## **Psoriatic Arthritis**

Sacroiliitis

- A 28-year-old patient
- Familial history of SpA
- Low back pain that worsens when sitting for a long time
- · Buttock pain

**Fig. 1** Coronal TSE T2-weighted sequence with fat saturation (**a**), coronal SE T1-weighted image with fat saturation following the administration of contrast medium (**b**). Note the massive bone marrow edema and intra-articular fluid (intra-

articular hyperintensity) (**a**); contrast medium administration demonstrates symmetric massive acute inflammation of both joints (osteitis), in particular on the sacral side, and intraarticular enhancement (synovitis) (**b**)

Case

58

## Follow-up after 13 months of TNF-blocker therapy

**Fig. 2** Coronal TSE T2-weighted image with fat saturation showing resolution of the inflammatory signs of both joints (absence of bone marrow edema)
