to whistleblowing aims at uncovering of organizational evil and degrading treatment of human beings in business (Rendtorff 2014). Accordingly, this method can also be used by NGOs and human rights activists to uncover human rights violations in organizations.

Workplace Activism and the Search for Business Legitimacy

In the following, we present examples of Wallraff's radical method of uncovering and documenting a complexity of human rights violations at the workplace in order to understand challenges to business legitimacy. Our methods of analysis are based on theoretical and practical approaches to business ethics (Rendtorff and Mattsson 2006; Rendtorff 2009a, b). We also use insights from philosophy of management as focus of interpretation (Rendtorff 2010, 2013a, b, c, d). And our analysis can be considered as a critical theory and case study of Wallraff's activist method (Rendtorff 2015, 2016). We consider the activist method as inspired by undercover journalism, role-playing, and postwar experiences from his own life and as a challenge to the traditional academic concepts of whistleblowing. The concept of whistleblowing in the academic literature is according to Vandekerckhove characterized by a deactivation (2006, p. 11). Vandekerckhove concludes his book by saying that "From an exponent of the protest against labour discipline it seems to have turned into a disciplinary apparatus itself" (p. 5). The current trend in whistleblowing policies in nations as the USA, Australia, New Zealand, the UK, South Africa, Japan, and Belgium entails the risk of organizational domination over the individual and hence an institutionalizing of the individual (p. 5). "In that sense, the advocacy of whistleblowing has experienced a backlash" (p. 5).

With the presentation of Wallraff's method, and its origins in the ideological climate of the 1970s, so to speak before post-socialist and post-social-democratic era, we want to argue for a more activist and open-ended understanding of whistleblowing as having the potential to uncovering and documenting a complexity of human rights violations at the workplace in particular with regard to misery and exploitation of the work environment in different workplaces. Seen in the historical context of the 1970s, our interpretation of Wallraff's activist method could be interpreted as a reconstruction of the origins of the concept of whistleblowing, in line with Vandekerckhove's historical perspective on the 1970s: "whistleblowing in an organizational context originated as an activist and hence politico-ethical concept" (p. 11).

Whistleblowers can be more activist and authentic coming from the outside than those employees we normally encounter inside organizations that often are caught in the conformity of spirals of silence (Noelle-Neumann 1974). This common silence can be understood as a historical heritage of the main force that for decades has been in conflict with the need to blow the whistle, the claim to absolute loyalty towards the organization (Vandekerckhove 2006, pp. 1, 7–8, 11).

Wallraff's approach can thus be seen as a contribution to the institutionalization of undercover journalism as an activist method of whistleblowing in a society with severe social problems, power, and domination (Kroeger 2012). Kroeger is converging to such an understanding of whistleblowing in her analysis of the American tradition of undercover reporting when she writes: "… under-cover reporting has a built-in ability to expose wrongs and wrongdoers …It can illuminate the unknown, it can capture and sustain attention, it can shock or amaze" (Kroeger 2012, p. 15).

Wallraff's method represents a concept that combines whistleblowing with strong criticism of power on behalf of the powerlessness, in order to change their situation. Detection of the complexity of human rights violations at the workplace that offend *powerless* persons is in the center of his concept of whistleblowing. Wallraff emphasizes consequently that whistleblowing through undercover journalism contributes to give public voice to the voiceless. Accordingly, whistleblowing can be considered as a reformulation of the moral challenges to journalism and whistleblowing as potential ways of giving speech to the voiceless. However, this kind of whistleblowing is also an offer to NGOs and human rights activists to actively engage in undercover activities to reveal human rights violations in organizations. Wallraff considers undercover journalists as gatekeepers of democracy and spokespeople for a large number of powerless that have experienced a violation of their basic human rights at the workplace. The combination between whistleblowing and undercover journalism reformulates employee's freedom of expression as publically uncovering and documenting a complexity of violations of human rights at the workplace (Seyerstedt 1999).

As we will show later, Wallraff's radical method of whistleblowing had a tremendous influence in the public life of Germany in the 1980s. The general public interest for his project might have contributed to significant changes in the German laws on freedom of speech. This is not least the fact when it comes to Lex Wallraff, as we will comment on. According to recent interpretation of German labor law, there is in general a large space for freedom of expression in corporations. Rieble and Wiebauer (2010) link this fact to a discussion of a complex presentation of the German legal situation in relation to whistleblowing, exchange of opinions, discussions, and leak of information in companies. Today, the companies cannot expect that employees and citizens at any case should expect order and peace in the company. Both employer and employees have in German labor law freedom of expression. Nevertheless, we also see limitations of the freedom of expression in German labor law, for example, when the minority of the board is restricted in its freedom of expression with regard to critical judgments of the corporation (Rieble and Wiebauer 2010). However, criticism is also allowed within the board, for example, between representatives of the employee's unions and the employers, but it is an open question when such an exchange of opinions becomes unacceptable.

It is difficult to assign a limit of what is legally permitted according to the law, for example, when critical employees compare companies to concentration camps (Rieble and Wiebauer 2010). Accordingly, there is a large space of freedom for critical opinions, even though this space cannot be considered as absolute.

W. Vandekerckhove argues in his book *Whistleblowing and Organizational Social Responsibility*, that whistleblowing should be legitimized as a fundamental human right (Vandekerckhove 2006). He underscores first of all Article 19 of the

United Nations Universal Declaration of Human Rights on freedom of opinion and expression. Vandekerckhove argues that the declaration was originally a response to the atrocities of the Second World War and was addressed to national governments that by writing the declaration into their constitution accepted it as their duty to respect, protect, and even realize human rights as inalienable rights individuals can "claim on their governments." The historic development of globalization has implied a new understanding of human rights as a similar duty for international corporations, having governments as their historical predecessors. The old social contract between the state having responsibility for the law of the nation and the private sector working for profit maximization, together creating economic wealth for the citizens, is outdated. Incidences of scandals involving private sector employees and senior management acting strictly for profit maximization "within a judicial vacuum or abroad in a state of ethical confusion," the mobility of multinational companies using their unrestricted freedom to choose the legal system they prefer, and their enormous power, imply that private sector has been challenged to take seriously the duty to respect and promote human rights. This duty has symptomatically become an important issue high up on the agenda of many multinationals the last couple of decades. Vandekerckhove argues that the whistleblowing policy of international corporations has to be understood as part of this historic picture of a new social contract where private sector is sharing the responsibility with national governments to respect, promote, and realize human rights.

Wallraff challenges this picture of the macro- and meso-level of society having an exclusive responsibility of promoting whistleblowing as a fundamental human right, by introducing the importance of the activist approach at the micro-level. Wallraff's activist project implies that he considers it *also* as the duty of an individual – namely, himself and others – to respect, promote, and realize freedom of expression, by uncovering and documenting a complex set of human rights violations in public as well as private organizations, when collective entities fail to do so. Even if he is weak compared to governments and organizations, he places this duty upon his shoulders in order to promote a fundamental human right. By this activist approach, he challenges not only the public and private sector of his time for lack of whistleblowing as a human right project. He also challenges influential parts of the discourse of the whistleblowing of research today for their lack of understanding whistleblowing as an individual duty to respect, promote, and realize human rights.

Whistleblowing as a Contemporary Field of Business Ethics and Human Rights

Accordingly, whistleblowing as individuals strategically using freedom of speech to uncover and document human rights violations in public and private organizations is still a hot topic. Moreover, many NGOs and human rights activist can highly benefit of whistleblowing as a method of revealing fundamental human rights violations – based on individuals using the national implementation of the human rights declaration as their legitimizing basis. In contemporary society, the phenomenon is perhaps higher at the international agenda compared to Wallraff's project in the 1970s and 1980s. Contemporary international icons working post Wallraff are quite a few. We can just mention WikiLeaks and the leak of confidential information from governments, undertaken by Julien Assange and his WikiLeaks team. Alternatively, the infamous scandal of Edward Snowden who made classified information about the US government surveillance of private citizens public and had to flee his country and went to Russia. Alternatively, we can mention Bradley (Now Chelsea) Manning who also made public classified government information and was put to prison in the USA with a severe sentence by the courts. These activists have been important for turning the human rights movements towards whistleblowing as essential to detecting human rights violations at the workplace, based on the universal right of freedom of speech.

In private business, whistleblowing is also important for justice and the compliance for human rights in organizations. Often such cases refer to situations where individuals feel moral responsibility to "blow the whistle" in the public about cases of wrongdoing and fraud in their organizations (Rendtorff 2009b). Whistleblowers often need close links to NGOs and human rights activists to succeed. Indeed, from that perspective, whistleblowing emerges as a individually created weapon against corruption, mismanagement, and general non-compliance with legal obligations by a broader public (Thüsing and Forst 2016). In the USA, famous cases where whistleblowing was important include the Enron and WorldCom scandals with the breakdown of Arthur Andersen accounting firm, which lead to the Sarbanes-Oxley legislation. Brinkmann (2008) underscores that the disclosure of Enron based on the whistleblowing of Sherron Watkins was a shock for the US public life. Enron was among the best in class when it comes to the integrating of business ethics procedures.

As *Time*'s person of the year together with the whistleblowers Coleen Rowley of the FBI and Cynthia Cooper of WorldCom, Watkins revealed that Enron as the advisor of the US Government, backed by the world's biggest banks, rated by top analysts, and a paragon of CSR and ethics with all the business ethics tools in place, was a company completely different from the perfect icon citizens of the USA had entrusted. We suggest that NGOs and human rights activist turn towards whistleblowing as a method for making human rights violations public in order to provoke debates about human rights and fostering social change.

Whistleblowing in the Theory and Practice of Law and Ethics

The problem of whistleblowing occurs partly from the conflict between employees' loyalty to the company and their obligations to society or others outside the company (Rendtorff and Pedersen 2004; Rendtorff 2009b). It is in the interest of society to protect employees who by virtue of their affiliation with the company have obtained information on the company's violation of basic human rights. The employee believes the public has a right to know about these violations because of their unethical or abusive nature and because the company is part of society. The employee has an obligation to come out with the information since the public has a legitimate interest in the information.

Therefore, whistleblowers are often in a difficult situation. They can be bound by all forms of contractual ties to the company, which means that they can be prosecuted if they break their confidentiality. It is true that the employee's contract with the company includes a certain loyalty and commitment, but not as something unlimited, and the company has no right to put strong political and social constraints on their staff, not least because freedom of speech is guaranteed as a universal human right for citizens in many modern democracies, but to a different degree, as we have underscored with Fasterling and Lewis (2014). Their study focus on the challenge that different legal systems of nations and the international society protect whistleblowers as insiders in an organization to a different degree and should therefore be improved, specifically when it comes to the problem of retaliation. In business ethics, as a parallel, the discussion of whistleblowing is mostly about how to protect the employee and how to do justice to employees in the process of whistleblowing. We find a normative literature about the necessary protection of whistleblowers, and we encounter proposals for ensuring good regulation of the right to be a whistleblower in different countries (Thüsing and Forst 2016). However, this literature is mostly based on the assumption that whistleblowing is taken care of by people inside organizations who observe human rights violations and cannot do anything else than blow the whistle or keep silent, due to the fear of different forms of retaliation.

Theoretical Basis for Activist Whistleblowing: Beyond Restrictive Criteria

The debate about whistleblowing among business ethicists has focused on defining criteria for ethically acceptable whistleblowing. Different business ethicists have tried to define when it is acceptable or a duty to blow the whistle (Hoffman and McNulty 2011, p. 45). This is because whistleblowers often have been criticized as being disloyal serving their own interests in contrast to the interests of their organization. Therefore, it is necessary to define the justification of whistleblowing with the framework of how business ethics – directly or indirectly – relates the question of whistleblowing to the problem of violating of basic human rights.

As Hoffman and McNulty remind us, whistleblowing originally refers to blowing the whistle on the sports playground in order to stop or judge something or when a police officer detects criminal behavior (Hoffman and McNulty 2011, p. 46). The metaphor signifies either a judgment or a legal action. Here, Hoffman and McNulty refer to the definition of whistleblowing by Marcia Miceli and Janet Near "the disclosure by organization members (former or current) of illegal, immoral, or illegitimate practices under the control of their employees, to persons or organizations that may be able to effect action" (Hoffman and McNulty 2011, p. 46). This definition combines elements of the legal and ethical aspects of whistleblowing. However, it does not say much under which conditions whistleblowing is permitted or whether we should have an activist or passive, internal or external, or descriptive or prescriptive definition of whistleblowing as uncovering and documenting violations of basic human rights. Moreover, it does not underline whistleblowing as a fundamental type of human right – freedom of speech – and as such its legitimacy as a powerful means to uncover and document violations of human rights.

The US-business ethics Richard De George proposed rather restrictive criteria for whistleblowing. These criteria have, to no surprise, been subject to debate. They help to shape the development of criteria for whistleblowing in the business ethics literature. The starting point is that the whistleblower is somebody who has no power and therefore needs to go to the public to reveal problems in the organization. George has proposed some fundamental justification for whistleblowing with his criteria that say when whistleblowing is prohibited, permitted, or required (De George 1986; Hoffman and McNulty 2011, p. 47). These criteria that argue for a theory of morally permissible whistleblowing are the following:

1. The firm, through its products or policy, will do serious and considerable harm to the public, whether in person or of the user of its product, an innocent bystander, or the general public.
2. Once an employee identifies a serious threat to the user of a product or to the general public, he or she should report it to his immediate supervisor and make his or her moral concern known. Unless he or she does so, the act of whistleblowing is not clearly justifiable.
3. If one's immediate supervisor does not effective about the concern or complaint, the employee should exhaust the internal procedures and possibilities within the firm. This usually will involve taking the matter up the managerial ladder and, if necessary – and possible – to the board of directors.
4. The whistleblower must have or have accessible documented evidence that would convince a reasonable, impartial observer that one's view of the situation is correct and that the company's product or practice poses a serious and likely danger to the public or to the user of the products.
5. The employee must have good reasons to believe that by going public, the necessary changes will be brought about. The chance of being successful must be worth the risk one takes and the danger to which one is exposed (De George 1986; Hoffman and McNulty 2011, p. 47).

As a critique of these principles, Hoffman and McNulty argue that this definition of whistleblowing is too restrictive since many of the recent cases, where whistleblowing was appropriate cannot be captured by De George's definition. We can mention Enron (violating Article 3 and 5) and WorldCom (violating Article 19), Bernie Madoff (violating Article 3 and 5), and other cases where it was difficult to get good evidence and good reasons from the organization and where the violations of human rights could not immediately be identified. Moreover, it is not clear when it is morally required to blow the whistle following De George's theory. In addition, it seems like it is difficult for De George to justify that the employee should blow the whistle when it represents a strong personal danger and has serious personal costs for the employee.

Therefore, Hoffman and McNulty propose an alternative theory of whistleblowing arguing for a more activist concept of whistleblowing, important for the consideration of whistleblowing as an activist methodology of uncovering and documenting violations of basic human rights. They argue for a prescriptive theory of whistleblowing defining ethical criteria for whistleblowing within business ethics. These conditions for whistleblowing rely on a theory of respect for the uniqueness of human dignity as the foundation of the right to whistleblowing in an organization. Hoffman and McNulty call it the universal dignity theory of whistleblowing, based on the philosophy of human dignity saying that all human beings have intrinsic worth or value, apparently in line with the articulation of such a universal dignity in the human rights. This theory is based on the following criteria:

1. Compelling evidence of nontrivial illegal or unethical actions done by an organization or its employees that are deemed to violate the dignity of one or more of its stakeholders.
2. A lack of knowledge within the organization of the wrongdoing or failure by the organization that take corrective measures.
3. One is conditionally exempted from the duty to blow the whistle if one has credible grounds for believing that by doing so one would be putting oneself or others at risk of serious retaliation (Hoffman and McNulty 2011, p. 51).

This activist concept of whistleblowing is more open since it takes into account the dignity of all stakeholders and is also somewhat more precise than the theory proposed by De George. The activist method is a very good possibility for NGOs and human rights activists to use to get deeply into the human rights violations of organizations. It addresses the concern for the individual human dignity of the whistleblower in cases of risk of serious retaliation. In an article with Mark S. Schwartz, Hoffman continues this effort to develop a more activist concept of whistleblowing (Hoffman and Schwartz 2015). The aim of the commentary is to argue that the concept of harm as suggested by De George in his theory of whistleblowing is limited. The concept of harm that motivates whistleblowing should be defined much more broadly within the perspective of violating what basic human rights are intended to protect: the intrinsic value of the human being.

Therefore, Hoffman and Schwartz continue the definition of the concept whistleblowing as based on the principle of respect for human dignity. The revised principles as defined by Hoffman and Schwartz revised criterion:

1. Misconduct has taken place or is expected to take place that violates the law or involve serious physical harm, serious psychological harm, serious financial harm, serious infringement of basic moral rights, or a serious injustice (HS1).
2. Reasonable evidence or belief of misconduct based on firsthand knowledge will be provided (HS2).
3. Misconduct must first be reported internally whenever feasible to one's direct supervisor and, if no action is taken, all the way up to the board of directors or

through the designed reporting channel if one exists (e.g., compliance or ethics officer) (HS3).
4. Unless one is a professional, an effective written anti-retaliation policy must exist at the firm (HS4).
5. Unless one is a professional, effective legal protection for employees must exist (HS5) (Hoffman and Schwartz 2015).

In our approach to whistleblowing, we follow this theoretical concept of whistleblowing as a key to understand Günter Wallraff's activist method of whistleblowing as a methodology for uncovering violations of basic human rights at the workplace as linked to uncover and document the underlying offending of human dignity. With Hoffman and Schwartz, we move beyond the restrictive criteria of De George, and we consider the concept of protecting human dignity as the foundation of why radical activist whistleblowing is so consequently at the agenda of Wallraff through decades. At the same time, we move beyond Hoffman and Schwartz in relation to several important dimensions of the concept of whistleblowing in business ethics.

With Wallraff's approach, we allow the external investigative journalist to penetrate the organization from the outside and become at the same time an external and internal whistleblower in the service not only for uncovering and documenting the truth about single violations of human rights at the workplace but first *the continuously offending of human dignity in each situation*. To which degree do we find this fundamental foundation of Wallraff as legitimate? Obviously it links to the pivotal concern for dignity as proposed by Hoffman and McNulty and formulated in the human rights of 1948. The foundation of radical activist whistleblowing is the concern for the human dignity (Criterion 1). Indeed, this approach aims at detecting lack of knowledge and action in relation to the wrongdoing in the organization (Criterion 2). However, radical activist whistleblowing may be critical to the idea of exemption of duty when there is risk of serious retaliation (Criterion 3). The moral duty of whistleblowing is central to the radical activist concept of whistleblowing, as proposed by Wallraff.

With regard to the problem of harm, the radical activist whistleblowing approach follows the criticism of Hoffman and Schwartz (HS1), and it agrees that the misconduct and violations of basic rights must be detected by firsthand reports (HS2). As such the method strengthens the possibilities for practicing whistleblowing as a way of telling the truth. To be in direct contact with the situation that represents the problem does increase the possibility to collect true information, compared to collecting information from a secondary source. However, the radical activist concept of whistleblowing moves very soon from internal reporting to external reporting (HS3), and the activist approach considers external reporting and anti-retaliation policies as essential to the duty of whistleblowing (HS4 and HS5). Also the external reporting to the public sphere strengthens the possibilities for practicing WB as a way of telling the truth, because the different points of views embedded into the rationality of the citizen's increases the possibility to correct misconceptions and arrive closer to the truth. However, the radical activist concept goes beyond Hoffmann, Schwartz, and De George by considering fictitious identities in social roles as necessary presuppositions for collecting information for external reporting. In fact, this too increases the possibility to find the truth, because people are trusting the role you fictitiously play and consequently give you information they otherwise wouldn't have given.

Therefore, the activist radical whistleblowing approach as suggested by Wallraff goes beyond the dominating concepts of whistleblowing, even though it also adopts elements of the theories of whistleblowing as proposed by De George and Hoffman and others. Now, we will go to the presentation of Wallraff's radical method as a new concept of whistleblowing that moves beyond the dominant concepts of whistleblowing in business ethics by consequently using a fictitious identity to uncovering and documenting human rights violations at the workplace. Indeed, this new method of whistleblowing is offered as an important opportunity to NGOs and human rights activists to work actively to uncover human rights violations to the public.

Whistleblowing as Uncovering and Documenting Human Rights Violations at the Workplace: Examples, Background, and Motivation

We have so far interpreted Wallraff's radical concept of whistleblowing as a reply to the contemporary debate on the definitions of the concept of whistleblowing in the context of developing a framework for how to uncover and document the truth about violations of basic human rights at the workplace. Indeed, recent radical whistleblowers like Snowden and Manning show us the limitation of De George's and Hoffman's approach to whistleblowing. In order to understand the different dimensions of the radical, activist concept of whistleblowing as an individual duty, we need to go deeper into Wallraff's life and work. In Wallraff's life and lived existence, whistleblowing for human rights in business becomes a mode of authentic existence and search for the meaning of life. A short definition of Wallraff's radical whistleblower activist method can be reformulated based on Hoffman and McNulty's use of Marcia Miceli and Janet Near's definition:

> The activist whistleblower method for uncovering and documenting basic human rights violations at the work place means that the whistleblower engages fully with his or her personal life by going undercover as a member of the organization. Whistleblowing is based on role-playing and an undercover activity where the whistleblower takes over the identity of organization members (former or current) and penetrates into the organization in order not only to detect complex violations of human rights at the work place, i.e. illegal, immoral, or illegitimate practices under the control of employees, persons or organizations that may violate human rights, but also the underlying offending of the dignity of all the persons involved.

As we see the radical change of the concept of whistleblowing as suggested by Wallraff is that we face an external intruder who "takes over" the identity of an employee of the organization in order to detect violation of human rights in the organization and present it to the public. NGOs and human rights activists have good opportunities to work as backups for such intruders and help to identify businesses where there is suspicion of violations of human rights in the workplace.

Participating

According to Wallraff, his method of undercover journalism has three elements. He defines his method as "participating, acting, and provocative observation" of how systems of society functions (Dialogue at BI Business School Oslo October 2016). He *participated* on a broad basis in systems of oppression *playing fictitious roles* at the bottom of the system showing how underprivileged persons experienced that representatives of the establishment violated their basic human rights. The broad participation intended to give him the best possible lookout to be able to *observe* how the system of powerful institutions of society violated the basic human rights of the weakest. This experiencing of oppression and thereby observing was apparent when playning fictotious roles in the coal industry, the psychiatric institution, the newspaper industry, the Catholic Church, the police, and representatives of the government and political parties, as we will show by interpreting some significant examples.

Acting

He acted strategically in these roles, in order to observe how this institutional system responded. He placed himself through strategic actions in many dangerous situations that informed him in detail about how human rights violations took place in detail at the workplace. Two different dimensions in this acting were typical for Wallraff.

As a whistleblower Wallraff acted as an undercover journalist in order to identify and show solidarity with the suppressed. The roles he chose was never part of the upper strata of society, but always part of the bottom of the organizations. He wanted to participate as an oppressed in different organizational contexts in order to experience how such people themselves experienced such a life. This led him into dangerous situations for his physical and mental health, such as the role as a Turkish guest worker in the coal industry and to the "prisoned" life as a psychiatric patient in psychiatric hospitals. The key to knowledge seems to be the self-understanding of experiencing danger and risk yourself by interating with the systems.

Wallraff has several times underscored that he *played* when he was active with the method and thus had fun. This has been called "Situationskomik" (Linder 1975, p. 105). Böll interprets Wallraff accordingly as an author who penetrates into a situation and submits to it, often by using a language of dark humor in order to tell about the tragedy going on (Linder 1975, pp. 9–10).

Wallraff considered it as funny to fool persons in power positions, to experience that they believed he was another person as the journalist he actually was. He used the distinction in Latin between the concept of *homo ludens* and *homo faber* in order to explain what he did. He told us that:

> I do enjoy to play. Knowledge is often something we receive through playing. We have the Latin concept homo ludens and homo faber, the person who works, the person who is unable to laugh. That is dangerous. We know this from the pedagogy, children learn by playing. Moreover, we know from pedagogy that you remember much better things you were playing than what was harped. So my method is actually a childish, naïve method. (Interview Oslo October 2016)

Wallraff also explicitly talked about being a mockery and the fun he had in all the roles as a way of experiencing joy and pleasure, which made it possible for him to endure the burdens he met when he used the method to identify with the suppressed.

Provocation

The provocative element has to do with abusing trust as a pure means to achieve his goal: to collect and publish controversial information revealing misery and guilt in order to initiate debates in public life and thereby promote progress in society. Wallraff misused the trust management showed him believing he was the person he said he was and therefore giving him controversial information unknown for public life. As trust-givers management expected him to keep the information internally in the organization (Alm and Brown 2016), but he went public with the information by blowing the whistle externally when he published his books.

The resistance against this provocative way of misusing management's trust was strong and continued for a long time. His opponents dragged him to court several times, accusing him for breaking the laws of the society when going public with "private" information. Nevertheless, the public attitude changed gradually through the decades in favor of Wallraff. Lex Wallraff, the law legitimizing undercover journalism, was probably his greatest victory for uncovering and documenting human rights violations at the workplace. It was also the most important defeat of his opponents saying that it was legal to lie about your identity in order to collect information if the publishing of it was in the general interest of the citizens of society (Alm and Rendtorff 2016).

Ganz Unten

Wallraff's most famous, controversial, and debated uncovering and documenting of human rights violations at the workplace was the book *Ganz Unten* (1985). As the basis for this work, he planned in detail and worked out a fictitious identity as a Turkish guest worker, Ali Levent, penetrating Germany's illegal labor market (Pilger 2004). Most horrible is probably his uncovering of the hazardous working conditions in a Thyssen steel factory where guest workers worked for months in clouds of cancer inducing coal dust with long-term consequences for their physical health. He also uncovered that the workers in the industry were forced to work without any type of protection, that their working days lasted up to 12–14 hours a day and 7 days a week, and that the wages were at a very low level. Based on detailed notes, he revealed situations characterized of racism when the manager sympathizing with Nazism treated the workers more like animals than human beings. In the book, Wallraff also uncovered and documented how he was treated in a brutal and dehumanizing way as a human guinea pig in the pharmaceutical industry.

It does not seem correct to argue that Wallraff in this context uncovered and documented violations of one specific human right. On the contrary, he uncovered and documented rather that several basic rights were severely and repeatedly violated in a process were such violations appeared as routine; of relevance are Article 3, offending the security of the person; Article 5, inhuman and degrading treatment; and Article 23, offending favorable and just conditions of work. As such, he showed that the human dignity of a high number of Turkish guest workers was offended in the illegal German labor market.

Wallraff's uncovering and documenting of such a severe situation in the illegal German labor market unknown to public life may contribute to explain why the whistleblowing of the book was his most successful. He sold more than 2 million copies in less than 5 months. "On publication day in 1985, people queued outside bookshops, and the ensuing national debate about working conditions and racism, specifically German attitudes to 'guest workers', was unprecedented" (Pilger 2004).

Wallraff's uncovering and documenting resulted in a raid. The establishment was provoked to react. German prosecutors and tax officials penetrated into the offices of Thyssen. They were searching for evidence that the company was breaking the law regulating and protecting contract workers. "In the state of North Rhine Westphalia the setting of Wallraff's expos the Social Democratic government moved to stamp out 'lease' labour, a kind of bond silavery. Throughout Germany more than 13,000 criminal investigations were instigated, and penalties were increased tenfold" (Pilger 2004).

Bild-Zeitung [Picture Journal]

A few years earlier, Wallraff had prepared the ground for the strong public interest in his authorship by publishing the so-called Bild-triologie, three books where he uncovered and documented the human rights violations in the journalistic methods of the most selling German boulevard newspaper *Bild-Zeitung*, owned by the Axel Springer company and often compared to the English newspaper *The Sun*. He published *Der Aufmacher* (1977), *Zeugen der Anklage - Die Bild-Beschreibung wird fortgesetzt* (1979), and *Bild-Störung* (1981).

He worked in *Bild-Zeitung* under the cover name Hans Esser and used his own experiences of contributing to the unethical journalistic methods as empirical basis for publishing these books drawing the attention to three topics. A. The competition among the male journalists to produce the most spectacular and sensational lies about ordinary German citizens and harassing their interview objects, often in the form of sexual harassment of women. This was the most effective way of pleasing the company's commercial needs of selling large volumes of newspapers. B. Wallraff wrote in detail how he was lying in order to be in front among his male peers as the most popular journalist internally and how this influenced his integrity, apparently referring to this "deconstruction of integrity" as what was going on among all the editors and journalists. After a short time, he got used to lie and harass and participated wholeheartedly in the competition. C. Wallraff also uncovered the consequences for ordinary citizens of experiencing the destructive public power of the newspaper as a pillory; people ended sometimes in despair when lied and harassed.

The deconstruction of the journalist's professional integrity by contributing to lie and harassment could be linked to Articles 5 and 23 as objects of violations. However, Wallraff seems first to uncover and document that Article 12 is violated, and in a systematic way; the institutionalized way of lying and harassing ordinary citizen's life, not least women, could be interpreted as attacks upon the honor and reputation of ordinary citizens and as such on their dignity as human beings. Nevertheless, there is apparently a close connection between the two types. Wallraff's uncovering and documenting seems to show the violation of Articles 5 and 23; the deconstruction of the professional integrity of the journalists is a presupposition for their attack on the honor and reputation of ordinary citizens, or, to put it even more basic, the first offending of human dignity is a cause for the second.

13 Unerwünschte Reportagen [13 Unwanted Reports]

Wallraff's way of blowing the whistle by the use of undercover journalism to uncover and document basic human rights violations at the workplace is characterized by a development when it comes to how much time and effort he invests in the project. There is a line coming from the first period of his authorship when he used limited time in his fictitious roles into the second and third period we have analyzed so far, the 1970s and 1980s. While he was playing the role as Ali Levent for 2 years from 1983, he worked in *Bild-Zeitung* for 3.5 months as Hans Esser in 1977. The most famous book from the first period, *13 Unerwünschete Reportagen* (1969), portrays a more fragmentized picture. He uses hours, days, or some weeks in each role. In this period, the element of humor when almost teasing the persons he fools is more in the foreground compared to the second and third period.

He penetrates into a psychiatric clinic behaving as an alcoholic trying to uncover that the patients are treated in a dehumanizing way. In this way he challenged treatment models for patients in psychiatric hospitals (Jørgensen and Rendtorff 2018). He lies about his identity as a member of the government asking the management of different German companies how far they have come in the recruitment and training of paramilitary groups that should be used against striking workers that might have communistic sympathies. He contacts the security police, presents himself as a member of the neo-Nazi party NPD, and wants to be an agent that could spy on communistic sympathizers with potential contacts to East Germany. He pretends to be a regretting sinner asking for forgiveness meeting priests in the Catholic Church. He told them that he was an owner of a company producing the most important material of napalm bombs and that he had managed to sell a large order to the American army.

These more fragmentized pictures of violations of human rights at the workplace have for the three first examples to do with inhuman and degrading treatment (Article 5).

Our interpretation of the examples gives us the possibility to formulate a working hypothesis:

> Wallraff develops his method of blowing the whistle about human rights violations at the work place and about the underlying offending of the human dignity of powerless people by using more and more time on each project. This gives him the possibility to uncover and document more and more in detail how the violations more concretely are taken place at the workplace and correspondingly how detailed and concrete human dignity is offended.

Revitalization

However, Wallraff did not invent the method of undercover journalism as blowing the whistle about human rights violations; he vitalized it as a method that had existed for a long time. Broeke Krueger argues in her book *Undercover Reporting* that "much of the valuable journalism in the past century and a half has emerged from undercover investigations that employed subterfuge or deception to expose wrong" (Kroeger 2012).

Examples are according to Krueger persons as James Redpath who mingled as casual traveler and walked 700 miles in the southern states on foot in order to interviewing slaves and collecting relevant material. The stories were published in 1859 as *The Roving Editor: Or, Talks with Slaves in the Southern States*. The book's production costs were covered by prominent antislavery philanthropist Gerrit Smith (Mogensen 2000). Nelly Bly, a female journalist who acted as a mentally sick and was admitted to hospital in 1987, is another example. She exposed unacceptable conditions there and published her material in *Ten Days in a Mad-House*. Moreover, Upton Sinclair who dressed like a worker and mingled into a meat factory for 1 week in 1904 (Kroeger 2012) is also another case. Undercover journalism was not only rooted in an American tradition but also a European. Haas (1999, p. 307) refers to an interesting analogy between the French author Eugene Sue and Wallraff. Sue published his *Secrets in Paris* in 1842–1843 as a novel in *Journal des Débats* in Paris. The protagonist, a dandy, enters the underworld of Paris disguised, in the world of the poor and criminals. Sue criticizes the circumstances and suggests improvement. Some of them were realized.

Wallraff's undercover journalism occurred in continuity with this old American and European tradition of detecting violations of human rights and injustice – vitalized it and institutionalized it into the infrastructure of media, by the introduction of Lex Wallraff, a law important for the activist journalism of the radical student movement.

Wallraff and the Radical Youth-Movement

However, Wallraff's method ought to be understood also in line with more recent sources of inspiration that existed closer in time and space in connection with the concern for the citizen's rights movements of the 1960s. Wallraff based his radical method of whistleblowing on his undercover journalism and as such on an activist method of accurate preparation, planning, ideological reflections, and cooperative writing (Haas 1999, pp. 306–307).

As such, his activist journalism was part of the radical student movement's public criticism of western democracies as a capitalistic system that exploited industrial workers and other employees at the bottom of society to the benefit of the ruling class (Gottschlich 2010, p. 62).

Wallraff being at the age 26 in the pivotal year of 1968 when the demonstrations occurred in Paris, influenced this student movement with his activist journalism throughout the 1970s and 1980s. Moreover, the movement influenced his synthesis through the same period.

On the one hand, Wallraff's use of the journalistic method was a great inspiration for the radical student movement, not least when it comes to the part of his authorship categorized as "Arbeiterliteratur." He published reportages from a large number of German industrial companies: Ford in Köln, Blohm+Voss in Hamburg, Siemens in Müchen, Benteler in Paderborn, and Sinteranlage and Thyssen-Hütte in Duisburg (Ludwig 1976, pp. 86–87). The books were sold in large editions. The student movement used his authorship as a documentation of the suppressive function of the system.

On the other hand, significant front men of that movement, among them Heinrich Böll and the French working priests, were an inspiration for him as well, precisely when it comes to the use of the activist method of informing the public. *The Lost Honor of Katharina Blum* inspired Wallraff to write in the same way as Böll did, trying to document how ordinary people suffered injustice and experienced lack of meaning almost as in Franz Kafka's stories, because of the irrational exploitation of the system, not because of individual evilness. His explanation was structural, as was the Marxist inspired explanation of the movement (Interview and dialogue at BI Business School Oslo October 2016). In addition, the Nobel Prize winner Heinrich Böll, as one of the front men of the movement, supported Wallraff when his enemies dragged him to court and tried to criminalize his undercover method. Talking directly to the judge, Böll with his eminent metaphorical skills gave the judge the opportunity to identify with Wallraff's project:

> If Wallraff's method is criminalized . . . one deprives . . . the current literature in BRD a large possibility. The possibility to fulfill the function that neither unions nor employers' associations are able to fulfill: to control if the companies comply with the law. That's what I mean Wallraff does: Almost acting as a lawyer in public life. (Gottschlich, p. 75)

Existential Motivation

Wallraff has underscored that his father's dead was important for the development of his method (Interview Oslo 2016). His father died after being a worker in the private industrial sector for his whole life. According to Ludwig (1976), Wallraff's father ended his working life in the "Lackhölle bei Ford." He had lost all his illusions about the working life of Germany. The working conditions were hazardous and seemed to have caused his death. Consequently, the causes behind his father's death seem to be an initial and significant experience of injustice for Wallraff.

Another analogue experience was the anxiety of losing his identity as a child. Jürgen Gottschlich writes in his biography that his father was in hospital for several months when Günter was a child. His mother had to work in order to save the economy of the family. She sent the boy to an orphanage administered by nuns. Wallraff was suddenly thrown into a world where he was a stranger experiencing a deep loss of identity. He has underscored that the feeling of losing his identity lead him as an adult to try to find new identities by entering different kinds of roles. As an artist of identity transformation, Wallraff is playing a fool game of assuming different identities in different life contexts.

Wallraff writes a poem, using pseudonym, in the lyric journal "Flugschrift," where Heinrich Böll was editor. His main point of view is that he is without identity because masks occur on the surface of his existence as a reflection of his inner life. Ludwig (1976) underscores that Wallraff's decision to be a military evader influenced his attitudes significantly. Wallraff was applying much too late to evade the military service (Walraff 2000). Consequently, in 1963, he was forced to participate. He refused during 10 months to use a weapon and wrote down in his diary what happened. Supported by Heinrich Böll, he challenged the system by saying he would go public with the diary. He was offered to leave the service but refused. The military doctor used an accident where Wallraff got concussion as a pretext to force him to be a patient at the psychiatric clinic in the military hospital in Koblenz, where he was observed and stigmatized with a psychiatric diagnosis. Ludwig (1976, p. 86) argues that Wallraff understood the challenging experiences he was confronted with by the military service as an example of how individual burdens are caused by repressive dynamics of a system.

The Relevance: What Can We Learn from Wallraff's Method?

We have demonstrated that compared with the contemporary understanding and approaches to whistleblowing, Wallraff's method converges or moves towards the dignity-based concept of whistleblowing in relation to uncover and document the truth about violations of basic human business rights at the workplace. What is at stake in Wallraff's concept of whistleblowing is not only to detect some single violations of human rights or some wrongdoing or harm, but it is a more principle-based defense of human dignity in relation to some specific, fundamental human rights. In line with Hoffman's and McNulty's Universal Dignity Theory of Whistleblowing, we can say that Wallraff's concept of whistleblowing is concerned with the fundamental defense of human dignity of the relevant stakeholders of the organization in relation to the concern for human rights at the workplace. With Hoffman and McNulty, we can mention Kant's principles of human dignity as essential: "All human beings have intrinsic worth or dignity by virtue of their humanity and no individual has the moral authority to deny others their inherent dignity" (Hoffman and McNulty 2011, p. 50; Kant 1983). Such a visionary principle can also be said to be the driving force of Wallraff's radical activist method of whistleblowing. The concern for human dignity of the oppressed and the protection of the human rights of employees based on a public discussion of the information given by his whistleblowing is an important motivation for Wallraff's concept of human dignity. In this context, the method for detecting human rights violations can be offered as an important method to be used by NGOs and human rights activist groups.

However, there are also important elements in Wallraff's approach that moves his methodology beyond a purely visionary/Kantian concept of human dignity. Wallraff's existentialist focus on the right to lie in going undercover to detect human rights violations breaks with the Kantian principles of the duty always to say the truth. Moreover, Wallraff has a strong Marxist and phenomenological account of human dignity as conditioned by the employee's social and bodily existence rather than abstract morality. It is true that Wallraff adopts the concern for human social and bodily dignity as pivotal, but this concern also moves beyond Kant's concept of autonomy and the free will. Wallraff agrees with Kant that human beings should not be reduced to objects and instruments for other people, but he also moves beyond Kant with his Marxist interpretation of human dignity that focuses on the concern for the dignity and human rights of the bodily and social existence of the workers or employees in the factory or business firm. This combination of phenomenological existentialism and Marxism in Wallraff's approach is important as a foundation for protection of human dignity in order to foster human rights at the workplace.

We can emphasize the following dimensions of this dignity-based concept of whistleblowing.

Whistleblower Activism as a Mirror of Organizational Wrongdoing

The general relevance of Wallraff's method for conceptions of whistleblowing in organizations is that his books function as a detailed mirror of the problems of how injustice in organization are hurting or threatening the dignity of human beings as a phenomenon of spirit/free will and bodily existence. The role-playing contributes to the formulation of a general theory of problems of justice in organizations and protection of human rights in business. With his activist undercover approach, he shows the violations of basic human rights in different parts of the working life and how human dignity is basically threatened.

From Silent Victim to Active Victim

Here we see that the victim of harm is not conceived as a passive, silent subject unable to give voice to the experience of spiritual and bodily harm or offending of dignity. On the contrary, the victim in the role of experiencing the violations of basic human rights is conceived as the whistleblower with firsthand knowledge to what has happened. The whistleblower is by the use of undercover journalism method actively seeking situations of injustice as an eyewitness in order to report about them to the public. Here, Wallraff's radical method challenges us not to remain silent victims passively ignoring our possibility to use freedom of speech as a fundamental human right to support other basic human rights. On the contrary, he challenges us to be active victims and seekers of the situations of injustice and to use the human right of freedom of speech when we work in all kinds of organizations in order to create justice and to protect human dignity.

Whistleblowing as Existential Commitment

Wallraff's method provides us with a language for understanding whistleblowing as an existential commitment of employees towards a basic human right in their organizations – freedom of speech – as a commitment to a dangerous weapon. With the activist method, the employee understands the need and obligation to fight for social justice in organizations, by using this weapon, which is protected by national law and by the human rights declaration of 1948. Since whistleblowing is protected to a different degree by national laws and constitutions on freedom of speech, as we discussed with the support of Fasterling and Lewis (2014), the commitment is easier to see in the relation to the Universal Declaration of Human Rights from 1948 than in relation to particular national laws. Employees can no longer be morally, blind, mute or deaf to injustice in their organizations confronted with this universal vision. They have an existential obligation to blow the whistle as an effective vehicle to protect human dignity in the double sense we have focused upon.

Whistleblower Activism as Employee Engagement

Wallraff's method makes us aware of the need to be actively involved for organizational justice, as a contribution to a democratic society as a structural protection of human dignity. The problem of whistleblowing is not only about individual justice or about institutional justice in an atomistic sense but indeed an issue of employee engagement for justice and democracy in society based on justice in organizations. Wallraff's method contributes to move the problem of organizational justice from the individual to be a general concern of what type of society we need to take care of human dignity. Lex Wallraff legitimizing undercover journalism and securing justice in the society is one important consequence of this method.

Organizational Justice

Wallraff's method demonstrates that there is a close link between organizational openness and democratic justice in society and its laws on the one hand and between organizational lack of openness and injustice on the other. The public criticism of organizational injustice is problematic for the image and brand of organizations when they act as closed and secret entities. Businesses need to take the challenge from this activist whistleblowing seriously, in order to restore their image and create more transparent structures. Employees can use Wallraff's method as a driver of change for openness and justice in their organizations.

The Will to Suffer

Wallraff was an inspiration when it comes to showing a deep will to suffer in order to experience and identify what type of human rights violations one ought to blow the whistle about. Wallraff entered a lot of different institutions and situations showing an extraordinary strong will to suffer for the sake of protecting other person's human dignity against human rights violations. It is an inspiration for us in our organizations to be influenced by such an unselfish will and to enter situations that could turn out to be a physical and psychic burden, aiming to protect our fellow colleagues and their interests against the same type of human rights violations and as such protect their human dignity towards harm and injustice.

Trusting Public Opinion

Wallraff's activist method of whistleblowing can be interpreted as a radical expression of trusting the public opinion as a guarantee for the protection of basic human rights. According to Wallraff, public opinion, discussion, and criticism, informed by whistleblowing, is the main force able to move institution's from violating basic human rights to be transparent, just and protecting human dignity. As such, Wallraff's position converges towards Jürgen Habermas evaluation of the transformational power of public opinion. We can say that the communicative power of public opinion contributes to the development of a framework for protecting basic human rights in business.

Preliminary Conclusion on Dignity and Human Rights

With this approach to a radical activist method of whistleblowing as an essential method for detecting human rights violations in business firms, we can conclude with a highlight of the concept of human dignity and human rights in business that is the basis for detection of wrongdoing and injustice in organization. Essential in this conception is the Marxist and existentialist correction of the Kantian concept of human dignity based on the phenomenological approach to the social and bodily dimensions of oppressed and alienated human work life in organizations. Protection of human dignity and revelation of violation of human dignity is here the most important task for the whistleblowing method in organizations.

Arguments for Institutionalization of Wallraff's Method

Therefore, what are the arguments for institutionalization of undercover journalism as a method of whistleblowing in contemporary society? We can emphasize that there is a need to make human rights violations public in democratic society. NGOs and human rights groups can with great success contribute to this by using methods of activist whistleblowing based on the institutionalization of undercover activities. More transparent organizations created by whistleblowing are necessary in order to protect and respect human dignity in a more profound way. However, there is not only a freedom of expression but also a responsibility of expression. The focus on the concept undercover journalism in whistleblowing contributes to make the need for public democratic discussion of injustice present in society.

Wallraff's method can be seen in the perspective of Jürgen Habermas' idea of the central importance of the rationality of public space for protection of basic human rights and civil rights in society (Habermas 1989). However, Wallraff's method combines the actions of playing fictitious roles with observation and going public with the verbal information, while Habermas' idea concerns the verbal discussion on the societal level. Through Wallraff's is combination of undercover journalism and whistleblowing, it is possible to detect injustice in society and this contributes to define ethical and social legitimacy in the public space with regard to the concern for protection of human rights in society. Legitimacy of organizations is defined through social acceptance in society. Undercover journalism and whistleblowing contribute to the evaluation of legitimacy as an important feature of the social existence of organizations, businesses, and institutions in society. We can say that Wallraff contributes to the institutionalization of undercover journalism as a method of whistleblowing in contemporary society.

A potential criticism of this institutionalization of undercover journalism is that there may be severe ethical problems linked to Wallraff's method because one basis of the method is a lie. This is the Marxist criticism of the Kantian approach to dignity, as we described earlier. For Wallraff in opposition to Kant, we need to accept that in extreme situations where you have a moral duty to detect wrongdoing and violations of human rights, ends justify means, and you are allowed to hide your identity in order to detect injustice in organizations. You have to go undercover in order to detect injustice and reveal the destruction of human dignity in bodily and social terms. However, Wallraff moves from a position close to Kant to a position close to Marx when he argues that the evil of lying is a smaller problem than a persistent injustice. Wallraff argues consequently that this unethical behavior is justified by the fact that injustice is revealed. Therefore ends justify means in the fight for protection of basic human rights in business.

A more practical criticism is that Wallraff's method does not really function in practice and continues to be some kind of scandal journalism. This criticism is based on an unethical and not very argumentative approach to journalism and whistleblowing. This is connected to a populistic criticism that argues that this method is based on populism where the product of the whistleblowing activity is based on scandalizing the authorities of society. Accordingly, the argument goes, we cannot really justify that whistleblowing is based on undercover journalism because it can never live up to the ideal of Habermas' rational argumentative discussion in public debates. Here, we would like to emphasize that to promote human rights in business through radical whistleblowing is based on sincerity and seriousness by those using this method of undercover journalism. Only in this way the method can be effective.

However, the institutionalization of Wallraff's method for uncovering violations of human rights in business also leaves us with some more practical problems. How should we practice whistleblowing undercover journalism in order to develop good proposals for ethics of business and business and human rights? What kind of whistleblowing activity is also ethical and how does whistleblowing contribute to democratic processes between freedom of expression and responsibility of expression for human rights in business? What is the responsibility of expression by those, including NGOs and human rights activists, who engage in this kind of undercover journalism in order to promote human rights in business?

Discussion: What Are the Limits and Possibilities of Wallraff's Method of Whistleblowing for Democratic Justice?

So we have presented Wallraff's method as a new form of approach to whistleblowing that generalizes the right to whistleblowing as a universal human right based on the respect for fundamental human dignity of people in organizations and organizational stakeholders, but what are the limits and possibilities for this new concept of whistleblowing in organizations?

The Decay and Revival of the Public Sphere

Traditionally, public discourse is considered as a necessary precondition for democratic justice, because a broad and thorough public discussion is necessary in order both to lay the most informed fundament for significant decisions on the different sectors of society and to promote the most thorough criticism fostering the largest potential for improvement at the same sectors.

However, theorists as Habermas underscore the problem of decay in the public life of democracy. One of the most important elements of Habermas' iconic dissertation *The Structural Transformation of the Public Sphere* (Habermas 1962) is the concept of public decay. According to this analysis, the public sphere returns to an earlier stage of development, less rational, through modernity. Persons discussing in the public sphere becomes less interested in listening to the argument of his/her partner. It became more important to be eloquent, nice, sympathetic, and reasonable. When discussions from Bundestag were communicated on the television, the discussions changed considerably. It was more important to be understood as a trustworthy person than to convince your discussion partners in the hall. The rational and valuable discussion was challenged.

It is reasonable to consider Wallraff's synthesis of whistleblowing and undercover journalism as foundation for detecting human rights violations in business as presupposing something likewise radical as Habermas' theory. Wallraff indicates that the public does not know that institutions in the public and private sector are breaking the laws of working life and thus being responsible for a waste array of human rights violations. Wallraff's main concept here is what Böll in a testimony in court has called "institutions as secrets." It is because workplaces as the government, church, police, companies, and hospitals are secret entities that the public does not know what is going on there. An institution is a phenomenon in time and space hiding what is going on inside.

Consequently, the public sphere is a phenomenon without sufficient knowledge about the offending of human dignity in the institutions in society. Wallraff's radical synthesis of whistleblowing and undercover journalism as a means to promote democratic justice has this critical understanding of a decay in the public sphere as an important point of departure for the need to use the radical method for uncovering and documenting a complex set of human rights violations in business.

Wallraff's ability to fight the problem of decay and to contribute to a structural transformation of the public sphere is linked to a strategy of radical transparency. His large number of books function as detailed mirrors or complex proofs of the problems of the secrecy of human rights violations in organizations in the hand of what Böll called "a lawyer accusing concrete persons and institutions." According to Böll, Wallraff acted as a lawyer in the public sphere trying to fill the function that neither unions nor employers association were able to fulfill: "To control if the companies were acting according to the law." By mentioning the concrete names of the management in specific parts of the church, police, industrial companies, and healthcare sector responsible for human rights violations, he contributes to a more enlightened public sphere.

Several debates about the dangerous conditions in the working life of the West German society were raised because of his provocative way of combining whistleblowing and undercover journalism (Gottschlich, pp. 54–58, 75, 86–88, 99–100, 107–108, 113, 128–151, 179–192). As a way of fighting the decay of the public sphere and contribute to a more enlightened one, his synthetic method was an enormous success. His project did not only change the restrictive legislation on undercover journalism in West Germany to allow it. Books were sold in millions of exemplars, *Ganz Unten* in five million. This book about the Turkish guest worker was the most sold nonfiction book in West Germany after Second World War when published.

On the one hand, it would be naïve to imagine that it is possible to use Wallraff's method and have the same success when it comes to contribute to a more enlightened pubic sphere by blowing the whistle. Wallraff's success of bearing the burdens of whistleblowing and undercover journalism was closely linked to historically unique presuppositions at that time: to extreme presuppositions in his own life and to the extraordinary receptivity of the society he operated in. He was physically and mentally an exceptionally strong person. He was a marathon runner during large parts of his life, and ran 10 kilometers each day until the age of 65. His biograph Jürgen Gottschlich begins his book by stating "The energy of the man seems to be inexhaustible." His courage was tremendous. He dared to place himself repeatedly in situations that were not only a risk for his mental and physical health but was deadly as well. When it comes to the receptivity of his society, Wallraff was suddenly the right man at the right time. His first book, *Wir brauchen Dich. Als Arbeiter in deutchen Industriebetrieben* (1966), appeared in the center of a discussion about the future of the bourgeois literature. Hans Magnus Enzensberger predicted at that time a much better outcome for the documentary literature than for the bourgeois novel. He challenged German authors to raise the mind of German citizens politically. He underscored Wallraff's industrial reportages as a positive example. The student movement in West Germany that begun as a protest towards the "professor university," the big coalition in the Bundestag between the two large political parties and towards USA's war in Vietnam, was searching for a theoretical basis for their vision of fundamental changes of the society. Their problem was that Marx, Lenin, and Engels idealized the working class as the power behind the revolution, not the student movement. Among them, almost none came from the working class. For most of them, Marx's description of the proletariat referred to another planet. Wallraff's industrial reportages came in the very right moment. The whole movement was searching for what they found in him and his books. Consequently, Wallraff became one of their most influential moral heroes (Gottschlich, p. 62).

On the other hand, some elements in Wallraff's successful synthesis is possible to implement in the historical situation of our time even if the person that should blow the whistle through undercover journalism does not have the extreme physical and mental strength of Wallraff and does not meet the same high receptivity in society. It is apparently possible to use the method based on normal personal presuppositions and a normal receptivity in society, as history shows us. Many undercover journalists have blown the whistle about basic human rights violations during the last decade, more or less in the same way Wallraff did. This was, for example, the case in connection with the business scandals of the financial crises or other cases of corruption and wrongdoing in organizations. However, in a postmodern area, one could argue that the visionary goals of society have vanished. "The horizons have disappeared," to quote Friedrich Nietzsche.

Undercover journalism was a means in the hands of political activists in order to achieve a visionary goal, a more just society. In a postmodern area, a more just society becomes something new, entertainment, reality TV, something to consume, to argue along the line of Colin Campbell (2005). Symptomatically, Wallraff himself is today the editor of a reality program at the most commercial TV channel in Germany, RTL. Undercover journalism has become reality TV, entertainment. The spectators are not inspired to go undercover, but they are entertained. Neil Postman criticizes this trend in modern media and show business with the well-known ironic words: "We are amusing ourselves to death" (1985). Here, maybe NGOs and human rights activist groups may contribute to a more serious use of activist whistleblowing in organizations.

In this neo-Nietzschean perspective, what Wallraff is doing is to contribute to the play between visibility and invisibility in the transparent organization making itself transparent as a part of the logic of neoliberal society. This transformation is indeed the case in the digital concept of disclosure in the digital age (Heemskergen 2016). Wallraff's construction of narratives of transparency is supposed to contribute to visions of democracy and emancipation in the public sphere, but in reality it is just a new dimension of the neoliberal domination logic of capitalist business organization, because his undercover journalism contributes to hide power structures as the entertaining media at the same time as it makes other structures visible. In this Foucault perspective on transparency and whistleblowing, social visibility cannot contribute to emancipation, but rather it is a part of a neoliberal visibility regime where Wallraff as author and emancipatory activist is becoming himself a part of biopolitical panopticon in sociotechnical control society (Brighenti 2010). Wallraff's status as icon and showperson in the German public illustrates this neoliberal and postmodern function of his work, where his public exposure contributes to hide other biopolitical domination structures in society. His narrative of emancipation may not be a real radical narrative, but rather a narrative in the tension between the visible and the invisible (Birchall 2014). This postmodern critique of Wallraff's project is a very serious critique not only of his project of whistleblowing for revealing injustice but indeed also of the whole concept of subjectivation of individuals with human rights in business. In the constructivist perspective, in contrast to our phenomenological and hermeneutic point of view, the oppressed worker, revealed by Wallraff, is indeed also constructed as a subject which is objectified and stigmatized as "the other" and as the person who is "Ganz Unten" with the process of whistleblowing of his work conditions in the public. In this sense Wallraff's work can be interpreted in a field of establishing subject positions between seeing and being seen. This is a strategic field of visibility/invisibility, transparency/intransparency that is also characterized by indeterminacy, because it is manipulated by the subjects themselves as part of the biotechnological field of social control (Brighenti 2010). As success writer, who sold a lot of best seller books on constructing the oppressed other and himself as a hero of whistleblowing, Wallraff is himself a part of this logic of visibility/invisibility who plays in a space of biopolitical subjectivation.

Another type of criticism comes from Wallraff himself. He has criticized his own method sharply (Interview 2016). He underlined that he should not have limited himself to use the method to reveal human rights violations and injustice in the West. The reason for this limitation was the fear to give ammunition to "the envy." He should also have used the method in order to show human rights violations east of the iron curtain. The implication of this criticism is that the method has a universal potential of protecting human dignity, independent of what type of political system is in power.

However, our interest goes in the direction of one specific element: the virtue-ethical basis of Wallraff's synthesis of whistleblowing and undercover journalism. We consider this basis as a bridge to a more general use of his method.

Authenticity and Whistleblowing

Charles Taylor's concept of authenticity could be a useful theory to identify this virtue-ethical basis when identifying the possibilities of his method. Taylor developed his theory in two books, *Sources of the Self* (1989) and *The Ethics of Authenticity* (1992). In the first book, he argued that the moral sources of early western tradition were de-cosmologized and internalized the closer we come to modernity. Taylor was inspired by Weber's theory about secularization as the "Entzauberung der Welt." Three periods are significant in this development away from the concept of cosmos as the source of moral life: the affirmation of ordinary life in the reformation, the ideal of nature in romanticism, and the ratio of the enlightenment. Representatives of the French and German strand of romanticism, Jean-Jacques Rousseau (1712–1778), Johann Gottfried Herder (1744–1803), William Blake (1757–1804), and William Wordsworth (1770–1850), develop a new understanding of ethics. In opposition to the reformation's understanding of the inner world of humans as sinful, they understood the inner nature as something we ought to meet and be in dialogue with. This inner nature contained depths impossible to control by our articulations but at the same time only possible to grip by our inadequate articulations, words, and art.

In the second book, Taylor argues that romanticism articulated a modern, individualistic, ethical, ideal authenticity, the quest for being sincere and honest towards your originality, in order for this originality to flourish, in opposition to copy other persons and be lost in conformity and traditionalism.

Wallraff's successful synthesis of whistleblowing and undercover journalism, could be interpreted as *a radical and complex type of authenticity*. Wallraff's way of being authentic was to publish books as a detailed mirror of the complex set of human rights violations at several workplaces, based on participating in these institutions through playful role-playing. As such, he showed honesty and sincerity towards his originality as a human being, his father's death and suffering in the chemical industry, his anxiety as a child for losing his identity, his quest as a young man for bearing masks in order to create new identities, and his search for homo ludens as the way of creating true knowledge. This was included in his will to expand the right to freedom of speech to include lies about your identity in order to fight for basic human rights in the capitalist economic system.

Consequently, the concept of radical and complex authenticity opens the door to use Wallraff's synthesis of whistleblowing and undercover journalism as an inspiration to fight injustice, foster human rights in business, and contribute to an enlightened public sphere where human dignity is offended. Human beings are able to be sincere and honest towards the experience of death, suffering, anxiety, masking, homo ludens, and freedom of speech, as Wallraff was so consequently in his life, in order to protect human dignity. Such an existential authenticity towards archetypical human experiences opens the door to participate actively in institutions, but on a more fragmentary basis than Wallraff, in roles where you are hiding your identity inside systems of oppression. There you can act strategically in these roles, in order to observe how the system responds, and last but not the least misuse trust in order to collect information of public interest and go public with this information, even if it hurts. However, this radical authenticity is legitimate, only if it is linked to being honest and sincere towards such original experiences in the lives of the persons involved. Only then would it be legitimate to blow the whistle, in a

Wallraffian perspective, based on accurate preparation, planning, and ideological reflections (Haas 1999, pp. 306–307).

Conclusion

In this chapter, we have investigated Günter Wallraff's method of radical activist whistleblowing as a proposal for a method for uncovering and documenting violations of basic human rights in the workplaces. We have demonstrated how whistleblowing can be a contribution to institutionalization of CSR, ethics programs, and integrity in organizations (Rendtorff 2011a, b). Therefore, whistleblowing is essential to cosmopolitan business ethics (Rendtorff 2017). This is a good case that shows the complexities of business legitimacy and whistleblowing. With the use of this method, it is in particular possible to detect the underlying offending of the human dignity of the powerless employees in organization. This method detecting violations of human rights in business represents a radicalization of the dominant concepts of whistleblowing in the literature on business ethics. Wallraff's concept radicalizes the justification of whistleblowing by Richard De George and Michael W. Hoffman by adding the activist element to whistleblowing as undercover reporting. Now, whistleblowing has become an activity where the whistleblower actively goes undercover by penetrating into the organization in order to uncover and document violations of basic human rights in organizations, trusting the public sphere as a force able to create progress on the basis of an informed discussion. NGOs and human rights activist can learn a lot from this and use this method to work systematically to detect hidden human rights violations in organizations. Wallraff's approach is in line with the Kantian urge to protect human dignity, but it also breaks with the Kantian tradition from a Marxist, existentialist, and body phenomenological perspective. Whistleblowing in order to detect violations of human rights in organizations can therefore be considered in the perspective of the universal dignity approach to human dignity, but it also goes beyond that concept by focusing on engaged whistleblowing as existential commitment based on human authenticity. Whistleblowing as role-playing is also an art of taking over identities in organizations in order to have better access to the effort to detect injustice and wrongdoing in organizations with the focus on protecting human rights in the workplace. Radical activist whistleblowing makes whistleblowing a way of life searching for authentic human existence in the fight against injustice to promote human rights in business.

Communication and Public Constructions of Business Legitimacy

Business Legitimacy and Communication Ethics: Discussing Greenwashing and Credibility Beyond Habermasian Idealism

34

Mario D. Schultz and Peter Seele

Contents

Abstract

In the chapter, we present and discuss the concept of legitimacy as established in business literature from an ethical perspective. After a brief outline of different ethical lenses such as virtue ethics, deontology, and utilitarianism, we identify Habermasian discourse ethics as communication driven approach already established in the literature. The core of the article consists of two parts: "Legitimacy lost" and "Legitimacy gained." Legitimacy lost addresses the various situations where companies struggle with a legitimacy deficit: We make use of the greenwashing concept to illustrate the loss of legitimacy in a communication ethics perspective. In this way, we first introduce the standard definitions of greenwashing going back to the invention of the term from "towel-reuse" in the hospitality industry, which focusses on

the misleading communication of corporations. Subsequently, we present the latest research on greenwashing, redefining greenwashing from a co-constructivist perspective that incorporates not only the sender but also the receiver of a greenwashing message. The second part "Legitimacy gained" deals with the concept of credibility. The context of application chosen here is CSR reporting as an example for (potentially) participating at, and contributing to deliberative democracy – and corporate political activity aka lobbying and here more specifically astroturf lobbying as an example to proactively undermining the (idealized) political role of corporations. We, therefore, discuss in conclusion the limitations of communication driven, Habermasian Political CSR as idealized normative thinking. As a final outlook, we present future questions and possible answers to the limitations of the Habermasian approach depicting the implications of digitalization, which can lead to "data deliberation" a form of corporate legitimacy creation through bottom-up transparency, standardization, and accountability in the digital democracy of tomorrow.

Business legitimacy · Habermas' discourse ethics · Moral legitimacy · Greenwashing · Credibility · CSR reporting · Corporate political activity · Digital democracy · Data deliberation

Introduction: Ethical Lenses and the Suitability of Habermas' Discourse Ethics

Business legitimacy has evolved into a central concept in Communication Ethics. It is defined as "generalized perception or assumption that the actions of an entity are desirable, proper or appropriate within some socially constructed system of norms, values, beliefs and definitions" (Suchman 1995). The legitimate behavior of an organization can be viewed from three distinct perspectives: cognitive, pragmatic, and moral legitimacy (Suchman 1995; Long and Driscoll 2008). Whereas cognitive legitimacy refers to taken-for-granted norms and values of an organizations' presence in society (Wagner and Seele 2017), pragmatic legitimacy stems from the benefits that an organization's existence and actions can yield for society (Scherer et al. 2013). Both cognitive and pragmatic legitimacy mainly rest on the corporate compliance with national regulations and the assumption of stable societal expectations (Palazzo and Scherer 2006). In contrast, moral legitimacy is permitted to a corporation based on its conformity with (dynamic) social values and responsibilities and thus, relates to the moral judgments of the corporate conduct and behavior (Long and Driscoll 2008). What is deemed "appropriate" or legitimate also depends on the ethical principles in a given societal context. In this regard, three major streams of ethical thinking (Virtue ethics; Deontology; Utilitarianism) have served as the analytical basis for moral legitimacy issues. In addition, this chapter focuses on Habermas' notion of discourse ethics, which recently gained novel traction in its extension as political CSR (Scherer and Palazzo 2007). Political CSR allows for a deliberative legitimation process in which corporations can actively engage in as political actors. Thus, the discourse ethical stream of moral legitimacy in its contemporary form has high practical relevance for practitioners (Scherer and Palazzo 2011).

Virtue Ethics

Virtue ethics describes individual and organizational virtues and vices by building on Aristotelian virtue ethics (Fernando and Moore 2014). Aristotle can be seen as "the first business ethicist," advocating the idea that the individual is embedded in a broader community and should promote the well-being of society by striving for individual virtues, such as integrity (Solomon 2004). In turn, the larger community determines the positive character traits of the individual. Corporate legitimacy builds on customs and social recognition highlighting the possibility of those with a legitimate interest (stakeholder) to intervene in corporate actions of their concern (Sison 2011). Thus, legitimacy from a Virtue Ethics perspective is dominated by the role of the individual that is embedded in the organization. Hence, the limitations of this ethical stream arise in the form of the bounded rationality of individuals, who may have self-serving biases that are not favorable to the broader society (Solomon 2003). Boddy (2011), recently discussed the role of "Corporate Psychopaths" in this regard, and their role as a cause for the Global Financial Crisis. Moreover, Virtue Ethics – as a character-based approach – is often criticized for its aspirational nature, emphasizing what a person should do rather than focusing on what actions or behavior is permitted.

Deontology/Kant

In contrast, deontological ethics follows a rule-based approach, considering the duties of an individual and the rights of others. According to Kant's categorical imperative, individuals should act only in such a way they want it to become a universal law. Therefore, some actions are seen as intrinsically good or bad. From a deontological perspective, upholding the rules is fundamental, and people should act according to them – regardless of the consequences. Consequently, a rule-based approach to legitimacy faces the challenge that certain groups or individuals are entitled to be treated in a given manner, yet, when the rights of individuals or groups conflict, Deontology provides limited guidance on how to balance them (Gao 2008). Transferred to the business context, this raises the question, which rules to follow and whose rights are prioritized; id est will the shareholder's demand for higher dividends be prioritized over employees demands of a salary increase or the other way round?

Utilitarianism

Rather than focusing on the intrinsic value of actions, Utilitarianism is concerned with the outcome or consequences of actions. A behavior is deemed appropriate in a moral sense, if it maximizes the utility, meaning the maximization of happiness for the highest number of people while reducing adverse externalities (Gustafson

2013). This traditional formulation of Utilitarianism has evolved and presents itself as a cost-benefit analysis of business behavior in today's societies (Gao 2008). Gao (2008) points out that the cost and benefits may take the form of economic, social, and human value, measured in monetary, societal, and emotional value. Thus, the calculation of legitimate business behavior is given, when the benefits outweigh the costs. In turn, corporate conduct is likely to be unethical once overall cost for society is higher than the benefits. The practical limitations of Utilitarianism lie in the limited possibility to foresee the outcome of future actions, and thus, the potential consequences for society. Further, minority voices are overruled by the net benefit for the greater society. Ultimately, moral legitimacy that follows a Utilitarian approach might solely focus on the result, overlooking the means taken to reach it.

Discourse Ethics/Habermas

Ethical discussions often center on the three previously mentioned streams overlooking the discourse ethical approach. Particularly representative in this stream is Habermas' conception of discourse ethics (Harbermas 1984, 1987), which extends to the concept of deliberative democracy (Habermas 1996) and is also the point of reference for discussions about business legitimacy as Political Corporate Social Responsibility (Scherer and Palazzo 2007, 2011; Scherer et al. 2016; Scherer 2017). Discourse ethics prescribes rules for governance participation that rest on the criteria of non-persuasiveness, non-coercion, and expertise (Moon et al. 2005). Further, it is a process-focused approach that evades moral judgments of norms as opposed to the other ethical streams. The moral legitimacy underlying the Habermasian discourse ethics rests on communicative validity. Thus, individual validity claims are brought forth in a deliberative communication process, in which others can challenge the initial claim to arrive at a joint validity that goes beyond negotiation (Sabadoz and Singer 2017). Essentially, the deliberative process leads to legitimate decisions, actions and thus societal legitimacy.

Legitimacy Lost: Greenwashing

What is Greenwashing: The Standard Definitions

Complex ecological problems are increasing worldwide, bringing the planet to its limits. As a result, 'Planetary Boundaries' have been or are about to be reached – particularly concerning climate change, the global nitrogen cycle, and the loss of biodiversity (Whiteman et al. 2013). Business firms are criticized and depicted as one of the causes for the worldwide ecological problems. As a consequence, environmental and social management has become a critical aspect of their business conduct to assure the social legitimacy of the firm (Walker and Wan 2012). However, corporate scandals and catastrophes – such as the sinking BP's Deepwater Horizon – remind the public that corporate commitment to address environmental problems often remains a mere symbolic communication gesture, also known as greenwashing

(Matejek and Gössling 2014). Marciniak (2010) describes greenwashing as a negative form of ecological marketing and “the unjustified appropriation of environmental virtue by a company to create a pro-environmental image.” The term “greenwashing” was established over 30 years ago in 1986, when the biologist and environmentalist Jay Westerveld used the word to stress environmental hypocrisy in the hotel industry (Pearson 2010). Westerveld criticized hotels for promoting a green image by putting up signs that are encouraging the reuse of towels to save water, whereas the real intention aimed at profit maximization by cutting laundry costs. While greenwashing emphasizes the link to the natural environment, the closely related term “bluewashing” is used to indicate the connection to the blue color of the United Nations and its Global Compact (UNGC) initiative. The UNGC encourages socially and environmentally responsible business conduct with several thousand-participant companies worldwide. The symbolic adherence to ten UNGC principles and the exploitation of its lack of mechanisms to monitor compliance has been portrayed as bluewashing (Stamoulakis and Bridwell 2009). The term greenwashing is more commonly used than bluewashing, which is also reflected by its entry in the Oxford English Dictionary: “The creation or propagation of an unfounded or misleading environmentalist image” (Oxford English Dictionary 1990).

Motives for Greenwashing

An environmentalist image can be advantageous for a firm because it is associated with an enhanced reputation (Baum 2012), consumer purchase intention (Spack et al. 2012), and willingness to pay (Laroche et al. 2001). Most importantly, greenwashing is seen as a corporate activity to attain legitimacy, which in turn is critical for a wide range of corporate activities, such as resource access, the attraction of workforce, and business relations (DiMaggio and Powell 1983; Walker and Wan 2012). Legitimacy leads ultimately to increased financial performance (Deephouse 1999). Thus, corporations have strong incentives to engage in greenwashing. However, when a company is accused of greenwashing, the consequences can be detrimental.

A Co-constructionist View on Greenwashing: Accusation-Based Definition

Due to its disguised nature, greenwashing is not always obvious and is often interpreted differently. The tourism industry shows that a green standing does not always go along with responsible business conduct. In a study about ecotourism on the Galapagos Islands, Self et al. (2010) distinguish between “ecotours” and “greenwashed tours,” which both claim to protect the fragile biodiversity, yet differ substantially in their actual commitment. Seele and Gatti (2015) therefore argue that greenwashing lies in the eye of the beholder, meaning that the external accusation determines whether the corporate behavior is deemed to be greenwashing. The authors suggest an accusation-based definition of greenwashing consisting of: **greenwashing** (misleading green message of a firm and a greenwashing accusation), **false greenwashing** (consistent green message of a firm and a greenwashing accusation), **no greenwashing** (consistent green message of a firm without accusation), and **potential greenwashing** (misleading green message without accusation) (Seele and Gatti 2017). Consequently, greenwashing can remain covered, fostering a firm's legitimacy. However, when the watchful eye of the public raises a greenwashing accusation – regardless of its justification – a firm can easily slide into a legitimacy crisis.

A legitimacy crisis can be viewed as a process-element that emerges from the interplay between legitimacy and greenwashing. The process can be divided into three phases: building, losing and/or restoring legitimacy. Legitimacy can be built on different pillars: (1) strategic manipulation (pragmatic legitimacy), (2) isomorphic adaptation (cognitive legitimacy), and (3) moral reasoning (moral legitimacy) (Seele and Gatti 2017). In an attempt to gain pragmatic legitimacy, companies strategically and "instrumentally manipulate symbols to attain social support," often resulting in greenwashing accusation (Seele and Gatti 2017). As a result, instrumental legitimacy may last only for a short amount of time. *Cognitive legitimacy* is usually achieved when corporations mimic common/institutionalized business practices in response to uncertainty (DiMaggio and Powell 1983). However, "doing what everyone else does" can also lead to disparities between corporate claims and societal expectations, limiting the chances of gaining durable social acceptance. Thus, from a long-term perspective, building on pragmatic and cognitive legitimacy is not ideal. In contrast, *moral legitimacy* is gained when corporations engage in deliberative discourse to meet societal expectations. Although, this moral legitimacy building process can fail if no consensus is achieved, an infinite number novel attempts can be made. Moreover, moral legitimacy-building provides an avenue, when overcoming a legitimacy loss (phase 2), resulting for example from a greenwashing accusation, and when restoring legitimacy (phase 3). Ford Motor Company can serve as an example in this regard. The corporation managed to overcome a greenwashing accusation and turned into a celebrated "green" car manufacturer through a moral legitimacy building process (Mitchell and Harrison 2012). The next paragraphs will center on how businesses can gain moral legitimacy.

Legitimacy Gained: Credibility

Application Context 1: CSR Reporting

Corporations can engage in voluntary Corporate Social Responsibility (CSR) activities, such as CSR reporting to express their environmental and social commitment. CSR reporting is also known as non-financial reporting and is usually carried out by following a reporting guideline such as outlined by the Global Reporting Initiative (GRI), or ISO 26000 (Knebel and Seele 2015). CSR reporting is becoming widespread and even mandatory in some countries like India and for certain company types such as recently in the European Union (Gatti et al. 2018). Firms can signal their compliance with environmental and social standards to external stakeholders via CSR reports. This is a crucial step when it comes to establishing legitimacy or regaining legitimacy. However, CSR reports are often used as a tool for instrumental communication, and thus, tend to focus on mere pragmatic legitimacy. The reports' lack of comprehensiveness, accessibility, and comparability and the amount of flexibility in the disclosure of non-financial data have been criticized in this regard (Knebel and Seele 2015). Thus, CSR reporting practices do not always go along with an increase in public trust or confidence in the business performance. This lack of trustworthiness is known as "credibility gap," challenging the legitimacy of a firm (Dando and Swift 2003). Seele and Lock (2014) argue that credibility gaps arise when CSR reports are used as one-way communication tools that inform, rather than interact or engage stakeholders.

CSR Reporting in a "Deliberative Democracy"

CSR reporting in a Habermasian sense avoids the credibility gap that stems from pragmatic and cognitive legitimacy-building processes (Wagner and Seele 2017). Gaining moral legitimacy is at the center of political CSR and its deliberative underpinnings (Scherer and Palazzo 2011). In this sense, a firm's (moral) legitimacy rises from credibility, which is attained through ethical discourse leading do discourse ethics contributing finally to deliberative democracy. The ethical discourse follows the four Habermasian validity claims of communicative action (truth, sincerity, understandability, and appropriateness) and political CSR's demands of open discourse, participation, transparency, and accountability (Lock and Seele 2016b). Transferred into practice, this means that political CSR reporting goes beyond one-way communication and involves inter alia weblogs, social media and Wikis, but also unpublished communication means, such as stakeholder roundtables, and dialogues with employees, NGOs, and advocacy groups (Seele and Lock 2014). To raise reporting credibility and thus legitimacy, Lock and Seele (2016b) advice firms to focus on comprehensiveness, truth, sincerity, and stakeholder specificity of their CSR reports and regulators to provide a level playing field regarding CSR reporting regulations. In sum, corporate communication practices that are embedded in political CSR focus on a broad foundation of discourse and deliberation that is essential to establish sustained (moral) legitimacy. The described form of political corporate action should, however, not be confused with corporate political activities, which are more generally known as lobbying.

Application Context 2: Lobbying and Astroturf: Credibility Crisis in CPA

Corporate political activity (CPA) is defined as "corporate attempts to shape government policy in ways favorable to the firm" (Hillman et al. 2004). CPA functions as an umbrella term to subsume corporate activities that include inter alia campaign contributions, (direct) lobbying, government membership on company boards, voluntary agreements, PACs (political action committees), constituency building (forming grassroots and Astroturf groups) and sometimes even illicit practices such as bribery (Hillman et al. 2004; Lawton et al. 2013). The question has been raised whether firms should be allowed to influence public policy or even have a legitimate right to do so – in other words – is CPA "part of a healthy democracy or a source of perversion" that should be regulated (Dahan et al. 2013)? (Dahan et al. 2013). Since CPA is understood, practiced and perceived differently across countries, there is no unanimous answer to this question. Whereas some actions, such as bribery are widely denounced and prosecuted as an illegal practice, other CPAs are subject to context-specific interpretation, which leads to varying classifications of their legitimacy. Particularly noteworthy in this regard, are corporate constituency building processes that tap into legal grey zones. They go along with ethical challenges and frequently have detrimental legitimacy effects on the firm if they are discovered.

Lobbying: From Grassroots to Astroturf

In recent years, traditional forms of lobbying have been received as increasingly ineffective. In contrast, the so-called grassroots lobbying has become a rising star. In grassroots lobbying, a lobbyist indirectly influences policymakers and the governmental agenda by involving civil society through citizens' movements that have a stake in an issue of concern (Lock and Seele 2017). Grassroots lobbying is a two-stage process in which lobbyists contact citizens, which in turn reach out to politicians via phone or email. The effectiveness of this lobbying strategy stems from the authenticity, trustworthiness, and credibility of the citizen group, which can exert power through their vote during an upcoming election (McGrath 2005). Grassroots lobbying can thus be seen as a legitimate democratic process that gives voters a (more) substantive collective voice.

Hitherto, on some soil grass does not grow, which led to the invention of Astroturf. Astroturf is a form of artificial grass, symbolizing the instrumental inversion of authentic grassroots activism (Lock et al. 2016). Astroturf lobbying is pseudo-grassroots lobbying meaning that "apparently grassroots-based citizen groups or coalitions that are primarily conceived, created and/or funded by corporations, industry trade associations, political interests or public relations firms" strive to exert political influence (Sourcewatch 2018). The lobbying strategy stretches the boundaries of legality, as the sponsoring and orchestrating company remains in the dark (Lyon and Maxwell 2004). The covert sponsorship is thereby the decisive element that marks the line between unintentional and intentional mislead. Regardless of legal sanctions that such a strategy might have and which are usually country-specific, if Astroturfing is uncovered, it can result in a significant legitimacy set-back, similar to the consequences of a greenwashing accusation. In fact, it is no coincidence that CSR and CPA – and likewise their instrumental inversions such as greenwashing and astroturfing – often share specific overlaps and should therefore not be treated in isolation.

As outlined by den Hond et al. (2014), the relation between CSR and CPA can take three states: misalignment, non-alignment, and alignment. In the case of misalignment, the company strives to accomplish diverging effects concerning a policy matter. An exemplary "worst case" of misalignment is, therefore, greenwashing combined with Astroturf lobbying. In such a scenario, the company follows a two-pronged approach of presenting a misleading environmental image to the public while at the same time covertly lobbying regulatory entities for lower environmental standards (den Hond et al. 2014). A non-alignment of CSR and CPA may evolve but can also be a deliberate firm choice. As a result, a non-alignment, as well as a misalignment of CSR and CPA, can substantially affect corporate reputation and compromise the ongoing legitimacy of a firm (Anastasiadis 2014). To avoid reputational and legitimacy losses firms can strive for CSR and CPA alignment.

Alignment of CSR and CPA: "Deliberative Lobbying"

Deliberative lobbying bridges CSR and CPA by setting out a minimal standard for CPA to coincide with proclaimed CSR strategies. It is defined as "a corporate political activity aligned with CSR that, based on discourse, transparency, and accountability, aims to resolve public issues" (Lock and Seele 2016a). Similar to political CSR reporting outlined above, the discursive pillar builds on Habermasian discourse ethics and the four validity claims of ideal speech. The exchange of arguments – on an equal level – is central, which is giving minority voices the possibility to participate in a dialogue that reaches consensus through the quality of the argument and not the power or position of an actor (Harbermas 1984). The second pillar of deliberative lobbying refers to transparency and thus, moral legitimacy creation. It means that the discourse process needs to be transparent to all stakeholders, giving them the possibility to gain relevant insights into the aspects of their concern. The third pillar of deliberative lobbying rests on the accountability of the actors. Not only should the discourse participants know each other, but also bear the responsibility for their statements and actions. In turn, the other discourse participants can hold them accountable. Corporate accountability is, therefore, an essential element of moral legitimacy that ensures societal control over corporate conduct (Seele and Lock 2014).

In sum, deliberative lobbying takes account of a dynamically evolving world, rather than looking at a static system. Thus, the corporate license to operate is gained through iterative discourse processes establishing moral legitimacy that can be redefined in future deliberations. Deliberative lobbying is, therefore, an "argument to maintain self-regulation against critics claiming that corporations should be excluded from all political processes." (Lock and Seele 2016b). Conversely, the theoretical core of deliberative lobbying – political corporate social responsibility and thus Habermas' discourse ethical approach – does not remain unchallenged. Consequently, the following paragraphs will focus on limitations of Habermas' theory, political CSR, and possible future pathways of moral legitimacy creation, which go beyond the dominant schools of ethics depicted above.

Conclusion: Habermas' Limitations as Idealized Philosophy/Normative Thinking

Habermas' notions of deliberative democracy and ethical discourse represent an idealized philosophy. The theory was developed following World War II encouraging critical thinking and normative reasoning (Wagner and Seele

2017). Thus, the conceptual advancements of it, such as political CSR, remain also normative ideals with aspirational or desirable character (Schultz et al. 2013). Their realization and implementation in real-world settings are challenging and require substantial efforts. The practical limitations – still to overcome – are particularly visible when looking at the political CSR construct and the legitimacy of corporate political action conjointly. Political CSR theory depicts corporations as actors with a political mandate to participate in global governance especially in situations where national governments failed or are unable to uphold their regulatory duties (Scherer and Palazzo 2007, 2011). Still, this corporate political activity – especially in the form of taking over governmental tasks – is marked by a legitimacy deficit that derives from a missing democratic foundation (Wagner and Seele 2017). Corporate governance models worldwide are characterized by leadership that is selected, and not democratically elected. Hence, corporations have no operating license in the sense of political actors (Scherer and Palazzo 2007). *Political CSR* strives to overcome the absence of democratic legitimacy by proactive moral legitimacy creation. As outlined above, this can be accomplished through public dialogue and participatory processes that rest on the democratic mechanisms of discourse, transparency, and accountability. From a practical perspective, democratic stakeholder engagement is realized via CSR reporting in a deliberative sense and multistakeholder meetings, which both serve as tools for moral legitimacy creation. However, the "fuzziness" and nonbinding character of current CSR reporting standards (see, e.g., GRI G4.0) leaves room for reporting that appears to be political in a Habermasian sense (Wagner and Seele 2017). Closer examination reveals that corporations can provide too much information and even report on aspects that have no ground for comparison. Such Information overload and incomparability leave stakeholders uninformed and thus unprepared for an ideal discourse (Wagner and Seele 2017). Consequently, the outlined concepts of "political CSR reporting" and "deliberative lobbying" are exposed to the risk of misuse in the absence of a global governance framework that assures a level playing field in the global political economy (Bobby Banerjee 2014). Thus, the limitations but also the frontiers of Habermasian theory building lie inter alia in the transformation into practice relevant constructs, which can uphold their aspirational normative demands in a day-to-day business setting. In this sense, firm-level but also global governance structures that are based on the foundations of "committed" deliberation are promising future pathways – also for a sustained moral legitimacy of the corporation (Bobby Banerjee 2014; Wagner and Seele 2017).

Outlook: New Approaches Beyond Utilitarianism, Deontology and Virtue Ethics: Digital Democracy and Data Deliberation

In an increasingly inter-connected world dominated by information and communication technologies, corporations can use novel forms of moral legitimacy creation. In this new digital context, it is worthwhile to consider approaches that go beyond the dominant schools of ethical thinking. Progressive digitalization of corporate data and technological advancements are playing a pivotal role, particularly when it comes to CSR reporting (Seele 2016). Whereas early forms of digitalization in the reporting context referred to digitizing written reports into online publications, the more recent digitalization processes indicate a fundamental shift toward digitally enabled transparency and accountability. Thanks to substantial advancements in digital reporting standards that are already in use for financial reporting, CSR reporting can increase its credibility – and in turn firm legitimacy – by building on a unified digital standard, such as XBRL, namely, eXtensible Business Reporting Language (Seele 2016). The XBRL reporting standard is already used by the US Securities and Exchange Commission for digital financial data exchange and has recently moved into the focus of the GRI to advance its CSR reporting standard (Seele 2016). Applied on a global scale, a unified reporting language can offset the previously mentioned lack of comparability of firm data, giving stakeholders the ability to enter an informed discourse (Wagner and Seele 2017). Further, the precision of coding standards that follows from the referencing of CSR indicators to single data points in the XBRL repository signifies a shift toward standardization and rule-based regulation (compare to 1.2 Deontology/Kant). Consequently, the creation and propagation of misleading environmental performance data, as well as the exploitation of legal grey zones through unclear and fuzzy information will be complicated.

The key contribution of a digital reporting standard lies, however, in a 24/7/365 transparency of corporate behavior, which stands in sharp contrast to the current practice of reporting about passed business conduct (Seele 2016). The consequence of this time-ontological shift is twofold. On the one hand, digital transparency stands at the borderline of ubiquitous digital surveillance that can create new challenges for moral legitimacy. On the other hand, real-time sustainability data gives corporations the ability to contribute to the resolution of global public challenges in an entirely new manner of pro-social surveillance (Seele 2016). Corporations are key elements in global societies that are increasingly interconnected, not only by the Internet but also by the "Internet of Things" (Gershenfeld et al. 2004). The "Internet of Things" fosters data generation in an unprecedented manner, such that data volumes "double every 12 h rather than every 12 months, as is the case now" (Helbing and Pournaras 2015). Thus, corporations will gradually contribute to what is commonly known as "big data."

In an ideal scenario, big data can empower citizens and foster the well-being of society at large. In its current form, however, the potential of big data often remains in closed, and or opaque corporate databases, rather than adding value to the broader society. Hence, Helbing and Pournaras (2015) call for the open sharing of data in a digital democracy, outlining that big data can help to solve the world's challenges when governed in a pluralistic and bottom-up manner. The digital democracy framework that the authors depict represents a deliberative approach in a Habermasian sense. Thus, moral legitimacy creation of businesses embedded in a digital democracy can occur through the open sharing of corporate data, building a collective "data commons." The data sharing can contribute to (1) societal debates and support governmental efforts that use data analytics to anticipate and resolve local (Seele and Schultz 2017), and global challenges (Helbing 2013) of the networked society, (2) a responsible governance of colossal transnational projects such as the Chinese Belt and Road Initiative, also known as the New Silk Road (Seele and Helbing 2018), (3) fostering and safeguarding peace (Helbing and Seele 2017). Consequently, for a new form of moral legitimacy creation in the digital democracy of tomorrow, this form of open data sharing can be labeled as "*data deliberation*."

Legitimacy, Political Organization, and Communication

35

Peter Aagaard

Contents

Abstract

This chapter will address the question of public legitimacy in connection to the communication of political governed organizations (PGOs). My point of departure is that legitimacy in the public sphere is a central purpose in the communicative effort of any political governed organization. Overall, the paper takes an institutional approach to the subject and aims to clarify the institutional modes and forms PGOs are embedded in connection to the public sphere, as well as how these forms and modes transform in the public sphere. I will not only address the institutional form and modes but also the agency and strategic ability to influence the challenge of public legitimacy.

Keywords

Political communication · Political organizations · Strategy · Phronesis · Public affairs

Introduction

PGOs, in general, have become more engaged in the fight for positive public attention to legitimize their production of public value (Schillemans 2012: 11). Simultaneously, they also increasingly run the risk of being caught up in public scandals (Allern and Pollack 2012), especially in social media campaigns. Negative public awareness can be devastating for any PGO in the attempt to act and fulfill its role as producer of public value.

Though the risk of negative publicity is growing in the light of media attention and growth of digital media, PGOs are not victims of the increased mediatization, though they may occasionally experience media attention as a witch-hunt. PGOs also use the media and mediatization to manage public attention and awareness. Today, PGOs are expected to be able to justify and clarify or at least explain or excuse their behavior publicly. Ideally, they must be able to influence the public agenda setting, before others set or influence the public agenda for them. Some are better at doing this than others (ibid.: 147).

The paper will be divided into six subsections. After the introduction, the following section will clarify and define the key concepts: political governed organizations (PGOs), communication, and legitimacy are defined and clarified. The next section will consider the external environment for PGOs, especially how environment has transformed, historically, as well as in recent years. The next, and fourth, section changes angle and considers the internal environment of PGOs, especially how the space for strategic efforts and processes can be framed and understood. The fifth section will discuss and relate legitimacy to the question of ethics and political communication. A final section summarizes the chapter and concludes.

Key Concepts

This subsection will clarify the three key concepts: legitimacy, political governed organization, and communication.

Legitimacy

In this chapter, the approach to legitimacy is based on the work of Suchman (1995). Overall, Suchman's perspective can be seen as a synthesis of two different approaches: an agency-oriented approach moving from the inside-out of the organizations and institutional-oriented approach moving from the outside-side of the organization. Both approaches will be considered in this chapter.

Suchman sees legitimacy as “a generalized perception or assumption that the actions of an entity are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs, and definitions” (1995: 574). This approach to legitimacy links back to the concept of logic of appropriateness (March 1991). Logic of appropriateness guides decision-making based on duty, obligations, identity, and social expectations. In their book *A Behavioral Theory of the Firm* (originally 1963), Cyert and March (1992) argued that actors are not only guided by a logic of consequentiality as mainstream organizational theory claimed at that time but also by a logic of appropriateness, where actors do what is considered appropriate or is expected of them in any given situation they are in. Instead of fixed rules and preferences (as in logic of consequentiality), rules and preferences are much more dynamic and shifting, guided by the given situation and context. This means that legitimacy is not a cohesive, one-dimensional phenomenon. Instead, it is social constructed in relation with other actors and dependent of the given context. This also means that there is not just one type of legitimacy but continuously many different forms of legitimacy for actors to consider. Shifts in context or institutional spheres, from state to market, for example (Friedland and Alford 1992; Thornton et al. 2012), will therefore change the social rules and expectations of how to gain legitimacy or to behave legitimate.

As mentioned, Suchman also emphasizes the role of agency (and strategy) in the creation of legitimacy. Here the belief is that organizations can “manipulate and deploy” (1995: 572) symbols in the pursuit for legitimacy. Newer institutional approaches (Thornton et al. 2012) also have an increased focus on agency. In the institutional logics approach, the agent is seen as an institutional entrepreneur in the pursuit of legitimacy, where the overlap of different societal spheres or logics makes knowledgeable agents capable of mixing different institutional logics.

Political Governed Organizations (PGOs)

Political governed organizations (PGOs) are related to the notion of public organizations but yet a broader phenomenon: PGOs are not only municipalities, hospitals, and schools but also include civil society organizations, foundations, political parties, social movements, etc.

Though it is a broad category, the PGO label gains meaning, since political governance today goes beyond the borders of formal state government. Today, a range of private or self-owned organizations becomes subject of increased politicization and/or is linked to polycentric forms of governance. Governance is not only taking place through the formal chain of command in public administration but also through a range of networked relations (Osborne 2006, 2010; Peters and Pierre 1998) and public, semipublic, or informal arenas (Binderkrantz et al. 2015).

PGOs often have an ideological purpose. Their purpose is often value-based instead of profit-driven. If they are not a direct part of the state budget (Aagaard and Agger 2017), they are often financed indirectly by public subsidies, but fundraising and membership payments may also play a role as well.

It may seem that PGOs, which are already publicly funded, have an easy task earning their legitimacy in the eyes of the public, but that is not the case. An overwhelming part of PGOs output/outcome can be described as public value (Alford and O'Flynn 2009; Moore and Bennington 2011; Moore 1995; Vigar et al. 2014). According to Moore (1995), public value can be social, cultural, political, environmental, and economic (see also Bennington 2011: 45). In other words, public value can be rather different things. Consequently, PGOs become subjects for public and political scrutiny of their worth and purpose.

So, proven their worth is a diligent strategic task for PGOs. This became evident after the introduction of New Public Management (Hood 1995) in the 1980s and 1990s, where governments began to treat public organizations as economic responsible entities in themselves, instead of just parts of the larger public bureaucracy (Schillemans 2012: 14). The same can be said, when it comes to PGOs. PGOs though do not only serve politicians and their parliamentary committees. PGOs continuously also need to behave responsible to gain legitimacy in relation to an additional range of stakeholders: that is, the political elected board, citizens who benefit directly from the public value the organization produces, taxpayers, as well as – and not least – the media.

Such a diverse set of stakeholders change the nature of PGOs. They do not contain fixed and formal entities that only need to be economically responsible to gain legitimacy. Instead, PGOs tend to adopt more fluid or flexible entities that shift, depending on relations and context. One example can be a municipality. An NPM-focused national government will evaluate a municipality as a social service provider, but organized local interests will primarily evaluate the municipality as a political community. In other words, when context and stakeholder relations change, the criteria for legitimacy changes.

Communication

Managing legitimacy "rests heavily on communication" (Suchman 1995:586). In this chapter, communication is associated with public and political communication. This means that the communication of PGOs is mediated through the public sphere. The purpose of this communication is to gain or sustain legitimacy in the eyes of the public in general or a specific target group (or stakeholders) that inhabits parts of the public sphere. A long range of different subfields and theories are dealing with different forms of contemporary political communication: mediatization (Strömbäck 2008), public affairs (McGrath et al. 2010), (media) lobbyism (Binderkrantz and Pedersen 2017), and agenda-setting (Baumgartner and Joones 1993; Dearing and Rogers 1996).

Mediatization focuses behavior on drama, simplification, personalization, polarization, and concretization in the fight for public attention (Strömbäck 2008). Scholars like Strömbäck (2008) and Mazzoleni and Schulz (1999) both describe how political actors are increasingly influenced by or dependent on the logic of media. Research in mediatization has grown considerably in recent years. The research has had a tendency to focus narrowly on the behavior of politicians and political parties, but more recent contributions though also look at the mediatized behavior of public administrators and civil society organizations (Korthagen and Klijn 2014; Schillemans 2012).

While PGOs become more engaged in the fight for positive public attention to legitimize their production of public value (Schillemans 2012: 11), they also increasingly run the risk of being caught up in public scandals (Allern and Pollack 2012) or so-called shitstorms in social media campaigns. Negative public awareness can be devastating for any PGO in the attempt to act and fulfill its role as producer of public value.

Outside-In: Institutional Changes Affecting the Legitimacy of PGOs

This subsection will reflect on the outside communicative environment of PGOs and discuss how this environment influences PGOs. In that sense, the section reflects on the "outside-in" institutionalization of PGOs' external legitimacy creation. The environment of PGOs is conceptualized as the public sphere, but even the institutional structures of the public sphere are transforming. So, the focus will be on the changes of the public sphere and the shifting norms and demands that PGOs need to address to maintain and built legitimacy through public and political communication.

In general, the communicative environment of PGOs has transformed in four historical phases (Blumler 2013; Blumler and Kavanagh 1999), that are closey related to the raise and development of the public sphere and liberal democracy.

The first phase started at the emergence of Rechtsstaat-principles and bourgeois political societies in the early eighteenth century (Fraser 1990). Suddenly, very old forms of PGOs, like religious institutions, found that their dogmatic foundations could increasingly be subject for free, public debate among citizens that valued the freedom of speech. Later on, the bourgeois political societies transformed into editorial press and very early forms of PGOs, such as political parties and civil society movements.

The second phase emerged in the dawn of welfare state and electronic mass media, first the radio and later on, in the post WW II era, the television. Along with the welfare state also came the notion of state-driven public communication. Now, the state became an active player in the creation of new norms of citizenships. The welfare state constructed new roles of citizenship, such as being a public school student or an elder care patient. To maintain legitimacy a long range of PGOs needed to influence the construction of these new roles of citizenship. Consequently, public communication becomes a professional task that PGOs were expected to solve. Increasingly, the professional public communicator needed to be able to manage public campaigns and measure mass media effects on target groups through focus groups and surveys.

The third phase began in the aftermath of Western welfare state crisis in the 1970s, where governments introduced new austerity politics. Governments installed the institutional framework of managerialism (New Public Management) into public organizations and later into a long range of civil society organizations (Mazzoleni and Schulz 1999; Schillemans 2012). Now, every PGO was an economic responsible entity in itself that could be subject of public scrutiny and debate. In addition, the public sphere was marked by austerity and marketization among the independent editorial media organizations. Newspapers saw their readers immigrate to electronic media, and public service television saw their audiences immigrate to private broadcasters. Meanwhile, politics was also commodified, as political actors started to become involved in political marketing (Sparrow and Turner 2001). Public attention among PGOs also needed to be gained the right way and by the right target group, so now priming (agenda-setting) and framing (McCombs 2005; Scheufele 2000) was no longer just a task for the media but for any strategic, political actor. The overall increased fight for attention among political actors and media outlets leads to early forms of mediatization (Mazzoleni and Schulz 1999; Strömbäck 2008). Consequently, during the 1990s and 2000s, mediatization as a new institutional logic began to influence the legitimacy creation of PGOs.

The fourth phase emerged in the aftermath of the financial crises in 2008. Priming and framing is still important, but more is expected of PGOs. Audiences immigrate once again, from traditional mass media to new digital media platforms. Due to digitization the structure of the public sphere has become a hybrid of editorial media and social media (Bennett and Segerberg 2012; Chadwick 2011). The hybrid public sphere is combined with continued demands for mediatization and increased demands for strategic professional communication across different media platforms and spheres of influence. Today, PGOs must learn to micromanage their entire stakeholder relations professional and to use the hybrid public sphere to do so. The needs and demands of every individual citizen can in principle be traced and stored through the tools of digitization (Bennett and Iyengar 2008: 707), and the production of public legitimacy can then become a much more flexible task where individual citizens may be approached as target groups. Digital technology is able to do this already, but legislation like the GDPR may circumvent the full range of the technology, since citizen surveillance is often a precondition for its use.

As implied, each new phase has meant new norms for communicating and new forms for proper PGO conduct in the public sphere. In addition, the structure of the public sphere has shifted dramatically. Today, it no longer makes sense to see the public sphere as one, united sphere as in the eighteenth century. Neither is the public sphere a place, where political actors are able to raise above their own strategic interests to found the most rational solution to the problems of the common good. Instead, the public sphere is fragmented or consists of different niches (Mazzoleni and Schulz 1999), where each niche can be seen as a habitat for one or more PGOs. These habitats and their discursive processes need to be nursed by professional communicators to maintain an inhabitable environment for PGOs. Seen this way, the

Table 1 PGOs and the four phases of communication

Phase of political communication	Public sphere characteristics	New logic of appropriateness for PGOs
1. *Rechtsstaat regime emerge*	Meeting place for free citizens, mediated by newspapers	PGO as subject for free, public debate
2. *Welfare state regime emerge*	Electronic mass media emerge	PGO must be professional, public communicator
3. *Marketization regime emerge*	Public sphere as market of attention	PGO must engage in mediatization to gain attention
4. *Digitization regime emerge*	Public sphere as a hybrid of edited media and social media	PGO must be a strategic communicator across several media platforms

public sphere today is more like an ecosystem, where niches are constantly framed and edited by outsiders. This development urges PGOs to take responsibility for their own niche. Table 1 summarizes the four phases.

It is important to emphasize that the phases do not mean that public and state regimes are replacing each other historically. Instead, a new phase represents a new archeological layer of institutions. New forms, modes, and types of praxis emerge on top of older ones and transform how the public is perceived and how key actors organize.

Furthermore, it is important to emphasize the importance of the niche in the fourth phase of political communication. Though the environment poses many similar demands and expectations across the broad spectra of PGOs, it is important to remember that there still is a huge difference in the occupying the niche of, for example, a public school compared to the niche of a social economic firm.

Inside-Out: Managing PGO Legitimacy

A long range of different questions arise for PGOs in the fourth phase that all affect legitimacy. Especially questions of transparency and whistle-blowing become increasingly relevant in a hybrid media system, where information can easily be moved, copied, or hacked. PGO strategists must ask themselves questions like: What information is important for us to obtain through digital and social media? How much should we surveil users and citizens through digital media? What information is important for us to communicate and to whom? How open and transparent should we be? What information should be free for users and for citizens? How should we deal with whistle-blowers? How much should we cooperate with external media? How should we deal with public citizens' initiatives in our field? How much should we and how do we influence political decision-making through the public?

While the fourth phase of political communication pushes PGOs toward professionalization, mediatization, and digitization, PGOs can also make organizational responses to the fourth phase development. Most theories on political communication focus on the external communication, through priming and framing, public relations, etc. Therefore, the subject of *internal organizing of external* *political communication* is rather underdeveloped. The division between external and internal can be rather artificial, though, when even employees can be stakeholders, the PGO leadership may best reach through the public sphere.

The increased need for PGOs to nurse their niche, agenda set, and opinion shape elevates the importance of strategic political communication (Moss et al. 2012: 58). Therefore, strategic organization of political communication has become an unavoidable task for the leadership of PGOs. While the strategic responsibility for public legitimacy creation previously was in the hands of the communication consultant or the spin doctors of political parties, this responsibility has now been elevated to the administrative front office or the political secretariats of the leadership of PGOs and is connected to a broader set of competences and more complex strategic endeavors.

To increase their success in the digital age of communication, there is range of different task PGOs can obtain:

- They can produce and communicate their own data on emerging political issues.
- They can produce and communicate their own data on their production of public value.
- They can use digital platforms to publish themselves.
- They can hire public affairs consultants.
- They can conduct media lobbyism (Binderkrantz & Pedersen) and issue management (Mcgrath et al. 2010) with the aim of nursing the niche of the public sphere that they inhabit.

To adopt strategic modes and targets as these PGOs still depend on financial resources, they also need access to information and people with the right capabilities and skills.

Two interconnected bodies of literature, which I label public affairs and policy professionals, describe the new roles and forms of praxis that shape PGOs in the fourth phase:

Public affairs is the external noncommercial activities of the organization. It is about the wining and creation of legitimacy through good stakeholder relations, but the literature also describes the emerging profession of public affairs consultants and their capabilities. The public affairs consultant conducts issue management. That is the ability to timely introduce new issues or to influence how new issues and trends are perceived by selected audiences (McGrath et al. 2010: 343). As a profession public affairs has spread across political communication, marketing, and management (Moss et al. 2012). Sometimes the public affairs concept is used interchangeably with lobbyism (McGrath et al. 2010: 336), though lobbyism as a profession often has a more narrow focus on influencing the formal political decision-making through direct contact. Others (Binderkrantz and Pedersen 2017) make a distinction between inside lobbyism (classical backstage lobbyism) and outside lobbyism (through the media). Public affairs contains both stakeholder relations and inside and outside lobbyism.

Policy professionals were originally described by Hugh Heclo (1978). He saw them as a new political elite that was central to the issue interest networks he argued exists across national politics. Recently, scholars have used the notion of policy professionals to describe a similar phenomenon in Scandinavian, primarily in Swedish, politics (Garsten 2014; Svallfors 2016a, b). Policy professionals are not traditional lobbyists or typical public affairs consultants but have a broader set of capabilities. They often have a university degree as well as experience from state administration or communication consultancy in political parties (Blach-Ørsten and Willig 2016). They have a deep understanding of national political processes (Garsten 2014: 20; Svallfors 2016a: 59), both frontstage and backstage processes, and they are often well connected to both journalists and editors in the media, as well as to top bureaucrats in the state administration. That gives them access to information and relations they can use to launch and frame both policy problems and solutions. While they are driven for the quest for power, media is their most important arena for influence, and knowledge about policy problems and solutions is their most important resource (Garsten 2014: 21). Policy professionals can also be described as a kind of professional political activist, but despite their political idealism, PGOs should not count on their loyalty for too long. According to a Swedish study, policy professionals in average shift jobs after 2 years (Svallfors 2016a: 59).

So what do these public affairs consultants and policy professionals do, when they become employees of PGOs? How can they help make adequate strategic decisions that sustain and build the public legitimacy of the PGO? The ability to make strategic responses is rooted in organizational capabilities and processes. Strategy is not just the result of deliberate choices of management and leaders but is often also the result of practical experience and organizational history. There are different strategic responses PGOs can make, because PGOs are all different. There is no one-size-fits-all procedure to strategy, but different responses to reflect and act on, and different dilemmas to handle. To describe this field of responses and dilemmas, I will combine two classic descriptions of the interior of organizations: (1) the input, throughput, and output and (2) vertical versus horizontal coordination.

Input, Throughput, and Output

All organizations have processes of input, throughput, and output. Reflections on how to handle the flow of information and to sustain and build public legitimacy in each of these processes can improve strategic capabilities (see Schillemans 2012 for a similar approach).

– *Inputs* are about scanning the PGO niche to learn how to operate. All relevant sources of information, both public and backstage office in government, can be relevant sources of information on how to operate and position the PGO.

– *Throughputs* are about the internal processes, where the PGO must decide to what extent internal operations must be adapted to live up to the public legitimacy demands and standards.
– *Outputs* are about the interaction with the external environment – Like news organizations, state agencies, or citizens' initiatives that all affect the public experience of the PGO legitimacy.

Vertical Versus Horizontal Coordination

PGOs react differently to the need for public legitimacy. Some PGOs centralize the management and responsibility of public legitimacy; others spread the management to specialists (Schillemans 2012: 142). Some PGOs are more risk-taking and actively embrace the media as a way of reaching their goals, while others are more risk-averse and mainly want to avoid negative media coverage. The former wants to "use" the media – the latter wants to "handle" the media (Schillemans (2012:147).

This distinction between strategic responses that are more proactive or reactive can also be found in the mainstream strategic literature (Mintzberg 1994). Below, these two types of responses are titled *vertical coordination*, which is associated with the notion of centralized strategic planning (Mintzberg 1994), and *horizontal coordination*, which is associated with the notions of networks and complex responsive processes (Stacey 2001). These two types of responses are both highly relevant and make an obvious clarification of the fundamental strategic dilemmas for PGOs, in the fourth phase: Should our respond be reactive or proactive? Should our respond be centrally or decentrally managed? In each phase (input, throughput, and output), the PGO must decide on vertical coordination versus horizontal coordination or aim for a hybrid form of coordination.

Vertical Coordination

Vertical coordination rests upon the Weberian idea that change can be instrumentally controlled top-down (March 1995, s. 43). The approach builds on distinctions between different levels of the organization: strategy (leadership), tactics (administration), and the operative (implementation). According to Mintzberg (1994: 22), this layering of organizations is the strongest argument for maintaining vertical coordination, since it makes it possible to make distinctions between daily routines and actual change.

Furthermore, proponents of vertical coordination assume that the organization has a unified culture directed toward a unifying, primary purpose. This purpose is assumed not to change. Likewise, the organisation is assumed to have a clear hirarchy, where actors believe they are able to arrange problems, and solutions to public legitimacy in an order of causation. This order of causation tends to follow formal, procedural guidelines, created to manage processes of input, throughput, as well as output. This means that actors can make intended and linear changes to the way the organization responds to public legitimacy questions. In fact, proponents of vertical coordination believe that public legitimacy problems always can be solved by technical-instrumental solution, in the form of new knowledge, rules, or procedures (Organ and Greene 1981). Managing public legitimacy is just a question of defining target groups, defining and framing message, and then allocating sufficient resource to that part of the organization, who according to formal procedure are skilled to solve the problem. The very same approach can also be used, if problems of public legitimacy are outsourced to external public affairs consultants or public relations agencies, who are able to advise the PGO on how to maximize cost-efficiency in the pursuit of public legitimacy.

In general, there is a quest for causal predictability inherent in vertical coordination. The approach favors general modalities, formal rules, and procedures, which managers often believe can be effectively applied to more specified problems of public legitimacy. Through formalized procedures, managers verbalize their intentions and plan how internal or external reality should be altered in accordance with purposes and ideals (Mintzberg 1994: 12–14).

Horizontal Coordination

Horizontal coordination has a different understanding of strategic decision-making and leadership in organizations (Stacey 1995, Stacey 2007, Mintzberg et al. 1994, 2005; Bovaird 2008). Proponents of horizontal coordination tend to see the PGO as a relational, networked, and collaborative organism. Accordingly, strategy is seen as a pattern that emerges from responsive processes based on the simple interactivity among many different actors. The strategic pattern can go across the borders of the organization and enter the public niche the PGO inhabits. External media or involved citizens can be just as important and related to the strategic pattern as the colleague next door. Actors are seen as self-aware, interdependent entities, which are able to act strategically toward a specified goal, but no single actor is in control of the entire coordination (Stacey 2007: 298). This also means that the impact of leaders is limited, though not irrelevant (Byrne 2005; Klijn 2008: 314; Thompson 2004: 416). Authority and expertise are not given but rest on coalitions and recognition based on trust and continued reciprocity. Continuously actors must ask: Who is best, in this given situation, to respond to the emerging and changing demands of public legitimacy, the PGO face? The answer to this question will often lead to decentralization of the decision-making on public legitimacy challenges, to the ones who in the given situation are recognized as experts.

This line of strategic thinking has become part of the mainstream thinking in business management, but it is just as relevant in PGOs (Stacey and Griffin 2006; Mintzberg and Jørgensen 1987; Farjoun 2002; Bums 2002; Davis et al. 2009; Teisman and Klijn 2008; Bovaird 2008: 325; Paarlberg and Bielefeld 2009).

Instead of a simple transmitter-receiver relation (Lasswell 1927), everyone is able to communicate. That also means that direct, causal effect of communicative efforts can be difficult to measure. Output effect may also be the least important issue in horizontal coordination. Instead, new learning in the form of new communication capabilities is often the purpose of horizontal coordination. The aim is not to learn to be more efficient in daily routines but rather to enhance the ability to be more proactive (Paarlberg and Bielefeld 2009: 250). This can, for example, be done by elevating the skills and knowledge of every member of the organizations and not just the few members of the communication department.

The development of new communication capabilities is seen as an evolving, incremental learning process combined with rapid radical change, which has no obvious connection to the amount of resources put into strategic effort (Bovaird 2008: 322).

Table 2 summarizes the strategic space in PGOs, aiming for public legitimacy creation. It is important to recognize that both the vertical and the horizontal approaches have limitations.

Vertical coordination can be related to a profound belief in institutional engineering, where legitimacy can be "deliberately designed, chosen and reformed by actors" (Olsen 2002: 584). This approach is highly criticized by Olsen, because it is "not likely to capture processes of comprehensive reform in complex and dynamic political orders" (Olsen 2002: 582–582) like the ones that exist inside PGOs and their niche of the public sphere. A short-termed effectiveness may be achieved, but it may also be achieved on behalf of exploring the opportunities for more long-term survival (Olsen 2002: 588). PGOs are not rational organizational instruments, and preferences and goals are not consistent, especially not when it comes to legitimacy creation in a hybrid media system. Social media develop so fast (due to technologies like bots, AI, VR, etc.) that social-engineered responses of PGOs become obsolete in the process. Furthermore, the growth in niche media calls for more decentralized or specialized forms of surveillance of the media flow in the input phase, as well as the decision-making on how to respond to news stories and interaction with media in the output phase. You could even argue that in the fourth phase, any PGO professional employee must develop capabilities of public communication. Communication cannot be just an issue for the central communication unit. All PGO professionals must to some extent, and in their own specialized habitat, develop the ability to handle public affairs.

Critics would tend to claim that *horizontal coordination* cannot be a general alternative to vertical coordination. Instead, it should be seen as a supplement. Despite its fragmented character, the hybrid media system is not always fragmented.

Table 2 Strategic space in PGOs

	Vertical coordination	Horizontal coordination
Input	Centralized unit surveils all media flow in a more reactive manner	Decentralized/specialized and more proactive surveillance of selected parts of the media flow
Throughput	Centralized unit decides on the degree of adaptation to external media in a more reactive manner	Decentralized/specialized and more proactive decision-making on the degree of adaptation to external (often niche) media
Output	Centralized unit decides on the interaction with external media	Decentralized/specialized and more proactive decision-making on the interaction with external (often niche) media

Occasionally information circles (Chadwick 2011) centralize the public sphere and focus all attention on one event. These information circles take the form of scandals, shitstorms, or mega events. Here PGOs cannot rely on horizontal coordination but must also have a centralized – or at least an integrated – strategy. In general, vertical strategic planning can hardly be dismissed in any organization that attempts to be recognized as rational. Plans and planning still have a major important role to play in organizations, at least as resources that provide alternative courses of action (Cunha and Cunha 2002). Organizations still need strategic planning to make distinctions between efforts and goals of the daily routines and efforts and goals of their future strategic efforts.

Despite the two approaches, PGOs seldom have to make clear-cut decisions between them. Instead, PGOs can aim for a form of *hybridity*. Many PGOs have a historic preference for vertical coordination. Nevertheless, the fourth phase of political communication creates a need for more decentralized and specialized responses to public legitimacy, so the wind may currently blow in favor of more decentralization in many PGOs.

But in the long run, both vertical and horizontal coordination are needed. Public legitimacy is an outcome of both outside-in and inside-out processes. In other words, it is very difficult to say if it is the PGO leaders' strategic aim of creating public legitimacy that creates professional employees, who aim for public legitimacy, or if it is professional employees with a strong ethos that create the strategic considerations on how to build public legitimacy. In praxis, every PGO will attempt to integrate and balance the two forms of coordination into a hybrid form of coordination.

Legitimacy, Ethics, and Communication

The question of political communication and legitimacy unavoidably relates to how ethical values (like transparency or obligations to inform the public) are developed and practiced in PGOs. Therefore, the last subsection will discuss possible ways for PGOs to work with ethics as an active part of their political communication in the effort of creating public legitimacy. The reflections can be order in three categories, taking place at the three traditional analytical levels of social science:

1. What to expect from the professionals (micro)
2. What to expect from the PGO (meso)
3. What to expect from the branch of PGOs (macro)

What to Expect from the Professionals

At the individual (micro) level, the question of legitimacy can become ambivalent.

On the one side, it is clear that policy professionals of PGOs do not nurse the interest of the public but the interests of PGOs. Often policy professionals in privileged PGOs are caretakers of the power interest of elites. As the "hired guns" of elites, policy professionals may very well make compromises on behalf of higher ethics that in the long run may undermine an informed and democratic public debate. In that case, policy professionals tend to exclude the broader public and preserve political communication for the elite (Svallfors 2016b: 514).

On the other side, power will always be part of political communication. Likewise, policy professionals will always serve the interests of PGOs. Different political organizations have different – and in general – legitimate interests in influencing the public agenda. So professional communication is not necessarily bad for an informed, democratic public debate, if the outcome is a diversity of sources informing the public. To put it short – morally speaking – policy professionals in PGOs are acting with legitimacy, when they are *making* the news. However, if they are *faking* the news, they are clearly acting with illegitimacy.

Professional mind-sets and ethics become a challenge and a key asset in the age of digital communication. When the technological possibilities for data-driven communication are growing, data is no longer what is missing. What instead becomes a challenge is the ability to ask clever questions of how to create public value from the growing amount of data. Therefore, professional judgment may be even more important than before.

To take care of their role in legitimate ways, policy professionals in PGOs could aim for value-based wisdom in their daily judgments. Such an orientation is linked to the notion of *practical wisdom* and *practical ethics*, also known as *phronesis*. Phronesis is an ideal for practical action that takes account of the contextual circumstances, hereunder the distribution of power. As such it is not objective, but rather a value-based form of knowledge, which comes to life as a habitual disposition, when policy professionals try "to do the right thing, at the right time and for the right reason" (Küpers and Pauleen 2015 (online version): 494). Practical wisdom and ethics thus place the daily and habitual experiences of professionals at the center of attention and put practical knowledge into focus (Flyvbjerg 2006: 371; Nonaka and Takeuchi 2011: 59).

What to Expect from the PGO

We can also find the ambivalence of legitimacy at the organizational level (meso). PGOs are often subjected to two forms of legitimacy that can be labeled window in and window out (McGrath et al. 2010: 338).

Window out – deals with the inside-out processes described above. It is about the capability to enact and appeal to the outside world by communicating the values of the PGO to stakeholders. Ideally, this enables the organization, especially the leadership of the PGO, to influence the outside and enact the world in the PGO's own picture. Such external legitimacy may not necessarily be public or address the common good, but it can very well be so, if citizens, clients, or media organizations are among the stakeholders.

Window in – deals with the outside-in processes described above. It is about the external demands and societal values imposed on the organization. Window in can therefore be described as the “window” through which society influence on the internal organizational modes. The ideal is that the policy professionals take upon the responsibility to inform or even educate the organization and its leaders in how the outside world wants the organization to behave: Where and how are the winds of change blowing? What new trends can we expect to transform the niche, we, as a PGO inhabits (Ibid: 337)?

Window in and window out build on an idealistic notion of the relationship between organization and society. Instead of understanding communication as a form of simple transfer of information from organization to a passive audience in the outside world, the ideal is that the organization should seek a relationship, characterized by reciprocity, symmetry, and dialog. Of course, this is easier said than done. Window in and window out represent a double legitimacy relationship: On the one hand side, policy professionals must obtain legitimacy in the eyes of their PGO leadership. On the other hand, policy professionals must also gain legitimacy in the eyes of external stakeholders. There may not always be a conflict between window in and window out legitimacy, but often there is, and it is the task of policy professionals to navigate and handle this. Again, policy professional can base their navigation on a *phronetic* form of communication.

What to Expect from the Branch of PGOs

PGOs are a rather compound set of organizations, spread all over the state organization and civil society. This spread makes it difficult to perceive PGOs as one common branch. However, as described above, they also share a range of common features, like political- or value-based governance and the production of public value.

PGO also shares an embeddedness into a hybrid media system. As part of this system, PGOs must recognize that citizens and other stakeholders are not necessarily passive. Instead, social media can make citizens co-producers of political communication and thereby enable them to influence the niche of the public sphere that the PGO inhabits. So, PGOs and their audiences will occasionally take part of the same circles of information (Bennett and Segerberg 2012; Chadwick 2011). Instead of neglecting this new media reality, PGOs should support transparency and participatory democracy.

Social media in itself will not enable citizens, though. It still takes many resources to facilitate a strategic effort, also in a social media landscape. Especially those PGOs that are part of the state organization have a huge responsibility, when it comes to secure open access to new digital media platforms (Blumler and Gurevitch 2001: 9).

Again, a phronetic orientation in PGOs could be useful. Accordingly, any PGO should continuously try to answer simple questions, such us: Who benefits and who loses from our actions as PGO? Is this outcome fair and justifiable? How do our actions as PGO affect the common good? What are the democratic consequences of our actions?

Summary and Conclusions

Suchman emphasizes that legitimacy creation “rests heavily on communication” (1995: 586). Therefore, in this chapter, I have addressed the question of legitimacy creation for political governed organization (PGO), with a special focus on the communication task. Communication is associated with public and political communication.

PGOs are primarily value-driven instead of profit-driven. Accordingly, they are situated in the organizational body of government or in the civil society. Their purpose is, in general, to produce public value in the interest of common good of society. Regardless of where they are situated, PGOs today are expected to be able to justify and clarify or at least explain (and sometimes excuse) their behavior publicly.

Suchman’s perspective on legitimacy can be seen as a synthesis of two different approaches: an agency-oriented approach moving from the inside-out of the organizations and an institutional-oriented approach moving from the outside-in of the organization. Since public legitimacy is an outcome of both outside-in and inside-out processes, I consider both approaches in this chapter.

The external (outside) communicative environment of PGOs has transformed in four historical phases, a development that is closely related to the rise of the public sphere and the liberal democracy. Today, due to digitization the structure of the public sphere has become a hybrid of editorial media and social media (Chadwick 2011; Bennett and Segerberg 2012). This hybrid public sphere is combined with continued demands for mediatization and increased demands for strategic professional communication across different media platforms and spheres of influence. Each PGO is expected to take responsibility for their own little niche in the public sphere.

To describe the internal inside-out approach, the chapter combines two classic organizational models to frame the strategic space of PGOs: (1) an information process model, based on input, throughput, and output, and (2) a model of two types of coordination, horizontal and vertical. Vertical coordination is associated with a notion of more centralized planning, while horizontal coordination is associated with more networked form of strategic action. In the long run, both vertical and horizontal coordination are needed.

Finally, the chapter addresses how political communication and legitimacy relate to ethical values in the public. The reflections are order in three categories: (1) what to expect from the professionals, (2) what to expect from the PGO, and (3) what to expect from the branch of PGOs. Here I argue that a quest for more phronesis – the enactment of practical wisdom and practical ethics can help professionals and PGOs – in their communication can help sustain and develop public legitimacy.

Abstract

This chapter focuses on the role of the news media in the creation, maintenance, or disruption of business legitimacy. The chapter first introduces the concept of legitimacy in organization theory and describes the evolution of new institutionalist approaches to legitimacy. The chapter then turns to the role of the news media, which are often seen as a conduit for public opinion with respect to business. Recent scholarship has come to question this passive view and has begun to examine how news media per se exert an influence on business and public opinion. Drawing on research on agenda setting and mediatization, the chapter argues that the news media should be viewed as an independent political institution, embodying particular values and beliefs and playing an active role in the preservation or challenging of organizational legitimacy.

Introduction

This chapter addresses how the news media affect business legitimacy. The point of departure will be institutional theories of organizational legitimacy and work in media sociology and organization and management studies that examines the role of news media in the creation, maintenance, and disruption of organizational legitimacy. The chapter builds on a descriptive approach to legitimacy. A descriptive approach is not preoccupied with the validity or desirability of particular organizational or societal values. Rather, it is preoccupied with the role that such values play in constituting particular organizational entities or activities as legitimate.

The emphasis in the following is on the institutional role of news media. Organization and management researchers often use mass media reports as data sources either to map the actions of organizational actors or as a proxy for "public opinion." Until recently, the distinct role and contribution of media and journalism were scarcely considered. In contrast, the argument in this chapter will be to view mass media as institutions in order to highlight how they play a distinct role in relation to organizational legitimacy. They do not simply reflect broader social values but embody, produce, and reproduce particular values and beliefs.

The chapter is structured as follows: First, it introduces the concept of organizational legitimacy and its key dimensions and describes the evolution of approaches to organizational legitimacy within institutional theories of organization. The chapter then examines the distinct role of media in creating, maintaining, or disrupting business legitimacy, first by challenging conventional views of media and business, then by drawing on the concepts of agenda setting and mediatization to describe the institutional role of news media, and finally by describing the role of news media in relation to organizational legitimacy.

Organizational Legitimacy

The concept of organizational legitimacy stipulates that organizations rely on social acceptance and not only on operational efficiency in pursuing their goals – and indeed to survive. The American sociologist Mark Suchman has offered one of the most influential definitions of organizational legitimacy: "Legitimacy is a generalized perception or assumption that the actions of an entity are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs, and definitions" (Suchman 1995: 574).

The definition involves four distinct claims:

– Organizations always face one or more constituencies or audiences upon whom they rely for approval.
– Legitimacy involves evaluations (passive or active) that render particular actors and actions appropriate or acceptable.
– Such evaluations build on a broader system of norms, values, beliefs, and definitions.
– This system is both a generalized property of organizational environments and, at the same, a social and historical construct, amenable to change.

Suchman's definition draws on several theoretical sources. Max Weber is often cited as the originator of the modern sociological concept of legitimacy, according to which "action, especially social action which involves a social relationship, may be guided by the belief in the existence of a legitimate order" (Weber 1978: 31). The American sociologist Talcott Parsons later rearticulated Weber's definition, in his introduction to a modern sociological theory of organizations. Parsons stated: "the value system of the organization must imply basic acceptance of the more generalized values of the superordinate system" (Parsons 1956: 67f). Conformity or convergence between specific organizational values and broader social beliefs or values was seen a prerequisite of organizational action. Therefore, any organization has an institutional dimension, alongside its task- or goal-oriented function. Theoretically, however, the latter function remained at the forefront of organizational theorizing (and business studies).

From the mid-1970s, the legitimate order or the generalized values of society changed from being a background assumption in organizational theory to a key theoretical issue. In their seminal article on institutionalized organizations, John Meyer and Brian Rowan (1977/1991) suggested that modern organizations were increasingly subject to the forces of highly institutionalized environments in ways that increased formalization (or bureaucratization) regardless of the technical or operational requirements of individual organizations. The authors stated that "formal structures of many organizations in postindustrial society. . .dramatically reflect the myths of their institutional environments instead of the demands of their work activities" (1977: 41). In this view, legitimacy is not a background condition but a force that imposes new and potentially disruptive structural and procedural demands on organizations.

Institutionalized environments, which encompass state institutions, professional associations, trade associations, etc., embody rationalized institutional rules that define roles, status, and appropriate ends and means for particular organizations and actors operating within their confines. Institutional environments justify actors and actions but may also withhold justification – which may have serious consequences: "Organizations that . . . lack acceptable legitimated accounts of their activities. . .are more vulnerable to claims that they are negligent, irrational or unnecessary" (Meyer and Rowan 1991: 50).

From these early formulations came a surge of organizational scholarship that both expanded on the idea of institutionalized environments and identified legitimacy as a key organizational concern.

New Institutional Perspectives on Organizational Legitimacy

The new institutional perspective on organizations involved new and more complex ideas of the nature of the legitimating values and beliefs. W. Richard Scott (1983) summarized the bases of legitimacy in terms of a typology of institutional rules: regulative rules, normative rules, and cognitive rules. In other words, institutional environments encompassed both formal and informal behavioral expectations as well as broader cultural systems of knowledge and meaning. Suchman (1995) added the category of pragmatic legitimacy to indicate that legitimacy may also involve more mundane and interest-based assessments by stakeholders of the value of organizations.

According to the new institutional perspective, to be legitimate as an organization is not only to adhere to general social values and norms or to act within the confines of formal (legal or bureaucratic) rules. Legitimacy also requires organizations to display congruence with particular cognitive structures, such as those conceptions of rational management and hierarchical control that inform public policy or private sector institutions – and to be an organization that other actors consider as “valuable.”

The interest in legitimacy involves a shift from a “logic of consequence” to a “logic of appropriateness” in social science inquiry (March and Olsen 1989). In an age preoccupied with rational decision-making, markets and the celebration of management, building on a model of rational choice, focusing on legitimacy, reinstated an interest in the social nature of choice and action.

Institutional scholars thus challenged the prevailing micro-theories of action and insisted on a sociological and contextual understanding of decision-making, action, and motivation. Here institutional theory offers a meso-level approach that situates organizations and organizational actors in particular institutional environments that are themselves “organized.” Rules of legitimacy may very well be “generalized,” but they are also carried by and reproduced by particular institutions that confer legitimate status upon individual organizations or groups of organizations.

Paul J. DiMaggio and Woody W. Powell drew on the sociological concept of “field” and described how organizations are part of organizational fields that are “sets of organizations that, in the aggregate, constitute a recognized area of institutional life; key suppliers, resource and product consumers, regulatory agencies, and other organizations that produce similar services or products” (1991/1983: 64f).

Within a field, there are particular organizations that have the capacity to evaluate or pass judgment on individual organizations. Institutional scholars have often highlighted the role of the state and professional associations as key sources of legitimacy (or challenges to legitimacy), using legislation or defining professional norms and standards for organizations in the field.

Research into the dynamics of organizational fields has tended to be preoccupied with the structure of fields and with institutional effects. At the field level, the key question is the following: What structural characteristics lead to intensified pressures for legitimacy? Field-level explanations have emphasized increased state involvement in particular sectors, industries, etc., processes of professionalization, and the concentration of capital and power within an industry.

At the organizational level, the key question concerns institutional effects: What are the effects of environmental legitimacy pressures on the individual organization. Here, one observed the ongoing proliferation and elaboration of formal organizational structure, leading to increasing uniformity across organizations, industries, sectors, and nation-states. Referencing Max Weber's notion of "the iron cage" of rationality, created by modern capitalism, the authors described new iron cage created by "the structuration of organizational fields," sustained by state policy and professional associations, leading to increasing homogeneity "in structure, culture and output" (DiMaggio and Powell 1983/1991: 64).

Over the last 20-30 years, however, institutional research has gradually moved away from this largely determinist approach and has embraced approaches that highlight context, process, and agency (see Lawrence et al. 2009).

Context. Researchers have highlighted the evolution and dynamics of specific contexts when seeking to identify the role of institutions and the nature of institutional outcomes. Institutional environments have histories that may be both unique and discontinuous and involve a distinct variety of institutional actors. A large body of institutionalist scholarship has examined changes in institutional contexts over time or across regions, nation-states, and industries. Such studies suggest that, although one may observe the spread of seemingly universal organizational values and beliefs in most developed economies, there are significant differences in the timing, the selection, and the concrete adaptation of legitimate organization forms. Here factors such as the role of the state or the structure of firms and industry are important contextual factors (e.g., Neil Fligstein 1990).

Processes. There is a renewed interest in institutional processes, which embraces at least two types of processes: legitimation processes and organizational agency.

By highlighting concrete processes of legitimation, i.e., the processes through which institutional actors confer legitimacy, researchers are able to discern the more specific dynamics involved in institutional processes that otherwise may appear to be both deterministic and pervasive. The different types of legitimation processes have been summarized by Deephouse et al. (2016: 10):

1. In most cases, organizations and organizational actions are simply passively accepted as legitimate as part of the ordinary conduct of business in a field.
2. Many organizations are deemed "proper" after having been subjected to a routine evaluation that follows standard procedure, e.g., as annual audits of financial reports.
3. Sometimes organizations or organizational practices may be debated, which means the appropriateness of particular aspects of the organization is questioned in relation to more fundamental values, e.g., when hiring practices are being challenged or a company's environmental performance is deemed questionable.

4. Occasionally, organizations are seen as illegitimate and judged as entirely inappropriate within a particular organizational field, e.g., in cases of systematic and pervasive criminal conduct or products/services deemed entirely inappropriate.

Agency. By focusing on processes of legitimation, one may highlight both stability and change and discern the particular dynamics involved both in routine processes of legitimation and in highly conflictual processes of contestation. Scholarship, inspired by Pfeffer and Salancik's (1978) early work on resource dependency that propagates a much more active and strategic approach to legitimacy, describes the ways in which organizational actors (managers, employees) respond to challenges to organizational legitimacy, e.g., by engaging in impression management in the engagement with external actors. Some of these contributions will be considered in detail below.

However, even scholarship building on institutional theory has come to focus on process and agency. Some organizational scholars have challenged the notion of "diffusion" in the institutionalist model, i.e., that isomorphism occurs as a process of more unilineal diffusion particular norms, concepts, models of organization, etc. across organizational boundaries. Brunsson and Olsen (1993) suggested that processes of change are much more loosely coupled and open to interpretation than hitherto imagined. Czarniawska and Sevon (1996) proposed that the diffusion metaphor be replaced by the concept of *translation* to indicate how organizational models and concepts are continuously translated and reworked as they travel to new contexts (how agents respond to institutional pressures and adapt and mediate them through loose coupling, sensemaking, and modification of ideas when implemented in specific settings (translation)). Thus institutional effects are never predictable; one always needs to examine concrete processes of sensemaking translation.

Institutional scholarship has moved even further in their emphasis on agency and has focused on institutional entrepreneurship to highlight how individuals and organizations may engage in the creation or reworking of existing institutions (but see DiMaggio also). The notion of "institutional work" has been suggested by Lawrence et al. (2009: 1), as a concept to focus on the "practical actions through which institutions are created, maintained, and disrupted."

The shift in institutional studies of organizational legitimacy away from a structural model of institutional influences toward more contextual and processual approaches thus prompted an interest in intermediary organizations, and an interest in distinct processes of legitimation and delegitimation, and in organizational responses both to legitimation challenges and to the broader institutions that are part of such challenges. Examples of intermediaries at the level of organizational fields are educational institutions, NGOs, and consultancy firms, all of which are important carriers of institutional values, norms, and beliefs. However, a large body of literature suggests that "the media" or more accurately "the news media," i.e., outlets where there is a predominant focus on news production and where journalists are key content producers, have come to play a key role in creating, maintaining, or disrupting organizational legitimacy.

Organizations and the Role of News Media

The interest in the relationship between organizations and news media has emerged since the 1990s, primarily in research on corporate or organizational reputation and in research on the diffusion of management ideas and models. From having viewed news media either as information channels or as arenas in which public opinions were being processed, researchers gradually began to raise the question of whether news media should be seen as a source exerting influence in its own right.

The study of organizational reputation is preoccupied with collective judgments by stakeholders or “the public” about the status and performance of organizations that may, among other things, create important competitive advantages (or disadvantages) for actors in a market. Early studies in the field of organizational reputation and image (e.g., Fombrun and Shanley 1990; Dutton and Dukerich 1991; Sutton and Callahan 1987; Elsbach and Sutton 1992; Elsbach 1994; Hatch and Schultz 1997) often used news coverage as an important data source in their mapping of cases where the reputation or image of organizations was being challenged. Aside from using news coverage as a data source, these scholars often saw the news media as an arena of public opinion in which image crises played out. They also noted that organizational strategies of impression or reputation management were primarily oriented toward the media, although the actual sources of disruption and influence were often found outside the news media – in the legal system, social movements, etc. (Brown and Deegan 1998). In an important programmatic article discussing the relationship between organizational culture, identity, and image, Hatch and Schultz (1997) noted that external images not only affected organizational reputation but also internal identity: “a negative reading of organizational image by the press can affect organizational identity when news reports are perceived as genuine reflections of organizational activity or intent” (p. 361). Morsing (1999) later illustrated this emerging dynamics in a study of the interplay of (positive) media attention and internal identity change in a Danish manufacturing firm that suggested how organizational actors attach real significance to and act upon media portrayals of organizational reality.

In studies of the diffusion of management models in various industries, researchers noted that the professional press, i.e., specialized outlets read by particular occupational groups, were important for the early awareness of new management ideas (Barley et al. 1988; Burns and Wholey 1993). Alvarez (1996) and Mazza and Alvarez (2000), examining the spread of academic ideas of management into business practices, saw the media as important for the popularization of management knowledge. They observed a growth in the coverage of business and management issues by the popular media, where widespread stories of implementation and successful performance were instrumental in linking global management ideas to local contexts. Diffusion research often adopted the notion of *carrier* in their approach to media (Sahlin-Andersson and Engwall 2000) and not only highlighted the importance of the news media as intermediary organizations but also warranted an interest in whether and how carriers shape the ideas and messages carried. In a parallel vein, adopting the lens of fashion theory, Abrahamson (1996) studied the spread of management fads and fashions, using, among other sources, media content to map the rise and fall of popular management ideals, concepts, and models. He observed that such the media could be seen as a "fashion setting community" and explicitly called for a closer analysis of mass media effects on dissemination.

Agenda Setting and Framing

By the early 2000s, several organizational scholars, inspired by these findings, began to theorize the role of news media as a distinct source of influence on organizations (Tsoukas 1999; Deephouse 2000; Mazza and Alvarez 2000; Pollock and Rindova 2003; Kjær and Langer 2005; Kjær 2009; Pallas and Strannegård 2010; Deephouse et al. 2016).

A significant first step was to theorize the agenda-setting role of news media with respect to organizations. Agenda-setting theory originated in research on political communication (McCombs and Shaw 1972) as an alternative approach to media effects. (It should be noted that agenda-setting arguments can also be found on the field of organization and management studies, especially in the study of decision-making in organizations (such as in the work of James G. March and John W. Kingdon).) Agenda setting here entailed the ways in which journalists and news media can influence the salience and valence of particular issues simply as an effect of the relative attention given to issues by the news media. The agenda-setting argument rejects the idea that news media can control what audiences think but at the same time asserts that the news media can affect what audiences think *about* and even offer particular ways of framing issues.

Deephouse (2000) argued that even though agenda-setting theory is based on studies focusing on public and political issues, the theory also applies to the study of reputations in a business context. According to Deephouse (2000: 1097), "the media provide a forum where firms and stakeholders debate what constitutes a good firm and which firms have good reputations." Thus the media both had an agenda-setting role and a role in the social construction of perceptions of actors.

Carroll and McCombs (2003) also focused on the news media's agenda-setting role when it comes to influencing the public's images and opinions about major corporations. Stating that "the core proposition in agenda-setting theory is that the prominence of elements in the news influences the prominence of those elements among the public" (Carroll and McCombs 2003: 36–37), the authors claimed that a number of contingent conditions "define the situations in which agenda-setting effects are enhanced or reduced" (Carroll and McCombs 2003: 43–44). Among these contingent conditions are the age and size of a corporation since both may affect the newsworthiness of a corporation, the proximity of a firm to news sources (e.g., local newspapers covering firms important to local economy more fully than other firms), and the difference between newspaper sections, especially between general news and specialty news. Thus firms are found to get a more favorable coverage in the general section and a more critical coverage in the business section. Finally, Carroll and McCombs (2003: 44) stressed that news media have a special fascination with CEOs due to their celebrity status and that the coverages of the CEO may have a huge influence on the public's image of a specific firm.

Favorable versus unfavorable coverage and the emphasis on CEO's rather than, e. g., structural aspects of corporations are examples of how news media may choose to frame the stories of an organization or a firm (see also Chen and Meindl 1991). To frame an issue, according to Entman (1993: 52), is to "select some aspects of a perceived reality and make them more salient in a communicating text, in such a way as to promote a particular problem definition, causal interpretation, moral evaluation, and/or treatment recommendation for the item described."

Media framing was highlighted in an influential study by Pollock and Rindova (2003: 631) that investigated how so-called information intermediaries (or infomediaries), such as the news media or financial analysts, affect investors' impressions and opinions of firms. The authors presented two rival views of the influence of these intermediaries: an economic view where the intermediaries simply convey information between buyers and sellers and an institutional approach that argues that the information intermediaries, particularly the news media, through their framing and exposure of firms, influence what stake- and shareholders perceive as desirable, worthy, and trustworthy. Based on a quantitative analysis of media content, the authors (2003: 640) find clear evidence that news media framing plays an important role in the evaluation of new business opportunities by affecting the salience and perceived value of a firm. Similarly, a number of qualitative studies have identified particular dominant frames in business reporting, such as history, nationalism, or inevitability (Tienari et al. 2003, 2007).

The agenda-setting approach can be viewed as an institutional approach. Although it starts from a straightforward measurement of prevalence of themes and positive versus negative evaluations, it directs our attention to selections built into news media organizations and journalistic practice. Routine choices of large versus small firms or old versus young or the prevalence of particular frames such as that of leadership or national status are indicative of a particular set of beliefs, norms, and values that constitute a particular "logic of appropriateness" of media institutions. Thus if we want to understand the influence of news media, we have to understand the routinized judgments and selections built into journalistic work and editorial processes (Deephouse 2000). This is elaborated further in the next section.

Mediatization

Over the last 10 years, the relationship between media institutions and organizations has been explored even further by utilizing the concept of *mediatization*. Here scholars have moved from simply examining agenda-setting and framing effects toward a broader field-level theory of the interaction between news media and organizations. The concept of mediatization, which draws on debates in media studies, can been used to describe the nature of this interaction (Kjær and Slaatta

2007; Pallas 2007; Pallas and Fredrikssson 2013; Ihlen and Pallas 2014; Kantola 2014; Wonneberger and Jacobs 2016).

The theory of mediatization builds on earlier institutional studies of the news media (such as Tuchman 1978, and Fishman 1980) but takes the institutional argument a step further. Whereas the classical concept of mediation (Strömbäck 2008) referred to how mass media functioned as a channel of information between politicians and their voters, the concept of mediatization refers to how the news media as an institution in its own right selects and shapes the information (news) that is presented across various platforms such as television, radio, newspapers, and online news sites. Thus the premise of mediatization theory is that the news media in many Western countries, from the 1980s onwards, has developed into an independent institution. This institution is guided by its own rules and norms, often summarized as "media logic" (Cook 1998; Strömbäck 2008; Allern and Blach-Ø rsten 2011), and over time the news media as a political institution and its logic have become deeply integrated into different levels of society (Hjarvard 2008; Strömbäck 2008). Studies on mediatization have mostly focused on how mediatization has transformed national politics as both political parties and politicians have adapted to media logic (Esser and Strömbäck 2014; Blach-Ørsten 2016), but, similar to the case of agenda setting research, many scholars have made the argument that the process of mediatization has not only influenced politics but has had just as big an influence on firms and organizations. Thus both Kjær and Slaatta (2007) and Pallas (2007) argue that just as national politics have become mediatized in many Western countries, so have firms and corporations. Based on a study of the rise of the Nordic business press from 1960 to 2005, they argue that the business press in the Nordic countries, but also around the world (Pallas 2007; Reed and Lewin 2005; Kanola 2014), has expanded and an increasing number of journalists have been hired to become business reporters. They also argue that the focus and working routines of business journalists have changed during this period (Kjær and Slatta 2007). From covering macroeconomic issues and labor markets, the primary focus of the business press has become corporations and stock markets.

In this environment the news media may influence not only the legitimacy and reputation of a corporation but also its brand and policy (Ihlen and Pallas 2014). Thus studies show that just as the coverage of politics can focus on scandals and crisis (Allern and Pollack 2012), so can the coverage of firms and organizations (Langer and Kjær 2004: Blach-Ørsten 2009; Vallentin 2009). And just as the coverage of politics have seen a rise in the personalization of politics understood as an increased focus on political leaders (Blach-Ørsten 2011), business news have seen an increased focus on the coverage of CEOs and their personality and, sometimes, also private lives (Kantola 2014).

It is therefore only natural that modern corporations have incorporated media logic and developed, or tried to develop, a workable relationship with the news media.

Writing on corporations and their media practices, Wonneberger and Jacobs (2016: 368) stress that the process of mediatization can affect several processes, levels, and structures in an organization or corporation. Pallas (2007) and Pallas and

Fredriksson (2013) argue that the process of mediatization is shaped by various interactions or negotiations between corporations and the news media. Some of these negotiations are front stage, such as press conferences, whereas other negotiations are backstage, for instance, negotiations about access to personal information (Pallas 2007). But Pallas and Fredriksson (2013) do not conclude that one side (the media) or the other (the corporation) controlled the interactions in the long run. Instead both parties are in continued interactions with one another, and these interactions are shaped and negotiated and changed by both parties. Indeed an article reviewing 50 years of empirical research on communication between corporations and the media (Verhoeven 2016: 514) concludes that just one key word can sum up the relationship: interdependence.

Summing up, this means that in recent years more and more studies have begun to focus on the news media as an important factor in shaping the legitimacy of firms and business corporations. Increasingly studies have turned to the theory of mediatization in order to better understand the relationship between news media and corporations. A central argument in mediatization studies is the existence of a media logic that not only shapes how the news is produced but that also increasingly becomes adopted by other institutions (Strömback 2008). The news media logic is constituted by three factors according to Esser and Strömbäck (2014: 19): (1) journalistic professionalism, that is, the ideals, norms, and routines that guide journalists in their work (also see Ørsten 2004); (2) commercialism that is to say the economic rationales motivating news media as business organizations; and (3) media technology which is the different media platforms and their affordances.

In other words the main argument behind a focus on the mediatization of business corporations and firms is that it is influenced by a certain kind of logic, a logic that in many ways are similar to the "contingent conditions" that Carroll and McCombs (2003) highlight. Thus the media logic influences which types of firms and corporations that the news media focuses on. Central parts of the media logic are the so-called news values or news criteria that journalists apply to select between what is considered newsworthy and what is not. Writing on news values and organizational newsworthiness, Kjær and Morsing (2011) write that Danish business journalists apply the same news criteria to business news as to regular news. Thus they focus on what is current, but preferable also something that also entails the possibilities of conflict and identification. Kjær and Morsing (2011: 25) also point out that Danish business news media tend to focus on national firms and corporations, as well as companies that are publically traded since that is expected to make them more interesting to the public and potential shareholders.

Agenda Setting, Mediatization, and Legitimacy

How, then, do agenda setting and mediatization influence organizational legitimacy?

First of all, the news media, through the processes of agenda setting and mediatization, assign importance and valence, and frame attributes of organizations, which may shape public opinion and knowledge about the organization in question.

The news media mirror general social expectations, such as honesty, human rights, or sustainability, but their focus may be shaped by the media logic with a routine focus on conflict or identification. In addition, the news media routinely use business representatives as expert sources (financial analysts, market analysts, etc.), which may legitimize some types of business as important social actors.

News media agenda setting per se does not influence organizational legitimacy. Agenda setting influences which organizational issues and actors are attended to by the public. The prevalence of, e.g., financial reporting over political reporting may install a sense of public importance to corporate financial performance. Similarly the frequency with which a particular organization or executive officer is mentioned may create a sense of familiarity. However, the influence on legitimacy depends on the valence (positive or negative) and framing of news media reporting. Again, the valence of individual news stories does not automatically influence organizational legitimacy, but sustained positive or negative reporting may decrease or increase the likelihood of challenges to legitimacy. Similarly, news media framing may both naturalize and problematize particular organizations and aspects of organizational reality. News frames emphasizing leadership may thus create expectations of individual agency, decision-making, strategy, and initiative by executive officers. Failure to meet such expectations may result in a questioning of management authority by the general public and among internal stakeholders. Similarly, framing events as scandals may create a sense that public trust has been lost or a sense of organizational "stigma" leading to both external and internal calls for remedial action (see also Sutton and Callahan 1987).

News media shape worldviews and processes in both organizational fields and individual organizations, both in the short run by reinforcing or upsetting established expectations and also in the long run through a gradual structuration of norms, routines, and interactions between news media, journalist, and organizations. This field-configuring property suggests that news media may, in the long run, affect the broader system of norms, values, beliefs, and definitions of a field (Suchman 1995), i.e., the perceptions or assumptions on the basis of which actors evaluate actors and actions within the field. Thus the long-term trend toward "financialization" of business and organizations or the popularity of "corporate social responsibility" may in part be related to mediatization and new routines and norms of news media production related to business.

Research on organizational legitimacy has moved from general claims about the importance of legitimacy to an interest in specific processes of legitimation. Suchman's four legitimation processes (accept, evaluate, debate, disrupt) discussed above may provide a useful elaboration of processes of influence and interaction between news media and organizations in relation to organizational legitimacy:

(a) By default, most firms and organizations are *accepted*. From a news media perspective, the vast majority of firms are "under the radar." They are beyond the media gaze and are simply passively accepted.
(b) A number of larger, mostly publicly held firms are routinely *evaluated*. This routine evaluation has expanded in recent decades as news reporting has shifted

from the simple listing of shares and commodity prices to the systematic monitoring of quarterly and annual reports, product news, market entries, etc. Usually evaluations follow standard schemata and elicit standard responses, based on highly organized interactions between corporate communicators and business reporters. Such interactions are often asymmetrical as news outlets, working under both economic and temporal constraints, rely on information, news releases, and sources controlled by strong corporate communication offices (Pallas 2007).

(c) Some firms are *debated*, based on sustained poor performance or problematic practices. Here a firm's claim to legitimacy is being brought into question, typically in a series of news reports, as expectations are not being met, norms are being breached, or status is being questioned. Debating not only involves journalists and corporate communicators but also experts, stakeholders, and other actors speaking on behalf of the public. Debating also typically involves remedial actions on behalf of the involved organizations to regain public confidence.

(d) In rare cases, firms and organizations face *disruption*, as large-scale media storms erupt and corporate responses fail. Media storms erupt when problems become scandals and spread across media outlets and arenas. Media storms are likely to erupt when corporate behavior involves illegality (fraud, white-washing), danger (industrial accidents), or systemic crises (the collapse of markets or projects), often combined with a failure to respond to public questioning or attempts to cover up (Tsoukas 1999; Langer and Kjær 2004; Ørsten 2009). While media attention may play a significant role in processes of disruption, it is important to emphasize that such processes often move into other arenas, such as the courts, local or national parliaments, or professional communities.à

This elaboration of processes of legitimation is indicative of the concrete ways in which news media reporting may influence organizational legitimacy, but it also suggests how there are interactions between news media institutions and organizations. This ongoing interaction can be described as a pattern of action and reaction, but as suggested above the relationship is perhaps best characterized as a case of interdependency (Verhoeven 2016). Much business reporting is effectively "corporate reporting," based on strategic communication produced by firms. At the same time, many firms depend on media attention in order to reach their customers or stakeholders and manage their role and status in various fields. The two sides thus depend on one another and can be said to engage in a process of negotiation – of attention, valence, and framing – rather than simply a never-ending battle for superiority.

Concluding Remarks

This chapter has outlined the concept of organizational legitimacy, which can be described as a particular set of beliefs and norms, a logic of appropriateness, built into institutional environments.

News media can be seen as intermediary institutions that both convey and rely on broader societal norms and also exert an influence in and of themselves via processes of agenda setting and mediatization. As institutions, the news media influence legitimacy norms, and processes of legitimation, but also engage in interactions with organizational actors over news production and legitimation.

While much research has been conducted in the field of news production, agenda setting, etc. in relation to business and organizations, the interaction and interdependency between media institutions and business should be studied more closely in the coming years, especially in the context of processes of legitimation and delegitimation.

The present introduction to organizational legitimacy and the news media has adopted a traditional approach to media communication. Future research will have to look more closely at the impact of social media on legitimacy. Although traditional news media still play the most important part in setting the public agenda even in a hybrid-media society (Chadwick 2017), social media and the interaction between social media and traditional news media with regard to the legitimation of corporations and organizations need to be examined. Here we could find a combination of volatile interactions and, perhaps, lower level of institutionalization deserving attention it its own right.

Crisis Communication and Organizational Legitimacy

Contents

Abstract

Drawing on two major reviews of the academic literature on organizational legitimacy, the aim of this chapter is to examine how crisis communication scholars have adopted and applied the concept of organizational legitimacy since the early 1990s. More specifically, the chapter addresses the following issues: How do crisis communication researchers define organizational legitimacy? How can a potential crisis damage the legitimacy of an organization, and how can the organization mitigate this damage by managing its legitimacy before, during, and after the crisis? Last, but not least, why do crisis communication researchers seem to have lost interest in organizational legitimacy in favor of reputation after the year 2000?

Introduction

"Danske Bank violates our understanding of what is right and what is wrong." This was the captivating first sentence of a background article headlined "Overdraft in the bank" and published by the Danish newspaper *Weekendavisen* in July, 2018 (Hansen 2018). The occasion was a gigantic money-laundering scandal, a scandal in which two of Denmark's biggest banks, Danske Bank and Nordea, were deeply involved.

This article was unusual, not only because it was very long but also because it told the story about the three most severe crises that Danske Bank had faced since it was founded in 1887. The first crisis broke out in 1920 when Danske Bank was involved in stock exchange speculations and risky loans to such an extent that it had to be reconstructed with help from the Danish state. The second crisis took place in the years following the financial and economic crisis in 2008. At the time, Danske Bank was perceived as an arrogant and elitarian bank. Its CEO Peter Straarup, nicknamed the "fee vulture," denied all kinds of responsibility for the international crisis on behalf of Danske Bank. Finally, the third crisis was the money-laundering scandal. Between 2007 and 2015, DKK 1500 billion derived from criminal activities flowed through accounts in Danske Bank's Estonian branch. Danske Bank was accused of not obeying the Anti-Money Laundering Act and of reacting too slowly.

All three crises can be described as *crises of legitimacy*. Legitimacy plays a crucial role in all types of organizations, private as well as public. If there is no congruence between an organization, its activities, and value systems, on the one hand, and the expectations, activities, and value systems of the larger social system in which it operates, on the other hand, it is difficult to gain or receive legitimacy. And without legitimacy it is difficult to find resources, active and passive support, and a license to operate (Diaz-De-Castro and Peris-Ortiz 2018).

This chapter is about crisis communication and organizational legitimacy. The aim is to examine how crisis communication scholars have adopted and applied the concept of organizational legitimacy in their research since the early 1990s. How do they typically define legitimacy? Have they succeeded in adding new dimensions to this field of study? How can a crisis damage an organization, and how can the organization avoid that this will happen by managing its legitimacy before, during, and after the crisis? Last, but not least, why do crisis communication researchers seem to have lost interest in organizational legitimacy in favor of reputation after the year 2000?

The last of these issues remains a puzzle. How can we explain this development? Both academics and practitioners seem to agree that legitimacy is a central concept for our understanding of the relationship between an organization and its environment. However, even if we left the specialized subdiscipline of crisis communication and looked at the discipline of public relations as such, the negative reaction would still be the same. Patel et al. (2005) criticized public relations researchers and practitioners for being slow to consider the importance of organizational legitimacy in establishing and maintaining organization-public relationships. Their bibliometric study of two major public relations journals (all issues released between 1995 and 2005) and four major public relations textbooks (all released since 2003) clearly demonstrates how low the interest is. Only two journal articles, but none of the text books, incorporated organizational legitimacy. Unfortunately, Patel et al. (2005) only identified the problem without providing an explanation.

The chapter is structured in six sections. Apart from the first section, each of these sections begins with a presentation of a key issue in organizational legitimacy research (definitions, typologies, management, and communication) based on the two reviews of the academic literature. The presentation is then followed by a discussion of how this issue has been approached in crisis management and crisis communication. The first section consists of a brief introduction to crisis communication. The following two sections focus on how legitimacy can be defined and how it forms part of a small constellation of key concepts (such as reputation and status). The fourth section is devoted to legitimacy management and crisis management and the fifth section to legitimacy communication and crisis communication. The chapter ends with an attempt to solve the puzzle.

Brief Introduction to Crisis Communication

What is an organizational crisis? Pearson and Clair (1998) have established one of the most popular definitions. According to this definition, a crisis is a "low-probability, high-impact event that threatens the viability of the organization, and is characterized by ambiguity of cause, effects and means of resolution, as well as by a belief that decisions must be made swiftly" (p. 60). A crisis can harm an organization in several ways, economically, politically (influence), socially (trust), and symbolically (reputation). Many crises, like Danske Bank's money-laundering crisis, can also damage the legitimacy of an organization.

Crisis management and crisis communication are the two core components of the crisis preparedness of an organization. Crisis management can be defined as the conceptualization, implementation, maintenance, and enactment of the organizational crisis preparedness, that is, the resources allocated by the organization to be able (1) to detect strong and weak signals indicating that a crisis is building up; (2) to prevent that a crisis breaks out; (3) to prepare to handle the crisis if it breaks out any way; (4) to bring the crisis to an end and reduce the damage caused by the crisis to the organization, the industry, and external and internal stakeholders as much as possible; and (5) to learn from the crises experienced by the organization and other organizations and to implement the changes made necessary by this organizational learning process (Frandsen and Johansen 2017). This comprehensive definition of crisis management includes all three stages of the so-called crisis life cycle: the pre-crisis stage, the crisis stage, and the post-crisis stage.

Crisis communication can be defined as made up of two parts: (1) to manage information (collecting and analyzing crisis-related information which may serve as input for crisis decision-making) and (2) to manage meaning (influencing how people perceive the crisis and the organization in crisis) (Coombs 1995). The bulk of the academic literature on crisis communication focuses on how individual organizations in crisis try to influence how stakeholders perceive the crisis and the organization in crisis by applying various types of crisis response strategies. This is also the case in legitimacy management and legitimacy communication.

Since the mid-1990s, two theories have dominated the field of crisis communication (Avery et al. 2010). The first theory is image repair theory (IRT), which represents a rhetorical and text-oriented stream of research (cf. Benoit 1995). The second theory is situational crisis communication theory (SCCT), which represents a strategic and context-oriented stream of research (cf. Coombs 1999; for an overview of crisis communication theories, see Frandsen and Johansen 2017). Both of these theories have contributed importantly to our understanding of organizational crises. One of their key points is that handling a crisis is primarily about protecting and repairing the image and/or the reputation of the organization in crisis.

Today, crisis communication research is still mostly conducted within the discipline of public relations. The consequences of this bias are manifold. The approaches are often organization-centric, crisis communication is conceptualized as *apologia*, and the sparse but interesting research conducted within the field of management and organization studies, based on, for example, organizational perception management (Elsbach 2006), is largely neglected. Recently, however, new approaches focusing on complexity have emerged, including, for example, rhetorical arena theory (RAT) and the multivocal approach to crisis communication.

Defining Organizational Legitimacy

Organizational legitimacy has been the subject of academic research since the early 1970s. If we include pioneers such as Max Weber (1864–1920) and Talcott Parsons (1902–1979), we can even go further back. It is therefore no surprise that our body of knowledge on this topic is substantial and that numerous attempts have been made to define what we understand by organizational legitimacy. However, the ambition in this section is not to add yet another definition to the list. Instead, our plan is to introduce two major reviews of the academic literature on organizational legitimacy, including their overviews of definitions and typologies. Both reviews are written by researchers in organizational studies. After this introduction we will take a look at how organizational legitimacy is defined by crisis communication scholars.

The two literature reviews – Suchman (1995) and Suddaby et al. (2017) – were published at two different points in time, with an interval of more than 20 years. The motives behind the two reviews were also different. Suchman (1995) was written to make a synthesis of a rapidly growing literature. The idea behind Suddaby et al. (2017), on the contrary, was to find back to the core of the concept and to remove the layers of surplus meaning and misunderstandings generated by the widespread application of the concept in various disciplinary contexts.

How is organizational legitimacy defined? Suchman (1995) defines legitimacy as "a generalized perception or assumption that the actions of an entity are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs, and definitions" (p. 574). Suchman describes his own definition as an inclusive and broad-based definition that incorporates both an evaluative dimension and a cognitive dimension, but he does not tell us how he has reached this definition. The definition is followed by a series of typologies in the remainder of the review article: general approaches, basic types and subtypes of legitimacy, and strategies for legitimacy management.

Suchman (1995) has become *the* definition of organizational legitimacy. The article has been cited more than 12,500 times (Google Scholar, August 2018). About half of these citations are verbatim repetitions of the original text. Deephouse et al. (2017) refer to this as "the concept's ossification" (p. 28), but there are also citations that reveal that Suchman's definition after all is dynamic. Finally, in the first edition of *The SAGE Handbook of Organizational Institutionalism*, Deephouse and Suchman (2008) recommended that the term "desirable" had to be removed or bracketed to avoid potential confusion with the concepts of status or reputation. In the second edition of this handbook, Deephouse et al. (2017) continue the updating of the reception history of Suchman's definition.

In contrast to Suchman, Suddaby et al. (2017) do not define what they understand by legitimacy. Instead of providing us with a general definition established by themselves (like Suchman does), they use the result of their interpretive review or thematic analysis, to identify "three distinct configurations of legitimacy" (p. 2). These three configurations emerge from asking three questions:

1. What is legitimacy? The authors offer three answers to this question: (a) legitimacy as *a property*, that is, a thing, a resource, an asset, or a capacity of an entity; (b) legitimacy as an *interactive process* of social construction, and (c) legitimacy as a sociocognitive *perception*.
2. Where does legitimacy occur? Once again there are three answers: (a) between an organization and its external stakeholders, (b) between multiple actors, and (c) between individual and collective evaluators.
3. How does legitimacy occur? Once again three answers: (a) through a "fit" between the attributes of an organization and the expectations, (b) through purposive efforts, and (c) through social judgments.

If you take a look at the table entitled "three streams of legitimacy research" at the end of Suddaby et al. (2017), you will observe two interesting things: first, that Suchman (1995) is categorized as representing the legitimacy-as-property tradition and, second, that the literature review is not only systematic but also chronological.

We need to address one more issue before we take a look at how crisis communication researchers define legitimacy: the concept of *illegitimacy* or *legitimacy crisis*. According to Suchman (1995), a legitimacy crisis is a "crisis of meaning."

According to Suddaby et al. (2017), there are two distinct conceptualizations of illegitimacy: (1) illegitimacy is not a "low level" or "absence" of legitimacy but rather a qualitatively different set of properties; (2) legitimacy and illegitimacy are part of a continuum of attributes that exist in opposition.

Defining Organizational Legitimacy from a Crisis Communication Perspective

Seeger (1986) became one of the first researchers who studied organizational legitimacy from a crisis communication perspective when he investigated the *Challenger* disaster on January 28, 1986, as a legitimacy crisis for NASA. Seeger attached particular importance to the Rogers Commission appointed by President Reagan to investigate how the space shuttle could disintegrate only 73 s into its flight killing all seven crew members. In its report released already on June 9, 1986, the commission claimed that the accident was caused by a design flaw in the O-rings and by bad decision-making and management structure. The commission also urged NASA to improve its safety features on the shuttles and in its organizational handling of future missions. Seeger concluded that with the aid of the Rogers Commission, NASA worked to reestablish its social legitimacy by holding open hearings, shifting authority, creating an impression of renewed rationality, and limiting performance goals.

In their important review of the communication and organizational literature dealing with crisis, Seeger et al. (1998) devoted an entire section to legitimacy and organizational crisis.

Suchman (1995) was written at a time where crisis communication research was still at its very beginning. The same year saw the publication of William L. Benoit's *Accounts, Excuses, and Apologies* and W. Timothy Coombs' "Choosing the right words: The development of guidelines for the selection of the 'appropriate' crisis-response strategies," which launched image repair theory and situational crisis communication theory, respectively.

We have already emphasized that crisis communication researchers seem to lose interest in the concept of organizational legitimacy by the end of the 1990s. This applies to the most popular and comprehensive textbooks and handbooks as well as to the most dominant theories of crisis communication, including image repair theory and situational crisis communication theory. When the authors occasionally refer to organizational legitimacy, it is almost always through Suchman's (1995) definition. But then, can we not expect this to take place in many other disciplines?

In what is perhaps the most authoritative textbook, W. Timothy Coombs' *Ongoing Crisis Communication* (1999/2019), the concept of organizational legitimacy was introduced and defined briefly for the first time in 2007, that is, in the second edition of the book. In this definition, Coombs refers to Suchman's (1995) definition: "Legitimacy refers to actions that are considered desirable, proper, or appropriate to some system" (Coombs 2007, p. 43). However, Coombs also refers to Mitchel, Agle, and Wood's (1997) use of the legitimacy perspective in their stakeholder salience model, claiming that legitimacy can be used to establish a "likelihood score" (Coombs 2012, p. 61). In the fourth edition of the textbook from 2015, the concept disappears again. In W. Timothy Coombs and Sherry J. Holladay's *The Handbook of Crisis Communication* (2010), the absence of the concept of organizational legitimacy is once again conspicuous. However, the concept is mentioned in the short introduction to corporate apologia (Chap. 1), including the work of Keith Michael Hearit, (see below), but it is not listed in the subject index of the handbook. Coombs and Holladay define social legitimacy as a form of reputation.

Some crisis communication researchers apply definitions made by scholars who were active before Suchman (1995). This applies, for example, to Keith Michael Hearit who defended his dissertation entitled "Organizations, *Apologia*, and Crises of Social Legitimacy" in 1992. Hearit is inspired by Dowling and Pfeffer (1975). He defines organizational legitimacy as "the rhetorically constructed and publicly recognized congruence between the values of a corporation and those of a larger social system in which it operates" (Hearit 1995, p. 2). Social legitimacy is one of the key concepts in Hearit's theory of terminological control or definitional hegemony.

Boyd (2000) has tried to introduce the concept of *actional legitimacy* as a new area of study for public relations research. Inspired by Brummer (1991), Boyd makes a distinction between institutional and actional legitimacy. Institutional legitimacy takes place at a macrolevel of analysis, while actional legitimacy takes place at a microlevel of analysis. This approach allows for the study of more day-to-day public relations activities in which publics have a more immediate impact on corporate policy.

Massey's (2001) study of the effects of crisis response strategies on stakeholders' perception of organizational legitimacy is one of the very few experimental studies in the field. Massey wants to test if organizations that produce *consistent* crisis communication across different stakeholder groups will enhance their legitimacy while organizations that produce inconsistent crisis communication will reduce their legitimacy. He also wants to test if *niche width* plays a role, that is, if generalist organizations who have broader width in a market are perceived as being more legitimate than specialist organizations who operate in single domains having a narrower width. Niche-width theory is part of organizational ecology yet another of these streams of research focusing on organizations and their environment that emerged in the 1970s (see Hannah and Freeman 1977).

Massey comes close to Suchman (1995) in his approach to organizational legitimacy. He cites Suchman's definition *verbatim* right from the beginning of his article, and like Suchman, he is also in favor of combining the strategic and the institutional approach (see the section on legitimacy management and crisis management). However, there are some important differences. Like Hearit (1995), Massey emphasizes the ways that organizations strategically manipulate symbols, through communication behavior, to achieve legitimacy. But Massey views the ongoing interaction between organizational strategy and stakeholder expectations as a "dialogical process" (Ginzel et al. 1993) or as "ritualistic communication" (Carey 1989).

Combining Legitimacy, Reputation, and Status

So far, we have examined organizational legitimacy as a concept in and for itself. However, we must not forget that this concept also forms part of a small but very important constellation of concepts that share the same semantics: they all refer to how stakeholders perceive or evaluate organizations. In his theory of legitimacy, reputation, and status, Bitektine (2011) calls them *social judgments*. The fact that crisis communication researchers have moved away from the concept of legitimacy toward the concept of reputation makes a comparison of these concepts, if not necessary, then at least rather interesting. Neither Suchman (1995) nor Suddaby et al. (2017) really take up this challenge. Admittedly, Suchman is alert to the fact that the various types of legitimacy coexist in most real-world settings. He also emphasizes that the combination of different types of legitimacy may represent both a strength and a weakness. But his treatment of this aspect remains within the same conceptual typology.

What is the difference between legitimacy and reputation? According to many scholars, legitimacy is based on *similarity* as the key principle, whereas reputation is based on *difference*. An organization receives legitimacy when there is a sufficiently large amount of *con*gruence, *con*formity, or sameness, between the organization and the larger social system in which it operates. Reputation is sometimes defined as the "assessment of a company's attractiveness to a specific group of stakeholders relative to a reference group of companies with which the company competes for resources" (Fombrun 2012, p. 100; see Deephouse and Suchman 2008, for an overview of definitions of legitimacy, reputation, and status, including explanations of how and why the literature frequently confuses and conflates the three concepts).

We can add the concept of status to our repertoire of social judgments, that is, an organization's position in a hierarchical order or ranking of organizations, based on the esteem or deference that each organization can claim by virtue of the organization's membership in a group with distinctive practices. So we can expect that there will be, for example, high-status and low-status banks. The day before Danske Bank released the results of an internal investigation of the bank's involvement in the money-laundering crisis (September 19, 2018), the Danish newspaper Politiken published a vox pop where customers told about their relationship to Danske Bank. A 91-year-old lady who had been a customer for 60 years declared: "I am truly disappointed. It is an old bank. I thought it was a bank that I could trust." A 26-year-old man declared: "The reason why I have not switched to another bank is that I have had my account [in Danske Bank] ever since my parents opened it for me" (Hergel 2018). Thus, being old, in the sense of having stayed in business for a long time or having had a business relationship for a long time, confers status to an organization.

Inspired by research within sociocognitive psychology, Bitektine (2011) has formulated four questions to which an organization's stakeholders, or *evaluators* as he prefers to call them, try to provide an answer: (1) Does the organization have the right to exist? (= sociopolitical legitimacy judgment), (2) how will the organization perform/behave in the future relative to other organizations in the set?

(= reputation judgment), (3) where does the organization fit in the ranked order of similar organizations =? (= status judgment), and (4) does the organization belong to any class or category which is already familiar and nonproblematic? (= cognitive legitimacy judgment). These four questions are very useful, but again, they do not tell us anything about what would happen if the concepts were combined. For example, would a company in crisis that has an unfavorable reputation but a high status do better than a company in crisis that has an unfavorable reputation but a low status? Is it possible to describe and explain how the complex cognitive inferences or processing of information that take place among individuals at a microlevel are combined with equally complex social processes at a macrolevel?

There are scholars who reject that legitimacy should be different from reputation. This applies, for example, to King and Whetten (2008) who perceive legitimacy and reputation as perceptions of approval of an organization's actions. Organizations are perceived as having legitimacy when they comply with the minimum standards of a prototypical X-type organization. Similarly, organizations are perceived as having a good reputation when they are viewed favorably relative to the ideal standard for a prototypical X-type organization. King and Whetten use a social actor conceptualization of identity to propose a complementary, reciprocal relationship between organizational legitimacy and reputation.

However, the idea of a constellation of different types of social judgments can improve our understanding of the complexity of crisis communication from a rhetorical arena perspective, including the role played by organizational legitimacy. If we combine the three reputational levels identified by Frandsen and Johansen (2018) in their study of the crisis communication of trade associations with the types of social judgments and crises, we get something similar to Table 1.

Table 1 Complexity, actors, crisis, and types of social judgment

Level of complexity	Actors and crisis situation	Type of social judgments
First level	One organization in crisis	Corporate reputation (organization in crisis)
		Legitimacy
		Status
Second level	Two or more organizations in crisis (e.g., members of the same industry)	Corporate reputation (organization in crisis)
		Reputation commons (the industry)
		Legitimacy
		Status
Third level	Several organizations in crisis (members of an industry, one or more trade associations)	Corporate reputation (organization in crisis)
		Reputation commons (the industry)
		Intermediary reputation (trade association)
		Legitimacy
		Status
Fourth level	Network of actors	All types of social judgments

The first level represents what we may call the standard crisis situation where complexity seems to be low. Typically only one organization is in crisis, and the corporate reputation of only one organization is threatened. The second and third levels represent higher degrees of complexity. It is mainly due to interorganizational relationships and multi-crises, crises by association, or spillover crises. The second level represents a crisis situation where two or more organizations representing the same industry are involved. Concerning social judgments, a *reputation commons*, that is, the reputation of the industry (King et al. 2002), has been added to the corporate reputation. So now we have two different types of reputation.

The difference between the second and the third levels is important. We are still dealing with a crisis situation where two or more organizations representing the same industry are involved, but we have added a third type of reputation: the reputation of the trade association that protects the reputation, not only of the industry and its members but also of the trade association itself. As the crisis situation becomes more complex, involving industry and trade association, legitimacy will also frequently tend to be activated as an evaluation category. The fourth level represents the highest degree of complexity: a crisis situation in the shape of a network. Legitimacy, reputation, and status are located at the fourth level of complexity, but they can of course be present at the other levels as well.

The idea of a multi-conceptual and multilevel approach, based on a constellation of key concepts such as legitimacy, reputation, and status which can be combined or not in specific crisis situations, represents a major step forward in both organizational legitimacy research and crisis communication research. Such an approach will serve as a counterweight to the typological craze in legitimacy research (see, e.g., Wæraas 2009). Some categories of social judgments will perhaps be organization-specific. Wæraas (2009), for example, who examines the significance of organizational legitimacy for public sector organizations, claims that public organizations depend more on legitimacy than on a favorable reputation. Finally, some combinations of social judgements, for example, legitimacy *and* reputation or reputation *and* status, will reveal how complex the interaction between legitimacy management and reputation management is.

Legitimacy Management

In the previous section, we focused on how to define organizational legitimacy both as a concept in and for itself and as part of a constellation of concepts representing different types of social judgements. We also observed that most crisis communication researchers defined organizational legitimacy along the lines of Suchman's (1995) classic definition. In this section, we will concentrate on the managerial dimension. What are the most important approaches to legitimacy management? And to what extent have crisis communication researchers been able to benefit from these approaches?

Suchman (1995) divides the academic literature on organizational legitimacy into one of two categories: *strategic* or *institutional*. The strategic approach views legitimacy as an operational *resource* that organizations can extract from their cultural environment and employ in their efforts to achieve their long-term strategic goals. From this instrumental perspective, the process of legitimation is seen as purposive and calculated but also as pervaded by conflicts between managers and stakeholders or between competitors. Suchman (1995) refers to Jeffrey Pfeffer and his collaborators as important representatives of the strategic approach (see, e.g., Dowling and Pfeffer 1975).

The institutional approach views legitimacy as *a set of constitutive beliefs*. According to this approach, organizations do not simply extract legitimacy from their cultural environment, as if it was a kind of underground mining. Organizations are penetrated and constructed by external institutions in their environment, and legitimacy is viewed as the amount of cultural support received by an organization where culture refers to shared systems of belief held by society in general and by stakeholders in particular. Suchman (1995) refers to neo-institutional researchers as the most important representatives of the institutional approach (see, e.g., DiMaggio and Powell 1983).

In 1995, Richard Scott published his today classic introduction to neo-institutional theory *Institutions and Organizations*. Inside this book, you find the following definition of legitimacy which sums up the difference between the strategic and institutional approach: "Legitimacy is not a commodity to be possessed or exchanged but a condition reflecting cultural alignment, normative support, or consonance with relevant rules or laws" (as cited in Deephouse and Suchman 2008, p. 31).

Suchman's distinction between a strategic and an institutional approach conflates with the first theme in Suddaby et al. (2017), that is, the functionalist understanding of legitimacy as a *property* possessed in some measurable quantity by an organization.

After having introduced the distinction between the strategic approach and the institutional approach, Suchman (1995) continues building up his conceptual system by introducing yet another important distinction, this time between three broad types of legitimacy. Each type of legitimacy involves a generalized perception or assumption that organizational activities are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs, and definitions. However, the three types of legitimacy are based on what Suchman refers to as different behavioral dynamics. They also include a number of subtypes, which makes it obvious to consider the concept of legitimacy what French sociologist Edgar Morin has named a macro-concept (Morin 1982).

The first broad type of organizational legitimacy is *pragmatic legitimacy*. This type of legitimacy is based on stakeholders' self-interested calculations. Is the activity performed in the most competent and effective way and in favor of stakeholder interests? There are three subtypes of pragmatic legitimacy (exchange legitimacy, influence legitimacy, and dispositional legitimacy). The second broad type of organizational legitimacy is *moral legitimacy*. This type of legitimacy is based on a positive normative evaluation of the organization and its activities. Is the activity the right thing to do? There are four subtypes of moral legitimacy, corresponding

Table 2 Overview of Suchman's three (sub)types of organizational legitimacy

Broad types	Subtypes	Example
Pragmatic legitimacy Focus: Interest	Exchange legitimacy Influence legitimacy Dispositional legitimacy	Exchange legitimacy: "As consumers we only focus on one thing: ourselves. This also applies when we choose a bank. Most people don't care about the ethics and moral of the bank. It is the price of the product and the service we can get for the our money that determine our choice" (the results of a survey made by Megafon and TV as presented by *Politiken* 24.9.2018)
Moral legitimacy Focus: Evaluation	Consequential legitimacy Procedural legitimacy Structural legitimacy Personal legitimacy	Structural legitimacy: The day before Danske Bank releases the results of an internal investigation of the bank's involvement in the money-laundering crisis (19.9.2018), *Politiken* published a vox pop where customers told about their relationship to Danske Bank. An 91-year-old lady who has been a Danske Bank customer for 60 years declared: "I am truly disappointed. It is an old bank" Personal legitimacy: The legitimacy of the CEOs of Danske Bank, in particular Peter Straarup, Eivind Kolding, and Thomas F. Borgen
Cognitive legitimacy Focus: Cognition	Comprehensibility	

roughly to Max Weber's theory of legitimate authority: consequential and procedural legitimacy both reflect legal-rational authority, structural legitimacy reflects traditional authority, and personal legitimacy reflects charismatic legitimacy. The third broad type of organizational legitimacy is *cognitive legitimacy*. This type of legitimacy is based neither on interest nor on evaluation but on cognition or comprehensibility. Table 2 provides an overview of all the (sub)types, including a few examples from Danske Bank's money-laundering scandal.

Suddaby et al. (2017) see the multiple attempts to identify types and establish typologies of legitimacy as one of the hallmarks of legitimacy-as-property research. They also question the utility of such projects hampered as they are by the "obvious over-proliferation of types" (p. 12).

Legitimacy Management from a Crisis Management Perspective

The strategic approach to organizational legitimacy is also the dominant approach within the field of crisis management. Before crisis management became an academic discipline, it was a simple practice. The key question sounds like this: How can the organizational practice of crisis management be as effective as possible when it comes to preventing, preparing, and mitigating crises? The institutional approach to organizational legitimacy is, if not nonexistent, at least very rare. The key question is how has crisis management been institutionalized in organizations?

Keith Michael Hearit is one of the scholars who have contributed the most to the study of crisis communication from an organizational legitimacy perspective (though he prefers to talk about *social* legitimacy). Hearit is a rhetorician, and his research is firmly rooted in the *corporate apologia* tradition, that is, the new type of rhetorical studies of the organizational and managerial rhetoric that emerges in the United States in the 1980s. We call his theory terminological control theory (see Frandsen and Johansen 2017).

Regarding the concept of organizational legitimacy, Hearit is first and foremost inspired by Dowling and Pfeffer (1975). Hearit defines corporate apologia as the public response to a social legitimacy crisis, a response that seeks to distance actors from their wrongdoing and reaffirm their adherence to central values. Hearit combines two criteria that a company must fulfill to achieve and maintain legitimacy: *competence* or the ability to "deliver the goods" and *community.*

Frandsen, Johansen, and Salomonsen are among the few scholars who have attempted to apply an institutional approach to crisis communication based on a cognitive understanding of legitimacy. In a series of articles published between 2009 and 2016, they have investigated how an older institutional logic (an emergency management logic) has been supplemented, overlayered, and, in some cases, replaced by a newer institutional logic (*a crisis management logic*) in public sector organizations in Denmark following a far-reaching municipal reform consolidating 271 municipalities into 98 larger units, effective January 1, 2007. The two logics have different histories, vocabularies, status, and focus. The old emergency management logic emerged in the 1930s, while the new crisis management logic did not appear until 2007. The term *crisis* was not used very frequently in the old logic; it talked instead about *extraordinary incidents*.

Inspired by the institutional logics perspective (Ocasio et al. 2017), the Danish scholars investigated how the shift in institutional logics took place. First, Frandsen and Johansen (2009) conducted a multiple case study examining how emergency managers (emergency departments) and communication managers (communication departments) perceive themselves and each other, how they use different professional vocabularies, and how they interact. Then, Frandsen and Johansen (2013) conducted a major document analysis based on a large corpus of different types of general and specific emergency management plans (EMPs), crisis management plans (CMPs), communication strategies, and policies. The data also included a study of the relevant concept literature and development arenas. Finally, Frandsen et al. (2016) investigated the complex process of institutionalization of reputation management and crisis management.

Within the field of crisis communication, Massey (2001) has taken up Suchman's distinction between a strategic approach and an institutional approach emphasizing how organizations achieve legitimacy through their communication behavior. He summarizes the distinction in the following ways: the strategic approach views legitimacy as a *resource*, and the institutional approach views legitimacy as a *constraint*. Thereby he joins Suchman in a reading of Dowling and Pfeffer (1975) that must be characterized as oversimplified. Legitimacy, social norms, and values constrain the actions taken by individual organizations, but at the same time actions taken by the very same organizations for the purpose of legitimation can alter these norms and values.

Legitimacy Communication

In the literature on organizational legitimacy, communication is often assigned a key role in gaining, maintaining, or repairing legitimacy. In their list of things an organization can do to become legitimate, Dowling and Pfeffer (1975) mentioned three strategies. First, the organization can adapt its goals, methods of operation, and output to the prevailing definitions of legitimacy. Second, the organization can attempt, through communication, to alter these definitions so that they conform better to the organization's activities. Third, the organization can attempt, again through communication, to become identified with symbols, values, or institutions that have a strong base of social legitimacy. Unfortunately, Dowling and Pfeffer were not very specific about what we have to understand by communication in this context. These three strategies mentioned above are rather similar to the issues management strategies proposed a few years later by Jones and Chase (1979).

Suchman (1995) also emphasizes that legitimacy management is based on *communication* between the organization and various types of stakeholders. However, his understanding of communication goes beyond "traditional discourse, to include a wide range of meaning-laden actions and nonverbal displays" (p. 586). As we shall see later in this section, Suchman (1995) has a broader approach to crisis communication (a term that he does not use) than traditional crisis communication research. For each of the three broad types of legitimacy – pragmatic, moral, and cognitive legitimacy – Suchman provides us with examples of strategies for gaining, maintaining, and repairing legitimacy. Given our focus on crisis communication and organizational legitimacy in this chapter, we are first and foremost interested in the last category of strategies.

Suchman (1995) defines legitimacy repair as a "reactive response to an unforseen crisis of meaning" (p. 597). Most crisis or disruptions are based on what he calls "failures of meaning." They happen because managers have become enmeshed in their own legitimizing myths and because they have not noticed that their cultural support is declining. According to Suchman, the literature has identified three broad types of tactics for repairing legitimacy (for an overview, see Table 3). The first tactic is to formulate a *normalizing account* that separates the "local" crisis or disruptive event from more "global" assessments of the organizations as a whole. This tactic has four subtypes: the managers may attempt to deny the problem; to excuse it by questioning the organization's social responsibility; to justify the disruption; and to explain it, that is, to frame it in such a way that the organization will preserve its support. The second tactic is to facilitate legitimation through *restructuring*, a strategy that has two subtypes: to create monitors and watchdogs and to disassociate. The replacement of executives, like in the case of Danske Bank and its CEO Thomas Borgen, may serve as an example of disassociation. The third tactic is rather straight forward: *to avoid panic*.

Table 3 Suchman's list of strategies of repairing legitimacy

Strategies	Tactics	Example
(1) Formulate a normalizing account	Four types of normalizing accounts: (a) Denial (b) Excuse (c) Justification (d) Explanation	
(2) Strategic restructuring	Two types of strategic restructuring: (1) Creation of monitors and watchdogs (2) Disassociation	Dissociation: Replacement of the CEO
(3) Avoid panic		

Legitimacy Communication from a Crisis Communication Perspective

Crisis response strategies have been one of the cornerstones in crisis communication research since the 1990s. The many empirical studies of crisis response strategies, conducted either as case studies or as experimental test, have been inspired by different theoretical frameworks such as *corporate apologia* (see Ware and Linkugel's article "They spoke in defense of themselves," 1973); the *sociology of accounts*, that is, statements made by a person or an organization to explain unanticipated or untoward behavior (see Scott & Lyman's article "Accounts," 1968); and *impression management* or the attempt to influence the perceptions of other people about a person (see Goffman 1959).

If we compare the repertoires of crisis response strategies in image repair theory (Benoit 1995/2015) and in situational crisis communication theory (Coombs 1999/2019) with Suchman's rather short list, we immediately see that there are both similarities and differences. There are a few verbal legitimacy communication strategies, such as *denial*, *excuse*, and *justification*, which are similar to crisis communication strategies. There are also a few different strategies such as *avoid* panic. Suchman explains this strategy by combining it with threat-rigidity theory (Staw et al. 1981). Finally, there are also some nonverbal strategies such as *the creation of monitors and watchdogs*. What characterizes Suchman's approach is his usage of nonverbal tactics.

Allen and Caillouet (1994) are early but important contributions to the study of crisis communication from an organizational legitimacy perspective: "Crises occur when an event or series of events threaten a corporate actor's legitimacy and therefore, ultimately, its survival" (Allen and Caillouet 1994). The goal of the study is to provide a detailed typology of naturally occurring message strategies that can shape stakeholder attitudes regarding organizational legitimacy. The theoretical framework of the study combines institutional theory and impression management. The findings of the study demonstrated that *ingratiation* was the primary strategy appearing in the almost 800 statements collected for this study, followed by denouncement and justification. Surprisingly, there were no apologies. However, the most interesting finding was that different impression management strategies were used with different stakeholders.

A Wasted Opportunity?

In this section, we want to return to the puzzle that we touched upon at the beginning of the chapter. If it is a fact that the survival of an organization is closely linked to the legitimacy it receives from the society in which it operates, how can we then explain that crisis communication researchers have lost interest in the concept of organizational legitimacy in favor of the concept of reputation? As we have observed, the academic literature on crisis communication research in corporating an organizational legitimacy perspective is not very extensive. There seems to be at least two plausible explanations.

The first explanation concerns the academic (sub)disciplines that make up the context in which the concept of organizational legitimacy can be developed. Max Weber and Talcott Parsons, a German sociologist and an American sociologist, normally are identified as the two originators of the concept of (political or organizational) legitimacy. In Weber's case, the concept was introduced as part of a theory of legitimate rule. In Parson's case, the concept was very much related to the congruence of organizational values with societal values. Similarly, systems theory, neo-institutional theory, resource dependence theory, and population ecology, four streams of organizational research from the 1960s to the 1970s focusing on the relationship between organizations and their environment, made legitimacy into an "anchor-point" in organizational studies (Suchman 1995, p. 571).

Crisis communication has to a large extent developed as a subdiscipline under the discipline of American public relations. This means, among other things, that there has been a strong influence from psychology at the expense of sociology and that it has been less obvious to incorporate theories from management and organizational studies into public relations research. If we go to Europe, the situation changes. Here, it is much more common to take a sociological approach. *Public Relations and Social Theory: Key Figures and Concepts*, edited by Øyvind Ihlen, contains a chapter authored by Arild Wæraas "On Weber: Legitimacy and legitimation in public relations." Thus, the lack of interest in the concept of organizational legitimacy among crisis communication researchers could be explained as the result of a specific academic tradition.

The second explanation concerns a methodological issue. "To date, relatively few research efforts have involved the application of legitimacy to crisis and crisis communication. This may be due to the fact that organizational legitimacy as a concept is very difficult to operationalize" (Seeger et al. 1998, p. 257). To operationalize is to define the measurement of a concept so as to make it understandable in terms of empirical observations. The supporting structure of organizational legitimacy is the relationship between an organization and the larger (peer or superordinate) social system in which it operates. The organization seems to be the easiest of the two to operationalize, but what do we have to understand by the larger social system? Is it society at large, or an organizational field, or specific external stakeholders?

Conclusion

On September 19, 2018, Danske Bank released a report on the money-laundering scandal that the bank had ordered from Bruun & Hjejle, a Danish law firm. "The bank has clearly failed to live up to its responsibility," said Ole Andersen, chairman of Danske Bank. On the same day, the CEO of Danske Bank, Thomas Borgen, resigned. He declared:

Even though the investigation concludes that I have lived up to my legal obligations, I believe that it is best for all parties that I resign. As the CEO, I have the responsibility for the things that take place in the bank, and of course, I take on this responsibility. It has been clear for me for some time that resigning would be the right thing to do, but I have held off the decision, because I felt a responsibility for seeing the bank through this difficult period towards presentation of the investigation. It has been a great privilege to lead the more than 20,000 employees who each day work tirelessly to give our customers the best advice and services on the market, and I will miss them all. The bank obviously has a big job ahead of it because of this case, but has a strong foundation and is well prepared for the future. (Dansk Bank, September 19, 2018)

As it appears from the statement made by Thomas Borgen, the bank does its best to attempt to restore its reputation using crisis response strategies such as bolstering. However, external stakeholders, such as business partners, local governments, and NGOs, are challenging the banks by declaring that they will stop their cooperation with the bank due to its behavior and involvement in the scandal. For example, Copenhagen Business School wants to stop the cooperation with the bank as it "no longer constitutes a proper role model to their students" (Finans.dk, October 10, 2018). However, it is not only the corporate reputation of Danske Bank that is threatened but the reputation commons of the banking industry in Denmark. A month later, following new revelations, Danish experts encouraged the politicians to get to grips with what they called the bank's "culture of greed" (Morgenavisen Jyllands-Posten, October 19, 2018).

Finally, it is not only the corporate reputation of Danske Bank that has been damaged but also its legitimacy, its *license to operate*. Danske Bank is facing problems related to pragmatic as well as moral legitimacy. The crisis management of the bank did not live up to what one can expect from a big and important bank operating internationally, and the bank did not have a proper crisis prevention system able to perform the necessary signal detection to avoid criminal activities such as money laundering.

Philosophical Dimensions of Corporate Citizenship and Business Legitimacy

Business Legitimacy in the Social Market Economy: Individual and Corporate Economic Citizenship

38

Alexander Lorch and Christoph Schank

Contents

Abstract

Questions of business legitimacy do not touch upon organizational and stakeholder issues alone. Businesses are also set in a particular social and economic system, with specific norms and values that need to be considered – especially in an economy that is increasingly connected, globally and culturally. To analyze this normative background, the idea of a social market economy needs to be considered. Being the spiritual and factual foundation for many European economies, it suggests a more just design for economic policy, possibly remedying the problems and inequalities the past decades of unbridled capitalism have brought.

J. D. Rendtorff (ed.), *Handbook of Business Legitimacy*,
https://doi.org/10.1007/978-3-030-14622-1_42

Considering this idea of a specific economic order, the social market economy is examined with regard to business legitimacy, i.e., the relationship of business and society and how it ties in with current debates of business legitimacy. By looking at the historic economic thoughts of ordoliberalism as its underlying theoretical foundation, what defines a social market economy and the role of business for this economic order are discussed. The discussion of a just economic order is then connected to considerations of a republican view of *economic citizenship*. This concept ties the idea of the social market economy to both the legitimacy and responsibility of businesses and individual integrity and citizenship.

Keywords

Social market economy · Ordoliberalism · Third way · Legitimacy · Responsibility · Citizenship · Corporate citizenship · Corporate social responsibility · Integrity · Corporate economic citizenship · Civic virtues · License to operate

Introduction

Building upon Max Weber's (1978) definition of legitimacy, organization studies define legitimacy as the "generalized perception or assumption that the actions of an entity are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs, and definitions" (Suchman 1995: 574). In the wake of recent business scandals, it became rather clear that such business behavior is not perceived as desirable or proper by a large part of society: The public reacts with outcries, demands stricter state regulation, or is boycotting firms that were involved in illegitimate practices. Legitimacy is thus very relevant for the success and survival of both individual organizations and the industries to which they belong (Deephouse and Suchman 2008).

Over the past decades, such repeated business scandals have not only resulted in a loss of trust in and reputation of corporate actors and very vocal public debates on the legitimacy of business practices but also eroded trust in the stability and legitimacy of the economic system in general. While legitimacy is usually attributed to a specific action of an actor (be it a business or an individual), legitimacy depends upon the social order the action takes place in – this is the system of norms, values, and beliefs mentioned in Suchman's definition. As such, questions of business legitimacy do not only touch upon organizational and stakeholder issues alone: Businesses are set in a particular social and economic system, with specific norms and values that need to be considered, especially in an economy that is increasingly connected, globally and culturally. These values, norms, and beliefs are never just *set* – they rather develop in a cultural, political, and historical setting.

Most notably during the events of the world economic crises from 2008, the debate thus opened up to questions about not only how specific actors behaved or ought to behave but about the values and norms of market economies, the way they are functioning, and whether capitalist economies in general can or should be considered legitimate or not. The past years have thus seen a rise in discussions of heterodox economics (such as feminist economics, social economics, post-growth economics) (Lawson 2005) and how to think about the legitimacy of the economic system in a broader sense (cf. Ulrich 2008; Lorch and Beschorner 2018). It therefore seems necessary to imbed the discussion on business legitimacy in the discussion about what role corporations are and ought to be playing in a specific economic order and in society.

The treaty of Lisbon has constituted the idea of a *social market economy* as the shared economic order for the European Union, i.e., the world's largest domestic market (cf. European Union 2007, Treaty of Lisbon, Article 2.3). The idea of a social market economy, which has, as a specific economic term, most notably determined German economic and political thought for more than the past 60 years, can be found in one way or another in most European countries. It strives to be an alternative attempt at constituting and moderating a liberal market economy, suggesting a more just design for economic policy and possibly remedying the problems and inequalities the past decades of unbridled capitalism have brought.

Considering this idea of a specific economic order, the social market economy needs to be examined with regard to business legitimacy and how it ties in with current debates on the relationship of business and society. By looking at the historic economic thoughts of ordoliberalism as its underlying theoretical foundation, the social market economy can be defined, and the role of business for this economic order can be discussed. Notably, while the social market economy has a lot to say about the rules and regulations of a competitive market order (i.e., allocation and distribution) and also rules of redistribution (i.e., economic justice), it did not conceive of corporations (or consumers) as specifically relevant actors with regard to legitimacy – which seems problematic, considering the current debates. In part 3, the discussion of a just economic order is connected to discussions of *economic citizenship*. This concept ties the idea of the social market economy to both the legitimacy and responsibility of businesses and individual integrity and citizenship. The chapter concludes with some final remarks on business legitimacy in general.

The Economic Order as a Source of Business Legitimacy: Discussing the Social Market Economy

The first challenge of discussing business legitimacy in the specific setting of the social market economy is to find an acceptable definition of this economic theory. As constant adaption to political and economic circumstances has changed the concept significantly from its inception, the social market economy has become a rather vague term that is quite difficult to define. Nevertheless, a certain theoretical foundation of a set of economic policy considerations has remained and can still be considered the core of the social market economy today.

Ordoliberalism and the Social Market Economy

During and right after World War II, a group of economists attempted to shape political and economic thinking in Germany. The work of these scholars, known as ordoliberals, and their influence on political and economic debates cannot be underestimated: not only have they laid the theoretical foundation for the unique economic success story of the postwar German economy with the conceptualization and implementation of the social market economy and its related “economic miracle” (“Wirtschaftswunder,” Ptak 2004; Sally 1996). The social market economy has also become a major term in economic theory, and, furthermore, ordoliberal thinkers were also members of the renowned Mont Pèlerin Society that reinvented and broadcasted liberal political and economic thought in the twentieth century – their efforts are today commonly known as neoliberalism (Mirowski and Plehwe 2009).

The focus of ordoliberal thought, mostly undertaken between the 1930s and 1950s, was the design of a “third way” between laissez-faire capitalism on the one hand and a socialist planned economy on the other, striving to reconcile the promises of and the issues with these two conflicting ideologies. The result of the theoretical considerations was the conceptualization and implementation of the social market economy in Germany.

To the ordoliberals, the social market economy meant a clear commitment to a liberal constitution of the economy that is closely linked to a specific social setting. The authors emphasize that the social market economy is not just a free and unrestrained competitive order, as this would lead to unwanted social problems. The market economy would inevitably fail if it is not politically shaped and embedded:

> The market economy is not everything. It has to be embedded into a higher order that cannot rely on supply and demand, free prices and competition alone. (Röpke 1958: 19, own translation)

As ordoliberal authors such as Eucken, Müller-Armack, Röpke, and others have emphasized, the social market economy is not just an economic order, limited to the description of socioeconomic rules and policies, but rather a shared notion of how the economy is to be integrated into society. This facet is crucial: The social market economy ties its design for economic policy very closely to social predispositions. Thus, the social market economy has two components:

One is the decision for a competitive market economy based on economic principles that especially Eucken (1990) discussed extensively. The essential elements of these principles are legal preconditions regulating trade (such as the guarantee of property rights, freedom of trade, liability, and contract rights), fiscal conditions (taxes and duties), and infrastructural preconditions necessary for economic performance (such as the availability of human capital and services, transportation networks, and telecommunications) (Eucken 1990: 254–303).

At the same time, the specification of a “social” market economy is not only delineating a social system in the form of the welfare state, for an ex post redistribution. It rather symbolizes the aforementioned social embeddedness and the thoughtful ex ante design of the market economy. The addition of the "social" is not just a mere attachment to the market economy but a constitutive principle of the economic order. It is meant to "civilize" the market economy and constitute a humane economic order by tying it to a superordinate notion of a good society, to counter the competitive and egoistic tendencies that are characteristic of a market order. As Müller-Armack puts it:

> The market is incapable of integrating society as a whole and of producing common attitudes and value norms, without which society cannot exist. It nibbles away at the substance of historical forces of cohesion and places the individual into a painful isolation. (Müller-Armack 1978: 327)

Underlying values, norms, and social cohesion are fundamentally important for a competitive market order to function properly – the economy is based on "the precondition of an already existing minimum of basic ethical convictions. In other words: the market economy does not exist in a moral vacuum. It is always endangered to lose its ethical footing if it cannot rely on moral support" (Röpke 1955: 285).

While these general ideas of ordoliberalism seem sensible with regard to current debates on business legitimacy, the way the ordoliberals designed the social order seems rather problematic, as they are at least anachronistic and sometimes outright paternalistic. They share a very traditional view on individual values and virtues as a condition for an operational, i.e., legitimate market economy, based on Christian values and a return to certain traditions and virtues. In order to "civilize" the egoistic, competitive participants of the market economy, the authors of the social market economy demand a "return to eternal values" (Müller-Armack 1981: 50) and to "subordinate economic life" (Müller-Armack 1981: 50) to the values of Christian religion (Goldschmidt 2009). Ordoliberals thus define the necessity of a "higher order" in which the economy needs to be embedded:

> Every economist, at least the mentally ambitious ones, must agree on the fact that the market, which consists of competition, of supply and demand, and flexible prices, can only be thought of as a part of a higher order. This higher order consists of morals, law, the natural conditions of existence and happiness, of government, politics, and power. Society as a whole cannot only consist of the law of supply and demand. (Röpke 1958: 130)

However, this "higher order" or the "natural conditions of existence and happiness" are not arbitrary – according to Röpke, they are bound to a very specific set of virtues:

> Self-discipline, a sense of justice, honesty, fairness, chivalry, moderation, public spirit, respect for the dignity of others, strong moral norms – these are things that man needs to have when going to the market. They are indispensable pillars that save him from degeneration. Family, church, real community and traditions need to equip him with these. (Röpke 1955: 286)

Throughout their writings, it becomes quite clear that the values the authors of the social market economy demand are based on a rather romantic view of humankind as an enlightened, benevolent people with strong family bonds, situated in a small rural and religious community (cf. Lorch 2014, 2017), regressing to religious beliefs that form the background for a particularly traditional European ideal society.

While these considerations do not seem adequate for a globalized and pluralistic society, the social framework seems especially important when considering questions of legitimacy: What can be seen here is that the market economy does not exist in a vacuum. It is not only connected but even dependent on a certain set of social norms and values, which it cannot (re-)produce on its own.

The Role of Business in the Social Market Economy

Based on this cursory overview of what the social market economy is about, the specific role of business and its legitimacy needs to be considered.

The way the social market economy was conceptualized was by thinking about what *rules* to establish, the rules that govern the market economy, and to embed the economy in a larger order. This is mostly why specific economic actors were only considered in passing. Eucken, for example, tasked the government, academia, and churches (Eucken 1990: 325) with the implementation of the rules and principles of the economic order – businesses were not supposed to have any considerable influence but were meant to be embedded in the economic order and only mattered if they would influence the economic order negatively.

Such influences by businesses were seen with regard to two aspects: One was the danger of excessive market power. The social market economy rests on the neoclassical conception of perfect competition, and so any way that a single actor could influence the market by sheer size or power poses a threat to the economic order. One of the founding ideas of the social market economy is that any sort of excessive power, be it public despotism or private cartels or monopolies, can only be to the benefit of the few wielding that power and will have negative impacts on the rest of society. The most important function of the state in the conception of a social market economy is thus to limit and dissolve groups that gain too much power (Eucken 1990: 334). Public institutions to govern markets would thus be tasked with upholding a state of perfect competition and appointing a trade commission. Considering this deep-rooted optimism of perfect competition, it becomes clear why businesses do not play a prominent role in the conception of a social market economy: They were simply not supposed to wield a large amount of power and influence (on the market or on society) in the first place.

The second aspect of influence the ordoliberals considered was the question of liability, which was also a pivotal foundation of the social market economy. Showing first signs of an early debate about corporate responsibility, the ordoliberals argued for the liability and responsibility of the *business man*, rather than business itself. Analogous to the early debate on corporate responsibility, the discussion in the first half of the twentieth century mostly revolved around the actions of the business founder and/or owner, which at that time was still mostly the same person managing the operations (cf. Bowen 1953, for an overview, see Carroll 1999). This entrepreneur was also the focal actor in the theory of a social market economy: It was she/he who carried the entrepreneurial risks and was awarded with the corresponding profits if the endeavor was successful. Entrepreneurial courage and initiative were virtues to be fostered – the locally embedded entrepreneur, a spirited, courageous, and successful, yet also responsible, tactful, and considerate individual is one of the major foundations of the social market economy (Aßländer 2009: 247).

Heavily interwoven with this entrepreneurial spirit is also the call for the entrepreneur to be liable for his/her actions and the risks she/he is taking. Liability is where taking responsibility becomes legally binding – those who are liable are legally required to take responsibility for their actions. For the social market economy, it was essential that it is clear who is liable and that this liability is encompassing for all economic actions of the entrepreneur. It is essential that entrepreneurs are liable and even retire from their activities if they don't manage the invested capital carefully. As such, responsibility and legitimacy are closely attached to the entrepreneur, and not the corporation.

Over the past decades, very different corporate structures have developed that are (a) much larger and influential than ordoliberals would have liked and (b) shift the focus from the responsibility and legitimacy of the business woman/man to that of the business itself. This is due to the change in ownership structures and the implementation of professional managers who are not the owners of the business anymore. These developments, not yet foreseen by the authors of the social market economy, make it necessary to discuss more than just legal liability of the owner and think about businesses as important and influential actors in societies.

In summary, the social market economy sets the stage for legitimacy in business, but does not really address the behavior of businesses specifically. Legitimate business practice here seems to boil down to being profitable, to follow the law, and to not wield excessive market power. The social market economy is a useful framework for a discussion about business legitimacy, but while it seems natural to include legitimacy and responsibility in the conception, it currently does not discuss these aspects. While the state has the task of establishing the conditions of a well-functioning market economy and the social market economy calls for embedding this market framework in a social setting, it rarely makes suggestions as to how this social setting comes about. It does not discuss the actors – neither business nor consumers – or how they would generate legitimacy.

It seems rather remarkable that the guiding principle of the current economic order is conceptually rather anachronistic in parts and not adapted to a modern global economy. It should set the stage for a discussion of business legitimacy but falls rather short in this regard and just shifts this discussion toward the state and/or civil society, without specifying how economic actors assume legitimacy. The next section thus wants to introduce economic citizenship as a way to integrate business legitimacy in the theoretical context of a social market economy.

Business Legitimacy and Economic Citizenship

Following the brief overview of its theoretical foundations, one essential problem of the social market economy seems to be that it only focuses on the rules of the (economic) game of the market economy and does not sufficiently consider the actors, i.e., the players of the game. By focusing on the backdrop of the economic order alone, it assumes that the business of business is just business (Friedman 1970). But in the debate on business ethics, it is now widely accepted that businesses face legitimate claims by a multitude of actors, arguing for a shift from a shareholder value approach to a stakeholder one (Freeman 1984, 2004; Freeman and McVea 2001). The social market economy omits this discussion of the socially correct function and the legitimacy of business activities entirely (cf. Ulrich 2008: 376f.) and therefore ignores the reciprocal relationships between the institutional ethics of the market economy and socially responsible corporate management. To close this gap, the concept of economic citizenship is introduced, discussing how a just society and a beneficial market economy need actors whose self-conception includes being economically active while being conditionally legitimized as part of a surrounding societal system.

In the broadest sense, citizenship "implies membership in a bounded political (normally national) community" (Hettne 2000: 35). In both Greek and Roman societies, citizenship meant more than mere membership though – citizenship was connected to a sense of civic responsibility; with the rights of a citizen also came certain duties, as every citizen was meant to participate in a shared *res publica* (cf. Ulrich 2008: 274f.). This liberal-republican definition of a citizen is the core of economic citizenship to be introduced (cf. Schank and Lorch 2015). Citizenship, in this sense and adjusted to modern societies, implies that free and democratic societies grant individual rights but also depend on the civic sense and political participation of its citizens. Individuals then need to adhere to a certain *minima moralia* in order to uphold the regulative idea of the public: Citizens should be willing to reflect on their preferences and attitudes; they need the will to compromise in areas of dissent and to accept the need for legitimation (Ulrich 2008: 99).

Turning toward *economic* citizenship, these civic virtues are not only necessary conditions for dealing with political matters in the public sphere. In a civic community, *any* action needs to be questioned for its legitimacy – thus civic virtues also become *economic citizen virtues* insofar as business activities always have public relevance:

> [T]he idea of a neat and tidy separation between the political citizen (as homo politicus) and the economic citizen (as homo oeconomicus) turns out to be the symptomatic expression of a privatistically reduced self-understanding of the bourgeois who has lost his awareness of the priority and indivisibility of his status as a citoyen. The core of a republican economic ethics consists precisely in reflecting on the indispensable republican civic ethos in the self-understanding of the economic agents and putting it into practice. From this point of view, all economic agents essentially share a responsibility that cannot be delegated. Their shared responsibility refers to the quality of societal processes of deliberation, particularly in regard to debates concerned with the general economic, social and political conditions for the legitimate pursuit of private economic interests. (ibid: 300)

It is this legitimate pursuit of private economic interests and the connected *integrity* of the individual that is the regulative idea of economic citizenship. Citizens need to adhere to the principles of legitimization in all areas of their life, including economic matters and such roles as that of an employee, a manager, or a consumer. Economic citizens then are “economic subjects who do not separate their business acumen from their civic spirit, i.e., their self-conception as ‘good citizens’, but integrate both” (Ulrich 2005: 14; cf. Ulrich 2008: 283) in a community of free and equal citizen.

Economic citizenship therefore refers to a kind of integrity built upon two complementary notions (McFall 1987): The *moral notion* requires one to comply with the ethical convictions, shared values, and civic virtues that are the foundations of a shared vision of economic activity and which in a sense enable a well-ordered society in the first place. This notion does not negate moral conflicts, which are the necessary ground of a pluralistic society, but requires moral compromising in areas of dissent (Goodstein 2000). The second, *nonmoral notion* of integrity emphasizes the original Latin sense of the word, as in being “holistic” or “undivided.” This personal integrity of the citizen requires a person to be consistent in their convictions, intents, and actions and let neither part of this triad be endangered by systemic constraints. Integrity in this sense is not only a duty of the individual but a value per se, as the basic foundation for a succeeding life of the individual (Koehn 2005). But to think, act, and judge with integrity in this sense are also not only the duty of the actor: It requires an organizational and social setting that does not impede or restrain the integrity of a person through conflicting requirements, processes, or objectives as well.

Importantly, this call for integrity and legitimacy extends to all economic actors, and not just individuals alone. This means that in the wake of debates on corporate social responsibility and corporate citizenship, the idea of economic citizenship can be applied to both natural (i.e., individual) and artificial (i.e., corporate) actors. For both dimensions, what legitimacy means with regard to economic citizenship needs to be discussed.

Individual Economic Citizenship

While businesses constitute the most powerful and influential (and certainly the most visible) actors in economies today, the moral character of those companies is still largely determined by individuals, i.e., the kind of management authority and how this authority is used in the company (cf. Warren 2003: 156). Therefore, and in line with the concept of the social market economy, individuals still play a major role for the legitimacy of business. According to the republican understanding of economic citizenship and the discussion about corporate economic citizenship, it should have become clear that not only managers but every individual has to be concerned about the legitimacy of their economic actions at all times. It thus remains everyone’s *individual* responsibility as citizens to participate in a shared *res publica* (Ulrich 2008: 274f.).

Economic citizens are faced with a multitude of different roles every single day – as consumers, employees, managers, family members, and political actors – and these roles might certainly be conflicting. Thus, legitimate actions depend again on the integrity of the actors. This concerns all kinds of actions: decisions about consumption and purchasing, investment and portfolio strategies as an individual, decisions made as a member of an organization, as well as political commitment and voting decisions. They all concern political and social matters which can and should be reflected. Economic actions can be the cause for substantial externalities, like environmental damage, precarious labor conditions, or violations of human rights. This is especially true in a world economy that is increasingly globalized, where local events are embedded in worldwide chains of interdependence. The individual is thus embedded in multiple social settings, such as movements and groups that shape their behavior. One of these settings is business organizations, where many individuals spent most of their working time and are influenced by rules, processes, and hierarchies they can only shape in a limited way. This is why, besides the individual actions, collective actions of corporate actors need to be considered as well.

Corporate Economic Citizenship

While the individual actors remain important, a rise in the discussion about another important addressee of citizenship in corporate actors can be observed. Corporations are the central actors of modern economies; with their global supply chains, they substantially affect the social and natural environment and influence other social subsystems like education, health, or politics through countless interdependencies. This indisputable power and the influence of (especially global) corporations call for an in-depth discussion of their legitimacy (Matten and Crane 2005).

It is important to note though that the idea of citizenship cannot simply be transferred to artificial actors like corporations. The nexus of contract theory, for example, defines corporations as simply the sum of all implicit and explicit contractual relationships and the way they are established between individuals in the form of employment or purchase contracts or property rights (Jensen and Meckling 1976). This way, a corporation could not be the addressee of responsibility or legitimacy at all, as it is nothing more than a formal entity, comprised of multiple individual responsibilities. In his seminal article, Milton Friedman (1970: 122) also establishes this view:

> The discussion of the 'social responsibilities of business' are notable for their analytical looseness and lack of rigor. What does it mean to say that 'business' has responsibilities? Only people can have responsibilities.

To so reduce the discussion of responsibility and legitimacy to natural individuals alone does limit the discussion tremendously though and can hardly be satisfying in an age where the economy is based heavily on the division of labor and countless interdependencies. As most business scandals show, corporate actions can rarely be attributed causally to the actions of single individuals anymore. To understand corporate actors simply as the sum, aggregate, or legal entity of individual actions and responsibilities therefore deprives the discussion of an important addressee.

By discussing organizational goals and dynamics, views have developed that acknowledge that corporate actors, in the sense of a machine (Ladd 1983) or an organism (Goodpaster and Matthews 1983), intervene with the responsibilities of individuals and might thus justify their own sphere of responsibility. Most notably, French (1979, 1995) equalizes artificial and natural actors and acknowledges a metaphysical existence of corporations, thus interpreting them as adequate moral actors.

But even without following these extensive analogies, it seems comprehensible to understand corporate actors generally as moral actors (Werhane 1985; Goodpaster 1983) to acknowledge the degrees of freedom and rights they have in the social market economy. This is also in line with the general impression of the public that does ask for the legitimacy of economic actions and demands that corporations assume their respective responsibilities.

Contrary to natural actors, corporate actors do not have a natural right to exist but have to constantly legitimize their activities in the market and in society. This is being discussed in the debates on the social *license to operate*, which is very closely linked to the debate on legitimacy (Gehman et al. 2017). Acquiring and securing the social license to operate are the most visible expression of legitimacy of corporate actors and the focus of many scientific and business debates. Following Palazzo and Scherer (2006) and in line with the republican view of citizenship, legitimacy can only be acquired through discourses that mirror the plurality of society and that consider a broad range of stakeholder. What legitimacy means for corporate actors and how good corporate economic citizenship is established can thus not be decided by simply following a static catalogue with certain criteria but requires a continuously dynamic process. Such requirements are mostly discussed in the current discourses on concepts such as corporate social responsibility (CSR) and corporate citizenship (CC) – discourses that have by now also found their way into mainstream management literature (Beschorner and Schank 2013: 87). But while corporate social responsibility has been defined quite extensively and in a legitimate and inclusive way in the ISO 26000 (Castka and Balzarova 2008: 303), corporate citizenship is still a rather contested concept.

As was mentioned, a corporate economic citizen is understood as a *citoyen* in a republican tradition that acquires legitimacy not just by paying taxes and following the law and the rules of the game but that understands all its economic actions in the light of social legitimacy (Ulrich 2008; Beschorner and Schank 2013: 93). For a corporate actor, following its economic self-interest then remains legitimate as long as it does not violate any substantial moral rights of its stakeholders. Its ambition for legitimacy requires it to constantly reflect its own business activities with regard to the common good. In contrast, a corporate *bourgeois*, following the liberal tradition, might also further the common good (e.g., with its corporate philanthropy activities) but would not consider the common good in its core business, thereby sometimes even possibly contradicting its well-meant efforts of philanthropy (Moon et al. 2003, 7f.). While corporate citoyens would follow an extensive, *proactive* understanding of responsibility, the corporate bourgeois only *reactively* follows the rules of the economic order. The core of a republican understanding of economic corporate citizenship is the search for legitimate collective solutions and an approach to responsibility that is not limited to the "internal" corporate social responsibility performance of a company. Legitimate corporate actors should thus not merely act according to the rules of the game but ought to be game changers themselves, through an active political participation. The commitment and engagement of companies to develop ethically sound standards within their industries or their participation in multi-stakeholder initiatives are important examples of the political co-responsibility of firms.

In conclusion, legitimate business behavior is seen as embedded in a nexus of social and economic norms, set by a social and economic order that itself is constantly changing and needs reflection and support of actors that are striving for integrity and legitimacy. Different actors and levels of analysis are thus always interwoven and establish a multitude of interdependencies with regard to business legitimacy (cf. Fig. 1).

Corporate economic citizenship means the individual and collective responsibility of corporate actors for the effects of their core business, above and beyond legal requirements. They do not understand themselves as a counterpart to the political sphere and civil society and strive to only follow legitimate economic interests. They can thus be an active partner for and an integral constituent of a well-ordered society.

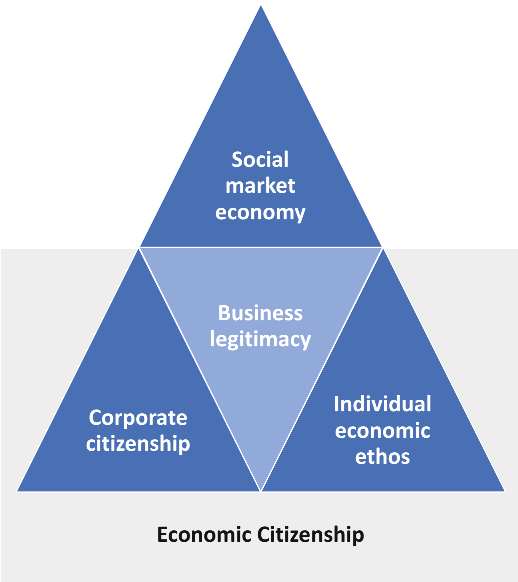

Fig. 1 Economic citizenship, business legitimacy, and social market economy

Conclusion

The social market economy laid the ground for the discussion of economic citizenship. It is an economic theory that tries to reconcile a liberal market economy with the acknowledgment that a market economy is dependent on certain social values and norms to function properly and in order for it to generate welfare for all. The economic order thus needs to be designed in a way that it prevents civic virtues and public welfare orientation from being subordinated to the pure systemic logic of economics. While the economic and social principles of the social market economy generally seem sound and important, the discussion about how economic actors ought to behave in modern, global economies falls short and misses input from current debates in business ethics on corporate responsibility, corporate citizenship, and business legitimacy. *Economic citizenship* was introduced as a concept to enlarge the discussion of corporate citizenship, by introducing a republican view on citizenship that grants individual rights but also asks (corporate) citizens for a certain minimum involvement in the *res publica*.

It should have become clear that the kind of legitimacy here discussed goes further than the descriptive definition of Weber and Suchman: It is not enough for an action to only be in line with the de facto values, norms, and beliefs of a social system. In line with the republican understanding of citizenship here introduced and above the mere adherence to social expectations, economic citizens need to *reflect* upon these values and norms and should, if necessary, help shape the society they are embedded in (for an in-depth discussion of descriptive and normative legitimacy, see Peter 2017).

Abstract

In this chapter, we argue that there are good reasons for ascribing human rights duties and other duties of justice to transnational corporations. We do so by basing duties of justice on human dignity. Though a contested idea, human dignity provides a sound basis for grounding all duties of justice on one common concept as well as linking the argument to current political and legal discourse. Our argument is that corporations are not only private economic actors that act within a certain political and judicial framework, but they proactively play a part in shaping the legal framework that governs their economic activities. Because they are political actors, it is reasonable to ascribe not only negative duties to respect human rights but also stronger duties to protect to them when they operate outside sufficiently just states. But even if states are sufficiently just, it is a mistake to think that no duties of justice remain for corporations, since at all times there is the duty to follow the spirit and not only the letter of the law. Moreover, because legal systems are only more or less just, there is room for

improving justice beyond what the law requires. Finally, we draw the conclusion that corporations' license to operate depends on their fulfillment of their dignity-based duties and that if they do not fulfill their duties sufficiently, it is legitimate and maybe even mandatory to withdraw their license to operate.

Introduction

Companies and especially transnational corporations play an important role in shaping our social world and individual lives. Everybody experiences this almost daily, which is probably a central reason why the idea that corporations do have moral responsibilities receives considerable support in academic literature and public discourse. This idea is at least as old as the discourse on corporate social responsibility, which was initiated in the beginning of the twentieth centuries when transnational corporations emerged as a global force operating relatively independently of their home states (Carroll 2006, 2008).

Compared to this idea of general moral responsibilities, the more specific thought of corporations as political actors with precise duties of justice is rather new. To be sure, the basics of this argument were prominently elaborated by Onora O'Neill (2001) in a seminal paper almost 20 years ago. But the idea generated traction only more recently in the context of the ongoing discourse on business and human rights (Wettstein 2012; Karp 2014). Scholars and activists, who were unhappy with the global compact, lobbied for a document called "Norms on the Responsibilities of Transnational Corporations and Other Business Enterprises with Regard to Human Rights." However, this initiative was not endorsed by the UN Commission on Human Rights (Ruggie 2007; Wettstein 2015).

Instead, in 2005 John Ruggie was appointed as a special representative of the Secretary-General and charged with developing a new framework. In 2008, he presented his own proposal to the UN Human Rights Council (which replaced the UN Commission on Human Rights in 2006), which was endorsed after extended reworking as the "UN Guiding Principles on Business and Human Rights" in 2011 and as of today is the official position of the UN regarding the human rights responsibilities of companies. This framework limits the responsibility of companies to not violating human rights themselves and not being complicit to the violation of human rights (Ruggie 2011, 2013).

In this chapter, we want to defend the claim that corporations do have proper duties of justice, which includes human rights or at least human rights-related duties (Hsieh 2015). We will do so in four steps. In the first step, we will argue that the idea of human dignity is a good moral foundation for ascribing duties of justice to corporations. In the second and third steps, we will show that, as political actors, corporations do have human rights duties and other duties of justice. In the fourth and the final step, we will argue that their license to operate depends on their fulfillment of their dignity-based human rights duties and other duties of justice. Thus, if corporations do not fulfill their duties sufficiently, it is legitimate and maybe even mandatory to withdraw their license to operate.

We will use two examples in making the argument. The purpose of the examples is not to provide detailed case studies. Rather, they are only meant to focus the discussion on different aspects of corporate duties of justice. One example is the Volkswagen emissions scandal, where Volkswagen used programming software in their diesel-engined cars to cheat during emissions testing, which was revealed in 2015 (Bovens 2016). We will point out that in so doing, Volkswagen violated several duties of justice toward its customers and the wider community. We will also consider the further complication that Volkswagen is one of the biggest German companies and an important player in domestic and regional politics, which can influence those political bodies that are supposed to control the company's activities and thus have a strong effect not only on the lives of current people but also future generations with respect to environmental issues, e.g., by successfully lobbying for less strict emissions thresholds (Bovens 2016: 264).

The second example is the Savar building collapse in Bangladesh in 2013, which caused the death of 1134 people and injured approximately 2500 people. The collapse was due to a number of factors, including the inappropriate use of the building as a factory, the addition of three floors, and the use of substandard construction materials. Also, warnings regarding the state of the building were ignored by owners and officials. Companies located in the building produced garments for well-known brands such as Benetton, Mango, Primark, and Walmart (Neate 2014). This leads to the question whether the corporations owning those brands share responsibility for what happened and, if so, to what extent.

Before we start the argument, four clarifying remarks are in order. First, we focus on corporations and exclude other kinds of firms from our discussion. The reason for this focus is not only that corporations are normally the largest, most international, and most powerful kinds of firms (Hansmann 2000); it is also that corporations have a certain legal structure which makes it possible to deal with their license to operate in a specific way. Kraakman et al. (2017) argue that corporations all over the world share five legal features. They have legal personality, limited liability, and delegated management, and their shares are transferable and owned by investors. As we will see later, because of these features, specific questions of corporate legitimacy emerge.

Second, we speak of transnational and not of multinational corporations. Not much depends on this choice of words, but there are two advantages in using "transnational." It is more open to the idea that corporations are not just entities that operate across borders, but that they are political actors that take part in shaping the structure of the transnational institutional world. At the same time, it points to the fact that corporations are still embedded in the legal structures of states. Their activities are subject to the laws of the states they operate in. Moreover, their headquarters are located in one single state and their constitution, organizational structure, and basic legal responsibilities, including, for instance, tax duties, are subject to the laws of this particular state (Dietsch 2015: 84–85).

Third, we use the concepts of "responsibility" and "duty" in a specific way. There are quite a number of different ways of determining the relation of these two concepts. They may simply be used interchangeably. "Duty" may be seen as the more specific and "responsibility" as the vaguer concept (Feinberg 1966). Duties, especially duties of justice, may be seen as something that is legally enforceable, while responsibilities are not necessarily enforceable (Lyons 1970). In what follows, we will speak, for the simple reason of terminological clarity, of general moral responsibilities and specific duties of justice. As said, the claim advanced here, which we will discuss in the following sections, is that transnational corporations have not only very broad moral responsibilities, but quite specific duties of justice, including human rights duties, based on the concept of human dignity.

Fourth, we will simply assume from the outset that corporations are responsible agents. They can have moral responsibility and as political actors – something for which we will argue later – they can also have political responsibility. There is an older debate over whether or not corporations can have this kind of responsibility (Velasquez 2003). But in the work of Peter French (1979) and later, in the work by Philip Pettit (2003) together with Christian List (List and Pettit 2011), we find very strong arguments for the assumption that they indeed are responsible agents. In our reading, these strong arguments have gone unchallenged up until today, which makes it reasonable to assume that this is the dominant position now from a philosophical point of view (Chapple 2014). We think that this discursive setting provides sufficient reason to accept the position that corporations are responsible agents as a given for the more practical purpose of this chapter, which is to show that, on top of their basic responsibility, corporations also have human rights duties and other duties of justice.

Human Dignity, Human Rights, and Justice

The widespread assumption that transnational corporations have human rights duties and duties of justice seems to derive from the belief that they are powerful actors operating in our midst and shaping the world we live in. However, a skeptic may ask on what ground it is justified to ascribe these duties to transnational corporations (Bilchitz and Deva 2013: 2–3). Then it seems to be a good initial response to refer to human dignity. The normative idea of human dignity includes that all moral actors must respect the dignity of all human beings in what they do or omit to do (McCrudden 2014). So, if we assume that transnational corporations are moral actors, then it follows that they also have to respect the dignity of human beings. Moreover, it seems to be straightforward to derive duties of justice and human rights duties from the idea of human dignity. In the case of human rights, it is common to assume that human dignity is the foundation of human rights duties (Griffin 2009; Habermas 2010). In the case of other duties of justice, it is also possible to ground them in the idea of human dignity (Nussbaum 2007; Dworkin 2011). We will call this the standard account.

How this general perspective of the standard account works for transnational corporations can be easily seen by applying it to the two aforementioned examples. When Volkswagen (VW) decided to install fraudulent software to sugarcoat the emission level of their diesel-engined cars, it violated the dignity of different human beings in several ways. VW certainly instrumentalized its customers by lying to them about the environmental friendliness of their cars – they made false claims about the level of NO_x emissions under real driving conditions and thus concealed information that consumers may have regarded as crucial in their purchase decision. Thus, it used customers only as a means to its end and completely disregarded the ends of the customers themselves, which are often seen as a basic moral requirement (Hill 2000). VW also jeopardized the health and lives of citizens living in densely populated areas. Its cars contributed greatly to exceeding safe NO_x levels in those regions by exceeding the legally established safety value for cars. For these reasons, it seems to be appropriate to say that VW violated its duties of justice by disrespecting the dignity of different human beings in the described ways.

In the case of the Savar building collapse, it is beyond doubt that the human rights of workers were violated. This is certainly the case for the right to life and security of persons as stated in article 3 of the Universal Declaration of Human Rights. It also applies to the right to social security in article 22 and the right to desirable work in article 23. It could be argued that in the aftermath of the collapse, rights to freedom of speech (article 19) and peaceful assembly (article 20) have also been infringed upon. The Declaration is quite clear about the fact that these human rights are grounded in dignity. The preamble states: "Whereas recognition of the inherent dignity and of the equal and inalienable rights of all members of the human family is the foundation of freedom, justice and peace in the world... Now, Therefore THE GENERAL ASSEMBLY proclaims THIS UNIVERSAL DECLARATION OF HUMAN RIGHTS as a common standard of achievement for all peoples and all nations..." Other human rights documents list similar rights. The central open question here, to be discussed later, is of course whether or not transnational corporations are among the actors who violated the dignity of workers and protesters.

For now, it should be clear how both examples make look promising the initial thought of justifying human rights duties and other duties of justice of transnational corporations by referring to human dignity. However, there are also serious problems with this approach. We want to discuss two particularly thorny issues, one briefly and the other more extensively. First, human dignity is a contested idea and some opponents argue that we should avoid it altogether. We will only make a few remarks on this aspect, because an extended discussion would lead too far away from corporate duties. Second, and for this chapter more importantly, it may very well be that all moral agents have a moral responsibility to respect human dignity. But, as some authors argue, only certain political agents have specific duties of justice to protect human dignity, including accordant human rights duties (Beitz 2009: 122–128; Buchanan 2013: 130–131). We will discuss the first problem in this and the other problem in the subsequent chapters. Our aim is to overcome or at least weaken the skepticism deriving from these two problems. The hope is to thereby strengthen the idea that corporations are actors with human rights duties and other duties of justice.

The first problem for the standard account mentioned above is that human dignity is a contested idea. Although referred to in several human rights documents as the basis for these rights, critics argue that human dignity is not a useful concept. There are three common objections. The first objection is that dignity rests on controversial metaphysical assumptions; for instance, regarding the nature of human beings or their relation to a transcendental entity (Moyn 2015). Second, it is argued that dignity is used as a vehicle to advance a specific worldview based in Christian or European perspectives (Rosen 2014: 147–149). Third, it is claimed that dignity is void of any sufficient justification that can overcome reasonable skepticism (Sangiovanni 2017: 14–16). For two reasons, we do not think that these kinds of criticism are damaging for our idea of grounding corporate human rights duties and corporate duties of justice in human dignity. One reason is that we do not deny the possibility of replacing the mere word "dignity" with other words such as "common humanity" or "equal self-respect." It is therefore wrong to associate the use of the word "dignity" with metaphysical assumptions or historical ideas of thought. In fact, nothing much depends on this; it is rather that by using "dignity," a certain tradition that emphasizes the nobility of being human is invoked (Waldron 2007, 2012; Habermas 2010; Neuhäuser and Stöcker 2014). The central point is that it is the property of being human itself that gives human beings an equal and high moral status, which has to be respected by all moral agents. This status can be called dignity, but it can also be given another name.

The other reason is that the philosophical discourse about human dignity underestimates the normative force of socially established morals in the sense of German *Sittlichkeit*, which includes the moral standing of positive law. If, generally speaking, moral concepts used in social practice and law can be judged as having a progressive impact, then one must have strong reasons for wanting to replace them (Honneth 2015: 63–68). Since international human rights law invokes the idea of human dignity and because, all things considered, human rights law can be seen as an important source for progressive global morals, it seems to be prudent to stick to the concept of dignity, especially if one wants to work within the human rights tradition. Something similar holds with respect to important traditions in justice theory, which also draw heavily on the idea of dignity and related ideas (Nussbaum 2007: 159–160; McCrudden 2014). We concede that our reply to this facet of criticism is more contestable in the area of justice because important philosophers of justice, such as John Rawls, have tried to avoid using the concept of dignity. However, even Rawls worked with a concept of self-respect that plays a fundamental role in his theory and that is very close to dignity (Rawls 2005: 440–446). It may very well be that he simply wanted to avoid the metaphysical and traditional baggage all too easily associated with the use of the word "dignity." However, since our aim is to discuss human rights duties and duties of justice of transnational corporations together, in a way that is close to the legal and political discourse, it seems to be prudent to stick to the word "dignity" and not to replace it with "self-respect" altogether. Moreover, grounding human rights and other considerations of justice in dignity allows for combining both kinds of related duties in a straightforward way. In this perspective, human rights duties and duties of justice both derive from the normative necessity to respect the dignity of human beings (Habermas 2010). Their difference is rather that they address different actors and are embedded within different social structures. It is because of this, we claim that they also have a different scope. Human rights duties are duties of political agents operating on an international level. They apply to those agents in a direct way, because their international activity is not embedded within the legal structure of domestic states. Human rights duties also apply to political actors in single states of limited statehood and in rogue states (Moon et al. 2005; Börzel 2013). This is so because the legal structure in those regimes does not secure justice in a sufficient way. In other words, human rights duties are background duties that apply when legalized duties of justice do not respect human dignity and instead are inexistent or extremely dysfunctional. Of course, on a theoretical level, it is also possible to simply assume just one and the same set of duties of justice on a domestic and international level. In this view, talking about human rights duties would then simply be a specific way of talking about duties of justice.

Since we do assume that both duties of justice and human rights duties derive from human dignity, we see some truth in this view. However, it underestimates the different ways in which human rights duties and other duties of justice are socially and politically embedded. Human rights duties were established on a global level for the specific purpose of dealing with situations that are not covered by justice based in domestic law (Moyn 2010). Separating duties of justice and human rights duties takes this specific purpose of human rights into account. If one wants to work within the existing normative framework of the global order and not propose a completely different framework, then human rights duties and duties of justice need to be separated in the way described above, although both are grounded in human dignity.

Also it becomes possible to conceive that some duties of justice emerge in the context of states and are directed at citizens and residents only. Since people living in one country, integrated into the same institutional structure for their cooperation and subjected to the same laws, stand in a relation that is different from the relation they have with other human beings in other countries, it is reasonable to assume that different duties of justice emerge within this societal context (Scheffler 2018). Since we see duties of justice as grounded in human dignity and because the ability to live a dignified life depends on institutions and structures of interaction, those structures and institutions have a direct impact on what duties of justice exist.

Human Rights Duties of Corporations

What are the consequences for corporations if human rights duties and other duties of justice are grounded in human dignity? From this point of view, it may seem as though corporations do not have human rights duties and are not agents of justice at all. They do not seem to have human rights duties, because in the traditional view, only states have human rights duties (Kobrin 2009: 352). They do not seem to be agents of justice, because if they act within states with a sufficiently just legal system, it seems to be enough for them to simply follow the law (Friedman 1970; Pies et al. 2009). In our reading, both appearances are misleading. It is a mistake to think that only states have human rights duties. It rather is the case that only political actors operating outside of sufficiently just states have human rights duties (Karp 2014). It is also a mistake to think that no duties of justice remain for non-state actors, such as corporations, in sufficiently just states. There is always the duty to follow the spirit and not only the letter of the law. Moreover, since legal systems are only more or less just, there is room for improving justice beyond what the law requires. Also, corporations are not only actors that behave within a certain political and judicial framework; they also proactively play a part in shaping the legal framework that governs their economic activities (Néron 2010). It is worthwhile to elaborate on these points. In this section, we will focus on human rights duties and in the next, on other duties of justice emerging within single states with sufficient human rights protection.

Not only states, but all political actors in the international arena have human rights duties because human rights are meant to fill a regulation gap on the global level. The basic idea here is that the global structure should be governed by human rights in order to secure human dignity. From this basic idea, it can be inferred that all morally capable actors, who have the power to take part in global governance, have a prima facie duty to do so to a certain extent. In other words, they have a prima facie duty to respect and implement human rights. Their human rights duties are only prima facie duties, because there may be overriding concerns. One important overriding concern is that there are other agents who are better equipped to act within the human rights framework (Ladwig 2016). So, if the state of Bangladesh and a transnational corporation are capable of protecting human rights in Savar and willing to do so, then it seems prudent to assign the respective duty to the state. The most important reason for this assessment is that this arrangement is more compatible with the human rights framework itself, especially the right to self-determination (Kobrin 2009: 353). However, if the state is unable or unwilling to implement sufficient mechanisms of human rights protection, then it is the duty of transnational corporations such as Mango and Primark to step in and help to secure the protection of human rights in the factories of their suppliers. They can have a remedial responsibility in cases like the Savar building collapse (Miller 2001, 2011).

At this point, we have to concede that the received view, especially within human rights law, is that only states have human rights duties (Buchanan 2013). However, we think that this is so for the simple historical reason that at the time of its development, the creators of human rights law believed that apart from the supranational UN-structure, only states are relevant political actors within the international realm. They simply did not envision that transnational corporations and NGOs would become global political players as well. If this is correct, then it seems to be prudent to go one level deeper and ask why states were seen as the primary duty bearers in the past and whether those reasons also apply to transnational corporations today. In our understanding, there are two reasons why states were seen as the primary duty bearers. First, they have the political power to violate human rights on a large scale, since they are not controlled by a higher authority (Lukes 2005). The human rights framework is an attempt to implement such a higher authority. Second, states have the power to secure human rights in areas of limited statehood and against rogue states. The human rights framework is an endeavor to coordinate, but also to prevent abuse of this power; for instance, in the case of humanitarian intervention (Buchanan 2004: 176–179; Buchanan 2013: 196–204).

We think that something similar applies to transnational corporations today. They are not exactly like states, since there is much dissimilarity regarding the monopoly of force and sovereignty. But corporations should also be recognized as political actors on a global level with the political power to violate and secure human rights. The Guiding Principles acknowledge that corporations have a responsibility to respect human rights. However, they do not assign any duties to protect and secure human rights to them (Ruggie 2007). In our reading, this is an inconsistency because the same argument that allows for assigning them a responsibility to respect human rights makes it possible to assign stronger duties (Wettstein 2010). One needs to have additional reasons to argue that there is a fundamental difference between a responsibility to respect and stronger duties of protection. We do not think that there are convincing reasons of this sort and want to show this by discussing the three strongest reasons given in the literature.

First, it is argued that it is simply not the job of transnational corporations to protect and secure human rights. They are private actors with the task of increasing their profits within the boundaries of the law, which is their only responsibility. In the absence of a strong legal framework on the global level, human rights can be seen as setting those boundaries. This is why it can be argued that transnational corporations have a responsibility to respect human rights. This view was brought forward by John Ruggie (2013) and the way we present it shows that it resembles the way Milton Friedman (1962, 1970) understood the idea of corporate social responsibility. However, if corporations have something like a duty not to violate and instead to respect human rights, why can they not have positive duties as well? If the overall aim is to secure human rights, all kinds of duties can derive from this central goal for all kinds of duty bearers, as Henry Shue (1988) has shown. In the Savar building collapse case, it seems to be normatively incoherent to claim that transnational corporations would have had a duty to secure human rights if they operated the factories themselves, but could have easily gotten rid of this duty by simply outsourcing the production (Pogge 1992).

Second, it is argued that according to the existing framework, only states have legal human rights duties. Transnational corporations, on the other hand, only have something like human rights-related moral responsibilities. It is true that corporations do not play an important role as duty bearers within the existing human rights law framework (Karp 2014: 33–34). However, concluding from this that they should not play such a role would be a violation of Hume's law that ought cannot be derived from is. The fact that transnational corporations are not primary duty bearers within human rights law does not support the conclusion that this should not be the case. Instead, a good reason for assuming that transnational corporations should have stronger human rights duties is that they are transnational actors with the political power to protect and secure human rights in cases where states are unable or unwilling to do so. If this is true, then the existing human rights law is simply defective and should be reformed accordingly (Bilchitz 2016).

This leads to the third reason usually given for not assigning stronger human rights duties to transnational corporations. It is argued that they are controlled by states, especially those where their headquarters are located (Dietsch 2015: 144–145). Those states could define and enforce certain duties for transnational corporations; for instance, regarding their duty to monitor their supply chain. Corporations buying their apparel produced by suppliers in Bangladesh would then have a duty to make sure that their clothing is produced in safe working conditions. However, for three reasons this argument is inconclusive. First, assigning human rights duties to corporations in public discourse helps to pressure states to assign stronger duties to corporations in the first place (Young 2006). Second, as political actors, corporations can influence states to not burden them with strong duties; for instance, through lobbying and by threatening them with relocating their headquarters (Ulrich 2006; Malleson 2014: 137–138). Third, if corporations are moral actors, as we assume, then they simply have the duty to respect human dignity, which implies human rights duties independently of state enforcement (Griffin 2009: 101–104; Karp 2014: 138).

Other Duties of Justice of Corporations

Even if corporations have human rights duties in cases where they are not sufficiently controlled by domestic law, it still looks like they do not have any additional duties of justice based on human dignity. In cases where they are sufficiently controlled by domestic law, it seems to be enough for them to follow the rules of the law and otherwise focus on doing business, as Milton Friedman famously has claimed. However, for two reasons we think that corporations do have additional duties of justice based on human dignity that are not directly related to the human rights regime. The first is that certain demands of justice may be unfulfilled even in legitimate states that respect human rights. The second again has to do with the political status of corporations. Because they can influence law making, it is not enough for corporations to follow the letter of the law. Instead they are able to judge what justice demands of political actors who are able to strongly influence the process of law making. This insight can lead corporations to refrain from exercising their influence altogether. And in cases where this is not possible, it can lead them to express what justice demands and work together with governments on solutions to change policies accordingly (Heath 2006).

The case of VW can help to clarify both points. Since VW mainly operates in states such as Germany and the USA, it is reasonable to assume that in those countries, a domestic law is in place that attempts to protect human rights. We want to argue that it is not only the case that VW broke the law in countries such as the USA and Germany, although there is an obvious duty of justice to obey human rights-based law. It is important to emphasize that, in addition to that, VW also showed lack of respect to its customers. And it violated its duty of justice to refrain from influencing the law-making process in a negative way and its duty of justice to work on solutions of running their business in accordance with what human dignity demands.

Regarding the first point, it is reasonable to assume that VW knows about the objective, but also the subjective importance its customers may place on environmental protection and especially the control of emission levels of cars. By lying about the real level of emissions and even installing software to cheat in test situations, VW decided not to take the concerns of its customers and the wider society seriously. Even if, contrary to the facts, we assumed for the moment that VW had good reason to believe that the laws were too strict and their real emission levels safe, it violated a dignity-based duty of justice, by cheating its customers. The reason is that it made it impossible for customers to make their own sufficiently informed decision about what car to buy or not, based on a sufficient provision of information that they deem to be important, which creates a kind of market failure (Heath 2006). VW simply treated their customers as a means to boost its own sales, without also respecting the widely acknowledged moral constraint of considering the ends of the customers themselves (Hill 2000). This also implies that even if there were a loophole in the law, VW would have had a duty of justice to provide accurate information for its customers.

The second point regarding the political role of VW might be of even greater importance. Large car manufacturers have a great deal of influence over politics in those countries where they operate, because they are strong contributors to the gross national product and because they employ many people. Given that steady growth and a low unemployment rate are important success factors for any government, especially in countries where the headquarters of large car manufacturers are located; those governments have a strong interest in keeping the corporations happy. For instance, the German government used its influence to push through a rather lenient environmental regulation for its manufacturers on the EU level. It is worth showing in more detail how this works.

Already in 2012 the European Commissioner for Environment noted the profound difference in NO_x emission during testing compared to on-the-road emission (Potočnik 2012). Even before that, the Commission instituted a working group to establish a procedure that could test cars under so-called “real driving conditions”. The process was protracted and observers attributed this to interference by automobile industry lobbying (Faller et al. 2017). The VW scandal sped up the process, but those member states with large automobile industries intervened and successfully negotiated for transition periods which allowed for exceeding the agreed-upon emissions levels by a factor of 2.1 until 2021 and subsequently to a factor of 1.5, while originally it was planned to allow transgression of 1.6 until 2021 and 1.2 after that (Deckwirth 2016; Faller et al. 2017). A similar impact of lobbying activities resulted in the adjusted CO_2 emission level thresholds that were announced in November 2017. The goal was set at a reduction rate of 30% until 2030. Beforehand, the president of the German Automobile Industry Association (VdA) spoke to several EU officers to convince them that a higher target would threaten the automobile industry (Balser and Mühlauer 2017).

It is obvious that these political maneuvers are due to the influence of companies such as VW, Daimler, and BMW. It may not even be necessary for representatives of those companies to journey to the chancellery, although this happens frequently. In many cases, the government simply knows what the interests of those companies are and has a strong incentive to give them a great deal of consideration (Crouch 2011, 2015). In cases where the government is uncertain, it will make sure that it learns of the interests of one of its most important industries. This is why companies such as VW are political actors quite independently of whether or not they want to be. Because of their political importance, everything they do and say, but also and importantly, do not do or do not say, will have political meaning and impact. Because of this, corporate political actors such as VW have an additional duty of justice beyond the requirements of law. VW must consider how its decisions relate to wider social concerns and how they can be reconciled with what justice demands.

The general result of this short discussion of the VW case is that we can assume at least three additional duties of justice based on human dignity for corporations, even when they operate in countries where human rights are to a large extent implemented into constitutional law. First, there is an obvious duty to operate within the boundaries of this law. Second, there is a duty to respect partners and customers and treat them as ends in themselves instead of merely as means. This also applies in cases not regulated by the law. Third, corporations have a duty of justice to evaluate their political role and bring it in line as much as possible with what human dignity demands. In some contexts, this can result in refraining from exercising political influence altogether. In other cases, it can require them to speak out in favor of policies that respect human dignity and to help find regulations that make sense from an economic point of view without violating what justice demands.

Corporate Responsibility and Legitimacy

If it is correct that corporations do have human rights duties and other duties of justice, then it becomes possible to assess the legitimacy of corporations and their activity on those grounds. In all those cases of corporations whose business is to produce goods or provide services mainly used for violations of human rights or other justice-based rights, the whole enterprise is simply illegitimate. This applies, for instance, to corporations producing anti-personnel mines or software especially designed for manipulating democratic elections. In most cases, however, it is not the nature of the business itself that is at odds with human rights and justice, but rather the way corporations conduct their business. It would be legitimate for corporations to conduct this business if they did not violate human rights or other justice-based rights while doing so. Also, the more they fulfill their human rights-related duties and other duties of justice, the more legitimate corporations become in doing their business. Since justice is used as a basic normative standard for assessing the legitimacy of corporations and since corporations can act more or less justly, they can also be more or less legitimate. Just like justice, legitimacy is a gradual concept (Buchanan 2013: 178–180). Linking justice and legitimacy in this way provokes two questions. First, what is the use of the concept of legitimacy when it is so closely tied to justice? Second, when are corporations sufficiently legitimate in their overall conduct and what follows if they are not?

If the concept of legitimacy is directly linked to justice, then it is not clear anymore what the additional value of introducing this concept is. Why is it not enough to speak of more or less just and justified corporations? We think that initially the concepts of justice and legitimacy can be seen as distinct in the following way. Justice is used for the critical judgment of the activities of individual and corporate actors from a moral point of view, in the approach advanced here, based on dignity. Legitimacy is used for the critical assessment of political actors from a political point of view that is somewhat distinct from the moral point of view. Bernard Williams (2005: 4–6) has famously called this normative point of view the basic legitimation demand and argued that political communities need to fulfill this demand in order to be stable. Without legitimation, they lack cohesion in times of crisis. The authority of political actors depends on legitimation; otherwise, it is reduced to more or less fragile power.

If one follows Williams (2005) in seeing legitimacy and not justice as the first political virtue, how then is it possible to link political legitimacy and justice in the way described above? It is possible to do so, but contingent on members of a political community and subjects of political authority basing their assessment of legitimacy on concerns of justice (Weber 1958). For instance, in liberal societies, the legitimacy of government depends on respecting liberal rights in the eyes of the citizens subjected to this government. In cases of autocratic regimes, the government might not be seen as illegitimate in the eyes of its subjects, if those subjects do not take a liberal stance. However, even then, such regimes will not appear to be legitimate in the eyes of the citizens of liberal states and a liberal-minded global audience. This insight can be translated to corporations as political actors. The conduct of those corporations is judged as more or less legitimate on grounds of justice. From the liberal point of view advocated here, human dignity is used as the normative foundation for this assessment.

At this point, it is possible to object that although corporations may be political actors, it is still a categorical mistake to ascribe more or less political legitimacy to them. According to this objection, legitimacy should be linked to authority. What is assessed is whether or not a political actor with a certain authority makes legitimate use of this authority or not (Buchanan 2013: 190–191). Following this objection, corporations can be seen as having political power, but not political authority. They are not granted specific positions within the political structure that authorizes them to make collectively binding political decisions. We concede that corporations do not have authority in this strong sense. However, for three reasons, they do have authority in a somewhat weaker sense. First, as mentioned in the introduction, they are granted legal personhood and limited liability by states (Ciepley 2013). It is possible to say, then, that they are authorized, in a wider sense, to conduct their business in a certain way. States grant corporations those privileges because they expect them to increase the overall welfare and act within certain boundaries. If those expectations of states are not fulfilled, observers can judge the conduct of corporations as illegitimate and states can, at least in principle, revoke those privileges. In other words, corporations are authorized to pursue profits, under the condition that this benefits the wider society and happens within the boundaries of justice. The current investigation of the German car industry into the allegation of forming a cartel, for instance, may result in severe financial penalties precisely because they did not conduct their business within the boundaries of justice (Diekmann 2017).

Probably more straightforward is the second reason why corporations can be seen as having authority. Especially large corporations have something like authority over their workforce. In some countries, where regulation of the economic sphere is very weak and freedom of contract rather unrestricted, such as in the USA, corporations can create strong, almost law-like regulations for their employees. Contracts can depend on personal conduct and even the personal faith of employees. Also, unbelievable as it may sound, corporations can decree that employees have to wear diapers, instead of granting them more bathroom breaks. Based on these kinds of observations, Elisabeth Anderson (2017) argues that corporations act like neo-feudalistic governments in their sphere of influence, which not only affects their workforce, but also the communities in which they are active.

Third, and maybe most importantly, corporations have influence over those political bodies that do have authority. They can influence collectively binding, decision-making processes to a large extent, as the example of the car industry in Germany shows. To be sure, corporations are not formally authorized to exercise this kind of political meta-authority, although they are regularly encouraged to do so by governments, who ask for their expertise and advice (Crouch 2011). So, in reality, they do have this de facto authority. At this point, two theoretical options are available to deal with the authority, and especially the meta-authority, of corporations. The first is to take away the de facto authority from corporations and thereby also solving the most important issue of illegitimacy of corporate political action. The second is to make corporations more legitimate in their internal organizational structure and through external control and thereby also legitimizing their authority. Both are theoretical options in the sense that it is not clear whether there is any feasible way of carrying them through. Moreover, it is not obvious what the possible consequences of such rather fundamental changes would be.

The first option would require severely restricting corporations' license to operate; for instance, by taking away their legal personhood or limited liability. This would reduce the attractiveness of big corporations and favor small- and medium-sized enterprises. It could be argued that this would then result in less negotiation power of corporations in the political process as well as reduced influence over their workforce. However, it may be that some important businesses, such as aviation, require big corporations in order to work at all. More importantly, those countries whose whole business model relies on big corporations would most likely not agree to such a fundamental change of corporate law, because it would take away most of their competitive advantages. So, although this first option sounds attractive as an idea of reinstalling the primacy of politics over business, it also appears to be rather unrealistic.

The second option would require fundamental changes within corporations, but also in the way corporations are controlled externally. For instance, a democratization of corporations or strong measures of stakeholder integration could make corporations more accountable to the interests of those who are not shareholders, leading to more responsible decision making and higher legitimacy (Hsieh 2008, 2009). Stronger measures of corporate control in international law may increase their accountability as well. However, this second option appears to be rather unrealistic too, because it also depends on the willingness of the majority of states to change regulations accordingly in order to avoid competitive disadvantages. It appears then that the chances of either a considerable increase in the legitimacy of corporations as political actors or a decrease in their political agency are rather low in the absence of a global political will to make the necessary changes.

In light of these rather gloomy observations, it does not seem that major changes in the political and legal international framework are soon to be expected. Nevertheless, the perspective on corporations as active participants in the political process, argued for here, does imply that there are good reasons to see them as agents of justice. This normative conclusion substantiates the possibility of ascribing stronger duties of justice to transnational corporations on a theoretical level as well as advocating the position that corporations are to be held morally responsible for their actions in public discourse (Young 2006).

Philosophical Theory of Business Legitimacy: The Political Corporation

40

Jacob Dahl Rendtorff

Contents

Abstract

This chapter addresses the concept of business corporation as a good citizen as a fundamental political-philosophical legitimacy strategy. This strategy is based on a democratic-republican formulation of theory of legitimacy in business ethics. From this, the chapter defines the concept of good citizenship in the light of a democratic corporate ethics as the basis of legitimacy. Thus, good citizenship and the political becomes the basis for the definition of corporate social responsibility (CSR). The argument is that it is necessary to assume the notion of good citizenship to make sense of CSR, which can be considered as an argument for political CSR. The chapter covers the following main parts: (1) legitimacy strategies that build on the good citizenship go beyond the neo-liberal view of economics and politics; (2) legitimacy as defined as based on a democratic-republican perception of the role of the corporation in society; (3) definition of good citizenship of the company and of the cosmopolitan legitimacy of global corporate ethics; (4) discussion of legitimacy through the company's good citizenship and political role in society; and (5) conclusion and perspectives.

Corporate citizenship · Corporate citizen · Democratic-republican business ethics · Global corporate citizenship · Political corporation

Introduction

In the current philosophical and business ethics debate, the legitimate company that has achieved stable public relations is defined as based on the concept of "Good Corporate Citizenship" (Scherer and Palazzo 2007; Rendtorff 2009a; Rendtorff 2013f: 158–179). This concept has a long history back in the middle of the twentieth century, when Peter Drucker, in his famous book about *The Concept of the Corporation* of 1946, based on a case study of General Motors during and after World War II, introduced the concept of "Corporate Citizens," where the company was perceived as an institution which, during the war, specifically contributed to the struggle for a free society by helping in the Second World War.

In continuation of this, Drucker described companies with good citizenship as institutions that contributed to the integration of human beings and society to develop a free society (Drucker 1946: 23–24, 114). In continuation of this, it can be argued that "corporate citizenship" was already perceived as a holistic concept early on, which summed up the ideal perception of the company's legitimacy as a responsible participant in the processes of society (Butten and Birch 2005).

One can also distinguish between different stages of development of "corporate citizenship" (Mirvis and Googins 2006). There are different levels of legitimacy expressed in the relation of the corporation to society (Mirvis and Googins 2006: 106). The stages run from committed, innovative, integrated into a complete transformation of the business to be politically responsible as fully oriented towards its social obligations.

It is on this basis that one can describe the concept of "corporate citizenship" as central to a democratic-republican political theory and perception of company ethics, which focuses on democratic societal and political unity as a basis for the perception of legitimacy. Therefore, "corporate citizenship" of the political corporation can be considered the most basic concept of legitimacy, which aims to summarize the company's responsibilities, values, and ethics in a political philosophical and ideological framework of the company's legitimate contribution to community and place in society (Rendtorff 2009a, 2011b).

A philosophical definition of the company's citizenship in a democratic-republican perspective is that the company is regarded as a responsible institutional political person who, as a participant in Republican democracy, has duties to the representatively structured and constitutional state. This is clarified by the discussion of the corporation in philosophy of management (Rendtorff 2013a, b, c, d, e, 2014a). Thus, the company's good citizenship involves a generalization and summary of the ideals behind the company's social responsibility. Similarly, corporate citizenship can be regarded as the basis for other concepts of the company's social commitment and social involvement, such as political CSR, corporate governance, corporate social responsibility, corporate social responsiveness, corporate social performance, stakeholder theory (Matten and Crane 2005: 167; Buhmann and Rendtorff 2005). In an institutional perspective, the concept of corporate citizenship is regarded as an expression of the company's acceptance of its obligations as a member of society (Jeurissen 2004: 87). This means that companies also have moral obligations and can be regarded as collective agents with a collective ethical responsibility (Jeurissen 2004: 95).

It is important to distinguish between the political-philosophical concept of corporate citizenship and the goal of the company's legitimacy strategies as an ethically responsible democratic citizen and a number of more or less vague definitions of corporate citizenship. Thus, one cannot reduce the company's citizenship to a particular notion of social responsibility. For example, it is not possible to understand "corporate citizenship" solely as corporate philanthropy, which would misunderstand the scope of the concept. Although enlightened self-interest and profit maximization can be one of the arguments for corporate citizenship, this is not the only argument, and a deeper understanding of the concept is needed if you want to work with an ethical understanding of the company's institutionalization as a legitimate agent in society through the development of good corporate citizenship with political responsibilities for the common good of society.

Corporate citizenship includes social responsibility, but it also goes beyond social responsibility, as it characterizes the fundamental role of businesses in society and does not limit corporate institutional responsibility to social responsibility (Birch and Littlewood 2004). It goes beyond social responsibility by arguing for fundamental corporate institutional and political responsibilities, that is, the economic-social role of corporations and their responsible political actions in society as a responsibility far more comprehensive than purely social responsibility (Rendtorff 2008a, b).

The Controversy Between the Neo-liberal Business and Democracy View

The legitimization of the company through corporate citizenship can be said to presuppose a social-liberal notion of a democratic-republican social order that goes beyond the neo-liberal view of society. The notion of citizenship must be understood not only from the liberal tradition which defines it by emphasizing that citizens have certain inviolable social, civil, and political rights (Matten and Crane 2005: 171). It is a concept of citizenship that refers to the duties of organizations and institutions to good governance towards society and its individual members. It is possible to agree with Crane and Matten when they argue that the concept of "corporate citizenship" in the liberal tradition is difficult to transfer from individuals to organizations (Matten and Crane 2005: 170; Rendtorff 2011b).

What is understandable about the concept of the company as a good citizen and politically responsible agent is rather that companies – as public and state actors – are in a place in society where, in order to legitimize their actions, they must behave as organizations and institutions involved to create a good and just society. When companies, in order to legitimize themselves, have to act as good citizens, their role in society is not only economic but also social and political, and therefore businesses cannot be fully understood as economic agents, thus challenging the neoliberal and neoclassical business model. This is the approach to the analysis of the company's democratic-republican legitimization process as a political citizen of society.

If one analyzes the company's legitimacy strategies in the light of the different approaches to business ethics, including liberalism, communitarianism, and Kantianism, it can be emphasized that the liberal position does not see the company's good citizenship as important for the company's legitimacy in society (Rendtorff 2017a, 2009a). The liberal view of the company describes it first and foremost as an economic entity that produces value for society. Production of value constitutes the real political legitimacy of the company and in addition to that, the company must accept the applicable norms and legal rules in society. The communitarian and virtue-based approach to business ethics goes beyond the liberal position, since in addition to economic value creation; it perceives personal and organizational integrity through good character and ethically correct action as fundamental to legitimacy. The communitarian and virtue-based perception of business ethics argues that the company's good citizenship must first and foremost be established locally and nationally, and that it is important that the company with high integrity contributes to the formation of the common good (Logsdon and Wood 2003: 161). In addition, the Kantian approach to business ethics considers corporate citizenship as an obligation to follow universal principles and this approach protects rights and freedoms and contributes to justice in society (Bowie 1999). In relation to these different perspectives on legitimization, that is, the liberal, the communitarian, and the Kantian, it can be said that the democratic-republican approach to corporate legitimacy strives to integrate the different levels into one whole. It is true that legitimizing companies is based on value creation, but we should also take national and international levels into account when dealing with the value creation of the company.

At the local and national level, the communitarian approach means that legitimacy is created by embedding the business and contributing substantially to strengthening society's cohesion (Solomon 1994). At the international and universal level represented by the Kantian approach, the universalist legitimacy strategy involves not only engaging locally, but also legitimizing itself as a world citizen committed to defending human rights and universal ethical principles of autonomy, dignity, integrity, and vulnerability (Rendtorff 1998, 2002, 2003, 2008a, 2014c; Jørgensen and Rendtorff 2018; Jørgensen et al. 2018; Rendtorff and Kemp 2019d). Following on from the integrated contract theory, this approach emphasizes the importance of local moral freedom to follow local and national business ethics standards as long as they do not violate fundamental human rights (Donaldson and Dunfee 1999).

Regarding the democratic-republican legitimacy strategy, reference can be made to the political-philosophical tradition of "civilian republicanism" to describe the company's engagement as a good citizen. It is an important element in the concept of "corporate citizenship" that it must be considered as a metaphor for the company's social commitment to society (Moon et al. 2005: 433). As a metaphor, it describes the companies' fundamental moral responsibility as the basis for the companies' commitment to different conditions in society (Rendtorff 2015a, b, 2017a, b, c, 2019a, b, c). With reference to Gareth Morgan and his book on the *Metaphors of Organizations* (1997), it can be argued that metaphors are used to characterize different metaphors for organizations in organizational analysis and, in this light, the notion of the company's democratic-republican citizenship can be highlighted as being the best metaphor for describing a company that achieves good social legitimacy as a stakeholder-oriented and socially responsible company (Morgan 1997).

The good citizenship metaphor in this context integrates the notions of corporate organizational responsibility, its ethical identity, and integrity into one whole as a basis for legitimizing the company in society. Moon, Crane, and Matten refer to the classical tradition of political philosophy, and they claim to have found four models of good citizenship: "liberalist minimalist," "civic republicanism," "developmental," and "deliberative" that can describe various forms of participation in society, which can be said to stem from the idea of "corporate citizenship" as a metaphor for relations between companies and society (Moon et al. 2005: 435).

One might say that the Democratic-Republican legitimacy strategy contains elements from all four of these concepts of citizenship, although it particularly combines elements of the civil republicanism idea of community participation with the concept of deliberative democracy in an open public and with the idea of an open dialogue with stakeholders as central to ensuring the company's legitimacy in society. This deliberative model and civilian republicanism is based on the notion of business and the market as a mediating social institution that contributes to community integration between state and civil society. One can say that the legitimacy of the company as a good citizen is expressed in the vision of the French philosopher Paul Ricoeur for the foundation of the just society based on "The Good Life for and with the other in just Institutions" (Riceour 1992: 202; Rendtorff and Kemp 2009).

In continuation of this, reference can be made to James E. Post's definition of the company's citizenship as: "the process of identifying analyzing, and responding to the company's social political, and economic responsibilities as defined through law and public policy, stakeholder expectations, and corporate values. and business strategy. . . [it] includes both actual results (what corporations do) and the process through which they are achieved (how they do it)" (Thompson 2005). With this definition, we have a more concrete and operational determination of legitimizing the company through the good citizenship and we can say that corporate citizenship implies that companies act responsibly and socially, both locally, nationally, and internationally in the globalized society (Rendtorff 2009a, b, 2010a, 2013a, b, c, d, 2014a).

Legitimacy in the Perspective of a Democratic-Republican Business Ethics

In order to deepen the understanding of the company's legitimate citizenship, it is appropriate to elaborate on the concept of democratic-republican understanding of business ethics. One can say that the Republican company ethics involves a holistic approach to business ethics that integrates elements of the different perceptions of the business into one whole. This approach recognizes that the various business ethics credentials, that is, Liberal business ethics, stakeholder management, and the communitarian, Kantian and universalist as well as the theory based on the social contract contain important elements that are integrated into a democratic-republican view of society (Rendtorff 2009a, b, 2011a). This means that legitimate companies must be justified in the light of a deliberative concept of democracy (Habermas), which translates into a democratic constitution, based on fundamental constitutional rules that protect common good in the republic (res publica).

This approach is inspired by Jürgen Habermas' description of the democratic rule of law in *Faktizität und Geltung* (1992) and has been particularly developed by the German business ethicist Peter Ulrich (1998, 2008), who works on the concept of "integrative business ethics," which integrates economic, social, and political aspects of social action. Ulrich's formulation of the concept of "integrative business ethics" helps to give reasons why it is the purpose of economic markets and economic action in companies to contribute to realizing the good life between free and responsible citizens in a democratic rule of law (Rendtorff 2009a, b, 2011a).

One can say that the goal of legitimate business is to help develop a free and fair society. Through its value creation and economic activity, legitimate businesses help protect and promote individual political and social citizenship as a legitimate corporate citizen in society (Ulrich 1998: 235). Thus, contracts and other agreements in companies are only legitimate if one can say that they contribute to value creation in society and contribute to strengthening the development of society's economic, social, environmental, and political conditions. It is crucial that the company handles the demand for legitimacy by signing up as a responsible player in the political public domain. Seen in this perspective, the company's free value creation in itself becomes an important emancipatory ideal for society, where progressive companies can increase their legitimacy by striving to create more freedom in society (Ulrich 1998: 283).

This can be achieved by ensuring, in order to ensure the legitimacy of their products and services and economic activities, that they are considered democratically acceptable through dialogue with communities, the state, and the international community as to whether they contribute to the strengthening of a democratic republican social order. The democratic-republican perception of business ethics thus emphasizes that the company achieves its legitimacy by entering into open and transparent public relations, where the company communicates rationally and dialogue-based with the public, which is the case of Habermas' theory of communicative action, which, contrary to instrumental action, is based on the better arguments free of coercion (Habermas 1981).

According to the democratic-republican perception of the company, the legitimacy of economic action and value creation is based on the recognition of the critical public use of reason as a basis for understanding the company's responsibilities towards the various stakeholders, cf. R. Edward Freemans' concept of "corporate stakeholder responsibility" (Freeman et al. 2010). This means that companies, public organizations, and other economic actors must strive to pursue democratic values and establish a just and fair economic market based on fair competition without corruption and bribery, discrimination, and repression or any other form of undermining of democratic values. The democratic legitimization of the companies implies that companies in different ways should integrate a critical democratic public dialogue in relation to their stakeholders as a basis for both external and internal decisions and decision-making processes (Ulrich 1998: 304). According to this view, decisions at all levels of the company should be responsibly matched to economic conditions, community law, and ethical values in society, as uncovered in the joint communicatively regulated public, based on a democratic-deliberative reflection between rational participants in a community of communication and argumentation (Habermas 1981; Ulrich 1998).

Conversely, it is also the task of a democratic society based on a critical-rational public debate to help clarify the normative structures that define the democratically legitimate business, business and economic value creation. In such an endeavor to "civilize civil society" by making it more democratic and fair, the legitimacy of the economic system depends, in particular, on a critical public in society where the various stakeholders are properly involved in the joint creation of values between businesses and their stakeholders (Rendtorff 2010a, b). It is important here to understand that, according to the democratic-republican business ethics, the market logic, contrary to the system theorist Luhmann's theory of the market as a differentiated system (Luhmann 1988), is not closed to itself in an economic "black box" with its own and independent systemic structures. Rather, it is an open reflective system that is part of a dynamic interaction with other systems of society, that is, the legal sphere, the political sphere, the social sphere, and the technological sphere, and the legitimacy of market dynamics is structured through the critical interaction with these systems. With the view of the American economist Buchanan, this perception of interplay between market and society can be referred to as a "New Constitutional Economics" (Buchanan 1990) that addresses the demarcation of the liberal tradition of state, society, and market, and basing the economy on individual property rights.

A democratic-republican constitutional economic theory is an institutional approach to the economy, which regards the economic market as an integral aspect of the political and social structure of society. In this perspective, economic policy, both in the public domain and in relation to the civil society's private market and in relation to corporate governance decisions, must be regarded as an instrument for managing society for the purpose of common value creation and for achieving common social and political goals aimed at the common good in society (res publica). Such a constitutional democratic-republican perception of economics and economic action regards the company's legitimacy through ethical stakeholder management as part of democratic communication in society. This stakeholder approach involves a democratization of the company, where there is a continuous dialogue on the legitimacy of privileges in the form of ownership and wages and power relations in companies in relation to the economic market (Rendtorff 2017a). Economic inequality is justified in this context on the basis of efficiency considerations related to Rawls' difference principle, which states that inequality can be allowed if it is to the benefit of everyone and the weakest (Rawls 1971). However, the freedom-based legitimacy of economic inequality is often neutralized for the sake of the weakest, which is then compensated for by inequality through social benefits, which companies also contribute to making available to the weakest. In the constitutional economy, corporate citizenship is thus defined by the participation of the company in the political community as a responsible player with duties and rights.

Therefore, the concepts of “business ethics,” “corporate social responsibility” (CSR) (Carroll 1999), “corporate responsiveness,” “corporate accountability,” “corporate philanthropy,” and “corporate governance” express the company’s efforts to legitimize itself as a democratic player in society. (Crane and Matten 2004). By actively addressing these areas and formulating a management strategy in relation to this, the company contributes to actively legitimizing itself as a socially responsible player, which makes the community commitment a prerequisite for its “license to operate.” Here, the company can appear to be particularly legitimate if it includes in its strategy and management national and international goals and strategies, such as “sustainable development,” focusing on the sustainable ethical principles in relation to both social, environmental, and economic conditions (Rendtorff 1998, 2002, 2003, 2008a, 2014c; Rendtorff and Kemp 2009; Jørgensen and Rendtorff 2018; Jørgensen et al. 2018). No wonder the three Ps, People, Planet, Profit, today are an integral part of most companies’ legitimacy strategies, where they work to integrate a balance between social (People), environmental (Planet), and economic relationship (profit) in business operations (Rendtorff 2015b). It is the case that corporate citizenship is specifically implemented as an effort to follow the triple bottom line, which not only aims at economic profit, but also towards environmental and social profits.

Thus, it appears that good corporate citizenship is not only based on the individual integrity and responsibility of individual managers and employees, but rather implies that the company as an institution and collective entity. The company is more an economic-legal instrument for gaining profit as a whole is attributed to a political and ethical responsibility for the common good in the social and political institutions of society (Rendtorff 2009c, 2010b, 2014b, 2015c).

The democratic-republican perception of corporate legitimacy can be seen as a response to the strong societal demands and expectations of “good corporate governance” ethical business and social responsiveness that have become stronger with globalization and intensified with the capitalist system’s corporate scandals and crises. This was the case of the international financial crisis in 2008 and the criticism of capitalism’s creation of greater inequality, where the Occupying Wall-Street movement’s 1/99 dogma, claiming that inequality in USA after the financial crisis has worsened, where 1% has gained more while 99% have become even poorer. These demands on businesses mean that businesses have to convince the people that they are able to take responsibility that can contribute to economic profit and value creation in society at large so that they can secure their legitimate existence. The political-philosophical discussion of corporate social legitimacy, which has emerged from the discussion of the various business ethics theories, thus builds on a communicative and ethical perception of politics and political legitimacy.

This means that the ethically and politically mature company understands legitimization as other than power politics or self-staging with “window dressing” or “green-washing” as instruments, but understands it self as a sincere democratic player who will gain points by being respected for its integrity and responsibility as the basis for the company’s license to operate (Crane and Matten 2004: 41–49). The company as a good citizen with political responsibilities is a company that works actively to bridge the tension between ethics and economics by formulating its strategy and management in accordance with society’s needs and democratic principles. This definition of corporate citizenship involves an idealization of politics, where politics is not solely a power policy, but is defined by a focus on the common values of society, which have an impact on values-driven management (Pedersen and Rendtorff 2004; Mattsson and Rendtorff 2006). Distribution or development of value in society is based on what is considered politically legitimate goals of economic action. Focus on democratization of the company and on stakeholder engagement contributes to the development of the political company that chooses the democratic-republican legitimization strategy (Rendtorff 2015a, b, 2017a, b, c, 2019a, b, c).

This is also reflected in the market dynamics of advanced democratic societies. Consumers do not choose here products based on pure economic and material considerations, but they appear to be politically creative and value-conscious consumers who prioritize their own ethics and morals in the choice of products. Likewise, suppliers are demanded a decency in respect of human rights and the environment, and shareholders and investors are politically and ethically aware in their valuation of companies and the purchase of shares. In addition, employees have become more aware that the companies they work for have decent values so that they can handle the company’s handling of human rights, environment, and contributions to the community (Rendtorff 2011a). Furthermore, there has been more focus on multinational and national companies’ tax payments and financial contributions to the community. All of this contributes to documenting the requirement for the company’s political legitimacy as a good citizen in the welfare state, where the corporate responsibility implies contributions to realizing common social and political objectives.

These demands for increased democratic-republican legitimization are increased by the legislative focus on corporate social responsibility and social and political commitment. In addition to environmental reporting and other forms of alternative reporting, the Danish Financial Statements Act from 2009 made CSR reporting for the largest companies in Denmark subject to an accounting requirement in the Act. Developing CSR initiatives beyond what is common law is not a legal requirement. However, it is understood that a company that does not work with social responsibility or sustainability and, in general, does not think about involving its stakeholders, cannot be perceived as a good citizen (Rendtorff 2019a, b, c, d). Therefore, voluntary work on social responsibility as part of the company’s ethics and values becomes an important part of the company’s efforts to legitimize itself in society. This applies not only nationally but also internationally, where the company is accounted for its attitude towards sustainability, the triple bottom line, and protection of employees' rights and welfare. It is thus an integral part of legitimizing the company as a good citizen, that it is part of open dialogue and communication with the public and stakeholders (Ulrich 1998: 443; Rendtorff 2015a). Thus, the democratic-republican business ethics contribute to making respect for democratic values and social goals central to the company's legitimacy.

The Company's Good Citizenship and Global Business Ethics

There is an increasing focus on the concept of "corporate citizenship" as a basis for legitimizing the company's global and cosmopolitan ethics (Scherer and Palazzo 2007). When the Global Economic Forum in Davos in Switzerland defines the company's citizenship, it is emphasized that not only is it a CSR concept or a new concept of the company's philanthropy. Here, the concept of its citizenship is much more fundamental, as it must be done an integral part of the company's strategy and day-to-day practice if it is to be able to legitimize the company's activities in the globalized society. At the same time, the company's citizenship on the democratic-republican basis is an attempt to understand the business of a global cosmopolitan society where different cultures and states live together while creating a common supranational reality that we all must relate to. The democratic-republican business ethics here becomes a cosmopolitan business ethics, which, based on the universal norms of all people and all companies, nevertheless recognizes the cultural differences and claims that there must be some free moral space to organize in different cultures as long as this does not violate fundamental human rights and ethical standards (Rendtorff 2017a). This means that even though the company's legitimacy must be measurable on the universal cosmopolitan rules, there is also room for some local variance in the theorization and practice of "corporate citizenship." It turns out in practice, because there are differences in the way different cultures and different countries define the concept of the company's good citizenship (Katz et al. 2001: 149).

Being a good citizen as a company does not mean, primarily, that you follow ethics and rules in the national state. On the other hand, the company's efforts to legitimize itself as a good citizen in addition to its affiliation with the nation state and demand of companies become "a citizen of the world," a participant in the world community (Rendtorff 2017a). Here, the company deals with the problems of the world community and acts in relation to its universal obligations as a member of the world community. The UN Global Compact Principles on Environment, Human Rights and Corruption in the light of the UN Sustainable Development Policy reflect how businesses have commitments beyond national law. Since more than 9000 companies have now joined the Global Compact principles integrated in sustainable development, it can be said that there is great support for this cosmopolitan legitimization of the company's good citizenship (Rendtorff 2015a, 2017a, b, c, 2019a, b, c, d).

It can be said that businesses will appear to be good citizens, are forced to handle, and respond to world society's expectations of meeting sustainability demands, respecting human rights, and taking responsibility for development and the communities in which they operate, among others, by paying taxes and not dealing with corrupt regimes that violate human rights (Rendtorff 2015a, 2017a, b, c, 2019a, b, c, d). Moreover, companies' efforts to obtain legitimacy at international level are becoming more urgent, as they are increasingly acting globally outside national law. Not least because critical media such as international watchdogs are increasingly pursuing businesses and shouting rifles if they pursue their own greed and profit without being able to legitimize their actions as important to the international community.

At the international level, "corporate citizenship" is about how to overcome the imbalance between economic growth, poverty, and the destruction of the environment by ensuring a connection between economy and happiness and social welfare. At the international level, "corporate citizenship" is also closely linked to "Fair trade" and other ethical initiatives concerning cross-border trade (Zadek 2001: 40). It is important to overcome the inequality between the West and the developing countries (Zadek 2001). The company's cosmopolitan citizenship is about working for greater international and transnational justice in the world.

Jeanne M. Logsdon and Donna J. Wood have developed the concept of Global Business Citizenship, which expresses the need to legitimize corporate global engagement (Logsdon and Wood 2005). They argue that global corporate citizenship is linked to corporate efforts to legitimize themselves with cosmopolitanism by incorporating universal values into their mission and value catalogs to show that they live up to international business standards (Rendtorff 2017a). Global business citizenship is being promoted as an attempt to build a business ethics at the global level that can legitimize companies as responsible international actors. Logsdon and Wood define the global corporate citizenship in the following way: "A global business citizen is a multinational enterprise that responsibly implements its duties to individuals and to societies within and across national and cultural boarders" (Logsdon and Wood 2005).

Being a global citizen means for a business that it must develop universal standards and norms and values for its actions and must have global principles for its strategy and leadership as it follows the world (Rendtorff 2009a, b, 2011a). At the same time, the company must pay attention to cultural differences and respect these differences as far as these differences do not violate the universal international human rights standards. In addition, the global corporate citizenship implies that the company engages in the learning process of developing international norms and values in order to respect human well-being in global development (Rendtorff 2015).

James E. Post has also defined "global corporate citizenship." His definition is in line with Logsdon and Wood's conceptualization. Post emphasizes the importance of the company's global commitment as a "Stakeholder Corporation." At the same time, the global corporate citizenship expresses the fact that companies are actively engaged in the development of democratic values internationally (Post 2003: 143–153). Here it becomes particularly clear that legitimization through corporate citizenship is not just about economic value. This is rather about the company's public activities as a contributor to the common good in a democratic society. It is the political commitment to common democratic public and civil values, political and social human rights, which lies behind the concept of the good citizenship of the company. This notion of citizenship involves a close link between citizenship and democratic stakeholder management, which enhances the consideration of sustainable development, where respect for the threefold bottom line and the three Ps: People, Planet, and Profit is central (Rendtorff 2015a, 2017a, b, c, 2019a, b, c, d).

Discussion of Legitimacy Through the Company's Good Citizenship

However, legitimizing companies through good citizenship also faces a number of critical objections, which it is important to relate to if you want to assess the strength of the theory. One frequently encountered objection is that the new focus on "corporate citizenship" as legitimation is not a solution to the legitimacy problem, but rather a symptom of a broken contract between company and society. Not least, the cynicism and the greed of many companies that led to the financial crisis testify to this imbalance (Rendtorff 2016). Short-term profit maximization has replaced a sustained commitment to society's long-term goals. This has led to the dissolution of employee loyalty and the consideration of shareholders and investors have separated the companies from their stakeholders. Above, companies' citizenship involves an effort to reinstate the company in the center of society as an active, committed, and constructive citizen. Identification through corporate citizenship implies a new focus on the companies' obligations to society and commitment to society's "long-term interest" (Waddock 2005; Rendtorff 2009a, b).

Moon, Crane, and Matten have analyzed Logsdon and Wood's approach in this perspective (Moon et al. 2003). They believe that a better conceptual justification for corporate legitimacy is needed for the ide of companies as good citizens. Primarily, it does not really make sense to take the concept of corporate citizenship literally, so the concept should be regarded as a metaphor. In addition, it is important that the notion of citizenship does not rely on much disagreement between liberal and communitarian positions, but instead helps to create continuity between the two positions so that political philosophy can be based on insights from both approaches (Moon et al. 2003: 431). This is, in many ways, the intention of the democratic Republican approach that combines elements from both approaches. We can emphasize that the important thing about the concept of "corporate citizenship" is that companies understand themselves as citizens and contributors to the common good or to the general interest in society. Here, the communitarian model for social participation in political philosophy and business ethics is important in understanding what really lies behind the concept of citizenship. It is also wrong when someone has historically wanted to restrict "corporate citizenship" to philanthropy and participation in community activities. "Corporate citizenship" cannot be reduced to philanthropic CSR, but includes all considerations for all the company's stakeholders.

This fundamental perception of legitimacy through corporate citizenship is also the central argument of Matten, Crane, and Cheapple in an article emphasizing that corporate citizenship means that large corporations, like governments and other administrative institutions, must contribute to the protection of certain rights and obligations with the same kind of responsibility that governments have (Matten et al. 2003). They emphasize corporate citizenship as a more central concept than CSR and stakeholder management, because the concept includes the essentials of both these types of socially committed management thinking. Therefore, it is possible to emphasize that "corporate citizenship" is a good new concept that precisely refers to the role that we want companies to have in society (Matten et al. 2003: 116–117). Similarly, in another article, Crane and Matten claim that legitimacy through corporate citizenship implies that, by virtue of their social involvement, companies intervene in areas where governments, municipalities, or other public administrations are unable to provide social tasks that protect and promote the rights of citizens (Matten and Crane 2005: 172). Companies can help protect and promote citizens' social, civil, and political rights, and they can play an active role in formulating welfare policies and contributing to the social development of society.

Crane and Matten define, by extension, "corporate citizenship" in the following way: "CC describes the role of the corporation in administering citizenship rights for individuals. Such a definition reframes CC away from the notion that the corporation is a citizen in itself (as individuals are) and towards the acknowledgment that the corporation administers certain aspects of citizenship for other constituencies. These include traditional stakeholders, such as employees, customers, or shareholders, but also include wider constituencies with no direct transactional relationship to the company" (Matten and Crane 2005: 173). Although this is a good description of the content of the democratic-republican perception of the company's citizenship, it is not enough to understand the concept from the point of view of human rights and civil rights. There are many conditions in society that cannot be understood from the point of view of social, civil, and political rights (Matten and Crane 2005: 174), so we need a more comprehensive definition of corporate citizenship, which we have described as based on the company's legitimacy through the consideration of "The good life for and with the other in just institutions."

At the same time, however, Crane and Matten are not reluctant to emphasize that there are many problems with this broader definition of corporate citizenship. The question is, for example, how far companies can go in order to take over the role of public institutions and organizations in formulating politics and strategy for social development without turning the balance between public and private over in a way that makes society even more undemocratic than it was before. This would not have been the case if the companies had remained within the economic sphere. A fundamental democratic problem arises when it is argued that the companies' stakeholder democracy must play a more active role in society, where they take over the role and functions of the governments (Matten and Crane 2005: 177).

A more critical objection is that there are no real social intentions behind legitimization through companies' good citizenship. This objection focuses on the fact that "corporate citizenship" is nothing more than a new ideological legitimacy discourse that serves to give capitalism a more humane face. From such a critical social science point of view, the company's ethics and responsibilities are legitimized through good citizenship, nothing more than the fashion phenomenon, which is used as a strategic power tool to cover the companies' real interests in always obtaining more money and profit. The ethics and responsibilities of companies in this light are nothing more than a rhetorical attempt to certain that one wants to adapt to society's expectations (Chouliaraki and Fairclough 1999). This discourse analytical approach claims that business citizenship acts as a discourse that strives to adapt businesses to their environment. The discourse analysis argues that the legitimacy as a good citizen makes it possible to merge the social and ethical within the company, so that the profit perspective is covered by social and social concerns. The discourse on good citizenship should be seen as an attempt to construct and strive for social contradictions and conflicts, whereby the company, through the discourse on good citizenship, appears to be socially legitimate. Thus, the discourse analysis is right in this point. We must not be naive about companies' interests in legitimizing themselves as good citizens. The discourse on "corporate citizenship" serves a well-defined strategic goal of legitimizing the company's value creation and economic earnings as a contribution to the common good for everyone in society.

A system theoretical approach analysis of the company's legitimacy through good citizenship, like the discourse theory, considers a social system that follows codes of profit maximization and competition as the fundamental logic of the system (Luhmann 1988). With the German sociologist Niklas Luhmann, we can consider legitimization through the company's good citizenship as a way in which the company interacts with society's other systems and handles tensions and irritations between the company and other social systems (Holmström 2004). Accepting and legitimizing society is important to the company, because legitimacy determines the company's ability to act in society. The system theory also emphasizes that "corporate citizenship" acts as a marker, whereby the company adapts to its environment to avoid image loss and destruction of its social and economic conditions of existence.

Discourse and system theoretical analyzes are important for understanding the company's legitimacy processes in society. They uncover the ideological dimensions of legitimization through the good citizenship as the company's endeavor to survive and adapt as an economic-strategic entity in a complex economic market. At the same time, the discourse and system theoretical analyzes also have certain blind points when they are to understand "corporate citizenship," since they do not have theoretical instruments to assess the company's citizenship normatively. Here we go from the discourse analysis and the system theory back to the political philosophy and company ethics, which assesses corporate citizenship in the light of justice and ethical theory.

Conclusion and Perspectives

Simon Zadek helps us to conclude our discussions on legitimization in relation to corporate citizenship and political responsibility of business. He can say to develop the different positions that we have met at Matten and Crane and Scherer and Palazzo and the theorists for a concrete management theory. Zadek's book *The Civil Corporation. The New Economy of Corporate citizenship* (2001) won the 2006 Academy of Management award for being the best management book. Zadek uses the concept of "New Economy of Corporate Citizenship" to include new partnerships between companies, governments, public organizations, and NGOs. The economy that emerges from the companies' good citizenship is at the same time an answer and a result of the networking's new forms of partnerships (Zadek 2001: 2). Zadek's concept of "corporate citizenship summarizes the content of legitimization through corporate citizenship by emphasizing that stakeholder engagement is an integral part of corporate efforts to make money and maximize their profit" (Zadek 2001: 8). Citizenship is a financial benefit for the company because it creates trust and long-term sustainability (Rendtorff 2015b, 2017a, b, c, 2019a, b, c, d).

The principles of interaction in the network economy are a "civil governance" and polycentric decision-making situation where not only governments are governed by the states, but where companies as political actors become key figures for decisions in a form of decentralized political networking governance, through which companies go through ethics and responsibility contributes to creating the norms and values of society (Zadek 2001: 10). Cross-sectoral partnerships are becoming more and more common. The network economy is based on the companies' active responsibility and commitment as a basis for institutionalizing trust relations (Zadek 2001: 13). The network economy institutionalizes governance relationships based on the good citizenship in response to the new economy's intensified credentials due to radical organizational changes and intensification of innovation, production, and communication in the information society (Zadek 2001: 27). Zadek emphasizes that "civil regulation" is a great advantage for society (Zadek 2001: 43).

When companies contribute to society with self-regulation, it is both in their own and in the interest of society. Nevertheless, it is also a response to society's expectations of companies that have been increasingly intensifying towards social responsibility demands over the past 50 years. Therefore, "corporate citizenship is the expression of learning and innovation in the new economy." The slogan is "Doing well by doing good" (Zadek 2001: 76). Identification through the good citizenship of companies is concretized at the same time in the company's voluntary civil commitment and self-regulation, where the companies nationally and internationally build systems for ethics and value management that govern the market without any direct form of state interference (Zadek 2001: 101). "Civil governance" is based on company ethics and communication with stakeholders through value-based management with mission, vision, and goals that are essential for the design of the good citizenship (Zadek 2001: 162). Here are various kinds of social and ethical accounts and alternative reporting of great importance.

The new economy of corporate citizenship is no longer based on strict legal rules, but is to a large extent a confidence economy. Trust is only achieved through genuine care and consideration of the company's stakeholders, such as when a company seriously does something to improve product quality or employees "working conditions, because trust depends on the citizen's" autonomous impressions and assessments (Zadek 2001: 39). Therefore, transparent communication and stakeholder dialogue is a prerequisite for achieving legitimacy (Zadek 2001: 221). This ethical definition of trust based on the good citizenship does away with antisocial networks that do not contribute to social integration (Field 2003: 72). Social capital in the network society cannot be based on opportunistic manipulation, because society's expectations of companies are that they act with integrity and reliability. Even game theory emphasizes mutual confidence-building behavior as at one time maximizing one's own and common interests (Govier 1997: 10). Cooperation is a game, and it is a great risk to be open and enter into cooperation with others (Axelrod 1984). Therefore, both parties have the greatest benefit of playing with open cards facing each other. However, it is difficult to work with a strong contradiction between trust and not trust, as there are many different levels of trust in the organization's practical reality (Govier 1997: 11).

Amartya Sen considers the guarantee of trust and transparency as fundamental to protecting the individual's freedom to act in the capitalist market (Sen 1999: 39–40). This helps the company's good citizenship to strengthen its confidence in the economic market. Well-established rules for behavior and predictability on the market are an important prerequisite for the development of the market economy (Sen 1999: 265). Rules for value-based management and ethics help ensure this confidence in the company at institutional level. This is strengthened through the company's self-regulation as a good citizen. Ethical principles formulated as ethics rules in the company are important to help create a culture of trust between the company and its stakeholders. According to the theory of "embeddedness" developed by Karl Polanyi and later Marc Granovetter, one can say that legitimization through the company's citizenship contributes to securing embeddedness in civil society (Granovetter 1985; Polanyi 1944).

Against this background, we can conclude that the company's legitimacy through the good citizenship, as it is the case in the democratic-republican political philosophy, constitutes the real basis for the company's social responsibility and company ethics. "Corporate citizenship" constitutes a political-philosophical conceptual basis for strategic management, which aims to integrate the company into society and strengthen a market-based network and trust economy nationally and internationally.

Abstract

In a report to the European Commission from an EU-BIO-MED-II Research Project with 22 Partners from different European countries, researchers proposed four ethical principles as guiding ideas for a European ethical and legal culture. Researchers had chosen to investigate the concepts of autonomy, dignity, integrity, and vulnerability. This research on bioethics and biolaw was mainly about how to give these ethical principles meaning in bioethics and law. However, during the research for this book emerged awareness that the ethical principles being classical ethical ideas with a fundamental significance for European culture do not only apply in bioethics but might have significance in other ethical fields, in particular business ethics, corporate social responsibility and business legitimacy.

J. D. Rendtorff (ed.), *Handbook of Business Legitimacy*,
https://doi.org/10.1007/978-3-030-14622-1_90

This chapter shows how the values of autonomy, dignity, integrity, and vulnerability can be applied in business ethics as the basis for business legitimacy. In this perspective, the ethical principles constitute a core of protection of human persons including their rights to economic development and the duty of civil society and its corporations not to let human beings be eliminated in subhuman conditions of poverty and misery. The argument is that the concepts of basic ethical principles have fundamental significance both at the individual and at the organizational level – and in addition that they provide an important foundation for ethical standards of sustainability in a future global culture of human rights. The chapter provides a brief outline of the meaning of the concepts in business ethics illustrated by some examples of the uses of the concepts in different fields of business ethics as the foundation of business legitimacy.

Ethical Principles · Institutional responsibility · Organizational integrity · Sustainable development · Vulnerability

Introduction

In a report to the European Commission from an EU-BIO-MED-II Research Project with 22 Partners from different European countries, researchers proposed four ethical principles as guiding ideas for a European ethical and legal culture. Researchers had chosen to investigate the concepts of autonomy, dignity, integrity, and vulnerability. The book *Basic Ethical Principles in European Bioethics and Biolaw*, *Autonomy, Dignity, Integrity and Vulnerability*, Vol I-II (Rendtorff and Kemp 2000, 2009) is mainly about how to give these ethical principles meaning in bioethics and law (Rendtorff 1997, 1998, 2002, 2003, 2008, 2014c; Jørgensen and Rendtorff 2018; Jørgensen et al. 2018; Rendtorff and Kemp 2019). However, during the research for this book emerged awareness that the ethical principles being classical ethical ideas with a fundamental significance for European culture do not only apply in bioethics but might have significance in other ethical fields. Thus, the same ethical framework is very powerful for business ethics, and in this context, the basic ethical principles can also be understood as the basis of protection of basic economic rights of the human person (Rendtorff 1997, 1998, 2002, 2003, 2008, 2014c; Jørgensen and Rendtorff 2018; Jørgensen et al. 2018; Rendtorff and Kemp 2019). Therefore, it is possible to apply the basic ethical principles of respect for autonomy, dignity, integrity and vulnerability in business ethics and corporate social responsibility. Thus, overview gives an outline of this application on the basis of earlier research in the field (Rendtorff 2009a: 9–19; b).

This chapter shows how the values of autonomy, dignity, integrity, and vulnerability can be applied in business ethics and philosophy of management (Rendtorff 2009a, b, 2010a, 2013a, b, c, d, 2014a). In this context, the ethical principles constitute a core of protection of human persons including their rights to economic development and the duty of civil society and its corporations not to let human beings be eliminated in subhuman conditions of poverty and misery. The argument is that the concepts have fundamental significance both at the individual and at the organizational level – and in addition that they provide an important foundation for ethical standards of sustainability in a future global culture of human rights. The chapter will provide a brief outline of the meaning of the concepts in business ethics illustrated by some examples of the uses of the concepts in different fields of business ethics and business legitimacy (Rendtorff 2009a, b, 2011).

Definition of the Basic Ethical Principles

In the book, researchers provide an extensive definition of the basic ethical principles (Rendtorff and Kemp 2000, 2009). They are four values to guide decision-making for law and public policy in late modernity. The context is the rapid developments of the life-sciences, for example, biomedicine and biotechnology. We only need to mention genetics, transplantation, pharmaceutical industry, food production, and the difficult problems of genetic manipulation, patenting of the human genome, commercialization of the body, production of transgenetic animals, environmental protection, etc. Thus, there is a need for good ethical values in order to protect human beings in technological development. Moreover, the relationship between business and biotechnology is clear. Society is in a process of developing new markets, and we already witness the globalization of the biotechnology business by multinational pharmaceutical companies with increased power and responsibility (Rendtorff 2014b).

In short, there are many overlaps between bioethics and business ethics, and the two disciplines have to work together in solving the great ethical problems of the globalized biotechnology industry. However, the basic ethical principles do not only apply to biotechnology, but they can be extended to be said to constitute an important foundation for the idea of "Sustainable development" as proposed by the UN report "Our Common Future" by the World Commission on Environment and Development from 1987. The basic ethical principles constitute the foundation of the "triple bottom-line" as proposed by John Elkington in his path-breaking book *Cannibals with Forks: The Triple Bottom Line of 21st Century Business*, which is conceived as an application of the principle of sustainable development in international business practice. This has recently been expressed in the definition of the UN sustainable development goals as essential for creation of corporate social responsibility and legitimacy of business corporations (Rendtorff 2015a, b, 2017a, b, c, 2019a, b, c, d).

In this context, the basic ethical principles provide the important link between protection of human persons, social and economic development, and concerns for the environment, because they indicate central values for taking care of nature, society, and human beings (Rendtorff 1997, 1998, 2002, 2003, 2008, 2014c; Jørgensen and Rendtorff 2018; Jørgensen et al. 2018; Rendtorff and Kemp 2019). We do not only talk about human integrity and vulnerability but also about the integrity and vulnerability of nature and society (Rendtorff 2015a, b). In addition, there is a close link between the human social and natural environment to the required respect for our autonomy and dignity. Therefore, we need casuistry for the application of the principles of autonomy, dignity, integrity, and vulnerability in developmental policy, economic progress, and business ethics.

In the report to the European Commission, we defined the ethical ideas in the following manner (Rendtorff and Kemp 2000):

1. Autonomy should not only be interpreted in the liberal sense of "permission," instead five aspects of autonomy should be put forward: (1) the capacity of creation of ideas and goals for life, (2) the capacity of moral insight, "self-legislation," and privacy, (3) the capacity of rational decision and action without coercion, (4) the capacity of political involvement and personal responsibility, and (5) the capacity of informed consent. However, autonomy remains merely an ideal, because of the structural limitations given to it by human weakness and dependence on biological, material and social conditions, lack of information for reasoning, etc.
2. Dignity should not be reduced to autonomy. Although originally a virtue of outstanding persons and a virtue of self-control in a healthy life – qualities, which can be lost, for instance by lack of responsibility or in extreme illness – it has been universalized as a quality of the person as such. It now refers to both the intrinsic value of the individual and the intersubjective value of every human being in its encounter with the other. Dignity concerns both oneself and the other: I must behave with dignity, and I must consider the dignity of the other; I must not give up civilized and responsible behavior, and the other should not be commercialized and enslaved.
3. Integrity accounts for the inviolability of the human being. Although originally a virtue of uncorrupted character, expressing uprightness, honesty, and good intentions, it has, like dignity, been universalized as a quality of the person as such. Thus, it refers to the coherence of life that should not be touched and destroyed. It is coherence of life, which is remembered from experiences and therefore can be told in a narrative. Therefore, respect for integrity is respect for privacy and in particular for the patient's understanding of his or her own life and illness. Integrity is the most important principle for the creation of trust between physician and patient, because it demands that the physician listens to the patient telling the story about his or her life and illness.
4. Vulnerability concerns integrity as a basic principle for respect for and protection of human and nonhuman life. It expresses the condition of all life as able to be hurt, wounded, and killed. Vulnerability concerns animals and all self-organizing life in the world, and for the human community it must be considered as a universal expression of the human condition. The idea of the protection of vulnerability can therefore create a bridge between moral strangers in a pluralistic society, and respect for vulnerability should be essential to policy making in the modern welfare state. Respect for vulnerability is not a demand for perfect and immortal life, but recognition of the finitude of life and in particular the earthly suffering presence of human beings.

The basic ethical principles are promoted in the framework of solidarity and responsibility as the basis for sustainable development. It is an expression of the movement of society in the civilizing process toward the Kingdom of Ends. This framework indicates a movement toward global justice (equality). In this context it is important to stress that the four values have a universal foundation in a hermeneutical circle of "wide reflective equilibrium" and considerate judgment. The principles should be interpreted as expressions of the concrete phenomenological reality of the everyday human lifeworld. Accordingly, they have great importance as reflective ideas for concrete decision-making. This "weak universality" of the principles indicates their position as important values for European (and global) ethical and legal culture. Moreover, in this framework emerges a foundation for dealing with global poverty problems, indicating the fight against poverty as an important concern for development policy based on basic ethical principles (Rendtorff 2009a, b).

The Basic Ethical Principles in Business Ethics

Now, the chapter will discuss how it is possible – with some modifications – to use this framework of ethical principles, responsibility, solidarity (equality) in business ethics as the foundation of business legitimacy. A significant change of perspective is that the principles no longer only concern individuals but also the institutional context of organizations on economic markets. We have already considered the reality of global biotechnology as one important field of application, but the principles can indeed be extended to other fields of business ethics. In fact, the shareholder-stakeholder debate has similarities with the bioethics debate about who should be subject to moral concern. Applying the basic ethical principles to business ethics is an argument taking all stakeholders – that can be identified – serious as subjects of moral concern. In this perspective, basic ethical principles provide an argument for the need of ethical values and social concerns as the basis for economic institutions in different societies.

This argument must be based on a communicative or integrative paradigm of business ethics (Ulrich 1997). The integrative view challenges a libertarian concept of business ethics. Instead of building ethics on the principle of profit maximization, integrative business ethics argues for institutional external limitations of the market. It disagrees with the view that "business is business" and that morality is external to the market. Legitimate profit maximization is limited by structural and institutional external conditions. The framework for integrative business ethics is critical rational reflection on correct profit maximization within these standards (Ulrich 1997).

In this critical view, we realize that no theory of profit maximization can escape external constraints. Profit maximization is only meaningful as a moral duty within social legitimacy and responsibility. Arguments for profit maximization as a metaphysical virtue and life form of protestant economic man presuppose the external view of the common good (Rendtorff 2009a, b).

Milton Friedman's famous statement "the social responsibility of business is to increase its profits" can be considered as an example of this mistake. He mentions the following constraints on the principles of profit maximization: "to make as much money as possible while conforming to the basic rules of the society, both those embodied in law and those embodied in ethical custom" (Friedman 1970). "There is only one social responsibility of business – to use its resources and engage in activities designed to increase its profits so long as it stays within the rules of the game, which is to say engages in open and free competition without deception or fraud" (Friedman 1970).

So even Friedman – the great neoliberalist – admits external ethical constraints on profit maximization. International corporations have to respect conditions of fair competition in acting on economic markets. The principle of profit maximization is an ideal and formal principle, which in concrete situations is dependent on conditions for legitimate action, social custom, consequences of actions, and implied stakeholders.

Thus, profit maximization must be justified in the perspective of general social welfare. Perhaps, an argument based on Pareto-optimality and utilitarian welfare policy might deliver the sufficient conditions for coherence of the doctrine of profit maximization (Ulrich 1997). Concerns for short-term profits for shareholders could be replaced by long-term profits for general welfare for consumers and community. Nevertheless, this is not possible on a purely formal basis solely on the conditions of the market. A principle for maximizing community welfare is dependent on social legitimacy of action. Moreover, shareholder value can only be defined as long-term profit maximization, which opens up for considering the interests of other stakeholders of the firm. Nevertheless, this is very far from the original individualist definition of shareholder value.

The external limitations of profit maximization signify that even if this principle is constitutive for the economic market it should always be considered as integrated in other social life forms and practices. Real profit maximization can only be morally legitimate profit maximization (Ulrich 1997: 415). It is dependent on socially defined conceptions of the common good in a republican state (Ulrich 1997: 416).

In this chapter, we can consider the basic ethical principles of respect for autonomy, dignity, integrity, and vulnerability to be based on such an integrative view of business ethics and therefore they are the basis for the idea of the "triple bottom line" as an essential principle of good and fair business. This should not be confused with an instrumental ethics. It is wrong to reduce ethics in business to a moral investment in good business in order to improve public relations or human relations of the firm (Ulrich 1997: 421). The strategic improvement of external and internal relations might be an important consequence of ethical behavior but it is not the whole meaning of business ethics as critical reflection on market conditions.

It is also wrong to understand business ethics as based on charity or generosity. Saying that "Social responsibility is fine, as long as we can afford it" opens up for a potential conflict between ways of earning money and ways of using the surplus of the firm. Charity cannot be the ultimate foundation of a communicative and republican concept of business ethics. Critical reflection on business life conceives principles of business ethics at the level of the totality of the activities of the firm and it tries to see firm as an actor that contributes to the common good of society.

On this basis, the basic ethical principles emerge as important values in stakeholder dialogue. Integrative business ethics considers stakeholder communication in the perspective of political deliberation in a critical public sphere. This contributes to a communicative foundation of the basic ethical principles. Stakeholders are not only defined strategically as causes of possible benefit or harm of the firm. They are considered in the broader light of the common good. Freeman's definition of a stakeholder can help to define this position: "A stakeholder in an organization is (by definition) any group or individual who can affect or is affected by the achievements of the organizations objectives" (Freeman 1984: 53).

This definition is symmetric because it takes into account both future changes in the strategy of the firm and because it relates to broader issues of policy. Stakeholders connote legitimacy. They should be treated as ends and not only as means. Property rights are not a license to ignore respect for persons (Freeman 1984). Integrative business ethics aims at institutionalizing stakeholder rights as a part of a culture of responsibility in business. The basic ethical principles of respect for autonomy, dignity, integrity, and vulnerability are the very values to insure the emergence of such culture as external constraint on profit maximization.

This argument is based on the fact that the basic ethical principles are important reflective ideas for formulating codes for values-driven management, which are coherent with basic human rights. Such a process of formulating codes based on autonomy, dignity, integrity, and vulnerability is predominant in international regulation of bioethics, for example, The UNESCO Declaration on Protection of the Human Genome (1997). The work of international groups like the World Economic Forum and Global Reporting Initiative (1997), but also OECD Guidelines for multinationals (1976 and 2000), but also United Nations Global Compact's principles for environment and human rights can be said to presuppose the basic ethical principles in the framework of solidarity and responsibility as important values for constituting the good society. In addition, similar principles play a role in the Caux-Roundtable guidelines as well as the codes developed by American firms trying to comply with the law. Together with the ideas of "Sustainable development" and the triple bottom line they may also be the case for EU's different communications on corporate social responsibility promoting a European framework for corporate social responsibility. Here, it important to notice that the European Commission emphasizes the importance of impact as an important goal of basic ethical principles in corporate social responsibility.

Thus, the basic ethical principles are already widely used in business ethics. Moreover, our task is not an invention or social construction of morality, but an interpretative social criticism of the ethics implicit in our social behavior (Walzer 1987). We are clarifying the meaning of ethical ideas that have an importance for our lives. In doing so, we come to understand the institutionalist context of the principles that is based on the framework of justice, responsibility, and solidarity (equality).

In this way social responsibility is essential for the legitimacy of the firm. Originally, responsibility had the significance "to respond to the other." It implies the capacity to respond for your own actions. It is closely related to having power over your own actions. Institutional responsibility includes three different subjects of the responsibility: the corporate board, the employees, and the organization. Social responsibility for all stakeholders in the perspective of the principles places the firm in society as a community. It implies a moral dimension of the economy (Etzioni 1988) where the firm has a duty to contribute to the protection of the vulnerable and weak in society. Thus, international firms are important actors in order to fight poverty and contribute to social coherence of the developing world.

This culture of responsibility in the perspective on integrative business ethics therefore has three dimensions: (1) Economical responsibility as defined by the mandate of profit maximization: "the social responsibility of the firm is to increase its profits" (Friedman 1970). (2) Judicial responsibility. The firm has responsibility to behave according to the legal rules of society, at all levels locally, nationally, and internationally. (3) The ethical responsibility of the firm. This level is beyond the two other levels. It is defined by the respect for justice and fair treatment of all stakeholders. The ethical responsibility defines the democratic legitimacy of the firm in community.

When moving from bioethics to business ethics and sustainable development we go from solidarity toward equality, fairness, and trust. It is difficult to define the meaning of solidarity in business ethics (Rendtorff 2015a, b, 2017a, b, c, 2019a, b, c). The concept was important when the labor unions should fight capitalism, and therefore, it seems to reject any kind of market-driven economy based on Darwinian reason. Trust seems to be a much more useful concept than solidarity (Fukuyama 1995). It can be defined as the expectation that a person, a group, or a firm is behaving in a moral way. Trust is the basis for engaging in a community of moral action and economic transactions. When trust is breaking down, the moral and social community is destroyed. So trust is necessary for making economic transactions and that is why economic science starts to work with trust as an important social glue of civil society. We realize that there is a close connection between responsibility, trust, and the basic ethical principles as essential values for development of sustainable economies.

Justice means "fair constraints" and equality in market interaction. Justice also commits to the Rawlsian "difference principle" as a guiding component of justifying inequality in market economics and the whole business system (Rawls 1971). On this basis, the ideas of autonomy, dignity, integrity, and vulnerability constitute important guidelines for fair business and market interaction and they help to define good governance for the developing world. Nevertheless, how should we define the particular applications of the principles in relation to the fields of business ethics and business legitimacy?

The Applications of the Principles

Autonomy

Even though it mostly is considered as a political principle of democracy, autonomy is very important in "liberal market economics." The market is based on the idea of free self-determination and creation of your own business. Participation in economical contracts is based on free will and workers should be free to accept different types of work. However, as it is the case in bioethics we see that autonomy is an ideal notion that can be questioned. All kinds of economic, social, and organizational constraints soon tell us that decision-making at the market is far from free. To focus on autonomy implies “a capability approach” to economic development. And autonomy is only understood as market liberalism, the right to pursue your own interest. The moral dimensions of autonomy have been totally forgotten. Autonomy has been considered as the right to egoism rather than in the perspective of the Kantian ideal of autonomy. It has been defined as the rights of the individual to maximize profits.

Organizational autonomy of the firm has been defined as the right of the firm to be independent and autonomous in relation to society. However, this consideration of autonomy is challenged by the recent shareholder-stakeholder controversy (Goodpaster 1991). Our integrative stakeholder view of the firm does not define the firm as an independent entity. Rather it argues that the firm should take into account the social context – not only its own autonomy but also the autonomy of all stakeholders that have an interest in the firm. The whole idea of social responsibility to the local community of the firm indicates such a communitarian critique of the abstract idea of autonomy, arguing for the local situatedness of the firm.

Another example of this change of the notion of organizational autonomy has been recent developments of values-driven management from a perspective of democratic communication (Thyssen 1997). Such a theory emphasizes the interests and autonomy of all the participants in the dialogue with regard to the formulation of goals and accountabilities of the firm. To respect autonomy means being aware of the interests of all the stakeholders (Rendtorff 2009a, b). The stakeholders all have a perspective that includes the respect for their autonomy. Such new communicative autonomy-based view of the firm is in accordance with democratic theory of the stakeholder society. To do ethical accountability of the firm is a second-order reflective way from the perspective of the domination free dialogue to measure all types of interests and stakeholders.

Dignity

In a similar way, the concept of dignity can be borrowed from political philosophy and applied to the fields of business ethics and business legitimacy.

Concerning weak individuals, dignity indicates the respect for each human being not only as means but also as Ends in them-selves. This is the foundation of Human Rights Declarations. The respect for “the right to work” and not to live in poverty is very important. It is said that dignity in working life is essential to individual well-being. The idea of the individual as a being without a price and that everyone should not only be treated as means but also as “Ends-in-themselves” accordingly has an application in business. At the same time, this is difficult because we all sell ourselves and our body to our employers. Dignity is important to indicate limits of the rights of business to corporeal exploitation of individuals and discrimination at the workplace. Nevertheless, we can also mention cases of degradation of human beings in the organizational hierarchy. Respect for dignity limits the rights of superior officers to reduce their employees to mere things.

Concerning the powerful individuals, dignity indeed finds an interesting application. It is a matter of the dignity of the directors and board of the company to be responsible for how they treat their employees. They lose moral dignity if they do not respect the people who work in the firm. Similar things can be said about criminal behavior of the firm, for example, non-corporation of the firm with law-enforcement officials.

Moreover, it is a matter of dignity of how high officials cope with success and failures. Some leaders are not able to handle success and they lose dignity while experiencing success or failure. To act with dignity is evidently a question of moral virtue in the experience of happiness or tragic (moral) losses.

As with autonomy, it is a major theme of discussion to what extent organizations can have dignity. This relates to the question of whether they can be held responsible for their actions and it concerns the relations of organizations to the environment. The initiatives of organizations that have had success to contribute to social success and welfare illustrate how organizational dignity can be demonstrated in superior generosity.

Integrity

The concept of integrity has been quite popular among scholars of business ethics (Badaracco and Ellsworth 1991). Integrity has mostly been defined as coherence or completeness indicating the purity of a totality that has not been destroyed. The notion is associated with identity, honesty, respect, and trust (Rendtorff 2015a, b). In short, business ethics has been working with the idea of personal integrity as moral virtue. But this notion of integrity has in modern legal theory been extended to institutional structures and legal entities (Dworkin 1986). Important scholars have using the idea of "organizational integrity" described this implied broader ethical perspective on ethics and law of the firm (Paine 1994). The *US Federal Sentencing Guidelines for Organizations* (1991) that admit organizations significant mitigation of sentence if they have incorporated a meaningful ethics and compliance program can be seen in this perspective because they focus on organizations rather than on individuals.

Such a notion of organizational integrity implies a collective perspective on values-driven management (Rendtorff 2015a, b). Moral and legal responsibility is not only individual responsibility but also dependent on the structure and culture of the firm as a "nexus of formal and informal contracts." We should not only focus on the Moral Manager but also look at the organization in interaction with the environment, which can be described as the Moral Market (Boatright 1998).

Many researchers have stated that management by values is an important way to ensure sound just decision-making based on corporate values taking into account all stakeholders of the firm. The programs of values-driven management are an indication of the fact that ethics is not merely a personal issue but is influenced by the culture of the organization. The demand for an effective ethics program as a prevention of wrongdoing implies the possibility of becoming more conscious of the ideals and values of the organization. An ethics program can help the corporation to improve its social legitimacy and participation in the life of the community. Such procedures "will not prevent all illegalities or improprieties but they can help to influence the character of an organization and its employees" (Driscoll and Hoffman 2000). An institutionalist account of integrity moves the perspective from individual morality toward the analysis of the "ethical logic" of basic concepts of modern economies: organizations, markets, property, information, etc (Rendtorff 2015a, b). Integrity in organizations is an important indication of efforts of corporations to contribute to the constitution of non-corrupt institutions of civil society in the developing countries.

Vulnerability

The concept of vulnerability is closely linked to the idea of the social responsibility of the firm, because the relation to the vulnerable generates particular concerns from responsible business managers (Rendtorff 2009a, b). Vulnerability, defined as an ontological concept, seems to be contradictory to the idea of competitive market relations involving a struggle for success and survival in which vulnerability can have little significance. The social struggle of Darwinism indicates a vulnerability of the weakest that are destroyed by the competition at the market. The market conditions are that competition is free and that participants should increase their profit submitted to some minimal conditions for restricting the market. It is acknowledged that each participant in the market competition has vulnerabilities (Brenkert 1998).

This means that the dark side of business is vulnerability and the vulnerable will not survive. Vulnerability expresses the exposedness or disadvantaged position of a person or an organization to another stronger person or organization that is able to do harm to this person or organization. The vulnerability is a point of the person or organization, some special characteristics, which means the possibility of the destruction of this entity when certain conditions are actualized. In this way, vulnerability is a part of the business condition because no one would be able to make one-self assured against all evil.

Although some overlap exists, the vulnerable groups cannot be totally identified with the disadvantaged but must be considered as a distinct group (Brenkert 1998: 517). We can talk about psychological, physical, and social dimensions of particular vulnerabilities. Especially in marketing, concern for the vulnerable means a specific awareness of the firm to the vulnerability of the consumers, for example, children, elderly, poor, people from developing countries in the global business system. Nevertheless, it could also mean responsibility toward employees with particular vulnerabilities. It must be the aim of the firm or society to avoid irresponsible action destroying these particularly vulnerable groups.

The meaning of vulnerability in business ethics accordingly generates a principle of respect for vulnerability. It seems to be the responsibility of business to give the vulnerable a fair treatment, not exploiting their vulnerability but rather in caring and being aware of their dispositions. Responsible managers and salespersons would not exploit vulnerable people but rather support them in a responsible business relation built on dignity, integrity, and trust (Rendtorff 2009a, b; 2015a, b). Respect and care for vulnerable human beings is the basis for protection of the integrity of society.

Conclusion

The aim of this chapter has been to show that – although they were firstly developed within bioethics – the ethical principles of autonomy, dignity, integrity, and vulnerability in the framework of justice based on responsibility and trust can have a powerful meaning and application in business ethics (Kemp et al. 2000; Rendtorff 2005, 2010b). The basic ethical principles are also the foundation for the idea of sustainable development in international economics. Moreover, they help to give substantial content to the idea of the "triple bottom line" (Elkington 1999). The principles are analyzed in the perspective of integrative business ethics and a communicative paradigm of stakeholder dialogue (Rendtorff 2009a, b). The principles are not limited to the European perspective but they can be applied globally as the foundation for the fight against poverty and creating fair and healthy markets in developing countries. In this context, the basic ethical principles are closely linked with the need to rethink corporate social responsibility and business ethics for sustainable development. Since the Brundtland commission there has been a development toward the millennium goals of sustainable development and more recently the UN sustainable development goals as goals for global development of the whole world toward a sustainable future for humanity (Rendtorff 2015a, b, 2017a, b, c, 2019a, b, c). This is a cosmopolitan horizon for business ethics and business legitimacy (Rendtorff 2019d). The principles are not only theoretical ideas but also practical guidelines for business. The task is not to reduce one principle to another but their internal tensions should be further investigated. There is much further work to do concerning their particular implications in light of reflective judgment. In working this out, a powerful and comprehensive theory of business ethics and economic development policy will emerge.

society, governed as it were by an invisible hand, with the business world working in cooperation with society rather than in opposition to it.

The history of Western democracies in the twentieth century has exposed many flaws in the quest to achieve this balance between industrial sectors and more generally the business world and political decision-makers.

The nature of this alliance has been progressively transformed. The balance ensuing from this voluntary process has been forced on the business world by means of rules, norms, and laws. The legitimacy of corporations proposing a declaratory approach has become more conditioned by legal constraint, whereas the equilibrium between the public and private spheres was previously based on the capacity possessed by market and society to negotiate their common ground, their demarcation lines, their independence, and their respective third parties.

This equilibrium was maintained thanks to accepted embodiments of representative democracy in liberal and neoliberal regimes, thanks to intermediary political institutions – classical Labor Unions for the most part. Lastly, the notion of a juncture between the economy and politics was an inherent major feature in explaining the appeal of stakeholder theory at the end of the 1980s, the period commonly referred to as the birth of the global economy.

As for stakeholder theory itself, it is deeply rooted in the ability of the decision-taking entities within corporations (their governing bodies) but equally within Nation-States (elected governments) to take into consideration the multiple interests which are liable to either converge or diverge and are essentially complex in nature and to negotiate in a context characterized by multiple contradictory factors. By considering this complexity inherent to civil societies, their internationalization, and the importance of the nonprofit sector, it has enabled liberal economies and societies to enjoy prosperity.

Nevertheless, between the end of the 1980s and the noughties, the legitimacy of corporations has been challenged and the very notion contested. In this paper, our ambition is to review the main features of this radical shift in perception.

Changes in the Status of Legitimacy

It is interesting to observe the way in which the notion of the legitimacy of corporations has altered from the standpoint of critical studies in business administration. Indeed, the issue regarding the legitimate right of economic entities intervening in markets is difficult to address without taking into consideration (1) a rational legal system regulating this form of action, (2) the dialectic between legitimacy and legality, and (3) the distinction between public and private spheres and their permeability.

The Rational Legal System of Action

All action, whether it has economic or other motivations, is set in the context of society and is open to challenge. "All questioning of any action whatsoever amounts to a challenge to the legitimacy of the person responsible for the aforesaid action" (Laufer 1996). If we accept that the State has the monopoly regarding legitimate violence, that is to say authority based on law, we also accept that this violence meets with the consent of all members of society (even if the legitimate violence exerted by those incorporating justice may sometimes give rise to unjust verdicts). The origin of legitimate violence in a democratic State was explained at the time by Max Weber, to whom we owe the sociological theory of legitimacy (Weber 1922, 1958). The dominant form of legitimate authority in the nineteenth and twentieth century was the preserve of Nation-States and is of the rational legal variety which means that two principles are admissible in rendering an action legitimate: scientific rationality and the laws. Hence, conflicts which mere negotiation has failed to resolve can be brought before a tribunal deemed competent to judge them. Thus, in a rational legal system, legitimacy is superseded by legality, or, to cite Weber, legitimacy is only valid if it is legal and rational, so it presupposes the identity of law and the State.

The Dialectic Between Legality and Legitimacy

"The role played by Law in the smooth running of the system of legal rational legitimacy is an accurate reflection of this system of legitimacy" (Laufer 1996). There have been three successive periods: the era of public power (1800–1900), the era defined by the criterion of public service (1900–1960), and the era marked by the crisis of this criterion (1945 to the present). This process of dividing the history of legal rational legitimacy into distinct periods sheds light on why the notion of legitimacy has re-emerged. In fact, once the legal doctrine itself recognizes that it can no longer provide citizens with simple, easily identifiable criteria, the notion of legitimacy may (and even must) reappear as a managerial concern: either as a way of avoiding the vagaries of relying on the courts or as a way of presenting one's action in a more favorable light towards those very same courts. "In this way, the legitimacy of actions doesn't just emanate from respect for institutional rules alone but from the consent of people concerned to actions which at the end of the day determines the degree of confidence which people are willing to bestow on the institutional system which governs their destiny in the final analysis" (Laufer 1996). The crisis of the criterion originates precisely from a loss of faith among the general public in the legal rational. We could say that we have come full circle, were it not for the fact that these lines were written at the end of the 1990s before the framework of administrative law had been weakened by the crisis in the institutional system: the undermining of the sovereignty of Nation-States by capitalist hegemony, specifically that of multinational and transnational corporations.

The Crisis in the Rational Legal System and Fluctuating Legitimacies

Up until then the rational legal system was supported essentially by the sacred separation between the public sector and the private sector as well as by the separation between administrative law and private law, the legitimacy of action was derived from its end purpose: the general interest or private interest. However, it would seem that this dichotomy no longer works as well as it used to and that there is now a kind of permeability between the two spheres. The proliferation of rules and of management norms in the public sector designed to facilitate the implementation of what is usually termed "public management" since the 1970s illustrates the inability of the public sector to develop its own system of norms as it had succeeded in doing during the period in the nineteenth century which was described by Max Weber as the heyday of bureaucracy.

The theme of corporate social responsibility has become a business in its own right, capable of supplying a range of services, norms, rules, and guidelines profiting from the crisis in the rational legal system and the permeability between the public and private sectors. It has often been said that social responsibility constitutes a "soft law" replacing legality or, as Anglophones put it, replacing hard law. But, above all, during this period CSR assumed a prescriptive role, offering business leaders a guarantee of legitimacy in carrying out action which might otherwise have been undermined or challenged. The emergence of Business leaders' legitimacy is closely linked to the emergence of the question of the legitimacy of the Corporation and of Management, and this is reflected in the fact that, henceforth, a Corporation's activity operates simultaneously on two levels: on the level of action exerted on the system of social norms (particularly via lobbying activities) which defines the legal and scientific set of rules which are supposed to govern the Corporation's activity and on the level of activity carried out inside the framework of the rules which have been shaped in this way (Laufer 1996).

The Different Stages in the Development of CSR in France

The history of corporate social responsibility in France as an area for research and as a normative activity in corporate affairs began with a long spell in the wilderness from 1950 to the 1980s and then saw a breakthrough in terms of public awareness between 1984 and the late 1990s and finally underwent a period of institutionalization. Several highlights merit our attention, over and above the recognition of these aforementioned distinct phases (El Akremi et al. 2008).

Economic Activity Increasingly Governed by Legal Requirements: From Norms to Laws

In Europe, social responsibility has progressed from occupying a marginal role in economics, management, philosophy, law, and political science to achieving legitimate status between the end of the 1990s and the noughties, championed by the European Commission in its Green Book in 2001 and then in its European model of social responsibility in 2011. Corporate social responsibility went from strength to strength once an approach founded on responsibility became accepted via the ISO norms (ISO 26000 for CSR, 14001 for environmental management, 9001 for the CSR control framework, 50001 for energy management).

In France, legality began to replace incentives from 2001 onwards. For instance, there was the law relative to new economic regulations, referred to as the NER laws, adopted on 15 May 2001. These laws regulate three areas (financial regulation, competition, and corporations), and they oblige publicly listed corporations to make public their social and environmental record (article 116). The Grenelle Laws 1 and 2 were adopted in 2009 and 2010, following large-scale concertation. They were good examples of negotiations with the different stakeholders. Launched in 2007, the Grenelle Environment summit brought together representatives of the State, from local government, NGOs, corporations, and employees, with a view to promoting action in favor of ecology, the environment, and biodiversity in France. Certain of the objectives came in for criticism, however, particularly the jettisoning of the carbon tax plan. Five years after Grenelle Environment, a "national debate on the topic of energetic transition" (the NTE) began in France, resulting in the adoption of the law on the energy transition towards green growth in the summer of 2015.

The Grenelle Laws

Grenelle Law 1: The Law Relating to the Time Schedule for the Implementation of the Grenelle Environment Agenda

The "Grenelle Bill" was tabled by the government in the French Parliament in June 2009. It was adopted on 23 July 2009 and promulgated on 3 August 2009 (1). This law is a program framework which confers legal status to the Grenelle process. It states the major objectives set and the pledges undertaken by the State. This law sets out, via 57 articles, measures relating to the battle against global warming, the protection of biodiversity and natural habitats, the setting up of a new form of governance, and, finally, protection against risks to the environment and health. Among other measures, it features France's commitment to reducing greenhouse gas emissions by 75% between 1990 and 2050 ("the factor 4"). Furthermore, the State pledges to look into "the setting up of a so-called climate-energy program designed to encourage responsible behavior relating to carbon emissions and energy." This plan for a carbon tax was abandoned in 2010 (it was later relaunched and adopted by Parliament at the end of 2013) which at the time caused the Nicolas Hulot Foundation to quit the work groups presided by the government in connection with the Grenelle Laws in favor of the environment and the oceans.

Nonetheless, the measures announced were not submitted to a detailed cost-assessment.

Grenelle Law 2: The Law Promoting National Mobilization in Favor of the Environment

The Grenelle Law 2 was presented by the government of Nicolas Sarkozy to the Senate in January 2009. It was finally adopted by Parliament on 29 June 2010 and published on 12 July 2010. This law covers the implementation of a number of commitments undertaken by the Grenelle Environment summit.

The 248 articles which this sizeable bill comprises were considerably embellished by Parliament and detail measures relating to six major project areas: buildings and urban planning, transport, energy consumption, biodiversity, risks, health, and waste and ecological governance.

However, no measures concerning energy conservation norms or monitoring procedure were mentioned. Furthermore, the bill omitted to broach the financial means which were to be made available.

Other Laws Linked to Grenelle 1 and 2

In addition to the "Grenelle Laws 1 and 2," further bills reinforced the commitments made at the Grenelle Summit, such as the law relating to environmental responsibility, the GM law, and the law concerning the organization and regulation of railway transport.

The law relating to environmental responsibility dated 1 August 2008 introduced for the first time into French law the concept of responsibility for causing severe damage to the environment and constitutes a strong crackdown on pollution of the oceans. This bill translates into national law the European Directive 2004/35/CE which sets out a common framework of responsibility in the case of severe damage caused to the environment. The GM (genetically modified organisms) law adopted on 25 June 2008 aimed to clarify the conditions surrounding the growing of transgenic plants and their coexistence with "traditional" farming. This law resulted in the setting up of the National Council for Biotechnology, among other things. This council's rulings, which are made public, deal with the pros and cons of GM organisms with regard to the environment and public health. The goal of the law organizing and regulating railway transport was the introduction of a process of efficient regulation in this field, guaranteeing nondiscriminatory access to the network for all railway companies. This ruling was rendered necessary by the opening up to competition of rail freight transport from 31 March 2006 on and the similar measure for international passenger transport introduced on 13 December 2009.

Since then, other binding legislation has been introduced: for instance, the laws about parent companies' obligations to remain vigilant and to oversee, requiring them to document, identify, prevent, and calculate all the social and environmental risks run by them and their subcontractors in France and abroad. This legislation, strongly backed by the socialist deputies during François Hollande's presidential term in office, forces corporations to be alert to a wide range of risks linked to fundamental human rights (child labor, forced labor, threats to freedom to join a

Labor Union, premises not complying with safety regulations, damage to the environment). These restrictions apply to firms employing more than 5,000 employees in France or 10 000 for those whose headquarters are located abroad. The special feature of this law is that it covers the activity of both the firm itself and also that of its subcontractors or suppliers with whom it is engaged in “a proven business relationship,” to quote the legislator. The aim of the bill was to access more detailed knowledge of the production chains and to be able to question the consequences of different investment decisions. It also offers the means to prevent certain tragedies, such as the Rana Plaza scandal in Bangladesh, where the collapse of a building housing dozens of subcontractors operating for Western textile manufacturers caused the death of more than 1000 workers in April 2013. Despite the fact that the ideas which had inspired the bill encountered wide approval, it gave rise to heated debate and was fiercely opposed by French business federations. The law’s wide scope (it applies to subcontractors and suppliers and covers the entire gamut of social and environmental risks) indeed makes life tough for international corporations. However, the penalties initially intended to punish infringements were considerably attenuated by the Conseil Constitutionnel, and the fine of 10 million euros was removed from the text even if the notion of criminal responsibility was retained.

We can observe that the French Grenelle Laws (2009–2010) and those concerning vigilance were directly inspired by the dramatic impact which international crises of both an environmental and social or financial nature had on successive governments. For the record, in 1982 we witnessed the industrialized nations’ debt crisis; in 1984 the Bhopal catastrophe occurred, followed in 1986 by the Exxon Valdez oil spill tragedy and the nuclear disaster in Chernobyl. In 1999 it was the turn of the Erika scandal, succeeded by another nuclear horror in Fukushima in 2011 and the surge in the number of category 5 cyclones during the period 2000–2017, from 11 in 1924 to 33 in 2000. The financial sector wasn’t unscathed either: in Europe and in France, the regulation CRBF 9702 in 1997 as well as the Basel Committee in 2003 obliged banks and financial and credit establishments to comply with legal and regulatory requirements. Norms and obligations were introduced to regulate these professions, to limit risks, to prevent insider trading, to fight against money laundering and funding of terrorism, to enforce trade embargos, etc.

In the United States, the federal law proposed by Senator Paul Sarbanes and Congressman Mike Oxley, referred to as the SOX law, was approved virtually unanimously by the Congress on 25 July 2002 and ratified by George W. Bush on 30 July that same year. It followed in the wake of the scandal involving the firm Enron, the pride of the American energy sector, which occurred during the stock exchange crash of 2001–2002, with the debt crisis and multiple bankruptcies providing the backdrop. Thousands of investors lost their savings and their retirement pensions. Although the SOX law brought some order to the proceedings, it wasn’t able to forestall the sub-primes crisis nor sovereign debts nor scandals like the one caused by Madoff.

Legal Regulation of Business and Loopholes in the Coordination of Different Public Sovereignties

It's irrefutable that corporate social responsibility, whether voluntary or arrived at through constraint, has established itself in different hemispheres, supported by governments facing major international crises. CSR has well and truly undergone the transition in 30 years from moderate measures of incitation to regulatory constraints. The systems in place have been beefed up, increasingly placed within a legal framework, extended as in the case of GAFA. Thirty years ago, outside insider circles, themes relating to tax justice weren't relevant to CSR. Was corporate tax optimization considered immoral back then? It was the widening inequality gap which appeared at the turn of the new millennium between the Internet giants and small entrepreneurs (who nevertheless make up the backbone of the European economic system) on the one hand but also and above all the chasm between those same mega corporations and the mass of citizens which proved the decisive factor behind the popularity of the idea of social responsibility, albeit a more technical version of the concept but one whose underlying philosophy views the economy from the angle of political science.

When Margrethe Vestager, the commissioner at the head of the department in charge of competition at the European Commission, sued Google for more than 2.5 billion euros and Apple for 13 billion – a record sum corresponding to the firm's illegal tax avoidance over a number of years – she had no qualms about doing so as she was merely playing her role as guardian of the antitrust laws (in a sense she was simply acting in accordance with the rational legal mode previously alluded to). She also felt quite justified in acting in this way owing to the context of growing public indignation in the face of social injustice exacerbated by governmental powerlessness to arbitrate, especially when up against tax avoidance and cheating perpetrated by corporations and individuals visibly oblivious to their social and moral obligations towards the Nation-States where they had set up their businesses. Likewise, when the same European Commissioner imposed a 110 million £ fine on Facebook and Twitter during the conference "All for Democracy." Actually, what was really behind all this wasn't just the antitrust laws regulating the protection of personal data available to GAFA but the core issue of how wealth created in the European Union could be redistributed by the Member States acting in cooperation with local players, assuming of course that the Nation-States concerned approve of the European Commission's approach. Ireland, for instance, was opposed to Europe's attack on Google. At the same time, the very notion of a country's attractiveness and government policy intent on approving it is a tricky area. In 2018, IBM announced that they wanted to create 1200 jobs for engineers in France; Facebook confirmed that they were increasing their funding dedicated to academic research, and Uber entered into a partnership with AXA to insure their drivers against certain serious risks. But the lion's share of big corporations' assets lie elsewhere, in Silicon Valley mostly, in Seattle, or in Boston. The same applies for Huawei. Much of the value created (highly qualified engineers, tax breaks obtained through public subsidies) is seized by these multinationals who then promptly send it back home to their headquarters and to their top executives or distribute it to their shareholders around the world. So we can see that what is presented as contributing to welfare in another country simply amounts to treating that country as a subcontractor in the production chain, for wealth is created locally but is promptly dispatched elsewhere. For these multinationals to act in a socially responsible manner, they would need to commit to meaningful, sustainable local development.

The factors alluded to above emphasize the growing importance of social responsibility which has gravitated from being a well-meaning incantation inspired by a sense of morality to induce a form of liberal harmony between the economy and society to embodying a conflictual relationship between the global economy and worldwide civil society within a context characterized by the drastic decline of public sovereignty (which no longer guarantee basic human rights) or at best by a remodeling of this sovereignty (giving rise to coordination between Nation-States and Europe, e.g., or between States and federal government, as in the United States).

Nation-States, Less and Less in a Position to Uphold Basic Human Rights

In France, exactly 70 years ago, on December 1948, 50 States ratified the Universal Declaration of Human Rights, drafted by René Cassin, an expert in legal matters. Although this declaration is the most widely translated document in the world (into 152 languages in fact), the record concerning its application makes for grim reading. One hundred and ninety-three UN Member States have adopted it, but none have entirely put it into application. “Worse still, if this text were to be put before the UN General Assembly today, it would probably be rejected outright” stated Kumi Naidoo, the General Secretary of Amnesty International in the issue of “Le Monde” dated 8 December 2018.

The original flaw in this declaration stems from the fact that it isn’t a treaty: hence the act of approving the text isn’t legally binding but simply involves compliance with nine conventions (on political and civil rights, economic and social rights, racial discrimination, discrimination against women, torture, children’s rights, migrants’ rights).

Yet towards the end of the 1990s, in order to advance the cause of fundamental human rights in the wake of the wars in the very heart of Europe (in what was previously Yugoslavia to be specific) and following the genocide in Rwanda, two new concepts saw the light of day: “International Penal Justice” on the one hand and “the moral duty to protect” on the other hand. The latter was the brainchild of a Frenchman, Bernard Kouchner. The first idea assumed a concrete identity in 2002 with the setting up of the International Penal Court whose jurisdiction covered genocides, crimes against humanity, and war crimes as defined in an international treaty (the Statute of Rome). This treaty was ratified by 127 countries. The second concept was adopted by all UN Member States in 2005.

But despite these two new concepts, despite the setting up of an International Court, and even if the twentieth century marked an end to apartheid, slavery, the colonial system, and the absence of rights for women, the Declaration of Human Rights still resembles a polite progressive petition rather than a real set of constraints for existing or putative democracies. We need to ask ourselves whether the 15 years ensuing the end of the Cold War were an exception, given that we have witnessed a clear worldwide regression of human rights. It would be impossible to draw up a list of all the States around the world who don't uphold human rights. However several events which have occurred in recent decades stand out in our memories: the torture perpetrated in the United States (during the traumatic post-9/11 period) and the illegal assassinations which followed, the example of China who simply pay lip-service to Human Rights, Latin America (with a special mention for Brazil, Mexico and Venezuela), not to speak of the Middle-East countries or of Africa.

The fragile nature of democracies, the setting up of democratic regimes not based on pluralism but featuring a single party unchallenged by any institutional counter-powers, and political regimes of an extremely authoritarian nature such as those present in Turkey or in Russia, all these examples show us that States which justify legitimate violence are incapable of protecting fundamental human rights. Even worse, "Some strong men whip up hatred against minorities and legitimize, in the name of national sovereignty, measures which jeopardize basic Human Rights" according to individuals who have witnessed such exactions, such as Yves Daccord, Managing Director of the International Committee of the Red Cross. He went on to assert: "It is abundantly clear that Nation states no longer inspire a consensus amongst their citizens, that they have ceased to seek collective solutions to problems, and that we're experiencing a period characterized by exceptionalism."

Without a shadow of a doubt, if Nation-States are no longer up to guaranteeing their citizens basic rights, and if no international organization is in a position to rectify this major flaw, the key issue which needs to be addressed isn't whether corporations can attain legitimacy by concerning themselves with the common good still realistically attainable as much as with their bottom line but rather how to set about tackling the vital issues which need to be resolved if we are to ensure a sustainable world to live in. Solving these problems is assuredly the vital prerequisite facing any organization aspiring to achieve legitimacy for its role in society.

The standard-bearers posing these legitimate questions are nowadays civil societies who some observers would like to see operating on the international stage. Immanuel Kant, who was a fervent advocate of a cosmopolitan outlook, ardently desired this; he wrote: "The major challenge facing mankind, one which nature obliges us to resolve, is how to instigate a civil society which applies the Law on a universal basis." "A universal civil society alone is capable of getting Nation States to renounce their absolute and potentially brutal freedom of action via the adoption of a civil constitution free to determine their foreign policy" (Kant 1784).

Yet the universal or even international civil society of the type alluded to by Immanuel Kant in the eighteenth century hasn't yet seen the light of day or at best only partially.

Legitimacy which Has Shifted Towards an Emerging International Civil Society

Stakeholder theory has long since stressed the legitimacy of the interests of all stakeholders affected by or influenced by business activity which impacts society (Freeman 1984, 1994).

Naturally it goes without saying that all business activity affects society and citizens in one way or another. In support of this premise, certain theorists have even gone as far as calling for the construction of a new social contract (Donaldson and Dunfee 1999). The theory has won over many adepts: it is used on a wide basis nowadays in multinational corporations which produce a map of their stakeholders in order to facilitate their relationship with them and to avoid conflicts; it has exerted a widespread influence on public decision-makers who incorporate them in their diaries in order to create opportunities for dialogue and to rationalize and optimize deliberation faced with the surge of requests to participate in the decision-making process and the proliferation of legitimate representatives at the committee stages (from the COP 21 to the COP 24). But overall, after 35 years of practical experience, interpretation of stakeholder theory has been restricted to the identification of the various stakeholders (Bonnafous-Boucher and Rendtorff 2014, 2016). Even if Mitchell et al. (1997) managed to render this identification more intelligible by applying the set theory instead of a mechanical listing of internal and external stakeholders, of primary and secondary rank, the fact of hierarchizing the importance of their aspirations and their demands only goes to show to what a large extent the question of recognition of the composition of these stakeholders is an issue in its own right. Depending on the viewpoint one adopts, stakeholders are, respectively, a set of players who don't represent the State, according to the United Nations, the World Bank, and the European Commission; they can equally be considered as a set of individual players – the civil society in the Hegelian sense of the term – as they are treated by the multinationals (Bonnafous-Boucher 2004, 2006, 2011), or the nonprofit sector, as they are viewed by public authorities. In this respect, the growing inclusion of stakeholders' agendas in the strategy of certain multinational corporations or likewise in that of public authorities has enabled them to embrace a prodemocratic rhetoric which enhances the legitimacy of their strategies without fundamentally undermining their stances. At any rate, that is what is implied by certain schools of thought in political science, at the World Bank, for example (Hibou 2001).

Essentially, in 30 years globalization has profoundly transformed the core facets of the market and economic organization (multinationals, transnationals, medium-sized companies, born global, the statute of independent businessmen and entrepreneurs); it has radically deconstructed the rules of public and political life by inviting civil societies to confront local and global issues simultaneously, whereas they had previously intervened at either a national or micro-local level. At the same time, we have witnessed a considerable increase in the importance of players unconnected with the State. Their growing influence has transformed them into defenders of sectorial interests on an international and world scale. It is highly questionable whether we can compare their role to that of a civil society thought (Bonnafous-Boucher 2011). This ambiguity resides in the precise philosophical definition of the very concept of civil society in Hegelian terms. Let's leave aside philosophical tradition for a moment and content ourselves with observing that non-State organizations may be compared to lobbies when they represent sectorial interests "although they are not motivated by the pursuit of personal profit, they are not invested with a comprehensive vision of the common goods" (Thaa 2001). Furthermore, some observers point out that the representative nature of NGOs is completely relative: their leaders are unelected, they have no clearly defined responsibilities towards their members or civil society, and their independence from their donors is often rather tenuous, which amounts to saying that the very status of non-State players is still rather unclear and leads us to imagine new forms of cooperation between the State and the market and between political authority and civil society (de Senarclens 2002). This also leads us to observe a certain ungovernability and to reflect on a new conception of democracy featuring direct supervision of government policy via popular assemblies and movements able to protect basic rights instead of relying on parliamentary institutions. In this new situation, democratic negotiation can take place on a local level and deal with international issues, such as how to deal with migration or even to further the cause of tax justice in different countries. Certain authors such as Dahl (1999) have perceived in this updated conception of democracy a wish to see an international civil society based on the ideal of a cosmopolitan democracy whose citizens would "enjoy rights and be subject to moral obligations rather than create laws." Such a vision raises certain questions; and some authors consider on the contrary that "this conception doesn't provide any answers to the problem of the democratic deficit largely created by the forces of internationalization and economic and financial integration which impose an external limitation on the leeway Nation States possess, particularly with regard to Keynesian policies designed to fund social policy and job creation achieved by means of budget deficits" (Cox 1997). Drawing attention to this ungovernability, or even to the continual improvisation governing authorities resort to when facing legitimate and radical demands expressed by citizens represented in non-State entities, amounts to "stating that, faced with the growing degree of social complexification, the current political system is no longer fit to govern society on its own and must, therefore, acquire more complexity by sharing its power with players from outside the system. Put otherwise, the conclusion that our societies have become ungovernable goes hand in hand with the existence of an imperative need to transform authority by removing the central role of the State" (Perret 2003). But the hypothesis involving this loss of authority, which has also been designated as a crisis of the rational-legal mode, is a double-edged sword however. On the one hand, it could take the shape of the rise to prominence of a neoliberal version of governance still called "a government without government," in which States no longer retain a monopoly of legitimate power but are forced to share it with other entities such as international organizations, NGOs, corporations, and associations. The latter contribute, at different levels, to social regulation and to the maintenance of a certain international order. In this case, governance combines a logic both of privatization and of decentralization of authority resulting in a joint regulation carried out by networks of public and private players (Rosenau and Czempiel 1992).

On the other hand, especially in the Eastern part of the globe, we can witness a strengthening of the central role and prerogatives of the State, achieved by reducing civil rights, vehemently opposed to civil society and built around alliances between authoritarian regimes and semi-dictatorships.

But a third model may see the light of day: the chance to counteract the decline in the regulatory power of the State by embracing a new political ideal, the objective being to build a cosmopolitan democracy via a global system of governance. "This response aims to hand back control over public life to the citizen, specifically by foreseeing the establishment of new political entities on every level, thanks to the reinforcement of a spirit of solidarity locally and its subsequent dissemination internationally" (Dahl 1999).

Ultimately, non-State players, despite their stature and their potential for action on an international level, have yet to organize themselves in the shape of a civil society even if coalitions of non-State players do exist.

In fact, even if between the end of the 1990s and the noughties nongovernment organizations existed in relative isolation, we could nonetheless observe the formation of NGO coalitions pursuing a common strategy whose aim was to subordinate the world economy to the goal of social justice, subsequent to the failures epitomized by several signed agreements: the Multilateral Agreement on Investment, for example, reached in 1998 at the OECD, the Seattle summit in 1999 which also gave birth to the anti-globalization movement, and the vicissitudes in the negotiations with Monsanto which sought to outlaw the use of terminator. To cut a long story short, coalitions uniting various NGOs managed to systematically organize counter-summits or alternative forums such as the one at Davos (Houtart 2010).

It remains to be seen of course how these coalitions of non-State players acting both on a local and an international level could sync into an international civil society and hence claim legitimacy. Several problems raise their head in this respect. First of all, the context we have described emphasizes the State of upheaval which legitimate governments are subject to. An international civil society would need to establish itself alongside resilient democratic regimes. Yet, as we have seen, we continue to witness the ongoing crisis of the rational-legal mode which causes a multitude of woes: loss of upholders of basic human rights, the instability of the very institutions which are meant to guarantee those same human rights in free democratic societies, and the vulnerability of pluralist democracies when confronted with authoritarian regimes including some hiding behind a parliamentary façade. Secondly, without an effective guardian of the Rule of Law, how to avoid being torn between legitimate rival interests? And thirdly, conditions of principle come into play in order for a civil society to exist. It is difficult for these conditions to prevail today in a Sovereign State and even harder to transfer those conditions onto the international stage.

Comparison of the Problems Facing Non-State Players with the Ones Confronting Stakeholders

The Position of Stakeholders in a Deconstructed Public and Private Space

Stakeholder theory is embedded within a specific strategic and political context, the displacement of sovereignty. By creating a new center of gravity, corporations have introduced competition between public sovereignty and economic sovereignty; as a result, the equilibrium inherited from the liberal philosophies of the eighteenth and nineteenth centuries has gradually disintegrated for it was based on an alliance between an organized public space and a private sphere, national civil society. Stakeholders came into being in an environment composed of competing interests and not as a sort of global civil society. From the outset they didn't attempt to engage with public or para-public national institutions but rather with multinational or transnational corporations implanted globally, whereas up to that point, the dual relationship between liberal democracies and capitalist systems of production had been centered around an exterior force for regulation which guaranteed the autonomy of civil society, namely, the Rule of Law. The steady shift in the center of gravity of sovereignty has raised questions as to its legitimacy and continues to do so.

Can a multinational or transnational corporation claim to represent civil society? Can it don the mantle of an arbiter for the stakeholders? These questions reveal that stakeholder theory is positioned on the one hand at the interior of a latent conflict of interest between economic organizations and institutions and on the other hand that it is the expression of the competition between different organizations: private organizations but also regional and intergovernmental ones, starting with the EU and a host of other players (e.g., NGOs) who have multiple, final objectives. Profit-making organizations as well as nonprofit-making ones are engaged in competition with established institutions that made the laws and the norms and whose role was to monitor the activities of private entities. Voluntary agreements, above all charters embodying commitments, are visible proof of this encroachment on prerogatives which had previously been the sole preserve of public institutions.

This radical change in perspective is the expression of new needs, different rules regarding counter-powers in civil society for the change in the strategic environment appears to be irreversible. In fact (1) the distinction between national and international no longer has the same meaning: we are now acting in a world domestic policy framework; (2) the abolition of the boundaries between the economy, politics, and society signals the beginning of a new confrontation between power and counter-power (Beck 2002).

Stakeholder theory questions traditional demarcation lines between public and private space; it deconstructs political philosophy, ethics, business management, and corporate strategy and advocates a different approach to these areas.

Stakeholder Theory as a Theory of Civil Society

Stakeholder theory is presented as a theory in turn relating to civil society associated with the corporation. Which bridges exist between stakeholder theory and civil society theory? There is indeed a similarity (the dependence of stakeholders on the compositions activity), but this is not a connection (the dependence of civil society on positive law embodied by governing authorities). In fact, whereas the classical theory of civil society initiated by Adam Ferguson (1783) and Hegel (1820) is constructed around a dependency on the state, the civil society comprising stakeholders exists in a state of dependence on companies and more particularly on large corporations.

The major argument is that the state allows members of civil society to give full expression at their liberty, whereas a corporation exerts its own liberty to act and prosper without feeling the necessity to guarantee the liberty of the stakeholders.

Review of Definitions

In his *Philosophy of Law* (1821), Hegel defines civil society as being the sum total of the intermediary groups existing between the two extremes represented by the individual and the State. He instigates a division/separation between what relates to the organizing state (political state) and what relates to society (the exterior state), comprising the liberty of an individual separated from the state but linked to it principles by positive law and the awareness of the law. Later Tocqueville asserts the autonomy of civil society, the natural birthplace of political expression; it monitors the state by means of its activism and associations. Stakeholder theory refers to his premises and analyses by basing the separation between organization and individuals no longer from the starting point of the state but rather of the corporation. In order for the stakeholders to form a civil society, we would need to accept that a civil society is built on an economic entity, whereas in the liberal philosophical tradition, it develops in relationship with but independently of the Nation-State. Such a change would represent a turning point in the history of liberalism and capitalism. What is the basis justifying the congruence between stakeholders and civil society?

The First Principle of Civil Society Consists in the Recognition of Individual Interest

Civil society is primarily characterized by the selfish tendencies of individuals who seek to obtain satisfaction for their needs (§ 182). These specific interests are concrete and of a socioeconomic nature because individuals in a modern society are dependent on collective economic production. Thus civil society is a system of interdependence of individuals with regard to the whole of society “where the individual’s welfare depends on the standard of living of the entire community” (Fleischmann 1964). The descriptive approach to stakeholder theory develops this very hypothesis since each stakeholder represents an individual interest which has to be taken into account, and the addition of these individual interests can give rise to a convergence (the convergent approach to stakeholder theory).

The first principle of civil society is in phase with stakeholder theory in as far as each individual merely seeks his own well-being by aspiring to the satisfaction of his vital interests. But the realization of a superior form of common welfare is necessary to enable all the individual interests to coexist because they participate in social organization via work. Individual interest is connected to the collaboration of other interests which are means to achieve an end. Satisfaction is obtained by means of other people's mediation.

The Second Principle Views Civil Society as a State Existing Outside the Political State; It Is the Basis of the Individualist, Liberal Society

"Liberal society effectively acknowledges the rights of all individuals to procure material goods for themselves, it recognizes as an objective right whatever they feel to be their duty, that is to say ensuring a comfortable lifestyle for themselves and their families" (Fleischmann 1964). Rights are associated with duties, and the nature of individualism is such that the notion of common good can seem to be negated. We are, writes Hegel, facing the advent of a "moral reality confounded by its extremities." Although this struggle between conflicting interests is a justified one (nothing which is universal can be obtained simply by refuting individual claims), it is nevertheless impossible to consider this interplay of interests as the ultimate goal of civil society. In reality, civil society exerts pressure and constraints on its members, in order that they may become not merely individuals but also useful members of a community founded around the universal principle of work (§186–187). For Hegel, individual interests are neither arbitrary nor abstract, and the individual isn't either; he is defined as belonging to a class. He is the individual industrial worker, and his personal interest is also that of his class. This is what prompts Hegel to declare: "social classes are the second pillar of the State, after the family." These classes have opposing interests, and collective wealth is produced within a process of differentiation of income which results in the exacerbation of the age-old opposition between "rich and poor." Indeed, with the emergence of civil society, a modern form of poverty develops in the shape of a mass of individuals (unemployed workers, peasants reduced to an itinerant existence, ruined craftsmen) who are literally victims of social relegation, not belonging to any particular class, forming rather a paradoxical class. They represent a large group of individuals bereft of those conditions which enable each separate being to satisfy his legitimate private interest and his interest as a member of a class by means of a useful job, performed with dignity and a sense of professional honor. Reduced to being unable to satisfy this interest, the members of this populace lose their sense of the common interest. The only option left open to them is subversion. Therein resides the veritable state of nature which, far from being the mythical origin of society, is the historical outcome produced socially. For if civil society is the mother of modern man, it can also reveal itself to be a cruel stepmother (§245). Yet were it to remain on this level, civil society would just be "the battlefield of individual private interests, of the combat between all of them." This is where we discover deep down the roots linking self-interest to universal interest, State interest whose role is to make this connection firm and long-lasting. Individual interest cannot become constituent, contrary to what natural modern law believes when confusing civil society with the State. The social bond which truly embodies genuine universal interest cannot emanate from calculating individual interests. Left to its own devices, the mechanism based on the system of needs, the market system and production for and by the market system, is threatened with disappearance.

As for the third principle, it involves the universalization of individual interest by means of positive law. However, all the issues pertaining to law are not present in positive law, and for Hegel there exists (a) a "legal apparatus," (b) an awareness of the law, the code representing the publication of the law or what is more its empirical manifestation in the form of (c) a court.

But without positive law and without the State, there exists no possibility of pursuing one's own private interest. Civil society realizes the seriousness of this threat, that of the presence of a natural state within civilization, and it attempts to outline a correction which entails organizing private interests in the form of the corporation or trade guild: "the evaluation of private interests according to a quasi-political universal ideal," and "self-organization of the classes belonging to civil society by resorting to the expedient of the corporation." The corporation simply means that private interests take shape and organize themselves on a meta-level, in the form of professional associations or guilds or of consumer groups, for example. "Partial interests are already invariably of a social nature, they relate to regularities and institutional regulations which distance themselves from the interests in question by placing them within exterior networks of relatively autonomous solidarity. This is how civil society demonstrates that it is in fact an exterior State."

The judiciary apparatus in civil society (§208) is the defense of the common good – collective wealth and universal property – against the arbitrary actions of individuals. The judicial system limits itself to maintaining the status quo brought about by economic competition between free human beings. The law, in civil society, is the guardian of private property. For Hegel, capitalism is a conversion of private property into collective wealth belonging to the entire community.

An awareness of the laws signifies the realization by civil society of the economic necessity of what it ultimately aspires to, namely, the universal goal which it strives for and which can only be accomplished in its breast. To put it another way, the law and freedom represent a perfect match in as far as it is an intrinsic, internal movement belonging to the private interests of civil society which creates the laws necessary to its own existence, civil society acts on its own in becoming aware of the law.

This exterior universalization which characterizes civil society is at once both its strength and its weakness. It ensures the constitution of the universal concept of man as a rational subject of needs and definer of interests, the equal of all his peers in terms of possession of the same freedom (§190), which allows us to complete the description of the individual whom we have already defined in legal and moral terms.

Stakeholder Theory in Terms of an Unattainable Civil Society

The detour via Hegel's philosophy on law shows us that if there is a similarity between civil society and stakeholders, it doesn't amount to equivalence however. The civil society of old does not experience a Cassandra-type renaissance in the form of stakeholders; it is more a case of stakeholder theory putting paid to the cozy, well-balanced relationship between civil society and the State, for several reasons. It is true to say that stakeholder theory, like civil society, acknowledges the coexistence of private interests, as well as their infinite number. But the mere existence of these private interests doesn't suffice to label stakeholders as being a civil society.

First Objection

We can lodge *a first objection*. In the case of civil society, the different interests can be added together in the universal form of civil society; all these divergences between rival interests can only be resolved by the State. The descriptive approach to stakeholder theory, for example, into something which supersedes those divergent interests: the stakeholders are aggregates unless we decide to allow all the irrefutable demands of all the direct or indirect claimants. In this case, the intrinsic legitimacy of all the stakeholders is real enough but not calculable in a regulatory entity such as the State by means of positive law but not exclusively. The issue of corporate governance in a stakeholder context is precisely that the corporation governs but is unable to total the divergent interests represented by the consumers, the suppliers, the shareholders, and the employees. It is obliged to recognize them and to hierarchize its action towards them. Conversely, the stakeholders are unable to form an entity integrating the divergences: What does a supplier negotiating with a purchasing manager about product quality and a consumer disputing the quality of a product have in common?

Second Objection

Stakeholder theory doesn't allow for mediation capable of providing the different players with a coherent existence and enabling them to give voice to their intentions. Each side is left to state its intentions in a context where the law is becoming obsolete. The traditional confrontation between shareholders and management is replaced with a new one opposing those who have entitlement and those who do not. Stakeholder theory is, from this point of view, the proof of shortcomings in positive law which we generally recognize as being a deficiency in regulation. The stakeholders' recourse to firms is really a matter of legal rights, but we are talking here more about incitements. In France, the law dated 15 May 2001 dealing with new economic regulation made it obligatory for companies to publish annual reports on sustainable development (the annual report issued by listed companies comprises information as to the way in which they take into account the social and environmental consequences of its activity). (We could add two other laws passed in France to this list: the law concerning employee savings (February 2001, article 21), "the rules of employee savings funds will specify in the future . . .. . .the social, environmental and ethical norms that the asset management firm must comply with when buying or selling shares and when exercising associated rights"; the relating to the reserve fund for retirement pensions (law passed on 17 February 2001, Article 2), the board has to report to the supervisory committee on "the way in which strategic choices regarding investment policy have taken into account social, environmental, and ethical issues.") In the United Kingdom, the July 2000 law insisted that social, environmental, or ethical issues should influence in the choice, maintenance, or carrying out of investments. In Germany, regulation was voted in on social and environmental criteria for private pension funds. And in the Netherlands, a legal obligation for pension funds to invest 50% of their capital in firms boasting the CSR label came into force in 2008. But on a worldwide level, we are looking at nonlegally binding incitements. In France, the law voted in on 15 May 2001 made it mandatory for companies to issue annual reports on sustainable development (the annual report of listed companies comprises information about how they take into account the social and environmental consequences of their operations). In the United Kingdom, a law passed in July 2000 imposes that firms consider social, environmental, and ethical considerations when making choices, renewals, or fresh investments. But it was deemed necessary to set up an association in order to monitor compliance with this law in October 2001 (Association of British Insurers). In Germany regulation regarding social and environmental criteria for private pension funds was introduced in January 2002. And in Holland a legally binding obligation requiring pension funds to invest 50% of their capital in firms boasting the RSE label was decided on in 2008. But on a worldwide scale, we're still talking about incitement rather than real legislation. In 1976, then again in 2000, the OECD drafted guidelines intended for multinational corporations. In July 2000 the UN published the Global Compact which is a benchmark in terms of stakeholder demands and aims at establishing RSE best practices. In 1977 the International Labor Organization had also published a declaration of tripartite responsibility dealing with multinational corporations and social policy. This declaration was updated in 2000. Anyway, corporations have an incentive to obtain stakeholder approval; by doing so they meet overall performance targets, but there is no obligation involved other than their own medium-term interest.

Rating corporations have been created: for declarative rating and sought rating. Indeed, the breaking up of law into regional law led by J.P. Di Maggio and W.W Powell considers that the right response to stakeholder claims is a utilitarian one and relates to an instrumental approach of several varieties: the firm complies with the rules because they are laid down by public and para-public authorities (institutional constraints) or again because professional bodies are favorable to them (normative constraints) or lastly because it is imitating a partner, competitor, or another firm (imitation constraints).

Third Objection

The different intentions and interests of the stakeholders cannot be categorized in specific groups unlike the classes described by Hegel, and the methodological question of the identification of stakeholders is a recurrent problem in the descriptive approach to the theory. The theory's future and its unity are dependent on its ability to define the nature of stakeholders and consequently determine how to identify them. If we can manage not only to clearly identify the stakeholders influencing or being influenced by an organization's activity but also succeed in taking into account the firm's embeddedness and consequently the structuring of the vested interests defended by legal entities, public interest groups, individuals, and groups of individuals, if we can get to discern the intention of these stakeholders (is not intentionality the very basis of the business process), and if we can take into account the specific and historical action frame which this theory is unfolding in, namely, a novel form of capitalism (at once salaried and proprietary), well then we could perhaps manage to comprehend better how a firm addresses stakeholders whom it equates with a national or global civil society.

Conclusion

Between the end of the 1980s and the mid-2000s, the legitimacy of corporations was challenged and the very notion contested. The present chapter offers a review of the main features of this radical shift in perception.

The theme of corporate social responsibility has become a business in its own right, supplying a range of services. Norms, rules, and guidelines allow various actors to profit from this crisis in definition as well as a permeability between the public and private sectors.

As an area for research and as a normative activity in corporate affairs, corporate social responsibility has a long history in France. After a long spell in the wilderness from 1950 to the 1980s, it saw a breakthrough in terms of public awareness between 1984 and the late 1990s and finally underwent a period of institutionalization. Corporate social responsibility only grew in import as a concept once an approach founded on responsibility had gained acceptance via ISO norms (ISO 26000 for CSR, 14001 for environmental management, 9001 for the CSR control framework, 50001 for energy management). In France from 2001 onward, legality began to replace incentives: laws pertaining to new economic regulations and referred to as the NER Laws (2001), the Grenelle Laws 1 and 2 (2009, 2010), and finally a national debate in 2015. The Grenelle laws and other laws concerning vigilance were directly inspired by the dramatic impact which international crises of an environmental and social or a financial nature had on successive governments.

Influential on these factors has been the growing importance of social responsibility, which has gravitated from being a well-meaning incantation inspired by a sense of morality, and intended to induce a form of liberal harmony between the economy and society, to signifying a conflictual relationship between the global economy and worldwide civil society. This latter context is characterized by, at its worst, a drastic decline in public sovereignty (which can no longer guarantee basic human rights), or, at best, a remodeling of this sovereignty (giving rise to coordination between, for example, Europe and various Nation States, or, in the United States, between states and the federal government).

One result of the health crisis of 2020 that led to a global suspension of activity both economic and social has been the awakening of civil societies to the historical failings of public authorities that have, over time, seen a diminishment in their capacities to take on the role of strategist as a state. Many perspectives, those of social movements, collective uprisings, and the protests of workers organizing against the resolution of major crises as their vital activities ensure the functions of daily life and even survival can go on, have been heard, from China to Europe and across the Americas. It remains to be seen if these echoes will ricochet, spreading, from one continent to another, and if an international coordination of civil society or global governance will emerge. Too many conflicting interests are at stake.

Over the course of decades and crises, stakeholder theory has also evolved and been called into question for it has shed a light on divergent interests which, atomized, have difficulty coordinating.

Stakeholder theory is deeply rooted in the ability of not only decision-making entities within corporations (their governing bodies) but also Nation States (elected governments) to take into consideration multiple interests which are liable to either converge or diverge and are essentially complex in nature, and to negotiate in a context characterized by multiple contradictory factors. By taking into account this complexity inherent to civil societies, their internationalization, and the importance of the nonprofit sector, the theory has, in its application, contributed to the prosperity that liberal economies and societies enjoy.

What appears as a newly emergent international stakeholder system could be, in turn, the first sign of a legitimacy under construction.

Change, Institutional Theory, and Business Legitimacy

Abstract

This chapter brings together and discusses the implications of neo-institutional theories about organizational change as translation for the implementation of stakeholder management and the legitimate business organization. It suggests that – according to these theories – being a legitimate business organization is not something that the organization is but rather something that the organization does. First, the organization needs to institutionalize stakeholder management as the way the business organization organizes its management processes. Then it needs to negotiate and develop its identity as a socially constructed boundary object that is interpreted, theorized, and viewed as legitimate across stakeholders

intersecting social worlds. Then as more and more humans and stakeholder groups become interested and mobilized, exercise their roles, and start acting on the basis of the assumption that the particular business organization as a boundary object is to be interpreted and viewed as legitimate, the legitimate business organization is becoming constructed as a social fact.

Keywords

Legitimacy · Stakeholder management · Translation · Implementation · Neo-institutional theory

Introduction

Researchers agree upon the importance of business organizations being legitimate (Suchman 1995; Deephouse and Suchman 2008). A lot of research have thus been done, and a lot of efforts have been put into showing how and why this is the case and into finding out ways in which organizations may obtain such an aim (Suchman 1995; Deephouse and Suchman 2008; Freeman 2010; Mitchell et al. 1997; Schrempf-Stirling et al. 2016; Waddock et al. 2002). As a consequence, many management ideas have developed that present themselves as means to helping organizations become a legitimate business organization. Such management ideas include management approaches with many different labels: corporate social responsibility (Schrempf-Stirling et al. 2016), ethical management (Peale and Blanchard 1988), stakeholder management (Freeman 2010), and total responsibility management (Waddock et al. 2002). Becoming a legitimate business organization however does not happen by itself. It depends on such ideas being carefully translated and thus implemented in the organizations that adopt them (Czarniawska and Joerges 1996). In other words, it depends on organizational change. If the organization does not change as a consequence of introducing such management ideas, nothing will happen, no change will occur, and no effects on stakeholders' legitimacy assessments will be produced.

Change management may be defined as "the process of continually renewing an organisation's direction, structure, and capabilities to serve the ever-changing needs of external and internal customers" (Moran and Brightman 2001: 111). Change management is about an organization's ability to identify where it needs to be in the future and how to manage the changes required getting there (By 2005: 369). In this chapter we will explore the implications of neo-institutional theories about organizational change for the introduction of a popular management idea, the idea of stakeholder management in organizations attempting to change into or becoming legitimate business organizations.

The concept of translation is central to neo-institutional theories about organizational change (Wæraas and Nielsen 2016). It focuses upon and accentuates the exact types of work that needs to be done to make organizational change happen. Czarniawska and Joerges (1996) draw upon Bruno Latour's definition of the concept of translation who claims that "... The spread in time and space of anything-claims, orders, artefacts, goods -is in the hands of people; each of these people may act in many different ways, letting the token drop, or modifying it, or deflecting it, or betraying it, or adding to it, or appropriate in it" (Latour 1986: 267). The concept thus implies that people need to do something with an idea for it to move, become institutionalized, and change the organization. The fate of new ideas and concepts and their ability to produce organizational change thus literally lies in the hands of the receivers of these ideas each of whom may react to it in different ways as the idea is moved between humans and groups of humans within the organization as well as in the organization's environment.

The chapter is organized in the following subsections.

The first section explores and gives an overview over different ways to theorize and define the concept of organizational legitimacy. It is suggested that it is the socially constructed interpretations and theories stakeholders have about organizations as social entities with certain structures, actions, and ideas that are being assessed and subjected to legitimacy judgments.

The second section presents stakeholder management as an approach to management based on certain ideas and implying use of certain types of tools that may be used to becoming a legitimate business organization.

In the third section, two types of (organizational change) work that need to be done to realize the intention of becoming a legitimate business organization through the use of stakeholder management are identified using translation theory as a lens:

(a) Stakeholder managers need to translate the idea of stakeholder management in a way that assures that the idea becomes institutionalized in their organizations.
(b) Stakeholder managers need to negotiate and socially co-construct the organization as an appropriate and legitimate boundary object in collaboration with the organization stakeholders.

The fourth section asks when the legitimate business organization has become constructed as a social fact. It is suggested that the legitimate business organization becomes materialized, powerful, and socially constructed as a social fact as more and more humans and stakeholder groups become interested and mobilized, exercise their roles, and start acting (Callon 1986) on the basis of the assumption that the particular business organization as a boundary object is to be interpreted and viewed as legitimate.

The fifth section focuses upon the practical consequences of the analysis for stakeholder managers wanting to introduce stakeholder management as an approach to becoming a legitimate business organization. The specific question discussed is what stakeholder managers should consider in such a situation.

In the sixth section, some conclusions are drawn about using stakeholder management to becoming and performing the legitimate business organization. It is emphasized that in the view of the translation perspective, being a legitimate business organization is not something that the organization is but rather something that the organization does.

Gaining Organizational Legitimacy

Deephouse and Suchman (2008) have reviewed and given an overview over how legitimacy has been theorized in organizational institutionalism: Weber (1978) suggests that legitimacy can result from conformity with both general social norms and formal laws. According to Meyer and Rowan (1977), organizational survival may result not only from being efficient but also from conforming to institutionalized myths about appropriate organizing from an organization's environment. They point out that organizational legitimacy can result from suppositions of rational effectiveness, legal mandates, and collectively valued purposes, means, and goals. They highlight that legitimacy protects the organization from external pressures and protects it from having its conduct questioned. As pointed out by Pfeffer and Salancik (1978), comments and attacks will occur when activities of an organization are considered illegitimate (Pfeffer and Salancik 1978: 194). In a political and interest group perspective, legitimacy may thus be defined as "the acceptance by the general public and by relevant elite organisations of an association's right to exist and to pursue its affairs in its chosen manner" (Knoke 1985: 222).

In 1995 Suchman defined legitimacy as "a generalised perception or assumption that the actions of an entity are desirable proper or appropriate within some socially constructed system of norms, values, beliefs and definitions" (Suchman 1995: 574). He identified two approaches to obtaining organizational legitimacy: a proactive approach based on resource dependence theory and a reactive approach based on neo-institutional theory. The approach based on resource dependence theory suggests that one element of competition and conflict among social organizations involves the conflict between systems of belief or points of view (Pfeffer and Salancik 1978). It theorizes legitimacy as an operational resource that organizations extract – often competitively – from their cultural environments and that they employ strategically in pursuit of their goals (Schuman 1995: 576). In contrast the institutional approach downplays both managerial agency and manager-stakeholder conflicts and depicts legitimacy not as an operational resource but as a set of constitutive field-related beliefs about what characterizes an appropriate organizing of organizations in a given field. Thus according to Suchman (1995) in this view, a manager's decisions are constructed by the same belief systems that determine audience reactions because they are all embedded in a strong and constraining symbolic environment. This is in accordance with Oliver's (1991) view that managers in organizations may choose to react to external pressures and contests of legitimacy by reactively adapting to institutional pressures from socially embedded (Granovetter 1985) stakeholders or by proactively trying to influence them. Managers may thus choose to adapt to external pressures by habitually following taken-for-granted norms, imitating legitimate institutional models, and complying with rules and accepted norms. Alternatively, they may choose to try to proactively influence stakeholders that exert these pressures and question the legitimacy of their organizations. This is by trying to make compromises with, avoiding, defying, or manipulating, these stakeholders. In their analysis of legitimacy in organizational institutionalism, Deephouse and Suchman (2008) identify the different dimensions of legitimacy. Legitimation and delegitimation is the process by which the legitimacy of the subject changes over time. Subjects of legitimation are defined as "those social entities, structures, actions and ideas whose acceptability is being assessed." The sources of legitimacy are "the internal and external audiences who observe organisations and make legitimacy assessments." They are those entities who have the capacity to mobilize and confront the organization.

As proposed by Tost (2011), whether a subject of legitimation is assessed as legitimate or not depends on individual-level legitimacy judgments. Because individuals' judgments and perceptions constitute the micro motor that guides their behavior, they thereby influence interactions among individuals, which in turn coalesce to constitute collective-level legitimacy and social reality. Tost (2011) identifies three dimensions of content underlying legitimacy judgments: instrumental, relational, and moral. When a social entity is viewed as legitimate on instrumental grounds, it is perceived to facilitate the individual or group attempts to reach self-defined or internalized goals or outcomes, for instance, perceptions or beliefs concerning the effectiveness, efficiency, or utility of the entity. An entity is viewed as legitimate on relational grounds when it is perceived to affirm the social identity and self-worth of individuals or social groups and to ensure that individuals or groups are treated with dignity and respect and receive outcomes commensurate with their entitlement, for example, as when an entity is perceived or believed to be fair, characterized by benevolence or communality. Thirdly, an entity is perceived as legitimate on moral grounds when it is perceived to be consistent with the evaluators' moral and ethical values. This includes perceptions or beliefs related to morality, ethicality, or the integrity of the entity.

As implied above organizational legitimacy is a socially constructed phenomenon. It is produced, reproduced, and changed by internal and external audiences/groups that are separated in time and space who observe organizations and make legitimacy assessments and judgments and thus interpretations of the appropriateness of organization's structures, actions, and ideas. During this process, those subjects of legitimation whose acceptability is being assessed are organizations as "social entities, structures, actions, and ideas" as the stakeholders interpret and theorize them. It is thus the interpretations and theories stakeholders have about organizations as social entities with certain "structures, actions, and ideas" that are being assessed and subjected to individuals and stakeholders' instrumental, relational, and moral legitimacy judgments. In such a view, a completely legitimate organization would be one about which no question could be raised. Every goal, mean, resource, and control system would be necessary, specified complete, and without alternatives. The perfect legitimate organization would thus be based on a perfect interpretation and theory about that organization, complete without uncertainty and confronted by no alternatives (Meyer and Scott 1983: 201). Such an organization would be perceived as efficient and effective, as pursuing its affairs in a socially acceptable way and in a way that is in accordance with generally accepted beliefs and values of the groups of stakeholders that affect or are affected by the organization's activities.

From Profit to Triple Bottom-Line and Stakeholder Management

Milton Friedman (Friedman 1970) once suggested that the social responsibility of the firm is to increase its profits. The Brundtland report later defined sustainability as "... economic development that does not compromise the ability of future generations to achieve and enjoy the same level of welfare or standard of living as the present generation" (Brundtland 1987). Since then things have changed further. Today firms and corporations are expected to behave responsibly toward their employees as well as in relation to the environment. In their global compact initiative, the United Nations has even broadened the social responsibilities of business organizations to also include principles related to human rights and anti-corruption (https://www.unglobalcompact.org/sdgs/17-global-goals). As a consequence being a legitimate business organization has increasingly become associated with behaving responsibly and ethically. It has become associated with triple bottom-line slogans like "profit, people, planet" (Elkington 1994) rather than Milton Friedman's more narrow claim and focus upon only profits. As pressures on business organizations for behaving in sustainable and socially responsible ways have grown, different ideas and concepts have developed suggesting how an organization may organize and use different approaches to obtain such a goal. These include ideas and concepts like "corporate citizenship" (Matten and Crane 2005), "corporate social responsibility" (Schrempf-Stirling et al. 2016), "sustainability and total ethical or total responsibility management" (Waddock et al. 2002), and "stakeholder management" (Freeman 2010). In the following sections, it will be looked into how a fashionable idea related to corporate social responsibility (CSR) and ethical management, namely, "stakeholder management," may travel between and into organizations in organizational fields. It will be discussed how translating the idea of stakeholder management and thus changing the organization may lead to business organizations being interpreted and theorized as legitimate by stakeholders in instrumental, relational, as well as moral ways. However, before we do that, the content of and types of recipes (Røvik 1998) related to this theory and approach to management will be analyzed.

Stakeholder Management as an Idea

In an interview, Freeman (Freeman and Moutchnik 2013) points out that stakeholder theory changes the unit of analysis of business. He notices that business is not just about economic transactions. It is about relationships with customers, suppliers, employees, communities, and financiers. And it is about how these relationships are dependent on each other. Stakeholder theory is thus about how we cooperate with each other. He explains that as a consequence, there is no need for a separate CSR approach since the stakeholder perspective has a wide definition of stakeholders and integrates their concerns into the business processes. It may be suggested that a similar type of argument may be applied to business ethics. Since stakeholders that are influenced by or have the ability to influence the business organization are included in a dialogue and discussion of the business organization's activities, their different types of interests and values are taken into consideration and dealt with pragmatically during the stakeholder management process. What is or should be considered ethical (and thus legitimate) in relation to a business organization is thus socially constructed, contested, negotiated, and decided upon pragmatically as part of the stakeholder management process.

According to Rendtorff (2005), stakeholder management theory is the strategic basis for business ethics and CSR. Instead of theorizing humans as actors rationally pursuing their economic self-interests in the marketplace, stakeholder management theory builds on institutional theory that theorizes humans as embedded in social groups and networks. In such a view, the responsibility of the business organization is not only to increase its profits and shareholder value. Rather profits and increased shareholder value as well as long-term survival are viewed as dependent on a business organization's ability to serve and manage different stakeholder groups with different beliefs, values, and interests in relation to the organization's activities. In the sections that follow, we will shortly describe the content of stakeholder management as an idea and some of the tools or recipes related to practicing stakeholder management.

The Content of Stakeholder Management

The stakeholder approach builds on active management of the business environment, relationships, and the promotion of shared interests (Freeman and McVea 2001). The central task is to identify, manage, and integrate the relationships and interests of shareholders, employees, customers, suppliers, communities, and other groups in a way that ensures the long-term success of the firm. The interests of key stakeholders should be integrated into the very purpose of the firm, and stakeholder relationships should be managed in a coherent and strategic fashion. It offers a single and flexible strategic framework making it possible for the business organization to adapt to its environment in a flexible way. According to Freeman and McVea (2001), the content of the stakeholder approach (as a theory/an assembly of ideas) may be characterized in the following manner:

1. It is a strategic management process rather than a strategic planning process. Managers should not plan but set a direction for the organization while considering how the firm may affect the environment as well as how the environment may affect the firm.
2. To survive and achieve the organization's objectives, management must direct a course for the firm rather than just try to optimize current outputs. To successfully change course, management needs the support of stakeholders who can affect the firm, and management needs to understand how the firm will affect others. Management focuses upon balancing and integrating multiple relationships and multiple objectives.

3. Stakeholder management develops strategies by identifying, and investing in, all the relationships that will ensure long-term success. To be successful it incorporates values of the different stakeholders as a key element of the strategic management process. It assumes that different stakeholders can only cooperate over the long run if, despite their differences, they share a set of core values.
4. The stakeholder approach builds on concrete facts and analysis, and is thus descriptive, but it must also recommend a direction for the firm, given its stakeholder environment. The strategic stakeholder management process thus helps management plan and affects stakeholders in a way that helps to create the future environment of the firm. It enriches management's understanding of the strategic options they have.
5. Stakeholder management builds on developing an understanding of the stakeholders who are specific to the firm and the circumstances in which it finds itself. It is assumed that it is only through this understanding that management can create options and strategies that have the support of all stakeholders. And it is only with this support that management can ensure the long-term survival of the firm. Rather than only understanding how customers react to a price, it is important to understand why customers as well as other stakeholders react as they do.
6. Finally, stakeholder management builds on an integrated approach to strategic decision-making. Rather than deciding upon a strategy for each stakeholder, managers must find ways to satisfy multiple stakeholders simultaneously. Successful strategies thus integrate the perspectives of all stakeholders rather than offset them against each other.

The Tools of Stakeholder Management

Stakeholder management is not just based on certain ideas and principles but also implies that certain tools are used. As managers move from a theory of strategic planning to a theory of strategic stakeholder management, Edward Freeman thus suggests that managers need to assure that the organization's relationships with its stakeholder groups are managed in an action-oriented way (Freeman 2010: 53). Processes and techniques are needed that enhance the strategic management capability of the organization defined as "the organisations understanding or conceptual map of its stakeholders, the processes for dealing with the stakeholders, and the transactions which it uses to carry out the achievement of the organisations purpose with stakeholders" (Freeman 2010: 73). Edward Freeman identifies three things that a stakeholder manager needs to do in order to manage the relationships with its stakeholders. Firstly, the stakeholder manager needs to analyze who the stakeholders in the organization are and how they perceive their stakes. Secondly, he/she needs to understand the organizational processes used to implicitly or explicitly manage the organization's relationships with its stakeholders and whether these processes fit with the stakeholder map of the organization (identified by the stakeholder manager). Thirdly he/she needs to understand the set of transactions or bargains among the organization and its stakeholders and deduce whether these negotiations fit with the stakeholder map and the organizational processes for stakeholders (Freeman 2010: 53). An organization's stakeholder management capability will now depend on the organization's ability to put these three levels of analysis together. The tools used to analyze the abovementioned three processes are described in detail by Freeman (see Freeman 2010: 54–79).

He suggests that stakeholder managers start with using the generic stakeholder map and different types of grids as a tool to analyze and map who the stakeholders of the organization are, how they perceive their stakes, and what their roles, relationships, power, values, and interests are. This analysis has to be supplemented with an analysis of the organization's strategic and operational processes, that is, the organizational processes that are used to achieve some kind of fit with the external environment including formal standard operating procedures as well as more informal assumptions about "the way we do things around here." Examples mentioned are portfolio analysis processes, strategic review processes, and environmental scanning processes. This analysis is followed by an analysis of the interactions and transactions between stakeholders. Questions focused upon are how do the organization and its managers interact with stakeholders? What resources are allocated to interact with which groups? The aim is to create a better fit between the organization's stakeholder map and the organization's transactions and processes with stakeholders identified by that map. Successful transactions with stakeholders are assumed to be built on understanding the legitimacy of the stakeholder and having processes to routinely surface their concerns (Freeman 2010: 73). Transactions must be executed by managers who understand the currencies in which the stakeholders are paid. They need to think about how to assure that the stakeholder and the organization win at the same time. Or put differently the relationship between the organization and its stakeholders needs to be built on voluntarism – that is, a willingness to satisfy the organization's key stakeholders (Freeman 2010: 74).

Edward Freeman suggests that the abovementioned analysis should be followed by three types of strategic management processes and suggests a number of tools that might be used in each of them. The three processes are (1) setting strategic direction, (2) formulating strategies for stakeholders, and (3) implementing and monitoring stakeholder strategies (Freeman 2010: 83–192). The tools used to setting strategic direction include tools aimed at making stakeholder analysis, values analysis, and social issues analysis. Moreover, stakeholder audit is suggested as a tool to setting the strategic direction at the corporate level just as a typology of enterprise and stakeholder strategies is provided. The tools related to formulating strategies for stakeholders include a standard process for formulating strategic programs for stakeholders and a model of the stakeholder strategy formulation process consisting of six major tasks: (1) stakeholder behavior analysis, (2) stakeholder behavior explanation, (3) coalition analysis, (4) generic strategy development, (5) specific programs for stakeholders, and (6) integrative strategic programs. The tools related to implementing and monitoring stakeholder strategies include grids, an implementation matrix, and some concepts that may be used to implement strategic programs and a number of concepts and methods that may be used to monitor progress with stakeholders as well as control the implementation process.

As demonstrated above then, a management idea as stakeholder management does not only consist of assemblies of certain internally related ideas and principles but also of a number of more specific tools and recipes (Røvik 1998) describing how such an idea may be realized. The stakeholder management process is thus described as a process consisting of not only ideas and principles but also of certain steps, activities, and tasks that have to be performed if the idea of stakeholder management (and thus the legitimate business organization) is to be realized in practice.

Two Tasks when Constructing the Legitimate Business Organization

We have now analyzed and discussed different views on the legitimacy of business organizations. And we have identified the subjects of legitimation whose acceptability is being assessed as organizations as "social entities, structures, actions, and ideas" as the stakeholders interpret and theorize them. We have moreover shown how researchers in the area of stakeholder management theory have theorized the stakeholder perspective and how they interpret this strategic management perspective as a way to realize the idea of the legitimate business organization. In the following sections, we will analyze the different types of work a business organization needs to do to introduce the idea of stakeholder management. The analysis takes its point of departure in theories about organizational change developed in neo-institutional theory. In this stream of research, ideas like stakeholder management are not implemented but rather translated when they are introduced in organizations (Wæraas and Nielsen 2016). It will be suggested that according to these theories of organizational change as translation changing your organization into a legitimate business organization will depend on how you as a stakeholder manager handle two important tasks:

1. Your ability to translate and institutionalize the idea and practices of stakeholder management in your organization
2. Your ability to negotiate, translate, and co-construct the organization as a legitimate boundary object with each stakeholder group as well as across stakeholder groups

First Task: Translating Stakeholder Management

In neo-institutional theory, organizational changes have been theorized as translation processes (Czarniawska and Joerges 1996). The translation perspective focuses upon how an object or token changes from one state to another as it "travels" within and across organizational settings (Wæraas and Nielsen 2016). In this view an approach to obtaining business legitimacy like stakeholder management is theorized as a management idea that circulates and travels between and into organizations in organizational fields.

According to Czarniawska and Joerges (1996), ideas may be defined as images which become known in the form of pictures or sounds (words can be either one or the other). They suggest that the ideas and concepts that circulate in institutionalized organizational fields, for instance, “stakeholder management,” are abstract, symbolically mediated, and communicated entities that travel by being translated into an object (for instance, a book about stakeholder management, some recipes or tools related to practicing stakeholder management, a PowerPoint presentation, or other types of publication) that is then dis-embedded from one social group and context and later translated and re-embedded in another social group and context. The idea of stakeholder management is thus viewed as an abstract and symbolic object that literally “travels” among and between humans and groups of humans that are situated differently in time and space.

The authors suggest that in order to become implemented, an idea or assembly of ideas as those related to stakeholder management need to be institutionalized. They claim that an idea or assembly of ideas will be translated into an object and then into actions which if they are repeated as routines become institutionalized. The concept of translation is central to this theory. Czarniawska and Joerges (1996) draw upon Bruno Latour’s definition of the concept of translation which claims that “. . . The spread in time and space of anything-claims, orders, artefacts, goods -is in the hands of people; each of these people may act in many different ways, letting the token drop, or modifying it, or deflecting it, or betraying it, or adding to it, or appropriate in it” (Latour 1986: 267).

The concept of translation thus suggests that people need to do something with an idea for it to move and become institutionalized. The fate of new ideas and concepts literally lies in the hands of the receivers each of whom may react to it in different ways. It follows that new ideas have to resonate with the local interest in order to be taken up and that the way in which they will be attributed meaning will depend on local conditions. The successful translation of an idea and concept thus proceeds along an uninterrupted chain of translations where the energy that makes the idea or practice move in time and space is provided by each new human who takes up and starts acting upon it. At each step, the idea or practice is somewhat reinterpreted and modified in order to fit the interests of the new imitators. Thus instead of a process of transmission, the process of translation is characterized by continuous transformation (Nicolini 2010).

Second Task: Constructing the Organization as a Legitimate Boundary Object

Another phase in the work of becoming a legitimate business organization unfolds after the organization has institutionalized stakeholder management as the way the organization organizes its management processes. At this point in time, the business organization needs to identify who the stakeholders of the organization are and which types of legitimacy assessments and judgments and thus which types of interpretations of the appropriateness of the organization's structures, actions, and ideas the different stakeholders have. At this point in time, the subject of legitimation whose acceptability is being assessed becomes the organization as characterized by certain structures, actions, and ideas as the stakeholders interpret and theorize them (as explained above). Or put differently the organization becomes socially and symbolically constructed as an object whose appropriateness and legitimacy are being assessed and judged by the stakeholders. Following Star and Griesemer (1989), such an object may be theorized as a boundary object:

> Boundary objects inhabit several intersecting social worlds and satisfy the informational requirements of each of them. They are both plastic enough to adapt to local needs and the constraints of the several parties employing them, yet robust enough to maintain a common identity across sites. They are weakly structured in common use, and become strongly structured in individual site use. They may be abstract or concrete. They have different meanings in different social worlds but their structure is common enough to more than one world to make them recognisable, a means of translation. (Star and Griesemer 1989: 393)

In accordance with stakeholder management theory, Star and Griesemer (1989) address the problem of common representation in diverse but intersecting social worlds and suggest that the creation and management of boundary objects is a key process in developing and maintaining coherence across intersecting social worlds. According to stakeholder management theory, stakeholder managers have a similar aim. They want to socially construct and negotiate a version of the business organization (characterized by certain structures, actions, and ideas) that is perceived as appropriate and legitimate by each stakeholder group as well as across these groups. In order to succeed with that, the organization as a perceived and interpreted boundary object needs to satisfy the informational and legitimacy requirements of each stakeholder group. It moreover needs to maintain a common identity as a legitimate organization across sites and stakeholder groups. As a consequence interpreting, negotiating, and co-constructing the organization as a legitimate boundary object with each stakeholder group as well as across stakeholder groups is a key activity and (the second important) task for stakeholder managers working with turning their organizations into legitimate business organizations. It is an important means to making stakeholders translate the organization as a legitimate entity.

An organization as a boundary object will be assessed and judged as being legitimate if it is perceived as efficient and effective, as pursuing its affairs in a socially acceptable way and in a way that is in accordance with generally accepted beliefs and values of the groups of stakeholders that affect or are affected by the organization's activities. In order to socially construct and maintain stakeholders' perception of the organization as boundary object as a legitimate business organization, stakeholder managers must be able to confront and find legitimate answers to any attack, question raised, uncertainty, or alternative communicated by the stakeholder groups that may question the legitimacy of the organization as a boundary object in the eyes of each stakeholder group as well as across stakeholder groups.

When Has the Legitimate Business Organization Become a Social Fact?

An obvious question that arises when constructing the legitimate business organization is how you evaluate when the idea of the business organization as a stakeholder organization and a legitimate boundary object has been realized? As pointed out by researchers in actor-network theory, the more people and objects that are mobilized and start acting and doing work that realizes an idea or practice, the more powerful it becomes (Latour 1986; Callon 1986). The successful translation of an idea like stakeholder management thus depends on the number of managers and employees that take up, start acting, and mobilize objects in accordance with the ideas, concepts, and recipes related to that management approach (Røvik 1998). Secondly the legitimacy of the organization as a boundary object depends on the number of external stakeholders that are mobilized and agree upon interpreting the organization as boundary object as legitimate (despite they may have different reasons for doing so). Translation thus has a political meaning, referring to the political struggle related to the translator's pursuit of interests or specific interpretations, involving acts of persuasion, power plays, and strategic maneuvers (Nicolini 2010) (Wæraas and Nielsen 2016). Or as Michel Callon and Bruno Latour point out: "by translation we understand all the negotiations, intrigues, calculations, acts of persuasion and violence, thanks to which an actor or force takes, or causes to be conferred on itself, authority to speak or act on behalf of another actor or force" (Callon and Latour 1981: 279). The idea of the business organization as a legitimate boundary object is thus first realized when stakeholder managers have done the work – that is, all the negotiations, intrigues, calculations, acts of persuasion, etc. – making solving the two types of tasks mentioned above possible. First then managers and employees as well as other stakeholders will have been mobilized and made to do the practical work that realizes the idea of the organization as a legitimate boundary object. And first then a stakeholder manager will be able to become a spokesperson for and a representative of the will and acts of all those who do work and thus in practice realizes the idea of stakeholder management and the idea of the business organization as a legitimate boundary object.

Discussion: What Should Stakeholder Managers Consider?

In relation to the first task mentioned above, stakeholder managers should consider and be aware of the following: If the idea of stakeholder management and the recipes and tools related to it are not just implemented but rather translated. And if that which is translated depends on what the next human in the translation chain does with these tokens, what the outcomes may be of this translation process becomes uncertain. As pointed out by the Norwegian translation researcher Kjell Arne Røvik (2016), the idea of stakeholder management and the recipes and tools related to it may be copied and thus translated as intended. It may be modified, that is, cautiously adjusted to the local context. Something may be added to it or something may be omitted and thus toned down or some elements abstracted from it. As a consequence managers need to be aware of what is translated in relation to the idea of stakeholder management by whom and where in their organizations since these translations will eventually produce the concrete outcomes of the introduction of these ideas and recipes in these organizations and thus affect the organization's ability to become a legitimate business organization. And that however only if researchers in stakeholder management are right when they assume that this management approach may help realize such an aim.

In relation to the second task, stakeholder managers should consider the following:

It should be noted that stakeholders are separated in time and space. Some stakeholders like managers and employees are close in time and space, while other stakeholders like suppliers, customers, competitors, policy makers, investors, communities, the media, etc. are more remote in time and space. Therefore, the level of information a stakeholder may have about an organization when making legitimacy assessments of it as a symbolic boundary object may vary and be asymmetric. Organizations may participate and communicate symbolically about their engagement in programs such as the United Nations Global Compact program to obtain legitimacy in the eyes of stakeholders without practicing or living up to the standards suggested by these programs. Managers and employees of an organization may publicly talk and communicate about CSR, business ethics, and their stakeholder management program without translating these ideas into actual decisions and actions without other stakeholders noticing it (Brunsson 1992). Another similar situation may occur when an organization boasts about its CSR and ethical and stakeholder-based approach to business while at the same time using child labor in the production of their products or polluting in third world countries situated far away from other stakeholder's view and the Western markets where they sell their products. Or they may write up contracts with their suppliers where the suppliers promise to follow the organization's ethical standards, which are then not followed by the suppliers nor controlled by the organization making the contract, thus making it possible for the organization to claim that it did not know and that it was a fault if a stakeholder as the media finds out.

In all of these situations, stakeholder's perceptions of the organization as a legitimate boundary object will be affected if the organization is found out and attacked and questions were raised about the legitimacy of the activities of the business organization (perceived as a boundary object). As a stakeholder manager, thus you need to decide whether you want to take the risk and rely on the asymmetric level of information between stakeholders who are situated close compared to those who are situated far from your organization and continue the potentially illegitimate activities of your organization. Or whether you will adopt and translate stakeholder management effectively through all chains of translation and negotiate one or more versions of the organization as legitimate boundary objects as honest as possible with stakeholders who affect or are affected by the organization's activities. This either because you/the stakeholder manager truly believes in stakeholder management as a way to practice ethical management and to obtain legitimacy in the eyes of your organization's stakeholders. Or because you assess that the risk (and potential costs) of your organization being found out and your organization as a boundary object being judged not legitimate by stakeholders has become too high. For instance because, local and global societies have become more connected and transparent than before because of the development of global news media as well as global media such as the Internet, Facebook, Twitter, etc.

Finally a stakeholder manager needs to remember that becoming recognized as a legitimate business organization depends on the number of managers and employees who take up and translate ideas and recipes of stakeholder management in appropriate ways in their organizations as well as on the number of external stakeholders who are mobilized and through different methods made to agree upon interpreting the organization as boundary object as legitimate. Only then the stakeholder manager will have become a spokesperson for the wills and acts of all these people, and only then the aim of becoming a legitimate business organization will have been realized as a social fact!

Conclusion: Becoming and Performing the Legitimate Business Organization

It follows from what was mentioned above that being a legitimate business organization is not something that the organization is but something that the organization does. First, the organization needs to institutionalize stakeholder management as the way the business organization organizes its management processes. Then it needs to negotiate and develop its identity as a socially constructed boundary object that is interpreted, theorized, and viewed as legitimate across stakeholders' intersecting social worlds. Then as more and more humans and stakeholder groups become interested and mobilized, exercise their roles, and start acting (Callon 1986; Latour 1986; Callon and Latour 1981) on the basis of the assumption that the particular business organization as a boundary object is to be interpreted and viewed as legitimate, the legitimate business organization is becoming constructed as a social fact. Or put differently, the idea of the particular organization as a legitimate entity is becoming materialized and powerful.

The legitimate business organization is thus first realized when stakeholder managers have done the translation work – that is, all the negotiations, intrigues, calculations, acts of persuasion, etc. – making the construction of such a social fact possible. First then managers and employees as well as other stakeholders will have been mobilized and made to do the practical work that realizes the legitimate business organization. And first then a stakeholder manager will have become a representative for and a representative of the will and acts of all those who do work and thus in practice realizes the legitimate business organization.

Corporate Legitimacy and Institutionalization: From Corporate Innocence to Responsibility for Complex Impacts

44

Inger Jensen

Contents

Abstract

This chapter studies some of the significant changes in history of corporate responsibility and legitimacy. One line of development is that the company in the middle of last century was considered innocent. The main coordination mechanism was the market and economy. Gradually, more values and norms were introduced to judge the impacts of the company; and national regulation addressed some of the market imperfections and business impacts on health and environment. In this development, sociological theories, New Institutionalism, came up with very broad and general theories about norms, values, habits, norms,

and institutions. The author finds that the very broad theories did not focus on the material aspects and the complexity of the praxes of the many agents. Therefore, Jean-Paul Sartre, John R. Searle, and Jürgen Habermas are introduced to focus on social reality as materialized result of the many agents. In light of this, social construction is considered in two ways: institutions as socially constructed coordination mechanisms and as materially mediated and legitimate when supported in praxis. In the historical development of companies, their responsibility and legitimacy, there is a growing awareness of the need of new institutionalized coordination mechanisms that do not leave all responsibility to the individual company but enable cross-sector collaboration to address common international priorities.

Corporate social responsibility · Institutionalization · Coordination mechanisms · Complexity reduction · Materially and socially mediated praxis · Seriality · Collaboration · Cross sector partnership · SDGs

Introduction

There is no position from which the legitimacy of corporations can be finally established or defined. In history, a marked change has taken place and changes will continue. It is implicit in the very concept of legitimacy that it has to be based on acceptance and that it can still be discussed. This means that values forced upon agents in fundamentalist and authoritarian regimes that are not open for critical discussion cannot claim legitimacy. This chapter will trace some of the changes by examining the coordination mechanisms involved, from pure market mechanisms to international institutionalizations. There seems to be a historic evolution from corporate innocence to growing awareness of the complexity of material impacts on the globe and human life. Before outlining these changes, the chapter will present some critical reflections on the theoretical approaches to legitimacy and institutions.

Jean-Paul Sartre criticized the way Marxist-inspired theories tend to describe history as general laws that neglect the variety of human praxis and its material and social mediation. Inspired by this, the author also finds that social constructivism makes the concepts in theories of legitimacy and institutions too general and static. They focus on language, values, and norms, neglecting the complexity of human praxis and the multiple influences in reality.

John R. Searle, with his concepts of brute facts, agentive functions, and the social construction of reality, has contributed to an understanding of institutionalization that underlines the processes of the many agents, the materialization of these activities, and the legitimacy that links to realization in praxis.

Jürgen Habermas' concept of legitimacy focuses on the continuous discursive processes in the public sphere where primarily governmental regulations but also corporate impacts can be criticized and legitimized. His concepts of systemic coordination mechanisms and communicative coordination will be introduced in relation to institutionalization.

Jean-Paul Sartre's Critique

In 1960 Jean-Paul Sartre claimed that the Marxist theories of development had ossified and turned into a stagnated dogma. He criticized what he called a fundamentally asymmetric relationship between the particular individual praxis and general development. The particular activity had lost its role as co-constituting the total movement and been reduced to an expression of overarching history; man had become a puppet in the general movement. Sartre wanted to reintroduce human activities into historical processes, making it comprehensible how humans create history and that they always do so based on directly given and handed-down conditions (Sartre 1960; 2004).

He therefore focused on praxis as having an impact on inert material that has an antidialectical function: the individual praxis – say, for instance, digging a ditch – makes lasting changes in the field that enable the individual to continue from where he stopped the day before. However, the inert material also makes it possible for other individuals to continue the former work on the ditch, to ruin it, or to transfer it to something else. The antidialectical function of the inert material has an accumulated function that facilitates some praxis rather than others. When you look at the inert material in a city – the streets, houses, shops, tools, and vehicles – all materialized results of former projects – the antidialectical function of the inert material calls upon some praxis and makes other praxes difficult. It is sensible to walk on the pavement rather than in the middle of the street. However, this does not mean that the transformed material enforces human beings per se. The particular conditions that the transformed material seemingly enforces on the human subject result from the praxes of multiple coexisting individuals.

To understand how multiple individuals simultaneously coexist in the praxis inert fields and in a social field, Sartre describes two fundamental societal forms: seriality and groups.

Seriality is the societal form whereby a number of individuals have parallel praxes. They can be isolated from each other, not knowing their similar praxes. They can know the existence of the others, like passengers in the subway, but do not have a common project. They can register the number of others and the accumulated impact of their praxes. They can be in each other's way, as when queuing to acquire scarce goods. They can realize that their similar praxes accumulate in a negative way, like leftover litter. Alternatively, they can realize that their similar praxes accumulate in line with their own intentions, as when they are present with many others to show respect at a funeral. Finally, they can hope that many others by their similar praxes will manifest the number of individuals with similar projects, like voters in a referendum. In this last example, the seriality could transform into collective praxis.

The group – unlike seriality – is an internal unity that reciprocally mediates the members' intentions and praxes to a common project and a common praxis.

Every member of the group is the mediator that organizes their individual goals into the mediated common goal and praxis of the group. An important point for Sartre is that the group never becomes one organism – a hyper-organism. It will always depend on the reciprocal mediation of different individual projects to a common praxis. The group is unstable and risks splitting if the reciprocal mediation is discontinued. Sartre also describes how a political party group can turn into petrified processes that simply keep the bureaucratic procedures running without a reciprocal project. In society, active groups can operate in serial relationships following similar or opposite projects. Furthermore, the inert material can mediate societal issues, as illustrated by the crosses on paper collected and counted in a referendum.

This very brief presentation of more than 800 pages from Sartre aims primarily to stress what is lost when a conception of history is reduced to positivistic empirical studies or abstract generalizations (Jensen and Vestergaard 1979; Sartre 1960, 2004).

Sartre wanted to make it comprehensible how humans create history and that they always do so based on directly given and handed-down conditions. That means understanding the socially constructed as a result of human praxis and understanding social realities as constructed by the many – in seriality or with collective intentionality. It also means that the socially constructed becomes reality mediated in material, setting further conditions for human agents.

Sartre criticizes a positivist approach to society because it constrains studies to what we can observe directly. The obligation of a positivist – a naïve realist – is to observe carefully and describe correctly. Within this approach, truth is a question of correct reference. What is lost here is the complexity of the social and material mediation of praxis and intentionality that is not directly observable.

Searle represents a further development in line with Sartre's epistemological approach. Searle argues against radical constructivism. As opposed to naïve realism, radical constructivism holds that reality is socially constructed through the concepts we develop. It does not make sense to presume any objective reality out there: we will always be caught in phenomena defined by our concepts and language, and truth is merely a question of agreement and shared conception. Against this radical constructionism, Searle offers a very advanced analysis of epistemological and ontological concepts of reality, facts, and truth (Searle 1995, 2010). Utterances about facts can be true or false, so it makes sense to distinguish between facts and fake news. The author finds that many theories about legitimacy and institutionalism belong to social constructivism. They tend to be too generalized and mainly deal with concepts, values, and norms – not with the complexity of praxis and material aspects.

John R. Searle's Concept of Social Reality

Using Searle's theorizing, the author will further develop Sartre's ideas to understand the socially constructed as a result of human praxis and as reality – rather than just a matter of concepts (Searle 1995, 2010). By doing so, the author will include concepts of institutionalization and legitimacy.

Using Searle's concepts, one can describe a continuum from "brute facts," the least socially constructed, pure material facts, through "agentive functions," and ultimately to "institutional facts," the most socially constructed reality (Searle 1995, pp. 20–27). Respective examples we will consider further are Arctic ice (brute fact), the attributed function of a screwdriver (agentive function), and the parliamentary election (institutional fact). According to Searle, and in line with Sartre, brute facts or material matter are involved in the whole continuum.

Brute Facts

Brute facts are the material and physical qualities that are supposed to exist at a given time, independently of what we say and mean about them:

- Arctic ice
- The materials (metal and plastic) from which the screwdriver is made
- The lists of candidates and the crosses made by voters on ballot papers in the polling station

We can observe the brute facts and test the observation. Of course, when we say and mean something about them, we are depending on language that is socially constructed. We could influence Arctic ice by CO_2 emission or by making an igloo on an Arctic expedition; we could break the metal of the screwdriver; or we could tear up the candidate list or draw caricatures instead of crosses in the voting booth. Thus, we can change the brute facts, but their physical qualities are supposed to exist in some form at a given time. Moreover, their social functions may be changed.

Agentive Functions

Agentic functions are attributed by users, producers, and observers. Our daily life is replete with objects with attributed agentive functions: screwdrivers, cars, computers, drinking tubes, etc. These tools and means are socially constructed and understood in line with Sartre's focus on how praxis transforms and is mediated by the material around us. To be reality, agentive function depends on the activities of users. The agentive function of a screwdriver depends on users. Perhaps a superglue could replace the function of a screwdriver. However, the reality does not depend on collective activity. Few or many individual activities can realize the function of a screwdriver. The very first or the very last person using the screwdriver can individually use it as screwdriver. This understanding of agentive functions is in line with Sartre's concept of serial praxis. Individual praxis can be similar to many others' praxis and does not need to have collective intentions.

Institutional Facts

In institutionalization, a social coordination function is attributed based on collective intentionality. Let us study two banal examples: the queuing system at the pharmacy and the procedures for forming the parliament.

When you go to the pharmacy, you may be asked to take a queue number from a roll. You know that if your number is 25 and a costumer with number 24 is just being served then it is your turn next. Normally, you do not reflect on the installation of this little institution as the preferred way to coordinate the order for serving customers. A number of different principles could have been used or discussed: customers could have been treated according to their importance, wealth, power, age, gender, or busyness. Under ordinary conditions, we prefer not to discuss the relative importance of such principles and accept the queue number principle as a legitimate institution. Imagine, however, if a badly hurt and bleeding person suddenly enters the pharmacy. It is likely that all the customers and the pharmacists – except, maybe, a stubborn person – would spontaneously suspend the queuing institution until the bleeding person has been taken care of. After this, they would reinstall the queuing institution as usual. This banal example illustrates that we collectively install and accept an institution as a legitimate social coordination mechanism. It also illustrates that the conditions of legitimacy could be limited to "ordinary conditions" (cf. Jensen 2013, p. 68).

In parliamentary democracies, discussion takes place in many contexts about a variety of political programs before constituting the parliament. Because nobody believes it would be possible to reach consensus by continuing the discussions, election procedures are established. The detailed procedure for where and when individuals can cast their vote and how the votes are counted and calculated are formulated and carefully surveyed. When people trust the procedure and find it a legitimate means to calculate the mandates, and when they realize the election procedure by casting their votes free of pressure, it can be considered a legitimate institutionalized social coordination mechanism that is socially constructed; it thereby becomes a reality for and by citizens (cf. Jensen 2013, p. 69).

The institutional function cannot be directly observed or performed solely by virtue of its material qualities: the lists of candidates and the crosses of the voters will not suffice to realize the function of the election. The reality of the election depends on the collective belief, trust, and activities of many agents. Single individuals cannot create or disregard institutional facts. However, if no voters or very few turn out, the election would lose legitimacy as institution. A strictly positivist study could not observe what is occurring.

What are the common features of the queuing procedure and the election? Beyond mere habits and routines, they are social coordination mechanisms of many agents and are based on constitutive rules. These rules are explicitly declared and often implicitly taken for granted in praxis. To be a social reality, institutions depend on corresponding interpretation, agreement, and practice by many agents. Thus, they are based on collective intentions.

Legitimate institutions are created by communication. They are anchored in matter (brute facts) and reduce complexity. They coordinate the praxes of many agents in one of many possible ways and are sustained as social coordination mechanisms in praxis. As replacements for explicit, dialogical communication, they are changed or cancelled by explicit communication or by nonattendance. An institution can be relatively independent of other institutions, like the queuing procedure, or can be highly integrated into a complex hierarchy of institutions, as in a parliamentary election. Somewhere in between, corporations are composed of a number of coordination mechanisms institutionalizing the board, the divisions, and more or less formalized agendas.

Habermas' Coordination Mechanisms

In *The Theory of Communicative Action*, Habermas describes two fundamentally different forms of social coordination mechanisms: communicative coordination and systemic coordination (Jürgen Habermas 1991, 1992). In a communicative action, three different validity claims can be questioned: truth, normative rightness, and trustworthiness. In communicative coordination, the agents organize their activities based on the actors' explicit communication. However, in this communication, not all validity claims are necessarily met. Open and hidden intentions can come into play. Thus, in communicative coordination, all participants are not necessarily trustworthy.

Systemic coordination, by contrast, does not happen via explicit communication. The participants' activities are mediated by a system medium. In the market, that medium is money. The availability of this abstract medium enables a huge number of transactions. Habermas pointed out that the system coordination in the market implies that participants primarily tend to care about the instrumental validity criteria: what one can achieve with money. Normative, ethical validity criteria are not primarily demanded in the market. Other important systemic coordination mechanisms are made by regulations, institutions, and procedures. The coordination medium is the power and/or right that is attributed by rules. Habermas would understand the procedures at a parliamentary election as an example of systemic coordination. According to Habermas, we face a paradox: systemic coordination – including markets and institutions – can relieve the coordination of social actions by reducing complexity while simultaneously undermining the validity criteria of communicative coordination. However, this cannot be concluded in general but must be included in a critical reflection on the legitimacy of a coordination mechanism (Fig. 1).

In sum, based on Sartre, Searle, and Habermas, the author stresses that to understand the history of legitimacy and corporate responsibility, one must focus on: (1) institutionalized coordination mechanisms that are realized in praxis; (2) communicative coordination and discursive processes involving normative and ethical validity criteria; (3) communicative and discursive processes that express collective intentions by questioning the legitimacy of corporate material impacts; and (4) communicative and discursive processes that initiate or change institutional coordination mechanisms.

Fig. 1 Institutional facts as social constructions. (Source: Inger Jensen inspired by John R. Searle (1995) and Jean-Paul Sartre (1960))

Tracing Changes in Corporate Responsibility

Since the middle of last century, there has been a marked change in concepts of corporate responsibility and in related corporate praxis. This chapter will track some of the significant changes that imply a growing complexity. The chapter's premise is that there is no position in society from which the content of legitimate norms and values can be finally established. What we can study and reflect upon, however, are the processes, dynamics, and discourses that – at a certain time in praxis – define and delimit what is legitimate. It is possible to study how these processes develop locally and globally in history.

Table 1 illustrates some of the changes in the concepts of companies, the development of coordination mechanisms, and public discourses related to corporate responsibility in four periods. The years are tentative: they vary from country to country and overlap across countries.

The First Period

Historically, corporate legitimacy rested on the fundamental basis that the company was free from responsibility – it was innocent. In the first period, the public did not question that companies were primarily coordinated by market mechanisms and their economic success, without further responsibility. There was no attention to the environmental or societal consequences of private business.

Table 1 From corporate innocence to responsibility for complex impacts (Inger Jensen)

	First period until about 1950s	Second period between 1950 and 1980	Third period between 1980 and 2010	Recent period from 2010 to date
Concepts of legitimate companies	Financial success; no further responsibility Innocent	Financial success; compliance with law; no further responsibility Compliant	Financial success; compliance with law; responsible locally and globally Multiple bottom lines Compliant and philanthropic	Financial success; Compliance with law; responsible locally and globally Cross-sector partnership Compliant; philanthropic and transformational
Coordination mechanisms	The market	The market; regulation as a reaction to market imperfections	National and global markets; national regulations; International collaborative institutions UN Global Compact (UNGC)	National and global markets; national regulations; International collaborative institutions UNGC UN Sustainable Development Goals Cross-sector partnership
Public discourses related to business	Hardly any	Market imperfection; political regulation of businesses' impact on the environment	Businesses' roles in global development; discrepant national rules NGOs	Businesses' roles in global development; inequality Tax haven; tax incentives Cross-sector partnership Transparency
Concepts of corporate legitimacy		Legality equals legitimacy	License to operate Compliance with generalized norms and values	Progress related to specific and complex impacts Collective intentionality

The Second Period

During the second period, H.R Bowen (1953) commented, "social consciousness of managers means that businessmen are responsible for the consequences of their actions in a sphere somewhat wider than that covered by their profit-and-loss statements" (p. 44) (Bowen 1953). He was a pioneer on the broader impact of companies. In public discourses, there was a growing focus on externalities.

Externalities are consequences of business activities that are not included in price mechanisms. In reaction to these market imperfections, national governments regulated impact on health and environment through taxes and fines, which added former externalities into economic calculations. Consequently, the legitimate company had to comply with rules, such that legality equals legitimacy.

However, not everyone agreed with Bowen's position in this period. Milton Friedman, recipient of the Nobel Prize in Economics and one of the most cited opponents of corporate social responsibility, wrote that "The social responsibility of business is to increase profit" (Friedman 1970, p. 1). He argued against what he found to be undue governmental regulation and socialism.

The Third Period

At the beginning of the third period, in 1983, the Danish chemical company Cheminova was in deep crisis. Over a long period, it had deposited poisonous waste in the sand dunes on the company's estate at Harboøre Tange, located where the Limfjord meets the North Sea. Environmentalists drew attention to the deaths of sea birds and fish near the plant. It became evident to a number of interest groups that the poison was leaking from the sand dunes into the fjord and the sea. The fishers' associations were concerned about the quality of edible fish in the fjord and the North Sea, while the local population and tourist association witnessed the destruction of attractive natural resorts.

Interestingly, in the public debates it was argued that the company had not broken any law. There were no regulations on depositing waste on private property at that time; however, the critics did not accept that the company was free from responsibility.

Before the crisis, the management defined Cheminova as a company that produced chemical products of high quality for international industrial customers. It was a company with highly qualified technicians, and there was no reason, nor tradition, to communicate with environmental organizations or the public sphere in general. The policy of the company was to obey the law. Thus, their self-understanding belonged to the second period.

The management had not recognized the development in political opinions at all (Jensen 1987). The company suffered a serious loss of reputation and legitimacy (Some years ago, the company was acquired by new owners and changed its name. It became a signatory of the UN Global Compact in 2015).

In this third period, companies were not considered responsible if they focused on only one bottom-line: profit. Responsible companies introduced multiple bottom lines, such as people-planet-profit.

A new institution, the UN Global Compact (UNGC), was established in 2000 as a voluntary coordination mechanism to reduce the complexity for corporations that commit to following ten principles regarding human rights, labor, the environment, and anticorruption. The author analyzed this kind of institutionalization in an earlier work (Jensen 2013, pp. 72–78).

Some of the pioneers of theories of organizational institutionalism have similarly questioned the idea that appropriate decisions by managers could be based on one single technical/economic rationale (DiMaggio and Powell 1983; Meyer and Rowan 1977; Meyer and Scott 1983; Zucker 1977). They questioned the specific type of business concept illustrated by the Cheminova case before the crisis in 1983. Accordingly, they also introduced the understanding of norms, rationalized myths, and shared meanings, thereby drawing attention to the importance of developing values and norms beside the technical/economic rationale.

In this third period, Suchman (1995) distinguished between two groups of legitimacy studies in organizational theory: the strategic and the institutional. Strategic approaches adopt a managerial, instrumental perspective to garner support from society, thereby being able to manage and control these processes. Legitimacy is here perceived as something manageable, purposive, and calculated (Suchman 1995, p. 576).

The institutional interest lies in understanding how pressures in the form of cultural norms, symbols, and beliefs constrain and empower organizations and organizational actors. Suchman places himself between these two approaches and defines legitimacy as "a generalized perception or assumption that the actions of an entity are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs and definitions" (Suchman 1995). The term "license to operate" was coined in this period.

In the third period, there was a growing awareness of the complex roles that businesses play in global development and of discrepancies in national cultures and regulations. Companies are held responsible for more than economic results and compliance with governmental regulations. These responsibilities are not always compatible with economic success. In this period, Porter and Kramer (2006) argued that corporate social responsibility is unavoidable. Corporate legitimacy crises are too expensive, while corporate social responsibility is not necessarily expensive. The individual company is not supposed to solve all the world's sustainability problems but must select areas of responsibility that are consistent with competitive advantages (Porter and Kramer 2006).

In UNGC's CEO Studies (2013), it is reported that CEOs in 2007 were optimistic regarding the possibility of the individual company practicing the principles of sustainability. The impression was that consumers and the market would demand and support sustainability. However, in 2013, after the finance crisis, business leaders described a plateau beyond which they cannot progress without radical changes in market structures and systems, driven by a common understanding of global priorities (UNGC-Accenture 2013). This marks an important transition to the recent period.

The Recent Period

In the recent period, we see a number of changes. CEOs do not trust that the market would support the responsibility of individual companies Thus, they were not convinced that Porter and Kramer's (2006) instructions would suffice, and that the individual company must select areas of responsibility consistent with competitive advantages. The CEOs surveyed in 2013 expressed the need for radical changes in market structures and systems, driven by a common understanding of global priorities (UNGC-Accenture 2013). This means that they question the prevailing system coordination mechanisms: the markets and national regulations. They call for collaboration and new coordination mechanisms – regulations or other institutions that transform markets.

UNGC participants must deliver a yearly Communication of Progress Report about the ten principles regarding human rights, labor, the environment, and anti-corruption. Today, there are about 9,000 active companies and small- and medium-sized enterprises. At the time of writing, there are 1,355 active global and local NGOs (https://www.unglobalcompact.org/). The UNGC website lists all participants and provides free access to their reports and details on a number of collaborative initiatives. Every third year a general progress report is made available in the UNGC Library. Thus, this institution addresses some of the common interests and contributes to transparency.

At the beginning of the recent period, and with references to the third period, Greenwood et al. (2011) argued in favor of the broad definition of institutions by W. R. Scott: "Institutions consist of cognitive, normative, and regulative structures and activities that provide stability and meaning to social behavior. Institutions are transported by various carriers—culture, structures, and routines—and they operate at multiple levels of jurisdiction" (Scott 1995, p. 33). In opposition, Heather A. Haveman and Robert J. David argued that the broadness of the concept also implies weakness: "If institution and institutionalization mean everything and explain everything—changes and stability; routines, values, and norms; intra-organizational, organizational, and inter-organizational structures and behaviors; cognitive, regulative, and normative processes—then they mean nothing and explain nothing" (Haveman and David 2008, p. 583). The author agrees with the latter position. There are several advantages to Searle's constricted definition of institutions as coordination mechanisms, reducing some of the complexity, based on constitutive rules, involving brute facts, realized and legitimized by praxis of many actors. It clarifies the difference between, on the one hand, habits and routines without any collective intentions and, on the other hand, institutions as collectively invented and realized coordination mechanisms. Together with Habermas' concepts of communicative coordination and systemic coordination and their mutual dialectic, this precise definition of institutions presents an understanding of the social construction of reality that differs from the radical constructivism described above: beyond words, concepts, and norms, it contains the results of praxis and material impacts.

Focus in the third period was on how the individual company could comply with generalized norms and values. In the recent period, by contrast, we find awareness of complex material impacts on the globe and human life, and the need for radical changes in market structures and systems, driven by a common understanding of global priorities. The focus on responsible companies shifts from individual compliance and adaptiveness to becoming transformative and engaging in new kinds of institutionalizations – cross-sector partnerships. This involves companies taking initiatives to transform coordination mechanisms in areas unsupported by the current market. In an earlier work, the author provided case examples of such transformative praxis (Jensen 2017).

One prominent initiative to institutionalize common priorities is the 2030 Agenda for Sustainable Development, adopted by all United Nations Member States in 2015. The 17 Sustainable Development Goals (SDGs) stress that ending poverty and other deprivations must be combined with strategies that improve health and education, reduce inequality, and spur economic growth – all the while tackling climate change and working to preserve our oceans and forests.

The SDGs initiative was initially intended to impose mutual obligations on nations and their governments. In 2017, the UNGC and the Global Reporting Institute (GRI), an independent international organization that has pioneered sustainability reporting since 1997, undertook a new initiative to involve companies

Fig. 2 United Nations Global Compact Progress Report 2019 (UN-Global-Compact 2019)

with the SDGs. Having worked through all 17 goals and 167 targets, they generated detailed suggestions on how businesses can contribute to the targets (GRI-UNGC 2017). The initiative institutionalizes business reports. Thus, it consists of guidelines to make the reports comparable, but it is not just about words and norms. The guidelines capture the complexity of business praxis and material impacts on the 167 targets.

However, not all SDGs are easy to address for individual companies or companies in partnerships. The UNGC Progress Report describes the ways that members' CEOs take action on the goals (UN-Global-Compact 2019). Figure 2 shows the relative importance for businesses, rather than for the world.

The report also describes differences between company size and the very uneven distribution of company members around the world: Europe accounts for about half of the members. If we use Searle's understanding of what makes institutionalization real and legitimate, namely, collective intentionality and the extent to which it is realized by praxis of the many actors, it is, at best, the very beginning of the process.

Conclusion and Further Perspectives

Humans create history and they always do so based on directly given and inherited conditions. The history of companies, their impacts and responsibilities, shows that there is no position from which the legitimacy of business can be finally set or generally defined. In the middle of the last century, it was unquestioned that the market was the main coordination mechanism, the company was "innocent," and profit was the only success criteria. Later, some governments regulated externalities and legality equaled legitimacy. Further, the individual company was confronted with the normative criteria of responsibility. In recent years, public discourses have identified a number of business impacts on the material world and human life. It has been realized that the prevailing coordination mechanisms – national and global markets and disparities between national regulations – do not support sustainability. The individual company cannot meet the challenges on its own. International institutions are invented to commit nations and to support voluntary companies by creating coordination mechanisms to reduce complexity and find collective ways to balance impacts.

An important methodological question about such institutionalization concerns transparency and support in praxis. As described above, according to Habermas, legitimacy depends on the ongoing discursive processes within democratic nations. With the globalization of companies and the disparity of regulation in various nations, it is interesting to observe whether international institutions can be based on deliberative democracy as described by Habermas (1998). In her chapter of this handbook, Luise Li Langergaard (▶ Chap. 23, "Public Sector Innovation, Social Entrepreneurship, and Business Legitimacy") discusses the nuances of this important question.

Management of Corporate Social Responsibility and Business Legitimacy

Major Management Thinkers on Corporate Social Responsibility

45

Yves Fassin, Simon Liekens, and Marc Buelens

Contents

Abstract

Many of the most influential management scholars had a focus on strategy. The objective of the explorative study was to analyze and discuss the view on CSR of the major management thinkers of the twentieth century. The study was performed on the basis of an earlier study that analyzed the major works and the contribution to theory of 22 selected management thinkers. Their view on

CSR, business ethics, and stakeholder management are investigated through their writings and through articles on those management thinkers.

In fact, the major management thinkers acknowledge the importance of social responsibility, if not explicitly, at least implicitly, even if the term CSR had not been coined at the time of their writings. They encourage good relations especially with employees and recognize the importance of a stakeholder approach to management. In fact, contrarily to the academic finance thinkers, the major management thinkers who have a broader strategic approach had integrated a CSR vision in their strategy, explicitly or implicitly. Business legitimacy in relation to the environment of the corporation is an essential condition for the strategic views of management thinkers.

Keywords

Management thinker · Corporate social responsibility · Business ethics · Stakeholder management · Strategy

Introduction

Management education has contributed to the dissemination of management knowledge to the business world. Whereas a large number of specialized researchers on specific management fields as finance, marketing, many of the most influential management scholars had a focus on strategy.

In this diffusion process, a number of important management thinkers, consultants, professors, and some practitioners have played a major role. Marc Buelens (2000) studied the work of the major management thinkers of the twentieth century, and on the basis of the impact of their contribution in management education, made a selection of 22 management experts, who played an important role in the twentieth century. Buelens called those management thinkers “management prophets.”

In this same twentieth century, and more especially in the last decades, corporate social responsibility (CSR) has emerged as an important managerial concept. CSR is about the role of business in society and the responsibility of corporations toward its stakeholders. CSR encompasses business legitimacy in relation to the environment of the corporation. The aim of this chapter is to study what the view is on CSR of those 22 management thinkers, as well as their views on related themes as business ethics and stakeholder management.

Methodology

The selection of the management thinkers was based on a study of the managerial literature of the twentieth century, especially “the classics” in general management and in strategy, by Marc Buelens (2000). On a basis of different criteria, with a focus on impact in the business world and in business school education, he selected a list of

20 management thinkers; in this list appear two duos, who worked closely together during long years; this leads to a total of 22 management thinkers. Buelens studied the work of those selected management thinkers and defined their main ideas and contribution in management, organization, and strategy.

The first search relates to the studies and background of those authors, and their period of activity. Subsequently, the management thinkers' view on CSR, ethics, and related fields is analyzed and their vision compared. A systematic literature review in the Web of Science is undertaken on the terms "corporate social responsibility," "business ethics," and "stakeholder management" combined with each of the selected management thinkers. A further search was performed in Google Scholar for the CSR terms in each author's work, not only in their publications in academic journals but also in the books written by those management thinkers. The results were grouped around the selected terms and topics and further analyzed.

The Management Thinkers

The selected management thinkers are presented hereunder, with either the title of their most important book, or the basic focus or major concepts of their research.

1. Frederick Taylor: *The Principles of Scientific Management* (1911) or Taylorism – the right man on the right place
2. Henri Fayol: *Administration industrielle et Générale* (1915): planning, leading, organizing, control, coordination – prepare the future
3. Max Weber: bureaucracy – *The Protestant Ethic and the Spirit of Capitalism* (1930)
4. Herbert Simon: *Administrative behavior* (1947) – bounded rationality – satisficing vs. homo economicus satisfactory
5. Michael Hammer and James Champy: *Reengineering the Corporation* (1993), HBR-article 1990 – business process reengineering
6. Henry Mintzberg: *The Structuring of Organizations* (1979) – management process, organization theory, strategy
7. Geert Hofstede: *Cultures consequences* (1980) – four dimensions of culture
8. Charles Handy: *What Is a Company For?* (1990) – corporations are institutions for people
9. Elton Mayo: *The Social Problems of an Industrial Civilization* (1945) – human relations movement – Hawthorne experiment
10. Douglas McGregor: *The Human Side of Enterprise* (1960) – theory X and Z
11. Abraham Maslow: *Motivation and Personality* (1954) – pyramid of needs
12. Peter Drucker: *The Practice of Management* (1954) – corporation as a political and social institution
13. Michael Porter: *Competitive Strategy* (1980) – value chain – creating shared value
14. Gary Hamel and C.K. Prahalad: *The Core Competence of the Corporation* (1990)

15. John Kay: *Foundations of Corporate Success* (1993), four ways to success: stakeholder relations, reputation, innovation strategic advantage
16. Tom Peters: *In Search of Excellence* (with Waterman, 1982) – transformational leadership
17. Daniel Goleman: *Emotional Intelligence* (1996)
18. Rosabeth Moss Kanter: *The Change Masters* (1983) – empowerment
19. Chris Argyris: *On Organizational Learning* – (1978) single-loop and double-loop learning
20. Peter Senge: *The Fifth Discipline: The Art and Practice of the Learning Organization* (1990)

Table 1 presents the country of origin, the year of birth and death of the management thinkers, the universities, the degrees they obtained, and the professions of the selected management thinkers. Most of the management thinkers are American; a few of them are British or Irish. Only the pioneers Fayol and Weber are French and German, while Frederick Taylor is American. Three-quarters of the management thinkers obtained a PhD. Three-quarters of the management thinkers studied at American universities. Frederick Taylor later obtained a degree in mechanical engineering via correspondence. Fayol, Hofstede, and Mayo did not go to the big management schools. Fayol based his work on practical experience in the company he worked for.

Figure 1 presents the timeline of the lives of the management thinkers and the positioning of the year of publication of their major impactful work. Half of the most important works were published in the 1990s, a period of expansion of the notion of CSR.

About one-quarter of the management thinkers died before 1970, which means that they have hardly been confronted to the notion of "formalized" CSR. Half of the management thinkers are still alive in 2020. While most of the management thinkers have been active in management research during the largest part of their professional life, solely James Champy was active only for a decade. One-quarter of the major works have been written before 1970, and a majority in the 1990s; all management thinkers were over their 30 when they published their major work, mostly in the mid of their career. Later on, when aging, their synthetic approach and sharp remarks generally diminished. Some of the management thinkers wrote on CSR in their later career as Mintzberg and Hofstede in 2009. Some others like Porter, in a somewhat opportunistic approach following the recent trends, wrote, with a coauthor Mark Kramer, a few articles on CSR (2006) and shared value (2011) applied to their core strategic work, in case competitive strategy.

Most of the management thinkers have taken up professorships at universities. Many of them stepped over toward consultancy or entered the lucrative conference circuit to lecture and present their theories all over the world. That partially explains why their innovative drive diminished.

The list of management thinkers contains only one woman, Rose Kanter. There are four Harvard professors in the list (Mayo, Argyris; Porter, Kanter) and six other professors wrote influential articles in the *Harvard Business Review*. Drucker

Table 1 Country of origin, year of birth and death, university, degree, and profession of the selected management thinkers

	Country of origin	Year birth and death	University	Degree(s)	Profession
Frederick Taylor	USA	1856–1915	Harvard university (not terminated) and Stevens institute of technology University of Pennsylvania	Mechanical engineer (via correspondence) Honorary doctor of science	Engineer, manager, professor, and consultant
Henri Fayol	France	1841–1925	École Nationale Supérieure des mines de Saint-Étienne	Mine engineer	Engineer, manager, and director
Max Weber	Germany	1864–1920	Humboldt-Universität zu berlin	Doctor of law	Sociologist, philosopher, lawyer, and political economist
Herbert Simon	USA	1916–2001	University of Chicago	Doctor in political science	Economist, professor, and political scientist
Michael Hammer and James Champy	USA USA	1948–2008 1942	Massachusetts Institute of Technology and Massachusetts Institute of Technology, Boston College Law School	Doctor in computer science and engineering and Master of science in civil engineering, doctor of law	Engineer, professor, and consultant
Henry Mintzberg	Canada	1939	McGill University and Massachusetts Institute of Technology	Undergraduate degree in mechanical engineering and doctor of management	Professor
Geert Hofstede	Netherlands	1928–2020	Technische Universiteit delft Rijksuniversiteit Groningen and Maastricht	Master of science in mechanical engineering and doctor in social psychology	Social psychologist and professor
Charles Handy	Ireland	1932	Oriel College and Massachusetts Institute of Technology	Master of business administration	Philosopher, marketeer, professor, and economist

(continued)

Table 1 (continued)

	Country of origin	Year birth and death	University	Degree(s)	Profession
Elton Mayo	Australia	1880–1949	University of Adelaide	Master of arts degree in psychology	Psychologist and researcher
Douglas McGregor	USA	1906–1964	Rangoon Institute of Technology and Harvard University	Bachelor in mechanical engineering and doctor in psychology	Professor and director
Abraham Maslow	USA	1908–1970	University of Wisconsin	Master of arts degree in psychology	Psychologist and professor
Peter Drucker	Austria - USA	1909–2005	Goethe University Frankfurt	Doctor in international law and public law	Consultant, professor, journalist, and economist
Michael Porter	USA	1947	Harvard university	Master of business administration and doctor in business economics	Consultant, economist, and professor
Gary Hamel and C.K. Prahalad	USA India	1954 1941–2010	University of Michigan, Harvard University, and University of Madras, Harvard University	Doctor of international business and Bachelor in physics, doctor of business administration	Consultant, management expert, professor, and Professor
John Kay	Great-Britain	1948	Edinburgh University and Heriot-Watt University	Undergraduate in economics en Honorary doctorate	Economist, professor, director, and consultant
Tom Peters	USA	1942	Cornell University and Stanford Business School	Master's degree in civil engineering, master of business Administration and doctor in organizational behavior	Consultant, advisor, and engineer
Daniel Goleman	USA	1946	Harvard University	Doctor in psychology	Journalist and professor
Rosabeth Moss Kanter	USA	1943	Bryn Mawr College and University of Michigan	Doctor in sociology	Professor, director, and consultant

(continued)

Table 1 (continued)

	Country of origin	Year birth and death	University	Degree(s)	Profession
Chris Argyris	USA	1923–2013	Clark University, Kansas University and Cornell University	Master of arts in psychology, master of science in economics and doctor in organizational behavior	Professor and consultant
Peter Senge	USA	1947	Stanford University and Massachusetts Institute of Technology	Bachelor of science in aerospace engineering, master of science in social systems modeling and doctor in management	Engineer and professor

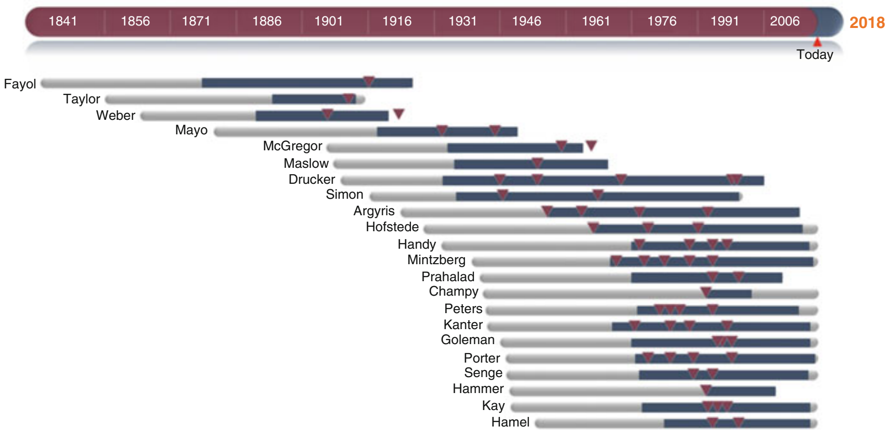

Fig. 1 Main works and most active publication periods of selected management thinkers

published 35 articles in HBR before 2000, Kanter 24, Porter 19, Prahalad 16, Hamel 15, Argyris 14, Mintzberg 12, Hammer 7, and Handy 4.

The research in *Management profeten* by Marc Buelens (2000) analyzed the contribution of the work of the selected management thinkers and their major ideas. He distinguishes six fundamental forces or viewpoints: rational, sensitive, steering, self-regulating, result searching, and stabilizing. He further analyzed the major contribution of the selected management thinkers to management theory and practice. The difficulty for comparison lies in some radically different approaches:

some authors study an industrial sector from a macroeconomic point of view (Porter), while others focus on corporations (Hamel, Kay) or on individuals (Maslow). Those different viewpoints can complement each other. Interesting approaches try to emphasize relations. Many management thinkers own their status to the shape they express their ideas: Handy to a stirred style, Mintzberg to his provocative syntheses, Porter to his sharp analyses. Many of the successful models of management have been introduced by major management thinkers. Despite critique on the simplicity of some of those models, and despite more sophisticated models with a more realistic view on the complexity of organizations, the shaper insights of a simple model prevail to reach a wider audience and to gain status (Buelens 2000).

The View on CSR

Based on this analysis of the work of the major management thinkers, a survey is the basis for analysis whether they wrote on CSR or whether they indirectly give some opinion on the underlying themes of CSR, people, environment or planet, profit. The search focused on their main ideas around CSR and related issues, on stakeholder management, and on business ethics. Selected quotes in their work or in contributions on their work were retrieved (Bardy and Rubens 2010; Carr 2003; Driver 2012; Drucker 2006; Freeman and Liedtka 1991; Goleman 1995; Hamel and Prahalad 1990; Hofstede 1990; Hoppe 2004; Kanter 1985; Kanter 1995; Kanter 2011; Liekens 2018; Mintzberg 1983; Mintzberg 1989; Mintzberg 2005; Moore 2003; Pervin 1997; Pugh and Hickson 2007; Schwartz 1998; Senge 1995; Wren et al. 2002) (see Table 2).

Discussion

The quotes in Table 2 make an attempt to survey the writings of the major management thinkers on CSR and underlying themes. An additional analysis was performed whereas the CSR approach is mentioned explicitly or implicitly (Matten and Moon 2008).

A further examination concentrated on how the management thinkers view and interpret stakeholder management (Phillips et al. 2003), their attitude regarding personnel management and empowerment, and also their standpoint on shareholder maximization.

Efficiency and Profitability

The eldest management thinkers, Taylor and Fayol, have been the first to analyze the internal working of organizations, with emphasis on efficiency of production. Efficiency is a major common concern in all the further strategic management

Table 2 The selected management gurus' view on corporate social responsibility and on ethics/business ethics

	Corporate Social Responsibility	Ethics/Business Ethics
Frederick Taylor	Equal responsibilities between employees and management No mention of the environment of the corporation	Realized that there were ethical problems around his thesis and posits that there were limits to the realization of the optimum and that the health of the employees should not be harmed.
Henri Fayol	Good relations within the company No mention of the environment of the corporation	Clear advocate of conditions, principles, and rules in the corporation.
Max Weber	Internal view No account for the environment of the corporation	Ethics arises by finding solutions to unethical activities of the corporation. Talks about ethics of conviction and ethics of responsibility.
Herbert Simon	Corporations should react upon the values of the environment and this should go beyond explicit legal considerations	Every researcher is responsible for the social consequences of his research and should inform people.
Michael Hammer and James Champy	Building unique relations with radical changes can have negative consequences for the environment	Realized that problems can arise with important changes in the firm and with unadapted application of *reengineering*. Find it important that everybody respects the others in an organization.
Henry Mintzberg	Managers implement CSR, because it is a form of natural enlightenment Large companies have to take their social responsibility seriously. Healthy companies take CSR seriously	Is opposed to the exploitation and abuse of large corporations. Finds that when companies are too dominant people can suffer.
Geert Hofstede	He noticed the upcoming of new systems with a long-term vision, less fascinated by growth and personal enrichment but more responsibility toward society Cultural integration as duty for top management	Research around five dimensions and ethics. But has no clear stance on it.
Charles Handy	Corporations are institutions for and by people. Corporations with CSR have to check whether they have negative effects from their competitors. But finds that firms have obligations toward their customers, employees, and community. CSR can diminish in hard periods	Noticed that large firms give statements of vision and values with a focus on CSR. Those companies may want to play too ethically, as the rules allow to play it hard. Admits that ethics was a side issue, that survival was the main objective..
Elton Mayo	Countries where businessmen do not only strive for economic profits but also set responsible goals will grow in a more stable and surer way	Advocate of taking decisions in group Tried to diminish the negative effects of hierarchy

(continued)

Table 2 (continued)

	Corporate Social Responsibility	Ethics/Business Ethics
	Corporations should take up their social responsibility, integration is more difficult for large companies.	People are social beings and want to be part of a team .
Douglas McGregor	Was one of the first generations that was in defense of CSR and who talked about CSR He dared to attack business leaders to question their good intentions	Defended a more democratic approach in business life Managers create a climate that reflects their conviction on their employees (theory X and Y) Managers should always be positive, have to respect everybody, and should not manipulate people
Abraham Maslow	Persons who attain self-actualization try to make the difference by contributing to the common good. Management should take up Carroll's responsibilities	Corporations should comply to the physical and safety needs of their employees They should respect their employees and follow the law
Peter Drucker	Described corporations as political and social institutions He advocated for a self-steering community where individuals and work-teams take all kinds of decisions He posits that corporations have huge social power and therefore have also to take up great responsibilities	Was against the use of *business ethics*. It stimulates the *whistle blower*, so that the power of the firm decreases. It is always politically loaded and has ethical preferences Despite that, he judged an ethical behavior against employees necessary
Michael Porter	He saw that most companies found it is obligated to support good social initiatives How to strategically implement CSR He formulated with Kramer the notion of "*creating shared value" (CSV)*. That stands for policy and ways to increase the competitive power of corporations and at the same time the economic and social circumstances in the communities where they are active CSV instead of CSR	With his value chain, diamond model and 5-forces model to look at the relations in and outside the firm The creation of shared value is for him a new opportunity, but also a new responsibility
Gary Hamel and C.K. Prahalad	Described how social responsibilities require a combination of activities, as the intense study of the powers that can determine the future of industry Environmental problems will become more important in the formulation of strategies	Communication toward *stakeholders* and ethical business behavior are important for him
John Kay	Firms who work with stakeholder groups are more democratic, more socially responsible and also more competitive than other companies CSR is a way to distinguish yourself from your competitors. Many	Good relational contracts with and between employees Commitment to the goals of the firm stimulates a common ethical behavior

(continued)

Table 2 (continued)

	Corporate Social Responsibility	Ethics/Business Ethics
	corporations use CSR in an instrumental way; a self-interested way and not from an ethical viewpoint	
Tom Peters	Managers have to take into account all people who are influenced by their decisions and actions, not only customers of their products and service Every stakeholder has to be well treated	Good and ethical relations with the employees are necessary for success. He finds business ethics has to be applied in a very general way and you have to see it as a way to add value rather than as a constraint. Focus on the employees via an ethical program that stimulates *empowerment*
Daniel Goleman	Many environmental projects of companies are easy wins to convince skeptics of your company Sustainability leaders have to check how the company can be profitable without creating fear to harm the environment or creating social inequality	Emotional intelligence leads often to ethical correct behavior, but this is not always the case
Rosabeth Moss Kanter	Social responsibility is omnipresent in her work The start-up of a firm to be socially responsible is the newest trends to obtain an honorific distinction The alignment between the company's objectives and social values is important to obtain public approval Leaders as the architects of social institutions can solve the modern changes and problems	There are several steps to fight fraud; one of them is to make an ethical code. De leading managers have to be morally and ethically coached
Chris Argyris	His objective was to diminish the injustices in the world He witnessed that some governmental institutions prefer to create social crumbling than to solve the common problems	Finds it important that top-managers have certain values, a kind of ethical *framework*. He was also an advocate of value-directed trainings for managers and other activities that stimulate the ethical participation of management
Peter Senge	The objective of the firm is to create a common Well-being in this heavily changing world. He sees firms as a helping means to force changes, but he sees possibilities for systematic changes when several companies want to learn from each other. Formulates the slogan "*act locally, think globally*"	The creation of a learning organization should always be the objective of the ethical correct leader The goal of the corporation is to create general Well-being and they should always handle ethically

approaches from Drucker to Porter, Hamel and Prahalad, Tom Peters. Hammer and Champy focused on business processes:

> "During the 1980s, top executives were judged on their ability to restructure, declutter, and delayer their corporations. In the 1990s, they'll be judged on their ability to identify, cultivate, and exploit the core competencies that make growth possible - indeed, they'll have to rethink the concept of the corporation itself." (Hamel and Prahalad 1990, p. 2)

Later, other thinkers have focused on the soft management skills as empowerment, organization learning, Argyris, Kanter, and Senge. However, despite his rational and technical approach, Taylor, already in those days, realized the importance of people:

> "The principal object of management should be to secure the maximum prosperity for the employer coupled with the maximum prosperity for each employee." (Taylor 1911, p. 9)

The shareholder maximalization of the Chicago School is not present in most management thinkers' writings. On the contrary, Kay posits:

> "No one will be buried with the epitaph 'He maximised shareholder value'." (Kay 2010, p. 79).

Only a minority of management thinkers consider shareholder maximalization as the goal of the organization. Most of them find profit a necessary condition for a business; organizations need profit to survive. Simon even questions the shareholder maximalization paradigm:

> "Whereas economic man maximizes - selects the best alternative from among all those available to him, his cousin, administrative man, satisfices - looks for a course of action that is satisfactory or good enough." (Simon 1947, p. xxix)

Social Responsibility

Mayo is the first of the selected management thinkers who explicitly mention the social responsibility of companies. The majority of the management thinkers tend toward a CSR and stakeholder approach. Power brings responsibility toward the society. Some authors mention explicitly the common good concept:

> "If the managers of our major institutions [. . .] do not take responsibility for our common good, no one else can or will." (Drucker 1974, p. 325)

CSR is omnipresent in Kanter's work. Mintzberg, Porter, and Argyris are big supporters of CSR. They see CSR as a kind of enlightenment that has to be integrated in the corporate strategy. They agree that companies have a responsibility to help to find solutions for social issues.

Other management thinkers, as Hammer and Champy, and Goleman are more skeptical or neutral toward CSR, as they stress the importance of profitability. CSR can be a disadvantage compared to competitors as companies with a CSR strategy are continuously scrutinized. And CSR has the tendency to diminish in hard times. Goleman argues that companies have to be profitable and do not have to fear to harm the environment or to create social inequality; John Kay warns against an instrumental use of CSR rather than from a genuine ethical attitude.

The CSR view of those twentieth-century management thinkers focus on the social aspect of CSR with emphasis on the employees, some on the society and surroundings, but does not yet encompass the sustainability or green aspects CSR has included in the last decades (Fassin et al. 2011).

Values and Purpose

Some of the management thinkers explicitly mention the notion of values of the corporation. Some other authors notice the necessity for employees that the company has a purpose. Decades before those notions became fashionable, Peters and Waterman have examined this value concept in their studies of excellent companies:

> "Every excellent company we studied is clear on what it stands for, and takes the process of value shaping seriously. In fact, we wonder whether it is possible to be an excellent company without clarity on values and without having the right sorts of values." (Peters and Waterman 1982, p. 280)

But other authors had previously drawn attention to extrinsic features:

> "Once employees base their motivation on extrinsic factors they are much less likely to take chances, question established policies and practices, or explore the territory that lies beyond the company vision as defined by management." (Argyris 1978, p. 236)

> "It must be possible for the individual as he works to see that his work is socially necessary; he must be able to see beyond his group to the society." (Mayo 1919, p. 37)

Change has also been studied by the management thinkers, either as reengineering the processes of a company or from a system thinking approach:

> "[. . .] it's doubly hard to see the whole pattern of change" (Senge 1990, p. 7).

> "Systems thinking is a framework for seeing interrelationships rather than things." (Senge 1990, p. 68).

Studies on change lead also to organizational learning and to empowerment:

> "Embrace change as an opportunity to learn, to improve, to make a difference in others' lives as well as in your own." (Kanter in Morris 2011)

Stakeholder Management, Personnel Management, Empowerment

Peters finds the employees have to be considered as the most important stakeholder. To realize this objective, he proposes an ethical program that stimulates empowerment. Kanter also advocates empowerment in companies. She illustrates how bureaucracies hinder talents. Peters, Senge, and Kanter are strong proponents of empowerment of employees. Taylor, Fayol, and Weber prefer clear rules and hierarchy in corporations. The other management thinkers have a less strong opinion around bureaucracy and empowerment.

> "Companies used to be able to function with autocratic bosses. We don't live in that world anymore." (Kanter in Jayaraman 2008, p. 159)

> "The essential task of management is to arrange organizational conditions and methods of operations so that people can achieve their own goals best by directing their own efforts toward organizational objectives." (McGregor 1960, p. 178)

> "Creating in all employees the awareness that their best efforts are essential and that they will share in the rewards of the company's success." (Peters and Waterman 1982, p. i)

There is no systematic approach of the stakeholder management concept as introduced by Ed Freeman (1984). While most of the management thinkers concentrate on the employees as major stakeholder, customers as stakeholders are judged as trivial and not really further studied in depth. Some authors mention the broader community, or society. But the systematic analysis of each important stakeholder group is not integrated in their writings. Many authors assert that the environment has to be taken into account. Although most see the environment as the external circle of the firm's stakeholder, including society as a whole. Porter views the environment from a strategic perspective:

> "The essence of formulating strategy is relating a company to its environment." (Porter 1980, p. 3)

A few authors already mention the environment in the meaning that the term has gained in the last decades in a more sustainability or green approach. Hammer and Champy and Hamel and Prahalad warn for the negative consequences for the environment. Goleman pleads that companies should not harm the environment.

The attention for the role of business in society and for the responsibility of corporations in relation to the environment of the corporation also indirectly encompasses the concept of business legitimacy. However, just as for CSR, this notion is not explicitly used.

Business Ethics and Corporate Governance

Hamel, Prahalad, Peters, Kanter, and Argyris are strong proponents of ethics and/or business ethics. They find ethical relations in corporations essential for success and advocate ethical codes and ethical programs. Only Peter Drucker opposes to the use of the term “business ethics” because of its political component and ethical preferences. His fear is that whistleblowing may undermine the corporation’s power. He refuses an instrumental use of “business ethics,” while he supports ethics in corporations, especially an ethical attitude toward the employees.

For some concepts, especially for corporate governance, mainly aspects around systems in decision making were found. The relation between governance and management has not been investigated in depth by most management thinkers, probably as also this concept and their study emerged at the end of the twentieth century.

Proponent or Opponents of CSR?

Most major management thinkers are proponents of CSR. In fact, most of them integrate CSR in the corporation strategy. However, not all those management thinkers explicitly talk about CSR. Most of the selected major management thinkers wrote their main works before the term of CSR had even been coined. In that case, the presence or absence of the main elements of a CSR policy in their work was examined. They did not express a clear standpoint whereas they were pro or contra, but often described the consequences of their theories. This analysis shows how most of them at least implicitly had accepted and integrated the principles of CSR.

In order to better visualize the results of this explorative study, a Likert scale was used in an endeavor to position the different management thinkers on a scale from opponent to CSR to strong proponent of CSR, and also to which extent the view on CSR is implicit or explicit in their work (Matten and Moon 2008). The three researchers quoted first independently from each other, and in a second stage a common classification was negotiated in agreement. The combined result is presented in a matrix (Table 3) on those two dimensions, with the constraint that these positions are somewhat arbitrary and reductive as based on interpretation of the researchers on the view of those thinkers expressed in their various publications.

Table 3 Positioning the major management thinkers’ view on CSR

	Explicit	Vague	Neutral	Implicit
CSR strong proponent	Drucker Kay Kanter Mintzberg Handy	Argyris McGregor		
CSR proponent	Senge Hamel & Prahalad	Mayo Peters Porter Maslow		Simon
CSR neutral		Hammer & Champy Hofstede	Fayol Goleman Weber	Taylor
CSR opponent				

Limitations

The present study has limitations: its explorative character, a possible bias in the researchers' interpretation, and the reductive aspects inherent to any succinct synthetic report of a complete oeuvre. The arbitrary selection of the 22 authors may have been somewhat biased by the personal preference of the author of the book. There might be arguments to include some other management thinker. The selection was made in 2000, one could also envisage to add more recent management thinkers. Although the advantage of the present selection with classics is that most have written their major book in the period of emergence and of early diffusion of the CSR phenomenon, some authors have evolved over the years and may have a different view on CSR than in the beginning of their career, which is not so clearly reflected by the reductive character of their single position on the continuum in the matrix.

It would also be interesting to confront their views with that of other business professors, especially those in finance and the proponents of shareholder primacy of the Chicago school (Milton Friedman). Another interesting comparison could also be with the writings of authoritative academic thinkers in business and society issues, CSR, and business ethics (Howard Bowen, Archie Carroll, Donna Wood, etc.), or stakeholder management (Ed Freeman). Yet another interesting alternative could be a confrontation to the work of the experts in quality management Deming and Juran, whose work has been implemented overall in the world.

Management education has been developing in the last decades. The influence of business schools has increased all over the world. In this evolution, some management thinkers have gained the status of superstar, or have even been called "management guru." While this is not the case for all the 22 management thinkers, most business school professors, some of them entered the conference circuit and have gained this status of management guru. The temptation was to call them management gurus, but some major management gurus, are not academic management thinkers. In fact, some influential managers of corporations have also attained that status of management guru, even if they did not write as much as academic thinkers: Henry Ford, Alfred Sloan, Thomas Watson, Jack Welsh, Bill Gates. It would be interesting to see how those managerial "gurus" thought about business ethics and CSR. Besides them there are a series of practitioners in different areas of sustainability; some of them such as Anita Roddick have also attained great popularity and visibility, and have substantial impact on business.

Conclusion

The objective of the explorative study was to discuss the view on ethics and CSR of the major management thinkers of the twentieth century. On the basis of their major works and contribution to theory and through a search for citations of their work, their view on CSR and ethics was examined.

In fact, all major management thinkers are, if not explicitly, at least implicit supporters of the practice of CSR and ethics in companies. They find ethical relations in corporations essential for success. Even if their work had been before the concept of CSR has been launched, they acknowledge the importance of social responsibility. They argue to build good relations especially with employees and acknowledge the importance of a stakeholder approach to management. This view encompasses the foundations of the concept of business legitimacy in relation to the environment of the corporation.

While some management thinkers have a clear opinion on CSR and discuss the CSR measures explicitly, other management thinkers have an implicit support that can be deducted from their writings even if the term CSR had not been coined at the time of their writings. In fact, contrarily to the academic finance thinkers, the major management thinkers who have a broader strategic approach had integrated a CSR vision in their strategy, explicitly or implicitly. Business legitimacy is an essential condition for the strategic views of management thinkers.

Legitimacy, Institutions, and Practical Responsibility

Contents

Abstract

The rationality behind corporate responsibility must evolve for business to gain and retain legitimacy and to strengthen the institutional framework of global governance. Responsibility in practice as a means toward legitimacy is becoming more important for corporate actors in line with the growth of their influence in global governance and the external expectations connected to that. At the same time that the dynamics of governance and the role of business changes, the quality of governance issues has changed. With the emergence of universal and existential issues in a context of complexity and connectedness, business legitimacy faces growing scrutiny. The potential for a universal scope of responsibility for businesses due to their global influence in the context of various governance issues and with that a wide range of addressees, means that corporate actors need to meet the growing challenges of their legitimacy. This chapter suggests that a general structure for an approach that utilizes responsibility, as a means toward sustainable legitimacy, should incorporate at a minimum the three phases of critical reflection, prioritization, and collaboration. It is important to emphasize that a responsibility in practice needs to incorporate both the social and natural

environment, as defined by Jonas. Additionally, it must build on prospective evaluation of expected consequences of business operations, despite apparent complexity. This chapter points toward teleological ethical considerations as opposed to established moral and legal norms to guide the approach toward consequence-based responsibility in practice and thereby sustainable business legitimacy.

Keywords

Business legitimacy · Existentiality · Global governance · Practical responsibility · Universality · Corporate responsibility · CSR

Introduction

The legitimacy of corporations is increasingly threatened. The last financial crisis and repeated corporate scandals over the last decade have contributed to increasing scrutiny of corporate activity (Basu and Palazzo 2008; Heidbrink 2016). There is a widespread consensus that the legitimacy of corporations is reaching historically low levels (Sethi 2002; Rendtorff 2009; Porter and Kramer 2011). Aside from corporate actions, two major developments cause threats to the legitimacy of corporations: changes in global governance dynamics, marked by the growth of power and influence of corporations, and the changes in the characteristics of global issues. This chapter highlights these developments in global governance and outlines an approach toward responsibility in practice, enabling corporate actors to secure sustainable legitimacy as a license to operate. The approach consists of three phases: critical reflection, prioritization, and coordination.

Legitimacy (For a more detailed review of different types of legitimacy, see Suchmann (1995). He presents a comprehensive overview of various forms of legitimacy and discusses how actors can engage with their surroundings to manage legitimation processes in order to gain or retain some degree of control over their relative freedom from regulation and control.) is important for corporate actors is to secure or gain operational freedom as they seek to reduce or avoid external pressures and control that would limit or harm their organizational aims. Simultaneously, legitimacy functions as a license to operate, particularly in arenas where they participate in global governance. Corporate actors lack democratic legitimacy, leading to critical views of their role as political actors (Buhmann 2010).

The structure of the chapter is as follows: section "Business Responsibility and Legitimacy" examines how the concepts of responsibility and legitimacy relate to each other and their significance for business. Section "Challenges to the Legitimacy of Corporate Actors in Global Governance" highlights the two significant developments influencing the development of legitimacy and responsibility of corporate actors: these actors' role in global governance and changing characteristics of global issues, such as universality, existentiality, complexity, and connectedness. Section "Considerations for Corporate Responsibility in Practice" builds on the previous sections and outlines an approach toward sustainable business legitimacy by means of critical reflection, prioritization, and coordination of corporate responsibility. Finally, section "Conclusions" concludes the chapter.

Business Responsibility and Legitimacy

Before engaging with the role of corporate actors in global governance and their interactions with governments and other nongovernmental actors, this section briefly defines the conceptual link between responsibility and legitimacy and its importance. This chapter defines business the legitimacy as the license to operate of corporate actors with a particular focus on their role on global governance (compare Rendtorff 2009, 154). Such a license provides an actor with the right to exert influence in a way that is acceptable for those under its influence and interested third parties. The aim of gaining, retaining, and repairing legitimacy for corporate actors is to secure or gain operational freedom as they seek to reduce or avoid external pressures and control that would limit or harm their organizational aims. Limitations to their freedom derive from a multitude of developments in global civil society, including certification pressures, soft law, movements such as sustainable investment (Rendtorff 2009). Additionally, legitimacy deficits pose a considerable risk for corporate actors as they become vulnerable to outside criticism (Buhmann 2010; Schneider and Scherer 2015).

Heidbrink (2017) describes the interconnection of legitimacy and responsibility, providing four principle definitions of responsibility: (1) as accountability and functional competence (Zustaendigkeit), (2) as a contextual reflection principle, (3) as a structure- and steering instrument, or (4) as a consequence-based legitimation principle. The fourth definition is most relevant for illustrating the conceptual link between legitimacy and responsibility. Theories of responsibility thereby evaluate acts not in view toward, but with point of departure from expectable consequences (Heidbrink 2017, 13). The consequence-based view of responsibility highlights that responsibility arises where actors exert or have the potential to exert influence on other actors and their environment. Responsibility is a means for the achievement of legitimacy. Corporate actors need to manage concerns about their legitimacy and can do so via engagement with their responsibility, often captured in the phenomenon of corporate social responsibility (CSR) (Ougaard 2012, 25).

Challenges to the Legitimacy of Corporate Actors in Global Governance

This section analyses how changes in global governance dynamics and in the characteristics of governance issues challenge business legitimacy and notions of corporate responsibility. Changes in governance dynamics marked by growing corporate influence alter the perception of the role of corporate actors in society. Expectations from the external environment of business evolve, including from the general public, civil society organizations, and states, all of whom qualify as major stakeholders of business. The increased scrutiny and critique of the legitimacy of business is not only a result of changing dynamics and influence. The 2008 financial crisis is an example of a global issue that led to a critical perception of an entire industry, that is, the finance sector. Evaluations of the role of financial actors in causing the crisis go as far as to assigning moral blindness (Rendtorff 2014). Furthermore, repeated corporate scandals over the last decade have also contributed to increasing scrutiny of corporate activity (Basu and Palazzo 2008; Heidbrink 2016). There is widespread consensus that the legitimacy of business is reaching historically low levels (Rendtorff 2014; Porter and Kramer 2011).

Investigating the governance dynamics in which questions of legitimacy and responsibility arise requires a review of the diverse literatures on business and global governance. It is a multifaceted area of research and theoretical variation and diversity are significant (Ougaard 2012, 26). From around the end of the Cold War, a transition began taking place whereby state-centered hierarchical governance is becoming "heterarchical and contextual" (see Heidbrink 2016). In the course of this transition, private actors gain significant power and influence across governance regimes (Cutler 1999; Haufler 2001). Here power shall mean the capacity to influence others, that is, potential influence (see also Falkner 2008). Corporate actors exert their influence through forms of self-regulation, lobbying, and a variety of private business practices. At the same time, a variety of factors draws corporate actors into more active governance participation, including the privatization of the provision of public goods or hard and soft law requirements toward reporting and codes of conduct (Buhmann 2010; Ougaard 2012). Corporate actors are thus becoming involved in addressing global governance issues are, for example, the dynamics around production practices and value chains in the context of sustainability and climate change (Humphreys et al. 2017), and financial regulation aiming to secure stability in the global and national economies (Moschella and Tsingou 2013; Ougaard 2012). Various forms of certifications and standards are gaining ground such as the UN Global Compact, various ISO standards, and a variety of value chain-related certifications for better human rights and sustainability.

Business contributes to the societal and environmental conditions that form its operational context and corporate actors need to reflect on their contributions, because they depend on stability and access to various forms of resources (Barney 2001; Kivleniece and Quelin 2012). In the post-Westphalian order, there are different types of responsibilities that arise for corporate actors. There is negative responsibility, that is, the avoidance of harm. It is clear that business is a major contributor to issues like pollution, resource exploitation, human rights violations, and others. Additionally, is positive responsibility, that is, contributing to the improvement of social and environmental aspects. At the heart of their positive responsibility is the contribution to the availability of public goods and to normative processes that formerly were the sole domain of states and intergovernmental organizations. Business (and other non-state) actors participate in what Pies and Koslowski (2011) call a new process of governance, whereby business becomes an active cocreator and implementer of regulations and underlying norms. This ordo-responsibility extends beyond the scope of business operations into the systemic societal conditions under which business operates (Heidbrink 2016).

Let us now examine the other major development, namely emerging characteristics of governance issues demand investigation. These include universality, existentiality, complexity, and connectedness. Universality of responsibility is both a crucial and highly contested notion and so this section commits more attention to it than the other three characteristics. Universality is crucial for the concept of corporate responsibility, because in the presence of universal issues the responsibilities of corporations and their shareholders become shared responsibilities. As Pava and Krausz (1997) illustrated in their model of legitimate CSR, there is always a trade-off between the responsibilities of a company toward those it exerts influence on and its shareholders. While, for example, the knowledge of a problem and its potential solutions are grounds for corporate responsibility, financial performance acts as a counterweight to it. Managers often try to mitigate the conflicts of interests between the potential ethical obligations of a company and its fiduciary obligations, that is, the financial interest of their shareholders, by integrating CSR measures into their commercial strategy. (For further reading on the theoretical landscape surrounding the emergence of strategic CSR, see Brown et al. (2010).) This is problematic, because financial interests often overrule ethical concerns (Freeman 1994). Shareholders, that is, principals, share the responsibility of corporations and their narrow financial interests must not overrule their responsibility, even if their investment in a company is at arm's length and lacks any practical involvement. The mere fact that they provide resources to and exert influence on a company establishes their sharing of responsibility.

For an issue to be universal, it needs to either affect all or the majority of the world population or be affected by a majority. There are different way that issues can be universal. For example, nuclear weapons and the related threats of nuclear destruction is an issue that potentially affects the whole world's population. It has been the most prominent issue in raising questions about universal responsibility (Gerhardt 2017; ICRC 2018 (https://www.icrc.org/en/document/nuclear-weapons); UN 2019 (http://www.un.org/en/sections/issues-depth/atomic-energy/)). While the issue potentially affects everyone, only few actors have direct influence over it. The issue is universal in the scope of its potential consequences for present and future generations. Other examples are anthropogenic climate change and antimicrobial resistance (AMR), which are also universal in scope, but differ from the previous example. Both issues affect populations globally, but all actors also have direct influence on how these issues develop. Universality of issues thereby indicates the potential set of actors with a responsibility for an issue.

Universal issues also differ according to their institutional governance context and thereby also in terms of the importance of business responsibility. While nuclear and health governance regimes have clear representation in the form of international organizations, climate change lacks such a centralized and formalized governance. The International Atomic Energy Agency (IAEA) and the World Health Organization offer forums for discussion and platforms for internationally binding and non-binding agreements. Corporate actors influence both organizations directly or indirectly and both are subject to a degree of unilateral interventions from powerful states. However, despite any critique of those organizations, they do represent the will and the ability of the international community to address major issues such as nuclear proliferation and AMR as a collective. That is quite different for climate change, which depends on voluntary and unilaterally reversible commitments from state and non-state actors. It is therefore an example of the importance of business responsibility, as corporate actors contribute to pollution, resource exploitation, and other aspects of climate change, while the institutional context is comparatively underdeveloped leading to a lack of binding regulations.

Despite a consensus that issues have become universal, the universality of responsibility is controversial. Historically, arguments for universal responsibility have been inherent in various religious traditions, but there is a significant variety of arguments beyond theology, including sociological, biological, and phenomenological. (The scope of this chapter allows only a narrow selection and brief presentation of relevant authors and ideas. A suggestion for further reading on the nature and reasoning for universal of responsibility with humanity as a frame of reference is available under the following link: https://plato.stanford.edu/entries/levinas/.) While a detailed discussion of all of these arguments is beyond the scope of this chapter, it is worth highlighting some of the most influential ones. Karl Jaspers (1957), a central figure for the conceptual thinking about responsibility in the twentieth century is Karl Jaspers (Gerhardt 2017), who provided the first comprehensive work on the potential influence of nuclear weapons for the future of humanity (Jaspers 1957). Not least through Jasper's work, universality becomes a central characteristic of contemporary issues for the conceptualization of responsibility in a global context.

Even prior to the nuclear threat, Dietrich Bonhoeffer (1966) argued that responsibility for others and ourselves is a natural state of all human beings, that is, it is universal. He agrees that there needs to be a differentiation between the concrete responsibilities (Verantwortlichkeiten) of each individual actor, but for Bonhoeffer this does not change the fact that responsibility as such is inherent to everyone. The basis of his argument is that everyone is first responsible toward herself or himself, because he or she is human (Bonhoeffer 1966, 240). Thus, Bonhoeffer makes two implicit claims. First, he claims that there is a connectedness between all individuals as humans and, second, that each human being has an inherent value or dignity providing a normative fundament for any universal responsibility claims. Although Bonhoeffer's Ethik (Ethics) builds on Christian notions that might not seem easily transferable to a global governance context, Joas (2011) shows that there are a number of secular institutional manifestations of the Judeo-Christian–inspired notion of value or dignity inherent to all human beings, also central to Bonhoeffer. These include The Universal Declaration of Human Rights, the Charta of Universal Rights, and the German Constitution (Grundgesetz). Joas argues that the rights granted in these documents, which in turn have become the basis for claims of responsibility (Moon 2013), do not intend to and in fact might not be able to prevail without reference to a superior authority and what he calls the sacredness of the person. (See also Chapter 5 of *The sacredness of the Person* by Hans Joas for a historic sociological analysis of the transformation from the concept of the soul to the self as an attempt to naturalize elements of religious tradition. Joas shows that historically the justification applied for universal human rights was the gift endowed to humans in the act of creation and that without these notions no evolution of relevant values is possible. As an example, he refers the famous phrase “all men are created equal” (p. 170).)

In Das Prinzip Verantwortung (The principle of responsibility), Hans Jonas argues, similar to Karl Jaspers (1957), that humanity has developed the capacity for self-destruction in the form of nuclear weapons and how this has far-reaching consequences for ethics in general and responsibility specifically. Jonas derives a duty for all actors, that is, universal, to engage with and reflect on their responsibility, because technology (techne) enables cumulative actions, which have consequences of unprecedented severity, reaching beyond the present into an “indefinite future” (Jonas 2017, 32). Jonas further argues that technological innovations not only have potentially existential influence on humanity, but that through technology, the very nature of human beings is subject to alterations that can be both severe and irreversible (ibid.). Since the works of Jonas and Jaspers, other issues have emerged with far-reaching and extreme consequences looming. Anthropogenic climate change, antimicrobial resistance, and gene selection and manipulations to name just a few. All of the above demand a responsibility that incorporates the future, an ex ante responsibility.

Jonas argues further that all ethics before the second half of the twentieth century has been anthropocentric. Ethics focused on the social environment (the “Stadt”) of humans rather than the natural environment. Nature as such was no object of ethics, except for notions of stewardship that date back to early religious traditions (Jonas 2017, 29). He explains the exclusion of nature as an object of responsibility in the perception that human efforts to cultivate the earth and the harvest of its resources remained largely superficial and depletion of resources or irreversible destruction of natural habitats were far removed from human experience. However, the increase in techne’s potential influence called for changes to the scope of ethics and thereby responsibility. Jonas argues that nature has to be an object of responsibility, because the collective and cumulative technology-enabled actions of human beings.

Even today, normative debates about the scope of actors’ responsibility feature positions along a spectrum from cosmopolitanism to particularism (Ainley 2017; Heidbrink et al. 2017). Four authors are representative of the various positions. Peter Singer (Benatar et al. 2003) represents the most cosmopolitan position and argues for influence as the decisive criteria, that is, he sees positive responsibility based on the mere ability to help. Thomas Pogge (2008) argues for the responsibility of those with relative abundance to share of their wealth and alleviate poverty globally and to help provide access to essential goods like medicines. His work refers to systemic and historical injustice that created and maintains an unjust status quo, that is, he sees a violation of moral responsibility in the active or passive act of profiting from injustice. David Miller (1993, 2007), representing a strict particularistic perspective, sees a quasi-natural limitation of the scope of responsibility based on a need for particular connectedness in the form of a nation. Iris M. Young (2011) acknowledges, in some ways, particularistic critiques of cosmopolitan notions of responsibility. Incorporating the positions of both Pogge and Miller, Young argues that given the structural and institutional connections, we live in a state of social connectedness and thus we are under a shared global political responsibility to revise any systemic injustice and share wealth globally. Notwithstanding the entrenched controversy about potentially universal responsibility, corporate actors, particularly those with global value chains, need to consider the scope of their responsibility as universal in geographical terms, extending into a more or less indefinite future and incorporating nature.

The next emerging characteristic of governance issues is existentiality. (It is possible to differentiate between existentiality in the sense of threats to survival from *ultimacy*, that is, the fact that resources are not just scarce in an economic sense, but also finite and potentially irreversibly lost. Ultimacy applies among other things to fossil fuels and biodiversity.) The fact that there are issues, which are both universal and existential in nature, is a phenomenon that only emerged in the latter half of the twentieth century and therefore the combination of those characteristics had not been part of ethical and responsibility considerations. Further, despite the emergence of issues that have both characteristics, there has not been sufficient adjustment of either norms or regulations. We do not see global institutions that have fully incorporated the need to rethink and redesign norms and institutions, in order to meet the challenges resulting from universal and existential issues. Morality and legal institutions grow over time and out of an interplay between experiences and expectations. Moral norms predominantly follow experience and grow out of a historical context. Unfortunately, there is a temporal disconnect between the causes and effects connected to universal and existential issues, so much so that, for example, carbon emissions continue to worsen the climate for several decades into the future. Experience cannot therefore be the source of moral norms, because actors need to change their behavior and the underlying norms and institutions prior to experiencing their consequences.

Conceptually, the third characteristic of governance issues, complexity, conflicts with universality in that it either limits or at least diffuses the set of potential subjects of responsibility. In essence, greater complexity means that fewer actors have the capacity to understand the ramifications of their influence on a given issue and thereby make reasoned judgments about a preferable course of action. Complexity thus provokes questions about the limitations of an actor's scope of responsibility. With the transition to modern and postmodern societies marked by social, economic, and political complexities, responsibility receives increased attention particularly in ethics (Bayertz and Beck 2017). In the second half of the twentieth century ethics and, along with it, responsibility spread from philosophy to other academic fields (Benatar et al. 2003). Sociological system theory emerges as one of the most influential and extreme interpretations of the set and scope of responsibility, with Nilklas Luhmann as a protagonist (Heidbrink 2017). The concept of system responsibility emerged from the doubt about actors' capability to have responsibility due to increasing complexity and systemic differentiation. Luhmann even goes as far to negate the ability of actors to have responsibility in the context of complex and differentiated systems and labelled increasing references to responsibility as an act of desperation (Tomaschek and Streinzer 2014). However, despite complexity, contemporary debates on system responsibility find actors to be indispensable as subjects of responsibility, appreciating that actors are the only ones that can intervene in systems and their inherent logics (Wilhelms 2017). Section "Considerations for Corporate Responsibility in Practice" returns to the debate on the nature and role of the subject of responsibility, but attention there shifts from external systemic circumstances to the collective nature of subjectivity.

Hans Jonas (2017) points toward the complexity of consequences in collective and cumulative actions, because rather than superficial and transient consequences of certain human action have become permanent and even irreversible. With that, knowledge receives an entirely new dimension. Knowledge, even for Aristotle was a necessary condition for responsibility. Due to cumulative technological developments, however, promoted through *homo faber* becoming the essence rather than an aspect of *Homo sapiens*, knowledge of consequences needs to incorporate not just the present but an indefinite future. This necessarily means that there is immense and overly high complexity. This dilemma, in time, where technological advance is no more a means to an end but an end in itself, actors need to incorporate these dynamics into their practical engagement with their responsibility. Toward the end of section "Considerations for Corporate Responsibility in Practice," the consequences for actors' approach to responsibility receive further attention.

The fourth and final characteristic is connectedness, marked by "immensely increased global economic interconnectedness represented by private business [being a] profound characteristic of the contemporary world order" (Ougaard and Leander 2012). Economic interconnectedness, however, is only one aspect of global connectedness. First, telecommunication via a host of technological solutions, support direct communication and interaction, such as VoIP. Second, the internet has become the dominant source of information and a medium for dissemination. Third, increased physical mobility of goods and people allows physical presence globally inside of 1–2 days and at unprecedentedly low cost. Finally, connectedness also exists in terms of isomorphic processes, whereby corporation adopt similar strategic trends and technological solutions. Culturally and politically, common institutions such as International Organizations, similar technologies, products, news, and entertainment and the spread of English as a lingua franca support connectedness across the globe. Even though divides and conflicts remain between certain nations and groups, subject to variations over time, the trend toward greater connectedness is apparent. With growing connectedness, emerge material consequences for the scope and potential set of subjects of responsibility.

Connectedness has conceptual and practical implications for actors in terms of their responsibility. Actors across the globe "can use the power of the internet to fight against [. . .] disinformation and improve the long-term prospects of their children and grandchildren [. . .]. They can demand action to reduce the existential threat of nuclear war and unchecked climate change." (Mecklin 2019, 8). This means that the great majority of people can influence even the most important issues in global governance. Moreover, contrary to, for example, democratic elections, the use of social media and other internet media as outlets for information allow even relatively powerless actors to multiply their views to convince and mobilize others around the globe, without needing immense resources. Both positive and negative responsibility follow as the power of the internet allows to work toward solutions of issues, but also to target the spread of disinformation to discourage others from taking action or even to incite hatred and violence. Aside from physical mobility and certain isomorphic cultural trends, the most influential developments lie in the rapid spread of virtual connectedness.

The possibilities that lie particularly in virtual connectedness lead to an explosion of the scope of potential responsibility. Not only do most actors have the opportunity to access information from around the world in near real time at the push of a few buttons, they also have far-extended capacities to act on that information. One example is the possibility to transfer money to alleviate poverty or finance social political action by donations to NGOs or directly to recipients in remote refugee camps. Given the extreme differences in wealth, many actors, particularly resource strong corporate actors but also individuals, can share their abundant resources and have immense impact without even parting with amounts that would reduce their wealth significantly. The fact that sharing a fraction of one actor's income can save the life of another demands attention and reflection of all actors who have more than enough to survive.

Connectedness in a world of extreme wealth differences and persistent injustice means that the scope of responsibility for many actors has grown near exponentially. A longstanding critique of universal responsibility is the notion of Ueberforderung, that is, the fact that actors cannot be responsible for all the issues in the world, because that is simply too much to demand. Later in this chapter is a description of how actors can manage their responsibility under such circumstances that have overgrown their capacities and resources, circumstances that make it difficult to assign particular responsibilities to respective actors. The decisive notion, also found in Bonhoeffer (1966), is that there is no reasonable basis for requiring more of an actor, than his capacity would allow.

To sum up this section, universality and existentiality have far-reaching consequences for the legitimacy of business. The way that business can regain, retain, and repair legitimacy is through living up to their responsibility in practice. The dominant positivist rationality that marks most of CSR rhetoric and measures will not lead to the kind of consequences that support corporate actors' license to operate, that is, their legitimacy. They much rather have to engage with their responsibility, allowing responsibility to be a material component of their rationality. They need to do so under conditions of complexity and connectedness. The following section outlines an approach for corporate actors to do so, following the steps of critical reflection, prioritization, and coordination.

Considerations for Corporate Responsibility in Practice

To illustrate the necessity of critical reflection on corporate responsibility, it is useful to start this section with a corporate sustainability initiative, which illustrates how current CSR norms might fall short of responsibility in practice. The example here is an announcement by a large toy producer that they will manufacture all parts resembling plants with plant-based material (polyethylene produced from sugar cane). In an announcement, the company states that 1–2% of their production will be made of the new plant-based material. Consequently, this means that they will still produce 98–99% of their products with regular plastic sourced from fossil raw materials.

An initial reaction to this initiative is that the company deserves praise for it. They invest into what appears to be sustainability and a reduction of plastic pollution without recognizable regulatory requirements to do so. They exceed what they have to do so they deserve praise from a moral standpoint. Utilizing the initiative for marketing purposes serves their business interests, arguably also building legitimacy for the corporation. However, nearly 99% of their production remains unchanged, so the initiative has a limited impact and a near unchanged negative contribution in terms of plastic pollution. The real impact is uncertain, because the announcement of the initiative might increase sales and thereby production, which in turn might mean even less positive or even increased negative impact, depending on whether they increase sales and overall production by more or less than the 1–2% that is to be produced with the plant-based material.

Viewing the initiative and its communication through the lens of what the company's impact is, invites a reflection that emphasizes facts over framing. This form of reflection coheres with the definition of responsibility as a result-based legitimation principle (Heidbrink 2017). The intention of the reflection is not to criticize the initiative itself, because it appears to be objectively better to change some of the production to plant-based sources than to change none of it, particularly since the company further intends to use only sustainable materials by 2030. The problem lies in the framing of the announcement and its potential side effects. While the announcement is transparent, technically speaking, concerning the facts about the impact of the initiative on production, it conveys that the initiative is a major improvement in terms of sustainability. Thereby, the framing diverts attention from the factual influence of company's production, namely, that it produces massive amounts of plastic waste.

As indicated, the company's initiative appears to be good from both a moral and an empirical point of view. It goes beyond the legal requirements and contributes to more sustainability of the present levels of production and consumption. The company assumes morally positive and prospective responsibility. They take a step in the right direction. However, pollution through plastic is a universal issue and the resources used for around 99% of their production are of fossil origin. Overall, the company has only potentially reduced their negative impact rather than to actually eliminate or even reverse it. For the company to implement holistic change in the issue of plastic pollution would actually at least require them to keep all plastic materials produced by the corporation from ever leaving the cycle of use and reuse, that is, reducing plastic pollution to zero. Only at that point does the company achieve a state of responsibility in practice regarding the issue of plastic pollution and thus sustainably secured effects on their legitimacy. Therefore, their initiative is only a step in the right direction both in terms of their need to protect their legitimacy and its impact needs multiplication in order to turn apparent assumption of moral responsibility into actual responsibility in practice.

With the proliferation of the use of the term responsibility in practice and across academic disciplines follows a lack of conceptual alignment and clarity, leading to contradictory conceptualizations and implications for practice (Bukovansky et al. 2012). Aside from a clear definition of the concept of responsibility, scholars and practitioners need to make clear distinctions between responsibility and similar concepts like accountability, duty, and obligation (Beck 2015; Vetterlein 2018). It is important to know the structure of the concept in order to assume and evaluate responsibility both in research and practice.

Responsibility in practice for the sake of this chapter is not a new concept. It is rather an expression of conceptual choices for how to prioritize between the dimensions of responsibility. With a focus on their influence on other actors (addressees) and their social and natural environment, corporate actors can take a first step toward directing the reflection on their respective responsibility beyond the expectations of third parties. This is a necessity for sustainable legitimacy, because acting in accordance with current norms, such as in the case above, does not lead to sufficient evaluation of the actual influence of a business actor. As long as the judgment of third parties evaluates their actions according to a moral perspective, incremental changes to their operations can suffice for the sake of retaining and even gaining legitimacy, but once the consequences of issues such as pollution have not actually reached a state, where the broader public has felt them directly. It is not clear where the threshold for changes in normative perspectives of the public are, but eventually corporate actors will face the results of the fact that they contribute to making global issues, such as climate change and pollution worse. Unless they have fully understood their influence in good time, dependence on moral and legal criteria of today is unlikely to be sufficient to protect their legitimacy tomorrow.

Responsibility exists irrespective of morality and legality as normative frames of reference. It arises where actors exert or have the potential to exert influence on other actors and their environment, that is, exert direct or indirect influence. Beck (2015) speaks of a relationship that emerges through the influence that actors exert on each other. Responsibility exists as an expression of such relationships. Its relational nature in turn carries the important normative dimension that all actors create relationships to other actors by means of their actions and need to manage those relationships to varying degrees. Mitchell et al. (1997) present a theory that differentiates between various types of stakeholders and their potential influence on the interests of a corporation. A crucial inference from their work is that there is reciprocity in relationships and that the influence that actors exert on others leads to varying degrees of reactions and among these are actively or passively formed opinions on the legitimacy of corporate actors. With that, legitimacy of business and responsibility are intimately related and interdependent. Corporate actors need to manage concerns about their legitimacy and can do so via engagement with their responsibility, captured in the phenomenon of corporate social responsibility (CSR) (Ougaard 2012, 25).

If corporate actors want to challenge norms and externally created demands on their organization in order to gain sustainable legitimacy, a useful starting point is to identify who their addressees are and which issues they exert actual or potential influence on. Once a business actor exerts influence on another actor, either directly or indirectly, a responsibility relationship arises, because such influence always has consequences (Heidbrink 2017). Direct influence is an alteration of another actor's attitudes, values, behaviors, or physical condition. Indirect influence is an alteration of another actor's social and/or natural environment. The fact that business exerts influence on a host of other actors creates responsibility relationships. These relationships between corporate actors and those they exert influence on can be one-directional or reciprocal, but they often display considerable imbalance of power in favor of corporate actors, where power is the capability to exert influence on other actors.

Influence displays similarities to causality as a source of responsibility, but the two demand careful differentiation. While causality has been part and parcel of deciding on who potential subjects were, it has a lesser standing than other sources of responsibility such as morality, legality, and ethics. Causality is limited in its temporal orientation, primarily directed at ex post responsibility, that is, retrospective. In line with the argumentation about how systemic differentiation and complexity in modern societies complicate clear identification of causal relationships (Banzhaf 2017), causality further loses potential to serve as a source of responsibility. Influence, however, differs from causality in that it allows for more open analyses incorporating notions of potentiality, indirectness, and thereby uncertainty. As such, an actor becomes a subject of responsibility already upon identification of potential or indirect influence, which is much harder to incorporate under the notion of causality. Additionally, influence indicates a focus on current and future developments and opens up for a prospective view of responsibility. Referring to the characteristics of contemporary and emerging global governance issues, influence provides a better analytical fundament than causality as it allows for uncertainty and complexity and a prospective orientation (see also Vetterlein 2018) (Fig. 1).

The subject and addressee are two of the so-called relata of responsibility. The subject of responsibility deserves particular attention. Even though CSR is an established field of practice and research, conceptual questions about who or what can be a subject of responsibility remain. The agency of corporate and collective actors is still not fully established across all disciplines; while the CSR literature and practice implicitly accept it, debate remains in international relations literatures (Erskine 2008). This chapter follows the line of argument developed by French (1979, 1996) that emphasizes the ability of corporations to have even moral agency by means of a Corporation's Internal Decision Structure (for further contemporary developments of corporate responsibility and adjacent concepts like collective responsibility see Held (1970), Miller (2006), and Isaacs (2014)). Consequently, in

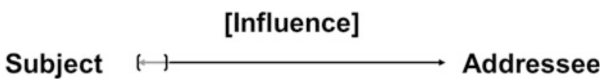

Fig. 1 Illustrates a responsibility relationship

this chapter the term actor will include both individual natural persons and corporate and organizational actors, that is, supra-personal actors with legal and moral rights and responsibilities sui generis.

The debate between various positions on the primacy of individual as opposed to some form of collective responsibility is ongoing and the scope of this chapter does not allow for a comprehensive representation. However, in refocusing on the specific role and responsibility of corporate actors, one can point out a way forward for the debate that allows corporate actors to engage with their responsibility. About the responsibility of corporate actors, Heidbrink (2016) proposes a combination of methodological individualism and methodological collectivism concerning the corporation as the scope of collectivity. He argues for a heuristics recognizing that the reality of corporations include both elements of collective intentionality and influence that one cannot reasonably reduce to any individual persons in the corporation. On the other hand, there are the actions and intentions of individuals that either shape or divert from the collective intentionality of their corporation and thus fall outside of the collective scope of responsibility.

While Heidbrink's methodological proposal allows for the conceptual work with collective responsibility within the scope of a corporation, corporate actors cannot neglect the work of Jonas prima facie. First, as shown in section "Challenges to the Legitimacy of Corporate Actors in Global Governance," there are global governance challenges that are universal, existential, complex and connected. Additionally, corporate actors qua their actual or potential influence, increasingly become involved in those issues leading to externally induced processes questioning their legitimacy. At the same time, they face capacity constraints, that is, Ueberforderung, and external limitations to act on their potential responsibilities. Under such circumstances, corporate actors need to follow an approach that consists of at least the following three steps: first, reflection, to identify the set of issues that they exert influence on and to identify the gaps in their knowledge vis-à-vis the consequences of their influence. Second, prioritization, aiming at the establishment of a hierarchy of issues that actors would like to engage with given the nature of issues and the actor's capacity and interest to work with the issue. Finally, coordination with other relevant actors, not least because of the need to have legitimacy, but also to address issues of interdependence and the fact that their capacity to solve issues is limited.

Apart from the subject, the other principal party to a responsibility relationship, next to the subject, is the addressee, or the actor(s) that a subject exerts influence on. This is similar to common notions of the stakeholder, but the conceptual scope of the addressee is broader. Some kind of economic reciprocity signifies stakeholder relationships. That is to say, corporate actors recognize and engage with those other actors that are likely to exert influence on them, that is, where there is reciprocity of influence. The problem with such a view is that it excludes a large number of actors, namely those that, for example, suffer from the effects of corporate pollution, insufficient controls of work conditions in value chains, or the consequences of climate change, all of which are issues that business contributes to and needs to reflect on in terms of its responsibility (Fig. 2).

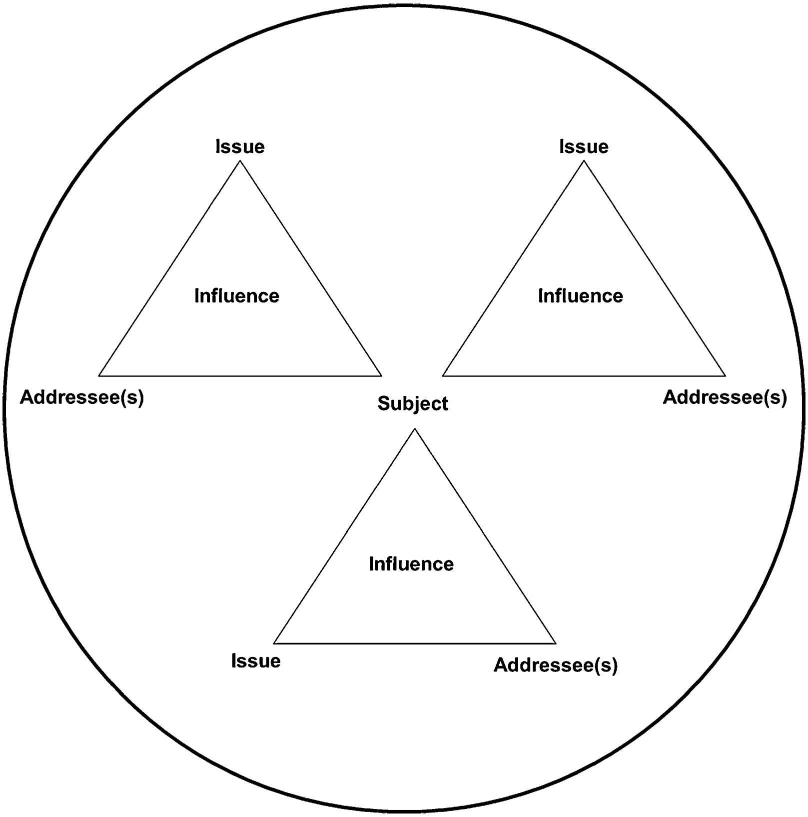

Fig. 2 Sphere of influence

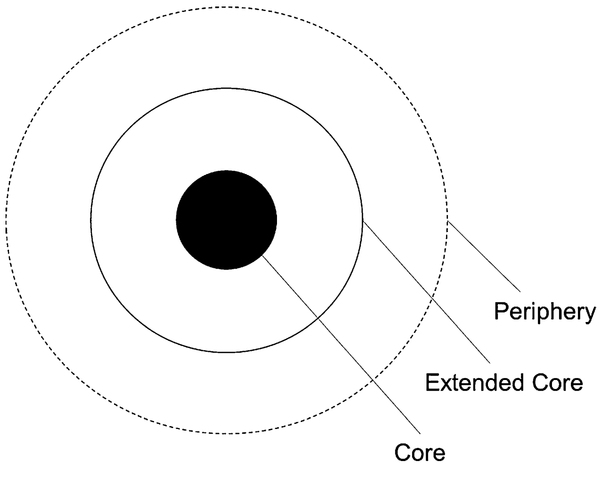
To facilitate a systematic process of critical reflection on corporate actors' responsibility, this section develops the notion of the sphere of influence (SoI). The SoI provides the means to organize responsibility according to clearly definable sets of addressees connected to a respective issue. As described earlier, the subject's actual or potential influence connects it to any number of addressees related to a given issues. The subject, that is, an actor, is at the center of the SoI. A number of issue/addressee combinations surrounds it. It is possible that addressees are influenced in terms of several issues and vice versa. It is a matter of analytical perspective, whether one starts by identifying addressees and thereby concluding on the set of issues that the subject has influence on, or the other way around. Both approaches serve to establish who a subject is responsible toward (the addressee) and in terms of what (the issue or object). For example, a pharmaceutical corporation finds that it has an influence on patients who consume or need their drugs. The corporation also influences whoever finances the drugs, which maybe public institutions, insurances, or donors. Issues of access to medicines, quality, and affordability immediately arise. However, production and use of chemicals and energy also exert influence on other addressees, including the environment.

Critical reflection based on the SoI likely yields a large number of issue/addressee combinations. The mere identification of these combinations speaks to the specific structure of an actor's responsibility and indicates a set of potential responsibilities. There are however differences between the respective connection between the actor and those combinations. Therefore, one needs to differentiate between the modes of influence that the actor exerts on them. Influence can be direct or indirect, potential or actual. Additionally, an actor can exert it exclusively itself or through some form of intermediary. Figure 3 differentiates between three levels of influence, described as the core, extended core, and the periphery of the SoI. The core captures all those instances, where the actor exerts influence itself. The extended core includes instances where an actor exerts influence through an intermediary, but does so deliberately and with a relatively high degree of control. The periphery includes those instances, where an actor exerts influence, but does so in ways that it is either unaware of or has very limited control over.

Once a business actor has reflected on its sphere of influence and thereby established the scope of its potential responsibility, the second step is to prioritize issues and addressees. There is however, no norm system inherent in the concept of responsibility. In order for a concept of responsibility to be relevant for the practice of corporate actors in a global governance context, it needs to provide orientation regarding the desired outcomes of corporate involvement in governance. Engaging with concrete normative frameworks and their applicability in this context is beyond the scope of this chapter. However, from the perspective of teleological ethics, concrete moral or legal norms are not necessary for providing ethical orientation. Rather actors can refer to supra moral goods that they should attempt to achieve, that is, positive responsibility, and evils that they should try to avoid, that is, negative responsibilities (Steigleder 2017). Examples of such goods are life, dignity and

Fig. 3 Levels of influence



sustainability reaching into an indefinite future that surpasses the physical existence of any contemporary actor (Joas 2011; Jonas 2017).

Responsibility in practice, independent of the applicable norm system needs to have guiding principles that actors can apply across issues to achieve orientation, allow for prioritization of issues and to evaluate the expected influence that they exert in the present and future. With humanity and the environment, that is, the space and resources that sustain and provide for life, as the overall addressees of practical responsibility, human life is the first element that all positive and negative responsibility needs to incorporate. Life in and of itself does not incorporate notions of quality; dignity shall capture both the value, rights, and the environmental conditions necessary for a desirable quality of life. Finally, in order to incorporate the prospective nature of responsibility and the permanence of human influence across generations, potentially leading to existential threats, sustainability needs to be included as well. Therefore, this chapter suggests a baseline for responsibility is sustainable dignified life (SDL).

Aside from the ethical structuring of priorities, it is important to acknowledge the fact that prioritizing of responsibilities requires deselection of issues, because in the presence of universal issues and a global scope of responsibility, corporate actors are confronted with a set of issues that surpasses their capacity. This is commonly referred to as the problem of Ueberforderung, that is, accepting universal responsibility means that actors face more issues than they could possibly address. Also, some form of negotiation between corporate interests and external and ethical demands takes place. Pava and Krausz (1997) argue that “in those cases where the firm possesses knowledge about a specific problem and its solution, is directly responsible for causing harm, where a shared consensus among all relevant stakeholders exists, and financial performance will be enhanced, social responsibility projects are ideal (p. 338).” That is to say, they are ideal for managers, because it is very easy to handle both internal and external “stakeholders” in such a situation. In reality priorities are contested and business interests are naturally dominant, but as argued in this chapter, universality and existentiality of issues change the nature of responsibility for business and sustainable legitimacy demands an effective responsibility in practice. That means responsibility is insufficient as a means toward sustainable legitimacy unless business influence leads to consequences akin to the notion of SDL, while also avoiding negative consequences.

Therefore, the final phase of engaging with responsibility in practice for sustainable business legitimacy is coordination with other actors. This is an established element of legitimation processes and there is ample research on the importance of transparency and inclusiveness that includes the expectations and interests of all relevant stakeholders (Buhmann 2010). Following the argumentation in this chapter, the influence on addressees that are not within the scope of the common notion of stakeholders should also receive attention. Moreover, while corporate actors are free to choose priorities in terms of their responsibility, they are not free from the expectations of external actors and neither are they free from responsibility for issues that they do not choose to prioritize. In that, business and governments are increasingly in a similar position in needing to find ways to engage with other actors to ensure addressing issues within their sphere of influence. Means of coordination are partnerships, participation in regulatory processes, establishment of institutions geared toward certain issues, and financial contributions to the work of civil society or public engagements.

Conclusions

There is ample space for business to gain and retain legitimacy and to strengthen the institutional framework of global governance. Responsibility in practice as a means toward legitimacy is becoming more important for corporate actors in line with the growth of their influence in global governance and the external expectations connected to that. While the dynamics of governance and the role of business changes, the quality of governance issues has also changed. With the emergence of universal and existential issues in a context of complexity and connectedness, business legitimacy faces growing scrutiny. The potential for a universal scope of responsibility for businesses due to their global influence in the context of various governance issues and with that a wide range of addressees, means that corporate actors need to meet the growing challenges of their legitimacy. This chapter introduced an approach that utilizes responsibility as a means towards sustainable legitimacy, which incorporates the three phases of critical reflection, prioritization, and collaboration. It is important to emphasize that a responsibility in practice needs to incorporate both the social and natural environment, as defined by Jonas (2017). Additionally, it must build on prospective evaluation of expected consequences of business operations, despite apparent complexity. This chapter points toward teleological ethical considerations as opposed to established moral and legal norms to guide the approach toward consequence-based responsibility in practice and thereby sustainable business legitimacy.

Corporate Social Responsibility (CSR) as Social Legitimacy Management

Siri Granum Carson

Contents

Abstract

This chapter defines corporate social responsibility (CSR) as the managing of social legitimacy, with basis in a normative social contract theory of the relationship between business and society. The chapter is a conceptual exploration of the relationship between corporate social responsibility and legitimacy, and argues (1) that the broad conception of the social role of corporations has changed as a consequence – or as part – of the emergence of a global, free market and (2) that this political and economic development may be conceptualized in terms of a redistribution of responsibility. However, this redistribution need not be understood as a development towards increasing political legitimacy for corporations, which would entail a fundamental challenge to democratic ideals. Rather, it makes sense to view it in light of an ethics of responsibility whereby, e.g., ecological problems must be addressed in terms of collective responsibility and collective agency.

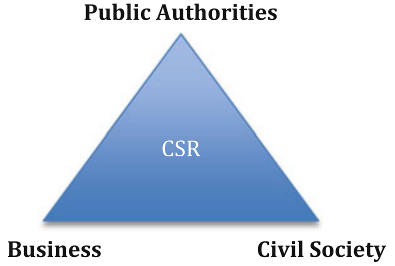
Introduction

Corporate social responsibility (CSR) is a concept suggesting that private companies have certain obligations towards society. Private companies do not exist in a vacuum – they are always an integrated part of a society. The relationship between companies and society is – or should be – one of mutual advantage: A company needs workers, customers, and access to raw material; it needs governmental support, for example, in the form of infrastructure and market regulation; and in general, it needs goodwill from its surroundings. In return, it provides employment, products, and services and may contribute to the general growth and prosperity of the society. The relationship can be illustrated in the form of a triangle, where business constitutes one of the corners, public authorities constitutes the second, and the third is constituted by civil society (cf. Carson and Skauge 2019, p. 167) The relationship between these three corners is one of negotiation and constant renegotiation, and changes over time. Thus, one could claim that the social responsibility of business at any given point in time is to answer to the legitimate demands or expectations from the other two corners of the triangle (Fig. 1).

While the relation between business and society has always been multifaceted and complex, the transition to a global, free market has made the relation even more complex by changing the basic condition for private companies. Companies today frequently operate within multiple legal and regulatory frameworks. In this situation, the nation states lose some of their authority and control, and corporations are expected to compensate for this regulatory gap by implementing self-regulation (cf. Vogel 2010; Matten and Crane 2005; Scherer and Palazzo 2011). This entails an expanded operating space and new opportunities for business but at the same time it constitutes a threat against the social legitimacy of the companies:

> *[O]rganizations as actors in the transnational realm face an increasing 'legitimacy gap'. They make decisions whose consequences transcend any particular time or place – and thereby the regulatory apparatus of the state.* (Beck and Holzer 2007, p. 4)

Fig. 1 The triangle of CSR



Some corporations seek to reestablish social legitimacy through various forms of institutionalization of CSR, e.g., sustainability reporting, stakeholder dialogues, or partnerships with nongovernmental and/or governmental organizations.

In line with a previous article (Carson 2019), the concept CSR is here understood in terms of a social contract theory, proposing that the responsibility of a corporation is the outcome of a negotiation – and constant renegotiation – between business and society. CSR thus consists in obligations emerging from the social contract between corporations and society in a given context at a given point in time. This normative social contract theory specifies the foundation of corporate obligations towards society. It is further explicated in terms of a corporate legitimacy theory, according to which social legitimacy is a measure of the how organizations successfully respond to the expectations from their surroundings. CSR thus consists in policies, actions, or other measures implemented by business organizations with the objective to gain, maintain, or regain social legitimacy.

This definition is normative to the extent that CSR is something corporations *have* as a result of a social contract and descriptive to the extent that CSR is something corporations *do* in response to expectations from society. Thus, a corporation may perform a number of actions, or implement a number of policies, designated "CSR," but still fail achieve the sought-for social legitimacy, if it is unable or unwilling to fulfil the obligations it *has* according to the social contract (cf. Carson 2019).

This chapter is organized as follows: In the section "The Social Contract Theory of the Corporation," this account of CSR as managing of social legitimacy is put in connection to the social contract theory of the corporation. In "CSR as the Managing of Social Legitimacy," the idea of CSR as managing of social legitimacy is specified on the basis of organizational legitimacy theory. In "Corporate Legitimacy Challenges: Social Versus Political," the idea of CSR as social legitimacy management is contrasted with a concept of political CSR understood as indicating the increasing political legitimacy of corporations. Section "Corporate Ethics of Responsibility" launches an alternative perspective of the increasing responsibility of corporations based on the ethics of responsibility, and section "Concluding Remarks" contains a synthesis of the main arguments of the chapter.

The Social Contract Theory of the Corporation

Business ethics theories based on the idea of a social contract go back at least to the early 1980s. Thomas Donaldson's *Corporations and Morality* (1982) was primarily based on the philosophical ideas of John Locke. Donaldson proposes the existence of an implicit social contract between business and society, that, if specified, would consist in certain indirect obligations that business organizations have towards society. Together with Thomas Dunfee, Donaldson later developed his idea further into the so-called "Integrative Social Contract Theory" (ISCT) (Donaldson and Dunfee 1994, 1999). According to ISCT, two kinds of contracts are relevant to consider as the basis of business ethics: firstly, a normative and hypothetical, "macro" social contract appealing to all economic participants and secondly, the real, "micro" social contracts existing between members of actual economic communities. The macrosocial contract provides some fundamental rules called "hypernorms," which take precedence over other contracts, and "are discernible in a convergence of religious, political and philosophical thought" (Donaldson and Dunfee 2000, p. 441). The microsocial contracts consist in explicit or implicit agreements that are binding within a specific community, whether an industry, a company, or an economic system. These contracts generate "authentic norms" based on the attitudes and behaviors of the members of the specific, norm-generating community. In order for these to be legitimate, they must be compatible with the hypernorms.

A motivation behind ISCT is to come up with a theory that overcomes the limitations of traditional business ethics theories, be they deontological or teleological, in the sense that these are too broad, too general, and too badly adapted to the specific traits of business as opposed to other areas of life. According to Donaldson and Dunfee (1994), business is different from other key social institutions (such as family or the village) in the sense that it has an "artificial" character, meaning that it is created for a specific purpose rather than something that arises "naturally." This implies that the rules and structure of business are arbitrary and may vary dramatically between different cultures, different industries, and different companies. By integrating two different kinds of contracts, ISCT aims for a theoretical basis allowing for "conditional" or "situational" morality – in other words, legitimate differences between various business communities and historical periods – while at the same time recognizing certain universal moral norms. In this way, the theory can account for the changing expectations when it comes to the social responsibilities of business but without compromising or relativizing basic moral principles such as "Don't lie" and "Be fair":

> *[A]s social contracts change, so too do the challenges for business. The ethical 'game' of business today is played by different rules and harbours different penalties and benefits than it did decades ago. Broad shifts of moral consensus have occurred. In subtle, far-reaching shifts, managers and members of the general public have gradually redefined their view of the underlying responsibilities of large corporations. Half a century ago, companies were basically expected to focus on producing goods and services at reasonable prices; today, corporations are held responsible for a variety of issues involving fairness and quality of life.* (Donaldson and Dunfee 2002, p. 1855)

ISCT sets out to integrate empirically based descriptions and explanations of ethical behavior in business – the "is" – with normative discussions about how business should be – the "ought." This creates an opportunity to explicate the (often implicit) ethical values of business and thereby to expose the unarticulated assumptions underlying the social expectations in different business contexts. While one might argue, against the quote above, that corporations have always had responsibilities with regards to fairness and quality of life (as part of the "hypernorms"), Donaldson and Dunfee's point is that the "authentic norms" change in line with shifts in economic and political power and this affects our social expectations. In the context of this article, ISCT provides the normative basis for the claim that the changes in expectations imply real changes in the social responsibility of corporations – to paraphrase Donaldson and Dunfee: As social contracts change, so too do the responsibilities of business.

CSR as the Managing of Social Legitimacy

The basic claim of this chapter is that CSR is a way by which corporations manage their social legitimacy. Legitimacy is fundamentally speaking a quality by which something or someone is accepted as right or proper in a certain manner and context. The term *social* legitimacy is here understood in accordance with Mark C. Suchman definition of organizational legitimacy as:

> *a generalized perception or assumption that organizational activities are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs, and definitions.* (Suchman 1995, p. 577)

CSR may, from Suchman's approach, be considered as a "strategic approach to legitimacy." In contrast with this definition of social legitimacy, the term *political legitimacy* is generally understood as referring to the right and/or acceptance of a certain political authority, sanctioning, for example, a privileged right to use force. In *Stanford's Encyclopedia of Philosophy*, political legitimacy is defined as "a virtue of political institutions and of the decisions—about laws, policies, and candidates for political office—made within them" (Peter 2017), referring to a.o. Max Webers' theory about what makes a particular political regime legitimate.

Social legitimacy, on the other hand, is defined in line with organizational legitimacy theory, which is related to "new institutionalism" whereby organizational change comes as a result of the chase for social legitimacy (Powell and DiMaggio 2012). The concept of organizational legitimacy is by Dowling and Pfeffer (1975, p. 122) defined as:

> *a condition or status which exists when an entity's value system is congruent with the value system of the larger social system of which the entity is a part.*

According to legitimacy theory, organizations depend on legitimacy as a resource for their survival. Organizations therefore continually seek to align their operation to the bounds and norms of their respective societies. For example, if a company adopts a voluntary environmental reporting system, it typically does so because such an activity is expected by the community within which it operates (Deegan et al. 2002).

Legitimacy theory poses that organizations are accepted as part of a society based on an implied or perceived agreement that they overall make up a positive contribution to that society. In this sense, legitimacy theory relies on the idea of an expressed or implied "social contract" between a company and the society in which it operates, cf. Shocker and Sethi 1973, p. 67:

Any social institution – and business is no exception – operates in society via a social contract, expressed or implied, whereby its survival and growth are based on: (1) the delivery of some socially desirable ends to society in general; and (2) the distribution of economic, social or political benefits to groups from which it derives its power.

Matten and Moon claim that legitimacy is of vital importance since "organizational practices change and become institutionalized because they are considered legitimate" (Matten and Moon 2008, p. 411). They build on legitimacy theory and new institutionalism with their distinction between implicit and explicit CSR, separating between CSR in the form of explicitly formulated, corporate policies, and CSR in the form of implicitly assumed, collective values and norms. Adopting explicit CSR, i.e., becoming more expressive regarding social and environmental values, is a strategic move by which an organization can gain legitimacy.

Against this background, Matten and Moon explain the development from implicit to explicit CSR in the UK: "[C]oncerns about business's own legitimacy pushed corporations toward explicit CSR" (ibid., p. 415). They argue that the European companies, although they have traditionally kept a lower profile on the topic of CSR than American ones, cannot in general be seen to have acted in a less socially responsible manner. However, American companies have typically adopted explicit CSR, in other words company-specific and explicitly formulated policies regarding social and environmental responsibility. European companies, on the other hand, have traditionally rather implicitly assumed certain collective values and norms. These past couple of decades, explicit CSR is increasingly adopted by European companies, as a response to globalization processes and other changes of market and production conditions. Companies turn to explicit CSR in order to maintain or regain legitimacy, e.g., in situations where business operations are relocated from vulnerable local communities to low-cost regions abroad (cf. Carson et al. 2015).

Corporate Legitimacy Challenges: Social Versus Political

Is it reasonable to view corporations as legitimate political actors in society, in the sense that they should take part in the political decision-making processes of the society they are part of? Corporate managers are not democratically elected and have traditionally been seen to represent only the private interests of the owners of the corporation. Could it, however, be argued that, in light of the wide-reaching political and economic changes discussed above, corporations increase their political power and, *eo ipso*, their political responsibility? The basic claim of Swiss business ethicists Andreas Scherer and Guido Palazzo's approach to corporate social responsibility is that transnational corporations have become global political actors with significant economic and political power. Scherer and Palazzo define globalization as

the process of intensification of cross-area and cross-border social relations between actors from very distant locations, and of growing transnational interdependence of economic and social activities. Globalization processes can be viewed as ideological transitions, where

> *stakeholders and national legislation as well as international norms and initiatives creates new expectations towards business*. (Scherer and Palazzo 2008, p. 416)

Scherer and Palazzo's point of departure is the actual increasing political influence of corporations in a globalized economy. On this (descriptive) basis, they argue (normatively) that corporations *should* take on more extensive political responsibilities, specifically in the meeting with grand societal challenges such as the ecological crisis. In order to describe this new situation, they adopt the term "political CSR," suggesting:

> *an extended model of governance with business firms contributing to global regulation and providing public goods.* (Scherer and Palazzo 2011, p. 901)

Scherer and Palazzo suggest that the strict division of labor suggested by classic political theory does not hold any more under the condition of globalization, and in the face of grand challenges such as climate change (ibid. p. 899). To clarify how the concept of political CSR departs from other theories about the social responsibilities of corporations, they contrast it with stakeholder theory. They argue that, while both of these approaches imply that corporations have commitments towards society, the scope of these commitments differs significantly. Stakeholder theory specifies that the responsibilities of companies extend to anyone who can affect or are affected by the results of corporate activity (cf. Freeman 1984). Political CSR, on the other hand, argues that corporations have a general commitment beyond this, a commitment to promote social good. These extended commitments arise from the global nature of the challenges facing humanity:

> *In contrast to stakeholder management which deals with the idea of internalizing the demands, values, and interests of those actors that affect or are affected by corporate decision making, we argue that political CSR can be understood as a movement of the corporation into the political sphere in order to respond to environmental and social challenges such as human rights, global warming, or deforestation.* (Scherer and Palazzo 2011, p. 910)

Stakeholder theory is a diverse term, and given the broader conceptions one could argue that there is no practical difference between political CSR and stakeholder theory, as important decisions made by large corporations might directly or indirectly affect more or less the entire global society. The justification is different, however – while normative stakeholder theory (cf. Donaldson and Preston 1995) founds the moral commitments so to speak in the one-to-one relationship between a company and its stakeholders, political CSR poses a general corporate duty to promote common good, a duty based in the extensive political power of corporations.

Scherer and Palazzo's version of political CSR is based on a realization of the global challenges we face and on the argument that corporations must lead on in the meeting with these challenges simply because they are in the best position to do so – a kind of reversed Kantian argument where "can implies ought." They address how the growing engagement of business firms in public policy gives rise to a democratic deficit of (cf. e.g. Scherer and Palazzo 2011, p. 907) but claim that a new and more significant political role for corporations is nevertheless both unavoidable and desirable:

> *[I]n order to respond to the globalization phenomenon and the emerging post-national constellation, it is necessary to acknowledge a new political role of business that goes beyond mere compliance with legal standards and conformity with moral rules.* (ibid, 906)

While sympathizing with the pragmatic considerations concerning power and urgency, I argue that the ascription of increased political responsibility inevitably points in the direction of a strengthening of political rights (cf. Carson 2016). In line with the distinction between political and social legitimacy in the section above, I propose that the *social legitimacy* challenges that corporations face as a result of power and urgency shifts should not be confused with a demand for increased *political legitimacy* in the sense of accepting increasing political authority for corporations. While acknowledging a growing political influence for corporations, it is important to delineate legitimate versus illegitimate uses of this increased influence. Presumably, it is in the best interest of many corporations that such a line is drawn. In Carson 2015, I quote the following statement by a former vice president for international exploration and production in the (partly state-owned) Norwegian petroleum company Statoil (now Equinor): “The most important contribution in the countries where we operate is the value creation for which our investments lay the basis [. . .] I believe that doing business with the aim of changing the system of government in the countries where we operate falls beyond the scope of what a company legitimately can do.” (cf. Carson 2015. The quote is from 2005, by Peter Mellbye)). Arguable, modern political theory could gain from developing further ideas concerning how to promote socially responsible corporations within the limits of legitimate models of democracy and political authority.

Corporate Ethics of Responsibility

Above, it was argued that the concept of political CSR in Palazzo and Scherer’s version entails an implicit challenge to basic democratic ideals. At the same time, the increased political influence of corporations, as well as the global nature and urgency of some grand challenges such as climate change, should be acknowledged. In *Das Prinzip Verantwortung* (1979), Hans Jonas argues that we need a brand new ethics in the face of technological development and ecological crisis. The reason is that “old” ethical theories implicitly presume that the basic condition of humanity is constant, while the ecological crises of our time reveal that this is not the case. For the first time, humanity stands in danger of eradicating itself. Jonas addresses the issue by posing the ethical question: “What should be done?” He argues that while traditional ethical theory has addressed this question as one to be answered by individual subjects; this is no longer an option. The complexity of the ecological crises of today requires that many forms of expertise are brought together and thus implies a collective responsibility to act.

Jonas' theory is a form of technology ethics where the individual agent or the individual act is no longer in the center. Instead, collective agents, their collective acts, and the cumulative effects of these are the main addressees of moral obligation. This could represent another way towards establishing a normative reason for the increasing responsibility of corporations, seen as collective agents, for the grand societal challenges we traditionally have viewed as political responsibilities. Like Palazzo and Scherer, the argument entails a reverse Kantian "Du sollst, denn du kannst." But, as opposed to the theory of political CSR, this is a theory of moral responsibility and may as such offer the advantage of avoiding issues of political legitimacy.

Jonas' theory brings responsibility into the center of ethics, as an alternative to traditional basic concepts of ethics such as duty or utility. One advantage is that the concept of responsibility is more general in the sense that it does not presuppose a corresponding right or utility for anyone specific. However, the theory has been criticized for proposing an untenable moral imperative of "saving mankind at any price" (cf. Apel 1997). It may be argued that such an imperative in principle opens up for versions of "social Darwinism" where, for example, parts of humanity are sacrificed in order to save others. (While this is clearly not Jonas' intention, Apel's point is that a tenable ethical theory should in principle exclude such solutions, cs. Apel 1997. Apel argues, vs. Jonas, that we need an (implicit, regulative) idea of (technological and social) progress to save not only the *existence* but also the *dignity* of humanity.)

Concluding Remarks

In this chapter, the relationship between corporate social responsibility and legitimacy has been explored. Based on a social contract theory of the relationship between companies and society, CSR has been described as the managing of social legitimacy challenges. I have suggested a careful distinguishing of social versus political legitimacy in order to avoid misconceptions of the political role of corporations.

Arguments that corporations must take on increasing social responsibilities aim to avoid not only a "legitimacy gap" but also an "ethical vacuum." Hans Jonas' ethics of responsibility argues that collective agency and collective moral responsibility gain increasing importance in the meeting with complex, global challenges such as ecological crises. In this chapter, I have discussed how the idea of corporate social responsibility can and should be adapted to these changes.

Transcending the Instrumental Logic of Social Responsibility: A Corporate Reputation Perspective

48

Abosede Ijabadeniyi

Contents

Abstract

The urgency of the uptake of ethical business practices has popularized legitimacy-based research in the organizational studies and marketing fields. The limitations of compliance-based legitimation approaches have equally been reiterated in theory and practice. This chapter therefore offers a cognitively dominated corporate reputation approach to business ethics and legitimacy, which deepens understanding of firms' intrinsic morality beyond the instrumental logic of corporate social responsibility (CSR) practices. This chapter offers a synthesis of the stakeholder-contingent application of CSR and corporate reputation in the corporate marketing literature with the institutional-strategic understanding of legitimation in organizational studies. The chapter critically assesses how cognitively situated appraisal of corporate behavior can transcend compliance-based reputational outcomes. A framework is thereafter offered, which can serve

as a guide for assessing the thresholds of stakeholder animosity toward organizational behavior. An overview of insights generated from the applied framework is thereafter presented, in the context of a company listed on the Financial Times Stock Exchange (FTSE)/Johannesburg Stock Exchange (JSE) responsible investment index. It is further explicated in the chapter how the appraisal of corporate behavior through the legal CSR lenses can erode strategic legitimation approaches. While espoused philanthropic practices can enhance perceptions of financial stability, perceived incompatibility of such practices with prevailing CSR standards can signal strategic attempts at cosmetically building reputation. The chapter concludes with an overview of the limitations of the instrumental logic of social responsibility and positions stakeholder perceptions of firms' intrinsic morality at the forefront of sustainable and legitimate business practices.

Corporate social responsibility · Corporate reputation · Business ethics · Legitimacy · Social license to operate

Introduction

The legitimation of corporate social responsibility (CSR) practices has historically been controversial. Controversies often emanate from the implementation of and motivation for CSR (Okoye 2009), which are highly contingent on sociopolitical frameworks (Dartey-Baah and Amponsah-Tawiah 2011) and stakeholder pressures (Famiyeh et al. 2019). CSR's application is faced with situated complexities, especially in emerging economies for which CSR is still aspirational (Ramlall 2012). Complexities often emanate from coerced legislative requirements, which ironically encourage socially irresponsible behavior (Ndhlovu 2011). Stakeholder pressure is however mounting on socially irresponsible organizations, which often undermine the ability to acquire and/or maintain the social license to operate (Famiyeh et al. 2019). Ad hoc response to such pressures hampers the ethical positioning of CSR (Ijabadeniyi and Govender 2019), which is not often accounted for in third-party reputational outcomes and/or integrated reporting.

The practice of integrated reporting has equally been described as a symbolic attempt at acquiring organizational legitimacy (Haji and Anifowose 2016). Reliance on such symbolic compliance to legislative CSR requirements can hamper the sensemaking of legitimacy and the social license to operate (Elkington 2018). The ability to balance altruistic and profit-motivated CSR practices often poses a challenge to its legitimation (ibid.). It is on this account that this study draws on Parson's (1964) notion of organizational legitimacy which foregrounds the evaluation of legitimacy on the consistency of organizational values with those of the society. Parson's account of legitimation reveals the value of a stakeholder-contingent lens for assessing the threshold of such consistency. The consistency of organizational values with societal values in the context of this study constitutes the evaluative power of stakeholder expectations of CSR on reputational outcomes. As such, ethical organizational practices suggest legitimate cultural alignments and normative support (Scott 1995). This study signals the efficacy of stakeholder-contingent resources (Ferrell et al. 2010) to understand the nature and managerial implications of ethical organizational practices which transcend marketing gimmicks (Balmer et al. 2007).

This chapter explains how a cognitively oriented approach to stakeholder evaluation of organizational governance will not only be valuable for understanding prevailing notions of moral consciousness but also offer self-reflective approaches for balancing profitability goals with sustainable development. Following Smith et al. (2010), perceptions of CSR can be subject to a halo effect in which consumers are primed to subliminally gauge overall performance based on strategically communicated CSR activities and green marketing. To address such halo effect, this study offers an approach which helps to interrogate the efficacy of CSR's actual practices vis-à-vis consumers' expectations, in terms of its ability to stretch beyond the limits of mere adherence to national and/or global legislation on ethical corporate behavior. Based on this backdrop, this chapter concludes by explicating how a stakeholder-contingent approach to CSR and corporate reputation can transcend conventional market-based and third-party metrics for appraising business ethics and legitimacy.

Navigating CSR's Instrumental Logic

The relationship between corporate reputation, CSR, and legitimacy is highly contested. CSR communication strategies targeted at gaining reputational benefits (Pomering and Johnson 2009) have been reported as capable of diminishing the efficacy of a dialogical approach to legitimacy (Cornelissen 2014). The adoption of a stakeholder-contingent approach to the evaluation of corporate reputation therefore has implications for legitimacy since reputation is interconnected with corporate culture, strategy, communication, and brand experience (Abratt and Kleyn 2012).

CSR is the responsibility an organization has toward the society, as a result of its impacts on and activities in the society (King Committee on Corporate Governance 2009). The tenets of social responsibility require firms to be transparent and exhibit ethical behavior in accordance with the law and international standards in contributing to sustainable development and dealing with stakeholder legitimate interests and expectations. This notion is supported by Balmer (2013) who argues that CSR corporate strategy should foster ongoing and mutual positive stakeholder relationships. The UN Global Compact (2014) advances that the essence of CSR is to relationally create value to the stakeholder of the business, in a way which extends beyond legal compliance. Dartey-Baah and Amponsah-Tawiah (2011) also argue that CSR refers to organizational relationships with the society, cultivated with the aim of maintaining a balance between economic, environmental, and social responsibilities.

Nevertheless, the adoption of a nonobligatory approach to CSR is long overdue. While a predominantly strategic approach to CSR has gained widespread popularity both in theory and practice, its prevailing understanding is largely instrumental as it is often approached as a predictive variable (Aguinis and Glavas 2012). The capacity to adopt a nonobligatory approach to CSR is however faced with situated factors, given the diversity in historical and institutional frameworks and taken-for-granted CSR understanding (Hildebrand et al. 2010). In response to this diversity, a holistic and societal CSR focus has been advocated in the strategic marketing and management fields (Balmer 2013). Prevailing efforts have been devoted to investigating the instrumental capacity of CSR to enhance corporate reputation, with particular emphasis on the moderating role of demographics on customer awareness and perceptions of socially responsible corporate behavior (He and Lai 2014). A skewed focus on the instrumentality of CSR to foster affinity is however short-lived (Tilling 2004), not only because CSR communication is more effective when CSR claims are perceived as altruistic (Schmeltz 2012) but also for its deleterious effects on stakeholder trust (Balmer 2013) advocacy and legitimacy (Ijabadeniyi 2018).

Conversely, corporate reputation has been described as the degree to which stakeholder cognitive association of a firm can intrinsically predict the former's affinity and behavior (van Riel and Fombrun 2007). The concept comprises two major dimensions of corporate social performance (CSP): evaluation of firms' economic performance and socially responsible behavior, based on stakeholders' perceptual manifestation of past performance and future projections (Gotsi and Wilson 2001). Corporate reputation can uphold desired positioning as it is dynamic and enduring (Dowling 2008).

The evaluation of an organization's reputation goes through some psychological processes underpinned by cues acquired from personal experiences, reference groups, and the media (van Riel and Fombrun 2007). The corporate reputation literature has recorded notable controversies over its relationship with organizational performance. For example, Inglis et al. (2006) found no significant relationship between the concepts, which is inconsistent with Eberl and Schwaiger's (2005) study which identified a significant relationship between corporate reputation and organizational performance. Corporate reputation management has been reported to be largely influenced by CSR involvement (Komodromos and Melanthiou 2014), which is equally instrumental for gaining competitive advantage (Melo and Garrido-Morgado 2012).

Stakeholder Contingency and Legitimation

The stakeholder literature in marketing is predominantly underpinned by an overt cause and effect analysis of CSR and corporate social performance (CSP) (Park et al. 2014), which this study deviates from by advocating for more agreements between interdisciplinary schools of thoughts to arrive at a holistic understanding of organizational legitimacy. Corporate marketing is uniquely different from traditional marketing orientations in terms of its strategic identification with CSR and its focus on promoting mutually beneficial relationships with key stakeholder groups (Balmer 2013). This study is foregrounded on the theoretical framing of a stakeholder-contingent perspective to ethics and legitimation vis-à-vis the instrumental-strategic legitimation paradigms in organizational studies. The utility of this framing lies in Parson's (1964) core thesis of a nonobligatory societal dimension of legitimation, which provides a foundation for unraveling the efficacy of a stakeholder-contingent lens for understanding the trajectory of legitimacy crises. With respect to the emphasis on the societal dimension of legitimation, this chapter explores a cognitively dominated approach to legitimation, with implications for corporate reputation, building on the earlier works of Dutton et al. (1994), Bhattacharya and Sen (2003), and Bhattacharya et al. (2009) on consumer-company identification (C-C identification) as well as Till and Nowak (2000) on associative learning.

CSR, Stakeholder Theory, and Legitimacy: Implications for Corporate Reputation

CSR's unknown and uncharted territories, especially the untapped cognitive domain of the evaluation of corporate reputation (Smith et al. 2010), necessitate cross-fertilizations of consumer psychology intervention in the legitimation literature. C-C identification is principally informed by the degree of overlap between consumer values and perceptions of organizational values (Dutton et al. 1994). Following Sen and Bhattacharya (2001), the C-C identification with respect to CSR, congruence between a corporation's socially responsible behavior and consumer values, can lead to psychological attachment which informs identification with and favorable perceptions of CSR efforts. As an extension of the C-C identification, it is proposed that congruence between expectations of CSR and corporations' socially responsible behavior can be instrumental for not only assessing stakeholder affinity but also firms' perceived morality while taking cognizance of the moderating roles of the self-concept and possible demographic factors on such evaluation.

CSR is generally viewed by stakeholders as firms' commitment toward the improvement of community well-being through discretionary business practices and contributions of corporate resources (Kotler and Lee 2008). Conversely, legitimation in the context of organizations is the process through which firms justify their rights to existence to a peer or superordinate network (Maurer 1971). Suchman (1995:573) conceives legitimacy as "a generalised perception or assumption that the actions of an entity are desirable, proper or appropriate within some socially constructed system of norms, values, beliefs, and definitions." The notion of legitimacy is centered on respect, fairness, and trustworthiness as trust qualifies organizational practices as legitimate (Gladwell 2015). Organizational legitimacy has historically been premised on the compatibility between the organization and its cultural environment as well as the extent to which the collection of conventional cultural narratives justifies organizational existence (Scott and Meyer 1983). Legitimacy would therefore be largely determined by stakeholder perceptions of the contributions organizations make toward the improvement of living conditions and societal well-being (Lewis et al. 2001).

As advanced by Freeman et al. (2010a), any individual or group who can influence or is influenced by the actions, decisions, policies, practices, or goals of an organization is considered a stakeholder. Of particular importance is the need to balance stakeholder interest given the broad scope of the concept. Stakeholder groups have been categorized as either primary or secondary, internal or external, and normative or derivative (Carroll and Buchholtz 2012). In line with the notion of stakeholder contingency, Ferrell et al. (2010) argue that firms need to prioritize stakeholder group(s) with the most power, urgency, and legitimacy (Santana 2012). For example, normative stakeholders should be prioritized over derivative stakeholders. However, the ability to balance stakeholder interest has been criticized given the complexities the theory attracts (Ali et al. 2015). More importantly, awareness of the need to prioritize the adoption of effective approaches to the evaluation of legitimate stakeholder groups (Abratt and Kleyn 2012) have hampered mutually beneficial stakeholder relationships.

Stakeholder theory is underpinned by the three stakeholder attributes of power, urgency and legitimacy. The ability to understand the relationship between these attributes is critical for identifying stakeholder interests and saliency (Carroll and Buchholtz 2012) and also for understanding the interconnectedness between CSR, profitability (Freeman et al. 2010a), and corporate marketing strategies (Maignan and Ferrell 2004). A stakeholder culture plays a central role in the corporate marketing philosophy. Such culture encompasses the beliefs, values, and practices that organizations employ in addressing stakeholder issues (Balmer 2013). Effective stakeholder management demands senior managers' active involvement and commitment across all levels of the organization. Such an approach maximizes stakeholder engagement practices, which enhances CSR's strategic decision-making and provides a platform for supporting the CSR vision of the organization. Stakeholder engagement, fairness, and thinking and the cultivation of a stakeholder culture are central to the sustainability of CSR (Idowu and Leal Filho 2009). CSR is maximized when corporate rhetoric and stakeholder dialogue match corporate behavior (Bernstein 2009) and is underpinned by leveraging stakeholder collaboration as a strategic thrust to enhance corporate sustainability, cost reduction, sustained customer and employee loyalty, and consequently, favorable corporate reputation (Sarstedt et al. 2013).

Organizational behavior toward customers and employees exerts the most influence on the overall performance of the organization. The importance of identifying and understanding salient stakeholder interests cannot be emphasized enough. Stakeholder power, legitimacy, and urgency of issues are the three crucial elements of evaluating stakeholder influence (Leap and Loughry 2004). Santana (2012) takes the discussion further by contending that stakeholder power and urgency, without legitimacy, are insufficient in deriving stakeholder saliency. The author contends that stakeholder saliency constitutes how the focal organization manages stakeholder legitimacy as an entity, stakeholder claim and behavior, while taking cognizance of potential mismatch between organizational and stakeholder perceptions of legitimacy.

Legitimacy is socially constructed, so is perception (Harvey and Schaefer 2001). Legitimacy is underpinned by a sensemaking and sense-giving approach to individual and collective interpretations (Weick et al. 2005). Santana (2012) argues that factors such as societal norms, behavior, organizational principles, values, structure, and strategies influence the priority accorded to stakeholder legitimacy. Stakeholder legitimacy plays a central role in stakeholder theory and has been advocated as a key element in the determination of stakeholder influence (Phillips 2003). While the influence which stakeholders can exert on business operations differs across stakeholder groups, the degree of stake and power a stakeholder group possesses at any given time would determine the urgency of such an influence (Freeman et al. 2010b). Situated factors would therefore moderate the urgency of stakeholder influence, which points to the need to prioritize stakeholder collaboration in the stakeholder management process (Cornelissen 2014).

While legitimacy is acquired objectively, it can equally be created subjectively. Weber's theory of organizational legitimacy stresses that organizations acquire legitimacy by conforming with rational prescriptions and legal frameworks (Weber 1968). Parson's contribution to the organizational legitimacy literature exemplifies that organizational goals must be consistent with societal values to earn legitimacy (Parsons 1964). The prescriptive undertone of Weber's framework suggests a stringent and obligatory stance toward organizational legitimacy, which makes it inappropriate for unraveling firms' intrinsic morality. While Parson's ideology of legitimacy leans on organizational compliance with societal values, it can however deepen understanding of stakeholder evaluation of firms' intrinsic morality since societal values are contextualized and shared among communal groups (Hofstede and Minkov 2010).

Taking a cue from Parson's stance of organizational legitimacy, the consistency of organizational values with societal values in the context of this study then constitutes taking cognizance of the predictive power of CSR expectations on reputational outcomes. "Legitimacy is therefore not a commodity to be possessed or exchanged but a condition reflecting cultural alignments and normative support" (Scott 1995), contextual conformity, and coherent implementation of reputational strategies (Czinkota et al. 2014). In a similar vein, a morally conscious interplay between the approaches to legitimacy proposed by Suchman (1995), namely, strategic legitimacy and institutional legitimacy, discreetly operationalizes Parson's notion of legitimacy.

The strategic approach to legitimacy, which Tilling (2004) refers to as the "organisational level" of legitimacy, is based on the notion that organizations competitively extract legitimacy by conscientiously acting in ways which conform to prevailing social norms, industry charters, and reporting requirements (Smit 2010), in the pursuit of survival. The strategic approach to legitimacy has a managerial undertone, and it is within the control of the organization (Suchman 1995); as such, it is the process through which organizations strategically seek legitimacy (Oliver 1996). Proponents of strategic legitimacy, such as Dowling and Pfeffer (1975) and Ashforth and Gibbs (1990), conceive legitimacy as an operational resource to the organization. However, in the words of Suchman (1995), the outcome of strategic legitimation is usually symbolic. The institutional approach to legitimacy, also known as the macro theory of legitimacy (Tilling 2004), is based on the ability of organizational practices to earn legitimacy by default (DiMaggio and Powell 1983); (Meyer and Rowan 1991); (Meyer and Scott 1992), which, as a consequence, yields a substantial outcome. For example, the use of halo-removed reputational surveys to the measure of CSP can signal institutional legitimacy (Brown and Perry 1994), given that such an approach can reveal stakeholders' perceptions of firms' intrinsic morality (Jones and Wick 1999).

Suchman (1995) proposes the hybridization of the two approaches, since organizations face both strategic and institutional pressures, with particular emphasis on the mindfulness and authenticity of the hybrid. Nevertheless, increasing globalization and associated market turbulence can exacerbate the tendency to gravitate toward acquiring legitimacy strategically. Of paramount importance is grounding organizational identity on mutual trust. Besides, deeply situated forms of legitimation have instrumental capabilities. Legitimacy should therefore not be used as a deliberate strategic tool, given that the instrumentality of legitimacy is consequential.

The socially constructed nature of the legitimation process makes a responsive communicative approach particularly essential for acquiring and/or maintaining legitimacy (Deegan 2002). A further justification for a communicative approach to legitimacy is proposed from a political connotation of corporate citizenship as presented by Matten et al. (2003), on the grounds that the standpoint of the political connotation qualifies the organization to engage in public deliberations, also taking into account that the concept of communication and citizenship is dynamic.

Earlier conceptualizations of corporate citizenship are categorized as the limited and equivalent views of corporate citizenship (Crane and Matten 2008). The limited view is criticized for rationalizing corporate citizenship to social investing (Waddock 2001) given that it has a strategic focus which tends toward corporate philanthropy (Carroll 1991); the equivalent view, as championed by Carroll (1999) and Maignan (2001) coined from Carroll, is criticized for its performance-based connotation of CSR. The authors propose an extended view of corporate citizenship building on the works of Logsdon and Wood (2002) by illuminating the already political role organizations play in the society, being political actors which engage in decision-making on ethically contested issues such as fair trade, global warming, social and political struggles of recognition, as well as redistribution of claims (Crane and Matten 2008).

Corporate citizenship is therefore premised on the key role corporates play in societal governance. Paraphrasing Crane and Matten (2008), corporations are active players in a dynamic landscape of citizenship institutions, as they play a role in determining the configurations of corporate citizenship, which extends beyond the legal status (Isin and Turner 2002). It follows then that corporate responsibilities in the field of citizenship are inherently contestable, hence the need for a communicative approach to legitimacy, which incorporates the dynamism in the configurations of societal governance. In addition, a focused strategy to the identification of specific stakeholder issues (Kleyn et al. 2012) is equally instrumental for sustaining a communicative approach to legitimacy.

Conceptualizing the Corporate Reputation Construct

The corporate reputation scholarship has attracted significant attention across various fields; the contributions of Fombrun and Shanley (1990), Fombrun and Rindova (2000), and Fombrun and van Riel (1997) have been pivotal in marshalling further contributions to the measurement of the construct (Balmer 2009). However, an increasing interest in corporate reputation management, given its saliency in leveraging competitive advantage coupled with globalizing markets, has attracted unprecedented research in corporate reputation measurement approaches (Lee and Roh 2012). This is evidenced by the well-substantiated scales developed to measure the construct (Sarstedt et al. 2013), such as Schwaiger's dimensions of corporate reputation (Schwaiger 2004), the reputation quotient (RQ) (Fombrun et al. 2000), customer-based corporate reputation (CBR) (Walsh et al. 2009), and Helm's formative measure for corporate reputation (Helm et al. 2010).

Corporate reputation can be approached from an evaluative, impressional, or relational perspective (Chun 2005). The evaluative school is premised on the assessment of corporate reputation from a financial value and/or performance viewpoint, while the impressional and relational notions of corporate reputation are based on affective associations made with the organization from the perspectives of a single stakeholder and multiple stakeholder groups, respectively (ibid.). CSR-based approach to corporate reputation in marketing management has been predominantly impressional, although premised on instrumental evaluation of organizational CSR activities, which aims at fostering affinity to and alignment with societal interests and acquiring trust (Park et al. 2014). Studies which stem from the three schools have also been reported in the marketing literature. For example, corporate reputation has been assessed based on financial performance parameters (Stanaland et al. 2011), consumer brand image, equity (Saeidi et al. 2015) and loyalty (He and Lai 2014), third-party market indices (van Riel and Fombrun 2007), and multiple stakeholder perspectives (Helm 2007). The mediating roles of the congruence between consumers' characteristics and those of the corporation also known as the consumer-company identification (C-C identification) (Bhattacharya and Sen 2003) have equally been used to determine the influences of CSR activities on consumers' behavioral outcomes. Corporate reputation has historically been operationalized as a one-dimensional construct approached as either an affective construct (Fombrun and Rindova 2000) or a cognitive construct (Gray and Balmer 1998).

Dimensions of Corporate Reputation

Building on earlier works of Hall (1992) which proposed that corporate reputation consists the knowledge and emotions people conceive of a company, Schwaiger (2004) established that corporate reputation is a two-dimensional attitudinal construct comprising both the affective (sympathy) and cognitive (competence) dimensions, further subdivided into quality, performance, responsibility, and attractiveness. Performance is reported to have negative effects on sympathy, positive influence on competence, and vice versa for responsibility, while both quality and attractiveness positively relate to sympathy and competence, but a stronger positive relationship was found between quality and competence and between attractiveness and sympathy (ibid.). This study is premised on the quality, performance, and responsibility dimensions considering the relatively higher level of familiarity and identification consumers require to assess the attractiveness dimension.

Evaluation of product attractiveness (Sen and Bhattacharya 2001), financial performance (Saeidi et al. 2015), and social responsibility (Becker-Olsen et al. 2006) could be influenced by the congruence between relevant company CSR activities and consumers' CSR-related beliefs, which is also reported to be a self-definitional source (Sen and Bhattacharya 2001). Companies have been criticized for a lack of altruistic motive toward CSR initiatives (Pasolini 2015) on the account that approaches to CSR communication are perceived as targeted at conscientious and strategic legitimation (Suchman 1995), which has aggravated skeptic responses to CSR.

Psychological factors such as consumer values are instrumental determinants of altruistic corporate reputation, for which halo-removed techniques serve a strategic purpose. This notion can be traced back to the seminal contributions of Forsyth (1980) on ethical ideology, a set of values, attitudes, and beliefs which serve as a frame of reference and guide evaluation of ethics and behavior. Consumers with high idealism tend to consider positive CSR images to be good for the society (Forsyth 1980). In line with ethical ideology, people with high relativistic dispositions to CSR are easily convinced and tend to evaluate CSR images based on personal feelings as opposed to standardized principles. The reverse is true for consumers with low relativistic disposition to CSR as their evaluations of CSR images are based on premeditated stimuli. As such, the interplay between CSR images and consumer-company identification for consumers with low relativistic dispositions tends to be stronger (Chang and Chien 2013). Similarly, people with high collectivistic tendencies process information differently to individualistic and conservative consumers, although collectivistic dispositions were not found to significantly influence perceptions of CSR (Pérez and Rodríguez del Bosque 2014).

Conceptualizing the CSR Construct

There have been notable controversies over the application of and motivation for CSR (Okoye 2009). Controversies predominantly stem from CSR's motivation being contingent on sociopolitical frameworks (Dartey-Baah and Amponsah-Tawiah 2011) and stakeholder pressures (Famiyeh et al. 2019). This notion is evident in the obligatory versus relational undertone of prevailing conceptualizations of CSR. The CSR discourse was initiated in the early 1930s by Berle and Means (1932); seminal contribution dates back to the 1950s in the works of Abrams (1951), Management's Responsibilities in a Complex World, and Bowen (1953), Social Responsibilities of the Businessman, which inspired later conceptualizations by McGuire (1963), Davis (1973), and Brown and Dacin

(1997). Bowen (1953) conceptualizes CSR as organizations' obligations to demonstrate its allegiance to the society by pursuing activities which conform to societal values and expectations.

CSR in its antecedent stage emerged as spontaneous responses to social and environmental matters detrimental to the business community. The second era of CSR is characterized by more obligations to ethical conducts and improved commitments to goals, global reporting, and accountability to stakeholders. The third and present era of CSR integrates sustainable development practices into business policies and fosters sustainable businesses that benefit the business, people, and the environment. A UN Global Compact and Accenture survey reveals that 93% of CEOs, globally, were of the opinion that sustainability issues will be critical to the success of business in the future. The figures were higher for Asia Pacific and Africa which stood at 98% and 97%, respectively (Forstater et al. 2010). Underpinning CSR practices from a corporate marketing perspective is the challenge of the strategic positioning of the concept due to widespread shareholder-centric culture as opposed to a multi-stakeholder management culture (Hildebrand et al. 2010), which minimizes the long-term sustainability of CSR and the potential to create shared value across the triple bottom line: people, planet, and profit (Savitz and Weber 2014).

The CSR concept has been conceptualized in many ways, some of which are controversial (Freeman et al. 2010a) and can be skewed toward national priorities. The controversy surrounding the conceptualization of CSR emanated from two main schools of thought: the traditional and the emerging schools (Adeyeye 2012). The traditional school, as propounded by Milton Friedman, maintains that the only form of responsibility a company has toward the society is to maximize profit and prioritize the interest of its shareholders (Friedman 2007). However, proponents of the emerging school of thought, Edward Freeman and William Evan among others, opine that the responsibility of a company goes beyond profit maximization and safeguarding shareholders' interest. This school of thought argues that the concept extends to protecting the interests of its shareholders and stakeholders and promoting social and ecological sustainability, considering the impact of business operations on the environment (Mukusha 2012).

The emerging school of thought has gained widespread popularity over the past decade due to globalization and its effect on the move toward standardizing business ethics. The concept of CSR has therefore been elaborated to account for changing priorities in societies. Holistically, CSR is concerned with the entire relationship between global corporations, government, and the general public. Precisely, CSR centers on the relationship between an organization and its stakeholders (Crowther and Aras 2008) and comprises four fundamental components such as economic, legal, ethical, and philanthropic responsibilities (Carroll and Buchholtz 2012). There are a number of generally acceptable principles associated with CSR in today's modern business landscape, one of which highlights that CSR initiatives reflect innate organizational ethical conducts. CSR advocates that organizations adopt an organizational culture that treats the environment with dignity and adheres to strict corporate governance practices. Such culture is evidenced by initiatives that promote respect for civil and human rights, safety of lives and property, careful selection of supply chain, anti-corrupt practices, and community development.

One of the popular frameworks for implementing CSR and sustainable development in the marketing and organizational study literature is Carroll's (1991) CSR pyramid. Carroll's CSR pyramid is underpinned by philanthropic, ethical, legal, and economic dimensions of CSR and predominantly referred to as a performance-based connotation of CSR. Crane and Matten (2008) categorized Carroll's typology of CSR under the equivalent view and later conceptualizations of CSR championed by Waddock (2001) as the limited view. While Waddock's (2001) work was considered an attempt at reducing corporate citizenship to social investing, Crane and Matten (2008) offered a notion of corporate citizenship which is premised on the key role corporations play in societal governance, building on the works of Logsdon and Wood (2002).

Paraphrasing Crane and Matten (2008), corporations are active players in a dynamic landscape of citizenship institutions, as they play a role in determining the configurations of corporate citizenship, which extends beyond the legal status (Isin and Turner 2002). While this notion of CSR is pivotal for amplifying social leadership, Carroll offers a framework which explicates how expectations of CSR can intrinsically signal and be influenced by organizational activities in practice. To understand the mechanisms of organizational activities such as CSR and its potential to drive sustainable development, there is need to assess institutional embeddedness (Whittington 2010) in relation to stakeholder expectations.

The four-phased appraisal of CSR, viz., economic, legal, ethical, and philanthropic responsibilities, first appeared in the work of Carroll (1979) and was thereafter operationalized as CSR expectations scale (Aupperle et al. 1985), which (Carroll 1991) developed into a pyramid. Carroll's CSR pyramid demonstrates the efficacy and centrality of the economic dimension, being the foundation upon which the legal, ethical, and philanthropic dimensions are built. Taken together, the pyramid showcases how profitability, adherence to legal requirements and ethical codes, as well as discretionary responsibilities are the main channels through which firms show allegiance to the society (Carroll 1991).

Carroll's operational definition offers a holistic framework for measuring stakeholder expectations of CSR (Carroll 1991), although later conceptualizations of CSR emphasized the contextual undertone of the concept, its root in socially constructed standards, and the implications of these for business practitioners and stakeholder engagement (Dahlsrud 2008). Marketing management scholars such as Maignan (2001) and Podnar and Golob (2007) have operationalized Carroll's CSR pyramid in relation to consumers' expectations and appraisal of corporate behavior in the context of US, French, and German consumers as well as Slovene consumers, respectively. While Carroll's notion of CSR has also been replicated in countries such as Malaysia (Rahim et al. 2011) and Korea (Han 2015), prevailing claims of Carroll's CSR pyramid in Africa, following Visser (2006) and Dartey-Baah and Amponsah-Tawiah (2011), are predominantly conceptual, with the exception of Lindgreen et al. (2009) and Fadun (2014) from a stakeholder and organizational perspective, respectively.

Lindgreen et al. (2009) found that organizations in Botswana and Malawi did not deviate from Carroll's (1991) CSR pyramid, in a study based on a sample of 84 companies across both countries. Consumers were also reported to rank economic, legal, and ethical responsibilities higher than philanthropic responsibilities in the Nigerian context (Fadun 2014). A popular conceptual study proposed that Carroll's CSR pyramid be reordered as economic, philanthropic, legal, and ethical responsibilities in Africa (Visser 2006). Nevertheless, Dartey-Baah and Amponsah-Tawiah (2011) reckon that such reordering would be unfounded given the role of underlying African cultural values of sharing and communal harmony (Ubuntu) on behavior. While acknowledging Visser's proposal, it is of particular importance how expectations of CSR can showcase consumers' situated notion of firm's morality.

Philanthropic CSR

Philanthropic CSR, as conceived by Carroll (1991), is largely discretionary in nature and often given the least priority as it is placed on the last level of the CSR pyramid (Matten and Crane 2005). Philanthropic responsibilities comprise CSR activities which promote societal well-being. These activities include corporate charitable support/giving and cause-related marketing initiatives (Morris et al. 2013). Corporate philanthropy means different things to different people on the account that culture (Maignan 2001) and other country-specific factors such as the antecedents of the political and economic structures (Rahim et al. 2011) determine its perceptions and expectations. Consumers often associate with socially responsible companies and exhibit positive attitudes toward them (Mohr et al. 2001). Espoused corporate philanthropic activities can therefore enhance reputation and image. Although philanthropic CSR is normatively desirable, consumers have historically ranked the dimension low. For example, Maignan (2001) and Podnar and Golob (2007) report that philanthropic CSR was ranked the third most important dimension. Conversely, Rahim et al. (2011) found that philanthropic CSR was ranked the second most important dimension. Albeit, corporate philanthropy, as opposed to customer-centric community volunteering initiatives, was perceived to significantly influence attitudinal and behavioral outcomes toward brand image (Hinson and Ndhlovu 2011). These findings provide evidence which suggest the potential influence of contextualized factors on consumers' reactions to philanthropic CSR.

Ethical CSR

Ethical CSR embodies societal standards, norms, and expectations which extend beyond codified law (Carroll 1991). Ethical responsibilities can be likened to what DiMaggio and Powell (1991) refer to as the "taken-for-granted societal frameworks" which stipulate what society conceives as fair, just, and appropriate corporate behavior. The ethical dimension of CSR exemplifies the social embeddedness of CSR as it largely relies on socially constructed standards which define appropriate corporate behavior (Dartey-Baah and Amponsah-Tawiah 2011). Ethical CSR has predominantly received less priority, which could be due in part to the subjectivity of the concept. For example, the ethical and philanthropic dimensions were merged to form one dimension: ethical-philanthropic CSR due to the nonperformance of the two dimensions in a study conducted among Slovene consumers (Podnar and Golob 2007). The authors justify the merger of the dimensions given that both dimensions relate to societal obligations which extend beyond legal requirements (Bloom and Gundlach 2001). Rahim et al. (2011) found that the preference of Malaysian consumers for ethical CSR is consistent with the CSR pyramid proposed by Carroll (1991), on the account that the dimension was ranked the third most important. Conversely, Maignan (2001) found that ethical CSR was ranked the second most important dimension among French and US consumers, with the exception of German consumers who ranked both legal and ethical dimensions as the most important. From an African corporate governance perspective, Visser (2006) proposes that the ethical dimension may be the least important. Since ethical CSR is largely uncodified and socially constructed (Carroll 1991), it follows that historical and sociopolitical frameworks could have patterned effects on consumers' expectations of ethical CSR.

Legal CSR

Societal expectations, norms, and values all serve as a framework which informs the federal, state, and local government laws and regulations that set the rules under which business must operate. Legal responsibilities predominantly relate to societal expectations of business in meeting its economic duties within legal requirements (Carroll 1999). Consumers have been reported to have a high preference for legal CSR. This notion is supported by Podnar and Golob (2007) who found that Slovene consumers ranked the legal CSR higher than the other CSR dimensions. German and French consumers in another study also perceived the legal dimension of CSR as the most important (Maignan 2001). The tenets of predominant CSR reporting standards and industry chapters would equally play a role in the uptake and application of legal CSR.

Economic CSR

Economic CSR is premised on the maximization shareholder value and profit (Maignan and Ferrell 2004) and hence the raison d'être of business, given its accorded priority in the CSR pyramid (Carroll 1991). The fulfilment of economic CSR is paramount not only for survival of business but also for the fulfilment of the other CSR responsibilities. There is no consensus on consumers' preference for economic CSR. Maignan (2001) established that consumers consider economic CSR as the least important CSR dimension, with the exception of US consumers. This notion is supported by Podnar and Golob (2007) who claim that the economic dimension is perceived as the least important among Slovene customers. A similar finding was reported in Malaysia where consumers accorded the highest priority to the economic dimension (Rahim et al. 2011). Although Visser (2006) proposes the economic dimension to be the most important dimension, this proposal is not backed up by empirical evidence. In addition, the study was conceptualized predominantly from a corporate governance perspective. More so, Turker (2008) conceives the economic CSR as mandatory and hence not an aspirational dimension of CSR for external stakeholders.

A Halo-Removed Framework for CSR and Corporate Reputation

Marketing management literature has historically been associated with meeting and exceeding stakeholder expectations (Sweeney 1972) and, in particular, the consumer stakeholder (He and Lai 2014), especially from a CSR viewpoint (Maignan et al. 2005). Since it has been established that CSR is a socially constructed concept (Dartey-Baah and Amponsah-Tawiah 2011), it follows that consumers' expectations of CSR are contingent on the social context. In line with the conceptual framing of this study, a stakeholder-contingent notion of legitimacy and the extended notion of the C-C identification are equally socially constructed. The framework of this study therefore offers a tool for predicting the extent to which congruence between consumers' expectations of CSR and firms' socially responsible behaviour can evaluate firms' intrinsic morality, as explicated by the corporate reputation construct.

The framework was applied in the context of a Financial Times Stock Exchange (FTSE)/Johannesburg Stock Exchange (JSE) responsible investment index listed company, based on a survey of 291 consumers recruited across 5 shopping malls in South Africa, in line with standardized ethical research practices. A 24-item survey instrument was adapted from the standardized scale and literature on Carroll's four dimensions of CSR expectations and Schwaiger's three dimensions of corporate reputation, which was aimed at investigating the predictive outcomes of CSR expectations on the corporate reputation. Responses provided were based on consumers' familiarity and identification with the company, which were analyzed using path analysis in structural equation modelling (SEM). Composite reliability and Cronbach's alpha were above 0.7, to indicate that all factors have good reliability (Bagozzi and Yi 2012). The model validity demonstrates the consistency of the measuring instrument to its objectives. This was measured by the estimate of convergent validity and discriminant validity (Raykov 2011). Convergent validity was assessed using three tests, namely, composite reliability of constructs, reliability of questions, and variance extracted by constructs. Convergent validity assesses the extent to which items of a specific factor represent the same factor and is measured using a standardized factor loading, which should be above 0.5 (Fornell and Larcker 1981).

Fifty-seven percent of respondents were males, while 43% were females. Thirty-seven percent of the sample population were aged between 18 and 24 years, with 30%, 14%, 12%, 4%, and 3% being between the ages of 25–34, 35–44, 45–54, 55–64, and 65 years and above, respectively. Sixty percent of respondents were Africans; 7%, 6%, and 27% were Indians, Whites, and mixed race, respectively. The results as shown in Fig. 1 reveal that CSR expectations have a significant influence on the company's corporate reputation. The weakest link was found between legal CSR and the performance dimension of corporate reputation ($\beta = 0.03$, $p = 0.31$) which makes the link the least unsupported on the nomological net for the company. The strongest link was found between philanthropic CSR and the performance dimension of corporate reputation ($\beta = 0.33$) with a p value of less than 0.01 which makes the link the most supported. Results also show that the paths between ethical CSR ($\beta = 0.22$; $p < 0.01$) to quality, ethical CSR ($\beta = 0.23$;

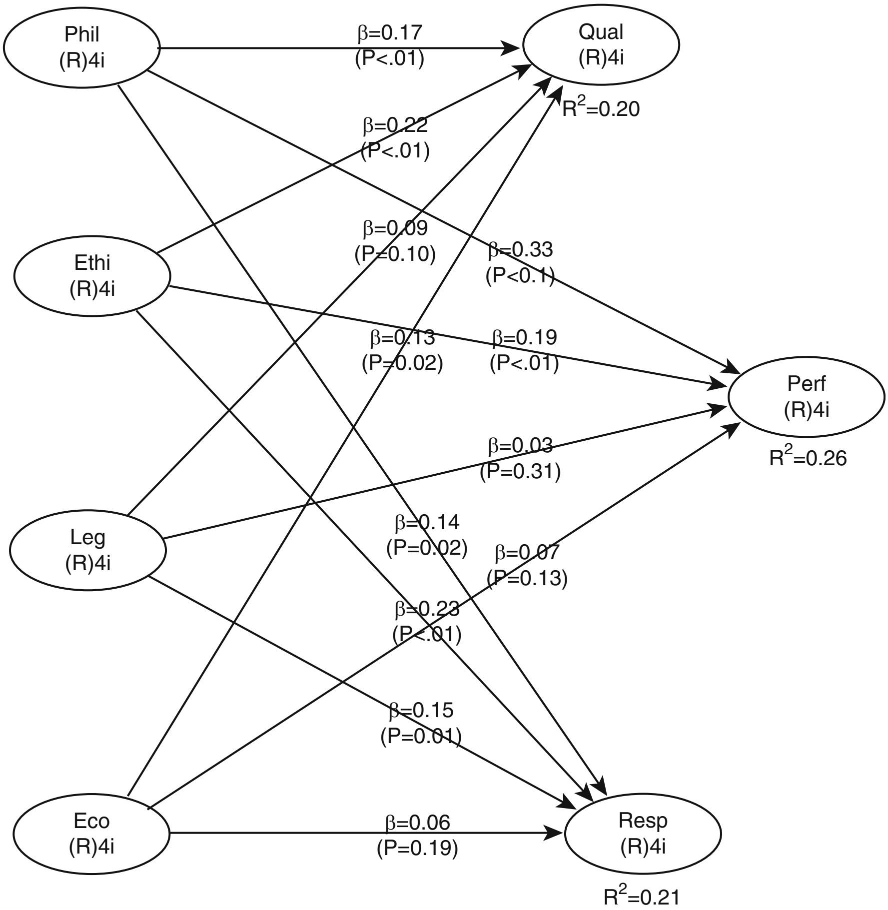

Fig. 1 A halo-removed framework for CSR and corporate reputation

$p < 0.01$) to responsibility, ethical CSR ($\beta = 0.19$; $p < 0.01$) to performance, and philanthropic CSR ($\beta = 0.17$; $p < 0.01$) to quality yielded significant contributions to the model. It can be inferred that a total number of five paths yielded positive contributions, while seven paths yielded negative contributions to the model. The result reveals that the fulfilment of philanthropic, ethical, and economic CSR expectations has the strongest influence and predictive relevance on the company's corporate reputation. The positive explanatory power of R^2 for (quality = 0.20), (performance 0.26), and (responsibility = 0.21) reveals the strength of the variance explained for the model, which further demonstrates the extent to which the exogenous constructs (philanthropic, ethical, legal, and economic CSR) have predictive relevance on the endogenous constructs (quality, performance, and responsibility dimensions of corporate reputation).

Findings reveal that philanthropic CSR had the most significant predictive outcome on the performance dimension of the company's reputation. This finding further establishes that the fulfilment of consumers' philanthropic expectations is associated with consumers' evaluation of financial performance. It can therefore be inferred that consumers' perceptions of corporate philanthropy are associated with financial stability, which is not unfounded following the proposition that economic prosperity is a catalyst for social responsibility (Carroll 2016).

Ethical CSR had the most significant predictive outcome on the social responsibility dimension of corporate reputation, showing that the fulfilment of consumers' expectations of ethical corporate behavior positively enhances perceptions of the company's socially responsible behavior. Conversely, results also show that legal CSR had the weakest predictive outcome on the performance dimension of corporate reputation. The predominance of the company's reputation for financial performance is also revealed in the highest explanatory power yielded for the dimension. The high priority given to legal CSR in a developing country such as South Africa (Dartey-Baah and Amponsah-Tawiah 2011) suggests that the weak predictive outcome of legal CSR on the performance dimension of the company's reputation could be an indication of consumers' skeptical disposition toward the company's financial performance.

Discussion

Stereotypic CSR engagements which are aimed at building corporate reputation are a fallacy. Consumer trust is pivotal for enhancing institutional legitimacy on the account that prevailing strategic legitimacy is socially coerced. The legitimacy of CSR is therefore contingent on its ability to demonstrate goodwill. Consumers' perceptions of financial viability could be enhanced by engaging in philanthropic CSR. The ethicality of business practices could also result in favorable perceptions of product quality and social responsibility. The adaptability of business practices to prevailing legal frameworks will further enhance consumers' perceptions of companies' reputation for social responsibility.

Ethics are uncodified and based on prevailing institutional and cultural frameworks, whereas legal frameworks are prescriptive. The predominance of the ethical and legal notions of CSR in this study showcases that companies should engage in CSR based on moral conscience as the ethical-legal divide cannot be leveraged with a stereotypical CSR approach. While a tick-box approach to CSR could appease political and institutional pressures in the short term, such an approach does not demonstrate good corporate citizenship and governance. A tick-box approach to CSR has social consequences and undermines authenticity. In addition, while such an approach could portray adherence to legal frameworks, it may fall short of acceptable ethical practices on the account that ethics are evolving and are socially constructed. It therefore takes a morally conscious corporate citizen to interpret implicit socially shared values.

The longevity of organizations which adopt a passive CSR business model is therefore questionable given increasing stakeholder expectations of CSR (KPMG 2013). While increasingly socially oriented markets and global regulations such as Global Reporting Initiative (GRI), International Organization for Standardization (ISO), and the Global Compact (GC) are gradually converging organizational norms and values (White 2008), innovative and dynamic entrenchment of prevailing CSR ideologies into business models will be key indicators of corporate sustainability in the future (Carroll 2015). Entrenched CSR corporate identity has to be sufficiently tangible in order to meet and exceed stakeholder expectations of CSR (Kleyn et al. 2012). As noted by Goutzamani (2007), what organizational insiders perceive as their core identity usually varies significantly with its external overall evaluation, which creates a divide between internal and external perceptions of the organization.

Similarly, consumers' expectations have historically been proposed as antecedents of trust (Barber 1983) on the account that trust is the result of fulfilled expectations. McKnight et al. (2002) reiterate that trust is a consequence of a strong belief that the trustee is reliable, honest, and benevolent. Hosmer (1995) offers a conceptualization of trust which overlaps with the legitimacy of CSR claims. Trust is the trustee's fulfilment of expectations which are grounded on ethically justifiable behavior, morally conscious decisions, and practices based on ethical principles of analysis between social actors who engage on the basis of an economic exchange (ibid.).

From a consumer perspective, trust is conceived as a strong belief that an organization will act in ways consistent with expectations, expertise, integrity, and reputation (Park et al. 2014). The notion of reputation which maintains that reputation is an amorphous concept which an organization cannot influence (Argenti and Druckenmiller 2004) resonates with the ideology of cognitive legitimacy, which is pivotal for gaining institutional legitimacy (Suchman 1995). It is therefore apparent that the predictive power of consumers' CSR expectations on corporate reputation can serve as a platform for assessing institutional legitimacy. In other words, an empirical validation of the propensity of consumers' CSR expectations to predict corporate reputation as shown in Fig. 1 can open up new insights for deepening our understanding of the role of trust in the evaluation of business ethics and legitimacy.

Conclusion

The commentaries presented in this chapter have established that there is need for a new common understanding of the notion of embedded CSR interests. The conceptualization of morality is determined by the capacity of social forces at work to define the parameters of corporate governance. The core legitimacy issues this chapter addresses are shaped by the antecedents of sociopolitical frameworks. The instrumental use of CSR distracts attention from the real issues that must be addressed. There is need for wisdom to resist this growing trend, especially when it attacks social structures such as ethics and legitimacy.

The ability to understand the role of consumer psychology on CSR-related consumer behavioral outcomes has unique implications for institutional legitimacy. The divide between the ideologies espoused by companies and stakeholders can only be bridged by earning stakeholder trust. In other words, morally conscious organizational behavior toward CSR enhances stakeholder trust on the account that the latter inadvertently leverages institutional legitimacy. Espoused CSR practices are largely a reflection of the moral consciousness of management, which is passed down through corporate values, vision, and mission and reinforced by an inside-out approach to CSR communication.

Emerging trends in literature reveal that prevailing approaches to CSR are underpinned by what can be categorized as a tick-box or compliance-based approach. While such an approach may appease regulatory pressures to gain strategic legitimacy in the short term, its sustainability is questionable given the inadaptability of business models to proliferating global and industry charters and stakeholder expectations. CSR practices grounded on moral consciousness can therefore gravitate toward institutional legitimacy. In particular, the understanding of contextualized and/or ideal CSR practices is pivotal for legitimation. While the notion of an ideal situation is subjective and largely determined by organizational antecedents, institutional and cultural frameworks, contextualized ideologies, and expectations of CSR could serve as a guide for linking strategy to legitimate CSR outcomes.

Extant literature has revealed that the diversity and instrumentality of CSR-related consumer behavior are best understood from a consumer psychology perspective. Country-specific factors and cultural diversity are predominantly responsible for the lack of consensus on the mediating and moderating effects of CSR on consumer behavioral outcomes. These factors include preference for specific CSR domains, loyalty to socially responsible companies, and purchase intentions. In spite of this, emerging trends reveal that antecedents such as awareness of CSR and perceived authenticity, which are driven by consumer values, serve as factors predicting consumer behavioral outcomes. In addition, current thinking in stakeholder evaluation of corporate reputation gravitates toward a hybrid of affective, behavioral, and cognitive connotation of stakeholder behavior. It cannot be emphasized enough that stakeholder trust will play a crucial role in the legitimation of corporate citizenship practices, which transcend mere ad hoc manipulation of CSR for reputational outcomes.

accountability systems have been challenged for not serving the interest of the public, that is, to act for society's wider interests. In the accounting/accountability literature, in particular, calls have been made for envisaging "innovative" accounting and accountability systems which act as social means for promoting society's main interests. Such forms of accounting and accountability are conceptualized as means for activating some form of emancipatory change, in the relationships between business, society and the environment. In order words, this debate has called for the need to reconsider the "ethical" foundations of accounting and accountability systems and practices. This chapter contributes to this debate by proposing a conceptual model which could help to illuminate some of the complexities of the relationship between accounting/accountability and business ethics. This model, which is based on a "metaphorical merger" between ethical firm system theory and stakeholder management theory (Rusconi, Eur Manag Rev 1–20, 2018), is able to highlight the ethical responsibilities of the management of the firm system, the rights and duties of every stakeholder and to identify the dialectic nature between "pure" or "instrumental/strategic" ethical legitimacy. The implications of such a model for improving the process of ethical and social legitimacy of the various accounting and accountability practices are then addressed.

Social Accountability · Stakeholder Theory · Business Ethics · Legitimacy and Legitimation · Public Interest

Introduction

Increasingly over the past years, business and corporations have been criticized for not always being able to ensure to act and conduct their commercial and operational activities in an ethical and socially responsible way. For example, events such as those related to Enron and/or Parmalat at the beginning of the 2000s, the credit crunch at the end of 2008, and/or more recently those related to the unethical behavior of the so-called dieselgate, which has involved companies such as Volkswagen, have dramatically impacted on the institutional environment within which corporations and business conduct their activities. These events have affected the stability of the global business market (e.g., financial) by generating in the public the idea of lack of trustworthiness and weakness of the current governance systems to *ex ante* prevent and subsequently deal with these unethical and irresponsible practices. Criticisms have also regarded the capability of the current accountability and control systems to provide adequate information to account for and report on these practices. In particular, accounting and accountability systems have been challenged for not always being able to serve the interest of the public, in other words, for deviating from societies' wider interests. In the accounting and accountability literature, in particular, calls have been made for envisaging, designing, and implementing "innovative" accounting and accountability systems which act as social means for promoting society's main interests (Gray 2002). Such forms of accounting and accountability have been conceptualized as able to activate emancipatory forms of change (Gray 2002; Contrafatto 2004, 2009). These accounting and accountability systems, which are mechanisms for promoting emancipatory change in the form of understanding the relationships between business, society and environment, should be able to gather and provide information for preventing or reducing the risk of unethical and irresponsible behaviors. In other words, this debate has called for the need to reconsider the "ethical" foundations of accounting and accountability systems, which are really for the interests of society and stakeholders. This essay contributes to this debate by proposing a conceptual model which could help to illuminate some of the complexities of the relationship between accounting/accountability and business ethics. In particular, the aim of this chapter is to apply a conceptual model to accounting/accountability, which is the result of a *metaphorical merger* between a specific version of stakeholder theory and a systemic view of business ethics. Such a model, it is argued, would be able to contribute to address some of issues related to the relationships between accounting, accountability and business ethics. The implications of such a model for improving the process of ethical and social legitimacy of the various accounting and accountability practices are then discussed. In particular, these aspects are discussed with reference to two interrelated forms of accounting: management accounting and external accounting. As widely understood, management accounting is seen as a set of practices and documents which are mainly used to support the decision-making process of the management. The second, on the other hand, represents the set of practices and documents which are instead produced, published and presented externally to all interested stakeholders and are regulated by law and accounting principles (very often indirectly empowered by law). The accounting information that is produced by accounting systems is fundamental for the process of accountability. In the literature, accountability is conceptualized as a multiple responsibilities-based framework which provides the rights and duties in the relationship between two subjects: the principal and the agent (Gray et al. 1996; Contrafatto 2009). On the one hand, the principal is the subject that holds the rights and the resources for "instructing" what is required and/or expected from the agent. On the other hand, the agent is the subject (individual or collective) who has the "duty" to act on behalf and for the benefits of the principal. As explained by Contrafatto (2004, 2009), at the core of the accountability framework, therefore, there is the idea of the "ability" to provide "accounts" for the actions, and results, by the agent. It is clear that at the center of this framework, there is a need to provide appropriate accounting-based information. Without such information, the accountability mechanisms would not be possible. In the accountability literature, such information should be neutral, complete, transparent, correct and fair. It seems evident that the accountability mechanisms, and the role of information within them, will manifest in different ways in relation to the different "types" of accounting (Gray 2004): the accounting for internal managerial purposes and accounting for external disclosure (this will be discussed in the following section).

The accomplishment of the accountability duties to provide and disclose information is relevant not only from a strict business ethics point of view but also from a legitimacy-based perspective.

Clearly, the legitimacy-related issues are much more relevant for the external forms of accountability documents, such as those related to the financial and social (sustainability) accounts and reports. In this context, the correctness, neutrality, completeness and fairness of these documents, and related information, are an essential component of the accountability mechanisms which link the relationships between principal and agent. But what is legitimacy? As explained by Suchman (1995), legitimacy is:

> a generalized perception or assumption that the actions of an entity are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs, and definitions. (Suchman 1995, p. 574, about legitimacy see also Shocker and Sethi 1974; and Patten 1992)

Suchman (1995) emphasizes that:

> The analysis identifies three primary forms of legitimacy: pragmatic, based on audience self-interest; moral, based on normative approval; and cognitive, based on comprehensibility and taken-for-grantedness. (Suchman 1995, p. 571)

The author, in the same article, examines several legitimacy strategies which can be used for gaining, maintaining and repairing legitimacy understood in its three different forms (pragmatic, moral and cognitive). At the outset, it could be observed that, from a strict business ethics point of view, the moral form of legitimacy is a logical coherence. However, it is important to emphasize that not all the ethical legitimation practices are strictly connected with a real ethical view of managers and accountants, because these can be done for instrumental compliance only at times. What seems important, in this context, is to identify how both these compliance mechanisms with ethics work in the accountability processes and what the effects on the legitimacy processes are. As mentioned above, in this chapter we introduce a conceptual model, based on a "metaphorical merger" between ethical firm system theory and stakeholder management theory (Rusconi 2018), that is able to combine the ethical responsibilities of the management of the firm system, the rights and duties of every stakeholder, and to identify the dialectic nature between "pure" and instrumental/strategic ethical legitimacy. In particular, it is argued that the application of this model would have implications in terms of business ethics and legitimacy, in the context of three forms of accounting:

(a) Management accounting;
(b) Financial accounting, where strong law and principles, like "true and fair view" or "neutrality," exist along with spaces for discretional power;
(c) Social accounting, where the multidimensional and different kind of documents that exist could give more space for manipulation/instrumental ethics and legitimacy.

The remainder of the chapter is organized as follows. In the next section, we address the issues related to the interlink between accounting ethics and legitimacy. The third section discusses the concepts of legitimacy and legitimation in the context of ethics accounting. In the fourth section, we introduce and describe the heuristic model. In the final section, some final remarks are reported.

Accounting Ethics and Legitimacy: Preliminary Considerations

In this section we will address the issues of the relationships between accounting and ethics, with reference to the three forms of accounting mentioned above: management accounting, financial accounting and social accounting.

Ethics in Management Accounting

Management accounting is described as the branch of accounting which focuses in particular on the process through which accounting-based information is produced to support the managerial decision-making process. As emphasized by Drury (2008), management accounting information is mainly produced for internal users (i.e., managers), who need this information for deciding the most effective and efficient allocation of resources for achieving the operational, tactical and strategic objectives. Therefore, management accounting could be seen as a sort of "free-zone from any ethics" (see Gauthier 1986 regarding free-zone from ethics in economics and business) considerations. Indeed, any misuse or wrong "calculation" seems to be inconceivable, because these misuses, wrong or unethical actions would produce damage for the management. However, we argue that such superficial analysis would require further and deeper considerations. Since management accounting information can strongly influence the behavior and the focus of managers in their relationships with other stakeholders, we argue that it is possible to see a space for ethical considerations. There are, indeed, several situations where the decisions taken by managers, drawing on information generated by management accounting systems, will have an impact on other relevant stakeholders, for example, employees and investors. For instance, in situations of "make or buy," i.e., where assessment of whether it is more convenient and/or efficient to outsource part of the production process, the information generated by management accounting systems will be pivotal. If the management accounting practices are not carried out in a responsible, rigorous and ethical way, these will generate "disguising" information, which, in turn, will lead to "erroneous" decisions that potentially affect other stakeholders, such as, in the above example, employees. From this perspective, it seems important to talk about "ethical principles" in the way in which management accounting systems and practices are designed and implemented. These ethical principles should be able to guide the controller in the implementation of a system that is managed in a correct, transparent and responsible way. In addition, the same principles should be applied to guide the management accountant in the decision-making process, which should be undertaken in a responsible way. This implies that the management accountant, in deciding whether or not to undertake a certain action, should ensure that the decision is grounded on a transparent, fair and responsible set of managerial considerations. In other words, these ethical principles, therefore, should be seen as guiding principles not only in the designing and implementation stages of the management accounting systems but also in the subsequent process of decision-making. As a result, these principles will contribute to make the management accounting systems, processes and procedures more legitimate. In this sense, legitimacy should be seen in the form of trust, reliability and plausibility of the entire management accounting-related processes.

Ethics in Financial Accounting

Financial accounting, which is the oldest and still most diffused accounting practice, assumes that managers are responsible for providing an annual account about the costs and revenues of the closing financial year and the assets, liabilities, and equity at the end of the same year to several interested stakeholders. The historical development of financial accounting shows a continuous increasing set of regulations that have been adopted to avoid abuse, fraud and non transparent practices. National and supranational laws and regulations frame a detailed set of regulations that could be seen as the best way towards social legitimacy and ethics:

> Our understanding of the nature of accounting information has been influenced by professionally entrenched ideals about its qualitative characteristics (Hines 1991). These have been explicated in the Statement of Financial Accounting Concepts No, 8 (2010), issued by the Financial Accounting Standard Board (FASB) in the US. This statement enshrines the characteristic of faithful representation [nda: True and fair in various legislations and accounting principles] (FASB 2010, p. 17). There should be a correspondence between accounting information and the economic phenomena that it purports to represent (p. 17). Representational faithfulness entails three qualities: completeness, neutrality and freedom from error. (Andon et al. 2015, p. 989)

From this perspective, any space for ethics, which goes beyond the law and rules, seems to be quite limited, because the rejection of any incomplete, not neutral and erroneous financial accounts could be pursued only by respecting law and regulations; the true and fair view is required by law and accounting principles and not by an ethical volunteerism. On the other hand, however, the existing regulatory framework, which regulates firms' operations, leaves room for subjective evaluations of some accounting items, e.g., for possible lobbying of accounting principles and for other issues that affect the ethics of firms. For instance, avoiding bias in the accounting evaluations of certain items (e.g., goodwill, stock, etc.) does not imply trying to avoid loss. In this sense, discretionary accounting politics and evaluations should not be intended for fraudulent and/or opportunistic behaviors. Although the law and accounting principles are continuously trying to prevent and reduce the risks of instrumental manipulations and biases, these are sometimes unable to fully prevent such opportunistic behaviors, which may occur regardless of a formal compliance. Therefore, in order to better clarify the ethics aspects in the context of financial accounting, we should consider:

(a) The so-called earnings management as a key issue also for exploring the overlap between ethics and regulations;
(b) Lobbying of accounting principles and regulations.

Earnings management (hereafter EM) has been widely examined, particularly in connection with the effects of the cost of capital and/or economic resources allocation (Merchant and Rockness 1994; Healy and Wahlen 1999; Zahra et al. 2005; Martinez-Ferrero et al. 2016) and in connection with the positive accounting research (Watts and Zimmernan 1978, 1986).

EM practices occur when “management’s use of judgement also create opportunities for ‘earnings management’, in which managers choose reporting methods and estimates that do not accurately reflect their firm’s underlying economics” (Healy and Wahlen 1999, p. 366).

Although, EM practices are always not fully coherent with the true and fair view, these may not be able to be discovered, because these are undertaken by exploiting the discretionary valuations of some accounting items. With regard to this, we could distinguish between three different situations:

1. Clearly aggressive and not fully legal accounting politics (e.g., to present a real annual expense as capital expenditure): in this case, compliance could be done simply for avoiding penalties and criminal issues and not for ethical considerations. This is what happened with the “creative accounting” practices which emerged in various famous scandals such as Enron and Parmalat.
2. Voluntary but evident bias when accounting principles leave a discretional power to the firm in accounting valuation: this creates space for ethics.
3. Avoiding bias only for avoiding the risk to be punished and for pursuing an instrumental legitimacy rather than for a real ethical awareness.

Finally, EM practice could also be mentioned as a form of “micromanipulation” (Gowthorpe and Amat 2005), because there is “macro-manipulation”:

> The term ‘macro-manipulation’ is used to describe the lobbying of regulators to persuade them to produce regulation that is more favorable to the interests of preparers. (Gowthorpe and Amat 2005, p. 55)

In this case, there is an issue of ethical misusing of lobbying power by companies or associations of firms or professionals, which could foster official legitimacy by the public, but in the cases of evident bad results of this macro-manipulation, it could risk a big decline of public trust in the whole system of accounting regulations.

Ethics in Social (Sustainability) Accounting

Social (sustainability) accounting has been described as the part of accounting which is involved in producing information about the social, environmental and ethical impacts of the economic and operational activities undertaken by organizations (Hibbit 2004). As explained by Gray (2004, p. 80), social accounting represents therefore "*the universe of all possible accountings.[. . .]. social accounting covers an enormous range of issues- not just all of accounting and finance but labour law, ecology, carbon trading, theories of justice. [. . .]. The issues we are concerned with are exceptionally complex- the relationships between human culture, information, economics, business, morality, the planet and society.*" At the root of social accounting, as it has been described here, there is the normative framework of social accountability. It is through the preparation of social accounts and the disclosure of social and environmental information that the several stakeholders are potentially able to assess and evaluate the actions and initiatives that are (are not) undertaken by organizations in their commercial and operational undertakings. From these preliminary considerations, what seems to emerge is how the issues of ethics play an even more important role in the context of social accounting. The substantial lack of an overall and encompassing regulatory framework implies that there is the need to ensure that in all stages of the social accounting process (design, preparation, diffusion and auditing), there are always clear and transparent procedures, rules and frameworks which have been followed. In particular, it would be essential to avoid misuses of social accounting reports and processes, which, instead of being used for genuine forms of accountability, become tools which are instrumentally used by organizations and/or managers (Owen et al. 2000) to manipulate the impressions of several stakeholders (e.g., through forms of impression management) and/or image re-lifting. Hence, social accounting documents (e.g., sustainability reports, ethical documents, etc.) are required to be prepared and disclosed in a responsible way, i.e., they need to be prepared and used as genuine documents of accountability, rather than as instrumental documents for some opportunistic interests of managers and organizations.

In this section, we have briefly discussed issues of the relationships between accounting (in its several forms) and ethics. We have also seen how these different forms of accounting have implications for legitimacy. In the following we introduce and conceptualize the concepts of legitimacy and legitimation.

Legitimacy in the Ethics of Accounting

Lindblom (1994) explains that "legitimacy is a condition or status which exists when an entity's value system is congruent with the value system of the larger social system of which the entity is a part. When a disparity, actual or potential, exists between the two value systems, there is a threat to the entity's legitimacy" (p. 111). In other words, legitimacy is a situation which is achieved when the set of values of an organization is coherent with the values, expectations and requirements of the wider social context in which the organization operates (Buhr 2002). From this perspective, therefore, legitimacy is a "measure" of the "social acceptance" of the society with regard to the organizational activities (Neu et al. 1998). In this sense, the legitimacy is a critical element for the survival, prospect and future of any organization. It is for these reasons that organizations often adopt specific initiatives for gaining, repairing, or acquiring an acceptable level/status of legitimacy, so as to avoid negative consequences, which could potentially impact the existence of the organization itself. The legitimacy is acquired through a process of legitimation, which indicates the ways (i.e., the "how") in which organizational entities act toward the achievement of a desired state of legitimacy. In the process of legitimation, organizations could adopt different strategies (i.e., legitimacy strategies) through which to affect the perceptions, views, and expectations of the several stakeholders. At the core of the legitimacy theory, there is the idea of the existence of a social contract between the organization and society. The social contract (Suchman 1995) represents an informal contract between the organization and its stakeholders within society. How wide this range of stakeholders is depends upon the position on the continuum between a strategic/managerial attitude and orientation and a holistic/ethical one. From this perspective, organizations can be regarded as existing in a web of societal contracts. Some of these will be formal (legal) contracts, which set out the legally enforceable rights and responsibilities of each party to the contract. Others will be a broader generally applicable sets of rights and responsibilities established in regulations and legislation. Finally, there will be other forms that are informal sets of nonlegally enforceable expectations, which stakeholders have with regard to the rights and responsibilities of an organization. When there is a perception that there is variance between the actions and initiatives undertaken by an organization and the expectations/requirements of its social contract a *legitimacy gap* will emerge. This legitimacy gap will be addressed through a process of legitimation and by adopting specific strategies through which to acquire, maintain, regain, and increase the level of legitimacy. Among this process of legitimation and strategies that could be adopted by an organization, an essential role could be played by the different accounting and accountability documents which we have described above. As we mentioned in the introduction section, there are different types of legitimacy. For example, Suchman (1995) distinguishes between three forms: (a) pragmatic, which is based on audience self-interest; (b) moral, based on normative approval; and (c) cognitive which is based on comprehensibility and taken for grantedness. In the following, we will discuss how these legitimacy-related issues could be addressed from the perspective of the conceptual model which has been proposed in this paper. We argue that this stakeholder-based model could provide a strong contribution to this debate. The proposed model has two aims:

1. Firstly, it emphasizes that the complex and articulate relationships among all different stakeholders (top management included) always imply a very open approach toward the accountability legitimacy processes by and among all stakeholders.
2. Secondly, it points out that the "dialectic" relation between "strategic" and "pure" ethics may help to pursue a "moral legitimacy."

A Stakeholder-Based Model: What About Ethics and Legitimacy of Accounting Practices?

The stakeholder perspective developed from the work of some precursors (various precursors are indicated in Freeman and Reed 1983; Freeman 1984), who anticipated some partial aspects of this perspective. Originating from the strategic disciplines (Freeman and Reed 1983; Freeman 1984), stakeholder management theory (hereafter SMT) has widely diffused since the 1990s to impact on other related disciplines, for instance, business ethics, marketing and accounting (Freeman et al. 2010). SMT was applied, more or less consistently, to disparate fields of knowledge, from sociology to public management and politics (Phillips et al. 2003).

At the outset it should be noted that SMT should be understood as a "good useful idea" (Freeman 2005, p. 423) that forms a genre of theories (Freeman 1994; Freeman and Phillips 2002), which draw on six main theoretical concepts/principles. These will be discussed below.

> SMT1) a stakeholder can be defined as 'any group or individual who is affected by or can affect the achievement of an organisation's objectives' (Freeman and McVea 2001, p. 189);
>
> SMT2) a company can be described as a system of stakeholders and their relationships;
>
> SMT3) a top manager, acting in compliance with the stakeholder management approach and theory, works out strategies that take their consequences into account, not only for the stakeholder 'shareholder', but all the stakeholders;
>
> SMT4) top managers (stakeholders too) maximizing the well-being of every stakeholder, and, in this way, the shareholders' interests too;
>
> SMT5) a business operation without ethical aspects does not exist;
>
> SMT6) SMT is neither a socio-economic or political theory nor a comprehensive ethical theory. The need to refer to a specific 'normative core', therefore, follows (Signori and Rusconi (2009, p. 305)).

SMT1. . .SMT6 have a sound foundation in the pivotal paper and books about stakeholder view (Freeman and Reed 1983; Freeman 1984, 1994; Wicks 1996; Freeman et al. 2010).

SMT has been widely discussed, applied and debated in extensive literature in management fields. In particular, several critical questions about the ethics of business legitimacy have been posed (Rusconi 2009, 2018). The most important (and arguably the key issue for SMT) is understanding the connection between ethics and business; therefore the strict connection represents a useful key aspect for this analysis. In this chapter, we focus on the ethics/business relationship from the perspective of accounting ethics' legitimacy.

If we consider the work of Suchman and his classification of the forms/types of legitimacy, it could be observed that, unlike the pragmatic legitimacy, the moral form of legitimacy is "sociotropic," that is, it does not draw on the judgments about whether a given activity benefits the evaluator but rather on the judgments about whether the activity is "the right thing to do" (Suchman 1995, p. 579). As explained by Suchman (1995), the moral legitimacy *"may involve either affirmative backing for an organization or mere acceptance of the* *organization as necessary or inevitable, based on some taken-for-granted cultural account"* (Suchman 1995, p. 583).

Hence, the pursuit of social-public legitimacy is not necessarily seen as an ethically grounded behavior, because the respect of rules, law and ethical-accepted customs could not be ethically justified. On the other hand, the fact that SMT considers the conformity to ethical principles not only as an external limitation but also as an opportunity for implementing a sustainable business implies that the different ways of achieving legitimacy (in particular the instrumental and moral ones) could be indistinct. In this case, it would be possible to achieve a moral legitimacy by behaving ethically because ethics and sustainable business are seen in this situation as synergic aspects.

In addressing the aspects related to ethics, accounting, and legitimacy, two interconnected issues/questions emerge:

(a) How is ethical behavior related to accounting involved in the legitimacy pursuit process?
(b) Is it possible to achieve a real ethical and not only pragmatic/instrumental legitimacy? How is this research relevant both for business and ethics?

In order to address these interconnected issues/questions, a conceptual model is proposed that is the result of a "metaphorical merger" between an application of the so-called ethical firm system theory (Rusconi 1997, hereafter EFST) and SMT (see Rusconi 2018 for this merger). It is argued that these two theoretical perspectives are complementary, because both view ethics and business from a synergic positive relationship, and they reject any kind of separation thesis (Freeman 1994; Wicks 1996) and reduction of ethics only as an external constraint.

This conceptual model (EFST-SMT) is based on four principles:

1. The firm is a stakeholder system.
2. Each stakeholder "draws up" his own specific stakeholder "map."
3. All stakeholders tend to seek to achieve a reciprocal, dynamic equilibrium based upon "minimal mutual acknowledgement (hereafter MMA)."
4. While respecting MMA and inviolable ethical constraints, each stakeholder is involved in a negotiation in order to reach the strategic equilibrium most favorable to his/her own legitimate interests (Rusconi 2018, pp. 10–12)

Each of these principles is discussed below in more detail. A firm is conceived as a unitary system of stakeholders (top management and entrepreneurs included) and could be thought as ethically responsible, especially for their "deciders" (usually top management), and this responsibility is also connected with their legitimacy toward all stakeholders (principle 1).

Each stakeholder group identifies/constructs (almost implicitly) maps about their relationships with other members of the firm system (principle 2).

A stakeholder management approach must aim to find an equilibrium based on a "minimal mutual acknowledgment" (hereafter MMA), regarding at least a satisfactory well-being for all stakeholders (principle3). Not respecting MMA towards some stakeholders could put the legitimacy and the sustainability of the firm at stake, so that managers have to follow the fundamental synergy between ethics and business which is the key point of SMT.

With regard to principle 4, this is not relevant for financial and social accounting, because the principle concerns management and business decisions and not transparency, trustfulness and neutrality in complying with accountability duties toward all interested stakeholders.

SMT (see SMT1. . .SMT6) is not an ethical theory but originates from externally different ethical principles (Phillips et al. 2003). This could be seen as a good idea (Freeman 2005) for building a synergic cooperation between ethics and business, which, especially in the long term, is important for a sustainable business. For the business ethics point of view, it is nevertheless important to avoid an ingenuous view of a simple "a priori" easy convergence of ethics and business (see also Rusconi (2009)). As explained by Rusconi (2018):

> From a theoretical point of view, the refusal of an ingenuous *a priori* win-win is, first of all, connected with the fact that SMT is not a 'comprehensive ethical theory' (Phillips et al. 2003) and, secondly, that the 'genre' of SMT theories may be based on various ethical positions (Freeman 1994; Wicks et al. 1994; Freeman and Phillips 2002; Phillips et al. 2003). It is logically inconsistent to maintain that all the best decisions on profit-making for shareholders are always acceptable from any potential normative core. It is also inconsistent to think that all religions and philosophies always have the same ethical implications not for the majority, but for all potential economic decisions. From a practical point of view, let us consider the context of a degraded socio-economic-civil environment in which ethics plays a negligible role and where there may even be widespread disregard for the law itself, leading to advantages for dishonest citizens and firms. In this sense, we could easily refer to illegal (also often underpaid) labor, tax evasion and corruption, when they are systematic and go unpunished. (Rusconi 2018, p. 15)

So the EFST model proposes to insert a distinction between "strategic" and "pure" ethics, where the latter comes from the ethical point of view of stakeholders:

> 1. strategic ethics . . . consider that 'all the moral choices are made so as to safeguard the long-term equilibrium of the business system; here especially the aim is to avoid behavior in which the need to maximize profits is acted upon by a shortsighted management' (Rusconi 1997, p. 154); and
> 2. Absolute or pure ethics – concern the moral principles to be dealt with by the individual, or group of individuals, involved with business decision-making. In certain instances (which are rare if the viewpoint is not too narrow-minded), such principles could possibly conflict with the development of a success strategy, in which case a suboptimal ethical strategy might be developed (Rusconi 2018, p. 6).

The possibility of suboptimal decisions is nevertheless reduced as far as top managers and entrepreneurs are creative and aware of the future consequences for the firm of their politics (e.g., in absence of strong environmental regulations), but its possibility cannot be excluded, though could be a stimulus to be increasingly more proactive and enlightened. But what are the implications of this model for the relationships between accounting/accountability, business ethics, and legitimacy?

Clearly, the ethics of accounting/accountability involves all the subjects who are responsible for the preparation of these accounts: the auditors, the standard setters, and the national and supranational (e.g., European Union) governments. However, in this chapter we will focus on top management, entrepreneurs, and the firm's chief accountants: how and to what extent is the EFST-SMT perspective relevant? In the following we provide some reflections about how the proposed model could be adopted to avoid unethical behavior and improve the ethics of accounting/accountability processes.

As far as regards management accounting practices and documents, these are not connected to accountability. Managers and entrepreneurs, as seen above, have to take account of some cases in which decisions about "measurements" can, though indirectly, impact on their legitimacy and ethics toward stakeholders. This is, however, not a question of accountability, so these situations are not discussed further here.

Turning back to the context of financial accounting, one of the most important issues for ethics and legitimacy is connected with earnings management (hereafter EM), which is now considered not only in compliance with the law and accounting principles but, as we have seen before, can be covered in some cases, because of the subjective and discretionary politics of how to treat the accounting process. Excluding the situations of evident misrepresentations and fraud (such as Enron, Parmalat, or WorldCom), which are clearly very dangerous for the individual company and business, we focus on the manipulative use of the discretionary power of accountants. Managers and accountants can in some cases generate some estimated subjective advantage for the firm by adopting a moderate EM. Our proposed conceptual model, which draws upon a holistic view of the stakeholder idea, is a deterrent to EM because, in the respect of principle 3 (MMA), management should act by taking into account stakeholders (more or less implicit) mapping and decisions-making, by avoiding forms of manipulation for self-interested concerns. Some authors emphasize that EM does not represent transparent discretionary practices, because these "affect investors, employees, customers and the local communities, which is eventually reflected in corporate reputation and, hence, the market value" (Martinez-Ferrero et al. 2016, p. 305, who refer to Zahra et al. 2005). In particular, the authors sustain that "accounting practices could affect the value of companies, their stakeholder relationships, reputation and corporate image (Fombrun et al. 2000; Roychowdhury 2006)" (Martinez-Ferrero et al. 2016, p. 305).

Therefore, the application of a more holistic view of stakeholders could help to prevent some ethical short-sightedness of accountants and managers and to avoid practices that could jeopardize the legitimacy of their role and the accounting practices adopted and/or implemented.

Some firms practice another managerial behavior that is not compliant with ethics, though not easily seen by the general public: the so-called macro-manipulation, opposed to *micromanipulation* like EM (Gowthorpe and Amat 2005). This practice is clearly against the principles of neutrality and completeness.

Lobbying accounting principles jeopardize a possible pursuing of pragmatic legitimacy only if it can be clearly discovered, especially if the lobbied principles come from law or professional regulations. In any case it has a consequence on the unfair and unequal position among stakeholders, so that, sooner or later, if discovered can delegitimize firms and even accounting practices.

The EFST-SMT perspective, like with the EM case, can therefore contribute to prevent this risk of future delegitimizing.

The remaining issues of whether the dialectic between strategic and pure ethics, which is introduced by this stakeholder view of the EFST model, can help to shed light on the different forms of legitimacy, i.e. particularly pragmatic and/or moral (Suchman 1995). Though we assume that stakeholder approach can stimulate firms to reduce and/or avoid micro and macro-manipulation and to increase their legitimacy, there is still a need to consider whether this behavior is only a pragmatic (Suchman) means towards reducing the cost of capital, or it is related to moral consciousness: with regard to this, the strategic/pure dialectic EFST-SMT's point of view is useful.

An important and fruitful application of EFST-SMT could be a stimulus by "pure" ethics to a strategically instrumental one to be more ethically sound, because of its direct connection with "pure" ethics not with only pragmatic principles: this soundness could help to achieve a wider long-term perspective of the firm's management.

Turning back to social/sustainability accounting (hereafter SA), this has quite developed over the last two decades. Several important standards, though very often voluntarily, have been proposed. Ethics/legitimacy of SA needs more ethical focus than in the case of financial accounting. Although publishing this document could be seen as ethical and responsible *per se*, the multidimensional nature of these documents could favor micro- and macro-manipulation, even more than in financial accounting, that has for a long time been ruled by laws and accounting principles. Various principles and accounting/reporting standards have widely diffused, especially the Global Reporting Initiative (GRI (2018)) and Accountability 1000 (ISEA) process standard, whose aim is to be accountable to all stakeholders about the general impact of firms to them: economic-financial, social and environmental.

In any case, following an ethical/legitimacy point of view, essential principles are completeness, no material errors, and neutrality (like in financial accounting), but inclusion has to be emphasized also. Inclusion is important because of the multidimensionality of social (sustainability) accounting, by using not only financial quantities but also narratives and other qualitative types of information. This approach makes the manipulation of data and information easier. This unethical behavior can, sooner or later, jeopardize legitimacy. Even if official laws or rules do not exist, discovering not neutral or not inclusive social reports could delegitimize the firm and even (like in financial accounting) all the credibility of the reporting process. With regard to the macro-manipulation, similar reflections, like those related to financial accounting, could be done.

In conclusion, like in the case of financial accounting, EFST-SMT can:

(a) Defend ethical legitimacy by preventing some myopic social accounting process by taking account of principles 2 (taking into account the mapping by stakeholders) and 3 (pursuing a MMA condition).
(b) The strategic/pure ethics dialectics shed lights on the nature of pursued legitimacy; if it is moral or pragmatic, the second is less ethically sound in the case of less estimated risk of unethical behavior toward stakeholders.
(c) Put "pure" and "strategic" ethics in a positive and fruitful synergic relation, especially taking account of the multidimensional character of SA.

Concluding Remarks

In this chapter, we have addressed the issues related to the "ethical" foundations of accounting and accountability practices, for the purpose of envisaging accounting/accountability practices which are really for the interests of society and stakeholders. In particular, we have contributed to this debate by introducing a conceptual model that is able to illuminate some of the complexities of the relationship between accounting/accountability and business ethics. In particular, the model, which is the result of a *metaphorical merger* between a specific version of stakeholder theory and a systemic view of business ethics, is able to provide insights for improving the ethical foundations of accounting/accountability processes and to ensure their legitimacy.

The most important consequences of applying EFST-SMT to accounting ethical legitimacy are:

(a) It emphasizes that firm's accountants are in a system, where other stakeholders "make their accounts," so that legitimacy, of both a single firm or the whole business, should be always considered at risk of not legitimate, both with clearly aggressive and smoothing accounting manipulations.
(b) The legitimacy of firm's accounting practices is fostered by the awareness of the dialectic "pure"/strategic ethics, in order to provide an instrument for better understanding the difference between pragmatic and moral compliance. This helps accountants to open their minds, because of the stimulus of "pure" ethics to look for satisfactory and creative ethical solutions and, on the other hand, to let ethics experts be aware of real questions in accounting practices.

So in conclusion, speaking about ethics of accounting is at the same time simple and complex. It depends on the degree of the depth in which such issues are addressed. In a very simple way, it could be thought that being ethical and legitimate means only respecting laws and accounting regulations. On the other hand, considering the discretionary margins pose much more problems both for ethics and genuine accounting legitimacy. The proposed model, first emphasizes the dialectic synergy between ethics and strategy, in connection with the SMT's idea of synergy between ethics and business (Freeman 1994). This supports managers to take into account several subjects who are involved in the financial and social accounting, as an ethical disincentive against hidden frauds or window dressing. Second, the model incentivises scholars and practitioners to look for situations where ethical compliance could not be real moral legitimacy, but it is only the way to pursue pragmatic legitimacy. This chapter calls for future research to study, where and when, in accounting, it is possible to distinguish the different accounting practices toward legitimacy.

Abstract

This chapter aims at contributing to the section of accounting, financial reporting, and business legitimacy of the Handbook of business legitimacy as it unfolds a discussion about how social processes that exist at socially constructed relations within business context could be understood. In particular, the chapter challenges the arguments behind three main concepts and puts them under the same umbrella in order to enrich the already existing and open for further discussions about relations between corporate governance, social network analysis, and business legitimacy. More specifically, the idea behind this discussion is to encourage researchers to utilize the social network analysis methodology as an engine as it enables to opening alternative perspectives of looking into discussions on business

legitimacy in corporate governance and accounting contexts. In addition, the aim is to contribute to the field of public relations and philosophy of management by emphasizing the possibility of looking into the notion of legitimacy through networks, which are accounted as to be responsible for formulating of an interplay between business sector and society.

Introduction

This chapter aims at opening and broadening a discussion about the specific facets of a corporate governance world. In particular, one of the most prevalent issues that takes over an attention of researchers within the field of corporate governance is how a process of selection of board members, including both executive and non-executives, is undergone in practice. From a theoretical point of view, researchers have so far been interested in understanding of a such problemacy both from macro- and microeconomic perspective. Studies have centralized the problem either at a company level or at the national level. The focus of the company level research was to primarily discuss what are the consequences of the new board member selection on the efficiency and quality of corporate boards. Whereas, at the broader (national) level, studies are mainly focused on identifying the reasons and rationals for establishing of interlocking directorships.

For theory building incentives, it is noticeable that various aspects and theoretical concepts have been implemented to discuss the problemacy of selection process under the corporate governance umbrella – such as social, economic, political, managerial, etc. However, it is conspicuous that literature has omitted to discuss the construct of a selection process at its broader perspective and in relation to the concept of legitimacy in terms of how within and cross-company selection of board members is socially perceived to be legitimate. Albeit studies have directed attention and elaborated some other perspectives of relations between the concepts of corporate governance and legitimacy, that discussion has mainly been pointed to state governance, public governance, and the problem of power. In order to further broaden the discussion and emphasize the necessity of understanding the consequences and idea of social legitimation of social selection processes within the corporate governance context, this is found relevant to turn to the question of legitimacy in relation to the executive and non-executive director selection mechanism. Therefore, this chapter aims at shedding light to the importance of understanding the existence of social selection processes and the need to legitimation of those. Also, the chapter pursues that in order to better understand how social processes are legitimate during the selection, it is important to integrate the social network analysis.

Corporate Governance, Relations, and Networks

The Cadbury report defines the concept of corporate governance "as a system by which companies are directed and controlled" (Cadbury 1992). OECD extends the previous definition by integrating the concept of "relationship" where it states that corporate governance, besides of its genuine idea to direct and control the action, also includes set of relationships between company's management, board, shareholders, and other stakeholders.

One of the very first incentives toward integrating relationships has been found in Pattigrew' work (1992). In his review, Pattigrew (1992) was interested in developing the study where he will put the focus on inter- and intra-board processes while looking at the issues of power and influence. In a subsequent piece, he repeated the claim that any data on the close operation of boards in action is sparse. His work also argued that the research in corporate governance should emphasize actual behavior of board members and boards as units and not to only accounting for the presence of the members. Following this argument, the aim of the forthcoming chapter is to set an argument that, in order to understand corporate strategies, it is important to understand behavior of board representatives. Also, to better grasp how processes at the boards are socially legitimized, it is crucial to identify and analyze relations that unfold between the present actors.

OECD pointed out that relationships are fundamental for understanding the manner in which the objectives of the company are strategized (OECD 2009). This initiates the idea that relational ties that exist between social actors might reveal relatively more information about business strategies, than what individuals representing boards hold in regard to the strategy. By recognizing the magnitude of information held in ties, OECD incorporated the term of "relationship" within the definition in order to emphasize the importance of accounting for structures on acquiring understanding of the corporate governance. Forbes and Milliken (1999) argued that studying about the roles of board processes can help in clarifying the complexity of board design and, as a result, may induce boards to consider adopting process-related interventions to enhance board effectiveness. Such an argument has resulted in a long tradition of the research on corporate governance.

Relationships help to understand means of attaining companies' strategies and business objectives but also performance monitoring. Pointing to the fact that relationship between stakeholders in corporate boards is what brings the autonomy, sovereignty, and consistency, the research seems to be putting limited effort to understand business through relations. Some important efforts are apparent, but the literature has ended up discussing relationships by debating about incentives for establishing collaborative ties through interlocking directorships across multiple boards. So far, research has pointed out few incentives including allocation of capital, business control, generation of an interdependence between companies that bring interlocks to emerge, achievement of cohesion at the upper level social class (Mizruchi and Stearns 1988; Pfeffer 1972; Allen 1978; Allen 1974; Stokman et al. 1985; Zeitlin 1974; Pfeffer and Salancik 1978), etc. while omitting to discuss the structural appearance of network relations through an elaboration of more complex network configurations and how such incentives for interlock emergence are legitimate.

In this chapter, main interested is to further broaden the discussion of relevance for accounting on social relations to better understand strategies of corporate governance. In particular to emphasize how the use of social network methodology may be implemented as a sufficient statistical tool to identify network configurations that tend to emerge within the corporate governance context. Also, once the configurations are identified, they should serve as an evidence to explicating characteristics of the governance network as regards the identification of legitimacy of business strategy.

How Does that Link with Legitimacy?

Studies of neo-institutional tradition primarily understand the concept of legitimacy as a static unidimensional phenomenon that is dichotomous in nature and which separates the outcome on whether a firm possesses it or not (Pfeffer and Salancik 1978). In order to move from this static unidimensional phenomenon toward a more dynamic understanding of legitimacy, it is crucial to introduce some other concepts through which legitimacy will be contextualized and observed. In this regard, the concepts of corporate governance and relations are introduced. This does not imply that the central concept of legitimacy will cease within discussion related to an interplay between the other two concepts, but those two aim at enriching the understanding and broadening perspectives on how legitimacy may be alternatively understood. Thus, the aim of this chapter is to centralize discussion of the concept of legitimacy in the context of corporate governance that is observed through relational lenses. Therefore, in order to establish the base for problem comprehension, it is relevant to define the scope at which the suggested approach will be contextualized.

The concept of a business legitimacy is not new. Several conceptual discussions have been developed in regard to how different forms of political and governmental legitimacies have been attempted to be followed by corporations. Also, how such forms, if applied inside different contexts, appear to be legitimized by society (Coglianese 2007). Though the correspondence among corporate and governmental legitimacies has not been apparent in earlier days, nowadays they are more conspicuous. Particular similarities are apparent in institutional mechanisms that drive reforms of companies' systems of corporate governance, particularly in relation to membership structures at corporate boards.

Inside the governmental context, legitimacy is traditionally distinguished between (1) procedural legitimacy and (2) substantive legitimacy. According to Coglianese (2007), procedural legitimacy is defined as a democratic accountability, where elections are recognized as its dominant component. Also procedural legitimacy is defined in terms of institutional arrangements as the separation of power, transparency, and the rule of law that intend to combat abuses of power. On the other hand, substantive legitimacy represents rights, particularly those rights that are enshrined within constitution that makes certain actions off limits even to an otherwise procedurally legitimate legislature (Nozick 1974).

Based on this, a clear parallel could be drawn between government and corporate institutions. Corporate governance, generally, refers to appointment of two different elements – separation of powers across management, shareholders, and boards of directors, which is preceded by the procedures for selection and removing of board representatives. Following distinctions, it is apparent that the clear parallel between government legitimacy and corporate/business legitimacy exists on the level of procedural legitimacy, though not even at the substantive legitimacy level the parallel is missing.

The question of selection and removing/dismissing the board representatives has been of an interest to researchers for a long time. Studies within this field have also changed and enlarged the scale and the scope. It is apparent that the research field was initiated by the business entity scale (inter-board) and due to an interest to understand reasons for interlocking directorships extended discussion outside the scope of one company (intra-board). As a result, the reason for extending the scope of the corporate governance context is an omnipresent deficiency of a discussion on procedural legitimacy. Therefore, emerging validity and reliability problems stimulated extension of the research scope, which, on contrary, further limited the ability to approach to discussion of legitimacy at the broader empirical scale.

Turning back to the earlier introduced concept of relations and the characteristics of procedural governance, the question of how selection procedure of board members is legitimate to some extent tends to be lacking the answer. In particular, what both practitioners and researchers are lacking of to understand is how board member selection process is legitimate when the extent of the research surpasses a business entity level. The problem is found to be rather methodological, as the power of traditional research methods is limited, thus unable to capture structures through which the legitimacy could be observed. The question itself is legitimate as mechanisms that boards utilize to select board members may be rational and in compliance with regulations, while on a wider extent the existing relations between board members across different boards could condition a new ones to appear.

In extension to a Granovetter's (1985) argument, this chapter aims at pointing out the capacity of a social network analysis methodology for the research in business legitimacy at the corporate governance context. In particular, to identify how social selection processes are socially legitimate. The necessity for raising this question is legitimate itself as the selection process might be more complex if is observed across multiple boards due to a possible conglomerate of intertwined relationships that need to be understood.

During the past three decades, government regulations have introduced constraints to delimit how companies should be acting. The regulations and acts have significantly altered corporate behavior by making it less liberate and more limited. As to the response to a few well-known scandals (Enron, WorldCom, etc.), some necessary changes in a corporate world were in demand (Coglianese 2007). This has resulted with an introduction of Sarbanes-Oxley law of 2002 (SOX 2002), which was supplemented with the rules issued by regulators such as SEC, and stock exchanges. All those put together produced more procedurally constrained and less dissimilar corporate governance institutional structures in regard to those procedural devices imposed to government (Seligman 2005). There are four institutional features specific for corporate governance: separation of powers between executive and non-executive directors, transparency, code of ethics, and elections. *Separation of powers* with its incentive to counteract ambitions across structures breaks down the responsibility for leadership in two branches while employing the CEO who runs the company. In comparison to the separation of powers in governmental institutions, board members and corporate management have never been entirely separated (Coglianese 2007). Exactly such a continued permeation creates the blurred line of power separation between delegated groups and urges for utilization of alternative methodological tools to better understand how a requirement for legitimacy is fulfilled in, on a first glance, structured power delegation. The problem of blurriness has yet been discussed to some extent, but from the perspective of conflicts of interests which were results of collaborative relations developed across different corporate governance levels.

Another key feature of procedural legitimacy that represents the institutional feature is *transparency*. This aspect resembles to what the concept represents within the government context. In particular, it is expected that laws are made in open, and disclosure of information has to be public. In the business context, companies have, as a result of well-noted crashes, been a subject to a variety of different disclosure requirements that aim to create transparency (Seligman 1983), and SOX has made a significant effort to enable transparency.

Code of ethics to a corporate context is adopted by SOX to expand its use (SOX 2002). It calls for the SEC to engage corporate lawyers to report to higher instances on the evidence of security law violation. Finally, *elections* or selection procedures are major feature of procedural legitimacy for governments but also corporations. In the corporate governance context, it is noticeable that corporate management becomes more electorally accountable to shareholders, while shareholders lose a part of their rights to select board members as the choice of candidates is not their responsibility. In practice, shareholders vote on members of the board of directors, but they typically vote based on the list of those that are nominated by the existing board (Bainbridge 2002).

What the main interest of this chapter is to emphasize that current conflicts of interests within assembled corporate governance structures are sown already during the process of selection of board representatives. Also, structures of the corporate governance assemblage, in fact, might reveal more information on how the conducts of actions are socially legitimized than pure business strategy analysis. Thus, the chapter here tries to accentuate that understanding of how relational structures unfold is equally important for understanding legitimacy and recognizing if the legitimate actions are notable in relational structures or are a part of manipulative actions toward public eyes. Therefore, to be able to recognize existence of issues on a wider scale, in the forthcoming part of the chapter, the capacities of the methodology of social network analysis are shortly discussed.

Social Network Analysis as a Methodological Tool Suitable for Research in Corporate Governance Legitimacy

Social network analysis (SNA) has been developed as a method and a tool to interpret the world from relational perspective. It is, in fact, understood as a set of tools that can serve as an engine to understand the research problem by replacing the focus from focal actors, such as individuals, organizations, or institutions, to relationships that exist between multiple objects of a kind (Wasserman and Faust 1994).

Social networks are defined as sets of ties that connect nodes (Robins 2015), where networks do not represent graphs – which are mathematical conceptualizations of network. The term "social network" dates from Moreno and Jennings (1938) who invented sociogram and named their approach *sociometry* (Wasserman and Faust 1994). Unlike any other actor-oriented methodological approach, social network studies advocate actors' actions through relations they establish with the others (Kacanski and Lusher 2017). Relations might differ in direction, strength, and content that is exchanged (purpose), which further defines the nature of the network. Relations might both be directed and undirected (Wasserman and Faust 1994) and might carry different contents. Apart from the fact that content may both be positive (e.g., friendship, trust, collaboration) and negative (e.g., anger and conflict), the strength of the tie can also be weighted (e.g., if some relations are repeated over the observed period).

The methodology acknowledges the existence of three network types: (a) unipartite, (b) bipartite, and (c) multilevel networks (Robins 2015). Unipartite networks are assembled of a one type of nodes (actors) and one type of ties connecting them, while bipartite networks are those assembled of two actor types, while relations exist only between those actors of a different kind. The most complex structures are those between two groups of actors and three types of ties, both between each of the level and across the network levels. Besides of the sociocentric networks, this methodology also recognizes egocentric networks or egonets (Robins 2015).

A very few studies have had a substantial role on developing of social network analysis methodology, such as Granovetter (1985) study on economic behavior been underpinned in social relationships. In this study he has introduced the concept of network *embeddedness*, which has further found its position in SNA. Besides, a phenomenon of a *small-world* (Watts 1999), cognitive social structures (Krackhardt 1987), and network emergence (Stuart and Sorenson 2007) are concepts that have found their position in the theory of SNA as they have contributed to developing of it.

Besides of theoretical concepts that have brought SNA to develop, there is also a group of concepts that serve as a methodological tool that are suitable for implementation into research. Concepts such as degree, density, homophily, reciprocity, transitivity, cohesive subgroups, centrality, structural equivalence, structural holes, bridges, and network brokerage are considered as core concepts for the SNA methodology. Each of these concepts has been developed apart from an incentive to prosper an additional methodological tool, but their joint capacity has been recognized as to stand upon the same argument – which is that any social setting is attributed by complex relational structures. *Degree* is the simplest and primary concept in SNA and provides with an information about the number of ties between a single node and all the other nodes. In directed networks, indegree and outdegree are particularly differentiated. *Density* presents a general level of linking between nodes in a graph. Mathematically, it represents the proportion of present relative to all possible network ties (Scott and Carrington 2011). Even though the concept seems obvious and simple, it provides with crucial understanding of general network properties. *Homophily* is the principle according to which networks emerge. The principle states that ties tend to emerge between those two nodes that are similar to each other (Freeman 2008; McPherson et al. 2001) and usually refers to the observation that *birds of feather flock together*. Such a principle creates niches by localizing positions of vast majority of social differences that are present across society and which can be classified as status or value homophily (McPherson et al. 2001). With the use of an SNA tool, it is possible to identify those regularities that exist in a particular social setting, which potentiate identification of actors' attributes that play a role in establishing relational ties (Lusher et al. 2013). *Reciprocity* is the concept specific for directed networks and represents the tendencies toward mutuality of relationships, as an exchange is considered as fundamental social process (Robins 2015). Reciprocity is connected to the involvement of positive emotions, while in contexts which involve formal hierarchies, the presence of an effect is uncommon. *Transitivity* is in the social network context also known as triangulation, as it represents the process of establishing triads (network configuration assembled of three nodes with ties between them) (Cartwright and Harary 1956). Transitivity is in lay terms best depicted as "a friend of a friend is a friend" and results with clustering or network cohesion. With the development of network studies, triads have become a main network configuration, which are seen as building block of many social networks. *Cohesive subgroups* are subsets of nodes within an observed network representing social actors with substantially greater density compared to the rest of the network (Robins 2015). Clique is the most common form of cohesive subgroup and represents a complete subgraph where all possible ties between nodes are present. Since cliques may overlap across the groups of nodes within the network, and the lack of a single tie means that clique is not present, some relaxed criteria are introduced, and new forms of cohesive subgroups are k-plex, k-cores, and n-cliques (Robins 2015; Scott 2013). *Centrality* reflects the prominence of a social actor or a node within the observed network (Robins 2015; Lusher et al. 2013). The concept originates from the sociometric concept of the star (Scott 2013). Besides that the literature outlined nine different centrality measures (Freeman 1979), according to Robins (2015), there are five types of centrality for undirected graphs, which from degree centrality is the most widely used. It is an intuitive notion of a single node activity, as it measures local centrality by isolating the most active and the most popular node in the network. *Structural equivalence* is a network concept that implies that equivalent social actors tend to establish equivalent relational ties. The concept of a block implies grouping actors into groups such as teams, departments, etc. which is defined as a set of structurally equivalent actors with respect to other such sets that lead to development of blockmodels (White et al. 1976). They have interpreted the blockmodel as an abstract pattern among few aggregate units that characterize more detailed interactions between larger populations of individuals. *Structural hole* is a concept developed by Burt (1992) who argued that individuals standing between two groups might yield multiple benefits. These are considered as actors or nodes that stand between at least two social groups. At an individual level, those actors by bridging regions are in the position to benefit by brokering between two isolated structures (Robins 2015). Those actors are critical for network cohesiveness, while their removal from the network ruins it (de Nooy et al. 2011). Burt (1992) suggests that the opportunity to yield benefits is in individuals' capacity to identify not yet bridged subgroups, and this may yield to better ideas (Burt 2004).

Social network studies have during the time of development of the methodology mainly used linear regression to account for tendencies toward network tie emergence. As regression requires categorization of variables on dependent and independent, an ultimate condition for network emergence is not fulfilled. The problem of a classical dependent-independent condition has found its long way toward the inclusion and adaptation to its statistical form of the concept of *interdependency*. This concept implies that both endogenous and exogenous variables have simultaneous impact on an interplay of social relations that emerge at a particular setting. Therefore, it is not possible to distinguish them between the two elements of a classical condition. In this regard, a new class of statistical modelling has been developed to account for the presence and the absence of relational ties, named *exponential random graph models* (Robins et al. 2009; Robins et al. 1999; Robins et al. 2007; Wang et al. 2013). ERGMs are defined as tie-based statistical models for network structure that permit inferences about how and why network ties emerge (Lusher et al. 2013:9). Instead of observing tendencies toward tie emergence, the idea of ERGMs is to look at the presence of specific network configurations assembled of multiple ties. Configurations are representations of small local subgraphs. As a result, ERGMs work as pattern recognition device that estimates parameter values for a combination of configurations that are introduced into the model. The output of statistical estimations provides with the parameter values, which are further used for theoretical inferences (Lusher et al. 2013). Most importantly, ERGMs hold for the most important theoretical feature of social networks, which is that ties are dependent on each other. This assumes that the presence or the absence of a particular tie may have an influence on emergence or an absence of another tie in the network. The aim of the ERGMs is not to predict social actors' outcome in the network, which is called *social diffusion* or *social influence*, but to detect patterns and inform about network formation processes. Theory recognizes three tie formation processes: (1) network self-organization, (2) attribute-based processes, and (3) dyadic covariates. The first assumes that ties influence the other ties to emerge, while the second encourages the use of actor attributes to further explain network tie emergence, while the last one ties hold for special characteristics that further have an impact on other ties. Modelling in ERGMs is expected to be conducted in a manner that researcher should select those configurations that resemble the social processes that might characterize the social processes within that network, with the condition to simultaneously include all relevant network parameter. That is a crucial condition because social relations in empirical sense develop as a reaction to multiple processes, actors, and social variables that determine the emergence of social networks.

As an addition to this section, several network configurations that belong to the social circuit model are introduced, which is developed as an extension to the previous Markov model. Previous models have in SNA methodology found to be rigid, which caused degeneration problem-related modelling of relational parameters. Therefore, the introduction of a social circuit model has enabled to model tendencies for tie emergence through more complex network structures, rather than triangles only.

A Step Toward a Discussion of Corporate Legitimacy in Corporate Governance Context Through SNA Lenses

The question of “do we?” and if so “how?” do we understand corporate strategies and how business strategies find their way to be publicly legitimate is yet open for discussion. The incentives toward a better understanding of business strategies by public eyes have resulted with that companies publicly, and to some reasonable extent, present their business strategies. Such a public presentation aims at enriching social acceptance of corporate practice, which further results with achieving a level of legitimacy to those present and future actions.

What certainly has become an emerging issue in regard to the development of business strategies is the question of who develops them and in collaboration with who. Accounting for the concepts of power and influence on business strategy development, the argument that society can better understand business strategies and corporate incentives through understanding behavior of board representatives, it was immanent to propose alternative angles toward understanding the issue. As gaining access to observe corporative boards during the process of establishing business strategies might seem to be relatively difficult task, revealing alternative approaches to understand business strategy has been necessary. An emerging issue that prevented society from legitimizing publicly revealed business strategies, as previously mentioned, has been caused by different corporate scandals, so OECD (2009) argued that relations reveal more about corporate strategies, than the strategy itself. In particular collaborative relations that are established both within and between companies and other organizations and institutions might reveal more details about the strategy. This complies with the power of a theory of social networks that relations between actors might carry more information about actors than actors themselves.

The combination of corporate strategy and social relations holds for the capacity to give dynamics to the concept of legitimacy. Transformation of the concept from politics to the context of business has enabled to introduce and emphasize the relevance for social justification of corporate activities. However, social relations that are argued to hold for the capacity to reveal more information are of a special complexity to identify and approach. Since of the interest here is to observe one out of previously defined four institutional features of procedural legitimacy, *election*, the continuation of a discussion refers to that part of the concept comprehension.

By arguing that corporate strategy is dependent on those board members that assemble particular board, the selection of board members and relations established between them may reveal what the business strategy is. Such a revealing of business strategy through social relations enables putting the business entity's legitimacy to a test, since relational angle provides with the capacity to conduct comparison between promoted and actual corporate strategy. The board selection process plays an important role in the process of generating corporate strategy, as personal and professional attributes in the form of attitudes, experiences, education, interests, and knowledge may play a role in redirecting corporate incentives. Therefore, what is potentially found to be important is the reason behind the selection, and how and why relations tend to come about, and not the board assemblage itself. The reason for that is the possibility that board members establish relations with those they know or a similar to them (homophily), with who they might share common interests, which might be in the opposition with the overall business strategy.

Contrary to that, without analyzing relations, it is not possible to identify structuring principles behind board formations. Such complies with the argument that shareholders have only passive role in board member selection, as the election works on a principle of voting for pre-selected candidates. To this extent, it is relevant to add that even further complexity to the network study could be given if besides to board selection, also the selection of executive directors is introduced to the network. Such an idea may be utilized to identify tendencies for board and executive selection in order to analyze and understand business strategies at the corporate level utilizing two-mode network methodology.

In the following table, a limited number of network configuration are provided for the sake of giving the idea about the capacity of ERGMs and software, named MPNet (Wang et al. 2013), which in this regard may be utilized to model social processes within selected network. It is important to draw the attention that network configurations are open for interpretation, but the interpretation made based on their visual substance should be developed with care, in order to resemble the theoretical arguments introduced from different theories (Table 1).

The previous table gives suggestions on the use of a methodological tool of social network analysis to the research of business legitimacy in corporate governance. The structure and combination of parameters are not predetermined and final. The selection of network configuration will depend on development of hypotheses and theoretically driven arguments and in context to this book chapter should be serving only for an inspiration.

Conclusion

As a contribution to the Handbook of business legitimacy, this book chapter aimed at opening future discussions about triangulation between legitimacy, social networks, and corporate governance. The idea of triangulation is settled in the emerging

Table 1 Outline of few ERGM network configurations that may be utilized for estimation of parameters of corporate governance networks

Network configuration	Possible interpretation
	*One-mode popularity effect* – Parameter indicates presence of highly central actors. The significance of this parameter shows that network is characterized by board members that are popular in an observed corporate governance network
	*One-mode clustering effect* – This is an opposite effect from closure and indicates transitive collaborative relations at the governance level, where tie between central actors misses
	*One-mode closure effect* – Indicative of triadic clustering between actors. Shows if collaborative relation between two board members influences the selection of the same other board members
	*Two-mode popularity effect* – Parameter is used to estimate tendencies toward the presence of highly central actors that have ties established with nodes of a different group but the one the node belongs to. Parameter may be used when relations between executive and non-executive board members matter for analysis
	*Two-mode clustering effect* – Indicative for relations between different node types, where central actors do not have a tie between them. That is a transitive configuration where, e.g., non-executive boards might select those executives that have no collaborative relations between them
	*Two-mode closure effect* – It is indicative of triadic clustering across levels that include within-level closure. Such configuration may be used to identify, e.g., whether a collaborative relation between non-executive directors impacts the selection of same other executives for the board

problem of witnessing various corporate scandals of those companies that have already had legitimated practices. Arguing that publicly revealed business strategies might potentially counter to what corporate practice is, it has been emphasized that understanding relations within and across boards might reveal more information about the strategy than what public announcements on corporate strategy do. Besides, the chapter here introduced the concept of relations and the methodology of social network analysis together with providing input on the capacity of exponential random graph models for the analysis of corporate strategies and business legitimacy, to better understand the strategy and identify potential misalignments between the two. Lastly, the chapter briefly outlines several network configurations that belong to the social circuit model, which might be utilized to estimate parameters for network tie emergence. Finally, this chapter aims at informing future researchers about the capacity of the social network analysis and ERGMs as a cutting-edge statistical methodology for the research in the context of corporate governance for investigation of the problem of business legitimacy.

Social Accounting and Business Legitimacy 51

Leire San-Jose, Xabier Mendizabal, and Jose Luis Retolaza

Contents

Abstract

The monetization of social value of organizations has been questioned but also positively defended during the last decade. After a review of different methods, this chapter argues that social accounting (monetizing the social value) can make a positive contribution to legitimacy if it is well-designed, extended, and internalized in the organization. Having used practicing theory for 10 years, as more than 100 companies have applied social accounting, we have made an exploratory analysis to detect and describe the main reasons for businesses to use this method for monetizing social value. The findings show that legitimacy is the most

important reason for using this method; however, legitimacy to society is more important for businesses than legitimacy to public administration. Results also suggest that there is a change, at least in those companies, as their purpose is more social than economic, as they do not only worry about generating economical value but also, or even more importantly, about creating social value to society. It implies the beginning of a reinvention of the economy based on companies with social purpose.

Keywords

Social accounting · Monetize social value · Legitimacy · Social purpose

Introduction

Currently, social accounting has become a growing area in the field of business ethics (Gray et al. 1995; Gilbert and Rasche 2008; Retolaza et al. 2016). Particularly, society does not trust exclusively financial indicators, such as EBIT or EBITDA, or GDP from a general view. Then, the perspective that we have assumed is that we will need other social measurements to legitimate companies in society. In the era of triple bottom line (Elkington 1998) and sustainability (Dyllick and Hockerts 2002; Rendtorff 2016, 2017), financial analysis is not sufficient, because it only covers the financial performance and financial purpose of companies, but if we assume that financial performance is not the main purpose of companies, then a social measurement is needed (Retolaza et al. 2016). In this case, experts, such as N. Craig Smith in *The Wall Street Journal*, have also shown that "there's no question that there is growing awareness that the integration of environmental, social and governance factors into business practice is vital to managing risk and creating long-term value for the company." Then, the social accounting could give us the option to develop a complete social view of business that could generate a system to show the social purpose of the companies (Rendtorff 2017). With this aim, many forms of systematic measurement show the social contribution to the society by companies, legitimating them and arguing different reasons for their existence. Furthermore, many tools and principles' systems have been developed for this purpose, and almost 40 different measurements have been identified by Gilbert and Rasche (2008): UN Global Compact, Common Good Matrix, ISO 14001, Global Reporting Initiative, or Social Accountability 8000 (SA 8000), among others.

In this chapter, firstly we will show the meaning of business legitimacy and its importance and secondly a review of different methods to show the social value that a company is generating or could generate. Then, after describing different systems, we will present the utility of social accounting from a practical point of view using the results of a questionnaire with some companies that have already applied social accounting. One of the clearest results is that the first reason for using social accounting is reputational; however, when the process has been applied, organizations notice the other benefits of social accounting, that is, they do not only understand what type of company they are, but they also manage the company to a more social purposed company. Then, social accounting is useful for legitimating the businesses, not only from a reputational view but from a strategic one as well.

Indeed, we should change the prism that we use to understand companies, not only from a theoretical point of view by using Sustainable Development Goals (www.un.org/sustainabledevelopment/sustainable-development-goals/) that could change our society to a more sustainable world but also by employing some tools and measurements in order to understand in a quantitative way the actions that each business conducts. We have listened more than once that "the essential is invisible to eyes" (the tale of the little prince); and it is the basis of our argument; there are many things that companies make without a financial purpose, just with the aim to contribute to the wellbeing or a better feeling of stakeholders. In general, society has managed the economy and business exclusively in a quantitative form and using money as the basic element, as the financial perspective is unique for legitimating. Nevertheless, it is not the most essential point of business; there is a more important element, like the social purpose, relationships, and actions for humans that need to be reinforced and measured to show that businesses are managed based on social aspects too. Then, with this challenge, the discipline of social accounting has developed in different ways and aspects, and one of those is the social accounting based on GEAccounting experiences (see www.geaccounting.org) that we will use as the empirical root in this chapter to show the importance that social accounting bears for legitimating a company.

Business Legitimacy: From the Concept to Reporting

Traditionally, it has been considered that businesses are social creations and that their existence depends on the willingness of society to continue to allow them to operate (O'Donovan 2002). Legitimacy theory has its roots in the idea of a social contract between the corporation and society. A company's survival and growth depend on its ability to deliver desirable ends and to distribute economic, social, or political benefits to the groups from which it derives its power (Magness 2006). According to Suchman (1995), legitimacy could be defined as: "a generalized perception or assumption that the actions of an entity are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs and definitions" (p. 574).

Another noteworthy definition of legitimacy was proposed in the work of Deephouse and Suchman (2008), where they noted: "organizational legitimacy refers to the degree of cultural support for an organization – the extent to which the array of established cultural accounts provide explanations for its existence, functioning, and jurisdiction, and lack or deny alternatives. In such an instance, legitimacy mainly refers to the adequacy of an organization as theory. A completely legitimate organization would be one about which no question could be raised (every goal, mean, resource, and control system is necessary, specified, complete and without alternative). Perfect legitimation is perfect theory, complete (i.e. without uncertainty) and confronted by no alternatives" (pp. 50–51). "Contrary to the economic postulates that circumscribe the role of the associated companies exclusively to obtain the maximum benefit for the shareholder, there is a doctrine that envisages an alternative vision: they operate in society by virtue of a social contract" (Pahlen et al. 2014, p. 10). Then, companies must respond to the needs of society.

In this sense, the previous idea of an intangible social agreement or contract between business and society has served as a theoretical linchpin for many other theories, like stakeholder theory (Clarke 1998; Freeman 1984; Mitchell et al. 1997), legitimacy theory (Guthrie and Parker 1989; Patten 1992), accountability theory (Gray et al. 1995; Rendtorff 2016, 2017), and political economy theory (Buhr 1998), which have been developed in an attempt to explain various aspects of corporate social behavior (O'Donovan 2002). In this regard, the previous legitimacy theory rests on the assumption that an organization has no inherent right to exist. This right is conferred by society, but only when the company's value system is perceived to be congruent with that of the society in which it operates (Magness 2006).

According to Tornikoski and Newbert (2007), in order for new organizations to survive, they must be perceived as legitimate in both a cognitive sense, that is, they must be accepted by all of those groups who might be inclined to engage in resource exchanges with them, such as customers, suppliers, potential employees, and the like, and a sociopolitical sense, that is, they must be perceived as engaging in appropriate activities. Since legitimacy theory is based on perception, any response by management must be accompanied by disclosure, for actions which are not publicized will not be effective in changing external parties' views of the organization (Cormier and Gordon 2001; Magness 2006). If companies do not make use of appropriate disclosure, the intended audience will be unaware of what the company is doing or trying to achieve, and legitimacy will be problematic (O'Donovan 2002).

Concerning the issue of disclosure, it should be noted that disclosure in annual reports was primarily identified for creditors and shareholders and designed to discharge stewardship obligations so as to ensure ongoing access to financial markets (Gray et al. 1995). Over time, the concept expanded to include communities, consumer associations, regulators, environmental groups, and the media, plus others (Magness 2006). The objective of accounting expanded to include the provision of information to help stakeholders estimate the amount, timing, and uncertainty of future cash flows (Magness 2006), as well as to satisfy future interests (Gray et al. 1995).

Hence, in accordance with the previous viewpoints, creating a perception of attractiveness, credibility, or legitimacy is important in that legitimate organizations are considered to be more meaningful, more predictable, and more trustworthy (Suchman 1995; Tornikoski and Newbert 2007). Understandably, an organization must often "create an impression of viability and legitimacy before it will receive support" (Tornikoski and Newbert 2007, p. 314). Thus, "the company can be analyzed under the legitimacy taking into account the information that it transmits such as financial-accounting information or social reporting" (Retolaza et al. 2018, p. 162). By gaining legitimacy, a nascent organization should find it easier to successfully attract customers (Wiewel and Hunter 1985), recruit employees (Williamson 2000), and gain access to other critical resources (Baum and Oliver 1991). In short, legitimacy can provide the means by which a nascent organization becomes an operational organization (Tornikoski and Newbert 2007).

Quantification of Social Value Models: An Overview

In recent decades, the conception about businesses as generators of purely economic value has been modified, in favor of a more holistic approach that considers them as economic social systems that carry out their activities within a social system with which they interact. Firms distribute value widely across their stakeholder networks by means of higher wages or better benefits for employees or managers, better terms to suppliers, community programs, better customer services, or lower prices (Harrison et al. 2010). In this regard, social accounting relates to the social and environmental effects that are not reflected in traditional financial accounting practice, since the latter has traditionally been linked only to financial and economic magnitudes.

More precisely, social accounting could be defined as "the process of communicating the social and environmental effects of organizations´ economic actions to particular interest groups within societies and to societies at large" (Mathews 1997, p. 483). However, one of the main pitfalls of this discipline is that, in comparison to financial accounting, there is no universally recognized framework for social accounting. Therefore, the social accounting models chosen do fulfil the following conditions: firstly, they are applicable to any kind of businesses, for-profit or nonprofit. Secondly, they are models that can lead to the self-assessment of businesses. Finally, the information about them is publicly accessible (Tuan 2008).

The following points will describe these models and evaluate them according to different dimensions, like level of application, stakeholders' participation, metrics generated, data requirements, and effort required.

The Economy of Common Good

The Economy for the Common Good (ECG) is a comprehensive and coherent economic model and is practiced in hundreds of businesses, universities, municipalities, and local chapters across Europe and South America. It represents an alternative to both capitalism and communism, as it emerges out of a holistic worldview and is based on "sovereign democracy," a stronger democracy than exists today (Felber and Habelberg 2017).

The Matrix of Common Good intertwines fundamental values – human dignity, cooperation and solidarity, ecologic sustainability, social justice and democratic co-determination, and transparency – with the main stakeholders of the business: suppliers, financers, ecologic sustainability, customers, and social and natural environment. The assessment follows a punctuation scale in terms of percentages from 0% to 100% and is divided in diverse development measures. Each one of the 17 criteria is assigned a maximum punctuation (between 30 and 90 points), and there are even negative criteria concerning detrimental behaviors for the common good, which add up to a number between 100 and 200 negative points for each criteria selected. Overall, business could obtain up to 1000 points (Ayuso 2018; Felber and Habelberg 2017).

B Impact Assessment

B Impact Assessment is a tool developed by B Lab organization to assess the social and environmental performance of a business (Ayuso 2018). B Lab is a nonprofit organization that has promoted the B Corporation model, which refers to businesses that meet the highest standards of verified social and environmental performance, public transparency, and legal accountability to balance profit and purpose. B Corps are accelerating a global culture shift to redefine success in business and build a more inclusive and sustainable economy (www.bcorporation.eu/about-b-corps).

The B Impact Assessment (BIA) is a free, comprehensive, and industry-specific tool designed to measure the social and environmental impacts of a company. Taking the BIA will let see where the company could improve across five aspects, called "impact areas": Governance, Workers, Community, Environment and Customers. To progress with B Corp Certification, the company must reach, in the approximately 100 questions of the questionnaire, a total verified score of at least 80 points out of 200 available on the BIA (Ayuso 2018; www.bimpactassessment.net/).

After completing the BIA, B Lab will verify the score to determine if the company meets the 80-point bar for certification. Then, business representatives that have completed the BIA will meet virtually with B Lab staff to review the completed BIA and submit confidential documentation to validate the responses. To maintain certification, B Corps update their BIA and verify their updated score every 3 years.

Social Return on Investment (SROI)

SROI is a term originating from return on investment (ROI) used by traditional investors. It describes the social impact of a business or nonprofits' operations in dollar or euro terms, relative to the investment required to create an impact and irrespective of its financial return to investors. It is based on the net present value of these nonmarket impacts in dollar terms (Lingane and Olsen 2004).

In fact, it tells the story of how change is created by measuring social, environmental, and economic outcomes, using monetary values to represent them. This represents a ratio of benefits to costs. For instance, a ratio of 3:1 indicates that an investment of 1 € delivers 3 € of social value (Nicholls et al. 2009). The SROI measures the value of social benefits created by an organization, in relation to the relative cost of achieving those benefits, as illustrated below (Rotheroe and Richards 2007):

$$\text{SROI} = (\text{Net Present Value}/\text{Net Present Value of Investment})$$

Moreover, SROI explicitly involves stakeholders at every stage, from deciding what indicators to use to putting financial values on outcomes (New Philanthropy Capital 2010).

Global Reporting Initiative (GRI)

GRI has developed sustainability reporting since 1997. It is a project created by the collaboration between UNEP (United Nations Environment Programme) and CERES (Coalition for Environmentally Responsible Economies). In fact, most of the largest corporations report on their sustainability performance using this type of reporting. It is based on the triple bottom line in order to disclose economic, social, and environmental issues of an organization in a standardized way. It helps to detect risks and to show where opportunities to improve the impacts to the society are. It is based on everyday activities and to report the organization's values and governance model. This type of report quantifies, but does not monetize social impacts, and although "expectations have grown up that GRI may be a step towards standardization in regard to accounting, the truth is that so far no regulations have been established in regard to monetizing indicators, and given that GRI is being developed as a framework for presentation rather than valuation such regulations are unlikely to be created" (Retolaza et al. 2016, p. 7).

The main purpose of GRI is general, and basically it is about reporting for understanding the sustainable development while establishing how to improve it. However, something this reporting has considered as a systematic system that shows basic information about the indicators, but they are not enough to enable new accountability relationships.

The GRI calculates social impact of economic activity using adapted cash value added statement, arguing that a part of the social impact comes from economical transactions. It is based on retrospective data, and it has made an effort to improve during the last years; however, there are some lacking points such as an explicit, geographically based, and scale-based theoretical framework. In this line, we should highlight its lack of usage for strategic decisions, as its focus is mostly on communicating. See www.globalreporting.org for a more exhaustive practical explanation.

Monetization of Social Value (SPOLY Methodology)

The SPOLY methodology, better known as the "polyhedral model," is a social value monetization model that was coined by the ECRI Research Group of the University of the Basque Country and the University of Deusto (Basque Country, Spain). The findings obtained have enabled an integrated accounting model where the social and economic value generated by the organizations for their stakeholders as a whole can be considered jointly. Nowadays, an economic interest group, called

GEAccounting (www.geaccounting), which paradoxically has no profit purpose, exploited it. This organization consists of the grouping of university, companies that have applied the social accounting, and consultants who help companies implement the social accounting system. In this regard, the SPOLY methodology rests on four basic assumptions:

- Stakeholder theory: This theory posits that the firm needs to satisfy stakeholder interests, and this satisfaction enables the firm to create value to stakeholders. It has been argued that "the primary responsibility of the (business) executive is to create value for stakeholders" (Freeman et al. 2010, p. 28). Creating value requires a joint effort by all stakeholders with implicit knowledge that their stakes are multifaceted and interconnected (Garriga 2014).
- Phenomenological paradigm, as the aim of interpretative phenomenological analysis, is to explore in detail how participants are making sense of their personal and social world. The main currency for this study is the meaning that particular experiences, events, and states hold for participants (Grocke 1999).
- Action research, defined as: "a participatory, democratic process concerned with developing practical knowing in the pursuit of worthwhile human purposes, grounded in a participatory worldview. It seeks to reconnect action and reflection, theory and practice, in participation with others, in the pursuit of practical solutions of issues of pressing concern to people. More generally it grows out of a concern for the flourishing of individual persons and their communities" (Bradbury and Reason 2003, p. 156).
- Finally, another vital principle of this methodology is that of fuzzy logic. In contrast to two-valued logical systems, where a certain proposition is true or false, in fuzzy logic a proposition may be true or false or have an intermediate truth value (Zadeh 1988). This logic is adequate in the process of social value quantification, where there is difficulty in assigning a range of value to a certain output due to the range of variability of upper and lower bounds, in comparison to classic financial accounting, where the range of variability is more reduced (Retolaza et al. 2016).

The development process of SPOLY methodology follows five phases: creation of a timetable for the process, identification of stakeholders and sketch of a stakeholder map, identification of value variables by means of interviews with stakeholders, monetization of outputs, and calculation of the social value. Even if the duration of the monetization process may vary from one company to another, it is believed that the average duration ranges from 6 months to 1 year. In this regard, the execution of interviews with stakeholders tends to be the main reason why the project can be delayed (Retolaza et al. 2016).

In this respect, it should be mentioned that this methodology has been applied successfully in different organizations, like Euskaltel and Gamesa, or nonprofit companies like Lantegi Batuak and Formació i Treball (organizations that strive to give a job to disabled people) or the mining museum of the Basque Country. The results have been encouraging, and it is expected that the methodology will increase its practical application.

Once the chosen social accounting models have been explained, Table 1 will sum up the main characteristics of the different models.

Table 1 Overview of social value assessment models

Social accounting systems	Economy of common good	B impact	Social return on investment (SROI)	Global Reporting Initiative (GRI)	Social accounting (SPOLY)
Objective	Establish a rating in relation to the value that companies bring to the stakeholders	Establish a rating in relation to the value that companies bring to the stakeholders	Evaluate investment Analyze internal efficiency	Report on the impact that the organization has on the relevant variables for its stakeholders	Measure generated social value of an organization during a period Analyze relative social efficiency
Analysis level	Business activity	Business activity	Social project	Triple bottom line: economic, social, and environmental	Business activity
Quantification of values	Points-based analysis (positive and negative)	Points-based analysis	Monetary value-based analysis	They are quantified but not monetized	Monetary value-based analysis
Benefits	They are defined deductively, standardized, and weighted for each company. It's not clear how they look	They go beyond profit, they consist of a range of indicators that the promoter group considers to contribute to the social good	Consider all kinds of impacts (social, economic, and environmental) Identifies the potential negative effects of the intervention Use financial proxies to estimate the value of profits that are not easily monetized	Inform the stakeholders about social and environmental risks, as well as the value generated in these areas. It allows comparative monitoring in relation to previous years and companies in the same sector	It incorporates the entire socioeconomic impact Report social benefit as monetary value It uses financial proxies to estimate the value of the total profit
Application level	Organizations	Organizations	Projects, programs, and policies	Organization and value chain	Organizational and strategic policies
Temporal perspective	Retrospective	Prospective	Prospective	Retrospective	Retrospective
Discount of flows	No. Points-based analysis	No. Points-based analysis	No	No	No; past value is used

(continued)

Table 1 (continued)

Social accounting systems	Economy of common good	B impact	Social return on investment (SROI)	Global Reporting Initiative (GRI)	Social accounting (SPOLY)
Dialogue with stakeholders	No	No	Yes	Yes	Yes
Main utility	Orientation to public intervention (incentive, limits)	Facilitate business transformation Orientation to public intervention	Establish priorities for investment decisions	Fundamentally communication and, to a lesser extent, review of the strategy	Understand the social value generated by exploitation of the company in a period Options to include in strategy and advanced management purposes

There are different methods for describing the social value of an organization. However, we have considered that it is necessary to get a comparable system not only in a unique moment but also during different years. Using this commitment as the basic norm, money is one of the best systems to establish comparability among organizations. The utilization of money has been generalized during decades, and it is used around the entire world. Then, it could permit the comparability in similar conditions between different companies around the world. Moreover, the SPOLY method that we have chosen is useful not only for taking decisions in a certain moment to determine, probably, which type of social project will be useful but also for analyzing if the whole running of the company in a period is efficient socially or not. Then, it is a retrospective analysis, similar to traditional accounting. Finally, another reason for the previous choice is because this method groups all the actions of the company, and not only part of them; then, the social accounting monetizing social value is the unique that includes all these previous queries.

Other methods are useful, of course, and we will use them in a complementary way. They are used for different purposes; for example, economy of common good is useful for a more qualitative analysis orientated to public intervention based on standardized aspects to analyze, B impact uses point-based analysis and then encourages the transformation of the company to the previously established social rules, and social return on investment is a very generalized system that is used to evaluate a social project. However, by using social accounting, it is possible to calculate the SROI ratio, as well. GRI is used in a standardized form, and after some reviews it seems that nowadays it is used not only with respect to classify the level of implication of activities with social impact but also to monetize some of them.

Understanding the Use of Social Accounting from a Legitimacy View

When speaking about methods and methodological approaches, one should first clarify what is meant by method. Method is the procedure of connecting propositions about causes with propositions about effects. It is the shortest way of finding out effects by their own causes, or causes by their own effects. In this regard, it is common to all sorts of methods to proceed from known things to unknown (Talaska 1988). The function of a method is twofold: discovery or invention and demonstration or manifestation of connectedness between conclusion and first principles; it can also be said that it is a means of proceeding in order to arrive at new knowledge and a means of teaching. Among the many different methods that are adopted with the aim of conducting research, we can find analytic-synthetic and hypothetic-deductive ones (Talaska 1988).

To start with, we should take a look at the different components of the previous methods. Concerning the analytic method, it has its roots in the world analysis. According to Diderot and D'Alembert (1751), analysis is the method to be followed in order to discover the truth, also called the method of resolution. By means of this method, one gets from the composite to the simplest, whereas synthesis leads from the simplest to the complex. Analysis consists in returning to the origin of our ideas, developing their order, decomposing and composing them in a variety of ways, comparing them from all points of view, and making apparent their mutual interrelations. In searching for truth, analysis is an enemy of vague principles and of every aspect that could be contrary to the accuracy and precision (Diderot and D'Alembert 1751).

In contrast, the synthetic method is a method used to find out the truth by means of already demonstrated principles and propositions that we have already proved, with the objective of getting to the conclusion by a sequence of well-known and already demonstrated truths. This method is also called the method of composition, and it is the method that has been used in the majority of mathematic demonstrations in the past, where the usage of definitions and axioms is customary in order to get to the solution of propositions and problems (Diderot and D'Alembert 1751).

When putting together both methods, we can arrive at the analytic-synthetic method, which consists of splitting a problem into its elementary component parts, analyzing them separately, and then integrating them into a relational model (Retolaza et al. 2016). This is particularly true in areas like philosophy, where the most general procedure is to start with knowledge of the most universal things and their causes and to proceed synthetically by deduction to explain less universal things. But to get to the knowledge of universal aspects and their causes, we should take into account that the knowledge of universal things that are contained in the nature of singular things is to be acquired by resolution or by analysis (Talaska 1988).

We will explore the reasons to apply the social accounting (SPOLY) using different secondary data. Our evidences are generated based on those companies (half hundred in 2018) that apply this method with the purpose of monetizing social value. Then, by applying the evidence that comes for applying practicing theory perspective (Feldman and Orlikowski 2011), we will show what the most important reasons for using social accounting are.

We got the answer of almost half of companies that started the social accounting method for monetizing social value of organizations during 2017.

Firstly, we show that most of companies answer 4 or 5 in a Likert scale of 5 points (see Fig. 1); then as we could expect, the companies apply social accounting method because it is quite or very interesting for their companies in a general view.

Then, the results show that monetizing the social value of organizations with the aim to show what they are doing apart from the economic activity is a subject of interest for all the organizations analyzed. However, in this chapter we want to show not only the positive side of applying social accounting for all the organizations that use it but more importantly the reasons for using the system for organizations in general. In this regard, in the next figure (see Fig. 1), we have shown the mean value using a Likert scale for evaluating the level of importance of each statement in relation to legitimacy, communication, and knowledge.

In this line, other studies, such as the study carried out by Lazkano and Beraza (2019), have shown that one of the most important reasons is the "need to justify subsidies received from Public Administrations" (Lazkano and Beraza 2019, p. 7). They suggest that it is also very important the mission and the use of social accounting to measure its veracity and impact into society. Then, the purposes of applying a social acounting system are based on legitimacy, and there are evidences that show this (Lazkano and Beraza 2019). Then, in general the studies show that legitimacy to society is more important than legitimacy to public administration. In the second level the reasons are based on social value creation knowledge, increasing the social value for society with a 4.17 and knowledge of the own organization with a 4.13 points. Finally, the reasons are based on communication aspects with a mean value of 3.7 because there is a huge difference between the intentions to

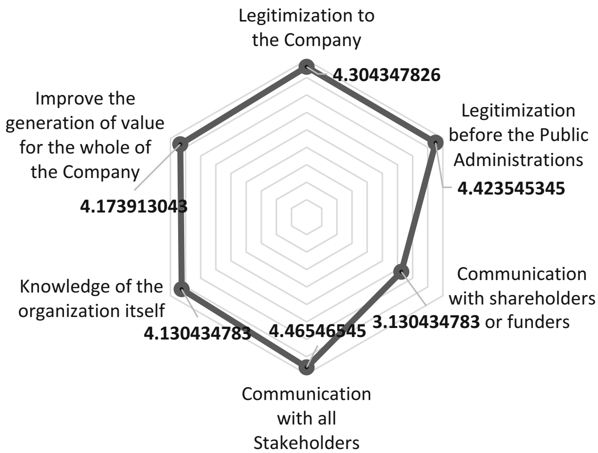

Fig. 1 Importance level of the reasons for applying social accounting in order to monetize social value (note that the values from 1 to 5 point to the importance of a list of statements based on Naranjo-Gil and Hartmann 2006)

communicate with stakeholders that are valued with 4.3 points and communication with shareholders with only 3.1 points. One of the first findings is related to the importance of using the social accounting for legitimacy purposes but also understanding that the company is important and the communication with others that are not shareholders or financiers is vital too.

Also, it is shown in San-Jose et al. (2020) that there is an option to apply the social accounting data as an efficient ratio. For this purpose, it has been applied the social accounting to health system, a hospital concretely; and it is useful to establish if the public financing is used with social purpose. Then, social accounting is not only a communication system but also is strategically possible to develop, legitimating this information system not only to communicate to society and public administration but also to monitor the results and improve the quality of them.

Concluding Remarks

Businesses are social creations, and their existence depends on the willingness of society to continue to allow them to operate, and for that to happen, they should be legitimated for this purpose. There are many different methods that help in this process because the methods show the results of the established purpose of companies. When we assume that companies should give back to the society a value, we need to establish this value not only with economic measures, because classic value measures are only using the economic transactions and in a business there are other different aspects that are more relational or, at least, they are not linked to a money transaction. Then, it is important to review different methods with this purpose, and therefore after the comparison between different methods that we have made, we have chosen the social accounting that monetizes the social value to show three aspects of companies that have already applied it: level of interest, importance, and utility. We have used an online questionnaire to get information about these issues based on a pre-evaluated questionnaire during 2018.

It is expected that the results of this chapter will have made a threefold contribution. Firstly, we have shown that the social accounting system based on monetizing social value is possible to use (we show another evidence for practicing theory), and at least almost half of the businesses analyzed are happy and value positively the utility of the method. Secondly, the most important reason for using this method is legitimacy to society; then it is important not only to know and improve the social aspects of organizations, as they give them the validity in front of society to explain and argue what they are contributing to the society and why. Then, it is shown that there are some important reasons based on legitimacy but also other aspects that go beyond permitting to organizations to include as an important strategic key the social purpose objective. Thirdly, the social values are important, and even more important than economic results for some companies, so we have perceived the beginning a reinvented economy based on companies with social purpose.

Legitimation Strategies for Business Corporations

Business Legitimacy and the Variety of Normative Contexts

52

Contents

Abstract

Legitimacy research suggests that companies obtain moral legitimacy when acting in accordance with commonly held norms and values of the social system. In recent years, more attention has been paid to the fact that such systems are heterogeneous. Assumptions about what is morally right and wrong differ, not only between normative contexts but also within them. For that reason, the issue of moral legitimation becomes complex. The focus of the chapter is on the nature of the normative contexts in which companies attain legitimacy. Light is shed on the variety of normative contexts and the way that companies relate to these. It is argued that normative contexts differ with regard to both the number of competing normative ideas and the strength of these ideas. In addition, multinational companies face a multitude of social systems in which moral legitimation takes place. The chapter provides a model for understanding various normative contexts. It is argued that depending on the nature of the contexts, moral legitimation will operate differently.

Keywords

Heterogeneity · Legitimacy · Moral legitimacy · Normative context

Introduction

Business legitimacy is a concept that has gained much attention in recent years. It has been studied from institutional and strategic aspects (see, among many, Aldrich and Fiol 1994; Suchman 1995). Today, we know much about the basis and the nature of legitimacy and about corporate strategies to gain, maintain, or restore legitimacy (Aerts and Cormier 2009).

Legitimacy is frequently understood as either moral, pragmatic, or cognitive (Suchman 1995). It has been defined as a “generalized perception or assumption that organizational activities are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs, and definitions” (Suchman 1995, 577). Legitimacy, thus, is contextual and is granted by a collective audience relevant to the company.

These audiences, however, are not easily defined as uniform clearly situated collectives. Contemporary businesses often face legitimation problems relating to the fact that they do not only encounter a variety of audiences but they also operate within complex and varying systems of norms, values, and beliefs.

The fact that legitimation in general, and perhaps moral legitimation in particular, has become more complex in recent decades can been explained by two overarching forces: first *individualization* and second *globalization* (including migration). Various scholars have discussed legitimacy and legitimation against this background. Scherer and Palazzo (2006), for example, point to the ongoing process of individualization that fragmentizes the once more or less homogeneous cultural understandings of societies (see also Scherer and Palazzo 2011). In modern cultures, values, interests, goals, and lifestyles flourish alongside each other, sometimes causing conflict, but at the very least increased complexity and heterogeneity. Globalization, furthermore, brings worlds together and, accordingly, also various cultural and existential understandings that used to be separated by borders and distance. Legitimation, for these reasons, becomes a much more complex process that what can be assumed in uniform and homogeneous environments.

It is a well-known fact that companies, in particular multinationals, navigate between different expectations and requirements in the varying contexts where they operate. Being, for example, a multinational enterprise (MNE) involves legitimation complexities both externally – through operations in different countries with varying normative assumptions and perceptions – and internally, where various subunits may strive for legitimacy within the firm (Kostova and Zaheer 1999). Due to lack of uniformity within and between social systems (Child and Rodrigues 2011), companies face simultaneous and conflicting moral legitimation and delegitimation. An implication of this is that most, if not all, companies live in a state of legitimation ambiguity. In the case of the MNE, this relates to dealing with more specific practices (cf. Donaldson 1989), as well as more general normative requirements that the normative contexts prescribe.

For corporations seeking legitimacy, the issue is problematic for at least three reasons. *First*, the company may operate within different social systems, with a multiplicity of requirements from both a legal and moral perspective (Scherer and Palazzo 2006), resulting in conflicting and contradictory legitimation processes (and strategies). *Second*, even within the same social system, it is likely that generalization is complex due to conflicting norms, values, and beliefs (Child and Rodrigues 2011). *Third*, due to the complexity of legitimacy itself, and its different variants, even within the same social system, some form of legitimacy may be present while others are not.

However, despite the fact that legitimacy has been seen as a complex phenomenon due to heterogeneous normative contexts (Kostova and Zaheer 1999; Scherer and Palazzo 2006), relatively little focus has been on *how* these contexts are heterogeneous from a normative and a moral point of view and in which way this matters to corporate moral legitimacy. Thus, the chapter focuses less on specific strategic approaches of companies given heterogeneous normative environments (cf. Pache and Santos 2010; Lamin and Zaheer 2012; Reast et al. 2013; Scherer et al. 2013) but more on the contexts themselves and the predicament facing businesses given that they operate within or between them.

More specifically, the research question of the chapter is: In which way are normative contexts varying, and what is the significance of varying normative contexts for business legitimation? The chapter will give an answer in terms of discriminating between (a) the "number" of competing ideas within a particular context and (b) the relative strength of the normative ideas within the context. In doing so it also takes into account (c) the predicament of business organizations situated in separate normative contexts.

The chapter is structured as follows: First, the corporate need for moral legitimacy is discussed. Then, the variety of normative contexts in which moral legitimation takes place is highlighted and analyzed. Next, the nature of heterogeneous normative contexts is treated through an analytical lens. Finally, conclusions are drawn.

Moral Legitimacy

Legitimacy has been the topic of business studies for at least four decades. Starting with a more general interest in the institutional conditions of the company (Parsons 1956; Meyer and Rowan 1977), and how they explain organizational phenomena (DiMaggio and Powell 1983), scholars have paid attention to the strategic aspects of legitimacy (Suchman 1995), seeing it as a resource necessary to obtain, maintain, and retain depending on the circumstances (Pfeffer 1978).

Commonly, legitimacy has been understood as either pragmatic, moral, or cognitive (Suchman 1995), that is, building on self-interest, values and norms, and meaningfulness, respectively. Legitimacy, in general, is "a condition reflecting cultural alignment, normative support, or consonance with relevant rules or laws"

(Scott 1995, 45). According to this view, legitimacy is not a commodity that an organization owns or exchanges. Normative and cognitive forces condition legitimacy in the sense that they constrain, construct, and empower organizational actors (Scott 1995, see also Deephouse and Suchman 2008). Legitimacy can never be owned; it is, rather, a construct of the social system in which the company is situated. Legitimacy may relate to law, being sociopolitical in the words of Aldrich and Fiol (1994), but it is not reducible to legal compliance. Rather, it depends upon cognitive and normative recognition of corporate activities. Thus, the bases on which legitimacy is constructed differ.

Whatever form of legitimacy that is referred to, external constituents' understandings of the procedures, operations, goals, and structural forms of the organization condition legitimacy for the specific company or its particular operations. The construction of legitimacy is essentially provided by a collective audience which is, usually, not clearly demarcated and defined as a group, such as specific stakeholders (cf. Mitchell et al. 1997). Legitimacy, although aspired for through managerial activities and strategies, should not be conflated with acceptance by stakeholders (cf. Deephouse and Carter 2005). Being a macro-level concept, it is not to be equated with corporate attention to the stakes of individual stakeholders.

Legitimacy, rather, presupposes some form of generalized assumption or perception that the specific activities, actions, or organizations in general are desirable, proper, or appropriate (Suchman 1995). Evaluation is at the heart of the legitimation process (Dowling and Pfeffer 1975). Its basis – against which evaluation takes place – may vary. *Moral legitimacy* specifically relates to societal norms, beliefs, and values, understood in ethical terms. In particular within the business ethics literature, moral legitimacy has attracted particular interest. This may, on the one hand, be easily explainable through the fact that it is an ethically relevant analytical concept. But notably, explaining its analytical popularity, moral legitimacy has also developed into the core source of societal acceptance, as argued by Palazzo and Scherer (2006; see also Roloff 2008; Scherer and Palazzo 2011). Thus, one could argue that moral legitimacy tends to be seen as more decisive and conspicuous in contexts where other forms of legitimacy also exist. For that reason it is singled out as the most distinguished and meaningful form of legitimacy used for analytical purposes (see, e.g., Baur and Palazzo 2011).

Along with other forms of legitimacy, moral legitimacy is granted in social contexts, in which a collective audience defines the normative frames constraining and conditioning corporate action. Focusing specifically on moral legitimacy, it follows from normative correspondence, implying congruence between the behaviors of the organization and the shared beliefs of some relevant social group (Parsons 1956; Dowling and Pfeffer 1975; Suchman 1995). Moral legitimacy "reflects the consistency of organizational action with social norms and values" (Deephouse and Carter 2005, 339). This also relates to how moral legitimacy functions. A central aspect is the moral evaluation made by a social audience by reference to specific value systems resulting in the granting of legitimacy (Parsons 1956; Dowling and Pfeffer 1975; Vaara and Tienari 2008). Roloff (2008, 244) claims moral legitimacy to be "a result from a conscious moral judgement that is based on giving and considering reasons to justify corporate strategies and practices." Understood in this way, moral legitimacy is much about a condition following justification, which takes place against a backdrop of norms and values of a collective audience relevant to the company. It is also necessary for the societal "license to operate" that the company aspires to obtain (De Geer 2002). Specifically, the moral dimension of legitimacy contains normative assessments of rightness regardless of costs or benefits for the legitimating audience (cf. Thomas and Lamm 2012).

For Suchman (1995), moral legitimacy comes in different forms. It relates to consequences, procedures, persons, or structures of the organization. Moral legitimacy, sometimes referred to as normative legitimacy, presupposes congruence with norms shared by people, groups, organizations, and social systems (Dowling and Pfeffer 1975; Deephouse and Suchman 2008). Such norms frame apprehensions and assessments of what is good, bad, desired, or seen as right or wrong. Increasingly, moral evaluation is channeled through the media (Deephouse and Carter 2005; Aerts and Cormier 2009), and the relevance of social media for legitimation is steadily rising (Castelló et al. 2016).

The issue of generalization is important to understand, in particular, when it comes to moral legitimacy. As Suchman (1995, 589f) argues: "Because moral legitimacy reflects more generalized cultural concerns than does pragmatic legitimacy, organizations are somewhat more limited in their choice of moral standards than in their choice of exchange partners. Nonetheless, the range of moral criteria remains quite broad, and the relative weighting of various desiderata depends largely on the goals that the organization sets for itself and on the domain of activity that those goals imply." From a more strategic vantage point, companies, thus, select between moral criteria by adjusting organizational goals. Criticizing such instrumental approaches, Scherer and Palazzo (2007, 1100) argue, "In the canon of conflicting expectations, the morality of the mighty is accepted by a company's top management as a calculable means of its own continued existence," and suggest a more deliberative approach to moral legitimation.

Even though it is commonly acknowledged that legitimacy is granted in a social context, few would argue that this context is simple and uniform. As Deephouse and Suchman (2008) note when talking about the source of legitimacy, it can be "some" socially constructed system of norms, etc. (cf. Suchman 1995). This rather indefinite formulation also implies, Deephouse and Suchman (2008, 55) argue, that "a central issue of legitimacy research is identifying who has collective authority over legitimation in any given setting." This acknowledgment, however, claims but does not show that someone actually has unquestionable authority of legitimation in a specific setting. Most likely, if someone had such specific authority, in particular of the normative context, it would not be an expression of a social system but rather of an institutionalized, perhaps legally enforced, idea of desirable corporate behavior.

What this acknowledgement suggests, however, is the lack of uniformity of the social collective granting legitimacy. Suchman (1995) recognizes that individuals' values may differ from the more generalized opinions within the social system. What such an idea presupposes, however, is the existence of a strong "mainstream" opinion that forms the generalized perception of the public. Strongly polarized or fragmented social systems do not fit the description that Suchman (1995) provides. As Child and Rodrigues (2011, 805) note: “the treatment of ‘the environment’ as a system can easily ignore its differentiation into a plurality of not necessarily co-ordinated social institutions and other units.” This insight has gained a foothold within organizational research in recent years. Thus, Deephouse et al. (2017, 33) acknowledge “the presence of active disagreement within the social system, often among different stakeholders or between dissident stakeholder and the organization.”

Furthermore, the discussion has also gained from the realization of the predicament of the MNE and its dependency on legitimacy stemming from various and sometimes conflicting normative contexts. Thus, and specifically tied to moral legitimacy, legitimacy and legitimation seem to be complex issues for two reasons: first, international larger companies pursue simultaneous operations in various social systems with essentially differing normative preferences and, second, even internally, within the MNE, conflicting normative contexts may exist that complicate internal legitimation.

Varieties of Normative Contexts

That companies are situated in a conflicting normative context or within a variety of normative contexts has been established in the literature for decades. Norms do not only change over time, they can be – and are – contradictory (Dowling and Pfeffer 1975). Within organization theory, one perspective that takes this complexity into account relates it to diverging and conflicting institutional logics, stemming from institutional complexity (see, e.g., Pache and Santos 2010; Greenwood et al. 2011). This literature, however, has less interest in the institutions and normative contexts per se and emphasizes to a higher degree the institutional logics of professionals within the organizational settings (McPherson and Sauder 2013) or the strategic approaches of the organizations situated within institutional complexity (Pache and Santos 2010). Instead, heterogeneous moral contexts are touched upon in two related but still distinct literatures, the business ethics and management literature and the international business literature.

In the *business ethics and management literature*, Scherer and Palazzo (2007, 1099) write that “modern societies exhibit a plurality of particular and conflicting moralities. What can be a justified social claim in the eyes of a social interest group may be different from the moral ideas of managers, suppliers, customers, or other interest groups.” Likewise, Scherer et al. (2013) talk about complex environments with heterogeneous sustainability demands on corporations. Although institutional factors have brought about homogeneity in rules, values, and practices, a coexisting reality increased cultural heterogeneity within society, traceable to individualization and migration. With regard to legitimation, the normative context in which moral legitimation takes place is not differing across borders but also within cultural communities. Not least MNEs face conditions of complexity and end up in dilemmas acting upon heterogeneous expectations from societal and institutional environments in which they are active (Scherer et al. 2013). In such cases, adhering to some normative expectations while disregarding others that are in conflict is a high strategic risk when it comes to legitimation.

More normative approaches to the legitimation problems of heterogeneous societies have suggested that legitimacy should be understood more discursively and that the basis of legitimacy should be active justifications in relation to society rather than responding to its demands (Scherer and Palazzo 2006).

Within the *international business literature*, specific focus has been on MNEs operating in different and sometimes conflicting normative contexts. Kostova and Zaheer (1999) point to the legitimacy of the MNE as a whole and that of its parts, that is, a situation where issues of both internal and external legitimacy are of relevance. In their analysis, the company is first and foremost understood as situated within fragmented institutional environments, the domains of which reflect different types of institutions, of regulatory, cognitive, and normative kind. Since MNEs operate in many countries, they are exposed to a multiple and fragmented institutional pressures.

Clearly, challenges of legitimacy exist, pertaining to the cognitive and normative domains of the varying institutional environments. If the institutional distance is high compared to home country standards, the issue of legitimacy becomes harder. Not least since the MNE must develop and adapt organizational practices. Such difficulties are multiplied if the MNE operates in many countries, although competence to deal with legitimacy issues may be generated within the MNE. When operating in a local context, a subunit also has to deal with internal legitimacy within the MNE, apart from conforming to the local regulative, cognitive, and normative context. In pointing this out, Kostova and Zaheer (1999) also bring up the issue of how organizational structure relates to legitimacy. A more complex structure, for example, stretching over national and cultural borders and possibly involving various and ambiguous corporate activities, also complicates (moral) legitimation.

To Kostova and Zaheer (1999), the normative context and, accordingly, the moral expectations on companies are seen as contained within an environmental complexity. To this, organizational complexity, relating to corporate structure, and the complexity of the legitimation process are other aspects of relevance when it comes to the legitimation of the MNE and its operations. Related to the moral sphere, Kostova and Zaheer (1999) propose that the cognitive and normative domains of the institutional environment in which the MNE subunits are situated will challenge the legitimacy of these units to a higher degree compared to regulatory requirements.

The literature, thus, points to institutional complexity, heterogeneous moral contexts, and complicated organizational structures in need of legitimacy. As a consequence, some knowledge exists regarding the problems with and nature of legitimation in complex contexts. However, knowing that the normative contexts are heterogeneous does not itself tell us how they are and which significance the nature of these contexts have on moral legitimation. From an analytical perspective, this issue will be dealt with in the next section.

The Nature of Heterogeneous Normative Contexts

The fact that normative contexts are complex does not tell us in which way they are and the implications for moral legitimacy. Accounting for heterogeneity within social systems calls for further analyses. Even though heterogeneity has been dealt with in earlier approaches, for example, cognitive and relational heterogeneity (Child and Rodrigues 2011), the specifically moral heterogeneity deserves further attention. In the following, an understanding of the normative context will be developed along two dimensions. First, it will be argued that the “number” of (conflicting) normative positions characterizes the social system. Second, it will be posited that even if the number of normative positions characterizing a social system matters, the strength of these positions, in the sense of high or low moral significance to the audiences holding them, will also matter. In Fig. 1, a tentative understanding is depicted that will be elaborated on in this section.

Referring to Fig. 1, the first dimension to take into account when trying to understand the nature of normative contexts is the *number* of (conflicting) normative ideas within a specific context. This, of course, should not be seen as a specific count of ideas but as an indication of the existence of actual disagreement in moral issues within a social system. For example, within a context, certain moral issues may require disagreement in many aspects, whereas others are more uniformly adopted and accepted.

The second dimension of the normative context relates to the *strength* of normative ideas. Strength, in this case, should be seen as the intensity through which a certain belief is held by a collective audience. There is in this case an obvious link to Mitchell et al. (1997) and the criterion of urgency for discriminating strategically between stakeholders. Here, strength is used purely descriptively. In a context of strong moral convictions, moral legitimation becomes more important than in a context of weak convictions. That is, it matters to audiences whether companies or the business sector in general live up to the requirements of morality.

Companies, thus, face different situations when striving for moral legitimacy due to the nature of the normative context. In a situation where disagreement about moral issues is high, and the intensity of beliefs in the issue is also high, they face *moral competition*. When disagreement is low within the social system, but the intensity of the moral conviction is high, they encounter *moral dominance*. Low intensity in moral convictions and high number of normative ideas result in *moral indifference*, whereas low intensity and a low number of normative ideas entail *moral paucity.*

If the normative context is shaped differently, according to these dimensions, the fundamental preconditions for moral legitimation will differ. Without

Existence of conflicting normative ideas	**Strength of normative ideas**	
	High	**Low**
High	Moral competition	Moral indifference
Low	Moral dominance	Moral paucity

Fig. 1 An understanding of the nature of normative contexts

problematizing the heterogeneous character normative contexts, we easily end up in an understanding of moral legitimation as in the scenario of *moral dominance*, according to the terminology used above. That is, normative correspondence is relatively easily understandable and identifiable. The company must understand and relate its operations to shared norms and values of the normative context.

More complicated – and perhaps more interesting – is moral legitimation in contexts characterized by *moral competition*. The moral convictions of the collective audience are strong and heterogeneous, which means that correspondence with one system of beliefs may imply conflict with another. Examples could be industries in controversial sectors (weapons, alcoholic beverages, to mention some) or company operations in relation to typical lifestyle issues. Other examples include private business active in the welfare sector of welfare states (De Geer et al. 2009), where the moral (and political) discussion is strongly polarized with regard to the reasonability of profiting from taxpayers' money within, for example, the school or healthcare system. In such cases, moral legitimacy is strongly contested within society itself. A certain audience may welcome corporate operations, whereas another one completely rejects it. In such cases, moral legitimacy will be conditioned by the relative practical significance of the audiences in question. Seen from a resource perspective, whether moral legitimacy is granted from (parts of) the social system, it may be enough to generate other resources that the company needs (Dowling and Pfeffer 1975; Pfeffer 1978). However, the company and its operations will act in a state of *legitimation ambiguity*, where it is seen as both morally legitimate and illegitimate depending on whom you ask. This also follows from the fact that various constituents usually do not have the power (or the legitimacy themselves) to define normativity on a worldwide scale – and not even locally.

In cases where the intensity of moral convictions is lower, the very issue of moral legitimation becomes less decisive, even though it exists. *Moral indifference* exists when disagreement in terms of the number of existing ideas is high, even though the intensity of the held beliefs is low. This makes moral legitimacy somewhat less relevant, possibly leaving way for other forms of legitimacy to become more relevant. When normative ideas are weaker, although many ideas circulate (representative of moral indifference), another aspect is that the organization, its procedures or actions, are not easily attributable to specific ideas. The issue of what it takes to make operations legitimate is more difficult to establish in the sense that it is not easy to link congruence to specific ideas. In the case of fewer ideas, it is simpler, but *moral paucity* prevails, since the ideas of right and wrong are significantly weaker even though they are more easily identified. Seen strategically, managers have more freedom in adjusting organizational goals selectively among available alternative moral criteria (Suchman 1995). The difference between moral indifference and moral paucity is that, in the latter case, the potential aspects of disagreement are fewer whereas intensity is low. Morality is less heterogeneous in the case of moral paucity, and it matters little with regard to the specific issue that is legitimated. Other forms of legitimacy may matter more.

In the case of the MNE, it operates within different normative contexts that may be understood and analyzed according to the matrix (Fig. 1). This complicates the picture even more. Depending on whether normative systems can be seen as separate or not, one could argue either that different cultural norms exist within one overarching worldwide system (moral competition) or that the MNE is actually part of different systems and, for that reason, normative contexts. In the latter case, even though two contexts have the same character, for example, moral dominance, this does not mean, of course, that the same moral convictions dominate the two different contexts. If so, the MNE goes, at an aggregate level, from a situation of moral dominance to one of moral competition.

Conclusion

As shown, the normative justification of business is complex. One feature of such complexity is the normative struggle of various constituents of a specific context to define the normative "correctness" from which corporate moral legitimacy stems. One could even argue, somewhat controversially, that the customary reference to the corporate license to operate builds on a specific understanding of the normative context as one that this chapter has described as a state of "moral dominance," that is, when a specific moral idea is strongly pervading the normative context in which legitimation takes place. One way of expressing the focus of this chapter is to see it as an enquiry into the nature of the interface between the company and the normative context(s) where it operates. Understanding this is a clue to how moral legitimation takes place in modern societies.

Summing up the argument, the nature of the normative context highly conditions what moral legitimacy – and legitimation – turns out to be for a company in the end phase of legitimation. In summing up the argument, one may reflect on what the issue of ambiguous normative contexts leaves us. From corporate perspective, the issue becomes one of *relevance* and *choice*. First, depending on the nature of the normative context, the issue of moral legitimation should be reflected against the strength of the normative ideas. To put it straightforwardly, if collective audiences do not care much about the moral issues at hand, moral legitimation becomes less relevant from a practical point of view. However, and more interesting, when moral disagreement exists within collective audiences, and the normative ideas are strongly held, moral competition exists. In such cases, moral legitimation presupposes some kind of choice in the very general sense of the word. Whose ethics should the company adopt, and which ethics could the company stand for? In particular when the setting is characterized by moral competition, companies have the tendency of choosing sides in the societal debate. This leaves them with controversial decisions and positions. They turn not only political (cf. Scherer and Palazzo 2011) but also ideological.

Considering the ever-increasing importance of moral legitimacy, and the fragmented and heterogeneous environments that constitute the normative contexts, the state of moral competition is steadily present. What companies must do in this state is to understand ethics and also to choose. The basic question given moral legitimation becomes *which company we want to be*. Unanimous consent by a collective audience is usually not possible. However, just reducing the issue to moral choice reflects a simplistic understanding of a scenario of binary character presupposing well-defined conflicting moral alternatives. The ambiguity of legitimation also means ongoing moral challenges to the company given the flux of normative ideas in society. Suggestions to deal with this have been articulated, mainly relating to the processual aspects of moral legitimation. Examples include an open and deliberative approach to moral legitimation (Palazzo and Scherer 2006; Seele and Lock 2015) and, from a more practical point of view, legitimacy seeking through co-construction of agendas, networking, and participation in open platforms of non-hierarchical kind (Castelló et al. 2016; see also Scherer and Palazzo 2011). In cases of uncertainty, or even ignorance about morality in a certain context, organizational learning about alternative options through collaboration has been put forward as an option (Child and Rodrigues 2011).

What is important to note, however, is that a more deliberative and co-creative approach is not just a means toward reaching more informed moral choices but possibly also a necessity because of the fragmented nature of normative contexts. Furthermore, it also necessitates that companies, in their active choices and dialogues, *co-construct the moral discourse* in which they are active. The consequences for moral legitimation are obvious. It is, to a much higher degree than the traditional literature within organization theory has spelled out, *mutually* constructed and ambiguous. Unlike more idealistic approaches to deliberation, one has to bear in mind that despite this mutual construction, ambiguity still prevails. Not everyone will be convinced by the moral approaches that companies choose. At least in contexts characterized by moral competition, moral legitimation will most likely be partial for companies, whether or not they are actively and consciously seeking it or not.

A consequence of the heterogeneous normative contexts is that there are reasons to problematize the *idea of generalization* of the often diverging and conflicting normative contexts that companies are active within. To put it simply, what is desirable, proper, or appropriate within the socially constructed system of norms, values, beliefs, and definitions is not easily generalized (cf. Suchman 1995). The reason for this is, of course, that norms, values, etc., may clash or conflict and vary between contexts. Put differently, legitimation of business or organizational activities between different socially constructed systems can be complicated, which is also the case within one system. Generalization, yes, but how, by whom, and on the basis of what, are relevant questions. As argued, since the nature of normative context is varying, and companies must in many cases relate to this, the generalized belief is to a high degree a mutually constructed belief in the primacy of a certain moral understanding.

This should also be taken into account in research, in particular in studies focusing on the legitimacy-seeking activities of companies. Such activities should not be automatically assumed to correspond to the dominant ideas of the moral context (moral domination, according to the terminology of this chapter). If companies actually contribute to shaping the moral context given the predicament of choice in heterogeneous contexts, one can seriously question the use of moral legitimacy as an independent variable in extant studies (cf. Edelman and Suchman 1997). Companies do not just reflect or respond to moral standards to get legitimacy, they also try to sustain those moral standards according to their own held ideals and in order to perpetuate their own status as legitimate companies. More specific work needs to be done empirically on differing and varying normative contexts, and corporate interaction with those contexts and their ability to affect them deserve being taken into account. Also, when it comes to moral legitimation and generalization, one should not forget what soft regulation (standards, certifications, etc.) brings about. Soft regulation tends to institutionalize norms at a wider level (see, e.g., Vogel 2010; Engwall 2018), creating frames for morality at a worldwide scale. A consequence of this is that moral institutionalization through other means than laws (cf. Aldrich and Fiol 1994) deserve being taken into account in research on moral legitimation. Furthermore, ambiguity due to heterogeneous normative contexts merits further studies. Companies may be seen as morally legitimate and illegitimate – simultaneously. What that means to companies remains to be shown.

Legitimizing Catchwords of Service Marketing: The Role of Academia

53

Anne Vorre Hansen

Contents

Abstract

Concepts such as value co-creation and value propositions are buzzwords of current business lingo and of the academic discipline of service marketing. The focus on value creation, and how to support value creation to occur, is linked to an increased focus on not only the customer but on the sphere or lifeworld of the customer. In academia this is theorized as a shift from value-in-the exchange, over value-in-use, to value-in-(social) context. A vast amount of literature focuses on these conceptualizations, but few seems to challenge the apparent taken-for-grantedness of the customer as willing to co-create the generic nature of applied concepts and the idea that customer orientation in itself leads to innovation. Furthermore the language, despite adopting phenomenological and hermeneutic

terms relative to this claimed customer focus, obscures that companies are driven by economic value based on a market logic.

This chapter argues that a dual move of legitimization is happening; businesses legitimize their pursuit of economic value through the lingo of value co-creation, and academia, as an authoritative social entity, further legitimizes this by giving concepts that are uncritically derived from empirical phenomena analytical authority – partly based on pragmatic legitimacy – i.e., to own interests of keeping a research domain alive. The implication might be that the terminology of marketing, in both practice and academia, becomes detached from the empirical reality of the customer that the concepts are meant to mirror and hence only serve an academic purpose, but less a practical one.

Keywords

Value co-creation · Service marketing · Conceptual legitimacy

Introduction

The field of service research is basically concerned with the concepts of the customer (Alam and Perry 2002), (value) co-creation (Grönroos 2008; Helkkula et al. 2012), and service innovation (Hasu et al. 2015; Miles 2005; Toivonen 2010). Service is perceived to be processual and interactional, which is why the field from the very beginning has been concerned with the company-customer relationship. Nevertheless, context has more recently come to the front alongside a more profound change in perspective from company to customer (Heinonen et al. 2013; Prahalad and Ramaswamy 2000; Vargo 2008). This change in focus is primarily driven by the field of service marketing and especially the American service-dominant logic (S-D logic) and the Nordic service logic (SL) and customer-dominant logic (C-D logic) perspectives (Lusch and Vargo 2014; Grönroos et al. 2015; Heinonen and Strandvik 2015). In these research streams, context is seen as a door into the locus of customer value creation, but the view that customer value is created in a specific setting and hence is situated is also perceived hard to assess (Matthing et al. 2004; Wäger et al. 2012).

Nevertheless value co-creation as concept is perceived a trigger for a new business paradigm, framing the service relationship, the role of the customer, and the way innovation is to be understood. Within service marketing, innovation is thus seen as a way to manage or facilitate the customer's process of value co-creation or as a way to engage in concrete collaborations with customers that might or might not lead to increased value for the customer. The innovation lingo of these research approaches is depicted by terms such as value propositions (Helkkula and Kelleher 2010; Skålén et al. 2015), value promises (Grönroos and Voima 2013; Heinonen et al. 2013), and integration of resources (Lusch and Vargo 2014). That value co-creation is perceived a certain aspect of service innovation (Edvardsson et al. 2012) highlights that the two concepts are deeply interwoven – since the reason to explore and understand the sphere of the customer is to refine the service offering and/or to ensure a qualitative service relationship (Maglio and Spohrer 2008; Skålén et al. 2015). Despite slight differences in underlying assumptions, neither of the research streams discuss what the analytical and practical implications are of applying concepts such as value co-creation, value propositions, and the notion of resource integration – e.g., "what are the implications to the market?", "what are the implications to the company-customer relationship?", and, lastly, "what room for thinking does these concepts leave us?". As such relevant questions regarding the legitimacy of the concepts and the role of academic knowledge, production in this regard are missed out.

It is widely recognized that research on legitimacy draws upon the work of Max Weber and his notion of validity, that is, how/when a social order is perceived valid (Suchman 1995; Tost 2011). The main research perspectives on legitimacy have subsequently been developed within institutional theory and social psychology, respectively. Across perspectives literature is concerned with how legitimacy is defined and managed and how processes of legitimacy are enacted (Tost 2011). Despite different levels relative to the unit of analyses, the focus is either on organizational legitimacy or on individual value judgments and how these come about. Thus, legitimacy is approached as a phenomenon to be analyzed from the academic outside, and less focus is put on the role of academia in processes of legitimizing the domains under study.

Based on current discussions of the role of the customer in service research, especially concerning value as created in context as well as the understanding of service innovation as the creation of new value propositions depending on relations and interactions (Lusch and Vargo 2014; Miles 2005; Skålén et al. 2015), the chapter sets out to analyze what the implications of these understandings are to both practice and academia. In the discussion the notions of cognitive and pragmatic legitimacy will be applied to better understand the duality of academic legitimacy, that is, giving exogenous legitimacy to a certain practice (the right to govern/operate in specific ways) while at the same time obtaining and maintaining endogenous legitimacy simply by having the authoritative power to normatively evaluate and discuss practice.

Structure

The chapter begins by setting the scene relative to prevalent perceptions of legitimacy, with a specific focus on the understandings that will be drawn into the discussion. This is followed by a short tour de force of the service research field to frame a presentation of service marketing and the main concepts to be discussed: value co-creation and value proposition as a take on innovation. Having the key concepts in place, the subsequent discussion will be structured around different forms of legitimacy in regard to conceptual usage, and finally the implications in regard to academic knowledge production/legitimacy will be assessed. To round off the chapter, concluding remarks will be given, and future (or further) debates are outlined.

Since the chapter is essayistic in nature, there is room for drawing main points and claims a bit sharper than in a journal article format. Hopefully this will provoke new ideas and arguments or at least give food for thought.

Setting the Legitimacy Scene

In the following a short account of the concept of legitimacy, mainly from an institutional theory point of view, is given. The aim is to ensure conceptual clarification before presenting the field of critical marketing and its take on legitimacy in a business context.

The concept of legitimacy is both founded in political science and political philosophy. Political science has been concerned with how legitimacy of an authority is obtained and maintained through systems of governance and self-governance. In political philosophy, political/democratic legitimation and legitimacy of the law, or rights such as human rights, are debated. These debates relate the concept of legitimacy closely to a notion of normative validity (Habermas 1998; Fraser 2008). Despite differences legitimacy is thus understood as based on and related to social contexts – be that at an individual or at a system level. To bridge these levels, Tost (2011) sets out to integrate perceptions of legitimacy from both institutional theory and social psychology. Referring Suchman (1995), legitimacy is, in organizational theory lenses, defined as "a generalized perception or assumption that the actions of an entity are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs and definitions" (Suchman 1995:574). These entities, here understood as organizations, are thus judged legitimate if they are appropriate within the social context in which they operate. From a social psychology perspective, legitimacy is rather related to actors and group procedures and hence based on subjective evaluation of socially distributed outcomes (Johnson et al. 2006; Tost 2011). The implication is a more explicit focus on power structures of what is judged to be fair and just.

Digging further into the concept, there is in literature a shared differentiation between types of legitimacy: pragmatic legitimacy based on self-interests, moral legitimacy based on a normative evaluation of what is perceived right, and cognitive legitimacy primarily based on taken-for-granted assumptions and accounts (Suchman 1995; Tost 2011). As Suchman underscores, all three types of legitimacy rest on the idea that the activities of an organization are proper within socially constructed systems of norms and prevalent beliefs (Suchman 1995:577). Thus, the difference mainly rely on diverse behavioral processes; pragmatic legitimacy is related to the nearest audience's consequence calculation of organizational policy, i.e., what's in it for me, moral legitimacy rests on a positive judgment of what seems normatively right to do based on the audience's value systems, and cognitive legitimacy refers to the audience's passive acceptance or active backing for an organization based on the stand that seems inevitable, or taken for granted, to do so. These takes on legitimacy stress the interrelatedness between processes of gaining and upholding legitimacy within either defined groups, organizations, or systems. Thus to sum up, organizational legitimacy is a generalized perception based on subjective "reactions of observers to the organization as they see it" (Suchman 1995:574).

The debate on legitimacy is also found within the field of marketing, both implicitly and explicitly. There is a vast amount of literature that discusses marketing from a critical theory stand, mainly based on Marxist or Foucauldian analyses (Cova et al. 2015; Skålén et al. 2006). The main critique is centered around the objectification of the customer and the discourse of the marketing field (Cova et al. 2011; Skålén 2010). Furthermore the moral, or more precisely the immoral, aspects of marketing have both been put forward as criticism from the outside and as an internal debate of how to respond to this (Stoeckl and Luedicke 2015). However, a more explicit articulated focus on marketing legitimacy and legitimization is introduced by Marion (2006). Marion argues that marketing as discipline is a performative science since it concurrently describes and constructs the subject matter under study (Marion 2006:247). This entails the following three layers: marketing as a practice, marketing as a knowledge base consisting of tools and certain principles, and marketing as an ideology. The layers underscore the intertwined relation between doing and thinking marketing. According to Marion, the issue at stake is that when turned into an ideology, marketing terminology and metaphors permeate action and lingo in a diverse range of contexts – hence producing and withholding legitimacy both in- and outside the marketing domain.

Marketing legitimacy is, according to Marion, defined as "the generalized assumption that marketing actions are desirable and appropriate within the market economy. This legitimacy reflects the congruence between the behaviour of marketers and the shared beliefs of customers/consumers within the system of norms, values and definitions provided by the market economy" (Marion 2006:249). To exemplify, the notion of the customer as "king" implies that the customer comes first and hence that the interests of customer and company are basically aligned – since the perception is that the customer's actions and decision-making processes are based on a rationalistic market logic. In this manner legitimacy judgments are not anchored in moral concerns but simply based on the logic of the market, deeply grounded in pragmatic legitimacy. But as Marion stresses, this cost-benefit understanding of the customer is based on a short-term maximizing rationality (Marion 2006:257) that forgets how people constantly move between different logics and domains: market, family, collectivity, individuality, etc. Furthermore, the challenge of marketing criticism is that marketing ideology incorporates the critique itself by adapting current metaphors in new "analytical grids" (Marion 2006:259). Thus, Marion calls for renewed criticism to challenge the taken-for-grantedness of marketing doctrine.

In the context of this chapter especially, the understanding of pragmatic and cognitive legitimacy is applied as basis for looking into the interplay between practice and academia in legitimizing a certain terminology and hence opens for a new sort of marketing critique: the role of academia in reproducing certain belief systems and ways of looking at the world.

Service (Marketing) Research

The field of service research is rooted in business administration and has developed since the 1970s (De Jong and Vermeulen 2003; Edvardsson et al. 2005). It was founded on the underlying assumption that services have specific characteristics that differ from products and manufacturing. In the early days of the research field, the definition of services was therefore based on how service, as opposed to goods, is characterized by intangibility, heterogeneity, perishability, and simultaneity (Lovelock and Gummesson 2004; Zeithaml et al. 1985). Thus the aspect that services are simultaneously perceived, produced, and consumed has historically been an indicator for a fundamental customer centricity embedded in service research. Nevertheless, the aspect of simultaneity has since been widely challenged, especially due to the emergence of information technology-based services (Sandström et al. 2008). The shared perception of service, across research streams within the service field, is now that service is processes, deeds, and performances (Bitner and Brown 2008) where actors integrate resources to the benefit of another party (Lusch and Vargo 2014). In this sense service is fundamentally process-oriented and relational, which is why the interplay with customers as a service characteristic is still understood as key (Alam and Perry 2002). Despite the move from products/manufacturing to service, and hence a move from the company sphere to that of the customer, a discussion of the relation between marketing practice and academic theorizing on service marketing has not emerged. The role of service marketing as academic discipline still seems to be that of either describing marketing practices or developing models to practice. The consequence is a shared application of terminology that, as also stressed by Marion, leads to a blurred boundary between marketing as practice and as theoretical field.

Bringing the Customer to the Fore: Value Co-creation

In early perceptions of value creation, the process was related to the service exchange between company and customer, referred to as value-in-exchange (Vargo 2008). In line with the focus on establishing service research as a research field with specific characteristics apart from manufacturing, scholars began emphasizing that value-in-exchange in a service perspective does not grasp the relational character of service (Prahalad and Ramaswamy 2000). The service-dominant logic perspective (Vargo 2008; Vargo and Lusch 2004) and the service logic perspective (Grönroos 2008; Grönroos and Voima 2013) explicated this viewpoint by a change in focus from the exchange situation to the use situation (value-in-use). Recently value-in-use has been supplemented with a shared focus on the customer sphere or the network of the customer. In service-dominant logic terms, this is referred to as value-in-context (Edvardsson et al. 2005; Lusch and Vargo 2014) and in service logic as value-in-experience (Heinonen et al. 2013). Where value-in-context still is concerned with a specific point in time, the experiential approach to a larger degree adds temporal and social aspects to value creation. Gummerus (2013) argues that value creation is deeply embedded in the past and the present and frames future expectations. Thus it becomes vital to understand the sphere of the customer in a broad, holistic sense (Voima et al. 2010; Gummerus 2013). Accordingly the shift in focus from the goods/services divide to company-customer relations leads to an understanding of value co-creation as a phenomenological structure determined by the beneficiary and not only related to systems, products, or services per se (Lusch and Vargo 2014). Therefore, if value is defined in the sphere of the customer, companies can only offer value propositions (Grönroos and Voima 2013; Lusch and Vargo 2014). This has implications for the distribution of roles between companies and customers and hence for the process of innovation.

Service Innovation

The interest for and research in service innovation is relatively new, compared to the wider field of innovation studies – the majority of research literature on service innovation is from the mid-1990s onward (De Jong and Vermeulen 2003; Miles 2005; Toivonen 2010). In recent years, service innovation has received increasing attention as both service companies and manufacturing companies become aware of the importance of innovation of services as a crucial factor for business development (Bitner and Brown 2008; Drejer 2004; Gallouj and Savona 2010). Furthermore the process view of service research, alongside the distinct customer focus, has initiated a change in the perception of innovation as something more and different from systematic processes in research and development (R&D) departments (Droege et al. 2009). For example, the service take on innovation has opened the notion of ad hoc innovation, which denotes that innovation might occur as changes in daily organizational practices (Sundbo and Toivonen 2011), for an explicit focus on the role of employees in development (Umashankar et al. 2011), and for the point that innovation processes first might be considered innovation in retrospect (Toivonen 2010:232).

The service marketing perception of innovation more recently has become a perspective on service innovation. This stream of research maintains the notion of the customer because of the view on innovation as integration of resources (Vargo and Lusch 2016:18) that is based on an ongoing debate on the locus of value creation – which is in general perceived more broadly than the mere use situation. In this perspective user experience becomes the platform for value co-creation (Gummerus 2013; Rihova et al. 2013) and eventually for innovation. Consequently value co-creation becomes an aspect of service innovation (Edvardsson et al. 2011; Payne et al. 2008; Perks et al. 2012).

Value Co-creation as an Aspect of Innovation

As mentioned in the section on service innovation, the service marketing perspective on innovation has come to the discussion quite late. It seems as if the focus on value co-creation, and this specific way of understanding and writing about the company-customer relationship, triggered the emergence of new service development (Matthing et al. 2004). As such the term value co-creation is transferred to the field of innovation, which is why value co-creation becomes a certain way of understanding and approaching, not only service but also service innovation (Edvardsson et al. 2012). Some researchers highlight that value co-creation is the foundation for creating new value propositions or value promises (Grönroos and Voima 2013; Lusch and Vargo 2014) and others that innovation is an ongoing process of value co-creation (Helkkula et al. 2012; Russo-Spena and Mele 2012), whereas a third stream applies a combinatory perspective emphasizing both the management of value promises and the way they are facilitated and co-created with customers (Hasu et al. 2015; Skålén et al. 2015).

In the S-D logic and service logic perspectives, co-creation is understood as the foundation for developing the service offering. Since value is determined in the sphere of the customer/beneficiary, the company can either offer value propositions (Lusch and Vargo 2014), facilitate where value might occur (Voima et al. 2010), or actively engage in co-creation with customers (Grönroos and Voima 2013). Thus the objective of co-creation is to develop competitive value propositions, implicating a wider perspective on user involvement than merely identifying user needs. Since the process of co-creation, in regard to service innovation, is founded on interactions or interplay with customers (Perks et al. 2012), the relation is reciprocal and not unidirectional (Edvardsson et al. 2012; Ford et al. 2012). In the combinatory perspective, Skålén et al. (2015) more explicitly argue that the focus should be on *managing* what kind of value a value proposition offers along with how this might be co-created with customers (Skålén et al. 2015). This is based on two processes within the company: the process of acquiring the resources needed and aligning them with the requirements of the customer and the process of developing relevant practices to engage in co-creation. The microlevel perspective is also applied in the other streams of research, which see value co-creation, and thus innovation, as an ongoing process. Here the focus is on different stages of innovation and hence a shift in focus from outcome to process (Russo-Spena and Mele 2012:528). The implication is that innovation is seen as different co-creation practices, which are, through actions and interactions, part of everyday life.

The Role of the Customer

Across perspectives presented, innovation becomes the way a company, in practice, manages co-creation, understood as the integration of both company and customer resources. Drawing value co-creation into the field of service innovation is therefore also related to the increased focus on the role of the customer in innovation processes (Edvardsson et al. 2012), which is illustrated by the change from an approach to innovation as an internal process going on inside the company to an open process, where contributions from customers, suppliers, and stakeholders are integrated in development (Hennala et al. 2011; Sørensen et al. 2010). The explicit acknowledgment of the importance of inviting customers into development also implies that the view on the customer frames the understanding of the innovation process itself. In the following, this will briefly be related to the perception of the customer, in the presented views on value co-creation, to the understanding of innovation processes.

Regarding innovation, the customer-dominant logic research stream claims that the explicit focus on the sphere of the customer addresses both service strategy and service innovation (Heinonen et al. 2013; Helkkula and Kelleher 2010). The argument is that companies need to become aware of the potential of both present practices of the customer and the customer's imaginary experiences, i.e., customer's ability to envisage how a future value proposition might be (Helkkula and Kelleher 2010:69). Similarly, Voima et al. (2010) argue that the focus on customers' lifeworlds, including mental state of mind and physical surroundings, supports a segmentation of the customer base, thus making room for facilitating the customer's process of value formation (Voima et al. 2010:12). Nevertheless, in these views it is not exactly clear what the perception of service innovation is and how value creation, or formation, is linked to the company's development or whether the mere focus on lifeworlds is development in itself.

To sum up, it can be argued that different schools, to position themselves, apply slightly different concepts to explain and theorize on the same phenomena, instead of using the same concepts to understand something better and deeper or to go beyond existing knowledge. As such service marketing research seems to be trapped in between an expectation of empirical sensitivity and an academic urge to show innovativeness and originality by introducing new concepts to the field. Even though the research community, as mentioned, acknowledges this conceptual obscurity, this has not yet led to a critique of how concepts legitimize certain practices – be that outside or inside academia. The self-critique of mainstream service marketing research is mainly centered round the lack of empirical studies based on the mentioned theoretical frameworks, and the critical marketing stream of research mainly highlights the power structures of the prevalent terminology but does not engage in a debate of academia's role in language usage or development.

Critical Comments

In the following the duality of service marketing research legitimacy, i.e., exogenous and endogenous legitimacy, is illustrated. This will form basis for a critical discussion of academic knowledge production, as part of both constructing and describing marketing, by unfolding the notion of conceptual legitimacy.

Exogenous and Endogenous Legitimacy

The concepts of value-in-use, value-in-context, and value-in-experience imply a shift in the understanding of innovation, from an internal to an external locus of innovation (Frow et al. 2015:466). However, there are still different perceptions of those engaging in the innovation process and how they engage. Service logic maintains a company focus and therefore has a firm-centric view on innovation, C-D logic is customer-centric preserving a profound focus on the customer, and the S-D logic perspective, by more broadly focusing on open innovation, is network-centric. Nevertheless, as mentioned, the marketing understanding of innovation is quite vague since there is no clear definition of innovation and more importantly no explicit focus on what the incentive for innovation is (Drejer 2004). The discussion on innovation ends up being centered around the notion of value co-creation and the role of the customer and company herein. Therefore, it seems as if the concepts of value co-creation and innovation can replace each other without analytical consequences. In this manner, the economic aspect of innovation slides into the background due to a dislocation of the concept of value. Despite differences in foci, the terminology of value co-creation, value propositions, and value facilitation is depicted by positive connotations, e.g., the understanding of value as a benefit or something that supports something beneficial to occur making something or somebody better off. Since the academic field of service marketing does not challenge the implication of this, in either practice or academia, the concepts become a special sort of given truth, or taken-for-grantedness, about the service relationship between company and customer, a truth that legitimizes the way marketers operate in the market.

This aspect is also illustrated in the perception that service is an overall way to approach life in general – to exemplify, some researchers have emphasized the transformative potential of service innovation with the claim that service innovation supports making the world a better place. These claims are articulated by innovation assisting the process of "making people better off" and "improving quality of life through service" (Bitner and Brown 2008:44) or "...actors, often unaware of each other, that contribute to each other's wellbeing" (Vargo and Lusch 2016:9). Service innovation in these macro-level approaches ends up as a service philosophy, or a service sociology, where it becomes difficult to see what exactly the unit of analysis is, besides the whole system or the entire process of... hmm, what? In contrast, the combinatory approach to innovation, anchored in micro-studies (Skålén et al. 2015), maintains that in service innovation the relational aspect of service is key, since the overall aim is to find ways to develop better service relationships. But, across macro- and microlevel perspectives, innovation is defined as an ongoing process of creating or facilitating value propositions and/or service offerings (Grönroos and Ravald 2011; Skålén et al. 2015; Lusch and Vargo 2014) – sort of downplaying the economic heritage of the innovation concept (Drejer 2004).

However, what is again left out is a discussion of what the implications are for the understanding of innovation when the customer contributes to value creation. For example, does the role of the customer as value producer lead to a competitive advantage; does this customer role do something to the market or to society? If value is something solely related to the customer sphere or the mental state of the customer (Gummerus 2013; Heinonen et al. 2013), it becomes somehow detached from the market and the perception of innovation as something, which makes an economic difference in this market (Drejer 2004). As such the stance on service innovation from service marketing focuses on who is part of the innovation process, but the question of what innovation is the answer to is not addressed. This key question fades away since the objective of innovation is downplayed by positioning value outside the domain of the company. Consequently it becomes ambiguous why there is a need to be concerned with value in the first place. This furthermore makes it difficult to distinguish innovation from service strategy and to explain why some companies are better at meeting the needs of their customers than others. Also it is taken for granted that the customer actually wants to engage in resource integration and that this process of integration happens on equal terms. In this manner the boundary between company and customer is almost theoretically erased – a condition that can lead to further outdistancing because the customer might end up feeling exploited instead (Cova and Dalli 2009:334). In literature it is recognized that a fruitful company-customer relation is based on trust (Greer et al. 2016), but still the question of how the customer reacts to the marketing terminology of customers as co-creators and actors on the market is not contested and discussed in the prevalent research streams. In this manner academia gives exogenous legitimacy to the main actors of the market, simply by reproducing existing underlying assumptions and logics. And at the same time, by applying concepts and metaphors that support this sort of cognitive legitimacy, academics are ensuring endogenous legitimacy – based on the sustained authority to discuss the very same practice and the urge to position themselves in the research domain itself.

Conceptual Legitimacy

The close relation between service marketing research and marketing practice might explain that within the prevailing research streams, it is not clear whether value co-creation, and herein innovation, is applied as empirically derived concepts or as analytically derived concepts. Based on the literature presented, it seems that value co-creation is, within service research, rather the answer and not the question. For example, if value co-creation is an aspect of innovation, then value co-creation might be a desirable goal itself. The same occurs for value co-creation referring to the service relationship – it denotes a desirable process by the use of a positive concept. Turning to value-in-context and hence the sphere of the customer, value co-creation is again perceived as a positive process instead of a neutral process of valuation. In this manner, academia's role in knowledge production encompasses processes of pragmatic and cognitive legitimacy by giving conceptual legitimacy to both the theoretical and the practical field. But the question is: Can academia set out to explore the sphere of the customer with a concept, which at the same time is believed to be the solution for the benefit of companies?

What service research might gain from is therefore a debate about the objective of the research itself: is it solely to support and understand business related processes, or is it also to reveal and understand underlying assumptions and taken-for-grantedness? Ideally it is both, since the problem is dual: if the research fields get detached from practice, it might end up becoming conceptually self-referential (Said

1995) and as such irrelevant for practitioners, and, on the other hand, if a research field grounded in an instrumental business logic overlooks the logic of the private domain, it might support reducing the customer sphere to a subsystem. As such academia's passive acceptance of a specific value system sustains and withholds cognitive legitimacy not only to marketing as practices and tools but also to marketing as ideology. Furthermore, it becomes difficult to analytically move beyond existing understandings and engage in theorizing on the subject matter in ways not perceived terminological legitimate. If language frames present understandings and is constitutive for future action, it is key that academia dare to critically asses its own role in concept development and usage.

Concluding Remarks

To sum up, the main issue at stake in the conceptual usage of service marketing in both practice and academia is that the presented systems of norms, beliefs, and definitions do not necessarily reach out of the domain itself. The implication is a lingo that risks becoming detached from the people from whom legitimacy is hoped to be given (the customers), since in the domain of service marketing legitimacy only refers back to the one who seeks legitimacy (the companies and academia) – with the danger of becoming a self-referential system where the ones who seeks legitimacy are the ones who gives legitimacy, i.e., the value that is articulated as value to the customer is basically value to the companies (despite their claim to facilitate customer value creation and formation). Backed up by academia, this is cognitively legitimized besides being based on a pragmatic calculation of how marketing knowledge production can legitimize service marketing as a research field. In this manner the foundation for legitimacy is not linked to societal norms and cultural rules but only to the norms or rules of the private sector and academia itself. A circumstance mirroring Edwards Said's seminal work Orientalism (1976), which revealed how the domain of Orientalism only existed in the dialogue and work of Orientalists and did not refer back to an empirical reality. In the case of service marketing, there sure is an empirical reality but mainly as a specific business practice that operates on a market logic. Nevertheless the empirical reality of the ones that this practice seeks to target and understand, the customers, is constructed in a manner depicted by catchwords and smart metaphors that are given legitimacy by the authoritative power of academia.

The discussion of this chapter can therefore also be applied to new buzzwords of service research, such as transformative service and well-being (Anderson et al. 2013; Blocker and Barrios 2015; Hennala et al. 2011). If once again these concepts are uncritically applied, the service marketing field might end up in the same conceptual trap, whereby well-being is a goal to achieve and not a concept that enables a deeper understanding of the processes under study. Across the different concepts, the exploration of the processes of value creation, well-being, and transformation is done for a reason – a reason which is embedded in the sphere of the company and hence based on a systems logic of purpose. Even though some researchers acknowledge that the customer and the company might have different goals (Grönroos 2017), the criticism would be that the research streams presented still fail to fully acknowledge that there are different logics at play in different domains of society. And since marketing researchers do not add these nuances to the field because they constantly develop new concepts that mainly reproduce the logic of the market, academia further legitimizes both research and practice.

Johnson et al. (2006) ask*: Does a social object need to be replaced by a new social object for it to become delegitimized? For example, must new organizational forms and practices be created and legitimated for old forms and practices to fall out of favour? Or can a social object lose widespread acceptance by an audience even though nothing is there to replace it?* (Johnson et al. 2006:73).

The answer is hopefully not! A continuous debate regarding academic knowledge production and its role in producing conceptual legitimacy might ensure that taken-for-granted assumptions about the social world, if detached from an empirical reality, can be phased out. Moreover, this opens up for a nuanced understanding of how different forms of legitimacy frame what is possible to think – making room for challenging cognitive straitjackets of marketing practice and pragmatic concerns for academic career building.

Note The chapter is partly based on the author's PhD dissertation: What's at stake? Critically exploring the concept of value co-creation in service research – *Or an anthropologist going na(rra) tive within business administration.* Roskilde University, 2016

Deficit of Legitimacy in Startups: Main Consequences and Strategic Solutions

54

Jørn Kjølseth Møller

Contents

Abstract

The purpose of this study is to identify and discuss consequences and solutions related to the phenomenon of "liability of newness" among startups causing a deficit of legitimacy among new ventures. In the literature, the "liability of newness" or lack of legitimacy is related to three legitimation mechanisms: identity, associative, and organizational mechanisms. They account each for various consequences of a deficit of legitimacy among startups. In the literature on evolutionary theories, there are different opinions about how new ventures can solve this lack of legitimacy – the institutional position claims that new venture enhances their legitimation by activities that make them more reliable and

accountable. The social relationship position argues that developing relationships with stakeholders represent a better way to increase the legitimacy of new ventures – lastly, the Schumpeterian position claims that new venture survivals depend on obtaining control over and recombining resources in a way superior to that of established organizations. With the aim of investigating the identified consequences of the legitimation mechanisms and strategic solutions discussed in the literature empirically, this study builds on findings from a survey conducted in late 2016 among 300 startups. All startups were part of a growth-enhancing incubation program in the region of Zealand, Denmark, and the data collected and methodology used in this survey form the background for analyzing evidence supporting the various position in the literature. The findings show that, in the short run, the entrepreneurs can compensate their deficit of legitimacy by relying on local networks and resources close to them, but in the longer term, they need to solve the lack of organizational legitimacy vis-à-vis established organizations and their surroundings to survive and achieve the necessary economic growth.

Introduction

The widespread tendency to a deficit of legitimacy among startups represents an obstacle for many entrepreneurs to grow and develop or even survive in the long run as an operating enterprise. As new ventures, this perceived lack of organizational legitimacy is a critical issue for entrepreneurs and managers to address. It is also a complicated issue because there are many different kinds of legitimacy issues depending on relationships, resources, type of startups, etc., to address.

New ventures face many challenges especially associated with their organizational age, such as a lack of management structure and specific role definition, a small or non-existent customer base, and much dependence on decision-making and performance of the founder (Stinchcombe 1965 m.fl.).

This new and untested situation for many startups has since the groundbreaking article by Stinchcombe in 1965 been described as the problem of "liability of newness," which is a perceived lack of legitimacy (Freeman et al. 1983). When a new idea or opportunity occurs, its legitimacy is typically low because it is unknown. The challenge of the entrepreneur is therefore to find an audience that will listen to the idea and support with, among other things, resources. It requires legitimacy that others accept it as a substantial opportunity in a market context.

Without legitimacy, the idea is not a real opportunity, because you cannot realize it. The legitimization process is fundamentally a social process in which the entrepreneur, through interaction with the market, achieves an impression of whether the idea represents a real opportunity or not. Something is legitimate if it complies with the norms, values, beliefs, practices, and procedures accepted by a particular social group or audience (Johnson et al. 2006). According to Suchman (1995), something is legitimate when there is "a generalized perception or assumption that the action of an entity is desirable, proper, appropriate, within some socially constructed system of norms, values, beliefs, and definitions."

It follows then that the entrepreneur's idea or created opportunity is a legitimate option when the economic, social, and political surroundings accept its existence as a valid part of the market. Without the necessary legitimacy, the entrepreneur will have difficulty in raising the necessary capital, recruiting employees, getting customers, etc. An empirical study of a large number of organizations in their early years (startups) confirms that the ability to survive depends on the ability to achieve legitimacy (Delmar and Shane 2004).

Johnson et al. (2006) indicate the process by which new objects – such as a new idea – gain legitimacy and thus evaluated as a real possibility. The process consists of four phases: (1) innovation, (2) "local" validation, (3) diffusion, and (4) general validation. As a result, of this process of diffusion, the new idea is, over time, more widely accepted as a natural part of the environment and business community. Therefore, the legitimacy process looks like "ripples that spread across the water and eventually disappear completely and become an integral part of a larger sea" (Fisher et al. 2017).

To solve this problem for legitimacy, the entrepreneur got different strategies for building legitimacy and *solutions* to address the lack of legitimacy and thereby to cope with the *consequences* of the deficit of legitimacy. Research projects (Überbacher 2014) have indicated various deliberate actions that the entrepreneur may take to convince the environment regarding the idea's relevance and legitimacy. For example, the entrepreneur may imitate other organizations already accepted by the surroundings or may seek to obtain official certificates to emphasize that the idea makes sense in the light of the existing opportunities exploited (Shane 2003).

Furthermore, it may be appropriate for entrepreneurs to cooperate with others to gain legitimacy in society, for example, through a new trade organization or a new network, rather than seek legitimacy separately. Another strategy for building legitimacy is to focus on creating trust among key stakeholders that will provide the entrepreneur with access to knowledge, resources, etc. Trust is important because it is fundamental to all types of interaction between people. The entrepreneur has various opportunities to build trust. For example, he or she can convince others that the option makes sense, by acting "as if" the activity were a reality – producing and directing great theater, as it were, may convince others of the tangible reality of the new business (Aldrich and Fiol 1994).

Many other approaches used to promote legitimacy include practical/symbolic actions such as producing a business card, letterhead, and a website. The entrepreneur can also obtain legitimacy by drawing on people who have high legitimacy within a particular business area, for example, by using a mentor or by putting together a management and advisory board. Finally, contact with an existing organization that has legitimacy can provide a route to greater legitimacy. If an entrepreneur can write "trusted by" a well-known organization on the business card, it helps to overcome his or her "liability of newness."

The chapter contains four main sections. *Firstly*, the relevant literature regarding "liability of newness" and organizational legitimacy is reviewed and discussed to highlight how a deficit of legitimacy occurs due to organizational age, resources, audience, relations, and type of startups. *Secondly*, some findings from a study of 300 startups in a growth-promoting incubation program in the region of Zealand, Denmark, are analyzed to identify connections between the consequences of "liability of newness," on the one side, and organizational age, resources, audience, relations (networks), and type or area for startups. *Thirdly*, various strategies for building legitimacy or solving the legitimacy problem identified in the study of 300 startups are discussed. *Finally*, the conclusion summarizes the findings and recommends further avenues of research.

The Concept of "Liability of Newness" and Organizational Legitimacy

The challenge upon entering a new line of activity in existent organizations or a new organization, where few precedents exist in the society, is the task of winning acceptance, either for the action in general or for the validity of their practitioners (Suchman 1995, 586). The problem is in general that a higher proportion of new organizations fail than old. It is particularly true of new organizational forms such as startups. They involve new roles, which have to be occupied and learned by the entrepreneurs behind startups. Often the entrepreneurs exploiting new opportunities in new organizational settings have to use generalized skills produced outside the organization or have to invest in education in employees and accept the cost of inefficiency until people have learned their new roles.

This "liability of newness" (Stinchcombe 1965, 148) has at least two aspects. Firstly, when new operations are technically problematic or poorly institutionalized, early entrants – for example, entrepreneurs – must devote a substantial amount of energy to create a kind of "sector" or "industry building," that is, to create a sense of feeling that the new endeavors will define an industry that exists independent of particular incumbents. Secondly, the challenge of legitimacy building applies with equal force both to new industries and to new entrants into old sectors or industries.

However, the entrepreneurs do not create new firms from one day to the next, but create them through a series of actions – obtaining inputs, conducting product development, hiring employees, seeking funds, and gathering information from customers undertake it to different degrees, in different order, and at different points in time, by different partners (Gartner 1988). That gives different opinions about the survival of new ventures:

1. The *institutional* theoretical position of evolutionary theory which argues that venture survival is enhanced by activities to make new ventures appear reliable and accountable, thereby increasing the legitimacy of the organizing effort (Hannan and Freeman 1983; Meyer and Rowan 1977)
2. The *social relationship* school of evolutionary theory which argues that new venture survival is enhanced by activities to establish relationships with external stakeholders, thereby overcoming the liability of weak social ties between new ventures and their external stakeholders (Stinchcombe 1965; Stuart et al. 1999)
3. The *Schumpeterian* position of evolutionary theory which argues that new venture survival is enhanced by obtaining control over and recombining resources in a way superior to that of established organizations (Nelson and Winter 1982; Schumpeter 1934)

Especially the time dimension of organizing is essential because new ventures are initially disadvantaged relative to established organizations in three fundamental ways (Schumpeter 1934; Stinchcombe 1965): *Firstly*, new organizations lack the legitimacy – or taken for grantedness – that established firms typically possess (Hannan and Freeman 1983). New ventures or startups often do not appear as accountable and reliable as existing organizations. Therefore they need to create the external perception that they are legitimate to garner resources and survive competition about established firms.

Secondly, new firms lack the same relationships with customers and suppliers possessed by established firms (Stinchcombe 1965) because social ties are an essential lubricant to all economic transactions (Arrow 1974), which make those actors with social relations advantaged in the marketplace (Granovetter 1973). New ventures, therefore, need to establish social ties to external stakeholders that are functionally equivalent to those of established organizations to garner resources and survive competition with these established organizations (Aldrich and Zimmer 1986; Stinchcombe 1965).

Thirdly, ventures, by being new, lack the productive routines and experience that established firms have for transforming resources into products and services (Schumpeter 1934; Nelson and Winter 1982). New firms must, to survive competition with established firms, obtain the resources that they will transform, develop a set of routines for doing so, and market the output of that transformation on the market.

To solve the lack of legitimacy in new ventures, the literature has identified some mechanisms that may be employed by entrepreneurs to establish or manage the deficit of legitimacy of the startups. Fisher et al. (2017) identified and categorized based on a review of around 70 articles in the literature of new venture legitimation the following 3 broad categories of mechanisms of legitimacy:

1. *Identity mechanisms* account for an entrepreneur's strategic use of social tools and identity claims such as images, symbols, and language to enhance and manage new venture legitimacy (Swidler 1986; Weber and Dacin

2011). They account for the explicit and implicit claims and impressions an entrepreneur portrays about a venture to align it with an audience's identity expectations.
2. *Associative mechanisms* account for the relationships and connections that entrepreneurs and their ventures forge to establish and manage their legitimacy. A contact with other powerful and recognizable actors in a field (e.g., with corporate elites, organizations, high-profile investors, etc.) signals to different audiences that the new venture has achieved evaluative approval and as such should be accepted as legitimate because others have already done so (Rindova et al. 2007).
3. *Organizational mechanisms* are the third category of devices or mechanisms for establishing and managing new venture legitimacy related to the organization and structure of a new venture and achievement of success measures by that venture. According to institutional theory, a new venture is perceived as legitimate if it engages in "standard" or "normal" organizational behavior within a given field of activity (cf. Meyer and Rowan 1977) or if it achieves certain levels of performance and professionalization based on the standard expectations of those within the field (cf. DiMaggio and Powell 1983). Hence, organizational mechanisms – including the implementation of the expected organizational structures and the attainment of corporate achievements – might facilitate new venture legitimacy. This might also happen when the right profile person is chosen for a leadership position (e.g., Cohen and Dean 2005; Tornikowski and Newbert 2007) or when achieving specific organizational outcomes or milestones such as a product launch and company registration or certification (Choi and Shepherd 2005; Delmar and Shane 2004; Khaire 2010; Kistruck et al. 2015; Rao 1994).

Using the perspectives on new venture legitimation identified by Überbacher (2014), the new venture legitimation mechanism is described by looking at the audiences, purpose, consequences, control level, and dimension of the mechanism. Especially the consequences of new legitimation mechanism are discussed in the following, and it contains "benefits" or beneficial consequences such as the *creation of opportunities*, *evolution*, *initial public offerings*, *growth,* and *survival.*

Entrepreneurial Leadership and Management of Organizational Legitimacy

Following the view of organizational institutionalism, one of the central corporate mechanisms of legitimacy is when the entrepreneur or the person in the leadership position of a startup has the right profile and mindset, showing entrepreneurial leadership and how to exploit and use an entrepreneurial mindset in practice. An entrepreneurial mindset is both an individual and a collective phenomenon that is important for entrepreneurs, managers, leaders, and employees. It is how leaders and entrepreneurs must think about their new venture business focusing on the benefits occurring from newness and uncertainty, capturing opportunities as a result, and thereby contributing to an organization's competitive advantage (Miles et al. 2000; Fernald et al. 2005) and in the end creating the necessary organizational legitimacy of the new venture.

In defining the role of an entrepreneurial leader, Burns points out that "vision is the cornerstone of the entrepreneurial architecture" (Burns 2005), i.e., the entrepreneurial leaders need an ability to define and communicate a shared vision for an organization. They are strategic thinkers and effective communicators, also being able to monitor and control performance, and above all, they create the appropriate culture within the organization to reflect their priorities. Put together Burns (2013) defines leaders by the following five elements:

- Having a *vision* for the organization (clear focus and direction)
- Being able to develop *a strategy* (a strategic framework)
- Being able to *communicate* effectively – particularly the vision (making sense)
- Creating an appropriate *culture* in the organization (the glue that binds it together)
- Managing and monitoring *performance* (balancing between freedom and control and managing risk)

The main aim of the entrepreneurial leader is always to build an *entrepreneurial architecture* for the organization so that it can efficiently operate on its own, without them, but also to signal that the new venture is legitimate because it engages in "standard" or "normal" organizational behavior within a given field of activity (cf. Meyer and Rowan 1977). However, becoming an entrepreneurial leader also requires other qualities and depends on the context and situation. Certain types of leadership theory, therefore, seem to be more conducive to entrepreneurial settings and a natural starting point for establishing relevance for entrepreneurial leadership education (Møller 2018).

Besides being a visionary leader and strategic thinker able to communicate efficiently and aware of the role of leading a learning organization requiring specific leadership skills and abilities, the entrepreneurial leader also needs to possess some personal attributes. Attributes, which signal *authentic leadership,* incorporate, for example, emotional intelligence, self-awareness, self-management, ability to follow principles, values, and beliefs, which in the end strengthen the trustworthiness of the person in command and promote the organizational legitimacy of the new venture.

However, effective entrepreneurial leadership is not just about the leader's characteristics or traits. It is complicated, because of "the interaction and interconnections between the leader, the task, and the group led by the leader and the situation or context, and therefore the appropriate leadership style depends upon how these factors interact" (Burns 2013). Following situational or contingency theory, many different leadership styles may be useful, with various tasks, groups, and contexts. Thereby, situation and context become important in teaching leadership which increases the trustworthiness of entrepreneurial leaders, because leaders, as well as entrepreneurs, are often facing uncertainty, rapid change, and risk-taking.

A part of the leadership literature gives some further insights into how to lead organizations through periods of change. Bass (1985), for example, contrasts what he calls "transactional" leadership with "transformational" leadership, where the first is about efficiency and incremental change reinforcing organizational learning and the last is about inspiration, excitement, and intellectual stimulation. Entrepreneurial leaders are therefore builders of organizations that are both visionary and transformational (Burns 2013). However, entrepreneurial leaders are also drawing on models of distributed and team-oriented leadership that focus leadership across all levels and in different forms (Gupta et al. 2004; Mintzberg 2009).

Lastly, entrepreneurial leaders have to act on the challenges of the time, where leaders and organizations currently are facing an increasing dependence on context, complexity, and connectedness (Gitsham et al. 2011). During a lifetime of an entrepreneurial business, the challenges to entrepreneurial leadership will change dramatically from startup to running an established company. Survival of new ventures is how the operation of the enterprise can grow and become legitimate in the eyes of the stakeholders and surroundings in general.

Altogether, the literature on leadership theory and specifically research on entrepreneurial leadership give some indication of essential themes and "inputs" to entrepreneurial leadership development. With a focus on innovation and entrepreneurship, it is vital that entrepreneurial leaders focus on leading the creation or discovering, evaluation, and organizing of opportunities in a strategical way with the aim of creating a learning organization that meets some of the challenges and build on mechanisms that increase the legitimacy of the new venture. That is done when the entrepreneur or the leading people is communicating the vision and strategic intent to stakeholders efficiently and making use of appropriate leadership styles depending on tasks, groups of employees, and context (Sarasvathy 2008). The source to create an effective entrepreneurial leadership must rely on a combination of inherent personality traits, environmental influences, and learned behaviors. The crucial point is how to acquire the entrepreneurial leadership behavior either by education or afterward in practice, due to a model of work-based learning (e.g., Raelin 1997).

Experiences from an Incubation Program of Startups

The effect of founders' actions on the survival of new ventures has often been problematic to evaluate empirically because reliable evidence is difficult to gather (Katz and Gartner 1988). Archival sources generally do not record the existence of new ventures that fail very early in their life, biasing the efforts to identify new ventures from lists of new firms (Aldrich et al. 1989; Katz and Gartner 1988). Consequently, most researchers begin their investigation of new ventures at the point at which new organizations initiate production or are legally established and have ignored what has happened to new ventures before that point in time (Aldrich and Wiedenmayer 1993; Carroll and Hannan 2000; Katz and Gartner 1988).

Public records, therefore, miss many of the firms that fail before they reach their first birthday (Aldrich et al. 1989). Thus, not only does focusing on recorded organizations hamper our understanding of essential activities that occur before firms become formally filed (Katz and Gartner 1988); also the selection processes might make new ventures that survive long enough to become documented organizations systematically different from the population of all new ventures (Aldrich and Wiedenmayer 1993).

In this chapter, we have chosen to build on experience from 300 startups (existed less than 3 years) participating in a growth-enhancing incubation program for small- and medium-sized enterprises in the region of Zealand (Denmark). A program is running from 2014 to 2016. The research project collected data through a survey (questionnaire) conducted among the 300 participating startups at the end of 2016. The results from the study published in a report to Væksthus Sjælland and EU in 2017 (Møller and Grünbaum 2017).

As mentioned earlier, the participants in the study represent companies that have existed for less than 3 years. Some of the companies were even established relatively shortly (few days or months) before they answered the questionnaire in the survey, and some have participated less than a month in the incubation program while others for 2 years or more. Thus, there is a large spread in the experiences and age among the participants in the study.

The original aim of the study did not focus on organizational legitimacy and the “liability of newness,” but other issues related to the experiences of the 300 startups in their early life of entrepreneurship. Some of these issues are as it is shown in the following of course intimately related to the consequences and solutions to the phenomenon of the “liabilities of newness” and topics related to managing legitimacy in new small- and medium-sized ventures.

The process of the incubation program, financed by the Social Fund of EU, lasted for each venture typically 1–1.5 year and had the following competence-developing elements:

- Workshops in business development
- Growth vocational training with an overarching management module
- Milestone conversations with project manager/subproject leader
- Innovation processes for production companies
- Mentor progress/advisory board

The incubation process also included practical tools, necessary follow-up, and milestones, each of which supporting the incubation program’s goal of contributing to the company’s growth and survival.

In addition to the above activities, the project management and daily managers of the incubation program continuously facilitated the social and professional networking among the participating entrepreneurs in the project.

The aim of the present research project had thus to examine the informal interaction and learnings among the participants in the incubation program mentioned above. Also, the functioning of the social networks facilitated during the process of the formal incubation program was studied as well as some other matters of importance to the participating entrepreneurs.

The present study is therefore not a study of the formal part of the incubation process, but rather an examination of what spontaneously came out of the interaction and knowledge sharing between the participating entrepreneurs. The official part was evaluated by a private consultant firm (Cowi 2016). Therefore, it can't directly be attributed to the planned competence-developing elements of the program. On the other hand, it has examined some of the related business activities that have an impact on the legitimacy of the startups.

The underlying assumption in the survey has been that there are a lot of informal knowledge sharing and learnings among participants in a formal education that is not immediately subject to the planned competence development activity. It represents a vital learning component of the participants in the further educational process and a crucial source to the creation and development of legitimacy in their startups and venture activities.

The study, thereby, focuses on the experiences of the participating entrepreneurs in the completed incubation program with a focus on informal knowledge sharing and learning. It builds partly on the use of social network analysis (SNA) and knowledge from entrepreneurship research in general. It relies on an expectation that the study can gain experience and produce analytical results that are of interest in a broader circle than the participating entrepreneurs, at the same time as the findings of course also affect Væksthus Sjælland's evaluation of the overall impact of the incubation program on the participating entrepreneurs.

Knowledge sharing and learning among small- and medium-sized enterprises in informal social networks have proved to be of great importance for exploiting their business potential, legitimacy, and further development.

Knowledge sharing and learning among small- and medium-sized enterprises in informal social networks have also proved to be of great importance to their potential for innovating and overcoming barriers to growth and development, which is documented in other studies; see below. A social network analysis helps to identify the extent and presence of interaction and trust among a group of entrepreneurs, as well as the type of knowledge sharing and learning that is particularly useful to the individual entrepreneur in the network.

This insight also affects authorities and decision-makers when planning and deciding on new growth and development activities among the small- and medium-sized group – including startups and entrepreneurs.

In entrepreneurship research, it is an established empirical finding that entrepreneurs participating in social networks have better chances of exploiting opportunities for business success because of better access to resources through networks (Jenssen and Koenig 2002). Research has also documented that the strength of entrepreneurial relations with others in the network system has an impact on what kind of resources it can gain access to, which can increase their organizational legitimacy. According to Kanter (1983), the resources contain three broad areas: (1) information and knowledge, (2) motivational resources, and (3) material resources.

In particular, access to "information and knowledge" is considered critical to newly established entrepreneurs, as the startup of entrepreneurship can be viewed as a process of learning, of overcoming the liabilities of newness tough information acquisition (Cooper et al. 1995, p 108). Also, the focus has been on the importance of weak ties "(Granovetter 1973) for entrepreneurs" access to information and knowledge so that "weak ties" often give greater access to information and knowledge than "strong ties" often leads to conformity.

On the other hand, strong ties often provide better access to motivation by others and access to financial resources. Thus, the entrepreneur's weak and strong links to others in a social network have a positive effect on startup entrepreneurs, because they provide information, motivation, and financial resources (Aldrich and Zimmer 1986).

In this study, the participant's relationships and ties – including experience-gaining access to information and knowledge – to other participants in the social network established during the incubation process were investigated by using a survey among participants in the incubation program. The survey method based on the distribution of a questionnaire to all course participants with questions that all focus on the scope (strength), but also on the nature (content) of the interaction between the members of the above social networks. The survey was conducted as an online survey in the last part of 2016, where the participants – 284 in total – received an email with access to the questionnaire in SurveyXact. The answers in the survey were afterward analyzed by use of the UCINET analysis program (Borgatti et al 2002), developed specifically for social network analysis.

The survey was completed over a period from August 2016 through December 2016 (year-end 2016/2017) and immediately followed by an analysis phase in January 2017. The results of the study were submitted in a separate report to Væksthus Sjælland, and the participants in the study received a summary of the most important empirical findings from the survey itself.

As part of the analysis of the data from the survey, a dropout analysis has been carried out on the submitted responses to the questionnaire in the study. It shows that out of 304 potential respondents that received the online survey, which constitute the group of registered participants in the incubation program during the 3 years of existence, 20 respondents returned the emails (wrong email address), and 284 potential respondents, therefore, received the survey questions.

In total, 98 of the above group of respondents answered the questionnaire. It gives a response rate of 34.5%, which is satisfactory because online distributed surveys usually give a response rate between 30% and 40%.

Regarding the answers to the questionnaire, 68 respondents out of that 98 rementioned above answered the entire inquiry, while 30 respondents only answered part of the survey. Thus, there is a partial deletion of some questions in the investigation. Typically, some issues were not required for the respondents to answer (e.g., relationships up to five other in informal networks) or they represented options in an item (e.g., membership of different types of associations).

It is thus the overall assessment of the dropout analysis that there has been no systematic elimination of respondents, which has affected the overall result in a particular one-sided direction, and that no specified groups of respondents have systematically failed to answer the whole or part of the questionnaire.

Data Collected from a Survey

This research is based on a survey, which has, as its primary focus, the gathering of knowledge about how and the extent to which startup entrepreneurs utilize informal networks to gain access to knowledge, resources, and legitimacy. Either through their identification with another kind of ventures or expectations from the environment, associative initiatives to create relationships and connections or organizational activities that are perceived as legitimate, because the startup thereby is engaged in "standard" or "normal" organizational behavior.

The findings from the survey among startups in the incubation program (region of Zealand, Denmark) are presented under the following headlines: Identity Mechanism, Associate Mechanism, and Organizational Mechanism.

Identity Mechanism

Many startup entrepreneurs make use of support and counseling from people in their immediate social circle already in the process of starting and establishing their businesses, and it takes a lot of time to seek out and utilize these personal contacts. The family and closest acquaintance circle thus constitute a substantial base and resource when starting up their own business, but also as a primary ground for identification and as an identity mechanism. It is thereby their primary source of legitimacy.

As the company evolves, consolidates, and enters a stable operating phase, a shift occurs in types of personal relationships that are of importance to counseling, support, and identification. Now the entrepreneur's business partner is gaining influence as the identity mechanism of the entrepreneur and startups. It is an exciting finding that in this sense, the more professional counselors such as the bank and the auditor, according to the entrepreneurs themselves, play a relatively minor role in all phases from the start, establishment, and operation of business than other types of relationships such as family, social, and professional relations in the social networks. Professional organizations such as banks, auditors, and other licensed counselors usually are the organizations or institutions which in the literature (Rindova et al. 2007) give legitimacy to startups and new ventures and help them to overcome their "liability of newness." In this study, they are used to a much lesser extent by the startups in the region of Zealand (Denmark), and they don't play the critical role as the "associative mechanism" for the startup, which is evident from the distribution of the answers from the entrepreneurs in Table 1.

As such, the entrepreneurs (startups) are not using professional organizations to overcome "liability of newness," but they rely on their close social networks, business partners, and informal social network.

Table 1 *I have discussed my* **business startup** *with the following type of persons or enterprises,* the percentage distribution in %

Assessment:	Type: Professional counselor (bank, auditor, etc.)	Family	Work colleague	Business partner	Person from informal network	Other things
Strongly agree	14,0	43,0	12,9	28,0	26,9	15,2
Agree	30,1	41,9	30,1	21,5	40,9	23,9
Neither agree nor disagree	17,2	9,7	24,7	18,3	22,6	40,2
Disagree	15,1	2,2	9,7	9,7	4,3	4,3
Strongly disagree	23,7	3,2	22,6	22,6	5,4	17,4
Total (N)	93	93	93	93	93	93

Associate Mechanism

When the entrepreneur enters a more permanent operational phase, there is a shift in the relationships and the use of sparring partners from their social and professional network. The entrepreneurs reduce the importance of the family and give the business partner a more prominent position as the entrepreneur's sparring partner. Almost 40% of the respondents now indicate to "strongly agree" with the statement that business operation is discussed with the business partners, compared to 28% in the startup phase of the business. The professional advisors, such as the bank and the accountant, have somewhat unchanged importance, whereas people in informal networks have slightly reduced their significance. So business partners and organizations close to the entrepreneur become even more important as part of the "associative mechanism" of legitimacy. The importance of the business partner is shown in Table 2.

When entrepreneurs get the opportunity to enter into informal networks, as it has been during the participation of the growth-enhancing incubation process, it is characteristic that the strength of the relationship between entrepreneurs and other participants in the network structure is decreasing as the number of network relationships increases. It is not perceived as an actual good of the entrepreneurs to have many networking contacts. Instead, it is "close" and "intense" relations in the networking contacts that affect the entrepreneurs – having an impact on their legitimacy. Social and professional network thereby becomes an essential part of the "associative mechanism" of legitimation. Relationships in the network that are "close" and "intense" give access to "information and knowledge." That is considered critical to the entrepreneurs because the startup can be viewed as a process of learning, of overcoming the challenge of "liability of newness" through information acquisition (Cooper et al. 1995) and motivation by others in the same position as the entrepreneur (Aldrich and Zimmer 1986).

Table 2 I have discussed the business operation with the following types of persons or enterprises, the percentage distribution

Assessment:	Type: Professional counselor (bank, auditor, etc.)	Family	Work colleagues	Business partner	A person from an informal	Other things
Strongly agree	13,5	32,6	14,6	39,3	27,0	12,4
Agree	29,2	38,2	21,3	21,3	34,8	15,7
Neither agree nor disagree	28,1	19,1	31,5	18,0	23,6	48,3
Disagree	7,9	7,9	10,1	4,5	4,5	4,5
Strongly disagree	29,2	6,7	25,8	20,2	13,5	20,2
Total (N)	89	89	89	89	89	89

It also applies to the degree of trust in other network participants, as confidence is falling with an increasing number of network connections. The mutual knowledge sharing also takes place best among a limited number of participants, and therefore the expansion of network connections does not necessarily contribute to an increased knowledge sharing and legitimacy, which again gives an insight into essential *dimensions* of the venture mechanism legitimation (Überbacher 2014).

In an overall assessment of the usefulness of participation in informal networks, it is easy to see that entrepreneurs benefit from participating in networks, for example, knowledge and insight into other entrepreneurs' business operations and development, greater confidence in their forces and abilities (motivation), new ideas for business development, as well as improved implementation of knowledge acquired in the formal courses of the incubation process. They are all representing examples of *associative mechanisms*, and it means that associative relations and mechanisms are the most important in the effort of startups to reduce their "liability of newness" and therefore to increase their organizational legitimacy.

On the other hand, neither increased sales nor better earnings are by any entrepreneurs endorsed as a central statement about the benefits of the informal networks, which usually is critically for the survival of new ventures. It is generally the point that the value of participating in the informal network among entrepreneurs primarily has been "informative" (information and knowledge) and "motivational" (support and motivation) rather than of a "material" kind (economic exchange and resources), i.e., social value not economic value. This conclusion is clear from looking at Diagram 1 beneath.

Although most of the entrepreneurs have a rather low rating of the economic effect of participating in an informal network of entrepreneurs, 54.4% of the entrepreneurs indicate that they have experienced a positive development in the company's economic activity, and thus, there has been an increase in revenue, gross

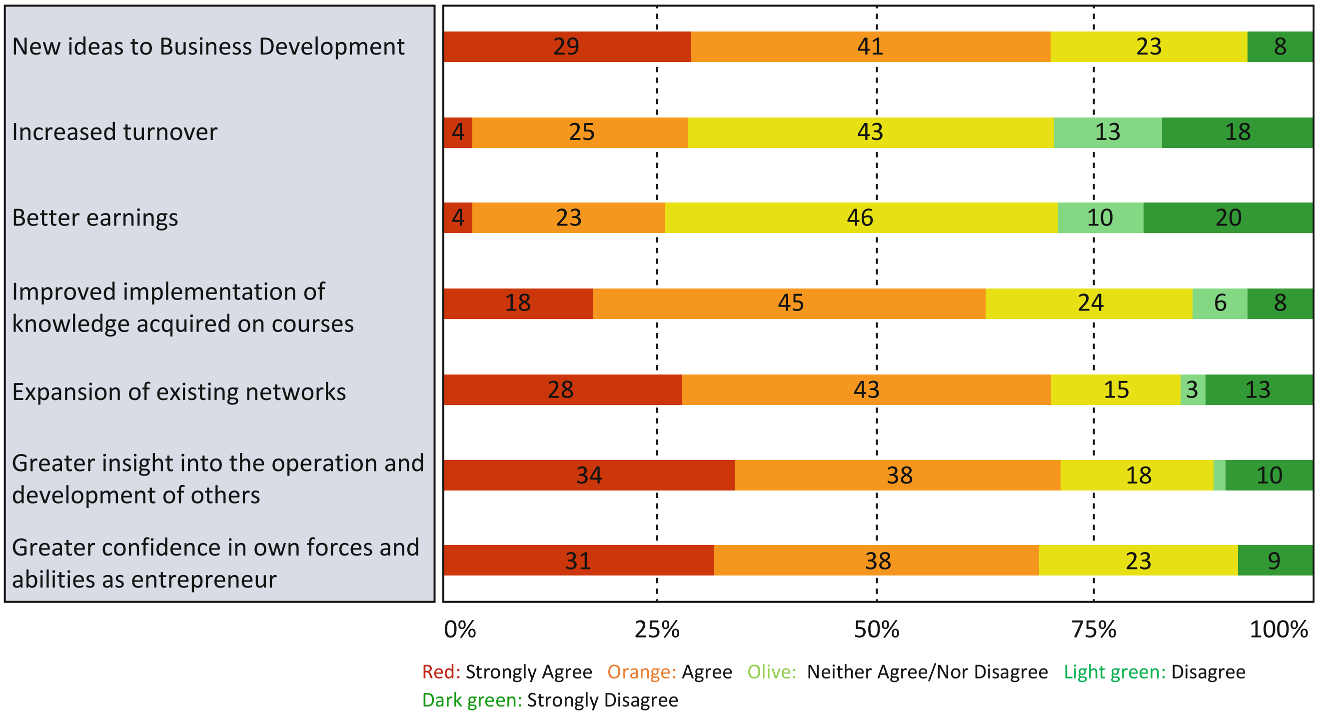

Diagram 1 *Overall, what has been the effect of participating in an informal network in the incubation process (taking into account statements about the impact of network participation)*, the percentage distribution

profit, and profit for the last year. The latter is particularly positive as one could expect that increasing revenue risk being eaten by various costs in an establishment and economic-expansion phase. It should be noted that increasing revenue can also be expected, starting from a low starting point, which is likely for a startup business. Also, about 39.7% of entrepreneurs have indicated that revenue, gross profit, and profit for the year have remained at a constant level. That may suggest that many startups have difficulties in expanding business activity and increase employment. Finally, a smaller proportion of entrepreneurs, i.e., 7.4% of respondents, have experienced a decreasing activity level.

However, about entrepreneurs' expectations for future economic activity development, it looks otherwise positive. Here, almost 80% of entrepreneurs expect an increase in both revenues, gross profit, and profit for the year. This result regarding expectations for the companies' future economic development is more positive than a similar investigation for companies throughout the Zealand region showed earlier (Center for VækstAnalyse 2015).

Organizational Mechanisms

The survey also looked at some specific relationships related to the entrepreneur himself and their business. Thus, participants in the incubation process generally have a higher education level than what is the case for entrepreneurs in the region of Zealand as a whole. The group of people with higher education is therefore overrepresented relative to the average for the area as such (58.7% in the survey and 19.3% in the region as a whole), and the group of persons with vocational education is similarly underrepresented (16.2% in the study and 41.2% in the region as a whole), cf. the Regional Statistics Bank of the Danish Business Administration, 2017. There is thus a central target group for the incubation process, which has indicated that they, to a lesser extent, have wished to make use of the offer to be part of a growth-promoting incubation process.

The majority of entrepreneurs (59.5%) have grown up in the region of Zealand, and, in line with other studies, they reproduce their parents' employment background, with 20.3% coming from families where one of the parents (typically the father) was self-employed. They have a strong identification in being an entrepreneur and self-employed, which goes hand in hand with other dimensions in the "identity mechanism."

This tendency for entrepreneurs to be affected by their parents' employment background has also been found in previous studies, among other things, research conducted by researchers at the University of Copenhagen in 2013. More specifically, 20.3% of the fathers and 13.9% of the mothers of entrepreneurs were self-employed. Table 3 gives a more detailed picture of this reproduction of social identity.

Financing of startups is a frequently discussed topic in the public debate and often related to the discussion of "liability of newness" because difficulties in getting finance from banks and financial institutions are caused by lack of organizational legitimacy to be unknown in the financial world. It is also typically argued that this

Table 3 Parents' socioeconomic status, absolute numbers, and percentage distribution

Employment:	Number of respondents	Percentage distribution (Father)	Number of respondents	Percentage distribution (Mother)
Self-employed	16	20,3	11	13,9
Cooperative spouse	1	1,3	7	8,9
Top manager (executive)	6	7,1	2	2,5
Highest-level wage earner	10	12,7	1	1,3
Middle-level wage earner	27	34,2	20	25,3
Basic-level wage earner	15	19,0	23	29,1
Other wage earner	1	1,3	2	2,5
Non-occupational	3	3,8	13	16,5
Total, absolute, and percentage ($N = 158$)	79	100,0	79	100,0

is a sub-prioritized area that has significant consequences for entrepreneurs as well as for society as a whole.

However, in this study, a different pattern is drawn. Thus, 51.5% of the entrepreneurs in the survey strongly agree or agree that it has been easy to finance their startup. Only 11.4% of respondents found it very difficult. The same pattern applies to the financing of operations, where 50.0% agree, strongly agree or agree, that it has been easy to obtain funding for the operation of their new business. 55.7% of the entrepreneurs say that the financing of activities is of importance, while 34.3% are neutral regarding this statement. However, there are also some concerns about the operation in the future, with 44.8% strongly agree or agree that they worry about the future financing of their business. Table 4 gives a more detailed insight into the response distributions of the entrepreneurs on this item.

The survey shows that the vast majority of funding for startup and operation of companies comes from the personal savings of the entrepreneur or their close family. Thus, 63.2% mention that the funding is through personal savings, and only 25% mention that they have used other sources for their financing. Also, a substantial part of the financing after the establishment comes through the profit realized by the company. The latter thus indicates that entrepreneurs do not significantly withdraw capital from the company regarding dividends, but reinvest the earnings in the company's continued development. More traditional types of financing sources, e.g., mortgage lending, the growth fund, business Angels, venture capital, and the like, are hardly used. Only bank financing can show a particular share, more precisely 14.7%, which have the consequence that startups don't lose the necessary funding due to lack of legitimacy but find alternative solutions by using other sources of finance (Møller and Grünbaum 2017).

Table 4 Experience with financing your business

	Experience:			
	It has been easy to finance my startup	It has been easy to finance operations	Financing of the continued operation has the highest priority	I am very concerned about the future financing
Assessment:	(Percentage distribution and absolute numbers)			
Strongly agree	28,6 (20)	22,9 (16)	30,0 (21)	15,9 (11)
Agree	22,9 (16)	27,1 (19)	25,7 (18)	28,9 (20)
Neither agree nor disagree	30,0 (21)	30,0 (21)	34,3 (24)	30,4 (21)
Disagree	7,1 (5)	10,0 (7)	4,3 (3)	5,8 (4)
Strongly disagree	11,4 (8)	10,0 (7)	5,7 (4)	18,8 (13)
Total in percentage (N)	100,0 (70)	100,0 (70)	100,0 (70)	100,0 (69)

It is a paradox when we know from many studies and reports (Erhvervsfremmestyrelsen 2017) that half of all startups after 5 years survive and that it is only a small number of these that become large companies and that the startups don't need funding from outside. One can, therefore, ask why there is this pattern as regards the financing of the startups and operation of the newly established companies when we know that finance and funding from outside are vital and "normal" behavior if you want to survive and expand your operation as a new venture.

According to institutional theory, a new venture is in fact perceived as legitimate if it engages in "standard" or "normal" organizational behavior within a given field of activity (Meyer and Rowan 1977) or if it achieves certain levels of performance and professionalization based on the standard expectations of those within the field (cf. DiMaggio and Powell 1983). That means either have a normal behavior as new venture vis-à-vis use of external funding or achieve a certain level of performance by growing its business. None of this kind of organizational mechanisms for legitimation is present among the startups represented in the survey. On the other hand, the entrepreneurs have achieved some legitimacy by participating in the incubation program receiving formal education in business development, sale, and marketing, business administration, and economics, together with training and couching in social networking. They have as such improved their position as professional and legitimate leaders of new ventures and startups being able to meet what Suchman (1995) describes as an "expectation or assumption that the action of an entity (the 'new venture') is desirable, proper, appropriate, within some socially constructed system of norms, values, beliefs, and definitions."

Strategic Solutions to Lack of Legitimacy

Related to the consequences or impact of the 3 mechanisms of legitimation (identity, associative, and organizational) on new ventures creating a deficit or lack of legitimacy among many startups, the present study of 300 startups in the region Zealand (Denmark) shows that:

> Many small new ventures or startups compensate their deficit of legitimacy by getting support from close networks such as family and business partners (use of associative mechanisms), where they can find support and have their identity and benefit from "closeness" as a kind of identity mechanism (building on identity as a mechanism of legitimacy).
> By changing their educational profile through participating in the leadership courses in the incubation program and also by being active in creating informal networks of entrepreneurs (associative mechanism of legitimacy), they increase their legitimacy as entrepreneurial leaders of new ventures by developing a more legitimate business profile (increase their organizational legitimacy).
> Last, but not least, many entrepreneurs accept the condition that they can't grow their business by external funding and have to rely on their sources (equity or earnings), which of course has the consequence that they retain their deficit of legitimacy because they can't grow as fast as needed. In the end, they risk being forced to close their business after a few years.

Knowledge Sharing and Learning in Social Networks

In this study of the "liability of newness" and the problems of the legitimacy of new ventures, the topic has been examined on the base of data collected through a survey about the informal knowledge sharing and learning among the participants in a formal incubation program and informal network of entrepreneurs.

The assumption in the survey has been that there is a lot of informal knowledge sharing and learning between participants in a formal education course that is not immediately subject to the planned competence development activity. It represents an essential learning component of the participants in the education process and a source of increased self-efficacy and legitimacy of the entrepreneurs because it motivates the entrepreneurs for further development and growth.

The analysis builds on the use of the social networking analysis (SNA) and knowledge from entrepreneurship research in general, as well as an expectation that the study can gain experience and produce analytical results that are also of interest in a broader circle, beyond that of the participating entrepreneurs.

Knowledge sharing and learning among small- and medium-sized enterprises in informal social networks have proved to be of great importance to their potential for innovating and overcoming barriers to growth and development in some other studies and even for the survival of many startups in the longer run. It is, thereby, related to investigations of organizational legitimacy of startups in general.

This insight also affects authorities and decision-makers when planning and deciding new growth and development activities about the small- and medium-sized group – including startups and entrepreneurs.

In entrepreneurship research, it is also an established empirical finding that entrepreneurs' participation in social networks influences their opportunities for business success by giving them access to resources (Jenssen and Koenig 2002). The strength of entrepreneurial relations with others in a social network has thereby an impact on what resources it can gain access to, but can even become a reliable alternative resource, to achieve organizational legitimacy in a public sphere.

According to Kanter (1983), she divides resources for startups into three broad areas: (1) information and knowledge, (2) motivational resources, and (3) material resources. In particular, access to "information and knowledge" is considered critical to newly established entrepreneurs, as startup processes can be viewed as a process of learning, of overcoming the liabilities of newness through information acquisition (Cooper et al. 1995, p 108).

Also, the focus has been on the importance of "weak" and "strong" ties "(Granovetter 1973) for entrepreneurs" access to information and knowledge, so that "weak ties" often give greater access to information and knowledge because "strong ties" often lead to conformity. On the other hand, "strong" ties often provide better access to motivation by others and access to financial resources. Thus, it is assumed that the entrepreneur's weak and strong links to others in a social network have a positive effect for startup entrepreneurs because they provide information, motivation, and financial resources (Aldrich and Zimmer 1986).

This study has, first of all, focused on the *consequences* of lack of legitimacy among startups and not directly on the legitimation mechanism of the new venture, which could have produced valuable insights into relevant strategic solutions solving the lack of legitimacy of new ventures. However, it has given some indication of how startups and entrepreneurs can compensate the lack of organizational legitimation by relying on, e.g., close and local social networks and business partners, instead of seeking legitimacy in public in general. Thus, it gives some resemblance to Johannisson's concept of the 'social entrepreneur' with close relationships to the local community (Johannisson 1988). On the other hand it also means that one of the barriers preventing startups and new ventures from solving their deficit of legitimacy is caused by the fact that many entrepreneurs don't want to be involved with professional organizations such as banks and financial institutions, because they are afraid of losing their independence. Even though banks and financial institutions can reduce their deficit of legitimacy and secure their organizational legitimacy by the external approval of the business activity of their new venture (Rindova et al. 2007).

Conclusion

In conclusion, the framework and empirical findings presented here provide some insights into how startups can handle their deficit of legitimacy by focusing on legitimation mechanism, such as identity, associative, and organizational, especially the consequences of these three mechanisms for startups and relevant solutions to solve the problem of a deficit of legitimacy. Although startups are dependent of the assessment of their stakeholders and surroundings, the study has shown that to certain extent entrepreneurs and startups, in the short run, can compensate for the deficit of legitimacy on the market or in public in general by relying on networks and resources close to them. Although they, in the long term, risk their survival because lack of legitimacy means obstacles and deteriorated conditions for economic growth and survival in the future, time and timing are therefore of great importance for solving the deficit of new venture legitimacy.

From Cooperation to Competition: Changing Dominant Logics and Legitimization in Liberalizing Industries

55

Kristian J. Sund

Contents

Abstract

This paper explores the transition from logics of cooperation to logics of competition within strategic groups in liberalizing industries. The notion of dominant logic, usually associated with studies of institutional fields, can usefully be applied to the study of interorganizational cognition and legitimacy in the formation of strategic groups in liberalizing industries. Over time, a group dominant logic emerges because of observations and interactions between executives across organizations in the group. These processes serve to maintain the dominant logic of competition in strategic groups over longer periods, until external environmental changes lead to a sufficiently large disconnect between the new reality and the old logic, prompting the emergence of a new logic.

As an illustration, within the Nordic postal industry, until the end of the 1990s, cooperation was maintained and competition avoided. However, the subsequent transformation from government agency to government-owned corporations, as well as the gradual liberalization of the European postal market, initiated a transition from logics of cooperation to logics of competition within the strategic group. Then, in 2007, the logic of cooperation within the group was permanently disrupted by the unexpected merger of the Swedish and Danish posts, leading to the creation of a new company, PostNord. This legitimized competition and a new logic focusing on competition in the group emerged during the 2000s and entirely replaced the logics of cooperation in the aftermath of the merger.

Introduction

Studies of managerial and organizational cognition continue to be popular in the business and management literatures, not least thanks to a renewed interest in the micro-foundations of strategy and organizational behavior (Teece 2007). Interpretation theories dominated early studies, while more recently theories of sense-making, identity, and institutions appear to have come to the forefront (Hodgkinson et al. 2017; Huff et al. 2016; Sund et al. 2016). The individual manager has thus been referred to as an information worker, and organization has been seen as a mechanism by which people collectively make sense of the world around them and act on their interpretations (Sund 2015; Weick 1995). Over time this sense-making leads in the organizational context to the construction of shared mental maps of the environment and a joint understanding of cause-effect relationships linked to organizational action, or what is now commonly by institutionalists called logics of action (DiMaggio 1997).

Over the last few decades, there have been attempts to study how organizational cognition may explain the creation and adaptation of shared mental models across different organizations competing in the same environment, i.e., not within organizations but *between* organizations. Early studies on such interorganizational cognition suggested the importance of cognition in terms of defining strategic groups (Reger and Huff 1993) and hinted that groupthink among organizations may explain why such groups collectively fail, particularly in the face of competition external to the group, or in the face of major environmental change (Porac et al. 1989).

A complementary yet slightly different direction has been taken by institutional theorists. Institutional theory suggests the existence of interorganizational fields, defined as groups of organizations that are similar, share common practices, and have a common focus of attention and a shared definition of market (Anand and Peterson 2000). Work in this area therefore points to the emergence of a collective (cognitive) steady state, or what Prahalad and Bettis (1986) at the organizational level refer to as a dominant logic. In this paper I explore the emergence of, and the transition between, such dominant logics at the interorganizational level, in particular in strategic groups. What happens to the dominant logic when the institutional environment legitimizes, or even demands new types of actions?

To illustrate the emergence and transition in logics in such a context, I trace the recent history of a group of organizations composed of the national Nordic postal operators, as they have had to develop strategies to deal with a rapidly changing environment. These posts were all incorporated (i.e., became government-owned independent companies) during the 1990s, in preparation for future privatization. The 1990s and 2000s saw the gradual liberalization of the market for letters and parcels across the European Union, and since the early 2000s, the market for letters has started to decline as a result of digital substitution effects. The context of my illustration is therefore one of the combinations of large former monopolies, with a mature and subsequently declining core product, in a destabilizing environment. During this period, the organizations in this group gradually moved from a state of national monopoly, in which they saw each other more as partners with whom cooperation and joint ventures were common, toward a state of competition. There was, in other words, a transition in the dominant logic, from logics of cooperation to logics of competition.

The largest shock to the group came in 2007 when two of the four members of this group were merged by their owners (the Danish and Swedish governments). This came as a surprise to both the Norwegian and Finnish Posts, which, I will argue, perfectly illustrates the kind of dissonance between the strategic group dominant logic and the evolving organizational logics of action that has commonly occurred as these organizations have moved from one set of institutionalized practices to another (Bacharach et al. 1996). The dissonance served as a sense-making catalyst among group members as they scrambled to redefine their strategic position within and outside the strategic group. Threat interpretations for both the Norwegian and Finnish Posts definitively changed their strategic stance and led to a new dominant logic of competition. Formerly, cooperation was legitimized and endorsed through formal interorganizational relationships in the group (Galaskiewicz 1985; Singh et al. 1986). Now, with the breakdown of these interorganizational relationships, competition became legitimate, and the dominant logic shifted.

Strategic Groups as Cognitive Communities

Hunt (1972) first introduced the concept of strategic groups through his unpublished dissertation study of the home appliance industry (Hoskisson et al. 1999). The early conceptualization of such groups of organizations focused on measurable objective qualities that linked the organizations, such as similarity of products, distribution channels, or customers. For example, Hatten and Schendel (1977) and Hatten et al. (1978) study the strategic groups within the brewing industry. They use variables such as firm size, concentration ratio, manufacturing, marketing, and financials to determine the basis for the formation of a strategic group (Hatten and Schendel 1977;

Hatten et al. 1978; Hoskisson et al. 1999). Hatten et al. (1978) focus on business strategies specifically. According to them, business strategy "defines how the firm will deploy its resources in a given product/market area," and similarity in business strategy indicates strategic group membership.

Porter (1980) defines a strategic group as a "group of firms in an industry following the same or a similar strategy along the strategic dimensions." He argues that once strategic groups have formed within an industry, the firms in each strategic group resemble each other in many ways besides their strategy. Firstly, they "tend to have similar market shares" and secondly "respond similarly to external events or competitive moves in the industry because of their similar strategies." Belonging to a particular strategic group, when the groups are defined by adherence to a particular generic strategy, has in some studies been shown to have implications for performance, such that some groups are more successful than others (Dess and Davis 1984; Leask and Parker 2007). Caves and Porter (1977) further examine the notion of strategic group but connect it with mobility barriers. "The hypothesis of group structures generates strong implications for the theory of barriers to entry. Each of the standard sources of entry barriers can vary with the characteristics that define industry groups" (Caves and Porter 1977, p. 252). Mobility barriers isolate firms within a strategic group and disables firms from other strategic groups to enter through means such as scale economics, product differentiation, or distribution network (Caves and Porter 1977; Hoskisson et al. 1999).

What is less clear from this line of research is whether these studies collectively simply prove that having a clear differentiation strategy (low cost, differentiation, or niche (Porter 1980)) is better than being "stuck in the middle," rather than proving the existence of any particular subgroups recognized by the management of these organizations. The term is therefore not without critique. According to Barney and Hoskisson (1990), there are two untested assertions in strategic group theory: (1) whether strategic groups actually exist beyond the definition of the researcher and (2) whether a firm's performance depends on strategic group membership. They argue that the existence of strategic groups in an industry rests largely on the researcher's presumption that strategic groups actually exist (Barney and Hoskisson 1990; Hoskisson et al. 1999).

Cognitive Perspectives on Strategic Groups

One way to overcome this critique is to consider strategic groups not as objectively measurable by the outside researcher but rather as subjectively perceived by managers inside the group. Reger and Huff (1993) offer such a perspective on strategic groups, defining these in cognitive terms and focusing on the subjective nature of strategic groups. They suggest that strategic groups exist through "the way strategists organise and make sense of their competitive environment." In other words, organizations are grouped by virtue of the fact that their executives perceive each other to be in a group, typically because they directly compete against each other. Decision-makers' perceptions and cognitions of the market are in fact constantly creating and confirming the existence of strategic groups (Reger and Huff 1993). These perceptions and cognitions of similarities and differences among competitors subsequently influence strategic decision-making (Reger and Huff 1993).

Porac et al.'s (1989) classic study of the Scottish knitwear industry supports Reger and Huff's (1993) reasoning. They argue that market boundaries are socially constructed around a collective cognitive model that summarizes typical organizational forms within an industry (Porac et al. 1995). Firms observe each other's actions and use this information to define unique product positions in relation to each other. Their study suggests that the variables size, technology, product style, and geographic location affect the perceptions of the competitors (Porac et al. 1995). The mechanism they offer for the emergence of group-level shared cognitions is linked to what they call indirect and direct imitation, where "indirect imitation occurs because strategists from different firms face similar technical/material problems with a finite number of solutions. Belief similarity develops as a result of interpreting the same cues and solving the same problems. Direct imitation occurs because of both formal and informal communications among the set of competitors" (p. 270).

Institutional Theory and Legitimacy

Recent work in institutional theory complements the cognitive perspective by examining a different category of relations than the strategic group – namely, institutions. Where strategic groups can simply be defined as groups of organizations where managers perceive each other as direct competitors, institutions are defined, perhaps more intricately, as "social structures composed of cognitive elements that provide stability and meaning to social life in a normative and regulative fashion" (Scott 2001). Institutional theory contains the notion of organizational field, defined as a group of organizations that constitute a recognized area of institutional life, such that they are structured into a field, through competition, the state, or the professions (DiMaggio and Powell 1983). The structuration of such a field "consists of four parts: an increase in the extent of interaction among organizations in the field; the emergence of sharply defined inter-organizational structures of domination and patterns of coalition; an increase of the information load with which organizations in a field must contend; and the development of mutual awareness among participants in a set of organizations that they are involved in a common enterprise" (DiMaggio and Powell 1983, p. 148). A key question in institutional theory is why do we see a degree of isomorphism among organizations in a field?

The notions of field and strategic group in fact refer to different categories of interorganizational relationships but share many of the same underlying socio-cognitive processes. The notion of strategic group makes it relatively easy for the researcher to define the margins of group belonging. Executives can be asked to identify their main competitors, who are then asked the same question, and the answers can be used to define which organizations are core to the strategic group, and which are peripheral, or secondary (Reger and Huff 1993). Strategic groups over time develop a group identity, defined as a “set of mutual understandings, among members of a cognitive intra-industry group, regarding the central, enduring, and distinctive characteristics of the group” (Peteraf and Shanley 1997). It is precisely the fact that these characteristics are identifiable for executives that make it possible for them to describe what organizations belong or do not belong to the group.

The study of institutional belonging is somewhat more complicated. First and foremost, recent research shows how at both the individual actor level and field level multiple identities and logics are at play simultaneously, making it more complicated for the researcher to completely map this level of analysis. At the individual actor level, one person may belong to several fields (e.g., a professional field, such as engineering, but also an industrial field, such as the construction industry, and a functional field, such as design), each with its own set of logics, which the person uses interchangeably in their daily activities (McPherson and Sauder 2013). At the organizational level, one organization may contain a number of subdivisions and subcultures, each with their own logics, such that it becomes difficult to link large organizations to only one institution or organizational field (Besharov and Smith 2014; Purdy and Gray 2009; DiMaggio 1997).

Linking institutions to the issue of legitimacy to some extent helps us clarify organizational belonging. Legitimation is the process whereby an organization justifies its existence and actions to a wider set of actors (Pfeffer 1981; Suchman 1995) but also clarifies such actions to key stakeholders (DiMaggio and Powell 1991). Such justification is necessary in order to ensure the continual support of key stakeholders (such as owners) in providing the resources necessary for the organization to function (Suchman 1995, p. 574). This legitimation is typically carried out by top management, or board members, as they are the ones vested with the power to define the purpose of the organization. Thus, although larger organizations may see a number of subcultures emerge, with some degree of belonging to specific fields, top management will typically identify explicitly with one or few institutional fields, for the purpose of legitimizing and explaining the logic by which they operate.

Logics of Action

At least in contexts where competition is present, organizational fields are created as groups of actors develop and share information about the market in which they compete (Anand and Peterson 2000). This information is structured and interpreted into cause-effect relationships that inform actions undertaken by the organization. Some scholars have labelled such knowledge content as schema (Weick 1979; DiMaggio 1997), while others prefer the term logics of action, emphasizing the type of schema directly linked to the actions of the organization. A shared logic of action can thus be defined more precisely as a set of shared and regular ways of thinking and acting that include a delimitation of such elements as domain, unit, dimension, quality, and behavior (Dequech 2008). Logics of action are just one type of institutional logic, specific to the means-end relationship that individuals and groups bring to an exchange (Bacharach et al. 1996).

Logics of action exist as a cognitive frame at the level of the individual actor, but logics become shared through socialization processes and daily action within the organization or across organizations. Logics of action mostly operate in a taken-for-granted fashion but critically manifest themselves when individuals have to explain and justify their actions (Bacharach et al. 1996). This point is critical, as it forms a basic assumption for the analysis in this paper, like in much of the research on such logics. I assume that actors are able to recollect and verbalize the logics of action underlying key strategic decisions of the past.

Bettis and Prahalad (1995) suggest that what focuses attention at the strategic level in the organization is a dominant logic. This dominant logic results in a consistency of action over time, despite a changing environment (Reger and Huff 1993). It is known, for example, that people are more likely to perceive information that is compatible with existing schema (Von Hippel et al. 1993) and recall such information more rapidly and accurately (DiMaggio 1997). In fact, small changes in the environment will not upset the dominant logic, which in the thinking of Bettis and Prahalad (1995) acts as a type of magnet, or funnel, eliminating or distorting environmental information to fit with the existing logic. Logics of action at various levels of the organization must fit within the dominant logic. Only large environmental disturbances have the potential to create a mismatch between the dominant logic and the external reality. While Bettis and Prahalad (1995) are unclear on the cognitive underpinnings of such a mismatch, Bacharach et al. (1996) suggest that the effects of such a mismatch inside the organization result in a feeling of cognitive dissonance in organizational members. Parties seek to avoid such dissonance, or contradictory cognitions, in the social context and will seek to reduce the dissonance through changed behavior, through reevaluation of the importance of the cognition, or by seeking new cognitions (Bacharach et al. 1996; Festinger 1962).

The concept of logics of action can be useful in explaining cognitions underpinning the existence of a strategic group. At the level of a strategic group, executives from different members of the group will commonly interact with each other at both formal and informal gatherings, such as conferences, conventions, trade fairs, and so forth. Similarly, they share information through communication channels such as trade publications or actors such as trade associations, research institutions, or consultants. They are thus likely to share cognitions, which may include at least elements of a dominant logic (Reger and Huff 1993), as well as some logics of action.

To illustrate, I will take inspiration from the strategic group, as well as the institutional theory literatures, in particular Reger and Huff (1993), Porac et al. (1989, 1995), and Bacharach et al. (1996), as I portray the evolution of the Nordic postal industry, as a strategic group, over the past 20 years. A key difference to the studies discussed above is that I suggest that strategic groups share elements of a dominant logic, which constrains the action of each group member, effectively limiting their repertoire of actions. This dominant logic is maintained through a process of collective sense-making across organizations in the group which reinforces perceptions and means-ends logics. Executives seek to maintain consistency of logics not just within their own organization but also across organizations in the strategic group. It is only larger environmental changes that have the potential to create a sufficient mismatch between the group dominant logic and the external reality, such that contradictory environmental information can no longer simply be distorted or ignored. The organizations within the strategic group must under these conditions transition to a new dominant logic to accommodate for the environmental change and to regain external legitimacy (Deephouse et al. 2017). It is this transition which will be the focal point of the next sections, where I examine the evolution of the Nordic postal operators as they transition between cooperative and competitive logics of action.

An Illustration

Industry Background

Up until around 20 years ago, the typical European postal operator was a government agency, with no shareholders to satisfy, no market shares to defend, and little freedom of action for management (Sund and Osborn 2010). Today the picture is very different, and strategy has become a crucial consideration. The European postal industry has been undergoing rapid transformation over the past two decades (Sund 2011). The main drivers of this transformation include the growth of the Internet, which has resulted in digital substitution for many applications of letter mail. On the other hand, e-commerce has resulted in substantial growth in the parcel delivery business. Further drivers have been the gradual liberalization of the industry by national governments and the European Union alike, as well as moves toward privatization in some countries. For example, the United Kingdom's Royal Mail and Portugal's CTT Correios were both privatized in 2013. Figure 1 illustrates some of the effects of this transformation in terms of (1) a move from physical to digital mail processing, (2) a move from private mail items toward mainly business mail items, and (3) a move from monopoly positions toward increased competition (Bogers et al. 2015).

National postal operators have responded in a variety of different ways to these changes. Some have, for example, diversified their national business, while others

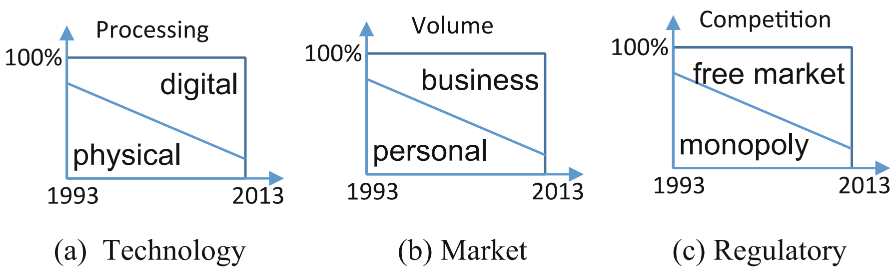

Fig. 1 Changing landscape exerting pressure on the postal industry

have internationalized their activities (Dietl and Jaag 2011). Where before these operators held national monopolies and cooperated in cross-border activities, they now compete much more directly with each other than ever before. This is as true for the Nordic countries as it is for the rest of Europe (Sund and Osborn 2010).

The analysis will follow the evolution of the strategic group composed of the Nordic postal operators of Finland, Sweden, Norway, and Denmark and to some extent the wider European postal market, from the late 1990s until today. A particular focal point will be the periods before and after the declared merger between the Swedish Post and the Danish Post, in 2008, which, I will show, came as a complete surprise to the other actors in the market because such a merger had never before been attempted and did not form a part of the action repertoire of the posts in question. The development will be described and commented upon mainly from the perspectives of Norway Post and Itella (Finland Post). The aim is to understand the events in the development, the drivers leading up to them, and how this influenced on and possibly changed the perception of the strategic landscape, the perception of how the other players might act and react, and their perception of threats and opportunities on behalf of their own company. In other words, how the logics of action changed in response to the wider changes in the environment.

Finland Post was in 2007 rebranded to Itella Corporation (an acronym for "intelligent logistics"). In order to ease the understanding, this company will henceforth be referred to as Itella throughout this chapter. The merged postal companies in Sweden and Denmark are referred to as PostNord after the declaration of the merger on April 1, 2008 but as Swedish Post and Danish Post before this date (It should be noted that although announced on April 1, 2008, the merger only came into effect a year later, on June 24, 2009). Table 1 presents an overview of demographic information concerning the Nordic Posts from 2000 to 2013.

Table 1 Core firms in the Nordic postal strategic group

	Norway Post	Finnish Post (Itella)	Swedish Post	Danish Post
Total turnover (2000)	NOK 13,659 mio	€ 1,069 mio	SEK 24,508 mio	Dkr 10,936 mio

Changing Strategies and Logics of the Nordic Posts

Pre-2000s: The Logic of Cooperation

Although the exchange of documents and parcels obviously dates back much further, the postal industry as we know it today can in the Nordic region trace its history back to the creation of the Danish Post by King Christian IV in 1624, which following a period in private hands was nationalized in 1711. Kungliga Postverket (The Royal Postal Agency) followed in Sweden in 1636, established by the Lord High Chancellor of Sweden, Axel Oxenstierna. By 1638 this post covered Finland as well (then a part of the Swedish Kingdom). Finally came the creation of the privately owned Postvesenet in Norway in 1647, which was eventually nationalized by the Danish-Norwegian government in 1719. For almost four centuries, these organizations functioned as government agencies, gradually building up a universal service enabling citizens in all parts of their respective countries to exchange letters and parcels with each other and across borders. Especially in the area of cross-border exchange, the Nordic posts would cooperate, guaranteeing a seamless delivery of mail and small parcels from citizens, businesses or governments from one country to another (Only interrupted by the occasional conflicts between these neighboring countries).

For most of the twentieth century, the Nordic posts experienced a steady development of mail and parcel traffic as the economy grew. Simply put, more industrial and service sector output led to more pieces of mail traveling through the postal system (Ansón et al. 2006). The same was true for the telecommunication sector, which had become the twin sibling of the post. The 1990s saw the first major signs of change. Market-oriented reforms were gradually introduced by all four Nordic governments, resulting in perceived environmental instability for the postal organizations (Oliva and Suarez 2007). The telecommunication arms of all Nordic posts were divested, liberalized, and privatized. This showed the posts which way their sector was likely to go, but all the way up through the 1990s, the Nordic posts continued to see each other more as partners than competitors. Before, and in a period of some years after, the first postal directive, all the postal companies would cooperate in the letter distribution. If a customer sent a letter from Norway to Sweden, it was natural for the two national posts to cooperate in getting the letter across the border and to the mailbox of the recipient.

The dominant logic of cooperation allowed for a number of strategic actions during the 1990s. Firstly, all posts focused internally on increasing the efficiency of their own operations, through investments in automation equipment and the reduction of the workforce. Secondly, the Nordic posts all invested resources in experimenting with new digital technologies as a way of diversifying their businesses. Thirdly, they continued to seek cooperation opportunities with each other, for example, through the creation of joint ventures. None of these strategic actions contradicted the historical logic of cooperation, since they did not result in head-on competition with each other.

The organizations were all incorporated around the same time in the mid-1990s, ahead of the gradual liberalization of the postal market by national governments and the European Union. The expectation was that the posts should become profitable in preparation for a later possible sale by government, which pushed these posts to seek to improve efficiency. Investments into automation became important. However, one of the things causing most concern to the management in the mid-1990s was the developments in the information technology sector. They saw new communication technologies emerging and wondered how this would affect the letter volumes in the future. In 1996 Norway Post decided to invest in the IT business and bought an IT company called ErgoGroup. The purpose was to learn about the new technology and its implications. One idea was to develop hybrid products by combining mail products with new technology. For example, business customers could now send a digital copy of their mail to Norway Post, who would print the mail, put it in envelopes, and ship it. The combined efforts of Norway Post and ErgoGroup resulted in innovation of a lot of products in the late 1990s, but they were not a huge success.

Itella in Finland started investing in IT slightly earlier than their Norwegian counterparts. Already in the mid-1990s, Itella prepared for the future by reducing the number of post offices and by innovating new hybrid mail solutions.

The investments into hybrid mail were a success, and Itella at that time considered themselves one of the leading European companies within this business segment. It is evident that both companies came close to the same conclusions at almost the same time regarding the importance of information technologies. Although there was an imminent threat that new technologies would replace letter mail over time, both companies also saw opportunities arising with the new technology. This led to investments into the adjacent IT segment with the main purpose to protect the mail volumes by developing hybrid mail services and thereby extend the life cycle of mail. There appears to have been shared logics of action driving these decisions, which remained compatible with the dominant logic of cooperation within the group.

Early 2000s: Liberalization and the Emerging Logics of Competition

The first EU Postal directive was introduced in 1997, opening up the market for domestic and cross-border letters weighing over 350 g. A second directive in 2002 prepared the opening of the market for letters over 100 g and for letters over 50 g in 2006. A final directive led to the complete liberalization of the European postal market in 2013. The original intention of the European Union was to open the market earlier, but several national governments managed to postpone the opening for a few years. The impending deregulation of the postal market forced the national postal companies to prepare for competition and optimize their operations.

In 1999 Norway Post hired a new CEO, Kaare Frydenberg, who begun a process of improvement. The new CEO launched a comprehensive turnaround process cutting cost, reviewing operations and service quality, and redesigning the operational and administrative processes in the company. One of the major initiatives he launched was to reduce the number of post offices and transform them into a “shop in shop” solution. The “shop in shop” is a franchise system where external retail chains run a “post office” integrated within their grocery store. This transition led to substantial downsizing over the following years.

In this same period, Norway Post also prepared a plan to restructure and streamline the entire national mail distribution network and infrastructure. Substantial cost reductions and quality improvements were achieved by reducing the number of terminals and making the distribution routes more efficient. This period was thus primarily characterized by internal processes to professionalize and streamline the company. This internal focus did not yet clash with the dominant logic of cooperation in the strategic group. The specter of competition was already there, and the intention of becoming competitive was there as well, but interestingly there was a reluctance to publicly name the other Nordic posts as potential competitors. In official documents, such as the annual report, future competitors were by Norway Post defined as being “major international logistics and communications companies” (Norway Post 2000 Annual Report, p. 8).

Jukka Alho was hired as new CEO at Itella in 2000. Already from the beginning, he started to renew the strategy process. For the first time, the company began to systematically map the market structures and trends, identifying and understanding possible customer segments and selecting product lines to focus on and invest in. Itella was convinced that within 10–15 years, letter volumes would only decline, and competition would grow. That year, in their annual report, similarly to Norway Post, Itella named several other posts as potential competitors, none of which were their Nordic neighbors.

In its further business development, Itella decided to investigate the value chain of its customers and try to find ways to offer and deliver “total packages” which would provide added customer value. Such a package could include IT services, hybrid mail products, printing, invoicing, and general logistics. Itella was by now already present in the Nordics but decided to expand the geographic footprint and move more eastward, especially to Russia and the Baltic rim.

In June of 2007, the former Finland Post (Posti in Finnish) rebranded the corporation to the new name Itella. The rationale behind the rebranding was to establish and build a strong Nordic and Baltic brand name around what was perceived as the new core business, namely, intelligent logistics, combining the traditional capabilities in the movement, sorting, and storage of mail, parcels, and goods, with the more recently developed know-how in IT (Pääkkönen 2014). Itella decided to keep the Posti brand, although renewed in style and logotype, as the brand for the postal consumer market in Finland. Unlike Norway Post, Itella did not expand its letter business outside Finland.

Based on common beliefs in a strong growth in international e-commerce leading to a big increase in imported parcel volumes to the Nordic countries, and this flow potentially being dominated by the big global logistics players, the four Nordic postal companies in 1999 decided to join forces (one last time), in the international parcel distribution segment. They created a joint venture company, PNL (Pan Nordic Logistics), where each Nordic postal company would have a 25% ownership. The plan was to jointly capture the European and global inbound volumes to the Nordics and that each postal operator would be the network and distributor on behalf of PNL in their respective country. At this time and in this segment (inbound international parcel distribution), the Nordic postal companies still saw each other as partners, rather than competitors. Instead, they defined the large global logistics companies (such as UPS, TNT, DHL, and DB Schenker) as their main and common competitors. But then something changed.

At this point, everybody believed all markets were to be deregulated by January 1, 2007 (As previously indicated, it eventually took longer, full liberalization being completed only in 2013). However, several other and equally important factors and development drivers became evident in the early 2000s, such as globalization and industry consolidation. One of the effects of the globalization was that international corporations were increasingly defining the Nordic region as a single market. The Nordic postal companies almost simultaneously came to the same insight: if your customer defines the Nordic region as one region, you must also define it as such. This influenced the strategic thinking and drove the postal companies to develop their own pan Nordic solutions. First Itella decided to withdraw from the joint venture and instead cooperate with DHL. Itella could not see the rationale behind PNL and was concerned that conflicting strategies between the owners could be a problem in the future.

In 2001 Swedish Post also left the PNL joint venture to undertake a Nordic franchise for the DPD parcel system (owned by the French Post), one of PNL's main competitors. The main argument from the Swedes for this surprising move was that the EU postal directive would eventually force the Nordic postal companies to become competitors. At this time the trust and relationship between Norway Post and Swedish Post was starting to deteriorate. Itella and the Swedish Post maybe left PNL for different reasons, but it appears that they based their decisions on the same emerging perceptions of future competition. The believed implications of the liberalization of the letter market changed the former perceptions about the market conditions, and as a result the relationships deteriorated between the Nordic postal companies. Norway Post and Danish Post remained as 50/50 owners of PNL. This joint venture continued until 2008 when the Swedish and Danish Post declared their merger, effectively forcing a definitive stop to the joint venture.

Around this time, in its strategy work, Norway Post started to paint a scenario whereby a competitor could penetrate their domestic market and steal a substantial market share. The assumption was that a challenger could cherry-pick the market, by only operating in the high-density and high-volume part of the country, such as the capital Oslo. Such a challenger could create a business model not hampered by the universal service obligations of Norway Post, who are obliged to deliver mail to all citizens 6 days a week. The challenger could focus on large business customers, i.e., industrial mail, conducting a 3-day a week distribution model, thereby gaining a substantial cost advantage and undercutting Norway Post on price. This threat interpretation of the effects of the impending market liberalization for the first time truly opened up the possibility of a new type of dominant logic in the Nordic market, based on direct competition with the other Nordic operators, rather than collaboration.

Based on this rationale, Norway Post in 2002 expanded its letter business into Sweden by acquiring an entrepreneurial venture named Citymail. This was the beginning of building a new business model as challenger to the incumbent player in the traditional core letter mail market in Sweden. Norway Post's strategic intent in this period was to establish a market leader position in the Nordic letter mail market with distribution networks in all the Scandinavian countries. Based on this strategy, Norway Post also decided to expand the mail business into Denmark by creating a new company, Bring Citymail Denmark. Based on the assumption that there could only be one surviving challenger in each market, winning the challenger position in Sweden and Denmark early would make Norway Post the only player with letter distribution in three out of the four Nordic countries. Through this strategy Norway Post hoped to control the Nordic letter market and thus defend its own home market in Norway. However, there were no plans to expand into Finland, who was still seen more as a potential cooperation partner.

At the end of this period, Norway Post also expanded their logistics operations, mainly into adjacent product segments in its home country, such as cargo transportation, container trekking, and warehousing. The rationale behind those investments was Norway Post recognizing that their core capability distributing letters really is a logistics operation and that many business customers didn't recognize the differentiation made by the postal companies between parcels, packages, and so on. The customer simply had a need to send goods of various types and sizes from one location to another. In order to succeed within the parcel distribution segment, the postal company also had to be able to offer various cargo transportation and even storage services. In 2004 the Norwegian cargo transportation company Nor-Cargo was acquired as a foundation for building a comprehensive logistics business model and operations.

In the early 2000s, cooperation was still the dominant logic within the group, and at least publicly the four Nordic posts refused to identify each other as direct competitors, including in newspaper interviews. However, by the middle of the 2000s, all four posts had improved their operations; identified similar market opportunities in parcels, IT, and the wider logistics market; and developed a shared perception that they would ultimately be competing with each other directly in most of their service areas. The dominant logic of cooperation was contradicted directly when the PNL joint venture started to fall apart and was further tested by the competitive moves of Norway Post into Sweden. The final major disruption that resulted in a permanent transition away from the original logics of cooperation was the unexpected merger of the Danish and Swedish Posts, announced on April 1, 2008.

Late 2000s Onward: The Merger of the Swedish and Danish Posts and the End of the Logics of Collaboration

On April 1, 2008, April Fool's Day, the Swedish and the Danish Post declared a merger of the two companies, forming a new and massive player in the most populated and central part of the Nordics. The new entity was named PostNord. This merger came very unexpectedly for Norway Post and Itella and was a clean break with the existing logics of action. The merger was a first globally (no other cross-border merger of incumbent postal operators had occurred until then). The option of such a merger was therefore not in the repertoire of strategic actions available to Norway Post or Itella. The immediate reaction of top management in those companies was one of disbelief. In fact, it is reported that as the merger was announced on April 1, April Fool's Day, top management in Norway actually believed for several hours that the announcement was a joke.

Nor did it seem a legitimate action. Both Norway Post and Itella feared that the merged company (PostNord) would become too dominant a player in the Nordic market, especially in parcel distribution and perhaps in the wider logistics market. Both Swedish Post and Danish Post were already very strong within parcel distribution in their respective domestic markets, which were the two biggest markets in the Nordics. By acquiring or building distribution networks also in Finland and Norway, PostNord could become by far the most dominating player in the entire Nordic region. Norway Post and Itella both appealed to the European Commission in Brussels fearing that this dominant player would change the market conditions and competition in the Nordics.

The appeal to the EU commission was unsuccessful. In reality, the market was, and still is, characterized by sufficient competition for the merger not to result in excessive market power. Before the merger, the main concern to both Norway Post and Itella was that Swedish Post would expand its letter business into their respective domestic market. It would seem naturally that the merger would reinforce this concern. However, retrospectively we see that this expected move did not happen. Letter volumes by now were steadily declining, even showing an increasing pace. This, and the fact that there are very limited synergies in cross-border mail consolidation in the Nordics, made an international expansion unattractive. Norway Post realized this fact after the failed attempt to become a pan Nordic player in the letter market. They eventually gave up their operations in Denmark and have now defined their letter operations in Sweden (Bring Citymail) as a standalone business.

On the other hand, PostNord posed a very clear threat in the growing logistics market. PostNord had the advantage of dominating the two biggest and most attractive markets in the Nordics. The strength of this position is enhanced as many Nordic and international corporations are consolidating their Nordic operations and in most cases situating their Nordic headquarters in Stockholm and their logistics operations in the south of Sweden.

After the merger, there were now three Nordic postal companies all competing in the logistics segment and growing their market presence through strategic acquisitions, but not, as expected for almost 10 years, competing very much in the mail segment. By the early 2010s, all three operators (PostNord, Norway Post, and Itella) explicitly identified each other as direct competitors. For example, PostNord in their 2013 annual report indicate "national postal operators in Norway and Finland" as direct competitors in the area of logistics. From a past as national mail monopolies, this group of organizations have transitioned together to form a new strategic group in the regional logistics market, under a dominant logic of competition.

Discussion and Conclusion

Through a detailed narrative of the recent history of a specific group of newly liberalized organizations, this paper traces the transition from one dominant logic to another, in the context of major environmental change. I started this paper by discussing the importance of cognitive perspectives in explaining the emergence and persistence of strategic groups but also pointed to the lack of theory and evidence about the actual transition between shared cognitions in such groups. The intention in this paper has been to suggest that a shared dominant logic forms an important part of the identity of a strategic group (Peteraf and Shanley 1997). This higher-level dominant logic acts as a constraint on the actions available to each member. It is therefore my suggestion that multiple logics of action develop, evolve, and coexist within any organization (Besharov and Smith 2014), which collectively define the organization's repertoire of actions, and that membership of a strategic group will create a higher level of shared dominant logic, with which each member's logics of action must then be compatible. This is the condition of equilibrium to which Bettis and Prahalad (1995) refer and which they suggest can only be disrupted by major changes to the external environment.

In my example of the Nordic postal sector, such major changes are present. However, the dominant logic is disrupted not by the environmental changes per se, but when one organization in the group engages in actions inconsistent with the dominant logic, thus opening up the possibility of legitimizing possible new actions. Norway Post and Itella react to the surprise merger by complaining to the European Union, effectively challenging a change of logics that has already occurred (Bacharach et al. 1996). These two organizations can be seen to challenge and test the legitimacy of the merger. Once the merger is deemed to be legitimate by the European Union, this opens up the possibility of new strategic actions, compatible with a new logic of competition.

Crucially, the final effect of the dissonance experienced at various stages throughout the 2000s is not in this case to create any form of negotiation or attempt to return to the old logic but to abandon those old logics of action and seek new ones that are compatible with the new emergent dominant logic of competition (Bacharach et al. 1996). Competition has now been legitimized by the environment (Suchman 1995). The new dominant logic of competition in logistics emerges through this exploration for new actions. The transition from logics of cooperation to logics of competition is thus gradual in nature and is fuelled from within the members of the strategic group, as they cope with a changing environment by exploring new logics of action.

Introduction

This chapter addresses the relationship between corporate social responsibility (CSR) legitimation and organizational identity. The purpose is to examine through the lens of organizational identity the tendency for modern organizations to seek legitimacy as socially and environmentally responsible actors and become associated with values such as sustainability and altruism. Specifically, the chapter highlights the CSR legitimation implications of the tendencies for business organizations to seek a normative organizational identity despite having a predominantly utilitarian identity and government organizations to seek a utilitarian identity despite having a predominantly normative identity. These identity category dynamics, it is argued here, shed light on why organizations promote themselves as socially and environmentally responsible in order to acquire and maintain legitimacy. The argument is that CSR legitimation should not be seen in isolation from important identity questions such as "what are we" and "what do we want to be."

In this chapter, CSR legitimation is defined as the process of acquiring legitimacy as a socially and environmentally responsible organization. The definition is inspired by Matten and Moon's (2008, p. 405) understanding of CSR as "clearly articulated and communicated policies and practices of corporations that reflect business responsibility for some of the wider societal good." The focus is on what government and business organizations say about their CSR activities (how they seek to "look good"), and the identity dynamics underlying such CSR legitimation, rather than what they actually do to be socially and environmentally responsible (how they seek to "be good"). The propagation of CSR is considered a strategic matter aimed at providing legitimacy benefits, for which both government and business organizations are assumed to have a clearly felt need.

Organizational legitimacy can be defined as "the perceived appropriateness of an organization to a social system in terms of rules, values, norms, and definitions" (Deephouse et al. 2017, p. 32). The basis for legitimacy results from the overall benefit of the organization to the individual evaluator, generating *pragmatic* legitimacy, or to the society as a whole, producing *moral* legitimacy (Bitektine 2011). In this chapter, these forms of legitimacy are assessed with respect to government and business organizations. Their basic features are well-known: Government organizations have *normative* identities, meant to protect and promote the public interest (thereby generating moral legitimacy), whereas business organizations are *utilitarian*, designed to pursue the interests of their owners (thereby generating pragmatic legitimacy). A central argument of this chapter is that these category differences have blurred and that government and business organizations have answers to their identity questions that differ from what their respective category identities would suggest. More importantly, these answers have implications for their legitimation strategies, including CSR legitimation. The chapter proceeds by distinguishing between these different identities and legitimation strategies and explores the blurring of the category boundaries that adds to our understanding of CSR legitimation.

Organizational Identity

Organizational identity are "those features of an organization that in the eyes of its members are central to the organization' character or 'self-image', make the organization distinctive from other similar organizations, and are viewed as having continuity over time" (Gioia et al. 2013, p. 125). By providing answers to questions such as "who are we," "what are we," "what do we stand for," and "what do we want to be," organizations define and express their central, distinctive, and continuous features, which in turn provide a platform for actions and decisions. They also define their social identities in the sense that they signal membership in a social category of organizations. The answer to the question "who are we" typically involves features that are shared with other organizations in addition to those that are unique. By declaring membership in social identity categories, organizations signal who they are similar to and who they are different from (Albert and Whetten 1985).

A central argument in organizational identity theory is that identity categories matter for legitimacy. This point of view is particularly significant in the social actor perspective on organizational identity (King and Whetten 2008; Whetten et al. 2014; Whetten and Mackey 2002), but also in strategy research on categories (Navis and Glynn 2010; Zuckerman 1999) and in organizational legitimacy literatures (Bitektine 2011). According to King and Whetten (2008, p. 195), being recognized as a member of a known category of organization is "the principal means whereby organizations gain legitimacy." Having a specific identity type as an organization signals what stakeholders can expect from it in terms of behavior and thus the standards by which to hold it accountable. Members of the same category are subject to the same expectations and are evaluated on the basis of the same metrics. Organizations whose category identity is unknown or uncertain will face difficulties acquiring and maintaining legitimacy as well as attracting the resources they need to survive (Zuckerman 1999). Moreover, organizations whose actions and behavior do not correspond to stakeholders' expectations of them based on the category to which they belong are likely to face legitimacy issues. It follows that category membership allows stakeholders to observe, evaluate, and understand organizations and to derive expectations of their behavior.

If we accept that identity category matters for legitimacy, then the strategic decisions made at the beginning of an organization's life cycle will influence this organization's chances of acquiring and maintaining legitimacy over time. Strategic decisions involving a movement toward a different identity category at a later stage in the life cycle will also influence the organization's legitimacy. Every identity category comes with a certain set of values and features that members "inherit" and become associated with (cf. Barnett and Hoffmann 2008; King et al. 2002). This spillover effect from the category to the individual organization could be a blessing and a curse depending on the legitimacy of the category. As a result, different categories of organizational identity could have different needs for legitimation.

Normative and Utilitarian Identities

Organizations can be sorted into one or several overarching ideal-typical categories associated with a specific set of core characteristics and values: business, government, and charity (Bromley and Meyer 2017). Within the limited space of this chapter, the focus is on the identities of business and government organizations, their blurring, and the implications of this blurring for CSR legitimation.

As an ideal-typical category, business organizations have utilitarian organizational identities emphasizing economic production, individuality, profit, and efficiency (Albert and Whetten 1985; Parsons 1960). They pursue their own interests and behave in a way that benefits their owners and customers. The interests of the larger society, underprivileged individuals, or specific local communities are not intended to be prioritized domains. This fundamental aspect of business organizing was described by Milton Friedman (2007, p. 178) in the following way: "There is one and only one social responsibility of business–to use its resources and engage in activities designed to increase its profits." His viewpoint is controversial today and refuted by many who argue that businesses can create value for the society while at the same time creating value for themselves (Kleine and von Hauff 2009; Porter and Kramer 2011). However, others have advocated Friedman's view (Peter Drucker, quoted in Bakan 2004; Henderson 2001; Karnani 2010).

In the case of business organizations, the relationship between organizational identity and legitimacy is relatively straightforward: The utilitarian organizational identity mainly generates *pragmatic* legitimacy. By responding to the needs of "their most immediate audiences," (Suchman 1995, p. 578) business organizations seek legitimacy based on the "self-interested calculations" of these audiences" (ibid.). In contrast, government organizations have normative identities emphasizing cultural aspects, collective welfare, and moral values (cf. Albert and Whetten 1985). They are not created to pursue their own or their owners' interests. Rather, they exist to serve the public interest and promote societal welfare. Their missions manifest themselves through the provision of intangible services and goods from which it is difficult or impossible to generate profits, including the handling of societal challenges and issues such as unemployment, pollution, national security, and social problems, which require national regulation, taxation, funding, and legislation.

Thus, in contrast to business organizations, government organizations in Western liberal democracies have a strong built-in responsibility for social and/or environmental issues. This is a central part of their *raison d'être* and an important basis of what they are and what they do – their identity. It primarily generates moral legitimacy in the sense that their existence is based on their ability to effectively promote societal welfare (Bitektine 2011; Suchman 1995). However, these are arguments from an ideal-typical point of view. The differences are blurred for various reasons in practice, including the tendency for utilitarian organizations to adopt features of the normative identity and vice versa.

Legitimacy and Legitimation

Scholars agree that legitimacy is a requirement for organizational survival. This is a fundamental insight in all organizational and management research, applicable to all kinds of formal organizations including business organizations. Organizations are social institutions, generally dependent on their stakeholders having favorable perceptions of them, in which case they receive support and better access to human, financial, and physical resources.

Many organizations have experienced, and continue to experience, a need to bolster their legitimacy. Scholars have noted that acquiring and maintaining legitimacy are "chronic difficulties" (Elsbach and Sutton 1992, p. 700) and "always problematic" (Ashforth and Gibbs 1990, p. 177). Empirical research has identified legitimacy problems arising from unethical behavior, greenwashing attempts, and various scandals and corporate irresponsibility committed by business organizations. These problems have led to a loss of support from key constituents, forcing these companies to defend their legitimacy and implement legitimacy-restoring strategies of both the substantive and symbolic type. Similarly, government organizations in Western democracies have faced legitimacy issues arising from perceived lack of transparency, corruption, and bad quality of services (Rothstein 2011), leading to bureaucracy-bashing and the image of government being surrounded by a "pessimistic fog of distrust, cynicism, and contempt" (Farnswarth 2003, pp. 2–3).

The active process of acquiring and maintaining organizational legitimacy is legitimation. This is a strategic process that involves justifying one's "right to exist to a peer or superordinate system" (Maurer 1991, cited in Suchman 1995, p. 573). According to Ashforth and Gibbs (1990), legitimation encompasses substantive or symbolic approaches. When pursuing substantive legitimation strategies, an organization makes real change in its practices, goals, structures, processes, and priorities in order to conform to the expectations of its constituents. When pursuing symbolic legitimation strategies, an organization designs its communication and description of its practices, goals, structures, processes, and priorities so that external constituencies *believe* that the organization is behaving in accordance with the rules, values, norms, and definitions of the larger system. CSR legitimation could be both substantive and symbolic.

CSR Legitimation in the Business Sector

To acquire and maintain legitimacy, companies increasingly "adopt the language and practice of CSR" (Matten and Moon 2008, p. 404) by engaging in legitimation activities involving both substantive and symbolic approaches to CSR (Schons and Steinmeier 2016). The aim of CSR legitimation is to justify one's right to exist as an organization on the basis of its commitment to CSR.

A wide range of substantive approaches have been observed in empirical studies of business organizations such as, for example, reducing waste and pollution, recycling, trading CO_2 quotas, donating money to charities and other social purposes, and having employees volunteer for social enterprises and in local communities. As noted earlier, however, the focus here is mainly on the symbolic aspects of CSR legitimation because substantive change often offers less direct legitimacy benefits. Recent studies have found that stakeholder awareness of organizations' CSR activities is low (Bhattacharya et al. 2008; Du et al. 2007; Sen et al. 2006). Unless legitimacy-granting audiences are aware of the socially and environmentally responsible actions, companies are unlikely to obtain legitimacy benefits from them. As a result, companies want to not only "be good" but also "look good" (Perez-Batres et al. 2012), leading to the proliferation of a range of symbolic approaches involving the direct communication of companies' CSR commitment and "green" legitimation (Wæraas and Ihlen 2009). Examples from business organizations include CSR reporting; CSR communication strategies; strategic philanthropy; CSR branding through core values, mission statements, and visual designs promoting CSR; and other symbolic and sensory means of expressing CSR commitment.

A number of scholars have argued that symbolic CSR involves ceremonial conformity with stakeholder expectations (Boiral 2007; Schons and Steinmeier 2016; Weaver et al. 1999). The argument is that symbolic CSR legitimation involves insincere CSR claims, taking advantage of the fact that stakeholders have little awareness of actual CSR performance. This can, of course, be the case if symbolic approaches are not matched with corresponding substantive CSR actions. Such ceremonial conformity could encompass activities described as window-dressing (Weaver et al. 1999), greenwashing (Marquis et al. 2016), bluewashing (Bigge 2004), green spin (Alves 2009), and CSR-washing (Pope and Wæraas 2016). However, symbolic CSR legitimation is not necessarily insincere or completely decoupled from realities. It could be a relevant strategy for informing or reminding stakeholders about non-visible CSR activities, especially for government organizations that typically are associated with negative perceptions despite having users or clients with positive perceptions.

CSR Legitimation in the Public Sector

CSR legitimation strategies are equally available to all kinds of organizations from a theoretical point of view. However, with some exceptions (Abdelmotaleb and Saha 2019; Bennett 2011; Hawrysz and Foltys 2016; Ogarcă and Puiu 2017), CSR has typically not been studied in the context of government organizations. Studies tend to examine the role of governments in promoting CSR in the business sector rather than how government organizations undertake CSR initiatives or promote themselves as CSR-oriented. As a result, mapping the CSR legitimation strategies of government organizations is trickier compared to business organizations.

Still, it is possible to argue that CSR has become a relevant legitimation strategy for government organizations (cf. Gjølberg 2010, p. 203). Consider, for example, the following statements made publicly by local governments in Norway (translated by the author).

The above statements can be understood as legitimation efforts aimed at becoming associated with altruistic values and characteristics relating to social and environmental responsibility. As such, they are legitimacy-*restoring* responses to critical claims pointing to the inability of government organizations to successfully address their own social and environmental responsibility (Lanested 2019; Mandag Morgen 2007). They could also be seen as legitimacy-*enhancing* initiatives creating conformity with business organizations, which generally are considered more "complete" organizations (Brunsson and Sahlin-Andersson 2000) and have a more comprehensive focus on CSR.

Regardless of the underlying reason, the statements are arguably examples of symbolic legitimation approaches to CSR. The listed municipalities in Table 1 formulate their missions, priorities, guidelines, values, and functions using well-known and already institutionalized CSR concepts such as social responsibility, ecological balance, climate challenges, sustainability, and reducing environmental footprint. The mere fact that they use the word social responsibility the same way as business organizations suggests that it is not sufficient simply to "do good" for government organizations, but they must also convince stakeholders by communicating about their values and priorities in order to "look good."

It follows that the social and environmental responsibility of government organizations can be described as having two aspects. The first is strictly connected to the ability of government entities to substantively fulfill their institutional mission of generating some form of societal benefit. The second is the symbolic aspect of CSR legitimation, associated with government organizations' ability to gain legitimacy benefits from propagating their CSR values, principles, intentions, internal regulations, and involvement in areas that may or may not be directly related to their institutional mission.

Organizational Identity Dynamics and CSR Legitimation

The dramatic increase in CSR initiatives in the private sectors of the Western world observed by a number of scholars seems to be a paradox. Substantive CSR activities are, at least strictly speaking, not consistent with the utilitarian organizational identity of these organizations. CSR could only be seen as consistent with the utilitarian identity if it is a means to an end, that is, if it is carried out as a symbolic legitimation strategy and/or contributes to the maximization of profit.

Table 1 CSR statements retrieved from Norwegian local governments

Municipality	Statements
Moss	"Moss Municipality shall emphasize social responsibility when carrying out procurements." (Moss Municipality 2019)
Lier	"An open, values-driven, and socially responsible municipality." (overall objective) (Lier Municipality 2011)
Bergen	"Bergen Municipality shall be a frontrunner regarding the environment, sustainable development, and adaptation to climate change. Environmental concern shall be an overarching principle in all our business and planning." (press release) (Bergen Municipality 2016)
Sandefjord	"Sandefjord Municipality is an inclusive working life organization (IA company) as of January 2017... The overarching goals of the IA-agreement is to improve the work climate, strengthen turnout, prevent and reduce absence, and prevent rejection and abandonment." (Sandefjord Municipality 2016)
Nesodden	"Ecological balance. Nesodden Municipality is aware of the global environmental and climate challenges and we are proactive in reducing the environmental footprint of our own activities and from the municipality in general. The environmental perspective is clear in the attitudes and actions of the municipality." (Core value statement) (Nesodden Municipality 2019)
Molde	"Employees and politicians shall be aware that they manage the common resources of society on behalf of all citizens of the municipality. Everyone is required to protect the municipality's resources financially and rationally in sustainable manner, and should not misuse or waste the municipality's resources." (Molde Municipality 2019)
Asker	"The new Asker Municipality is built on the UN sustainability goals" (Asker Municipality 2018)
Lørenskog	"Lørenskog Municipality shall be a healthy, green, and diverse municipality" (job advertisement) (Lørenskog Municipality 2019)
Haugesund	"Haugesund Municipality is an I-A company, which means that the municipality is aiming for an inclusive working life. It means to include everyone who can and wants to work." (Haugesund Municipality 2019)
Porsgrunn	"Porsgrunn Municipality is an IA-organization." (Porsgrunn Municipality 2008)

For government organizations, a different paradox emerges with respect to CSR legitimation. Substantive CSR legitimation is consistent with their normative organizational identity because social and environmental responsibilities are central aspects of what they are and do. However, symbolic legitimation is arguably at odds with the normative identity because it does not directly benefit societal welfare or the public interest. Rather, it benefits the interests of the relevant government agency because it positively influences stakeholder perceptions. Moreover, symbolic CSR legitimation could involve exaggerated claims and the projection of an image that does not correspond to actual realities. Undertaking additional CSR that does not directly fall within the institutional or social mission of these organizations is also a paradox, especially when such activities are conveyed strategically in social media, websites, campaigns, and other means of communication.

How can these legitimation paradoxes be understood and explained from organizational identity theory? The remainder of the chapter describes important dynamics of organizational identity categories and discusses how they add to our understanding of CSR legitimation.

Identity Category Dynamics

The dynamics of organizational identity categories of interest here can be summed up in the following way: Business organizations have generally moved toward normative identities, whereas government organizations have moved in the opposite direction by adopting aspects of the utilitarian identity.

Business Organizations' Quest for Normative Identities

Given that organizational identity constitutes a platform for actions and decisions, new actions often emerge from a revised identity or have the potential to change identity over time. Accordingly, CSR legitimation in the business sector can be understood in light of a desire to transition from utilitarian to normative organizational identities.

The normative identity is expressed in multiple types of identity claims. Companies of any size, industry, and geographical location tend to have core value statements, vision and mission statements, codes of conduct, company philosophies and credos, and so on, expressing central, continuing, and unique organizational characteristics. These statements are not necessarily direct reflections of member understandings of the organization, as they more often are the result of top management's internal sense-giving attempts (cf. Ravasi and Schultz 2006). They are also typically meant to generate a favorable impression of the company among external stakeholders and can be important components of corporate branding strategies. Consider, for example, the statements made by these companies (Table 2).

The companies are the ten mostly highly ranked on the 2019 Fortune Global 500 index. They are the most profitable, powerful, and successful companies in the world. They have not become profitable, powerful, and successful by being socially and environmentally responsible, i.e., by pursuing a substantive CSR legitimation strategy. In fact, the self-interested pursuit of profit and wealth for themselves and their shareholders has brought them to commit intentional acts of fraud, bribery, pollution, the mistreatment and discrimination of workers, and the violation of human rights. These incidents become "scandals" when they are uncovered (although many continue to deny any wrongdoing), many of which having significant legal and financial ramifications. For example, in the recent "Dieselgate" scandal, Volkswagen pleaded guilty and accepted to pay $4.3 billion in penalties in the USA (The New York Times 2017), and Volkswagen-owned Audi division accepted to pay a fine of €800 million in Germany in connection with the same scandal (The New York Times 2018). In June 2019, Walmart was ordered to pay

Table 2 Identity statements retrieved from Fortune Global 500 top ten companies

Company	Statements
Walmart	"To save people money so they can live better" (mission statement) (Walmart 2019b) "Service to the customer," "respect for the individual," "strive for excellence," "act with integrity" (core values) (Walmart 2019a)
Sinopec	"Fueling beautiful life" (mission statement) (Sinpoec 2017) "People," "responsibility," "integrity," "precision," "innovation," and "win-win" (values) (Sinpoec 2017)
Royal Dutch Shell	"Honesty," "integrity," "respect for people" (core values) (Shell 2019)
China National Petroleum	"Caring for Energy," "Caring for You," "Energize," "Harmonize," "Realize" (mission statement) (China National Petroleum 2019a) "Dynamic," "loyal," "honest," "committed," "Achieving excellence through innovation and integrity" (core values) (China National Petroleum 2019b)
State Grid Corp. of China	"Promoting re-electrification, building energy intergrid, meeting power demand with clean and green alternatives" (mission statement) (State Grid Corporation of China 2019) "Customer-oriented," "professional and dedicated," "ever-improving" (core values) (State Grid Corporation of China 2019)
Saudi Aramco	"Excellence," "safety," "integrity," "citizenship," "accountability" (core values) (Saudi Aramco 2019)
BP	"Safety," "respect," "excellence," "courage," "one team" (core values) (BP 2019)
Exxon Mobil	"Finding safe, efficient and responsible ways to bring affordable energy to a global market" (core values) (Exxon Mobil 2019)
Volkswagen	"Shaping mobility – for generations to come" (vision statement) (Volkswagen 2019b) "Responsibility," "honesty," "bravery," "diversity," "pride," "solidarity," "reliability" (core values) (Volkswagen 2019a)
Toyota	"Contribute to making the earth a better place to live, enrich lifestyles, and promote a compassionate society by supporting industrial and social infrastructure around the world through the continuous supply of products/services that anticipate customers' needs" (vision statement) (Toyota 2019b) "Respect for the law," "respect for others," "respect for the natural environment," "respect for customers," "respect for employees" (company principles) (Toyota 2019a)

$282 million to settle a bribery investigation concerning payments made to Mexican and Chinese officials (Forbes 2019).

These incidents are arguably the result of a very strong utilitarian organizational identity. However, paradoxically, the utilitarian identity is not the most dominant in these companies' mission statements and core values. By claiming to stand for a large number of values expressing a normative identity such as service, respect, integrity, people, honesty, caring, loyal, commitment, citizenship, solidarity, pride, and bravery, the companies want their employees to act in accordance with a normative identity and their external stakeholders to perceive them as having “soft” identity characteristics emphasizing relational and people-oriented values. Walmart expresses its normative identity through its mission to make people “save money” so they can “live better.” Volkswagen elaborates its core value “responsibility” by saying that “We are part of society. We take on social responsibility. We pay attention to the environmental compatibility of our products and processes, and improve them, every day.” Shell claims to stand for “integrity,” “honesty,” and “respect for people.” Toyota wants to “make the earth a better place to live” and “promote a compassionate society.” Very few values in Table 2 express a utilitarian identity. Typical utilitarian values such as performance and profit orientation, which could be very helpful for business organizations, are actually not mentioned at all.

The above examples are consistent with a longitudinal study of company self-presentations in employment advertisements (Wæraas 2020). The study showed a clear tendency for business organizations to present themselves as “leading,” “competitive,” “better than others,” “hardworking,” “hands-on,” “growing,” “producing good results,” and “world-class” in the 1980s and 1990s. Toward and after the 2000s, however, characteristics emphasizing a normative identity gradually took over and dominated the identity statements.

Thus, the tendency for business organizations to seek legitimacy on the basis of CSR is increasingly coupled with what they *are* and *stand for*. They redefine their activities in the language of CSR by communicating identity labels that emphasize normative rather than utilitarian identities, promoting moral rather than pragmatic legitimacy. The normative identity enables considerations of the society, people, the environment, and local communities. In turn, such considerations are more likely to entail CSR commitment than utilitarian identities (cf. Bingham et al. 2011; Wickert et al. 2017). The more company statements reflect a normative identity, the more understandable these companies’ CSR activities become.

Government Organizations’ Quest for a Utilitarian Identity

With the blurring of the boundaries between businesses and government organizations, a need arises to reexamine the role and significance of social and environmental responsibility legitimation in the public sector domain. The adoption of business identity characteristics manifests itself in two ways for government organizations:

First, large-scale reforms (known as New Public Management) in many public sectors of the Western world have enabled the “liberation” of public organizations (Light 1995) by giving them increased autonomy and/or by turning them into single-purpose agencies with distinct identities (Verhoest et al. 2012). Whereas traditional, monolithic public organizations are instruments of politicians in carrying out public policies, unable to act on their own behalf, autonomous public agencies are “liberated” and designed to pursue their own interests. As noted by Brunsson and Sahlin-Andersson (2000), public organizations have been transformed into organizational actors in their own right. In doing so, the reforms have weakened the normative public sector identity of government organizations and introduced strong components of the utilitarian identity. The reforms are based on the assumption that government organizations should be held to the same standards of efficiency and performance as any other organization and that notions of "outputs" and "results" are relevant guidelines for these organizations. The reforms have created government entities that in their managerial practices, priorities, and structures resemble private sector organizations.

Second, as a result of these reforms, government organizations are encouraged to understand themselves less as specific cases of public sector entities and more as formal organizations in pursuit of goals and results. Empowered public agencies have the liberty to define their own identity and to compare themselves to business organizations. This comparison has resulted in a large-scale adoption of business and management practices from the private sector such as performance measurement (van Dooren 2005), management by objectives, strategic planning (Berry 1994), and risk management (Power 2004), to mention a few. In many cases in Norway, these practices are imposed by law or regulations because the central government requires state-level organizations to report results and goal fulfillment on the basis of key performance indicators. However, in many other areas, government organizations voluntarily adopt well-known business models and practices such as balanced scorecard (Chan 2004), lean (Radnor 2010), reputation management (Wæraas and Sataøen 2014), and core value statements (Kernaghan 2003).

Such adoptions are strictly speaking not consistent with the traditional, bureaucratic, rule-oriented public sector organization. It requires a new or at least modified self-understanding: an identity that enables government organizations to see themselves as similar to business organizations and to require the same organizational "building blocks" as these organizations (Wæraas 2018). This identity drift is probably never going to be completed because of the overarching mission of government organizations of serving the public interest, which is, in the end, different from those of business organizations. For this reason, public administration research examining the organizational identity implications of NPM reforms has found more modifications and local translations of "old" administrative values and identities rather than the full-scale adoption of a "new" managerial identity (Meyer and Hammerschmid 2006; Rondeaux 2006; Skålén 2004).

Nevertheless, radical changes in the overarching identity of public organizations are more likely to occur with the influence from business sector identities than without, and business identity characteristics can still be prominent in external legitimation efforts. The table below shows how a sample of Norwegian local governments officially describe themselves on the basis of values and characteristics that are consistent with a utilitarian organizational identity (Table 3).

It is perhaps not surprising that municipalities choose to focus on efficiency in resource use given the scarcity of resources faced by many of them and the formal accounting and administrative requirements imposed on them. Moreover, there is no contradiction between maximizing collective welfare and being goal-oriented. However, the statements, as well the actual practices of these organizations, confirm

Table 3 Identity statements retrieved from Norwegian local governments

Municipality	Statements
Løten	"Løten Municipality is goal-oriented in its work to develop a professional organization emphasizing leadership development, quality management, and management by objectives. The municipality is well-managed and we are concerned with results in combination with developments and reforms." (job advertisement) (Løten Municipality 2016)
Os	"We are a very results-oriented municipality." (Mayor's newspaper statement) (Hamre 2013)
Eidsberg	"We are concerned with results, open communication, and team spirit." (job advertisement) (Eidsberg Municipality 2015)
Sandefjord	"We are a goal-oriented organization with accountable employees who implement what we have decided." (job advertisement) (Sandefjord Municipality 2019)
Karasjok	"The municipality shall be a goal-oriented organization." (municipal plan) (Karasjok Municipality 2019, p. 24)
Drammen	"Drammen shall be one of the best municipalities in the country concerning the quality of services and efficient resource use." (main goal) (Drammen Municipality 2015)
Lørenskog	"Lørenskog Municipality has implemented Balanced Scorecard, BMS, as a management system in order to ensure reporting and monitoring of the municipality's goals." (municipal plan) (Lørenskog Municipality 2013, p. 13)
Kragerø	"Kragerø Municipality uses management by goals and objectives as a fundamental governing principle." (financial guidelines) (Kragerø Municipality 2017, p. 4)
Asker	"Asker Municipality shall deliver good and efficient services with the right quality to users and citizens, working systematically to achieve this through the management of goals and objectives." (action program) (Asker Municipality 2016, p. 50)
Lyngdal	"Comprehensive management is about setting clear goals for what the municipality should achieve, measure results, and analyze them. This information is used in the management and further development of the municipality." (strategy plan) (Lyngdal Municipality 2019, p. 5)

the institutionalization of goal orientation, results, performance, rational systems, and management in government summarized by Brunsson and Sahlin-Andersson (2000) as the transformation of public sector organizations into "complete" organizations. Any examination of Norwegian municipalities' web sites would reveal a multitude of management and governance documents describing systems for rational and goal-oriented governance, with goals broken down into sub-goals supplemented with adequate indicators for verifying whether the goals have been met.

The statements also confirm a transition toward utilitarian organizational identity in public sector organizations because goal orientation, performance managements, results, and rational management are values and characteristics not only associated with what these organizations do but also deliberately with what they *are* and they *stand for*. The municipalities themselves claim to represent these values and to organize their activities in accordance with them. Løten Municipality "is goal-oriented," Os Municipality is "very results-oriented," Sandefjord Municipality is “a goal-oriented organization,” Drammen Municipality “shall be one of the best” concerning “efficient resource use,” and so on. As such, utilitarian characteristics arguably have an external legitimation function for these organizations. When conveying their rational organizational systems and processes to external stakeholders, government organizations seek conformity with “more complete” business organizations.

Against this backdrop, it is not surprising that many government organizations have redefined and currently propagate their socially responsible mission in CSR terms. When CSR is ubiquitous among business organizations, and government organizations identify with and adopt many of the other practices of business organizations, they also become more likely to adopt CSR practices, including symbolic CSR legitimation. The identity drift toward the utilitarian organizational identity suggests that CSR legitimation follows logically and “naturally.” Government organizations engage in substantive and symbolic CSR legitimation because they want to not only “do good” but also “look good” – just like business organizations.

Discussion and Conclusion

The questions of “who are we” and “what do we want to be” are fundamental identity questions whose answers influence strategies, decisions, and actions. Whether an organization is a government or a business organization matters for what it does because overarching normative and utilitarian identities entail different underlying values and characteristics, which in turn influence strategies, decisions, and actions.

The argument developed in this chapter, however, is that these boundaries are fluid and that CSR legitimation should be seen in conjunction with the blurring of organizational identity categories. A business organization that adopts characteristics of the normative identity will not stop understanding itself as a business or no longer seek pragmatic legitimacy, but it will be more likely to assume responsibility for issues outside its business area and propagate its CSR involvement in order to tap into the moral legitimacy basis of the normative identity. Similarly, a government organization that adopts characteristics of the utilitarian identity is unlikely to stop understanding itself as government or no longer seek moral legitimacy, but it will be more likely to adopt those managerial practices that are more typical for business organizations, including a more strategic approach to its social and environmental responsibilities.

These complex identity dynamics represent an important background for understanding CSR legitimation. Figure 1 sums up these arguments in the following way.

First, substantive CSR legitimation is associated with the normative identity because it aims to benefit collective interests, whereas symbolic CSR legitimation is associated with the utilitarian identity because it aims to benefit self-interests. Substantive CSR legitimation generates moral legitimacy, but can also result in pragmatic legitimacy if CSR actions directly benefit specific groups or individuals.

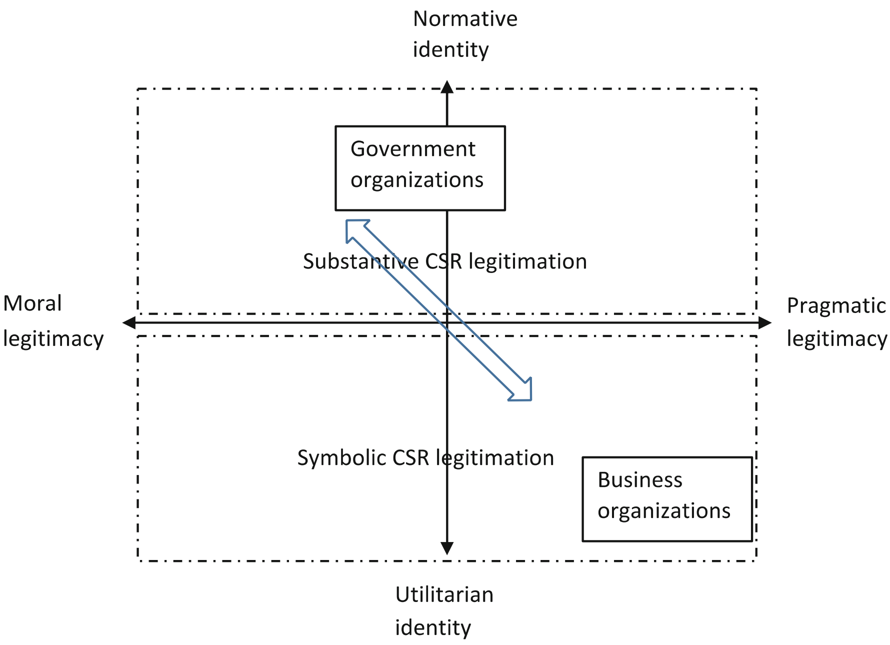

Fig. 1 Organizational identity dynamics and CSR legitimation

Symbolic CSR legitimation creates moral legitimacy because it aims to establish a perceived connection with altruistic values, but could also generate pragmatic legitimacy if it involves creating the impression that the organization caters to the needs or interests of specific groups or individuals.

Second, for business organizations, which by definition are meant to purse their self-interests, CSR is consistent with the utilitarian identity only if it is a means to an end, that is, if it is carried out as a symbolic legitimation strategy and/or contributes to the maximization of profit. However, driven by the limitations of the pragmatic form of legitimacy, modern business organizations aspire toward the normative identity. This leads them to seek moral legitimacy by engaging in both substantive and symbolic forms of CSR legitimation. By contrast, government organizations have normative identities and engage in substantive social and environmental legitimation activities by their nature. However, they aspire toward the utilitarian identity of business organizations because of large organization-building reforms and the proliferation of the idea that government entities also are "organizations," just like business organizations. This aspiration leads to the adoption of managerial practices and models from the business sector, including symbolic forms of CSR legitimation.

These arguments are abstract, generalized, and limited because they do not distinguish between different types of government organizations, between different industries within the business sector, or between different cultural contexts. As a result, there are ample opportunities for future research to examine in more detail the CSR legitimation implications of organizational identity dynamics. Some government organizations may not aspire toward a utilitarian identity at all, and some business organizations may not aspire toward the moral identity at all, in which case none of them is likely to propagate their CSR activities. On the other hand, some government organizations might show a stronger disposition toward the utilitarian identity than others. Some business organizations could have a stronger need for moral legitimacy than others. Local government, for example, interacts more closely with specific user groups than central government bodies and may therefore have a stronger aspiration toward the utilitarian identity. Future research could seek to determine how and to what extent such nuanced category differences influence CSR legitimation, including the ways in which substantive and symbolic CSR legitimations vary under different identity dynamics.

Human Resource Management and Business Legitimacy: Changing Roles and Legitimacy-as-Process

Margit Neisig

Contents

Abstract

This chapter aims to analyze the role of legitimacy in mediating the people management-society relationship. Emphasis is on how the historically changing theorizations of people management reflect different institutional and historical contexts, legitimating notions of how to position people management and expectations of the role it ought to play. Also, emphasis is on specific types of blindness preventing long-term sustainability and legitimacy of HRM.

J. D. Rendtorff (ed.), *Handbook of Business Legitimacy*,
https://doi.org/10.1007/978-3-030-14622-1_6

The chapter is based on a *legitimacy-as-process perspective* claiming theorization as a critical element of legitimation. The theorization of the field of people management (of which HRM is a specific variation) is analyzed based on literature representing highly influential authorships and major knowledge institutions often cited in the literature influencing the field of people management and on secondary literature such as review articles.

A brief historical analysis of the changing core of the people management/ HRM ontology, epistemology, and its legitimating notations is performed, and four types of emergent HRM epistemologies and corresponding notions of legitimacy are identified based on the fragmented future HRM landscape.

The findings and practical consequences are that although the perspective of HRM is broadened, blind spots unavoidably generate paradoxes and an ever-existing "crisis" of the HRM project, which must be accepted as a precondition for the profession but also for its adaptation toward current challenges.

The chapter adds to legitimacy and HRM literature by providing an understanding of why the legitimacy-as-property and legitimacy-as-perception perspectives must be subordinated to the legitimacy-as-process perspective and how this appears in the case of HRM.

Keywords

Human resource management · Legitimacy-as-process · Future HRM · Paradoxes and deparadoxication · Sustainable HRM

Introduction

A crisis of human resource management (HRM) has been claimed, debated, rejected, and maintained throughout decades – but for different reasons (Legge 1995, 2005; Keenoy 1990, 1999; Keenoy and Delbridge 2010; Guest 2011). Especially the strive to position HRM as strategic HRM (SHRM) is met by critique and legitimacy issues, even though this position has dominated theorization of HRM since the 1990s. Accusations are that HRM are "swimming against the tide," have a "tired project," and may benefit from establishing "social partnerships and mutual gains" (Lucio and Stuart 2004) or more directly outspoken by Kochan (2004, first published 2013):

> The human resource management profession faces a crisis of trust and a loss of legitimacy in the eyes of its major stakeholders. The two decades effort to develop a new "strategic human resource management" role in organizations has failed to realize its promised potential of greater status, influence, and achievement. To meet contemporary and future workplace challenges, HRM professionals will need to redefine their role and professional identity to advocate and support a better balance between employer and employee interests at work.

While SHRM has retained the mainstream position, new ways of positioning HRM are emerging. As we shall see below, this not only represents a shift of the HRM project but also a shift of legitimating notions.

In this chapter, the interrelatedness between people management and society is understood as mediated by legitimating notions which have changed radically throughout history. The epistemological and ontological core of people management (of which HRM is seen a distinct variation) has been under reconstruction ever since the emergence of the discipline and so has the underlying legitimating notions. It is not the intension to understand or analyze in depth the entire change process of how legitimating notions mediate the people management-society relationship, but rather the query is how the historically changing theorizations of this field reflect different institutional and historical contexts and how this produces changing perceptions of how to position HRM and the role it is expected to play. Also, the query includes how these changing positions produce specific types of blindness of HRM preventing long-term sustainability and legitimacy. The unavoidable blind spots are identified to generate an ever-existing "crisis" of the HRM project, which must be accepted as a precondition for the profession but also for its adaptation toward current challenges.

The historical development is only briefly described, while the chapter is elaborating more on various positions emergent for the future.

Before the historical introduction of people management as field (section "A Brief History of People Management as Field") and before the analysis of the emergent positions and blind spots of HRM today (section "Emerging Types of HRM Epistemologies Resting on Four Different Notions of Legitimacy"), we will explain our understanding of legitimacy (or rather of legitimation) as well as our analytical strategy (section "Legitimacy versus Legitimation: Strategy of Analysis").

After the brief historical introduction, various emergent HRM epistemologies and corresponding notions of legitimacy are categorized into four different types, and we argue that they may lead to specific types of blindness:

Type 1. A unitary approach becoming reflective toward (some) stakeholders
Type 2. An approach oriented toward HRM taking part in heterogeneous networks letting HRM reflect on broader economic and societal factors
Type 3. An approach challenging the former rationality of HRM advocating reflection of the way in which HRM are "thinking" and creating knowledge
Type 4. An approach taking new tools as big data, cloud computing, and deep learning technologies into consideration as tools supporting reflection under highly complex conditions

As a practical consequence the analysis predicts that although new epistemologies and notions of legitimacy are broadening the perspective of HRM, they unavoidably also produce new types of blind spots leading to an eternal spiral of legitimacy paradoxes and attempts of deparadoxication – a notion used by Luhmann to understand a way of handling unavoidable paradoxes by postponing them in time. Otherwise, actions would be paralyzed (Luhmann 1993, 1995; Rasch 2000; Gonzalez-Diaz 2010).

Legitimacy versus Legitimation: Strategy of Analysis

In order to understand the role of legitimacy in mediating the people management-society relationship, we find it useful to differentiate between and apply the three different perspectives found by Suddaby et al. (2017). They identify three different answers to the question: "what is legitimacy?", each with a unique epistemological and ontological position. They find most scholars theorizing legitimacy as a thing – i.e., a property, resource, or a capacity of an entity. They term this perspective *legitimacy-as-property*. Scholars researching by using this perspective focus primarily on legitimacy as a product of two primary actors: the organization and its external environment. The scope of this type of research is to identify the elements or characteristics that constitute legitimacy. In this chapter we only use this perspective as subordinated to the second perspective, in which other scholars view legitimacy not as a thing but as an interactive process. This perspective, Suddaby et al. (2017) is calling *legitimacy-as-process*. In this perspective, "legitimacy" may not be as relevant as the term "legitimation." According to Suddaby et al. (2017), scholars using this perspective adopt a somewhat broader lens that "examines legitimacy as the product of interaction of multiple actors (typically organizations) operating largely, but not exclusively, at more macro levels of analysis, such as the organizational field" (Suddaby et al. 2017).

The third group of scholars categorized by Suddaby et al. (2017) understand legitimacy as a form of sociocognitive perception or evaluation. This perspective is termed *legitimacy-as-perception*. This stream of research sees legitimacy as occurring as "a cross-level process of perceptions, judgments of appropriateness and actions that occur in interactions between the collective and the individual" (Suddaby et al. 2017).

Our level of analysis is *the field* of people management, which has been termed differently throughout history, but since the mid-1980s, HRM, and its language and rhetoric, which by Keenoy is termed HRMism (Keenoy 1997), gained ground as further elaborated in section "A Brief History of People Management as Field." Therefore, we prefer to call the field people management rather than HRM which is a specific variation of people management.

Using the perspective identified by Suddaby et al. (2017), our analysis is rooted in the "legitimacy-as-process perspective." Nonetheless, it also finds the need to integrate the other perspectives, but as subordinated. The analysis identifies how different and changing anticipated "legitimacy-as property perspectives" are playing the role as legitimating notions of various paradigms of people management, of which HRM*ism* is one. The analysis does this historically as well as in emergent positions. Also, it identifies how different "legitimacy-as-perceptions" are struggling against each other as different "frames of references" (Fox 1966) creating paradoxes of legitimacy for emergent positions of HRM.

In applying the "legitimacy-as process perspective" in this chapter, we lean toward one important stream of research claiming theorization as a critical element of legitimation. The notion of theorization was first used by Strang and Meyer (1993) and has since been unfolded and researched in many organizational change processes and professional fields and may take on different forms (Suddaby and Greenwood 2005). Theorization refers to the process by which existing norms and practices are abstracted into generalized specifications or categories. This process is seen as one stage in a process model of institutionalization. As the theorized practice or form diffuses across an organizational field, it takes on even greater legitimacy until it becomes taken for granted (Suddaby et al. 2017). As already delineated in the introduction, this chapter does not intend to understand or analyze the entire process in depth but rather to identify how the historically changing theorizations of HRM reflect different institutional and historical contexts and how this produces changing perceptions of how to position HRM, the role it is expected to play, and the specific types of blindness it produces.

The theorization is also analyzed as framed by and framing "legitimacy-as-perception." In accordance with this perspective, it is identified how "the frame of reference" as first developed by Alan Fox (1966) and later elaborated by Cradden (2011), Ackers (2014), and Sappey et al. (2014) appears in the theorization of HRM. The two main frames of reference are unitarist and pluralist, while Fox later developed a radical approach (Fox 1974). Industrial relation research has later expanded his work into more "frames of references" as, e.g., corporatism and strategic choices, and new ones may emerge. A unitary system has one source of authority and one focus of loyalty. Pluralism is characterized by the need to accept the existence of rival sources of leadership and attachments. In a radical approach, the industrial relations are deeply and inherently biased toward conflict between management and workers.

Also, the theorization process is analyzed as drawing on very different concepts of "legitimacy-as-property," which is identified as fundamentally different concepts playing the role as legitimating and delegitimating notions of people management historically and in emergent HRM positions. A notion of "legitimate authority" (Bowen and Ostroff 2004) leaning toward a Weberian understanding of legitimacy versus a notion of "social legitimacy" as elaborated in more modern institutional theory (e.g., Suchman 1995) and an emergent notion rooted in ANT theory are identified and related to the different institutional and historical contexts in which they play a role in legitimating the role of HRM.

The theorization of the field of people management is analyzed based on literature representing highly influential authorships and major knowledge institutions often cited in the HRM literature as well as on secondary literature such as review articles. The four types of emergent HRM epistemologies and corresponding notions of legitimacy are identified based on the fragmented future HRM landscape as well as the gaps in the literature depicted by Stone and Deadrick (2014, 2015) and on future concepts advocated for by major HRM knowledge institutions such as the influential US-based senior executive think tank: the Results-Based Leadership Group (RBL), the London-based Chartered Institute of Personnel and Development (CIPD) with more than 145,000 professional members around the world, recent lines of scientific research concerning changes of the knowledge production systems of the twenty-first century, as well as large HRM consultancies with a worldwide scope.

A Brief History of People Management as Field

As already stated, the ontological core of HRM has never been concluded and is still debated. Kaufman (2014) argues that HRM ought to be defined broadly and inclusively as "people management in organizations." He questions the universalistic "more HRM is better" (Wright and McMahan 2011:97) proposition, as he finds the narrow definitions (e.g., Storey's definition below) overestimate the modern success of SHRM. This debate on how to define HRM – the ontology – is very important, as this is about the role of HRM and hence about whose interests to take into consideration. Also, it is about the historically changes of legitimating notions.

One of the most accepted definitions of HRM stems from Storey (1995): "HRM is a distinctive approach to employee management which seeks to achieve competitive advantage through the strategic deployment of a highly committed and capable workforce using an integrated array of cultural, structural and personal techniques."

This definition already shows challenges caused by the global networked society, in which more and more people either are not "employed" or the organizations are dependent on human resources outside the organization. Kramer (2014) therefore argues that the notion needs also to: "... include managing people, such as sub-contractors, consultants and people on non-employment contract as well as possibly also managing relationships with other organizations." Hence, already this short time frame shows evidence on the challenges of defining HRM in too narrow terms.

Keenoy (1990) argues that the notion must acknowledge interest differences and give up a "unitary" and "managerial" approach. He argues that HRM needs to reinvent a pluralistic view as before personnel management turned into HRM and to *include more voices, and not only big companies*.

This short argument shows how "the frames of references" as first developed by Fox (1966) are actualized in the HRM theorizing and struggling to legitimate or delegitimate different views.

Another reason to dwell on the history of HRM is that not only the ontology is socially constructed but also the epistemology of HRM is socially changeable. Kramar (2014:1082) states that "processes of HRM have been framed within the SHRM literature predominantly within a rational view of organizations."

Legge (2005) summarizes that to understand HRM you need to understand "the nature of work, the social relationships and the economic dynamic in which HRM is embedded". This constitutes a need for studies of HRM in a longitudinal perspective. Historical and culturally informed studies are allowing the understanding of the organizational institutional settings. She also calls for more efforts in studies of what HRM is about: the employees.

This brief introduction shows the social construct of people management. Below, we will headline some major landmarks of the historical landscape of HRM, just to show how history has shaped and reshaped ontology, epistemology, and the legitimating notions of HRM. The current reconstruction of HRM, thus, is part of an ongoing, never-ending process of reinterpreting what people management is about.

The Rise of the Profession and the Field

The rise of labor unions in Europe in the late eighteenth century (and in North America in the nineteenth century) gave rise to the labor management/industrial relations. Collective bargaining between trade unions on one hand, and employers and their associations on the other, has always been the core subject-matter of that discipline. The predecessor for HRM, however, is often counted as the welfare officer or secretary. This profession also came about during the industrial revolution and was primarily protecting women and girls working in the UK factories. What is today the Chartered Institute of Personnel and Development (CIPD) was established in 1913 as the Welfare Workers' Association (WWA) (CIPD 2018). Both labor management/industrial relations and the welfare secretary had very different notions of legitimacy than today's HRM. Both were recognizing the conflict of interests between employees and employers, and they were not seen as a support function for management.

After WWI, the scientific industrial revolution took place, and the first way of scientifically describing people management emerges from Frederick W. Taylor: "Principles of Scientific Management" (1911). This approach aimed for economic efficiency and labor productivity. About the same time, Henry Ford introduced the assembly line, and Henry Fayol wrote: "Administration Industrielle et Générale" (1916). Based on his own experiences concerning business administration, also Max Weber (1922) wrote "Wirtschaft und Gesellschaft" describing the bureaucracy. In these works, human labor was perceived as what Persky (1995) has called the "homo economicus," and the legitimating notion was science showing how to obtain increase of productivity for the economic benefit of both workers and employees. By that time the "labor manager" in the large factories was handling absence, recruitment/onboarding, dismissals, and complaints on bonuses, and the consciousness of class differences was clear. The employer's union negotiated at a national level with the labor unions but with local and regional differences and a lot of disagreements.

The human relations school emerged through the Hawthorne trials (1927–1932) at Western Electric Hawthorne Works in Illinois, which was documented by Elton Mayo's Hawthorne studies, described in his contribution, *The Human Problems of an Industrialized Civilization* (1933), and about and after World War II, what has been termed "Personnel Administration" appears as a people management paradigm distinct from "labor management." Welfare was integrated into this function as well as compliance with the increasing legislative rules shaping people management. Knowledge on human relation and behavioral sciences is also integrated with Personnel Administration as is education and training becoming a subfield of Personnel Administration. Thus, the profession is becoming increasingly institutionalized. The predecessor of HRM was taking shape, but as claimed by Kramer (2014) Personnel Administration was not linked to the corporate strategy and was as a discipline a sub-subject of the much broader defined field of industrial relations. The role of the people manager was, in the middle of the interest conflicts, described as "the man in the middle," a buffer and potential scapegoat for the actions of the rest of management (Legge 1989).

We will not dig into any details about the development from the 1940s until the 1970s; just mention that in this period, the neo-human relation movement was shaping Personnel Administration. This movement questioned the widely used economic management and planning that by that time was mainstream in management. Instead, the neo-human relations movement was advocating a focus at human relationship and goal orientation.

Often the rise of HRM is explained by the increasing complexity which also gave rise to what has been termed the knowledge society. Another explanation is the crisis in the 1970s through which the Japanese industry was demonstrating its competitiveness along with a very different people management approach than the Western and a very different notion of legitimacy, based on a unitary frame of reference, which was not until then common in Western countries.

The Rise of HRM

The crisis in the 1970s and the industrial competitive edge gained by the Japanese industry led to an increased American focus at people management during the 1980s – as an active, not only a cost. This new orientation is often called *Human Resource Management* and is related to a *Human Capital theory*, in which the human capital is narrowly related to the business strategy. This relationship between HRM and strategy is pivotal and differentiate HRM from Personnel Administration as distinct paradigms of people management.

In the mid-1980s, larger integrated models and definitions of HRM came about in the theorization of the field in the USA:

- Fombrun et al. (1984), Michigan
- Michael Beer et al. (1984), Harvard

Later, HRM was "discovered" in Europe and among others described by Guest (1987) and Storey (1989).

As described by Guest (1990), HRM emerged in the 1980s at a time when power relationships shifted among employers, managers, employees, and trade unions. Guest (1990) describes it as meaningful to regard HRM initiatives and HRM language as being closely intertwined with this shift of power, while Keenoy (1990, 1999) and later Keenoy and Delbridge (2010) account for the blindness of HRM in that it neglects conflicts of interest and voices from anything else besides large corporations (not included are, e.g., small- and medium-sized enterprises, micro-employments, NGOs, not-for-profit labor). HRM is also associated with the emergence of new managerialism, as described by, for example, Clarke and Newman, underlining that HRM "has been both a source and beneficiary of these wider economic and political transformations" (Clarke and Newman 1997:58). This swatch of literature understands new managerialism including HRM as the mode of governance aligned with neoliberalism.

HRM was by Storey (1989) characterized as a "hard" school represented by the Michigan model developed by Fombrun et al. (1984) and a "soft" school, represented by the Harvard model developed by Beer et al. (1984). He described them in this way:

> The hard one emphasizes the quantitative, calculative and business-strategic aspects of managing the headcounts resource in as "rational" a way as for any other economic factor. By contrast, the "soft" version traces its roots to the human-relations school; it emphasizes communication, motivation, and leadership. (Storey 1989:8)

However, in the book, *Human Resource Management: Rhetorics and Realities*, Legge (1995) described the hard and soft school as two sides of a coin, often used interchangeably. The two-sided coin was reconfirmed by Truss et al. (1997). Keenoy (1990, 1999) has furthermore argued that many of the dichotomies of HRM, such as personnel-HRM, rhetoric-reality, hard-soft, flexible-specialization, loose-tight structure, and core-periphery workforce, rather are dualities, as they work together and are dependent on each other.

During the 1990s, the concept of SHRM emerges (Wright and McMahan 1992), which developed into empirically testing the link between HRM and firm performance (Paauwe 2009); and in their article, "Strategic human resource management: a wrong turn for HRM research?", Boselie and Brewster (2015) argue that contemporary SHRM approaches implicitly build on the "hard" approach, largely neglecting "soft" more developmental approaches such as the Beer et al. (1984) model.

The two models (hard and soft) were debated for several years, but later this discussion transformed into a debate divided along other lines which by Delery and Doty (1996) were described as a "universalistic," "contingent," and "configurational" approach. The first two approaches were renamed by Richardson and Thompson (1999) as "best practice" and "best fit," while the configurative approach was associated with the bundling of HRM practices. These approaches are described in most HRM textbooks.

All the abovementioned approaches have a unitary perception and managerial frame of reference, and as described by Boselie and Brewster (2015), they "compete" by empirically testing their "link" between HRM and firm performance. Keegan and Boselie (2006:1506) have also described the epistemology of these approaches as "prescriptive, positivist, managerial, functionalist and strategic." Hence, all these schools are preoccupied with HRM's role in setting up HRM models and strategically aligning HRM practices and tools that improve and measure performance in terms of the economic results.

In terms of legitimating notions, the unitary approach is preoccupied by the notion of legitimate authority of the HRM system and its agents. According to Bowen and Ostroff (2004), legitimate authority:

> leads individuals to consider submitting to performance expectations as formally sanctioned behaviors. Influence by legitimate authority is essentially a perceptual process—that is, one

> sees the behavioral requirements of one's own role as subordinate to another that stands out as the legitimate authority (Kelman and Hamilton 1989). . . . The HRM system is most likely to be perceived as an authority situation when the HRM function is perceived as a high-status, high-credibility function and activity. This is most likely when HRM has significant and visible top management support in the firm and can be achieved through investments in HR practices or the HRM function, or perhaps by placing the director of HRM in a high-level managerial position. (Bowen and Ostroff 2004:209)

This notion of legitimate authority resembles the Weberian notion of legitimacy based on three types of authority, charismatic, traditional, and legal-rational (Weber 1947), and is a "legitimacy-as-property perspective" legitimating SHRM.

Other lines of research, drawing on discourse analysis, have illustrated how these power relations inherent in HRM are internalized by employees by technologies of the self (Townley 1990; Fournier 1998).

A newer body of literature, however, is emerging which indicates a shift in both epistemology and the legitimating notions of HRM. The increasingly interdisciplinary evolution of HRM and the constraints of a unitary perception of management address a reconstruction of the language of HRM (Janssens and Steyaert 2009). Scholars point to the need of admitting the conflict of interests in relation to HRM and release HRM from managerialism claiming a united interest by employers and individual employees (Kaufman 2014; Keenoy and Delbridge 2010; Cleveland et al. 2015; Kramar 2014). This new position shows up as the merger of HRM, CSR, and sustainability gains scholarly attention. Besides Kramar (2014), this is also the case for scholars as Ehnert (2009), Jackson and Seo (2010), Rhodes and Harvey (2012), and Ehnert and Harry (2012). Kramar (2014) reveals a comprehensive survey depicting various positions within this field of research and discusses the semantics of the notion of sustainability for each position. As distinguishing sustainable HRM from SHRM, Kramar underlines that:

> it acknowledges organizational outcomes, which are broader than financial . . .explicitly identifies the negative as well as the positive effects of HRM on a variety of stakeholders, pays further attention to the tensions in reconciling competing organizational requirements and takes an explicit moral position about the desired outcomes of organizational practices. . .in the short as well as the long term. (Kramar 2014:1069)

Moreover, other managerial disciplines are facing similar paradigmatic changes underlining an increasing importance of horizontal governance across multiple levels, departments/sectors, and disciplines. A new governance in the form of networks appears to be emerging and constituting a new mode of governance *beyond* unitary managerial frame of reference. This kind of new governance has broadly been studied in settings of public governance (Sørensen and Torfing 2007; Torfing and Triantafillou 2011; Klijn and Koppenjan 2012); however, they are still not as widely studied in terms of HRM.

These types of fluid networks are also crossing the boundaries of the public and private sectors, with a common theme being how to obtain results across very complex networks and settings. The steering and management strategies and semantics are different from those used in more classical management approaches (Klijn 2005), because it is a matter of complex interaction processes and the process of negotiation in networks involving private-for-profit, non-profit, and public organizations.

Also, the epistemology and legitimating notions of HRM are shifting and tend to go beyond a unitary managerialism. As example, Boxall et al. (2007) write: "While HRM does need to support commercial outcomes (often called 'the business case'), it also exists to serve organizational needs for social legitimacy."

Boxall, Purcell, and Wright's position is elaborated in their book *Strategy and Human Resource Management* (2010) influenced by neo-institutional theory. They refer to *Varieties of Capitalism* by scholars as Hall and Soskice (2001), as well as to Scott (1995), who defines "three pillars of institutions": the "regulative," the "normative," and the "cultural-cognitive." Also, Suchman's (1995) work on "Managing Legitimacy: Strategic and Institutional Approaches" is referred to as is Deephouse's theory of strategic balance (Deephouse 1999).

For decades, also Chris Brewster and Jaap Paauwe have published on HRM from an institutional perspective (e.g., Paauwe 2009; Brewster et al. 2014; Boselie and Brewster 2015) showing empirically how HRM varies according to the varieties of capitalism and a strategic balanced approach. Especially, the "Cranet" surveys have created a strong empirical evidence for this position. "Cranet" is an international network of business schools around the world conducting a periodic survey of human resource management, enquiring into policies and practices in people management through a set of common questions. The survey is undertaken approximately every 4 years.

The notion of social legitimacy which is different from the Weberian notion of legitimacy based on authority is an important shift in the legitimation of the role of HRM. Organizations not only require labor, capital, knowledge, and materials but depend on the acceptance by the society in which they operate. Suchman (1995) defines legitimacy in this way: "a generalized perception or assumption that the actions of an entity are desirable, suitable, appropriate within some socially constructed system of norms, values, beliefs and definitions" (Suchman 1995:574). Suchman's research on legitimacy has as Weber's a "legitimacy-as-property perspective," but nevertheless they are very different concepts.

Boxall, Purcell, and Wright take some steps to leave the unitary frame of reference behind. Also, the HRM literature strengthens the focus on employer branding, CSR, authenticity, and even the human resources in the circular economy. Nonetheless, a legitimacy conflict exists between a still dominant unitary mainstream SHRM approach and a more socially responsible approach leaning ever more toward something emergent, but not very well-defined, termed sustainable HRM. This legitimacy conflict is depicted by, e.g., Rhodes and Harvey (2012).

Emerging Types of HRM Epistemologies Resting on Four Different Notions of Legitimacy

In two special issue volumes on HRM Past, Present, and Future published by the *Human Resource Management Review* in 2014 and 2015, scholars depict a fragmented landscape for the future of the scientific theorizing regarding HRM

(Stone and Deadrick 2014, 2015). The summarized main learning points from these contributions are a need of a broad definition of HRM and a need to address not only the shift from an inside-out toward an outside-in approach of HRM but also a shift toward addressing sustainable HRM. To go one step further, an addressed gap in the literature is identified as a shift from a rational HRM epistemology toward an approach dealing with complexity, interest conflicts, and emergent processes and the ability to take advantage of digitalization version 2.0 focusing on not only efficiency but also effectiveness.

Based on Stone and Deadrick (2014, 2015) and on future concepts advocated for by major HRM knowledge institutions such as the RBL, the CIPD, recent lines of scientific research concerning changes of the knowledge production systems of the twenty-first century, as well as large HRM consultancies with a worldwide scope, four different types of theorization on future HRM approaches are outlined and analyzed below. This shows how the ontology and epistemology of HRM still evolve and how the notions of legitimacy are broadening the perspective of HRM, but nonetheless, unavoidably producing new types of blind spots leading to an eternal spiral of legitimacy paradoxes and attempts to deparadoxication (Luhmann 1993, 1995; Rasch 2000; Gonzalez-Diaz 2010).

Type 1: A Unitary Approach Becoming Reflective Toward Stakeholders

As described, one of the criticisms put forward by Kramar (2014:1073) is that HRM does not have a stakeholder approach. However, this is exactly what is elaborated in recent years by Ulrich et al. (2012). They have suggested adjusting HRM processes as to be outside-in, which would transform HRM organizations toward assisting businesses to *become part of* a reflective business paradigm, a notion described by Holmström (2004, 2005) as organizations seeing themselves from the outside.

The "HRM from outside-in" approach (Ulrich et al. 2012), championed by the influential US-based RBL Group, represents a way of implementing stakeholder theory into all of HRM's processes and practices, allowing alignment of cognitive models and management tools with stakeholder (mainly customers') interests. Ulrich and Dulebohn state the emphasis of customers and investors as the most important stakeholders very clearly: "HR's relationship to the business is defining HR value outside-in, *through the eyes of customers and investors*" (Ulrich and Dulebohn 2015:101, Table 1). Thus, not acknowledging conflicts of interest, this type of HRM language still has a unitary managerial perspective, the ontology is still the narrow definition of HRM (Storey 1995), and the notion of legitimate authority of the HRM system and its agents (Bowen and Ostroff 2004) is still prevalent.

Type 2: A Heterogeneous Network-Oriented Approach Reflecting Broader Economic and Societal Factors

As mentioned, a new position representing a merger of HRM, CSR, and sustainability is gaining scholarly attention. This broader definition of HRM is also approached by the European-based CIPD. Articulated by Sears on behalf of CIPD, HRM:

> [. . .] requires not only an understanding of both the market trends and forces that are affecting the business, but also an understanding of the broader macroeconomic *and societal factors* influencing the organization now and, in the future. (Sears 2010:15)

Sears predicts the next big evolution for HR is to become more of "an insight-driven function" using its core activities to further inform the organization about challenges, course correction, and big opportunities. By "insight driven," the CIPD expands the savvies that HRM must possess. For decades HRM had to possess organizational savvy. Then, to get strategic influence, HRM had to build business savvy. Now, to become "insight driven," HRM also must build contextual savvy.

Contextual savvy is also called for by Ulrich and Dulebohn (2015); however, the difference between the CIPD and the RBL approaches is through which eyes to observe the context. Ulrich and Dulebohn (2015) underline HRM's relationship with business looking outside-in through the eyes of customers and investors, whereas Sears (2011) underlines HRM having an "objective nature" that enables it to act as both confidante and commentator (Sears 2011:13). The CIPD approach also point to HR functions using creative techniques to bring the embedded insight held by employees to the surface.

While CIPD establishes HRM as being "organization guardians and commentaries" (Sears 2010), this competency is not part of the RBL vocabulary that underlines the most important HRM competencies to be strategic positioner and credible activist (Ulrich et al. 2012: Chap. 3–4), which implies targeting and serving key customers of their organization.

By focusing on organizational equity, CIPD is expanding the focus from the traditional HRM core on human capital. Organizational equity is explained further by the word: "future fit cultures." CIPD (Sears 2010) asks: "where was HR? when unsustainable business strategies were supported by unsustainable reward strategies (e.g. the financial crisis)." CIPD (Sears 2010) thus underlines *sustainability* as core targets for future HRM, and, in doing so, *authenticity* is made a keyword: "to build future-proof organizations HRM has to refocus: From employee engagement to organization authenticity. . ." (Sears 2010:8).

The sustainable, long-term orientation is constantly underlined in the CIPD concept, while the focus on customers and investors as well as the strategic business orientation is underlined by the RBL. In the CIPD concept, HRM steps up to be *a guardian, a steward, or a champion of corporate sustainability.* HRM gets a responsibility for the overall "future-proofness." This brings however, to the core, the question of HRM gaining legitimacy in actively transforming the businesses into sustainable practices.

Rhodes and Harvey (2012:49) underline that HRM organizations must be aware of legitimacy paradoxes if they are to keep a unitary managerial frame of reference. A *unitary managerial position* leads to the ethical being subsumed under the managerial. This will constrain HRM in becoming the new guardian of the ethics (Rhodes and Harvey 2012:49). Instead, HRM needs to take part in heterogeneous networks of ethical guardians (Rhodes and Harvey 2012) in which HRM plays a role. It may then become necessary to let the unitary perspective go, which Janssens and Steyaert (2009) also address. In this approach, the notion of social legitimacy reemerges (to some extend) – but still the main mission of HRM is to create organizational equity.

Type 3: An Approach Challenging the Former Rationality of HRM Reflecting the "Way of Thinking" and Creating Knowledge

The type 2 approach is still rooted in a rational epistemology, and HRM is understood as having an objective nature, just needing to expand its savvies. However, Kramar (2014) also points to the rational view of organizations and HRM processes within the SHRM literature as a problem for sustainable HRM. She underlines the lack of an explicit discussion within the sustainable HRM literature on the role an emergent iterative approach to the HRM processes ought to have for enabling an exploration of the competing outcomes desired by various stakeholders. Further, she points out that previously Colbert (2004) applied a complexity lens to the resource-based view, and Wright (1998) has touched upon levels of abstraction in the HR System. Kramar finds that sustainable HRM calls for a renewed theorizing of an emergent iterative approach to HRM processes.

As to quote Kramar (2014), sustainable HRM:

> takes an explicit moral position, requires a multidisciplinary approach and needs to be informed by theories which enable an understanding of ambiguity, feedback between action and outcomes and complexity. Critical processes will involve iterative and emergent processes, stakeholder management and recognition of the interdependence of processes at a number of levels.

Challenging the epistemology of HRM has for a long term been a position taken by critical HRM (Legge 1995, 2005; Keenoy 1999; Keenoy and Delbridge 2010); however, now it is also taken by those who are studying the production of knowledge within and between organizations.

As businesses are increasingly building interorganizational networks (Teubner 2002), learning to think differently than traditional knowledge workers is an issue (Rylander 2009) and implies that HRM organizations need to embrace what is termed design thinking defined as combining empathy for the context of a problem, creativity in the generation of insights and solutions, and rationality in analyzing and fitting various solutions to the problem context (Kelley and Kelley 2013:19–20).

In addition, changes in the knowledge production systems of the twenty-first century are identified by different authors and termed mode 3 knowledge-producing ecosystems (Carayannis and Campbell 2012; Carayannis et al. 2012) or quartet helix (Kaivo-oja and Santonen 2016). Both the quartet helix model and the mode 3 knowledge production system architecture focus on and leverage higher-order learning processes and dynamics that allow for both top-down government, university, and industry policies and practices and bottom-up civil society and grassroots movements and priorities.

This also complies with Kramar (2014) addressing the need of HRM to embrace complexity and to deal with moral and ethical concerns, paradoxes, tensions, and conflicting interests and let go a rational view of organizations.

Both type 2 and type 3 approaches also represent a shift from the notion of legitimate authority of the HRM system and its agents (Bowen and Ostroff 2004) toward the notion of social legitimacy (Suchman 1995).

Type 4: An Approach Taking New Tools as Big Data, Analytics, and Cognitive Computing into Consideration as Tools Supporting Reflection Under Highly Complex Conditions

To manage complexity, organizations must seek flexibility by regarding administration and management as a process that can be decentralized by self-governance. Paradoxically, by doing so even more complexity is created. In the article "The influence of technology on the future of human resource management," Stone et al. (2015) claim that up till now eHRM has enhanced a rational, transactional efficiency improvement of HRM at the expense of human interaction. The emergence of social media and the entrance at the labor market of a new "born digital" generation of people provide the foundations of a digitalization version 2.0, which may generate a change of organizations as well as future HRM practices. What it takes to obtain effectiveness (and not only efficiency) and to lead the multigenerational workforce in a world of increasing complexity, nonetheless, appears as a gap in the research literature, which is addressed by Carpenter and Charon (2014).

As the complexity of knowledge-producing communication in and between organizations increases, HRM organizations are challenged to apply *tools* providing a framework for meta-communication (communication about communication) on an inter- and intraorganizational scale; tools *that allow reducing or handling this complexity.* Such tools are to an increasing degree embracing big data, analytics, and cognitive computing, which encompasses a lot of dilemmas as elaborated by Ekbia et al. (2015).

This change has also generated new HRM roles and competencies. According to an analysis done by Accenture (León et al. 2013), these are, e.g., talent data analyst and "extended workforce" talent manager. The title "training consultant" has changed, and HRM now co-creates, facilitates, and markets content to attract learners. The rolls have also changed from development of formal procedures toward designing incentives, market-based mechanisms, and tools to support knowledge sharing. These types of HRM competencies, after all, comply well with data-driven analysis and the celebration of rationality that Rylander (2009) argues fit well with the traditional management discourse.

However, as HRM was born out of new power relations, as described, new disruptive algorithmic technologies may again reshape the social landscape in which HRM is embedded and the notion of legitimacy of HRM. Some of the ethical questions gaining importance in the wake of ubiquitous social media, big data, and the algorithmic economy are privacy, democracy, for which purposes the technology is used, data ownership, and inequality (Kitchin 2017).

Again, we may see the need to expand the savvies of HRM and add to the development described by CIPD as first embracing organizational savvy and then also business savvy and in the type 2 approach furthermore to include contextual savvy (Sears 2010). In the type 3 approach, we saw the need of HRM to also embrace new ways of thinking, not only rationality, and include networking in heterogeneous networks leaving behind the position of a unitary approach of people management. However, the type 4 approach furthermore points to the need of HRM to expand its savvy on algorithmic socio-technical systems and all its implications.

This development is challenging the epistemology of HRM, as the epistemology of algorithms are challenging. Kitchin (2017) concludes that algorithms are contingent, ontogenetic, and performative in nature. They are embedded in wider socio-technical assemblages and can be perceived in several ways: technically, computationally, mathematically, politically, culturally, economically, contextually, materially, philosophically, and ethically. One may conclude that besides the "old savvies," HRM may also need all these new savvies to master taking new tools as big data, analytics, and cognitive computing technologies into consideration as tools supporting reflection under highly complex conditions.

Also, a new array of questions is arising and requiring a reinterpretation of the legitimating notions of HRM which is becoming intertwined with big data, algorithms, and cognitive computing. Using big data, algorithms, and cognitive computing may at a first glance lend a strong legitimacy to HRM as being "objective" and rational, much the way statistical data bolsters scientific claims. But far from being objective, impartial, reliable, and legitimate, critical scholars argue that algorithms possess none of these qualities except as carefully crafted fictions (Gillespie 2014).

HRM will find itself as just one actor in what Floridi (2014) has termed the infosphere, and the legitimacy of HRM is becoming intertwined with how legitimacy in such an environment is being constructed. Who are we as a species? What constitutes our environment – natural and build? How are we interacting as human and with other forms of intelligence (e.g., artificial)? Which morals should AI obey when interacting with humans? Which rights are to be respected (Veruggio 2007; Anderson and Anderson 2011; *Bostrom and Yudkowsky* 2011*; Floridi* 2011*;* Evans 2015; Sheliazhenko 2017)? Legitimacy may once again be redefined – and businesses and HRM may need not only to listen to voices from more social stakeholders but also from nonhuman stakeholders with nonhuman agency (Dürbeck et al. 2015), much in line with actor-network theory.

Conclusion

Through the analysis in this chapter, the theorization of people management proves to be underpinned by different notions of legitimacy playing the role of legitimating or delegitimating the prevailing paradigm of people management. The social construct of legitimacy , thus, is an integrated processual part of the historically changing paradigmatic shifts. In a historical perspective, "legitimacy-as-process perspective," hence, needs to permeate the understanding, as the epistemological and ontological core of people management. The process perspective explains the permanent reconstruction, which has taken place ever since the emergence of the discipline of people management. The economic crises in the 1970s, the Japanese competitive edge intertwined with them, unitary frame of reference concerning people management, and the rise of knowledge and service professions shifted the power relations and HRM as a distinct way of perceiving and practicing people management emerged. Until then, interest of conflicts and a predominantly pluralistic frame of reference were prevailing, though both employees and employers gained from economic prosperity. The role, name, and institutionalization of the HR function, profession, and field have changed along with the complexity of organizations and the nature of work, but the shift from Personnel Administration toward HRM also shifted the role of the people manager, from being "the man in the middle," a buffer, and potential scapegoat for the actions of the rest of management to becoming part of strategic management. The SHRM sought legitimation through a notion of legitimate authority resembling the Weberian notion of legitimacy based on authority. The SHRM is blind toward a lot of stakeholders, as well as broader societal issues.

What can be learned from the analysis of the emerging new epistemologies and legitimating notions of HRM is that a broader reconstruction of the reflexivity in and between business corporations and society takes place, in which the epistemology and notions of legitimacy related to people management are again changing, now pursuing social legitimacy. However, an interesting question is to which extent the emerging new epistemologies and legitimating notions of HRM are producing different types of blindness and long-term unsustainability.

The type 1 approach is a unitary approach becoming reflective toward (some) stakeholders. This position is still unitary and blind to interest conflicts, bound to a rational, mainly positivistic epistemology and a notion of legitimate authority of the HRM system and its agents.

The type 2 approach goes beyond a unitary managerialism, increasingly underlining pluralism of interests, and an interdisciplinary evolution of HRM, integrating employer branding, CSR, authenticity, etc. However, the position is still struggling to reinterpret the new role of HRM and has a rational epistemology blind to reflect on its own rationality taking for granted the "objective nature" of HRM. After all, the notion of social legitimacy reemerges, but dilemmas and paradoxes appear as the position still needs to grapple with the predominant unitary ontological position of the still prevailing SHRM.

The type 3 approach goes one step further challenging the former rationality of HRM. Now design thinking is included as a distinctive different discourse compared to the managerial "knowledge worker" discourse. The quartet helix and mode 3 knowledge production, which is a distinct different pattern of knowledge production compared to the triple helix or mode 1 and 2 knowledge production, appear. The notion of social legitimacy reappears, and the ontological position is heterogeneous (maybe indicating a new frame of reference coming op, which resemble, but is not quite like pluralistic). This position, however, is blind toward its own paradoxical role in producing complexity.

The type 4 approach takes new tools as big data, analytics, and cognitive computing technologies into consideration as tools supporting reflection under highly complex conditions.

This may again lead the epistemology to celebrate rationality; however, the epistemology of algorithms needs also to be perceived as social constructs.

The definition of HRM is not determined by the technology; however, because of an ontogenetic and performative nature of cognitive computing, HRM needs once more to expand its savvy to grasp the socio-technical development. According to Stone et al. (2015), limited research has assessed how technology enables organizations to reach their HR goals of attracting, motivating, and retaining employees. HRM may also require an expansion of the notion of social legitimacy, as to include the social and ethical aspects of technology. Nonhuman actors and stakeholders are to be recognized (as in the actor-network theory). While expanding its savvy and notion of legitimacy, HRM may also lose its identity as HRM and become something different, more suited for complexity management – not only delimited to people management. For now, sustainable HRM tries to embrace the complexity and move toward a heterogenous perception.

A future role and legitimacy of people management may shift even more far-reaching, as the nature of work and the social power relations may change dramatically due to the technological development.

As a perspectivation, it is worth mentioning that Spencer-Brown (1969), Luhmann (1993, 1995), Rasch (2000), and Gonzalez-Diaz (2010) underline the impossibility of cognition or knowledge of the world (because of the operational closure of the system). This also counts for big data, algorithms, and cognitive computer, no matter how general intelligent artificial intelligence becomes.

As at the same time, the need for structural coupling is growing in an increasingly differentiated and complex society, which is inherently paradoxical, Luhmann points to making use of time and moving to a higher level of observation as the most effective way to handle a paradox, i.e., postponing it in time. Gonzalez-Diaz (2010) explains that constructing an image of the world and developing increasingly sophisticated theories, methods, procedures, and technologies are a way of dealing with this impossibility of access to our environment, but as there exists no omnipotent observer with direct access to the environment:

> paradox will be present as long as our knowledge system exists, and so will the need to resolve paradox by the system that Luhmann calls deparadoxication. Gonzalez-Diaz (2010)

This also underlines why we will see HRM in a never-ending "crisis," and it explains why "legitimacy-as-process perspective" needs to be the overarching perspective, while "legitimacy-as-property perspective" and "legitimacy-as-perception perspective" must be subordinated and used to understand the process of legitimation.

Motivating Employees in a Globalized Economy: The Moral Legitimacy of Applying Gamification in a Corporate Context

58

Marianne Thejls Ziegler

Contents

Abstract

For decades, corporations, consultants, and academics have examined different ways of incentivizing employees to align their volition with the interests of the corporation. This so-called soft Human resource management (HRM) adjusts working environments to the emotional needs of their employees. Critical voices have accompanied the attempts, blaming corporations for manipulating the very souls of their employees into identifying with the interests of the managerial elite without rewarding their dedication.

One of the latest management fads, gamification, has been met with similar criticism. With reference to a more detailed account of gamification and arguments from one of its critics, this chapter will show that the criticism is based on a perception of the relation between management and employees that questions the fundamental moral legitimacy of business and, as such, shows that the criticism is therefore of a circular nature. When academics presume that

the overall system is deprived of legitimacy, then it only has to be demonstrated that the given HRM initiative is coherent with the values of that system in order to argue that the given HRM initiative is also deprived of legitimacy.

This circularity provides academics with a cornucopia of opportunities to criticize corporations. This chapter wishes to encourage academics, who reject neoliberal capitalism in its totality, not to waste their time also rejecting its individual manifestations but instead either apply a more differentiated approach that might assist managers and employees in cooperating across hierarchical differences or to dedicate their efforts to developing alternative social and political models.

Human resource management · Gamification

Introduction: Incentivizing Human Resources

The so-called soft HRM model focuses on the possibilities of management to incentivize employee commitment through influence, respect, and responsibility. It is an alternative to the more old-fashioned hard HRM model, which is linked to a workforce management focusing exclusively on maximizing the use of human labor as a resource and prioritizing the strategic aims of the corporation over the well-being of the employees (Gill 2007). One might be tempted to believe that the former would enjoy a higher level of legitimacy among academics; however, the attempt to optimize human resources with a soft rhetoric of team building and empowerment has been a subject of intense debate. Soft HRM has been criticized for only pretending "to be concerned for workers whilst reasserting management control" (ibid.). Hence, soft HRM is, in its essence, no different from hard HRM, and it has the same connotations as hard HRM: "goal-directed activity, inputs and outputs, [a] black box of production, where organizational inputs -employees- are selected, appraised, trained, developed, and remunerated to deliver the required output of labor" (Townley 1993).

The description of the work of human beings in terms of "production," "input," and "output" refers to the practical aspect of work; the expressions "delivered" and "required" indicate that this work is performed in the context of power relations. Since all manifestations of work share a practical element, an element of human beings engaging in an activity that serves a purpose existing independently of the working person, the goal-directed activity, input and output as describing the purpose of HRM, can be seen from two angles. From one point of view the description is self-evident, in so far as input, the human work, and output, the product or result of the work, are inherent elements of work. From another point of view, however, "input" and "output" refer to a presumed reduction of humanity to functionality within a power relation ("delivered," "required"), which deprives the HRM of legitimacy, in so far as a superior deprives the subordinate of humanity. Since academics normally refrain from self-evident statements, the description of HRM is more likely to be read according to the second interpretation. Critics of the relations between a managerial elite and the employees therefore make use of an implicit moral reading of originally neutral terms that appears to have become habitual in parts of academic literature.

Critics of HRM interpret the aim of corporate endeavors as the reduction of humanity to a function, and hence, they presume that the optimization of a human resource is more than just a manner of making human beings work and cooperate more efficiently, but instead it eradicates the human element of work. The example above seems to be based on a hidden assumption that it is not possible to work as an employee and receive instruction on how to improve efficiency or be incentivized to improve efficiency without compromising one's own humanity. This reduction of labor and professional performance to a function where the worker is treated as a means serving an end determined by corporate rationality can be traced back to the Marxist conception of Alienation. Treating employees in this manner is, of course, deprived of moral legitimacy.

This chapter will approach the question concerning the legitimacy of human resource utilization by distinguishing between a polarized legitimacy and a balanced legitimacy. The aim is to identify hidden assumptions in the debate on the legitimacy of creating working environments and develop working methods for the purpose of stimulating and exciting the intrinsic motivations of employees.

Evaluating the legitimacy depends on two circumstances that are reflected in the criticism of soft human resource management in general and gamification in particular. The first circumstance is the question as to whether management's persuasive methods are legitimate. If it is pointed out that HRM entails management manipulation of employees, then this manipulation is not legitimate because it takes place within a power relation. Or, one could say, the attempt to persuade is referred to as a case of manipulation, which is possible because of the power relation. It is therefore the hierarchical differences that undermine legitimacy. If a more powerful person (A) attempts to persuade a less powerful person (B), then legitimacy is undermined because (B), due to his or her inferiority, is not in a position to resist. Accordingly, in a business context where management initiates team events or gamify processes, legitimacy is also undermined by the power relation between management and employees.

The second circumstance is the question of the legitimacy of the aim of the actions that (A) wants (B) to perform. If the aim of the action (X) is not legitimate, then nor is the attempt to persuade a person to do (X) legitimate. Generally it would be legitimate if a minister were to ask his church community for a contribution to a charity project in the name of the lord, but if a manager is asking his employees to work with more enthusiasm in order to improve the performance of his business, then it is only legitimate in so far as the aim of the business is legitimate. An academic, who believes neoliberal capitalism is not legitimate, would thus consider all attempts of management to persuade their employees to work harder or with more dedication equally deprived of legitimacy.

The two criteria work their magic as hidden, uncontested assumptions. It only has to be pointed out that management attempts to direct the volitions of their employees, and the reader already knows that this is bad. It only has to be pointed out that gamification serves the aims of Neo-liberal capitalism and the reader knows gamification is bad.

In both circumstances, the power relation and the lacking legitimacy of the aim constitute criteria for legitimacy that business can hardly live up to. The criteria are based on simplified moral assumptions of the powerful versus the powerless and of neoliberal capitalism in an undifferentiated totality. In that way, critics use a polarized conception of legitimacy in their approach to phenomena like HRM and gamification that leaves very little room for debate. A balanced conception of legitimacy would enable differentiation and make the criticism more interesting.

Since soft HRM has been seen as a reaction to increasing employee dissatisfaction caused by globalization, this chapter will start with a brief outline of the historical setting of soft HRM upon which it will then outline a recent HRM fad called gamification and describe two practical applications and the arguments of one of gamification's critics. The chapter will also argue that the critics of gamification are not substantially different from the critics of soft HRM. In the conclusion, I will attempt to demonstrate that the arguments of HRM and gamification opponents are enabled by the polarized conception of legitimacy (sketched above) that has already deprived all focus on corporate rationality and any exercise of control in an organizational context of legitimacy.

The Setting

It was the declared goal of postwar economic politics that the people should never again experience the devastating consequences of severe economic depression caused by unrestricted casino capitalism and short-sighted politicians. The promise was possible to keep, because Europe and the United States experienced almost three decades of unprecedented growth. In the early 1970s, the golden age came to an end and was followed by more turbulent times. The growing strength of OPEC; the increasing competition, in particular from Asian countries; and the more or less successful attempts to stimulate the economy with deregulation contributed to deteriorating conditions in particular for European and American workers (Eichengreen 2007). This process culminated in the 2008 financial crisis. At the time of writing, economy appears to have recovered, but on a fragile foundation of ever-increasing debt. Whether this attempt to save the liberal market economy will result in an even more severe crisis than the one of 2008 is yet to be seen.

The postwar golden age of continuous, economic growth was characterized by a relatively widespread social consensus. The memories of the devastating unemployment of the 1930s were still alive, and this incentivized workers, particularly in countries like Austria, Germany, and Holland, to accept wage restraint in return for investment in production, in other words, for a higher level of job security (Ibid.). During these more turbulent decades as globalization slowly, but steadily, forced companies to outsource production to low-wage countries, the negotiating power of European and US workers was weakened. The necessity of maintaining competitiveness became a lever for management, justifying stagnating wages and deteriorating job security. It is yet to be seen, if the Golden Age of unprecedented economic growth between the late 1950s and the early 1970s constitutes the climax of a capitalism capable of incentivizing citizens with promises of rising welfare and prosperity for all, or if capitalism as we know it will someday belong to the past.

Globalization and economic turbulence have created a gradually growing sense of social dissatisfaction. The rapid industrialization of successful Asian economies contesting European and American economic dominance has polarized western societies and produced winners and losers of globalization. As a consequence, the rise of populism in recent years brings back memories of the interwar political process in Germany, as if history was about to repeat itself in slow motion.

The financial crisis of 2008 gave rise to expressions like “privatizing profits and socializing losses.” Those who were wealthy before the crisis have become even wealthier in the years after the crisis, and the income of the normal part of the population, the 99% as they sometimes call themselves, has stagnated. Though statistics may be subject to variations, and though the increase in inequality appears to have been more pronounced in the United States than in some European countries, the success of populism is indicative of a general disbelief in the fairness of the economic system. This disbelief, whether justified or not, endangers social stability.

Well-being, Fun, and Games as Cure for Deteriorating Working Conditions

As the Harvard professor Lesley A. Perlow wrote back in 1998: “More recently, it has become difficult to design jobs as a series of explicit tasks to be performed, with appropriate incentives to ensure adequate output from qualified employees” (Perlow 1998). This inability to provide incentives to work has challenged managers, consultants, and academics alike to find manners to compensate for this development. Since the early 1980s, the recognition that fun and a good atmosphere at work motivates employees has inspired soft HRM to attempt to create a more joyful working atmosphere. The undertaking gained momentum as Tom Peter and Roger Waterman published their famous book *In Search of Excellence* in 1982.

The apparent lack of motivation among employees has inspired managers and consultants to replace the traditional incentives, such as the sense of duty and/or the hope of increasing prosperity, with an alignment of volition of employees and the interests of management. Instead of feeling obliged to work and finding pleasure in acting out of or being motivated by promises of rising incomes, employees should be attracted to the entertaining nature of professional challenges, i.e., by the challenge itself. Academics and consultants who propagated the trend encouraged managers to loosen up and to create a less formal and less hierarchical working environment in which the employee feels more relaxed. In return, the increasing well-being of the employee was supposed to increase motivation, dedication, and productivity (Fleming 2005).

Gamification is a more recent method applied by management for this purpose of fertilizing personal commitment to the workplace. Inspired by the impressive ability of well-designed online video games to capture the time, ingenuity, and dedication of gamers, managers and their consultants have cooperated with game designers in order to transfer elements of games to a professional context. According to its proponents, work can be reorganized to resemble a game and, thereby, become just as exciting and entertaining.

The fundamental principle is not new. Through history, games have been used for education and for training soldiers (Huizinga 1980), and they were even applied in the Soviet Union where Lenin built a theory of socialist competition in which workers were encouraged to compete with each other. His system bore resemblance to modern principles of gamification, rewarding success symbolically, and was highly contested as an indirect application of capitalist ideals (Nelson 2012).

The potential of games became apparent when Microsoft and DreamWorks launched an internet game in 2001 as part of the promotion for the Steven Spielberg science fiction film A.I. (Artificial Intelligence). The game designers distributed digital clues that were eventually noticed by members of online communities. The game was played by over two million people, but one group of players excelled in particular. The clues inspired a computer programmer to launch the internet group *Cloudmakers*, the members of which began to collectively explore the riddles and clues created by the game's producers. The group grew to over 7000 members in the 3 months that the game lasted, and their cooperation came to display an unprecedented level of collective intelligence and ingenuity to the extent where the producers of the game had difficulty keeping up with the pace at which the Cloudmakers solved the riddles (McGonigal 2003).

This cooperation among the Cloudmakers gave an initial indication of the immense ability of games to engage agents in collective action. Since then, the video gaming industry, i.e., the industry of electronic and multiplayer online games, has grown to a multi-billion-dollar business with a reputation for being addictive, undermining the social capacities of youths and reinforcing violent and extremist tendencies (Ebner 2017). Considering that video gamers spend on average 6 h per week gaming (Limelight Networks 2019), it is not surprising that this phenomenon caught the interest of researchers and consultants, who have been intrigued by the possibility of transferring this immense energy to the professional environment for the purpose of increasing productivity. According to one of the most prominent gaming gurus, Jane McGonigal, game developers "know better than anyone else how to inspire extreme effort and reward hard work. They know how to facilitate cooperation and collaboration at previously unimaginable scales" (McGonigal 2011).

Gamification applies game design elements in a non-gaming context (Deterding 2011), which can be done in two ways: as structural gamification or as content gamification. Structural gamification is the application of game elements to a professional or learning process that does not change the content. The work or task is provided with an outer shell enabling agents to receive instant feedback on progress and/or compete with co-workers for points. Content gamification alters the content to make it resemble a game. The task could be enhanced with a narrative element incentivizing the learner or worker to engage in, for example, a riddle; the task that is gamified would be performed as a side effect (Kapp 2014). Gamification can change behavior by changing agents' motivation. It can make tedious tasks, such as practicing mathematics, eating a healthy diet, and taking the stairs instead of the escalator, more enjoyable. Within companies, it can enhance or alter tedious work tasks for the benefit of the employees who are required to perform them, and it can pit employees against each other in order to create competition, where none would have been otherwise, by making individual performance visible to the team as a whole. The performance can be displayed on leader boards, highlighting top performers. It can also, will be shown below, be used in training programs.

Challenges in the Application of Gamification

The efficiency of gamification has been contested. According to Ian Bogost, gamification is "primarily a practice of marketers and consultants who seek to construct and then exploit an opportunity for benefit." In this context, gamification over-promises and under-delivers (Bogost 2014). The difference between positions appears to depend on how tasks are gamified. According to game designer Yo-Kai Chou, gamers are motivated by "elements of strategy and great ways to spend time with friends, or they want to challenge themselves to overcome difficult circumstances" (Chou 2014). He distinguishes between the shell and the deeper level of the game and criticizes the belief that gamification is achieved by applying points, badges, and leaderboards to a task. Competition, in the form of points, leaderboards, and symbolic rewards (badges), cannot change the behavioral patterns of employees on a long-term basis, if they are only applied as a shell to demotivating tasks within discouraging organizational structures. If the premises of Yo-Kai Chou's argument are correct, then content gamification is preferable, as it is more efficient than structural gamification. An essential element of successful gamification is voluntary participation and the possibility of exercising choices (Deterding 2011; Fleisch 2018). In his *Octalysis Framework*, Yo-Kai Chou identifies features of good gamification: meaning, empowerment, social influence, unpredictability, avoidance, scarcity, ownership, and accomplishment (Yo-Kai Chou 2014). These are the characteristics of good interactive video games, and the extent to which they can be transferred in a professional context determines the success of the gamification.

According to Yo-Kai Chou, gamifying work processes beyond the application of points, badges, and leaderboards challenge the process designer in particular with regard to the voluntary element. The work of an employee is exercised in the context of a power structure, and the application of gamification in the working processes will be initiated by professionals working at management level. Within the framework of the workplace, tasks are performed at the initiation of management level professionals. When gamified tasks are performed within hierarchical professional interaction, participation in the game is no longer voluntary, or at least the voluntary element is weakened. The extent to which a process designer succeeds in enabling the employee to make choices during the process depends on the context, the success criteria, and the consequences of the game. In the following two sections, two examples will be presented of how gamification can be applied in a professional context that differs in particular with respect to this voluntary aspect.

Elements of Gamification by General Electrics

In 2017, General Electrics cooperated with EY Fraud Investigation and Dispute Services in creating a pilot of an IT-based compliance system called *Profit and Loss-of-One* (*P&L-Of-One*). The pilot attempts to solve the challenge of how to provide thousands of employees with relevant compliance information without overloading them with irrelevant material. It should overcome the challenges of isolating target audience, deliver messages tailored to the individual risk profile, and assess the effectiveness of the training. Using forensic data analysis, the program designers created so-called digital twins of employees in order to be able to predict which situations would be of high fraud risk (Walden et al. 2018). Digital twins are normally digital versions of physical objects that, for example, inform technicians of expected malfunction by combining forensic data with data collected from sensors installed on the object.

To create a digital twin of the employee, "GE used historic travel and entertainment expenses (T&E), training history, information on business sales opportunities" (ibid.), and other factors to develop risk models for each employee in the pilot. These risk models form a risk profile in an employer's digital twin. It simulates the working processes in situations with higher fraud risk and can time the relevant information. If a sales person is planning a trip to a country with a high level of corruption, just-in-time messages informing the employee of risks, rules, and regulation are sent shortly before the departure of the employee's business trip. Employees are expected to respond and take appropriate action such as watching a recommended video link or clicking on a compliance certification.

The system has three pillars: The first pillar is the automization of the system for the sake of transparency. The second pillar is to make the system intriguing by incorporating elements of gamification where the employee receives points for an integrity score based on participation in the program. "Organisations can track these employee scores to encourage competition or peer bench marking [and . . .] managers can use this information to recognise employees with high scores" (Ibid.). Initially, the digital twin informs the human twin, but if the employee ignores the communications the system reacts with more direct messages "such as requiring training courses, with possible notification of management" (Ibid.). The third pillar is the relevance of the information; this is achieved by the ability of the digital twin to predict when the employee will be faced with a specific compliance risk.

As explained above, in Yo-Kai Chou's Octalysis Framework, the quality of a gamification process is analyzed with reference to eight different criteria: meaning, accomplishment, empowerment, ownership, social influence, scarcity, unpredictability, and avoidance (Chou 2014). If the gamification aspect of "Profit and Loss-of-One" were to be evaluated, the score on meaning would depend on the extent to which the employee would identify with the vision of General Electrics. The possibility of achieving a sense of accomplishment would depend on the challenges of participating. The sense of accomplishment requires a development of skills; it requires a task that is difficult in the beginning and then becomes easier as the player gains more experience. If the content of the game only involves confirming that the employee has received information, the sense of accomplishment would be limited, since the ability to read information on compliance policies is unlikely to contain a potential for development of skills.

P&L-Of-One would in particular have an issue with regard to empowerment and ownership of the player. Reacting with more direct messages "such as requiring training courses, with possible notification of management" is incompatible with one of the most basic elements of the game, namely, voluntary participation and the possibility of exercising choices (Deterding 2012; Fleisch 2018). *P&L-of-One* combines elements of gamification with what resembles a surveillance system. Although management is not informed of details, they are informed if the employee does not participate. This feature undermines the gamification element of the system. It may be an efficient and convenient way of securing compliance for General Electrics, but because the employees are under observation by the program, the gamification element is unlikely to work its wonders.

Delta Airlines Adventure Travel Game

Among Delta Airlines' call center professionals, traditional e-learning programs have suffered from low popularity. Looking for new ways to keep their call center professionals updated, Delta Airlines partnered with an e-learning company called NogginLabs, Inc. to develop a game-based learning program. The airline had, at that stage, eight call centers, 4800 agents and 36 million calls per year. The cost of moving training professionals was immense; if all 4800 agents were to be absent for 1 h, the cost would be just over $100,000 in lost sales (Orendain 2014). The aim was therefore to create a game that would be so entertaining that the employees would play it in their spare time. In order to gain insight into the drivers of gaming, the Delta Airlines project leader, Mr. Ponch Orendain, played video games himself and engaged with the theoretical aspects of gaming. He was therefore aware that the key to engaging employees would be that the game was entertaining and challenging, and it would be crucial that the game was strictly voluntary and that it was separated from the professional working processes (Ibid.).

The result was a travel adventure game called *Ready, Set, Jet!*. The game would open with an airport departure board from which the player would choose a destination. This structure placed the player in the position of the traveller. During the selected trips, the player would be faced with tasks and challenges reflecting the Delta Airlines system, but the business logo was absent in the game in order to remove connotations of work. Players proceeded by selecting destinations, deciding whether to travel business or economy, arriving at the destination, and selecting activities in the form of mini-games awaiting the player at each destination. The solution to the individual challenges would provide information about, for example, car hire policies, tourist attractions, flight connections to other destinations, baggage policies for different destinations, price categories, etc. This information was the learning content that Delta Airlines wanted their employees to acquire. Capabilities acquired in the game would enable the call center professionals to answer customer queries regarding the same topics.

The game enabled the players to connect with colleagues. In this manner, a player could post challenges to fellow colleagues and engage them in mini-competitions. They could buy souvenirs for each other and leave them at odd places in the virtual world encouraging other players to undertake trips in the game to collect them. The leaderboard would inform the player of the top players and the players just below and above the player's own position (Cook 2013).

The game was a success. Within the first 2 weeks, 1400 employees had played the game, and after 6 months, the total amount of time the professionals had invested in the game amounted to over 30 years. The call center professionals spent a total of over 30 years of their spare time training and updating the knowledge needed to improve the quality of customer service. The eight criteria of success, meaning, accomplishment, empowerment, ownership, social influence, scarcity, unpredictability, and avoidance (Chou 2014), would all be met in *Ready, Set, Jet!*.

The two examples of gamification in organizations indicate an approximate polarity in the application. In the first case, *P&L-Of-One*, participation was compulsory, so even if the employee had been performing their job with absolute integrity and been aware of the details of company code of conduct as well as legal regulations and the state of corruption in countries with which General Electric was doing business, participation was compulsory. Since voluntariness is a core condition of successful gamification, it is clear that the Delta Airlines program is more coherent with Yo-Kai Chou's criteria for good gamification. Compliance issues may be of a more severe nature than the information level of call center professionals, but considering the apparent success of *Ready, Set, Jet!*, the question arises as to whether Delta Airlines' content gamification of the learning progress could also be applied to the compliance program of General Electrics, whereby the compulsory and the surveillance element could have been avoided. In Autumn 2018, NogginLabs, Inc., the e-learning company that build *Ready, Set, Jet!* for Delta Airlines joined EY, so maybe this acquisition will inspire EY in future applications of gamification that are more faithful to the basic principles of this method.

Gamification as Exploitation

Just as HRM has generally been contested, so has gamification been the subject of debate. Gamification has been criticized for exemplifying a new kind of surveillance. Gamification "leverages discourses of play initially to entice users into [. . .] self-monitoring. Surveillance is phrased in terms of enabling free play and promoting engagement" (Whitson 2014). The hidden assumption of this argument is the lack of legitimacy of management attempting to influence the volitions of employees.

The reproach would be valid for the instances of gamification where management use the gamified processes to place their employees under surveillance and *P&L-Of-One* would be such an instance. However, as it was demonstrated in the Delta Airlines application, surveillance is not an inherent aspect of gamification. Theoretically, management could be interested in individual players and require special access to the overall status of the gamers, but keeping an eye on the extent to which the program is used would primarily be of interest from an overall point of view, i.e., that the game is used in the first place. If Delta Airlines was interested in individual professional performance, customer feedback would be a more informative source of information. In this imaginary debate, it might be claimed that it would be naïve to presume that Delta Airlines is not monitoring their employees via the game. This claim is difficult to counter, since Delta Airlines is declared guilty until proven innocent.

The second line of criticism emphasizes that gamification pretends to serve employees, but in reality, it serves capitalism. The "concept of gamification is gaining currency, in large parts, because it fits well with certain ideological assumptions native to contemporary, post-industrial capitalism and [. . .] it is promoted because it is believed to benefit those who already occupy a position of privilege within this system" (Ray 2014). Gamification uses play in the service of neoliberalism: "such practices are deeply problematic as they represent the capture of 'play' in the pursuit of neoliberal rationalization and the managerial optimization of working life and labour" (Woodcock and Johnson 2018). Here is an instance of the hidden assumption that neoliberal rationalization and managerial optimization are not legitimate. Gamification "ignores the power dynamics in both the workplace and society, passing over the ways in which management actively seeks to maximise exploitation" (Ibid.). This is an instance of the assumption that management pursuasion is manipulative. Woodcock and Johnson distinguish between gamification from above and below, suggesting that real and genuine voluntary gamification would arise spontaneously among employees to sabotage the working processes. Free agency is not possible within the constraints of the capitalist system.

The wider concept of HRM in general is exposed to a similar criticism. Soft HRM attempts "to win the 'hearts and minds' of employees: to define their purposes by managing what they think and feel, and not just how they behave" (Wilmott 1993). "Though masquerading as a 'therapy of freedom' that expands the practical autonomy of employees, cultural culturism identifies cultural values as a powerful underutilized media of domination" (ibid.). Carol Gill summarizes the critics of HRM: "workers are exploited through work intensification, downsizing and casualisation of the workforce and that this exploitation is possible because HRM uses soft rhetoric to disguise hard reality" (Gill 2007).

The criticisms of gamification and HRM resemble each other in so far as the point of criticism is the coherence between the aims of gamification and that of capitalism. If pointing out that HRM and gamification are coherent with the aims of capitalism is a criticism, and this can be assumed since the academics referred to above do not appear to be great fans of capitalism, then the argument is based on the assumption that capitalism is eo ipso deprived of legitimacy. If capitalism has no legitimacy, then it is clear that the methods that management uses to incentivize their employees have no legitimacy either. However, the aim of the criticism is not bad gamification or an unconstructive company culture but any gamification and culture, that is, a product of business leaders. It is the presupposed lack of legitimacy of capitalism that gives the criticism its circular nature.

Conclusion: The Legitimacy of Encouraging Work Enthusiasm

The focus on soft HRM as an answer to decreasing motivation among employees has been explained with reference to the deteriorating working conditions and polarization of society caused by globalization and neoliberalist economic policies. The assumption of a causal connection between neoliberalism and globalization on the one hand and deteriorating working conditions and subsequent job dissatisfaction on the other hand reinforces the foundation on which academics challenge the legitimacy of capitalism as well as the attempts of a managerial elite to align the interest of the employees with those of the corporation.

It is highly likely that this causal connection exists. Globalization may, however, not be the only cause of dissatisfaction. Another possible explanation for the increasing focus on soft HRM could be the changes in industrial structures of an increase in the demand of knowledge workers and a decrease in the amount of manual work. The tendency is, as Peter Drucker predicted in his 1993 book on the *Post Capitalist Society*, continuing into the present time of writing. Dedication makes a stronger difference to the productivity of a knowledge worker than a manual worker, and their expectations are higher; thus, the need for new ways of motivating employees can also be caused by the increasing significance of knowledge workers (Salamon 2003). Another possible explanation for increasingly demotivated employees could be found in the changing pedagogical principles of the 1970s characterized by anti-authoritarianism and less coercive learning methods. These pedagogical principles have the potential to undermine respect for future employers, increase requirements to working environments and make workers unwilling to compromise personal feelings and preferences.

There is more than one possible explanation for employee dissatisfaction and the exclusive focus on the inhumanity of neoliberal capitalism simplifies the question of business legitimacy. The claim that it is manipulative to, for example, provide workers with the emotional environment they need in order to be productive may as well indicate an underestimation of the autonomy and the intelligence of employees. The exclusive focus on a fixed interpretation of management-employee relations may blind us to the possibility that in some context the free market economy can also provide the framework for creative cooperation. In this manner the criticism of gamification outlined above cannot distinguish the legitimacy of *P&L-Of-One* from the legitimacy of *Ready, Set, Jet!*, whereby important insights may be lost.

In order to comprehend the mechanism of the HRM and gamification criticisms, this chapter has distinguished between *polarized legitimacy* and *balanced legitimacy*. The foundation of polarized legitimacy can be seen as a misreading of the humanity formulation of Kant's Categorical Imperative from Groundworks for the Metaphysics of Morals:

> Act so that you use humanity, as much in your own person as in the person of every other, always at the same time as end and never merely as means. (G 4:429; cf. G 4:436)

The misreading removes two parts of the imperative: "at the same time" and "merely." The manager of a company should, in this version, never treat another person as a means, but always and exclusively as an end. This interpretation of the Categorical Imperative makes professional interaction across hierarchical differences impossible. According to the original version, human beings can interact with each other to promote practical ends; they can treat each other as means as long as they also treat each other as ends. This imperative would in its application require an individual evaluation of each situation in order to determine if the extent to which one person treats another person as an end suffices. According to the original imperative, conducting business would be legitimate as long as they balance treating as means and treating as ends. The interaction with the materiality of the world, where we apply ourselves as means to an end in cooperation with others that also use themselves and others as means to ends, i.e., work, is fundamental to humanity, but it is difficult to imagine how this interaction is to take place in accordance with a polarized conception of moral legitimacy based on a misreading of the Categorical Imperative.

As mentioned in the introduction, there is a general tendency to a certain moral reading of originally neutral terms that appears to have become habitual in parts of academic literature. Returning to one of the quotations from Woodcock and Johnson: ". . .in the pursuit of neoliberal rationalization and the managerial optimization of working life and labour." The concepts have a clear empirical content, but the vocabulary has become evaluative. "Neoliberal rationalization" and "managerial optimization" are not neutral concepts, but inherently highly reproachable phenomena. The pervasiveness of this tendency becomes apparent by reflecting on the extent to which the terminology describing business has obtained a stable moral polarity. In other words, it does not change its moral valence according to context, instead it is always bad (Levine 2009).

The polarized concept of legitimacy makes the world very simple to understand, but a more balanced conception of legitimacy, allowing for context dependent examination of trends, might provide more interesting results. The conception is a tool used by some academics who feed on the conflict between the interests of managers and employees, to repeatedly deny business legitimacy. This has, as indicated in this chapter, been going on for decades. The conception is neither capable of enriching our understanding of professional interaction, nor does it enable us to improve the conceptual tools needed to develop professional interaction. It is my hope that future generations of researchers will approach this important topic recognizing its moral as well as its practical complexity.

technological development. To do so the chapter applies the technology-organizational-environmental (TOE) framework of innovation adoption and qualitative analysis. Perceived benefits, organizational HRIS knowledge and expertise and top management support are proven significant in driving HRIS SMEs' adoption decision in the four cases. With the use of HRIS, SMEs HR management has especially improved work efficiency and been able to grow faster and this has benefit for acceptance and legitimacy by employees.

Introduction

Human Resource Information Systems (HRIS) are systems considered to be part of an organization's Management Information System. HRIS is defined as a system used to acquire, store, manipulate, analyze, retrieve, and disseminate information regarding the human resources within an organization (e.g., Lippert and Swiercz 2005). It is a form of human resource (HR) software that combines several HR processes, such as retaining, recruiting, administration, managing payroll, HR planning, performance record, employee self-service, scheduling, absence management analytics. HR management software is widely used by companies to ensure easy access of human resource data and management of employees' performance. HRIS is designed to facilitate administrative and strategic HR in an effective and competitive way (Poutanen and Puhakka 2010, p. 5).

Traditionally, HR systems are based on client server, and require high capital investment. In the 1990s, the emerging use of Internet makes web-based HR solutions more accessible to remote teams in global enterprises. However, it was still mainly used for administrative and operational purposes and usually an application of enterprise resource planning (ERP) systems. In the 2000s, HR software is designed for tackling specific tasks rather than just being an integrative ERP system. Employee Self Service (ESS) and Management Self Service (MSS) systems become prevalent in the late 2000s. With these applications, employees or managers can initiate and complete HR transactions without HR staff involvement. The range of transactions is highly configurable, and the access to the specific transactions is constrained depending on the employees' role (Florkowski and Olivas-Luján 2006). Potential employees can log into the system and apply for a position. Employees can view their own personal information and handle transactions such as travel reimbursement and vacation time, while managers can approve employee-related transactions (Shani and Tesone 2010) with the consequent delegation of responsibilities and activities shifting from HR professionals to employees and managers. This leads to more strategic HR focus, as the automation replaced time-consuming paperwork, but at the same time, it also leaves some challenges for HRIS implementation in an organization. Managers are frustrated with extra administrative tasks, and employees need guidance and motivation to adapt to the new system (Shani and Tesone 2010, p. 35). In 2010s, cloud and mobile deployment became a standard in HR software, providing users easy access and reducing costs of physical storage and IT support. The new cloud technology Software as Service (SaaS) offers several benefits including ubiquity, document control, and automatic updating, thus it has changed the HR software market, with increasing number of SaaS vendors and more solutions for SMEs. It can be said that the HR software is also specialized depending on the business size and needs. Large enterprises tend to use integrated HR systems or ERP while smaller enterprises tend to use specialized software. As today's HRM, focus is on fast talent sourcing, namely proactive searching for qualified job candidates; in this process, cloud-based talent management is playing a key role. In 2015, gamification features are introduced, which makes the work atmosphere more fun and interesting for employees. In 2016, HRIS with video features became popular among recruiters, which saves money and time on the recruiting process. From this historic development of HRIS, it can be seen that over the last few decades, the software delivery model has changed from on-premise to on-demand; the software's purpose has been shifted from administration to talent management, SaaS-enabled HRIS is expanding into SMEs. This is relatively a new trend, as traditionally company size has been a driving factor of IT adoption, and SMEs were believed to face more barriers in IT adoption.

Thus HRIS represents an important legitimacy challenge for businesses. HRIS implies new concepts of business ethics and corporate social responsibility (Rendtorff 2017a). Leadership philosophy and values in the development of the corporations depend on innovation and technological concepts and philosophy of management (Rendtorff 2013a, b, c, d). Here, there is focus on how HRIS can create shared value to improve the legitimacy of businesses in the context of development of advanced methods of Human Resource Management (HRM) (Rendtorff 2017b). New visions of leadership and management philosophies are required. Accordingly, we can situate the chapter in the context of dilemmas of ethics and responsibility with regard to the implementation of HRIS in business organizations. The chapter presents some lines of development within HRIS. These developments challenge ethical principles and values of business ethics and responsibility in relation to HRIS (Rendtorff and Mattsson 2006; Rendtorff 2009, 2010). Thus, values, ethics, and responsibility are important to improve legitimacy of SMEs in the process of HRIS adoption.

In addition, few empirical studies explain the increasing HRIS adoption among SMEs. Thus, it is interesting to examine the different drivers of SMEs HRIS adoption. This research is particularly interested in exploring the recent trend of HRIS adoption in Danish SMEs. Denmark ranks number 2 on the Information and Communication Technologies development index in 2013 in terms of information and communication technologies' access, usage, and skills according to the International Telecommunication Union (https://www.itu.int/en/ITU). SMEs represent 99.7% percent of the enterprises in Denmark (European Commission 2016). Yet, there is little research about Danish SMEs HRIS adoption, therefore the research question to be investigated in this chapter is: What are the determinants for Danish

SMEs to adopt HRIS and why? To answer the research question a qualitative investigation is conducted in four Danish companies.

The chapter is structured as follows. First, a literature review is provided and the theoretical framework presented, then the methodology is described. This is followed by a presentation of the determinants of HRIS adoption and the conclusions.

Literature Review

HRM

Human Resource Management (HRM) is the management of human resources, which is usually executed by HR departments. They are responsible for employee benefits design, employee recruitment, training and development, performance appraisal, payroll, and rewarding systems (Boon and Paauwe 2009) and accordingly HR professionals can specialize in recruitment, training, and development; employee relations; or employee benefits. Indeed, responsibility and ethics is important for human resource management professionals since they deal with the motivation and facilitation of the work of employees (Rendtorff 2010).

Today, as business becomes globalized and the competition intensified, it is even more important to attract top talents to stay competitive in the industry, and this demand has resulted in an even greater need for HR management to offer positive employee experience. HR management's focus has shifted significantly to managing employee experience, which has become a central issue for legitimacy of HR in business. Therefore, there is need for increased legitimation of the activities of HR professionals work in the movement of digitalization. International HR professionals realize the need of HR department as a service organization to examine and optimize their employee journey map, strengthen employee engagement, and revamp performance reviews. Besides, the labor market is increasingly characterized of short-term contracts, and freelance jobs and teamwork is often made of people with specific skills rather than fixed job positions. This requires HR professionals to react faster to identify the tasks and source the employees with the required skills, so the project team can quickly perform the tasks. Leveraging technologies may improve this process, therefore companies and HR professionals have real-sized the growing importance of using information technology in leveraging their HRM needs.

HRIS Types

Today's HR software can be broadly classified into human resource administrator segment and talent management segment. With the new cloud technology – SaaS as a key driven factor, the HR software market is shifting focus from administrator to talent management segment. Companies can adopt one specialist system focusing on core HR functions or integrated HR functions in one system, depending on their needs. The new HRIS still includes the basic administrative functions such as payroll and personal data administration, but updated with end-to-end feature and more user-friendly access. Furthermore, the new HRIS can collect and centralize all employee data and generate automatic transactions, thus improving other functions such as talents management and performance management.

The human resource administrator segment typically contains functions like payroll, time and attendance, and benefits administration. Time and attendance keeps track of employees' working hours on a task; benefits administration follows the employees' participation in benefits programs such as pension, compensation, and insurance. With payroll function, HR administrator puts in the employees' wage information and working hours, then the system automatically calculates wages, generates deposit and employees' tax reports, and delivers payment to employees' bank accounts. Employees can also login into the payroll system to check their personal information and salary.

These functions can be highly integrated with finance systems, and coordinated between the finance department and HR department. The HR administrator collects these data; the finance system analyses these data and makes the budget. It is in this context that the HR administration also needs to develop competencies of legitimacy, ethics, and responsibility in order to deal with the challenges of creating a better value-based organization in the process of digitalization.

Talents management segments encompass recruitment, performance management, learning and development, and compensation management (Little 2010). Talent management system can be a standalone application or a suite of applications aiming at supporting employee journey. This segment improves HR processes from hiring to training, and succession planning. At the same time, these HR processes also make up an employee journey, which HRIS pays attention to today. The new concept of employee engagement replaced talent management with the purpose of motivating and retaining employees, but the functions remain similar. Both can help companies achieve talent acquisition and retention. This concept of employee engagement corresponds to the challenge of social responsibility in the organization, where employees and HR administrators are in dialogue with stakeholders concerning the future activities of the organization.

As aforementioned in HRM, the role of talents acquisition has been more important to companies than ever, and the market of recruitment software has been growing rapidly. With cloud technology like SaaS, the online recruitment-featuring applicant tracking system is now commonly used by HR professionals because of its efficiency and low cost. For companies or recruiters, it does not require installation, and maintenance is provided by the vendor on the subscription base. Besides, the increasing number of SaaS vendors in the market has driven the price down, making it more affordable for SMEs. For HR staff, it streamlines the recruitment process automatically and centralizes both the data and communications in one place; it can also customize workflow, fields, forms and form layout, and e-mail communication. This significantly improves the recruitment process and the recruiters' productivity. In addition, anybody familiar with Internet browser can use the system, which makes it easy for applicants and executives.

Apart from talent acquisition, talent retention is also being highly valued. Talent retention is supported by learning management system, performance management systems, and compensation systems. Learning management system is an application that administrates, tracks, reports, and delivers training programs. It can automate the process of on-boarding a new hire or off-boarding a retired employee, develop employee skills as well as retain knowledge (Ellis 2009). Performance management applications provide real-time performance tracking, goal setting, and feedback, and it ensures the organizational goals are being continuously met effectively (Ellis 2009). Sometimes performance management is incorporated into learning management system. Compensation management designs reward system for employees' performance, and it is frequently integrated with performance management. These three applications with people-centric feature have been increasingly popular recently, as they encourage employee engagement and retention, and create an employee-centric learning environment (Bersin 2016). Accordingly, in this way, these applications contribute to the creation of business legitimacy in the organization. In the end, they build an agile organization and help companies achieve organizational effectiveness and strategic competence. HRIS types can also be distinguished by its approach of E-HRM. Ruël et al. (2004) recognize three different approaches of E-HRM: (1) Operational – the company focuses on the automation of basic HR administrative tasks, e.g., payroll administration and personal data administration (Table 1).

This can be the result from the adoption of human resource administrator. (2) Relational – the company uses HR tools to support the business processes such as recruiting, on-boarding, off-boarding, and succession planning. This can be associated with the adoption of talents management system streamlining the business processes. (3) Transformational – the company focuses on strategic HRM activities in order to support the organizational change process and strategic reorientation or strategic knowledge and competence management. This can be achieved through integrated sets of HR software that enable the employees to learn and develop in line with the company's strategic choices (Ruël et al. 2004).

It can be seen that the definition of E-HRM types are closely related with HRIS types. That is the result of HRIS adoption and the adoption of a specific HRIS type reflect a company's approach to HRM. A company can choose different approaches and adopt different types of software throughout the time, depending on their business size and needs. These different choices determine the concepts of Corporate Social Responsibility (CSR), ethics, and business legitimacy that are at stake in a particular company.

Table 1 HRIS classification (own elaboration)

E-HRM Approaches	Operational: Administrative tasks	Relational: Business processes	Transformational: Strategic activities
HRIS segments	⇓ Administrator: Payroll, time and attendance, etc.	⇓ Talent Management: recruitment, training, performance management, etc.	⇓ Integrated HR suites

HRIS Adoption in Denmark

According to the report "Market of HR systems in Denmark" (Pedersen 2013), various types of HRIS are adopted by Danish companies, and it is consistent with the development of HRIS and HRM. Traditionally it is a part of ERP, usually used by international corporations, to integrate all the business processes in one system. Later on, as the business software market is booming along with the prevalence of the Internet, HRIS has become gradually specialized as HR operation process management, competence and performance management, or one particular HR function. SMEs in Denmark tend to choose specialized HRIS rather than an ERP suite.

IT Adoption and Diffusion Theories

As HRIS falls in the category of information technologies (IT), the theories of IT adoption and diffusion is applicable here in explaining the phenomenon of HRIS adoption.

The most used theories in this field are diffusion of innovation (DOI) (Rogers 1983), technology-organization-environment (TOE) framework (Tornatzky and Fleischer 1990), technology acceptance model (TAM) framework (Davis et al. 1989), theory of planning behavior (TPB) (Ajzen 1991), and unified theory of acceptance and use of technology (UTAUT) (Venkatesh and Zhang 2010). TAM, TPB, and UTAUT explains individual end-user level of adoption. TOE framework illustrates factors of IT adoption and implementation at firm level. DOI explains how technology adoption and diffusion happens in an even broader context, covering individual, organizational, and social elements. This chapter chooses to use TOE framework in the investigation since TOE framework suggests technological, organizational, and environmental factors drive IT adoption, which is the subject of this chapter. This TOE framework is also the basis for understanding the legitimacy requirements and issues of responsibility and ethics in organizations that work with the adoption of new technology and acceptance of technology. Of course, the kind of technology that is proposed has an impact on the values and leadership philosophies of the organization (Rendtorff 2013a, b, c, d).

TOE Framework and SMEs

TOE suggests three factors of IT adoption: technological context, organizational context, and environmental context.

Technological context describes both internal and external technologies relevant to the firm, and the current internal practices of the firm as well as the available technologies external to the firm. The Organizational context refers to the characteristics and resources of the firm, such as firm size, scope, and managerial structure. Environmental context refers to the arena the company operates its business in –

industry, governmental incentives, and regulations. Even though TOE framework is consistent with DOI theory, TOE framework includes a new component – environmental context, which makes it more comprehensive. Technological factors are often referred as the characteristics of the technology and have been often measured by perceived benefits, which are one major factor determining the adoption of management information system such as CRM and ERP (Alshawi 2010).

The complexity of HRIS is getting lower and lower, as it starts to have more people-centric features, user-friendly interfaces, and easy access. Besides, HR software is segmented by functions. Apart from the technological characteristics, HRIS, as a tool of facilitating organizational management, is inevitably driven by organizational characteristics. Top management support plays a significant role in HRIS adoption, as top managers are the ones making decisions in the organization. Previous research shows that this applies to SMEs as well (e.g., Scupola 2003, 2006, 2009). Top management can include Chief Exective Officer (CEO), Chief Financial Officer (CFO), Chief Technology Officer (CTO), HR manager, marketing and sales manager, etc. All of them contribute to improve the legitimacy of the HR management in the SME organization.

In contrast to big companies, SMEs face some budget constraint, limited economies of scale, requirement of domain-specific technical personnel, and skilled workforce. Thus, SMEs desire cost optimization, high productivity, and top talents. Adopting recruitment software is crucial for SMEs' fast growth, as performance management systems are important for SMEs' to meet their goals and achieve high productivity. Affordable cloud-based HRIS certainly help SMEs save time and money finding high-potential employees and efficiently keep the employees' performance in line with the organizational goals.

Organizational maturity (Sierra-Cedar 2015; Celaya 2015) and organizational readiness (Kinuthia 2014; Malak 2016) are still found important in adoption decision of cloud-based HRIS or other management systems. These two concepts are related, as organizational maturity challenges the organizational readiness for technology adoption (Sierra-Cedar 2015). Finally, organizational HRIS knowledge and expertise is also driving the adoption. This can be indicated by whether the company's organizational structure has HR and IT specialists.

From an external environmental perspective, adoption of HRIS is usually associated with governmental and regulatory reporting requirements for employees and organizational trend such as globalization (Shani and Tesone 2010; Anitha and Aruna 2014). Globalization implies mobility of high-potential talents and intensified competition. A company can easily recruit high-potential talents from foreign countries; however under competition, they have to improve HR service on a global level and optimize cost-savings. This competition's effect in driving SMEs' HRIS adoption is evident in recent empirical research (e.g., Mukherjee et al. 2014). This means that SMEs' challenges of legitimacy and responsibility also have a global dimension (Rendtorff 2017a).

Both basic HR administration and employee engagement require compliance with the regional laws and regulations; HRIS vendors are highly segmented by region and have automatic solutions for compliance. Delivering legal changes in a timely manner, a key requirement for an HR solution, is greatly streamlined (Pruden 2017). This can be a specific reason for HRIS adoption as well, as without automatic compliance the human work of compliance might take time. In European Union, there is requirement for employees' data protection, so that personal information will not be leaked and misused. In April 2016, EU Parliament adopted General Data Protection Regulation (GDPR), and it has been enforced to its member countries since May 25, 2018 (eur-lex.europa.eu, 2018), which includes Denmark. GDPR requires that employers only keep a candidate's information for 6 months and afterwards the employer has to either ask the candidate again for permission to keep it or delete the profile in the database. This specific regulation can be challenging and inefficient to keep compliance with only manual work. HRIS adoption becomes inevitable when a company is actively hiring. As GDPR has only been enforced for the last 2 years, there are very few studies investigating its relation to HRIS adoption. To conclude, the two external environmental factors, competition in talents acquisition and GDPR, can be assumed to be driving Danish SMEs' HRIS adoption. GDPR is accordingly an important challenge to respect the legitimacy of digitalization of companies with HRIS adoption. This implies a conscious protection of basic ethical values of autonomy, dignity, integrity, and vulnerability of the human person (Rendtorff and Mattsson 2006; Rendtorff 2009, 2010).

Case Studies on HRM

When choosing the research strategy, the researcher has to consider three criteria: (a) the type of research question posed, (b) the extent of control an investigator has over actual behavioral events, and (c) the degree of focus on contemporary as opposed to historical events (Yin 1994, p. 4). HRIS adoption happens over time, and the explanation of how it was adopted, how it is perceived, and why is the adoption different needs to be traced over time rather than frequencies. Case studies, experiments, and histories are all suitable for explaining "how" and "why," while case study method is preferred in examining contemporary events, and when the relevant behaviors cannot be manipulated. Using the case study method can cover contextual conditions (Yin 1994, p. 13; Rendtorff 2015), which is highly pertinent in HRIS adoption.

In comparison to single-case design, multiple-case design is more compelling and robust, since it involves replication logic (Yin 1994, p. 45). EU's definition is applied here for SMEs case selection according to which SMEs are companies with number of full-time employees between 11 and 249.

Opinions on Digital HRM

This research has applied multi-method qualitative study. The qualitative data are from multiple sources, including semi-structured interviews, the official pages of the adopted HR software, the companies' websites, the companies' LinkedIn pages, and the business information provider Proff.dk and Bisbase.com. Companies' LinkedIn pages are first scanned to explore case study possibilities, and then used for number of employees and to indicate organizational maturity. The official page of HR software provides information about the software, from which the functions and the purpose of the software can be defined.

Semi-structured interviews are the primary data collection technique because of the nature of the research questions and the study. The interview themes include (1) HRIS classification, (2) management decision of HR software adoption, and (3) HR professionals' perception of the adopted HR software.

In the analysis, relevant data explaining the adoption factors are identified and highlighted in the interview transcripts and then categorized in terms of TOE determinants of HRIS adoption decision. At the same time, relevant secondary data complementing the interview data are also analyzed thus basing the analysis on multiple sources to ensure triangulation.

Determinants for Digital HR Information Systems

The decision-making units of all the four case studies agree on the perceived benefits of HRIS adoption as a significant factor in driving the Danish SMEs' HRIS adoption. The decision-making units also perceive relative advantages, not to be significantly influential in driving the Danish SMEs' HRIS adoption, as only one SME's HR support this relation. Interview data show that other factors such as ownership and partnership could also influence the company's decision in accepting HRIS adoption. Throughout the four cases, both secondary data and interview data confirm the top management support's necessity in accepting or approving SME's HRIS adoption. However, the HR professionals perceive top management's influence on the decision differently at different levels. This could be because HR managers might have different level of influence on the top management, due to the SMEs' different level of centralization and formalization. The findings also show that in the four cases organizational HRIS knowledge, organizational maturity, and expertise have significant influence on the SMEs' adoption decision. One or two companies only mention competition and GDPR as a determinant of SME's HRIS adoption as an influential factor in SMEs' HRIS adoption. This indicates the insignificance of competition as a factor influencing HRIS adoption. Three out of four of the case companies use both human resource administrator and recruitment software to manage HR related data, while one company uses integrated HR systems. Data also confirms the importance of HRIS adoption for increasing legitimacy of business in globalization. Companies can appear more responsible and more ethical by this improvement of their strategies of HR administration.

Correspondingly, three SMEs have relational HRM goals and focus on improving the recruitment process, while one has transformational HRM goal and requires more collaboration among employees. However, it should be noticed that operational goals and relational goals are not exclusive of each other. The data revealed the HR professionals' commonly perceived benefits and complexity in HRIS implementation. The common benefits mentioned include easier recruitment process and automatic workflow as well as ability to grow faster. In relation to the perceived complexity in implementation, the respondents mentioned that the newly adopted HR software are very intuitive and require a few hours to learn, which indicates the low complexity of the recent HRIS. It can be concluded that HR has overall positive perception of the adopted HRIS. Thus, HR sees the adopted HRIS as important for the improvement of business legitimacy of the business organizations.

Discussion and Conclusion

This research is significant, as it addresses a gap in literature regarding the reasons and results of HRIS adoption in Danish SMEs. The results of this study may be useful to academia, HR leaders implementing HRIS, and leaders in SMEs. It can be concluded that perceived benefits of HRIS adoption are significant in driving the Danish SMEs' HRIS adoption. This improves the perceived legitimacy of Danish SMEs in relation to stakeholders in the internal environment of the organization. Moreover, this can have an impact on the external legitimacy of the organization. In addition, the study shows top management support's necessity in accepting or approving SME's HRIS adoption. Organizational HRIS knowledge and expertise as determinants have significant influence on the SMEs' adoption, and company growth is also a determinant of HRIS adoption. Finally, it can be concluded that HR managers have an overall positive perception of their adopted HRIS for both improvement of HR administration and legitimacy of the organization, as they are useful in helping the company grow faster, improving HR work efficiency, and centralizing employee data in one place.

The study finds the TOE factors – perceived benefits, organizational HRIS knowledge and expertise, and top management support, to be significant in driving HRIS SMEs' adoption decision, therefore TOE framework's applicability in HRIS research; it also contributes to understanding legitimacy challenges of HR in advanced business organizations.

The findings also show that factors such as ownership and partnership could also influence the Danish SMEs' decision in HRIS adoption. This might be a theme for further investigation. Adoption of HRIS incredibly improves HR work efficiency, thus decreasing the job opportunities, since the efficiency of HRIS requires less HR paperwork. This helps to improve focus on ethical values and responsibility of the organization.

Therefore, HRM's focus is shifted to the strategic direction. An HR professional should increase his or her ability in strategic HR management. In addition, any one aiming to become an HR professional should keep himself updated with the technology change and HRM needs. Intuitive user-friendly software tends to be adopted fast. Moreover, because of the low cost, companies shift between HRIS vendors often. Therefore, HRIS vendors should continuously improve the product feature to keep the clients loyal. This is an important feature of responsible HR administration with focus on maintaining ethical values and integrity in managing HR. Business legitimacy of HR is dependent on service-oriented and efficient treatment of employees in the organization. HR administrators are required to be more aware of this working with HRIS.

Abstract

The world faces an increasing number of complex and mutually influential challenges that we have never experienced and cannot cope with our experience so far. The new economic age is an era of unparalleled resources and technological progress, but is also defined as the age of mistrust for a great number of people. This has led to increased requirement to new methods, new business models, and new business strategies to respond to this insecurity. Therefore institutions need to manage their risks in the long run in order to survive. Ethical and responsible behaviors, intellectual capacities, and corporate cultures are crucial for sustainable performance in this turbulent period. It is expected that the institutions that are able to establish the system of values can manage effective information sharing and communication with their stakeholders.

Sustainability has become one of the most significant topics within the lexicon of corporate endeavor in the light of these developments. While the concept of sustainability is in many instances indicated as fundamental in corporate activity, its definition is still problematic, and its use is so varied. Therefore the concept of sustainability and its dimensions are defined in the business setting at first in this chapter. Then the theoretical framework is also presented in this chapter to clarify why companies disclose their sustainable performance information. Moreover the financial consequences of sustainability implementations of companies are discussed in this chapter. Sustainability should be considered as not solely a process which must recognize the decision being made in the operational activity but also the distributional decisions which are made. Only then, a company can be considered to be sustainable.

Finance · Sustainability · Legitimacy theory · Social contract · Stakeholder theory · Institutional theory · Cost of capital · Risk reducing · Distributional problem

Introduction

In recent decades, due to the more volatile, uncertain, complex, and ambiguous (VUCA) conditions, the world faces a growing number of complex and mutually influential challenges that we have never experienced and cannot cope with our experience so far. The Global Risks Report (WEF 2019), which includes the multi-stakeholder approaches of the World Economic Forum, shows how high the risks are, including economic inequality, slowing global development and growth, climate change, geopolitical tensions, and accelerating the Fourth Industrial Revolution. While polarization is increasing in many countries, in some cases, social contracts that keep societies together are wearing down. Therefore, the new economic age is an era of unparalleled resources and technological progress, but is also defined as the age of mistrust for a great number of people. This has led to increased requirement to new methods, new business models, and new business strategies to respond to this insecurity.

In the new economic era, operating in VUCA world influences the direct business models and business strategies of corporations. Although the uncertainty is the only thing that is not uncertain in VUCA world, institutions need to manage their risks in the long run in order to survive. Ethical and responsible behaviors, intellectual capacities, and corporate cultures are crucial for sustainable performance in this turbulent period. It is expected that the institutions that are able to establish the system of values can manage effective information sharing and communication with their stakeholders.

In the light of these developments, sustainability has become one of the most significant topics within the lexicon of corporate endeavor. While the concept of sustainability is in many instances indicated as fundamental in corporate activity (Aras and Ingley 2017), its definition is still problematic, and its use is so varied. Mostly, corporations use this term merely to indicate that continue their existence into the future. In this chapter therefore, the concept of sustainability is defined in the business setting at first. Then this definition is extended with its dimensions (economic, finance, environmental impact, societal influence, organizational culture, and governance) (Aras and Crowther 2007a; Aras 2015b; Aras et al. 2018a, b, c). The theoretical framework is also presented in this chapter to clarify why companies disclose their sustainable performance information. Lastly the financial consequences of sustainability implementations of companies are presented in this chapter.

Business Sustainability

The concept of sustainable development was first identified in 1987 in Brundtland Report, which is also known as *Our Common Future* report, prepared by the United Nations World Commission on Environment and Development (WCED) and became a crucial phenomenon worldwide. In the definition of the United Nations World Commission on Environment and Development, it is stated that “meeting the needs of present without compromising the ability of future generations to meet their own needs” (WCED 1987). According to this definition, it is emphasized that no more of a resource must be used than could be produced. As part of an economic and social system, corporations must take into consideration not merely their effects and consequences in the present but also for the future of the business itself. In that respect, this approach to sustainability is ground on the Gaia hypothesis that describes the codependency of all living substance in ecosphere and a complete system (Lovelock 1979).

In the literature, it seems that there are two assumptions made commonly about the concept of corporate sustainability. The first extremely common confusion is about the terms of sustainability and sustainable development (Aras and Williams 2017; Aras and Crowther 2009a, b). While the pure sustainability signifies the ability to resume in a static manner, it is generally used to express development in a sustainable manner (Marsden 2000; Hart and Milstein 2003). Therefore, sustainability and sustainable development terms are mostly used as synonyms. The second is that sustainable company exists only by recognizing environmental and social matters and by involving them in strategic planning. On contrary to this common assumptions, Aras and Crowther (2008) emphasized that sustainable activity is an activity where current decisions do not restrict future options. If this belief of sustainability is accepted, it follows that development is neither a necessary nor desirable aspect of sustainability.

It is crucial to acknowledge the realities of global environment in so far as the organization is definitely stated in a global environment which inevitably takes into consideration not only the present but also the past and the future as well (Aras and Crowther 2007c). This effectively distinguishes stakeholders both in the present and in the future. Sustainability therefore involves a positive and negative distribution of impacts, which will eliminate the conflict between them and give attention to the future as well as to the present. Therefore, short-termism is no more acceptable for sustainability.

At first in the beginning, sustainability was seen as a concept that requires companies to be sensitive to the environment and to reduce their negative impacts on the environment. However, over the time this approach has been replaced by an approach that advocates the balanced consideration of the economic, environmental, and social objectives of the companies, which are defined as three pillars of sustainability. With triple bottom line concept introduced by John Elkington in 1997 for the first time, traditional accounting was expanded to include financial performance as well as social and environmental performance. According to this approach, the neglect of one of these three areas will endanger all company operations and future.

One of the first studies on this subject, Ranganathan (1998), in his study, emphasized the indicators of social, environmental, and economic performance of companies. These indicators are represented as competitive advantage, environmental management systems, supply chain, credit and investment opportunities, shareholder expectations, international standards, innovation efforts, competitive pressure, and reporting activities. Based on these criteria, social, economic, and environmental indicators should be connected. Similarly, Fricker (1998) argues that the sustainability of firms should be evaluated according to their economic, social, and environmental conditions. Despite the small number of economic indicators, it has been studied on to decide which indicator can truly measure sustainability. While social indicators are grouped under five headings, environmental indicators are examined under three main headings (air, land, and water) in his study. In Atkinson's (2000) study, the concept of corporate sustainability is dealt with in detail and developed various assumptions. In this study, the determination and measurement of corporate sustainability have been realized by determining the efficiency of investments in spite of the damage caused to the environment, and the effect of electricity production on air pollution has been evaluated financially.

The majority of sustainability analysis (e.g., Dyllick and Hockerts 2002) involves environmental and social of dimensions. However, there are a few studies (e.g., Spangenberg 2004) involving the dimension about organization behavior. Restricting analysis to environmental, social, and organization behavior dimensions is not sufficient (Aras and Crowther 2007b). Most studies in the area of corporate sustainability do not accept the need to acknowledge the importance of financial performance as an essential part of sustainability and therefore cannot perform financial analysis as well as other forms of analysis. Aras (2015a) and Aras and Crowther (2007c) argue that the financial dimension is a fundamental aspect of corporate sustainability and therefore adds a new dimension to sustainability analysis. They also argue that the third dimension, which is sometimes considered to be an organizational behavior, should actually include a broader corporate culture. For this reason, sustainability has four dimensions that need to be recognized and analyzed:

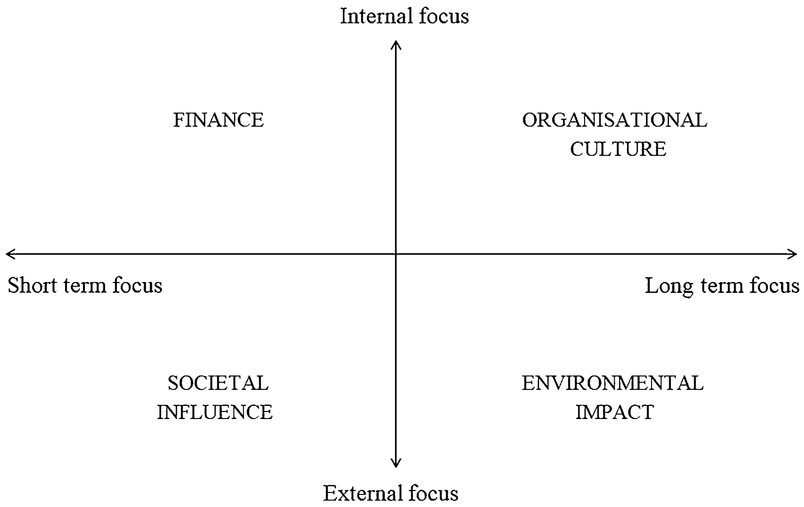

Fig. 1 Model for evaluating sustainability

- ***Societal influence*** expresses that society makes an impact upon the corporation regarding the stakeholder influence and social contract.
- ***Environmental impact*** expresses the effect of the activities of corporation upon its geophysical environment.
- ***Organizational culture*** expresses the relationship between the corporation and its internal stakeholders, especially employees, and all respects of that relationship.
- ***Finance*** expresses an adequate return for the level of risk undertaken.

Recommended by Aras and Crowther (2007a, c), four-dimension sustainability model is substantially inclusive and more complete than the others. These four aspects are represented in a two-dimensional matrix through internal-external focus and short-term-long-term focus poles as the model above model (Fig. 1).

In addition to these dimensions, Aras et al. (2017, 2018a, b, c) evaluate sustainability performance with an extended model including five dimensions of sustainability. This extended sustainability model takes into consideration environmental, social, governance, finance, and economic dimensions (Fig. 2).

Corporate Sustainability Performance Disclosures: Theoretical Framework

Considering sustainability in the level of enterprises, the recent transformation is remarkable. When the changes in the market value components in the last 40 years are analyzed, it is observed that the proportion of intangible assets increased from 17% to 87% (Ocean Tomo LLC 2015). A significant percentage of the market value

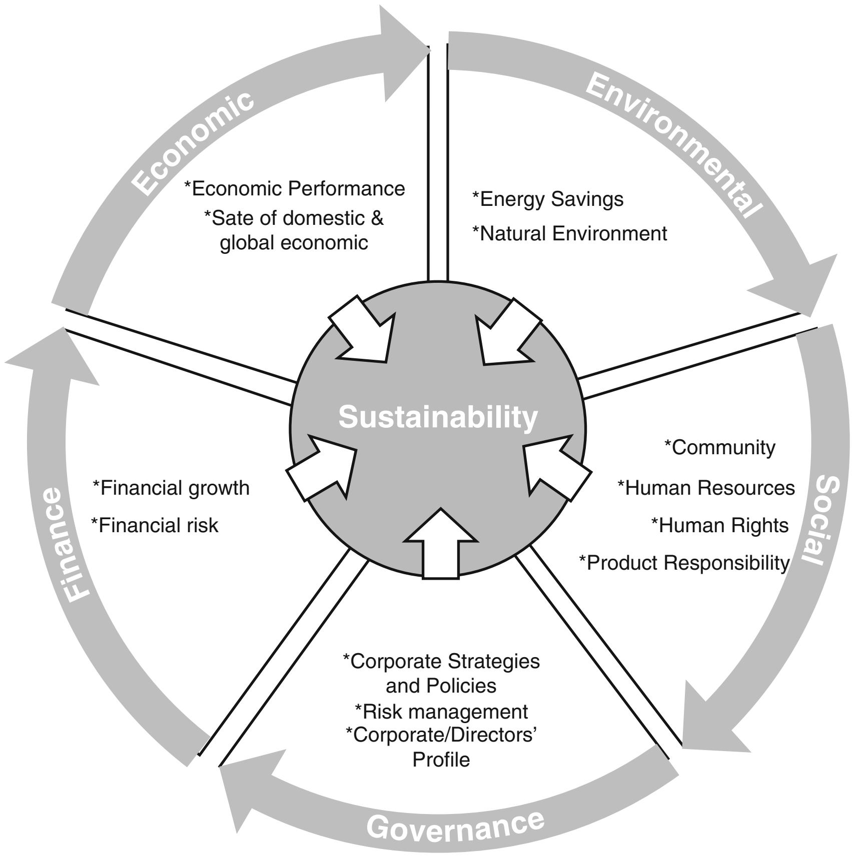

Fig. 2 Multidimensional sustainability model

components consist of intangible assets such as strategy, corporate trust, reputation, risk management, human capital, legitimacy of operations, and supply chain. This significant change in tangible and intangible values shows that the financial statements alone do not include a significant portion of the value of the companies. This change and transformation also leads to the development and growing of sustainability disclosures.

Although corporate sustainability reporting is mostly a voluntary implementation, today 93% of the world's 250 largest companies and 75% of the 4900 companies covering the top 100 companies in 49 countries disclose their sustainability performance (KPMG 2017). It has been a growing number of researches regarding why companies disclose their sustainability performance information with their stakeholders even though it is not mandatory. In the theoretical perspective, several motivations lead companies to disclose their sustainability information voluntarily (Fig. 3).

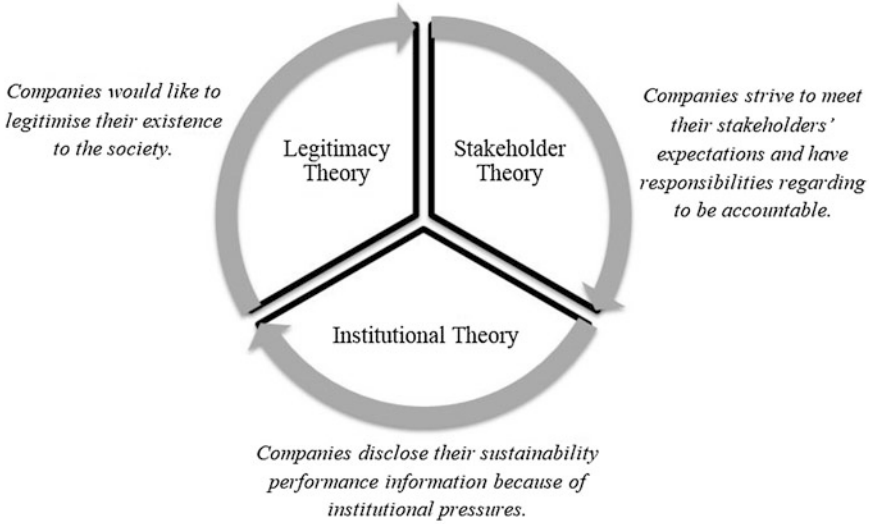

Fig. 3 Corporate sustainability performance disclosures: theoretical framework

Legitimacy Theory

Companies Would Like to Legitimize Their Existence to the Society

In the last quarter of the century, an increasing number of researchers have acknowledged that the activities of an organization have influenced the external environment and that such an organization is therefore not only solely responsible for its stakeholders but also wider audience. This proposal probably appeared in the 1970s for the first time by some authors who raise concerns about the social performance of companies that are part of the society. Thus these authors expressed that the company's performance should be addressed more broadly. Ackerman (1975) argues that the large business accepts the requirement of adapting to a new social responsibility environment but that the orientation of the entity to financial results hampers social sensitivity. On the other hand, McDonald and Puxty (1979) state that companies are no longer solely responsible for their shareholders. Since they exist in society, they have responsibilities to this society as well. Thus there is a shift toward more accountability of companies to all participants. In addition to all these views, Rubenstein (1992) argues that there is a requirement for a new social contract between a company and its stakeholders.

Guthrie and Parker (1989) refer that this theory can be used as a contract between society and companies, whereby the latter adopt social behaviors for gaining social approval. In line with *legitimacy theory*, that "social contract" is used for regulating the relationship between a company and society. Considering this contract, the company has to meet some requirements toward society in return for gaining the approval of the society. For instance, to enable the society to assess the company's sustainability performance, the company would provide information about its

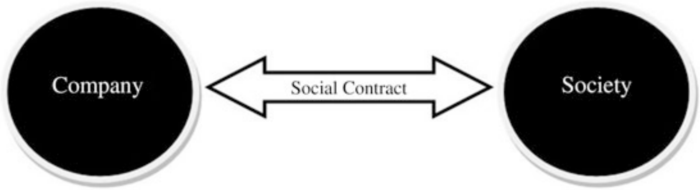

Fig. 4 The social contract

sustainability performance to society; otherwise, the society would assume this action as a breach of the "social contract" (Fig. 4). "Social contract" in turn led to the development of stakeholder theory.

Stakeholder Theory

Companies Strives to Meet Their Stakeholders' Expectations

Freeman (1984) defines the concept of stakeholder as "any group or people that may affect the company in achieving its objectives or that may be affected by the company's achievement." Thus, the stakeholder concept encompasses all groups that affect business activities Sternberg (1997). Stakeholder approach is a philosophy that takes care of employees, customers, suppliers, and shareholders and takes their expectations and needs into account. In line with *stakeholder theory*, a company's stakeholders have rights to the information about company's sustainability performance. Furthermore, Freeman et al. (2000) argue that stakeholder theory helps position sustainability management in a bigger picture and sustainability enters the debate on "values-based capitalism." Therefore, stakeholder theory provides an important support for business persuasion, which is why companies should adopt a corporate sustainability approach and why companies should disclose their sustainability performance information with their stakeholders.

Companies Have Responsibilities for Their Stakeholders Regarding to Be Accountable

In terms of the rights of stakeholders as mentioned in the stakeholder theory, Gray et al. (1996) have taken account of this from the perspective of accountability. In their *accountability model*, it is considered that companies have responsibilities to share their activities or inactivities not only because of the demand of stakeholders for information. According to accountability model, regardless of whether society demand or not for accountability information from the company, the company is still bounden to disclose this information to society. Therefore, it would be simplistic to assert that accountability model is based on the concept of social contract. In accordance with accountability model, there are two types of social contract: explicit terms and implicit terms. While the explicit terms are the laws, implicit terms are society's expectations. Thus, companies view corporate reports as a communication tool disclosing their accountability information to society both for explicit and implicit terms.

Institutional Theory

Companies Disclose Their Sustainability Performance Information Because of Institutional Pressures

Institutional theory explores the external pressures that influence the behavior of companies to adopt certain organizational practices (Hirsch 1975). Basically, that theory investigates the forms of companies' practices and clarifies why companies within a particular field have similarities in practices owing to the institutional pressures. Institutional theory supports legitimacy theory, but while legitimacy theory argues companies' strategies for achieving legitimacy, institutional theory considers companies' practices adopted to achieve it. The main reason of why researches on corporate sustainability reporting use institutional theory is that it complements legitimacy and stakeholder theories by ensuring insights for how companies react to institutional pressures. In the meantime, there is another significant reason for adopting institutional theory in corporate sustainability reporting studies. This reason is that the theory integrates organizational practices to the expectations of the society.

Corporate Sustainability Performance and Financial Consequences

In the literature, there are several studies examining the relationship between corporate sustainability performance and financial performance. The majority of these studies have been evaluated together in a comprehensive meta-study by Oxford University and Arabesque Asset Management Company (2015). In this study, a strong correlation has been found between corporate sustainability and financial performance according to meta-analysis results. Eighty percent of the resources examined show that the shares of companies with good sustainability practices are affected positively. However, 90% of these researches indicate that appropriate sustainability standards reduce the cost of capital, and 88% show that integration of ESG (Environmental-Social-Governance) practices into the companies' activities and strategies positively affects the performance of the company.

Cost of Capital

In the financial world, the cost of capital of any company is considered to be related to the perceived risk of investing in that company. In other words, there is a direct relationship between the risk of an investment and the expected returns from a successful investment. Therefore, it is generally accepted that more established and larger companies are a more precise investment and therefore have a lower capital cost. The cost of capital decreases as the certainty of returns increases. These are all recognized in the functioning of financial markets in the world and financial theory. Thus sustainable companies will be less risky than a company that is not sustainable. As a result, most large companies in their reporting disclose sustainability information and often show distinct characteristics. In fact, it is noteworthy that extractive industries, which by their very nature will not be sustainable in the long term, make sustainability a very important issue. Although the most important example of this is a very small part of its main activities, it can be seen in oil companies, which have a renewable energy feature and which are busy with redesigning themselves from oil companies to energy companies.

Mostly, companies do not really address real sustainability issues, but only create the image of sustainability (Aras and Crowther 2008). Therefore, the language of the statements made by companies tends to be used as a tool to disrupt thought (Orwell 1970) by using it as a tool of preventing thought about the various alternative realities of organizational reality. Significantly, it creates a security image for investors and thus reduces the cost of capital for such companies. This language should be considered semiotic as a way of creating the impression of true sustainability (Barthes 1973). When such an analysis is used, signification relates to the inclusion of the organization in the selected audience for comparative reports that the signification provides a common understanding with the authors. This is based on the acknowledgment of the approval code used to define the corporate activities in this way. As Sapir (1949) states:

> *... we respond to gestures with an extreme alertness and, one might almost say, in accordance with an elaborate and secret code that is written nowhere, known by none and understood by all.*

Risk Reducing

The methodologies for the assessment of risk are deficient in their evaluation of risk – especially environmental risk. The starting point for fully integrating environmental costs and benefits into the investment analysis process should be the definition of the cost and income types that should be included in the evaluation process. Once such costs are identified, it becomes possible to measure these costs and to include qualitative data on lesser material benefits that are not easily subject to quantification. Completion of an environmental audit will improve and facilitate understanding of relevant processes. When considering environmental benefits, unlike financial benefits, it is significant to select an appropriate time horizon to ensure that these benefits are recognized and accrued. This can mean a very different time horizon than which is determined merely by the requirements of financial analysis.

Once all data have been identified and aggregated and quantified, it becomes possible to incorporate this data financially into an assessment that includes more consistent risk. It is significant to recognize the costs as well as the benefits, and perhaps it is worth repeating that most of these benefits are less quantitative and less concrete and less relevant. For instance:

- Advanced company or product image – this may lead to increased sales.
- The benefits of health and safety.
- Ease of attracting investments and reducing the cost of these investments.
- Better society relationships – this can lead to easier and faster approval of plans.
- During the process of planning.
- Improved relations with regulators in relevant cases.
- Improved motivation among employees, higher productivity, and lower staff turnover.
- And therefore, lower training and recruitment costs.
- Enhanced image and relationship with stakeholders.

Most listed benefits above are not merely intangible but also take time to take place. Therefore, there is a requirement to choose an appropriate time horizon for the assessment of risk and associated effects. This time horizon is likely to be longer than traditional financial assessment. Definitely, cash flows should be taken into account at that time, and an appropriate evaluation method (e.g., a discounted cash flow technique) should be used in the assessment. None of this will change with the inclusion of environmental accounting information, except for the evaluation of risk and its relevant impact on the cost of capital, which is expected to occur when calculating the actual measure of the environmental impact.

Therefore, the steps involved in introducing environmental accounting into the risk assessment system can be summarized as follows:

- Identify environmental impacts in terms of costs and benefits.
- Measure these costs and include qualitative data on less tangible benefits.
- Use appropriate financial indicators.
- Determine an appropriate time horizon to ensure full environmental impact.

The Distributional Problem

However, it is obvious that any actions realized by an organization will have an impact not only on itself but also on the external environment in where the organization operates. Considering the impact on the organization's external environment, it should be acknowledged that this environment includes both the business environment in which the firm operates and the local social environment in which the organization is located and the wider global environment. This effect of the organization can be realized as many forms, including:

- Use of natural resources as part of production processes
- The impact of competition between itself and other companies in the same market

- Enrichment of a local community through the providing employment opportunities
- Conversion of landscape due to raw material extraction or waste product storage
- Distribution of the wealth created within the firm to the owners of the firm (through the dividend) and the workers of that firm (with wages) and the effect of this on the welfare of individuals

According to these examples, it can be seen that an organization can have a crucial impact on the external environment and it can really change its environment. It can also be seen that these different effects can be seen as useful in some cases and in other cases as harmful to the environment. In fact, the same actions can be seen as useful for some people while be seen as harmful by some. For this reason, it is for this reason that planning investigations, which take into account the possible effects of the suggested actions by a company, find the ones that are in favor and those who oppose them. This is, of course, due to the fact that the evaluation of the effects of an organization's activities on the environment is evaluated differently by different people.

For this reason, a company has been fully involved in its activities because it has such wide-ranging impacts. Thus, one of the key aspects of sustainability concerns the dissemination of the effects of its actions. The traditional approach to this was to record the profit as an internal of the organization and to treat it as an externality that should be ignored. Hence, the only discussion was related to the distribution of profits from institutional activity: to the owners as a risk handling return, as a reward for managers to profit, and to maintain future profitability.

Of course, such an approach ignores two aspects of corporate activity:

1. It is probable to gain an increase in profit by externalizing costs (as recorded by accounting).
2. It is not realistic to make a profit for other stakeholders – either active or passive – without making cooperation.

Therefore, the social accounting approach is to acknowledge all costs and benefits arising from the activities of a company and to focus on the distribution of them to ensure the all stakeholders' satisfaction – a common satisfactory approach in the social accounting literature. The basic principle is that if all stakeholders are satisfied, then the conflict between them will end and everyone will collaborate for mutual benefit.

Hence, there has been a growing concern about the performance of companies in a larger field than the stock market and the created value for shareholders. Fetyko (1975) regarded social accounting as an approach to reporting the activities of a company and underlined that it is necessary to identify socially responsible behaviors, to identify those responsible for the company's social performance, and to develop appropriate measures and reporting techniques. Klein (1977) regarded social accounting and defines that separate aspects of performance are distinguishing between stakeholder groups such as investors, society relations, and philanthropy.

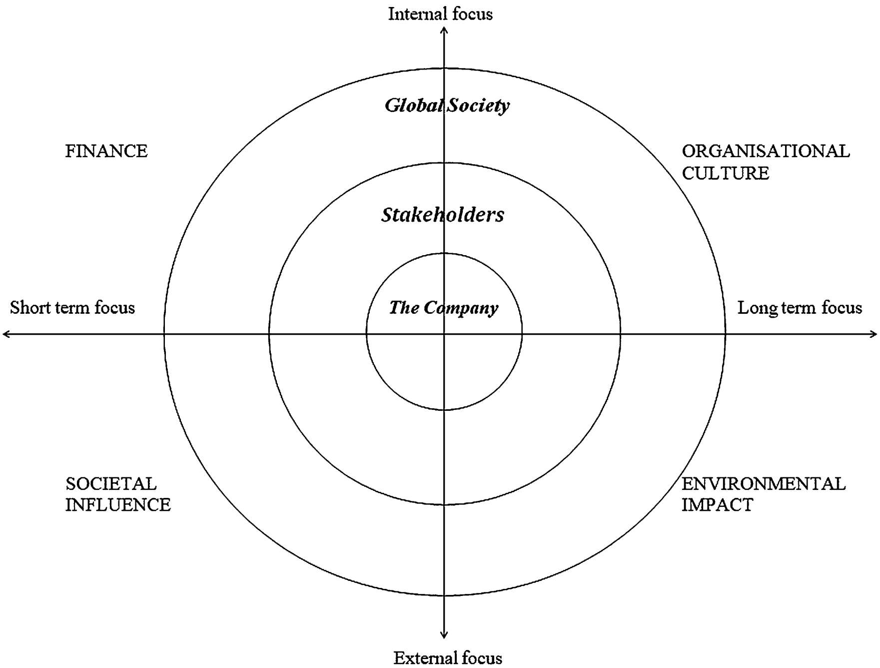

Fig. 5 Model of sustainable distribution. (Aras and Crowther Aras and Crowther 2009b)

Klein also considered different topics for assessment such as nonmonetary values, environmental impact, and consumer surplus. These authors, implying without considering the reason for believing that it is important to measure social performance, Solomons (1974), evaluated the reasons for objectively measuring the social performance of a company. He argued that while one reason is to help make decisions rationally, another reason is a defensive nature.

Thus, sustainability therefore requires the distribution of influences – positive and negative – in a way that eliminates conflict between all of them and pays attention to the future as well as today. Therefore, a short-term approach is no longer acceptable for sustainability, and Fig. 5 shows a proposed approach to sustainability in terms of sustainable distribution.

Conclusion

Sustainability has been a crucial concept for a business and surviving its existence. The term of sustainability is also essential for the surviving its existence not solely for actual economic activity but also for global environment. Hence this process includes both of making decision about operational activities of the company and distributional decisions.

Revealing the different theoretical perspectives, several motivations lead companies to disclose their sustainability information voluntarily and adopt sustainability practices. Sustainability reporting becomes particularly important in the legitimacy processes, contributing to the enhancement of credibility with all stakeholders. Additionally, undertaking not only the financial aspects but also the ESG aspects and voluntary disclosures has a significant contribution for achieving the objective of legitimacy in business environment.

Transaction Cost Theory and Business Legitimacy

Abstract

The importance of business legitimacy is continuously increasing. Beyond economic interests, companies are incorporating social responsibility and human rights management on both a voluntary and an obligatory basis, thereby strengthening their legitimacy. From a scientific perspective, there is potential for further

research to combine economic theory and the concept of business legitimacy. The following discussion aims to develop an approach in this direction, presenting literature from the fields of business legitimacy as well as transaction cost theory and integrating these. Three different levels (the institutional, the organizational, and the individual) are observed in this context. The discussion indicates that business legitimacy particularly impacts transaction costs in a positive and negative way. A possible mechanism for gaining legitimacy and reducing transaction costs is a stakeholder advisory board in combination with a values management system. In this emergent field for research, these findings can be further developed and discussed in the context of various situations. In practice, it is important to consider stakeholders' norms and values when conducting transactions. When organizations are increasingly likely to undertake sovereign tasks, or when legal enforcement is weak, especially in a global context, the legitimacy of organizations' transactions becomes relevant. The clear distinction between legitimacy, which is determined by ethical expectations, and legality, which refers to public regulation, is of paramount importance in this discussion.

Keywords

Transaction cost economics · Business legitimacy · Institutional economics

Introduction

The relationships between society and the business world are not limited to economic aspects (see Wieland 2014, 2018; Warren 2003). Corporations are organizations within society, and, thus, a society's set of norms and values affects its corporations (e.g., Rendtorff 2009, p. 13). The transactions of an organization are granted social legitimization in return for their successful integration of private and social value generation (see Wieland 2017a, p. 237). These organizations must and can evaluate their existence and their transactions on the basis of the combined observation of the communication of the market, the communication of other organizations, and the communication of actors in society (Wieland 2018, p. 107). Nonconformity with a society's values leads to a firm's exclusion from the spheres of legitimacy (Rendtorff 2009, p. 154). In an organizational context, legitimacy impacts reputation which in turn facilitates resource access (see Rao 1994, p. 32; see also Zimmerman and Zeitz 2002).

As Wieland (2017a, pp. 237–238) elaborates and, thereby, applies the following arguments, modern economic theory refers to corporations and their relations to society and politics, which emerged in the context of the development of organizational economics (see Gibbons and Roberts 2013), the economics of governance (Tadelis and Williamson 2013; Williamson 2005), and the theory of negative external effects (Kitzmueller and Shimshack 2012). One driving force triggering this development is the economic, political, and social change occurring within the processes of global value chains. Firms, as collective actors facilitating and promoting the cooperation of individual actors, play an essential role in transactions. For this reason, decisions are made not only about the returns and costs of value creation but also about the social legitimacy of the firm's existence (see Wieland 2017a for the aforementioned outlines; also Wieland 2018). Transaction cost economics (TCE) has, over recent years, become a diverse and interesting field for research and is highly relevant in this context. Currently, it is according to David and Han (2004, p. 39) "one of the leading perspectives [. . .] in organizational studies".

A large body of literature has underlined the importance of legitimacy for organizations (for an overview and a discussion see e.g., Deephouse and Suchman 2008; Suchman 1995; Vidaver-Cohen and Brønn 2008; Rendtorff 2009; Baumann-Pauly 2017). In this discussion, it is crucial to distinguish between the concepts of legitimacy, which refers to adherence to the values and norms of society (see Suchman 1995; Beetham 2013, p. 21) and is therefore an informal institution, and legality, which refers to adherence to the law and is a formal institution (see North 1991 for a distinction). The discussion later in this chapter considers this issue and explains the differences between the two concepts in detail.

Transaction cost theory (e.g., Williamson 1979, 1985, 1991, 2005) is particularly important when private ordering is involved (see Wengler 2005, pp. 125–126), and this is the case with the legitimacy concept. The joint observation of TCE and business legitimacy is critical for a better understanding of both. This discussion requires a link to the theory of the firm, which is mainly concerned in our perspective with *The Nature of the Firm* (see Coase 1937) as well as particularly with the characterization of the firm as "a nexus of stakeholders" (which centres the resources provided by a firm's stakeholders) (e.g., Wieland 2014, p. 105–120; 2018) and covers the firm's emergence and relationship to the market with a strong reference to transaction cost theory. Transaction costs are associated with transactions' arrangement, execution, and monitoring (see e.g., Williamson 1985; Ebers and Gotsch 2006 for a discussion). Legitimacy can lower the costs of initiating (e.g., search costs or reputation costs) and executing (e.g., trust in situations of uncertainty) a transaction (see also Kumar and Das 2011, p. 303), while, at the same time, legitimacy increases monitoring costs (e.g., evaluation costs of legitimacy drivers).

The issue of the legitimacy of transactions arises during the observation of corporations in particular, because they are, on the one hand, organizations for the pursuit of private interests, but, on the other hand, they are organizations in the society with which the society's economic transactions are performed (Wieland 2017a, 2018, p. 141).

In the following discussion, the main focus is an approach to a combination of TCE and business legitimacy. A sound understanding of TCE is indispensable for building the connection. Therefore, the chapter begins with a brief overview of TCE and an introduction to its basic concepts. This is followed by a discussion of the determinants of transaction costs and a characterization of the institutional arrangements that provide the framework for the execution of transactions (see Ebers and Gotsch 2006 for an overview on these arguments). To illustrate the relationship between transactions and the existence of corporations, the theory of the firm with an emphasis on the perspective of the "firm as a nexus of stakeholders" (Wieland 2014, 2018) is part of this discussion. After presenting the relevant TCE literature, business legitimacy is briefly described, but only at a general level and in sufficient detail to allow the most important aspects for the subsequent discussion to be introduced. After a discussion of the relevant literature, the main part of this chapter starts and is focused on a combination of business legitimacy and TCE as well as observations on the impact of different legitimacy levels (individual, organizational, and institutional) on transaction costs. This part of the chapter also discusses the distinction between legitimacy and legality. Finally, possible mechanisms for ensuring business legitimacy are presented.

Fundamentals of Transaction Cost Economics

The following section focuses on the fundamental issues of TCE. It is mainly based on and summarizes the discussions of Wieland (2014, 2018) and Ebers and Gotsch (2006). John R. Commons (1932, 1934) realized at an early stage the importance of moving beyond simple exchanges in the market (as in Tadelis & Williamson, 2013, p. 160; for the arguments on Commons here and in the following, see Wieland 2014; 2018). He describes as a fundamental problem of economic organization that "the ultimate unit of activity [. . .] must contain in itself the three principles of conflict, mutuality, and order. This unit is a transaction" (1932, p. 4; as in Tadelis & Williamson, 2013, p. 160; Wieland, 2014, p. 5). Commons defines a transaction as the "transfer [of] ownership under the 'operation of law'" (Commons 1950, p. 45).

He, thereby, shifts the focus of analysis from a system-oriented exchange and price mechanism to the transaction as a relation. In doing this, he connects economics, ethics, and law (see Commons 1934), and, as a result of this shift, legal, economic, and ethical aspects of exchange are at the same level of analysis (see Wieland 2014, 2018 for a discussion). An economic transaction occurs through the integration of different decision logics (e.g., law, economics, and ethics) and different actors who succeed in dealing productively with their interdependencies, because they are organized in a way that enables to respond appropriately to them (e.g., Wieland 2018, p. 38).

Without taking the ethical component into account, Oliver E. Williamson (1979, 1985, 1991, 2005) extends this framework and creates his economics of governance. The core of transaction cost theory is the cost comparison of alternative forms of the governance that provides the framework for the execution of transactions (see Wieland 2014, 2018; Ebers and Gotsch 2006 for a discussion). Two dimensions characterize the institutional arrangements: first, the mechanisms through which the transaction is governed and, second, the contractual form, which explicitly and implicitly determines the transaction framework (see Ebers and Gotsch 2006 for a detailed discussion, also for the following arguments). Actors choose the most cost-effective arrangement.

TCE distinguishes, as Ebers and Gotsch (2006) analyze based on Williamson (1985, p. 20), basically transaction costs ex ante, such as information and search costs or negotiation and contracting costs, from transaction costs ex post such as monitoring or adaptation costs (see Ebers and Gotsch 2006, p. 278). It is difficult or even impossible to predict the exact cost of a transaction in advance. However, this is not required since transaction cost theory is not concerned with a specific transaction's total costs but only with its relative costs comparing several institutional arrangements (ibid. p. 277). Transaction cost theory is concerned with the organization of the entire transaction process (see ibid.). The costs of a specific transaction are now discussed in more detail.

Determining the Costs of Transactions

To gain a better understanding of the drivers of transaction costs, this brief overview based on Ebers and Gotsch (2006; see ibid. also for further literature) introduces mainly the arguments of Williamson (1985). The characteristics of the institutional arrangement and the characteristics of a transaction determine the relative costs of a specific transaction. The three distinctive characteristics of a transaction are (I) frequency (Williamson 1985, pp. 60–61), (II) uncertainty (ibid. pp. 56–60), and (III) asset specificity (ibid. pp. 52–56) (see Ebers and Gotsch 2006, pp. 281–284; Tsang 2006, p. 1001).

(I) Frequency: As the frequency of identical transactions increases, the costs per transaction decrease. Williamson (1985, p. 60) discusses *specialized governance structures* that involve high costs and, therefore, should be used for in connection with recurring transactions to compensate for their cost. This phenomenon is due to synergy effects and economies of scale. The rise in frequency allows a more efficient design of institutional arrangements lowering transaction costs (see Ebers and Gotsch 2006, pp. 283–284).

(II) Uncertainty: Williamson (1985) considers two kinds of uncertainty – parametric (p. 59) and behavioral (p. 57) (for a discussion, also on the following points, see Ebers and Gotsch 2006, pp. 282–283). Situational conditions and their future developments cause parametric uncertainty, whereas behavioral uncertainty results from the possibility of opportunistic behavior by the transaction partners (ibid. p. 282). The behavioral uncertainties are further differentiated and are thus categorized more precisely. Ebers and Gotsch (2006, pp. 282–283) discuss Williamson's (1985) categorization applying the following citations. First, there is adverse selection (Williamson 1985, e.g., p. 47), which describes the uncertainty over whether the counterpart is capable of completing the transaction (Hart and Holmström 1987). Second, there is moral hazard and holdup, which impact on whether the transaction will be executed (Fama and Jensen 1983). Third, there is uncertainty about whether the transaction was fulfilled, which is mainly due to measurement and attribution problems (Alchian and Demsetz 1972).

(III) Asset specificity: Transaction-specific investments (see Williamson 1981, pp. 559–560) are investments made in the context and for the specific purpose of the transaction. Examples are site, human and physical asset specificity (see also Williamson 1983, 1991). On the one hand, transaction-specific investments reduce transaction costs through the realization of specialization advantages, but, on the other hand, they provide a driver for transaction costs because they increase dependency on the transaction partner (Ebers and Gotsch 2006, p. 281). In such a case, input factors are tailored to a specific transaction and have only a reduced value for an alternative use (see ibid. pp. 281–282 for a detailed discussion).

Based on these three variables, actors decide which governance structure is most suitable for the execution of a specific transaction, as will be discussed in the following paragraphs.

Characterization of Institutional Arrangements

The various institutional arrangements are also briefly described based on Ebers and Gotsch (2006). The consideration of institutional arrangements requires a discussion of the theory of contracts. Transaction cost theory distinguishes three institutional arrangements on the basis of contract theory. In this way, Williamson (1985) builds mainly on the works of Ian R. Macneil (e.g., 1978, 1987) to characterize three types of contracts: classical, neoclassical, and relational ones (see Ebers and Gotsch 2006, p. 284–285).

Classical contracts (see Ebers and Gotsch 2006, p. 284; Williamson 1985, p. 69) form the structure for discrete market transactions as an instrument to coordinate the interests of the affected participants). They precisely determine the conditions of the transaction and the specific object (good or service). Apart from some essential communication required for the execution of the transaction, there is no further coordination between the respective actors (cf., Macneil 1987). The transaction is conducted based on rules defined ex ante, with no additional commitments. Incentive mechanisms support the efficient execution of the transaction (Williamson 1985, p. 69).

A more open form of contract is the neoclassical contract (see Ebers and Gotsch 2006, pp. 284–85; Williamson 1985, pp. 70–71). Whereas the classical contract determines all the parameters of the transaction, actors using a neoclassical contract expect a need for further adjustment during the transaction. Neoclassical contracts allow decisions and coordination between the transaction partners during the transaction process (Ebers and Gotsch 2006, p. 285). Therefore, neoclassical contracts allow cooperation between the parties (Wieland 2018, p. 55). Neoclassical contracts are often an indicator of a long-term relationship between organizations, also “under the conditions of uncertainty” (Williamson 1985, p. 70).

Relational contracts enable long-term exchange relationships between transaction partners embedded in social complex relationships (Ebers and Gotsch 2006, p. 285, see also Williamson 1985, pp. 71–72). The roles that actors accompany may play an important role in relational contracts (Wieland 2018, p. 50). The ex ante definition of mutual obligations is more open for these contracts than for those previously discussed (see Macneil 1978). The entry into the long-term relationship requires joint decisions, bilateral exchange processes, and conflict resolution by the transaction partners without third-party enforcement (Macneil 1974; Williamson 1991) (as discussed by Ebers and Gotsch 2006).

The various institutional arrangements protect the transaction partners from opportunistic behavior in different ways. They also cause the costs incurred in executing the transaction to vary. Examples of these costs are monitoring costs or enforcement costs. The costs depend on how the arrangements are structured and on whether they solve transaction problems cost-effectively and encourage the efficient use of resources (see Ebers and Gotsch 2006, pp. 285–286).

After this brief outline of institutional arrangements, it is critical for the arguments that follow to describe the relationship between transactions and the nature of the firm.

The Nature of the Firm and the Link to Transactions

Firms are a critical pillar of the market because they enable actors to better cope with uncertainty what is discussed in transaction cost theory (Williamson 1985 as discussed by Freiling 2013, p. 29). Researchers go so far stating "that the scope of firms is determined exclusively by transaction costs" (Becerra 2009, p. 47). Thus, the theory of the firm is closely intertwined with TCE. Firms emerge as an alternative form of governance to the market, when the market does not provide a better alternative (see also Jensen and Meckling 1976, p. 310). In this connection, Ronald Coase (1937) elaborates in his article *The Nature of the Firm* why firms exist. Coase argues that firms exist due to the aim of avoiding costs when using the market. Inside the firm transaction costs are, according to him, widely negligible what makes the firm an alternative to the market (Dariot and Nascimento 2008, p. 19). Because of the transaction costs arising from imperfect information in the market ("to determine the size of the firm, we have to consider the marketing costs (that is, the costs of using the price mechanism)" (Coase 1937, p. 403)), entrepreneurs internalize transactions (also see Johnson and Turner 2003, p. 110). Therefore, the "distinction between the allocation of resources in a firm and the allocation in the economic system" (Coase 1937, p. 389) is thoroughly discussed in the theory of the firm. Jensen and Meckling (1976, p. 310) state that "[i]t is important to recognize that most organizations are simply legal fictions which serve as a nexus for a set of contracting relationships among individuals" (ibid., p. 310). The firm is, therefore, a vehicle serving as a governance structure for realizing transactions between and by its stakeholders (see also Wieland 2014 for a discussion of the firm as a nexus of stakeholders).

Business Legitimacy

The previous discussion outlined the main points of TCE and highlighted the fact that TCE is mainly concerned with comparing alternative governance forms for conducting transactions (see Ebers and Gotsch 2006). The primary criterion is the efficient structuring of transactions according to economic logic. However, empirical studies and comprehensive discussions have demonstrated that the role of corporations has shifted from a solely economic one (acting as an institutional arrangement for conducting economic transactions in the most efficient way) towards contributing to broader societal issues (Wieland 2014, 2017a, b, 2018, see e.g., Walsh et al. 2003 as noted in Baumann-Pauly 2017) which also impact the discussion of legitimacy (see Baumann-Pauly 2017 for a discussion and also Wieland 2017b Palazzo and Scherer 2006; Scherer and Palazzo 2007; Díez-De-Castro and Peris-Ortiz 2018). Particularly when executing operations globally, corporatoins move increasingly into the political sphere (see particularly Baumann-Pauly 2017 on whom the following outlines are based, also Palazzo and Scherer 2006, pp. 76–78; Scherer and Palazzo 2007, p. 1096; Wieland 2018, p. 99), which raises the question of their legitimacy (e.g., Scherer and Palazzo 2007, pp. 1097–1098). Corporations are organizations of private nature; however, they should be always seen in the context of the society that embeds them (Wieland 2018, pp. 141–142). As a nondemocratic legitimized entity increasingly also executing political functions (see Baumann-Pauly 2017 for a discussion), this entails new challenges to a corporate's legitimization particularly considering settings beyond the traditional nation-state (Scherer and Palazzo 2007, pp. 1097–1098). The reference point here is the transactions that are not legitimized. In order to facilitate this, the facts are transferred to the organization that executes the transactions.

Transactions impact societal issues to a large extent. The successful integration of private and public value creation is a basis for legitimizing the realization of transactions by companies (Wieland 2017a, p. 237). Also, societies conduct their transactions via organizations (Wieland 2018, pp. 141–142). When such transactions are not entirely legitimized by the legal system (see also section "Distinguishing Legitimacy from Legality"), as described above, corporations need to acquire their legitimacy in alternative ways, e.g., through social mechanisms (Beisheim and Dingwerth 2008, pp. 12–15 as noted in Baumann-Pauly 2017). Even firms that run suitable mechanisms to build their legitimacy face frequent criticism (see Baumann-Pauly 2017). John Micklethwait and Adrian Wooldridge (2005) remark in their study that "to keep on doing business, the modern company still needs a franchise from society, and the terms of that franchise still matter enormously" (p. 178). Companies as franchisees of society must, therefore, ensure that they have the legitimacy provided by society with regard to their transactions and mainly that the legitimacy will not be taken from them (see Wieland 2018, p. 142). Legitimacy in this context is a public process of social justification (see Perrow 1961 as in Dacin et al. 2007, p. 170). Society can thus regulate companies by withdrawing their licenses to operate and grow (Wieland 2018, p. 142). In this case, legitimacy is an input factor, which is a critical resource required for the execution of transactions (ibid.; see also Suchman 1995, p. 576).

Organizations can "occasionally depart from societal norms" and sometimes still remain legitimate (Suchman 1995, p. 574 referring to Perrow 1981), but only if these deviations are isolated events and are not routine practice (ibid.). Legitimacy is subjectively created, and, therefore, it is an assumption or perception arising from how an observer perceives the organization. Therefore, legitimacy is always earned legitimacy (Suchman 1995, p. 574). If the observer does not notice the deviation from the norms, the organization can still maintain its legitimacy. Further Suchman (1995, p. 574) elaborates that an organization can also deviate from the values of individual observers. In this case, society can still provide legitimacy to the organization or support it (see ibid. for a discussion).

Definition of Legitimacy

Researchers have defined the concept of legitimacy in several ways (for a detailed discussion, see Suchman 1995; Tilling 2004, 2010; Rendtorff 2009). The present outline appreciates the high number of definitions of legitimacy in research, but, for the following purpose, it is sufficient to narrow the choice since the focus here is on the interplay between (business) legitimacy and transaction costs. Legitimacy is frequently defined as "a generalized perception or assumption that the actions of an entity are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs, and definitions" (Suchman 1995, p. 574). A related definition sees legitimacy as "a broader concept that pertains to the extent to which a firm's structures and activities appear to conform with social norms, values, and expectations of the firm's economic and social environment" (Dacin et al. 2007, p. 171). Norms are impacted by culture (Rendtorff 2009, p. 121), which adds a cultural dimension to the legitimacy discussion.

Basically, legitimacy consists (see Zimmerman and Zeits 2002) of two components: on the one hand, the values, norms, and expectations of society and, on the other hand, the activities and outcomes of organizations. These two must be aligned in order to achieve legitimacy (see Ashforth and Gibbs 1990; Dowling and Pfeffer 1975 as noted in Zimmerman and Zeitz 2002, p. 416). Monica A. Zimmerman and Gerald J. Zeitz (2002) put these considerations in a nutshell and define legitimacy as "a social judg[e]ment of acceptance, appropriateness, and desirability, enable[ing] organizations to access other resources needed to survive and grow" (p. 414). Aditionally, legitimacy is not only important for utilizing resources but is also a resource itself (see Suchman 1995, p. 576; also in Tilling 2010, p. 4; see also Tilling 2004), as already explained in the previous section. In principle, conceptualizing legitimacy as a resource is appropriate, although this term must be handled with caution (see Tilling 2004, 2010 for a discussion, also for the following arguments). Legitimacy should not be conceptualized as a resource that can be exchanged, but rather it "is better conceived as both part of the context for exchange and a by-product of exchange. [. . .] It exists only as a symbolic representation of the collective evaluation of an institution" (Hybels 1995, p. 243, as in Tilling 2010, p. 4).

Distinguishing Legitimacy from Legality

A discussion of legitimacy always requires a clear distinction to be drawn between legitimacy and legality. From the perspective of institutional economics, the two concepts are constructed differently. Institutional economists distinguish between two kinds of institutions, formal institutions (e.g., laws) and informal institutions (e.g., values or norms), both of which determine transaction costs by dealing with uncertainty and creating order in exchange (see North 1991). Legitimacy is an informal institution since it is determined by norms and values. The opposite is true of legality, because legality is defined by laws and therefore it is a formal institution.

Legitimacy influences the cost function of a corporation. On the one hand, legitimacy is a costly investment; on the other hand, legitimacy affects information asymmetries and, therefore, may reduce costs. From the point of transaction cost theory, the question then arises as to which of the two options is more efficient or whether a combination is more reasonable. This point is central to the further discussion and will therefore be addressed again in the context of transaction costs.

Corporations often expect the legal framework to be the most important source of legitimacy for their transactions. In a democratic state, where laws reflect the normative expectations of society and therefore provide a scope for action, legitimacy and legality are closely interrelated and should be almost congruent; this perspective has its limits in times of global value chains. Therefore, in most cases a strict concentration on the law is not sufficient to create legitimacy, because legal mechanisms cannot always, especially not in complex and relational settings, legitimize corporations' transactions. Examples are the registration of a corporation in a tax haven or the production of destructive weapons. These are both, on the one hand, legal, but, on the other hand, they do not meet society's expectations, and consequently such transactions are legal but at the same time lack legitimacy.

Distinguishing Legitimacy from Reputation and Prestige

Further, the distinctions between legitimacy and prestige as well as reputation are crucial. Legitimacy is related to notions of prestige and reputation but still has some notable differences (cf., Dacin et al. 2007, p. 171 who engage in this discussion and, thereby, makes the following remarks). Prestige refers to specific roles or competencies that involve recognition and shapes the public image of an organization (ibid. based on, Perrow 1961). Reputation is an emotional or affective reaction to an organization and, therefore, an emotive estimation of an organization by its constituents (Dacin et al. 2007, p. 171 based on Fombrun 1996).

The Link to Transaction Cost Economics

Until this point, TCE and business legitimacy have been discussed separately in respect to organizations. It is now the aim to link TCE and business legitimacy. As already described above, transactions can be conducted using various institutional arrangements (Williamson 1995; see also Ebers and Gotsch 2006). In what follows, the discussion focuses briefly on the organization before the topic is further explored. Therefore, a return to the theory of the firm is necessary. Firms are a nexus of stakeholders (Wieland 2014) who provide resources. The individual stakeholders are linked by contracts (Jensen and Meckling 1976) of various kinds (see e.g., Macneil 1974, 1978; Wieland 2018). As a nexus of stakeholders, a firm continuously oscillates between market and social references (Wieland 2018, p. 142). In this context, “a firm should be observed as a socially legitimated governance structure for the realization of transactions between and by the members of a given societal formation” (Wieland 2014, p. ix). Thus, the acquisition of social legitimacy is obligatory and not an exception. The firm, seen as a social cooperation project using resources owned by individuals and linked through transactions for social welfare and individual and mutual benefit (see ibid.), is an excellent starting point for the following observation. As a result of the governance of transactions in this context through the various forms of contracts (e.g., Macneil 1974, 1978, 2000; see also Wieland 2018), the legitimacy question can be moved to the center of the discussion.

Since a company has an extensive resource network controlled by heterogeneous stakeholders, the transactions of the joint project linking the resources must be conducted with stakeholders who conduct legitimized transactions (see Wieland 2014) so that other stakeholders are committed to making their resources available for joint value creation (see Parsons 1960, also discussed in Palazzo and Scherer 2006 as well as in Suchman 1995, p. 574; see also Tilling 2004). Legitimacy affects how people understand organizations and contributes to the trustworthiness, predictability, and meaningfulness of an organization (Suchman 1995, p. 575; see also Dacin et al. 2007 for a braoder discussion). Therefore, legitimacy is valuable when it comes to efficient acquisition of the resources needed for survival (Hearit 1995, p. 2 as in Tilling 2010, p. 4) and growth (Zimmerman and Zeitz 2002).

Comparing Legitimacy and Legality Through the Lens of Transaction Cost Economics

When considering the distinction between legality and legitimacy from the point of transaction cost theory, the same question as discussed prior arises as to which of the two concepts is more efficient or whether a combination of them is preferable. Institutional economists have to deal with the trade-off between the two concepts. In a comparison of the concepts of legitimacy and legality, it is evident that they differ concerning transaction costs. Therefore, in the following, the differences between legality and legitimacy regarding transaction costs are observed. Critical components in this consideration are cooperation, bargaining, implementation, monitoring, and enforcement costs.

From the perspective of institutional economists, formal and informal governance converge. Actors must therefore decide which arrangement is most efficient. A change from one concept to the other is always associated with costs. A change from legality to legitimacy increases uncertainty, in the first place. The appropriate mechanisms must be established, and challenges must be responded to, according to the new concept. Formal mechanisms often appear more efficient at first glance because they involve less uncertainty, but informal mechanisms often have advantages in relation to implementation and monitoring costs over the long term.

Now, the focus is on legality. The state passes laws and enacts regulations that are generally nonnegotiable. Corporations gain legality by structuring their transactions in compliance with these laws and regulations. Primarily, the state bears the enforcement costs. Noncompliance results in sanctions for the particular corporation. The processes are therefore clear, so the transaction costs for obtaining legality are quite low.

The matter is different for legitimacy. Legitimacy requires cooperation with society, to understand to what extent the company's transactions need to be aligned with societal norms and values. These processes entail cooperation costs and bargaining costs, as the company must agree on values and norms with its stakeholders.

There are also differences between the two concepts in terms of enforcement costs. Using legitimacy, the company is solely responsible for structuring its transactions in line with the values and norms of the society, and, thus, only the company bears the enforcement costs. This is particularly true over short periods. For longer periods, if processes can be translated into routines, then the enforcement costs and implementation costs of legitimacy sharply decrease. Furthermore, legitimacy is strongly situation-dependent and consequently highly subject to external influences. This raises uncertainty and therefore increases transaction costs.

In this context, it is also evident that the concept of legitimacy is similar to relational contracts and the concept of legality to classical contracts. The concepts of legality and legitimacy are of particular interest in a globalized world. Global value chains span several countries (Gereffi and Fernandez-Stark 2016) with institutional frameworks that vary in maturity (Peng et al. 2008; Li et al. 2019). If formal institutional frameworks do not exist, or are incomplete, immature, or not properly enforced, transaction cost theory gains importance. Informal institutions substitute for formal frameworks if the formal frameworks are underdeveloped, absent, or weakly enforced (see Peng and Heath 1996 as discussed in Peng et al. 2008, 2009; Li et al. 2019). Therefore, in global value chains in which individual states have only a limited impact, legitimacy moves to the foreground. Both legitimacy and legality can reduce the uncertainty in transactions. However, the concept of legality lacks universal applicability due to restricted possibilities of state enforcement.

Uncertainty increases the role of legitimacy, and this affects transaction costs. Therefore cooperation, bargaining, and enforcement costs are lower under legality than under legitimacy when considering a short time frame in a stable environment. This is mainly due to the use of formal institutions in the concept of legality, which is more efficient as regards transaction costs because formal institutions involve less uncertainty than informal arrangements. Because of the strong dependence on the situation, legitimacy involves high uncertainty. Consequently, actors such as large companies, NGOs, and trade unions often prefer formal rules even over standards that can be implemented on a voluntary basis. In addition, NGOs and trade unions prefer formal rules because states are reliable in enforcing them. To sum up, transaction costs for legality are in general lower compared to the ones for legitimacy. This fact explains the necessity to manage legitimacy issues in a way that economizes on transaction costs.

Legitimacy and the Various Levels of Analysis

In the previous discussion, the focus was on the importance of legitimacy for actors conducting transactions through which companies access resources that are critical for their survival and growth. Now the three levels that provide the frame for transactions are considered. Niklas Luhmann (1986) distinguishes function, organization, and psychic systems (for a detailed discussion and explanation, see Wieland 2014, 2018). Luhmann's approach is highly appreciated, but in the following the aim is to adopt the main characteristics of this concept and apply them for the purposes of this chapter. Until now, research on legitimacy has distinguished between institutional (see also Suchman 1995) and organizational (Kaplan and Ruland 1991) levels (see Tilling 2004 who applies these arguments and discusses two levels, institutional and organizational). The individual level is added here for a more comprehensive analysis (see Bitektine and Haack 2015 for a comprehensive discussion on multilevel issues in legitimacy). Challenges of legitimacy are analyzed in the context of transactions by introducing distinct decision-making logics that are attributed to the various levels (for a detailed explanation, see Wieland 2014, 2018.)

Individual and collective actors are able, and obliged, to reconstruct and evaluate economic transactions in different contexts and decision logics, such as from the viewpoint of rational utility considerations, legal or ethical norms, technical feasibility, aesthetic preferences, or cultural values (Wieland 2018, p. 43). It is evident that all three levels are critical to conducting transactions, as transactions are embedded in each of them (see also Wieland 2014, p. 16, p. 33).

The following examples are given to explain the concepts in more depth. Before the analysis of the various levels, a brief recollection of the definition of legitimacy is given: the concept of legitimacy requires that the actions of an agent correspond to socially constructed norms. This is important for the upcoming illustrations. To simplify matters, the healthcare sector serves as an example for the illustrations.

Each example contains (I) the institutional, (II) the organizational, and (III) the individual level (when referring to a specific level, the focus is on its transactions):

1. It is assumed that the healthcare system, which is located at the institutional level, does not correspond to the values of a society. There may be several reasons for this non-legitimacy. One possibility is that there are irregularities in the billing for health services with insurance companies. The situation may be different at the organizational level. (II) The clinic in focus could be highly regarded in the region if, for example, it has managed to solve several challenging cases with high competence thereby living up to high moral standards. The legitimacy of the clinic as a health provider would therefore not be in question. (III) If the consideration focuses on the individual level, the physician in question could be a person with high ethical standards and a favored expert who is honest and

caring with his patients. His legitimacy would be beyond question, at least if only the given facts matter.

When analyzing this example, it is obvious that the transaction that the physician is conducting is legitimate. The legitimacy of the physician and the clinic can override the non-legitimacy of the healthcare system's transactions.

2. Other arrangements are also feasible in this context. (I) The healthcare system could be considered legitimate, but (II) this could not be the case for the clinic, if it frequently allowed expired drugs to be administered and people were aware of that fact. (III) The physician has legitimacy in this example.

   Therefore, the conclusion would depend on whether the physician could compensate for the organization's fraudulent acts and whether he could protect his patients. If he were unable to do so, he could also lose his legitimacy.
3. Another example would be (I) a legitimate healthcare system and (II) an equally legitimate clinic, but, at the same time, (III) the physician in question lacks legitimacy.

   In this case, it would be very unlikely for the transactions to be legitimate, as will be analyzed below.

Further combinations are also conceivable – for example, transactions at the organizational level are legitimate, but those conducted at the institutional and individual levels are not legitimate. The levels or systems in which the transactions are embedded therefore affect whether the transactions are considered legitimate. The level that mostly impacts the transaction is the most crucial one. It is not only individuals who conduct transactions, but organizations can also be actors. In the previous examples, the physician plays an essential role because here the action is mainly linked to the individual. Only when the action is influenced to a certain degree by another level, so that the relevant actor is overruled, is the other level the primary driver for legitimacy. All combinations of levels and influences on each other are feasible. The observation is highly context-dependent. It should also be noted that different systems have different decision logics (for a detailed explanation, see Wieland 2014, 2018, p. 95). What seems legitimate from the point of view of one specific organizational system (such as a managed firm) can be considered not to be legitimate from another's (such as an NGO). (For a detailed discussion, see Wieland 2014, 2018)

Legitimacy on Different Observation Levels and Transaction Costs

In the previous section, the question of legitimacy based on different levels was addressed. In this regard, it is important to focus on transaction costs, as this is the aim of this chapter. As already mentioned above, transaction costs can be divided into ex ante (such as information and search costs or negotiation and contracting costs) and ex post costs (such as monitoring costs or adaptation costs) (Williamson 1985; see the discussion of Ebers and Gotsch 2006). Transaction costs reach a minimum when all three levels at which the specific transaction is conducted are considered as legitimate. In this case, the transaction is performed in accordance with the norms and values of a society concerning all levels. High legitimacy indicates that the result and the process of the transaction are highly predictable (see also Suchman 1995), because the transaction is governed and conducted based on norms and values, which lowers uncertainty and, therefore, lowers transaction costs (in terms of lower negotiation, contracting, monitoring, and enforcement costs). (The present discussion does not engage in the discussion about whether this is due to enhanced trust, or reputation, or other concepts. For a discussion see Cook et al. 2005.) If not all levels at which the transaction is embedded are legitimate, the transaction costs are higher than in the aforementioned best-case scenario. (Cf. examples I–III above.) Higher transaction costs result, for example, from higher monitoring or enforcement costs. In the examples given above, if the clinic administered expired medication, the patient would have to ensure that the substance that was administered was still valid. In order to be able to evaluate this, the patient would have to gain specific knowledge. This process would cause costs, which would ultimately impact on the related transaction costs.

Transaction Costs of Actors with Low Legitimacy

Transaction costs should not only be viewed from the perspective that transactions are made with actors whose legitimacy is in question. The question is not only about the impact on transaction costs when conducting transactions with an actor who has low legitimacy but also about how the transaction costs of the actor who himself has only low legitimacy are affected.

In discrete exchange transactions, supply is always bound up with simultaneous demand, and demand is always bound up with supply (for a detailed explanation see Wieland 2018, p. 36). The physician in the example at the same time offers treatment and requests payment in return. Simultaneously, the patient offers financial incentives and asks for treatment. Both are in a similar situation in theoretical terms. Before this consideration, the analysis mainly concerned the transaction costs for patients. Now the focus shifts towards the physician whose legitimacy is in question. It is assumed that the healthcare system is similar to a classical market system and that there is no shortage of physicians at the moment. In such a situation, it would be more challenging for the physician to place his offer on the healthcare market because he needs to find patients who are willing to pay for his treatment. This process accounts for search costs in the terminology of TCE. Another possibility is to lower the prices for the service, responding through market mechanisms.

The transaction costs are even higher when the clinic also lacks legitimacy. In order to find patients, investments in signaling measures are required. If the health system does not have legitimacy either, the transaction costs are even higher again. Once more, all possibilities concerning legitimacy at the individual, organizational, and institutional level are conceivable.

The Importance of Legitimacy in Relational Transactions

In this chapter, the focus is mostly on exchange transactions, which are executed primarily under classical or neoclassical contracts. However, for relational transactions, legitimacy is even more critical, because actors rely primarily on informal safeguards (for a detailed analysis, see Wieland 2018). Legitimacy is a decision metric for the expected outcome, with the aim of reducing the uncertainty in this context.

Relational transactions are prevalent in long-term economic relationships between actors such as strategic alliances, partnerships, or networks. Such transactions are not one-off spot transactions but are repetitive transactions embedded in complex social relationships (see Ebers and Gotsch 2006; Wieland 2018). These complex social relationships demand high legitimacy if both transaction partners are to commence the transaction. Each player must partly identify themselves with the respective transaction partner, which requires a high degree of legitimacy. No one wants to identify himself with something or someone that is not legitimate because of the risk of his reputation and legitimacy declining.

Stakeholder Dialogues and Values Management Systems as a Solution

This section discusses suitable measures for strengthening and ensuring business legitimacy. The following two options are appropriate measures: the introduction of stakeholder dialogues and values management systems. Both possibilities allow a productive combination to improve the outcomes. As already elaborated above, the firm is a bundle of resources that are mutually provided by its stakeholders (Wieland 2014). This process involves transactions. The early participation of the affected stakeholders in a transaction can increase the legitimacy of the transaction because companies gain knowledge of what stakeholders expect. This relates to the norms and values to which the transaction should be aligned. As firms conduct many transactions on a day-to-day basis, the practice of including every stakeholder would become an insurmountable challenge.

Multi-stakeholder dialogues are suitable for addressing these challenges (for a discussion see Wieland 2014). These dialogues may be institutionalized in terms of stakeholder advisory boards. Through an early dialogue with stakeholders, their concerns can be heard, and possible solutions developed jointly. This will clarify which transactions the stakeholders expect and the specific conditions for transactions and allows the alignment of transactions with the norms and values of the society. Thus, the firm can gain or strengthen its legitimacy accordingly. These mechanisms also create new opportunities for transactions and new ways in which they can be conducted. This, in turn, contributes to innovation chances, since a stakeholder committee considers problems by following a variety of possible approaches and therefore the number of potential solution options increases. Societal involvement through the inclusion of stakeholders is ultimately essential, since

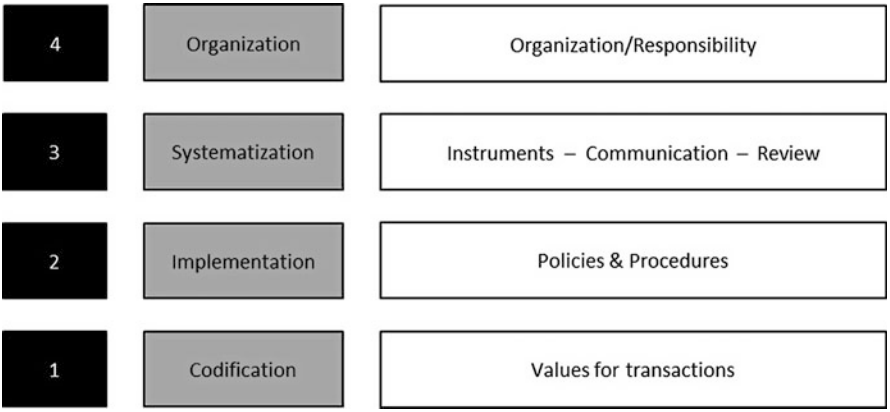

Fig. 1 The four fundamental stages for implementing a values management system. (Adapted from Wieland (2014) and the Center for Business Ethics (1998))

transactions can only be conducted in a sustainable way if society legitimizes them. Through these dialogues businesses can design their transactions in such a way that they gain legitimacy. The task of the stakeholder advisory board is to explore the values and standards prevailing in a society with which the company should align its transactions. The question then arises as to how to operationalize the respective values and norms.

These challenges can be addressed with a values management system. Such a system links value creation and moral values (Wieland 2005), thereby integrating economic, moral, legal, and political dimensions (Wieland 2003). Values management aims to achieve values-oriented behavior and organizational governance. It serves both to develop and promote a specific corporate identity and as a guideline for difficult decisions in everyday business practice (Fig. 1).

The firm can align its transactions with the expectations of society through values management, or it can decide which transactions will not be conducted because they negatively influence legitimacy. An orientation for the implementation of values management systems with regard to transactions is provided in the recommendations of the Center for Business Ethics (1998). Four stages are essential for the implementation of a values management system (see Wieland 2014, p. 165–168):

1. Values for transactions (codification stage): Every values management system has as its foundation the selection, determination, and codification of values. The company identifies the values and norms relevant to the legitimacy of transactions and incorporates these in its set of fundamental values. These values then affect and structure decisions about transactions as well as the overall vision and mission of the organization, which in turn should influence the code of ethics. The organization must consider what transactions it will carry out, under what conditions, and under what circumstances. The values set does not have to be complete, but it needs to allow the evaluation of transactions.

2. Institutional communication (implementation stage): The values and standards critical to the legitimacy of transactions are communicated formally and informally in organizations. They can be documented in policies and procedures or introduced to employees through training. The values become effective when they are integrated into routines. This ensures that transactions are evaluated with almost no additional effort in this respect. Stakeholders such as suppliers are also integrated into this process. Audit and monitoring systems should guarantee the alignment of the transactions to the values. Regular communications and training prevent the values from being neglected or forgotten.
3. Instruments, communication, and review (systemization stage): The organization anchors its values in its integrity and compliance and, of course, in its values management. The procedures and guidelines from stage 2 are systemized and integrated into the different management areas that deal with transactions. Stakeholders should also be involved in these programs. Clear communication through workshops and training, as well as information documents, is essential. Ethical audit systems ensure compliance with the values.
4. Organization/responsibility (organization stage): The success of a values management system in respect to transactions requires expertise. The implementation of an ethics or compliance office ensures that the critical values for the legitimacy of transactions are respected and ensures continuity in this regard. This process provides the company with a department that is responsible for intervening in the case of challenges. The commitment from senior management as a role model for the staff is also essential. Top management serves as a role model with respect to the transactions that are carried out. Employees are often guided by how top management behaves. Functional integration allows values to be respected across all hierarchy levels.

The values management system codifies and operationalizes the values that are critical for the legitimacy of transactions and embodies them in the organization. Those responsible get to know the values and standards via the stakeholder advisory board. The board should meet at regular intervals to adjust the values accordingly. Stakeholders also have the opportunity to alert the company at an early stage if there is a threat of legitimacy withdrawal.

Conclusion

This chapter discusses how transaction costs and legitimacy are interrelated. It provides a brief overview of TCE and business legitimacy issues that are relevant to the arguments and distinguishes between legality and legitimacy. Based on the theory of the firm, it is critical to acknowledge that the firm is a bundle of resources provided by its stakeholders (see Wieland 2014). The stakeholders must legitimize their transactions to ensure the sustainable long-term existence of the organization and the willingness of critical stakeholders to contribute resources to the cooperative project. In doing this, the company must pay attention to the legitimacy of the system levels at which transactions are carried out (institutional, organizational, and individual). The degree of legitimacy of the different levels influences the transaction costs. In the discussion, a distinction is made between legitimacy and legality, and the differences with regard to transaction costs are identified. At first, legality seems more efficient, but the concept quickly reaches its limits, and legitimacy becomes increasingly important. A change in the concepts is always associated with costs. The fascinating field that combines TCE and business legitimacy is still in its infancy. For that reason, the ideas presented here are only a first approach to the discussion. This provides interesting opportunities for future scientific discussions in this field.

Contents

Abstract

The present chapter analyzes the relationship between corporate governance and business legitimacy. After introducing basic foundations of corporate governance, the state of the art of legitimate structures, processes, and systems of corporate governance is outlined. Based on a compilation of extant corporate governance indices, the empirical evidence on the performance implications of corporate governance is dealt with and discussed. The chapter concludes by providing promising avenues for future research on the association between corporate governance and business legitimacy.

Introduction

Corporate governance deals with the system by which companies are directed and controlled (Cadbury 2002). This system pertains to the relationships at the apex of the organization among the board of directors, top executives, owners, and other stakeholders of the firm. Corporate governance arrangements refer to the structures and processes of how corporate assets are managed and overseen. These arrangements aim at facilitating that the goals of the enterprise are attained more effectively. Corporate governance arrangements about the management and supervision of the enterprise are hence not either good or bad. Their value rather depends on their contribution to a more effective attainment of the goals of the enterprise. In a broader view, corporate governance has implications on the country level as well as it is supposed to support economic efficiency, sustainable growth, and financial stability (OECD 2015). According to the OECD (2015: 7): "The purpose of corporate governance is to help build an environment of trust, transparency and accountability necessary for fostering long-term investment, financial stability and business integrity, thereby supporting stronger growth and more inclusive societies."

Depending on their root of origin within or outside the boundaries of the firm, internal and external corporate governance mechanisms are distinguished. Internal mechanisms refer to the board of directors, managerial incentives, or the role and responsibility of controlling owners. The board of directors, executive compensation, and shareholder meetings and voting have been viewed as the "most elemental components of a corporate governance system" (Bhagat et al. 2008: 1810). External governance mechanisms that have received comparably less attention include the legal environment, the market for corporate control, external auditors, stakeholder activism, rating organizations, and the media (Aguilera et al. 2015).

Whereas considerations of the effectiveness, and related performance consequences, have been the primary lens to develop and evaluate corporate governance rules and regulations, these provisions are increasingly also viewed from the perspective of their legitimacy (e.g., Aguilera et al. 2018; Filatotchev and Nakajima 2014; Judge et al. 2008). According to the definition by Suchman (1995: 574 italics deleted), legitimacy stems from "a generalized perception or assumption that the actions of an entity are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs, and definitions." Corporate governance arrangements appear thus to be more or less legitimate depending on their alignment with societal expectations, norms, rules, and regulations. Corporate governance attributes and the adherence to generally accepted standards are therefore pivotal to the legitimacy of companies, their activities, and their projects in developed as well as emerging economies (Khan et al. 2013).

This debate has gained much attention due to general threats to the legitimacy of the business sector whose license to operate, as a contractarian basis for the legitimacy of businesses' activities (Demuijnck and Fasterling 2016), is not taken for granted anymore (Gehman et al. 2017; Gunningham et al. 2004; Hall et al. 2015). As Palazzo and Scherer (2006: 66) put forward: "Financial scandals, human rights violations, environmental side-effects, collaboration with repressive regimes and other problematic issues have not only threatened the reputation of the involved firms but provoked critical questions about the societal role of business in general." Initiatives of corporate social responsibility and sustainable management are partly viewed as ideological movements to legitimize the power of the business sector (Banerjee 2012). Grand societal challenges like global warming, ocean acidification, as well as inequality within single countries and across the globe have strengthened concerns in this regard that also affect the system of corporate governance and potential future reforms with regard to business models and the overall goal of the enterprise (Marti 2018).

Notwithstanding that corporate actions are not the only cause of these challenges, the magnitude of their negative consequences and their transcendence of national borders provide a critical role to the business sector to develop and implement solutions that help to address and overcome these challenges and to change social reality. Corporations are therefore under pressure to pursue broader social goals beyond seeking purely profits as they have the potential to "trigger positive social change" (Aguilera et al. 2007: 836). Securing and strengthening the legitimacy of the business sector and its governance system is a precondition to protect and retain the license to operate in society and the supply of resources needed for value creation (Rendtorff 2019). This also needs to consider the extent of power granted to, and exerted by, the business sector and the role of corporate governance arrangements to exercise control and to guide this corporate power to socially accepted usage (cf. Coglianese 2007).

Foundations of Corporate Governance

Interest in the subject of corporate governance can be traced back to problems that emerge from the separation of ownership and control (Berle and Means 1932). In the modern (public) corporation, a professional management is hired to run the company that is different from the owners of the firm. As a consequence, the functions of decision-making and risk-bearing are separated (Fama and Jensen 1983). Against this background, corporate governance arrangements are developed to ensure that executives do not misuse their discretion and pursue courses of action that are in the interest of the firm and/or its owners (e.g., Roe 2000). Otherwise, professional managers who remain unchecked by a diffuse group of diluted owners may act for selfish rather than corporate motives leading to the concentration of economic power and inefficient resource allocation (Lipton 1987).

Following this logic, agency theory has become the dominant perspective to analyze phenomena and problems of corporate governance (Dalton et al. 2007). This stream of theory "is directed at the ubiquitous agency relationship, in which one party (the principal) delegates work to another (the agent), who performs that work" (Eisenhardt 1989: 58). With regard to the corporate governance system of management and supervision, agency theory deals primarily with contractual relationships between executives (as agents) and owners (as their principals). When the interests of these parties do not converge and information is asymmetrically distributed due to the division of labor, agency problems emerge as the agent may misuse his or her advanced information to the disadvantage of the principal.

Means to prevent that agency problems occur aim at aligning the interests of executives to the interests of the owners or the firm (primarily by arrangements of pay for performance) and reducing information asymmetries (primarily by various arrangements of disclosure and monitoring). This logic has been very influential to inform corporate governance rules and regulations as well as corresponding reforms including the diffusion of corporate governance codes around the globe (Cuomo et al. 2016), the adoption and implementation of which may be more or less effective. As Shapiro (2005: 269) puts it: "Corporations announced the adoption of new policies, explicitly invoking agency theory buzzwords about aligning incentives, discouraging self-interested behavior by managers, and reducing agency costs. Indeed, some adopted new policies that embraced an agency rationale without bothering to implement them, simply jumping on the bandwagon of a socially constructed institutional logic that bestowed increased market value on symbolic declarations alone."

To align the interests of executives to the interest of the enterprise, stock-based compensation plans have been recommended. While variable compensation plans have accelerated the dramatic growth of executive pay that has come under public attack and imperils the legitimacy of the business sector and its prevailing governance systems (Bank et al. 2016), the performance consequences of related agreements remain still open to debate (Bebchuk and Fried 2004). In addition, corporate governance rules have been enacted and strengthened to increase the transparency of corporate decisions and to disclose what arrangements of corporate governance are in place. Firms differ tremendously in their level of corporate governance disclosures (Al-Bassam et al. 2018) that are strongly influenced by the applicable legal framework and common practices within a given country, whereas the correlation with financial performance remains equivocal (Berglöf and Pajuste 2005). More transparency is therefore not necessarily superior; rather some opaqueness could better serve the interests of the firm and its owners (Hermalin 2014). To strengthen the monitoring role of the board, the appointment of a majority of independent directors and the formation of committees for audit, nomination, and remuneration have been suggested. While the specific definitions and criteria of independence vary (Zattoni and Cuomo 2010), the effectiveness of these arrangements is also by no means conclusive (Bhagat and Black 2002; Pearce and Patel 2018; Zorn et al. 2017).

More recently, the logic of agency theory has been increasingly criticized since its underlying assumptions and foundations may be too narrow or even invalid (Aguilera et al. 2016). Being an economic theory, agency theory rests on the behavioral assumption of self-interested men that seek for their own well-being with guile. Empirical studies have indicated that this assumption is too narrow as human beings are guided by a much wider range of motives (Fehr and Gächter 2000), including norms of reciprocity and perceptions of fairness (Bosse and Phillips 2016), and organizations have to be built on trust and commitment to succeed. While the assumption of opportunism may be beneficial to protect the firm against expropriation, it is bad for practice (Ghoshal and Moran 1996) as the assumption may become a self-fulfilling prophecy when related organizational arrangements crowd out pro-organizational interests, such as voluntary cooperation, and eventually create self-interestedness (Fehr and Gächter 2000). Even in the absence of opportunism, full commitment of organizational members may be lacking and governance arrangements remain necessary to deal with the "ubiquitous problems of communication, cognition and interpretation" (Hodgson 2004: 415).

A broader perspective is therefore requisite that acknowledges the ubiquitous necessity of corporate governance arrangements even if interests and goals of the involved parties largely converge. Even if ownership and control are unified, like in the case of owner management prevalent in many entrepreneurial and family firms around the globe (Schulze et al. 2001), managerial discretion could be misused for cognitive rather than motivational reasons which accounts for the establishment of control structures. Every organization of a sufficient level of complexity therefore needs to establish an eligible system of management and supervision. Agency theory emphasizes the relationships between the executives and the owners of the firm and assumes that the interests of owners are isomorph in maximizing their personal wealth. This perspective ignores that firm owners may pursue very different, and partly even competing, goals with regard to the risk, social impact, and time horizon of their investments (Chung and Talaulicar 2010).

In addition, firms rest on the contributions by multiple stakeholder groups to create value. In order to ensure the provision of these value-creating contributions, the system of corporate governance has to balance the contributions and the appropriate compensations of these stakeholder groups (Talaulicar 2010). As Garcia-Castro and Aguilera (2015: 137) explain, the firm needs to be decomposed into "multiple stakeholders who (1) *create* value by bringing in resources and capabilities that are firm-specific, causally ambiguous, and socially complex and (2) *appropriate* some of the value created in their relationship with the firm." Value-creating contributions legitimize their adequate compensation. If legitimate claims are ignored, necessary contributions may be withdrawn which compromises the sustainable creation of value by the firm. Barney (2018: 3305) resumes: "To attract the kinds of resources that can generate profits, managers must recognize that stakeholders, besides shareholders, have claims on the profits that their resources help generate." The corporate governance system needs to ensure that trade-offs in the dynamics of value creation and appropriation are sustainably balanced (Garcia-Castro and Aguilera 2015) and potentials of stakeholder synergies are tapped where value for two or more stakeholder groups can be appropriated simultaneously without reducing the value received by another stakeholder group (Tantalo and Priem 2016).

Assessing both the effectiveness and the legitimacy of the system of corporate governance depends on the social context of the firm that provides resources for the firm's creation of value. Resource relationships, social norms, and institutions are therefore pivotal to the development and success of corporate governance systems. Albeit largely ignored in agency theory, research has indicated that corporate governance systems, and their social desirability, are influenced by social norms, informal institutions, as well as formal institutions of the environment in which the firm is embedded (Boytsun et al. 2011; Estrin and Prevezer 2011; Judge et al. 2008). Since the nature and extent of agency relationships differ across institutional contexts, broader governance frameworks are needed that acknowledge the institutional embeddedness of the firm and the variability of governance outcomes depending on the institutional environment (Filatotchev et al. 2013). In this regard, prior research has indicated that assessments of the legitimacy that corporate power is concentrated, for instance, in the position of the CEO, are culturally variant and depend on institutions that influence the expectations and judgments of stakeholders regarding a firm's legitimacy (Krause et al. 2016).

Legitimate Systems of Corporate Governance

Systems of corporate governance are considered legitimate when their structures and processes are perceived to satisfy the social expectations of relevant constituencies. A lack of their legitimacy can prove threatening to the firm's viability as it may deter internal and external stakeholders from supporting the firm. Firms that lack legitimacy face barriers to enter into processes of social exchange as their potential partners do not rely on their adherence to social rules and expectations (Palazzo and Scherer 2006). Legitimate corporate governance arrangements, in contrast, facilitate the provision of resources from external sources and also shield the firm from external pressures (Desai 2008). Firms with legitimate corporate governance arrangements that conform to their stakeholders' expectations tend therefore to be more successful and to incur less unsystematic risk than illegitimate firms (cf. Bansal and Clelland 2004). The positive effects are evoked as firms with legitimate corporate governance arrangements conform to institutional expectations, have better access to resources, and are insulated from external scrutiny (Bansal and Clelland 2004).

Ensuring adherence to social expectations is challenging when there is ambiguity about the appropriate elements to be included in a legitimate corporate governance system. In the absence of such consensus, companies have to make individual decisions about their corporate governance and justify them to their stakeholders. Ogden and Watson (2008) have revealed the difficulties firms encounter when they attempt to justify and legitimate their executive long-term incentive pay (LTIP) schemes due to the indeterminacy and incoherence of guidelines for implementing good governance. Firms are therefore inclined to avoid such uncertainty that may lead to stakeholder criticism and justification pressures. They are rather open to adopt generally recognized standards of good governance that are widely shared and taken for granted. Due to the complexity of legitimacy judgments (Tost 2011), conformity with well-established corporate governance standards becomes appealing.

Against this background, corporate governance codes have been adopted in multiple countries around the globe and spread worldwide (Aguilera and Cuervo-Cazurra 2009; Cuomo et al. 2016; Zattoni and Cuomo 2008). These documents contain provisions of generally accepted standards of corporate governance and refer to the composition and structure of the board, tasks and responsibilities of directors and executives, and their remuneration as well as transparency and disclosures. While they are adopted with the intention to improve the systems of corporate governance further, compliance with these standards may also follow the wish to gain legitimacy by adhering to well-established standards that are widely believed to indicate good corporate governance. Prior research has indicated that the establishment of such standards as well as their adoption on the firm level may be temporally segregated such that early adopters seek efficiency gains, whereas late adopters seek to gain legitimacy (Ansari et al. 2010; Sahin 2015; Zattoni and Cuomo 2008). As a consequence, late adopters may decouple their conformity from truly implementing these standards (i.e., conform symbolically rather than substantially) if their lack of follow-through can be concealed and does not jeopardize the sought legitimacy gains (cf. Westphal and Zajac 1998). Such decoupling, or ceremonial adoption, tends to become more likely when corporate governance standards become mandated (Shi and Connelly 2018) the substantial implementation of which appears to be costly and to compromise economic efficiency (cf. Hengst et al. 2020).

Compliance rates with codes of corporate governance have been shown to be rather high (e.g., Werder et al. 2005). Due to the legitimacy gains that companies may seek from their compliance, this finding comes with little surprise. In contrast, deviation from these standards requests much more efforts on behalf of the companies (Aguilera et al. 2018) that are under pressure to justify to important constituencies why they prefer to select corporate governance arrangements that differ from widely accepted ones. As a consequence of these pressures of conformity, organizations and their corporate governance become more similar. This organizational isomorphism, i.e., the resemblance of a focal firm to other firms in its environment, has been shown to increase organizational legitimacy (Deephouse 1996) which is a fundamental proposition of institutional theory (DiMaggio and Powell 1983; Meyer and Rowan 1977). The high levels of prevalence of certain corporate governance arrangements indicate their social desirability and taken-for-grantedness. Firms implementing commonly used structures and practices of corporate governance are generally considered acceptable as they appear rational and prudent to the social system. However, this strong compliance orientation may neglect firm-specific peculiarities that may suggest different corporate governance arrangements to better reflect the context of the firm. In general terms, firms may be more or less inclined to follow conformity pressures depending on the salience of the issue at hand and the expected net benefit (Durand et al. 2019).

Standards of Good Corporate Governance

Based on theoretical considerations, codes of corporate governance, and practical suggestions by proxy advisors and institutional investors, provisions of corporate governance have been compiled and aggregated to corporate governance measures that indicate to which degree a company conforms to widely accepted standards of corporate governance. Gompers et al. (2003) have developed a Governance index

("G index") that is constructed from data provided by the Investor Responsibility Research Center (IRRC). This data is collected from corporate charters, bylaws, and other firm-level rules as well as legal rules from the state in which the firm is incorporated. The index focuses on director (as opposed to shareholder) rights and contains 24 provisions that are grouped into 5 categories: tactics for delaying hostile bidders; voting rights; director and officer protection; other takeover defenses; as well as state laws. The index ranges from 0 to 24 and is reverse coded, i.e., the higher the value of the G index, the weaker the corporate governance of the firm is. The 24 provisions cover shareholder rights-decreasing provisions of a company, such as classified boards, golden parachutes, supermajority requirements to approve mergers, poison pills, or restrictions to shareholders to call special meetings.

Bebchuk et al. (2009) have suggested that this index is to be reduced to an entrenchment index comprised of only a subset of six provisions as the (18) remaining ones provide little explanatory power, assessed by regressing Tobin's Q on each factor, the complete score minus the factor and controls. Out of the six influential provisions, four constitutional provisions prevent a majority of shareholders to take over the firm (staggered boards, restrictions to shareholder bylaw amendments, supermajority requirements for mergers as well as for charter amendments) and two provisions put the board in place to defend a hostile takeover attempt (poison pills and golden parachutes). The entrenchment index therefore ranges from 0 to 6, with higher values indicating weaker shareholder rights or poorer corporate governance, respectively.

To study corporate governance in emerging markets, Klapper and Love (2004) have utilized a report provided by Credit Lyonnais Securities Asia (CLSA) in which an index has been created with corporate governance rankings for 495 firms across 25 emerging markets. The corporate governance ranking compiled by CLSA is a composite of 51 binary (yes/no) questions to analysts. Each positive answer (yes) adds one point to the governance score that ranges hence between 0 and 51. About two thirds of the questions are based on facts, whereas the remaining ones rest on the analysts' opinions. The corporate governance questions in the CLSA report are grouped into six broad categories: (1) management discipline (nine questions, e.g., Has the company issued a mission statement that explicitly places a priority on good corporate governance?), (2) transparency (ten questions, e.g., Does the company publish its annual report within 4 months of the end of the financial year?), (3) independence (eight questions, e.g., Is the chairperson an independent, non-executive director?), (4) accountability (eight questions, e.g., Do independent, non-executive directors account for more than 50% of the board?), (5) responsibility (six questions, e.g., Is there any controversy over whether the board and/or senior management takes measures to safeguard the interests of all and not just the dominant shareholders?), and (6) fairness (ten questions, e.g., Do all equity holders have the right to call general meetings?). Since the distinction of the categories appears to be somewhat imprecise, only the sum index (termed GOV) is considered.

Based on data provided by the Institutional Shareholder Services (ISS, today accessible via RiskMetrics), Brown and Caylor (2006, 2009) have created a summary measure called Gov-Score that aggregates 51 firm-specific provisions on internal as well as external governance arrangements. A high Gov-Score indicates good corporate governance. Similar to the findings by Bebchuk et al. (2009), Brown and Caylor (2006, 2009) demonstrate that a subindex based on only seven provisions mainly drives the effects attributed to good governance. They use three statistical approaches to assess the explanatory power of the attributes. In addition to the method used by Bebchuk et al. (2009), they regressed Tobin's Q on the complete set of provisions and controls, and they run a stepwise regression using a forward-selection procedure that retained variables. Following these calculations, the seven most influential governance provisions put forward that (1) board members are elected annually, (2) the company either has no poison pill or one approved by its shareholders, (3) re-pricing of share options did not occur within the last 3 years, (4) average options granted in the past 3 years as a percentage of basic shares outstanding did not exceed 3%; (5) all directors attended at least 75% of board meetings or provided a valid excuse for their non-attendance, (6) board guidelines are in each proxy statement, and (7) directors are subject to stock ownership guidelines (Brown and Caylor 2006: 411).

Following guidelines by and compiling data from the ISS as well, Chung et al. (2010) have suggested 24 indicators to assess good corporate governance that are aggregated to an overall (equally weighted) summary measure:

(1) The audit committee consists solely of independent outside directors.
(2) The board is controlled by more than 50% independent outside directors.
(3) The nominating committee is comprised solely of independent outside directors.
(4) The compensation committee is comprised solely of independent outside directors.
(5) The governance committee meets at least once during the year.
(6) The board members are elected annually.
(7) The size of board of directors is at least 6 but not more than 15 members.
(8) The shareholders have cumulative voting rights to elect directors.
(9) The CEO serves on no more than two additional boards of other public companies.
(10) No former CEO serves on the board.
(11) The CEO and chairman duties are separated or a lead director is specified.
(12) The board guidelines are disclosed publicly.
(13) The company has no poison pill.
(14) A majority vote is required to amend charter/bylaws (not supermajority).
(15) A simple majority vote is required to approve a merger (not supermajority).
(16) Shareholders may act by written consent, and the consent is not unanimous.
(17) Shareholders are allowed to call special meetings.
(18) The board cannot amend bylaws without shareholders' approval or only in limited circumstances.
(19) The company is not authorized to issue blank check preferred stock.
(20) The directors receive all or a portion of their fees in stock.
(21) All directors with more than 1 year of service own stock.

(22) The executives are subject to stock ownership guidelines.
(23) The directors are subject to stock ownership guidelines.
(24) The company is incorporated in a state without any takeover provisions.

A shorter version that is also derived from the ISS guidelines has been created by Aggarwal et al. (2009) and utilized, among others, by Yu (2011). Starting from 44 attributes that cover 4 broad subcategories with regard to the board (25 attributes), audit (three attributes), anti-takeover (six attributes), and compensation and ownership issues (ten attributes), they suggest a corporate governance index that rests on only 7 characteristics and is therefore referred to as Gov7:

(1) Board independence: The board is controlled by more than 50% independent outside directors.
(2) Board size: The board size is at greater than 5 but less than 16.
(3) Chairperson/CEO separation: The chairperson and CEO are separated or there is a lead director.
(4) Board structure: The board is annually elected (no staggered board).
(5) Audit committee independence: The audit committee is comprised solely of independent outsiders.
(6) Auditor ratification: The auditors are ratified at the most recent annual meeting.
(7) Stock classes: There is only one class of common stock.

According to Aggarwal et al. (2009), these seven attributes are the ones that have received the most attention in research and practice. Interestingly, these items differ from the ones identified by Brown and Caylor (2006).

Ammann et al. (2011) have brought together 64 corporate governance attributes that were collected from Governance Metrics International (GMI). The 64 attributes are subcategorized by GMI into (1) board accountability, (2) financial disclosure and internal control, (3) shareholder rights, (4) remuneration, (5) market for control, and (6) corporate behavior. Interestingly, this index also covers specific corporate behavior that appears to be related to the firm's corporate social responsibility. This sixth subcategory contains the nine attributes whether the company has a policy addressing workplace safety, does not have pending criminal litigation against it, has no allegation that the company used sweat shops within the last 3 years, discloses its environmental performance, discloses its workplace safety record, has no regulatory investigation for a material issue other than for accounting irregularities, discloses its policy regarding corporate-level political donations, has not been charged with workplace safety violations within the last 2 years, and has not been alleged to have used child labor.

Based on primary survey data and with specific references to peculiarities of emerging markets, Black et al. (2012) have created a more comprehensive corporate governance index that consists of six subindices referring to board structure (board independence and audit committee), ownership structure, board procedures, disclosure, related party transactions, as well as minority shareholder rights. The board structure subindex contains seven elements. Four of these refer to board independence and indicate the proportion of independent directors and the separation of the roles of chairperson and CEO. The remaining three elements refer to the existence and independence of an audit committee and its inclusion of minority shareholder representatives. The ownership structure subindex (five elements) measures the proportion of nonvoting shares, the fractional ownership of voting shares by the largest shareholder, the wedge between this shareholder's voting and economic rights, as well as the size of the largest outside blockholders. The board procedure subindex (six elements) measures whether the firm had more than four physical board meetings in the previous year, provided materials to directors in advance of their meetings, has systems in place to evaluate CEO performance and other executives, and established a code of ethics as well as specific bylaw to govern the board. The disclosure subindex (12 elements) indicates, inter alia, whether related party transactions are publicly disclosed, management has regular meetings with analysts, and financial statements apply generally accepted accounting standards and are accessible on the webpage. The related party subindex (four elements) refers to (potential) conflict of interest transactions, their regulation, and their approval. The minority shareholder rights index (seven elements) captures the existence of potential takeout rights on a sale of control and freezeout rights at prices exceeding the legal minimum, shareholder rights for the election of directors, as well as procedures to arbitrate disputes with shareholders. Within each subindex, each element is equally weighted. To compute a subindex, all elements are summed up and then divided by the maximum score achieved by any firm. Each subindex consequently ranges between 0 and 1. The overall score is the average of the subindex scores (Black et al. 2012).

In sum, these standards remain very much within the logic of agency theory and focus on the division of power and corresponding rights between the directors and executives of the firm and its (minority) shareholders. They emphasize (easily observable) structural arrangements and have only recently started to consider corporate governance processes (that are much more difficult to access and assess). In line with their agency theoretical lens, they mainly refer to the US governance environment and have been less receptive to the peculiarities of corporate governance systems in other countries.

Performance Implications

A plethora of studies has investigated the effects of generally accepted standards of corporate governance. Although scales to measure the legitimacy of organizations and issues have been developed (Alexiou and Wiggins 2019; Chung et al. 2016; Etter et al. 2018), the legitimacy of corporate governance standards remains to be largely assumed rather than precisely tested. Empirical studies rather focus on the performance consequences associated with the adoption of these standards.

Overall, there is some evidence that certain standards of corporate governance tend to be positively associated with various measures of firm performance. However, the results remain equivocal. As Bhagat et al. (2008: 1814) resume: “the empirical literature investigating the effect of individual corporate governance mechanisms on corporate performance has not been able to identify systematically positive effects and is, at best, inconclusive." The extant evidence is based on single-country studies as well as multi-country studies. Studies have referred to single governance mechanisms like the composition of the board or its formation of committees or utilized composite measures integrating a multiplicity of governance arrangements, like the indices outlined in the previous section of this chapter. Outcome measures include accounting-based performance, market-based performance, and operational performance but also broader consequences such as corporate social responsibility or earnings management.

Reddy and Sharma (2014), for instance, have demonstrated that publicly listed companies in Fiji have adopted governance recommendations like the appointment of independent directors, the formation of board committees for audit and remuneration, and the separation of the positions of CEO and chairperson in order to gain legitimacy from stakeholders. Their findings also show that some of these arrangements, more specifically the establishment of audit and remuneration committees, are positively associated with firm performance measured by Tobin's Q. The authors conclude that firms adopt best practices of corporate governance practices to strengthen their legitimacy.

More recently, Elmagrhi et al. (2018) have shown that better-governed UK listed firms tend to arrange more modest levels of executive compensation than their poorly governed counterparts and that the pay-for-performance sensitivity tends to be stronger in firms with higher corporate governance quality. The pay-for-performance sensitivity therefore appears to be contingent on the quality of corporate governance arrangements. This is also indicated by Ntim et al. (2019) who demonstrate that the pay-for-performance sensitivity is higher in better-governed South African firms that have larger ownership stakes by directors and institutions and established independent nomination and remuneration committees.

Beekes et al. (2016) analyze about 5,000 publicly listed firms in 23 countries and find greater and more frequent disclosure by better-governed firms. Following Chung et al. (2010), the authors utilize a comprehensive measure of corporate governance that incorporates 24 specific governance provisions and includes an assessment of the functioning of the board of directors and its formed committees, stock ownership by and compensation of directors and executives, as well as change-of-control provisions in the charter or the bylaws of the firm.

Despite this positive evidence, the extant results remain rather inconclusive. Depending on the specific governance arrangements, the context and environment in which the firm is embedded (e.g., Aggarwal et al. 2009), the overall condition of a booming versus shrinking economy (Li and Li 2018), as well as the measurement of outcome consequences, findings do vary. Bhagat et al. (2008: 1808) resume "that there is no consistent relation between . . . governance indices and corporate performance. In short, there is no one 'best' measure of corporate governance: The most effective governance institution depends on context and on firms' specific circumstances."

There are important endogeneity concerns from which prior findings may suffer (Bhagat et al. 2008; Brown et al. 2011). Clearly, a broad range of different measurements of good governance have been applied that should be sensitive to local institutional arrangements and cover both internal and external aspects of governance (Aguilera et al. 2015; Brown et al. 2011; Cremers and Nair 2005).

Extant indices whose construct validity has seldomly been addressed (Black et al. 2017) treat corporate governance characteristics mainly as additive (Bhagat et al. 2008). However, there is evidence that these characteristics could substitute for each other rather than being complements (Brown et al. 2011). As they may substitute or complement each other, governance mechanisms may produce non-linear, non-additive, and interrelated effects (Rediker and Seth 1995). Two governance mechanisms operate as substitutes if the equivalent functionality can be achieved either by one or the other (Aguilera et al. 2012), i.e., one mechanism can be replaced by another without affecting the way the governance system functions. In contrast, two mechanisms are complementary if the presence of one mechanism strengthens the functional effectiveness of the other (Aguilera et al. 2008). In other words, they operate in a synergistic and mutually reinforcing manner (Schiehll et al. 2014). Scrutinizing corporate governance characteristics in isolation from each other is consequently insufficient as essential contingencies and interrelationships remain ignored.

The analysis of configurations, or governance bundles, appears therefore to be promising in order to reflect on, and account for, the complex interdependencies between various corporate governance characteristics whose interrelationships may also vary depending on the context in which they are embedded (Aguilera et al. 2012; Schiehll et al. 2014; Ward et al. 2009). In this regard, firm performance is not only an outcome that could be reached equifinally by multiple corporate governance bundles (Garcia-Castro et al. 2013). Rather, firm performance could also influence the composition of and the mix of corporate governance mechanisms within bundles (Ward et al. 2009). Misangyi and Acharya (2014) have shown that the effectiveness of board independence and the separation of the roles of CEO and chairperson depends on their combination with the other mechanism in the corporate governance bundle. They are therefore not singular elements of good corporate governance. Regarding the equifinal consequences of multiple corporate governance bundles, Oh et al. (2018) have indicated that similar levels of corporate social responsibility can be achieved with different combinations of corporate governance characteristics.

There are large cross-country differences of these bundles of corporate governance mechanisms that tend to rest more on board monitoring, executive compensation, and the market for corporate control in advanced economies. In contrast, the relationship-based systems in emerging economies tend to place a greater emphasis on the governance role of lending institutions, large blockholders including family shareholders, and organizational governance hierarchies (Armitage et al. 2017). Within developed countries, there are differences between stakeholder- and shareholder-oriented governance systems (Desender et al. 2016). Moreover, recent research has demonstrated that country-level institutional factors influence the interplay between internal governance arrangements and their relationships with external governance characteristics (Bell et al. 2014).

Conclusion

The system of corporate governance deals with the roles and responsibilities of directors, executives, shareholders, and other stakeholders of the firm. This system determines how corporate power is divided among the constituencies of the enterprise and who is consequently supposed to make, or at least influence, corporate decisions about the allocation of assets for value creation and appropriation. While corporate governance has been widely studied as a determinant of various measures of firm performance, it also influences to which degree a company and its structure, processes, projects, and operations are viewed to be legitimate. In this regard, firms may seek to gain legitimacy by complying with standards of management and supervision that are widely believed to indicate generally accepted and therefore good corporate governance arrangements.

Future research is needed to investigate the complex interrelationships and potential trade-offs between effective and legitimate systems of corporate governance in more depth. Well-performing firms may be assumed to be well-governed and assessed to be legitimate due their high levels of performance, whereas low-performing companies may jeopardize their reason to exist and face consequently threats to their legitimacy. Well-performing firms tend also to be better able to bear the costs associated with efforts to gain legitimacy (Jeong and Kim 2019). If legitimacy is gained from conformity to well-established standards of corporate governance that are taken for granted, companies tend to become more similar or isomorph due to their adoption of these standards. Above average rates of performance, however, tend to require to differentiate from the average firm and roles and routines that are widely shared within the sector. “Organizations face a constant tension to maintain legitimacy by conforming to industry norms, but also to differentiate by creating a distinctive market presence and competitive position” (Irwin et al. 2018: 270). As Deephouse (1999) has explained, performance tends to be increased by singularity due to less competition as well as by similarity due to more legitimacy. Hence, there are tensions between differentiation and conformity that need to be balanced.

Experimenting with new forms of corporate governance may be warranted to tap the full potential of the system of management and supervision and to tailor this system to the peculiarities of the individual firm. This may also request more efforts to explain and justify potential deviations from dominant logics about how (legitimate) firms are supposed to be governed. Since innovations break out of common ways of thinking, achieving their legitimacy may be rather demanding and needs to overcome contentions in order to become applied and accepted (Semadeni and Krause 2020). Gaining a sufficient level of legitimacy remains therefore to be a precondition that corporate governance mechanisms are approved by influential constituencies and widely adopted.

Corporate Governance and Corporate Legitimacy: The Role of Boards

63

Eythor Ivar Jonsson

Contents

Abstract

The field of corporate governance can to a large extent be traced back the aftermath of the Great Depression 1929. The problem which led to the crash of the stock market was described as a division between control and ownership. The problem was described as managerialism. The thesis of managerialism inspired agency theory which has been synonymous with corporate governance theory. The theory focuses on the shareholder perspective and the importance of maximizing profits. Although corporate legitimacy has become a more important concept within institutional theory, it has had limited influence on the corporate governance discourse. That is, however, likely to change as the importance of the stakeholder perspective is growing. To align corporate governance with stakeholder perspective and strive for corporate legitimacy will have profound effects on the role of boards and corporate governance.

Introduction Stakeholders and Corporate Governance

Corporate governance has many definitions, but the most common one claims that corporate governance is a system for directing and controlling companies. A few examples from different country codes illustrate the point.

Corporate governance is the system by which companies are directed and controlled (Cadbury Report – Cadbury 1992, p. 15). Corporate governance refers to the set of rules applicable to the direction and control of a company (Cardon Report – Cardon 1998, p. 5). Corporate governance is the goals, according to which a company is managed, and the major principles and frameworks which regulate the interaction between the company's managerial bodies, the owners, as well as other parties who are directly influenced by the company's dispositions and business (in this context jointly referred to as the company's stakeholders). Stakeholders include employees, creditors, suppliers, customers, and the local community (Norby Report – Johansen et al. 2001, p. 3).

The roots of the field of corporate governance can be traced back to Berle and Means' (1932) thesis concerning the problem of separation between control and ownership. The problem of managerialism which is described by Berle and Means (1932) focuses on the importance of shareholders as the ultimate owners of corporations and decision-makers. It has emphasized the importance of the shareholder perspective in the corporate governance discourse. An example of shareholder perspective is how Shleifer and Vishny (1997, p. 737) define corporate governance as "the ways in which suppliers of finance to corporations assure themselves of getting a return on their investment."

Although the literature of corporate governance has been dominated by the shareholder perspective, there have been attempts to define corporate governance from a stakeholder perspective. Demb and Neubauer (1992, p. 187) define corporate governance as "the process by which corporations are made responsive to the rights and wishes of stakeholders." Hilb (2006, p. 9), for example, defines corporate governance as "a system by which companies are strategically directed, interactively managed and holistically controlled in an entrepreneurial and ethical way and in a manner suited to each particular context."

Although attempts have been made to define corporate governance within the stakeholder perspective, there is however surprisingly limited discussion within the literature which represents corporate legitimacy as the social acceptance of business organizations and their activities (Filatotchev and Nakajima 2014). If this "social license to operate" or a "social contract" provides organizations a "reservoir of support" that enhances the likelihood of organizational survival (Dowling and Pfeffer 1975; Rao 1994) and perpetuates organizational influence by increasing individuals' loyalty to the organization and willingness to accept organizational actions, decisions, and policies (Tyler 2006), it should be a central issue within corporate governance rather than a footnote. Corporate governance research, however, points out that organizational leaders make decisions that may shape the foundations of leadership responsibility and accountability not only to shareholders but also to a wider body of stakeholders (Scherer et al. 2013). Therefore, it is important to explore the contradictory relationship between corporate governance and corporate legitimacy.

The Foundations of Corporate Governance

The field of corporate governance can to a large extent be traced back to Berle and Means' classic work from 1932, *The Modern Corporation and Private Property* (Berle and Means 1932). The focus of the work was Berle and Means' basic concern over the separation of ownership from control in large US corporations. The thesis became the inspiration for the leading corporate governance theory.

Berle and Means' concerns were about dispersed ownership, as firms grew the stocks became dispersed among a large number of small shareholders. Those small shareholders did not have the same power as owners as if the companies were owned by large shareholders. The limited power of dispersed shareholders created a vacuum in which managers, those who ran daily operations, had seized the power. The problem of that, according to Berle and Means, was that interests of managers were not necessarily in line with those of shareholders. Owners were more inclined to prefer profits to be returned to them as dividends; managers, however, might prefer to reinvest the profits or even use it for more self-serving purposes (Mizruchi 2004).

The idea of managerialism which Berle and Means (1932) proposed did attract considerable attention from transaction cost economics and agency theory (Mizruchi 2004). Oliver Williamson (1975, 1979, 1984) wrote about how managerial decision related to transaction cost could affect profit maximization. The active role of management in directing the firm was acknowledged, as reflected by Alfred Chandler (1977), as an important factor in organizational behavior as decisions were predicated on the assumption of managerial discretion (Mizruchi 2004). As transaction cost approach was based on the assumption of managerial discretion, the agency theory took the degree of managerial autonomy as far more problematic (Mizruchi 2004).

Agency theory (and transaction-cost theories) is usually described as part of organizational economics (Barney and Ouchi 1986; Donaldson and Preston 1995) or new institutional economics. As originated in the study of Berle and Means (1932), the use of new institutional economics in relation to corporate governance has primarily focused on the relationship between shareholders and managers of large public companies (Ulhøi 2007). Agency theory is the most common approach in empirical research within the governance field. It has been considered the dominant theoretical perspective in corporate governance (Shleifer and Vishny

1997). Furthermore, it is often used synonymously with governance theory (Lubatkin 2007).

Agency theory is concerned with the problems arising when one party (the principal) contracts with another (the agent) to make decisions on behalf of the principals (Fama and Jensen 1983). Three factors play a key role in this problem and capture the nature of the principal-agent relationship: (1) information asymmetry between principals and agents, (2) bounded rationality by both principals and agents, and (3) potential goal conflict (Gomez-Mejia and Wiseman 2007). The separation of ownership and control gives rise to conflicts of interests between shareholders and managers, their agents, because of the opportunism of managers (Lubatkin 2007).

Williamson (1975) and Fama and Jensen (1983) argue the role of the board of directors, and more generally of the corporate governance system, is to harmonize agency conflicts. The board is principally an instrument by which managers control other managers (Williamson 1984). It is an instrument of control with the primarily role of monitoring management activities in order to minimize agency costs and thereby protect shareholder interests (Stiles and Taylor 2001). It can therefore be argued agency theory is at least partially, if not completely, about control (Mace 1971; Zahra and Pearce 1989) and power (Finkelstein and Hambrick 1996; Pettigrew and McNulty 1998). The contractual relationship of the principal and the agent is related to potential moral hazard and adverse selection problems (Gomez-Mejia and Wiseman 2007). Moral hazard arises when agents shirk their responsibilities, as they believe their behavior is unobservable. Adverse selection arises when one party has information the other party in the contract cannot obtain without some cost. Moral hazard and adverse selection create the need for a governance mechanism (Gomez-Mejia and Wiseman 2007). As information asymmetries increase, it becomes harder for the principal to know whether the agent is fulfilling his contract (Balkin et al. 2000).

The key is to create an “alignment of incentives” in which managers’ interests will correspond with those of owners. Agency theorists focus on means by which owners can provide effective monitoring mechanisms. Much of the research within the area involves examinations of the effectiveness of these various mechanisms. A couple of ideas have been emphasized: (A) Aligning incentives to stock prizes. When managers own stock in the firm, they share interests in its performance with the remaining equity holders. (B) Effectiveness of markets, both in terms of its effect on the firm’s stock price and the related market for corporate control. This approach raises the possibility that managers could be ousted. (C) Direct monitoring through the appointment of an expert board of directors, who are constrained to operate in the stockholders’ interest because of their need to maintain their reputations (Mizruchi 2004).

There are serious doubts as to whether agency theory is applicable in other settings than large US corporations or even whether it was ever intended for any other settings (Ulhøi 2007; Lubatkin 2007). The main assumptions of agency theory are still being debated (Lubatkin 2007; Ulhøi 2007; Gomez-Mejia and Wiseman 2007). It is argued some researchers emphasize the opportunism of managers too heavily, as the main premise is not distrust (Ulhøi 2007), but rather insurance or protective measures.

The main premises of agency theory, Berle and Means' (1932) managerialism, have constantly been contested and somewhat ignored by economists (Mizruchi 2004). Berle and Means (1932) found that 44% of the 200 largest nonfinancial companies in the United States had no one shareholder with more than 20% stake in the corporation which was the cutoff point for approximate minimum necessary for control. They labelled these companies as management-controlled (Mizruchi 2004). Berle and Means' thesis was that management-controlled corporations would have worse results than ownership-controlled corporations. Researchers have only found limited influence on results if any between corporations labelled as management-controlled, with no owner with more than 20% stake, compared with ownership-controlled (Monsen et al. 1968). Furthermore, limited evidence has been found regarding increases in retained earnings in management-controlled organizations (Lintner 1959; Stearns 1986). The lack of evidence for the managerialism thesis might be the reason for limited discussion about the phenomena between 1932 and 1970 (Mizruchi 2004).

Furthermore, research has indicated that block holder ownership was even less frequent in the 1960s than in the 1930s as controlling for 10% ownership (Larner 1970) found that more than 80% of the 500 largest US manufacturers had no block owner with 10% or more. Zeitlin (1974) argued that as many as 60% of the companies in Berle and Means' (1932) sample had been owner controlled at the time.

The main thesis of Berle and Means (1932) was that ownership had become so dispersed there was no real owner of organizations, which in turn empowered managerial control of organizations. Many researchers question whether this is as common a problem as indicated, because ownership is much more concentrated in most companies (La Porta et al. 1999; Faccio and Lang 2002). La Porta et al. (1999) and Faccio and Lang (2002) have studied ownership structure in several countries and found corporate ownership is concentrated in most countries, although to a lesser degree in Anglo-Saxon countries. Many researchers have questioned the claim of dispersed ownership and how commonly corporations are management-controlled (Shleifer and Vishny 1997). Lubatkin (2007) argues the problem of dispersed ownership is nonexistent in majority of companies on a global scale.

It can therefore be argued that there is limited support for the management control thesis of Berle and Means (1932) as being a realistic problem, nor a problem in terms of the effect of managerialism that is supported by empirical evidence. The basis of agency theory in the corporate governance context is therefore weak at best. It is, however, the leading argument for the shareholder perspective in context of corporate governance.

The Role of Boards

Discussions about the role of boards in companies are often puzzling because the underlying theoretical frameworks differ. In the literature at least nine challenging theories can be found underpinning various perspectives and which may possibly lead to challenging arguments, e.g., agency theory, stewardship theory, managerial hegemony theory, institutional theory, resource dependency theory, class hegemony theory, networking theory, legalistic theory, and stakeholder theory (Zahra and Pearce 1989; Johnson et al. 1996; Hung 1998). Some researchers argue a general theory of the board is needed which avoids such confusion (Stiles and Taylor 2001), as well as an appropriate conceptual framework to adequately reflect the reality of governance (Tricker 2000).

The discourse of corporate governance has put emphasis on the monitoring duties of the board, partly due to the dominance of agency theory and partly because of legal requirements and regulations (MacAvoy and Millstein 2003). At the same time, interest in the "directing" concepts decreased (Lorsch and Carter 2004). It is, however, important to acknowledge the Delaware courts in the United States have emphasized both the monitoring and directing functions of the board. As has been made clear in a series of famous cases, e.g., Paramount Communications, Grobow v. Perot, Hanson Trust PLC v. SCM Acquisition, Moran, and Smith v. Van Gorkom, "boards could and should determine key strategic decisions, acting independently of management, through a thoughtful and diligent decision-making process" (MacAvoy and Millstein 2003, p. 23). Furthermore, directors themselves have emphasized the need for increased strategic participation (Demb and Neubauer 1992; Stiles and Taylor 2001; Lorsch and Carter 2004). In other words, the monitoring function has been fed, while the directing function has been starved. Agency theory, which is often used synonymously with governance theory, emphasizes the monitoring function of the board (Jensen and Meckling 1976; Lubatkin et al. 2007), while stewardship theory proposes the main function of the board should be directing (Donaldson 1990; Donaldson and Davis 1994). Agency theory has, however, received the most attention in the literature (Stiles and Taylor 2001; Lubatkin et al. 2007).

Stewardship theory takes a different view from agency theory of the relationship between management and the board of directors. It can be described as a counter theory to agency theory. Managers are considered good stewards of corporate assets, rather than opportunistic and self-interested actors as within agency theory (Donaldson 1990). It originates from organizational psychology and sociology, claiming executives are generally trustworthy (Argyris 1964; Donaldson and Davis 1994). Davis et al. (1997) compare the two theories and point out the limits and boundaries of the theories rest in their definition of behavior or the model of man. While both theories concentrate on the relationship between the board (or shareholders) and management, they view that relationship in totally different fashions. According to agency theory, managers are self-serving individualists focused on the short term, while stewardship focuses on managers who serve the collective and are long-term orientated (Davis et al. 1997).

The shareholder perspective, including the dominance of agency theory in the corporate governance literature, has been the focus of corporate governance. The perspective emphasizes the importance of the owner of the organization. Other stakeholders might be considered but usually only as influencers or associated with risk. Stakeholder theory, however, stresses corporations and boards must accept responsibility for stakeholders such as customers, suppliers, employees, and the community, rather than just shareholders (Lorsch and Carter 2004). The theory challenges the predominance of shareholders as the only real stakeholders and assumes interests of all stakeholder groups have intrinsic value (Jones and Wicks 1999). In agency theory and stewardship theory, companies are run for their owners, the shareholders, based on a simple profit-maximizing perspective. The stakeholder approach to the role of the governing board implies negotiation and compromise with stakeholder interests (Hung 1998). Stakeholder theory takes the broad view companies are not just profit-maximizing entities, but rather need to consider all stakeholders of the company. It can be argued this approach has at least three implications for the role of the board and its functions: (1) monitoring, as an example for ethical standards or environmental standards not directly linked with shareholder interests; (2) negotiations and compromise, where the board acts as a link and coordinator between management and shareholder interests on one hand and other stakeholder interests on the other; and (3) directing, with the focus of more than one success criteria which reflects the impact on different stakeholders.

The stakeholder theory differs from resource dependency theory, although it too focuses on the external environment. Resource dependency theory, like agency theory and stewardship theory, focuses on the shareholder perspective. The two theories can be contrasted in another way. While stakeholder theory focuses on the role of board in establishing long-term relationships between the firm and the stakeholders (Freeman 1984; Blair 1995), resource dependency theory focuses on the board as an instrument to facilitate access to resources critical to the firm's success (Johnson et al. 1996), both in the short and long term.

The role of the board within the stakeholder perspective is therefore to satisfy multiple stakeholder interests, rather than only to monitor conventional economic and financial factors (Donaldson and Preston 1995). The focus of the theory is not just shareholder-board-management interaction and goals. It becomes stakeholder-board-management interaction and goals. The model of the firm changes from a simple input-output model to a more interactive stakeholder model. The comparison of the shareholder and the stakeholder model indicates how much more complicated the stakeholder model is in practice (Donaldson and Preston 1995).

The complexities of the stakeholder model, to satisfy multiple stakeholders, is a reason for why the effort of management and boards is more inclined to focus on compliance with laws and regulations, including accounting rules and anti-fraud policies (Ball et al. 2003), which protects stakeholders rather than using it as a guideline for directing the organization. The stakeholder perspective with different institutional pressures may require different managerial approaches (Eesley and Lenox 2006). The key question will still be the question of how to measure success for stakeholders, including shareholders, as the organizational performance will determine the survival and legitimacy of the organization.

Compliance and Performance

The corporate governance debate seems to have been driven by corporate scandals (O'Brien 2005). Although it is hardly noted in the context of Berle and Means' (1932) thesis, it is hard to disregard the fact their book was a response to and written because of one of the most severe recessions in modern times, a recession which had an immense influence on politics and commerce around the world, the 1929 stock crash. There are indications that waves of interest in corporate governance occur at the break of prosperous times and irrational corporate confidence. MacAvoy and Millstein (2003) have, for example, studied the history of corporate governance in parallel with the waves of mergers in the twentieth century. This is even more noticeable in the emergence of corporate governance codes. The Cadbury Code of 1992 was a response to a series of scandals in Britain in the 1990s, most notably Coloroll, Polly Peck, Bank of Credit and Commerce International, and Maxwell Enterprise (Cadbury 2002). At the same time, some legendary corporations like IBM, General Motors, and Sears were faltering in the United States, which led to increased pressure from institutional investors, takeover firms, and judicial interpretations of fiduciary duties (MacAvoy and Millstein 2003). The Sarbanes-Oxley Act in the United States was pushed through congress in the aftermath of corporate scandals like Enron, WorldCom, Global Crossing, Lucent, Williams, Dynegy, K-Mart, and HealthSouth (MacAvoy and Millstein 2003; O'Brien 2006). This does not come as a surprise, as to quote Warren Buffett (Buffett and Clarke 2006, p. 47): “It's only when the tide goes out that you learn who's been swimming naked.”

The typical response to a scandal has been “where was the board?” (MacAvoy and Millstein 2003). It is therefore performance or rather the lack of performance which has been the driver of corporate governance codes and legislation.

Research on corporate governance has to a large extent focused on the association between the board and the performance of the board (Filatotchev and Wright 2005; Shleifer and Vishny 1997). The interpretation of organizational performance is therefore an important variable in corporate governance research, especially in research based on agency theory (Bøhren and Ødegaard 2003). The perspective of maximization of profit for shareholders is furthermore the objective of agency theory.

Organizational performance is the dependent variable in the formulation of the problem. Most models in corporate governance literature use corporate performance as a measure. Dalton et al. (1998), in a meta-analysis of 131 samples, note governance structure and financial performance research have relied mostly on accounting-based indicators, although some studies use market-based indicators or both types together. Several researchers claim Tobin's Q, the standard approximation of market value, is the leading indicator of performance in corporate governance (e.g., McConnell and Servaes 1990; Bøhren and Ødegaard 2003). Dalton et al. (1999) note, however, corporate governance research has relied on many different types of accounting measurement for performance.

Performance measures have received little attention in the corporate governance field. Organizational performance, however, is a major research topic and has been for a long time (Maltz et al. 2003). Organizational performance is a complex and multidimensional phenomenon (March and Sutton 1997). There is some concern simple outcome-based indicators as measures of organizational performance are insufficient (Brett 2000; Venkatraman and Ramanujam 1986). Some claim the trend in research is moving away from the tradition of measuring only financial performance of organizations (Ramanujam and Venkatraman 1988; Brett 2000).

Stakeholder perspective calls for a broader measurement of success than profit as the benefits for different actors cannot be solely achieved through increased profits. Those measures are gradually being developed. More variety of measures for boards to consider as part of their decision-making process complicates the role of the board. It is more than only compliance to laws and regulations.

It is evident that compliance has become more demanding as scandals have driven the regulatory framework of corporate governance. The legalistic perspective mandates boards to contribute to performance by carrying out their legal responsibilities (Zahra and Pearce 1989). Dulewicz and Herbert (1997) found, in their study of listed UK companies, boards do focus on the importance and effort of fulfilling their legal and fiduciary duties. In agency theory, this power comes from the shareholders, and in legal theory, power emanates from state law (Budnitz 1990). Legal theory is therefore less specific in identifying board duties to shareholders than agency theory (Budnitz 1990). Some legal scholars have argued that by making the board responsible for ensuring that the corporation in compliant with relevant laws and regulations and therefore making directors primarily accountable to the corporation itself, the debate moves away from the shareholder – management dichotomy (Lan and Heracleous 2010). In that context it is important to note that by law, almost universally, the board's fiduciary duty is first to the corporation itself, not the shareholders.

Legal theory emphasizes that law and regulation are the sole motivation for organizational behavior. The focus is on the agency relationship between the board of directors and the corporation, as corporate law restrains management's opportunistic behavior by devising rules to regulate the actions of the board of directors – not of managers generally (Nakajima 2012). By imposing accountability on the board of directors, the thesis is that management opportunisms may be restrained (Nakajima and Sheffield 2002).

However, in institutional theory the pressure is more pluralistic, as social pressure and convention structure the behavior of the board. It may be argued legal theory stands for more formal institutional pressure, while institutional theory focuses on more informal external pressure. The institutional perspective claims organizations are institutionalized through internal and external pressures (Hung 1998). Tolbert and Zucher (1983) argue the governing board can only act to maintain the relationship between the organization and the environment. The role of the board from an institutional perspective is therefore sometimes labelled as maintenance role (Hung 1998). The role of the board is to maintain the status quo in the face of pressure from outside the board. These pressures restrict and limit what the board can do, as it is constrained by social rules and taken-for-granted conventions (Ingram and Simons 1995). By instilling value, institutionalization promotes organizational stability and persistence of the organizational structure over time (Selznick 1957). Corporate legitimacy is a concept which was developed as part of the institutional theory.

Stakeholders and Corporate Legitimacy

The importance of legitimacy for development and endurance of organizations and other social systems is a research agenda for sociologists and strategy researchers. Organizational legitimacy can shape investor behavior and perspectives (Pollock and Rindova 2003). Organizations with high levels of legitimacy are insulated from unsystematic variations in their stock prices (Bansal and Clelland 2004). From the institutional perspective, legitimacy seems to provide organizations with a "reservoir of support" that enhances the likelihood of organizational survival (Dowling and Pfeffer 1975; Rao 1994) and perpetuates organizational influence by increasing individuals' loyalty to the organization and willingness to accept organizational actions, decisions, and policies (Tyler 2006). The key argument is that legitimacy facilitates effective governance (Gibson 2004), and legitimacy judgments lead to the persistence of inequitable social structures (Thomas et al. 1986). Legitimacy is therefore a central concept in institutional theory (Colyvas and Powell 2006).

Institutions consist of cognitive, normative, and regulative structures and activities that provide stability and meaning to social behavior (Scott 1995). Or in other words, institution is a system of rules, beliefs, norms, and organizations that together generate a regularity of (social) behavior (Greif 2006). Corporate legitimacy is a necessary component of institutionalization, which occurs as an emerging social entity gains a quality that leads it to be perceived as an objective and natural reality. Illegitimacy can consequently be specified as a critical driver of the pursuit of institutional and organizational change (Greenwood et al. 2002; Suchman 1995). Changes in organizational forms, practices, and policies require that new arrangements be viewed as more legitimate than existing ones (Oliver 1991; Suddaby and Greenwood 2005).

In this context, Deephouse and Suchman (2008) argue that early definitions of organizational legitimacy from institutional theorists viewed legitimacy as a function of the congruence or conformity of an organization to social norms or laws (Weber 1978). Legitimacy has also been defined as the degree of cultural support for an organization – the extent to which the array of established cultural accounts provides explanations for its existence, functioning, and jurisdiction, and lack or deny alternatives. A completely legitimate organization would be one about which no question could be raised (Meyer and Scott 1983, p. 201). Popular definition by institutional theorists is that legitimacy is a generalized perception or assumption that the actions of an entity are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs, and definitions (Suchman 1995, p. 574). The key issue is a fit or appropriateness of an organization with their social context.

The dominant perspective within corporate governance research, agency theory, has however been focused on the link between various corporate governance mechanisms from the perspective of shareholder and corporate performances or more the importance of maximum return on their investment (Filatotchev and Wright 2005; Shleifer and Vishny 1997). The fit between management and ownership intent is contaminated by the self-interested opportunism of management, and therefore the role of the board is to monitor the actions and intentions of management and restrain managerial discretion. The solutions for a better fit between management and shareholders are incentive schemes which align top management interests with shareholders interest (Bruce et al. 2005).

From this shareholder perspective, corporate governance studies have attempted to associate board structure and composition, shareholder engagement, and executive incentives, directly with the firm's financial performance rather than with managerial strategic decisions (Filatotchev and Wright 2005). Stakeholder perspective argues, however, that corporate governance relates to the structure of rights and responsibilities among the parties with a stake in the firm (Aoki 2001). From this broader perspective of corporate governance, the system needs to ensure that executives respect the rights and interests of company stakeholders, as well as to make those stakeholders accountable for acting responsibly with regard to the protection, generation, and distribution of wealth invested in the firm (Aguilera et al. 2008). This broader stakeholder perspective is also described in strategic management research as action taken by managers which need to benefit the stakeholders of the company and/or actions taken to avoid harmful consequences for corporate stakeholders and the larger society (Voegtlin et al. 2012). There is evidence that rather than being a short-term perspective, as some would argue, the stakeholder perspective and the focus on corporate legitimacy enables firms' sustainability and long-term survival (Donaldson and Preston 1995; Scherer et al. 2013).

A system of corporate governance which enables stakeholder theory probably needs to be different from system which has the role of facilitating shareholder agency perspective. The "legitimate" governance practices may have profound effects on the firm's leadership and its strategic decisions (Ioannou and Serafeim 2012). Corporate governance is a product not only of coordinative demands imposed by market efficiency but also of rationalized norms legitimizing the adoption of appropriate governance practices. In some cases, this process of legitimization may lead to changes in the firm's governance system itself, such as the creation of a board's committees or the introduction of nonfinancial metrics into internal controls, risk management, and incentive systems (Bell et al. 2014). This change becomes even more intense if the strategic focus of the organizations goes beyond of "doing good" by integrating social and environmental issues into formal and informal process of the firm from the perspective of shared value (Porter and Kramer 2006). As an example, corporate social responsibility (CSR) from a shared value perspective considers CSR to be an integral part of organizational capabilities and aligned with the strategic goals of the company to align best interests of stakeholders and the firm (Porter and Kramer 2006; Waldman and Galvin 2008). Then the corporate governance structures, such as corporate boards, board committees, and dominant owners, should not only monitor managers' compliance with laws and regulations but also determine how deeply CSR principles are integrated into the decision-making process at the top (Scherer et al. 2013).

Conclusions

Corporate governance and corporate legitimacy are concepts which have sparse common history. It is however important that boards of directors understand the social contract which can impact the survival of the organizations. Prioritizing corporate legitimacy will affect corporate governance and the role of boards. Decision will have to be taken in different manner where the stakeholder perspective with multiple measures of success will have to be the central focus of boards rather than a pure shareholder perspective with focus on maximizing profits.

It has somewhat been forgotten that Berle and Means' (1932) focus on separation of ownership from control was not only about managerialism and lack of accountability to investors, they were also concerned about lack of accountability to society in general (Mizruchi 2004). The concern was that a small group of people controlling the largest organizations had the power to build and destroy communities to generate great productivity and wealth but also to control the distribution of that wealth, without regard for those who elected them, the shareholders, or those who depended on them, the larger public (Mizruchi 2004).

The concerns of Berle and Means (1932) about society in general might not have been the main focus of their thesis, but it emphasizes that their work has somewhat been lost in translation as it led to the tunnel view of agency theory where the role of board becomes an act of monitoring management for the sake of investors and maximizing profits. Compliance with laws and regulations which try to safeguard the interest of society has become the name of the game. There is, however, a movement which emphasizes the importance of organization actions which go beyond compliance with laws and regulations and signal the willingness to advance the goals of stakeholders at large (Waldman and Galvin 2008). Such an effort is an attempt to secure corporate legitimacy.

The issue of managerialism has shed a light on who controls organizations for what reason. There were researchers which interpreted the separation of ownership of control as a positive thing as it has the potential to limit the power of the elite and increase democracy in the corporate context (Mizruchi 2004). Dispersed ownership and managerialism doesn't seem to increase corporate democracy or decrease the focus on shareholder wealth. That begs the question of what the role of the board is in this context. The definition of corporate governance is the system by which companies are directed and controlled (Cadbury 1992). At the core of the system is the board of directors who have the power by law to take decisions on behalf of the company (Stiles and Taylor 2001).

Lorsch and MacIver (1989) described the board in terms of pawns rather than potentates. It is, however, important that future boards will neither be described as potentates nor as pawns but as a fair decision-maker with a role which is relevant for the context of the organization. If boards have been largely irrelevant throughout most of the twentieth century (Gillies 1992), they need to get a different role. One of the key objectives of such boards and corporate governance in general could be to secure the corporate legitimacy of the company.

The board fiduciary duty is first to the corporation itself. It is only because of lack of clarity and context of legal framework that this fact has been somewhat lost in the corporate governance discussion. Legislation universally does not prioritize shareholders over the company although it is a common misconception. Boards of directors are the safeguards of the company not only the shareholders. They might be elected by shareholders, but it is clear by law that they are not the representatives of those same shareholders. They work for all shareholders but more importantly for the company itself. The best interests of the company usually coincide with the best interests of shareholders, but do not necessarily have to. The perspective of corporate legitimacy therefore becomes a more relevant objective than if the board were by law bound by the shareholder perspective.

The monitoring and directing role of the board can be adapted to the stakeholder perspective although the theoretical basis of the agency and stewardship theories focuses on the shareholder perspective. From the agency theory view of management, it would be important to incentivize management based on the stakeholder model and not just the shareholder perspective or align interests, and the monitoring function of the board would be to secure that decisions are taken with a broader view of stakeholders. The board would become the agent of society at large, and shareholders would be given the duty of actively seeking out societal expectations and protect societal rights before striving to maximize their firms value (Raelin and Bondy 2013). Directing, in line with stewardship theory, would have to include the risks and benefits for stakeholders in the strategic dialogue and decision-making. The change could be less imposing taking into account benevolent managerial behavior, intrinsic motivation, and the need for self-fulfillment (Scherer et al. 2013). A shift from agency theory, stewardship theory, and shareholder perspective to a more institutional and stakeholder perspective would call for structural and behavioral changes within boards and management.

The thesis of corporate governance, inspired by Berle and Means (1932) and driven by agency theory and shareholder perspective, is somewhat misaligned with the thesis of corporate legitimacy. It is most likely that corporate governance mechanisms need to change and adapt to a more inclusive stakeholder model in effort to align profit maximization, survival, and long-term sustainability of the firm and secure corporate legitimacy.

Abstract

In this chapter, the economic theories of the firm are used to ask what they can contribute to the legitimacy of business. The first step is to provide arguments why firms exist at all, and not only markets, and why the capitalist firm is the prevalent form of firms. In a second step, theories of the firms and their implica-

tions for business legitimacy are presented. Besides the dominant agency and contractual theory on the one hand and the stakeholder theory on the other hand, the legal theory of the firm is introduced, as well as the resource-based view of the firm and the behavioral theory of the firm. In a third step, a broader economic analysis is applied in which the existence of market power, multinational and “footloose” enterprises, and lobbying activities of firms are considered. Last, but not least, four methods of social norm enforcement are discussed, namely, consumer choice, business reputation, financial markets, and stakeholder interference. After all, the dominant legitimation of business comes from the provision of economic values in form of goods and services in a socially acceptable way. Even from a well-understood stakeholder perspective, long-term value maximization is seemingly the adequate firm objective.

Introduction

What legitimizes business in a society? This is a quite new question, as the discussion on the role of business in a society changed a lot over time. It evolved from the nineteenth to the twenty-first century along three main conflicts, from a Marxian conflict in the nineteenth and the early twentieth century between employees and employers, to a corporation conflict in the twentieth century between managers and firm owners, and, finally, to a legitimation conflict in the twenty-first century between stakeholders and firms (Prinz 2016). The Marxian conflict was mainly about the role of capital and labor as factors of production, as well as labor as a very special factor of production, provided by human beings. The corporation conflict reflected the separation of ownership and managerial control in firms and the consequences this implied. The recent stakeholder-firm conflict developed in advanced economies over the societal role of mainly large, internationally operating firms. This latest (legitimacy) conflict, although it started in the 1970s, gained momentum in the aftermath of the financial and economic crises of the years since 2000. Meanwhile, due to the alleged failure of states and international governmental organizations in the provision of global public goods, the role of a political agent is ascribed to business firms (Scherer et al. 2014), although the separation between business and politics remains very controversial (Pies et al. 2014).

Parallel to the evolution of conflicts, the economic theories of the firm evolved, too; the most prominent among them are:

- The firm as a legal institution
- The agency and contractual theory of the firm
- The resource-based view of the firm
- The behavioral theory of the firm
- The stakeholder theory of the firm

These theories emphasize certain aspects of firm behavior; none of them is the only theory of the firm.

The topic and aim of this contribution is to ask what theories in economics and finance tell about the legitimacy of business in a society. Although these theories do not focus on the legitimacy of business *expressis verbis*, they nevertheless contain implicit statements on this issue. The intention here is to reveal the respective legitimacy perspectives. To do this requires a definition of legitimacy. The starting point is the well-known definition of Suchman (1995, p. 574): "Legitimacy is a generalized perception or assumption that the actions of an entity are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs, and definitions." As pointed out by Suddaty et al. (2017, Table 1), three different approaches to legitimacy are adopted in the literature: (1) legitimacy as a property, resource, asset, capacity, or thing; (2) legitimacy as an interactive, constructive process; and (3) legitimacy as a social judgment, evaluation, or construction. In this study, the emphasis is on legitimacy as a property of business. Nevertheless, the perspectives of legitimacy as a process and an evaluation are also considered, particularly in the section "Conclusion" below.

The remainder of this contribution is structured as follows. In section "The Firm in Economic Theory," the reasons for the existence for firms, rather than only markets, are presented. The focus in this section is on enterprises and corporations that are characterized by the dominance of capital as a factor of production, i.e., capitalist firms. Section "Theories of the Firm and Business Legitimacy" gives an overview on the main economic theories of the firm and their implications for business legitimacy. These theories are complements to each other and are the basis for an economics understanding of businesses and their activities. In section "A Broader Economic View on Business and Its Legitimacy," a deeper view of businesses in a society is taken. In particular, certain imperfections of firms and markets are considered: market power, multinational and so-called "footloose" enterprises, as well as firms as political actors. The enforcement of legitimacy concerns is analyzed in section "The Enforcement of Legitimacy Norms." Section "Conclusion" concludes.

The Firm in Economic Theory

Why Firms?

To start with, transactions are the analytical basis of economic activity, as recognized by Commons (1932) and rediscovered by Williamson, as pointed out in his 2009 Nobel Prize lecture. Transactions are rarely costless; otherwise, as demonstrated by Coase (1960), all economic transactions could take place via markets, even when they imply external effects. With positive transaction costs – finding a trading partner and concluding and enforcing contracts – markets alone cannot allocate input factors, as well as goods and services, to their best use. This was the birth of the firm, so to speak, according to Coase (1937), on which Williamson (1979) could continue.

Another building block for firms in economic theory are property rights (Hart and Moore 1990), and with property rights connected are contracts to exchange them (Cheung 1983). A firm must be legally able to own factors of production, as well as the assets it holds and the products it manufactures. Moreover, all factors of production must be owned by someone to call a positive market price. In this respect, labor as a service of workers is owned by the workers, as is capital by the respective owners or investors. The problem is, however, that contracts are usually incomplete. To be able to sustain long-term relationships in a productive endeavor and to motivate so-called specific investments (investments that are of no or very little use outside the common endeavor) require the (legally different) structure of firms. This explains why Eugene Fama summarized the contractual nature of the firm as follows: “The firm is just a set of contracts covering the way inputs are joined to create outputs and the way receipts from outputs are shared among inputs” (Fama 1980, p. 290). Put differently, a firm is a legal construct that creates economic value and this value is distributed contractually among the factors of production.

However, with positive transaction costs and property rights, it would also be possible that the state organized all economic activities via laws, regulations, and bureaucracies. The crucial question is where the costs of the organization of production are minimized (Williamson 1979, 1981). Organization costs consist of production costs and coordination costs. Production costs are increasing with distance to markets because markets allow to exploit economies of scale and scope to the highest possible extent and risks can be pooled. A single firm in a market will only produce a good itself if its own production costs are the minimal cost.

In contrast, coordination costs – as a part of transaction costs – are high in markets. The reason is that a high number of contracts are necessary in markets, if coordination among individuals and firms is required. The contract partners must be searched and contracts concluded and enforced. In this respect, hierarchies can perform the coordination better since only a few eventualities have to be written into contracts, whereas the remaining contingencies are delegated to one party or the other (Hart and Moore 1990). Coordination costs are the more important the higher the specificity of assets is (Williamson 1981). Consequently, high asset specificity and high coordination costs are indicators for a comparative advantage of firms over markets.

In general, the combination of increasing costs of production and decreasing costs of coordination with the level of hierarchies implies that the minimal organization costs imply a certain, not too high level of hierarchy, i.e., firms. The state as the highest level of hierarchical organization comes into play if the externalities created in production become too large to be internalized by individual firms. This means that the respective goods are public goods, with maximal externalities:

nobody can be excluded from consumption at reasonable costs, and rivalry in consumption is small to nonexistent. Put differently, the state as an ordinary producer of goods and services comes into play only if markets and firms are failing more or less completely. The economic approach to the organization of the production of goods and services proceeds according to comparative cost advantages. In this way, the institution with the lowest organization costs takes over the responsibility for production. In a world of scarce resources, this principle seems to be adequate and, hence, legitimate.

These theoretical considerations on the nature of firms can be applied to give a first answer on the question of the legitimacy of business. First of all, the creation of value in form of goods and services via cooperation of people, as well as the coordination of productive activities, is the first and foremost legitimacy of business. To provide goods and services at lowest costs, i.e., with the lowest input of scarce resources, an organizational division between markets and hierarchies (firms and institutions up to the state level) is required. Moreover, this organizational division according to the principle of comparative cost advantage allows asset specificity and the specialization of human skills and activities (human capital). These specializations are preconditions for high levels of productivity.

Why Capitalist Firms?

From a theoretical point of view, firms could be managed by owners or their representatives, the managers, or by labor, i.e., the firm's workers, as demonstrated by the theory of the labor managed firm (Drèze 1976), or worker-capitalist cooperatives (Tirole 2017, Part III, section 7). The question is, therefore, why the dominant share of firms is by far capitalist. These capitalist firms are defined by private property; decision-making by owners, investors, or their representatives; and the liability of the firm for violation of third-party rights.

According to Jean Tirole, the "driving need for finance" (Tirole 2017, p. 177) is the main reason for the dominance of the capitalist firm. In other words, capital or financial resources seem to be the scarcest factor of production. This factor hires than the other, less scarce factors as, most importantly, labor services.

This explanation of the capitalist firm is incomplete. The reason is that capital alone is insufficient to justify the existence of a firm. For a firm to exist, and to justify its existence, ideas for products, services, and production processes are necessary. Otherwise, there would be no willingness to pay of potential customers that could contribute the financial basis for its existence. In this respect, the entrepreneur is at the center of a (new) firm. Since only entrepreneurs provide and enforce innovations, they are the main source of economic value, survival, and growth (Schumpeter 1934; Casson 2005). Nevertheless, to pre-finance a firm's economic activity, capital is the direly needed factor. The innovatory role of entrepreneurship and the financing with capital explain the economic basis of capitalist firms. As argued by Schumpeter later on, the great danger of the capitalist firm and the respective economic system is the monopoly of firms (see Ebner 2006 to the stages of Schumpeterian entrepreneurship). This will be a topic in section "A Broader Economic View on Business and Its Legitimacy" below.

If economic signals as, for instance, prices, interest rates, and profits, are correct, and if the firms are accountable for their actions, the only "business of business" is the creation of value for its investors (Tirole 2017, p. 186). Differently said, the legitimacy of capitalist firms is driven by three factors: (1) the provision of economic value by the efficient employment and use of capital and labor services, (2) the liability of firms for the damage they may cause for third parties, and (3) the creation of shareholder value. From a shareholder viewpoint, profits are an end; however, from an economic perspective, profits are means for business survival and investment (Tirole 2017, p. 175).

Theories of the Firm and Business Legitimacy

The Firm as a Legal Institution

The relevance and importance of the legal system for a world with transaction costs has been stressed by Ronald Coase in his Nobel lecture: "Because of this, the rights which individuals possess, with their duties and privileges, will be, to a large extent what the law determines. As a result the legal system will have a profound effect on the working of the economic system and may in certain respects be said to control it" (Coase 1991). Therefore the firm as a legal institution is of first and foremost relevance for the legitimacy of business in a society. The legal system defines the limits of actions of firm owners, the firm's management, as well as the stakeholders. Although legal rules can be changed, the legal system itself restricts these changes, too.

The legal objective of business corporations was summarized very briefly by the Michigan Supreme Court in 1919: "A business corporation is organized and carried on primarily for the profit of the stockholders" (Michigan 1919). John Commons put it as follows: "Thus the going business, while it is a flow of transactions, is built upon the expectation of implied agreements that the transactions shall be the means of compensation for services not yet compensated. It is a process of investment and liquidation implied in the institution of private property which gives to the proprietor power to withhold service until the expected compensation is deemed satisfactory. It is the recognition of this ethical relation between investment and compensation, that in recent years has led to re-definitions of both Capital and Property" (Commons 1924, p. 207).

Although the Michigan (1919) decision is no longer applied in its strict sense, its nucleus is still intact; anything that provides a plausible positive link between decisions of a firm's management and the value of the firm for its shareholders is legally acceptable and does not violate shareholders' rights. Legally, managers are fiduciaries of the investors, i.e., the stockholders. In this respect, the firm as a legal entity meets the economics of the capitalist firm, as pointed out above.

Said very simply, there are legal constraints to the objectives of managers in a capitalist firm. The most serious constraint is that no management policy is acceptable that violates shareholder rights to the extent that it reduces substantially the value of their claims (Strine 2012). Of course, the laws may provide regulations that do exactly that, but for all firms. The general and specific rules of law restrict also the rights of shareholders. This cannot be done unilaterally by the management in complicity with or in reaction to stakeholders.

The legitimacy implications can be summarized as follows: (1) The legal legitimacy of business is identical with law compliance. (2) Managers of firms and corporations are legitimated trustees of the firm owners and investors. (3) Long-term profitability – restricted by the law – is the most prominent legitimacy of business (OECD 1999). A problem may nevertheless occur, if the "retain and reinvest" strategy is replaced by a "downsize and distribute" strategy in which (profitable) firms are liquidated and the profits distributed among shareholders (Lazonick and O'Sullivan 2000).

The Firm as an Agency and a Contractual Arrangement

The starting point is the famous statement of Eugene Fama: "The firm is just a set of contracts covering the way inputs are joined to create outputs and the way receipts from outputs are shared among inputs" (Fama 1980, p. 290; see also Jensen and Meckling 1976, p. 310, who determine firms and other organizations as "legal fiction," i.e., "...the artificial construct under the law which allows certain organizations to be treated as individuals"; footnote 12, p 310).

First of all, the firm as a social entity is defined by Fama (1980), as well as Jensen and Meckling (1976), as the result of a large number of contracts. The basic (legal) principle is the freedom and voluntariness of contract. The objective of these contracts is twofold: (1) to determine how input factors are combined to produce output and (2) the distribution of the net surplus (or rent or residual claims) after the remunerating of all factors of production. As already said above, the firm as an organization is required because of transaction costs.

Nevertheless, the existence of markets plays a crucial role in the contractual theory of the firm. The reason is that firms compete with each other. Competition restricts the firm-external conditions for firm-internal solutions for management issues and opens up opportunities for business. In this sense, competition is a discipline device for all firm members and for managers in particular (Fama 1980). The separation of ownership (in securities rather than ownership as such that is seen as irrelevant in modern large corporations) and control that seemingly creates incentive problems for all participants can be solved by adequate incentive mechanisms and performance monitoring schemes for teams, individuals, and the management within firms (Fama 1980). As a consequence, the separation of ownership in securities and control is rather a solution than an issue for the so-called agency problem, i.e., if one party in a relationship with conflicting goals – for instance, the management of a firm – should act in the interest of the other party.

As pointed out by Jensen and Meckling, their theory of the firm intends to combine the theory of property rights, agency theory, and finance theory to get a new theory of the firm (Jensen and Meckling 1976). Most importantly, they stress that the firm is not an individual but rather comparable with a market; the outcome of firms is then an equilibrium of different individual objectives within the contract framework that defines the firm. Corporations with inside equity (in the hands of managers), outside equity, and debt (in the hands of persons or institutions outside the firm) are seemingly well-equipped to minimize agency costs. In detail, agency costs encompass monitoring costs, costs of economic bonding, and residual income loss. Put differently, there is no other form of organizing large firms that operate with "other people's money" in such a way that the costs involved are at a minimum as a publicly held corporation. Moreover, the separation of decision management from residual risk bearing in large publicly held corporations allows to use external risk sharing (Fama and Jensen 1983). Without external risk sharing, the management would concentrate too much on the surviving of the firm than on the exploitation of economic opportunities. The separation of management decisions on the one hand and the control of the management on the other hand solve the agency problem (Fama and Jensen 1983).

These considerations have a crucial impact on the interests of stockholders in open corporations. As shown by Fama and Jensen (1985), in a perfectly competitive capital market in which stock prices contain all relevant information and where no transaction costs exist, maximizing the current market value of stockholders' wealth is the best strategy because it maximizes the future stream of consumption for stockholders. Depending on the contractual structure, this might be different for, e.g., closed corporations, partnerships, or nonprofit organizations (Fama and Jensen 1985). After all, the minimization of agency costs determines the ownership structure and, hence, the legal form of the firms.

The implications of the contractual and agency theory of the firm for business legitimacy can be summarized as follows. (1) Given the legal framework for establishing businesses, particular organizational forms of firms, as well as their solution for agency problems, are chosen deliberatively. Workers, investors, and managers are free to accept these contracts. (2) Private written and unwritten contracts govern the production process and the distribution of residual claims. (3) The main legitimacy of business is the creation of conditions for voluntary cooperation to provide economic values for customers and the society as a whole.

The Firm as a Collection of Assets and Capabilities: Resource-Based View of the Firm

Not resources, but the services that resources can provide are the real inputs in production processes; the management of a firm is the firm's capability to make use of these services (Penrose 1959). Hence, the management and the firm's resources, in combination with the management's capability to make use of the services of the resources, define the perceived opportunity set of a firm.

Resources that are not fully employed are a source for experimentation and innovation. "Unused productive services are, for the enterprising firm, at the same time a challenge to innovate, an incentive to expand, and a source of competitive advantage. They facilitate the introduction of new combinations of resources - innovation - within the firm" (Penrose 1959, p. 85). The so-called Penrose effect describes the capability of the management as the firm-growth limiting factor (Tan and Mahoney 2005).

According to Wernerfelt, the crucial strategic element in a firm's resource acquisition is to make it "more difficult for others to catch up" (Wernerfelt 1984, p. 173). Among such rare resources are machine capacity, customer loyalty, production experience, and technological lead. Rare resources are in this view employed to gain competitive advantage by enhancing market imperfections.

The role of invisible or intangible assets as firm resources is stressed by Itami and Roehl (1987). Among these assets are reputation, corporate culture, technology knowledge, brand names, and – particularly relevant in the age of Big Data – accumulated information on customers. As pointed out by Mahoney (2005, p. 261), invisible assets are important as they can hardly be bought for money, its development and accumulation cost time, and they can provide a multitude of uses and benefits. Therefore the value of these assets for a firm may be very high.

In effect, the resource-based view of the firm underlines the peculiarity of the firm's resources, management capabilities, and the value of underused and invisible assets in order to gain competitive advantage and, hence, economic rents.

The essence of the resource-based view of the firm for business legitimacy is (1) the provision of an experienced, highly capable management to unlock the services of resources for creating economic rents. (2) By the efficient use of resources, abundant resources can be employed for innovations. These innovations may promote Schumpeter growth from which society will benefit. (3) Invisible or intangible assets, particularly accumulated information, as well as technical and organizational knowledge, may enhance the dynamics of the economy.

Behavioral Theory of the Firm

Firms are organizations; as such, they exert authority and influence the habit of their members; instead of being rational, individual organizational behavior is driven by bounded rationality via "satisficing rules of thumb" (Simon 1970).

Nevertheless, the most important new insight of the behavioral theory of the firm is that a firm is rather a quasi-political coalition of its members than a mere agglomeration of individuals. As a coalition, a firm is a social entity with its own internal norms, conflicts, and resolutions (March 1962). Therefore, the management of a firm is obliged to resolute conflicts and to avoid uncertainty for the firm's members (Cyert and March 1963). In effect, the objectives of the firm are compromises between the firm-internal group interests, in particular market shares, profits, and sales (for a review of research on the politics aspects of firms following the Cyert and March approach, see Gavetti et al. 2012).

In this respect, manager entrenchment can become a serious issue, as shown by Shleifer and Vishny (1989). A manager can reduce the probability of its replacement by investments that are specific to her or him, at the costs of shareholder value. Even investments in corporate social responsibility may be (mis)used as an entrenchment tool (Cespa and Cestone 2007). Moreover, manager power makes the remuneration of managers very costly (Bebchuk and Fried 2003).

In the behavioral theory of the firm, business legitimacy (1) rests on internal organization, i.e., on the ability of the management to avoid uncertainty and to arbiter conflicts between groups within the firm over the distribution of rents. (2) In a sense, the firm is rather a political coalition of groups than an agglomeration of contractual arrangements. Nevertheless, its activities are legitimated by creating economic rents that are secured by managerial conflict resolution. (3) The firm's outside world may offer ways for the management to appropriate a larger part of the organizational rent than required to fulfill its proper function.

The latter aspects lead directly to the stakeholder theory of the firm.

Stakeholder Theory of the Firm

Stakeholder theory surpasses the boundary between the firm and its socioeconomic environment by rendering the firm-society embedding interactive. As argued by Donaldson and Preston (1995), the stakeholder concept puts the firm at the center of a give-and-take relationship with employees, investors, suppliers, customers, communities, political groups, governments, and so on. In a certain sense, it could be said that the firm is in this concept a political organization whose existence depends on the mutual benefits for the firm and its relevant environment.

Moreover, according to the stakeholder theory, relevant stakeholders not only want to be involved in the firm's decision-making process but also to get a share of the firm's economic rent. In a more advanced form, Freeman et al. propose the following three (out of six) principles for a so-called stakeholder capitalism: (1) stakeholder cooperation, "[v]alue can be created, traded, and sustained because stakeholders can jointly satisfy their needs and desires by making voluntary agreements with each other that for the most part are kept" (Freeman et al. 2010, p. 281); (2) stakeholder engagement, "[t]o successfully create, trade, and sustain value, a business must engage its stakeholders" (Freeman et al. 2010, p. 282); and (3) stakeholder responsibility, "[v]alue can be created, traded, and sustained because parties to an agreement are willing to accept responsibility for the consequences of their actions" (Freeman et al. 2010, p. 282). Obviously, these are also the principles of shareholder capitalism, as implicitly contained in the contractual theory of the firm. If these principles really became effective, stakeholders would be de facto shareholders. Stakeholder theory, therefore, may be interpreted as an extension of shareholder theory, encompassing "relevant stakeholders." Moreover, the question is whether the firm will be transformed into a political coalition of shareholders, the management, employees, and "relevant stakeholders."

The two most relevant legitimacy questions are firstly, who are those "relevant stakeholders," and secondly, how can stakeholders be held responsible for the activities of the firm when they do not own a financial stake in the firm? In a so-called theory of stakeholder identification and salience, Mitchell et al. (1997) proposed three criteria for the salience of stakeholder to managers of a firm: power, legitimacy, and urgency. Stakeholders have power if they can impose their will on a firm by using coercion, financial and other resources, or normative claims (Mitchell et al. 1997, p. 865). Legitimacy is defined as in Suchman (1995), quoted above in the Introduction. Urgency means that the claim of the stakeholder is time critical and highly important concerning the relationship with the firm or its management, respectively (Mitchell et al. 1997, pp. 867 f).

Behind these definitions, a double legitimacy issue is hidden. The first is the firm's business legitimacy that seemingly does not directly depend on stakeholders. The second, however, is that stakeholders themselves must or should be legitimated to approach powerfully and urgently the firm or its management.

The first issue is that the firm is legally obliged to be accountable and liable for damages it causes by its actions and activities; stakeholders are not. As a consequence, stakeholder legitimacy cannot be based on legal or economic demands but only on moral claims. Concerning the second issue, the question is who decides which shareholders have powerful and urgent claims to managers or the firm? In the end, this is an empirical question. If stakeholders have power, they may define that their claims are urgent. This would change the moral character of the claim to a question of power.

The next implication is that within a corporation, either the management, the shareholders, or the employees may be the most powerful group. Outside stakeholders, therefore, may be urged to join one of these groups to become powerful. Put differently, a particular group inside the corporation or firm may join an outside stakeholder group to gain dominant power inside the firm, as already pointed out by Shleifer and Vishny (1989). In this way, stakeholder activism may harm substantially the (legally protected) interests of shareholders or owners and other stakeholders as well.

This leads to the question how outside stakeholders can be held responsible for the consequences of their activities and actions concerning the firm. As it seems, this question is not even asked, let alone answered in the relevant literature. It would only be irrelevant if stakeholders did only participate in the race to gain a share as large as possible from the economic rent a firm creates. Though it reduces the shares that shareholders and other groups inside the firm can appropriate, it does not harm the core business of the firm. This would be in accordance with the "enlightened value maximization" approach of Jensen (2002). Moreover, as also pointed out by Jensen (2002), multiple objectives are neither well-defined nor can they be applied as a guideline for managers.

In stark contrast, Harrison and Wicks argue that ". . .firm performance might be defined as *the total value created by the firm through its activities, which is the sum of the utility created for each of a firm's legitimate stakeholders*" (Harrison and Wicks 2013, p. 102; in italics in the original text). The authors provide a table of examples for specifying and measuring via potential proxy variables the happiness/well-being of employees, customers, suppliers, shareholders, and community. Even if these items were measured accurately, it would remain unclear who will define to want extent and with which weight the particular objective(s) is attempted. This is again a question of the legitimacy of stakeholder claims over and above the shareholders' objective, represented by the maximization of the long-term firm value (Hayek 1967; Jensen 2002; Sundaram and Inkpen 2004).

The latter question is addressed by Mena and Palazzo (2012), as well as Tricia Olsen (2017). Mena and Palazzo restrict stakeholder activities to the regulation of social and environmental externalities of global business that are unattended by governments. They analyze the conditions for the legitimacy of global institutions (i.e., corporations and civil society organizations) for so-called soft law regulation. On the one hand, "inclusion, procedural fairness, consensual orientation, and transparency" are identified as "input legitimacy criteria" and on the other hand, "rule coverage, efficacy, and enforcement" as "output legitimacy" conditions. However, such soft law regulations as (unwritten or written) private contracts are always possible, as long as they do not contradict national laws. In the latter case, a conflict between own legitimation and democratic legitimation might nonetheless occur. This tension between the state and stakeholder legitimacy is considered in Olsen's (2017) political stakeholder theory. In her theory, the state – and not managers – ultimately determines the legitimacy of stakeholders, although the influence from stakeholders and firms on the state is not excluded. However, the state has the legitimate power to regulate both corporations and stakeholders. Consequently, the legitimacy of firms may depend on the legitimacy of stakeholders – and vice versa. In a final analysis, the state is a unique stakeholder because only the state can legitimately use force (Olsen 2017, p. 76).

To summarize, business legitimacy and stakeholder legitimacy seem rather closely connected to each other. (1) Businesses, as well as stakeholders, require state legitimation. In a sense, the state and business and stakeholders are coproducers of social value and wealth. (2) A combination of shareholder and stakeholder theory implies that business is legitimate if it maximizes the long-term firm value. In this respect, stakeholders participate in the firms' economic rents because of not internalized external effects. (3) Although there is a multitude of stakeholders and a large number of values that stakeholders want from firms, the legitimacy and effectiveness of stakeholder claims depends to a large extent on state regulations of firms and stakeholders.

A Broader Economic View on Business and Its Legitimacy

In this section, a deeper economic view is applied to answer the question of the legitimacy of business by taking into consideration several greater issues of actual or alleged failures of firms, corporations, and markets. The following issues will be discussed:

- Market power
- Multinational and “footloose” enterprises
- Lobbying

The reason for choosing these issues is that these aspects of businesses arise from a combination of economic and financial decisions within firms and corporations, but also from a certain regulatory framework provided by the state’s economic policy. The latter cannot directly or easily be incorporated into economic and financial theories of the firm, although it plays a role in the stakeholder theory of the firm (see section “Stakeholder Theory of the Firm” above).

As argued in the previous section, the state is a unique stakeholder. In particular, the state’s policy defines the legal and regulatory framework for the actions and activities of businesses. This framework must be taken into account since it establishes the first-order conditions for the legitimacy of business, so to speak. Violating these conditions, businesses would risk to lose their “license to operate.”

However, it may be argued that the state’s first-order conditions for business legitimacy are not sufficient because they might be compatible with market power of corporations, multinational or even “footloose” enterprises, and political lobbying by firms. These aspects of business could be the origin for firm behavior that risks to violate the second-order condition for business legitimacy as provided by widely shared social norms.

Business as Creator of “Value Added” and Wealth: The Problem of Market Power

It is globally accepted that the state is responsible to set up a framework that guarantees competition among enterprises to avoid monopolies, as well as companies with significant market power. In particular, the reason of antitrust laws is to prevent the misuse of market power. This means that although large enterprises may exist for economic reasons, their market behavior is observed and sanctioned if it is in conflict with antitrust laws.

The misuse of market power may hurt customers, employees, suppliers, as well as newcomer businesses. In recent times, the so-called superstar company (The Economist 2016), mostly IT-related and other high-tech businesses, emerged in markets with strong network effects. The latter means that the products and services of these companies are the more valuable the larger the so-called installed base (i.e., the number of customers) is (Shy 2001).

The scandal at Facebook in connection with Cambridge Analytics is one of the signs that superstar companies may have market power that cannot easily and effectively fought by ordinary instruments of competition and antitrust policy. Moreover, countries may decline the application of antitrust laws if their superstar companies are relevant for the country’s industrial policy. Instead of manager entrenchment, company entrenchment is the new game in town (The Economist 2016).

Probably the most dangerous policy of these firms is to buy startups. The data collection of these firms is huge, and the customers' control over their own data is nil. To acquire these data, services worth billions of US dollars are given presumably for free to customers. Privileging their own platforms and services, competition is restricted to a large extent. The highest danger, however, seems to be the concentration of data, as described by Nunan and Di Domenico (2017).

Such developments do not only threaten the functioning of markets in economies but also the legitimacy of business. One can no longer deny that superstar companies have market power. Although it might be difficult to prove that they are misusing their power in the sense of antitrust laws that had been put into effect before superstar high-tech and IT companies grew big, the just-mentioned observable behavior gives rise to conjecture that there is such a misuse of power. Obviously, the misuse of market power, not negatively sanctioned by antitrust and competition policy, gives reason to doubt the legitimacy of these businesses, too.

To summarize, although there are economic arguments that market power of high-tech and IT companies is justified by large network effects, the misuse of the power is definitely not. Restricting market access for newcomer firms, privileging own platforms and services, as well as collecting and using customers' private data for their own business without informed consent of the customers is sowing the seeds of doubt as to the legitimacy of those businesses.

Business as an Accountable and Liable Entity: The Problem of the Multinational, Transnational, and Footloose Enterprises

Small and medium-sized enterprises (SMEs) are the heart of national economies as they provide by far the most jobs; in contrast, large multinational enterprises (MNEs), transnational corporations (TNCs), and footloose enterprises are no longer nation-based, although they create the largest part of the gross domestic product (GDP). SMEs must comply with those national laws and regulations where they are located. TNCs choose those states and locations where they can profit most from the respective laws and regulations. A case in point is the tax avoidance of TNCs; for instance, according to Phillips et al. (2017), 73% of the Forbes 500 companies used offshore subsidiaries in tax havens. The behavior of MNEs and TNCs with respect to state regulations could be dubbed as "regulation shopping" (with respect to international business taxation, "treaty shopping" is a closely related term), i.e., to locate specific activities of the enterprise at those locations and countries where the regulatory compliance costs are minimized.

The crucial question is whether TNCs and their likes have the same legitimacy as SMEs, even if they behave in a manner that is open to criticism. First of all, although the regulation density and deepness depend on the level of a country's economic development, it is not clear whether a worldwide regulation would really enhance the welfare of all. In this respect, it seems not very convincing to say that private enterprises are more powerful than states, as documented in Fuchs and Lederer (2007). If a state decides that it is best for its citizens to attract foreign firms by specific offers, it is doubtful that this is a reason to condemn such a behavior without qualification. In effect, all countries conduct policies to attract businesses, with different methods.

Secondly, to make a difference, only those regulations may be enforced worldwide that are accepted by most or all countries. For instance, basic human rights have this quality. As pointed out by Prinz (2017), complicity of corporations with governments that are unwilling or unable to regulate the enforcement of basic human rights in their countries could be called corporate social irresponsibility. Such a behavior would put the legitimacy of business at risk.

Thirdly, competition with business regulation and business taxation can be very useful from an economic point of view, at least to a certain extent. Worldwide regulations can only be put into effect if all countries agreed to such treaties. Economically, such treaties can be welfare enhancing if global externalities are the reason for the regulation. Nevertheless, even such regulations must take into account the differences of economic productive capabilities between countries. Otherwise, poorer countries would be hurt. If MNEs and TNCs take advantage of these regulatory differences, it is difficult to deny their business legitimacy in this respect. Although this might be judged quite differently in rich countries, poor countries must also have legitimate instruments to improve their economic well-being. Moreover, it is to expect that regulations in poorer countries will converge to those in rich countries when their economic productive capacity increases accordingly. The point is, however, that the governments in poorer countries are not corrupt and legitimated according to democratic principles.

A further related problem is that MNEs and TNCs may have the power to influence the regulations in those countries where they are located (Forsgren 2017, Chap. 7, p. 131 ff). If the democratic checks and balances of the respective political system do not restrict this power in such a way that the population decides on politicians and policies, the respective businesses are also at risk to lose their legitimacy.

To sum up, not all differences in business regulation and business taxation between countries are bad and should put business legitimacy at risk if enterprises use them to their advantages. If a country adopts rules of regulation and taxation according to democratic principles, it is to be presumed that enterprises can use them legitimately to their advantage. If this is not the case, that is, if countries do not comply with basic human rights, the state is corrupt, or big business employs its power to define the rules of the business game in an undemocratic way, their business legitimacy is at risk.

Business as a Political Actor: The Issue of Lobbying

As mentioned in section “Business as an Accountable and Liable Entity: The Problem of the Multinational, Transnational and Footloose Enterprises,” business as a political actor is a fact that cannot be ignored concerning its legitimacy. There are three questions that are relevant in this respect:

1. Do businesses manipulate democratic elections by campaign contributions?
2. Do businesses manipulate legislation to their own advantage by lobbying?
3. Do businesses undermine policies by regulatory capture?

First of all, businesses as legitimated institutions of society are relevant for politics because they are the main sources of economic value creation. This fact is the main reason for business legitimacy.

The first question is whether enterprises can manipulate democratic elections. The main source for such a manipulation is campaign financing of political parties. As long as political campaign contributions remain within the legal limits, there is no obvious argument that manipulation might occur. However, there are theoretical arguments for both that campaign donations may have an effect because of government's large expenditures for goods and services and that such donations will not have any impact since the winning probabilities for the candidates are not changed much by the individual contributions (Grossman and Helpman 2001).

Ansolabehere et al. (2003) argue that not only the US contributions remain beneath the legal limits, but also that most donors are individuals and not companies. Moreover, the contributions did not increase over time. They conclude that campaign contributions should not be interpreted as investments but rather as a consumption good or participation good of the donors.

This might be different in poorer countries where politicians and political parties depend to a larger extent on firm contributions. In such cases, public financing should be considered as an alternative as, for instance, in some European countries.

A greater importance has lobbying by enterprises, as argued by Kowal (2018). According to his results, it is the network of trade associations that is of particular relevance. An economic counter argument is, however, that costly lobbying delivers unintendedly important information about firms and sectors to legislators, despite the fact that the information provided by single lobby groups is biased (Grossman and Helpman 2001, Chap. 5, p. 143 ff). The reason is that the more urgent and important the information is that a lobby group wants to transmit to policy makers, the higher the costs it is prepared to bear. In this way, legislators receive information they could not get otherwise.

The most crucial political issue of regulations is called regulatory capture. It means that a government agency with the task to supervise industry regulations changes sides and works in favor of the industry instead of society. The reasons are asymmetric information between the regulatory agency and the industry, different interpretations of the legal regulation rules, and incentives for persons (Dal Bó 2006). Since people in the regulated industry have almost always more information about their business, they have an advantage to the regulation agency. If the agency employs persons from the industry, it cannot be sure whose interests they represent. Additionally, the legal rules almost always require interpretation; this interpretation often differs greatly between the agency and the industry (Randolph and Fetzner 2018). Last but not least, persons working for the agency may expect a subsequent employment within the regulated industry (so-called revolving door effect).

The empirical evidence is mixed. As argued by Dal Bó (2006), ideology of agency administrators plays a role, and elected agency persons may be more pro-consumer than otherwise chosen regulators. Moreover, external experts may be required to strengthen the abilities of the agency. According to Dal Bó, however, it is not clear whether funding, professionalism, and talent are important for the regulation.

To sum up, there is no clear indication that the power of business undermines politics. Although the manipulation of elections, lobbying, and regulatory capture are serious dangers for business legitimacy, there is no obvious evidence for these issues to be crucial in highly developed economies and societies. Nevertheless, this is a field of business activities that requires political attention.

The Enforcement of Legitimacy Norms

Without enforcement, legal rules, as well as social norms, will not be generally applied. While the enforcement of legal rules is delegated to authorities, the implementation of social norms occurs in a very different way. If social norms are widely accepted in a society, they may become laws (Bénabou and Tirole 2011). Meanwhile, however, whether a norm is applied or not depends on the decision of people who are the addressees of the respective norm. In other words, people have a larger degree of freedom in norm application than in law compliance.

In the following, the legality of business is assumed. That is, the respective business is founded and run according to the laws. Moreover, it is also assumed that the laws are enforced. If law enforcement is weak, the best remedy is to increase enforcement. In this respect, social norms are different. The measures to enforce social norms concerning the legitimacy of business taken into account here are:

1. Consumer choice (personal social responsibility)
2. Business reputation
3. Financial markets (shareholders, creditors, investors)
4. Stakeholder interference

(1) In a market economy, consumer choice plays a dominant role. If firms cannot sell their products, they will lose automatically their legitimacy via bankruptcy. Insofar, the economic survival of firms is a first substantial test of its legitimacy.

Nevertheless, markets can fail because of material and informational externalities. In principle, it is the task of the government to internalize such externalities. Governments, too, can and do fail quite often (Beck and Prinz 2015; Schuck 2015). From an economics point of view, this causes a dilemma as the internalization of externalities with positive transaction costs is a public good. This implies that consumer choice, carried out on the personal level, acts in this respect as the provider of a public good (Besley and Ghatak 2007). In a sense, private social responsibility would act as a substitute for government policy.

Consumers can avoid products and firms that violate social norms they share. The main question is: What motivates consumers to "punish" firms that produce non-internalized negative external social and environmental effects, i.e., that behave illegitimate in their view? Beside altruism, the visible social self-image may provide such a motivation (Ariely et al. 2009; Bénabou and Tirole 2010). Nonetheless, the impact of individual consumer choices seems not to be strong. The willingness to pay higher prices for goods that are morally more acceptable seems rather low (Öberseder et al. 2011). Nevertheless, consumers are prepared to protest against social irresponsible firm behavior (Grappi et al. 2013). The latter can have negative effects, even for the ethical standards of firms. Baumann and Friehe (2017) demonstrate in a theoretical model that firms may change to a worse production mode and decrease the market transparency of the production mode.

As a consequence, it seems unlikely that consumer choices alone can solve the issues of not internalized negative externalities. The main reason is that the effort to stage protests and to change the consuming behavior must be rather collective than individual. After all, the private supply of public goods is restricted to cases in which the private benefit of the public good is high.

(2) Business reputation has become a major issue in all enterprises. The first reason is the rise of social media that makes it possible to distribute information and gossip about firms and their (mis)behavior very quickly and widely. At the extreme, a shit storm may result, whether justified or not. The second reason is the growth of corporations and the number of their subsidiaries at home and abroad, as well as the length of their supply chain and the number of subcontracted firms. As a novel development, firms may (or may not) own now "reputational capital," defined as the value of the firm over and above its liquidation value, as well as the value of its intangible intellectual capital (Fombrun et al. 2000). This capital is at reputational risk if the firm is misbehaving in the eyes of its stakeholders. The risk of reputation rests on the perception of a company, often in contrast to its reality; if its reality is worse than its reputation, then there is a risk (Eccles et al. 2007).

The reputation of some industries in the economy is contemporarily confronted with negative social norms, for instance, so-called sin products as tobacco and alcohol. Nevertheless, these products are demanded by customers. Empirically, the stocks of the companies that provide these products have higher expected returns in comparison to other comparable stocks; the reason is that they own lower reputational capital; therefore they must provide a financial compensation for their stockholders (Hong and Kacperczyk 2009). In this example, stockholders require a sin-premium for holding such stocks.

The question is, however, whether corporate social responsibility pays off for companies. If social responsibility of firms is valued by shareholders, it should be expected that those companies can live with lower expected returns on capital. Moreover, if social responsibility of firms is a win-win arrangement, firms that offer social responsibility should have also higher returns on capital. In an analysis of studies concerning win-win social responsibility, Rost and Ehrmann (2015) detected positive reporting biases, i.e., that the empirical studies overestimated the efficiency of social responsible firm behavior.

According to the “risk management hypothesis,” firms with reputational capital based on corporate social responsibility accumulate a kind of insurance against adverse effects on the firm’s reputation (Godfrey 2005). In an empirical test, Godfrey et al. (2009) find evidence for this hypothesis but only if social responsibility activities are directed to society as a whole. Ducassy (2013) provides also some but not full evidence for the risk management hypothesis.

Finally, there is some evidence from an empirical viewpoint for the idea of an insurance against negative reputation shocks by social responsibility of firms. Although some doubts are possible, reputational capital may become a relevant concept for evaluating enterprises. Reputational capital may also be an indicator of business legitimacy within society as a whole.

(3) Financial markets may also take the position of referees for business legitimacy. In a certain sense, these markets act as a financial discipline device. If firms overspent or spent their financial resources for outside business activities, financial markets may punish this. Since shareholders, investors, and creditors on the one side and (secondary) stakeholders on the other side differ according to the money they put into the firm, the first group has a vital interest in a profitable firm. As already shown by the construction of business law, the management is legally responsible to its shareholders, as well as its creditors.

Despite much recent criticism of financial markets, they do function quite well in normal times. Of course, no regulation or bad regulations of these markets provide the basis for financial crises that may have strong and long-lasting effects on the economy. As indicated by the above sin markets (Hong and Kacperczyk 2009), a sin-premium must be paid by those firms to attract capital. With a win-win version of social responsibility policy, the financing of firms should not lead to problems.

However, if firms pay much for social measures that are not motivated by the firm’s business, the necessary profit to satisfy investors must come from other sources. Taking this into account, tax avoidance of otherwise socially responsible firms can be explained (Avi-Yonah 2014; Dowling 2014; Davis et al. 2016). There is some economic reason in this behavior, however. Since corporations provide a public good via investments in socially responsible activities for society, the latter participates in these costs by less tax revenue. This might be interpreted as the counterpart of the indirect subsidization for some charitable contributions of firms via tax laws. This interpretation is supported by the empirical result that detected tax-avoiding firms seem not to bear reputational costs and, if, then only for a short period of time (Gallemore et al. 2014).

(4) Stakeholder interference is the last measure to enforce social norms on firms considered here. The problem is how salient stakeholders are selected and what kind of motivation stakeholders may have. Not all stakeholder engagement and involvement is created equally, so to speak. Stakeholder interference may impose widely shared social norms on firm activities; however, it may also change firm activities to the worse. Responsibility of stakeholders is strictly required to improve the result of economic activities of enterprises. As said by Michelle Greenwood (2007), stakeholder engagement should be rather seen as a “morally

neutral practice" (Greenwood 2007, p. 315). This is in contrast to the view of Freeman et al. (2007) who would like to reframe capitalism ethically into "stakeholder capitalism."

Of course, stakeholder participation, engagement, and interference might be justified by economic, social, and ethical arguments. Nevertheless, the survival of the firm in its existent form should not be at stake. Since there are a large number of legal types of firms, stakeholder activism could be used to create nonprofit firms. However, if stakeholders want a long-lasting representation within the firm instead outside of it, several forms of participation for activist investors are available (Prinz and van der Burg 2006, 2010, 2013). These forms of engagement put stakeholders in the position of shareholders as they will have a financial stake in the firm. After all, this could be probably the best form of stakeholder engagement.

Conclusion

All in all, the main source of business legitimacy is the creation of economic value by providing goods and services. The evolution of the dominance of capitalistic firms demonstrates that capital is the scarce factor of production. Over time, human capital emerged as a new form of the quality of labor services that is accumulated, depreciated, and reinvested in a similar way as physical capital. In addition, reputational capital is a recent version of intangible capital that can also be accumulated, depreciated, and reinvested over time. Most recently, digital capital (i.e., customer data) as the newest form of capital is on the rise.

The justification and legitimacy of business and the economy as a special subsection of society requires that the creation of goods and services remains the dominant objective of business and of the economy. Instead of being an end of its own, goods and services determine only the material conditions of life in a society, and, therefore, they are the precondition for ethical, social, cultural, and political values. All theories of finance and the firm considered in this contribution demonstrate that the incorporation of other than economic values in the objective function of the firm would demand too much of firms, enterprises, and corporations. This holds even true for the largest corporations.

A well-understood stakeholder theory acknowledges the awareness that the creation of economic value is the nucleus of the legitimacy of firms. Since the creation of economic value requires first of all that the value of the product or service is larger than the costs of providing it, profits as the price for providing equity capital are indispensable. A well-understood stakeholder theory will acknowledge this, too.

Given the dominance of capitalist firms, a societal redefinition of values to be provided by firms requires that consumers are willing to pay for these values. If consumers' willingness to pay suffices, business will adjust to that and provide the new values whatsoever.

Otherwise, legal changes are a method to force all businesses to adopt new standards of creating economic value. However, these standards will always serve as restrictions on business activities; they will not become part of the business objective function.

The legitimacy of business is never absolutely fixed. A crucial issue for business is the volatility of legitimacy claims by stakeholder groups; another issue for business and politics is the legitimacy of stakeholders. In this respect, the state is a very special stakeholder as it can define its own rules as laws for all businesses and it can enforce them by force. Moreover, the state may determine the legality of stakeholders and their claims.

Part XVII

Legitimation with Different Forms of Practice of Legitimacy in Complex Societies

NGOs, Institutions, and Legitimacy: Empirical Findings and a Research Agenda

65

Tobias Gössling and Thomas Straub

Contents

Abstract

In this chapter, we discuss the possibility to assess and communicate NGO performance. We argue that legitimacy is a crucial factor for performance. The aim of this research is to analyze conditions that influence NGO legitimacy. We base our work on empirical data. The data was gathered in interviews with NGO executives in childcare organizations in Chisinau, Moldova. The interviewees discussed conditions for the legitimacy and performance of their organizations and the analysis of their statements unveiled that the performance indicators are embedded in constellations of these conditions. Consequently, we suggest a constellation analysis for assessing NGO legitimacy and performance.

Introduction

German supermarket chain EDEKA communicated to ban Nestlé products from their shelves due to a dispute about Nestlé's price and retail policies in 2018. Meanwhile, other companies, decided to boycott Nestlé in several contexts that are not related to the consumption quality of their products but rather to their sourcing, environmental, and human rights policies. For example, the gourmet guide GUSTO decided to not place any Nestlé water commercials because they disagree with Nestlé's water sourcing policies, especially in poorer regions of the world. Nestlé, though being known for their wide variety of products and activities have suffered from share price decreases in the context of this situation.

This example shows that legitimacy is important for performance and action possibilities of organizations. This is also the reason why legitimacy, defined as "generalized perception or assumption that the actions of an entity are desirable, proper or appropriate within some socially constructed system of norms, values, beliefs and definitions" (Suchman 1995, p. 574), is also referred to as the "license to operate" (Gehmann et al. 2017, p. 293; Gössling and Buijter 2017, p. 117). Organizations that do not appear legitimate to the society may lose their license to operate and experience difficulties for pursuing their activities. Organizations in general can gain legitimacy with regard to three aspects of their activities. First, the idea of pragmatic legitimacy relates directly to the products and services that organizations are offering. If those are needed and demanded on the market, organizations can operate successfully. Second, organizations can demonstrate that their activities positively relate with societal expectations about their behavior to gain moral legitimacy. Finally, organizations can manage their communication and appearance in such a way that they are appreciated or taken for granted in societies (Suchman 1995). This form of legitimacy, cognitive legitimacy, is a perception of the organization that might differ from its behavior but that is eventually of major importance for the relation between societies and organizations (Suddaby et al. 2017). It is worth mentioning that the equation of legitimacy as the license to operate is appropriate in that sense that we can severe financial and marketing consequences of a lack of any type of legitimacy for organizations (Matejek and Gössling 2014). However, examples for a complete withdrawal of the license to operate are rather scarce in that sense that organizations usually survive even major legitimacy crises.

Among the different types of organizations pursuing a greater good for society, Nongovernmental Organizations (NGOs) play a central role. NGOs are organizations which are made to achieve social goals and are not controlled by a government (Kourula and Laasonen 2010). Due to their independence and their embeddedness in the civil society, their level of legitimacy is per definition rather high as compared with both government as well as companies (Zadek 2001). However, there is an increasing pressure on NGOs to document their credibility and their commitment and success with regard to their societal goals (Dhanani and Connolly 2015; Joutsevirta and Kourula 2015).

Whereas the assessment tools and methods for companies are well defined and extensively used to evaluate both their economic performance and their social performance (van Beurden and Goessling 2008), NGOs cannot benefit from these insights and measurement possibilities (Fowler 1996). Even though the documentation of FPO performance has significantly developed in current years to the extent that FPOs are analyzed and evaluated social and financial performance indicators, financial indicators like stock value or return on assets are still regarded as crucial for their assessment.

NGOs are by definition not profit oriented and therefore, it is almost impossible to judge their performance on the basis of classical financial assessment methods. On the other hand, NGO performance is heavily related to, first, the impact of their work on societies and, second, the impression that the respective society has about their activities, in other words, their legitimacy. Legitimacy, however, is also a characteristic of organizations that is rather difficult to assess (Deephouse 1996; Suchman 1995).

Furthermore, NGO legitimacy is regarded as an asset for for-profit organizations to partner with NGOs. For such partnering decisions, however, it is crucial for the respective organizations to assess the legitimacy and other potential contribution of their partner organizations (Glasbergen 1998). NGOs are repeatedly criticized for their lack in adhering to their missions and commitment to doing good (Reimann 2005). The legitimacy challenge for NGOs increasingly consists in the demand to document their adherence to societal goals (ibid., Wagner 2002). That has, amongst others, also to do with the misuse of NGO structures. For-profit organizations and industry associations also make use of the legal form of NGOs in order to undertake political activities that do not represent civil societies' interests but rather particular interests (Polishchuk 2008; Kilduff and Brass 2010; Jamison Gromark 2008). For example, the US CEI, competitive enterprise institute, focuses on stigmatizing environmental initiatives as antisocial and tries to manipulate public opinion about global warming (Lewis 2007; Murray 2005). The German Initiative for new social market economy (Initiative neue soziale Marktwirtschaft, INSW) aims at manipulating societal thinking about employment towards radical market orientation and discredits labor unions as being detrimental for the economic development of a society. They distribute their tinted information material in schools (Speth 2004; Speth and Leif 2006). At the same time, NGOs in the entire world display behavior that makes observers ask critical question about their societal goals and commitment. For example, NGOs are criticized for spending too much money on buildings and personal benefits of their employees (Kamat 2004; Holloway 1997). Also the close collaboration between NGOs and for-profit organizations (FPOs), advocated as beneficial for societies and businesses (Glasbergen 1998), may impose challenges for the legitimacy and credibility of NGOs (Baur and Palazzo 2011).

Consequently, measuring and assessing NGO performance with regard to performance, impact, and legitimacy becomes more important to the same degree as the role of NGOs in societies gains impact and importance.

As for NGOs in general, they need resources. Their and donors, however, individuals as well as groups, may apply rational and critical decision-making when deciding about how to spend their financial means and which organizations to finance. These decisions will not be profit-optimizing in the strict sense, but following rational choice theory, also sponsors will donate their money to those organizations that are most likely to successfully pursue the social and benevolent goals of their sponsors. Consequently, the legitimacy challenge for NGOs increasingly consists in the demand to document their adherence to societal goals (Reimann 2005; Wagner 2002) and an effective use of their resources.

In other words, NGOs exist because of their moral legitimacy. Their reason to exist is the conviction of citizens that the task or purpose that an NGO represents is desirable for societies. At the same time, they are not viable on the basis of their marketable activities. They exist because volunteers work for them and because donators provide financial resources for their activities. In order to get access to funding, NGOs need to document their performance and legitimacy. Communicating their performance will contribute to their viability.

This research deals with the difficulty of assessing NGO legitimacy and performance by relating it to antecedents of NGO success. Even though theses antecedents are neither proxies nor exact measurements for NGO legitimacy and performance, this research suggests that insight into the antecedents of success will contribute to understanding NGO legitimacy and performance.

Problem Field, Research Problem, and Research Question

Our research was conducted in child care organizations and donor organizations in Chisinau, Moldova. Moldova appears to be a forgotten state in Europe. Located at the periphery of Europe, between Romania and Ukraine, without access to international havens, without a highly developed infrastructure and with a rather low level of technological development and industrialization, the country suffers from a rather low level of economic development. The level of income is low for European standards, with an average of about 300 €/month. Even though the possibilities for education are relatively high nowadays, the country is not a typical knowledge society. On the contrary, also access to medication and qualified physicians is limited. Especially on the countryside, the level of information and enlightenment is low (UN development report). Abortion is not illegal, but it is socially traditionally stigmatized. This combination of conditions results in a relatively high level of unintended pregnancies, on the one hand, and a high level of prenatal underdevelopment and nutritional and medical conditions that eventually result in high numbers of medical conditions and handicapped newborns in the country. Additionally, discrimination of handicapped people, especially children, is socially accepted and legally enforced, to the extent that especially handicapped children only have very limited access to state-financed care.

Therefore, in the Republic of Moldova, child care and child development is to a large extent a task that is provided by national and international NGOs. The overall economic development of the state is low, the government does not provide sufficient money for these tasks, accordingly, many grass root initiatives emerge and international NGOs enter the country in order to improve living conditions of orphans, homeless children, abandoned and disabled children.

Even though the NGOs do not compete in their primary activities, which are the provision of child care and development aid, they do compete for resources, especially financial resources. In order to be successful in their funding activities, many NGOs need to demonstrate and document their performance. However, clear performance indicators are lacking.

Furthermore, funding organizations as well as operating NGOs are interested in understanding the factors that influence NGO performance, also in order to make funding decisions and provide guidance for their core activities. In this context, there is a lack of evidence for performance predictors for NGOs.

Therefore, our research question is:

> Which factors determine the legitimacy and performance of NGOs in the childcare sector in Moldova?

Theoretical Development

According to the Resource dependency theory, the performance of an organization, as much as their potential to act and perform is dependent on the resources that they are getting from their environment. In that sense, organizations are even regarded as externally controlled by their partners, suppliers, financers, peers, etc. (Pfeffer and Salancik 1978). Other than FPOs, NGOs cannot produce, market, and sell anything and are therefore crucially dependent on external, often voluntary financing.

In other words, companies compete for market shares; the competition between NGOs is focused on funding. Even though the nature of the competition differs for firms and for NGOs some theoretical frameworks initially designed for firms in competitive environment could also be applied to NGOs. Among the theories extensively employed for analyzing the advantages, a firm can rely on in a competitive environment; the resource-based view (RBV, Barney 1991) explains this competition for resources. The RBV framework rests on the seminal work of Penrose (1959) in which organizations are conceived as distinct entities, each of them having idiosyncratic resources at their disposal. As such, they can use their idiosyncratic resources to build a sustainable competitive advantage by fostering four characteristics of their resources: their value, their rarity, their imperfect imitability, and their imperfect substitutability (Barney 1991). Nevertheless there is a limitation inherent to this conceptualization of the firm. This early RBV framework considered the firms as a single isolated entity, which only uses its own resources, and it did not take into account the shared resources used by several distinct entities, as it is the case for alliances for instance. Lavie (2006) pointed out this limitation and proposed an extension of the RBV in order to define more accurately the competitive advantage of interconnected firms. Interconnected firms are “embedded in alliance networks” (Lavie 2004). Because of their specific activities and organizational configuration, the NGOs, and in particular the ones in our study in Moldova, have common features with interconnected firms. Therefore we will use this latter extension of the RBV for our analysis.

Since NGOs cannot offer any direct material tangible assets in exchange, and given the aforementioned issue of legitimacy, NGOs are crucially dependent on their ability to establish relationships with their peers (Lister 2000; Banks et al. 2015). Given the vast field of research on structural aspects of networks for performance (Burt 1982; Provan and Milward 1995), we include a focus on network activities in our observation. Qualitative approaches to networks have shown to highlight especially the importance of the quality of relationships for organizational performance as well as tie or network performance (c.f. Oerlemans et al. 2007; Ren et al. 2009).

Also Lavie (2006) used insights from the relational view (Dyer and Singh 1998) and social network (Wasserman and Faust 1994) theories. Particularly he proposed that "the capacity of interconnected firms to gain and sustain competitive advantage will depend less on traditional RBV conditions and more on their relational capability—that is, their capacity to form and maintain valuable interactive relationships with alliance partners" (Lavie 2006, p. 650).

Data Collection and Interview Analysis

In a first attempt to explore the field, we held interviews with experts in childcare NGOs in Moldova. We held a total of 30 interviews with donor representatives as well as managers and employees of child care NGOs, of which 12 interviews with NGO representatives, 8 with donors and 10 with international NGO experts. Interviewing these three groups results in a complete overview of conditions that can explain NGO legitimacy and performance. These 30 organizations are chosen as a sample out of a total of 10,000 NGOs officially active in the relevant field in Moldova. Data were collected in NGOs in Chisinau, Moldova, in 2015 and 2016. All NGOs work in the field of child development and child protection in the Republic of Moldova. We added to this sample by interviewing representatives of NGOs in Geneva, foremost donor organizations and INGOs with subsidiaries in Moldova. These interviews took place in the fall of 2015. Finally, we assessed a group of international NGO representatives at an NGO management workshop in Geneva in the spring of 2016. The selection took place on the basis of advice of a NGO Network organization. In order to get familiar with the cases, we inspected several sites in the respective region and held spontaneous interviews with societal experts. Eventually, the recipient organizations as well as the sponsors are all exposed to very comparable institutional conditions that correspond with international and national legal conditions. Hence, the sampling is convenience based (Tansey 2007).

The interviews were held in teams of two interviewers and a junior researcher who protocolled. The interviews were semistructured. This is useful since it facilitates an open conversation with the interviewee which leads to new insights for the interviewers and does not limit the interviewee to the experience horizon of the interviewer (Arksey and Knight 1999). The topic list of the interviews is based on the theoretical framework and the design of the interviews allows for the spontaneous emergence of new topics, which then can be used for future topic lists. Most of the questions are non-directive questions; however, in the case of stalling, the researcher can ask questions in order to ask the opinion of the interviewee about possible relations between conditions, on the one hand, and legitimacy and performance, on the other.

The interviews showed certain patterns. All interviewees indicated that there success was crucially dependent on finances and that these finances again depend on their success and the ability to communicate their success stories. When asked about their possibilities to demonstrate success, however, no single interviewee indicated the existence of an accepted performance measurement standard or a reporting scheme for NGOs. When being asked about the availability of standard indicators, all interviewees indicated that they were desirable but not available. Furthermore, answers to more directive questions unveiled that hard data, such as an annual budget or a ratio that indicated the amount of children that were supported per financial unit were not considered as good indicators. All interviewees emphasized the importance of good communication and relationships with the donors. In that context, especially long-standing relationships with donor organizations were considered beneficial for future funding activities. Given this strong congruence in the answers, we reconsidered the open interview guidelines but could not find evidence for any question or comment that would lead to socially desirable answers.

Furthermore, the interviewees were also consistent with regard to the factors that may influence legitimacy and performance. However, there was disagreement with regard to the way in which the factors will influence the outcomes. The interviewees mentioned the following factors as being of influence:

1. The regional orientation of the operations of the organization. Whether the organization is operating regionally, nationally, or even internationally has influence on their ability to attract money. For this factor, some interviewees stated that it would be easier to get funding if they operated internationally whereas others perceived this as a burden.
2. The range of activities. Some organizations indicated that they perceived their own strict focus on child care activities as an important success factor whereas others indicated that a more generalist (including health care and schooling) approach facilitated access to funding.
3. Collaboration with other NGOs on the same level. Collaboration with other NGOs on the same level was perceived as beneficial for legitimacy and performance by some interviewees, neutral by some and even negative by some organizations.
4. Government Collaboration. Many interviewees indicated a firm decision not to collaborate with the government or any government agencies at all and indicated that it would be detrimental for access to funding to do so, whereas few others indicated the beneficial effects of government collaboration
5. Resource Ownership. Some of the NGOs are owner of their resources, of this group, some saw it as a burden for documenting performance and attracting additional funds to be the resource owner whereas other saw it as a privilege to

be in this position. On the other hand, also amongst the other NGOs, some experienced their situation as a great problem for finding financial resources, whereas others stressed the positive side of their independency.

6. Exclusive access to resources. A similar story can be told about exclusive access to resources, which was the case for subsidiaries of international NGOs. Also here, the opinion of the interviewees diverged. Some subsidiaries perceived it as a possibility to concentrate on their actual work, whereas others regretted the explicit or implicit interdiction to look for additional sources. For the independent organizations, some appreciated their independence that allowed for approaching donors whereas others rather regarded their fundraising activities as a burden that prevented them for doing their actual work.
7. Intermediary. Some organizations were providing child care in that sense that their employees or volunteers worked with or for children. On the other hand, some organizations work as intermediaries that subcontract other NGOs or for-profit-organizations to do the actual childcare work.

At first, these interviews just showed a rather skewed situation. On the other hand, on the basis of the sample, they provided a complete list of legitimacy and performance indicators for Moldovan child care organizations. The list was double-checked in expert interviews with interviews representing donor-organizations.

It was impossible to find clear linear relationships indicating denominators for legitimacy performance; however, given the differences in orientation and governance structures of the respective organizations, we started looking into patterns and constellations that would allow for a deeper analysis of the findings.

Thus, the conditions vary to a large extent. Which conditions matter for explaining both, legitimacy management success as well as organizational performance, depends on purposes, incentive structures, and legal systems and other societal, legal, economic, and organizational factors (Ragin 2006; Howard-Grenville et al. 2008). In this context, suggestions to define conditions for success that matter in the literature are often not empirically supported (Gangadharan 2006). On the basis of theoretical insights supported by our interviews with both, representatives of NGOs as well as donors, we constructed a list of conditions that are perceived as being influential are displayed in Table 1.

At first sight, these conditions look like binary. A closer look, however, suggest that most of them are rather extremes on continua, given the possibility to, e.g.,

Table 1 Conditions of interaction success of NGOs

Orientation	Local or national	International or global
Operations	Specialists	Generalists
Collaboration with other NGOs (same level)	Yes	No
Government collaboration	Yes	No
Resource owner	Yes	No
Exclusive access to resources	Yes	No
Intermediary	Yes	No

collaborate with just some other NGOs or with many others, they could engage in some or many collaboration activities with the government, could employ other organizations to execute childcare or could do so in addition to their main activities.

On the basis of these results, we could not even formulate hypotheses that would predict legitimacy and performance. On the other hand, a closer look into patterns unveiled that conditions for legitimacy and performance were mentioned in different combinations which suggested to analyze the findings with regard to patterns and constellations of conditions. As such, we assumed set-theoretic relationships (Schneider and Wagemann 2007). Therefore, we suggest hypotheses predicting legitimacy and performance on the basis of sufficient and necessary constellations of conditions. A necessary condition exists if we find that an organization that is perceived legitimate and well-performing will definitely meet the necessary condition. A sufficient condition is a condition that an organization that matches this condition will be perceived as legitimate and successful (c.f. Schneider and Wagemann 2007).

Further Analysis

Performance research is dominated by linear models. These models entailed fragmented views of the antecedents of organizational performance and may have oversimplified the complex causality relationships leading to organizational performance. Conversely, as stated by Fiss (2007, p. 1192): "A set-theoretic approach may contribute to the RBV by offering both a conceptual framework and an empirical methodology for analyzing how resources combine to form bundles and how these bundles affect firm performance." In our study we were interested in analyzing what are the combinations of NGOs characteristics that lead to organizational performance. That is the reason why QCA is particularly suitable to our research question. Hence, we suggest that a qualitative comparative analysis (QCA) will be an appropriate method to further assess NGO legitimacy and performance.

One advantage of the QCA, as a set-theoretic method, is that it does not "disaggregate cases into independent, analytically separate aspects but instead treat configurations as different types of cases" (Fiss 2011, p. 401). We used the crisp-set approach to qualitative comparative analysis (QCA) to explore the combinations of organizational characteristics that exist among the NGOs that are successful We will not detail here the full methodology of QCA (Ragin 2008). For further studies, we suggest to follow the procedures and steps of QCA analysis (Fiss 2011). We give here below an example of the truth table for two characteristics among the four analyzed.

A first attempt would be to develop a truth table to allow for detecting patterns in the conditions. A truth table looks into cases and displays the number of cases that match the conditions that are analyzed (Table 2).

As explained above, research for organization suggests financial performance as a measure, legitimacy measures rather work with proxy methods, often based upon proxies like public endorsement and media coverage. Furthermore, subjective

Table 2 Example of truth table for the characteristics resource "ownership" and "collaboration"

	NGO are the resources owner	NGO are sharing resources	NGOs are collaborating	NGOs are operating on their own
NGOs with high level of legitimacy	Number of successful NGOs who are the resources owner	Number of successful NGOs who are sharing resources	Number of successful NGOs who are collaborating	Number of successful NGOs who are operating on their own
NGOs with low level of legitimacy	Number of not successful NGOs who are the resources owner	Number of not successful NGOs who are sharing resources	Number of not successful NGOs who are collaborating	Number of not successful NGOs who are operating on their own

measure of organizational legitimacy and performance are equivalent to objective measure when they are carefully planned (Singh et al. 2016). Therefore, we used a subjective measure of organizational legitimacy and performance, namely, the evaluation of legitimacy and performance of the NGOs by the NGO managers. In order to operationalize this measurement further, we developed a survey for NGO managers to indicate legitimacy and performance indicators. Hence NGO managers are asked to answer seven survey questions about different aspects of the performance of the NGO. The different aspects that were taken into account were the use of performance assessment tools, the disclosure of performance indicators, and the subjective level of organizational performance perceived by the managers. As an example, for this latter aspect of the organizational performance, the managers answered the following question: "On a scale from 1 to 10, how do you evaluate the legitimacy of the organization?"

Eventually, according to the standards of QCA, there will be a need of more cases than the 30 cases already analyzed to run the future analysis. However, on the basis of the limited data set, we could already run a preliminary analysis that suggests constellations of conditions for future research. Amongst others, it allows us to develop set-theoretic hypotheses.

The within-case analysis is an important prerequisite of conducting QCA. Therefore, we developed and applied a protocol to ensure a uniform method of collecting the data. In addition, we used external data collection as well as archive data. For the collection of external, mostly archival data, we also took advice from the interviewees. The interviews are presented in a coded scheme. The coding of the interviews is done with the open coding technique that randomly creates categories, which eventually creates categories that are used to code all the transcripts (Corbin and Strauss 1990) which eventually leads to the conditions required for the QCA.

Eventually, our analysis led to building a dichotomous data table, which is based on the data collected during the interview and the archival data. From this table, the necessary and sufficient conditions leading to the outcome are deduced. In the end, the significance of the QCA-found results is evaluated with the help of the case knowledge.

The literature gives very limited suggestions for conditions that can explain NGO performance. This research describes a set of conditions and analyzes their eventual impact; the nature of this research is therefore explorative. In a preliminary phase of the research, we have selected and defined conditions on the bases of multi-coder coding of interviews as suggested for explorative qualitative research (Schneider and Wagemann 2007).

We performed a preliminary qualitative comparative analysis on the basis of interviews and observations. In a first round of qualitative interviews, we identified factors that were mentioned to be influential for NGO performance. These results and the corresponding conditions form the basis for the subsequent QCA. QCA is used to find the relationships between constellation of conditions and outcomes (Rihoux 2006; e.g., Bakker et al. 2010); in our study, the outcome is NGO legitimacy and performance and, more specifically, their success in getting access to financial resources for the provision of childcare. QCA further helps to develop theories that explain the mechanisms under research (Schneider and Wagemann 2010) and thus contributes to the development of an NGO performance assessment framework.

In this context, and on the basis of the method described below, we developed the following hypotheses:

H1: Orientation towards the society is a necessary condition for NGO performance.
H2: Specialization of NGOs is a necessary condition for NGO performance.
H3: A combination of specialization and collaboration is a necessary condition for NGO performance.
H4: A combination of resource ownership and exclusive resource access is a necessary condition for NGO performance.
H5: A combination of national orientation and intermediary activities is a sufficient condition for NGO performance.
H6: A combination of the avoidance of governance collaboration and resource ownership and exclusive resource access is a sufficient combination of NGO performance.
H7: A combination of the avoidance of governance collaboration and specialization and NGO collaboration is a sufficient combination of NGO performance.

Eventually, we included 30 cases in the QCA; however, this was insufficient to perform the definitive analysis and provide all a sufficiently solid result for the research question. However, we are able to indicate tendencies.

After the analysis of the interviews and the theoretical framework, the conditions are selected. The data required to determine the conditions of the organizations is collected. This data is partially collected with help of local NGOs. Funding conditions and performance rates of NGOs are taken into account when formulating the eventual judgment.

This within-case analysis is an important prerequisite of conducting QCA. A protocol is therefore developed to ensure a uniform method of collecting the data. This is especially important since interviews are performed by a relatively large group of researchers as well as local contractors, in different languages. Accordingly, the interview conditions as such will largely vary, but the protocol will assure homogeneity of evaluation standards. Familiarity with the cases is a requirement before, during, and after the analytical moment of a QCA analysis (Wagemann and Schneider 2007). In addition to the data collected in interviews, archival data is assessed. Archives provide partial information about performance records of NGOs across several periods as well as information about their historic funding and network relations.

The interviews are recorded, transcribed, and coded with an open coding technique that randomly creates codes, which eventually creates codes that are used to code al the transcripts (Corbin and Strauss 1990). After the coding, code families are determined to cluster related codes. The most often occurring codes and codes families are analyzed and form the base for the conditions that are used for the QCA.

The ratio of number of variables and the number of cases is a potential cause for problems (Schneider and Wagemann 2006). If too many variables are introduced in a model, the results can be too complex to be useful. Researchers suggest that 4–7 conditions are the maximum amount still manageable with QCA (e.g., Thiem 2010). This analysis of the interviews has created a total of 120 codes. The codes are assessed and familiar codes were placed in 7 code families as indicated above. Next to the codes in the code families, other often used codes are size of organization, religious underpinning, and spatial proximity. The code families and the most often used codes are assumed to be conditions. The amount of potentially relevant conditions is equal to what is methodologically regarded as acceptable (Ragin 2008).

Eventually, the analysis leads to building a data table, which is based on the data collected during the interviews, observations, and the archival data. From this table, the necessary and sufficient conditions leading to the outcome are deduced. In the end, the significance of the by QCA found results is evaluated with the help of the case knowledge.

Conclusion and Recommendation

This research unveils the difficulties in assessing conditions of legitimacy for NGOs. On the one hand, this lack of insight is surprising given the great importance of legitimacy for NGOs. On the other hand, the level of professionalism, especially in developing countries, is developing only slowly. Our work sheds light on conditions for NGO performance in a very specific societal and regional setting. We have identified conditions that are relevant for NGO performance, namely, regional orientation, focus of operation, collaboration with other NGOs, collaboration with the government, possession and exclusive access to resource, and distance from the eventual operations.

The sample we looked at is a unique sample of NGOs, doing societal work on rather small scales, without any major attempt to do political or lobbying work. They are “real” or “pure” NGOs, not business owned, industry run, or advocating the business interests. Neither are these NGOs criticized for serving the enrichment of their employees. The respective NGOs do local work, the employees are mostly locals, with regard to their education rather over-qualified for their work (e.g., holding a PhD in a management position) rather underpaid relative to their education and highly dedicated to their mission. This implies that much of the criticism often brought forward against NGOs does not apply on our sample. From all, the research team can judge on the basis of site visits, document studies, group interviews, and individual interviews, the NGOs who participated in this research actually contribute to solving the difficult problem of child development and child protection in Moldova.

To a large extent, these conditions are qualitatively different from conditions that are discussed as success factors for for-profit organizations, in any case they are specific. This is partially due to the fact that market conditions are not completely absent for NGOs; however, NGOs are exposed to different kinds of decisions and actions as opposed to organizations who provide directly marketable products or services. Central to this argument, especially in the context of our research, is that the beneficiaries of the services of the NGOs can hardly take any decisions and perform any actions that are directly relevant for viability, funding, or success of the organizations. Furthermore, our research helps at understanding the performance differences of NGOs, and our explanation differs to large extent from legitimacy explanations (Edwards and Hulme 1996).

The results provide guidelines for future research. First, the results of this qualitative study are limited with regard to generalizability. The subsequent large-scale data collection has already started. That research consists in a questionnaire that collects, on the one hand, data about the indicators analyzed in this research. On the other hand, it also focuses on psychological and sociographic data about the actual performance with regard to child development. This will eventually enable the research team to compare the self-indicated performance measures of NGO representatives with measurable and comparable data. Even though also these performance data will not be unbiased, the large dataset, consisting of a sample of approximately 1,000 NGOs will help at minimizing the bias.

The main approaches that have been previously used to test the RBV ignored the "resources bundles" specificities (Fiss 2007). In the present study, we contribute to the RBV research by suggesting QCA as a rather novel approach that seems to be appropriate to deeply benefit of the RBV framework. Even though the work nicely links *conditions* for success with eventual success of NGOs, our research points to the limited accessibility of performance *indicators* for NGOs. Finally, on the basis of the (limited) dataset, we were able to develop a set of set-theoretic hypotheses that can serve as a guideline for further empirical research into organizational legitimacy.

Methodologically, this present paper suggests an approach for further research in this field that will provide more documentation of the applicability of fuzzy QCA approaches, especially for fields of exploration. Furthermore, an important issue about the indicated conditions is that they are located on different levels. Organizations have to deal with their own organizational structure and culture; they are in relations with other organizations, both on a horizontal as on a vertical dimension; they are exposed to similar laws on our case, but too different regional conditions that to some extent differ heavily (e.g., the cultural difference between the capital and the extremely impoverished countryside; regions involved or uninvolved in the civil war). That leads to the suggestion that multilevel analyses are promising when assessing NGO performance conditions.

Abstract

This section describes practical experience, with how value-based management can be an effective lever, when working with the company's legitimacy. First, the key concepts are defined: values, value-based management, and business legitimacy. Next, an important tool – the scorecard – is shown. The decisive matter about the scoreboard is that it must be used in a certain way to get effect. Therefore, ten brief instructions on how the tool should be used follow. It is absolutely crucial that the instructions are followed. Finally, a brief summary of a research case is given. The case is from a company that has secure legitimacy through value-based management and has done it extraordinarily well. The reference list contains a link for downloading the case.

Individual responsibility · Brotherhood of honor · Mutual trust · Self-regulation · Win-win situations · Coordination of conduct · Internal consistency · Value dialogues · Inner motivation · Active involvement

Definitions

Values

A value is a consideration to be taken or a principle to be followed. A value expresses an ideal to strive for.

Values are culturally definite perceptions of what is valuable and desirable and what is not. Stable feelings about certain ideals of right and wrong, what one puts high and will work for. It may be family unity, personal freedom, success, and security.

Values are characterized as "the beliefs that determine and motivate our attitudes, actions, and assessments, based on our social institutions and political system." All people live their lives on the basis of values that are founded, at an early stage of their lives. Individuals, groups, and communities may differ in the way they rank their values, but as certain values are deeply embedded in culture, society's institutions, and a common way of life, they form the basis of social life, the political community and the state.

Value-Based Management

Today's management needs are directing those who can lead themselves, directing peers, leading experts, managing open tasks, and putting the customer at the center.

Effective techniques here are to enable self-control, upbringing, control through ideology, and control through individualization.

The management system must be able to create authenticity, integrity, symmetrical presence, recognition, feedback, and trust management and establish a culture of conversation, leadership through self-creation, the team as a microcontroller, dialogue management through coaching, and face-to-face contracts.

Value management fulfills this and provides a good foundation for emotional branding, as it makes it possible to tell who we are, where we go, and what we feel.

Value-based management sees the primary management task of controlling values and behaviors rather than controlling productivity and goals, understanding that values and behaviors must not be overlooked to achieve short-term productivity goals.

Business Legitimacy

A company has business legitimacy when it is recognized as effective and in accordance with general standards, habits, and rules and exhibits a true honorable business conduct.

External legitimacy is a generalized perception or assumption that the actions of the business are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs, and definitions.

Internal legitimacy is considered to be conditioned by the fact that employees acknowledge the management and the exercise of power, as something that should be respected.

Internal legitimacy is measured by the extent to which it depends on the employee's tacit acceptance and not, for example, coercion and violence.

According to German sociologist Max Weber (Loftager, Jørn (2015)), legitimacy can derive from the personal charisma of leaders, or it may derive from legality, i.e., that the exercise of power takes place by virtue of accepted norms and regulations.

Dialogue and influence are considered a condition for governance's legitimacy, but not necessarily an adequate condition. On the one hand, it is claimed that legitimacy implies stability, which again depends on the board's ability to efficient problem-solving; on the other hand, legitimacy is linked to the company's functioning.

In particular, German sociologist and philosopher Jürgen Habermas (1996) emphasized that legitimacy presupposes that through dialogue and discussion and argumentation, it should be possible to influence the power system.

Tool and Application

The Scoreboard

When it comes to creating and maintaining internal and external legitimacy, the scoreboard is a suitable tool (see Fig. 1).

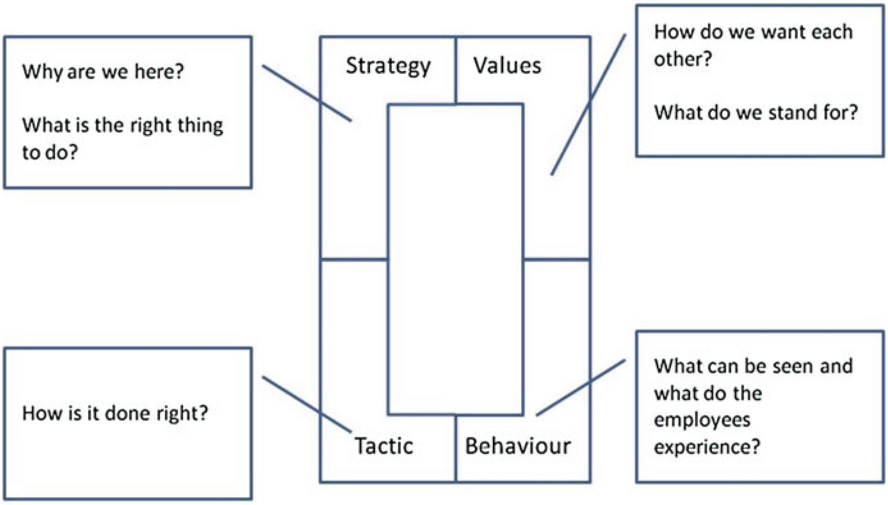

Fig. 1 The scoreboard

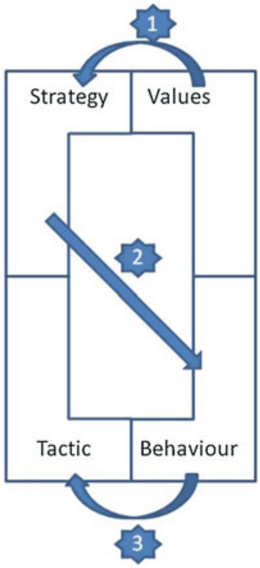
Fig. 2 The sequence of completing the scoreboard



When designing the company's scoreboard, start on the right side and move through the fields as illustrated in Fig. 2.

When formulating the company's values, one can choose different value orientations, depending on the formulation of the business concept (see the Table 1 below).

The scoreboard must show the company's conscience. Conscience is a continuous dialogue that the company has with itself. It is characterized by a two-way communication, where the company is both sender and receiver.

Table 1 Different value orientations

Dimension	Value
Society	Sustainability
The environment	Transparency, responsiveness
The business	Innovation, effectiveness, punctually, working environment
The employees	Honesty, integrity, confidence, responsibility
Customers	Dialogue, fairness, involvement

Communication must focus on the real motives that underlie the company's actions and nonactions. The dialogue must build a bridge between the individual, the community, and the environment.

It is important to have concrete behavioral formulations for each value you have chosen. It is the behavioral formulas that make it possible to control values and to introduce a greater degree of self-management.

The left side of the scoreboard must not erode the right side. Value-based management is based on concepts such as self-understanding, value leadership, self-management, diversity management, personal mastery, etc., and the management task is, through coaching and sense giving, for example, in interaction-based relations, to raise personal behavior both for individuals and for groups. An important part of the leaders job is to ensure the balance between the left side and the right side of the scorecard.

Application

Once the values are defined, they must be taken seriously; otherwise they will tend to erode the legitimacy of management instead of strengthening it. Values are not intentions but norms that will ensure cooperation and support between the company's actors. Values must be kept alive through a current value dialogue. It must run continuously. It is not a dialogue about values but about the interpretation of these. The interpretation depends on whether the behavior is in accordance with the values. Therefore, a value dialogue requires that there is a concrete behavior that can be discussed. Valuation dialogues must ensure that we agree on the values but also to what extent we live up to them.

The value discussions are characterized by a different logic than the one that characterizes the business economics. Is the company an unscrupulous machine or a conscientious organism? Today there are several trends that increase the need for companies to show conscience:

- Increased material prosperity
- The young generation, which is becoming more and more independent
- The huge explosion in technological capacity
- Greater awareness of the environment and energy problems
- The ever-increasing globalization trend
- The huge information pressure and information bulimia

For managers, the values mean that you will increasingly meet the requirement to show in practice, what you want with the managerial post. For the employees, it means that you have to make decisions on your own, also decisions that have not been formally answered in advance.

Guidelines of Importance

Value Formulation Is Heedful Action

When formulating your values, you may be tempted to slip in "hidden goals" that do not cover values but instead intend to put organizational focus on something that you as manager believes seem important.

By way of example, we can take the word "competitive." Competitive fits our universe best on the left side of the scoreboard. It requires a lot of conscious reflection to place it on the right side.

When designing the scoreboard, you must always keep in mind the separation between goals and values. Help can be obtained from Emanuel Kant (2002). He says, p. a.:

There are two kinds of imperatives: the hypothetical says, "You must do such and such, if you want to achieve a goal", and the categorical that says "that a particular kind of action is objectively necessary without regard to any particular goal". Moral value exists only, when a person acts out of a sense of duty. A value is a final ideal and not just a mean to reach a goal. Value-based actions correspond to the categorical imperative.

If you put "competitive" up as a value and thus accept it as a categorical end, it means that the management will not accept behavior like suboptimization as behavior, when the organizational units work to achieve their individual financial end goals. Does it mean we outsource all activities that others can do better than us? Does that mean that we always put the best man on a task, even when he does not count in our own department budget? Does it mean that we do not take over prices when the market allows it?

Values must be some that there cannot be found "good" excuses to violate, even in short-term situations.

Build a Bridge Between Goals and Values

One task which often is not solved, perhaps because one does not see it as an assignment, is to ensure that all parties in the cooperation can see that they can achieve the goals through the values and behaviors formulated on the right side of the scoreboard .

This task is not elementary, and it requires deep organizational reflection. Professor Liedman (2000) has in his book used hundreds of pages to argue why.

On a very short formula, it can be expressed as follows: "The conflict between the left and the right side of the scoreboard lies in the conflict between the rational and the appropriate. As soon as you have a goal, there are actions that will be rational in relation to the given goal, but if the actions also will be appropriate, requires a holistic approach."

If one does not solve this conflict, then it will happen – shows Liedman – that the left side erodes the right, and the values end their lives on a colorful folder that is shown on special occasions. For the employees, it means that they lose their maneuverability. They are only able to orient themselves to the left side, and then you're left in pure goal and rule management.

Self-management deals with people, as leaders believe in. This involves flat structures, project organization, delegation of responsibility and competence, and less emphasis on rules and instructions, but one must ensure that the new employees are instructed properly. The management's task is to create engagement about the values and goals, and the employees must orient them to, making dilemmas and principles clear and clarifying the responsibility that is a result from increased personal freedom.

Self-management is largely about creating a whole. A good example below is from the Danish Ministry of Finance's debate book (Gundelach 2000), written here:

Welfare work is not a standard product that can be produced for warehousing, on the contrary, welfare work must satisfy individual needs and wishes of a differentiated group of citizens, needs and services that often extend beyond performance in a narrow sense. An example is cleaning for the elderly. The employees must also take care of and observe changes in the physical, mental and social situation of the elderly, and help to make the older resourceful.

Therefore, the organizational need of an organization that produces welfare service is that it can play on many strings. It can be a municipality as a starting point. But over the last years, many municipalities have split production of welfare services and set productions rules on individual parts. This may give some immediate rationalization gains, but the risk is that the elements of the welfare service are beyond the core benefit.

Shared values are the norms and standards an organization and its stakeholders use to assess, whether the organization's behavior is reasonable. What is reasonable is based on an overall assessment, different views are weighed against each other, and the assessment is complex and multifaceted. It will contain solution objects, if mutual relation just represents the values you are looking for. The values in the institutions, for example, are about how to ensure, under the given economic and personal framework, the fullness of the welfare service that is provided.

Value Management Is Personal Development

The motivation for letting leadership be based on values is often a desire for more self-management and thus an organization that is more efficient.

On some occasions we can see, an incomprehensible reaction, that some employees do not want the greater latitude. We experience the duality between freedom and security. The bird in a cage is safe; it gets feed every day, while the bird in nature itself has to get it.

One can ask whether the ability to handle latitude is something we learn through our childhood, just as our ability to learn as Senge (1992) has argued in his book *The Fifth Discipline*.

Self-Management Is Learning Through Action

Young children learn quickly. They do, because they are good at action-driven learning. You act first, and then you see what happens and draw the experience.

When you are going to work during self-management, you do not always get instructions. You have to start acting on a looser basis and create your own fast learning circles.

Therefore it is important to work with personal mastery, a course where the individual experiences the ability to go beyond his own limits, doing something he would otherwise have left. Our experience is that such exercises are very fast, release energy, and solve some problems that otherwise would not have been solved.

The Value Formulation Is Completed Not Until the Behavior Is Described

Several have asked us, why they have not experienced an intensive discussion, when the value set has been submitted for discussion. At closer notice we do not think it's so strange again.

We have never seen a value you could not agree in, in the sense that it is always a clear positive thing, words as trustworthy, responsible, innovative, and holistic. Who will stand for the opposite?

The conflict arises when you subsequently will formulate which action is the right one. Values are never free. They cost something. When formulating the behavior, it becomes clear where and what the cost is. It is here that you decide which price you will pay.

If you have the value of doing everything for the customer, it means that when the customer comes and asks for one of your goods, as you know, that the competitor on the other side of the street sells at half price, will you send the customer there? It's here as in politics, the devil is in the details.

Be Aware of the Conflict Between Goals and Values

Many municipalities are based on a combination of both New Public Management and "value-based management." It answers figuratively to be able to play without problems on a football field, where rules and everything else change, when you pass the center line. Can you do that? Yes, we mean we actually can. It requires that we prevent that the goals and rules erode the values.

Remember, Values First Appear when They Are Organizationally Anchored

Values without organizational anchorage will quickly become an abstraction for employee and management and utterance without content and obligation. Values should never be exterior but internalized in the relationship that both management and employees have to their workplace, colleagues, customers, and citizens.

An acknowledgment of values personal significance for the actions of both employees and management is important for the self-understanding and credibility of an organizational culture.

Proactive action is a beginning to take responsibility and start living with choices that require personal integrity and courage for value dialogue. In this dialogue personal perceptions must be played on the pitch, otherwise there will be no personal and organizational development.

Let Dialogue Carry the Value Management

In dog fights you can have a strategy and a plan in advance, but in the meeting with the opponent, the plans must be adapted and the tactics changed. The value dialogue must give this possibility.

An organization culture that does not provide room for dialogue will cut employees and management from establishing a community of practice, where a sharing of knowledge can take place between all, for the benefit of the whole company and its surroundings. For companies with requirements for innovative processes, a reflexive practice will be a foundation for business development and moreover the company's earnings. It is the dialogue that removes the eye for the eyes.

Give the Dialogue a Meeting Place

Dialogue gives employees and managers the opportunity to work with the values in such a way that the individual values through a living interaction between thought and action are translated into personal, social, and professional competences for the benefit of the individual and for the social contexts such as workplace and outside world demands.

Without dialogue and learning, the introduction of values is a project that will legitimize management power. But the ownership of the project may not last longer than it takes to make it visible to the organization. Subsequently, no one in the organization can understand what becomes of the vision and values.

Create Balance Between Reflection and Action

Visions and values as entities in an equation with only theoretical variables will have the consequence that the responsibility for divert actions both among management and employees becomes abstract and imperceptible in both organization and business. Confronted with environmental expectations and organizational culture, the business can react with more specific goals and rules instead of conspicuous visions and values.

An experiment to design a scoreboard resting on theoretical ideas about the life in organizations is solely a waste of time.

Actions in isolation are visible. They give both executives and employees a sense of results and efficiency. Just that we act gives an impact on the personal and common plan, but whether it takes place in a coherent and collaborative culture is a completely different matter.

Transformation Powered by Values Is an Ongoing Process

Grounding a transformation process on values has only meaning, if the organization at the same time is able to both personal and organizational development. Commitment for this is extremely important, if the chosen values are meant to be internalized.

Just as it is in football, you are looking forward to teamwork, happy spectators (customers), and good play. Most often, the happiness is greater over this than if the match is won.

Japanese Professor Yoshio Kondo (1989) writes in his book, *Human Motivation*, that the following prerequisites for leadership must be present:

- The leader must have a dream (vision, ideal, common purpose).
- The leader must be ready to do what is necessary to realize this dream.
- The leader must win the employee support. To achieve this, his dream must be sufficiently desirable for all.
- The leader must be able to do more than his employees, and he should actually do it. But he must not interfere in what employees can do alone. However he must interfere if the employee does not or cannot; his job is to create capable employees.
- The leader must be successful – but he must not sacrifice his colleagues to obtain it.
- The leader must give appropriate advice to the employees and do it in time.

Extract from the Devoteam Case

The full case can be downloaded (Beyer 2013).

Self-Management Based on Values

Devoteam practices self-management based on three key values supported by a group of behavioral formulations. This means that the value set is manageable and easy to grasp and that it can be put into operation through behavior. The value set is actively used in daily work. There is an ongoing organizational dialogue on how to best express the values through action. The Devoteam scoreboard is as follows:

Strategy We create value in the intersection between business and technology Structure Process organization for release Balanced with control model and driving license Collaborative infrastructure and free seating Internalized values (value dialogs) Ongoing concept work	**Values** 1. Openness 2. Respect 3. Passion
Tactic Transparency Energy and motivation Flexibility and dynamics Better knowledge sharing New career paths Activation of multiple management resources Attracting talent Growth and renewal Outside marketing	**Behavior** *Openness* Give all relevant information to your colleagues Do not let internal things affect your performance negatively Do not just criticize, at least always provide an improvement proposal Indicate about risks and apply if you do not feel qualified for work Learn from your successes and failures *Respect* Treat the people you work with as yourself will be treated See your colleagues' time and work as just as valuable as your own Integrate new people into the team and make your guests feel welcome Be professional in your daily work Complete agreements *Passion* See the opportunity in all changes Be proud of your colleagues, your work, and the value you provide to the customers Help develop Devoteam You must always act to encourage, protect, and strengthen long-term relationships Give value and new ideas and share knowledge with your colleagues

Devoteam focuses on values; as an example I shall examine the value "respect for the individual." This value can be interpreted in the following ways:

1. We trust that employees will take responsibility, do their utmost, and know their own limits.
2. We accommodate employee differences/requirements.
3. We strive to ensure that employees work with projects they are passionate about.

Personal managers have the following tasks:

- Responsibility for minimum 3–5 employees
- Continuous coaching of employees according to their needs
- Annual performance review (including salary and goal setting)
- Preparing recommendations for promotions

Management has grown up from within and has become a team. Devoteam is led by a group of four directors, all of whom have a long history within the organization. The CEO was the fifth employee to be hired in 1982. The other directors have an average of more than 10-year experience in the company.

No Win-Lose Games

A director described it thusly:

> *We don't have any cutthroats, they'd be frozen out. And they are also weeded out during the hiring process. We have people with ambition, and we recognise that, but we don't put up with cutthroats. We won't tolerate being cheated, passed over, etc.*

Ordinary consultants expressed it like this:

> *You don't talk about people, but to them, and winning at the expense of others just doesn't happen. What I think is great is how there are very few tactical games played here.*

Values Are Used Actively

Values are often discussed at Devoteam. When it comes to projects, the consultants are very value-conscious, and in many projects, a value agenda is set. Time is also spent talking about values in connection with the introduction phase for newly hired consultants. A member of the management group had the following to say:

> *Values are living concepts and must remain so or become forgotten or transformed into dogma. The large management group sometimes discusses value; I recently experienced this, how you deal with it, provide feedback, etc. It quickly becomes a value debate.*

Management Philosophy Is Largely Self-Management

Devoteam's management philosophy is primarily based on self-management, freedom, room to self-organize, minimum standards, etc. This appears to be one of the reasons for the company's excellent results, but as with all other things, it creates challenges as well.

Self-management brings its own challenges, for instance, that it is very much up to the employees to create the learning loops and do the concept work to ensure integration of cultures, work processes, services, management style, etc.

Power and decision-making are delegated to the employees. Their task now is to find the balance between integration and differentiation. The case analysis indicates that this has not yet succeeded to its fullest extent.

Conclusion

My conclusion from analyzing the case is that value-based management is a powerful way to obtain external as well as internal business legitimacy, if management follows the guidelines and uses the scorecard.

Working in the Brand Economy

67

Work, Labor, and Experience

Eric Pezet and Juliet Poujol

Contents

Abstract

The humanist approach of work prevails in human resources management. It seems the most legitimate from a corporate social responsibility perspective because it postulates that work allows individual fulfillment. However, the Marxist approach, which emphasizes the context of exploitation through labor, is in many cases relevant to the reality of work. Salaried work is part of a Hegelian master-servant dialectic which is proving to be impassable.

A contemporary phenomenon, which is the entry of work into the brand economy through the employer brand, invites us to consider another approach to work, i.e., the experiential one. It replaces neither the Marxist nor the humanist approach, which remains relevant for reporting on employers' behavior. However, by focusing on the employees' point of view in assessing their work context, the experiential approach reflects the legitimacy of HRM, which is suggested by the entry of work into the brand economy, that is, offering employees a work experience compatible with their life projects. The master-servant dialectic is then replaced by a masterS-servantS dialectic.

Introduction

In management, work is considered in an organized context, and its study focuses on the relationship between the individual, the expression of authority, and the organization. The conception of work always includes a dimension of relationship to authority; it is a dialectical relationship between the individual and the organizational order. This dialectic is studied on the basis of two main philosophical referentials, the humanist and the Marxist, each marked by social history. The humanist approach sees salaried work as a way to achieve personal development, and the Marxist approach sees salaried work as a relationship of irrepressible domination. The humanistic approach to work seems the most legitimate from a CSR point of view; however, the recommendations made from a humanistic HRM point of view reveal the exploitation that the Marxist approach denounces (Dahl Rendtorff 2009: 220–227).

The Hegelian dialectic of work is present indirectly in these approaches through the authors it has influenced or inspired. In the Marxist approach, Alexandre Kojève has influenced research on work in management, for example. What makes the Hegelian dialectic of work particularly interesting to contrast the dominant approaches to work in management is that it is a dialectic of self-awareness, in other words a dialectic of the construction of the individual by himself through work. This approach is particularly contemporary because it addresses the issue of individual construction. It also makes it possible to integrate an aspect of salaried work that cannot be overlooked, namely, the relationship with authority. Work is considered in a master-servant relationship (*The Phenomenology of Spirit*, Chap. IV: *The Truth of Self-Certainty*).

From the Hegelian perspective, work is the activity by which the individual becomes self-aware by confronting an external object: "Self-consciousness exists in and for itself when, and by the fact that, it so exists for another" (Hegel, n°178). The external object allows self-consciousness if it is a self-sustaining object. In the master-servant relationship by which Hegel describes the social relationship, the servant is for the master a living object that cannot allow him to regain consciousness of himself because he is servile and the master cannot recognize himself in him. Nonliving objects are ephemeral and produce only an illusion of recognition. On the other hand, the servant experiences the worked object through his work. He therefore has the possibility of experiencing himself through the object, but the status of servant, by which the work is done in the service of the master, prevents him from becoming fully aware of himself in the object he has built.

The aim here is not to present the details of these philosophies but to show how their reception in management research has led study a new contemporary phenomenon, which is the entry of work into the brand economy through the emergence of employer brands.

The reference to Hegel (1977), who is indirectly present in work approaches, allows us to put these approaches into perspective and indicate how they deal with the contemporary question of self-building through work in an organized context. This question is contemporary because we observe a relatively recent phenomenon, namely, the entry of work into the brand economy based on the valuation of their employer brand by companies.

In both Marxist and humanist approaches, work does not belong to the brand economy since it is considered as one of the means by which the goods and services that make up the brand are produced. Labor force has a price that depends on a market. Work is not related to the brand. It is indirectly so through the product it allows to manufacture but is rarely present for itself in the brand.

Through the management of the employer brand, companies present work as an activity that can be chosen from the point of view of self-experience and thus create an opportunity for competition between them for recruitment on the basis of a promise of experience made to employees. Work is in the process of having its own brands, the employer brands.

From the point of view of the employee-company relationship, the contemporary phenomenon of the entry of work into the brand economy introduces an important change: the company addresses employees by mobilizing the language of consumption. However, until recently, work has not been studied in relation to the brand regime but to the economic regime of supply and demand.

When managing their employer brand, companies mobilize the techniques and language of product promotion to communicate on job offer. The employer brand is the perception that employees (internal employer brand) and potential candidates or stakeholders (external employer brand) have of the company's managerial behavior. The language of employer brand management is that of experience: it promotes an experiential approach to work through which an individual becomes self-aware.

Thus, alongside Marxist anthropology, which is a historical anthropology of class relations, a neoliberal anthropology has emerged in recent years where workers are encouraged to consider work as consumers: "work is reimagined through the language of consumer culture. Work is defined not as a constraint on freedom, but as an area where individuals represent, construct and confirm their identity as consumers" (Du Gay 1996).

The question that interests us here is how the two main philosophical traditions on which management research is based can take into account the contemporary phenomenon of the entry of work into the brand economy. If not, can a new approach be considered that could inspire management research?

Humanist Approach: The Possibility of Work

Humanism is a relationship to the world according to which man is the end of all activity. The discourse on work, promoted by the employer brand, has humanistic characteristics. By placing people at the center of the production system through the legitimization of individual experience, the management of the employer brand develops a communication on the rebirth of work, which should be initiated by the organization.

Talking about work in terms of brand expresses employers' concern for working conditions and the consideration of employees' expectations in terms of personal development. Compared to a conception that sees work as a necessary suffering, the communication of the employer brand is a discourse on the rebirth of man at work.

Humanism is the dominant reference philosophy in human resources management research, particularly in human development work. The humanistic psychology of Carl Rogers and the School of Human Relations have emphasized the importance of self-esteem and personal development at work (McGuire et al. 2005: 132). The humanistic approach to human resources management implies "regards concern for persons and human aspects in managing organizations" (Melé 2016: 33).

Philosopher Hannah Arendt distinguishes between *animal laborans*, who produce effort, and *homo faber*, who is an object maker. The first, as referred to by Simone Weil (1951), lives in immediacy, under the regime of necessity and the restorative consumption of effort. The second one inscribes his activity in the duration of the objects he manufactures. What is important in work organizations focused on effort productivity is to make those who produce these efforts work in rhythm, and "in this motion, the tools lose their instrumental character, and the clear distinction between man and his implements, as well as his ends, becomes blurred" (Arendt 1998: 146). Labor is different from work in two ways: first because it relates to utility and not to effort and, second, because work is long-term while effort is immediately consumed by the productive system and is reconstituted in consumption. By focusing on motivation and satisfaction, the language of work that underlies the employer brand is related to labor by offering a reproduction of effort. There are many jobs in paid work that are jobs of design where a type of work is performed, but research on the employer brand is not interested in them: what defines the individual is the language of labor and of the need to survive, not the language of work. The necessity of work, which translates into the organization of work through the concentration on the coordination of efforts, cannot be denied: what can be discussed is the incessant nature of the capture of time through necessity.

From the Hegelian perspective, only the accomplishment of work enables one to become aware of oneself because it is an object in which one can find an object of self-awareness. From this point of view, the employer brand promotes an ambiguous discourse: it uses the concepts of sustainability of effort to give hope for the accomplishment of work. The promised work is not the object like the one made by *homo faber*, but the work of the self.

From a research perspective, the question is whether the organization can preserve the possibility of individual development.

Work is based on a content theory of motivation, such as the theory of expectations. The employer brand having the valences expected by employees would thus be a good employer brand. The first scale for measuring the employer brand was developed by Berthon et al. (2005), who identified five dimensions to assess the perceived benefits of working for an organization: (1) interest value represents an enriching work environment, which uses creativity and new work practices; (2) the social value is inherent in a friendly, even fun environment, offering good working relationships and team spirit; (3) economic value refers to elements of compensation (higher than competitive salaries, bonuses), promotion opportunities, and job security; (4) development value is related to recognition and career opportunities; and (5) application value represents the opportunities to apply the knowledge learned and transmit it to others, in an environment that is both customer- and human-oriented.

The conception of work that underlies employer brand research remains close to a conception of work that makes it an activity focused on effort production. Working conditions must allow for a repair of this effort through a friendly environment and the possibility of a career. It must also reward effort with an attractive salary. Research on work motivation and job satisfaction is central, but it is not based on humanistic approaches.

For Locke (2002), whose research on work motivation is very influential, management education must give meaning to the research developed in organizational behavior. Locke (2002) proposes to give this meaning by reference to Ayn Rand's objectivist philosophy that holds an important place in research on motivation, satisfaction at work, and its teaching. Human development is at the heart of objectivist philosophy, but for Ayn Rand, it is the achievement of exceptional personalities to lead society (Rand 2007), and the proposed ethic is rational selfishness (Pezet 2018). Therefore, for many, it is a question of encouraging the continuation of effort and restoring the force producing effort.

Under extreme conditions, a conception of work, exclusively centered on the production of effort and the repair of effort, leads to work organizations that deprive employees of their use of imagination and creativity: "the tragedy is that although work is too mechanical to engage the mind it nevertheless prevents one from thinking of anything else" (Weil 2015: 11). For sociologist Georges Friedmann (1960: 695), a balance can be found in the employment relationship: "he [the employee] must give his company a minimum of his technical potential and moral participation, which reciprocally implies, for him, minimum salary, satisfaction, and a feeling of well-being." Weil (1951: 21; 2015: 11) does not share such optimism: "if you think, you work more slowly; and there are rate-fixed times, laid down by pitiless bureaucrats, which must be observed." For Hannah Arendt, effort is made painful by endless repetition (1998: 122).

The employer brand can be viewed as a public expression, visible to all, of the companies' search for an exchange of employee commitment in the company for well-being. This promise seems conceivable at a time when management is conceiving spirituality at work. However, this is not the spirituality at work that Simone Weil (1951) seeks. For Simone Weil, there is a link between work and spirituality, but it is a possibility offered by work and not a condition of its productivity. Research on spirituality presents it as a means of increasing the productivity of effort and as a technique for repairing this effort. For Petchsawang and McLean (2017: 218), spirituality is seen as a human need to be satisfied that gives meaning to work. Spirituality makes one feel part of a working community

(Ashmos and Ashmos and Duchon 2000: 137): it develops optimism and hope that make individuals more self-confident in the activities they undertake (Dust and Greenhaus 2013: 289). Spirituality is achieved through the practice of performance asceticism (Pezet 2007).

The humanism to which the communication on the employer brand refers is the humanism of the organizer who is attentive to the human. For many, work experience is not an experience of self-awareness. It is a psychological experience measured by the satisfaction felt and renewed by restorative consumption and the repetition of effort. Consciousness is tested by an intentional ability. Even *homo faber* is not free of this intentionality since utility is not decided by him, it depends on the employer's instructions.

Marxist Approach: Work as Labor

In the Marxist conception, work is not reduced to the relationship of capitalist domination; it is conceived in a broader way. In such a conception, work is not only a producer of economic goods but also a producer of solidarity and self-realization. The extended conception of work encompasses three dimensions of action: work as (1) an end-oriented activity (cognitive-instrumental or teleological dimension), (2) a form of social interaction and communication (practical-moral or social dimension), and finally (3) a practical self-expression of the human being, who develops "the free play of his bodily and intellectual forces" (Noguera 2011: 138). In the Marxist conception of work, work is an activity that allows an experience of oneself through confrontation with the world, but, in practice, in a capitalist regime, employees only sell their labor power and are dispossessed of this aspect of work, and the experience in the world is reduced to the experience of command.

In management research, neo-Marxist criticism is based on only one aspect of Marxist labor analysis, that of the work process in the company. Marxist criticism concerns the relationship of domination in which capitalist labor is embedded and the organization of production that makes it possible to transform labor into a consumable good in the production process. The organization of production transforms the labor force into a good consumed during the production process.

According to the approach adopted mainly in critical, neo-Marxist management research, work is an activity of capital development, and the employee is dominated because he is subject to power relations in the workplace, his activity is governed by impersonal mechanisms, and he holds a hierarchically subordinate job (Renault 2016: 26). The history of labor is important because it reflects the domination exercised by capitalist employers over employees. Edward Palmer Thompson's studies (1990, 1991) on the formation of the English working class and on work in the seventeenth century in England have supported this view, in particular as they highlight the importance of work experience and the phenomenon of revolt it has generated throughout history. Braverman's (1974) work has been particularly influential in neo-Marxist management research. For Braverman (1974), control over work led to a de-skilling of work. Braverman presents work in occupational psychology – e.g., the School of Human Relations – on motivation and satisfaction as attempts to adapt workers to contemporary working conditions.

The worker makes his working capacity available to the employer and is thus deprived of the possibility of work experience, which is the creative power of work. The individual at work becomes a "productive body" (Deleule and Guery 2014): his knowledge is captured. The labor process theory currently builds on Braverman's (1974) work and goes beyond it by deepening the critique of the effects of workers' dispossession of their knowledge within the production process. The themes of monitoring and control are particularly influential in management science research. Control is not limited to Taylorian strategy; it takes forms of direct control and responsible autonomy (Friedman 1990: 186). The labor process theory (Knights and Willmott 1990) has not lost its relevance with technological developments. On the contrary, the new jobs generated by the use of the digital platform have led to research on the platform as a ghost employer. Control over employees takes on new forms of feedback and evaluation by customers (Gandini 2019).

Work on industrial democracy acknowledges the impossible reconciliation of employers and workers and examines the conditions for reconciling interests. These studies try to overcome the rivalry of the Marxist class. This is the case of Dunlop (1970), who does not belong to the Marxist tradition but acknowledges the divergence of interests between employer and employee: on the one hand, he takes a critical approach to the theories of human relations by considering them as an attempt to increase control over workers; but on the other hand, he considers that there is a possibility of creating an ideology shared between workers and employers. For him, resistance can be resolved in accordance with a shared ideology institutionalized by the system of professional relations (Dunlop 1970). However, from a Marxist perspective, one may wonder how a common ideology can exist in a context of capitalist domination and hegemony. O'Donnell's (1999) democracy at work is a myth (cited in McGuire et al. 2005: 134).

In the context of capitalist domination, the only possible experience for workers is that of resistance to the capitalist order. Studies aim to describe the organization as the materiality of domination and thus suggest ways of resistance. It is for this reason that neo-Marxist critical research questions the performativity of research (Spicer et al. 2009); it is indeed in the perspective of awakening consciousness that it can contribute to awakening and guiding resistance.

In this perspective, the work experience proposed by the employer brand could be compared to the implementation of a playful work context in order to make it easier to accept the rules of production (Burawoy 1979). Such an experience would be a fall asleep of the employees' capacity of resistance by making it possible to find "relative satisfactions" in work. The experience of satisfaction, which is the basis of the work on the employer brand, curbs the temptation of the experience of resistance. The management of individuality has been suggested by the employer brand (Fleming and Sturdy 2011).

That is what the Marxist analysis of management considers as a set of managerial techniques to make acceptable the work done in marketing the employer brand as the object of communication. Managerial techniques are no longer only useful within the company to make an intense work effort sustainable (internal employer brand); they are also useful outside the company to make the company attractive to employees and socially legitimate because it meets contemporary expectations (external employer brand).

In the Hegelian approach to work, work reduced to effort does not produce any object that allows employees to become self-aware through their work. On the contrary, effort disappears in its consumption by the production system. The renewal of effort presupposes restorative consumption, which is what consumer society proposes, but consumption is ephemeral and does not allow self-awareness. Therefore, from a neo-Marxist point of view, the employer brand cannot keep its promise of emancipation. Management can only offer repairs to the effort to restore the workforce.

From a neo-Marxist perspective, the organization of work is the materiality of domination and raises the question of the new materialities of domination. The entry of work into the brand economy through the employer brand invites to develop work on new managerial techniques of control through responsible autonomy.

The Experiential Relationship to Work

The employer brand communicates the possibility of an organizational experience that satisfies the values to which the employee is attached. In the Marxist perspective, this experience is impossible because the worker is caught in the immediacy of effort and constrained by a system of authority. Studies based on the humanist approach seek to offer an alternative by focusing on effort management and repair. It introduces a new symbolism of work by substituting self-development and play work for hard work, but it remains on an anthropology of effort and restorative consumption. The sign of change that the employer brand carries is the entry of work into the brand's economy. The employer brand becomes a tool for differentiating companies from their stakeholders, but it also makes the employee a stakeholder in the company's economy. Research in human resources management on work in brand economics is becoming important today, but it requires a specific approach to work.

A common point of the humanist and Marxist approaches is to consider the employee's work experience from the perspective of the inside of the organization. The employer brand by considering the employee as a consumer of work context and activity suggests an experiential relationship to work. It communicates with an employee who does not undergo or experience the experience but who evaluates it. It evaluates it ex ante in relation to a desire (external employer brand), and it evaluates it in progress in relation to this desire (internal employer brand).

The entry of work into the brand's economy opens another path, which is the choice of work in a relationship with work that is comparable to a consumer relationship, i.e., where a value is given to consumption in relation to a personal context and a personal project. It opens it in two ways: on the one hand by creating a discourse on the characteristics of work, thus making choice criteria visible, and on the other hand by legitimizing choice in relation to work and opening up the possibility of public criticism of a given employer brand through these two channels.

The pragmatist approach, which is placed in the Hegelian lineage (Shook and Good 2010; Garrison 1995), places criticism within the work experience itself and involves the critical posture at two points in time, first at the time of choosing the experience and second at the time of evaluating it.

Experience is "the active relationship of the organism to its surrounding conditions, projecting ends as consequences to be achieved" (Bidet 2008: 213). The experience is underpinned by desire. The "content and object of desires are seen to depend upon the particular context in which they arise, a matter that in turn depends upon the antecedent state of both personal activity and of surrounding conditions... Effort instead of being something that comes after desire is seen to be of the very essence of the tension involved in desire" (Dewey 1939: 16). For Dewey (1939), experience is a practice and not a mental or psychological state. Effort is not absent from an experiential approach to work, but it is not the effort of work activity: it is the effort made to achieve a desire. The effort of the activity in an organized context is only one aspect of effort. It is part of a relationship of effort and desire that makes sense in an experiential relationship with work and also integrates the efforts required by "non-work" activities and not in a relationship of effort and repair that makes sense only in a given organizational context.

Experience makes sense over time as employees evaluate and reevaluate their experience. According to Dewey (1939), value is a component of any immediate experience. The process by which a value is assigned to the different elements of the experiment is called valuation by Dewey (1939). This process is both cognitive and emotional and is conducted in interaction with the environment.

Marxist and humanist approaches integrate a critique of the work context, but this critique is external to work, just like the critique of a conscious observer. You cannot work and criticize work at the same time. You cannot be involved in both work and organization and be critical. In the Marxist perspective, this is because domination prevents it in the humanist perspective, because satisfaction, which is the result of effort, silences criticism. On the other hand, from a pragmatist perspective, work allows us to acquire, *The Phenomenology of Spirit*, particularly Chap. IV: *The Truth of Self-Certainty*, reflexive self-awareness. It shows that the desire of others – in this case, the desire expressed by the employer through his strategic and organizational project – may be integrated into an experiential relationship with work and thus contribute to shaping oneself to the possibility of this desire (Garrison 1995). However, the experiential relationship to work is a critical one. The experience is evaluated.

The experiential relationship at work is a critical report that offers research perspectives in human resources management. The employer brand brings work into the brand economy by making the proposed experience a criterion for valuing the company among stakeholders.

In a brand economy, research can introduce the possibility of a comparison between trademarks, and this comparison must be conducted from the consumer's point of view. To move away from the conception of work as a necessity, which justifies concentrating research on the couple effort/repair, we can refer, as invited by the entry of work into the brand economy, to an approach that emphasizes employees' desires in relation to work. The economy of the employer brand invites to compare proposed (external employer brand) and lived (internal employer brand) organizational experience from the employees' point of view. The entry of work into the brand economy makes it possible to conceive intentionality and a choice of experience among those possible represented by employer brands.

The experience conducted in a given context is provisional. A given organization cannot hope to fill an employee on a long-term basis. The experiential approach to work makes it possible to integrate the fact that the organizational context of work is not necessarily the one that allows self-discovery in the Hegelian sense. This type of work is a work of concept. The development of experience requires this type of work, and this is why the experiential approach integrates the possibility of self-knowledge through work. This is given not so much by work itself as by the experiential process in which it is embedded.

Discussion

The salaried employment relationship makes it possible to refer to the Hegelian dialectic of work. The working relationship is a historical construction and is marked by conflict. It has a legal existence given by a contract defining the relationship between the employer and the employee. When this legal form is lacking or does not exist, the relationship between a master and a servant is a relationship of domination as in the case of forced labor or domestic work. Placing the analysis of the working relationship in the Hegelian dialectical perspective is to ask oneself to what extent the working relationship contributes to enabling the employee to experience self-awareness.

Employer brand research can follow different possible paths. When comparing employer brands, a distinction can be made between business contexts. Three types of relationships to activity can be proposed: a *homo laborans* report, a homo faber report, and a *homo experiens* report. From the company's point of view, the first two are determined by the organization of work, while the third is based on a human resources management policy that considers and accepts the unconstrained external mobility of employees. From the employee's point of view, in the first two cases, he entrusts the evaluation of his experiential relationship to work to the company, and in the third case, he carries out his evaluation in a broader context than the company, including life choices.

Each of these contexts may or may not be acceptable depending on the individual experiential projects in which work is not absent but only plays a relative role. In addition, all experience takes place in contexts where organizations are made up of several work contexts. Is the employer brand a global or local brand?

The entry of work into the brand economy can encourage some organizations to develop communication that is out of step with their actual work context. A critical dimension is introduced when the detachment between an external brand, perceived outside the company, and an internal brand perceived by employees, i.e., actually experienced by employees, is observed. The discrepancy is a sign of clumsy marketing communication if the internal brand is positive while the external brand is negative. Conversely, it is a sign of organizational hypocrisy (Brunsson 1993) if the internal brand is negative while the external brand is positive. The employer brand therefore provides an additional tool to assess the employer in a self-referential way, through the consistency of the internal brand and the external brand, and in a differential way compared to other employer brands.

The way employees build their experience is also an area of research into the experiential relationship at work. The experiential relationship to work has an emancipatory dimension since it relates work to desire, but it implies possible mobility between organizations. A work experience is only a step toward another experience. Employer brands can be assessed from this perspective in terms of the company's ability to contribute to this mobility.

The experiential relationship to work also requires research on the institutional context. A work context is more or less painful or even dangerous for employees, depending on the legal context. The experiential possibility is made more or less easy depending on the individual contexts of employees. Each of the three contexts of experience, *homo laborans*, *homo faber*, and *homo experiens*, may or may not be acceptable depending on the individual experiential projects where work is not absent but plays a relative role. In addition, the economic context also makes experience more or less secure and can have an impact on the quality of experience.

Conclusion

The issue here is salaried work in an organized system, which is why, for example, no reference has been made to Protestant ethics, which deals with the relationship between work and religion in a global cultural context. We have heard about philosophers and researchers whose work focuses on the relationship between work and organization and on the employee's work.

It is not a question of opposing humanism and Marxism but showing the differences in perspectives. Marxism is interested in the capitalist logic of domination of one social category by another in the production system and the mechanisms deployed to exercise and maintain this domination. The humanist tradition is concerned with the effect of working conditions on human development. In the humanist tradition, there are exchanges with the Marxist tradition (Weil 1951) and vice versa (Gorz 2011). Similarly, Dewey's pragmatism is not indifferent to humanistic thinking (Shook and Good 2010: 4).

From a research perspective, no approach prevails over the other. The choice depends on how the approach can reflect the master-servant relationship that is established in a given context. Work is a historical and anthropological concept, and not all regions of the world, or even all sectors of activity in the same country, are historically and contemporary in the same anthropological approach to work.

Hence, the entry of work into the brand economy could currently be a Western phenomenon whose scope is to be studied.

The experiential relationship to work allows for aspects of the experience that are promising for research development to be taken into account.

Work is part of the conduct of life but is not enough to establish a relationship with oneself. For Simone Weil, this closeness to oneself is spiritual. There may be a work spirituality, i.e., a spirituality that integrates work activity, but spirituality is not reduced to work activity (Weil 1951). This idea that work is essential to the establishment of a relationship with oneself but that this relationship with oneself is not exclusively related to work is also present in Arendt. For Arendt, public life is the most flourishing one.

The experiential approach to work makes it possible to take into account the fact that the construction of a paid work experience is linked to work in an organized context but also to activities outside the workplace. This approach is already present in research with studies on work-life balance, for example.

In the experiential approach, the meaning of work is no longer contained in the activity itself; it is a means to an end. Labor may be acceptable and meaningful in some circumstances but has no meaning in itself. The entry of work into the brand economy gives rise to the idea of a relationship of consumption at work. This is not a new idea. The reconciliation of work and consumption is present in the Marxist tradition where work is seen as an activity that is consumed by companies to produce wealth. Labor is a consumption that values capital. In a Marxist approach, work is the expression of a relationship of domination by which workers become producers of economic goods and wage labor is a social assignment resulting from social position. In the experiential approach, work is a consumption of a technical and social context that is part of the evaluation of experience.

The entry of work into the brand economy may allow some employers to contribute to promoting a relationship of the *homo laborans* or *homo experiens* type. The employer offers an experience but is not the master of the experiential project. The master-servant relationship inherent in the working relationship is replaced by a masterS-servantS relationship.

Conflicting Notions of CSR and Business Legitimacy in Globalization

Legitimacy Issues in Corporate Public Diplomacy

68

Kirsten Mogensen

Contents

Abstract

Transnational corporations negotiate with stakeholders in host countries to build long-term, trustworthy relationships. Such *corporate diplomacy* activities aim at creating economically and socially sustainable business solutions. The sub concept, *corporate public diplomacy*, refers to collaborations and negotiations directly with civic society. Based on a review of scholarly, peer-reviewed journal articles, where the authors use the term "corporate diplomacy," this article identifies four topics of special interest for discussions on legitimacy in diplomatic processes involving civic society: (1) Who can be perceived as legitimate representatives of civic society? (2) To what extent is it legitimate for corporations to seek political power and fill government gaps in host countries as well as in international politics, considering that the public has not elected the CEOs? (3) How do transnational corporations, from an ethical perspective, handle legitimacy issues related to the many different ideologies expressed by people in the countries where they operate? and (4) How do

corporations deal with disparities in power and expertise so that representatives from civic society, who generally do not have as much technical expertise and economic power, perceive the processes as well as the solutions as legitimate? Much of the literature on corporate diplomacy is either conceptual papers or macrolevel analyses of corporate behaviors in relation to world politics. So far, few case studies have been published. More case studies would be helpful in creating insight into the processes of transnational corporations' long-term negotiations and collaboration with civic society and in locating legitimacy issues related to practice.

Transnational corporations · Civic society · Power disparities · Public protests · Anti-corporate activism

Introduction

Transnational corporations' investments sometimes spark protests from people living on the lands where corporations intend to build factories, mines, or hydro dams. Well-known examples are the Indian Niyamgiri Hill range, where villages after years of anti-corporate protests voted against plans to mine bauxite – the primary raw material for aluminum (Kraemer et al. 2013; Seetharaman 2018) – and the Myanmar hydropower project in Kachin (Myitsone Dam) that would produce clean energy but was suspended by government after years of public protests (China Daily 2011; Sun 2012; Mogensen 2017).

For corporations, such cancellation or suspension of planned projects is expensive. For people in the affected areas, the uncertain years of protests mean that they cannot look to the future in peace and communities are disrupted. During the years of protests, local people in India and Myanmar were outraged about the prospect of being moved from their ancestral lands, the threatening undermining of their traditional livelihood, and the lack of respect for places of spiritual significance to them. Similar arguments are heard around the globe, just to mention that Brazil's indigenous people staged protest against loss of rights and land (Peres and DiLorenzo 2018), Native Americans protested against the Texas pipeline (Levin 2017), and Australians protested against a proposed Carmichael coalmine in Queensland (Hancock 2017).

When corporations undertook the initial expenses, related to the constructions in India and Myanmar, they had already negotiated successfully with relevant governments, and, as such, they were in the belief that their projects were legitimate. However, some people clearly did not find the projects legitimate. When they protested, they experienced closed doors and treats rather than an invitation to negotiate. It seems like the corporations did not perceive such protesters from civil society as legitimate actors in the corporate diplomacy related to their investments.

When corporations engage with stakeholders in other countries, this engagement may take the form of public relation, commercial diplomacy, and corporate diplomacy depending on the context and issues involved. While the first two aim at winning the public support for corporate products, ideas, and plans, the concept of corporate diplomacy implies a much deeper involvement with the public (Ali 2009; Ordeix-Rigo and Duarte 2009). Public relations, commercial/economic diplomacy, and corporate public diplomacy are interrelated concepts, and the practices share many techniques (Tam and Kim 2017). However, the emphasis is different. Respectively, keywords are perceived legitimacy (Vos 2011; Weber and Larsson-Olaison 2017), attraction (Ruël 2013; Nye 2014), and collaboration (Agmon 2003; Mogensen 2017). A number of legitimacy issues are involved when powerful corporations negotiate with less powerful actors such as governments and other stakeholders – including the general public – in smaller, poorer, and less powerful countries (Strange 1992, 1996; Agmon 2003; Ottaway 2009; Bloom 2016; Garsten and Sörbom 2017).

The focus in this chapter is on corporate public diplomacy, which is one aspect of the broader concept corporate diplomacy. In international relations, public diplomacy is a concept used to describe when a government engages directly with the public (Cull 2009; Memis 2010; Khakimova 2013; Seib 2013; Chang and Lin 2014; Mogensen 2015). In the transnational business world, the concept of corporate public diplomacy implies that management negotiate directly with civil society representatives (Mogensen 2017). As an example, corporations may engage civic society in an open discussion on how best to solve specific societal challenges in the hope to find solutions that are experienced as beneficial by both the corporation and the public. From an economic viewpoint, such direct negotiations are especially meaningful in situations where political opposition threaten to suspend or delay projects as experienced by, for example, China Power Investment Corporation (CPI) in Myanmar (Lwin 2015) and Vedanta Resources in India (Seetharaman 2018).

In the hindsight, "corporate public diplomacy – that is, collaboration with the general public in a host country through negotiation directly with civic society" (Mogensen 2017) might have saved the corporations for millions of dollars in wasted investments. Furthermore, at least in the case of Myanmar, analyses indicate that a profitable, sustainable solution could have been found though negotiations and co-creation activities with civil society.

This article will not elaborate on the economic perspective but instead discuss four other types of legitimacy issues related to "corporate public diplomacy." A search on EBSCOhost in May 2018 shows that the broader term "corporate diplomacy" has been used in less than 30 English language peer-reviewed journal articles and they form the core for this review. Many are conceptual papers, such as Asquers' (2012) cognitive-linguistic analyses inspired by George Lakoff, and several others discuss corporate diplomacy at macrolevel (e.g., Strange 1992, 1996). Case studies focusing on corporations' diplomatic activities with civic society are rare, but most of the scholarly literature on corporate diplomacy point to legitimacy issues that are relevant in dealing with civic society, and they will form the basis for discussion of corporate public diplomacy in the rest of this article.

The Concept of Corporate Diplomacy

As foreign direct investments and international trade grew after WW2, scholars, politicians, and practitioners with international relations discussed the need for transnational corporations to develop and practice diplomacy (Herter 1966; Strange 1992; Trice et al. 1995). However, up to the turn of the century, the use of the concept "corporate diplomacy" in academic peer-reviewed journals seems to have been limited to the use of scholars studying corporate history. Miner (1969) introduced the concept in a study of the St. Louis-San Francisco Railway Company back in the 1880s, and Smith (1976) a few years later used it in his study of "The Millspaugh Mission and American Corporate Diplomacy in Persia, 1922–1927."

When the international engagements grew rapidly in the 2000s (WTO 2014; World Bank 2016), the concept was adopted by scholars in business management. An early adopter was Steger (2003), who called his book *Corporate Diplomacy: The Strategy for a Volatile, Fragmented Business Environment*, and while it was not an academic article, a review was published in the strategic management journal *Long Range Planning*. A few years later, Steger co-authored a journal article about corporate diplomacy (Amann et al. 2007). Steger and his team defined corporate diplomacy:

> Corporate diplomacy refers to the attempt to manage the business environment systematically and professionally, to ensure that business is done smoothly, with an unquestioned license to operate and an interaction that leads to mutual adaption between corporations and society in a sense of coevolution. (Amann et al. 2007)

Amann et al. emphasized strategic as well as institutional legitimacy theory in their discussion of four cases of corporations faced with pressure from external forces such as NGOs. The cases involve reputation management, and as such, it could be read as not much different from the public relations and social responsibility activities that were covered under already know terms. However, in the hindsight the definition contains some words that imply a much deeper engagement with society, including "mutual adaption" and "coevolution," both of which require negotiations. The word "unquestioned" also requires an agreement with the local communities, because a project can hardly be considered unquestioned if local people protest.

Since then, scholars within different fields, including management, strategy, corporate communication, public relations, marketing, branding, international relations, and history, have used the concept in various contexts. More recently, scholars have suggested that corporations should take on new roles and try to solve problems that governments have not been able to, which means that they take on a more political role. As an example, Ordeix-Rigo and Duarte (2009) suggest that "corporate diplomacy is aimed at positioning the company or a group of companies as institutions" and that by "taking over some of the traditional state functions (. . .) they are also acquiring the status of interlocutor in an non-governmental environment." Mogensen (2017) writes that corporate diplomacy "is a relevant concept for activities which transnational corporations engage in, when they perceive an opportunity or a problem in a host country and try to develop a sustainable solution in collaboration with relevant stakeholders at all levels, including civil society."

Scholars have, for example, discussed (1) who are involved in diplomatic negotiations with corporations, (2) how these corporate diplomacy activities relate to government diplomacy, (3) what issues can be handled through corporate diplomacy activities, and (4) how they differ from related concepts.

1. Actors can be other businesses – foreign competitors and business partners, more or less powerful (Miner 1969; Asquer 2012), foreign governments (Strange 1992; Agmon 2003; Miller 2009; Asquer 2012; Jackson and Dawson 2017), international organizations (Pedersen 2006), NGOs (Amann et al. 2007; Mirvis et al. 2014), and foreign publics (Macnamara 2012; Mogensen 2017). A few history scholars also talk about corporate diplomacy when corporations are engaged in negotiations, damage control, and lobbying in their home country (Miner 1969; Schroeder 2011), but that is the exceptional use of the concept. In general, corporate diplomacy is used in connection with transnational negotiations.
2. When corporations work in foreign countries, they can have different links to their national governments. Before WW2 it was common that colonial powers appointed corporations as government representatives in other countries (Smith 1976; Ali 2009; Ottaway 2009; Westermann-Behaylo et al. 2015), and in a smaller scale, corporations are still appointed national consultees in areas where the establishment of an embassy is considered too costly. However, after WW2 the role of embassies in promoting the interests of corporations has developed. Such trade or commercial diplomacy recognizes the importance of the home government and the common interests between national governments and national corporations when they want to expand on foreign markets (Amann et al. 2007; Asquer 2012; Holden and Tryhorn 2013; Ruël 2013). On the other hand, corporations and individual citizens can also help create soft power for their national government if public abroad admires them (Ali 2009; British Council 2012; Tam and Kim 2017; White 2015) or harm the soft power of a nation if they undermine the trust in the country's core values (Miller 2009). While such cooperation centering on national interests is still the trend, some large corporations have started to claim independence from national governments, insisting that they are truly transnational and that they can do better alone than when linked to a national government (Ali 2009; Westermann-Behaylo et al. 2015). Management literature discusses when it is in the interest of transnational corporations to dissociate from national governments (e.g., Wang 2005). The relationship between a national government's diplomatic efforts and those of other actors is, in other words, not always in harmony (Miller 2009). This disharmony raises the questions of (1) who are the legitimate representatives of a nation and responsible for its image and (2) if it is legitimate for transnational corporations to act independently when its home country is involved in a territorial dispute with a host country (Tam and Kim 2017). These issues will not be discussed further in this article.

3. Scholars use the concept of corporate diplomacy in different contexts of which some seem very close to public relation concepts and others imply actual negotiations where the result is "a negotiated solution rather than perfect market equilibrium" (Agmon 2003). Examples of the first are that corporate diplomacy is used in an effort to "bring about mutual understanding and respect among people and cultures" (Wang 2005), "win the hearts and minds of external stakeholders in support of an organizational mission" (Henisz 2016), and reduce "nationalistic antagonism in overseas markets" (Wang 2005). Examples of the latter are transnational corporations' negotiations with states for better infrastructure (Agmon 2003), with other businesses to maximize their combined opportunities (Miner 1969), with civil societies to find solutions to societal problems (Mogensen 2017), and with all stakeholders to fill governance gaps and solve conflicts (Westermann-Behaylo et al. 2015).
4. *Corporate diplomacy* as a concept has evolved from government-to-government long-term relation building and negotiations, and mostly, the concept is used in contexts where transnational corporations are strong enough to negotiate directly with other powerful actors outside their home country. Scholars have discussed how corporate diplomacy differs from other concepts like economic and commercial diplomacy, negotiations in general, international relations, and business diplomacy (Asquer 2012; Rüel and Wolters 2016). Parallel to government diplomacy, corporate diplomacy is the responsibility of the top management (Pedersen 2006; Ali 2009), and it "requires engagement, two-way conversation, transparency, and hopefully win-win negotiations with a mix of interests" (Mirvis et al. 2014). *Public diplomacy* has evolved from the diplomatic communication from one government to foreign publics (Wang 2005). As a concept, it implies engagement, networking, and listening, but not negotiations, with the general public (Cull 2009; Mogensen 2015). Scholars have therefore struggled to describe the differences between the visible conduct of public diplomacy and of other concepts like public relations, propaganda, lobbying, relationship marketing, and nation branding (Pedersen 2006; Tadajewski 2009; Asquer 2012). Only after 2000 have scholars tentatively included civil society as relevant participants in genuine negotiations, and Mogensen (2017) suggests that "corporate public diplomacy" is a relevant term for cooperation and negotiations directly with civic society.

The Concept of Legitimacy

This article recognizes two ontologies of corporate legitimacy. Both are reflected in the literature, usually without elaboration; however since this article combines both types of study in the review, it is necessary to introduce a way of distinction:

1. Citizens' perception of the corporation's legitimacy. This is linked to the socially constructed image of its activities – a social construction that is usually negotiated

between the corporation and its social relations. Evaluations of this socially constructed image will in this chapter be referred to as "perceived legitimacy."

2. The actual conduct of corporations and its impact on society. The discussions refer to this ontological level whenever legitimacy is discussed without the prefix "perceived." In a perfect world, citizens have a transcendent view that allows them to evaluate the legitimacy of corporations based on their actual behavior, and there would be compliance between the ontological levels; however in the real world, some corporations manage to create a legitimate public image while behaving illegitimately backstage (Goffmann 1959). Examples are regularly uncovered by journalists and NGOs. In our imperfect world, there are also companies who behave perfectly good but are unjustifiably accused of illegitimate behavior. For these reasons, the perceived and the ontological levels of legitimacy are often not coinciding.

In the following discussion, Boltanski and Thévenot's (2006) six orders of worth, market, industrial, civic, domestic, inspired, and fame, plus Patriotta et al.'s (2011) green order of worth will be used as common reference without further elaboration. The framework is produced with social construction of justification in mind; however, the orders of worth refer to fundamental human values, and the categories of orders can therefore be used in discussions of legitimacy as well as perceived legitimacy. Even if the reader does not know the framework in detail, the meaning will be clear from the context in which it is used.

While there are many legitimacy issues involved in corporate diplomacy, the following discussion will be structured around four main topics that seem especially relevant when corporations cooperate with civil society in host countries:

1. Legitimacy of civil society representatives
2. Legitimacy of corporations as political actors
3. Conflicting ideologies
4. Imbalance in power and expertise

Legitimacy of Civil Society Representatives

When corporations engage with civic society on controversial issues, many actors will claim to speak on behalf of the community. In the cases of Myitsone and Niyamgiri Hill, outspoken protesters included, among others, the affected villagers, people from surrounding areas and towns, people living further away but fearing that their livelihood would be affected by the constructions, national politicians, surrounding countries that feared that the constructions would impact power balance in the region, national and international anti-corporate activists, artists, and individuals who enjoyed personal exposure from linking to a popular movement.

Often the affected villagers do not have the capabilities required to engage in campaigns, e.g., they speak only a local language and have no experience with media handling. In the analyzed cases, the most outspoken protesters came from outside the villages. They were better educated people with contact to media, e. g., artists. Because villagers can hardly create international attention around their resistance without such supporters from outside, they are needed in the process, but they are not legitimate representatives of the villages unless they are appointed by them. While the villagers tend to emphasize values from the domestic order of worth – link to the ancestral land, local heritage, spirituality, and traditions – the outside supporters are not attached to the land and can easily move on, as in the Niyamgiri Hill where one of the most outspoken protesters changed his mind and appeared officially as a supporter of the project after the corporation gave him a scholarship (Kraemer et al. 2013).

However, people from outside the affected villages can be perceived as legitimate stakeholders, if they have interests in the project or are affected by the consequences. For example, a hydropower station can create clean energy to millions of people, and, therefore, the interests of the villagers must be balanced with the interests of the larger community. Ideally, a solution can be found where the hydropower station is placed so that it can produce energy and be profitable and will not harm places that the villagers find sacred. In regard to mega projects, other countries may also be legitimate stakeholders. As an example, neighboring countries can fear that a foreign superpower – e.g., China in Southeast Asia – gets too much influence on regional policy if it controls major resources like hydropower dams and other infrastructures through its transnational corporations (Mogensen 2017).

Legitimacy of Corporations as Political Actors

This section will briefly discuss legitimacy issues related to three corporate roles that the literature has described:

1. Engagement with stakeholders
2. Representing home country
3. Broader political role

These three will now be discussed:

Ad 1

It may seem obvious that transnational corporations are legitimate actors in diplomatic activities involving them, including negotiations with stakeholders at all levels.

However, governments may not always find it appropriate that corporations negotiate directly with civic society, because they perceive themselves as the one legitimate negotiator on behalf of their country. For example, in Myitsone, the Chinese investors said that the Myanmar military government, with whom they had originally negotiated, did not want them to negotiate with the villagers (China Daily 2011). Governments can fear that negotiations will be complicated by the involvement of representatives from civic society, e.g., anti-corporate activism and lobbying in favor of the project, and that there will be lack of confidentiality during the negotiations. It can reasonably be argued that democratic governments are elected as representatives of the common will, while civic society are not. The extent to which civic society can be considered legitimate partners in negotiations will therefore depend on moral reasoning in the specific case.

Ad 2

The conduct of transnational corporations and their home countries mutually affect the perceived legitimacy of each other (White 2015; White and Kolesnicov 2015). Today, some corporations insist that they are truly international and therefore have no home country, or they try to distinguish themselves from the home country's foreign policy. However, mostly, transnational corporations benefit from and contribute to the home countries' brands, and they are to some extend representatives of that country. Referring to Kochhar and Moelleda (2015), Tam and Kim (2017) write that transnational corporations (TNCs) "serve an important political function as corporate diplomats of their countries of origin." Tam and Kim conclude that: "Corporate diplomacy should be practiced not merely for TNCs to gain legitimacy in foreign countries in which they operate; it should be practiced as a political function because of the association between TNCs and their countries of origin." Such a political function will, of course, affect civil society in the host country.

Smith (1976) names American Secretaries of State in the 1920s as "architects of corporate diplomacy," all working toward open doors for American investments throughout the world. It also included Washington's protection of American enterprises in other countries and contributed with corporate-friendly experts to administrations in other countries. As an example, Smith describes how the American economist Arthur C. Millspaugh worked as Director General of Persian finances between 1922 and 1927 and, at times, had "dictatorial powers." Eventually, an increasing number of Persian officials opposed him, because he and his staff "were not willing to accommodate Persian customs," "his disregard for the dignity of government (. . .) overshadowed all of Millspaugh's good qualities," and the Shah wanted to be the sole ruler of Persia. Smith's historical account demonstrates how corporate diplomacy lacks legitimacy when the dignity of the people and its government is not respected, even if the foreigners believe that they create a win-win situation.

Transnational corporations may be tempted to use their technical and economic resources to help solve problems in a country but then, as a by-product, influence politics and negate the authority of the legitimate (elected) government. It is relevant to discuss, if power founded on money and expertise legitimize such a political role, and if so, what the difference is between the new norms for corporate diplomacy and the Millspaugh example.

Ad 3

This leads to the recent discussion of whether transnational corporations should play a more extended role in solving problems across the world. In the literature, this discussion does not focus on aid and development programs, like those sponsored by Bill & Melinda Gates Foundation, but on how corporations intervene in societal problems beyond “narrowly confined commercial interests” (Riordan 2003, quoted by Macnamara 2012). Scholars do not agree on the extent to which corporate leadership should play an extend role in the political sphere.

The following discussion implies a distinction between the economic and the political spheres, even though these are social constructs and not all scholars agree with the distinction (Deblonde 2001). Deliberative democracies have developed different norms and standards for the two spheres. The norms for the economic sphere are similar to the market and industrial order of worth, e.g., price, cost, technical efficiency, expertise, and monetary, while the norms for deliberate democracies are civic, e.g., collective welfare, equality, solidarity, fundamental rights, rules, and regulations (Patriotta et al. 2011). From this perspective, it is a responsibility for national governments to create rules and limitations for corporate world, so that, e.g., the economic sector contributes to the collective welfare, that citizens can trust financial institutions, and that the food products do not contain too much poison.

It may seem obvious to include corporate world in the formulation of such rules and regulations, because they have the expertise, an argument drawing on the industrial order of worth. For example, Sako (2016) writes that corporate diplomacy is relevant both where there is a functioning government and that it is “equally needed where governments are absent due to deregulation or weak law enforcement capacity (. . .) a mind-set that sees the role of business as working with governments to create societal roles that governs the conduct of business.”

The question, of course, is to what extent such rules formulated by the corporations also satisfy the public’s ideas of how society should be organized. Corporate leaders are, after all, not elected by the public, but by the shareholders, and unlike democratic elected politicians, CEOs cannot be exchanged by the public. Worldwide, the growth in corporate power (Bloom 2016; Garsten and Sörbom 2017) seems to have been in parallel with a growth in – quoting The Guardian – “gap between the super-rich and the remainder of the globe’s population” (Neate 2017, see also Shorrocks et al. 2017). Some scholars have analyzed cases, where the environment was damaged by corporations (Schroeder 2011; Mirvis et al. 2014), but there are few known cases where corporations, solemnly out of idealism, have strengthen the civic and green values (environment friendly, sustainably) in host countries. Corporate social responsibility activities are generally introduced, because customers find corporate ethics important and not out of idealism.

Increasing the political role of corporations, Westermann-Behaylo et al. (2015) suggest that “corporate diplomacy can play a role in resolving social or political conflicts” such as peacemaking and peacebuilding, especially in “less developed and potentially conflict-prone host countries.” Other scholars also point to the larger societal role of transnational corporations in host countries (Ordeix-Rigo and Duarte 2009; Mirvis et al. 2014). This thinking seems to cast corporate CEOs as patrons and the citizens of host countries as clients. While there is no doubt that the corporations have power and expertise, it is conflicting with the civic values of equality. Such thinking, therefore, leads to moral questions such as: Why do people with access to money and technical expertise have a legitimate right to more influence in the political sphere – national or international – than other citizens? And what is the evidence that they will use their economic and technical strength in the interest of the collective welfare if it conflicts with the interests of their shareholders? So far, the literature on corporate (public) diplomacy has not attempted to answer these questions.

Henisz (2016) writes that for good historical reasons, citizens are often suspicious of foreign managers, who are not familiar with the local language, culture, and societal norms, so to build trust and legitimacy, they need not only to demonstrate their economic legitimacy but also to build sociopolitical legitimacy. In Myanmar, analyses of communication between corporation and the local community showed a conflict between the villagers' domestic and the corporation's international norms (Mogensen 2017). The corporation would refer to international standards and goals, while the protesters would refer to the domestic order of worth, e.g., the value of living on their ancestral lands and in accordance with traditions. Such conflicts in worldview may for a time be hidden, using measures like persuasion and economic incentives like job creation and infrastructure, but, from a legitimacy perspective, the conflicts about fundamental values are not easily solved, which leads to the next topic about the legitimacy in imposing foreign values on the public in host countries.

Conflicting Ideologies

There is an ongoing discussion of how to overcome the differences in values between transnational corporations and their host countries in practice. There are different positions in that argument. One perspective is that corporations are responsible for improving life of people in host countries, while others find that they should adapt to values in host countries.

Transnational corporations can claim to have core values that they hold on to no matter where in the world they operate. Such values can, for example, be linked to human rights and democracy. For a corporation, it makes economic sense to act in accordance with civic values, because in the social media age, everything they do anywhere in the world contributes to their reputation, and ethical behavior makes their products more attractive to customers in some countries. When transnational corporations communicate an image of ethical behavior, it creates an expectation that transnational corporations will contribute to reducing human right abuses and other social problems in host countries (GlobeScan, reported in Mirvis et al. 2014). Corporate public diplomacy is from a normative perspective in line with Western democratic thinking.

However, some scholars question the right of transnational corporations to enforce Western values, comparing it to missionaries who have already for centuries tried to tell people in developing countries what to do. For example, Ottaway (2009) writes:

> Can't shut down Big Oil? Then browbeat companies like Shell and ExxonMobil into preaching the gospel of human rights and democracy to their developing-world hosts. As appealing as this strategy seems to global do-gooders, it won't work.

Summarizing her argument, Ali (2009) writes about corporations trying to enforce Western values in other parts of the world: "they evoke an image of colonization and superiority."

The alternative is to adapt corporate values to local norms. Tam and Kim (2017) write that "corporate diplomacy could enhance the legitimacy of TNCs in foreign markets" by "aligning their corporate values with the societal values of the foreign countries in which they operate." It makes sense to adapt to cultural norms in host countries, for example, European countries expect transnational corporations from Africa or Asia to adapt to Western values when operating in Europe, but the same European countries do not appreciate if their corporations adapt too much to business norms in countries with, e.g., corruption and inhuman working conditions.

The conduct of business is affected by ideologies that differ. Some countries support free trade, while others do not. The vast opportunities faced by transnational corporations are based on free market principle, but when corporations control huge resources, it may be tempting from the perspective of a market order of worth to negotiate an agreement that prevent any other corporation from competing on equal term. However, from an ethical perspective, such behavior is questionable. Wang (2005) writes about multinational corporations (MNC) that "it is impossible, if not outright against free market principles, for any MNC to manipulate and control the competitiveness of a certain product category in a foreign market." In a global society where corporations benefit from free market principles, a solution cannot be perceived as legitimate if it creates a monopolistic situation where local competitors are faced with unreasonable high entrance barriers to a market.

Often the discussions about conflicting values center around rich transnational corporations working in poor developing countries. However, Miller's (2009) analyses of reactions to four US-based corporations aiding Internet-based censorship in China illustrate the core dilemma in a context where the actors are all powerful and based in rich countries. The USA and China differ in their understanding of human values related to free speech. The corporations act in accordance with market values; they want to sell their equipment. The power balance between them does not allow any of them to enforce their ideology on the other by use of coercion. When the corporations sell censorship equipment, their behavior reflects on the reputation of the USA. It sends two signals to people around the world: (1) that the USA's insisting on free speech is relative and (2) that USA corporations have freedom to act in ways that are not in accordance with the nation's official ideology.

As complex as it is when two superpowers are involved, the legitimacy issue becomes even more complex, when corporations negotiate with civic society. On the one hand, transnational corporations may express civic values such as democracy and free speech. On the other hand, many local societies rely on domestic and green values such as tradition, spirituality, and nature, as experienced by corporations in the Niyamgiri Hills and Kachin.

Imbalance in Power and Expertise

Actors enter the negotiations with different resources, e.g., the largest corporations control huge resources compared to poor countries. Such inequality needs to be taken into consideration when discussing the legitimacy of the bargaining process (Strange 1992). Ali (2009) writes that executives should "avoid any temptation to take advantage" of the lack of resources and experience to negotiate effectively when dealing with developing countries, and similarly, the literature generally warns corporations against using their superior power and technical expertise to manipulate the public into agreements that contradict their interests, because such agreements are not socially sustainable in the long run. If the public is not included in the decision processes, they can make protests and boycotts and use their democratic rights during elections and/or shopping power to undermine an agreement.

Macnamara (2012) describes processes-related issues in his comparative analysis of corporate and organizational public diplomacy versus public relation. The following list of norms for corporate public diplomacy is derived from his argumentation:

1. Ongoing dialogue with publics, even "in the face of complete disagreement and hostility" (except during war). Long-term perspective and relation building that require patience. Interpersonal communication preferred.
2. Mechanisms in place to compensate for power disparities, e.g., meetings on neutral ground, equal size delegations, equal time in discussions, return visits, and – when relevant – equal votes.
3. Diplomatic etiquette, "ensuring courtesy and civility," a preferable formal protocol with rules for meetings, e.g., reciprocal arrangements, turn-taking, and right to reply.
4. Acceptance of different interests and perception conflicts being not a sign of breakdown in the negotiations. It may not be possible to reach a win-win solution: "Even a 'win-win' position can sometimes involve publics having to give up their position to move to a mutually accepted position."

To avoid misunderstanding, the concept of "win-win" solutions may need to be extended, so that negotiations leading to a satisfactory result can be considered win-win even when all stakeholders have had to move their position to a mutually agreed. As an example, in Kachin the corporation wanted to build a big hydropower dam at a place considered sacred by the public. Kachins suggested instead to build two smaller dams at nearby places. It was not the preferred solution from the corporate point of view, but it might have produced the needed electricity. If it worked, such a solution could have been perceived as a win-win, but the corporation was either not interested in negotiations with the public at that time or had been told by Myanmar's government not to do it.

It may sound like a cliché to suggest that the stakeholders involved should perceive solutions as win-win, but the literature give examples. For example, Miner (1969) presents an analysis of the negotiations between the directors of two American railway companies in 1880–1882. While they were competitors, each of them celebrated the result as a great victory, because they both gained from the agreement. Miner (1969) writes that both "accomplished their ends by diplomacy not violence. . .the force used was diplomatic pressure and manipulation of interests, not cut-throat competition and rate wars," and he adds that the negotiators from the two railroad companies later became well-known diplomats.

Conclusion

Based on a review of peer-reviewed articles on corporate diplomacy, this article has briefly discussed four areas of legitimacy issues: legitimacy of civil society representatives, legitimacy of corporations as political actor, conflicting ideologies, and imbalance in power and expertise.

Corporate public diplomacy is highly relevant in a global economy. When it fails, it is costly for corporations and brings misery to communities. However, academia has so far shown little interest in exploring this field empirically. The few existing case studies are interesting read, because they bring light to new aspects of corporate legitimacy. As a start, case studies could explore the practice related to the four topics of special interest for discussions on legitimacy in the diplomatic process involving civic society: (1) who can be perceived as legitimate representatives of civic society? (2) to what extent is it legitimate for corporations to seek political power and fill government gaps in host countries and in international politics, considering that CEOs are not elected by the general public? (3) how do transnational corporations handle legitimacy issues related to the many different ideologies expressed by people in the countries where they operate? and (4) how do corporations deal with disparities in power and expertise between them and the stakeholders so that less powerful and knowledgeable stakeholders perceive the solutions as legitimate?

While accepting that humans have different values, negotiations and cooperation may increase the chance of finding socially sustainable solutions and limit expensive delays and cancellations of projects due to local protests and anti-corporate activism.

Political Corporate Social Responsibility (CSR), Development, and Business Legitimacy

69

Sameer Azizi

Contents

Abstract

The chapter focuses on the "political turn" in the CSR literature that has emerged in recent decades and focuses particularly on the debate about Political Corporate Social Responsibility (PCSR) in relation to developing countries. The main features of the PCSR literature are presented with an emphasis on the claim about the changing nature of businesses as political actors driven by a shift from instrumental motives towards moral legitimacy in the era of globalization. The chapter highlights some of the key critiques of the PCSR debate in regards to their claims about the changing nature of the businesses and assumptions about the role of business in promoting democratic global governance. It is argued that the PCSR claims and assumptions are empirically weak and theoretically flawed due to the biased normative ideals and conceptualizations of legitimacy and the political role/responsibilities of businesses. A call for contextualized studies grounded in empirical realities of the variances across "developing countries" is presented in the chapter for future studies.

Introduction

The CSR literature has in recent decades experienced growing interests in the political dimensions of CSR that is typically referred to as the "political turn" in the CSR literature (Scherer and Palazzo 2007; Mäkinen and Kourula 2012; Frynas and Stephens 2015). A recent review of this broad field documents the importance of institutional theory and stakeholder theory in this field and defines the political debate on CSR as the intended or unintended political impact of CSR activities or vice versa (Frynas and Stephens 2015). However, the focus of the paper is on Political Corporate Social Responsibility (hereafter PCSR) as the most debated dimension of the field. Through a series of articles and books various scholars have made claims that businesses — with a particular focus on Multinational Corporations (MNCs) — are playing a political role through Corporate Social Responsibility in society given specific conditions of globalization (Matten and Crane 2005; Moon et al. 2005; Scherer and Palazzo 2007, 2008, 2011; Crane et al. 2008; Scherer et al. 2016). The common understanding of legitimacy as "the generalized perception that the actions of an entity are appropriate within some socially constructed systems of norms, values, and beliefs" (Suchman 1995) plays a major role in the claims and assumptions of the PCSR arguments. The proponents of the PCSR debate seek to argue that businesses will/have shifted from an instrumental lens on legitimacy towards a more morally informed legitimacy, which will imply a political role and responsibility on businesses to engage in democratic governance in developing countries given the conditions of the era of globalization. Building on various points of critique of PCSR, the chapter attempts to argue the PCSR debate is currently theoretically flawed and empirical biased to make such claims and assumptions in relation to the developing countries. The aim of the chapter is not to provide an exhausted review of all studies related to the PCSR debate, but to provide the reader a general overview of both the claims and assumption made by the PCSR proponents and the related critique that the debate has triggered in the academic community.

The chapter will initially present the key features of the PCSR debate that will be followed by the main critique of the claims and assumptions in relation to developing countries. Finally, the conclusion section will summarize the key challenges of addressing and conceptualizing the political role and responsibilities of business in developing countries with brief indications to relevant future studies.

Introducing Political Corporate Social Responsibility

The PCSR debate generally argues that the globalization era has changed the classical understanding of business-society relations, and proposes revision of the role of business in a global society (Scherer and Palazzo 2007, 2008, 2011). The mainstream CSR debates are criticized for implying a neoclassical distinction between the political and the economic spheres in understanding business-society relations. The states are perceived to provide the conditions for well-functioning markets by providing legal rules, contract enforcement, public goods, and reduction or avoidance of negative externalities from business investments in society, whereas businesses are viewed as pure economic actors that provide services and goods that generate profit (Scherer and Palazzo 2007). However, the PCSR proponents argue that the era of globalization has changed the traditional distinction between "business" and "society" for various reasons implying that the boundaries between the political and economic spheres can no longer be differentiated as such. First, it is argued that globalization has led to the "shrinking of the state" that has diminished the ability of the state to provide public goods and/or the necessary regulatory framework and enforcement (Matten and Crane 2005; Scherer and Palazzo 2011). This is particularly seen in many nation states across the developing countries, as such states do not have the capability or even interest in providing democratic regulatory frameworks and/or basic public goods. Second, the international business landscape has changed due to the increasing number of MNCs that operate in multiple locations within and across national boundaries. The complex and dispersed operations of MNCs challenge nation states to regulate MNCs beyond national boundaries and have resulted in a "vacuum of regulation and social responsibility" throughout global markets, as the powerful MNCs force developing country states into a "race to the bottom" in order for them to attract foreign investments, technology, and know-how from MNCs (Matten and Crane 2005; Scherer and Palazzo 2008). Hence, a conceptualization of the "political" is required in the CSR debates that takes point of departure in changing conditions of globalization in order to make the core argument that corporations are increasingly taking on various political responsibilities and roles traditionally attached to the functions of nation states (Scherer and Palazzo 2007, 2011). However, it is important to note that what is referred to as the "PCSR" in the CSR debates consists of two distinct approaches conceptualizing the nature and drivers of the new political role of business through CSR.

The initial arguments about a political role for business through CSR emerged from the corporate citizenship approach that employed the "citizenship" metaphor from the political science literature (Moon et al. 2005). Advancing the concept of citizenship for CSR debates to a focus on citizenship and rights led to the "extended corporate citizenship" version as a descriptive conceptualization of the political role of corporations in society (Matten et al. 2003; Moon et al. 2005; Crane et al. 2008). The argument is that the process of globalization has enabled corporations to not only act as "citizens" as previously framed (Matten et al. 2003), but has also enabled a space for corporations to act as a channel for providing and/or enabling political, social, and civil rights through their CSR engagements for the public in general (Matten and Crane 2005; Crane et al. 2008). In this way the nature and role of corporations is reconceptualized from being purely economic into a political role in society, as corporations can potentially act beyond profit-maximization to address issues of citizenship and rights in society (Matten et al. 2003; Moon et al. 2005; Crane et al. 2008). The extended corporate citizenship approach, however, aims to be a descriptive framework eluding normative claims as to what the nature and political role of business in society should or should not be.

The political CSR approach, in contrast, aims to provide a normative framework inspired by the Habermasian theory of communicative action to emphasize the need for deliberation towards mutual understandings between businesses, civil society, and the nation state in a postnational global context (Scherer and Palazzo 2007). In other words, corporations need to adapt to globalization as a postnational era, as nation-states have limited capacity to tackle global "governance gaps" or "regulatory vacuums" (Scherer and Palazzo 2011). There is a need for collaborative solutions to be driven not only by the state but increasingly in cooperation with international and local civil society organizations (CSOs) and businesses to solve issues of global governance (Scherer et al. 2009; Scherer and Palazzo 2011). The emphasis on deliberation and collaboration implies a shift from a neoclassical view of business as purely profit-maximizing actor that is solely driven shareholder interests towards a political nature of corporations (Scherer and Palazzo 2007, 2011; Scherer et al. 2009) that utilizes collaborations to govern market mechanisms through democratic principles and/or provide public good (Scherer and Palazzo 2011). MNCs are particularly relevant for this claim due to global reach given their operations across nations on the one hand and their increasing economic and political power that makes them relevant global governance actors on the other hand. MNCs can influence global governance processes through "soft laws" as means to achieve private regulation (Vogel 2009). The PCSR debate highlights multistakeholder initiatives as promising initiative by corporations to involve citizens, businesses, and governments to achieve collaborative solutions (Mena and Palazzo 2012), but industry standards that address ethical challenges of, for example, global supply chains across nations are also indicators of the rule-setting engagements by MNCs (Lund-Thomsen and Lindgreen 2014). Furthermore, it is known from other studies that MNCs engage in the provision of public goods through CSR programs such as access to health service, education, clean water (Blowfield 2005; Newell and Frynas 2007).

A key argument in the new political role of corporations in society is that corporations can no longer gain and maintain self-interested instrumental legitimacy in society. Globalization has resulted in disability of the state to regulate business activities across nation states on the one hand and has enabled heterogeneous values and lifestyles globally on the other – these two conditions problematize the presumed rules and norms that once guided legitimate corporate conduct (Scherer et al. 2009, 2016; Scherer and Palazzo 2011). Instead, PCSR argues that corporations seek moral legitimacy in order to be able to collaborate with various actors in a postnational governance context (ibid). Hence, the nature of the businesses has changed from that of solely economic actors to that of increasingly political actors in society where CSR acts as an instrument to gain and maintain moral legitimacy that result in democratic governance of collaborations in order to identify and implement solutions to regulatory and public good deficits across nations (Scherer and Palazzo 2007, 2011; Scherer et al. 2013, 2016). The most recent PCSR 2.0 agenda argues that studying the political role of corporations in the new postnational setting is even more relevant after a decade of debates, but acknowledges that further empirical studies are needed to shed light on diverse governance settings throughout the world (Scherer et al. 2016).

Critique of PCSR in Relation to Developing Countries

The PCSR debate has triggered critique of their assumptions and claims about the changing nature of corporations and their political role in global governance that has particularly been raised in relation to context of developing countries.

Critique of the PCSR Claims About the Changing Nature of Business

The first point of critique relates to the claim by the PCSR debate that businesses – MNCs in particularly – are no longer solely driven by profit-maximizing but engage as morally driven political actors in global governance (Scherer and Palazzo 2011; Scherer et al. 2014, 2016). The PCSR proponents have been successful in provoking a debate on instrumental vis-à-vis moral legitimacy within the CSR literature. However, such claims have faced critique by scholars that empirically work with developing countries for various reasons.

First, it is worth noting that a specific "development-oriented CSR" debate was already established prior to the PCSR debate (see, e.g., Fox 2004; Blowfield and Frynas 2005; Prieto-Carrón et al. 2006; Newell and Frynas 2007; Banerjee 2008a). This debate was triggered by the mainstream claims in the CSR literature on how and why CSR led to social development with primary interest in CSR by MNCs operating across developing countries. One of the key arguments in this debate is that CSR essentially consists of both a business case (e.g., the financial, reputational, and strategic gains for the corporation) and development case (the societal gains). The problem is, however, that corporations either neglect or transform the "development case" of CSR into a managerial logic embedded in the profit-maximizing structure of particularly large corporations (Blowfield 2005, 2007). Such critique is relevant for the claims that corporations can administer citizenship rights and/or take a lead on democratic governance through collaborations with other non-business actors. The PCSR debate is criticized to merely focuse on multistakeholder initiatives and in particularly resting on the empirical example of the Forest Stewardship Council (FSC), which is presented as evidently proving a common interest among various actors in engaging in collaborative processes that hold actors accountable for their engagements (Scherer and Palazzo 2007). The PCSR takes for granted that the deliberative dialogue between the corporation and various stakeholder will encompass the demands of the local stakeholders, which will also force an internal legitimacy process to adapt the organization to external cultural norms, values, and beliefs (Kostova et al. 2008).

However, this attempt at empirical grounding is criticized for relying more on exceptions than on the rule in both developing countries and developed countries, since the process (e.g., collaboration to further a common interest), the output (e.g., standards and certificates), and the impact (e.g., increased accountability) may not be in the interests of corporations and/or local power-holders in developing countries (Banerjee 2014).

Another critique of the PCSR relates to the interests of corporation in collaboration and lack of understanding of power relations between corporations and other stakeholders. Scholars have long highlighted that corporations lack both the necessary capacity to identify the vulnerable segments of the society and the strategic interest in including such stakeholders in their CSR programs, which has resulted in exclusion rather than inclusion of marginalized social groups in CSR programs (Jenkins 2005; Newell 2005; Prieto-Carrón et al. 2006; Utting 2007). In addition, Banerjee (2001, 2008a, b, 2010, 2014) has among several other critical scholars pointed out the incommensurable differences between the interests of MNCs and certain groups of civil society in developing countries. Such marginalization is seen for instance in relation empirical examples of clash between the interests of the MNCs vis-à-vis the local community in accessing and utilizing land and/or resources in developing countries. At the end what appear to be legitimate actions by MNCs, end up excluding resilient voices in local communities leading to severe negative impact on the livelihood of such communities (Banerjee 2001; Ehrnström-Fuentes 2016). Similarly, studies on MNC and local suppliers in global value chains suggest that the compliance paradigm (e.g., corporate codes of conduct or ethical and labor standards) has not had the intended and idealized improvements on work conditions or laborers in export-oriented industries across developing countries (Lund-Thomsen and Lindgreen 2014). The findings also suggest that the recent move towards the cooperative paradigm (e.g., multistakeholder initiatives as proposed by the PCSR) – where MNCs and civil society actors engage in collaborations to build capacity of local firms and workers – has yet to improve the income and work conditions for workers in developing countries (ibid). The core critique relates to power asymmetries in the global value chains, as large international buyers (typically MNCs) constantly push local suppliers and finally the workers on the ground to reduce costs in order to stay competitive in highly competitive markets (ibid).

In other words, the interests of the corporations overshadow the interests of resilient stakeholders due to asymmetric power relations between vulnerable communities on the one side and MNCs and the national institutional power bases for MNCs on the other (Edward and Willmott 2008 p. 421). Hence, what may appear to be collaborative and morally informed business conducts to overcome governance gaps through private regulation and/or provision of "public goods" are at best driven by a process of excluding critical voices to overcome the incommensurable differences between corporate interests and the interests of heterogeneous group of stakeholders.

Both the extended corporate citizenship and the deliberative democracy approach (Scherer and Palazzo 2007) do not acknowledge the limitations in the abilities and interests of corporations in addressing societal concerns in the era of globalization

(Banerjee 2008b; Hanlon and Fleming 2009; Fleming and Jones 2013) and are rather led by normative assumptions about how and why corporations *should* act beyond profit-maximization, though neither of such claims have been theoretically or empirically proven (Banerjee 2008a). Further critical scrutiny of the theoretical foundation of PCSR is required to conceptualize the political role of business in relation to developing countries.

PCSR and Biased Democracy and Governance Ideals

The second type of critique relates to the general "political turn" in the CSR debates including the PCSR debate relates to the ideals and assumptions about conceptualizing the political role of corporations in era of globalization, which has triggered scholars to identify alternative theoretical frameworks for conceptualizing the political role of corporations.

One of the key points of critique in this regard concerns the assumptions about "shrinking state" and the conceptualization of "globalization." Whelan (2012) argues that the PCSR debate has taken important steps in their attempt to move beyond existing theoretical perspectives such as stakeholder theory and the corporate political activity debate towards a reconceptualization that is *"embedded in democratic mechanisms of discourse, transparency, and accountability"* (Scherer and Palazzo 2007 p. 1110). However, the assumption about a diminishing state capacity is problematic, as it is seen as a consequence of a somewhat universal process across the world, which has enforced corporations to engage in former state responsibilities (Whelan 2012). However, the PCSR debate lacks to understand that globalization is not simply a question about whether state functions and capacities have diminished or not, but is a matter of more complex processes of power relations within each nation state that cannot be generalized as presumed by the PCSR debate. Furthermore, it is even more problematic to claim that corporations will "fill in" such gaps left out by the state, as it is unclear why corporations should be motivated strategically in substituting the political role and responsibilities of the state rather than supporting or complementing state regulations and governance in general whenever preferable for strategic gains (ibid). Therefore, the proposed PCSR assumptions and claims seem to be biased by particular multistakeholder networks and initiatives such as the empirical example of certification through the Forest Stewardship Council (FSC) (Edward and Willmott 2008) without acknowledging that such examples indicate certain *forms of governance* in a globalized world rather than the *consequence of globalization* on nation states and corporate political responsibility (Whelan 2012).

Critical political-economy scholars have long highlighted that the new governance space for corporations is not a natural consequence of the "era of globalization" but should be seen as a result of the neoliberal process of privatization and deregulation across the world (Shamir 2008; Fleming and Jones 2013). Djelic and Etchanchu explore and compare the development of contemporary CSR in relation to paternalism in nineteenth century Europe and the North American managerial trusteeship in early twentieth century in order to argue that the political role and responsibility of businesses is not a new phenomenon driven by "globalization" (2017). In similar veins, it is argued that the PCSR debate cannot escape an instrumental logic of CSR embedded in the neoliberal ideology through the Habermasian concept of deliberative democracy – unless the institutional design of basic structures of society embedded in classical liberal system is problematized (Mäkinen and Kourula 2012 p. 665). CSR by MNCs have long been seen as a by-product of the neo-liberal ideology (Harvey 2007; Shamir 2008; Cederstrom and Marinetto 2013) that has not only enabled the privatization and marketization of public good in both developed and developing countries (Fox 2004; Fleming and Jones 2013; Mäkinen and Kasanen 2016), but has also constructed the voluntary nature of CSR in opposition to the mandatory regulation of corporate responsibility (Vogel 2006, 2009; Banerjee 2008a). The emphasis on voluntary nature of corporate engagements and multi-stakeholder collaborations lead to a supervising authority role for corporations, where corporations can hold other societal actors accountable without being held accountable themselves (Hussain and Moriarty 2018). The main challenge is not to provide such ideal intermediate role for corporations, but to change the governance role of corporations in ways that turn corporations into functionaries that accounts for the acclaimed provision of public goods, democratic governance (ibid). Unless the PCSR debate addresses the issues of neoliberal ideology that leads to asymmetric power relations and accountability mechanisms, CSR continues to be a smokescreen that is legitimized through private self-regulation in order to enable profit maximization throughout the world as CSR is embroiled in structural tensions and contradictions when corporations with the primary goal of maximizing profit claim to promote societal and/or environmental development. Hence, a debate about PCSR is therefore not a matter of providing democratic ideals about what role and responsibilities corporations "should" take, but to discuss how to overcome the "parasitical" (Fleming and Jones 2013), "predatory" (Hanlon and Fleming 2009), and "necrocapitalist" (Banerjee 2008c) structures that enable corporations throughout the world to create and sustain social and economic inequality. The key question for critical studies, therefore, is not *whether* corporations act as political actors with specific interests in developing countries but *how* businesses as political actors are enabled, and what such a political role implies for the various actors of society (Banerjee 2010; Fleming and Jones 2013). As a response to these critiques, Banerjee offers an alternative framework for global governance that seeks to provide more democratic decision-making forms and process by embedding the analysis of CSR and the corporations into the political economy context in order to overcome barriers imposed by corporate rationality (Banerjee 2014).

Another critique on the "political turn" of CSR and in particularly the PCSR debate is the postcolonial lens that mainly argues that the current PCSR debate paradoxically seeks to enforce a biased Western perception of business-society and business-state relations to a global one. The aforementioned "development-oriented CSR" debate has long called for the necessity of contextualizing the CSR-development relationships, as the taken-for-granted umbrella view on "developing countries" is misguided (Blowfield and Frynas 2005; Prieto-Carrón et al. 2006; Halme et al. 2009; Jamali et al. 2015a, b). Contextualization here means understanding the specificities of diverse national contexts including the formal and informal institutions (Brammer et al. 2012; Jamali 2014; Azizi and Jamali 2016), because "developing countries" vary in terms of state capacity, the form, and nature stakeholders across developing countries (Chapple and Moon 2007; Gond et al. 2011; Jeppesen and Azizi 2015). Furthermore, contextualization also relates to embedding the PCSR debate into the historical development of statehood, civil society, and private sector across developing countries in order to address the question as to what the responsibilities of corporations are when the presumed (former) responsibilities of the state have never existed in certain contexts of developing countries. The theoretical foundation on Habermasian deliberative democracy anchored in the PCSR debate is criticized for having historical and geopolitical roots in the realities of the modern societies of the West derived from realities of a bourgeois society in Europe failing to acknowledge and grasp with multiple realities beyond the biased understanding of the "modern" world (Mir et al. 2008; Ehrnström-Fuentes 2016).

Conclusion and Call for Future Studies

The chapter has briefly introduced the "political turn" in the CSR literatures by highlighting the debates about extended corporate citizenship as a precondition for the emergence of current PCSR agenda. The key assumption in the debate is that governments across nation states fail to fulfill their expected role as regulators and public good providers in the era of globalizations. Such global restructuration of governance configuration has enabled a governance space for corporations that operate globally and have sufficient resources to enact as political actors by filling in regulatory vacuums through CSR programs. The PCSR proponents claim that such political role is driven by shift from instrumental motives for gaining and maintaining legitimacy towards a morally informed legitimacy, as corporations need to engage in collaborative engagements with civil society and in some instances the governments in nation states in order to provide solutions for the global governance challenges.

The chapter has, however, also presented critical voices in the debate by highlighting the critics that perceive PCSR as a continuation of the instrumental logic that support and advance management tactics for profit-maximization in corporations. The PCSR claims a changing nature of corporations into a morally driven political actor is argued to be rather a contradiction to both with the core economic rationale that drives corporations and with the nature of corporations as authoritative and hierarchically organized entities that aim at maximizing profit and efficiency (Fleming and Jones 2013). Other scholars highlight the postcolonial biases in the assumptions about globalization and deliberative democracy that is foundational for the PCSR debate and argue for a contextualized understanding of power relations in the heterogeneous socio-political institutions of "developing countries" (Mir et al. 2008; Banerjee 2014; Ehrnström-Fuentes 2016). Hence, there appears to be a common understanding that corporations enact as political actors in global society – not least across developing countries – but how to conceptualize that political role has triggered scholars to apply various and very different normative assessments (Frynas and Stephens 2015). Regardless of the presented normative theories and assessments, the “political turn” in the CSR literature seems to share a common assumption that globalization has been precondition for the political role and CSR in general (Djelic and Etchanchu 2017). This precondition is problematic as it is biased by the contemporary embeddedness within the modern liberal political system that assumes particular understanding of public and private, business and society, economy, and politics (Mäkinen and Kourula 2012, 2016). The Habermasian deliberative democracy and the solely focus particular on multistakeholder initiatives are in other words criticized for being a “silver bullet” for conceptualizing the political role and responsibilities of corporations. Such theoretical grounding, however, lacks to acknowledge the multiple structures and actors that condition and drive the CSR-development relations within national, subnational, and industry contexts within and across developing countries (Frynas and Stephens 2015; see also Jamali and Karam 2016). Such contextualization is necessary to address the question as to what the responsibilities of corporations are when the presumed (former) responsibilities of the state have never existed in certain contexts of developing countries.

The chapter acknowledges the academic focus on the political role and responsibilities of business in societies of developing countries (Matten and Crane 2005; Scherer et al. 2009, 2014; Scherer and Palazzo 2011; Whelan 2012); however, in line with the critical views summarized above, the chapter finds the debate about the role of business in providing public goods and democratic governance in developing countries to be theoretically flawed and empirical inconsistent. The chapter argues that the complexity of assessing the political role of corporations through CSR calls for further conceptual development (Fleming and Jones 2013; Banerjee 2014) and that empirical studies representing the complex realities of developing countries are crucial for advancing the PCSR debate (Banerjee 2010; Frynas and Stephens 2015; Ehrnström-Fuentes 2016).

The recent review of the broader political CSR field highlights the increasing focus on developing countries, but calls for studies that (a) empirically include the diverse settings of developing countries in the PCSR literature and (b) integrate theories and analytical domains to advance the conceptualization of the political role of business in developing countries (Frynas and Stephens 2015). Future work on the “political turn” in the CSR literature therefore needs to reflect upon the realities and challenges of governance in many developing countries by overcoming the Western-biased ideas and assumptions about ideals for democratization that is embedded in current extended corporate citizenship approach (Matten and Crane 2005; Moon et al. 2005; Crane et al. 2008), Habermasian deliberative democracy approach (Scherer and Palazzo 2007), and even the recently suggested Rawlsian reading of political CSR (Whelan 2012). The chapter underlines the importance of understanding the political role and responsibility of corporations in accordance to multilevel governance realities in and across developing countries that includes multiple interests, views, and understanding based on interdisciplinary work that exceeds the current dominant theories (Frynas and Stephens 2015).

Such multilevel analysis of governance can draw upon recent concepts from political science literature such as the debate on governance in areas of limited statehood that highlights the need to advance beyond a nation state view in order to encompass the various governance forms that take place in different areas within nation states (Risse 2011; Börzel 2013). Recent review of CSR in developing countries has already suggested that localized analysis of multilevel governance offers a much more complex contextual understanding of political role and responsibilities of business depending on the degrees of statehood (Jamali and Karam 2016). Empirical studies have problematized the taken-for-granted dualism between corporate responsibility and irresponsibility and instrumental vis-à-vis morally informed legitimacy of CSR programs when applying a polycentric view on stakeholders to indicate that ideological differences exist between conventional and much more controversial stakeholders in areas within nation states (Azizi and Jamali 2016; see also Azizi 2017).

The presented critique has not only a reference to current PCSR, but the general understanding of mainstream and universal conceptualization legitimacy (Edward and Willmott 2008) as common values and beliefs and systems of norms (Suchman 1995). As pointed out in the chapter, future academic studies need to conceptualize and understand what legitimate business conduct and practices means in situations where businesses face incommensurable interests, values, and norms by local stakeholders. Should we expect businesses to engage in the acclaimed political role and responsibilities to ensure democratic governance given their for-profit structures and logics – if so, what role does business legitimacy play in this regard – if any? These questions provoke key puzzles for not only the specific debate on political CSR but also the general debate on legitimacy of business in a global society. In other words, future studies need empirical grounding to critically advance the exiting conceptualization of legitimacy and the political role/responsibility of business in order to encompass the heterogeneous realities of MNCs operating across regions, nation states, and industries in the era of globalization.

Eco-justice Perspective and Human Rights-Based Approach to Responsible Business in the Indonesian Mining Industry

70

Unang Mulkhan

Contents

Abstract

This chapter presents the eco-justice perspective and human rights-focused discussion of responsible business in the Indonesian mining industry. As a case-study of business legitimacy, this chapter relies on desk research and interviews of four mining companies located on four Indonesian islands. Findings revealed that restoring ex-mining sites is mostly conducted by mining companies in regard to comply with rules and regulations from the government. Corporate Social Responsibility (CSR) programs are used by the companies as a mechanism to engage with the community. However, the companies' practices regarding their responsibility toward the community and natural environment mostly reflect economic logic or an instrumentalization of responsibility, rather than a moral rationality or awareness in the sense of eco-justice and human rights perspectives. Factors such as unclear and changing government policy and the industrial context create more complex issues in the mining companies. This chapter, therefore, provides some proposal for different aspects of good mining practices,

Introduction

Mining makes a significant contribution to national economies generally (Bird 2016; Kemp et al. 2011). Even so, they have to deal with environmental problems, since they are extracting mineral resources from the ground. The location of many mining sites in remotes areas, often of wild forest, means that there is a high level of societal attention to the natural environment and increasing challenge to the companies. Major concerns relating to the mining industry have been the effects of mining on the environment and the impacts of mining operations on the local community (Bird 2016; Kemp et al. 2011). Complaints are often received that mining companies destroy the environment and dump waste, and that they compromise the health and access to natural resources of workers and local communities. Furthermore, since mining sites are explored and developed in remote areas, mining companies often enter into conflict with indigenous people who prefer to remain in their natural environment and claim their human rights as indigenous populations (Bird 2016). The mining industry in any country, therefore, faces problems in terms of social and environmental concerns (Welker 2009). This sector is complex, both socially and environmentally, as well as being subject to potential conflicts between mining companies and local communities (see Calvano 2008; Jenkins 2004). The issue of the environment and work safety, and relations to the community, are embedded in the characteristics of the mining industry (Bird 2016; Cragg and Greenbaum 2002; Kapelus 2002). This chapter, therefore, recognizes that the mining industry is inherently problematic from human rights and environmental perspectives.

Business organizations are expected to take responsibility which is consistent with societies within which they operate, such as respecting the natural environment, not creating pollution and destroying the environment (Blackstone 1990) as well as taking part in the issue of climate change (Besio and Pronzini 2014). Furthermore, based on the argument that business organizations exist with an implicit contract with society (Cragg 2000; Buchholz and Rosenthal 1997; Frederick 1986), they recognize that society has the power to pressure them to act ethically (Johnson 2016). For instance, societal pressure demands that companies be responsible for creating impacts on damage far outside their boundaries (Ladkin 2015). Consequently, companies have obligations to a variety of groups outside the companies, who are affected by their business operations.

Through considering several concepts or frameworks on business and human rights such as eco-justice approach, the democratic legitimacy of the UN "Protect, Respect and Remedy" Framework, and the corresponding Guiding Principles, as developed by the former UN Special Representative for Business and Human Rights, Professor John Ruggie, this chapter aims to understand how do mining companies in Indonesia address the social and natural issues posed by their operations? Do mining companies incorporate aspects of people, ecosystems, and non-human animals in their business planning and decisions? What are the potential challenges of implementing the Human Rights–Based Approach in the mining industry in Indonesia? This chapter presents the eco-justice perspective and human rights–focused discussion of responsible business in the Indonesian mining industry. Four mining companies have agreed to take part in this research; they are located on four different Indonesian islands. To anonymize these companies, they are referred to as the Yellow, Blue, Orange, and Mauve Companies. Thus, the significance of this chapter is to clarify what framework or approach, reflecting the democratic ideal of equality, participation, and accountability, fits well with the Indonesian mining sector and governance context of Indonesia. This chapter is structured as follows: First, the industrial context of the Indonesian mining industry will be explained with the aim to explain how the industry has progressed in terms of supporting economic growth of the country and what are its challenges and potentials in terms of social and environmental issues. Second, existing concepts and frameworks from business ethics and human rights are discussed. Third, research findings from empirical data will be presented and discussed. The fourth part of this chapter is conclusion and recommendation for future research agenda.

Industrial Context

This chapter is concerned with the mining industry in Indonesia as a case-study of business legitimacy. The Indonesian mining industry plays a vital role in the country's economy; Indonesia is still a significant player in the global mining industry producing coal, copper, gold, tin, and nickel (PwC 2016). The industry has a significant impact on export earnings, economic activity, and employment, and supports regional development. The global economic crisis in 2008 affected the industry in causing a very significant falloff of the commodity price. The industry slowly recovered in 2009 as a result of the high demand for coal from emerging economies, especially from plants in China and India (PwC 2016). However, the industry faces increasing social and environmental problems where almost all mining deposits or reserves in the country are located in tropical rainforests which have significant biological and environmental value. Furthermore, high demand from local communities for greater economic benefits sometimes leads to conflict between them and the mining companies. The creation of a worker-friendly working environment is still an issue. Thus, consistent with International Council on Mining and Metals (ICMM 2006), the issue of the environment and work safety, and relations to the community, are embedded in the characteristics of the mining industry.

The Indonesian mining industry is operated by state-owned, domestic, private, and international companies: however, domestic companies dominate the industry. The industry is expected by stakeholders to shoulder its responsibilities in securing social harmony and economic growth for local and national communities. For instance, in the case of Indonesia, often local communities surrounding the mining operations demand to be the companies' first priority in receiving benefits from the mining, including direct employment and business opportunities. Companies aim to achieve this through Corporate Social Responsibility (CSR). Thus, mining companies spend most of their social expenditure on that development, compared to other expenditures such as reclamation costs and employee training (PwC 2016).

In the Indonesian context, there are regulations which demand that the extractive industry operates CSR. By Law 40/2007 concerning Corporate Law, companies as legal entities have their responsibilities on CSR as stated under Article 74: (1) Companies which run their business in the field of and/or in relation to natural resources must put into practice social and environmental responsibility. (2) The social and environmental responsibility as referred in paragraph (1) constitutes an obligation of the Company which shall be budgeted for and calculated as a cost of the Company performance of which shall be with due regard to propriety and fairness. (3) Companies who do not put their obligation into practice as contemplated in paragraph (1) shall be liable to sanctions in accordance with the provisions of legislative regulations. (4) Further provisions regarding "Environmental and Social Responsibility" shall be stipulated by government regulation. Thus, there are efforts through mandated CSR to engage with communities. This included environmental responsibilities where natural resources were concerned. The law also required work safety, environmental management, and good business ethics. For State-Owned Enterprises (SOEs), there was already Law No. 19/2003 requiring CSR programs, Law No 05/MBU/2007 for partnership program with the Small and Medium Enterprises (SMEs) and for Community Development program. Mining companies therefore work with local governments in the implementation of development in areas where they operate. In short, the Indonesian mining industry benefits national and local economy, especially in the area of mining operations.

Eco-justice Perspective

The definition and development of eco-justice are deeply informed by the work of Gibson (1985, 2004), where he defines eco-justice as justice in the context of a new ecological awareness, which is ecological wholeness, economic and social justice. Therefore, eco-justice is beyond "social justice" and "environmental justice," where the only defensible rights are for humans and animals. Eco-justice includes protecting cultural and communal differences and biodiversity. Hessel (2004) considers that the idea of eco-justice fosters ecological sustainability as part of, and simultaneous with, social and economic justice. Thus, Washington et al. (2018) simply define that eco-justice is justice for nonhuman nature. In addition, eco-justice can be used as a lens to understand cultural assumptions or patterns of thinking of justice toward the natural world. The idea of eco-justice, therefore, provides an understanding that it is important to have fairness among humans, nonhumans, and the Earth (Gibson 2004; Hessel 2004). Business organizations, such as mining companies, are expected to take responsibility which is consistent with the societies within which they operate, such as respecting social and natural environment (Crane and Ruebottom 2011). Ethics between business organizations and society is founded on an implicit social contract where justice and fairness should be maintained (e.g., Hasnas 1998; Buchholz and Rosenthal 1997). Thus, concerns about natural issues are commonly brought into companies' consideration.

According to Gibson (2004), there are four basic norms of eco-justice which can be listed as follows: first is solidarity with other people and creatures in the sense of respect for diverse creation. The oneness of all human beings is reflected through caring people with the priority of mutually supportive, harmonious, and integrating relationship of humankind with the rest of nature. Second is ecological sustainability where environmentally fitting habits of living and working are aimed to flourish. Third is sufficiency as a standard of organized sharing through fair consumption. Fourth is socially just participation in decisions in order to achieve the good in common and the good of the common. Thus, ethical businesses do not violate justice and the members of a society will authorize the existence of companies only if these agree to maintain justice (Hasnas 1998). This view argues that business organizations are ethically obligated to understand what constitutes a fair or just agreement, between companies and society – refraining from violating accepted standards of justice and human rights. Companies have a responsibility to safeguard human rights and ecology in their business operations (Blackstone 1990).

Corporate Social Responsibility (CSR) is considered as actions of companies to make contributions to society (Maclagan 1998) by means of activities, such as helping communities through health and education (Johnson 2016), taking care of the natural environment and ecology which all these are viewed as the social contract of living in harmony in the community. In other words, corporations are asked not only not to cause harm to society, but also to contribute actively to human well-being. Thus, following the idea of Gibson (2004), CSR in the sense of a good relationship between companies and communities may reflect a mechanism to allow cooperation and productive relationships.

Human Rights–Based Approach

Bishop (2012) has convincingly argued that companies have a responsibility to respect freedom and human rights. The company will lose its power to operate if it does not act responsibly (Shaw and Barry 2016). As companies are a part of the social system, they must live up to society's standards (Jones 1980). The international human rights system developed its own approach to CSR through the UN Protect, Respect and Remedy Framework (UN 2008) and the UN Guiding Principles on Business and Human Rights (UN 2011). The three pillars of the UN Framework clearly state that the state duty is to protect against human rights abuses by business enterprises, the responsibility for companies is to respect human rights, and there is the need to have effective access to remedies. Thus, the Framework and the UN Guiding Principles (UNGPs) provide conceptual guidance and clarifications, involving the scope of business responsibilities on social and even environmental issues. Human rights' due diligence is the operation concept in the UN Framework and guides companies to identify and address their adverse impacts on human rights, including those of workers and local communities (UNGPs Principle 17). In other words, UNGPs target the conduct of economic actors to limit adverse impacts caused by their business operations (▶ Chap. 27, "Business, Human Rights, and Reflexive Regulation: Multi-stakeholder Development of Standards for Responsible Business Conduct").

The UN Sustainable Development Goals (SDGs) also clarify the role of the private sector in achieving the developmental targets by 2030. In the para 67 of SDGs, it clearly states the benefits from business activities in achieving sustainable development goals (UN 2015):

> Private business activity, investment and innovation are major drivers of productivity, inclusive economic growth and job creation. We acknowledge the diversity of the private sector, ranging from micro-enterprises to cooperatives to multinationals. We call on all businesses to apply their creativity and innovation to solving sustainable development challenges. (SDGs para 67)

The SDGs also refer to UNGPs and other international soft law instruments such as the Guiding Principles on Business and Human Rights and the labor standards of ILO, the Convention on the Rights of the Child, and key multilateral environmental agreements in protecting labor rights and environmental and health standards (SDGs para 67). Furthermore, the UN Framework and the Guiding Principles influence the adoption of human rights in the Sustainable Development Goals and other guidelines on CSR such as UN Global Compact, the ISO 26000, and OECD Guidelines for MNEs. All these initiatives and guidelines are legally non-binding. In other words, they are authoritative but still voluntary frameworks to promote human rights and corporate social responsibility of business entities through interactions among companies, managers, policymakers, and stakeholders.

The International Council on Mining and Metals (ICMM) formulated the framework on the integrated mine closure and practice guide. The framework provides mining companies with guidance in order to promote integrated planning closure and the uniformity of good mining practices through considering social, economy, and environmental issues in every stage of mining operations (ICMM 2019). This framework has similar principles with UN Guiding Principles on Business and Human Rights, stated as follows: "The responsibility to respect human rights requires that business enterprises: (a) avoid causing or contributing to adverse human rights impacts through their own activities, and address such impacts when they occur; (b) seek to prevent or mitigate adverse human rights impacts that are directly linked to their operations, products, or services by their business relationships, even if they have not contributed to those impacts" (UNGPs in Business and Human Rights, p. 15). In sum, concepts and frameworks for responsible business especially in the context of mining industry could help identify the existence of eco-justice and human rights in a specific context. In fact, the UNGPs in Business and Human Rights state that "the responsibility of business enterprises to respect human rights applies to all enterprises regardless of their size, sector, operational context, ownership and structure. Nevertheless, the scale and complexity of the means through which enterprises meet that responsibility may vary according to these factors and with the severity of the enterprise's adverse human rights impacts" (UNGPs in Business and Human Rights, p. 16).

Government Rules and Regulations

Environmental issues are particularly understood as an essential issue for mining companies because they are taking resources from nature. Not only are resources being taken from the ground, but mining operations result in myriad adverse consequences, such as local environmental degradation and spreading coal dust and chemical pollution. All these occur at all mining companies studied. They therefore recognize the great environmental problems that result from their business operations, and companies have to find a way to manage them. All companies are aware that mining is considered a business that impacts the environment. Caring for the environment is important for mining companies through "green mining" practices. This practice means reclamation of ex-mining sites. Reclamation is a systematic strategy to recover the natural environment. After the mining operations have come to a close, mining companies provide humus or topsoil, and they reclaim or re-vegetate the land.

Mining companies' concern for environment includes the responsibility for reclamation projects. However, the Indonesian government has created rules in this regard; the companies recognize that it is essential to comply with these rules as good mining practice. Based on regulation of the Indonesian Ministry of Energy and Mineral Resources Number 7 Year 2014, mining companies in Indonesia "have to conduct reclamation, which shall be an activity executed during the phase of mining business, to arrange, restore and improve the quality of the environment and the ecosystem so as to be able to function again, in accordance with the purpose agreed" (PwC 2016). For this purpose, a deposit has to be paid at the start of mining to ensure that mining companies reclaim the areas mined. This means that the government requires a reclamation deposit to be paid by mining companies.

Rules and regulations in the industry entail compliance of the mining companies with every mandatory requirement for conducting good mining practices, including paying a fee or deposit to mine. As a result, companies have mining contracts with the government which depend on this compliance. Mining companies must obey environmental regulations. This reflects companies taking primary responsibilities, which refer to duties and obligations in the sense of honoring contracts (Byerly

2013; Guthrie and Parker 1989), a responsibility to safeguard ecology (Blackstone 1990) and complying with laws once mining companies get licences to mine (Melé 2009). Mining companies can operate their business if they agree to perform various environmental actions in relation to the contract. In this case, responsibility of the mining companies involves a duty inherent in the characteristics of the mining industry.

Mining companies' goals and mission statements provide guidance and principles for action in accordance with planned reclamation. Companies understand that when they obtain mining permits from the government: a reclamation project is recognized as their responsibility. For them, therefore, reclamation is designed and implemented to minimize environmental damage. Mining companies associate their ethical concerns with the very nature of mining by accepting that they are responsible for degrading the environment and so for reclaiming it. In addition, authorities have to approve mining companies' plans for their post-mining programs. When the companies have reclaimed and totally handed over some ex-mining areas to local government, the community is expected to be economically self-sufficient once the companies are officially out of the area. This action is considered as part of respecting human rights by companies when there is a diligent process of closure, enabling the community to sustain itself. It was claimed by mining companies to go beyond their legal responsibilities, which are limited to reclaiming the natural environment of the former mining area.

All companies accept that a physical impact from mine water pollution is inevitable, since those waters eventually go into the river. However, Blue Company, for instance, explained that they have systems such as quality management, environmental management, risk management, safety management, and laboratory management. All these are their own corporate commitments and systems. The government demands that the company has good mining practice such as managing water pollution. Indeed this is a legal requirement so it's a matter of compliance with law and not merely Corporate Social Responsibility (CSR). In addition to legal sanctions, there would also be other consequences if the company does not follow environmental standards, for instance, the public will resist and the company can no longer operate. Thus, complying with rules and regulations is the mechanism shaping the issue of dealing with the environment. Furthermore, the company has contracts with the government which depends on this compliance. So the company is always in the spotlight. This means that it must maintain the principles of good mining practice (i.e., reclamation) contained in their contracts with the government. Environmental concerns are clearly a question of attitude where the company claims to do more than simply abide by rules and regulations.

In sum, restoring the natural environment is required by laws and regulations of Indonesia. Further, regulations in the industry entail compliance of the mining companies with every mandatory requirement for conducting good mining practices, including paying a fee or deposit to mine. As a result, companies have mining contracts with the government which depend on this compliance. Companies tend to comply with national rules and regulations. Further mechanism may also be a wish to avoid complaints from the local community. A decision to conduct environmental restoration, including managing waste and pollution from business operations, is morally problematic if the policy employed by companies may simply be to avoid costs in the future. This reflects the risk management logic that is used to define companies' benefits over their environmental responsibility. A calculative assessment of cost and efficiency in order to minimize risks as well as to obtain good performance and reputation leads to the emergence of moral issues. The language of cost/benefit analysis often appears in calculations on whether companies' actions cause environmental impacts. A decision to conduct environmental restoration, including managing waste and pollution from business operations, is morally problematic if the policy employed by companies may simply be to avoid costs in the future. Thus, the borderline between companies considering the environment and avoiding potential complaint is often unclear. Acting in compliance with just laws expresses a legal perspective derived from the authorities (Ladkin 2015).

Challenges of Good Mining Practices

There is a different attitude between large scale and smaller mining companies in the matter of reclamation. Smaller mining companies abandon their mining sites after the completion of operations, claiming that they have complied with the regulation on paying a reclamation deposit to the authorities. Smaller mining companies would rather just pay the compulsory reclamation guarantee than reclaim their own mining sites. And then, after finishing their operations, they argue that they have given a reclamation deposit to local government who thus appears to be responsible for clean-up and reclamation. Conducting reclamation is actually imposed under government laws, including in relation to good mining practice. However, there are common issues on the different role of central and local governments in giving mining permits, resulting in the complexity of business arrangements in the Indonesian mining industry.

The system organized by central government was claimed by interviewees to be working well, but mining companies feel that they suffer from the decentralization system. This is because they have to follow the bureaucratic systems of both central and local governments. But often the policies of these two do not match, in the sense that local government also controls the issuing of mining licences. Often, the political gap between central and local governments is very wide, resulting the arrangement and decision of getting a licence or permit to mine is a very long process. In the Indonesian system, mining licences for foreign mining companies are given directly by the central government, through the Minister of Energy and Mineral Resources. As a result, foreign companies have relatively few problems with the local authorities, since it is clear that they receive their legal documents centrally.

Based on Indonesian Government regulations (Indonesian Law Number 4/2009), Mining Permits are given by a mayor if a mining area is located in their territory. A governor can also grant a mining licence if it is located in their province, and it is given by the Minister of Mineral Resources if it spans more than one province. All these permits are valid for a maximum of 5 years and can be renewed. As for foreign mining companies, a mining permit (the contract of work = *Kontrak Karya* / KK) is granted directly by the Minister for 20 years and can be renewed every 10 years. This gives an enormous advantage to the multinational companies as the Indonesian government wants to encourage investment. National, private, and state-owned companies, on the other hand, must obtain mining permits from the local government as well as from the central government. As a result, they sometimes struggle to obtain permits from the local government. Companies recognize a dilemma as to how to deal with licences to operate their mining sites.

In addition, there are several cases where licences or permits for mining operations have been issued to one company, but then local governments have given that same permission to another company. Although central government makes good decisions in terms of mining licences, the local governments' decisions might be different. This is an example of the friction caused by the bureaucracy, as a result of the decentralization system. In short, the complexity of business arrangements in obtaining from central and local government licences and permits to mine leads to the question of social, economic, and environmental aspects. This has made it more complex for companies to respect and implement human rights principles and guidelines.

Local Community Engagement

Mining is an industry which brings people together from a wide area. Mines in developing countries such as Indonesia were originally operated in the middle of forests, and when they were developed, it was like sugar-attracting ants. There was a common understanding among interviewees that their companies do not just mine minerals from the area but also develop the community. Over time local communities have grown up around mining companies and become much larger. This means that where there was wild forest, because of the mining companies there is now a sizeable community. Often, mining companies claim that they have good collaboration with their local communities, especially in the areas of mining sites which have been operating for a long time. Local communities have grown up together with companies from the beginning. But in some areas, especially in new areas of mining operations, companies really need to make a great effort to achieve collaboration. Thus, the process of engaging the community often takes time.

Relationships between mining companies and local communities are claimed to be very strong because communities are dependent on mining companies for jobs, contracts, and CSR programs. This is especially when mining sites are located in remote areas, where they are a local source of power that people can go to for help. People are prepared to ask the company for help with their personal problems. This kind of respect for power in the community is relevant to Indonesian paternalistic culture. In mining operations on remote areas, a lot of community matters are addressed to the companies. Often, the community communicates with the companies rather than with the local government. People have more confidence in the company than in the local government. This relationship is strengthened because both the company and the local community live close together in the same area. The company has removed all fences in their housing complex, in order to increase interaction with the community. There are no barriers between employees' houses and the community. There is also a traditional market in a public place, which everyone in both community and company can access. This is one way in which the company can live together with the community.

Involvement of companies with communities mainly takes place through their CSR programs. CSR has evolved in terms of how companies organize and structure their CSR management through a special department. Previously they undertook CSR as a simple "firefighting exercise"; meaning that when a new problem arises, companies respond. But now, their CSR programs provide answers or preventive actions to deal with social problems and needs of the community, showing effort to be proactive socially through theirCSR. Mining companies provide economic benefits to the local community by giving business opportunities for local people and creating a skilled workforce, for example, giving priority to local people to improve economically and providing opportunities for local contractors to work for the company's projects. Companies purchase their food supplies from the surrounding community. Light engine spares for machines and fertilizer for the reclamation process are also purchased from the local community. All this means that there is a multiplier effect when mining companies empower communities in the economic sector.

Involvement with local communities is thus seen by the companies as relevant to human rights issue especially when they have mining sites in remote areas, where infrastructure and market activity are relatively underdeveloped. Companies are, in their rhetoric, ultimately trying to be "a prosocial force in the community" by giving it practical help. They provide guidance for small and medium enterprises, and assistance and training or education to groups of farmers, so that they can continue working when companies are no longer there. To this end, companies conduct programs for small businesses giving opportunities for local contractors to handle company projects and to learn work safety. Mining companies accept their responsibilities to benefit local communities by focusing on empowering them economically. They live in close proximity to each other so companies consider communities' norms. This view is related to the nature of the companies, where many groups of stakeholders in society have a moral claim on them, because they have the potential to harm or benefit them (Freeman 2010). This argument indicates that society has a power to pressure mining companies to act in accordance with social demands. Demands from the community mean that there is the public expectation of acting ethically, and business organizations will lose their power to operate if they do not act responsibly (Buchholz and Rosenthal 1997; Jones 1980).

The issue of community engagement arose in relation to how the local community was advantaged by the companies. There was a correlation between community engagement and business sustainability. The company-community relationship through CSR reflects companies' desire to help the local community including through its own initiative. For instance, the Yellow Company has a program of dairy farming, and the company provides milk to schools in the mining sites. However, companies' actions in relation to what some regard as obligations to society appear to result from external forces. Often, stakeholder mapping is a means to benefit companies, when it identifies groups of people who have the power to stop companies' business operations regardless of whether they are ethical or not (Maclagan 1998).

Prioritizing different stakeholders is often a way for companies to identify who are the most powerful stakeholders and how to manage them. Thus, stakeholders are considered as resources to be managed in the interests of companies. In fact, it is difficult for companies to satisfy all of their stakeholders at the same time or to specify in advance which stakeholders are more deserving when companies' resources are limited (Ladkin 2015). As a consequence, this raises an issue of power, where a decision to please stakeholders depends on who have powerful voices in society; then their interests are generally given priority. This kind of relationship between companies and stakeholders can be interpreted as being transactional (Maclagan 1998). In other words, companies' social policy depends on need. In fact, companies have difficulty satisfying all the demands of the community, and social problems with the community can occur if companies do not take into account and respond to all its needs. In the end, people in the community could ask companies to close their mines. Whether companies have had a positive attitude towards the community will determine its response.

The sense of control is evident when mining companies' social policy, for instance, depends on the priority as to who will be helped, being based on the power of stakeholders and limited resources of the companies. A company sometimes prioritizes stakeholders based on their power or influence. Stakeholders are often considered as resources to be managed in the interests of companies. In this context, stakeholders are regarded instrumentally in pragmatic ways. It was found that selecting which people in the community will be given more attention and help by the companies is a pragmatic policy when it means fitting with the companies' economic interests, rather than a way for them to really maintain human rights responsibility. How the companies implement an assessment of who will be helped in the community is based on criteria of calculation; therefore, cost/benefit analysis is often maintained in the sense that helping the community is equivalent to gaining profit or return (Fisher and Lovell 2009) or at least to avoiding conflicts (Snoeyenbos and Humber 2002). So, instrumental intentions are not sufficient to qualify a company as moral. In other words, it is more about community management rather than community engagement, showing "a company-centric way" of dealing with risks and complaints from stakeholders. This contradicts with the UNGPs in the sense that although the principles are based on risk management they are risks to human rights, not risks to the company.

However, there is best practice from the Yellow Company when it meets global and national standards on Corporate Social Responsibility (CSR) programs. The company refers to ISO 26000 in conducting CSR through seven aspects and one of them is community empowerment. Understand that CSR is the way a company adds value to the surrounding community. ISO 26000 is the international standard for addressing and assessing organizational social responsibilities related to a corporate mission and vision, operations and processes, and environmental impacts, as well as for considering all stakeholders (PwC 2016). The company provides a sustainability report under international standards which are the GRI and the UN Global Compact, and the International Organization for Standardization (ISO) 26000 on social responsibility. In this sense, mechanisms that shape the emergence of the companies-communities relationship are companies' proactive policies and practices on corporate social responsibility guided by international standards, so that the human rights responsibilities of corporations could be maintained.

Conclusion

This chapter has discussed that responsibility of mining companies involves a duty inherent in the characteristics of the mining industry. A mechanism appears in relation with restoring the environment and land in the mining sites that is rule and regulation from central and local governments. Although companies are practicing business responsibility toward the community and natural environment, the practices mostly reflect economic logic or an instrumentalization of responsibility rather than a moral rationality or awareness in the sense of eco-justice and human rights perspectives. Moreover, factors such as government policy and political practices at national and local levels create more difficult and complex for the idea of eco-justice and human rights based-approach to be exercised in the industry. The interactions of business organizations with communities and social structures are complex (see e.g. Buchholz and Rosenthal 1997; Sethi 1975). Thus, ethical issues in business organizations cannot be fully understood except in relation to that complex context. The business organization is part of the whole economic community, and the social responsibility of companies includes to play their role of serving larger social purposes. This chapter, therefore, suggests the Indonesian mining companies to support the HRBA with both insights from eco-justice perspective as well as with managerial mechanisms. Moreover, the discussion of UN guiding principles for human rights integrated with the UN Sustainable Development Goals (SDGs) for responsible business conduct therefore yields novel insights into some proposal for different aspects of good mining practices where the mining industry is a sensitive industry and has unique social and environmental challenges.

Acknowledgments This chapter is based on research supported by the Raoul Wallenberg Institute of Human Rights and Humanitarian Law (RWI), Sweden, and the Indonesian Ministry of Research, Technology and Higher Education. I am thankful to Dr Radu Mares, Dr Cécile Rozuel, Dr Scott Hurrell, and Dr Knut Laaser who provided expertise that greatly assisted the research.
