Acknowledgments

This endeavor could not have happened without the section editors who did the heavy lifting of soliciting authors and topics. Sulochini Pather, Xue Lan Rong, Victoria Showunmi, Geetha B. Nambissan, Belmira Oliveira Bueno, Elisabet Ohrn, Gaby Weiner, Paula Groves Price, James G. Ladwig, Kalwant Bhopal, and Francesca Gobbo (in order of their sections)—we cannot thank you enough. Production of the volume was ably handled by Madison Flager and, in the final sprint, Summer Pennell.

Of course any volume such as this takes us away from other parts of our lives. George thanks Mary for once again tolerating the distracted scholar at work. Bill thanks Kathy for understanding that emeritus professor doesn't mean he's available to cook every night and his two grandsons, Wesley and William, for enjoying him when he is available to them.

Contents of Volume I

Part I Africa

- 1 Urban Education and Inclusion in Africa:
Section Editor's Introduction.....** 3
Sulochini Pather
- 2 The Possibilities Offered by Inclusive Education
in Addressing the Challenges of Urban Education** 15
Sigamoney Naicker
- 3 Financing of Inclusive Education in Urban Settings
of Swaziland.....** 27
Cebisile P. Nxumalo
- 4 Trends of Inclusive Education and Impediments
in Urban Schools of Ethiopia** 37
Yirgashewa Bekele Abdi
- 5 Tackling Education of Girl Child with Disability
in Urban Settings of Uganda.....** 51
Lawrence Eron and Paul Emong
- 6 Role of Urban Non-formal Education in Inclusive
Education Provision in Nairobi Kenya** 67
Martin Mwangela Kavua

Part II Asia

- 7 Section Introduction: How Nation-States Respond
to the Impacts of Migration, Immigration and Ethnic
Diversity in the Context of Globalization in India,
China, Japan, Korea and Singapore.....** 79
Xue Lan Rong

8	Engaging Identities and Cultures in a Globalized, Postcolonial India: Implications for Decolonizing Curriculum and Pedagogy	97
	Nina Asher	
9	The Education Issues of the Children of Internal Migrant Workers in China	113
	Shizhan Yuan, George W. Noblit, and Xue Lan Rong	
10	Promises and Practices: A Case Study on Compulsory Education Policy Implementation in a Large Migrant-Inflow City in China	133
	Shuyin Liu, Wenyang Sun, and Elizabeth Barrow	
11	Transnational Migration and Urban Education in Japan	151
	Kaori Okano	
12	Multicultural Education in Korea	173
	Insil Chang	
13	Rethinking Diversity in South Korea: Examining the Ideological Underpinnings of Multicultural Education Policies and Programs	195
	Ji-Yeon O. Jo and Minseung Jung	
14	Educating All Children in Multicultural, Multilingual Singapore: The Quest for Equity Amidst Diversity	213
	A. Lin Goodwin and Ee Ling Low	
Part III Eastern Europe		
15	Urban Education in Eastern Europe: Section Editors' Introduction	237
	Victoria Showunmi	
16	Contemporary Educational Problems and Major Challenges as a Part of Curriculum Changes in Croatia: A Multiple Perspectives Insight	243
	Dijana Vican	
17	Urban School Culture in Croatia: Student Empowerment or Spirit Impoverishment?	265
	Anđelka Peko and Rahaela Varga	
18	Habitus of Multilingual Children and Youths in Urban Areas in Eastern Croatia	279
	Klara Bilić Meštrić	

Part IV India

- 19 The ‘Urban’ and Education in India:
Section Editor’s Introduction.....** 299
Geetha B. Nambissan
- 20 Homogenized Educational Imagination and Polarized
Educational Opportunities: Schooling in Contemporary
Kolkata.....** 319
Manabi Majumdar
- 21 The City, Education and Social Mobility: Women’s
Narratives from Delhi.....** 347
Divya Vaid
- 22 Education in the ‘Sanskarnagari’: Baroda, Provincial
Capital of a ‘Progressive’ Princely State in the Late
Nineteenth and Early Twentieth Century.....** 369
Nandini Manjrekar
- 23 Closed City ‘Spaces’: Differential Access to Education
in Vijayawada, South India.....** 397
N. Purendra Prasad
- 24 Production of an ‘Educational’ City: Shadow Education
Economy and Re-structuring of Kota in India.....** 417
S. Srinivasa Rao
- 25 On the Margins of ‘Opportunity’: Urbanisation
and Education in Delhi’s Metropolitan Fringe.....** 445
Radhika Menon

Part V Latin America

- 26 Urban Education in Latin America:
Section Editor’s Introduction.....** 471
Belmira Oliveira Bueno
- 27 Schooling Processes and the Indigenous
Peoples in Urban Contexts in Mexico.....** 487
Gabriela Czarny
- 28 Public Education Policies in Chile: Tensions
and Conflicts in the Ongoing Reforms.....** 505
Sebastián Donoso-Díaz and Moyra Castro-Paredes
- 29 Evaluation and Accountability in Large-Scale
Educational System in Chile and Its Effects on Student’s
Performance in Urban Schools.....** 523
Maria Luísa Quaresma and Juan Pablo Valenzuela

30	The Inclusive Potential of Secondary Education in Brazil. Contributions for an Analysis of Juvenile Trajectories After Secondary School	541
	Nora Nora Krawczyk and Edna Y. Taira	
31	1-1 Model and the Reduction of the Digital Divide: <i>Conectar Igualdad</i> in Argentina	563
	Silvina Gvirtz and Esteban Torre	
32	School, Religion and Intolerance: On Laic School and Religious Conflicts in Brazil	585
	Marcelo Andrade and Pedro Teixeira	
33	Public Policies on Deaf Education. Comparative Analysis Between Uruguay and Brazil.....	613
	Leonardo Peluso Crespi, Juan Andrés Larrinaga, and Ana Claudia Balieiro Lodi	
34	The Teaching Profession in Latin America: Change Policies and the Challenges of Poverty and Exclusion.....	627
	Cristián Cox, Carlos E. Beca, and Marianela Cerri	

Contents of Volume II

Part VI Nordic Countries

35 Urban Education in the Nordic Countries: Section Editors' Introduction.....	649
Elisabet Öhrn and Gaby Weiner	
36 Marketization of the Urban Educational Space.....	671
Lisbeth Lundahl	
37 Social Class, Inclusion and Exclusion: Teacher and Student Practices in Norwegian Urban Education.....	695
Anne-Lise Arnesen	
38 Educating 'Euro-citizens': A Study of a Vocational Uppers Secondary Programme in Health Care and Social Services in a Finnish (Sub)Urban Setting	719
Sirpa Lappalainen	
39 'We Are Not Interested in Knowledge for Its Own Sake. Knowledge Should Be Put into Motion...' Young Adults, Social Mobilization and Learning in Poor, Multi-ethnic Suburbs in Sweden's Metropolitan Districts.....	735
Ove Sernhede	
40 Young People and Local Power Geometries in Helsinki. The Intertwining of Social Class, Gender and Ethnicity in Public Spaces.....	755
Tarja Tolonen	

Part VII North America

- 41 Urban Education in North America:
Section Editor’s Introduction.....** 777
Paula Groves Price
- 42 Why Race Still Matters in Urban Education:
Critical Race Theory and Urban Education.....** 787
M. Alex Evans, Nancy Cardenas, and Adrienne D. Dixson
- 43 The More Things Change: Durable Inequalities
and New Forms of Segregation in Canadian Public Schools** 809
Gillian Parekh and Rubén Gaztambide-Fernández
- 44 Resistance Wisdom and Grassroots Urban Education:
Lessons from Detroit.....** 833
John Lupinacci
- 45 “Hold Up, Wait a Minute, Let Me Put Some Freedom
In It”: Hip-Hop Based Education and the Freedom
School Experience** 853
Kristal Moore Clemons, Paula Groves Price,
and Kawachi A. Clemons
- 46 Latina Urban Education: At the Crossroads
of Intersectional Violence** 875
Kathy Mariscal, Yesenia Velásquez, Arturo Agüero,
and Luis Urrieta
- 47 Keeping the Dream Through the CARE Model:
Examining Strategies to Bridge the Gaps in Education
Among Urban Youth** 887
Tiffany Hollis and Ramon B. Goings

Part VIII Oceania

- 48 Urban Education in Oceania: Section Editor’s Introduction** 909
James G. Ladwig
- 49 Urban Education Across the Post-colonial, Post-Cold
War South Pacific: Changes in the Trans-national
Order of Theorising** 913
Michael Singh
- 50 Urban Education, Work, and Social Mobility in Oceania:
World-Systems Patterns, and Limits, for Peripheral Zones** 933
Tom G. Griffiths

- 51 Middle-Class School Choice in the Urban: Educational Campaigning for a Public School** 945
Emma E. Rowe
- 52 Two Worlds Apart: Indigenous Community Perspectives and Non-Indigenous Teacher Perspectives on Australian Schools**..... 959
Jay Phillips and Allan Luke

Part IX United Kingdom

- 53 Urban Education in the United Kingdom: Section Editor's Introduction**..... 999
Kalwant Bhopal
- 54 Histories of Urban Education in the United Kingdom**..... 1005
Gary McCulloch
- 55 Wealth, Inequalities and 'Hidden Injuries' in the Global City: Educational Policy in London**..... 1021
Meg Maguire
- 56 Knowing Your Place? The Urban as an Educational Resource**..... 1041
David James
- 57 Race Matters: Urban Education, Globalisation and the Twenty-First Century**..... 1059
Gill Crozier
- 58 'Closing the Achievement Gap' in English Cities and Towns in the Twenty-First Century** 1079
Geoff Whitty and Jake Anders
- 59 Migrant Children in Urban Schools in Ireland**..... 1103
Dympna Devine
- 60 'I Trust Them More Than I Trust Myself': Detached Streetwork, Young People and the Building of Social Capital in Scottish Urban Communities** 1125
Ross Deuchar, Johanne Miller, and Lisa Borchartd

Part X Western Europe

- 61 Urban Education in Western Europe: Section Editor's Introduction**..... 1153
Francesca Gobbo

62	Bittersweet Success. The Impact of Academic Achievement Among the Spanish Roma After a Decade of Roma Inclusion	1169
	Bálint Ábel Bereményi and Sílvia Carrasco	
63	Trans-/Locally Situated: Informal Educational Processes and the Emergence of a New Urban Civil Society in “Post-Migrant” Berlin	1199

Biographical Statements

Editors

Kalwant Bhopal is a professor of education and social justice at the University of Southampton. Her areas of interest and expertise are centered around the achievements and experiences of minority ethnic groups in education. She has a great deal of research experience in examining the lives of Black minority ethnic groups as well as Gypsies and Travelers. Her research specifically explores how processes of racism, exclusion, and marginalization operate in predominantly White spaces with a focus on social justice and inclusion. She is a visiting professor at the University of Wisconsin-Madison and has recently been appointed as visiting professor at King's College London (Department of Education and Professional Studies). She has been a visiting professor at Queen's University at Belfast and visiting scholar at the UCL Institute of Education, London.

Belmira Oliveira Bueno is a professor of education at the University of São Paulo (USP), Brazil, and researcher fellow of the Brazilian Council for Scientific and Technological Development (CNPq). She is a former vice-provost for research at USP, and presently she is the director of the School of Education at USP. Her main areas of interests are teacher education, teaching profession, and the information and communications technologies in education. Currently, she develops studies in comparative perspective on ethnography of teachers (North America and Latin America) and on contemporary models of teacher training (Brazil and France). She worked as editor of the journal *Education and Research* (USP, Brazil) and of the Latin American section of the *International Handbook of Urban Education* (Springer, 2007). Currently, she is a member of the editorial board of the book series *Education, Equity, Economy* (Springer) and of the advisory board of the *Oxford Research Encyclopedia of Education* (OREE).

Francesca Gobbo held the position of professor of intercultural education and anthropology of education at the University of Turin (Italy) until February 28, 2014.

As of March 1, 2014, she is an associate editor of the international journal *Intercultural Education*, which is part of the Nordic Center for Excellence in Education, and is honorary member of the European Educational Research Association, where she collaborates with the networks “Social Justice and Intercultural Education” and “Ethnography.” She is also an elected member of the International Association for Intercultural Education.

After graduating from the University of Padova, she studied at the University of California, Berkeley. She was a Fulbright grantee (1969) and visiting scholar at UC Berkeley (1995) and Harvard University (2001) and will be a visiting professor at Masaryk University in Brno in spring of 2016. She is on the editorial boards of international journals, has published extensively in Italian and English, and has participated in Comenius projects.

She had studied contemporary educational issues from a comparative and interdisciplinary perspective, combining educational theory with cultural anthropology and anthropology of education so as to problematize and widen the discourse and research on intercultural education. She carried out ethnographic research among Italy’s “internal minorities” such as the occupational minority of traveling fair-ground and circus people in Veneto. She is presently researching the culture of cooking in nursery and childhood schools of Padua.

James G. Ladwig is an associate professor of education at the University of Newcastle, Australia. He has written extensively in the sociology of education, educational policy, and the philosophy of education and curriculum. He has designed and conducted several studies of school reform in Australia and Singapore and consulted for school reform projects on every inhabited continent. He is currently a co-editor of the *American Educational Research Journal*.

Geetha B. Nambissan is a professor of sociology of education at Zakir Husain Centre for Educational Studies, School of Social Sciences, Jawaharlal Nehru University, New Delhi. Her research interests focus on the sociology of school education and include the exclusion, the inclusion, and the education of marginal groups and the middle classes and educational advantage and the social and educational implications of private schools for the poor. She has published widely in these areas. Her publications include *Education and Social Justice in the Era of Globalisation: Perspectives from India and the UK* (Routledge, 2011 co-edited) and *Sociology of Education in India: Changing Contours and Emerging Concerns* (OUP, 2013, co-edited). She is on the advisory board of the *Journal of Education Policy* and on the executive board of the journal *International Studies in Sociology of Education*.

George W. Noblit is Joseph R. Neikirk distinguished professor of education at the University of North Carolina at Chapel Hill. His research has focused on urban education, race and equitable schooling, and qualitative research methods. He is an award-winning scholar, most recently of the Mary Anne Raywid Award for Distinguished Scholarship from the Society of Professors of Education. His most recent books are *School Desegregation: Oral Histories Toward Understanding the*

Effects of White Domination (Sense Publishers, 2015) and (co-edited with William Pink) *Education, Equity, Economy: Crafting a New Intersection* (Springer, 2016). He is the co-editor of *The Urban Review*. He was also a co-editor of the *International Handbook of Urban Education* (Springer, 2007) which was the predecessor to this volume. Most recently, he is the founding editor-in-chief of the *Oxford Research Encyclopedia of Education*, a global, online, continually revisable repository of education research.

Elisabet Öhrn is a professor of education at the University of Gothenburg in Sweden. Her research focuses on power processes and democratic participation and gendered and classed relations at different levels of education. This has included studies of suburban/urban schooling, the importance of local context for relations in school, and patterns of segregation and participation. Recent research includes *Democratic Education at Upper Secondary School* (2007–2009), *Gender and Career in Academia* (2009–2011), *Gender and Achievement* (2011–2013), and *Rural Youth: Education, Place and Participation* (2014–2018). She was a leader in the *Nordic Research Network on Critical Perspectives on Children, Young People, Welfare and Education* (NordForsk 2010–2014) and is presently leading a research team for the project *Justice Through Education in the Nordic Countries* (Nordic Centre of Excellence, NordForsk 2014–2018). She has written a number of research reports, books, and articles in journals, including two recent collections entitled *Young People's Influence and Democratic Education* (2011, with L. Lundahl and D. Beach) and *Fair and Competitive? Critical Perspective on Contemporary Nordic Schooling* (2014, with A. L. Arnesen, E. Lahelma, and L. Lundahl).

Sulochini Pather is a senior lecturer in special education at Canterbury Christ Church University. Her previous roles included being the lead consultant on an inclusive education project in Ethiopia, which was funded by the Finnish government. She was involved in teacher training at Warwick University, Roehampton University, the University of East London (UK), Sultan Qaboos University (Oman), and the University of Durban-Westville (South Africa). She was involved in various inclusive education projects in Africa, Asia, and the Caribbean and is currently involved in a project in Palestine. She has served as senior research officer at the National Foundation for Educational Research (UK), a senior research specialist at the Human Sciences Research Council (SA), and a teacher for 11 years in South Africa and England. Her area of expertise is in special and inclusive education, particularly with an international focus. She has published widely and presented at several international conferences.

William T. Pink is professor emeritus of educational policy and leadership studies in the College of Education at Marquette University, where he has served as both department chair and as director of the doctoral program. He has published widely in the areas of delinquency, sociology of education, and educational reform. He has been the co-editor of *The Urban Review* (Springer) since 1978; co-editor of a book series entitled *Understanding Education, Social Justice, and Policy* (Hampton Press); and co-editor of the book series entitled *Education, Equity, Economy*

(Springer), both with George Noblit. He was recently appointed as associate editor of the *Oxford Research Encyclopedia of Education* (Oxford University Press). His most recent books are *Cultural Matters: Lessons Learned from Field Studies of Several Leading School Reform Strategies* (Hampton Press, 2005), the *International Handbook of Urban Education* (Springer, 2007), and *Schools for Marginalized Youth: An International Perspective* (Hampton Press, 2012).

Paula Groves Price is associate dean for diversity and international programs in the College of Education and associate professor of cultural studies and social thought in education at Washington State University. She is the editor-in-chief of the *Western Journal of Black Studies*, and her research agenda is focused on issues of race, culturally responsive pedagogy, and Black feminist epistemology. She received a Ph.D. from the University of North Carolina at Chapel Hill in social foundations of education and BAs from the University of California Berkeley in social welfare and interdisciplinary field studies. She teaches undergraduate multicultural education courses for pre-service teachers as well as graduate-level courses in the areas of critical ethnography, qualitative research methods, multicultural education, race theory, and educational philosophy.

Xue Lan Rong is a professor of social science education and sociology of education in the School of Education at the University of North Carolina at Chapel Hill. Her major research areas include transnational migration, international education, education of Asian Americans, etc. Rong has published six books including *Educating Immigrant Students in the 21st Century* (2009); *Asian American Education: Identities, Racial Issues, and Language* (2011); and *Educating Asian Americans: Academic Achievement, Schooling Issues, and Identities* (2013). She is the author of over 20 research articles appearing in the best-regarded professional journals including the *Harvard Educational Review*, *American Educational Research Journal*, *American Sociological Review*, *American Sociologist*, and *Sociological Quarterly*. Prof. Rong also guest-edited three special journal issues, published 21 book chapters, and made over 80 presentations at national and international conferences.

Victoria Showunmi is a lecturer in education at UCL's Institute of Education in London, England. Her research interests include gender and leadership and Black girls and Black women's well-being. Her roots are in rural England; however, over time, she has been able to embrace and understand the complexity which contributes to the urban city. Much of her academic thinking and practice is drawn from community and business engagement which enables the academy and the wider community to work together.

Gaby Weiner is an honorary professor at Sussex University, her previous posts including professor of teacher education and research at Umeå University in Sweden (1998–2005) and professor of educational research (1992–1998) at South Bank University, London. She has been co-editor of two book series, *Gender and*

Education (with R. Deem) and *Feminist Educational Thinking* (with L. Yates and K. Weiler), and has written and edited a number of publications on social justice, gender, race, and ethnicity including *Feminisms in Education* (1994); *Equal Opportunities in Colleges and Universities* (1995, with M. Farish, J. McPake, and J. Powney); *Closing the Gender Gap: Postwar Educational and Social Change* (1999, with M. Arnot and M. David); *Kids in Cyberspace: Teaching Antiracism Using the Internet in Britain, Spain and Sweden* (2005, with C. Gaine); and *Deconstructing and Reconstructing Lives: Auto/Biography in Educational Settings* (2011, with L. Townsend). Recent research (with J. Forbes and others) focuses on independent schools in Scotland, their utilization of social and other capitals, and their gendered regimes and practices.

Contributors

Pedro Abrantes is a professor of sociology at Universidade Aberta, since 2013, and a researcher at the Instituto Universitário de Lisboa (CIES-IUL), since 2002, participating in (and recently coordinating) projects on education, youth, and inequalities. He was a lecturer in several universities and polytechnic institutes, including the Universidad Iberoamericana (Mexico), and he is currently an invited professor of planning and evaluation in the master's program in education and society of ISCTE-IUL. He holds a Ph.D. in sociology, supervised by Professor Rafael Feito Alonso, from Universidad Complutense de Madrid (Spain), and he developed his postdoctoral research as a visiting researcher at the Centro de Investigación y Estudios Superiores en Antropología Social (Mexico). He was a consultant for several programs, held by the Portuguese Ministry of Education and by the Aga Khan Foundation, especially on education in marginalized areas. Recent publications in English include "On the Strange Habit of Reading Adversity Instead of Diversity: Madrid's Middle-Schools and Their Latin-American Students" (ed. Miguel Pereyra, *Changing Knowledge and Education*, Peter Lang, 2008: 275–290), "Born to Fail? Some Lessons from a National Programme to Improve Education in Poor Districts" (*International Studies in Sociology of Education*, 23 (1), 2013, with colleagues), and "Socialization and Inequality: A Biographical Approach to the Working Class in Portugal" (*Current Sociology*, 61 (7), pp. 984–1002).

Jens Adam is a lecturer at the Department of European Ethnology (Cultural Anthropology) at the Humboldt University of Berlin. His research interests are centered around questions concerning anthropology of policy, urban anthropology, and anthropological studies about processes of Europeanization and cosmopolitanization. He wrote his dissertation about how objectives of the official German foreign cultural and educational policy are translated into practice in "areas of conflict". For this project, he realized ethnographic field work in Ramallah, Sarajevo, and Berlin. In his current work, he explores the formation of a "new urban civil society" in German cities.

Elise S. Ahn is an assistant professor at KIMEP University's Language Center. She is also the graduate program coordinator for the master of arts in teaching foreign language. She graduated with her Ph.D. from the University of Illinois at Urbana-Champaign (USA) in May 2011 in education policy studies with a concentration on comparative and international education and program evaluation. She has a number of forthcoming articles on education access and inequality and using spatial analysis in the construction of social structures. Her research interests focus on the intersection of space, structure, and scale in examining the effects of internationalization in education and policy production processes. She is also interested in issues related to language, education, and equity/access with a focus on urban contexts.

Arturo Agüero is an MA student in cultural studies in education at the University of Texas at Austin. His research at the nexus of queerness, education, and childhood considers the politics and materiality of sex/gender curriculums. Using queer of color and Chicana feminist perspectives, Arturo's research questions the dogmas of heteronormative schooling and teaching practices that shape K-12 educational systems. His thesis collects the representations of the queer child in Spanish and English language picturebooks paying particular attention to the [micro]genre of "boys in dresses." This research works through the entangled not only concerning boys and dresses but also race, class, gender, gender expression, schooling, childhood, adulthood, and futurity. He previously graduated from the University of Texas at Austin BFA with a degree in visual art studies and has since has been working in bilingual elementary and early childhood schools. Arturo was raised on both sides of the México/USA border and identifies as a queer Latinx.

Jake Anders is a research fellow at the National Institute of Economic and Social Research. He studied philosophy, politics, and economics at New College, University of Oxford, and then completed a Ph.D. in economics of education, focusing on socio-economic inequality in access to higher education in England, at UCL's Institute of Education. Jake has also worked as a committee specialist at the House of Commons Education Committee. Jake's research focuses on understanding the causes and consequences of educational inequality and evaluating policies and programs aimed at reducing it. He has received funding for this work from the Nuffield Foundation, the Sutton Trust, and the Education Endowment Foundation, among others.

Marcelo Andrade is an associate professor at the Pontifical Catholic University of Rio de Janeiro (PUC-Rio, Brazil). He has a degree in philosophy and an MA and Ph.D. in education at PUC-Rio. He did part of his Ph.D. studies at the University of Valencia (Spain). He is a research fellow of the Brazilian Council for Scientific and Technological Development (CNPq) and fellow of the Young Scientist Program of the Research Foundation of the State of Rio de Janeiro (FAPERJ). His research interests are foundations of education, ethics and difference, and education for tolerance.

Anne-Lise Arnesen is professor emerita of education at the Faculty of Education, Østfold University College, and at Oslo and Akershus University of Applied Sciences. Her main research interests and publications cover a variety of areas, encompassing inclusion/exclusion, marginalization, equality, diversity with the intersection of gender, class, disability, and social justice at all levels of education from kindergarten to teacher education. She has particular interest in power relations in the intersection between political, institutional, social, and relational dimensions of education. She has led several national, Nordic, and European projects. Her most recent projects are *Inclusion of Children with Disabilities in Kindergarten* and *Students at Risk: Pathways to Vocational Competence*. Her most recent book is *Inkluderings: Perspektiver i barnehagefaglige praksiser (Inclusion: Professional Perspectives in Kindergarten Practices)* (Universitetsforlaget, 2012). She is a member of the Nordic Centre of Excellence, for the project Justice Through Education in the Nordic Countries, under the subtheme “Enabling and Constraining Justice in Education: Agency, Marginalization and Diversity.”

Nina Asher (Ed.D., 1999, Teachers College, Columbia University) is a professor in the Department of Curriculum and Instruction, University of Minnesota-Twin Cities. Her work in the areas of postcolonialism and feminism, globalization, critical perspectives on multiculturalism, and Asian American studies in education has appeared in the *Educational Researcher*, *Teachers College Record*, *Postcolonial Directions in Education*, *International Journal of Qualitative Studies in Education*, and *Discourse: Studies in the Cultural Politics of Education*, among other journals. She was the recipient of a 2014–2015 Fulbright-Nehru Academic and Professional Excellence Award (Research) for her project, *Examining the Intersections of Globalization, Privatization, and Education After Two Decades of Economic Liberalization in India*. Nina is currently working on two book projects (under contract with Routledge) – *Postcolonialism, Globalization, and Education: Engaging Identities, Cultures, and Curriculum* (with co-editors Christopher Kolb and Justin Grinage) and a sole-authored work based on her Fulbright research.

Elizabeth Barrow Elizabeth is a fifth-year doctoral candidate in curriculum and instruction at the University of North Carolina at Chapel Hill. A former high school history teacher and department chair, her research interests include social studies education, global and international education, literacy and social studies, and critical multicultural education. Prior to attending UNC-Chapel Hill for doctoral work, she earned a bachelor of arts degree in American history at UNC-Chapel Hill and a masters of arts in American history from East Carolina University. Elizabeth currently teaches courses in secondary social studies methods and navigating the research university.

Carlos E. Beca holds a teaching degree in philosophy and has specialized in educational policies and issues relating to the teaching profession. He is an associate researcher at the Center for Research on Educational Policy and Practice (CEPPE) of the Pontifical Catholic University of Chile and executive coordinator of the Technical Secretariat for the Regional Strategy on Teachers for Latin America and the Caribbean

of UNESCO-OREALC. He served as director of the Center for Training, Experimentation and Pedagogical Research (CPEIP) of the Ministry of Education, Chile, responsible for teachers' professional development programs in the ambits of initial and continuous education, performance evaluation, and professional career. He has provided consulting services for various international agencies. He has authored publications on educational issues relating to teaching policies, continuous education, and the professional induction of beginning teachers.

Yirgashewa Bekele Abdi is an assistant professor of special needs education at Addis Ababa University, Ethiopia. She has rich teaching experience from primary to tertiary level which helps her to identify and examine the gap that affects success in education at schools and teacher training institutions. She has work experience at government regional educational offices and NGOs and has been a volunteer trainer at schools and private education institutions. She has research interest and experience in the area of learning difficulties, intellectual disability, communication barriers, inclusive education, and teacher training related to inclusive education and also in evidence-based researches.

Bálint Ábel Bereményi is a postdoctoral research fellow at the Department of Social and Cultural Anthropology, Universitat Autònoma de Barcelona (Spain). His research has focused on the schooling of minority groups, the impact of public policies on the social and labor market conditions of different Spanish Roma groups, as well as the impact of school mobility on the children of families affected by the mortgage crises. He conducted a school ethnography with Roma in Barcelona (Spain) and Bogotá (Colombia). Currently, he is a researcher of the RESL.Eu project on early school leaving (funded under the 7th Framework Programme) and the national PI of the PEER project (Participation, Empowerment and Experiences for Roma Youth 2015–2016, funded under DG Justice Action Grants). Also he is responsible for the Spanish team in the project “School Success Among the Roma in Romania and Spain: Conditions, Trajectories and Consequences” carried out jointly between the UAB and the Romanian Institute of Research on National Minorities. Together with the Federation of Roma Association in Catalonia, he led an evaluation (funded by OSIRIO EU Framework Advocacy Grant) that critically assessed the Comprehensive Roma Plan in Catalonia. He has also been co-supervising several doctoral dissertations related to European Roma. Dr. Bereményi has also been a visiting lecturer and researcher at several European universities. He has published in the abovementioned domains in Spanish and international journals.

Lisa Borchardt is a graduate student in criminology and violence research at the University of Regensburg (Germany). She graduated with a bachelor of arts in social work at the University of Applied Studies in Münster (Germany). During her studies, she acquired profound theoretical expertise in the fields of youth violence and policing. In 2015, she was a visiting scholar at the University of the West of Scotland supervised by Ross Deuchar, engaging in further research on gang violence and youth crime.

Moyra Castro-Paredes (Ph.D. of education) is an educator and the academic coordinator of the Institute for Educational Research and Development at the University of Talca (Chile). Main research areas of interest are educational policy and organization of public education, institutions of education at the subnational level, and decentralization of public education.

Marianela Cerri is a sociologist who graduated from the University of Chile. She is currently working as executive assistant at the Technical Secretariat for the Regional Strategy on Teachers for Latin America and the Caribbean of UNESCO-OREALC, which is coordinated by the Center for Research on Educational Policy and Practice (CEPPE) of the Pontifical Catholic University of Chile. Previous to this, she worked at the Ministry of Education, Chile, at the national coordination office of the schooling quality improvement programs of the 1990s (MECE programs) and then participated in the curriculum reform-managing unit, organizing seminars and public consultation surveys on the new national curriculum framework, organizing and coordinating plans and programs for the various curriculum disciplines, and later on coordinating the unit's studies on secondary technical-professional education.

Insil Chang is a professor in the Department of Education, Gyeongin National University of Education, Korea. Her research focuses on multicultural education, curriculum studies, extracurricular activities, and learning and teaching. She is the vice president of multicultural education studies and editor-in-chief of the *Journal of Curriculum Studies*. She is also the dean of the Research Institute for Korean Multicultural Education since 2009. She is a recipient of numerous government research funding awards for projects concerning multicultural education and extracurricular activities. Her articles have appeared in the *Journal of Curriculum Studies*, the *Journal of Elementary Education*, the *Journal of Educational Research*, *Multicultural Education Studies*, the *Korea Education Review*, and others.

Kawachi A. Clemons is a Miami native. He received his B.S. in music education from Florida A&M University, MM in arts management from Florida International University, and Ph.D. in education from the University of North Carolina at Chapel Hill. Dr. Clemons is an associate professor of music and director of the Institute for Research in Music and Entertainment Industry Studies at Florida A&M University (FAMU). Dr. Clemons is the immediate past chair of the Department of Music at FAMU (2012–2014). He is the former director of the Hip Hop Initiative and visiting assistant professor of music at North Carolina Central University (NCCU). At NCCU, he also served 3 years as the director of percussion and assistant director of the marching, pep, and symphonic bands. Prior to his work at NCCU, Clemons was an assistant director in the Office of Student Affairs at Florida International University (FIU). He has served on the production staff of the Academy Awards, Super Bowl XXXIII Halftime Show, and FIU Music Festival and has managed numerous special events with Walt Disney Entertainment.

Kristal Moore Clemons is a Chicago native. She is a graduate of DePaul University having earned her BA in women's studies and political science. She earned an MA from Washington State University in American studies, her Ph.D. from the University of North Carolina at Chapel Hill in education, and a graduate certificate in women's studies from Duke University. Dr. Clemons' qualitative research projects center on activism of Black women in various spaces ranging from Chicago tenement housing projects to civil rights efforts of Freedom School teachers in the South. She was the project director and co-founder of a Children's Defense Fund Freedom School at North Carolina Central University. In 2016, Dr. Clemons co-founded the North Florida Freedom Schools, a Children's Defense Fund Freedom School partner, and serves as co-executive director. Dr. Clemons is currently an assistant clinical professor and the director of the online Ed.D. program in education leadership and policy studies at Florida State University.

Cristián Cox (Ph.D. in sociology, University of London) is an associate professor at the School of Education, Universidad Diego Portales, Chile. Formerly he was the head of the Curriculum and Evaluation Unit of the Ministry of Education of Chile (1998–2006), director of the Center for Research on Educational Policy and Practice (CEPPE) of the Pontifical Catholic University of Chile (2008–2011), and dean of this university's Faculty of Education (2012–2015). His research areas include educational policy, curriculum, teacher education, and citizenship education. Among his publications are "Educational Inequality in Latin America: Patterns, Policies and Issues" (Oxford University Press, 2011); "El principio de fraternidad en los valores, instituciones y relaciones sociales de la educación escolar Latinoamericana" (Ciudad Nueva, 2013); and "Citizenship Education in Latin America: Priorities of School Curricula" (IBE-UNESCO, 2014). He has participated or he participates in the editorial board of journals such as *Cadernos de Pesquisa* (Fundación Carlos Chagas, Brasil), *Perfiles Educativos* (UNAM, México), *Encounters* (Canada), *Compare* (UK), and the *Journal of Professional Capital and Community* (USA).

Leonardo Peluso Crespi is a psychologist from Universidad de la República (UdelaR), Uruguay, with a linguistics BA degree (UdelaR), a master of humanities (UdelaR), and a Ph.D. of arts (Universidad Nacional de Córdoba, Argentina). At the UdelaR, he is a professor at the specialization in social and educational inclusion and the undergraduate program at the School of Psychology, Regional Norte, and he coordinates the degree in interpretation of LSU-Spanish (TUILSU) at the School of Humanities and Sciences of Education. His main research focuses on the relationship of the deaf with language technologies (writing, video recordings, and tics) and bilingual education.

Gill Crozier is a professor of education; former director of the Centre for Educational Research in Equalities, Policy and Pedagogy (2012–2015), School of Education, University of Roehampton, London, UK; and a fellow of the Royal Society of Arts. As a sociologist of education, she has researched and written extensively about parents/families and school relationships, young people in urban schools, access to and participation in higher education, and the sociocultural influences upon identity

formation and learner experiences. Her work is underpinned by a deep concern for social justice and is informed by the analysis of race, class, and gender and the ways these social locations and identities intersect and impact on life chances. Her books include *Parents and Schools: Partners or Protagonists?* (2000); *Activating Participation: Parents and Teachers Working Towards Partnership* (2005), co-edited with Diane Reay; and *White Middle-Class Identities and Urban Schooling* (2011 and 2013, second revised edition), co-authored with Diane Reay and David James.

Gabriela Czarny received her Ph.D. in educational research from the Department of Educational Research, Center for Research and Advanced Studies (DIE-CINVESTV IPN), in 2006. She is full professor at Universidad Pedagógica Nacional, Ajusco, México. Her research and writings have focused on indigenous schooling in cities and migration, with recent focus on indigenous youth. She is author of several articles and books chapters. Among her books included *Pasar por la escuela. Indígenas y procesos de escolaridad en la ciudad de México* (Going Through School: Indigenous and Schooling Processes in Mexico City; México, UPN, 2008) and *Jóvenes indígenas en la UPN: Relatos escolares desde la educación superior* (Indigenous Youth at the UPN: Schooling Stories from Higher Education; México, UPN, 2012).

Ross Deuchar is a professor and the assistant dean in the School of Education, University of the West of Scotland. He is a scholar of youth crime, criminal justice, and policing and has published numerous articles in international, peer-reviewed journals on his ethnographic and qualitative work on youth gangs, masculinity, street culture, and violence and also on violence prevention strategies such as detached and pastoral streetwork, early intervention, participatory and democratic education, and problem-oriented policing. He is the author of the books *Gangs, Marginalised Youth and Social Capital* (2009, Trentham) and *Policing Youth Violence: Transatlantic Connections* (2013, Trentham/IOE Press) and co-editor of the international collection *Researching Marginalised Groups* (2016, Routledge).

Dympna Devine is a professor in the School of Education, UCD, where she is the head of the school. She has published internationally in the areas of children's voice, rights and citizenship, and migrant children's experiences across home, school, and community. A Fulbright scholar in social sciences (2013–2014), she conducted research with migrant children in New York schools. Recent book publications include *Immigration and Schooling in the Republic of Ireland: Making a Difference?* (2011, Manchester University Press) and *New Managerialism in Education: Commercialisation, Care and Gender* (2015, Palgrave), co-authored with Kathleen Lynch and Bernie Grummell. She co-edited a special interdisciplinary issue for the journal *Children & Society* (2013) on "Children and Value: Education in Neo-liberal Times" with Wendy Luttrell.

Adrienne D. Dixon is an associate professor of critical race theory and education in the Department of Education Policy, Organization and Leadership at the University of Illinois at Urbana-Champaign. Her research examines educational

equity and race in the urban South. Her most recent publication, *Researching Race in Education*, focuses on how researchers engage and plan for understanding race and racism in their research projects.

Sebastián Donoso-Díaz (Ph.D. in education) is an academician of the Institute for Educational Research and Development at the University of Talca (Chile). He is an associated researcher of the Center for Advanced Research in Education Research Partnership Program of the National Science Council of Chile and a member of the following committees: the Advisory Council of the Ministry of Education of Chile to Strengthen Public Education, the Committee on Graduate Studies of the Education National Accreditation Commission, and the Education Studies Group of the National Science Council of Chile. He is a visiting professor at the universities of Valencia and Federal University of Parana. Main research areas of interest are educational policies and equity in education; institutions, financing, and development of public education; and students' retention in higher education.

Paul Emong has 17 years of experience in development work, research, policy analysis, and human rights campaign for policy change. Dr. Emong worked for 10 years with Action for Disability and Development (ADD) International rising through the ranks to become the deputy country director. For the last seven (7) year, Dr Emong has been lecturing at Kyambogo University and Uganda Martyrs University; undertaking research, surveys, and policy analysis; and developing position papers and consultancy works in human rights and inclusive development. Dr. Emong holds a doctor of philosophy (Ph.D.) and master of arts in human rights, postgraduate diploma in project planning and management, and bachelor of statistics. Dr. Emong has a thorough understanding of human rights issues and inclusive development and is familiar with the international, regional, and domestic human rights protection and promotion mechanisms, equality and nondiscrimination, and the affirmative action and equal opportunities approaches in working with the marginalized groups of people.

Lawrence Eron holds a doctor of philosophy (Ph.D.) and master of philosophy in special needs education, bachelor of development studies, and diploma in special needs education. He has extensive experience as a lecturer stretching over 20 years and held senior management positions at the then Uganda National Institute of Special Education (UNISE), now Faculty of Special Needs and Rehabilitation, Kyambogo University. From 1999, he was involved in developing the East African Institutional Linkage in Special Needs and Rehabilitation; therefore Dr. Eron is well versed with special needs, inclusive education, and rehabilitation developments in the region. He has been a national coordinator for Uganda during the development and implementation of the human resource development project on inclusive teacher education for Botswana, Kenya, Swaziland, and Uganda. Dr. Eron is currently involved in developing inclusive education trainings and the empowerment of children, youth, and adults with disabilities and special needs.

M. Alex Evans is an attorney concentrating in education law, civil rights law, and juvenile justice. Currently a doctoral student of social and cultural studies in education policy, organization, and leadership at the University of Illinois at Urbana-Champaign, his latest publication, *Schoolyard Cops and Robbers: Law Enforcement's Role in the School-to-Prison Pipeline*, examines race, school resource officers, and school discipline procedures in North Carolina.

Rubén Gaztambide-Fernández is an associate professor at the Ontario Institute for Studies in Education of the University of Toronto. His book *The Best of the Best: Becoming Elite at an American Boarding School* (2009, Harvard University Press) is based on 2 years of ethnographic research at an elite boarding school in the USA. He is a co-editor (with Adam Howard) of *Educating Elites: Class Privilege and Educational Advantage* (2010, Rowman and Littlefield). His current research focuses on the experiences of students attending a specialized arts program in public high schools in cities across Canada and the USA. He is also a principal investigator of the Youth Solidarities Across Boundaries, a participatory action research project with Latino/Latina immigrants and indigenous youth in the city of Toronto.

Paola Giorgis teaches English language, literature, and visual arts in Italian high schools and holds a Ph.D. in anthropology of education and intercultural education. Her main interest regards a critical and intercultural approach to foreign language education and the relation between language and identity. She has published a book and some articles, has participated at several international conferences, and is affiliated with different international associations of linguistics and interculture.

Ramon B. Goings is an assistant professor of educational leadership at Loyola University Maryland. Previously, he served as program coordinator for the Sherman STEM Teacher Scholars Program at the University of Maryland, Baltimore County. His research interests are centered on disrupting deficit narratives about African American males throughout the educational pipeline. Specifically, his scholarship explores the experiences of high-achieving Black males (PK-Ph.D.) and the development and experiences of Black male teachers and leaders. He currently serves as the managing editor of the *Journal of African American Males in Education*. Prior to working in higher education, Goings was a music education and special education teacher and intern with the White House Initiative on Educational Excellence for African Americans. He earned his doctor of education degree in urban educational leadership from Morgan State University, master of science in human services from Post University, and bachelor of arts in music education from Lynchburg College.

Nancy Cardenas is currently a doctoral student in the Education Policy, Organization, and Leadership Department with a concentration in social and cultural studies at the University of Illinois at Urbana-Champaign. Her current research interests focus on the impact of state testing on teacher and student performance, student tracking, and wraparound programs.

A. Lin Goodwin is Evenden professor of education and vice dean at Teachers College, Columbia University, New York. She presently serves as vice president of the American Educational Research Association (AERA), Division K, Teaching and Teacher Education (2013–2016). In 2015, she was honored as a distinguished researcher by AERA's Special Interest Group on Research on the Education of Asian and Pacific Americans and was named the inaugural Dr. Ruth Wong professor of teacher education by the National Institute of Education, Singapore. An international teacher education consultant, Dr. Goodwin is currently working with educators in Poland, Brazil, Thailand, and Singapore.

Tom G. Griffiths is an associate professor in comparative and international education at the University of Newcastle, Australia. Tom's research has consistently sought to explore the actual and potential contributions of mass education systems to the transition of our current capitalist world system toward a more democratic, equal, and just alternative. He has recently co-authored the volume *Mass Education, Global Capital, and the World: The Theoretical Lenses of István Mészáros and Immanuel Wallerstein* (New York: Palgrave Macmillan) and co-edited two volumes, *Logics of Socialist Education: Engaging with Crisis, Insecurity and Uncertainty* (Dordrecht: Springer) and *Education in/for Socialism: Historical, Current, and Future Perspectives* (London: Routledge).

Silvina Gvirtz holds her Ph.D. in education from the University of Buenos Aires, Argentina. She is the executive director of Conectar Igualdad, a researcher at the National Research Council (CONICET), and a professor at the University of San Martín. Previously she was the minister of education of the province of Buenos Aires and director of the School of Education at the University of San Andrés. In 2003, she was appointed as a fellow of the John Simon Guggenheim Foundation. She is the author of 22 books and of numerous articles published in national and international journals.

Tiffany Hollis is a doctoral student in curriculum and instruction with a focus on urban education at the University of North Carolina at Charlotte. She has a clear and strong commitment to diversity, equity, and social justice with over 12 years in the education setting as a social justice educator with a special education background. Her research interests include understanding the cultural and contextual (e.g., home, school, and community) factors and processes that contribute to resilience in economically, socially, and culturally diverse children and adolescents and the families and communities in which they live. She has written several peer-reviewed articles, briefs, and manuscripts, presented at numerous conferences around resiliency, hope, and academic outcomes of youth who have experienced adverse childhood experiences and trauma. She has over 12 years of experience in addressing risk factors facing urban, economically disadvantaged adolescents of color, including homeless youth, youth in foster and out-of-home care, youth in the juvenile justice system, youth who have mental health issues, and youth with special needs. She also focuses on using strengths-based approaches that are culturally relevant for these populations

as well as exploring assets and resources these youth can employ to thrive in the face of risk. Tiffany is currently working on several projects with community organizations to eventually create an intervention program for youth from adverse childhood experiences that focuses on academic and socio-emotional outcomes of youth while emphasizing youth development.

David James is a professor in the School of Social Sciences, Cardiff University, and director of the ESRC Wales Doctoral Training Centre. He is chair of the executive editors of the *British Journal of Sociology of Education* and an elected member of BERA Council. He cites his failing at the 11+ (which led to nonselective secondary schooling on the basis of low predicted academic ability) as the most significant educational event in his life and argues that the conventional “late developer” explanation is illusory, being a classic example of Bourdieusian misrecognition. In the late 1970s, he left his day job (clerical work in the local government) and his night job (musician) to become a mature student, gaining first a social science degree at Bristol University. He went on to teach sociology and psychology in FE colleges until the late 1980s, when he moved into higher education in the (then) Bristol Polytechnic. He completed a part-time Ph.D. in 1996. His research covers curriculum, learning and assessment in schools, FE and HE, and the relationship between educational policy/practice and social inequality. He has been responsible for many research projects and evaluations, including co-directing two ESRC-funded projects. These books include *Bourdieu and Education* (1998, with Grenfell), *The Creative Professional* (1999, with Ashcroft), *Improving Learning Cultures in FE* (2007, with Biesta), and *White Middle-Class Identities and Urban Schooling* (2011 and 2013, with Reay and Crozier). More of his work can be seen on <http://cardiff.academia.edu/DavidJames>.

Ji-Yeon O. Jo is a Korea Foundation assistant professor of the Korean language and culture and a Kenan junior faculty fellow in the Department of Asian Studies at the University of North Carolina at Chapel Hill. She received her doctorate from the School of Education at the University of North Carolina at Chapel Hill. Her research interests center around borders, citizenship, kinship, language, race/ethnicity, and belonging in relation to transnational migration. She has published book chapters and several articles in peer-reviewed academic journals. Her current research explores the diasporic and remigration experiences of later-generation diaspora Koreans in South Korea.

Minseung Jung is a professor in the Department of Education at Korea National Open University. She received her Ph.D. from Seoul National University in Korea and has published several books and many articles about lifelong learning. Her research interests range from women’s education to multicultural education focusing on transformative learning and activity theory. She has worked as a director of the Institute of Distance Education at KNOU and an editor of the Korean *Journal of Lifelong Education*. Recently, she has become interested in the professional development of cultural workers in the field of adult education.

Martin Mwongela Kavua, a member of the National Technical Committee on the Digital Learning Programme in Kenya, holds a joint Erasmus Mundus master's degree in special and inclusive education from Roehampton (England), Oslo (Norway), and Charles (Czech Republic) Universities. He has a bachelor's degree in special education from Kenyatta University (Kenya), among other qualifications. Currently, he is a lecturer at the Kenya Institute of Special Education (KISE) in Nairobi, Kenya. Mr. Kavua has done consultancy work for various government and nongovernmental institutions in Kenya and abroad on special and inclusive education, disability mainstreaming, and policy issues, as well as information and communications technology (ICT) integration in education. His publications include a book *Communication Strategies for Deaf Learners in Inclusive Settings* and a teacher training manual on inclusive education. He has presented academic papers locally and internationally.

Sonja Kosunen holds a Ph.D. in sociology of education from the University of Helsinki (Finland). Her dissertation concerned the functioning of the social space of school choice, where families and schools operate in cities. She currently works as a postdoctoral researcher in a comparative research project concentrating on politics of basic education in Nordic countries (University of Helsinki) and as a visiting scholar at the University of Copenhagen, Denmark.

Nora Nora Krawczyk holds her Ph.D. in sociology from the Universidade de Campinas (UNICAMP), Brazil, and a master's degree from the Facultad Latinoamericana en Ciencias Sociales (FLACSO), Argentina. She is an assistant professor at the School of Education, UNICAMP, in the field of sociology and education policies. She is also a research fellow of the Brazilian National Research Council (CNPq). Presently, she is doing a postdoc at University of Maryland (UMD), USA. Her works focus on public education and inequality in Latin America dealing with issues such as educational reform, changing scenarios for public action, governance in education, and secondary education. She is the author of several journal articles and books, including *Sociology of High School: The Critique of Economism in Educational Policy* (Sociologia do ensino médio: crítica ao economismo na política educacional, Cortez, 2014) and *The Educational Reform in Latin America: A Historical-Sociological Perspective* (Uma perspectiva histórico-sociológica da reforma educacional na América Latina, Liberlivros, 2012).

Sirpa Lappalainen is an adjunct professor, currently working as university lecturer in the University of Helsinki at the Institute of Behavioural Sciences. Her academic interests are in sociology of education as well as cultural and feminist studies. She has examined educational processes and pedagogical practices that construct normality and address differences in the various educational arenas, such as vocational education, special education, and pre-primary education, covering the life course from early childhood to late adulthood. One of her primary interests is qualitative methodology (especially ethnography). She is one of the founding members of NordForsk who funded the Nordic Centre of Excellence for the project "Justice Through Education in Nordic Countries." She has co-edited the special issue in

Nordic Studies in Education titled “Welfare, Social Justice, and Equality in Educational Settings in the Nordic Countries.” With her Nordic colleagues, she has conducted a cross-cultural ethnography, where two Nordic educational contexts (Finland and Sweden) have been analyzed side by side. She is on the editorial board of journals *Ethnography and Education*, the *Finnish Journal of Youth Research*, and *Nordic Studies in Education*. Currently she leads the project titled “Cultural Ideals of Citizenship in Formal and Informal Educational Contexts.”

Juan Andres Larrinaga is an English teacher (Binational Center Uruguay-USA) with a linguistics BA degree from Universidad de la República (UdelaR), Uruguay, and an in-progress Ph.D. in education from Universidad Nacional de Entre Ríos, Parana, Argentina. At the UdelaR, he is a lecturer in Traductorado Law School and associate professor at the School of Information and Communication and coordinates an area at the specialization in social inclusion and education in the School of Psychology, Regional Norte. His main research focuses on literacy, language teaching, and reading instruction for the deaf in the context of bilingual education.

Lorenz Lassnigg completed a degree in pedagogics and political science (1980) at the University of Vienna, did a postgraduate course in sociology at the IHS, and engaged in freelance research (among others, at the Institute of Depth Psychology at the University of Vienna). Since 1984, he has done both research and teaching at the IHS. He has also worked at the Social Science Research Center Berlin (WZB, main topics on labor market and employment, anticipation, transitional labor markets) and the University of California, Berkeley (Center for Studies of Higher Education, CSHE), and was a member of a reviewing team evaluating the system of vocational training of Minas Gerais, Brazil. He has worked as a consultant in Finland, Italy, Spain, and Macedonia and for the OECD. His primary focus is on sociological research of education and training at the interface of social, political, and economic interests, especially regarding the coordination of vocational training and employment, evaluation, and governance research.

Shuyin Liu is a Ph.D. candidate in the Graduate School of Education, Peking University. Her research interests include education policy studies, higher education administration, and college enrollment. Prior to Peking University, she got a BA in English literature from Tsinghua University, China.

Ana Claudia Balieiro Lodi received her Ph.D. in applied linguistics and language studies from the graduate program at Pontifícia Universidade Católica de São Paulo (LAEL-PUCSP), Brazil, in 2004. She is an assistant professor at Universidade de São Paulo (USP), Faculdade de Filosofia, Ciências e Letras de Ribeirão Preto, teaching for the education graduate program and teacher’s training undergraduate courses. Her research and writings focus on linguistics and educational policies promoting bilingual education for deaf people, literacy process in Brazilian and in Portuguese sign language for deaf students and teaching-learning pedagogical contents in general, the development of specific methodologies, and adequacy of contents to bilingual education for deaf students’ demands.

Ee-Ling Low is Associate Professor and the head of strategic planning and academic quality at the National Institute of Education, Singapore. She obtained her Ph.D. in linguistics from the University of Cambridge, UK, under the university's Overseas Graduate Scholarship Award. She won the Fulbright Advanced Research Scholarship in 2008, which she spent at Boston College. She played a leading role in the conceptualization of the NIE strategic roadmap: toward 2017 and the development of the teacher education for the 21st century (TE21) model. In 2012, she was awarded the Public Administration Medal (Bronze) by the president of the Republic of Singapore.

Allan Luke is an educator, researcher, and theorist studying literacy, multiliteracies, applied linguistics, and educational sociology and policy. Luke has written or edited over 15 books and more than 200 articles and book chapters. He is emeritus professor at Queensland University of Technology in Brisbane, Australia, and adjunct professor at Werklund School of Education, University of Calgary, Canada.

Lisbeth Lundahl, professor in the Department of Applied Educational Science at Umeå University, Sweden, is one of the team leaders of the new Nordic Centre of Excellence, for the project "Social Justice Through Education." Her research interests concern education politics, youth politics, and the school-to-work transitions of young people. Among her recent research projects is "Upper Secondary School as a Market and Troublesome Transitions: School-to-Work Transitions of Young People At Risk in Longitudinal Perspective." Some of her latest publications are "Guarded Transitions? Youth Trajectories and School-to-Work Transition Policies in Sweden" in the *International Journal of Adolescence and Youth* (2014, together with J. Olofsson); "Democracy Lessons in Market-Oriented Schools: The Case of Swedish Upper Secondary Education" in *Education, Citizenship and Social Justice* (2013, together with M Olson); "Educational Marketization the Swedish Way" in *Education Inquiry* (2013, together with I. Erixon Arreman, A. S. Holm, and U. Lundström); and "Fair and Competitive? Critical Perspectives on Contemporary Nordic Schooling" (2014, edited together with A. L. Arnesen, E. Lahelma, and E. Öhrn). Lisbeth Lundahl was the secretary general of the European Educational Research Association (EERA) in 2006–2008 and was one of the founders of the Swedish Educational Research Association (SWERA).

John Lupinacci is an assistant professor of Cultural Studies and Social Thought in Education at Washington State University. His research focuses on how people, specifically educators, learn to both identify and examine destructive habits of modern human culture. His work proposes that, through education, teachers can be leaders in confronting dominant assumptions about existing as individuals separate from and superior to the greater ecological systems to which we belong.

Meg Maguire taught for many years in inner London schools, including a period as an acting headteacher. Her research interests include the challenges of inner-city schooling, education policy and practice, social justice issues, the life and work of

school-teachers, and teacher education. She is a professor of sociology of education in the Department of Education and Professional Studies at King's College London, UK. Her most recent book *Ethics and Education Research* (Sage, 2014) is co-written with Rachel Brooks and Kitty te Riele. She is lead editor for the *Journal of Education Policy*.

Manabi Majumdar is a professor in political science, at the Centre for Studies in Social Sciences, Calcutta. Her research interest includes issues of politics of education, child labor, local democracy, decentralization and rural politics, social exclusion, and capability deprivation and its measurement. Her recent publications include *Education and Inequality in India: A Classroom View* (with Jos Mooij, Routledge, London, 2011 (paperback edition in 2015)).

Nandini Manjrekar is a professor and the dean of the School of Education, Tata Institute of Social Sciences, Mumbai. Her research interests are in the areas of sociology of education, education in conflict areas, gender and schooling, and women's studies. She has served on the executive councils of the Comparative Education Society of India and the Indian Association of Women's Studies. She was a member of the National Focus Group on Gender Issues in Education (2005) and is currently a joint editor of *Contemporary Education Dialogue* (Sage). She was at the University of Wisconsin-Madison as a Fulbright fellow (1997–1998) and has taught in the women and gender studies program of the Massachusetts Institute of Technology (MIT), Cambridge, USA (2005–2006).

Kathy Mariscal is a Chicana from South Central Los Angeles who is passionate about working with students of color. She is a first-generation college student and a product of many UCLA outreach programs such as VIPS, AAP, and McNair which influenced and supported her in pursuing a graduate degree at UT Austin. She enjoys paying it forward by working with similar programs and encouraging students to also pursue graduate degrees and/or continue through the educational pipeline. She is passionate about learning, teaching, and writing, and she uses all of these tools to work with the community and heal. She builds from Chicana feminist epistemologies and pedagogies that allow her to engage with the world in liberating ways whether that is research, mentoring, education, advocating, and writing. Her family has played a huge role in pushing her to pursue her dreams of social justice and education.

Alik Mazukatow studied European ethnology/cultural anthropology, gender, and media studies in Berlin and Istanbul and is currently a research assistant at the Department for European Ethnology (Cultural Anthropology) at the Humboldt University of Berlin. He is especially interested in connecting feminist theory with anthropological methodology. His Ph.D. research is located in the area of antidiscrimination work in Berlin, where he is trying to situate different understandings of law in social practice. The most important aim of this research is to explore how (antidiscrimination) law influences the work of his informant concerning policies and politics.

Gary McCulloch is the Brian Simon professor of the history of education and director of the International Centre for Historical Research in Education at UCL's Institute of Education. He has previously been the president of the UK History of Education Society and editor of the journal *History of Education*. He has published extensively on the history of education, including *The Struggle for the History of Education* (2011) and *Secondary Education and the Raising of the School-Leaving Age* (with Tom Woodin and Steven Cowan, 2013). He has edited a special issue of the international journal *Paedagogica Historica* (2016, with Georgina Brewis) on "Education, War and Peace." He is a member of the council and the founding convenor of the history special interest group of the British Educational Research Association. He is currently the editor of the *British Journal of Educational Studies*.

Radhika Menon is an assistant professor in the Department of Education, Mata Sundri College, University of Delhi. She has been teaching papers in liberal courses on education and as a social science specialist in teacher education programs. She has developed a curriculum for citizenship education, teacher education programs, textbooks, and assessment measures for secondary level and university programs through SCERT, NCERT, and CBSE. Her research interest includes educational policy, people's culture and impact of caste, and class and gender on educational practices. She regularly writes on a variety of public interest issues as interventions in popular discourses. Her research publications are mainly on education in Delhi.

Klara Bilić Meštrić is a postdoctoral fellow at the Centre for Croatian Studies, University of Zagreb. From 2009 to 2012, she worked at the Faculty of Teacher Education, University of Osijek, as a research assistant on a project led by Professor Branko Bogonar on the development of creativity in lifelong education of teachers where she became acquainted with the idea of action research, which she has been promoting and developing ever since. From 2011 to 2015, she participated in a European Commission transversal project, Languages in Urban Communities – Integration and Diversity for Europe (LUCIDE), conducting research on language, identity, and politics in the city of Osijek. From 2015 to 2016, at the Department of Linguistics, University of Zadar, she led the project financed by the European Social Fund, "Promoting Multilingualism in Zadar: Ethnolinguistic Vitality of the Zadar Arbanasi Community." Her research interests concern linguistic diversity, language policy, language and identity, and action research.

Johanne Miller has been a youth work practitioner for 10 years in Glasgow, specializing in street work and youth crime. Her undergraduate degree was in sociology and psychology (Hons). She has been involved in various research projects concerning young people and crime and has just recently completed her Ph.D. studying Glasgow gangs.

Sigamoney Naicker was appointed on the National Commission for Education Support Services by then President Nelson Mandela. He was the first national director of inclusive education in South Africa. Sigamoney has worked in various areas

of the education system in a senior management capacity which includes curriculum, assessment, early childhood education, adult education, and human capital development. Prior to joining the government, Sigamoney was a lecturer at the University of Western Cape. He was recently awarded an honorary professorship in education. He has published widely both locally and abroad and has spoken at a number of education forums.

George Noblit is the Joseph R. Neikirk distinguished professor of sociology of education in the School of Education at the University of North Carolina at Chapel Hill. His scholarly work has focused largely on educational equity and qualitative research methods. He has published 19 books, the most recent of which is *Education, Equity, Economy: Crafting a New Intersection* (Springer, 2015). He was the co-editor of the first *International Handbook of Urban Education* (Springer, 2007) as well as co-editor of this volume.

Cebile P. Nxumalo joined the Ministry of Education and Training in 1999 as coordinator for special education responsible for establishing the special education unit within the Ministry of Education and Training. She holds a master's degree in special needs and inclusive education obtained from Roehampton University in London. She has played a very significant role in providing leadership and strategic planning for special and inclusive education in Swaziland. She is a capacity builder, researcher, and trainer on education and development with national and regional experience working with a range of stakeholders including learners, universities, parents, intellectuals, government officials, NGOs, donor agencies, and politicians. She has experience in coordinating national and regional projects such as the ACP Project which included four countries, namely, Kenya, Botswana, Uganda, and Swaziland, and the SADC Project on Education for Children with Disabilities. She contributed in the development of the 2015 SADC Inclusive Education Strategy.

Kaori H. Okano is a professor at La Trobe University, Melbourne, Australia. She researches in sociology and anthropology of education, focusing on social inequality, multiculturalism, transitions to adulthood, and gender. Her major publications include *Nonformal Education and Civil Society in Japan* (ed., 2016), *Minorities and Education in Multicultural Japan* (ed. with Tsuneyoshi and Boocock, 2011), *Handbook of Asian Education* (ed. with Zhao et al., 2011), *Young Women in Japan: Transitions to Adulthood* (2009), *Language and Schools in Asia* (ed. 2006), *Education in Contemporary Japan* (with Tsuchiya, 1999), and *School to Work Transition in Japan* (1993). She has been affiliated with Kobe University and Waseda University as a visiting research professor during her sabbatical years.

Gillian Parekh is an SSHRC postdoctoral fellow with the Centre for Urban Schooling, Ontario Institute for Studies in Education, University of Toronto. With a Ph.D. in critical disability studies and years working as a teacher and researcher within the Toronto District School Board, Gillian's primary research focus explores structural barriers in accessing education, particularly for students with disabilities.

Her research interests include students' experiences of social citizenship, belonging and exclusion, academic streaming, inclusive education, as well as the institutional and relational construction of gifted and disabled identities.

Andelka Peko is a professor of educational sciences at the Faculty of Education, Josip Juraj Strossmayer University, Osijek, Croatia. She has spent two mandates as the dean of the Faculty of Education, and 3 years ago, she was appointed as the vice-rector of Josip Juraj Strossmayer University. She has designed and implemented several university courses and actively participated in the development of the Strategy of Education, Science and Technology (2013). She has been a project leader in three national projects funded by the Ministry of Science, Education and Sports, which aimed at improvements of educational practices on the national level. She is an expert employed by the University of Zadar (Croatia) on a project funded by the European Social Fund. The project is about qualifications of school head-teachers. Her scientific interest is in the area of contemporary teaching practices, student position in education, higher education and teaching methods, as well as leadership in education. As a result of extensive research, she has published numerous scientific studies, books, and journal articles. She also co-authored textbooks for young learners of the Croatian language. She is the editor-in-chief of *Life and School*, a journal for educational theory and practice.

Isabella Pescarmona is a secondary high school teacher and has a Ph.D. in intercultural education and anthropology of education. She collaborates with the University of Turin (Italy) and public schools in training teachers. Her interests in research are complex instruction, ethnography of education, intercultural education, and social justice. She has published a book and several articles in international journals on education. She is a member of IASCE and received the Distinguished Dissertation Award in 2010.

Jay Phillips is head of school for the School of Indigenous Australian Studies at Charles Sturt University, Australia. Dr. Phillips is a Wakka Wakka Gooreng Gooreng woman and educator from southeast Queensland. Originally educated as a primary school teacher, she has been teaching, researching, and advocating for indigenous students and communities in universities for over 20 years. She is particularly interested in the interaction between indigenous knowledge systems and Western colonial traditions with regard to colonial identity construction and intellectual authority and teaching for optimal learning in contested spaces. She has presented nationally and internationally on curriculum development for face-to-face and online contexts in universities. She has also taught and presented on indigenous and indigenist research methodologies and the ways in which indigenist pedagogies can mobilize student resistance to deepen learning by authorizing indigenous peoples and knowledges as empowered subjects, rather than objects.

William T. Pink is professor emeritus of educational policy and leadership studies in the College of Education at Marquette University, where he has served as both

department chair and as director of the doctoral program. He has published widely in the areas of delinquency, sociology of education, and educational reform. He has been the co-editor of *The Urban Review* (Springer) since 1978; co-editor of a book series entitled *Understanding Education, Social Justice, and Policy* (Hampton Press); and co-editor of the book series entitled *Education, Equity, Economy* (Springer), both with George Noblit. He was recently appointed as associate editor of the *Oxford Research Encyclopedia of Education* (Oxford University Press). His most recent books are *Cultural Matters: Lessons Learned from Field Studies of Several Leading School Reform Strategies* (Hampton Press, 2005), the *International Handbook of Urban Education* (Springer, 2007), and *Schools for Marginalized Youth: An International Perspective* (Hampton Press, 2012).

Silvia Carrasco Pons is a professor of social anthropology at the Department of Social and Cultural Anthropology, Universitat Autònoma de Barcelona (Spain). She has been a visiting scholar at several universities in Europe and in North and South America. Her research focus has been in the domains of childhood, gender, migration and minorities, cultural diversity, and social inequality in the education systems of changing societies in Southern Europe and in the countries of origin of migrant populations from an international comparative perspective, also conducting applied social research. As the lead investigator of the EMIGRA research group (UAB) and also the appointed vice-director of the newly created interdisciplinary Centre for the Study and Research on Migrations (UAB), Dr. Carrasco has been a principal investigator and local partner lead researcher of a series of national and international comparative projects and has supervised 19 Ph.D. dissertations. Currently, she is PI of the MOVIBAR project on pupils' mobility in Barcelona (funded under the National Research Plan, Spain) and national PI of the RESL.Eu project on early school leaving (funded under the 7th Framework Programme). She also participates in the PEER project on the civic participation of the Roma youth (funded under DG Justice Action Grants). Earlier, among many others, she was a lead researcher of the project "Conceptions and Implications of Academic Achievement Among Roma Youth in Spain" (financed jointly by two Spanish ministries, 2002–2004). She has widely published in Spanish and international journals and has authored several books and book chapters in the abovementioned domains.

N. Purendra Prasad is currently working as a professor and University Grants Commission (UGC) special assistance program coordinator in the Department of Sociology at the University of Hyderabad, India. He teaches classical sociological theory, sociology of development, rural society and agrarian change, and sociology of health for postgraduate students. He has guided several Ph.D. and M.Phil students. His research interests include three broad areas: first is agrarian studies centered on questions of drought, migration, caste-class dynamics of agrarian society, agrarian movements, farmers' suicides, and agrarian distress; second is political economy of health in India centered on questions of ill health and inequalities, role of state and market in access to health care, and commoditization of body; third is developmental questions and its discontents in context of globalization, urban

governance, and urban education. He has earlier worked as a fellow at the Centre for Social Studies, Surat, and Tata Institute of Social Sciences, Mumbai. He has published more than 25 research papers in peer-reviewed journals, two books, and several chapters in edited books. He is on the academic and ethical advisory board of several universities and institutions in India.

Maria Luisa Quaresma received her Ph.D. in sociology from the University of Porto, Portugal. She is an assistant doctor at the Universidad Autónoma de Chile and researcher of the Instituto de Estudios Sociales y Humanísticos, Facultad de Ciencias Sociales y Humanidades, Universidad Autónoma de Chile, and of the Instituto de Sociologia, Universidade do Porto, Portugal. Presently, she is the principal researcher of a project on school academic excellence in public schools in Santiago de Chile (CONICYT, FONDECYT). Her areas of interest are sociology of education and social classes. She has published articles and chapters on the Portuguese and Chilean education systems. Some recent and forthcoming publications, with co-authors, are *Sistema escolar chileno: Características y consecuencias de un modelo orientado al Mercado* (Revista Convergencia), *El sentido de pertenencia en escuelas públicas de excelência* (Revista Mexicana de Investigación Educativa), and *Mercantilização, competitividade e accountability no sistema de ensino em Portugal: o que se pode aprender da experiência chilena* (Revista Lusófona de Educação).

Carlo Raffo is a professor of urban education in the School of Environment, Education and Development. His main research interests can be located within the Education in Urban Contexts group and the Centre for Equity in Education. More specifically DfES, Joseph Rowntree, ESRC, Teacher Development Agency, National College for School Leadership, and EU research projects have focused on educational inequality and policy interventions in urban contexts, the conceptual mapping of the links between education and poverty, identity and transition issues for young people, teachers and cultural entrepreneurs in the new economies of the city, disaffection and the work-related curriculum, governance issues for neighborhoods and schools in challenging contexts, community-orientated and full service extended schools, school leadership, and social inclusion European policies of priority education.

S. Srinivasa Rao is an associate professor of sociology of education at Zakir Husain Centre for Educational Studies, Jawaharlal Nehru University (JNU), New Delhi. His teaching and research interests are diversity, equity, excellence, education in urban contexts, neoliberalism and educational restructuring, and processes of exclusion and stigmatization. He is the co-editor (with Geetha B. Nambissan) of *Sociology of Education in India: Changing Contours and Emerging Concerns* (Oxford University Press, New Delhi: 2013) and had written a block book on *Sociological Perspectives of Education* for M.Ed. students of Indira Gandhi National Open University (IGNOU, 2007). He had been a visiting scholar at the Department of Sociology, University of Hyderabad; Ontario Institute for Studies in Education (OISE), University of Toronto; Faculty of Education, McGill University; and Faculty of Humanities and Social Sciences, the Malaysian National University (Universiti Kebangsaan Malaysia). He

had served as general secretary to the Comparative Education Society of India (CESI) during 2010–2012. He is currently on the editorial collective of *Contemporary Education Dialogue*, a biannual journal in educational studies in India.

Clément Rivière holds a Ph.D. in sociology, obtained jointly from Sciences Po Paris (France) and the Università degli Studi di Milano-Bicocca (Italy). His thesis examined the parental supervision of children's daily urban practices in contexts of social and cultural diversity, on the basis of a comparison between two neighborhoods in Paris and Milan. He is currently a postdoctoral researcher at Lab'Urba (Université Paris-Est Créteil) as part of DIVERCITIES: Governing Urban Diversity, a European research project.

Emma E. Rowe is a lecturer in the School of Education, Deakin University. Dr Rowe's research draws on quantitative and qualitative methods to research urban school choice and urban spaces, educational geography, and social stratifications. Her recent Ph.D. thesis was the recipient of the 2015 "Outstanding Dissertation Award" from the American Educational Research Association, Qualitative Research SIG.

Rebecca Sansoé currently teaches philosophy and history in high school in Italy. She received her Ph.D. in 2010 from the University of Turin. Her interests include social stratification and inequality, urban anthropology, and ethnographic and theoretical engagement. Her research and writing focus on the intersections of immigrant students' choice and resources of vocational education.

Elisa Sartore is an independent researcher. She received her Ph.D. in anthropology of education and intercultural education from the University of Turin. Her main interests regard the cultural legacies of Italian colonialism and postcolonialism, collective and individual processes of identity construction in multicultural societies, biographies, and life stories. The aim of her research is to tell stories traditionally considered as "minor" stories. She is the author of *Quando la storia degli altri racconta di noi: Pedagogia interculturale e coscienza storica* (What the Others' Story Tells About Us: Intercultural Education and Historical Consciousness) and the assistant director of four documentaries (Memòries de Nou Barris, Encajados, L'Isola, El Retratista).

Ove Sernhede is a professor in youth studies at the Faculty of Education at Gothenburg University. He is also affiliated to the Centre for Urban Studies at the same university. He has for long been involved in research on different aspects of youth culture, adolescence, African American culture, and social pedagogy. His publications in English include a monograph *In Garageland: Rock, Youth and Modernity* (Routledge, 1995) and various articles in journals such as *Urban Education*, *British Journal of Sociology of Education*, *Young*, *Music Education Research*, and *Soundings*. His most recent research focuses on immigrant youth in the poor, high-rise suburbs of Gothenburg. His study on hip hop culture in contemporary Sweden, *Alienation Is My Nation* (Ordfront, 2002/2007/2009), is perhaps the best known of his publications in this field of research.

Federica Setti is a teacher of Italian as foreign language and holds a Ph.D. in anthropology and education from the University of Turin. Her research interests include Romani studies, cultural anthropology, and anthropology of death. She carried out long-term ethnographies focused on the history of intercultural relationships between majority societies and minorities. Her last publication is *In a Matter of Perspectives: Ethnography of Education and of the Relation Between Sinti and Non-Sinti* (2015, CISU: Rome).

Sofia Marques da Silva is an assistant professor at the Faculty of Psychology and Educational Sciences, University of Porto, Portugal, and a member of the Centre for Research and Intervention in Education (CIIE). She has a Ph.D. in educational sciences and has research experience in doing ethnographic and life stories research on youth cultures, gender, and education. Lately she has been involved in an online and offline ethnography with young people from border regions. She is also a researcher and coordinator of Portuguese teams in different research projects. She teaches research methodologies, sociology of education, and youth cultures and has experience in supervising thesis in educational sciences, psychology, and health and education on topics such as youth, education, and gender. She is a co-convenor of the European Conference on Educational Research (ECER). She is also the deputy editor of the Journal *Ethnography and Education*, has been involved in the evaluation of international research projects, and is an external consultant and evaluator for the National Federation of Youth Associations of financed national projects on youth and gender equality. She has both national- and international-level publications on youth, education, and gender. She is an expert of “NESET (Network of Experts on Social Aspects of Education and Training)” (council network for the European Commission Directorate General for Education and Culture). She is the vice president of the Portuguese Society of Educational Sciences (SPCE). Her recent publications include “Young People and Sensitive Information: Managing Protection and Dignity” (da Silva, Sofia Marques, 2013) in Kitty te Riele and Rachel Brooks’ (Eds.) *Negotiating Ethical Challenges in Youth Research* (pp. 96–108) and “Growing Up in a Portuguese Borderland” (London/New York: Routledge; da Silva, Sofia Marques, 2014) in Spyros Spyrou and Miranda Christou’s (Eds.) *Children and Borders* (pp. 62–78, New York: Palgrave Macmillan. doi: [10.1057/9781137326317.0008](https://doi.org/10.1057/9781137326317.0008)).

Michael Singh is a professor of education in the Centre for Educational Research at Western Sydney University. His work in higher degree research education, dissemination of research-based knowledge, and the conduct of real-world research projects focuses on three interrelated fields: Chinese language education, international doctoral education, and education and production. His recent publications include *Deschooling Learning: Young Adults and the New Spirit of Capitalism*, with Bobby Harrevel.

Juldyz Smagulova is an assistant professor at the Language Center, KIMEP University (Almaty, Kazakhstan). She received her candidate of sciences degree in language theory from the Kazakh National University in 2004 and her Ph.D. in

sociolinguistics from the King's College London (London, UK) in 2011. Her publications include the co-authored *Dictionary of Sociolinguistics* (bilingual in Kazakh and Russian) and *Dictionary of Linguistics* (bilingual in Kazakh and Russian), as well as articles in the *Journal of Sociolinguistics*, the *International Journal of Bilingual Education*, and *Bilingualism and Innovation: The European Journal of Social Science Research*. Her current research interests focus on language socialization at home and school, classroom literacy practices, and language policy and planning.

Wenyang Sun is a third-year doctoral student in the strand of cultural studies and literacies at the School of Education, University of North Carolina at Chapel Hill. Her research interests include bilingual education, heritage language maintenance, Asian American studies, and critical multicultural education. Prior to UNC-Chapel Hill, she graduated with a B.S. in economics and a BA in English literature from Zhejiang University, China, and received her M.Ed. from Vanderbilt University.

Edna Taira has a BA in statistics from the Instituto de Matemática e Estatística (IME), State University of São Paulo. She worked as a consultant at the Instituto Via Pública, Arcadis/Tetraplan, Dieese, and UNESCO/Sports Ministry. Since 1990, she has been an analyst at Fundação Seade. Among her responsibilities are development sampling plans, samples control, and statistical analysis of primary researches, involving different areas like health, education, labor, living conditions, environment, statistical data analysis, production of socioeconomic research indicators, and building sampling plans. In 2015 she has become UNICEF consultant.

Pedro Teixeira is a Ph.D. candidate in education at the Pontifical Catholic University of Rio de Janeiro (PUC-Rio, Brazil) Brazil. He received grants from the Brazilian Coordination for the Improvement of Higher Education Personnel (CAPES) and the Brazilian Council for Scientific and Technological Development (CNPq) for his research in Brazil and in the Institute of Education, University College London (UCL), UK. His work focuses on the teaching of evolution, creationism, religiousness, and religious diversity among students and teachers in Brazil. He holds a BA in biology (Federal University of Rio de Janeiro, Brazil) and an MA in education (PUC-Rio) and works as a science and biology teacher in private and public urban schools.

Tarja Tolonen is a lecturer at the Department of Social Research, University of Helsinki, Finland. Previously she was a senior inspector at the Ministry of Education, Culture and Youth (2011–2013) and Youth Network research coordinator (2010–2011). In addition, she was research fellow at the Department of Sociology, University of Helsinki (1994–2010). She is author of the monograph *Nuorten äänet ja tilat: Sukupuolten järjestykset koulun arjessa* (The Voices and Spaces of Young People: The Gendered Orders of Everyday Life of the School, 2001) and was co-editor of *Cultural Practices and Transitions in Education* (with Lappalainen, S.; Palmu, T.; and Kurki T., 2012). Other volumes she has edited include *The Leisure Time of Young People in Contemporary Finland* (with Määttä, M., 2011) and *Social Class and Gender* (2008). Research publications include *Gazing with Intent:*

Ethnographic Practice in Classrooms (with Gordon, T.; Holland, J.; and Lahelma, E., 2005) and *Collective Ethnography, Joint Experiences and Individual Pathways* (with Gordon, T.; Hynninen, P.; Lahelma, E.; Metso, T.; and Palmu T., 2006). She was leader of the project *Cultural and Material Formation of Social Class Within Families* of the University of Helsinki. Her current research focuses on marginalization of young people. Elina Lahelma and Tuula Gordon were her doctoral supervisors, and she would like to dedicate this chapter to them.

Esteban Torre is advisor to the executive director of Conectar Igualdad. He received his BA in political science from the Universidad Torcuato Di Tella and is completing his MA in education at the University of San Andrés. Between 2011 and 2012, he worked as advisor of the Minister of Education of the province of Buenos Aires. In co-authorship with Silvina Gvirtz, he wrote chapters in different books on education.

Luis Urrieta, Jr., is an associate professor of cultural studies of education at the University of Texas at Austin. He is (by courtesy) affiliated faculty with the Center for Mexican American Studies, the Lozano Long Institute of Latin American Studies, and the Native American and Indigenous Studies Program. Urrieta's research interests include identities and agency as social and cultural practices, movements related to education, and learning in family and community contexts. Dr. Urrieta is the author of *Working from Within: Chicana and Chicano Activist Educators in Whitestream Schools* with the University of Arizona Press (2009). As the son of Mexican immigrants from rural Michoacán, his motivation for advocacy and work with communities stems from his family experiences dealing with the perceptions and often hostility toward indigenous migrants, especially undocumented migrants. His professional and academic work in education has been dedicated to raising awareness and valuing Latina/Latino immigrant family and community knowledge as well as the importance of nourishing and supporting strong ethnic and linguistic identities in Latina/Latino children and youth while promoting and creating the conditions for high academic achievement.

Divya Vaid is an assistant professor at the Centre for the Study of Social Systems, Jawaharlal Nehru University. She holds a master's degree and a Ph.D. in sociology from the University of Oxford (Nuffield College). Prior to joining JNU, Divya held postdoctoral positions at the Center for the Study of Inequality and the Life Course (CIQLE) at the Department of Sociology, Yale University, and at the Centre for the Study of Developing Societies (CSDS), Delhi. She specializes in the study of social mobility and inequality, with a keen interest in class and education, and recently gender and urban life. She teaches courses on social stratification, on social mobility, and on statistics. Her work has been published as chapters in edited volumes and in journals such as the *Annual Review of Sociology*, the *Asian Survey*, and the *Economic and Political Weekly*.

Juan Pablo Valenzuela is associate researcher of the Center for Advanced Research in Education and the Economics Department, both at the University of Chile. He received his Ph.D. in economics from the University of Michigan-Ann Arbor. His

main research areas are economics of education and social inequality. He has published extensively about quality and equity in Chilean education. Some of his most recent publications with other co-authors include “External Technical Support for Improvement: Critical Issues from the Chilean Experience” (Journal of Educational Administration and History, 2015), “The Role of Reading Engagement in Improving National Achievement: An Analysis of Chile’s 2000–2009 PISA Results” (International Journal of Educational Development, 2015), and “Socioeconomic School Segregation in a Market-Oriented Educational System: The Case of Chile” (Journal of Education Policy, 2014), and his last book is *Lo aprendí en la escuela: ¿Cómo se logran procesos de mejoramiento escolar? (I Learned It at the School: How Do Schools Improve Their Effectiveness?)*, by Lom editor, Santiago, Chile, 2014).

Rahaela Varga is a research assistant in the field of pedagogy at the Faculty of Education, Josip Juraj Strossmayer University, Osijek, Croatia. She holds a Ph.D. in didactics and her scientific interests cover the areas of teaching and learning, classroom communication and relations, and student competences. She authored and co-authored several scientific publications, the most recent one being a book *Culture of Teaching With(out) Student Voice* (2014). She has participated in a project called Student Position In and Outside the Classroom supported by the Ministry of Science, Education and Sports. At the moment, she is working on a project which aims at improving professional competences of headteachers through systematic support from educational institutions designed by the University of Zadar (Croatia) and supported by the European Social Fund. At Josip Juraj Strossmayer University in Osijek, she teaches undergraduate students didactics, teaching and learning strategies, curriculum studies, pedagogical communication, and nonviolent communication.

Yesenia Velásquez is a cultural studies in education MA student at the University of Texas at Austin. She received a bachelor’s degree in political science from UCLA. Her research interests include home/community knowledge systems, Chicana feminism, and the relationship between epistemologies and identities. Her thesis examines a student organization serving the day labor population. By centering interactions and dialogue between the university students and day laborers, her study is taking steps toward illustrating these as legitimate ways of knowing, being, and understanding. Yesenia is the proud daughter of two Mexican immigrants and calls Gilroy, CA, home.

Dijana Vican is a full professor at the Department of Education, University of Zadar, Croatia. Her scientific-professional and teaching orientation is divided in several pedagogic disciplines – general, intercultural pedagogy, national curricula, educational policies, inclusive education, education for entrepreneurship, andragogy, and teacher education.

Last year, she prompted the establishment of the doctoral study of pedagogy quality in education. She also established the university center Stjepan Maticevic, which deals with vocational teacher education, professional teacher development, and adult education programs.

Her scientific research activity is realized through national and international projects. She led the project Education for Entrepreneurship, supported by the relevant ministry. In cooperation with the South East European Centre for Entrepreneurial Learning (SEECCEL), she led the pilot project Entrepreneurial Learning. She was an associate in two Tempus joint projects, EU Management and Counselling in European Education and Modernizing Teacher Education in European Context, funded by the EU. Today she runs the project School Principal: Profession and Qualification, not a Function, co-financed by the European Social Fund.

She continuously upgraded her scientific and professional work in Croatia and abroad – at the Department of Anthropology, University of Berkeley, California, USA, Danish Institute for Educational Training of Vocational Teachers (DEL), Politechnik Jyväskylä in Finland, Portoroz in Slovenia, and Scottish Qualifications Authority in Glasgow.

Presently she is the rector of the University of Zadar. She was the president of the Council for National Curriculum, a member of the Croatian government's Committee for Development of the Croatian Qualifications Framework, and the state secretary at the Ministry of Science, Education and Sports. Currently, she is the president of the Sectoral Council for Education.

Geoff Whitty taught in primary and secondary schools before working at Bath University, the University of Wisconsin-Madison, King's College London, Bristol Polytechnic, and Goldsmiths College. He joined the Institute of Education, University of London, as the Karl Mannheim professor of sociology of education in 1992 and served as its director between 2000 and 2010. He is now director emeritus of UCL's Institute of Education and holds a Global Innovation chair in equity in higher education at the University of Newcastle, Australia, as well as a research professorship in education at Bath Spa University, UK. He is also a visiting professor at the Universities of Bath, Bedfordshire, and Birmingham and an honorary research fellow at the University of Oxford. He is a past president of the British Educational Research Association and of the College of Teachers. In the Queen's Birthday Honours in 2011, he was awarded a CBE for services to teacher education. The latest among his many publications is *Research and Policy in Education: Evidence, Ideology and Impact* (IOE Press, 2016).

Shizhan Yuan was born in 1987 and is currently a Ph.D. candidate of cultural study and literacy program in the School of Education, UNC-Chapel Hill, where he obtained his master's degree in education in 2014. He has done some studies on the heritage language learning of the Chinese immigrant children in the USA and education issues of the children of internal migrant workers in China.

Globalized Urban Education: Tracking Change

It is all too common for people to see globalization as relatively recent and largely tied to the shifts in the global economy of the past 50 years. Yet it is also known that globalization is as old as human migration, as old as famine, as old as the wars that brought civilizations against each other in antiquity, and as old as patterns of exchange that moved goods across communities and wider land masses. The Western hubris of the term the Age of Discovery was seen to mark the primacy of Europe and initiation of modern forms of colonialism but in reality only signaled Europe's ethnocentrism and its consequent blindness to how people and goods had been traveling all along. There were no "new" lands—only lands that belonged to someone else that when conquered could be exploited for the victors. The wider view of globalization links migration, claims to land, exchange, war, and exploitation. The recent assertions of globalization do little to change this, adding only the dazzling scale of international connectedness, the dominance of global capital, and the speed of the Internet. Globalization is faster and more intrusive now but it is not all that new.

Urbanization is also a phenomenon that suffers from a truncated view of its history. All too often, it is linked to industrialization and the consequent need for localized centralization and concentration of workers. But as with globalization, this truncated view of history missed much. Urbanization has a much longer history and bound up in issues of security and protection from both beasts and warring neighbors. It is bound up in exchange. In villages, people could trade and devote themselves to developing skills and products that could be exchanged for needed food and products. Urbanization is also bound up in issues of land ownership as well. For many agrarian people, even today, one lives in a town and works the fields surrounding it. Sometimes this is for security but sometimes this is also the vestige of feudalism and/or plantation economies, where lords or masters owned the land and farmers (serfs, slaves, and freemen and women) worked it. Cities grew into commercial centers, distributing goods and services and creating new occupations to facilitate this—and needs for new skills and more widely spread knowledge. While people have raised their children and educated them in various ways for the length of human history, it was in cities that schools arose with such fervor to enable a popu-

lace to be spiritually and morally informed, to work in the constantly developing industries, to participate in governance, and to enable the full development of capitalism and its patterns of exploitation and wealth centralization.

There is, of course, much more to the above. Such generalized assertions miss as much as they reveal. There are great differences across the world in globalization, in urbanization, in economy, and in education. The above however is to point to the longer histories of these phenomena and to undercut claims to “newness.” It is to signal the interconnectedness of migration, war, cities, capitalism, and education. It is to highlight that to understand urban education anywhere, all this and more must be accounted for. In this *Second International Handbook of Urban Education*, the editors and authors have taken on the challenge to understand how urban education is embedded in historical processes, in international relations, in economic affairs, and in the desires of peoples to be knowledgeable and skilled, enabling them to participate in the affairs that govern their lives.

The *Second International Handbook of Urban Education* builds on our first attempt (Pink and Noblit 2007) in important ways. First and foremost, the content of this volume is completely new. We learned in our last effort that urban education, while deeply historically embedded, is always shifting. Urban education in this way can be seen as an artifact of both local and global changes. It marks the winds of change as much as it is an engine of development. However, there are other reasons for seeking new content, including the fact that, even with the extensive scope of large volumes such as this *Handbook*, there is no way to deal with all the facets of urban education. Volumes that are more national in scope may be able to come close, but even volumes that examine specific regions of the world cannot do all the issues justice. Thus, new content also allows this *Second Handbook* to expand on what was covered in the first volume.

Second, we found it exceedingly difficult to identify appropriate scholars in some areas of the globe as we developed the first volume. With this *Second Handbook*, we have made significant progress in reaching areas of the world we could not before, most notably India and Eastern Europe. It is important to note, moreover, that regions themselves are not stable geographies. The Asia Pacific is a good example. This was how the section was conceived in the first volume. Yet James Ladwig convinced us that how nations in the South Pacific identified with each other was shifting and offered “Oceania” as the alternative. Xue Rong agreed to take on Asia in this volume as a separate section. Similarly, we have a new section on Nordic nations which in the last volume was included in Europe. While this was a tough decision, it followed the realization that these nations have distinguished themselves in international comparisons and are increasingly regarded as offering lessons for other nations. Let us be clear, however, that we have not achieved any sense of total representation of the world. We have reached into new regions and nations and reconfigured some regions. We have also have found talented researchers and scholars who enable this volume to expand the knowledge base dramatically, but the result is still a partial accomplishment. We would want future volumes to dig deeper into the Middle East and Central Asia. We would want more nations to be covered in each region as well. Indeed, we would argue that it is important to

reach inside nations to see differences within as well. In this volume, we experimented with this by including India as its own section. Clearly, India is geographically large and thus in scale may be seen to approximate a region. India had not been covered in the first *Handbook* so it could be argued that such an intensive treatment is warranted. Nevertheless, we were experimenting with digging deeper into large and complex nations. We have concluded (and we believe others will concur) that this effort enabled unparalleled depth of understanding. We encourage readers to compare the India section with the compelling, but single, chapter on India in the Asia section. We purposely included that chapter in Asia to signal that India is also regionally situated. Such a comparison makes it clear that delving deeper into single nations is productive. We would argue that future volumes may find it useful to consider which nations at which times deserve extensive treatment and that, as the volumes accumulate, a better record of what urban education has entailed across the globe can be assembled. This is important as a historical record, marking where and when particular issues have salience. It can also enable a better tracing of where new ideas and practices are emerging and how these may travel the world.

Third, this volume has been written largely by new scholars as well. This was both by plan and by necessity. Scholars have specialties and long-standing research programs and thankfully so inasmuch as the current state of world presses for rapid results and shifting attentions. In this world, academicians serve a valuable role in staying the course, in digging deeply, and in tracking developments over time. Yet, for the production of new content, we were concerned that to return fully to the editors and authors of the prior volume would have likely returned to themes raised in the initial volume simply because of the authors' specialties and maybe not because these themes are especially relevant now. Sulochini Pather, as the new editor of the Africa section, argued that inclusion was an especially salient theme for Africa now and worked to organize the section around this theme. We will return to what this section reveals later in this chapter, but the point here is that new scholars led to new content. We, of course, did not abandon all who wrote and edited before. Belmira Bueno edited the Latin American section again, for example, and sought out new scholars and topics for this volume. Elisabet Ohrn and Gaby Weiner also are repeat editors (but now of the Nordic section) who solicited new chapters. Gaby Weiner was an author in the first *Handbook* but returns as a section co-editor. The result of all this has made it clear to us that shifting who was included in this volume and seeking new content has made this *Second Handbook* a fresh addition to the literature on urban education across the globe.

While a fresh addition to the literature, this *Second Handbook* also reveals that there are enduring themes in post-twentieth-century global urban education. In the last handbook, we suggested the reader approach, the daunting task of reading such an extensive volume through a set of "analytic lenses" (Noblit and Pink 2007, p. xviii) that included multiplicity, power, difference, capital, intersectionality, and change. Now, however, we are clearer now that the term "lens" should be replaced with "prism." As we read the draft chapters for this *Second Handbook*, we found that several of these terms were still generally useful and are worthy of inclusion here. However, we think this volume requires a full reconsideration of the list. We

ended up keeping multiplicity and power but speak differently about them here. We dropped change entirely, not because it is not applicable but because it is embedded in the others. We renamed two. Difference becomes inclusion/difference to emphasize positive efforts at change. Capital becomes global capital because recent scholarship has signaled an end to the linkage of economic growth to social mobility. This requires a wholly new image of urban education. In addition, we have done a light reordering of their salience. Most importantly, though, our shift is to see through the *refractive* elements, given the use of *prism* under as overarching strategy for reading these chapters.

We wish to emphasize that we are not asking the reader to use these prisms to reduce the following chapters to a list of similarities and differences and/or to seek generalizations. These all-too-common practices violate all that have been learned about global urban education. Context (region, nation, peoples, cities, development, economy, etc.) is all important. Similar practices in different contexts can have quite different meanings. As importantly, however, reading these chapters to reduce them to similarities and differences and/or generalization is akin to an act of symbolic violence (Bourdieu and Passeron 1977). We say this because acts of generalization, for example, serve the interests of states and policy processes. Following Scott (1998), “seeing like a state” requires making what are accurate portrayals of local processes or situations into patterns that can be recognized by the state. Once the patterns are made legible by the state, then they can be made further subject to the state via policies that enable the state (and less so everyday life). For the reader here, this can be avoided by reading in order to understand “particularities” (Noblit 1999, 2). Each chapter in this volume is a unique contribution and deserves to be understood as the contribution it alone is. It is true that the chapters are in dialogue with one another, but this dialogue can only be understood adequately by first recognizing the particularities of each case in each chapter. The prisms we offer below then are not to be taken as crosscutting themes or as reductions. Again, they are offered not to reduce the readers’ search for understanding but rather to complicate that search. This is what prisms do—instead of offering a singular focus, they refract into a rainbow of possibility. As such, they speak against efforts to “see like a state” and instead valorize particularities.

Multiplicity

We argue that one enduring prism of post-twentieth-century global urban education is multiplicity. In the previous *Handbook*, we argued that this prism (then “lens”) led to at least three questions the reader may wish to consider:

1. How is it that there are multiple forms of urban education, multiple interpretations, multiple arenas, and multiple actors?
2. What can we learn about our own settings from seeing a wide variety of settings?
3. What strategies enable us to consider multiplicity as an asset for change and empowerment? (Pink and Noblit 2007, xix)

We do not wish to predetermine the types of answers the reader may develop in considering this volume. Thus we will be cautious in our discussion. In this, we must highlight that, as readers, we add to the multiplicity by bringing our own interests into our reading. As two scholars who have studied education and school reform in major cities and who have recently completed a new book, *Education, Equity, Economy* (Noblit and Pink 2016) (and a new book series with Springer of the same title), we of course read the draft chapters asking how they could inform our understanding of these concepts. We were drawn to this many chapters, but we will point to only a few here (and will do the same in the discussion of each prism) so that we can illustrate the approach we encourage to reading with multiplicity in mind.

In the India section, Rao examines the economic transformation of the city of Kota. All too briefly, Kota had suffered from rapid deindustrialization in the late twentieth century. Yet Kota transformed its identity into an education economy. It would be easy to succumb to the desire to identify similarities/differences and/or generalize lessons for cities working the new economies, but we would push for reading and thinking about this chapter differently. Using the prism of multiplicity, we wonder how much of the Kota case is a particular instance of globalization and thus cannot be easily compared to urban areas in the West that are promoting the “creative economy” (Florida 2002). True, they may be linked but maybe as cases of dependency as much as similarity. This in turn makes us wonder about efforts in the United States, where we both live, to mimic cities that have made such transitions. Kota has been a “model” for other Indian cities, but the prism of multiplicity leads us to wonder if mimicry is actually an invitation to dependency, as Illich (1971) argued was the case when education in Latin America was trying to assume the education patterns of the United States and other Western nations. In turn, then, the prism of multiplicity leads us to read the case of Kota both for what it offers us and, critically, for the assumptions that undergird its experience as well as the logic of mimicry in development.

The chapter by da Silva and Abrantes highlights the Portuguese poor in suburban areas, reflecting our earlier comments about poverty in cities being not always in the urban core. In these settings, so much is multiple: the shifts in demographics, the multiple privations and stigmas, and even who is recognized as poor in the public discourse as compared to the historically poor.

Multiplicity is also evident in the many perspectives you find in this volume, including postcolonial, multicultural, culturally responsive, world systems, critical race, and so on. Yet perspectives also work within cases as well. Singh reveals, for example, that in the South Pacific, there are four interrelated ways to think about urban education—depending on one’s imagination, one’s connections with the nations within and beyond the region, one’s role in the forces at work, and the view of using South Pacific intellectual resources. He argues that these all are constitutive of urban education in this region. Lappalainen found that in Finland the health and social services curriculum is largely neoliberal but the female-dominated cultural practices in that field are complex, ambivalent, and resistant. Vican examined different perspectives in Croatia on the problem of education and curriculum changes in pre-tertiary level—teachers, pupils, parents, professional associates, and

school founders—finding a surprising unanimity on the issue of pupil motivation. Students live in multiple worlds as well that education is often hard pressed to respect. In multiethnic Croatia, there are 20 official languages, and the chapter by Mestric finds in part that hybrid multilingual identities are often performed as a hidden practice in closed communities and are frequently perceived as an asset outside of Croatia and also as a form of resistance.

Power

It is now well known that the concept of power is less definitive than it once was. Power seems ubiquitous in life and certainly in education, but exactly what power is and how it works is more elusive. For example, in much of the literature on education, power is conceived of as hierarchical. Power is seen as constitutive of superior/subordinate relations. Power is sometimes seen as “informal” contrasted to “formal” authority that is legitimated by existing organizational and institutional processes. Yet there are many conceptions of power. Foucault’s (1980) famous declaration that power circulates is but one example. In this conception, he is decoupling it in key ways from the persons seen as holding power and enables a more discursive view of power.

Anyone with a background in urban education is well aware that power plays through all of its affairs. Yet power is socially constructed and situated in key ways. One can read urban education less as a provision of services and more as a regime—or alternately as a mechanism for governmentality. But power does not always deliver. For example, Peko and Varga in their chapter on Croatia note both the failure of the state to actually implement modernization policies which has left students a relatively passive role in their education. It is equally important to read in what ways policy can actually emerge as rather powerless. Whitty’s chapter in the United Kingdom section, for example, notes that the all-too-limited reductions in the student achievement gap are best explained by demographic shifts rather than policy accomplishments.

Public education was first constructed as a colonial mechanism to make indigenous people into malleable functionaries for colonial regimes (Willinsky 1998). In the first *Handbook* (Pink and Noblit 2007), we approached power in terms of the imposition of a linear history of progress. This, of course, is still a worthy prism to read the chapters that follow. However, as we read the chapters for this *Second Handbook*, we were taken with the complexity of power. On the one hand, there is a continuing faith in educational policy as a mechanism for providing adequate educational services. Nxumalo, in the Africa section, for example, emphasizes the policy moves in Swaziland to instantiate inclusive education. There are many other chapters that focus on policy as well, as is to be expected. Educational policy is, after all, the primary state mechanism that governs issues of access, equity, quality, and the forms and purposes of urban education. Yet thinking of power as a prism leads us to wonder about the degree to which citizens, practitioners, politicians, and

scholars are limited by the centrality of policy in our thinking. Clearly, Nxumalo is pointing to policy and finance as moments of possibility. Inclusion is being brought into existence in Swaziland—and this is a good thing. However, reading through the prism of power, we suggest, asks the reader to look for when policy is a problem: as when it enables schools to legitimately deny services, as was the case in Yuan, Noblit, and Rong’s chapter on migration education in China.

Finally, reading power through a prism would also lead directly to an analysis of when policy is a problem: this perspective surfaces when policy is rendered powerless and thus is reduced to nothing but an overreach. Cox, Beca, and Cerri’s chapter discusses policies around the teaching profession in Latin America and was read by us partly in this way. Riviere and Kosunen discuss how different conceptions of market and school choice affect the socialization of children.

Power, of course, is too important a prism to be limited only to centralized and official educational policy. Kavua notes that in Kenya, for example, “nonformal” schools are providing access to education where centralized/official policies have not been able to deliver. For us, this signals that urban education must be read broadly, which means that we must systematically twist our prism to look more analytically at public pedagogies. Families, communities, and local institutions, such as libraries and museums, must all be brought into view through this reconceptualized prism of power.

Inclusion/Difference

As noted in the first *Handbook* (Pink and Noblit 2007), the meaning of urban education is greatly dependent on the context. In the United States, for example, urban education is conceived to be about problems—problems of poverty and race, primarily. For the wealthy, though, urban signals a cosmopolitan (Merton 1968) lifestyle, filled with promise, with the arts, and with financial gain. But, of course, in these locations, the wealthy do not use the public, urban schools. Rather, they have access to high-status, fee-paying private schools and to class-specific suburban schools, which Kozol (1991) found to be bastions of privilege, self-righteousness, and exclusion. Graduation from these private schools is highly correlated with subsequent status and success in the capitalistic economy. In Europe, by contrast, residential patterns often lead to suburbs being characterized as lower class, immigrant, and racially different. In what has been called the Global South, urban settings are often destinations for those who migrate to seek out access to education, work, and social mobility. Evidence suggests, however, that migration to these urban centers results in arenas of denial and despair for many. This *Second Handbook* speaks to these patterns of experience. Some examples include Vaid’s chapter on women in Delhi and James’ chapter on “the urban” as an educational resource in England. Many of the chapters in this volume view both urban and urban education as a phenomenon that is always caught up in the production of difference: be that as a

function of factors such as race, class, gender, religion, immigrant status, and language—and their various intersections.

While we used difference as a lens in the first *Handbook* (Pink and Noblit 2007), we noted earlier that our reading of the chapters that follow in this *Second Handbook* is better done through the prism of inclusion/difference. It is telling that we used difference before as a term to signal the multiplicity of inequities that characterize urban education. Another such term currently in vogue is social justice, which points to a goal in which many forms of differences can be included. But note how we end that sentence—included. There are no doubt limitations to using a prism of inclusion/difference to read this volume, including the fact that it has been most tightly associated with special education. But it is important to note that the field of special education itself is trying to escape how it has been caught as a form of difference. Thus, we argue that it is worth our time to explore what the prism of inclusion/difference might allow.

First and importantly, the refraction of inclusion/difference does highlight special education as a particular focus in urban education. Many have pointed out how the phenomenon termed “disproportionality” (Skiba et al. 2005), where students who have denigrated statuses assigned to their race, class, gender, immigration status, and language are systematically subjected to the classification of “special needs,” was read all too often by the school as inability or disability. This results, of course, in assignment to special classes and/or low tracks, which constrict life and occupational options. This asymmetry of denigrations is notable globally, and we will return to this in more detail when we discuss the prism of intersectionality.

For now, we encourage the reader to be sensitive to how well inclusion works to expand efforts to serve all students well. We, in particular, point to Crespi, Larringa, and Lodi’s chapter on deaf education in two Latin American countries as well as the whole Africa section, which is dedicated to the elaboration of inclusion in a variety of contexts. In this latter section, we read inclusion to bring a fuller focus on all that children need in addition to the specific more traditional educational services. Health and nutrition, for example, are essential for learning but are all too often not addressed in the practice of urban education or in the literature on urban education. Inclusion can also prompt expansion of access to educational opportunities: Krawczyk and Taira, for example, examine the inclusion of secondary education as a right in Brazil. Inclusion/difference signals the belief that everyone is equally deserving. Finally, the Africa section highlights inclusion as an international effort in part facilitated by the United Nations. We argue that the reading surfacing here is that inclusion also pulls nations together. In this instance, Africa then joins, and is joined with, others in a global effort to bring education to all.

We are also sensitive to the fact that this prism of inclusion/difference also refracts all the possible ways education acts on difference, including assimilation. The Global South joins the Global North when it assumes the ways of the Global North. Difference is suppressed as the powerful nations insist that their ways of education are the right ways. It is thus possible to read almost all the chapters from North America, the United Kingdom, the Nordic countries, and Europe as documenting the many and varied failures of urban education policies in the Global

North. If one follows this by reading the chapters in the Global South, it becomes very evident the degree to which these all-too-fallible policies are now being taken up and imposed via education/official policy in the Global South. There are many chapters in this volume which illustrate this pattern of development in urban education: one might start with reading Crozier on the redefinition of race/racism and “British values” in the United Kingdom section or Lunhahl on the development of marketization in Sweden or Maguire on austerity politics in London—and then follow it with Donoso-Diaz and Castro-Paredes’ chapter on Chile in the Latin American section or with Asher’s chapter in India (in the Asia section) or with Majumdar’s chapter in the India section. As this view through the inclusion/difference prism highlights, globalization loses its sheen in the tragic parallels that emerge across the world.

In a similar vein, inclusion/difference can, of course, be read either as assimilation or as tokenism. This is to say that inclusion inevitably fights an uphill battle, especially when trying to preserve difference as it also works to insure equity. We read three of the chapters in the Asia section, for example, as working this territory. Okano addresses the issue of immigration and education for integration in Japan. Chang shows how multicultural education in South Korea can have multiple meanings over time but still be mired in an assimilation logic (Noblit et al. 2001). Jo, in elaborating the case of South Korea, dives deeply into this issue, examining the ideological underpinnings of multicultural education. Finally, Goodwin and Ling unpack the case of Singapore as an urban nation that has embraced achieving equity amidst diversity with lessons that may help advance a less assimilative approach to inclusion. All of this work serves to challenge current definitions of inclusion as either assimilation and/or tokenism while preserving a set of well-established values and practices.

The analytical power of the prism to inclusion/difference also refracts the issues of opportunity (see Menon on Delhi), access (Prasad on Vijayawada, South India), as well as social class (Arnesen on Norwegian urban education; Tolonen on Helsinki, Finland), religion (Andrade and Teixeira in the case of Brazil), and history (Manjreker on the progressive princely state of Baroda in India; McCulloch on the evolution of urban education in the United Kingdom). In short, this prismatic orientation reveals that inclusion always battles difference on many fronts and that efforts at inclusion are frequently compromised by powerful social forces both in and beyond education. In this, difference seems to triumph.

Intersectionality

Critical race theory has been especially productive in terms of clarifying the ubiquity of racism in the West and unfortunately across the globe. It has also proved to be important in driving an intellectual agenda for scholars of color. The concept of intersectionality advanced by Crenshaw (1995) is a key part of this agenda, practically and intellectually. In the North America section, several chapters build on

critical race theory to advance our understanding of urban education. Evans, Cardenas, and Dixon's chapter, for example, argue that Obama's election spawned racial retrenchment, underscoring the need for a critical race theory approach to understanding urban education.

Conceptually, intersectionality is a focus on multiple marginalizations. It situates analysis and critique in the multiplicity we discussed above and focuses on the complexity of difference that efforts for inclusion must address. This perspective is evident in many chapters in this *Second Handbook*. Mariscal, Velasquez, Aguero, and Urrieta examine intersectional violence in Latina urban education. Lawrence and Emong reveal how gender and disability intersect to double the disadvantage in Uganda. Gobbo reveals how the intersection of teaching nursery school and gender in Italy requires male educators to draw deeply on their experiences to enact care. Notably, the collective wom.an.ed (Giorgis, Pescarmona, Sansoe, Sartore, and Setti in the Western Europe section) explore several intersections, beginning with difference and diversity. However, it is the intersection of difference with identity (also defined intersectionally) that they see framing and hindering the development of individual potential. They argue that the asymmetry of power has dramatic effects on such things as multicultural competence.

While analyses and critique reveal the ubiquity of racism and other oppressions, many scholars actively work against these by focusing on the cultural strengths. Clemons, Price, and Clemons in their chapter in the North America section discuss a culturally responsive pedagogy based in hip-hop. Hollis and Goings, also in the North America section, propose a model, CARE, that incorporates (C) culturally relevant pedagogy, (A) attachment to school, (R) regulating emotions (mental health), and (E) expectations of teachers. Sernhede in the Nordic section examines a young adult suburban mobilization, the Panthers for the Restoration of the Suburb, for its lessons about knowledge and learning and consequently for schooling.

As we read the draft chapters, though, we were stuck by the potential for a fuller prism of intersectionality. This is not to minimize in any way how critical race theory has used intersectionality. Indeed we are indebted to this line of analysis for sharpening our focus in this direction. Rather, as we read the chapters, we saw that the concept refracted a variety of ways that multiplicity worked against the interests of the full range of residents in cities. Elites, it has been argued, in many ways make the world malleable to their interests (Elliott 2016), while the rest of us (the non-elites/marginalized) inherit these constructions as "facts of life." As noted above, power plays out through policy as well as through the economy (as will be discussed below). A sharper focus on the impact of multiple marginalizations, then, can teach us about both the world views of the powerful and reveal the complex processes of subjugation that stratify the social world.

As a result of this perspective, we encourage you, the reader, to read chapters for what they say but also for the hidden messages of the elites that are implied. Looking as intersectionality as elite strategy is enlightening. For example, Lassnigg's chapter on Austria pushes intersectionality into the multiple political forces that lead to the topic of urban education being repressed and rural education driving educational policy. Bereményi's chapter on the Roma in Spain demonstrates how different pol-

icy contexts intersect with the often denigrated Roma people. Intersectionality, then, is a highly productive and provocative prism.

Migration

Humans have migrated the globe forever, either in need of new foodstuffs and land to work or simply because of the lure of exploration. Thus, urban education itself is heavily situated in migration and always has been. Agriculture is necessary for human survival but has always been threatened by infestations, crop failures, war, and depredation. Urban areas are tied to rural areas for food but also have historically served as places of both protection and refuge. Urban areas have also served places of last resort. When crops fail and when war threatens, rural people either die in place or move to new lands, often cities. Migration feeds the population of cities and often overloads the rather fixed residential spaces of cities as we see in squatter camps and favelas. These areas are often considered temporary and limited, or non-existent provision of services, from water to schooling, is thus justified as not needed. Yet, in actuality, they are frequently permanent settlements, and residents are permanently deprived of rights as well as services. The emergence of favelas reveals the limits of governments in the management of the population inasmuch as the migration and the settlements are often illegal or extralegal, as we see, for example, in the chapters on China in the Asia section. Yuan, Noblit, and Rong's chapter, for example, details both the educational dilemmas caused by migration and the complex failures of government from national to local to prevent or respond effectively. Recent legislative changes are moves in the right direction, but it can be argued to be too little and too late. Lui, in turn, examines the dilemmas created for local education authorities when China's internal migration hits up against policies of compulsory education.

Adam and Mazukatow reveal how Turkish migration to Germany and a transnational Muslim education initiative have combined to feed strategies of civic positioning in Berlin, including using Muslim private schools as vehicles for social mobility. Devine's chapter on Ireland argues that a conditional valuing of immigrant children undermines the rights of these children and sets the stage for wider injustices. Urban problems also lead to migration to suburbs and, as Rowe's chapter on Australia shows, efforts by the middle class to lobby for educational services.

The global economy, of course, feeds on mobile capital and increasingly mobile labor. A mobile labor force is dependent on global capital, a topic we will take up in the next section, and thus has little bargaining power. In the West, wages have been suppressed and labor unions undercut, as trade agreements have allowed global capital to increasingly dictate the rules of the economy. What is evident is that trade agreements benefit global capital more than workers and accelerated economic growth more than national development. Mobility, both within a country or region and cross nationally, increases the demands on urban education while also assigning marginalization of the migrant to education itself.

We invite you the reader to use the prism of migration to refract the stresses on urban schools and to discern the wider forces at play. The prism of migration may also be used to refract the lack of will of governments to protect all members of the population as it seeks to embrace in the Global South neoliberal reforms that have failed in the Global North.

Global Capital

In the first *International Handbook of Urban Education* (Pink and Noblit 2007), we argued that readers would find the lens of capital helpful in reading the volume: we emphasized that this was an underdeveloped line of analysis in the mainstream of scholarship on schools. We argued at that time that the lens pointed to capital accumulation, the idea of education as a market in itself, and highlighted Bourdieu's (1986) concepts of social, cultural, economic, and symbolic capital. However, the chapters in this *Second Handbook* lead us to argue that this volume can best be read through the prism of global capital. All the previous topics, of course, continue to be relevant. But capital, following Piketty (2014), after a century of being associated with growth and some minor level of social mobility, is shifting to patrimonial capital, which is characterized by a small cadre of elite families controlling the vast majority of wealth, along with a fixed rate of return. Economic growth, in the traditional sense, is clearly at an end.

This massive and insightful work by Piketty signals an end to many things that were taken for granted, including the myth of unrestricted social mobility, the myth that education “pays off,” and, perhaps most damning, the myth that aligning education with the economy is desirable. The recent rise of the influence of global capital has brought on some truly scary times. As we have seen in many countries around the world, it also may lead to social unrest and revolt. We noted earlier that several failed educational policies in the Global North have been exported to the Global South in ways that suggest a new form of what may be termed *capital colonialism*. The failed policies of the Global North pushed public monies into private gain and can be read to be doing the same in Global South. Put directly, our focus as scholars and citizens on improving urban education, when understood through a prism of global capital, refracts into not better education but rather increased capital accumulation: schooling, through practices such as privatization and charter schools, for example, has resulted in generating profits for the current elites and no gains in achievement for marginalized students. Griffiths notes that in Oceania urban education is deeply embedded in the colonial histories of extraction and cheap labor which, in turn, maintains the lows of global capital accumulation.

We suggest then that it may help to read the chapters in this *Second Handbook* less literally. Reading through the prism of global capital asks what is behind these accounts. It calls for a discerning *cui bono* (who benefits). It calls for imagining a future that is not like the past century. Parekh and Gaztambide-Fernández, for example, using the case of Toronto, argue that the current Canadian educational

system for all its efforts at equity reinscribes a dual system that serves the elites rather differently than other students.

The first *Handbook* ended with a set of dystopias because the section editors were overwhelmed with a sense that the future of urban areas, of education, and of society was bleak. We encourage the reader to return to them, not because they were especially propitious but rather because they give a sense of the possible futures—if *we do not make a different future*. In this *Second Handbook*, we suggest that the reader look toward a future that is not dystopic but rather a future marked by fulfillment and well-being, if not as tightly linked to global capital.

We argue that the prism of global capital refracts a future that builds on relations already developed and is less dependent on capitalism itself as the primary economy. It seems unlikely that capitalism will disappear as an economic system, but two other factors make it likely that the average citizen can be less subject to its whims.

First, there is a lot more to the economy than capitalism per se. Gibson-Graham (2006a) note there are other economies in play that are less apparent or visible because the prevalence language of the economy is tied to the market economy: they state that "... not all markets are where capitalist commodities are exchanged and not all commodities transacted in formal markets are produced by capitalist firms" (Gibson-Graham 2006a: 62). One such "nonmarket" (Gibson-Graham 2006a: 61) is unpaid household labor, which according to some estimates accounts for some 30–50% of all economy activity in nations. This economy is largely staffed by women, and, while often discounted, it is a form of work and an essential exchange relation. Other examples of nonmarket transactions are state allocations and appropriations, gift giving, indigenous exchanges, gleaning, gathering, hunting, fishing, and indeed theft and poaching. There are also "alternative market transactions" (Gibson-Graham 2006a: 61) such as alternative currencies and credit, co-op exchanges, local trading systems, sales of public goods, barter, informal markets, and so on. In like fashion, labor does not have to be wage labor. Nonmarket transactions often involve nonmonetary compensation, and in alternative markets, one finds cooperative, in-kind, and reciprocal compensation. If global capital growth will no longer be the basis of social mobility, then these economies can be expanded and contribute more to well-being and sustainability.

Second, the current response to the devastating effects of fast capitalism has been to oppose it, and there is good reason for this. However, this can be coupled with another strategy—recognizing that capitalism responds as well as dominates (Slater and Griggs 2015). The "autonomous" argument is that capital does not fully constrain action and moreover changes in response to actions of people. So that if a "diverse economy" (Gibson-Graham 2006b: xiv) is more fully developed, capitalism must change as well. For example, early in the last century, there was a major political shift in the United States to protect American and European democracies while allowing capitalism to continue (Rosanvallon 2013). The "grand bargain" "originated in the widespread apprehension that the rapidly growing power of robber barons, national corporations and banks (like J. P. Morgan's) was undermining fundamental American values and threatening democracy" (Keyassar 2011).

Given the unchecked power of corporations and increasing inequalities in Western societies, many felt that capitalism needed to be replaced with a “cooperative commonwealth.” While highly contested, over time, a grand bargain was fashioned. On the one hand, capitalism would be allowed to survive and nations would promote private business. On the other, regulations would limit the power of corporations; government would intercede to protect citizens from the rapacity of the market; unions would be allowed; and social security and other forms of social insurance would be created.

There is much more to this argument (see Noblit and Pink 2016), but the point is that in our reading of the chapters, there is a strong sense that global capitalism is deterministic. Case after case shows how neoliberalism, the political/policy domain of fast capitalism, is shaping the world. This view permeated the first *Handbook*, which led to the set of dystopias that ended the volume. With this second volume of scholarship, it is now time to read more imaginatively. We must ask a number of critical questions to shape this future: “Where in here are other forms of relations that could be maximized, that could supplant elements of capitalism, and that would sustain all of us rather than a few?” And “In what ways can we imagine forms of urban education that are decoupled from an economy that is no longer able to sustain a myth of social mobility?” There are economists arguing for a de-emphasis on economic growth, arguing that the economy should be asked to deliver well-being instead (Boston Consulting Group 2012). We should ask the same of urban education.

Looking Ahead

We have suggested here that the future of both urban education and the global economy is not set in stone. Rather it can be constructed in a variety of ways. Both of us have spent our lives trying to impact this future through teaching, conducting research, writing, and engaging in different kinds of interventions in schools and policy-making circles. We have had some modest impact but not near enough. Thus, we see this *Second Handbook* as a tool for stimulating conversations about the desired future(s) for both urban education and the global economy: we see the prismatic analysis outlined here to be a powerful tool for generating an understanding of the multiple factors which work together to limit the realization of equity and social justice in countries around the globe. Again, a strength of this broad international focus possible within the scope of a handbook is the ability to recognize both similarity and difference of factors that impact the development of urban schooling: again, this serves to underscore the limitation of looking for a single model for school effectiveness while also pointing up the importance of the local context. While we urge you the reader to use these analytic prisms laid out above to reconsider the implications of current urban education practice, we also urge you to reconsider your role as a social activist in bringing about the needed changes both in schools and the society. Such change, of course, requires knowledge about how

things actually work, and it is our hope that this *Second Handbook* can make a real contribution to that knowledge base. Change also requires the development of effective change strategies: knowing how to make things happen at the local, national, and international levels is important knowledge that must be coupled with the knowledge about how things actually work. Our sense is that such needed changes can only come about as a result of an orchestrated social movement of well-informed citizens working from a bottom-up playbook. As the scholarship in this volume demonstrates, we know a great deal about how things work. The task ahead is to disseminate this knowledge more widely and to play an active role in bringing about those changes in our schools and society that realize both equity and social justice for all students.

Part I

Africa

Chapter 1

Urban Education and Inclusion in Africa:

Section Editor's Introduction

Sulochini Pather

If Europe's emerging individualism was summed up in the seventeenth century by Rene Descartes with Cogito ergo sum, 'I think, therefore I am', Africa's communalist counter was, 'I am because you are'. It is the idea that the individual is defined not in terms of himself or herself but by his or her membership on an inclusive community, 'I am because I belong, because I participate, because I share'. (Perry 2015:40)

Perry's impression of Africa as a European, poignantly captures the essence of African community and culture. He shares tales told by people he has met through his travels through Africa to provide a captivating account of the histories and realities of the continent, suggesting that Africa has been misunderstood by Europe and this misunderstanding has caused a rift, which he believes is being healed by Africa breaking free and forcing us to rethink. In this series, we provide insight into education in five countries – South Africa, Swaziland Ethiopia, Uganda and Kenya – from the perspective of local scholars within these countries. As Perry emphasises, it addresses the need to let locals tell their own stories to avoid the misunderstanding. We look at this concept of 'I am because you are', from a community-based perspective, which is critical to an understanding of 'inclusion' in the African context. What this series aims to do is to provide a background to inclusion and inclusive education as an indispensable thread within the education landscape, within a global perspective and how this has been adopted in Africa, the rationale for a local commitment towards inclusion in the context of exclusion and marginalisation and how this is being translated into policy and practice, particularly within urban areas.

Governments across the world are committed to ensuring education for all children, albeit significant but slow progress has been made over the last 25 years (UNESCO 2015). It is a fundamental right for all children to be given access to quality education to ensure they reach their full potential as individuals; a right

which is reflected in international law in Article 26 of the Universal Declaration of Human Rights¹ and Articles 13 and 14 of the International Covenant on Economic, Social and Cultural Rights.² Twenty four years later, the Education for All agenda³ set by 155 governments, outlines six goals to achieving quality education and enabling access for all children, including the most marginalised and vulnerable. In response, 92 governments met and agreed in principle at the Salamanca Conference in Spain that the most marginalized groups of children i.e. children with special educational needs and disabilities, had a right to education in local mainstream schools. The argument was that regular schools with an inclusive orientation are: "...the most effective means of combating discriminatory attitudes, building an inclusive society and achieving education for all" (UNESCO 1994). This gave impetus to the Inclusive Education movement, which saw governments increasingly including children with disabilities and special educational needs in local mainstream schools. Governments met again in Dakar in 2000,⁴ to reaffirm these commitments to ensuring that all learners, including those with disabilities and special needs, would be included in education by 2015. However, this has not materialised fully. It is clear that not all learners are being afforded this opportunity, with 158 million children out of school and around 100 million who do not complete primary education (UNESCO 2015). Of these, the most marginalised and excluded appear to be those with disabilities. Countries reported to make the least progress since Dakar are in Sub-saharan Africa, Asia and the Arab world.

What emerged from an analysis of practice relating to inclusive education was the need for a deeper understanding of how children could participate fully in the learning process and environment, rather than simply being placed in a class with other children. This gave rise to a globally accepted notion of inclusion which was about *all* learners, not just about children with disabilities and special educational needs. As a globally accepted concept, inclusion, in its broadest sense is about increasing the learning and participation of *all* learners and improving the quality of their education (UNESCO 2005; Booth and Ainscow 2002). Inclusive Education is therefore a strategy to enable this. However, inclusion and Inclusive Education, have become contested notions held mainly by academics (Clough and Corbett 2000) and are being interpreted and translated into policy and practice in different ways across contexts (Armstrong et al. 2010). Inclusive education in the majority of contexts aspires to principal features with respect to students with disabilities (Mitchell 2005). These relate to membership in a regular class in the neighbouring school, access to appropriate aids and support services, individualised programmes

¹On 10 Dec 1948, the General Assembly of the United Nations adopted and proclaimed the Universal Declaration of Human Rights.

²Adopted and opened for signature, ratification and accession by General Assembly resolution 2200A (XXI) of 16 December 1966.

³In 1990, delegates at a conference in Jomtein, Thailand, adopted a World Declaration on Education for All.

⁴The Dakar Framework for Action was Adopted by the World Education Forum in Dakar, Senegal, 26–28 April 2000.

with appropriate differentiated curriculum and assessment practices. It has been agreed in principle, that inclusive education is a movement, which has transcended the basic understanding of simply placing learners in mainstream classes which is more integration (Ainscow 2000). It stemmed from a shift in thinking in the 1990s away from traditional special education practice which is concerned with the provision of specialist support and teaching in specialised settings (Skrtic 1991; Clark et al. 1998; Thomas and Loxley 2001). Medical models, which underpin these ways of thinking and working, have increasingly been replaced by social interpretations, which focus on the needs of individuals and communities and barriers which cause marginalisation and exclusion (Rose 2010). The emphasis is on addressing these barriers to all types of marginalisation, exclusion and underachievement by structural and attitudinal reform of society and schools, to increase the participation of *all* learners (Ainscow et al. 2006).

Increasingly, there is broad consideration of social justice and inclusion across a range of developed and developing contexts that encompasses a variety of concerns relating to domination, oppression and injustice, in recognition of the intersection of inclusion and exclusion (Curcic 2009). In Africa, this notion of inclusion 'seeks to understand the complex intersections of a number of often overlapping categories of social identity and conflict, including cultural, ethnic, and racialised identities, gender sexual orientation, class and disability' (Muthukrishna 2008, preface). Inclusion viewed in this way, is therefore a key priority in Africa, given the range of barriers that exist in this context which marginalises children in education, from the poor quality of school infrastructure, water and sanitation, school furniture, distance to school, overcrowding and multiple shifts, inefficient resource allocations (Theunynck 2009). Some of the key challenges to inclusion in Africa highlighted by Eleweke and Rodda (2002) are resonant with other developing countries. Inclusion is not receiving strong support from governments in terms of proper planning and resource provisioning, hence the lack of leadership and direction towards developing an inclusive system. There is a lack of mandatory policies and law to support inclusion, mainly arising from a lack of awareness and knowledge around Inclusive Education and models which may be locally sustainable. Early childhood education is virtually non-existent. Special Educational facilities (special schools or inclusive programmes) are concentrated in urban areas. Hence children with disabilities and special needs remain at home in rural areas because of distance to school and cost. Educational materials are lacking in regular schools which include children with special needs and there is a lack of support personnel. Furthermore, both teaching and support staff are inadequately trained. In those countries where there are training programmes, there is an emphasis on 'specialist teachers' and 'special school placements' which do not favour inclusive practice. Other challenges include student with special needs being segregated from their peers even in mainstream settings, inadequate facilities, poor infrastructure, lack of accessible environments, large class sizes and lack of funding. Special needs is not a priority for many of these countries and is deemed as an additional expense which comes second to general education priorities.

A dearth of literature exists on the subject of Inclusive Education in Africa from scholars in Africa specifically. In relation to Education in general, as was noted in

the previous *Urban Education Handbook* (Brennan and Nyang'oro 2007), not much is written by African scholars. A review of available articles and books on Inclusive Education in Africa reveal that the majority of texts originate in South Africa, with very few from other African countries. Hence, invitations for chapters for this series went out to African scholars from South Africa, as well as from Kenya, Uganda, Ethiopia and Swaziland, to reflect the situation in their countries. I have included five chapters, reflecting developments in both Northern and Southern Africa. The limitation here is of course the absence of Central, Eastern and Western African countries to get a real sense of what is going on across the continent. However, a review of the literature from these other countries reflects that the situation is not too dissimilar.

A review of African countries' response to the United Nations Convention on the Rights of Persons with Disabilities (Chataika et al. 2012) revealed that disabled people are still denied access to education. Only four of the countries reviewed (Lesotho, South Africa, Zimbabwe, Ethiopia) had an inclusive education policy or a general education policy, which espoused an inclusive ideal. Namibia has a disability policy but not integrated into an education policy. Zambia relies on philanthropists and non-governmental organisations to support special needs education at school level. Guinea, Mali, Senegal, Ghana, Malawi, Uganda and Tanzania promote other key general education issues in their policies which relate for example to school fees, enrolments, school attendance, etc.

One of the key concerns in Africa has been the influence of the North and the impact it has had on the local contexts. For delegates to the 2nd African Network of Evidence-to-Action on Disability Symposium in South Africa in 2009, the importation of northern models of inclusive education, particularly around testing, clearly do not take account of cultural settings and the discomfort created for children in testing environments (Chataika et al. 2012). They felt that indigenous customary education was not recognized or capitalized upon due to the dependence on models from the North. What was more significant was their recognition that 'this lack of fit between African realities and special education theories works against inclusion.' This was an argument put forward strongly since the 1990s (Kisanji 1998). Post-colonial perspectives in Inclusive Education from the South have since recognised and agreed that one of the key challenges for developing inclusive education in Africa is that notions and 'recipes' have been transported predominantly from the North through external consultants, collaborative projects or through practitioners studying abroad and transporting back ideas to transplant into their own contexts without careful consideration of how locally appropriate or sustainable these models may be (Pather 2006, Pather and Nxumalo 2012; Armstrong et al. 2010; Gadour 2008). The analysis of what is going on in the five countries we showcase in this series, will be based on this post-colonial framework. To what extent are models from the North being applied in these countries, how are they being applied in policy and practice, to what extent are they benefitting local communities, and what are the ongoing challenges, particularly in urban areas? We revisit Perry's notion of the African culture of 'I am because you are' and assess the extent to which these African countries are breaking free.

1.1 Description of Africa Chapters

In this section, I provide an overview of the chapters that have been offered from the five countries – South Africa, Swaziland Ethiopia, Uganda and Kenya. We begin in the South with South Africa and Swaziland, looking at the ideology of inclusive education, how this has been translated into policy and the challenges facing schools and communities. We then move on to the North African countries, beginning with Ethiopia which looks at how implementation of positive government initiatives have been challenged by broader socio-economic and political issues. The chapters on Uganda and Kenya move slightly away from policy to ground-level support initiatives, which have yielded significant benefits for learners who are generally excluded from formal education in urban settings.

To begin with, Naicker provides a powerful critique of urban education and the problems associated with it. He looks at inclusive education as an approach to addressing these challenges, providing valuable perspective on challenges within the South African context which have impacted on literacy and numeracy rates, retention, placement and support of children who experience barriers to learning and overall performance of the system. He focuses on barriers facing learners in this context; barriers such as pressure on their cognitive and emotional being and the need for trained teachers to deal with this. His fundamental argument is that teachers need training on how to ensure that children's basic needs are met. An interesting account of the socio-economic barriers is provided relating to nutrition and lack of oral language and reading stimulation in poor families. Naicker explores in detail other barriers within the South African context which include disability, language and communication where in an English medium school context learners do not have English as a first language or braille and sign language are not being offered, lack of parental recognition and involvement, negative attitudes, inadequate programme-to-work linkages to support learners transition to work. Naicker contends that within this context, the inclusive education policy⁵ and its ideology of a unified system of education, can create environments for success. Some interesting and useful recommendations are offered on how these barriers can be addressed within the school and community.

Nxumalo provides a detailed account of policy developments in Swaziland, which have led to positive changes within the system, to achieve inclusive education. She focuses specifically on the funding mechanism used to enable the implementation of The Education and Training Sector Policy (2011), which was the turning point in the education milieu, towards the achievement of an inclusive education system. Implementation began with the financing of nine schools as models of inclusion and the government appears clearly committed to funding inclusive education. Funding is mainstreamed through different general education pathways such as Free Primary Education (FPE), school development planning Free Primary

⁵ Education White Paper 6: Special Needs Education: Building an Inclusive Education and Training System (Department of Education 2001).

Education and through a school development planning programme called Schools as Centers of Care and Support (SCCS) which includes seven pillars – safety and security; psychosocial support; food security; health and sanitation; water, sanitation and hygiene; HIV/AIDS life-skills and quality teaching and learning. This programme is locally known as ‘Inqaba’ which means a fortress. It is based on child rights and the child friendly concept. The focus in this programme is on the active and meaningful involvement of teachers, school committees, parents and learners in all aspects of school development and management. Funding is also provided through capital projects and capacity building programmes, as well as from donor agencies such as UNICEF and Save the Children. Funding supports capacity building for teachers, provision of specialized teaching and learning material and equipment (including braille material), modification of infrastructure in schools, construction of appropriate structures, construction of ramps and pathways, modification of toilets and classrooms and provision of transport in selected urban schools. The key challenges highlighted by Nxumalo include the need for more funding to maintain inclusive education provisioning and the need to revise fee specifications in the free primary education act to allow for provision of children with special needs to access education.

Bekele’s chapter on Ethiopia paints a bleak picture in terms of the numbers of learners, including those with disabilities, who are currently out of school with no access to education. The author warns against the exactness of statistics, given the difficulty to obtain real data. On a positive note, central government’s efforts to address concerns over access and quality through Ethiopian Education Training Policy (Ministry of Education 2004) and subsequent Education Sector Development Programs over the past 20 years, are noted. The objectives of these policies clearly align with EFA development goals. However, Bekele believes implementation is fraught with difficulty. Although policies are in place to address the general concern over out of school children across the country, there appears to be a distinct policy-practice gap which is a result of lack of awareness in a decentralised system. Children with disabilities, many who are included in schools in the city of Addis Ababa, are not provided appropriate services or resources to support their inclusion in schools. Bekele suggests that urban education on the whole is challenged by overcrowding, rigid and poor teaching, lack of identification and support processes and often unstimulating learning environments. Overcrowding is a result of many from rural areas migrating into the cities in search of better work or schooling. Challenges faced by migrant children with disabilities from the rural to urban areas, to gain access to appropriate schools and to escape discrimination, are key issues. Of significance, however, is the release of a strategic policy document, namely the Special Needs Education Program Strategy (2012), which aims to improve educational access for children with disabilities and special needs and to improve support services. Bekele views this as a significant milestone. The support from the Finnish Government and international consultants in developing this policy and beginning its implementation through bi-lateral projects, is recognised. Some of the key challenges to the implementation of this strategy, according to Bekele, relate to the lack of quality of education provisioning, lack of accountability, lack of funding, negative attitudes towards disability, mis-utilisation of special needs teachers, lack of

awareness and training at all levels of the system, socio-economic factors which impede school attendance, school dropout and teacher turnover.

Lawrence and Emong's chapter on Uganda provide a clear explanation of the need for a social rights model of disability, rather than a medical model, to be applied in Uganda in recognition of how people with disabilities are being treated. The focus in this chapter is on girls with disabilities who clearly are the most marginalised in the education system. The national constitution and accompanying strategies and policies, including training at higher education, supports the inclusion of individuals with disabilities. The emphasis is on community awareness, advocacy and mobilization, making children with special needs and disabilities more visible in society. Lawrence and Emong share insight into the challenges within this context, which relate to the lack of capacity and commitment of teachers, inadequate education infrastructure, negative social attitudes, overcrowded classrooms, a shortage of necessary teaching and learning resources, lack of parental awareness, concerning enrolment and retention numbers of children with disabilities and the financial cost of including children with disabilities in education. Specifically, they look critically at factors affecting the inclusion of girls with disabilities and highlight attitudes as a key challenge. The voices of parents, which reflect attitudes towards children with disabilities, are particularly illuminating. Within this context, they provide a detailed account of two significant projects in the capital city, Kampala which attempt to improve access and the quality of education for girls – 'The Girl with Disability Challenge' project and a UKAID Project, 'The Girls' Education Challenge (GEC)'. These projects are undertaken by Kampala City Council (KCC) and Cheshire Services Authority and affected 119 schools, 1200 teachers, 442 parents and 2082 girls. They also describe a sub-project on Supporting Slum and Homeless street girls with disabilities in Kampala City aimed at increase enrolment, improve performance and retention of girls at primary schools in four out of five divisions of Kampala. The authors provide a positive account of the outcomes in terms of resource structures within the Special Needs Education/Education Assessment and Resource Services (SNE/EARS) programme for diagnosing, assessing, placement, referral and providing support to learners with disability and special needs education, as well as support personnel i.e. Special Needs Education Coordinators (SNECOs) within the system. These were set up through a DANIDA project initiative. Other positive outcomes include teacher training, the provision of teaching-learning material, paying of school fees, rehabilitation, provision of sanitary pads, transporting of the girls from their homes to schools and paying remedial teachers for additional support.

Kavua's chapter on the situation in Kenya, paints a similar picture to that of Ethiopia in relation to the numbers who have no access to education and the cost to those who live in rural areas who seek quality education in the cities. However, his is a more positive narrative, which focuses on the existence of non-formal education programmes in the city, which fill the gap. Kavua provides a critical analysis of what inclusive education means in Kenya and the contribution non-formal education has made to developments in this context. He highlights the tension between inclusion vs education for some children with disabilities in separate special schools, and the exclusion of certain groups of students from formal education. In response, non-

formal education programmes, which are essentially rehabilitation centres in mainly poor urban and peri-urban areas, provide for children in especially difficult circumstances or those in need of special protection, who would have otherwise been excluded from formal education. These are praised for providing access, but the quality of education provided in these institutions is questioned. Nevertheless, this form of education, in Kavua's opinion, is more inclusive than formal education by virtue of the fact that the curriculum offered is more learner directed, taking into consideration the needs of learners. He shares insight into the other benefits of non-formal education which include an individualised approach to teaching and learning, a focus on improving an equitable learning environment, flexible learning times, and low cost of provision which attracts poorer families, street children, homeless children and child labour victims. The challenges, however, point to the limited number of available teachers, untrained teachers, inadequate and inappropriate facilities and resources for teaching and learning, a lack of permanent structures and financial and administrative challenges. Kavua highlights the significance of non-formal education in a context like Kenya and makes valuable recommendations on how the quality of education provided in these institutions can be supported and improved.

1.2 Analysis

My approach to the writing of the chapters, was to leave it up to the authors, who themselves know their contexts far more than I do as an outsider. Having worked in two of these contexts (South Africa and Ethiopia) and with the other three (Kenya, Uganda and Swaziland), I have my own answers to the questions I framed for the analysis at the beginning i.e. to what extent are models from the North being applied in these countries, how are they being applied in policy and practice, to what extent are they benefitting local communities, and what are the ongoing challenges, particularly in urban areas? However, in attempting to answer these questions, I draw from the local narratives.

I begin by noting the paradigm of inclusion and definitions of inclusive education adopted by each author and how this has been conceptualised locally. It is clear that we all are in agreement about the concept of inclusion being about all learners and based within a social rights paradigm. We have drawn from academics in the North i.e. Booth and Ainscow (2002), Lewis (2009), and Barnes and Mercer (2010) but also from local scholars, for example, Muthukrishna (2008) who themselves have engaged with academics from the North and have applied concepts to local understandings. This is the nature of globalisation and cross-cultural sharing, which is a refreshing idea. It is clear that local understandings of inclusion have responded to the marginalisation of certain sectors of the community and hence the adoption of definitions of inclusion which counter this exclusion. In every one of the countries, the concept reaches beyond those with disabilities, to *all* learners who experience barriers to learning and participation. The definition of inclusive education is therefore about an education system, which addresses barriers relating to the school and community. This is an understanding which appears to underpin broad education

policies in each country, which are designed to address access and quality of education for all learners.

The focus, however, when talking about inclusion and inclusive education, appears to be about the education of children with disabilities and challenges, albeit the paradigm has moved away from a special needs one. Of deep concern are children with disabilities from rural areas and girl children, particularly those with disabilities. What was strongly represented in each of the countries was a profound understanding of the challenges and realities affecting the exclusion of children with disabilities and special educational needs. The challenges resonated with those highlighted by Eleweke and Rodda's account (2002), suggesting that there is still a lot to be done. The key challenges highlighted across the five countries in this series relate to attitudes of the community, parents and teachers to disability; the lack of availability of appropriate teaching and learning resources; lack of capacity and commitment of teachers, lack of funding; enrolment and retention of children with disabilities within the education system and exclusion of children living in difficult circumstances or those in need of special protection from formal education. Other challenges include inadequate education infrastructure, overcrowded classrooms, financial cost of including children with disabilities in education, and difficulties faced by migrant children with disabilities from the rural to urban areas. lack of accountability, mis-utilisation of special needs teachers, socio-economic factors which impede school attendance, and teacher turnover.

Voices around how each country is responding to such challenges, were equally strong, reflecting a deep commitment to ensuring inclusion within local communities. It is clear that governments have responded positively to the call for Education for All. This clearly demonstrates political will, although there appears to be a general lack of awareness of inclusive education and how it should be implemented. All of the countries represented in this series, reflect a strong commitment to education for all and to ensuring equal opportunities for every citizen irrespective of their ability or disability. This is reflected in their national constitutions. It also appears from our local narratives that since Eleweke and Rodda's account in 2002, inclusion appears to be translating into government planning and resource provisioning. There is growing leadership and direction towards developing an inclusive system, which has led to mandatory policies and law to support inclusion. Policies have been drawn up to improve the quality of education for all learners and to address the marginalisation of children, particularly those with disabilities and the gender disparity. In all countries the policy frameworks are in line with their local constitutions and Disability Acts, which call for the inclusion of every citizen. In Uganda, there is a more general education policy relating to Universal Primary Education as in Kenya, although a draft Special Needs and Inclusive Education policy has been developed through local stakeholder consultation and is awaiting a certificate of financing to be approved. Kenya has produced a guide on inclusive education, providing direction, although the general education policy leaves this out in its focus. Similarly, in Swaziland, a Free Primary Education policy has long been underway and the 2011 Education and Training Sector Policy has mainstreamed inclusive education and currently being implemented. A formal inclusive education policy being implemented comes from South Africa i.e. the 2001 Education White

Paper 6: Special Needs Education: Building an Inclusive Education and Training System. Ethiopia has designed a Special Needs Education Strategy in 2011.

The engagement with external consultants from the North in drawing up policy frameworks, cannot go unnoticed. In Ethiopia, this was the Finnish, although the operational framework was agreed between Ethiopia and Finland as part of the bilateral agreement between governments. Funding was the key driver in this context. Similarly, the Finnish and Swedish governments reached agreement on both the conceptual and operational framework for the Education White Paper 6 in South Africa. Increasingly, local government has taken ownership of the policy implementation, making appropriate adjustments where needed. The situation was slightly different, however, in Swaziland and Uganda. Although they adopted international definitions of inclusion and inclusive education, their policies were designed by local professionals, without external support. This was, as Perry suggests, is the breaking free.

In the face of assistance from external consultants for drawing up local policies, particularly in Ethiopia, one of the challenges is absence of clear guidelines, which appears to be major challenge. From my own understanding, this is linked to the lack of local knowledge and expertise at the helm and the reliance on external consultants and donors to bring new ideas and to support the development of policies and guidelines. Bekele suggests that this lack of knowledge filters down to grass-roots level where little is being done.

The involvement of NGOs and external agencies such as UKAID, Leonard Cheshire, Danida and UNICEF, is instrumental in providing support in local communities and schools. This is reflected in Uganda and Swaziland with the 'Girls Education Challenge' project, 'supporting slum and homeless street girls with disabilities' project, SNE/EARS programme and the 'Inqaba' (Schools as centres of care and support) project respectively. The support of local communities in owning and managing non-formal education centres, which fall outside the mainstream education provision and are not government owned, are also noted.

Some of the achievements across countries, apart from the policies, are far ranging. These include the positive outcomes of intervention through projects in the cities; projects such as 'The Girl with Disability Challenge' project and a UKAID Project, 'The Girls' Education Challenge (GEC)' in Uganda, which have resulted in greater access and support for girls with disabilities. The project in Swaziland called Schools as Centers of Care and Support (SCCS) with seven pillars, encourages active and meaningful involvement of teachers, school committees, parents and learners. Education programmes and structures have also been set up in Uganda to support children with disabilities, namely Special Needs Education/Education Assessment and Resource Services (SNE/EARS). Support personnel i.e. Special Needs Education Coordinators (SNECOs) are also appointed in some schools in the city. Teacher training is also a growing priority with local universities and colleges offering special educational needs and inclusive education courses. The benefits of non-formal education centres in urban and peri-urban areas in Kenya are also far-reaching and most importantly support the learning of children who would have otherwise been excluded from formal education.

1.3 Conclusion

In answer to the questions, which I've framed for the analysis, it is clear that models from the North are being applied in these countries, drawing from international frameworks such as EFA, Salamanca and Dakar. With support from external consultants, concepts of inclusion and inclusive education have been drawn from the North. What is clear is a strong commitment to the ideology of inclusion as that which recognises the need to remove barriers within the system. It moves away from the historical medical emphasis in the special needs paradigm, relating to deficits of disability and special educational needs, which is a reassuring development. This ideology of inclusion has driven local policy and strategies to support the inclusion of learners experiencing barriers to learning. Models of practice, underpinned by these notions, appear to have been adapted in line with local needs and challenges and in all cases, greatly benefitting local communities. However, it is clear from the emphasis in each chapter, that the focus in terms of inclusive education remains very much on disability and special needs. The general lack of knowledge and capacity and lack of funding across countries also continues to challenge implementation of these policies, with a reliance on the continuing support from NGOs and external agencies to fill the gaps. The commitment of government, particularly in Swaziland to address these issues, is noted. There is an endless list of ongoing challenges expressed by all scholars in this series, particularly relating to children with disabilities in urban areas, which are constantly the focus of intervention.

It is clear from the five chapters presented that the urban phenomenon across cities in Africa are quite different. The particular socio-political histories of each dictate how education unfolds in each and how these in turn affect populations living inside and outside these domains. Urbanisation is attractive for those in rural areas who have no access to adequate and appropriate education facilities, which forces many to leave their homes and settle in the big cities. This was clear from the analysis of the situation in Ethiopia and Kenya. What is also clear, is the relatively better services and appropriate support in the cities than in rural areas, a phenomenon being addressed through the informal education programmes like those in Kenya.

Overall, the series provides evidence that attempts are being made in the corners of Africa represented, to break free from the rift described by Perry (2015). It is hoped that the local narratives will force us to rethink the notion of inclusion in Africa and how this is being conceptualised and operationalized locally, and the realities in each of the showcased countries.

Chapter 2

The Possibilities Offered by Inclusive Education in Addressing the Challenges of Urban Education

Sigamoney Naicker

2.1 Introduction

Researchers and policymakers involved in the field hold divergent views on what urban education means (Goodwin 2002). What is quite clear is that Urban education is closely associated with education in cities and suffers from many problems, but worst among them is the spread of dense areas of poverty, where multiple social ills converge. The correlates of poverty—poor health, inadequate housing, high crime rates, single-parent families, substance abuse—create an environment in which extra-ordinary efforts are necessary in order to sustain aspirations for the future and a willingness to work hard for delayed benefits.

The key issue is that schools have a choice, either to reproduce the status quo or develop support to assist children by changing how they respond to challenges in learning. From the days of mass education not much has been done to radically alter pedagogy and pedagogical responses whilst there has been radical revolutions economically and socially. In this chapter an attempt is made to provide a framework of thinking that is associated with inclusive education as a response to the challenges of urban education. Whilst this chapter offers some theoretical tools, it is important that there are far reaching changes to educational discourse and practice given the large numbers of children that leave the schooling system or do not succeed in it. What is the point of developing education systems that are really not very beneficial to the lives of so many poor children (Bird 2007).

An Inclusive Education theoretical framework does not necessarily apply to disability but as a much broader foci. This broader emphasis is absolutely essential within the complexities posed by twenty-first century education. According to the Weekly Mail and Guardian in South Africa (2012), results from two international

e-mail: smnaicker9@gmail.com

assessments, Progress in International Reading Literacy Study (PIRLS) and Trends in International Mathematics and Science Study (TIMSS), released in 2012, show pupils in rural public schools performed worse than their urban counterparts in languages, mathematics and science. But, overall, the performance of South African pupils in these international benchmarking assessments remain at rock bottom of the study rankings. The challenge in South Africa is both rural and urban.

The correlates of poverty—poor health, inadequate housing, high crime rates, single-parent families, substance abuse have particular implications for learning and teaching. South African education authorities like their counterparts in other parts of the world have struggled with producing good results amidst the challenges outlined above. With globalisation there has been several gains but also challenges particularly relating to education performance since the correlates of poverty has worsened since 2008. It seems like sovereign states have less influence and its policies become quite difficult to implement in this socio-economic malaise. Most people who are held accountable for results become pawns in a global economy that have little respect for people who are poor. Within the South African context more than a million jobs were lost since 2008. This has serious implications for teaching and learning. Teachers will require new theoretical tools to deal with these complexities of the twenty-first century (Shepherd 2008).

Inclusive Education provides a useful framework for dealing with these challenges which is located with the notion of barriers to learning. There are two important issues here. Firstly, we cannot view the child as a problem. Secondly, we need to see the child as part of a system which has to be changed so we can embrace all learners. Social and other pressures create the conditions for poor literacy and numeracy results. Children in many urban contexts tend to have too much of pressure on their minds and emotions thus they are unable to focus. This paper will attempt to provide that framework that addresses the correlates of poverty by drawing on intellectual tools from inclusive education.

2.2 Urban Education and Inclusive Education

For children in poverty, effective schools are crucial; schools often are their last and best hope for a better life (Fleisch 2008). Children should be able to learn but often this is not possible because of poverty. There is too much pressure on their cognitive and emotional well-being. There is not enough mental space to absorb and acquire new information in the minds of children given the trauma and challenges around them. When they advance into the higher grades this inability to progress begins to reveal itself. Therefore, large numbers of children are unable to read and do mathematical equations in the later grades. These are often the children that drop out of schools. Teachers have to compete with very adverse circumstances. Often teachers in very challenging socio-economic areas argue before reading and writing children need love and care. In many situations children who cannot pay attention to literacy and numeracy lessons are regarded as candidates for special education (Bearne and Marsh 2007). It is very important to train teachers but also reframe how people think

about education to support and assist these children. They should remain in the mainstream of education with support.

There are tremendous benefits to using the ideology of Inclusive Education in most classrooms that under immense pressure as a result of poverty. Like many other countries, special education ideology has been a dominant thought and of course a popular practical intervention in South Africa. Whilst the South African government has made a major intervention in terms of funding as well as on the policy front, challenges continue to plague the education system.

Global economic trends and patterns since the 2008 recession has impacted on the educational terrain in very significant ways. Education in the classroom and the social fabric of society have been impacted on by a number of broader changes that on the surface appear to have very little impact on the classroom. The urban education terrain has undergone major changes. The central position of this paper is that Inclusive Education provides an useful framework for teaching and learning to be successful.

2.3 The Ideology of Inclusive Education: Barriers to Learning

Attitude and practices in the classroom can be traced to educational theory and frameworks. Attitudes and practices are never neutral. To place a child outside the mainstream class and identify the child as a problem is a practice of special education. It is a choice the system makes about children who cannot adapt to the demands of the middle class curriculum. In most cases being taken out of the mainstream of education is most devastating for learners and parents. This was a common practice in South Africa and many other countries. With the advent of inclusive education, different theories, assumptions, practices and tools emerged. In the social sciences the shift from special education to inclusive education constitutes a paradigm shift since we move from one set of theories, assumptions, models, practices and tools to another completely different set of thinking and practices.

Repositioning this system will require fundamental changes to structures and thinking. The structural changes relate to how government departments collaborate and change and this may not be very relevant to this paper. In this paper the central focus is on how the challenges could be ameliorated by using a framework of thinking that underpins Inclusive Education called barriers to learning.

2.4 The Challenge

Every human being according to Maslow's hierarchy of needs (McLeod 2014) requires certain fundamentals in order to progress to the next stage of development. For example, children need proper maintenance of the human body which is

Table 2.1 Maslow's hierarchy of needs (McLeod 2014)

Physiological needs are to do with the maintenance of the human body. If we are unwell, then little else matters until we recover
Safety needs are about putting a roof over our heads and keeping us from harm. If we are rich, strong and powerful, or have good friends, we can make ourselves safe
Belonging needs introduce our tribal nature. If we are helpful and kind to others they will want us as friends
Esteem needs are for a higher position within a group. If people respect us, we have greater power
Self-actualization needs are to 'become what we are capable of becoming', which would our greatest achievement

physiological needs. The next step on the hierarchy relates to safety needs which involve a roof over the heads of children. This is following by needs of belonging which involves a warm and friendly environment. Esteem needs are next which means that people feel good about themselves and finally the person self-actualizes which is the greatest achievement. The correlates of poverty in urban areas which include single mothers, poor nutrition, violence and fear are not conducive to developing within the trajectory of this hierarchy. This implies that they do not receive the necessary platform for the learning and teaching process. It is important for the teachers to be aware of this and prepare the classroom for children to learn against the background of these challenges. The pedagogy of teaching must be influenced by and reshaped by a consideration of social matters and psychological dimensions. Table 2.1 above provides a useful explanation of Maslow's hierarchy of needs.

2.4.1 *The Five Needs*

Based on Maslow's hierarchy in the table above, it follows that children will not learn literacy and numeracy if certain basic needs are not met. Children should be in a secure environment and feel safe emotionally as a point of departure. It is important therefore that teachers are trained within a pedagogy that takes into consideration broader social issues. A societal theory of inclusion should underpin any pedagogical training. That societal theory must seek to understand the learner within the system that learner is functioning in. Consequently if there is learning breakdown, then that breakdown should be understood within the system and to a limited extent the learner since we are talking about large numbers of learners who are all victims of the correlates of poverty.

2.5 Urban Education and Inclusive Education

Urban education systems in many parts of world experience limit the possibilities of children self-actualizing within the framework of Maslow. It follows that many of these children will not learn to read and write in view of societal factors that seem

to characterise most urban education centres which South African cities are also familiar with. It is important for education departments to reposition themselves to deal with societal challenges since they pose a serious threat to the success of the education department and the society. Different support packages should be developed based on the challenge or challenges of the learner. Twenty-first century education is faced with challenges that relate to a number of barriers and teachers should be trained accordingly. Schools in urban centres are faced with a myriad of challenges and theoretical tools should be provided to teachers to meet these challenges.

To improve the performance of poor learners, it is important to locate those learners within a system and attempt to establish how the system could be changed to support the learners. Education White Paper 6 on Special Needs Education: Building an Inclusive Education and Training System (DBE 2001) emphasized a major shift at a theoretical level when it introduced barriers to learning as a body of knowledge in our attempts to understand poor performance. White Paper 6 asserts that barriers can be located within the learner, within the centre of learning, within the education system and within the broader social, economic and political context.

These barriers manifest themselves in different ways and only become obvious when learning breakdown occurs, when learners 'drop out' of the system or when the excluded become visible. Sometimes it is possible to identify permanent barriers in the learner or the system which can be addressed through enabling mechanisms and processes. However, barriers may also arise during the learning process and are seen as transitory in nature. These may require different interventions or strategies to prevent them from causing learning breakdown or excluding learners from the system. The key to preventing barriers from occurring is the effective monitoring and meeting of the different needs among the learner population and within the system as a whole.

2.6 A New Framework for Teaching and Learning

It is very important for teachers and the schooling system to establish what forms of support is required by a learner if the learner is not making progress in school. Packages of support and adapting the system to children's need is also important for the education system to be relevant and useful to children. As Bowles and Gintis points out schools tend to reproduce the status quo. For schools to make a meaningful contribution to the lives of children it has to rupture the status quo. For schools to do that it must be flexible and accommodating of the diversity of the learner population. This is not a welfarist approach to poverty but rather a serious concern about the pedagogical implications of poverty. Teachers need to be sympathetic towards learners by creating a welcoming and supporting environment. Experiences that involve stimulation, enrichment and play must be created to compensate for the previous deprivation regarding reading, mathematics, spatial development and sensory experiences. These could often be enrichment programmes that involve first

hand experiences (actual experience), play with concrete objects and reading to learners so they understand that print is meaningful.

At social level, an environment should be created that is comforting, that listens to the voice of learners, that is able to detect distress and depression. Appropriate referral to professionals should be made for formal assessment of depression.

The school needs to reach out to poor communities, and should be a secure haven for learners. School nutrition programmes should act as incentives for poor and hungry learners to attend school. Schools should establish meaningful relationships with the courts, police, relevant NGO's [e.g. child welfare and Department of Social Services]. Joint procedures to discourage any form of abuse should be developed. When learners become the perpetrators of abuse and crime the above contacts are essential. Where district based support teams have been established they should be called upon to assist in matters of abuse and other learner related issues. Where such support teams do not exist, institution level support teams must be established. Use of accelerated academic bridging programmes and programmes-to-work linkages are vital for learners who enter the system late or who have experienced severe interruption in their schooling as a result of socio-economic factors. Baseline assessment should be used to establish current academic level and facilitate placement in the appropriate grade and/or set of learning programmes. Fast tracking to acquire basic literacy, numeracy and life skills through accelerated programs with a view to assisting the learner to catch up with his/her age cohort.

One way to achieve this level of success is to draw from the notion of barriers to learners as it evolved within the South African context as part of the work of the National Commission for Education Support Services.

2.7 Socio-economic Barriers

Socio-economic barriers should be disaggregated in order to attempt to understand the kind of impact it has on learning and teaching. This type of barrier could result in diverse forms of support (DBE 2001). For example, there are certain characteristics of working class children that had a direct impact on performance in the classroom. In many homes the use of oral language is limited since there is fewer conversations in working class homes. In this case the lexicon of the middle class schools differs from what working class children are exposed to in their homes. This impact on the oral language ability of learners when they arrive at school since they possess a less developed vocabulary than their middle class peers. There are several implications for learning for these children since they do not possess the vocabulary that is required in ordinary classrooms. This implies that they are unable to participate fully in conversations in classrooms and consequently they struggle to read books since they have not been exposed to a print culture. Further, they do not have the vocabulary to interact with books in the early years of schooling.

On the issue of reading, we know that very few working class children are read to at an early age (Schiefelbein 2008). Of course one of the reasons is that there is a limited culture of print in the homes of these children. How does a teacher respond

to both the limited vocabulary and the challenges of reading? It is critical that the teacher reads to the child and makes books available so children get sufficient exposure to books. Reading of stories and the discussion of stories in the classroom is a very important part of the process of learning to read. It is difficult to teach someone to read but it is easier to create the conditions for reading by reading to children and creating a print rich schooling environment.

The above discussion reflects on an aspect of the impact of socio-economic barriers. There are several others and it may be necessary for teachers to be training in understanding various support needs and provide those or learning may not take place. What we need to note here which is crucial in the life of any child is that they are not put on a special education programme or excluded from the mainstream because they do not have the vocabulary and the necessary exposure to print as their middle class peers do.

2.8 Disability as a Barrier

Most understandings of disability relate to individual deficit. Therefore, disability has always been regarded as a barrier to learning. These barriers include:

- Visual barriers
- Auditory barriers
- Oral barriers
- Cognitive barriers
- Physical barriers
- Medical barriers
- Psychological barriers

Learners who experience barriers to learning as a result of disability should be welcomed in ordinary school environments provided that the necessary support is in place for learners to achieve their full potential. Teams that include parents, teachers and other relevant professionals should establish the nature and extent of support needed by the learner. Below are a few examples of how the system could be modified or changed to meet different kinds of support that individual learners may require:

- Modified access to buildings e.g. ramps, adapted toilets and speaker systems in where applicable.
- Brailed signage on doorframes, passages and outbuildings.
- Enlarged print.
- Appropriate assistive devices e.g. Braille, hearing aids, tape recorders, splints, adapted computers, wheelchairs, walkers, modified tricycles and standing frames.
- Therapeutic intervention.
- Learner based and learner paced teaching.

2.9 Language and Communication

There are normally three main barriers related to language. Firstly, learners are often forced to communicate and learn in a language which they do not usually use at home and are not competent to learn effectively. Secondly, learners who use South African Sign Language as a language for teaching and learning and as a (language) subject did not have access to the language. Thirdly, learners experience difficulties with communication. Learners who are non-speaking due to the severity of their disability experience enormous barriers to learning and development. These barriers arise from the general unavailability of augmentative and alternative communication (AAC) strategies to enable them to engage in the learning process, and more often than not find themselves totally excluded from learning and development experiences. AAC systems could consist of alternative communications systems, supplements to vocal communication and communication through facilitators.

Therefore it is important that:

All learners are to learn their home language and at least one additional official language which include South African Sign Language. Braille as a code can be used as a medium of teaching and learning.

When learners enter a school where the language of learning and teaching is not their home language, the teachers of all the learning areas/programmes and the school should provide support and supplementary learning in the language of learning and teaching until such time that learners are able to learn effectively through the medium of that particular language. It is the responsibility of each individual teacher to ensure that the language of learning and teaching does not become a barrier to learning in such instances. Ideally, parents should be encouraged to participate in interventions regarding language. Learners should receive extra support in the language (“subject”) which is also the language of learning and teaching. The learner should work towards and be assessed against the assessment standards of the appropriate language level (Home Language, First Additional Language or Second Additional Language).

2.10 Lack of Parental Recognition and Involvement

Parents whose children do not utilise oral communication experience communication barriers with their children. Difficulties around parental support of learners may arise due to a range of situations e.g. a parent who cannot read Braille would not be able to support a grade 1 learner with his or her Braille homework. Parents are not always adequately informed of their children’s problems or progress, and therefore are often deprived of the opportunity to participate in their children’s development. Parents who are unable to understand the emotional and/or behavioural problems of their children may aggravate their barriers.

Non-involvement and non-recognition of parents by the system creates a lack of respect for parents as, informed role players in the assessment and future development of their children. A lack of communication and support around HIV/Aids infected or affected families creates barriers for learners from such families.

At school level, partnerships should be established with parents in order to equip them with skills and knowledge to participate effectively in their children's learning and school life. Parents should also be fully involved and informed regarding the identification, screening and assessment and placement of their children. Parents should be encouraged to take an active interest in the teaching, learning and assessment of their children. In order to facilitate early intervention for children with disabilities parents may consult community based clinics and/or other professional practitioners including teachers to conduct an initial assessment and to plan a suitable course of action for the learner. Schools which use South African Sign Language are encouraged to run accredited SA Sign Language courses for parents and teachers.

Braille courses should be run to enable parents to communicate with their children and assist them with homework, reading and writing in Braille. General newsletters can assist in keeping parents informed of developments and programmes at the school. This is particularly important for boarding schools where distance separates parents from the school. Schools can run information sessions and workshops to enable parents to better understand their children and their emotional and behavioural problems. Staff from district based support teams, including psychologists and social workers, could assist at such workshops.

Where appropriate, school-based support teams should be strengthened with expertise from the local community, district-support teams and higher education.

It is essential that schools maintain open channels of communication with families infected and/or affected by HIV/Aids, and render support to parents and learners wherever possible. This could be facilitated by openly displaying a clear HIV/Aids policy for the school. Shared HIV and Aids status could also help destigmatise the disease.

2.11 Negative Attitudes

Negative and harmful attitudes towards *difference* in our society remain critical barriers to learning and development. Discriminatory attitudes resulting from prejudice against people on the basis of race, class, gender, culture, disability, religion, ability, sexual preference and other characteristics manifest themselves as barriers to learning when such attitudes are directed towards learners in the education system.

Labelling of learners should be discouraged since it makes it difficult for learners to grow beyond the limitations of the label. It is important for teachers, parents and peer groups to adopt positive attitudes towards learners who experience barriers. Even learners who were once regarded as ineducable benefit from appropriate intervention. Learners should not be categorized since they often are placed in a particu-

lar learning environment merely because of the category and not because of the particular learning needs of the individual learner. In many cases, the categorisation was convenient for the system and not in the best interests of the learner. Do not discriminate against learners who are HIV positive or who have AIDS since a lack of knowledge about this issue has led to negative assumptions associated with the disease. All learners and staff should be treated equally. When it comes to blood all cases are treated as universally HIV positive.

All learners should be viewed in a positive light and there should be a determined effort to establish what their real strengths are for the purpose of further development. Do not create conditions for fear of learners with disabilities to develop, since negative attitudes often result from beliefs that are illogical and encourage discrimination. Schools must be welcoming environments for all learners, since any negative attitude by adults in a school environment influences learners. Schools should embark on positive awareness campaigns about difference and the value of celebrating diversity based on new South African policy and principles. Acknowledge and respect differences in learners, whether due to age, gender, ethnicity, language, class, disability or HIV status, sexual preference, etc.

2.12 Inadequate Programme-to-Work Linkages

Many children drop out of school in urban areas because they do not learn to read in the early years for reasons mentioned above. It is important that opportunities are created for these learners. Learners who experience cognitive barriers who are unlikely to achieve a full certificate as well as learners who, due to age constraints and social barriers, need specific programme-to-work linkages. Appropriate accreditation and certification for the level of skills achieved need recognition to facilitate life-long learning. A lack of partnerships between education and industry which would facilitate job accessibility could be a stumbling block to learners (DBE 2001).

Weighting of learning areas and time allocation can be adjusted to allow for chosen learning areas or learning programmes to become the major tool or vehicle for learning, thus fulfilling the vision of Education White Paper 6 of providing more options for learners as ways to learn and to provide programme-to-work linkages.

Linkages across learning areas will allow for assessment standards from various learning areas and from different grades to be achieved within the skills learning programmes allowing for work related linkages.

Collaboration between teachers within and across a phase or grade would be essential in the planning of learning programmes for specific learners or groups of learners to ensure effective programme-to-work linkages.

At local school level partnerships with industry should be established to assess the educational requirements of future employers and to facilitate hands-on work experience for learners.

Schools may issue a certificate of competency that includes specific reference to Learning Programmes that reflect programme-to-work linkages to learners who do not achieve a GETC.

2.13 Conclusion

Urban schools have changed radically over the last decade and the education landscape has shifted to one that requires a different pedagogical support package that embraces societal considerations. Any education system that is unable to deal with the social ills will not succeed in terms of ensuring children complete their schooling. There are too many reasons why children drop out of school but there is an abundance of research that points to poor reading and attrition. Every attempt must be made to develop packages of intervention that is suited to children in different geographical and economic areas. The youth in more affluent areas are not untouched by the challenges of urban education. Many of their challenges are central to alienation and complacency which often arises out of affluence and privilege. What this paper is calling for is a dynamic response to the challenges of urban education. Given the radical changes in social and economic terrain, how has education responded? How relevant is the pedagogic response in this dynamic rapidly changing world?

Chapter 3

Financing of Inclusive Education in Urban Settings of Swaziland

Cebsile P. Nxumalo

3.1 Introduction

Swaziland is a landlocked country in Southern Africa. It shares borders with Mozambique and South Africa. The country measures approximately 17,000 km², with a population of approximately 1.2 million, of whom 75% resides in rural areas. Out of the total population, about 17% are persons with disabilities (Central Statistical Office 2007). Over half of Swaziland's population is below 20 years old and there are estimated to be up to 144,000 orphans and vulnerable children (OVCs). Swaziland is classified as a lower-middle income country with a high per capita income of \$3248 (IMF Estimate 2015). However, with a very unequal income distribution, 63% of the population estimated to be living below the poverty line (less than 1\$ per day) and 30% are ultra-poor. Swaziland's UN Human Development Index (HDI) ranking has fallen from 103rd in 1990 to 148 in 2014.

The country was a British colony and in September 6th, 1968 Swaziland attained independence from the British. In its 1968 Independence Manifesto the newly independent Monarchy of Swaziland prioritized education. As early as 1968 the aspirations of the Swazi Government were that "all Swazi citizens should be educated". The Philosophy, Policies and Objectives of the Imbokodvo National Movement known as the 'Imbokodvo Manifesto' of 1968 called for the right to education for all Swazi citizens way before the EFA, Jomtien Conference of 1990. The manifesto had spelt out that one of its educational policies was that education is an inalienable right of every child and every citizen to receive to the limit of his/her capabilities.

The World Conference on Education for All (EFA) that took place in Jomtien in 1990 was a landmark event in that basic education was put on the international development agenda for the very first time. It gave new life and impetus to the idea

C.P. Nxumalo (✉)

Special Needs Education Unit, Ministry of Education and Training, Mbabane, Swaziland
e-mail: cebsilensexumalo@gmail.com

that education is a right for all children, young people, men as well as women (Herfkens 2002). This was followed, 10 years later, by the World Forum on Education for All where 164 Governments committed themselves to expand educational opportunities to achieve UPE by 2015. As indicated above, in Swaziland, this was not new as the Imbokodvo Manifesto prioritized education for every Swazi citizen.

3.2 Education Systems and Policy in Swaziland

Swaziland adopted a 10-year basic education programme as part of the Southern African Development Community (SADC) Protocol on Education. Primary education is 7 years starting with Grade 1 and culminating in an end-of primary school examination in Grade 7. Basic education up to the seventh grade is compulsory and financed by government. Secondary education is a 5-year programme divided into 3 years of junior secondary (part of basic education) and 2 years of senior secondary schooling. The whole of secondary education is financed by parents. A grant is provided by government for students who are orphaned and vulnerable. Tertiary education is offered by colleges and universities which awards certificates, diplomas, degrees and post graduate degrees for varying completion years. Pre-school covers the first 6 years of life and is provided in ECCD centres, day-care centres, community centres and neighborhood care points. ECCD is mainly funded by parents.

3.3 Inclusive Education in the Swaziland Context

The inclusive education movement has become the cornerstone of education reform in many countries (Armstrong et al. 2010; Holt 2003). Inclusive education is included in the education policies of many governments around the world and today there is a worldwide consensus about inclusive education as a desirable goal (Malinen 2013). The basic principle of inclusive education is a commitment to belonging, nurturing and educating all students regardless of their difference in ability, culture, gender, language, class and ethnicity (Kozelski et al. 2009).

The call for an inclusive education system was stated in the 1999 National Policy Statement on Education and supported by a 2006 strategy initially targeting nine primary schools with a rural and urban focus in each of the four regions in Swaziland, for designation as models of inclusion. In each of the schools four teachers were trained and designated as resource teachers for inclusive education issues. Since 2006 to date more all primary and secondary schools are participating in this programme which aims to empower mainstream schools to be able to support every learner.

In Swaziland, inclusive education has been framed within the human rights discourse as evident in the 2011 Education and Training Sector policy. Swaziland views the education of its citizens and access to basic education as a human right and inclusive education is perceived to be the most effective approach in reaching this goal. The key premise in the Education and Training Sector Policy is that schools are about providing quality education and meeting the needs of all children and youth regardless of differences, gender, life circumstance, state of health, ability/disability, stage of development, capacity to learn, level of achievement, financial or any other circumstance.

The move towards support for children and youth with special needs was largely influenced by international declarations and agreements such as the United Nations Human Rights Convention of 1949, the United Nations Convention on the Rights of the Child and then the right to Education for All (EFA) of 1990 and the 2006 United Nations Convention on the Rights of Persons with disabilities of which Swaziland is a signatory. The 2011 Education and Training Sector Policy mainstreamed inclusive education as an overarching goal for whole system change from pre-school to tertiary education in both formal and non-formal education. A rigorous restructuring of the system was formalized in the Education and Training Sector Policy of April 2011 which attempts to build an inclusive education and training system where no child is excluded from education. This policy calls for learners to be admitted and educated in schools in their neighborhoods. Furthermore, it recognizes that lack of access, meaningful participation and achievement arises from a range of artificial barriers within the education system. Resources are therefore geared towards increasing physical access, meaningful participation in learning and achievement to the learners' maximum potential.

3.4 Funding Mechanisms

The government of Swaziland has over the years made huge investments in education. On average, about 6% of Swaziland's Gross Domestic Product (GDP) goes toward education. The proportion of the annual budget devoted to education has been about 17% on average (MoET 2014). This proportion is slightly higher than that set by UNESCO for developing countries like Swaziland. Public expenditure on education has been fluctuating over the years. It reached its highest in 2005 (21.3%) and the lowest in 2009 (13.7%). The fluctuations were due to the unstable fiscas (MoET 2014).

The Ministry of Education and Training (MoET) has been receiving the largest portion of the national budget since 2000 as part of government's effort to respond to access, equity and quality in education while promoting Education for All goals and the Millennium Development Goals (Khumalo 2013). Furthermore, there is support towards education from the donor community. This share on education indicates government commitment towards funding and supporting education initiatives. Categories that make up priority include state-funded free primary education

and tertiary education scholarship funding. The government has managed to retain this share above 17% of the national budget, yet it is still not adequate to meet all educational needs including the total cost of free primary education per learner. Cost efficient ways to provide resources to support inclusive education have been adopted drawing from a broad range of resources (United Nations 2014).

In order to realize the goals of inclusive education for all, there is need for financing and support of education services for learners with special education needs through ensuring that system-wide investment is genuinely used to bring about improved diversity and reduced discrimination rather than just providing time-limited funding to isolated inclusive education projects (Lewis 2007). Financing is regarded as one of the most important factors that contribute to further development of inclusive practices. Unclear financing mechanisms for inclusive education have been identified in a number of countries – no doubt stemming from confusion over how to define it and therefore which funding ‘pot’ it fits into (Lewis 2007). Funding for inclusive education in Swaziland has been mainstreamed in the existing funding mechanisms for the different levels in the education system. Implementing inclusive education requires looking at the context and making use of available resources within the country (Pather and Nxumalo 2012). Mainstreaming funding for inclusive education in Ministry of Education and Training is transforming the education system such that it responds to the diversity of learners.

3.4.1 Free Primary Education

The Swaziland government has been subsidizing primary education since 2002 through textbooks for all subjects, stationery, grants for orphans and vulnerable children. In 2005, Swaziland adopted a national Constitution that committed government to providing free primary education (FPE) 3 years after 2006. The introduction of FPE started in 2010 in a phased form with a sizeable number of school going age children enrolling in the first and second grades of primary schooling. This programme reached Grade 7 (the last level of primary education) in 2015. Since the launch of FPE, children who may have been previously excluded from education have been able to enroll and attend school in urban and rural settings. FPE provided a renewed opportunity for children with special education needs to access education in mainstream schools.

To ensure that the FPE programme is implemented within a clearly articulated legislative framework, government developed the necessary legislations which include the Free Primary Education Regulations and the Free Primary Education Act, 2010. All these legal frameworks have made sufficient provision for the inclusion of all children with no regard to their social and economic status. However, a 2013 Swaziland Network Campaign for Education for All (SWANCEFA) report on budget tracking for children with special education needs within the free primary education in Swaziland revealed that children with disabilities were not fully provided for in the FPE planning, budgeting and implementation.

Though at its design there was no clear provision in the FPE Act the funding mechanism is undergoing development. Budgetary support and implementation commitments have been made by the Swaziland government to inclusive education through different funding mechanisms. The government of Swaziland is playing a significant role in providing financial support to implement programmes that further inclusive education unlike in other countries where non-governmental organizations and development partners play a significant role (UNICEF 2014). Remarkable change in the FPE budgeting and implementation has recently been implemented to support inclusive education in urban primary schools. Funding through recurrent budgets, capital projects and Free Primary Education programme is spent each year on educational matters such as capacity building for teachers, provision of specialized teaching and learning material and equipment, modification of infrastructure in schools, construction of appropriate structures and provision of transport in selected urban schools, institutions of higher learning. Resources have been provided to ensure easy access, meaningful participation and achievement for every learner.

Each year the Ministry of Education and Training supplies all primary schools with books and stationary. Grades 1–6 going up to grade 7 are funded as follows per student per year: Grade 1–2 = E560.00 (US\$80); Grade 3–4 = E580.00; Grade 5 = E640.00 and Grade 7 = E1010.00 (includes exam fee). Over above this fee, each learner gets free stationary and textbooks (MoET 2010). Beginning 2014, the Ministry has used some of the budget allocated to FPE to procure special stationary (e.g. different sizes of braille paper, stylus, frames, and exercise books with bold lines including material for binding braille books) for learners with special needs in both special and mainstream primary schools. The Special Needs Unit works closely with the FPE officers in identifying schools that have learners who need special stationery. The supply takes into consideration the number of learners and the stock required to cover the whole year. This development has contributed immensely to the improved implementation of inclusive education at primary school level.

Despite the considerable developments, the budget is still not able to meet all education needs including the total cost of FPE per learner (Khumalo 2013). The introduction of FPE raised expectations from parents who were expecting financial relief. However, the reality has been one of increasing education costs owing to the top-up fees that are requested by schools that are struggling to run on the inadequate budget provided for FPE. A study by the United Nations Children's Fund in 2012 (Khumalo 2013) found that the average FPE allocation had a major impact on schools income and expenditure per learner and on enrolment. Schools with more learners benefited more than schools with fewer learners owing to economies of scale. Yet, still the allocation per learner is not enough to cater for personal needs such as proper school uniform, which is a requirement in many schools. Furthermore, the funding cannot meet special needs of all learners such as transport costs to and from school and special teaching and learning material and equipment to name a few. Additional human resource that may be required by schools to cater for learners with special needs is not easily accessed by schools because the FPE schedule of fees does not have clear provision for special needs. One primary school (a model of inclusive education) that incorporated these needs in its development plan in

2014 and allocated funds for engaging two teacher assistants to support the school in teaching Braille, Orientation and Mobility to learners with visual impairment received audit queries from auditors for spending public funds on items that are not listed in the schedule of fees. On another note, the difficulty of collecting reliable statistical information on learners who are facing exclusion makes it difficult to have a clear picture of whether there is actual change (Armstrong et al. 2010).

3.5 School Development Plan

The School development plan is an initiative by the Ministry of Education and training for all public primary schools to prepare yearly business plans comprising the vision, mission statement, aims and objectives for each year and a detailed action plan and budget which is informed by seven pillars. The seven pillars are part of a programme called Schools as Centers of Care and Support (SCCS) locally known as 'Inqaba' which means a fortress. Schools are at the heart of Schools as Centres of Care and Support (SCSS) initiative. The SCCS is a child rights based and child friendly concept which has been mainstreamed into the Swaziland MoET sector policy. The concept puts emphasis on protection, safety and psycho-social support to all children, particularly the most vulnerable (UNICEF 2011) through the seven (7) pillars. It encourages active and meaningful involvement of teachers, school committees, parents and learners in all aspects of school development and management. The Inqaba has made a difference in terms of access and quality to education that can be measured (MoET 2014).

The Inqaba programme has been identified by the Swaziland Special Education Needs as a comprehensive care and support intervention that can be used to efficiently promote inclusive quality teaching and learning through implementing the seven pillars. It is one of the mechanisms to ensure presence, participation and achievement of all learners in education (Lewis 2007). Inqaba schools are rights-based and inclusive in their approaches. Each of the seven (7) pillars can be used to address barriers to learning and promote inclusive education. The Inqaba has seven pillars as follows:

1. *Safety and Protection*: this pillar focuses on raising awareness of in and out of school children, teachers, parents and guardians and the community at large about the need for a safe and protective environment. This pillar is therefore relevant to promote an inclusive culture and ethos in the school to ensure safety and protection of every learner in the school. This pillar also supports improvements to inclusion issues such as improvements in school infrastructure, learners safety and privacy
2. *Psychosocial support*: the pillar is about identifying children whose health and well-being is at risk and ensures that they get care and medical attention. It aims at helping children who are experiencing challenges to develop resilience. It is used to identify and address barriers psychosocial

3. *Food Security*: ensuring children have enough to eat through introduction and or expansion of school feeding programmes especially in food in-secure areas. Poverty has been identified as one of the barriers to quality teaching and learning and achievement for learners hence this pillar is relevant to promote inclusion of learners from poverty stricken families.
4. *Health and sanitation*: Develops values and health habits of children in school, within the family and in the community for health living. It ensures that children get basic medical attention. This pillar has been supported by the Ministry of Health through provision of school health nurses to do screening, assessments and support learners with special needs in school.
5. *Water, Sanitation and Hygiene*: This pillar is used to budget for modification or construction of accessible toilets for learners and teachers with disabilities; promote cleanliness in the school or classroom and provision of water and proper sanitation. It also looks at providing separate, clean and adequate sanitation facilities for both boys and girls with easy access for those using wheelchairs.
6. *HIV/AIDS Life-skills*: sensitize learners on HIV/AIDS and empower them with life-skills; address issues of resilience, set up clubs to address HIV/AIDS, disability issues.
7. *Quality Teaching and Learning*: Schools use this pillar to budget for procurement of special teaching and learning material; conduct school based workshops on specific special needs and inclusive education areas.

Every school is expected to submit the school development plan in order to benefit from the Free Primary Education programme. This funding approach helps in decentralizing education financing and responsibility on how the funds are distributed and allocated to make schools inclusive.

3.6 Capital Projects

The government of Swaziland has over the years made huge investments for infrastructure modification in schools. Since 2010/2011 to date the government allocates E3 million for the construction of ramps and pathways and to modify toilets and classrooms (MOET 2011, 2012, 2013). Schools that have benefited are those that have learners with special needs and have very uneven terrain which affects learners' mobility. In line with the Education and Training Sector Policy of 2011, the government has budgeted E2 million since 2012/2013 to date for the procurement of specialized teaching and learning material for learners with special needs in urban and rural primary and high schools, students in tertiary institutions and most recently the National Curriculum Centre.

The government's commitment to inclusive education has been reflected in significant increases in the budgets for supporting education for learners with special needs in recent years. The 2015/2016 budget indicated an increase of about seven million over and above what has been allocated over the past years. The most

important indirect expenses are financing teaching and learning. These expenses are in two forms, that is, regular expenditure and expenses for construction of physical facilities (new construction and repairing, purchasing of equipment, durable goods). The greater portion of this expenditure is from the budget on education allocated by the government of Swaziland.

3.7 Funding for Capacity Building

Underlying the process of inclusion is the assumption that the general classroom teacher plays an important role in the implementation of ‘inclusive pedagogy’ (Makoelle 2014; Harvey 2010). The most critical factor for inclusive education is the teacher and the most important arena is the school, in particular the classroom. The Swaziland Education and Training sector policy of 2011 support training of teachers on special needs and inclusive education (MoET 2011, p. 17). However, presently, there is no budget allocation that is specifically meant for training for teachers to address special education needs and inclusive education. However, such allocations are provided in training budgets within other ministries such as the Ministry of Public Service. Each year the government sponsors a teacher to pursue accredited studies in special needs and inclusive education in neighboring countries such as Uganda, South Africa and most recently Zimbabwe.

In 2015/2016 sponsorship was secured from UNICEF and the Swaziland Revenue Authority to enroll 29 teachers to pursue part-time accredited degrees in special needs and inclusive education in institutions of higher learning in Zimbabwe and Swaziland. Four teachers were drawn from mainstream primary schools known as models of inclusive education.

Funding is also provided by development partners such as UNICEF, Save the Children to run in-service workshops for teachers in both primary and high schools. Training of teachers is key to the success of inclusive education. Pre-service and in-service training has been localized by including special needs and inclusive education curricula in all teachers colleges and university, producing more skilled teachers. Teacher education has been revised in a way that makes learning about special needs and inclusive education the norm for every teacher enrolled in teacher training colleges. Cardona (2009) notes that focus on initial teacher education would provide best means to create a new generation of teachers who will safeguard the successful implementation of inclusive policies and practice.

3.8 Conclusion

Although merits of governments moving towards a per-capita model to support the implementation of inclusive education, the reality in Swaziland is that the most appropriate approach to financing inclusive education in primary schools would

mean increasing the already existing Free Primary Education Programme and strengthening the Inqaba programme. In spite very good initial achievements, budget spending is still inadequate to maintain inclusive education. Furthermore, there is need to review the free primary education Act such that the schedule of fees under section 8 makes explicit provision for children with special needs to access free education. The role of the Education Management Information System in the development of inclusive education cannot be over-emphasized.

Chapter 4

Trends of Inclusive Education and Impediments in Urban Schools of Ethiopia

Yirgashewa Bekele Abdi

4.1 Background

4.1.1 Introduction

Basic education as a human right is a relatively recent phenomenon in the history of globally initiated educational approach. The pivotal purpose of a human right-based approach to education is to secure access to quality education for every child. To achieve this goal, the Education For All (EFA) proclamation became the top agenda and has been receiving international commitments for the past decades with an enthusiasm to provide education for all citizens by 2015. To make EFA a reality, inclusive education is privileged as a strategy in enhancing the implementation capability of the education system (UNESCO 2010). The initiative for inclusive education indicates that special needs education could not move forward in isolation where the demand for education to marginalized group requires inclusive education and related reform on the overall education system and strategy to impact on social and economic policies (UNESCO 2009).

Inclusive education is a process requiring an ongoing improvement in the quality and appropriateness of educational provisions. However, the practical success seems far below from what is anticipated and appears inadequate internationally and not at ease particularly in low socioeconomic countries (UNESCO 2015). Although inclusive education is preferred as a strategy to achieve EFA, its outcome depends on the available resources in given communities and dependent on the commitment of the education leaders. Of course regardless of barriers, there is evidence that unlike the

earlier history of education, increased number of marginalized and minority children get the opportunity to attend schools (UNESCO 2006, 2001b; UNICEF 2007).

In Africa, children with disabilities are the demoted and the underprivileged groups are living in deprived circumstances (ACPF 2011). Researches assert that the majority of children with disabilities don't get the opportunity for education, social service and often neglected by their family, peers and communities at large (ACPF 2011; UNESCO 2010). The education service is less responsive to the learning needs of children with disabilities and schools have been marginalizing these learners and consider them as learners who fail to fit to the norms of ordinary schools. Ethiopia, as one of the countries in Africa shares a similar profile regarding the education and livelihood of people with disabilities. The country started providing education for children with disabilities in 1971 with the establishment of the missionary schools for people with visual impairment. Earlier, the opportunities to access education for children with disabilities were undertaken by the Orthodox Church where children with mobility challenge and people with visual impairment were favoured most. In addition, the country did not have an education policy that addressed the education of people with disability until 2002.

Ethiopia strives to get rid of poverty through multi-dimensional and innovative approaches towards economic development and expansion of education service to the rural and the hinterland locations. The country envisages achieving EFA through provision of inclusive education although, there are number of challenges in its implementation. Efforts have been made both from the government and the non-government organizations to enhance school attendance and to reduce the number of out of school children through initiations towards inclusion. General Education Quality Improvement Program (GEQIP) which aims in improving the quality of general education and gives priority for improved teaching-learning in primary and secondary schools and the School Improvement Program are evidences that Ethiopia is on the move to establish better school environment.

The country faces challenge accompanied with a number of barriers in implementing inclusive education (Wondwosen et al. 2014). Large numbers of children with disabilities are out of school due to lack of school readiness to welcome all children with the necessary accommodations. Poverty is considered as the dominant barrier that restricts the extent of school enrolment of the underprivileged groups since disability and poverty have strong tie. Child migration from rural to urban area becomes quite common due to poverty and lack of opportunities for education (Atnafu et al. 2014; Zemene 2014). There is high frequency of migration from rural to urban, UNICEF (2009) point out that up to 11.4% of Ethiopian rural children age 5–17 tend to independently migrates any time in their life. Children from rural area get less access to schooling and those who get the opportunity faces economic challenges to cover school cost which triggers the desire to migrate to urban area to find means for economic and educational needs (Atnafu et al. 2014). In this regards, the worst might be real for rural children with disabilities. As a result, children with disabilities also tend to move to urban areas by themselves or by the help of others where there are better education and work opportunities (International Organization for Migration 2005; Atnafu et al. 2014). There is discrimination and stigma within

the rural community and particularly, children with noticeable and severe disabilities have negligible opportunities for schooling and are also victims of social exclusion (ACPF 2011). Generally, an endeavor to provide inclusive education in the country seems problematic due to lack of access to schooling and lack of providing appropriate education (UNESCO 2007).

4.1.2 Prevalence of Disabilities

Regarding the prevalence disabilities in Ethiopia, absence of birth registration affects access to accurate number of people with disabilities in general and the accurate percentage of children with disabilities enrolled in schools. The obtained data about people with disabilities is often based on estimation (UNESCO 2010) where the reality on the ground seems quite different (Lewis 2009). The Education Statistics Annual Abstract and the Education Sector Development Program 5 of the country indicates that the accurate numbers of children with special needs are not known and as a result the obtained data are often based on estimate (Minister of Education 2015, 2011). However, World Health Organization (2011) reports that Ethiopia has as high as 17.5% of people with disabilities. Taking this estimate in to account, the school enrolment of children with disabilities seems less than 1%. According to Lewis (2009), even though the statistics are limited, the purpose has loss linked to build the capacity of schools or to ensure the education program improvement. The Ministry of Education (2007) state that 1.5–3 million learner with diverse special needs require attention to access appropriate education in the country. It is obvious that this statistical estimate neglects early childhood education programs which are urban based. This implies that early identification of the educational needs and early intervention are the unrecognized tasks of the education program of the country.

4.2 Policy Issues

4.2.1 Education Policy

The Ethiopian Education Training Policy (ETP 1994) appears committed to changes the education system and among other, promises to address the gender gap, regional disparities, and education access for the marginalized ethnic groups. It emphasizes the education and training of people with disabilities. The education and training policy's objectives underlines cultivating productive citizens through quality education, promoted technology and reducing gender gap and access to education to the disadvantaged. The issue of inclusive education is highlighted in the policy in the article no. 2.2.3 it states: "To enable both the handicapped and the gifted learn in

accordance with their potential and needs”. Although the term “handicapped” seems to have negative implications and is outdated nowadays, the policy was developed 20 years ago and implies the need for revision in terms of promoting a positive outlook for people with disabilities. The article seems to have power to help implementers plan and act considering diversity and responding to different needs, potentials and abilities.

The policy contains article no. 3.2.9 which states; “Special education and training will be provided for people with special needs” (p. 17). Although the purpose and approach in providing special needs education and training is not described in the article, it may help the education leaders to consider special needs education and training as part of the education service of the country. However, the article has no clear indications of whether education and training represents the existing segregated education provision or the assumed inclusive approaches. Consequently, it may lead to subjective decisions on the part of the implementers on how to provide education service for people with disabilities. Further, teacher training in special education is emphasized i.e. “Teacher training for special education will be provided in regular teacher training programmes” (ETP 1994, p. 22). Teachers’ training, its purpose and quality are indisputable to the learning outcome in general and significant for people with disabilities. The education policy gives consideration to teachers’ training for special needs education and more importantly, it is linked the regular teachers’ training program. Such direction at policy level enhances the involvement of the teachers’ training institutions on exercising inclusive education. Generally, the issue of inclusive education is not given attention on the education policy and as a result, the education provision for students with disabilities has both segregation and integration features (UNESCO 2010). Even though there are shortcomings and left out issues in the education policy and there are barriers in implementing educational and training needs of people with disabilities, the policy brought a remarkable change in the Ethiopian educational history and can be regarded as the first in its kind at least in sparking hope and securing the access to education and training for students with disabilities.

4.2.2 The Education Sector Development Program

To address the education policy of the country, the Ministry of Education launched and implemented four Education Sector Development Programs (ESDP 1, 2, 3, and 4) for the past 20 years where each ESDP was planned for 5 years in order to recognize the government’s desire to improve the quality of education. The ESDP 5 is the current plan which will be implemented in the years between 2015/2016 and 2019/2020. ESDP I and II were successful in their efforts to substantially increase the levels of primary enrolment (grade 1–8) and in improving access to education for girls and by reducing the levels of school dropout and repetition. But these two programs that were established shortly after the promulgation of the policy didn’t pay attention to education of the citizens with disabilities. Large number of children

with disabilities are left out from the education service where there was no education planning.

The Ministry of education introduced the education and training of people with disabilities in its ESDP 3 and 4 (2005/2006–2014/2015) and also in ESDP 5. The ESDP 3 emphasizes the need to narrow the gap in education provision between male and female, urban and rural and among regions. In addition, the accomplishments of ESDP 1 and 2 were pinpointed in the ESDP 3 plan that addresses the increased school enrolment. The report asserts the gap between urban and rural in Gross Enrollment Rate (GRE) was 85.3 % by the year 2004/2005 and underlines the need to give necessary attention to reduce this gap. The report shows that there is high concentration at urban schools and low attendance in rural schools.

ESDP 3 of the years between 2010/2011 and 2014/2015 introduces the major challenges identified during the accomplishment of the program. One of the major issues described was urban-based high concentration in pre-primary education particularly in Addis Ababa and in the better socio-economic communities where private pre-primary education providers take the considerable share (Ministry of Education 2005). ESDP 3 suggests that the policy frame work related to education and training program potentially supports the success of national level objectives such as rural and agricultural development and urban and industrial development. However, the program did not give attention to highly overcrowded and challenged urban education and related schooling issues.

Taking lessons from EDSP 3, ESDP 4 states one of its dedications to narrow the rural-urban disparities in accessing education. Regarding inclusive education, low level understanding about issues of disabilities and education service, negative attitude and resistance to changes, poor accommodation of students with disabilities are presented as pronounced barriers to inclusive education in the country. It is also indicated that lack of knowledge, rigid and poor teaching methods, lack of identification processes and inconvenient learning environments as barriers in the activities towards inclusive education. To alleviate the challenge that hinder the success of inclusive education, ESDP 4 state that the Ministry of Education has adopted inclusive education strategy that helps to assist provisions of education service within the existing structure and framework. It is indicated that the goal of the inclusive education strategy is to ensure access and quality education to children with disabilities (Ministry of Education 2010). ESPD 4 describes the expected outcome of the program that includes increasing enrolment of children with special needs and enhances the number of teachers' training for special needs education. However, there was no indicator in terms of percentage for improvement in the expected outcome. It was described in numbering i.e. increasing number of children with special needs from 47,461 in 2009/2010 to 1,739,000 in 2014/2015. The number doesn't show its proportion from the total of population people with disabilities in the country and in which location such action could be implemented.

Regarding the teachers' training for special needs education, ESDP 4 shows its concern in its General Education Quality Improvement Program (GEQIP) which contains in-service and pre-service teachers' training for inclusive education. ESDP 4 had planned to increase the number of trained special needs education teachers by

25 % (Ministry of Education 2010) where the number of existing teachers were not mentioned. There are indicators that large numbers of special needs teachers are working in big towns ESDP 4 also informs that qualified teachers are concentrated as high as 91 % and 82 % in the city of Addis Ababa and in town of Harare respectively.

ESDP 5 for the years 2015/2016–2019/2020 also includes inclusive education as a cross cutting agenda of the program and assert the need for responsibility specification guide for special needs education professionals and itinerant teachers. Similarly, the Ministry of Education (2015) indicates concern on the increased pre-primary enrolment which appeared exclusively accessible in urban schools. Generally, in all ESDPs of the country which were developed for the past 20 years, although mentioned urban and rural disparities none of the program addressed on how to intervene the over concentrated urban schools, high teacher turn over, unfair distribution of resources, approaches in teaching-learning and on how to establish conducive and safe learning environment and managing large class size in the inclusive setting.

4.2.3 The Special Needs Education/Inclusive Education Strategy (SNE/IES)

In order to make changes in line with the education policy and followed EDSPs, the Ministry of Education develops a Special Needs Education Program Strategy in 2012. The guideline for the implementation of the strategy was also produced which contains relevant resource needed and action required to be taken by the education leaders and school managements. The strategy pays special attention to inclusive education and provides different approaches to facilitate access to quality education. The rationale for inclusive education as describe in the SNE/IES emphasizes education is a human right and highlights that Ethiopia ratifies the Universal Primary Education (UPE) and Education For All (EFA) global commitment which requires the country's commitment for action. Furthermore, the document highlights inclusive education as a valuable instrument to enhance access in education for marginalized groups. The objective of SNE/IES states that it envisages ensuring educational opportunity for people with disabilities, increasing awareness of the society about the right to education of people with special needs education, strengthening teacher education so as to produce competent teachers, strengthen support system and adapt curriculum according to the learning needs. However, the strategy left out articulating the need to implement inclusive education and the obvious regular school setting as a mandatory education setting for children with disabilities. The document does not mention the education features, needed assistance to the densely populated urban and related education services, impacts on education due to difference between urban and rural education setting and related resource allocations and inclusive education implementation barrier.

The SNE/IES describes inclusive schools as “an ordinary (regular) schools open to all children and students regardless of poverty, gender, ethnic backgrounds, language, learning difficulties and impairments” (SNE/IES 2012). The document emphasizes about what is expected from special needs teachers describing that teachers working in inclusive schools are expected to know their students and identify diverse learning needs so as to provide appropriate support according to their learning needs. However, the strategy doesn’t introduce the approach at teachers training so as to produce teachers with the required competency needed for inclusive setting. The strategy document infers that the focus of special needs education needs to be the beginner learners who are at risk of repetition and dropout due to learning difficulties or any other barrier to learning.

According to SNE/IES (2012), access to schooling for children with special needs is insignificant at all levels of education. The document further state that the regular school has been reasons for increased number of out of school children since these schools commonly reject the admission of children with apparent disabilities. The document assert that the school administration and teachers have low level of awareness that children with disabilities have universal right to primary education and were not willing to accept these children. Regarding higher education, the strategy asserts that course in special needs education was introduced in the teacher education curriculum recently. Consequently, few numbers of teacher education colleges and universities opened the department or recruit trained teachers where only Addis Ababa University provides specialization training in the area.

The strategy document describes that low level of awareness at all level of educational administration such as MoE, regional education bureau, woredas (lower districts) and schools affects the availability of credible data about the school population with disabilities and service provisions. It is also emphasized that due to insufficient number of trained teachers in the area of special needs education, the country is not able to successfully undertake inclusive education. In addition, it was also asserted that regional education bureaus show fewer tendencies to recruit trained expert in the area. Although there are challenges in providing inclusive education, Ethiopia benefits a lot from the collaboration with Finland government. The collaboration apparently has impact on policy development, on producing the implementation strategy and its guideline and opening and equipping resource centers and recently in producing the master plan of inclusive education. Due to the collaboration, the country has been benefiting from the involvement of international consultants such as Dr. David Mitchel, Professor Hannu Savolinen and Dr. Sulochini which obviously helps to enhance the capacity of the country in providing inclusive education.

4.3 Practices of Inclusive Education in Urban Schools

4.3.1 Enrolment Versus Quality

The number of children with disabilities attending urban schools tends to increase recently unlike the earlier exclusion practices. The major initiative was achieving EFA goal and consequently, there is high pressure from the top education leaders that influence admitting children with disabilities however; accessing appropriate education in line with the learning needs is questionable. Children with disabilities attend school without the necessary support and most of the schools don't have trained special needs education teachers and relevant resources. There is no professional assistance for schools from education that might help the implementation of inclusive education and allows effective and quality education service.

The Ethiopian urban schools often neglect children with severe disabilities both in terms of attendance and/or participation. The schools also have preference on the type of disabilities to admit or reject based on the exclusion reasons associated with limitation of resources such as trained teachers or absence of resource room. Most urban schools just allow children with disabilities to attend schools without inputs for appropriate education and claim it is due to EFA and perceive EFA as physical attendance and away from inclusive education. Inclusive education is a means to facilitate the success of EFA goal and contributes to school system improvement. However, in what way inclusive education strategy potentially accelerates EFA goal is not well recognized. In reality, there is a strong link between EFA and inclusive education. However, the school leaders consider EFA as allowing children with disabilities to attend school and less proactive to initiate inclusive education activities.

4.3.2 Accountability

Absence of terms of reference on the duties and responsibilities of school leaders leads to launch inclusive education based on willingness of school leaders and those who take the initiative are ending up facing the flow of increased number of children with disabilities from different corners of the town with little assistance to such schools. On the other hand, those schools which neglect activities of inclusive education are less busy and are not accountable for not implementing inclusive education or admitting children with disabilities. Due to such irregularities in implementation, inclusive education become at the good well of the school leaders.

4.3.3 Financing Inclusion

Absence of the necessary finance is one of the barriers often fabricated by the school principals in most urban schools. The Ministry of Education allocate budget to various educational activities and the finance of inclusive education usually mainstreamed in the education budget plan. Accordingly, schools are expected to plan the budget of inclusive education in mainstreamed way with in the school financial plan. However, in most urban schools, after securing the annual finance of the schools, principals tend to neglect activities of inclusive education and use the budget allocated to other components of the schools activities. As a result, activities of inclusive education often put aside due to lack of budget. It is generally suggested that for better access and appropriate education for children with disabilities, there is a need to allocate budget which is specific, explicit and pertinent to the purpose (Lewis 2009). Therefore, it is important to equip schools with the necessary financial, human and material resources and encourage positive thinking and open mindedness among the education leaders in general and school principals in particular.

4.3.4 Attitude and Lack of Awareness

Attitude is the consequence of perceiving certain conditions the way some one believes and when such attitude are highly accessible, actions could often be guided by the attitude of the individuals (Ratanasiripong and Chai 2013). The attitudes that control behavior also control actions of the person. Hence, it is obvious that education of children with disabilities is affected due to negative attitude, actions and decision makings of education leaders and school principals (Wondwosen et al. 2014; Thompson et al. 2011).

The urban schools where children with disabilities are attending, the approach seems against the principles of inclusive education and most children with special needs benefit little and their physical presence is considered as getting opportunities to learn. The major barrier relates to negative attitude and lack of willingness of the school principals. It is obvious that the vital role of school principals can make a difference in changing the school system and equipping with the necessary teaching and learning aids. However, the school principals are less committed to act innovatively in line with the philosophy and principles of inclusive education.

Schools need to be flexible, require recognizing and taking into account the diverse needs of their pupils, use diverse approaches and pace of teaching and learning (Frederickson and Cline 2009). In most urban schools, the awareness about education of people with disabilities in general and about children with noticeable and invisible disabilities in particular is low. Various barriers attached to the customary ways of managing schools contributes to the ineffectiveness in providing quality education, among all lack of awareness of school leaders towards pupil with disabilities appears as the dominating factor that suppresses the success of inclusive

education. Therefore, it is imperative that the education leaders and school principals know that inclusive education doesn't mean physical placement rather accommodating with the necessary services, appropriate and relevant teaching and learning environment that make children with disabilities participate and achieve.

Attitude of teacher also has a tremendous impact on students learning (Zint 2002). The regular class room teachers do not get awareness and in-service training on how to work in inclusive setting and don't have experience in teaching children with disabilities. Hence, the teachers were not able to handle and address the learning needs of children with disabilities in the classroom. There is a need for reform in Ethiopian schools to establish relevant educational provision which result in maximum learning outcome from every learner.

4.3.5 Miss-Utilization of Special Needs Teachers

There are indicators about the existence of miss-utilization of special needs education teachers in schools. Schools are expected to assign special needs education teachers to facilities education for children with disabilities in their respective schools. However, most school principals don't let it happen since the special needs education teachers demand commitment of the school to involve in inclusive education activities. There are more demands from special needs teachers such as opening resource room, identifying special needs of children with disabilities and involve in intervention work where both financial and material resources are needed. To this end, most school principals prefer to avoid recruitment of trained teachers of special needs education.

In addition, school principals often assign special needs education teachers to other responsibilities away from their particular profession. In most schools, special needs education teachers involve in administrative responsibilities and assist the school principals or involve in any other school related tasks. They are also considered as stand by teachers who substitute the role of the teachers who left the carrier. The challenge in miss-utilization of the trained special needs education teachers can be seen from three points of view. First, the school principles don't allow and facilitate the involvement of the special needs education teachers in inclusive education responsibilities. Second, the special need education teachers themselves lack commitment to insist working in their area of profession and third the education office don't have guideline on roles and responsibilities of special needs education teachers and school principals and do not supervise the effectiveness on human resource utilization.

Teachers of special needs education believed to benefit up to 20% of students who have challenge in academics in one way or another. Hence, absence or misusing special needs education teachers contributes to high number of drop out, grade repetition and poor quality education. Therefore, duties and responsibilities of the school principals and the special needs teachers must be set by the education offices.

The principals need to realize that inclusive education is about providing suitable education for the learners and use resources efficiently.

4.3.6 Socio-economic Factors

The schools in urban which admit children with special needs are very few in numbers and are not easily accessible to the residence of children with disabilities. Hence, travelling long distance to attend school seems to be the daily task of children with disabilities and their families. According to Central Statistics Authority (2008), 44.2% of the population is living below the national poverty line. In this regard, poverty and disability are closely inter-influenced in the communities. Most poor families who have children with disabilities could not afford to purchase the necessary equipment for their children with disabilities or could not manage to pay for the transportation cost to take their children to schools where services are available. As a result, parents prefer to keep their children out of school or the children often drop out of school.

4.3.7 School Dropout

Children with disabilities exposed to school dropout due to various causes. In addition to the discouraging school situation and inconvenient school environment, parents also considered as a cause for drop out of children with disabilities. The pronounced challenge of parents in sending their child with disability to school was accessibility and distance of the school. It is obvious that looking for a special school, special unit, special class or intergated schools that admitt children with disabilty requires travelling longer distance particularly in big city like Addis Ababa. Since all school in urban don't open their door for childern with disabilities, families are forced to look for schools that provide education for children with disabilities. The distance of the school affects the daily business of parents and influences them to spend their limited income for the transportation of their children. Due to poverty, most parents can't afford expenses to send their childern to school and keep them at home while some parents use their children with disabilities as an income source from begging. Hence, even though schools may register increased number of children with disabilities at the beginning of the academic year, the number gradually decreases and small number of children with disabilities left at the end of the year. Low income families have difficulty paying for necessary aid such as mobility aid for their children with disabilities affects school attendance. Due to absence of wheelchair or mobility aid, some parents of children with physical disability are taking their children to school by holding on their back and later gave up.

4.3.8 Teachers' Turnover

Teachers' turnover is becoming an international challenge of the education system. International study on teacher education point out that large number of teachers leave teaching due to various reasons such as looking for more attractive job, young graduates are not attracted to be teacher, and teaching becomes an occupation of last resort (Robinson and Latchem 2005). Ethiopia shares related experience on teachers' turnover particularly among young teachers. Similarly, there is high turnover among special need education teachers in the country in general and most importantly from urban schools where they reside in larger number as compared to rural schools. Teacher turnover at urban schools also relates to low salary as a major reason where living expense is high in urban. As a result, teachers tend to look for non-teaching carriers with better income. There are two major issues in this regards that challenges inclusive education, special needs education teachers themselves leave the government owned schools where children with special need get more opportunity for schooling than private owned schools and second special needs teachers who are working in the government school influenced to take over the role of other subject teachers who left the carrier. Hence, they don't get the opportunities to promote inclusive education in the schools in general and get little or no opportunity to assist children with disabilities.

4.4 Conclusion

Generally, inclusive education seems challenged due to attitude, lack of awareness, miss-utilization and lack of resources, absences of guideline and job descriptions and accountabilities. The schools are not well equipped and the education provision seems more integration and segregation. There is ineffectiveness in planning and budgeting, implementing inclusive education. The experts at education offices are not in a position to strengthen the school capacity and are not working systematically to reduce the barriers to inclusive education. However, the number of children with special needs is increasing in schools. Therefore, the overall indicates tells that inclusive education principles and goals are not well internalized in the education system of the country.

4.5 Implications

The practice implies that the Ministry of Education need to act and build the capacity of the regional education bureau and the regional education bureau also required dedicating in building the capacity of school leaders and teachers. Urban school principals and teachers need training and attitudinal changes on how to manage

teaching-learning effectively in the inclusive setting. Regarding the overall implementation of inclusive education allocation and utilization of resources need to get fairness and attention in urban schools. There is a need to develop urban school policy and or guideline that assist provision of quality education in general and inclusive education in particular. Further, to improve the education service for children with disabilities, there is a need for the development of clearly stated and less ambiguous education policy supporting guideline that help the implementation of inclusive education in the country. The efficiency and effectiveness in implementing inclusive education need to be monitored. Furthermore, document on accountability and responsibility of school principals and teachers need to be produced and disseminated.

Chapter 5

Tackling Education of Girl Child with Disability in Urban Settings of Uganda

Lawrence Eron and Paul Emong

5.1 Introduction and Purpose of the Chapter

This chapter analyses how education of the girl child with disability in the Ugandan urban setting is being tackled. It draws from the involvement of the authors in the Cheshire Services Uganda (CSU) Girl Education Challenge project within Kampala City Council Authority (KCCA). The chapter, specifically and critically analyses the strategies being undertaken by Cheshire Services Uganda and KCCA to bring about an inclusive education environment in general and in particular for the girl child with disability and other special needs from among the urban poor.

The chapter examines how the teachers, School Management Committees (SMC) and Parents Teachers Associations (PTA), educational facilities and learning opportunities are made accessible and adaptable to all learners regardless of one's (dis)ability. The chapter further explores the relevance, effectiveness and sustainability of these strategies. In doing so, the chapter identified and discusses how factors such as health, economics of disability, attitude and psychosocial factors that influence inclusive education for the girl child with disability are being tackled. The chapter concludes by examining how effective these strategies are in bringing about a school which includes everybody, celebrates difference, supports learning and responds to individual needs.

It is important to state here that Kampala is the capital city of Uganda. Administratively, it is recognized as Kampala Capital City Authority (KCCA) and has five divisions, namely, Kampala Central, Nakawa, Rubaga, Kawempe and Makidye. Similarly, Cheshire Services Uganda (CSU) is a member of the Leonard Cheshire Disability Global Alliance – a network of over 200 independently managed Cheshire organisations in 54 countries across Africa, Asia, the Americas and

e-mail: eron.lawrence@yahoo.com; emongopaul@yahoo.co.uk

Europe. In Uganda CSU is legally registered as National Council of Leonard Cheshire Homes.¹ CSU visions an inclusive society where persons with disabilities are respected and empowered to develop their potential to lead a quality life. Its mandate is to uplift the quality of life of Persons with Disabilities and promote their independence. In accordance of their desires to change attitudes towards disability around the world, Cheshire Services Uganda identified the education of the girl child with a disability in the urban setting as one of the challenges that needed attention and came up with a project ‘Supporting Slum and Homeless Street Girls with Disabilities in Kampala City to Access Quality Primary Education’ as one of the Girl Education Challenge projects in Uganda. The strategy adopted by the project is to identify, map, assess and enroll girls with disabilities into school, build the capacity of teachers, KCCA education sector staff, the school management committees and parents to contribute to improving the enrolment, learning environment and retention of girls with disabilities in KCCA primary schools (CSU Newsletter 2014).

5.2 Educating the Girl with Disability in Ugandan Urban Setting

The strategy for educating a girl with disability in an urban setting is largely informed by two education programmes whose overall intents are to bring about an inclusive education in society. The first is the government of Uganda’s decentralized education programme, the Special Needs education/Education Assessment and Resource Services (SNE/EARS) programme. SNE/EAERS was an innovation aimed at identification, diagnosis, placement, referral and support to learners with disability and special needs education targeting children of 18 years and below. SNE/EARS become an integral part of the inspectorate in every district of Uganda. The second programme is the UKAID Project, ‘The Girls’ Education Challenge (GEC),’ which also funds Cheshire Services Uganda (CSU)- Girl with a Disability Education Challenge Project that forms the basis of this chapter. The Girl Education Challenge (GEC) launched in 2012 addresses gender parity in education through tackling factors perpetuating inequalities, exclusion and discrimination of girls in education. The target of GEC is to improve the learning opportunities and outcomes for up to one million of the world’s most marginalised girls through a diverse range of interventions and developing a voice that raises concerns of the girl child in education (UKaid 2015). These interventions include stepping up changes in the communities that are already having a positive impact on the education of a girl child, applying new interventions such as technological innovations, developing new partnerships, adapting proven solutions for new geographies, communities or age

¹CSU comprises of seven independently managed Cheshire services of Katalamwa, Nkokonjeru, Buluba, Budaka, Butiru, St Francis Rehabilitation Centre Pamba and the two St Francis Schools of the Blind Madera in Soroti district.

groups; and developing strategic partnerships with the private sector especially the multi-lateral companies in addressing girl child education challenge in the community (UKaid 2015). The GEC therefore provides hope for a better future for marginalised girls, their families and their communities.

Supporting Slum and Homeless street girls with disabilities in Kampala City to access quality primary education is to increase enrolment, improve performance and retention of girls with disability in Kampala City primary schools. The initial design of the project was to work with ten model primary schools in the four out of five divisions of Kampala- Central, Nakawa, Rubaga and Kawempe divisions. The fifth division, Makidyde was left out as a control place for purposes of comparing the impact of the project. The model schools were to be demonstration schools, where interventions relating to inclusive education for children with disabilities are to be carried out with a view of showing to government and education stakeholders how to tackle the challenge of educating the girl child with disability in the urban setting.

The interventions included training of 212 teachers in special needs education and inclusive education methodologies, support to 1102 girls with disabilities in the slums of Kampala to enroll and continue in their education and settling 100 of the 1102 girls who are homeless in the Cheshire homes or other similar homes. The support to the girl child with disability in the project includes provisions of scholastic material, paying of school fees, rehabilitation, and provision of sanitary pads, transporting of the girls from their homes to schools² and paying teachers to support girls who require remedial class work. Other interventions include training 171 members of the School Management Committee (SMCs) and Parents Teachers Association (PTA) in how to make schools inclusive, supporting parents of these girls with income generating projects and providing them with grants as a start-up capital. The start up also included, sensitising stakeholders like KCCA, Center Coordinating Tutors (CCTs) and Local council (LCs) leaders to work hand in hand with KCCA in training and monitoring the inclusion activities in the schools and the construction of model accessible toilets and ramps to help retain learners in school.

In the course of the project implementation, there was enormous demand for the project arising from the spread of girls with similar challenges throughout the city. The project was hence extended beyond the ten demonstrations schools. The project has increased from 10 and reached out to 119 schools; the number of girls with disabilities and special needs rose from 1182 girls to 2082 girls; 212 teachers were targeted but so far 1200 teachers have been reached and number of parents rose from 121 parents to 442 parents. So far twenty (20) schools have been helped to make ramps as a show case of accessibility for learners with disabilities. The ten (10) model schools have been supported to construct disability resource centers and equipped them with TVs, computers and videos. The disability resource center is a consulting room for disability issues. Overall, in the 119 schools, the enrolment is seen to be increasing and retention is observed because the children are enjoying the friendly school environment.

²CSU has ten accessible buses for transport aimed at serving as a model for quality inclusive transport in Urban settings.

Will those interventions meet the expectations of bringing up an inclusive school for children with disabilities? The next sections examines how effective these strategies are in bringing about a school which includes everybody, celebrates difference, supports learning and responds to individual needs.

5.3 Realizing the Right to Education of the Girl Child with Disability

Education is a universal right, a right on its own merits and is an enabling right to the attainment of other rights. Therefore, denying an individual girl child with disability a right to education is condemning such a girl and limiting her from the enjoyment of fundamental rights. In the human rights law framework, education is recognised as a fundamental right and in general terms States are required to make educational services available to all; to ensure non-discrimination in all educational systems, to set minimum standards and to improve quality and to outlaw discrimination in education at all levels.³ Specifically on women, the Convention on the Elimination of All Forms of Discrimination Against Women (CEDAW) article 10, requires States to ensure equal rights of men and women in education, including in matters relating to academic attainment at all levels. The convention places an obligation on States to take appropriate measures to eliminate stereotyped concept of the roles of women and men in all levels and forms of education. For people with disabilities, the Convention on the Rights of Persons with Disabilities (CRPD) in article 24 requires States to ensure that people with disabilities realise a right to education without discrimination and on the basis of equal opportunities. A right to education is to be realised progressively in accordance with the resources available.

Additionally, as per the requirements of the human rights standards on the right to receive an education, education should be made available, accessible, adaptable and acceptable⁴ for all irrespective of individual or group differences such as disability and gender that cause inequalities in the realisation of human rights. Availability implies existence of functioning educational establishments and programmes within a given jurisdiction. Accessibility entails non-discrimination, physical accessibility and economic access or affordability of education to all. Acceptability means educational services conform to the minimum established educational standards and/or religious or moral convictions of each State. Adaptability means education should be able to accommodate the needs of all learners. However, the meanings of these concepts should be interpreted within the context in which the right to education is being realised, as what each of them entails differs according to the conditions prevailing in a particular State or jurisdiction. For example, in some communities in Uganda, although pupils study under trees because of limited classroom facilities, education

³UDHR Art 26(1) and also see generally ICESR Art 13.

⁴See UN Committee on Economic, Social and Cultural Rights (CESCR), *General Comment No. 13: The Right to Education (Art. 13 of the Covenant)*, 8 December 1999, E/C.12/1999/10, para. 6.

is seen to be available, because the educational programme is functional in that area (Emong 2014). In some developed countries, a similar situation may be interpreted differently. For learners with disabilities, provided the educational service is available and acceptable, making education accessible and adaptable to their needs is vital in enabling them access it without discrimination and on the basis of equal opportunities. These standards require States to recognise the principle of equal educational opportunities for *all*, including learners with disabilities.

To achieve these education standards in a pragmatic approach, educationists in the international forum agreed on education frameworks, among others include Education For All (EFA) framework,⁵ the Salamanca Statement and Plan of Action on Special Needs Education,⁶ the UN Standard Rules on Equalisation of Opportunities for Disabled People (UNSRs), the Dakar World Education Forum of 2000, the just concluded Millennium Development Goals (MDGs), especially goal 2 and 3 whose focus was directly on education and the Sustainable Development Goals (SDG) especially goals 4, 5, 8, 10, 11 and 17 focusing on inclusive, equitable, sustained, and accountable system for the venerable – persons with disabilities, women and girls. Each of these frameworks, although with specific targets are meant, overall to translate the (education) standards codified in UN human rights treaties to realities experienced differently by governments and communities in realizing a right to education. These frameworks therefore, are arguably to guide governments adopt realistic legislative, administrative and pragmatic approaches to realise education for all, as a universal and as a fundamental human rights norm. Through these frameworks, the countries of the world agreed to “eliminate gender disparities in primary and secondary education by 2005, and achieve gender equality in education by 2015, with a focus on ensuring girls’ full and equal access to and achievement in basic education of good quality” (UNESCO 2012).

The commitments to education standards in the UN human rights treaties and pragmatic approaches are no doubt yielding positive results as far as gender parity at the primary level is concerned. Female enrolment is observed to be rising at greater rate than among males. On the overall, however girls and women especially those with disabilities still remain deprived of full and equal opportunities for education. Globally, it is estimated that 66 million girls are missing out in education and particularly, in developing countries, of which Uganda is one of them and one in every three girls is married by age of 18.⁷ In Uganda, more girls (9% or 352,397) are out of school than 8.9% or 348,191 among boys (Demographic and Health Survey 2011). Reasons provided for failing to meet international commits in educa-

⁵See Education for All framework, Art 3 para 5. EFA framework was adopted by the World Conference on Education for All, held at Jomtien, Thailand 5–9 March 1990. UNESCO documents.

⁶The Salamanca Statement was adopted by the World Conference on Special Education: Access and Equality in Salamanca, Spain in June 1994.

⁷See Framework of Educaid.be 2014 ‘Gender Mainstreaming in Education: Moving Beyond Theory, Sharing Experiences’ http://www.educaid.be/sites/default/files/gender_education_bibliography.pdf accessed on 29th January 2016.

tion among others include limited systemic capability in the education sector and the challenges associated to behavioural change, both within the public sector and among the population (UNDP 2015). Specifically for girls, common barriers to their education include early marriages, early child bearing, distance to school, security concerns especially school related gender based violence, cultural values, school costs, negative experiences of schooling, menstrual hygiene management and labour market participation.⁸ For a girl with disability, the above constraints are compounded by specific disability barriers that deny them equal opportunities in education. The specific disability related barriers include inaccessible environment, lack of assistive devices, negative attitudes, medical related issues arising from the impairments and a belief among parents and schools that children with disabilities are expensive. The effect of those factors on education of children with disabilities in Uganda is their high school dropout rate. National statistics on education point out that, 75 % of the pupils with disabilities who enrol in primary level of education hardly complete this level of education.

5.4 Uganda: National Context

The population of Uganda is estimated to be 34.85 million people (16.92 million males and 17.93 million females), of which children of primary school going age i.e. those between 6 and 12 years are estimated to constitute 23.1 %⁹ of the population (UBOS 2014), this is about 8,050,350 children. However, statistics show that, about 8.8 million children are enrolled in primary schools, constituting a gross enrolment ratio of 117 %. Meaning that there are more pupils enrolled in primary education than expected as per the official primary school going age. This is explained by the fact that in practice in Uganda, even persons who are above 12 years and sometimes up to 18 years are enrolled in primary schools.

On retention, studies indicate that, though the enrolment of both boys and girls in Primary One is often equal, from Primary Four the dropout rate for girls is higher than that of boys (Atekeryereza 2001). It is also observed that, a very small proportion of the girl child access secondary education and the number are even smaller in higher education and skills training. Statistics further indicate that, the proportion of females with no formal education is 24 % while 10 % of males have no formal education (GoU and UNFEP 2014). The implication is that the proportion of females with no education doubles those of males with no education. This discrepancy indicates more discrimination and exclusion in education exhibited against girls than those of boys. Girls with disability thus experience double discrimination, exclusion and disadvantage arising from their disability and gender stereotypes.

⁸ See particularly, GPE and UNGEI (2014), 'Accelerating Secondary Education for Girls: Focusing on Access and Retention.' Discussion Paper 1.

⁹ In Uganda, the ages of primary school pupils range from 6 to 18 years; and according to UBOS figures on the projected population by age group, 2015, people between 6 and 12 years constitute 23.1 % of the population and those between 13 and 19 years constitute 15.2 % of the population.

5.5 Inclusive Education and Disability in Uganda: A Snapshot

Inclusive education refers to and focuses on adjusting the school, the home, society at large and national education policy so that all children can have the opportunity to interact, play, learn, experience the feeling of belonging, and develop in accordance with their potentials and difficulties; and there by obtain a good quality of life within their natural environment. In delivery of learning, inclusive education embraces modification of curricular, teaching methods, materials, medium of instruction and adjusting learning environment to meet the individual learning needs. Inclusive education therefore centers on the exclusion of a child with disability in education to the school environment and not on the impairment the child has. This is also a clear shift away from the tenet of segregated education for people with disability. It is arguable that the segregated education as based on different disabilities, views the barriers to learning as being within the person with impairment. Thus, Inclusive education argues for tackling school factors¹⁰ so as to enable every child including a child with disability access mainstream schools in his/her community. It is a critical approach in the realisation of a right to education as a universal norm as it advocates for equal opportunity to all to access education regardless of one's backgrounds or disability (Reiser 2012; Ainscow 2005).

In the wider context of disability inclusion approaches, the ideology underpinning inclusive education is similar to the one of the social model of disability. Both approaches aim to address issues of marginalisation, oppression, exclusion and discrimination while trying to center the problem of disability on the environment. It therefore attempts to shift away from the tenet of segregated education for people with disabilities, which views the barriers to learning as being within the person with impairment (Winter and O'Rawl 2010). The shift towards inclusive education approach argues for schools to be reformed and pedagogy improved in ways that will lead them to respond positively to pupil diversity – seeing individual differences not as a problem to be fixed, but as opportunities for enriching learning (UNESCO 2005).

It is observable that the idea of inclusive education is critical in the education reforms in Uganda since the launch of Education White Paper of 1992. The White Paper is a blue print for education reforms. It is arguable that these reforms resonate international commitments discussed before. Thus, Uganda is aiming at providing Education for All and ensuring an inclusive education environment. This is demonstrated by Uganda's legal and non-legal frameworks on education and the established educational infrastructure for mainstreaming gender, disability and other special needs. Therefore, Uganda's commitment is to ensure that schools and other

¹⁰The concept school factors is itself appears broad in meaning in regards to the meaning of inclusive education as it is seen to be entailing education policy reforms, attitudinal change, making schools accessible and adaptable to the needs of the all learners. See also (UNESCO 2005) p. 15.

educational services are available, accessible and adaptable for all learners irrespective of one's abilities or limitations and ensuring that barriers to learning, participation and development are overcome.

The legal framework in favour of inclusive education includes the Constitution of the Republic of Uganda (1995), which is the supreme law of the land. The constitution in article 30 guarantees that all persons have a right to education. In the spirit of the constitution Objective XVIII, commits government to ensure free and compulsory basic education, take appropriate measures to afford every citizen equal opportunity to attain the highest educational standards possible and allow individuals or groups freedom to fund and operate educational institutions within the general educational policy. The constitution therefore provides a bench mark for government to make education available, accessible, adaptable and acceptable for all, including for people with disability. The provision however is silent on affordability when it comes to private provision as there is limited evidence of regulation on fees charged.

The spirit of the constitution is reflected in the Persons with Disability Act (PwDA) 2006. The PwDA in section 5 lays an obligation on the State to promote educational development of people with disabilities and in section 6 prohibits discrimination against people with disabilities by educational services. These legal commitments, if complied with appear to be capable of increasing meaningful inclusion of learners with disabilities and other special needs in education. In particular, the PwDA in section 5 requires government to:-

- (i) Encourage inclusive education as well as establishing special schools and units, with curricula designed for different disability conditions.
- (ii) Ensure relevant personnel in inclusive education by training of special needs education teachers and in service training for current teachers in mainstream schools. Also to enforce recruitment and retention of special education teachers in all schools and institutions.
- (iii) Formulate and design educational policies and programmes that devote attention to the special needs and the requirements of persons with disabilities in educational facilities, paying particular attention to girls and those in the rural areas.
- (iv) Provide structural and other adaptations in all educational institutions appropriate for the needs of persons with disabilities and promote specialised institutions that facilitate research and development of their educational needs.
- (v) Commit not less than 10% of all educational expenditure to the educational needs of persons with disabilities. This is a great provision as it safeguards the budgets for disabled people. However, as Emong (2014) observes, it is not clear whether this provision applies to the government or to educational institutions themselves.
- (vi) Provide during examinations assistive devices suitable for students with special needs including giving extra time.

This chapter argues that, in regards to education sector, the PwDA aims to develop an educational infrastructure in the country that would guarantee an inclu-

sive educational environment for all categories of people with disabilities. An environment whereby educational institutions will be taking into account the relationship between the learning environments and the impairment needs of people with disabilities. That is to say, educational institutions providing reasonable accommodation of the individual's requirements, providing effective individualized support measures to people with disabilities and other special needs in an environment that maximizes academic and social development, consistent with the goal of inclusion. It also mean that schools take in to account the educational needs of the most marginalised such as those with visual impairment or hearing impairment or those who are deaf-blind. That educational environment will enable people with disabilities and other special needs realise right to education without discrimination on the basis of equal opportunities as required by the Convention on the Rights of Persons with Disabilities (CRPD) in article 24. That a great provision and safeguard is made in the education budget for children with disabilities. However, as Emong (2014) observed, it is not clear if this provision applies to government or to educational institutions themselves.

The Universal Primary Education (UPE) was introduced in 1997 with the aim of achieving poverty reduction and human development. The intention of UPE is to provide facilities and resources to enable every child to enter and remain in school until the primary cycle of education is complete; make education equitable in order to eliminate disparities and inequalities; ensure that education is affordable by the majority of Ugandans and reduce poverty by equipping every individual with basic skills. The UPE programme has demonstrated that a poor country with a committed government and donor support can fight poverty through ensuring universal access to education for its citizens. The significant increase in primary school enrolment is also an indication that the payment of school fees was a big impediment to accessing education, especially for poor families.

The non-legal infrastructure includes training of teachers for special needs education at Kyambogo university formerly called the Uganda National Institute of Special Education – (UNISE) and establishment of departments of special needs and inclusive education at the Ministry of Education, Science, Technology and Sports (formerly the Educational Assessment and Resource Services (SNE/EARS) programme¹¹), the Uganda National Examinations Board (UNEB), the National Curriculum Development Centre and the Directorate of Education Standards (DES). Also, the representation of persons with disabilities at the Local Government District councils and the statutory bodies at the districts local governments¹² provides an infrastructure for mobilisation and advocacy for the education of children with disabilities and other special needs in Uganda. Overall, these infrastructures are making children with disability and special needs visible in education and thus promoting inclusive education at primary and secondary levels.

¹¹The SNE/EARS programme was a decentralized programme found in all districts purposely designed to identify, assess, place and refer children with disabilities and other special needs to services within their community.

¹²Statutory bodies at the district include the District Service Commission, the District Land Board.

5.6 Implications to the Education for the Girl Child with Disability

The achievements notwithstanding, tackling institutional constraints to the delivery of quality education services, taking advantage of opportunities offered by the liberalised education sector, and reducing inequity in access to education and the quality of education across districts and between rural and urban areas still remain a challenge. Various studies have concluded that this problematic situation is the result of various factors – including lack of capacity and commitment of teachers, inadequate education infrastructure, prevalent negative social attitudes, overcrowded classrooms, and shortage of necessary teaching and learning resources in schools (Arbeiter and Hartley 2002; Najingo 2004; Nyende 2012). Pupils with disabilities and other special needs still experience barriers to learning, participation and development in education resulting to their high school dropout rate.

It is in the enrolment and retention that the strong disparity in access to education by children with disability and others special needs in Uganda becomes clear (Table 5.1).

The table above shows that over 70% of the learners with disabilities and other special needs fail to complete the primary cycle of education. The implication is that the learners drop out from school at different stages of their education for varying reasons some of which could be the ones explained below.

There is the fundamental economic question that arises when planning for the education of the girl child with disability. The application of the fundamental economic question relates to scarcity, choice and opportunity cost of whether to educate the girl child with disability and other special needs or the ordinary boy child. Parents and caregivers particularly the low income earners make choices on where to invest with the hope of having a return. Recognising the high youth unemployment, most parents tend to invest in educating the ordinary child who will in turn take on self-employment hence support the family than the child with disability.

They think these children are expensive and that they will not be anything in life. (Director, Sickle Cell Association Uganda)

This quote from a leader of one of the conditions that is considered a disability and other special needs shows the value families and communities attaches to a child. A

child identified with a disability or any form of special need is considered a liability. First, is the cost involved in consultation with medical and other traditional healers in search for cure. The costs relate to what Arbeiter and Hartley (2002) noted that there is a lack of general knowledge about disability, as well as a lack of access to special programs that exist in the most populated cities in third world countries. The lack of knowledge implies that families engage in wasteful, costly and unproductive search for cure. Similarly the disabling condition will necessitate that the caregiver spends more time with the child with a disability at the expense of productive gainful employment. Secondly, educated and employed women are expected to repay their parents in kind and even more, by caring for the sick or the old. Education is not seen to be particularly practical for the latter purpose in the case of a girl child with disability. Thirdly, to some rural communities, literacy for the girl child implies no more than the functional ability to count, read, write and socialized on this basis come back, marry, cook for their husbands, comfort them in bed and produce children (Atekyereza 2001). The implication is that the girl child is a wealth for the family. A girl child with disability is considered not to provide the required income, support and care expected.

The effect of the fundamental economic question is also visibly experienced by persons with disabilities and other special needs in education are also experienced at school. The school and government in general consider the immediate term cost of educating the child with disability and other special needs. The education being a liberal entity, boarding fees levied are high for the urban poor parents. The nature of the urban setting also require parents to transport their girl child with disability to and from school each day therefore

Such children are expensive as they require meeting daily transport expenses because some children cannot walk due to their impairments. (SMC member)

The exclusion and discrimination experienced by a girl child with disability in education in the urban areas is intertwined between the health, economics of disability, psychosocial factors, attitude and limited trained teachers in special needs education. Caregivers recognize the need to provide assistive devices, pay boarding fees, and provide medical treatment whenever needed or transport the child to school each day. These decisions vary greatly but relate to some of the following observations made by parents

Children with special needs are expensive. It is expensive to buy facilities such as clutches, wheel chairs, hearing aids, spectacles, transporting the child are also expensive and therefore working parents get hard time to balance between their work and the care a child with disability and special needs require. (PTA Member)

The enabling policies seem not to translate to operational opportunities for the girl child with disability. While the state and other actors in education recognizes the economic advantage of educating children with disability, there is a tendency to argue about the high cost of educating the child with special needs. State and not state actors alike notes the high costs of their learning materials and infrastructure and the inability of the government to fund all priority areas. There is evidence indicating that there is low direct government expenditure on primary education

which falls below the needs of the sector affecting policy implementation (Omagor-Loican et al. 2002). The allocation of these minimal resources to the sector may not be rational and proportional to benefit the girl child with a disability at school, leaving high private costs on parents in relation to providing scholastic materials, uniforms, lunch, transport and additional fees to supplement teachers' welfare especially in boarding facilities that accommodate most deaf learners with disabilities. Uganda, having a broad-based population pyramid, exerts pressure on the limited resources available for the basic services like education (Eron 2015) which may leave the girl child with disability to be among those grossly affected.

Disabling condition is still perceived as a health problem. Many communities in Uganda believe that a child with disability is sick and needs fixing before that child is given education. Moreover, the information about the child's impairment is not provided to the school to help plan for the child. As noted by a member of the School Management Committee in a focus group discussion

parents most often do not inform the school of that condition and also such a child may not also express him/herself to the teacher that he has such a condition.

The lack of information has two implications, first rejection after being noticed with the assumption that it is contagious; second the feeling that the school may not have the capacity and facilities to accommodate the girl child. The second argument is corroborated with the statement below

There is no proper/special care for example when a girl is in her menstruation periods, no proper feeding, no specialised toilets/latrines, there is high medical cost and the child is too vulnerable to infections due to poor hygiene and sanitation systems in KCCA

There are sociocultural factors that have to dictate the decisions to be made during times of financial hardship on the gender and ability of the child to be educated. Some parents would have a preference based on the disability with a view of relieving them of the future disability load while others would focus on the gender as a determining factor to which child goes to school, in most cases preference is made on the ordinary boy child. To some parents there is the assumption that even when the girl is sent to school during times of hardship, their educational benefits are enjoyed by the family into which she marries and not by the family of origin. The patronal nature of the Ugandan community impact on the choice of support the girl child with a disability or special needs receives immediately after birth.

It could be argued that the nature of education provision for a child with disability and other special needs reflected the social, cultural, political and economic trend in the history of Uganda. For example, an account of indigenous education in relation to hearing impairment is scanty but brings to light the traditional practices, attitudes, myths and customs of Ugandan diverse nationalities. According to Matovu (1994), hearing impairment was equated to stupidity and dampness with a focus on philanthropy and natural aid to keep them going. This moral philosophy resulted into social rejection and ostracism that generated a feeling of self-hatred, dependency and hopelessness. The neglect and rejection limited the participation and interaction of learners with hearing impairment with their peers and escalated their

exclusion from community activities (Eron 2011). It followed though in many ways, the same sequence with other disabilities and special needs.

In a focus group discussion with the School Management Committee members of the project schools the following sentiments were raised that demonstrate the current perception towards a child with disability and special needs.

The is still negative attitude towards a child with disability, parents tend to be stigmatized when having such a child as they are considered a curse to the family

The stigma within the family is often extended to the school resulting to the rejection of the child. As one member noted

People think they will not be able to market their school since some can be slow learners impacting on the performance ranking

Liberalisation in education is an investment. The ranking of the school and its management is based on the pass rate in the national examination not necessarily the services being provided to *all* the children of Uganda. School management has to work hard to be ranked the best to attract more learners, remain in business and generate more income. A child with a disability in the school tends to lose out and develop low self-esteem. As state by a member of the School Management Committee in the project schools

People neglect children with disability; the child therefore develops low self-esteem.

Neglecting a girl child with disability may be intentional or non-intentional. It may be not intentional arising from lack of awareness of what role to play in support of the child. It may be intentional due to the negative attitude the actor has on a child with a disability. The implication is that all human resources involved in the welfare of the child have to be sensitized on the legal and social needs of educating children with disability. Sensitisation involves providing evidence of the relevance of education in the lives of successful persons with disabilities and their families. Providing this evidence may be a challenge as there is limited available information on how successful pupils are educated due to paucity of the data (Kasirye 2009).

Investing in information and education necessitates adequate moral, technical and financial support. However, government recognises the limited funding that it allocates to the sector incidentally associated with cultural attitudes (MoFP&ED 2004). The cultural attitudes cited by government emanate from policy makers, technocrats, parents and the pupils themselves. According to Omagor-Loican et al. (2002), there are negative attitudes by the majority of the people and children themselves. While positive attitudes are important for the successful implementation of special needs education very often there are hard-to-interpret attitudes towards special needs and inclusive education (Nakitende 2011). Cultural beliefs and societal attitudes towards persons with disabilities make the girl child to be continually marginalized and developments in their education very slow. Traditional negative attitudes are particularly associated with addressing the requirements of the girl child and children with special needs (MoFP&ED 2004). Negative attitudes influences the concepts and beliefs regarding best approaches in providing special needs and inclusive education (MoE&S 2011).

5.7 Conclusion

The education of the girl child with disability in Urban areas and slums in Uganda is largely challenging by among other factors negative community attitudes towards the girl's education, denial of education, unfriendly environmental facilities and the disabling condition. Efforts to address the educational needs of the girl child with disability in Kampala City Council Authority (KCCA) primary schools have demonstrated positive effects. Strategies to attain the positive effects implied that the KCCA had to work with a development partner – Cheshire Services Uganda. Cheshire Services Uganda is an NGO dealing in disability and education. In the KCCA, the aim is to bring about an inclusive education environment. It was established that many teachers, members of the school management committee and parents teaches associations had negative attitudes that limited the participation of girls with disabilities in the Kampala City council Authority primary schools. The negative attitudes were attributed to the lack of information by the human resources who are to promote the inclusion of the girl child in education. The implication is that educational facilities and learning opportunities are not made accessible and adaptable to all learners regardless of one's (dis)ability. It also implied that factors such as health, economics of disability and psychosocial factors influenced how inclusive education for the girl child with disability is provided. The strategies identified to enable every school going age girl child with disability in KCCA schools to access mainstream schools in her community included exploring how relevance, effectiveness and sustainability of the programme. How effective these strategies are in bringing about a school which includes everybody, celebrates difference, supports learning, and responds to individual needs will be evidenced at the end of the project.

5.8 Recommendation

After the identification of the needs of the urban poor and communities living in slum in relation to the education of the girl child and the training undertaken, it is recommended that further training, material resource provision and environmental modification continue to be undertaken. The model sanitary facilities transport and training materials are resources that should serve as a demonstration to engage practitioners, caregivers and policy makers towards promoting inclusive education for the girl child with a disability in urban setting and slums. Policy makers at local and authority (KCCA) level and education practitioners should develop strategies for utilizing these aspects of knowledge and information in enhancing inclusive education not only for the girl child but all school going age children in slums and among urban poor. Innovations of this kind needs follow up to ensure sustainability.

Chapter 6

Role of Urban Non-formal Education in Inclusive Education Provision in Nairobi Kenya

Martin Mwangela Kavua

6.1 Background to Kenya

Kenya is a country on the East African coast bordering Tanzania, Uganda, Ethiopia, South Sudan and Somalia. It covers about 581,309 km² and has a population of over 44 million people. Her official languages are English, Kiswahili and Kenyan Sign Language. Kiswahili is the national language. Institutionalized provision of education for learners with special needs in education (SNE) has evolved from special education, through mainstreaming/integration, to the current focus on inclusive education.

6.2 Introduction

According to the World Education Forum, Education For All (EFA): Framework for Action, agreed in Dakar (April 2000), education is a fundamental right of every person; a key to other human rights; the heart of all development; the essential prerequisite for equity, diversity and lasting peace. The framework for action acknowledges the contribution of non-formal education in achieving education for all (UNESCO 2000a, b). A similar conference held in 1990, aimed to achieve similar objectives. Between the two conferences, the Salamanca statement proposed inclusive education for all as the most appropriate provision in the last century and beyond. Contrary to expectations after the first EFA conference in 1990, education for all had not been achieved a decade later. The Dakar conference on education for all recognized that the high numbers of persons without access to education is an

M.M. Kavua (✉)

Kenya Institute of Special Education (KISE), Nairobi, Kenya

e-mail: mkavua@gmail.com; kavuam@kise.ac.ke

affront to human dignity and a denial of the right to education (UNESCO 2000a). Over two and half decades after the first conference on education for all, Kenya is yet to attain full access to education for all (Republic of Kenya/UNESCO 2012). This discrepancy may be attributed to poor access to education due to factors like cost and other non-monetary barriers especially in poor households (Orodho et al. 2013; The World Bank 2008).

‘Non-formal’ education is a key term in this chapter. Non-formal education may be defined as any organized educational activity occurring outside the formal education system which targets specific groups/categories of persons with life skills, values and attitudes for personal and community development. It views formal education as regular education provided in the system of schools, and other formal educational institutions. What the definition of non-formal education given here fails to consider is the evolving face of non-formal education to encompass similar curriculum content as the one found in formal schools (Ekudayo 2001). It is seen as a separate provision almost with no relation to formal education. The Basic Education Act places management of non-formal education under the ministry (MOEST 2013), this might be said to be a development towards its recognition as a viable option for education with full government support. Inclusive education has been defined as an educational provision that is modified to facilitate learners to participate in the learning process and education system while learning within their abilities (Kavua 2013).

6.3 Inclusive Education in Kenya

The Ministry of Education (MoE) (2009) defines inclusive education as

...a process of addressing and responding to the diversity of needs of all learners through the increase in participation in learning, cultures and reduction of exclusion within and from education. It involves changes and modifications in content, approaches, structures, and strategies with a vision which covers all learners

The ministry’s guide on inclusive education (MoE 2010) alludes to the above definition as well. While reiterating the government’s commitment to inclusive education in the country, the ministry of education also defines inclusive education as provision of education for learners with special needs in education within regular schools. Mainstreaming of special education in regular schools has been emphasized and presented as a prerequisite for provision of inclusive education (MoE 2012), as opposed to focusing on all learners regardless of difference as proposed by Armstrong et al. (2010). The policy framework on education (MoE 2012) leaves out inclusive education in its presentation of research data on access and provision of education at various levels. This indicates less focus on inclusive education in comparison with other educational provision options. Based on the above information, one may argue that there is need to broaden the scope of inclusive education and have it as the first option in educational provision in line with the Salamanca statement.

Kenya is a signatory of the Salamanca conference declaration. She has ratified the United Nations Convention on the Rights of Persons with Disabilities (UNCRPD). These bind her to the ideals of inclusion rights in education and society (UNESCO 2006). The right to free basic non-discriminative education is enshrined in the constitution of Kenya (The Republic of Kenya [GoK] 2010). In order to understand current inclusive education practice, it is important to view it in the context of various milestones that have been achieved in the country so far.

The current status and practice in provision of special needs education (SNE) is that Special schools and units are the key institutional structures through which SNE is provided. These institutions exclude learners from their own communities since they are rarely situated within their localities. However, with the establishment of free primary education (FPE), many learners with special needs have found their way into institutions in what may be seen as inclusion by default. With the existence of learners with special needs within their populations, schools are forced to accommodate learners with SNE.

The current legal framework in the country is protective of the right to education for all children especially those with disabilities. The persons with disabilities act (2003) has outlined clear guidelines on dealing with persons with special needs including children in various spheres of life including education. Access to education for children with disabilities is assured under the constitution (GoK 2010). It is illegal not to provide education to a learner on the basis of disability. Therefore, the right to free basic education is assured for all learners including those with disabilities. In 2009 the government came up with an SNE draft policy. Among other issues tackled in the document is inclusive education. The policy indicates the government's commitment to supporting and encouraging inclusive as opposed to special schools and units for the provision of SNE. However, education for learners with profound sensory impairment, multiple and severe disabilities may still be offered in special schools (MoE 2009).

Free primary education (FPE) started in Kenya from 2003. This saw the number of children attending primary school multiply. The government pays levies for learners in public primary schools. In cognizance of the fact that some children with SNE may need to attend residential schools, the government should fully fund their transportation to school if the school is far as well as their boarding fees. Children without disabilities living under especially difficult circumstances have benefited. Some can now attend the schools they would have attended outside their circumstances. Many have been attending non-formal education.

6.4 Non-formal Education in Kenya

Non-formal education seeks to respond to learning needs of persons who lack equitable access and/or sustained participation in formal education and learning opportunities. Major strides have been made since the Dakar conference in 2000 especially on gender parity. However, about 58 million children globally have no access to

school and around 100 million do not complete primary education (The World Bank 2008). Moreover, inequality in education has increased, with the poorest and most disadvantaged people shouldering the heaviest burden. The world's poorest children are four times more likely not to go to school than the world's richest children, and five times more likely not to complete primary school. Non-formal education seeks to respond to the learning needs of this population which lacks access and sustained participation in formal education, and learning opportunities. It is therefore a major contributor to inclusive education as it reaches an otherwise excluded population.

Most non-formal education centres in Kenya were established as rehabilitation centres for children in especially difficult circumstances or those in need of special protection (Ekudayo 2001). The situation remains almost the same today with children living under especially still dominating populations in non-formal institutions. A casual visit to non-formal schools reveals that majority are in poor urban and peri-urban areas. A few are located in lower working class areas. The environments in the poor areas where these institutions are situated appear least conducive. There is a greater possibility that majority of students are in poor health due to economic and environmental factors. This brings to question the quality of learning in the schools.

A 2001 study on informal, non-formal and community education centres in Kenya revealed that,

Non-formal schools and centres are not markedly different from normal primary schools in terms of curricular content. Their difference lies in the fact of their ability to provide access to education and learning opportunities for children, youths and adults who, in the absence of NFE schools and centres, may have been left out. (Ekudayo 2001)

Despite offering similar education, non-formal education centres seem not to get similar attention and capitation as formal schools. However, they are a poor replication of formal primary schools. And to a large extent, magnify most of the problems faced in formal education (Ekudayo 2001). This has been noted as of significant impact on quality as improving access may not translate to increased quality in education.

One might say that non-formal schools appear to be more inclusive than formal ones since they target populations which would otherwise not access education through the formal education system. They offer similar education to regular institutions; therefore, they might be useful in curriculum review especially where regulations governing conduct of education are concerned. Apple et al. (2001) assert that formal education has been an agent of exclusion. Certain regulations have excluded some children from school, including school uniform which is mandatory in Kenyan schools, buying learning materials like books and pens. For those in the lower income bracket, this is a real challenge. It has discouraged some parents and guardians from enrolling their children in school. In this case, non-formal schools act as an alternative provision option for education, hence supporting inclusive practice.

In non-formal education (NFE), learner orientation is reflected in the content that is learned, management of the learning process, and organization of the learning

environment. Content is dictated by the functional needs of the learners; duration and timing are flexible, cost is low, rewards are immediate and participatory management is expected. In general, NFE attempts to cultivate a participatory ethos (Ekudayo 2001). This consideration of learner differences allows for a more individualized approach to teaching and learning. This resolves one of the challenges of formal education that it is a generalized approach to learning where a similar approach is applied to all. However, these defining characteristics have raised a number of issues and concerns with regard to equity. One may question the standards of education provided in non-formal schools given that content is determined largely by learner characteristics. It is possible that content differs significantly from centre to centre and class to class over time, based on learner needs and differences. However, studies have shown that it is possible to improve access and equitable learning simultaneously. Despite the fact that NFE improves access, more needs to be done to achieve equitable learning across the board.

6.5 Inclusive Education Benefits of Non-formal Education

Ekudayo (2001) identifies benefits of non-formal education. Benefits described below are those that are seen as supportive of inclusive education. Sharing of primary school facilities where they are limited; enrolment limits dictated by availability of facilities and space often times lead to exclusion of learners. Flexibility of learning time (afternoons and evenings); unlike formal institutions, non-formal learning centres hold their classes at flexible times, which easily accommodate learners with various special needs. For instance, a child parent may attend evening classes when the siblings come back from school. Acceptance of learners of all ages, and strong community support; NFE centres are managed by the communities. Therefore, communities tend to own and support them. The curriculum responds to the felt needs of the learners; Studies have shown that NFE curriculum is tailored to meet the needs of individual learners. In one study Participants showed preference for a curriculum which included skills training and academic subjects, relevant to learners (Ekudayo 2001). Provision is generally low-cost (no uniforms, no levies). These characteristics allow for interaction, acceptance and inclusion of populations previously excluded in education.

One of the most glaring challenges in formal education is cost (Republic of Kenya). Coombs (1968) recommends non-formal education as complimentary to formal education. It helps to meet challenges of access and cost for majority of the people and allows third world countries to catch up with developed countries which have been ahead in development. In Kenya, non-formal schools charge low fees, which is of significant attraction to learners from needy backgrounds that may not be capable to meet the costs of formal schools. Non-formal schools appear to be a good option for learners from low income areas and those who may not have capability to

cope with requirements of formal schools including payment of levies. Such learners include former street children, homeless children, child labour victims and poor regular pupils. The consequence of failure to meet the sometimes costly requirements of education has led to increased school dropout rates for the above mentioned categories of learners. Studies in Ghana and Indonesia concluded with the contention that NFE could be highly instrumental in solving problems of equity and access to education. It provides inclusion for previously excluded learners in education.

6.6 Challenges

Ekudayo (2001) found that teachers in NFE were inadequate in number, inappropriately trained in content and delivery, and poorly remunerated. Turnover was high due to both poor remuneration and conditions of work. There was a general lack of adequate and appropriate facilities and resources for teaching and learning. Most places referred to as schools and learning centres were temporary and makeshift shelters. The situation has barely changed today. Most institutions do not possess their own land, therefore it becomes challenging to put up permanent structures. Physical facilities are generally inadequate and inappropriate. Learning materials are inadequate and of low quality. In Kenya, non-formal education has not been part of mainstream education provision. Others include inadequate teachers resulting in high teaching load prompting the use of ineffective teaching methods and Lack of motivation of the teaching force (Orodho et al. 2013).

Financial and administrative challenges are significant in NFE. Weak governance and accountability structures at all levels of education; lack of reliable data in some areas, especially in identifying the number of hard to reach children, number of children still out of school, and determining dropout and repetition rates; inadequate financing of education programmes, including teacher recruitment; inadequate enforcement of the right to access education based on the existing legal framework; and ineffective and uncoordinated monitoring and evaluation as well as reporting systems on education programmes form the bulk of challenges (Republic of Kenya/UNESCO 2012).

Non-formal education has been stigmatized as an alternative for the poor who stand the risk of further marginalization and exclusion. A review of the literature on non-formal education or alternative approaches to basic education indicates the concerns. For instance, The Commission of Inquiry into the Education System of Kenya noted that many non-formal schools, although catering for many poor children, lack infrastructure, qualified teachers, learning/teaching equipment, and are generally offering a very low quality education. This brings in to question the inclusivity of non-formal education as far as quality and curriculum achievement based on ability is concerned.

The government of Kenya is currently embarking on a digital learning programme for learners in public schools. Having been involved in planning and implementation of the programme, it's is of concern that non-formal education appears to feature little in provision of laptops and capacity building in digital learning for staff. Although a policy on NFE was developed in 2009 (Republic of Kenya/ UNESCO 2015), ongoing education sector developments like the digital learning programme appear to leave non-formal schooling out. It seems clear that more needs to be done.

6.7 Recommendations and Conclusion

Non-formal education can play an important role in achievement of EFA goals and inclusive education. For urban centres like Nairobi, a change of approach to education provision may be necessary in order to accomplish EFA. Dib (1988) recommends fusion of NFE approaches to education. He singles out correspondence and distance learning in mainstream education as examples of approaches which can be borrowed from NFE for formal education. Use of technology has to avail education to all has also been recommended by.

The radio could be a classic example of a technology which can contribute in availing education to large groups of people. Having in mind the increased accessibility to radio in Kenya through mobile phones, such provision could go a long way in supplementing traditional formal education. If supported through provision of learning materials, NFE schools and centres have the potential to provide quality education to those they serve through use of such technologies.

Infrastructure and staffing have been identified as a serious challenge in NFE. The Republic of Kenya and UNESCO (2012) recommend that access to education and retention rates can be increased through employment of more teachers and improvement of school infrastructure. Further, provision of midday meals may improve children's participation, health and nutrition. Increased national budgetary allocation to the education sector in proportion to national spending should also be done.

The recommendations of Ekundayo (2001) seem applicable in the Kenyan context since not much has changed in the NFE sector since his study. The recommendations include the following: Inclusion of NFE in the basic education system with parity of esteem of the formal and non-formal sub-sectors to avert the problem of non-formal education being regarded as a lesser option reserved for the poor; Creation of an interface between formal and non-formal sub-sectors of education to facilitate curriculum harmonization and ensure that the minimum essential learning needs are met. This would minimize discrepancies in the sector. A system of equivalency is recommended to facilitate movement between the two sectors. This, however, should not lead to the demise of the non-formal features of NFE.

A sustained programme for community education should be formulated. NFE providers, community members, school/centre managers and policy makers should be educated on the meaning, nature, purpose, scope, management, and benefits of non-formal education. This would ensure that NFE has similar recognition as formal education. To achieve this, information dissemination forums like seminars and conferences could be instrumental. Themes could be created to guide discussions among stakeholders about the issue.

Capacity building especially in teacher training, as well as provision of learning materials, and payment of teachers' salaries would go a long way in improving quality and motivation in the NFE sector.

It is important to note that the government of Kenya has made significant milestones in improving access and equity in basic education, especially due to provision of Free Primary Education (NFE) since 2013. This coincided with recommendations by the United Nations for governments to provide free basic education (United Nations 2013). How free FPE is remains highly debated because parents still have to put up some costs to educate their children in public primary schools. This current situation necessitates the existence of NFE, which provides access to education to those excluded from formal education by virtue of their circumstances – a step towards inclusive education.

Section Introduction: How Nation-States Respond to the Impacts of Migration, Immigration and Ethnic Diversity in the Context of Globalization in India, China, Japan, Korea and Singapore

Xue Lan Rong

7.1 Population Movement in Asian Countries: Urbanization and Globalization

Since World War II, and especially in the last three decades, increasing globalization, with de-territorialization of capital and redistributions in the international labor market, has brought urbanization and population movements to almost all Asian countries undergoing industrialization. Scholars (e.g., Bray 2013; Suarez-Orozco 2001; Torres 2013) point out that these economic, social and political trends have presented enormous challenges to education systems in policy making and implementation of compulsory education and beyond, mainly focusing on (but not limited to) allocating and distributing financial resources, governance and management, etc. Changes in educational systems – including centralization/decentralization, marketization, corporatization and privatization prompted by various internal and external forces – are re-shaping the balance between quality, equality and equity regarding educational opportunities and outcomes for a vastly changed student population in urban areas. These challenges are particularly acute for those who have been historically and/or currently discriminated against, including racial/ethnic minorities, immigrants, rural-to-urban migrants and working-class students with low social economic status.

In terms of urbanization and population movement, historically, as countries advance from low to higher productivity levels, labor moves from under-employment in low-productivity rural realms to fuller employment in higher-productivity urban manufacturing realms. The push for a speedy urbanization resulting from globalization and the transformations noted above have been spurred by export

X.L. Rong (✉)

e-mail: xrong@email.unc.edu

demand for goods produced in the urban sector. However, the level and pace of urbanization varies greatly across regions and countries and within individual regions and countries as well (Henderson 2009). According to a 2014 report (United Nation 2014), the most urbanized regions include North America (82 % living in urban areas in 2014), Latin America and the Caribbean (80 %) and Europe (73 %). In contrast, Africa and Asia remain mostly rural, with 40 % and 48 % of their populations living in urban areas, respectively.

The magnitude of rapid urbanization in Asian countries in the last three decades is evident in the increases in their urban population in relation to corresponding global figures. The percentage of urban population in Asia has risen from 32 % in 1990 to 48 % in 2014 and is expected to reach 64 % in 2050. In terms of the pace of urbanization, urban population accounted for 24 % of China's total population in 1990 and 54 % in 2014, and is expected to reach 76 % in 2050. India is following a similar trajectory, where urban population accounted for 26 % of its population in 1990 and 32 % in 2014, and will reach 50 % in 2050. Because all regions are expected to urbanize further over the coming decades, given that India and China have the world's largest rural populations (857 million in India and 635 million for China), Asia is expected to urbanize more rapidly than many other regions and will experience rural-urban population migration in the greatest magnitude (Kundu 2009).

As the world continues to urbanize, sustainable-development challenges in cities will increase, particularly in developing countries, where the pace of urbanization is very fast. The process of urbanization historically has been associated with other important economic and social transformations that bring greater geographic mobility, including internal migration (city to city and rural to city) and international migration. Nevertheless, rapid and under-planned urban growth threatens sustainable development when needed infrastructure is not developed or when policies are not implemented to ensure that the benefits of city life for all residents are equitably shared. Therefore, holistic policies to improve the lives of both current urban residents and newcomers are needed at each development stage. These policies should integrate all facets of sustainable development, ensuring that the benefits of urban growth are shared equitably among all residents, regardless of their geographic origins and length of their residency.

Scholars (e.g., Henderson 2009; Kundu 2009) have voiced their concerns about the enormous challenges posed by rapid urbanization in many countries, especially in countries such as China and India, where urbanization proceeds quickly while social and policy structures adjust slowly. Therefore, cities have become overwhelmed by challenges such as congestion, poverty and pollution, and by the development of urban slums, breeding health problems, safety issues and social unrest. Modernization in urban planning and management has become an urgent task to address these problems.

As pointed out by Kundu (2009 in *Urbanization and Migration: An analysis of trends, patterns and policies in Asia*), trends and patterns in migration, urbanization and city development across Asian countries can only be explained in the context of the countries' history, social fabric, political environment and cultural traditions.

For example, Kundu stated that one must analyze internal migration in China because there are very few international immigrants in China, so China's urban population growth derives from three main sources: the natural increase in urban population, population migration from rural to urban areas, and the re-classification of urban and rural areas. For instance, Wang (2013) reported that, the major population shift has been rural to urban migration, accounting for almost 70% of urban population growth in 2005. Through the Hukou system (residential permission authorized by city government) and other policies, China has maintained a strict separation of urban and rural sectors, making rural-urban labor mobility more difficult than in other countries. This strict separation of the urban and rural sectors has made income inequality in China one of the highest in Asia today.

In addition to internal migration and urbanization, international migration and city development also play significant roles in reshaping urban life in Asian countries. Since 1945, virtually all highly developed countries have experienced large-scale immigration and the dynamics of the migratory process, in which incoming workers and refugees settle into resident ethnic groups. These processes produce marginalization, based on the immigrants' vulnerable economic status and lack of local social networks, leading to labor-market segmentation and residential segregation. However, it also involves the process(es) of community formation, through which ethnic groups develop their own economic, social and cultural infrastructure, and mobilize politically. Scholars (e.g., Castles 1995; Castles and Miller 2003) have pointed out that increasing interaction between immigrant groups and local populations vary in character within each country and present a mixed bag of peaceful co-existence and hostility and violence. Therefore, it is imperative that the state reacts to immigration and ethnic diversity with policies geared toward employment, housing and education.

It is important to look at changing migration streams in Asian countries with respect to the historical legacy of the pre-colonial, colonial and post-colonial eras. Globalization with movements of capital and labor across national borders is not a new phenomenon in Asia, and each migratory wave has its own specific characteristics in various countries. Yet in comparing international migration trends and their impacts, we can find important similarities in Japan, Korea and Singapore (see Castles and Miller 2003), three countries with the highest percentage of urban population in Asia – 93% in Japan, 82% in Korea and 100% in Singapore (World bank 2015). In the cases of Japan and Korea, after decades of rural-urban internal migration, international migration trends have become increasingly influential in the twenty-first century. Migration streams in these two countries are more complex and dynamic, becoming part of social, economic, political and historical transformations closely connected with macro-economies that impact the fabric of everyday life for all citizens, especially urban residents. As a result, many governmental policies related to national and regional migration have been evolving constantly to keep up with the varied trajectories of human mobility, shifting hierarchies of citizenship and trans-national forms of unity, identity and belonging. Singapore has a uniquely complex history of political, social and economic policies implemented by the British colonial government, resulting in an inherited division of Chinese, Indian

and Malaysian racial (ethnic) groups (Barr and Low 2005). Therefore, it is imperative to draw attention to the importance of exploring the relationship between various types of migration and the transformation in economic, political and social domains in the context of contemporary changes linked to globalization in a range of societies, identifying the main issues and making comparisons across very different historical and cultural settings.

7.2 Theoretical Framework and Analytic Lens

For readers to synthesize the main themes across the seven chapters in this part and make comparisons between the underlined philosophies, purposes, and intended – as well as unintended – outcomes of educational policies and practices in India, China, Japan, Korea and Singapore, the section editor is proposing the political economy of education as an umbrella theoretical framework. Political-economy theory most commonly refers to interdisciplinary studies drawing on economics, political science and sociology, and it has gained ground in the past decade in research in international education and comparative education. By studying how economic theory and methods influence political ideology, structure, system and organization, political economy is the interplay between economics, law and politics, and shows how institutions develop in different social and economic systems, such as capitalism, socialism and communism. In the section editor's view, one of the most useful features of political economy for educational researchers is analyzing public policies in terms of how they were created and implemented in various contexts and how the study of the role of public policy may influence the economic and social welfare of a particular political unit or group (Weingast and Wittman 2008).

7.2.1 *Political Economy of Education*

Due to its interdisciplinary nature, political-economy theories have been adapted in educational research. In their book, *The Political Economy of Education: Implications for Growth and Inequality*, Gradstein et al. (2005) provide a theoretical framework for readers to understand the complex relationship between education, economic growth and income distribution in relation to how the state may formulate effective policies to improve the financing and structure of education. They emphasized that the dominant role played by the state in financing, regulating and providing primary and secondary education reflects the widely held belief that education is necessary for personal and societal well-being. The findings in their study demonstrate how the institutional arrangements through which education is financed and implemented might influence education spending, economic growth, income inequality and intergenerational mobility. The authors also suggest that some social

and cultural factors, such as religion and cultural values, play a role in shaping educational and economic outcomes, and that education influences social cohesion.

The section editor believes, due to its interdisciplinary nature, that by using political economy in education theory, readers may be able to adopt a wide range of analytical lenses to process the information presented in this book, synthesize their understanding cohesively and assess the suitability of the recommendations in the context of their own countries. However, the section editor also would like our readers to be aware of the limitations of using this theoretical framework. Political economy as a discipline is a complex field, covering a broad array of potentially competing interests. The theory's use in the areas of international and comparative education to study educational systems and policies comparatively is a rather recent trend. Because this theory was originated in Western countries and the field of international and comparative education is in a transitional period from neo-liberalism to post-colonialism, the editor is aware of other applicable theoretical frameworks. What follows are two examples of research studies that applied the political economy of education theories in their international comparative education research, and the notions articulated in these two studies may add a larger international context for educational reforms to the seven chapters in this part.

In the chapter of *The Political Economy of Educational Reform in Australia, England and Wales, and the United States*, Keating et al. (2013) construct a framework for a discourse on impacts from the trends of globalization on educational reform in three Western countries. They pointed out a rightward shift in these countries to marketization and privatization of educational services, spurred by neoliberalism and economic rationalism. This shift resulted in weakened public control over education and increased reliance on market forces and accountability in governmental education policies over quality control through standardization in curriculum, teacher training, and assessments of students and teachers. As put by the authors: "The economic rationalist argument concerning the primacy of material interests leaves little room for such issues as self-development or collective development, participation, equity, social justice, or even democracy" (p. 250).

Framed by political economy of education theories, Hirosato and Kitamura (2010) studied several developing countries in Southeast Asia, which face an enormous challenge in ensuring equitable access to quality education in the context of deepening globalization and increasing international competition. They believe government must provide education that simultaneously meets the goals of EFA (Education for All) at the basic education level and of developing a more sophisticated workforce required by the knowledge-based economy at the post-compulsory, especially tertiary, education level. Hirosato and Kitamura crystallized the dilemma in educational development in many Asian countries and asserted that to meet this challenge, developing countries need to reform/renovate their education systems and service delivery as an integral part of national development. However, most of the Asian countries they studied have not yet fully developed the institutional capacities to undertake necessary education reforms to respond to decentralization, privatization, marketization, etc. that require new roles at various (central and local, or public and private) levels of administration.

After all, considering the historical, social, and economic constraints many Asian countries have faced in the globalization process, the themes and issues discussed in this book are thought provoking. The scholars' examination of key challenges to a particular country, thus, provides an instructive illustration of how these multiple goals are incorporated into an existing national policies.

While the section editor believes the framework of political economy of education can benefit the understanding of educational equity and equality issues related to internal migration in the context of urbanization and to immigration in the context of globalization, the section editor would also like to provide an additional analytical lens – immigration related assimilation and multiculturalism theories for readers to examine the key challenges in education across nations. This lens provides an instructive illustration of interactions and intersections between cultural issues (philosophies, ideologies, beliefs, values, and traditions) and structural matters (power, policies and laws, and organization and operations, etc.).

7.2.2 Immigration and Education

Ensuring equitable access to quality education for all students is one of the central issues for most countries' educational reform efforts in Asia, but people in a particular location (urban or rural) often hold contradictory views with regard to the delineation of belonging, membership in a community, and local and national unity. It has been one of the challenges for internal migrants in countries experiencing urbanization. However, educators in developed countries with increasingly diverse immigrant populations may face some additional challenges. Educational policies are usually characterized by a multiplicity of definitions, theories, and practices, with multiple philosophical bases for exclusionism, assimilationism, pluralism, and multiculturalism. A discussion of policy and practice models for receiving newcomers may provide our readers with an applicable analytical lens for cross-national comparison through various historical periods.

In scholarly publications, Castles (1992, 1995, 2009) linked several models to different historical patterns of nation-state formation and ethnicity transformation, and suggested a typology of policy models regarding how nations respond to newcomers during several waves of large-scale migration in Europe and North America. Castles cited four basic ways in which a receiving location reacts to newcomers. First, the exclusion model is based on the desire to prevent permanent settlement of the newcomers. It includes total exclusion (preventing the entry of immigrants) and differential exclusion, in which immigrants are incorporated into certain occupations and segments of society, but are denied access to others areas (e.g., welfare systems, citizenship status, and political participation). Under differential-exclusion policies, immigrants become ethnic minorities, which are part of civil society, but are excluded from full participation in economic, social, cultural and political interactions. Therefore, it implies a strong and continuing link between low SES and ethnic background, as ethnic minorities are usually socio-economically disad-

vantaged. Castles believes the exclusion model is constructed on the acceptance of stereotypes by the governments and resident populations of the receiving countries. Many local residents might consider admission of migrants as a temporary solution, but view permanent settlement as threatening. Castles pointed out that the strategy adopted to keep immigrants temporary is usually based on restricting residency and preventing families from reuniting.

Castles (1995) characterizes the second model as an assimilation model that is usually defined as the policy of incorporating migrants into society through a one-sided process of adaptation: Immigrants are expected to give up their distinctive linguistic, cultural or social characteristics and become indistinguishable from the majority population. The role of the state in assimilation is to create and implement policies that will impose majority culture and values through insistence or even coercion (in some cases), such as requiring the use of the dominant language only when immigrant children attend public schools. In most cases, overt assimilation policies have faded away over time, replaced with policies seeking integration. According to Castles, integration policies are often simply a less-pressing form of assimilation, based on the idea that adaptation is a gradual process rather than a quick fix. Still, the ultimate goal is a complete absorption into the dominant culture.

Castles (1995) then discusses the more recent models of pluralism and multiculturalism. Pluralism was characterized as the acceptance of immigrant populations as ethnic communities with distinctions in language and culture. According to Castles, pluralism may tolerate differences, but does not believe it's the government's role to support the maintenance of ethnic cultures. Pluralism differs from explicit multicultural policies, which advocate for the majority's willingness to accept cultural differences and change their social behaviors and institutional structures accordingly. Multiculturalism may go further by promoting that the majority may even consider altering their perceptions about national identity and unity to accommodate the cultural and demographic landscape of the changing world.

With a wide range of views, other multicultural scholars also draw some distinctions between pluralists and multiculturalists. Pluralists (e.g., Feinberg 1998) believe that the "common school" plays an important role in reproducing a shared sense of membership in the national community while remaining relatively passive in promoting cultural identity, including language, religion, and other forms of group identity that should be confined to the private sphere. On the other hand, multiculturalists (Bank 2004; Gay 1997; Kymlicka 1998) seek the promotion of cultural identity through public schools, favoring cultural fairness – no one cultural group dominates over others. Kymlicka (1998), for example, contends that ethnic cultural groups have "a valid claim, not only to request tolerance and non-discrimination, but also explicit accommodation, recognition and representation within the institutions of the larger society" (147). These scholars maintain that any concept of national identity promoted through public education should include both the unifying and diversifying aspects of the national community and cultural, national, and global identities are interrelated.

These models have implications on a wide range of institutional domains and may determine immigrants' position in society through certain immigration policy (e.g., citizenship status, residence rights and family reunion), labor market position, residential situation and community formation, social policy, and racism toward minorities. According to multiculturalist scholars, multicultural policies in education are usually implemented through several agencies at all levels of government. In terms of the practice of multiculturalism for equal and equitable access to quality education, the government needs to recognize the need for special laws and institutional and social policies to overcome barriers to immigrants' full participation in society (Castles 1992) and provide specific accommodating services, such as receiving centers in communities, language courses, educational support for children, and translating and interpreting services, etc., which need to involve ethnic organizations' participation in planning and developing.

Interculturalism is also suggested by European scholars as an alternative to multiculturalism and assimilation (e.g., Cantle 2005, 2012; Wood 2010). Interculturalism focuses on inter-ethnic contact and the development of a shared understanding within super-diverse populations without referring to stable and fixed minority groups or national identities. Arguably, interculturalism is concerned with the interests of both majority and minority cultures, requiring cultural sensitivity and adaptation from all sides, in contrast to multiculturalism, which is primarily focused on the majority accommodating the minority, or assimilation, in which the minority has to adapt to the culture of the majority.

Scholars (e.g., Castles 2009) argue that some components in the differential exclusion model, mixed with the assimilation/integration model, are still subtly applied in countries with large immigrant populations. They have not been explicitly advocated due to social tensions and malignant racism. Countries applying the assimilation model generally have moved to a mixed approach of assimilation and pluralism, embodying some elements of multiculturalism. This approach varies, according to the degree of state intervention in settlement and community relations. Beyond these structural similarities, there are considerable differences in policies, attitudes and behavior toward immigrants in different countries.

7.3 What Is This Section About?

This section of the handbook brings together 15 scholars from six countries, with a majority possessing a practitioner's scholarship in educational policies and institutional studies, curriculum and instruction, and teacher training. Almost all of them have research experience in the United States, as well as in (at least) one Asian country. Focusing their writing on multicultural education and urban issues related to the provision of equal and equitable education for all children, these researchers identified the issues, concerns, strategies and recommendations that emerged when changes in education systems were necessitated in societies going through large-scale labor force redistribution and population movement. By analyzing and

critiquing the policies and implementations through carefully examined examples of successful and not-so-successful programs and practices in five nations, this section of the book should be considered to have two parts: Part One, *Globalization, urbanization, internal migration, and access to quality education in India and China, two industrializing countries* and Part Two, *Globalization, immigration and multicultural education in Japan, Korea and Singapore*.

Providing a larger framework to understand the developmental stages of Asian countries, Hawkins (2013) explains a common recognition among scholars who have expertise in Asian education: There has been broad regional diversity among Asian countries, and the Asia-Pacific region is often characterized by different development trajectories. At one end of the scale are the region's more historically developed nations such as Japan, Korea, and Singapore, continually pursuing economic development and finding themselves with labor shortages, especially at the lower end of the employment spectrum. Immigration became an inevitable strategy for labor supply in those countries. At the other end of the scale are India and China, whose massive economies are rapidly expanding with swift urbanization and city development, inducing rural-to-urban migration to provide new labor forces to meet both their own requirements and highly segmented global labor markets. Due to their different development trajectories, the challenges and priorities for education provisions are also different. Some nations, such as Japan, Korea, and Singapore, have come close to universal access to K-16 education. Other nations, such as India and China, continue striving to facilitate 9-year compulsory education. As pointed out by scholars who have applied political economy of education theory in their comparative education research, educational policymakers in Asian countries are aware of the complex nature of the relationship between educational expansion, access and equality (Hirosato and Kitamura 2010). Although policymakers and educational officials in some countries claim their ultimate goal is providing more education equality for disenfranchised student groups who's ethnic, linguistic, religious, caste, gender, SES, and other distinguishing characteristics become central to policymaking, their current education policies and practices vary from marginalization and discrimination to some forms of affirmative action.

To explore the contemporary challenge of government in urban societies transformed by migration and immigration, this section on urban education in Asia centers around several main concerns: When patterns of migration – internal, external or mixed – bring escalating transition and transformation to urban areas in some Asian countries, how have government officials, policymakers, educators and educational institutions responded to the needed changes? To what degree are these policies and implementations effective, compared with their purposes and intentions, and why?

In the first part of this section, three chapters focus on the educational challenges of rural-urban migration spurred by globalization and urbanization in the past three decades in India and China. One chapter articulates the notions and sentiments of the transformations in education and other social domains stimulated by the urbanization, migration, immigration/emigration, and discontent from the impacts of globalization on education. The other two chapters focus on the restrictions of

urban residential permission policies and other policies that significantly limit quality access by rural-to-urban migrant children to compulsory education and beyond.

There are four chapters in the second part of this section, providing examples in terms of exploring how multicultural education is implemented in diverse social, political, and historical contexts, and examining how tensions between various interest groups, as well as between local and national governments, are alleviated with culture-based policies and practices infused with distinct national characteristics (e.g., Schweisfurth 2006; Pike 2000). Each chapter in this part of the Asia section identifies key factors in establishing and reforming educational policies by linking their analysis to varying historical experiences of nation-state formation and the interplay of social, economic, and political factors before moving on to examine laws, policies, and implementation. As a whole, our readers will find that the chapters show differing educational responses to migration and immigration by individual nations; even as general trends and policy conclusions emerge. Moreover, from reading all seven chapters, readers will realize that the reality in each country is much more complex and contradictory than these studies can show.

7.3.1 Part One: Globalization, Urbanization, Internal Migration, and Access to Quality Education in India and China, Two Industrializing Countries

Both India and China have distinctive features of urbanization. Although both countries need to meet the challenges from ethnic tensions, classism, sexism, language barriers, religious conflicts, etc. during the urbanization process, India has to deal with the caste system and the legacy of being a former British colony, while China must navigate bumpy roads through economic modernization and political transformations. For example, China has experienced booming development and urbanization since the 1980s. Less than 20% of its population lived in cities in 1980, a percentage that increased to 26.4% in 1990, 36% in 2000 and almost 55% today (Wang 2013). As put by Henderson (2009), there are a variety of distinctive features in China's urbanization compared with other countries – the result of past policies, as well as legacies of the previous central planning economic system, the Hukou system, and other policies. For example, with the Hukou system, China has maintained a strict separation of urban and rural sectors, making rural-urban labor mobility more difficult than in other countries. As a result, China's urbanization is incomplete, and China's urbanization level can be overestimated.

In her unique tones and style, Asher, in her essay “Engaging Identities and Cultures in a Globalized, Postcolonial India: Implications for Decolonizing Curriculum and Pedagogy,” draws respective comparisons of time and culture to deconstruct globalization, urbanization and changes in education in theoretical terms inspired by theories of political economy of education and postcolonialism. Comparing educational scholarship in the U.S. and India, and analyzing Akash

Kapur's essay "India Becoming: A Portrait of Life in Modern India" as an illustrative study, Asher discusses in-depth the interfaces of identities, cultures, and education in "economically liberalized" and globalized postcolonial India, with particular reference to the journey of urbanization. She highlighted the effects of privatization, corporatization, and discourses of efficiency and accountability in the Indian and U.S. educational contexts to express her sentiments of discontent over globalization. Her research essay reminds educators of the hidden trends of recolonization in pedagogy, policies, and curriculum. Asher's study added a unique voice to studies in this field, as immigration usually is studied from a destination-country perspective, but not from an origin-country perspective, resulting in skewed and more asymmetrical views. By presenting four vignettes and quotations from several essays, as well as a critical examination of multicultural education in the U.S., Asher provides readers with perspectives from both sides.

The second and third chapters discuss the challenges and solutions for ensuring equitable access to quality education (mainly K-9 compulsory education) in China. The main discussion of both chapters focuses on a central issue: a large portion of rural-to-urban migrant children who cannot enjoy the benefits of quality compulsory education entitled to children of urban residents who have permanent resident permission. The chapter, "The Education Issues of the Children of Internal Migrant Workers in China" (by Yuan, Noblit and Rong), is a macro-scope comprehensive policy study with a baseline historical review. Highlighting the unequal and discriminatory treatment of rural migrant children regarding their enrollment in urban public schools, their school choices and the unfavorable admission policies when they face College Entrance Exam and college admission, this chapter reveals the major obstacles in policies and suggests short-term and longer-term solutions in policies and school practices.

The third chapter, by Liu, Sun and Barrow, is a micro-case study based on interviews of local government officials, school administrators, teachers, and parents of migrant children and permanent residents in Wu City, a large migrant-inflow city in China. Throughout the study, the authors articulate their understanding of how and why China's central government promised to ensure migrants' children to have equal access to public compulsory education, but local authorities' interpretation of the policies and their approaches of implementation have resulted in the problems with migrant children's access to K-9 compulsory education that have still not been resolved. The authors highlight a dilemma in which local education authorities at the urban level are in the middle of what they call the "promise-practice framework." Local authorities need to respond to the central government and are directly answerable to city stakeholders as well, but they are also burdened by limited executive powers and financial resources to resolve the problems, thus contributing to an environment of conflict identified by the interviewees, including: conflicts between local interests (contradictory views from migrant communities and local permanent residents) and the requirements from their superiors, between pursuing economic development and fulfilling compulsory education obligations, between equity and quality (meritocracy), and between the uncertainty of migrant laborers' geographical movement and a local permanent investment in compulsory education.

Approaching the same theme, but from different angles and with different scopes and research methodologies, Yuan, Noblit, and Rong's chapter provides historical, social and policy context for Liu, Sun and Barrow's study. In turn, Liu, Sun and Barrow's study supply bottom-up data with concrete examples for readers to understand the nature of the challenges in those contexts and to assess various potential solutions. These two studies are also complementary in achieving a major advocacy point: The current Hukou system in China must be reformed fundamentally, not just for humanitarian and financial concerns, but also for healthy and more complete urban development. Accurate, consistent, systematic, and timely data for policy analyses in education reform, urbanization and city growth are critical for assessing current and future needs with respect to urban growth and for setting policy priorities to promote inclusive and equitable urban development. To improve quality access to education, both chapters agree that substantial reforms in the Hukou system should be the policy priority for the Chinese government. The section editor was very glad to know the Chinese government took another giant step to change the Hukou system further in China with a policy published on Dec. 12, 2015.

7.3.2 Part Two: Globalization, Immigration and Multicultural Education in Japan, Korea and Singapore

Globalization and increased immigration have brought new opportunities, as well as new tensions, to post-industrialized Asian societies such as Japan, Korea, and Singapore. However, these three countries have different national identities due to past colonial history and more recent immigration. According to Esman (1992), Japanese immigration policies in the past were driven by the desire to maintain "ethnic purity" and prevent overpopulation. The desire shaped the historical experience of Japan's historic minorities, largely the indigenous minority (the Ainu), which has suffered severe discrimination, and the historic immigrants – Koreans who were recruited as workers for Japanese industry in the early part of this century, and particularly during World War II. There are more than 700,000 Koreans living in Japan, of whom 85 % were born in Japan. Many are now in the third or fourth generation of settlement and speak Japanese fluently. For a long time, it was extremely difficult for foreigners to gain long-term residency rights and virtually impossible to become citizens. Tracing the nation's history of colonization, occupation and neocolonialism, the current immigrant population in Japan is a result of several factors: a colonial past that led to immigrant inflows (Japanese returnees) from neighboring Asian countries, current foreign labor inflow (including documented, undocumented, and overstayed-visa workers), and admission of refugee inflows and asylum-seekers from the Asian continent. As a result, many immigrants remain highly segregated and experience discrimination in employment, education, housing and eligibility for public services. The makeup of immigrant and minority populations in Korea and Singapore is also complicated. For example, Barr and

Low (2005) summarized the historical influences of the political, social, and economic policies implemented by the British colonial government on the division of the people of Singapore, then part of Malaya, into racial groups. The authors of all four chapters in this part provide systematic and detailed information regarding the shaping and reshaping of immigrant and minority populations.

Challenges in educating diverse student populations in Japan, Korea, and Singapore draw together a group of distinguished scholars who focus their attention on redefining multicultural education and national and group identity in fourth, fifth, sixth and seventh chapters in this section. While all four chapters trace historical and macro-policy discourses on the national issues affected by multiculturalism, diversity and identity, each chapter studies specific situations, policies, and events in an individual country. These chapters reveal the uneven multicultural development in policies and implementation across different countries and the needed policy and implementation steps to bridge the gap between various communities. These chapters also explain how to construct a deliberative framework to create a sustainable democracy with shared values of individual dignity, multicultural diversity and national unity (Kim 2013). They also make suggestions for considering a newer educational paradigm for multicultural education.

In her chapter “Transnational Migration and Urban Education in Japan,” Okano identified “how best migrant children can be integrated into the mainstream schooling and the host society” in Japan as one of the most pressing issues facing urban education. Focusing on transitions from primary education to secondary education and higher education in large urban areas in Japan, her chapter reveals that the retention rates beyond compulsory education for children of immigrants have remained substantially below the national average in spite of the efforts made on behalf of the national government, local education boards and individual schools. Using descriptive national data and data from her qualitative study in Dai Primary school, Okano argues that governmental school programs alone are not enough to address the problems and, supported by her study’s evidence, that free, migrant-specific out-of-school programs (e.g., remedial academic coaching and entrance examination preparation) play increasingly significant roles in filling the gaps. She reports that collaboration between local schools and out-of-school programs have emerged in some localities as effective measures in promoting migrant children’s participation in schooling. She further argues that the increasing visibility of free out-of-school programs for immigrant children may have directed public attention to children from poor native families who are similarly struggling at school.

The next two chapters provide a thorough discussion on Multicultural education in Korea. However, each chapter makes its arguments using different approaches with different methodologies: Chang’s chapter focuses on historical and institutional policy analyses, and Jo and Jung’s chapter makes their arguments based on philosophical, ideological, and theoretical perspectives. Chang, in her chapter “Multicultural Education in Korea” reviews the development of the history of, and existing research in, multicultural education, and conducts an analysis on multicultural education policies in Korea, along with a critique of the changing definition of “multicultural families.” With carefully assembled descriptive data

covering a period of over half a century and thoughtful analyses of relevant educational policies, Chang highlights her discontent over the definition of “multicultural” in Korea. Chang contends that multicultural education should be for all children and families in Korea, not just for immigrant and minority children and their families. Based on that belief, Chang strongly advocated for a new direction for policy development and implementation.

In a departure from Chang, based on a philosophical and ideological examination of concepts, theories, and educational policies, Jo and Jung’s chapter, “Rethinking Diversity in South Korea: Examining the Ideological Underpinnings of Multicultural Education Policies and Programs,” aims to answer questions such as how the Korean education system understands diversity and how that understanding manifests in the development and implementation of policies and programs. Jo and Jung discuss several major challenges to educators and the causes and responses from Korean society. They highlight the contradictory understanding of multiculturalism and national unity, and the underpinning of the concept of “cultural nationalism,” which emphasizes the notions of “homogeneity,” “unity,” and “solidarity,” but de-emphasizes notions such as “diversity,” “heterogeneity” and “difference.” The two authors also show how schools launch efforts to provide equal and equitable education to diverse student populations on one hand, and the pressures to prioritize the meritocratic and elitist traditions on the other. By examining multicultural education initiatives in three metropolitan South Korean cities – Seoul, Incheon, and Busan – Jo and Jung stress the progress and pitfalls of those efforts, as well as the ideology that informs them. They concluded that cultural nationalism promotes an agenda of assimilation and creates social hierarchies not only between Koreans and foreigners, but also among native South Koreans, North Korean border-crossers and returning ethnic Korean migrants from various diaspora. Similar to Chang, the two authors also made a fundamental call for true multicultural education for the entire population to expand the notion of Korean peoplehood to embrace the true diversity of Korea’s population.

In Chap. 14, “Educating All Children in Multicultural, Multilingual Singapore: The Quest for Equity Amidst Diversity,” Goodwill and Low discuss how Singapore’s government implemented integrative educational policies to cope with ethnic division and tension in post-colonial Singapore (Ho 2009), which represents a diverse mix of various racial groups, cultures, languages, and origins (mainly of people from China, Malaysia, and India). As a city state, Singapore constitutes an urban nation and an urban school system – that is, employing several educational policies to successfully enhance social cohesion and advance social mobility among its multicultural citizenry. Goodwill and Low’s chapter begins with a brief history of Singapore to establish a contextual baseline, then goes on to use Singapore as an illustrative case to address the challenges in implementing integrative equity and language policies and practices for different racial groups through major developmental programs such as English education and bilingual education, teacher training, and recruitment and retention programs. Grounding their narratives in concrete contexts as they examine specific policies and practices, Goodwill and Low will lend their experiences and lessons to educators in other systems.

The section editor would like to remind readers that although the trends of policy models in responding to immigration and education in Japan, Korea and Singapore evidenced in this book indicate a philosophical and policy transition from assimilationism to pluralist/multiculturalism, there have been substantial exclusionary and assimilationist movements in all developed countries, and multicultural models remain controversial (e.g., Castles 2009). There are obviously many unsettled arguments and lingering questions put forward by the chapter authors of this book and many other scholars. For example, scholars (e.g., Kim 2013) analyzed South Korea's recent transition toward a multicultural society by highlighting some of the key problems for immigrants with regard to inequality, worker rights and human rights. They argued that South Korean multicultural discourse remains within the framework of the hierarchical assimilation policies of the government. Ho (2009) suggested that Singapore – a young, heterogeneous nation-state faced with interracial tension and strife from its inception – has managed to balance the demands of creating a unified “imagined community” (Anderson 2003) supporting diversity and promoting global perspectives. However, like any multiracial heterogeneous state with historical constraints, Singapore also faces the same struggles regarding balancing the promotion of national identity, diversity, and global perspectives through education. These tensions between the national and the global, as well as between unity and diversity, remain highly relevant in today's Singapore, with vast diversities in an increasingly globalized world.

Overall, the section editor hopes these chapters leave readers with a critically deepened understanding of the education challenges that Asian countries have faced from a variety of perspectives with myriad contextual considerations. We hope our readers will develop new answers for some of the larger and interconnected questions, such as: Who has access to what levels of education, with what outcomes, and why? Have the changes in educational policies and practices in the last 30 or more years provided greater equality, equity, efficiency, and quality, and how? What are the future directions for the shifts in pedagogical paradigms and policies changes? What are the theoretical framework(s), analytical lens, guidelines and benchmarks that policy makers and practicing educators can use to deconstruct and restructure their education system to accommodate the changed and changing student population? What are the historical, philosophical, and ideological foundations for the reconstruction?

Chapter 8

Engaging Identities and Cultures in a Globalized, Postcolonial India: Implications for Decolonizing Curriculum and Pedagogy

Nina Asher

Vignette 1

Towards the end of the first decade of this century, I (Asher 2009) wrote:

[O]n a research trip to Mumbai, India (where I was born and grew up), I was stunned to read newspaper articles that talked of many Indian students today not knowing who Mahatma Gandhi was. I wondered: Is this loss of history – a mere six decades after the end of colonial rule in India – an indication that we are now in “post-postcolonialism?” Or does it reflect the re-colonization of the “East” succumbing to the lure of global capitalism and consumerism shaped by the “West?” This summer, when teaching a graduate-level course ... in Louisiana, USA...., on “Curriculum and Teaching in a Global Context,” I was similarly stunned when my American students informed me that they did not know anything about the Vietnam War – a phase of recent history that certainly casts a long shadow over the US-American consciousness even today. (p. 1)

Vignette 2

In 2014, Gautam Bhatia (2014, December 3), an architect and sculptor, wrote in his editorial-page article, “Insecure and insular in urban India,” in the leading Indian daily, *The Hindu*:

In the design of a recent house in Delhi, I was intrigued by how the owner’s interest in the building was sustained merely by the gadgets that were part of the home. All rooms had air conditioners and humidifiers, each fitted with its own fridge, television and home entertainment, Internet, security and alarm system. A private lap pool and barbecue extended along the side of the house; four cars were parked in the driveway. Gadgetry proclaimed independence for all the residents of the house, while old ideas of comfort, familiarity family togetherness were all but forgotten.

It is easy to see how in the past 20 years the idea of private ownership has had a huge debilitating impact on urban life. The city has changed from being a congenial space of shared amenities and relationships to a fearful nightmare of private strongholds and walled compounds – insecure, insular and isolated. (p. 8)

Vignette 3

Varun (pseudonym) – a participant in my 2014–2015 Fulbright-funded qualitative research project on globalization and education in “economically liberalized” India – who was completing a master’s degree program in education at a university in a major Indian metropolis, reflected:

...Also I reflect on how it impacts the upper section of society and also the lower strata. So, you see a lot of tablets and computers and the Bisleri [brand] water bottles in villages but there is no electricity there! So giving tablets and laptops – which have information [provided] by the think tanks, which has no connection with their culture – is an indication. So, [for instance] we were trying to have media coverage of the work we were doing in Rajasthan, but the roads were very narrow. Yet everything is reaching out there! There are banners, there is Coca Cola, there is tablet. That for me is globalization. It has always been there for a while. But now with economic liberalization, it is in your face.

...

You can’t avoid it in the metros [metropolitan areas]. There is an identity crisis. In a tribal village, I was using this phone. The girls there asked me how I could use such a[n outdated] phone and not a touch-screen. That reflects the perception of urban areas, the mindset and the burden of civilization. So luxury is now becoming a need. It is very scary.

Gautam Bhatia’s and Varun’s words speak eloquently, evocatively to the effects of globalization, privatization, and consumerism in relation to urban contexts and urbanization in India today. In this chapter, I discuss identities, cultures, and education in globalized, postcolonial, twenty-first-century India – highlighting specific considerations pertaining to urban contexts – by drawing on key theoretical and policy-related writings as well as media reports to frame the issues, drawing on Akash Kapur’s (2012) *India Becoming: A Portrait of Life in Modern India* as an illustrative study, and considering implications for decolonizing education work. In framing this discussion, I consider how capitalistic forces such as privatization, consumerism, and corporatization drive cultural and educational shifts in transnational contexts – specifically the U.S. and India.

Postcolonialism and globalization – in theory and in effect – are inextricably intertwined. Various scholars have noted the ambivalent, intertwined relationship of the colonizer and the colonized (e.g., Bhabha 1994; Fanon 1952/1967; Gandhi 1998) and the effects of the expansion of capitalist ideology and relations across the globe (e.g., Alexander and Mohanty 1997; Appadurai 1996; Prashad 2006). Of course, the postcolonial situation is not identical in all parts of the world. Nonetheless, transnational forms of colonial oppression are controlled by the spread of Westernized imperialism through the globalization of the labor market, new

technologies, and global financial markets. Such forces – construed as spheres of social, cultural, political, and economic influence shaping human interaction – also shape educational discourses and practices in transnational contexts.

For instance, in *Modernity at Large: Cultural Dimensions of Globalization*, Arjun Appadurai (1996) discussed the production of “locality ... in new globalized ways,” (p. 9), in terms of such concepts as “ethnoscape, financescape, technoscape, mediascape, and ideoscape,” (p. 45). For instance, “ethnoscape,” according to Appadurai, is “the landscape of persons who constitute the shifting world in which we live... [where] moving groups and individuals constitute an essential feature of the world and appear to affect the politics of (and between) nations to a hitherto unprecedented degree” (p. 33). “Technoscape” is “the global configuration, also ever fluid, of technology ... that ... now moves at high speeds across various kinds of previously impervious boundaries” (p. 34). “Mediascape” refers to “the distribution of the electronic capabilities to produce and disseminate information ... which are now available to a growing number of private and public interests throughout the world, and to the images of the world created by these media” (p. 35). Financescape refers to the rapid, complex flows of global capital and ideoscape refers to political ideologies of states and counterideological movements. These “scapes,” construed as dynamic spheres of social, cultural, political, and economic influence that shape human interaction today, are also useful in considering the multiplex (multiple and complex), hybrid identities and cultures in the increasingly porous, oft-blurring locales of “East” and “West” today. The three vignettes at the beginning of this chapter provide apt illustrations.

Critical thinkers in the U.S. education field (e.g., Kumashiro 2008; Taubman 2009) have noted that the last two decades have been marked by individual monetary gain (often read as “wealth” and “success”), the facile, virtual proximity afforded by digitization, the spread of western-style capitalism and corporatization across nations, and the effects of escalating consumerism, debilitating economic collapses, and environmental depletion – all in a context of increasing global interdependence. They note that U.S. education and schooling are being shaped today by the spread of high-stakes testing and privatization. In his essay, “The global war against teachers,” Vijay Prashad (2006) discussed how the “ruling class” (p. 12), in order to maintain its power, works to spread its particular ideology of capitalism and democracy, not only shaping discourses of national identity and security but also silencing speech, including that of teachers with the demand that they “stick to the facts” (p. 12) and not teach in ways that question the status quo. Mediocrity that maintains systems of consumption and production becomes the goal, not intellectual endeavor that interrogates, critiques, re-visions.

8.1 Key Considerations Related to Education and Urban Contexts in “Economically Liberalized” India

Several scholars have discussed globalization and privatization in relation to education and urban contexts in India today in terms of such issues as the de-funding of government (i.e. “public” in U.S.-speak) schools, the growing privatization of education, evolving youth identities, and the renewed dominance of English as the language of economic success. In his editorial-page article, “Dispossession, development, and democracy” in the daily, *The Hindu*, Michael Levien (2015, February 4) wrote:

...[E]conomic liberalisation prompted State governments to start acquiring land for private companies on a large scale. *The reforms of the early 1990s gave a greater importance to the private sector, which began demanding land not just for manufacturing ..., but for real estate, mineral extraction, and all manner of infrastructure under public-private partnership (PPP) agreements* [emphasis added]. State governments, now competing with each other for this investment, began systematically acquiring land for private companies for almost any private purpose that constituted “growth,” whether elite housing colonies, hotels, *private colleges* [emphasis added] ... (p. 8)

In his detailed, unsparing historical overview of India’s educational policy, Anil Sadgopal (2009) traced the genesis and effects of the Structural Adjustment Programme (SAP) engineered by the World Bank and UN. According to Sadgopal, “In March 1990, India signed the ‘*World Declaration on Education For All*’ and ‘*Framework for Action To Meet Basic Learning Needs*’ adopted at the World Conference on Education for All: Meeting Basic Learning Needs,” held at Jomtien, Thailand under the joint sponsorship of three UN agencies (UNDP, UNESCO, & UNICEF) and the World Bank. The twin documents together known as the Jomtien Declaration have since become the chief strategic instrument of neo-liberal forces in school education. Per the Jomtien Declaration:

...the State *must ‘progressively’ abdicate* its Constitutional obligation towards education of the masses in general and *school-based* elementary education (Classes I–VIII) in particular, become dependent on external aid even for primary education (Class I–V) and work in partnership with NGOs, religious bodies, and corporate houses... (p. 9)

The call for external financing of primary education was part of the IMF-World Bank’s Structural Adjustment Program (SAP) and the Social Safety Net, rendering education “*a commodity* that can be traded in the global market and offered for WTO negotiations” (p. 10). According to Sadgopal (2009), given “the hidden agenda of privatisation” of the SAP:

... The undeclared but operative strategy ... was to *let the vast government education system (from schools to universities) starve of funds and, consequently, deteriorate in quality*. As the school quality would decline, resulting in low learning levels, the parents, even the poor among them, would begin to withdraw their children from the system. A sense of exclusion from the socio-economic and political space would prevail. (p. 12)

The consequent low enrollment in government schools would be claimed as the ground for declaring them ‘unviable.’ School campuses, Sadgopal (2009) noted,

“could then be converted into commercial ventures such as the fee-charging elite private schools or the shopping malls, especially in urban areas, as is the emerging phenomenon all over the country.” (p. 12)

Writing about the demise of the formerly accepted “civilizational superiority” of the West in the context of “a consumerist revolution occurring in India,” Dipesh Chakrabarty (2012) noted that the “politics of culture in India today cannot be separated from the presence of media and consumerism in Indian public life” (p. 149). This focus on individual freedom to consume marks an “emerging rich-poor divide” (p. 150). Indeed, such issues are reflected in recent policies and debates related to education in India. For instance, India’s 2005 National Curriculum Framework, or NCF, focused on the implications of “globalisation and the spread of market relations to every sphere of society” (National Council of Educational Research and Teaching [NCERT] 2005, p. 9) in terms of education in general as well as specific content areas. As per the NCF, “A pedagogy that is sensitive to gender, class, caste, and global inequalities ... also locates these within larger structures of power and raises questions such as, who is allowed to speak for whom? Whose knowledge is most valued?” (NCERT 2005, p. 24). While the NCF’s focus on critical thinking, technology, and constructivist approaches in education was recognized (e.g. Khirwadkar 2007; Pandey 2007), some also wondered if this shift away from some of “the fundamentals of India’s much vaunted education” indicated a “dumbing down” of the curriculum (Mishra et al. 2006). More recently, as per India’s 2010 Right to Education Act (RTE), the provision of “free and compulsory education of all children in the age group of six to fourteen years” has been declared a “fundamental right” (<http://mhrd.gov.in/rte>). However the RTE – like the 2001 No Child Left Behind mandate in the U.S. – has been critiqued as an unfunded, unregulated mandate, implemented in the context of privatization (Bhuyan 2013; Mehendale 2010), with student learning levels remain unacceptably low (Acharjee 2013).

In addition, scholarly works (Advani 2009; Lukose 2009; Rowe et al. 2013; Shahani 2008) as well as popular writings (Adiga 2008; Kapur 2012) have focused on the effects of economic liberalization including the schism between rural and urban India, internal as well as transnational migration to Indian cities, identities of urban youth, and the economic significance of learning English. For instance, discussing “gender, youth, and consumer citizenship in globalizing India,” Lukose (2009) described “the zippies of ‘India Rising,’” by quoting from *Outlook*, a leading weekly news magazine:

... [A] young city or suburban resident, between 15 and 25 years of age, with a zip in the stride. Belongs to Generation Z. Can be male or female, studying or working. Oozes attitude, ambition and aspiration. Cool, confident and creative. Seeks challenges, loves risks and shuns fear. Succeeds Generation X and Generation Y but carries the social, political, economic, or ideological baggage of neither. Personal and professional life marked by vim, vigour, and vitality (origin: Indian). (p. 5)

In her discussion of “language and the postcolonial predicament,” Advani (2009) noted that globalization has further consolidated the reign of English as the language that has afforded “access to metropolitan white-collar jobs” (p. 45) in India since it gained independence from the British, nearly seven decades ago. Her

analyses of Indian textbooks revealed the privileging of the urban middle class in depicting employment (e.g. doctors, lawyers, engineers) and the omission of such occupations as “weavers, potters, sweepers” (p. 119). Further, Advani noted:

Absent from the idyll of rural India, for instance, is any suggestion of its hardship. There are no floods or famine, no landlords and bonded labour, no failed crops or dispossession. Instead, as we have seen, the countryside is beautiful, and the best aspects of modernity are within reach of the peasants. ... Such a picture reiterates the schism between the (urban middle-class) readers of the textbook and those whose life it seeks to portray. (p. 118)

With this framing then, the key questions that I discuss in the paper is: How are globalization and privatization in economically liberalized, postcolonial India shaping identities, cultures, education? What are the related implications for resisting recolonization in terms of curriculum, teaching, teacher education, research, and theory/discourse?

Before proceeding further, I situate myself as a researcher and scholar between “East” and “West,” focusing specifically within and across the porous contexts/borders of India and the U.S. As a U.S.-based scholar of Indian origin who has studied and worked in both contexts for a long time, I now have deep knowledge of both cultures. My research and scholarly writings in education are in the areas of postcolonialism, feminism, critical perspectives on multiculturalism, Asian American studies, and, most recently, globalization. Educational researchers (e.g., Gonzalez 2004; Hall 1999; Lipman 2005) have called for research that attends to globalization, shifts in global power relations, and multiplex hybrid identities and cultures, even as it focuses on equity, social justice, and quality education. For instance, according to Hall (1999), “Critical to the study of globalization and shifts in global dynamics of power are concerns with the interrelationships among power, knowledge and identity” (p. 123). Researchers have also cautioned against the pitfalls of conducting research in global times shaped by “coercive pressures of transnational institutions, such as the IMF and WTO, to impose the dominance of the market on all countries and every sphere of social life” (Lipman 2005, p. 317). Calling for “politically engaged ethnography,” Lipman urges researchers to examine “relationships between cultural and social processes and policies in schools” through “educational ethnography that links micro with macro from an anti-imperialist, anti-neoliberal position” and “activist research aligned with teachers, students, and community members as they act against the effects of neoliberal economic and social policy, militarism, and repression” (p. 319).

8.2 India Becoming: Incredible, Shining, and Tigerish, Too

Economically liberalized India has gained the attention of “Western” media in the twenty-first century. The India of the “Raj” is replaced now in the Western imagination by an India that is supposedly “Incredible” and “Shining,” and, borrowing from Aravind Adiga’s (2008) award-winning novel (*The White Tiger*), tigerishly

entrepreneurial even as it struggles to emerge from a shameful history of caste-based oppressions and atrocities. Rapidly urbanizing, India is home to Bollywood, brilliant tech expertise, and, of course, that remarkable transnational lifeline on which so many of us depend in this age of globalization – the call center staffed with appropriately accented English-speaking young representatives (Gulati 2005; Rowe et al. 2013). It is also depicted as a nation in which women’s rights lag behind and contestations around LGBT rights continue, even as it became the first nation to recognize a third gender officially. Of course debates around women’s and LGBT rights and representations remain present in the “West.” For instance, while Australia as well as several countries in Africa, Asia, Central America, South America, and Europe have or have had women heads of state, the US and Canada have not so far. And the U.S. continues, of course, to struggle to emerge fully from a shameful history of slavery and racism. The uphill battle to desegregate schooling continues – 60 years after race-based segregation in public schooling was ruled unconstitutional in the U.S. in the landmark *Brown vs. Board of Education* case in 1954.

Akash Kapur’s sensitively written *India Becoming: A Portrait of Life in Modern India* – published in 2012 by Riverhead/Penguin captures many of the tensions – at times ambivalent and contradictory – of class, caste, gender, culture, and identity, in an “economically liberalized,” postcolonial India. Kapur is himself biracial with transnational identifications, and began researching and writing the book upon his return to India in the twenty-first century after having spent over a decade and a half overseas (in the U.S. and the U.K.). One may read *India Becoming* as his search for the home to which he thought (hoped?) he was returning, his effort – through his researches – to make sense of a country that seemed to be trying to become like “America.” (The quotation marks underscore how the proper noun “America” is used as synecdoche to refer to the U.S. – which of course is just one nation in the Americas – South, Central, and North.) In the prologue Kapur noted:

It was to this new nation – this country where rice fields were giving way to highways, farmland to software complexes, and saris to pants – that I returned in 2003. I was coming home, but in many ways it was to a home I didn’t recognize anymore. (p. 3)

Through the stories of the people he featured in his book, Kapur reveals how globalization and corporatization are shaping identities, cultures, and geographies in an India that has forsaken socialism for capitalism; shrunk investment in farming, focusing instead on the tech sector and the global corporation; and opted to repurpose rural land, yielding instead to “the beckoning magic of the new colonial metropolis,” which “frames the mythic journey to the city” (Nandy 2001, p. viii). Indeed, *India Becoming* speaks eloquently to Appadurai’s five “scapes” and the related implications for development and education in the context of India today.

For instance, Harsh – one of the people featured in Kapur’s book, who works at an American software company in, where else, Bangalore – lets Kapur know that he was reconsidering his original plan to work abroad. “He’d started thinking it would be silly to leave India. Europe and America were the past, he said. The future was in places like Bangalore – in cities that heaved with ambition and entrepreneurship and opportunity” (p. 46).

As Kapur wrote about the “more general movement toward meritocracy” (p. 34), away from a feudal and caste-based India, he also documented the perils, pitfalls, and pernicious outcomes of development. For instance, his descriptions of the anger of villagers, the ecological depredation, and the loss and despair of farmers as they lost not only their land but also sources of livelihood and ways of being in the face of development that catered to those from cities. For instance, Kapur noted that while the East Coast Road between Chennai and Pondicherry had become a modern highway convenient for city-dwellers, it had also become the site of numerous accidents and fatalities among those living in the villages and communities in the region that until recently had been rural. He cited Puroshothaman, a former farmer, who had sold land that his family had farmed for generations.

“I slogged all my life on that land, and I only made a loss,” Puroshothaman said. “To see a city fellow come in, put a little paint on some stones and make a fortune in three months – how do you think that feels? Of course it creates ill feeling. This village is filled with that kind of feeling.” (p. 235)

Kapur described the “emerging national mythology” that “exalted entrepreneurship and the entrepreneur’s lifestyle, that venerated capitalism and wealth accumulation in the same way that India had once venerated public service,” (p. 54). This focus on individual freedom to consume marks an “emerging rich-poor divide” (p. 150). And yet it is this national shift in identifying with a culture of capitalism that has opened up opportunities for so many who may not have had access to them in decades past. Witness Varun’s observations, per Vignette 3.

For instance, Kapur talked about Hari, a 27 year-old man, originally from Tindivanam – “a market town about 120 km south of Chennai,” and “a crowded, dreary place,” that Kapur knew “mostly as a traffic jam on the way to Chennai” (p. 51). Hari had left home at age 17 and, when Kapur met him, was working in Chennai at “a multinational business that outsourced research to India” (p. 50). We learn that Hari knew that he was different, that he did not quite fit into his hometown. Kapur wrote: “He said he had learned English from watching television, and from reading books and pamphlets at this mother’s workplace. From a young age, he was determined to be fluent; he knew that English was his ticket out of Tindivanam” (p. 61).

The English language remains one of the contradictions with which postcolonial India/ns live. Professional success – within India, in transnational settings, and certainly in an era of global corporatism – is the gain even as one may lose one’s own native languages and cultures. Frantz Fanon (1967/1952) wrote eloquently in *Black Skin, White Masks* about the effects of colonization on language, psyche, culture, and body. Fanon was from the French colony of Martinique, studied in France, and wrote *Peau Noir, Masques Blancs* in the language of the colonizer to critique the objectification of the black man as a result of the white man’s gaze.

Returning to *India Becoming*, we learn later about another facet of Hari’s difference – he is gay. Kapur narrated that Hari returned to India after a stint for work in London “with a clearer sense of his identity” (p. 272). Kapur wrote, “We didn’t

have to talk about ‘that thing’ or ‘it’ or ‘the way I am.’ Hari was able to call himself ‘gay,’ to speak about himself as ‘homosexual’” (p. 272). So while Hari was on the one hand caught up in the lure of a material culture – so much so that he amassed considerable debts – on the other he was able to break out of the constraints of heteronormativity and the socioeconomic and cultural limits of the small town in which he grew up. Thus *India Becoming* reveals the “enabling and constraining dimensions of globalization,” (Dimitriadis 2008, p. 137) and the possibilities, challenges, and contradictions related to negotiating hybrid identities, cultures, and self-representations in twenty-first century urban India.

Thus, *India Becoming* reveals the opportunities, the individual and corporate success stories within and beyond the borders of the nation as well as the struggles, challenges, and losses experienced in the context of globalization and economic liberalization. The insights it yields speak to issues of identity and culture in terms of gender, culture, class/SES, region, and nation. In conversation with Vinod Shetty, a Mumbai-based, leftist labor lawyer and activist, Kapur realized “that one man’s freedom was another man’s prison” (p. 196). Citing, for instance, India’s tech industry as a “shining success story,” Kapur also noted that “it employed only a little over two million people” in “a nation of more than one billion people” (p. 196). Kapur wrote:

The same economic path that in so many minds had unleashed India, set it on a trajectory to self-sufficiency, to Vinod marked a kind of national enslavement. The nation’s reforms, he told me, had started “the mortgaging of India.” He said he’d seen what happened to other countries that followed the diktats of the International Monetary Fund and the World Bank. They became, in his view, “neo colonies.” (p. 196)

One may recall that British colonial rule in India grew out of the establishment of the East India Company. Launched as a trading company in the year 1,600, it came to rule large parts of India. So, globalization and colonialism, in some ways, are old hat. In which case – what is different in twenty-first century India? The scale, the speed, and the “beckoning magic” of the city. The widespread reach of uneven change, of consumerism’s duping, insidious lure even as access to technology affords great convenience to the individual consumer, vendor, student, teacher, and citizen. For instance, with reference to multinational retailers overtaking traditional bazaars (e.g. vegetable markets), Vinod discussed with Kapur the inevitability of “unemployment for small traders across the nation” (p. 197). “What was the use of efficiency, he asked, if it put millions of people out of work? Shouldn’t the main objective of economic reforms – of any economic policy – be to provide employment and livelihoods to its people” (p. 197)?

Perhaps at the heart of *India Becoming: A Portrait of Life in Modern India* is the question of “the sobriety and moral purpose of a country before it succumbed to the bland homogenization of twenty-first century capitalism” (p. 12), as Kapur notes in concluding his prologue. Of course, this question of purpose, of the identity and culture of a country or a civilization at its core, at its heart, has also been central to the work of generations of scholars, activists, educators, community organizers, cultural workers, and others, in battling colonial and economic exploitation, racism,

caste-ism, patriarchy, and the need to focus on the social good over individual and corporate greed for many decades now, in many parts of the world.

Over the decades, as a teacher educator in the U.S., I have raised these issues in relation to the U.S. context not only in graduate seminars but also in the required, undergraduate “multicultural education” courses. (I have written elsewhere about how and why there is often a great deal of resistance from students in these required multicultural education courses. See, for instance, Asher 2005, 2007). Time and again, undergraduate students in elementary education programs – who are majority white and female and typically come from small towns, with limited exposure to “diversity” and “multiculturalism,” to study at the massive, top, public research university in their state – have narrated stories of such losses of livelihood in their own families and communities when large corporations made it impossible for small businesses to survive. While these students may (for various reasons) resist engaging the intersecting issues of race, gender, class, and nation in critical, transformative ways, they are, typically, able to analyze the detrimental effects of global corporatism more narrowly, in terms of their own lives and communities. So corporate colonization, in addition to being old hat “here” in India is also old hat “there” in the West. So, what gives? What lessons are we forgetting? Or simply not learning? Why? And what can we do in terms of education work to emerge from colonization – old and new, here and there?

8.3 Decolonization and Education: Thoughts on Curriculum and Pedagogy in an Era of Globalization

The detailed documentation that Peter Taubman (2009) presents in *Teaching by numbers: Deconstructing the discourse of standards and accountability in education* speaks to the deleterious effects of such commodification and corporatization in the present-day U.S. educational context. For instance, Taubman argues that the “audit culture” (p. 88) shaping the discourse and practice of accountability has led to the “loss of ideals” (p. 151), such as racial integration and economic equity, and has fostered in teachers a “melancholia” (p. 151). Noting that education now “consists of preparing for constant job retraining – all those twenty-first century skills” (p. 100), Taubman asks:

How did we allow the language of education, study, teaching, and intellectual and creative endeavor to transform itself into the language and practices of standards and accountability? How did it happen that we approved the use of pervasive testing that would shock us into compliance? How did we become complicit in the erosion of our own power, and why did we embrace the advice of salesmen, financiers, corporate lawyers, accountants, and millionaires? What led us to think that if we applied practices imported from the world of business we could solve our educational problems, and how did we surrender our right to define those problems? How did we lose our way? (p. 128).

Once again, we come up against the question of a moral purpose. Perhaps it is because the single-minded pursuit of capitalism has overshadowed the commitment

to a true democracy in the U.S. Successful entrepreneurship on the part of individuals (read “becoming multi-millionaires and billionaires”) trumps an engagement with strengthening a society “of the people, by the people, for the people.” It follows then that the private outstrips the public, the individual eclipses the social, the common. And, now, in the era of globalization, much of the rest of the world – or so it seems – has bought into the capitalist enterprise. It is this capitalist enterprise that requires us, even in educational contexts, to produce and consume tangible products (for instance, standardized tests), judge achievement and progress by means of measurable, quantifiable outcomes (for instance, scores on standardized tests), and come up with “quick-fixes” to boost performance and productivity (e.g. NCLB and Race to the Top in the U.S. context). This enterprise then keeps us – students, teachers, administrators – occupied with tasks that take us away from deep thought and foundational work (focusing instead, for instance, on grants-driven research in order to secure tenure), from critical self-reflection and contingent analyses, from cultivating the ability to read the world critically, from building community to achieve such goals as equity and justice in school and society.

The implications of these issues are, indeed, global – not only because the “aftermath of colonialism” (Hickling-Hudson et al. 2004, p. 3) pervades the metropolitan countries that built empires as well as the former colonies but also because systemic inequities are increasingly evident across educational contexts shaped by global capitalism and discourses of economic efficiency, accountability, and standardization (Jain 2015; Taubman 2009).

For instance, specifically, with regard to education in India, Jain (2015) noted that curriculum, teaching, and educational research in India today are being shaped by “growing privatization” and “foreign universities,” driven by profit, that are establishing campuses in India (p. 129). In her critique of the “private school agenda ... driven by markets and profit” (p. 730), Nambissan (2010) discussed the need to address poverty in rural and urban contexts, attending to such factors as caste and gender. Scholars (Govinda and Josephine 2005; Jain and Saxena 2010; Sarangapani 2009) have also raised such issues as the expansion of “public-private partnerships” (PPPs), the increasing reliance on “para teachers” (teachers appointed on a contract basis), and low teacher salaries.

8.3.1 *Implications for Curriculum and Pedagogy*

Noel Gough (2004) recommended “building transnational coalitions for public education that critically and creatively translate, adapt and expand national democratic ideals into international educational purposes” (p. 4). Reflecting the temper of the times, he urged curricularists to bear in mind that they need to prepare “future labour for a *global* economy” and “citizens for an *international* polity” (p. 4). To that end, he suggested that we think in terms of both “continuities and changes” in the “sociotechnical systems” that produce curriculum work as well as in the diverse “publics for which such knowledge is produced” (p. 10), across national borders.

And, Sheppard and Nagar (2004) recommended engaging “in collaborative work with one another and students, with educators in our local schools and communities, and with actors located in the global South who most directly experience the downside of neoliberal globalization” (p. 561). Furthermore, within the U.S. context, scholars have brought our attention to the need to develop the “worldliness of curriculum studies” (Miller 2005), build coalitions across different racial, ethnic, and cultural groups (Lam 2006; Ono 2005; Smith 1983/2000) in order to work towards social transformation, and map new mobilities and imagined geographies of place and networking that are influencing learning in a digital age (Leander et al. 2010). While these critical, theoretical analyses are pertinent to rethinking teacher education to foster critical global literacy, research- and practice-based analyses rarely appear in extant literature in either the U.S. or India.

Vignette 4: Pedagogical Challenges

Following constructivist thought and working to build from where the students are, I have used (along with other texts) an edited volume, *Rethinking globalization* (Bigelow and Peterson 2002), as a springboard for discussing issues such as global interdependence, consumerism, and the implicatedness of the “West” and the elite classes – the socioeconomically privileged – in relying on the exploitation of child labor in the “Third World.” (While these issues/analyses may seem facile and obvious to critical scholars for most of the preservice teachers in my classes, they are eye-opening.) Several of the articles in *Rethinking globalization*, written by K-12 teachers who draw on examples from their teaching practice, reveal – in accessible language – how different cultural frames as well as social and economic policies inform patterns of production and consumption in different parts of the world.

In the summer of 2010 (when I last taught the course), as we discussed the readings, the 35 students (1 African American woman, 3 Multiracial women of Color of Central/South American heritage, 30 White women, and 1 White male) began engaging Freire’s (1982) notion of “conscientization” and the concept of unlearning us-and-them binaries to arrive at in-between spaces so that we might recognize and build upon *both* commonalities and differences. Such learning reflected good progress. At the same time, several students were unable to accept the fact stated in one of the readings in *Rethinking globalization* that the U.S. is one of the two member nations (the other being Somalia) that have not ratified the U.N. Children’s Convention, pertaining to the rights of the child. Several of the students repeatedly said that they could not see why the U.S. would not do so. They surmised that how the document is worded could be the only possible reason. Despite reading critical texts and engaging in class discussions, they could not come to grips with the thought that the U.S. might actually be interested in keeping things as they are, rather than supporting efforts to end the exploitation of child labor.

But, in all honesty, one cannot count on one 15- to 16-week course alone to bring about lasting change in every student enrolled. With reference to the education field, Hickling-Hudson et al. (2004), writing out of Australia, noted that contemporary conditions of neoliberal capitalism have made for a limited conception of educa-

tional change and transformation. And I have argued that multiculturalism in the U.S. remains within a frame that situates “the White, Western, heterosexual, upper-class individual at the mythic center and others – queer, “ethnic” or in some way different – in their designated marginal locations” (Asher 2007, p. 70). Although multicultural education courses are now regularly required as part of the teacher education curriculum in the U.S. and the language of “multiple perspectives” and “cultural relevance” is widely used, stereotypic representations of diverse “others” persist in schools, classrooms, texts, and communities. Of course, our only recourse is to continue to persevere – in terms of theory, research, practice, and policy – in thoughtful, recursive ways.

Specifically in the context of India – with its mind-boggling cultural and linguistic diversity – educators and policy-makers will need to work to realize the RTE, especially in the context of increasing privatization marked by an erosion of government-funded schooling and the rise of elite and International Baccalaureate (IB) schools in urban areas. Curriculum and pedagogy, undergirded by critical, multicultural, and self-reflexive approaches will need to address issues pertaining to poverty, social justice, equity and indigenous knowledges, in systematic ways – in urban and rural contexts. And educational research and discourse will need to interrogate further the “recolonization” of language, identity, and schooling due to globalization and privatization and focus on illuminating viable alternatives.

8.3.2 *Rethinking Discourses and Difference Towards Transformation*

In her widely cited essay, “The master’s tools will never dismantle the master’s house,” Audre Lorde (1984) reminded us that we need to “recognize difference as a crucial strength” (p. 112). In the three decades since, a number of postcolonial and feminist scholars (e.g. Anzaldúa 1987; Bulbeck 1998; Connell 2007; Mohanty et al. 1991; Trinh 1989; Weedon 1999) have made significant contributions in terms of engaging difference. For instance, in her influential essay, “Under Western eyes: Feminist scholarship and colonial discourse,” Chandra Mohanty (1991) argued for the need to critique the colonizing, hegemonic discourses of Western feminisms and at the same time address “the formulation of autonomous, geographically, historically, and culturally grounded feminist concerns and strategies” (p. 51). And in developing the powerful concept of a “*mestiza* consciousness,” Chicana, *tejana* feminist poet and writer, Gloria Anzaldúa (1987), reminded us:

The struggle is inner: Chicano, *indio*, American Indian, *mojado*, *mexicano*, immigrant Latino, Anglo in power, working class Anglo, Black, Asian – our psyches resemble the border-towns and are populated by the same people. The struggle has always been inner, and is played out in the outer terrains. Awareness of our situation must come before inner changes, which in turn come before changes in society. Nothing happens in the “real” world unless it first happens in the images in our heads. (p. 87)

And Kelly Oliver (2004) noted that decolonization also entails, along with large-scale resistance movements, “psychic revolts that can take place in the everyday lives of ordinary people who resist domination” (p. 35).

Thus the work is both outer/systemic and also inner/psychic. Therefore, critical, self-reflexive scholars, educators, and cultural workers in multicultural, globalized twenty-first century contexts need to continue to: critique historical and extant relations of power; validate multiplicities within and across contexts; remain open to contradictions and engage ambivalent tensions; and engage discourses and pedagogies in relation to context. Such perseverance fosters equity and justice – here *and* there, in India *and* in the U.S., in relation to urban *and* rural contexts.

Chapter 9

The Education Issues of the Children of Internal Migrant Workers in China

Shizhan Yuan, George W. Noblit, and Xue Lan Rong

The decades after 1979 have been the golden age for the Chinese economy. With the rapid development of the export industry, the GDP of China has experienced continuous growth from 261 billion US dollars in 1979 to 10,361 billion US dollar in 2014. This “miracle” was largely due to the contributions of the Chinese low-cost surplus labor forces from the rural area, as well as the continuous implementation of the Reform and Opening-up Policy since Deng Xiao Ping’s era. Of particular importance is that the internal migrant workers mainly power the growth of Chinese export industry and Chinese GDP.

Before the implementation of Reform and Opening Up Policy in 1979, China’s urban development was slow—from 1950 to 1978, the percentage of the urban population of China only increased from 11.2 % to 17.9 % (Wu 2004). This was due to the restriction of the planned economic and household registration system. From the beginning of the Reform and Opening Up till now, China has experienced blooming urbanization—from 1979 to 2011, the percentage of the urban population increased from 18.96 % to 51.27 % of China’s total population, China is right in the middle stage of a rapid urbanization process (Wang 2013). National Bureau of Statistics of People’s Republic of China (2015a) reported that in 2014, China’s urbanization rate has reached 54.77 %. The rapid urbanization in the past 36 years was largely due to the internal rural-to-city migration. Rural-to-city migration has already brought millions of poor peasants to the cities. According to National Bureau of Statistics of People’s Republic of China (2015b), in 2014, the number of internal migrant workers was 273.95 million, which was a 1.9 % increase from 2013.

Many internal migrant workers also brought their children (the migrant children) to the cities with them due to the severe poverty and safety issues as well as problems to find adequate child care and other difficulties in the rural areas they left (Lv

S. Yuan (✉) • G.W. Noblit • X.L. Rong

School of Education, University of North Carolina at Chapel Hill, Chapel Hill, NC, USA
e-mail: syuan@live.unc.edu; gwn@unc.edu; xrong@email.unc.edu

2007). The schooling issues of migrant children surfaced as late as mid-1990s, when large numbers of young migrant workers had children or began to bring their children with them to the cities. By 2007, across the whole country, the number of children whose parents were migrants had increased to 28 million. Of these 28 million children, 22 million were left behind in their home villages while at least 6 million were in the cities (Liang and Chen 2007). And by the end of 2013, the number of migrant school-age children in the cities climbed to 12.77 million and this accounts for 9.3% of the total school-age children receiving compulsory education (Xinhua News Agency 2014).

With the increasing number of migrant children arriving in the cities, guarding their rights to receive free compulsory education in their destination cities has become an important agenda for the Chinese government at all levels. However, due to its decentralized fiscal and education system, the problems of migrant children have not been fully resolved. Some rural migrant children still have difficulties in accessing the public schools in their destination cities.

According to Li (2010, p. 175–187), the public school attending rate for the rural migrant children in the urban area ranged from 65% to 85%. That means 15–35% of migrant students still cannot attend public schools in the cities. And 3 years later, according to Du (2014), the vice minister of Education Bureau of China, in 2013 there were 12.77 million rural migrant children in the cities; 80.4% of them attended public schools in their destination cities. The rest of the migrant children have to either attend the low-quality private migrant schools in the cities or not attend school at all.

The other disadvantages that the migrant children have had is that they cannot be equally admitted to the local colleges and universities in their destination cities compared with the local urban children. Most migrant children, even if they have lived in their destination cities for many years with their parents, still cannot take their College Entrance Exam in their residential cities. They must return to their rural hometowns to take the exam, because they do not have Household Registration Certificate (Hukou) of their residential cities.

In China, nearly all of the top-notch universities (such as universities that participate in the government-funded 211 Project) are located in the major cities such as Beijing, Shanghai and Guangzhou. These universities usually have specific policies that favor the enrollment of local students, i.e. make local urban students with Hukou much easier to be admitted than the students from outside (Ji Nan Shi Bao 2012). So, when the internal migrant children were required to go back to their rural hometown to take the College Entrance Exam, they were denied by their residential cities the same benefits in the college admission that the native urban students with Hukou had.

To tackle the schooling access and quality assurance for rural to city migrant children, this chapter aims to answer the following two major questions:

1. To what extent are the migrant children able to equally access the public education resources (e.g. public schools and equal opportunities to be enrolled by the local colleges and universities) in their destination cities compared with the

urban children from 1990s to now? What are the major obstacles? How have those obstacles been removed (or not removed) in recent years? Why?

2. What were public policies developed for the education of rural migrant children in the urban areas from 1996 to 2013?

To address these questions, this paper will present and analyze the existing research literatures regarding the educational issues of migrant children in various years, and the studies on the difficulties faced by the rural migrant children when they attend the public schools in their destination cities, as well as the poor conditions of the schools run by immigrants.

9.1 Historic Background of Migration, Rural Migrant Workers and Migrant Children in China

The term “internal migrants” refers to the people who move within the national borders (Bi and Szente 2010). According to the National Bureau of Statistics of China (2014), in 2013 more than 260 million people in China were internal migrants, this number accounts for about 18% of the Chinese population, most of them had come to the major cities from the rural area. They work in the big cities doing all kinds of labor or drudgery that the normal city dwellers would not do and often receive a much lower salary than the local urban workers.

The children of the migrant workers are commonly called the migrant children. They may be born in the destination cities of their parents or in their parents’ rural hometowns. Because of the working status of their parents, most of them are not legitimately able to get a Household Registration Certification (Hukou) in their parents’ destination cities, so that they often cannot get equal treatments in their destination cities as compared to the native urban children in terms of equal educational access, quality assurance, etc. in terms of the free 9 years’ compulsory education (K-9), and the right to receive high school education (10–12 grade) in their destination cities, as well as the advantage of college admission.

The increasing number of internal migrant workers and children arriving in the big cities is the result of the largest urbanization movement in human history in any country, which was caused largely by Chinese economic reforms (Wang 2013). From the 1980s, when the Chinese government started to reform the central planned economy, it began to allow farmers to keep and sell their agricultural products in the market. This reform has greatly improved the peasants’ incentives and enthusiasm to do farming, as well as increased the agricultural productivity of rural areas. The rural areas did not need more agricultural labor, so surplus labor forces developed in the rural areas.

In 1980s, the “Reform and Opening Up” has entered a new stage. In order to develop a market-oriented economy and participate in the economic globalization, the government began to allow private sectors and foreign enterprises to participate in the national economy as well as lifted the ban on the internal migration by

allowing the rural peasants to be employed, open small business and even temporarily live in the cities. As a result, private factories and enterprises have been established in the towns and cities. These private enterprises have absorbed the surplus labor force from the rural areas. For decades, with the hardworking of the internal migrant workers, China has become “the factory of the world” producing inexpensive clothes, shoes, furniture, consumer electronic and home appliance that take a lion’s share in the world market.

These migrant workers made great contributions to the development of Chinese economy, but they received the lowest salaries in the cities. For example, in Beijing, the average monthly income of migrant workers is 2500 RMB, barely a living wage in the cities (Beijing Youth Newspaper 2012), while the people’s average income in Beijing of 2012 is 3,039 RMB per month (China News Network 2013). In Canton Province, which has the largest number of migrant workers (26 million) in China, the average monthly income of its migrant workers is 40 % less than the local urban dwellers, although they spend 50 % more time on their work than the local urban workers.

In addition, because of the restriction of the Household Registration Certificate, the migrant workers’ families face other types of discrimination in their destination cities and cannot acquire the same social welfare services as the native urban residents have enjoyed. These social welfare services include healthcare, education rights, retirement benefits and employment insurance as well as other employment related rights to jobs affiliated with government agencies at all levels. Among these inequalities, the most unacceptable one is that the migrant children cannot get access to high quality public education in the destination cities. Although the Chinese national government has urged the local urban government to guarantee the education rights of the migrant children in the cities, the local urban government, driven by their private interests, still set many obstacles for internal migrant children to have access to the high quality education resources in their destination cities.

9.2 The Educational Issues of Migrant Children

9.2.1 The Household Registration System (Hukou) and the Access to Urban Local Public School for the Migrant Children

Migrant children face administrative and financial obstacles in attempting to attend public schools in many cities. Among these obstacles, the Household Registration System is the major one. It was established in 1954, when the Chinese government began to implement planned economy (Li 2013). The major benefit of Hukou is that it makes easier for the government to manage the migration of its population and maintain public security and stability, especially after the ending of Chinese civil

war (1946–1949). China uses Hukou system to divide Chinese citizens into urban and rural residents, and separating the rural and urban residents in the aspect of accessibility and distribution of the social resources, products, welfare and services since 1950s (Qiao and Gong 2014). The Hukou is the internal passport system of China (Yiu 2014) and it is the biggest barrier of migrant children receiving equal education opportunities. Under typical circumstances, a person with rural Hukou status is not eligible for state services in the urban areas (including attending public or state schools in the city) (Montgomery 2012). In addition, the Hukou is primarily inherited from one's parents at the time of birth. Even if a child was born in the city, as long as their parents are rural Hukou holders, the child's Hukou is still registered in the same rural area where their parents registered. Thus the child still cannot enjoy the state services the other city residents are entitled to.

Administrative barrier are also major obstacles for migrant children to attend the public schools in the cities. There are some exceptions for which it is hard to qualify. In recent years (2015), some cities, such as Beijing and Shanghai, allow migrant children who do not own a local Household Registration Certificate to attend the local urban public schools as long as they have five certificates.

The five certificates include their parents' working certificate and temporary resident permits in the destination city, all family members' Household Registration Certificate, a house rental certificate in the city, as well as the certificate to prove that there is no one who can take care of the migrant children in their rural hometown (Beijing Municipal Government 2015). However, this underestimates what is actually required. The parents of migrant children may actually need to collect as many as 28 certificates because under umbrella of each item of the 5 certificates, there are many smaller certificates (Zhou 2015). For example, their parents' working certificate actually includes their working contract, their social insurance payment receipts, their employers' enterprise business license as well as the enterprise title number. The house rental certificate will include a house rental contract, rental tax payment receipts, utility fee payment receipts, house owners' ID and house owners' house ownership certificate. In addition, the parents of migrant children will also need to produce a marriage certificate, a population planning certificate and if they have two or more children, they also need to produce the certificate that they have paid the fine (social compensation fee) for their extra birth of the children (Goodburn 2009). The migrant children will also need to have a health certificate and an immunization record (Bi and Szente 2010).

To make matter worse, in the city of Beijing, even if some migrant children can successfully collect the 28 certificates, urban public schools can still deny those migrant students because of the limitation of the school's capacity (Yang 2015).

Before 2006 when the central government had yet to forbid the collection of temporary schooling fees and sponsor fees from the migrant children, the migrant children had to pay the fees from which most urban children are exempted if they wanted to attend any public school in their residential cities—which they usually cannot afford.

9.2.2 *Migrant Schools for the Migrant Children*

Many migrant children have to attend migrant-run schools until they reach the age of 12 when they will be sent back to their hometown in the rural areas to attend schools there. These migrant-run schools are normally unlicensed and the facility conditions are usually very poor. These migrant schools are founded by the private and for-profit groups, and they do not follow the standards and regulations required by the Ministry of education.

Goodburn (2009) studied those underground “black schools” for the migrant children in Beijing, and she found that these schools try to follow the state curriculum as much as possible but the biggest problem is a lack of high quality school teachers. Many teachers in the migrant schools had educational levels only slightly above that of their pupils. As mentioned by Kwong (2004), a study of 114 migrant schools in Beijing found over 65 % of teachers had no teaching experience and some had been construction workers, street hawkers, cooks, vegetable farmers, childcare workers and janitors. Also many migrant schools did not have facilities to offer some non-examination subjects such as PE, music and arts. Many private migrant schools served a large number of migrant students but the infrastructure is very poor. As Kwong (2011) mentioned that in 2000, there were 300 migrant children’s schools in Beijing with almost 80,000 migrant children attending and in 2008 about 134,000 students attended migrant schools. These migrant schools were often housed in abandoned warehouses, dilapidated buildings or even on open land. Some had no playgrounds, others no running water, and usually 50–80 students huddle in one classroom with poor lighting. It is surprising that the migrant children almost have never complained about the poor facilities in the private migrant schools. It may be that they were accustomed to the poor conditions at home, as well as to the schools’ poor physical environment. In many studies, the migrant school was described as a type of private-run, low-quality and inadequately funded schools without permanent addresses (Xiao 2011). Due to the poor facilities and extremely low education quality, most of the private migrant schools were on the verge of been completely shut-down. Some migrant schools survived over time, but they had to frequently change their school locations in order to avoid government inspection (Kwong 2004).

The ordinary public schools have better facilities, teaching staffs, curriculum, teaching and learning materials, while those segregated migrant schools were much more likely to have overcrowded classrooms, employed poor performing teachers, and provided a less nurturing atmosphere. Thus, the migrant children in the ordinary public schools tended to have higher achievement, higher self-worth, and better social competence (Lu and Zhou 2013). Urban public schools should admit all children without making distinctions. Education is a most important basic public service, and thus it should be accessible to everyone regardless of their place of origin, residential permission and social economic background.

9.2.3 Other Major Challenges to the Schooling of Migrant Children in the Cities

According to the research conducted by Mok et al. (2011) and Wang and Holland (2011), there are several other major challenges to the migrant children attending schools in their destination cities.

The most obvious one was the discontinuity of schooling experience due to the high mobility of migrant children. Migrant children belong to the floating population. Their parents changed jobs frequently, and they followed their parents to go to different cities, and attended schools in the cities where their parents work at (Mok et al. 2011). As mentioned by Wang and Holland (2011), migrant children were more likely to make schools transfer than local urban students. Further, the mobility rate of migrant children in migrant schools was higher than the migrant children in the public schools. The percentage of migrant children enrolled in the migrant children schools for 2 years or less was as high as 71 %, while the percentage of migrant children enrolled in the public schools for 2 years or less was 35 %. Moreover, even when in the public schools, the mobility of migrant children was much higher than that of local children.

The direct consequence of the high mobility of migrant children was that they had difficulties in catching up with the coursework. Schools in different regions vary in their curriculum, quality of teaching staffs and facilities. The quality of education varies across different regions of China. The different learning experiences and school environments may create great difficulties for migrant children to adjust to a new urban school if they make school transfers frequently.

The other challenge faced by the migrant children is that even if some of them have been admitted in urban public schools, they will be assigned to the public schools with the poorest facilities in the cities or in the suburban areas of the cities (Kunming Daily 2014).

Segregation and tracking within public school disadvantages migrant students in many ways. First, migrant students will likely be assigned to a separate class with other migrant children and apart from local urban students. In China, public schools usually assign children into different classes based on their academic performance. Because many migrant children have not received high quality formal education before they come to the urban public schools, their academic knowledge foundation is significantly less strong than the local urban students. As a result, their academic performance is usually lower than the urban students and they are likely to be assigned to a special class designated for them only.

Tracking migrant students into a special class actually does not bring any comfort to the migrant children and their parents. As reported by Kunming Daily Newspaper (2014), a representative member of National People's Congress of Yunnan Province mentioned that migrant workers spared no effort in getting their children to attend urban public schools. Yet, when they finally managed to get their children into the public schools, they found their children actually faced discrimination. For example, their children were often placed in a separated class or did not

have official school-record in the urban public schools. This congressman mentioned that the separation actually hurt the feelings of the migrant children and their families. Separating migrant children to a special class would not enable their adaptation to the urban public school environment. And on the contrary, it is a new form of discrimination for them.

The third problem is that the governments of the cities shut down many “unqualified” private migrant schools, even while some urban public schools were still closed for many migrant children.

The local government may have had a hidden political consideration regarding the closing of the private migrant schools and not completely solving the schooling issues of the migrant children in the destination cities. As mentioned by Kwong (2004), the local urban governments were afraid that resolving the problems relating to migrant children’s schooling would encourage more migrants to move into their jurisdiction and bring with them more social and educational problems.

According to Kwong (2004), the Chinese government at different levels has to consider the issues of social benefit allocations between the rural and urban dwellers. They may worry that the rural people could take too many urban resources in education and the urban dwellers might complain.

But on the other hand, we should consider why so many migrant children want to attend the private migrant school in the cities (not the public schools in their hometown) even if those schools are in a very low quality. The answer is clear. The rural areas are extremely poor and rural public schools are of the worst quality of all even compared with those banned illegal migrant schools in the cities. The urban areas may have sufficient funds to finance the development of their urban education, while the poor rural areas do not have money to improve their education system and infrastructure. The decentralized administrative and fiscal system has enlarged the disparity between the urban and rural area.

9.3 Beyond Compulsory Education

9.3.1 *Migrant Children Are Not Allowed to Take College Entrance Examination in Their Residential Cities*

The most important examination for the students in China is definitely the College Entrance Examination. As the only gateway to the tertiary education for most of the high school students in China, this exam will stream high school graduates into different professional and vocational tracks as well as different levels of higher education. However, this exam stratifies the population.

Due to the restrictions of their Hukou and the prejudices of the local urban governments, most of the children of migrant workers cannot sit for the college entrance examination in their destination cities, and they have to return to their place of origin to take the exam. As mentioned by Yuan (2012), the former Minister of

Education of China, migrant children and their parents must meet at least three requirements (三大准入) if they want to sit for the College Entrance Examination in their destination cities: (1) the parents must have stable jobs, stable income, paid a variety of social insurances, and have lived in the cities for a long period of time; (2) The migrant children themselves must have attended in the urban public school for certain consecutive years; and (3) The parents must work for the industries essential to the destination cities. Furthermore, each city was allowed to develop their own regulations for the migrant children to attend the college entrance exam in their residential cities.

This regulation provoked wide criticism from the general public, general public criticized the policy as protecting the interests of the native urban dwellers, and neglecting the education rights of migrant children, because it still permitted obstacles for many migration children in taking the exam in their residential cities (China Economy 2012). The floating migrant workers change their job frequently, and their salaries fluctuate drastically depending on their working places. Further, they may move to different working places. As a result, almost none of the migrant children could meet this standard. Actually this regulation made it almost impossible for the rural migrant children to sit for the exam in their destination cities. Ye (2012, p. 1) denounced the privileges of the urban students, he said “why did the urban citizens have the privileges? And why did not the rural students have the rights that they deserved to have? The urban citizens of Beijing and Shanghai have enjoyed the privileges for many years, why should we continued to allow them enjoy their privileges? Are the migrant children and children from rural areas not the citizens of China? Why shouldn’t we provide the migrant children equal treatments in the cities?”

As mentioned by Xinhua News Agency (2014), of 12.77 million migrant children in the cities, only 4,444 migrant students nationwide were allowed to take the examinations in their destination cities in 2013. Since the percentage was so small, it was obviously that the former Minister of the Education made a compromise when he made the regulations for the interests of native urban dwellers and sacrificed the interests of the migrant children in the cities. This is a major discrimination imposed on the migrant children.

The city governments were not interested in solving the issue of the college entrances examinations for the migrant students. If they allowed the rural migrant students to take the exam in the cities of Beijing and Shanghai, it would have encouraged more rural migrant students to come to take the exam in these cities. As a result, many rural migrant students would have been able to enroll in high quality urban universities. This would make the college enrollment more competitive. As a result, many local students who have Hukou would have lost the opportunities to be enrolled by the high quality local colleges and universities. The vice Minister of Education, Du Yu Bo, mentioned that:

In order to solve the College Entrance Exam problem of migrant children, we should not only consider the needs of these rural migrant students, but also not influence the interests of the local urban students of Beijing and Shanghai. (Modern Education Newspaper 2012, p. 1)

Actually, most of the cities only considered the needs of the local students. For example, in Beijing, although the city in 2013 began to allow some of the migrant children who met their requirements to sit for the college entrance examination there, the migrant children faced great discriminations when the local colleges and universities admitted students. Even if the migrant children get very high scores on the exam, they were not allowed enrollment in the bachelor programs of the universities. Instead they are only allowed to attend the low or medium level vocational or technical schools that the local urban students would never prefer to attend. In Shanghai, the plight of the migrant children was a little better than those in Beijing, for it allowed minimal number of migrant children whose parents met the special requirements attend the exam in Shanghai and enjoy equal college admission opportunities. However, for the vast majority of the migrant children whose parents did not meet the requirements, like in Beijing, they were only allowed to attend low-level vocational or technical schools regardless of their exam scores (China Education Online 2012).

It is very interesting to note that the China's practice of allocating rural migrant children to the vocational and professional training institutes was very similar to the US' practice after the Civil War in the US history. The Tuskegee Institute focused on cultivating practical vocational and trade skills of the African Americans, and this practice brought severe criticisms from many prominent African-American as well as educationists such as W.E.B. Dubois (College View 2014).

Even today, China still follows this discriminatory practice by channeling its migrant children to the vocational and technical schools. The outcomes of this policy may have resulted in a new generation of migrant children who will continue to work in the labor-intense industries (e.g., construction, sweat factories, etc.) and have little hope for social mobility.

9.3.2 Major Laws or Regulations Relevant to the Schooling Issues of Migrant Children

Historically speaking, Chinese cities with large number of internal migrant population were likely to fail to guarantee the education rights of migrant children because there had been no law to guarantee their educational rights until 1996.

Although the first *Compulsory Education Law* was published in 1986, it was not until 1996 that the central government (the State Council of People's Republic of China) began to consider the rights of internal migrant children to receive free compulsory education in their destination cities. According to *1986 Compulsory Education Law*, the government had responsibilities to provide free 9 years of compulsory education for the children who reach the schooling age (5–6). Governments of all levels received funding from central authorities and the local government were to use their own local budgets to provide education only for the local students who are registered as the residents of their locality (Xia 2006). The internal migrant

children were usually not considered as the residents of their destination cities because the migrant workers' families usually did not own the Household Registration Certificate of their destination cities. Without this certificate, they would forever be the temporary urban residents no matter how many years they had worked and lived in the cities. So, *1986 Compulsory Education Law* failed to legitimize the education rights of the migrant children from the rural areas who "temporarily" settled in the city with their parents. If the migrant children wanted to attend schools in the city area, they had to pay for their own education in the city. Although after 1996, other education laws tried to protect the education rights of internal migrant children, the migrant workers' families still faced many limitations as well as restrictions in access to the public education resources in the cities.

The government did not realize the schooling problems of migrant children until mid-1990s. In 1996, a *Provisional Acts Regarding the Education of School-age Children of Floating Population* (城镇流动人口中适龄儿童少年就学办法 (试行)) was enacted by the central government. This provisional act discouraged the rural migrant children from receiving compulsory education in the schools of the cities. It stipulated that state-run (public schools) only enroll children who hold local residence permits, which was nearly impossible for migrants to obtain at that time (Liang and Chen 2007).

Two years later (1998), the central government issued another *Temporary Regulation on the Schooling of the Migrant Children* (流动儿童少年就学暂行办法). This regulation, for first time, stipulated that governments at both the migrant origin and destination have the responsibility of providing education to migrant children (Liang and Chen 2007). According to the clause 3 and 7 of this regulation, migrant children who did not have guardians in their place of origin can temporarily attend the public or private schools in their destination cities (SCAU, College of Public Management 2011). However, the biggest problem with this regulation was that it allowed the destination urban public schools to charge Temporary Schooling Fees because the migrant children only "temporarily" attend the public schools in the destination cities. In addition to the "Temporary Schooling Fees", this law did not prevent the local urban schools from charging other exorbitant fees such as Sponsor fees. When this regulation was implemented, it actually encouraged local cities charge more fees from the migrant students. Migrant children come from the low-income families, they could not afford the Temporary Schooling Fees, Sponsor fees and many others (Cui 2003).

For example, in the capital city-Beijing, the local public schools charged rural migrant children a series of fees. These fees included an education compensation fee, a temporary schooling fee (placement fee), a miscellaneous fee, and a sponsor fee on top of their tuitions. When all of these fees were added together, they could range from 4,000 RMB to 6,000 RMB a year. It was a large sum of money for a lot of migrant workers' families with average annual income in 2002 of no more than 10,000 RMB (Goodburn 2009; Mok et al. 2011).

Fu (2011), Bi and Szente (2010), and Xia (2006) have mentioned that the migrant children in the city who want to attend the high quality public schools in the city center had to pay so called a "Temporary Schooling Fee (jie du fei)" which local

urban students were exempted from, as well as various donations and surcharges. The amount of those fees varied based on the reputation and location of the schools and they could be as high as 50 thousand yuan (equivalent to \$7,500) per year (Bi and Szente 2010). Thus many migrant children were prevented from going to the public schools because their family could not afford those expenses.

However, even when the new Compulsory Education Law came into effect in 2006 stressing the equal education rights between the local students and migrant students, many schools in the urban areas still charged migrant students the illegitimate temporary schooling fee (Xia 2006; Goodburn 2009). Even today in Beijing, according to Yang (2015), if the migrant children want to attend popular public schools or key schools, they have to pay a hefty “sponsor fee” which is far beyond the economic ability for most of the migrant families. The “sponsor fee” is said to be paid by the parents voluntarily, but everyone knows the “rules”. The sponsor fee is normally 100,000 RMB (16,666 US Dollar) and can be as high as 250,000 RMB (41,666 US Dollar) depending on the popularity and reputation of the school. The “sponsor fee” targets to the children who do not live in the school zone of the high quality public school, and it is not limited to the migrant children from the rural areas. But there is no doubt that almost none of the migrant children could afford the fee and even many native residents are not able to afford it.

The local urban public schools and local governments also had no interest to implement this regulation because it required the local government to use their own education budget to support the education of migrant children. Thus, this regulation in some ways actually restricted the education rights of rural migrant children in the urban areas.

In 2001, the central government issued the “*Decision on the Improving and Reforming on the Basic Education* (关于基础教育改革与发展的决定 2001)”, this decision stipulated that the migrant children should be placed under the jurisdiction of the government of the destination cities, should mainly attend local urban public schools, and that the local governments should take measures to guarantee the education rights of migrant children in the urban areas (两为主政策) (SCAU 2011). This decision encouraged the local urban destination government to tackle the schooling issues of the rural migrant children.

In 2003, the Central Government issued the “*Suggestions on Education of the Migrant Children* (关于进一步做好进城务工就业农民子女义务教育工作的意见)”. These suggestions required the urban public schools to enroll as many migrant children as they could and established that local government had the obligation to education all children residing in the urban areas regardless of where their family’s household registration certificates were registered (Wang and Holland 2011). These suggestions also required the local urban government to reduce or abolish the unequal fees charged to the migrant children who want to study in the local urban schools. It is important to note that it required that the rural migrant students and local urban children should be treated equally in terms of the fees that they are required to pay. Thus, for the poor migrant children, the local urban schools were to reduce their school fees, provide free textbooks for them, and provide assistance to help their schooling.

The key of implication is that the “2003 Suggestions on Education of the Migrant Children” required the local urban destination government to allocate a special budget for the compulsory education of the rural migrant children in the cities exclusively, and that special budget should be a subset of the total local compulsory education budget (SCAU 2011). This has caused substantial resistance on the city local governments to the implementation of this policy. Given the decentralized public finance system, the local urban governments had to use their own limited financial budget to support the education of the rural migrant children. At the same time this policy forbid the local governments to charge the migrant children exorbitant fees and asked them to charge migrant students and local urban students equally. Thus the implementation of this policy lacked financial support and the local urban governments had no enthusiasm to enact this policy. As mentioned by the Wang and Holland (2011), for many reasons the urban local governments have not implemented this provisional act to the full extent. Because central government has little enforcement power, this policy has been implemented only to the degree that the local government allowed.

In 2006, a new “Compulsory Education Law” was enacted, this law stipulated that the migrant children could attend the public schools in other places than their Household Registration indicates. They could attend the local public schools in the cities where their parents worked. In these cases, the local urban government should provide the rural migrant children with the equal educational opportunity to the local urban students.

In the March 2006, the central government issued “*The Central Government’s Suggestions on Solving the Multiple Issues of Migrant Workers* (国务院关于解决农民工问题的若干意见)”, among these suggestions, clause 21 stated that the destination urban government should shoulder the responsibility to educate migrant children in the urban area. It stipulated that the local urban government should enroll migrant children in the local public school system and that their education budget should also provide for the compulsory education of rural migrant students in the cities. The urban public schools should treat migrant students equally and Temporary Schooling Fee and other fees should be totally forbidden (Chinese Government 2006).

These suggestions represented a breakthrough in guaranteeing the equal education opportunities for rural migrant students and local urban students. This was because these suggestions also stipulated that governmental funds to public schools should be based on the real numbers of students in the schools, not based on the number of students who have local Household Registration. This is to say, as long as the local urban public schools take in rural migrant students regardless of their Household Registration status, the local public schools could get the same amount of the education funds from the local governments as when they enrolled the same number of the local urban students.

In 2010, the Chinese government made a *National Long-term Plan for Education Reform and Development* (国家中长期教育改革和发展规划纲要 2010–2020), and solving the education issues of the migrant children was also been incorporated in this plan. This plan not only consolidated the basic policy on the migrant chil-

dren: “the destination urban government should take main responsibilities on the provision of education for the migrant children, and the migrant children should mainly attend the urban public schools in their destination cities (两为主政策)”, but also at the same time, required the local urban government to work out plans for the migrant children to attend the High School Entrance Exam and College Entrance Exam in their destination cities (Chinese Government 2010).

From the laws and regulations above, we can see that the central government wanted the local governments to regard the migrant children as local students, and help migrant children in solving their education problems and provide improved social services for the migrant workers’ families. However, due to China’s decentralized administrative and fiscal system, the Chinese central government has limited power to enforce the laws in the local level. The local governments only implemented this law to the extent they wished (Wang and Holland 2011; Mok et al. 2011). So even through the central government vowed to settle the schooling problem of migrant children in the cities, the truth was that at the local level, many rural migrant children still could not attend urban public schools. As a result, they may have ended up attending unqualified underground migrant schools.

The changes of the education policies for the migrant children in the past two decades illustrate the fact that the Chinese government has slowly realized the importance of, and the challenges to, the education equality for the vulnerable migrant children. The increasing numbers of the rural migrant workers and migrant students arriving in the cities made Chinese government at different levels realize the urgency to address the needs of migrant children receiving public education and equal treatments in their destination cities. This may be a force that drives continual changes in the education policy for the migrant children in the cities.

9.3.2.1 Different Cities Have Developed Different Solutions to the Education Issues of the Migrant Children

Because of the decentralized education and governmental administrative system of China, the central government has given much freedom for the governments of different cities to work out their individual solutions for the education issues of the rural migrant children. Based on their own situations, different cities had work out their own plans to address the issues.

The governments of Wuhan, Tianjin, Hangzhou, Nanjing, Shaoxing, Jiaying, Ningbo, and Suzhou have tried to incorporate migrant children into their public education system as much as possible. Yet the city governments in Guangdong Province have had to rely on the private migrant schools to address the education issues of the rural migrant children.

In the capital Beijing, in 2009, there were about three million migrant workers and 418 thousand migrant children. Sixty-seven percent of these migrant children attended public schools, while the rest of the migrant children have to attend the low-quality private migrant schools (Li 2010; Yuan 2010). Compared with Guangdong Province, Beijing has done a relatively better job in ensuring the majority of the migrant children get into its urban public schools. However, at the same

time, in 2009, there were still about 200 private migrant schools in Beijing, and only about 60 private migrant schools had obtained a license for operation from the government. The Beijing urban government also provided a small amount of funds to help those licensed private migrant schools (Yuan 2010). Additionally, the Beijing government had chosen to close many of the unlicensed low-quality private migrant schools.

Like Beijing, Shanghai city in 2007 (Shanghai has 6.6 million floating population in 2007) has also incorporated large numbers of the migrant children (221,000) into its urban education system and this number accounted for 58.2% of the total number of migrant children (Li 2010, p. 181). In 2008, nearly 65% of the migrant children in Shanghai attended public schools (Yuan 2010). The urban government of Shanghai also tried to bring underground private migrant school under professional private educational management. For those low-quality private migrant schools, in order to improve and update their facilities, the Shanghai urban government provided a 500,000 RMB fund to each private migrant school. In order to get the funds, each private migrant school had to pass a third-party educational assessment and then sign a contract with district or county-level governments (Li 2010, p. 183). In 2007 and 2008, 116 private migrant schools were transformed into the professional management of the private education. Like Wuhan, the migrant children in the private schools of Shanghai also did not need to pay for the tuition and textbooks. The urban government also provided 1,900 RMB per person per year for the private migrant school to enroll migrant students in 2008, and the subsidy was increased to 3,000 RMB in 2009 (Li 2010, p. 183). The Shanghai government also shut down the private migrant schools which do not meet the private school standard.

Both Beijing and Shanghai have tried to increase the number of migrant students attending public schools. However, the numbers that needed served has also required that Beijing and Shanghai to try to increase the quality of private migrant schools. Closing many private migrant schools, though, may mean that some migrant students will continue to find it hard to receive an education.

9.4 Conclusion

This chapter discussed the education problems of the rural migrant children in the cities. All of the studies cited and analyzed in our chapter indicate that migrant children were not been treated equally in their destination cities, and their rights to receive compulsory education were not being fully guaranteed even though some helpful measures have been proposed and taken by the local and central governments.

Migrant workers are a vulnerable population in the cities. Migrant workers suffer from the institutional and systemic discriminations in the cities (Xiong and Yang 2012) and their children's rights to receive high quality education in the cities have been violated.

As many as 20% of the migrant children still have to attend low-quality private migrant schools, and attending these private migrant schools in the cities are still an important way for the migrant children to receive education in the urban areas. So, in order to help those private migrant schools, the government should legalize all of the private migrant schools. These schools should be improved with the professional management model as well.

Second, governments of all levels should provide sufficient funds to renovate the school facilities, improve the safety condition of the classroom, pay for teachers' salaries, teacher training, and maintain the professional operation of the schools. The central government should shoulder more responsibilities for the finance of migrant schools by providing special funds.

Third, the government of all levels should improve the quality of the teaching staff in the migrant schools. Currently, the teachers in the migrant schools are extremely low in quality, they are neither professional nor experienced. Many of the teachers in the migrant school are part-time teachers. Most of the teachers were not well educated. The majority of them have not received either a college education or professional training and they have not obtained teacher's certificates. Many teachers have only slightly higher academic skills and educational attainment than their students. The migrant school should recruit teachers from the colleges and universities, and in-service teachers should receive frequent professional training to upgrade their knowledge insuring they can use the latest methods to teach their students.

Currently, the most effective way to educate rural migrant children in the urban areas is incorporating them into public schools and mixing them with local urban children. In 2013, 80.4% of the migrant students attend public schools in the cities (OECD 2013, p. 58). However, simply placing migrant children together with the local urban students is far from enough. Effective measures should be taken to make migrant children from the rural areas better integrated into the urban society for a better life and an upward career mobility.

Xiong and Yang (2012) mentioned that it is far from enough for the urban governments to open the gate of the urban public schools to the migrant students, as the urban public schools have positive but limited effects on integrating migrant students into the urban society. The current education system in China has failed to provide migrant children sufficient opportunities to thrive in the cities and to have upward mobility in the urban society because the urban society repels the families of the migrant workers systemically and institutionally. Xiong and Yang (2012) also believe that since the discrimination towards the rural migrant workers still exists in the areas of employments, wages, occupation, social welfare, and higher education, simply providing the rural migrant children with opportunities to receive urban compulsory education will be inadequate.

The disparities between the urban and rural areas of China has been existed for decades, driving poor rural farmers leave their rural hometowns and work in more prosperous cities in order to seek for a better life for them and their children. But the discrimination that the rural migrants face in their destination cities has made them to realize the large gaps between their dreams and the realities in the cities. The poor plight of the rural migrant workers and their children in the cities indicates that

migrant workers have little social power to change their education situations in the destination cities.

Migrant workers are the most vulnerable group in the cities, and this vulnerability is caused by the social stratification in contemporary China. The governmental policies could either reduce or eliminate this vulnerability, but could not really remove all of the discrimination against the vulnerable groups of China. As in the case of the migrant children in China, although about 80% of the rural migrant children attended the urban public schools, only 4,444 rural migrant students nationwide managed to sit for the college entrance exam in their destination cities in 2013. Without a change in social stratification, even with all the positive changes in public school access at all levels in urban area, migrant children will still lag behind the other children in terms of social mobility.

Xiong and Yang (2012) mentioned that schools exist in a wide political-economic-social space, and the education is subordinate to the arrangements of policy and social power. Education may not be able to eliminate the social inequalities created by social power and economy. However, individuals, receiving a good education could change their fate, potentially empowering them to have a better life in the future, especially for the venerable groups.

By incorporating migrant children into the urban education system and reducing their difficulties in taking the college entrance exam, we could ameliorate the negative effects of institutional and systematic discrimination toward the migrant children and their families. It should reduce migrant workers' negative feelings towards the urban people and society, and promote social harmony and integration.

From the first appearance of the migrant children in 1995s till now, China has spent almost 20 years trying to solve the education issues of migrant children. Now migrant children are still facing much discrimination in the cities. Why has China taken so long to address this problem? The inefficient decentralized, education administrative and fiscal system is one important reason. Huge population and economic disparities of different regions is another reason. However, there is one important reason. The dominant social power is held by the people in the cities. The rural migrant working class has little power to change their inferior social status in the cities. The native urban residents are also reluctant to share their privileges and resources with the migrant workers even if the migrant workers have already made indispensable contributions to the growth of their destination cities.

China now is undergoing a process of profound economic and social transformation. Its public policies may still be incomplete in many ways to address the new emerging issues while protecting the legal rights of its citizens. The education experience of rural migrant children in the cities is evidence that China still has a long way to go to achieve equality and equity in education.

Chapter 10

Promises and Practices: A Case Study on Compulsory Education Policy Implementation in a Large Migrant-Inflow City in China

Shuyin Liu, Wenyang Sun, and Elizabeth Barrow

China has been undergoing unprecedented population mobility since the 1980s, due to the government's gradual ease of migration restrictions and the acceleration of urbanization. The rapid development of industrialization and a market economy has contributed to an increasing rural-urban income disparity, thus more rural labors have been migrating to cities seeking employment opportunities (Hu et al. 2014; Jia and Tian 2010; Wong et al. 2007). These migrant workers are often referred to as a "floating population (流动人口)," a term often used to describe "the large and increasing number of migrants without local household registration status (*hukou*, 户口)" (Liang and Ma 2004, p. 467). According to the National Bureau of Statistics of China (2014), the number of the floating population reached 253 million in 2014, which exceeded one sixth of the total population in China. The rapid increase in the floating population is represented in Fig. 10.1.

China is in an accelerated process of urbanization (Jia and Tian 2010; Wong et al. 2007), and the large scale movement of migrant labor from rural areas to more developed urban areas will continue to increase, thus adding to an already large population of floating migrants. Job vacancies created by economic expansion can be filled with the influx of migrant workers; however, a large floating population also contributes to new challenges, including increased demands on the city for immigrant workers' and their children's education, health care, and social security (Hu et al. 2014; Wong et al. 2007). The current trend of whole-family migration, as opposed to the individual migration patterns of several years ago, has resulted in more migrant children of compulsory education age (6–14 years old) enrolling in urban schools (see Fig. 10.2). This phenomenon has become increasingly high-

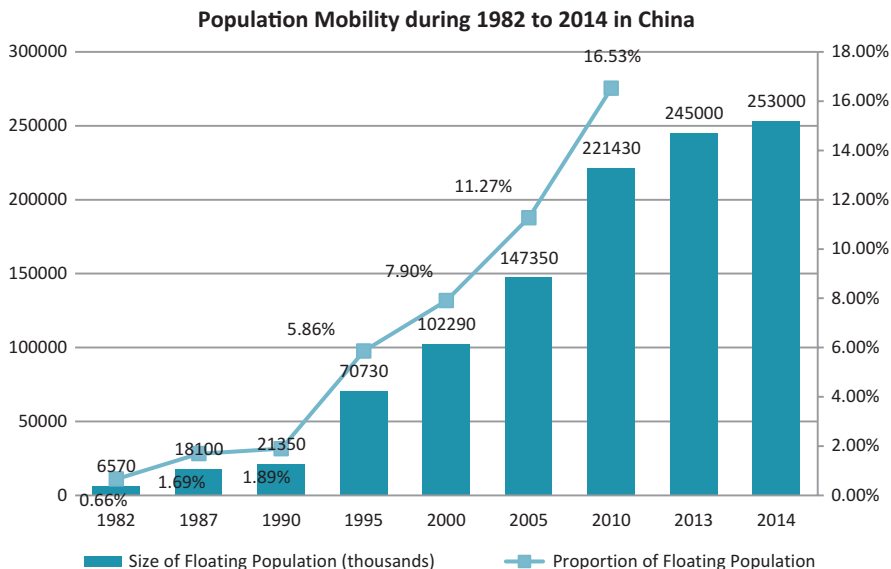

Fig. 10.1 Population Mobility during 1982–2014 in China. This figure is based on multiple data sources, including “*Report on China’s Migrant Population Development*,” by Department of National Floating Population and Birth Control, 2014, China Population Publishing House; “Nine trends on flow of floating population in China since the reform and opening up,” by C. Duan, G. Yang, F. Zhang, & X. Lu, 2008, *Population Research*, 32; “National Bulletin of the national 1 % population sampling survey in 2005,” by National Bureau of Statistics of China, 2006, *National Bureau of Statistics of China Website*, Retrieved from http://www.stats.gov.cn/tjsj/tjgb/rkpcgb/qgrkpcgb/200603/t20060316_30326.html; “Bulletin of the 6th national demographic census,” by National Bureau of Statistics of China, 2011, *National Bureau of Statistics of China Website*, Retrieved from <http://www.stats.gov.cn/tjsj/pcsj/rkpc/6rp/html/fu03.htm>; “National Data,” by National Bureau of Statistics of China 2014, *National Bureau of Statistics of China Website*, Retrieved from <http://data.stats.gov.cn/easyquery.htm?cn=C01>

lighted in China and is contributing to several social problems (Chan 2009; Mao and Zhao 2012).

Although China’s central government has mandated that local schools accept migrant children, local authorities at the county level have resisted their enrollment because the population of local resident children with hukou determines school funding, therefore schools have no monetary incentive to increase their levels of migrant student enrollment (Chen and Feng 2013; Ren and Treiman 2013; Wong et al. 2007). When public schools refuse to enroll migrant children, these children must attend migrant children schools, which are typically operated by businesses with market-driven agendas. Compared to public schools, migrant children’s schools not only offer limited resources, since owners attempt to minimize the costs; these schools also encounter substantial institutional barriers, since they are “not in the system.” They go without updated textbooks, certified teachers, safe and workable facilities, and so on (Chen and Feng 2013, p. 77). The migrant children who are able to attend urban public schools often face discrimination from teachers,

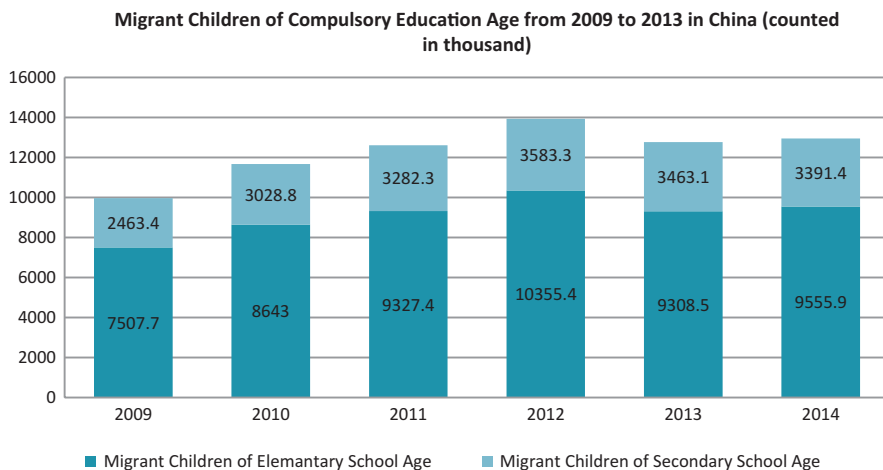

Fig. 10.2 Migrant children of compulsory education age from 2009 to 2014 in China. This figure is based on “National education statistical bulletin of 2009, 2010, 2011, 2012, 2013, 2014,” by Ministry of Education of the People’s Republic of China (2009, 2010, 2011, 2012, 2013, 2014), *Ministry of Education of the People’s Republic of China Website*, retrieved from http://en.moe.gov.cn/Resources/Laws_and_Policies/201506/t20150626_191391.html; http://www.moe.gov.cn/publicfiles/business/htmlfiles/moe/moe_1485/201008/xxgk_93763.html; http://www.moe.edu.cn/publicfiles/business/htmlfiles/moe/moe_633/201203/xxgk_132634.html; http://www.moe.edu.cn/publicfiles/business/htmlfiles/moe/moe_633/201208/141305.html; http://www.moe.edu.cn/publicfiles/business/htmlfiles/moe/moe_633/201308/155798.html; http://www.moe.edu.cn/publicfiles/business/htmlfiles/moe/moe_633/201407/171144.html; http://www.moe.edu.cn/srcsite/A03/s180/moe_633/201508/t20150811_199589.html

administrators, and local-resident students, which may negatively affect their psychological well-being (Chan 2009; Kwong 2011; Ren and Treiman 2013).

The Yangtze River Delta, a region with increased emigration, is gradually becoming one of the most attractive destinations for migrant workers. There, workers can find a good industrial infrastructure, convenient local and overseas transportation networks, and a rapidly expanding economy. Among the 22 cities in the Yangtze River Delta, seven have added more than one million migrants to their populations, including Wu City,¹ the second-largest migrant-inflow city in China (Bin 2013). Census records indicate that Wu City’s floating population reached 6.9 million in 2014, and now the floating population has surpassed the size of the registered population (People’s Government of Jiangsu Province 2015).

Hundreds of thousands of school age children arrived in Wu City with their parents over the past decade, adding pressure to the city’s system of compulsory education (Grades 1–9). The number of migrant children attending compulsory education in 2004 was 155,000; by 2013, that number had increased to 364,000. In 2014, migrant children enrolled in Wu City schools comprised 48.3 % of the total number of compulsory education-aged children in the city (Yangtze Evening News 2014).

¹“Wu City” is a pseudonym.

This project researched educational policies and their implementation pertaining to migrant children's compulsory education in Wu City. Over 6 months, the first author interviewed leaders of the local education authority and made observations about the policy implementation process. Research revealed that, when confronted with rapid population growth, systems of education in cities like Wu City had no capacity to meet students' needs effectively. Local education authorities are especially troubled, since they have limited resources and executive power to make decisions regarding the equity and quality of education for all resident and migrant children.

This chapter highlights the dichotomy of educational policy implementation at the city level regarding migrant children's compulsory education. In the promises-practice framework, the central government makes promises, while the local education authority is responsible for implementation. This chapter will reveal the specific conflicts local education authorities face, potential causes for these conflicts, and the reality of migrant children's education in a case study of one city in China.

10.1 Methodology

The data for this case study were collected from two main sources: (1) Archival and policy documents, and statistics related to the education policies of the central government and their related issues in Wu City (document analysis); (2) Interviews and informal conversations with officials of Wu City Municipal Education Department (MED), school principals, and parents. Analyses of the policies and archival documents from the central government level enabled the first author to illustrate how the central government made a promise to ensure the enrollment of the migrant children. Additionally, using data collected from the Wu City education department, local schools, and interviews with city officials and school administrators, the first author was able to further disclose the dilemma faced by local authorities when implementing the promises in policies.

The first author collected archival data, policy documents, and statistics from the Wu City MED.² The main sources of the data include: *The General Facts about Education in Wu City* (from 2004 to 2014), which included a summary of land use, population, GDP, and budget information, as well as statistics related to the elementary and secondary schools in Wu City; census data from the elementary schools and secondary schools that are directly administrated by the MED, which included general demographic information on the students and their family backgrounds; regulations and policies issued by Wu City MED regarding the reform of compulsory education and the education of migrant children; and the regulations concerning elementary school enrollment in recent years. The first author also conducted a

²To ensure the anonymity of the data, we do not provide complete citation and reference information.

9	Chief of Guard and Security (former deputy Chief of Elementary Education), Wu City MED	Q
10	Migrant workers who petitioned MED for children's enrollment	M1, M2,

survey of migrant children's learning conditions and family background information during fieldwork in Wu City.

Additional data were collected from seminars and workshops (audited by the first author). Seminars, organized by the Wu City local government, included participation by the local Development and Reform Commission, the Public Security Bureau, and the Bureau of Finance. Workshops included teachers' workshops held by Wu City MED.

The first author also conducted 642 min of interviews with nine officials from Wu City MED and migrant working parents who had petitioned the MED for their children's enrollment in public schools. Table 10.1 includes pseudonyms for all individuals interviewed in this study, as they appear in this chapter.

10.2 Context

10.2.1 *Promises of the Central Government*

In 2001, China's central government mandated that regional areas with large floating populations of migrant workers must provide migrant children with a compulsory education. The State Council's (2001) *Decision on the Improving and Reforming of Basic Education* highlighted that governments at all levels should pay attention to migrant children's compulsory education, governments of high emigration areas should be the primary providers for migrant children's compulsory education, and full-time public schools should be the primary receivers of migrant children. This later became known as the "Two Primaries" policy and is the standard by which all related issues are judged. Despite the State Council's decisions, the

situation for migrant children did not improve significantly, and the lack of educational opportunities and poor schooling conditions incited strong discontent among migrant workers. On Teachers' Day 2003, Wen Jiabao, China's prime minister at that time, visited a migrant children's primary school, and wrote "Under the blue sky, and grow together" on a classroom's blackboard (China News 2003). Just 3 days later, China's Ministry of Education, State Commission Office for Public Sector Reform, Ministry of Public Security, National Development and Reform Commission, Ministry of Finance, and Ministry of Labor and Social Security issued a joint resolution that reinforced the "Two Primaries" policy that migrant-inflow regions should shoulder the responsibility of providing compulsory education for migrant children and treat them without discrimination. The *Compulsory Education Law of the People's Republic of China* (National People's Congress 2006) was passed to further ensure the equal right to compulsory education for migrant children. The following clause was later added and amended at the 22nd Session of the Standing Committee of the Tenth National People's Congress, on June 29, 2006:

For a school-age child and juvenile whose parents are working or dwelling at a place other than their permanent residence, if he/she receives compulsory education at the place where his/her parents or other statutory guardians are working or dwelling, the local people's government shall provide him/her with equal conditions for receiving compulsory education.

Laws and regulations related to migrant children's compulsory education inspired promises indicating the commitment by the central government to provide equality of education for all children. What prompted the central government to make such promises? These laws were a response to the growing urbanization and market economy in China. The Chinese central government wanted to promote urban construction and economic development, and that required an increase in manual labor. In order to attract the needed workers, better laws protecting migrant workers and their families were needed (Knight et al. 2011). Also, promises of new laws protecting migrant workers were made under great pressure and protest from the general public. News reports across China highlighting the unfair treatment of migrant workers and their children, including the large numbers of migrant children dropping out of school, raised widespread concerns nationwide (Liang and Chen 2007). Migrant workers filled labor force vacancies in the cities and made great contributions to urban construction and economic development, and, over time, these workers and their children would gradually become citizens of their new city. In the meantime, however, these families deserved opportunities equal to those the locally registered people enjoyed. The central government realized the urgent need to address these practical issues, otherwise, they knew, social stability could be greatly undermined (Knight 2013). The guarantee of migrant children's equal access to compulsory education in inflow cities is an important aspect of floating population service. The central government's clear position and the promise of the "Two Primaries" policy served to soothe migrant workers' nerves and stabilize their emotions, thus, the government hoped, convincing them to stay and work in the cities.

10.2.2 A Promise-Practice Framework

Policy implementation falls under the jurisdiction of local education authorities (at both the city and county levels); the central government has no authority over local education practices. Local authorities must navigate the requirements of the “Two Primaries” policy, the leadership of the local government, the demands of migrant workers and their children, the discontent from the locally registered population, and the pressure from public schools and teachers. Hence, multiple conflicts of interest can occur at this level. Using Wu City and its ten counties as an example, there are conflicts between local interests and policy requirements from the central government, between economic development and education budgetary burdens, between education equity and quality, and between the mobility of laborers and the inflexibility in using resources for education. However, local education authorities at the city level are burdened by limited executive powers to resolve these problems, a condition that contributes to an environment of conflicts.

10.3 Findings: Policy Implementation in Reality

Based on the promises-practice framework, findings in this chapter reveal some specific conflicts and barriers local education authorities face when they implemented the central government education policies. Interview data provide the local officials’ interpretation and explanations of the causes for these conflicts, and their perceived dilemmas in terms of the potential solutions.

According to the statistics collected from Wu City MED, in the fall of 2013 there were approximately 383,800 compulsory school-aged migrant children in Wu City, which constituted 48.3% of the compulsory school-aged population. Among these migrant children, 74.4% were enrolled in public schools, whereas 25.6% were enrolled in private migrant schools. As the statistics above show, Wu City almost met the requirements of the “Two Primaries” policy by allowing the enrollment of migrant children of compulsory education age in public schools (General Office of the State Council 2006). However, local education authorities in Wu City experienced a backlash from various stakeholders, including opposition from local urban residents and protests from migrant worker parents. This caused increasing conflict for local authorities in Wu City as they strove to meet the requirements of the central government.

10.3.1 Conflicts Between Local Interests and the Requirements of Their Superiors

One of the difficulties in enrolling compulsory-aged migrant children in public school lies in the conflicts of interest among different counties in Wu City. The *Compulsory Education Law of the People’s Republic of China* (National People’s

Congress 2006) makes it clear that the governments at the county level shall mainly administer compulsory education, so county financing constitutes a major source of funding for compulsory education. However, due to differences in industries and economic patterns, there is an uneven distribution of the floating population among the counties of migrant-inflow cities, such as Wu City. In addition, migrant workers in Wu City often work in one county and live in another, which results in mismatches between the locations of their workplace and residential areas where their children are educated. In this case, counties that host migrant families with children (but which are not the location of the migrants' workplace) often take account of their own interests and do not want to share responsibility for carrying out the central government's policies. See Appendix A for charts explaining the population and registration status for elementary and middle schools in Wu City.

Counties II and JJ (see Table 10.1 for a list of county pseudonyms), in Wu City, house a variety of industries and maintain prosperous economies; they are becoming the main workplaces for migrant workers. On the other hand, county HH has more convenient living facilities and lower housing prices, thus it is becoming the main residential location for migrant workers. According to the "Two Primaries" policy and the tradition of principal of enrollment in the nearest neighborhood schools, county HH must accommodate the large numbers of migrant children of compulsory education age who live there, thus increasing HH's financial burden. As a result, county HH is reluctant to fund migrant children's compulsory education, when the economic value (production and taxes) of their parents' labor goes to other counties' prosperity, such as counties II and JJ.

The first author conducted a survey of migrant children's learning conditions and family background information during fieldwork in Wu City. The survey revealed a high-degree discrepancy among migrant children's residences and their parents' workplaces, as displayed in Table 10.2 (see Table 10.2). It can be concluded that most counties accommodate a significant number of migrant children whose fathers do not work there. School enrollment in county HH includes 20% migrant children in that category.

Under the circumstances of county-level finances supporting local compulsory education, if students want to go to school in counties where they live but where their parents do not work, the former are more likely to deny their enrollment, a practice that directly contradicts policies outlined by the central government. Such situations may need MEDs at the city level to coordinate, but the effects are quite limited. According to China's political system, functional departments at each level should be administered by the governments at the same level, and these should follow the operational guidance issued by their superior departments (Zhou 2009). Under such circumstances, education departments at the county level are mainly housed among the leadership of the county governments, therefore the MED of Wu City can provide professional guidance to county officials, but it cannot enforce policy implementation. As a result, when counties avoid the responsibility of caring for migrant children's compulsory education, the responses by the MED are not helpful in the matter.

Table 10.2 Mismatch of migrant children's residence and their fathers' workplace in each county in Wu City

County	Number of migrant laborers who live but do not work	Number of migrant laborers who work but do not live	Percentage of non-local employees' children at public primary schools
AA	1767	827	3.35 %
BB	1596	1096	2.70 %
CC	1635	928	4.58 %
DD	3212	1167	5.44 %
EE	2757	1734	3.76 %
FF	4658	3188	7.29 %
GG	2395	1641	4.43 %
HH	5210	2030	19.59 %
II	2146	3676	0 %
JJ	1844	2430	0 %

10.3.2 Conflicts Between Pursuing Economic Development and Fulfilling Compulsory Education Promises

Manual labor is required for urban economic development in many Chinese cities. The economies of most emigrant destination cities, including Wu City, rely greatly on processing trade and other labor-intensive industries, so there is a large demand for and dependence upon the manual labor force. The majority of migrants flowing into cities like Wu City are young adults with families. An increase in families means an increase in the number of school-aged children needing to attend school, which places demands on local economies to provide the infrastructure and resources required to educate them all.

In recent years, the number of migrant children of compulsory education age has increased rapidly in Wu City; therefore, public schools have experienced a severe shortage in educational resources. According to an interview with official B (see Table 10.1) in the Wu City MED, Wu City's 304 elementary schools had the capacity to provide education for only 79,000 students in 2014; in reality, 20,000 more students needed to be enrolled in schools. B predicted that, based on current trends, by 2020 if all the current schools (including private migrant schools) are still enrolling students, then Wu City will need to build around 110 new elementary schools and 100 new middle schools.

The growth of the migrant children population requires more teachers and staff as well as buildings; however, the availability of resources limits the number of new schools that can realistically be built. As official H said, "Funding is not the biggest problem for Wu City. The problem is the land" (interview notes). H mentioned that land is a rare resource in Wu City. When Wu City's government officials were planning the city, they encountered conflicts between zoning land for industrial or commercial purposes versus educational purposes. Government officials often pursued the maximization of economic interests at the expense of the educational needs of

the city's children. According to H, these zoning conflicts resulted in "sufficient money" for the county, but "no land" for new schools (interview notes).

The conflict between the pursuit of economic interests and the fulfillment of educational responsibilities is a common challenge for the governments of cities with increased floating populations. Local governments place a priority on solving local problems—usually they view economic prosperity as their highest pursuit, rather than addressing education issues. As local education authorities, MEDs are responsible for the organization of compulsory education, but, due to county control of all educational administration, Wu City MEDs are, in fact, quite powerless to challenge the choices of local governments.

10.3.3 Conflicts Between Equity and Quality

Wu City was one of the first cities in China to provide a universal 9-year compulsory education for local school-aged children in the 1990s. In the following decade, Wu City began to reduce class sizes to further improve education quality. However, when large numbers of migrants began flowing into the city, local education authorities had to expand school and class sizes to enroll more students, since the possibility of building new schools has been limited. An elementary school principal in County HH indicated that, 10 years ago, the average class size was 30 students, while nowadays every classroom is filled with students. Many classes even host 48 students, and therefore some students have to sit on either side of the teacher's podium (interview notes). This is not an uncommon case in Wu City. Most primary and secondary schools have been forced to overextend their limited educational budgets to accommodate more migrant children by expanding enrollment and enlarging class sizes. In a teachers' workshop held by MED, the first author observed that most teachers reported that they bore greater workloads and pressure, and had noticed a decline in the quality of students as more migrant children were enrolled. They also mentioned discontent among the local registered population, due to a decline in educational quality resulting from the reduction of per-student expenditures. During an interview with Q, the former deputy chief of education in the Wu City MED, he drew an analogy to describe the deflation of educational quality due to the over-enrollment of students: "This is just like purchasing food. Originally, 50 RMB was used to feed 1 person; but now, 50 RMB is used to feed 10 people instead. How could you not expect the degradation of food quality?"

Increased student-teacher ratios can also deter future teachers from applying to teach in Wu City. Under the requirements of the State Commission for Public Sector Reform (2014), the number of personnel supported by government finances should not be expanded, and staff levels in the primary and secondary schools should not exceed the existing allocation of personnel. According to the interview with H, Wu City is not endowed with any exceptions or policy exemptions regarding the allowed size of its schools' teaching staff, despite being a large floating population city accommodating hundreds of thousands of migrant children. Therefore, education

authorities have had to forgo hiring additional teachers to support the increasing student body at local schools.

It is a tough choice for local education authorities to make, between guaranteeing migrant children's equity access to compulsory education and ensuring the satisfactory quality of compulsory education for all. Based on an interview with official Z in the Wu City MED, the local registered population opposes the continued reduction of per-student expenditures to allow for the addition of migrant children's enrollment; however, local authorities' refusals to expand the public schools and therefore turn away migrant children from a public education will surely arouse protests and petitions from migrant parents (field notes). Currently, migrant children who are not admitted to public schools mostly study in local private migrant schools with poor conditions, which are operated by private owners who minimize the cost (Chen and Feng 2013). According to official Z, the MED of Wu City issued a document in 2006 aimed at improving the minimum standards for private school education for migrant children. The criteria for educational standards in the document were quite low, barely achieving the same educational level for public schools in Wu City decades prior. Regardless, 19 out of 95 private schools are still considered substandard. The vast majority of private schools for migrant children are in quite poor conditions, due to budget shortages and ineffective management, and the so-called qualified ones can only reach levels that were average in Wu City public schools nearly 20 years ago.

10.3.4 Conflicts Between the Uncertainty of Migrant Labors' Geographical Movement and the Local Investment in Compulsory Education

According to statistics provided by the Wu City MED, in 2013, the floating population in Wu City was over 6.5 million, of which 1.6 million people stayed for less than half of 1 year; 2.1 million people stayed for more than half of 1 year but less than 1 year; and the rest, 2.8 million people, stayed for more than 1 year. Migrants' mobility is largely affected by job opportunities. Although it is sure that rural laborers will continue to flow into cities with growing economic opportunities, it is difficult to predict the direction and magnitude of the floating population. As for Wu City, there is no clear picture how many migrant workers will flow into the city in the future, after it has already absorbed more than six million members of the floating population. Meanwhile, Wu City's local government has begun to realize that a foreign-capital economy and processing trade are not sustainable development patterns, so the city is actively seeking a transformation of its economic growth model (People's Government of [Wu City] 2012). This new economic growth model emphasizes the pursuit of economic quality rather than quantity, namely, a change from being labor-intensive to being knowledge-intensive. Economic transformation brings a change of labor demand—the demand for high-end technical workers will

surpass the demand for a general manual labor force. When migrant workers find it hard to get suitable jobs in Wu City under its new industrial conditions, they may begin to flow to other cities.

Local government and education authorities worry about the high liquidity of the floating population, which brings much unpredictability to public school systems. Expansion of education resources should be done after prudent planning; otherwise, new school buildings may become vacant when migrant workers begin to exit the cities. A director at the MED of Wu City, S, expressed his concerns about future enrollment. S said, “The population of migrant children will definitely decrease in the future. We are building so many new schools, and can only rely on the population growth led by the ‘two-child’ policy (compared to the one-child policy in the past 30 years) to make up the short supply of students in the future” (from the first author’s interview notes). Others worry that Wu City may become an even more popular destination among migrants, since the city is more accommodating of migrant children’s compulsory education, as compared to other cities.

The fixed educational funds determine that resources cannot follow along the population as it moves, or with every fluctuation in terms of educational needs. Local education authorities must strike a balance between the mobility of the floating population and the obligation to provide satisfactory education for all children with the fixed (inflexible) education resources.

10.4 Conclusion and Discussion

All in all, migrant children’s compulsory education is a complex social and management problem. The central government makes promises, and the local education authorities define the practices and implement them. This study highlights that local education authorities are situated in the middle of the promise-practice framework, between the promises regarding equity in education and the reality of educational practices. The dichotomy between promises and practices directly affects all stakeholders in this compulsory education issue (see Fig. 10.3).

Local education authorities have to face multiple pressures from the requirements of their superiors, the expectations of the floating population, and complaints from locally registered populations. Conflicts between a variety of expectations, values, and demands lead to compulsory education predicaments in migrant-inflow cities, and local education authorities’ powerlessness aggravates the situation.

The promises made by the central government are ostentatious; however, local practices are complicated and conflicting. As policy implementers, local education authorities such as MEDs are not given enough executive power to implement the policies, thus defeating the promise of educational equity.

This case study implies that the “Two Primaries” policy is more like a statement with strong symbolic significance than a must-implement policy. The central government made the statement to quell complaints and ease the indignation of migrant workers. The “Two Primaries” policy is a vague statement that neither clarifies the

PROMISES AND PRACTICES

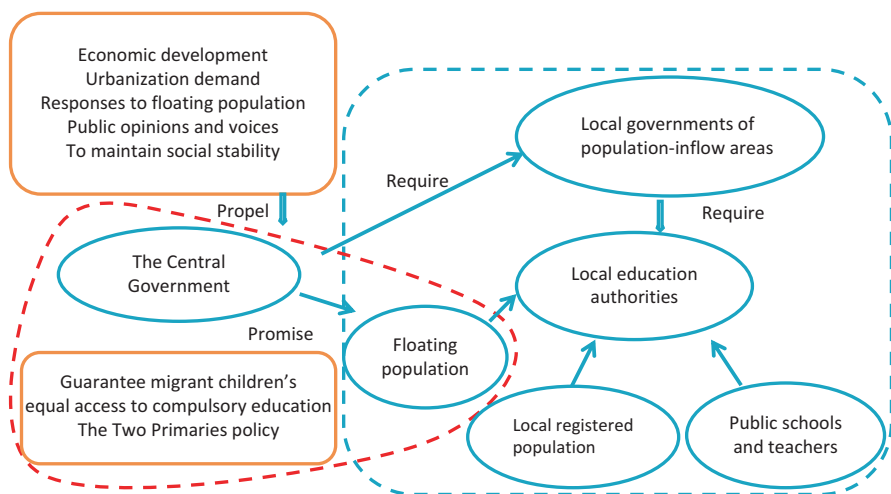

Fig. 10.3 A framework of promises and practices (This chart indicates the demands placed on the central government to issue laws of educational equity (promises) for the floating population, who are central to both national and regional politics and economic growth. However, as indicated by the chart on the right local education authorities face more demands from local stakeholders than the requirements of the central government (practices))

role of full-time public schools as the primary receiver of migrant children nor provides operational details for implementation. In the Compulsory Education Law of the People’s Republic of China (National People’s Congress 2006), the responsibilities of governments at each level are stated as:

Compulsory education shall be under the leadership of the State Council, be carried out under the overall planning by the provinces, autonomous regions, municipalities directly under the Central Government, and be mainly administered by the people’s governments at the county level.

Individual regions and cities are charged with deciphering the meaning of the policy, thus leaving room for varied interpretations and implementations. This study suggests that an equal access to compulsory education for migrant children is far from protected and substantiated by the central government’s promise alone.

According to the law, the education administrative departments of governments at the county level shall be responsible for the implementation of the compulsory education policy, which means county-level education authorities maintain the responsibility of organizing compulsory education, thus allowing for the exclusion of migrant children from public education despite laws passed by the central government. Meanwhile, the Chinese central government adopted a policy whereby the “city leads the county” (Zhang and Wu 2006). In other words, although the governments and MEDs at county levels are implementing the compulsory education policies, these institutions remain under the control of city-level governments. The

central government passed policies on compulsory education, and made promises to the migrant population, that local governments at city and county levels are either unable or unwilling to carry out.

Provision of compulsory education for migrant children is a pressing and confound challenge. Meeting the challenge has been determined by balancing social, political and economic powers in the process of urbanization and migration during China's rapid economic development. This case study raised questions on the centralized policy making and the decentralized fiscal and administrative systems. Findings from this study may imply several suggestions, such as rethinking about the current hukou policies in China, getting different levels of governments on the same page to coordinate coherent policies, provide funding from solid and stable sources, and educate urban residents to appreciate and welcome migrant children in local public schools (See also Tian and Wu 2008; Xiong and Yang 2012; Yuan 2014).

In December, 2015, Prime Minister Li Keqiang signed the Decree No.663 of the State Council of the People's Republic of China, the *Provisional Regulation on Residential Permit*, which emphasized the rights of residence permit holders' to public services in their resident cities/counties (The State Council 2015). Particularly, the new regulation mandates that the governments of county levels and above should incorporate public services for residence permit holders into annual fiscal budgets, and provide public services, such as compulsory education, to all residence permit holders. Compared with previous policies, the new *Provisional Regulation on Residential Permit* attaches rights including compulsory education, employment services, public health and family planning services, etc. to residential permit other than permanent household registration (or hukou), allowing for more people to enjoy public services. However, it is still a graduated rights protection system, meaning that still not all floating population can enjoy basic public services provided by governments at residential places. According to the regulation, people who have left their permanent household registration places and lived in other cities for more than half a year will be eligible to apply for the residential permit, if one of the following conditions is met: holding a legitimate and stable job, proof of legitimate and stable residence, and consecutive study at local schools. Unfortunately the new policy does not protect the rights of migrant workers who have lived in a city for less than half a year. Governments at the municipal level shall consider factors such as the administrative regions' economic development needs and settlement conditions when formulating implementation measures (The State Council 2015). The decision to issue residential permits is still the responsibility of governments at municipal levels, namely the local governments, and therefore these governments still control who is included in the public services and who is excluded. The new regulations, effective on January 1, 2016, will hopefully further carry out the promises from the central government by specifying the responsibilities of local governments on migrant children's education and lowering enrollment requirements, meanwhile putting more pressure on local governments to provide implementation. The problems of funding sources and conflicts of local interests still exist, and need to be solved with more careful negotiations among policy makers, local government and

MED officials, school educators and administrators, as well as parents with and without *hukou*.

Appendix A

Population and Registration Status of Students Enrolled in Elementary and Middle Schools in Wu City (2014).

Elementary School Registration and Enrollment

			Student enrollment in Wu City		Total
			Students with local household registration status	Students without local household registration status	
Grade	Grade 1	Number	45,366	44,308	89,674
		Percentage	50.6 %	49.4 %	100.0 %
Grade	Grade 2	Number	41,863	38,199	80,062
		Percentage	52.3 %	47.7 %	100.0 %
Grade	Grade 3	Number	47,403	35,761	83,164
		Percentage	57.0 %	43.0 %	100.0 %
Grade	Grade 4	Number	43,127	30,656	73,783
		Percentage	58.5 %	41.5 %	100.0 %
Grade	Grade 5	Number	39,614	26,738	66,352
		Percentage	59.7 %	40.3 %	100.0 %
Grade	Grade 6	Number	38,831	24,720	63,551
		Percentage	61.1 %	38.9 %	100.0 %
Total		Number	256,204	200,382	456,586
		Percentage	56.1 %	43.9 %	100.0 %

Middle School Registration and Enrollment

			Student enrollment in Wu City		Total
			Students with local household registration status	Students without local household registration status	
Grade	Grade 7	Number	41,799	19,814	61,613
		Percentage	67.8 %	32.2 %	100.0 %
Grade	Grade 8	Number	39,246	17,158	56,404
		Percentage	69.6 %	30.4 %	100.0 %
Grade	Grade 9	Number	37,413	13,554	50,967
		Percentage	73.4 %	26.6 %	100.0 %
Total		Number	118,458	50,526	168,984
		Percentage	70.1 %	29.9 %	100.0 %

Chapter 11

Transnational Migration and Urban Education in Japan

Kaori Okano

11.1 Transnational Migration and Urban Education in Japan

Target destinations for transnational migrants from the developing countries had long predominantly been urban centers in the developed West, regardless of their motivations (e.g., refugees, or economic migration). In recent years, however, Asian metropolitan areas have increasingly received migrant and guest worker families, including school-age children. Many urban centers in Japan now see a substantial number of students from Latin America, the Middle East and elsewhere in Asia.

Japan's system of education was underprepared for this influx. Although local governments and schools have provided a wide range of well-intentioned services to migrant children over the last two decades, social integration of migrant children has been far from successful. Migrant retention rate beyond 9-year compulsory schooling is low, less than a half of the national average. Given that 95 % of the age group complete high school diploma, migrant children without diploma are unable to secure stable employment as adults, which is likely lead to intergenerational reproduction of disadvantage. This will in turn affect the social cohesion of the entire society.¹ Education of migrant children has thus been one of the country's most pressing issues facing urban education in Japan.

¹Social cohesion generally refers to a harmonious society whereby members feel a sense of belonging. While academic conceptions of the term are extensive both in sociology and psychology (e.g., Bruhn 2009, p. 31–48), this paper uses the term social cohesion as a normative (or policy) goal (e.g., Shuayb 2012) Social cohesion is a positive outcome of the social integration of minority groups into the host society, whereby both minority groups and the host society make significant adjustments; which are ultimately beneficial to individuals and the society as a whole.

e-mail: k.okano@latrobe.edu.au

This paper examines how the arrival of migrant children has changed the educational landscape in urban Japan with the following questions: How has the Japanese society responded to the needs of migrant children in education? How have migrant children experienced formal schooling and other educational activities? To what extent has education been effective in preparing them for post-school lives and integration into the mainstream society? The paper examines many ad-hoc measures that schools provide to enable their participation in schooling, and out-of-school programs which sprang up in the civil society.²

My conceptual concern in this paper is equity and diversity in education – how education policy and practice deal with cultural diversity in ensuring access to, and pursuing equity in, education in an Asian liberal democracy. Providing equal institutional opportunities to schooling does not lead to equitable outcomes for children from migrant and/or disadvantaged families. Sociologists have long provided explanations for this, such as the cultural deficit model and cultural difference theory (inconsistency between the dominant middle class culture at school versus the working class/minority culture at home) (e.g., Persell 1981; Pianta and Walsh 1996). More refined explanations involved a focus on differences in language codes (Bernstein 1971), and diverse combinations of different types of resources (cultural, social and economic capitals) and family strategies (or lack of) to manipulate these resources in pursuit of promoting their children's education (Bourdieu 1984). Regarding migrants' education and career trajectories, Ogbu's ecological explanation in reference to the terms of integration ("voluntary" and "involuntary" migrants) which affects perception of life chances provide a useful perspective (Ogbu and Simons 1998).

As we see below, contemporary Japan provides migrants with institutional access to mainstream schools, whereby they receive Japanese as Second Language (JSL) classes and "cultural adaptation" classes before being placed into mainstream classes. Heritage language and culture learning is only provided in a limited number of schools. JSL and "cultural adaptation" classes are considered by the government as more important in facilitating migrant children to achieve academically and in arresting school's reproduction of social disadvantage. This paper suggests, however, that neither attempts have been adequate; and that this has prompted the development of out-of-school education programs for both purposes.

It is better understood in terms of the continuum from one way assimilative incorporation (the minority group adjusting to the dominant society) to genuine two way incorporation (a symmetrical process) (Alexander 2013, p. 532). In reality, we find most societies are located somewhere between the two ends of the continuum. Education is considered one of the most effective vehicles for facilitating the integration of migrants (Grant and Portera 2011; Banks, 2006) and social cohesion (Engel et al. 2013). Failure to equip migrant children to attain a certain level of educational achievement typically leads to unemployment. Without appropriate knowledge of the host society's workings and language, young people find it difficult to participate in society, and subsequently experience a sense of alienation. Education thus affects their sense of political, social and cultural integration.

²See Okano (2014) for a comparative review of research on race and ethnic inequalities in education in Japan.

I begin with illustrating the multiethnic population in Japanese urban centers to set the context. After briefly examining the national government policies, I will discuss the current practice of education that migrant children experience at the local government level and at individual schools. The paper will then turn to how volunteer groups and NGOs provide out-of-school education programs specific to migrant children, and their collaboration with local schools. I will also touch on similar out-of-school programs for children from poor urban families.

This paper draws on the fieldwork that I conducted between 2006 and 2014 in the Kobe and Osaka regions, where I have maintained contact with several schools. Dai Primary School which I refer to later is one of these schools. I observed educational practices, interviewed teachers (including the principal and vice-principal), and collected primary sources in the form of school documents. The paper also draws on a wide range of primary sources that are available from other schools, central and local governments, local education boards, and NGOs.

The paper suggests that government school programs alone have been inadequate to meet migrant children's needs, and that migrant-specific out-of-school programs play increasingly significant roles in filling the gaps. Collaboration between local schools and out-of-school programs began emerging to varying degrees in some localities, which seems to have been effective in achieving the shared goal of promoting migrant children's participation in schooling. The increasing visibility of free out-of-school academic coaching for migrants began to direct the public's attention to children from poor families who similarly struggle at school.

11.2 Increasing Cultural Diversity in Japan's Urban Centers

The dominant outsiders' perception of the Japanese school population has been one of ethnically and culturally homogeneous children. Indeed the national system of education has long been based on the assumption that all students are Japanese and have Japanese language capacity (Okano and Tsuchiya 1999). It was therefore a challenge for schools when migrant children began settling in Japan in the 1990s. When faced with children who were different, schools actively tried to assimilate them into the dominant Japanese cultural norms. "Cultural adaptation" and Japanese as a Second Language (JSL) comprised the pillar of the schools' attempts, first provided in the 1970s for Japanese children who had returned from lengthy stays overseas for their fathers' jobs (Nukaga and Tsuneyoshi 2011).

It was not that Japan had never had a migrant population. Japan's population has always been multi-ethnic (see Table 11.1). Migrant minorities in Japan are often categorized into two distinct groups. One is "old-comer" migrants whose origin predate the end of the Second World War, and the other is so the called "newcomers" (new migrants), who started arriving in the 1980s. The former include ethnic Koreans and Chinese (descendants of former colonial subjects) who came to Japan (either by force or voluntarily) during Japan's colonial occupation of those territories; and who hold special permanent resident status. Both Korean and Chinese

Table 11.1 The estimated populations of minority groups

Minority groups	Japanese citizens	Non-Japanese citizens living in Japan
Ainu (indigenous)	Exact number unknown (24,000 self-categorized in Hokkaido; 300,000 in Japan)	
Okinawan	Exact number unknown (1.37 million in Okinawa-prefecture; 300,000 in other parts of Japan)	
Amerasians in Okinawa	Exact number unknown	
People of <i>buraku</i> descent	Exact number unknown (estimated 1.5–3 million)	
Ethnic Chinese	Exact number unknown (88,123 naturalized 1972–2003; 55,708 children of Chinese-Japanese marriages 1986–2005)	606, 889 (2007)
Ethnic Koreans	Exact number unknown (320,232 naturalized 1952–2008; 263,996 Korean-Japanese marriages 1955–2007; 133,253 children of Korean-Japanese marriages 1985–2007)	593,489 (2007)
Registered foreigners – excluding Chinese and Koreans		952,593 (including 316,967 Brazilians and 202,592 Filipinos)
Naturalised Japanese citizens	Exact number unknown (133,684 in 1952–2008, excluding ethnic Chinese and Koreans)	
Children of mixed descent where one parent is a Japanese citizen	Exact number unknown	
Japanese returnees	Exact number unknown (12,000 returned in 2008)	
Totals	Exact number unknown (3.93–5.70 million or more)	2,152,973

Sources: Okano and Tsuneyoshi (2011, p. 6)

communities maintain fulltime ethnic schools, which run independently of the mainstream schools. Across the country about 10 % of Korean and Chinese children attend the ethnic schools.

Newcomer migrants have come to Japan voluntarily in search of better lives since the 1980s, and significantly differ from the “old-comer” migrants mentioned above. Returnees from China (war-displaced Japanese and their families from North East China) and Indo-Chinese refugees started arriving in the 1980s. Then Japan’s economic boom attracted foreign workers from Asia and South America. The 1990 revision of the immigration law allowed for the first time unskilled workers to enter the country, provided they could demonstrate Japanese ancestry, leading to influxes of South American migrants. Labor shortages in the manufacturing sector, the high

value of the yen and unemployment in their homelands accelerated the process. While most originally planned for a short term stay, many ended up becoming long-term residents or remained permanently.

We have estimated that the total minority population is between 5.78 million and 7.85 million, approximately 5–6% of the total population (Okano and Tsuneyoshi 2011, p. 6; Sugimoto 2010, p. 7, 191–5). This can only be an estimate, because of the national government's failure to document information on the birthplace and descent of its citizens. Once a Brazilian takes up Japanese citizenship by naturalization or marriage, he or she becomes simply a "Japanese citizen". There is also no record of the number of children of mixed descent who have at least one Japanese national parent and therefore have automatically gained Japanese citizenship at birth.

Two official categories used by the Ministry of Education in describing the increasing diversity of the student population are: "foreign nationals" (non-Japanese citizens) and "students who require instruction in Japanese as a Second Language (JSL)" (Okano 2012, p. 58). However the reality is not adequately depicted by just these two categories. For example, fifth-generation Korean nationals living in Japan typically have Japanese as their sole language, while many migrant children who had Japanese citizenship (of mixed marriage or otherwise) require JSL support. In the last two decades, a more inclusive term, "children with special connection with foreign countries", began to be used first by teachers in Osaka area, then by some local governments, and more recently by the Ministry of Education. The term is more inclusive, in that it removes boundaries based on nationality and Japanese language proficiency.

11.3 Migrant Children Struggling in Urban Schools

Migrant children have struggled in mainstream schools to varying degrees, despite a diverse range of programs to address their specific needs. These programs will be discussed later in this paper. The most pressing challenge now is the fact that some migrant children do not attend school and stay at home unsupervised (since their parents work long hours), after dropping out of a mainstream school or choosing not to attend school in the first place (Sakuma 2006; Miyajima and Oota 2005). Many of these migrant children become unemployed and/or disaffected teens attending no form of education.

Primary and middle schools (Year 1–9) are more likely to manage to keep academically struggling migrant students since it is the period of compulsory education (until age 16). Admission beyond this, that is, senior high school (Years 10–11) requires applicants to succeed in entrance examinations (based on the compulsory education curriculum), but many migrant students are not equipped to perform well for the exam. Their academic language capacity remains inadequate, although many of them learn conversational Japanese within a few years and give a false impression that their Japanese proficiencies are fine. Therefore it is crucial to enable these

children to keep up with school work, and to strategically choose migrant-specific special entry systems to senior high school (as will be discussed later).

Fewer migrant children proceed to senior high schools than non-migrant ones. It is difficult to estimate the ratio nationally since some migrant students drop out before middle school completion, others never attended a Japanese school in the first place, either choosing a “school for foreigners (or ethnic schools)”, or stayed at home. Based on available documents, in 2006 the high school entry rate for migrant children ranged from 53% in Hyogo prefecture to 85% in Osaka prefecture (Zenkoku-Zainichigaikokujin-Kyôiku-Kenkyûkyôgikai 2007; Hyogo-ken Zainichi-Gaikokujin-Kyôiku-Kenkyû-Kyôgikai 2007); with an average figure of 67% for the 17 local governments which are members of the Association of Cities with Many Foreign Residents (*Gaikokujin Shûjûtoshi Kaigi*) (Gaikokujin-Shûjûtoshi-Kaigi-Yokkaichi 2005). The national average rate for all students has exceeded 98% in the last two decades (Monbukagakushô 2015). These young migrants are unlikely to secure stable employment in the mainstream labor market where a high school diploma is the minimum requirement. It is imperative to devise ways to have migrant children attending some form of educational institution until completion of Year 12.

Osaka prefecture has maintained the highest percentage of migrants entering senior high schools in recent years. I suspect that the infrastructure that Osaka had already accumulated in human rights education to address disadvantages faced by *buraku* children (descendants of feudal outcastes) and Japan-born Koreans made it easier to build programs for migrants. Osaka’s case offers optimism that schools can make a difference in promoting migrant children’s retention to post-compulsory schooling; but in other cities there is a long way to go. Migrant education is thus one of the most pressing issues facing urban education in Japan. We will now see how this is tackled at the national level, local government level, and individual school level.

11.4 National Government Policies on Migrant Education

Japan is not a migrant society in the same way as Australia, Canada and the US are. The national government does not see itself as leading such a society given Japan’s relatively low percentage of immigrants, compared to these societies; and has neither formulated a systematic national policy to address the cultural and ethnic diversity of the student population, nor seems intent to pursue this in near future.

The current basic position is that all Japanese nationals are required to attend 9-years of compulsory education provided by schools accredited as “mainstream schools” (so called “*ichijôkô*”) by the Ministry of Education; and that non-Japanese nationals residing in Japan are expected to do the same, although this is not mandatory. Non-Japanese nationals are not legally obliged to complete nine years of schooling under the Fundamental Education Act (*Kyôiku Kihon Hô*). This does not mean that the national government is unaware of the increasing number of migrant children in schools, judging from a range of ad-hoc “notices” regarding the treatment of foreign nationals that have been issued to date.

In early modern days (from 1868 until the end of the Second World War), the national government exercised overtly discriminatory policies for ethnic and cultural minorities, indigenous peoples, *buraku* people, and Chinese and Korean migrants (forced or otherwise), by creating separate schools for indigenous and *buraku* people and excluding non-Japanese nationals from free textbook provision. During the postwar years, however, the Ministry of Education's basic position on minority education has been the "principle of simple equality" (treating everyone in the same way) (e.g., Okano 2000), whereby students even those with special needs (e.g., gifted children, children from disadvantaged families) received little special treatment at school. Originating in a 1953 Ministry notice regarding "oldcomer" ethnic Koreans (Okano 2011), this passive and seemingly innocuous policy continued unchanged for the next 25 years.

A slight shift in this approach was observed in 1991. It was driven from two directions – the old-timer Korean minority and new migrants. First, the Ministry of Education for the first time acknowledged the operation of after-school ethnic classes for Koreans at government schools in Osaka, which individual schools had run ignoring the Ministry's position since the 1950s; and approved their continuation. In the same year, in response to the increasing numbers of guest workers' children in local schools, there was a nation-wide collection of data on the number of students who required Japanese as a Second Language (JSL) instruction, in order to inform future measures. Lacking central government guidance, local government and individual school initiatives had tried to meet the daily needs of migrant children but in ad-hoc matter (Okano and Tsuchiya 1999). It took more than 10 years after 1991 for the Ministry of Education to issue the national JSL curricula for primary schools and middle schools (Monbukagakaku-shô 2003, 2007).

The Ministry also responded to requests for practical information and guidance for individual migrant families and schools. It designed and issued a guidebook in several languages to be provided to migrant parents ("Guidebook for Starting School") (Monbukagakaku-shô 2005). In March 2011, it produced a 68-page guidebook for schools and teachers about accepting "foreign children" (Monbukagakaku-shô 2011), an addition to the large number of already existing professional books of this kind prepared by commercial publishers (e.g., Usui 2009). The Ministry provides a homepage devoted to "children living abroad and returnees" (*Kaigaishijo kyôiku kikoku-gaikokujin jidôseito kyôiku nado ni kansuru hômu pêji*, CLARINET)³; and only in March 2011 instituted another homepage of information for "students with a special connection to foreign countries" (*gaikoku ni tsunagari no aru jidô seito no gakushû o shiensuru jôhō kensaku saito*, CASTANET).⁴

³ A homepage devoted to "children living abroad and returnees" (*Kaigaishijo kyôiku kikoku-gaikokujin jidôseito kyôiku nado ni kansuru hômu pêji*, CLARINET). Retrieved May 1, 2015, from http://www.mext.go.jp/a_menu/shotou/clarinet/main7_a2.htm

⁴ A homepage of information for "students with special connection to foreign countries" (*gaikoku ni tsunagari no aru jidô seito no gakushû o shiensuru jôhō kensaku saito*, CASTANET). Retrieved May 1, 2015, from <http://www.casta-net.jp>

In addition to separate measures and publications specific to the needs of migrants' education, the mainstream guidelines began referring to migrants and signaled a departure from the simple equality principle. Changes are seen in the national curriculum guidelines (*gakushūshidō yōryō*, officially translated as "course of study"), issued in 1998 for primary and middle school education, and in 1999 for senior high school education; and all updated with slight modifications in 2003. The new national curriculum guidelines provided educational practitioners with the scope for diverse interpretations to suit migrants' needs. They noted the need for special treatment for "Japanese returnees and those in similar situations", and encouraged schools to provide education that would effectively build on their prior overseas experience" (Chapter 1.5.2.7 in the primary school guidelines; Chapter 1.6.2.7 for the middle school guidelines; and Chapter 1.6.5.7 in the senior high school guidelines) (Monbukagakaku-shō 1998a, b, 2003). The needs of Japanese returnees (children of Japanese expatriates returning from a long period of residence overseas) and those of migrants differ in many respects, for example, in terms of their social class background and families' capacity to assist their children academically; but these guidelines illuminate the shared aspects (i.e., JSL and "cultural adaptation" to Japanese schooling). Indeed, international classes (*kokusai kyōshitsu*) often simultaneously cater for both Japanese returnees and migrant children (Okano and Tsuneyoshi 2011).

The current senior high school curriculum guidelines pointed out particular difficulties that migrants commonly experience at senior high schools, such as the needs of "students who are significantly behind their contemporaries in academic achievement" and stated that schools are encouraged to offer remedial teaching and subjects to ensure that students attain the compulsory education curriculum level (Chapter 1.6.5.6). These relevant points were maintained in the new 2009 version (Monbukagakaku-shō 2009), which was implemented in 2013.

I would suggest however that the most significant development is the Ministry's public statement about the benefits that culturally different students bring to all Japanese students. The latest national curriculum guidelines for primary schools and middle schools (issued in 2008 and implemented in April 2011) for the first time acknowledged this, and encouraged schools to provide migrant/foreign students opportunities to learn and maintain their own language and cultures (Chapter 1.4.2.8 for primary schools; Chapter 1.4.2.9 for middle schools) (Monbukagakaku-shō 2008a, b). These documents still use the term "foreigners"; but as we will see later, such a category is arbitrarily interpreted at local and school levels as "those with foreign roots".

11.5 Practice at the Local Level and Individual Schools

Individual schools were the first to respond to the needs of migrants, who unexpectedly appeared in classrooms in local schools in the early 1990s. Given the absence of national multicultural education policies, school-level practices have been ad-hoc

and trial-error in approach, which I have discussed at length (Okano and Tsuchiya 1999, p. 128–140). To this day, many studies (both academic and professional) have reported examples of programs addressing the needs of migrant children (e.g., Shimizu and Kojima 2006; Shimizu and Shimizu 2001; Watado and Kawamura 2002; Tsuneyoshi et al. 2011; Shimizu 2008).

When non-Japanese speaking migrant children began arriving, individual schools were compelled to “do something”. Schools first started with running JSL classes, creating “cultural adaptation classes”, also called “international classes”, where migrant children could feel comfortable, and in many cases appointed one of the existing experienced teachers as the coordinator in charge of migrant children. Schools were confused as to what to do, and sought advice and assistance from local education boards (Okano and Tsuchiya 1999).

Local education boards (which oversee government schools) and local governments then began to respond to the needs of migrant children at schools under their supervision. They started with providing financial assistance for what individual schools were already doing and in some cases recruiting extra teachers (part time or fulltime) to facilitate the integration of these children. Requests from these schools and local education boards compelled the national Ministry of Education to produce teaching materials for JSL and various guidebooks for migrant parents and teachers at schools which accepted migrant/foreign children.

Furthermore, a number of affected local governments have taken initiatives in creating multicultural education policies. In 2007 approximately 80 local governments maintained “policies for the education of foreign nationals in Japan” (*zainichi gaikokujin kyôiku hôshin or shishin*) (Zenkoku-Zainichi gaikokujin-Kyôiku-Kenkyûkyôgikai 2007, p. 26–8). While reflecting specific local conditions and histories, these local government multicultural education policies do share major elements (Okano 2006). They are: (1) involvement of the whole school population (not only minority students), (2) dissemination of accurate knowledge regarding Japan’s past and racial prejudice regarding other Asians; (3) promotion of respect for cultural differences and human rights, (5) JSL provision, (6) mother tongue maintenance, and (7) school assistance to establish post-school destinations for minority students. These elements are widely observed in similar policies elsewhere in the world (Banks 2010; Grant and Chapman 2008).

There is a significant degree of variation between individual schools and across localities, in how schools attempt to integrate migrant children. The absence of clear mandatory directives from the center, and the vague nature of the national government guidelines mentioned above have allowed local players (education boards, individual schools, and teachers) to interpret and implement the national guidelines with a degree of discretion as they see appropriately. Diversity across localities and individual schools can be a positive sign of responsiveness to unique conditions, but it also means that migrant children in some locations do not have the same access to migrant-specific education due to the lack of an enforced standard (e.g., Sakuma 2006).

11.6 Migrant-Specific Bilingual Classes at Primary Schools

One successful practice in promoting migrant children's school participation is migrant-specific bilingual classes at primary schools. Dai Primary School (pseudonymous name), one of the schools that I studied in my fieldwork, offered migrant language instruction in the name of bilingual JSL classes. In order to fund this, the principal secured a local government grant for JSL classes. He also secured further funding to employ extra teachers, on the grounds that Dai Primary has a large proportion of children from poor families. A principal's capacity to seek funding via the existing funding opportunities and to lobby makes a difference, as seen below.

Dai Primary School is a medium size school, located near Hyogo prefectural housing complexes accommodating migrants from China – returnees from China (war-displaced Japanese and their families from North East China).⁵ The school has a relatively large number of migrant children. In 2015 the school's student population was about 350, including 25 migrant children who required JSL. There were 22 teachers including the principal, vice-principal, a special education teacher, and a "teacher to assist student wellbeing" (*jidōseito shien kyōin*). The school has offered JSL classes since 1986. I have conducted fieldwork at this school since 2006.

A five-member team was in charge of meeting the special needs of the Chinese students. The principal personally approached a veteran teacher to take on the position of "teacher to assist student wellbeing" (*jidō seito shien kyōin*) and lead the team. In order to obtain this position, the school submitted a substantial application to the prefectural education board, arguing that the nature of the student population required such a position: (1) 25 students were migrants who required JSL; (2) 49% of all students received financial assistance for low income families (*shūgaku enjo*) from the education board; and (3) 26% of the school families were headed by a single-parent.⁶ It also stated that because of parents' long working hours the school was forced to pay special attention to the students' developmental needs. Dai Primary thus managed to receive an extra teacher (*kahai*) due to students' poverty, despite, by then, the cessation of the Ministry of Education scheme to provide an extra teacher for JSL.

The veteran teacher, Mr. Honma, spent considerable time cultivating relationships with the local Chinese community. He recruited two Chinese-speaking "volunteers" from the neighborhood (without going through the local education board) to teach Chinese and assist students when necessary. The school paid them in the form of supermarket vouchers. A teacher from the prefectural government's Center for Children's Multicultural Co-living visited the school regularly in order to assist newly arrived migrant children. The remaining member was Ms. Yuka, a young fulltime teacher who had recently begun her teaching career and whom the principal recruited because of her Chinese language proficiency.

⁵This is an abbreviation of the description of Dai Primary School provided in Okano (2012).

⁶Dai Primary School (pseudonymous name) (2006) Heisei 18 nendo gakkō hōmon shiryō [a document prepared for the education board's visit to the school 2006]. Kobe: Dai Primary School.

The School offered bilingual JSL, as well as Chinese language and culture classes, called “*Tonton kyôshitsu*” (児童教室 children’s classroom – “children” in Mandarin Chinese, and “classroom” in Japanese). Public announcements at school functions such as sports festivals and music concerts were also given in Chinese. Unlike many other schools, most migrant children at the school went on to senior high school; and the school hosted past students as a way of encouraging and inspiring current students.

Schools thus often generously interpreted vague expressions in the local guidelines and devised concrete ways to cater for the special needs of migrant children. Dai Primary School, for example, began teaching immigrant languages out of a concern that the loss of a first language would have negative consequences for learning Japanese and general academic achievement (Okano 2012), although teaching of migrant home languages is not mentioned in the national curriculum guidelines.

11.7 A Migrant-Specific Entry Scheme to Senior High Schools

What happens to these children when they complete compulsory schooling at 16? Do they manage to gain entry to senior high schools via competitive entrance examination systems? What happens to the bilingual capacities which these primary schools strove to maintain? There are two measures that some senior high schools provide in order to make admission to high school more accessible for migrant students.

The first is special consideration (or concession) for entrance examinations for new migrants (*nyûshi tokubetsu sochi*). These designated schools (often located in localities with relatively large numbers of migrants) provide migrant applicants with extension of examination time, phonetic readings of kanji characters, and permission to take language dictionaries into examination venues. This was offered by 30 prefectures in 2014, up from 20 in 2009 (Chûgoku-kikokusha-teichaku-sokushin-sentâ 2014, 2009).

The other measure is completely separate entrance examinations for migrant children (*tokubetsu nyûgakuwaku*). Common examples of such examinations include the replacement of social studies and Japanese language and literature examinations with long essays (which can be written in the migrant’s first language), and a reduction in the number of examined subjects (Okano 2012). As of 2014, 20 prefectures such separate entrance examination for migrant children (Chûgoku-kikokusha-teichaku-sokushin-sentâ 2014). Each school sets a quota for the number of students it will accept through this migrant-specific entrance examination. Some prefectures designate a large number of schools to participate in such special examinations, each accepting a small number of migrant children (e.g., Kagoshima prefecture); while others involve a relatively small number of schools,

each accepting relatively substantial number of migrant students, in order to avoid feelings of isolation amongst them (e.g., Osaka and Kanagawa prefectures) (Inui 2008, p. 35–36).

Osaka prefecture has attracted the attention of educational practitioners, in maintaining the highest percentage of migrants entering senior high schools in recent years. A research team estimated that this is due to the migrant-friendly senior high school and associated entrance examination system, specifically: (1) the large number of new migrant-specific places made available (2) generous eligibility conditions applying to special consideration for migrant children (e.g., flexible interpretation of time of arrival in Japan to include long-time resident migrants who would not otherwise qualify), and (3) entrance examination content which takes account of the needs of migrant children (e.g., Inui 2008, p. 40).

Many metropolitan education boards provide yearly information sessions on the senior high school entrance examination schemes for migrant children and what the boards consider to be “migrant-friendly schools”. The sessions explain in detail the application procedure, provided advice on how to prepare for the examination, and a list of schools with special entrance schemes and migrant languages offered in certain high schools.⁷

Migrant-friendly schools tend to have a long experience of accommodating local Japanese children from disadvantaged family backgrounds, and to have feeder middle schools with substantial numbers of new migrant children. They tend to be located near public housing complexes and cheap rental apartments. I shall discuss the interface of migrant children and children from poor families later.

11.8 Migrant-Friendly Flexible High School Course Structure

Despite gaining entry to senior high school through special schemes, migrant students continue to face challenges on the path to completion. They continue to require the schools’ deliberate efforts to facilitate and assist their study. For example, all five Osaka schools with the special entry scheme offer a “place of belonging” (*ibasho*) where migrant children feel comfortable in the center of the school building. They also conduct extensive human rights education across the curriculum for the whole school.

These schools also offer “migrant-friendly” subjects. They are what the school considers relevant and important for migrant children and include language subjects

⁷The information session, “Gaikoku kara kita kodomotachi eno shinro gaidansu” (literally translated as “Guidance for deciding on post-school destinations for children from foreign countries”), has been jointly organised by the Hyogo-prefecture Education Board, the Kobe-city Education Board, the Himeji-city Education Board, and the Himeji International Association (Himeji-city Kokusai Kōryū Kyōkai).

such as Mandarin Chinese, Korean, Portuguese, Spanish, Tagalog, and Vietnamese. Senior high schools began offering the wider range of such subjects (developed by the individual schools) because of a large-scale structural reform of the senior high school system in the late 1990s. The reform aimed to make post-compulsory schooling more flexible and diverse in order to meet changing needs, by providing greater subject choice (Okano 2009). The policy also aimed to merge schools and reduce their number, in the face of declining student numbers due to the declining birth rate.

It is innovative that some migrant-friendly senior high schools made a deliberate decision to capitalize on this general structural reform in order to facilitate migrants' school completion. More diverse types of senior high schools and school-based curriculum development allowed individual schools to respond to the needs of migrant students in a way that was not possible before (Okano 2012). In the new types of senior high schools, individual students can make their own curricula by selecting from a wide range of subjects designed by their schools. These subjects are expected to reflect local needs and conditions. Some schools chose to offer classes on the migrant languages (Chinese, Vietnamese, Spanish, Korean, etc.) and the history of these countries, which would assist immigrant students ultimately in graduation from senior high school. As of April 2013, 1,337 such high schools were operating in Japan (Monbukagakaku-shô 2014).

Individual schools have discretion about staffing. Some schools recruit fulltime teachers, while others employ teachers for such subjects from a "human resource bank" located within the local government. Schools also offer subjects to prepare migrant students for the Japanese Language Proficiency Test (the Japanese equivalent of TOEFL); and for university entrance examinations where they can take their first language as a foreign language (instead of taking the English examination which the majority of students do).

The quotas for migrant students at these migrant-friendly senior high schools have been readily filled, indicating that a healthy demand exists for the special entrance examination. Osaka Education Board's homepage explains the special entrance examination in six languages. There is now in place a long-term pathway for migrant children from primary school to senior high school. Seeing this, migrant children are now more likely to remain at school and proceed beyond compulsory education.

These migrant-friendly high schools exist in localities where a substantial number of migrants reside and where local governments are committed to their support. We should note that migrant students in other localities are typically excluded from the benefits of this type of schooling (e.g., Zenkoku-Zainichi-Gaikokuin kyôiku-Kenkyûkyôgikai 2011, p. 7–8). This is the gap which neighborhood communities, volunteers, and after-school homework clubs are attempting to fill.

11.9 Filling the Gaps Through Out-of-School Programs

There is no doubt that migrant children are now provided with a larger number of, and more sophisticated, migrant-specific programs, and non-migrant students and their parents are more familiar with the presence of migrant classmates, than two decades ago. Anecdotal stories are aplenty about non-migrant students making life-long friends with migrant children and appreciating the differences that the latter bring to school. There are also stories of migrant children being bullied at school, feeling alienated and refusing to attend school. School and local education boards have been responding to what they see as the needs of migrant children; but as I emphasized earlier, there are significant variations across schools and local governments. In this context, it is not surprising that voluntary initiatives have gradually emerged outside school, particularly in urban centers, which attempt to fill gaps in facilitating migrant children's participation in mainstream schooling.

One of these gaps is what migrant families are unable to provide for their children. Schools in Japan generally expect that parents or older siblings can assist in children's homework at primary school level; and if problems arise they would advise the teachers. Student progress is monitored by school and family. In the teacher-parent communication book (*renrakuchō*), students list daily homework and homeroom teachers regularly communicate specific messages about the child to his or her parents. Parents can also communicate with teachers via email. Schools soon realized that communication with migrant students' parents was difficult because of their lack of Japanese language proficiency, and began providing messages in multiple languages by enlisting volunteer university students of foreign languages (e.g., Portuguese, Spanish, Chinese, Vietnamese, Tagalog, etc.). Realizing that migrant students cannot rely on assistance with homework from their families, individual class teachers began offering individualized assistance after school. Teachers were therefore pleased when offers to assist migrant students with their homework came from outside the school.

There are seven categories of out-of-school programs to facilitate migrant children's learning, although overlaps exist: (1) specific homework assistance, and general academic tutoring; (2) fulltime courses to prepare for high school and university entrance examinations, (3) academic Japanese language classes, (4) seminars on migrant-friendly schools and strategies, (5) provision of "places of belonging" (*ibasho*) outside school, (6) ethnic language and culture classes, (7) provision of regular interaction with the elderly of the ethnic group in order to nurture a sense of one's own culture. In addition, community-based providers attempt to promote local schools' understanding of migrant children by sending to the schools elderly people of the migrant community and instructors, as well as "cultural materials" (e.g., for cooking classes). Local school children are also welcomed to visit these providers as a study trip.

The most prevalent forms of out-of-school programs are small neighborhood-based classes to assist migrant students' homework and provide remedial teaching. If there are sufficient participants, they are organized systematically in age-grade

classes. These after school and weekend programs enable migrant children to keep up at school and are led by volunteers such as university students and retired teachers. There are varying degrees of coordination with local schools (Okano 2016). In some cases, homeroom teachers of migrant children are heavily involved in out-of-school programs in close collaboration with volunteer teachers. Homework assistance is offered by many small neighborhood centers (Nakamatsu 2016), semi-autonomous divisions within local government offices, large scale NGOs,⁸ and ethnic organizations.

The second type of out-of-school program is the fulltime day-course. These are provided by large scale NPOs, such as the “Multicultural Free School” located in the Multicultural Symbiosis Center Tokyo.⁹ Fulltime courses are designed to meet the needs of over-aged migrant children who are excluded from attending government middle schools, in order to prepare them for senior high school entrance examinations. Some participants may have completed nine years of schooling before arriving in Japan. The systematic course runs 6 h daily (3 h in the morning and 3 in the afternoon), allowing students to enroll either in all-day course or the afternoon classes only. The Center applied for and won purpose-specific funding under the “Rainbow Bridging School Project”, which covers some of the operating costs, keeping fees at USD600 for 2 months of attendance. Of the 59 students who attended the fulltime course in 2011, 49 attempted the entrance examinations. Forty six succeeded.

The third type of out-of-school program is Japanese language classes for academic purposes. These classes emerged in recognition that daily life language proficiency was inadequate for succeeding in the entrance examinations to senior high school and universities. Fourthly, these provide valuable information about schooling for migrant children, such as which high schools offer separate migrant-specific entrance examinations. Seminars are held for migrant children and their parents covering the concrete content of the examination, high school curricula and career paths.

Lastly, these out-of-school programs offer migrant children with a “place of belonging” (*ibasho*). In being unable to fully engage with their host community, migrant children feel isolated, and seek a place where they feel genuinely

⁸ See for example the following large scale NGOs.

comfortable interacting and can share experiences with other migrant children outside school. Out-of-school programs for migrants (e.g., homework clubs and language classes) provide these students with a sense of mutual assistance, solidarity and identity. Their experience (even of a fulltime course which focuses on entrance examination preparation) therefore differs in this respect from academic coaching schools (*juku*) for mainstream Japanese students (e.g., Roesgaard 2006). These places also provide migrant children with regular opportunities to interact with senior members of their migrant community and learn about ethnic culture, which helps cultivating self identity.

One of the largest organizations assisting migrant children is the Multicultural Symbiosis Center Tokyo. The initial Multicultural Symbiosis Center emerged as a small information hub for foreign residents in Kobe after the Hanshin-Awaji earthquake in 1995, and subsequently expanded in scope and branched out to other cities (Tokyo, Osaka, and Kyoto). The centers now operate as independent NPOs but still share the name, Multicultural Symbiosis Center. Further centers with similar missions and the same name have been established in other cities as well (e.g., Hamamatsu, Tachikawa, Nishi-Tokyo, and Gunma).

The Multicultural Symbiosis Centers Tokyo¹⁰ (the Tokyo center hereafter) operates a fulltime day-time course for over-aged migrant children who are excluded from attending government middle schools. The Center also offers evening courses, comprising 90 min sessions 4 days a week for migrant children who attend local government middle schools and wish to proceed to senior high school. These courses are similar to those at commercially operated cram schools. The curriculum covers Japanese, English and Math, and includes remedial teaching as well as preparation for the entrance examination.

The Center also provides more conventional, free programs for migrant children. In the Saturday homework club (“Kids Project”) children aged 13–18 study with volunteers (often university students), covering academic subjects and essay writing. Kids’ Project also offers academic and career counseling in multiple languages (Chinese, Tagalog, Spanish, English, Thai, and Korean) and advice on attending senior high schools and universities, and the entrance requirements for these institutions. For primary school age students and their mothers, the Center runs “Parent-children JSL”.

11.10 Out-of-School Programs for Children from Poor Families

The increasing number of out-of-school initiatives to facilitate migrant children’s participation in mainstream schooling have raised public awareness of their struggles. In the last 5 years we have seen an emergence of various out-of-school

¹⁰Takunka Kyōsei Center Tokyo. Retrieved August 1, 2015, from <http://tabunka.or.jp>

initiatives provided for children from poor families, which are similar to those offered for migrant children. Many of these programs involve free academic coaching. Initially volunteer groups and NPOs began offering them (Saito 2015), and some local governments provided financial assistance (Sato et al. 2015). A large number of free out-of-school academic coaching programs are still run by volunteer groups and NPOs. As the media has begun to pay more attention to these programs, there is a greater awareness of “poverty amongst children” (*kodomo no hinkon*).

While poverty and education has long been one of the major concerns in sociology of education elsewhere, it had not been discussed widely in Japan either in the academia or the public sphere (Okano and Tsuchiya 1999, p. 83–88). When reference was made to poverty and education, it was in the context of the education of minority *buraku* children (descendants of feudal outcastes). One reason for the failure to focus on poverty in education is because it has been relatively invisible in Japan in comparison to other societies (Ishii 2014; Morimitsu 2011). The poor in Japan do not reside together in slums and specific areas, but are dispersed; and receive government financial allowances (e.g., living protection allowance and funds for bringing up children), which enable them to mask their poverty (Ishii 2014). But this has caused poor families to be isolated from other families in a similar plight, and invisible to the public to a large extent.

One in six Japanese children under 18 (16.1 %) live in poverty (Kôseirôdô-shô 2013), when poverty is defined as living with less than half of the median annual income. In the context of education debates and government discourse, poor families (*hinkon katei*) are often defined as single-parent families, and as families receiving living protection allowance (*seikatsu hogo*) and/or local government financial assistance for children’s education (*shûgaku enjo*). Receipt of both local government allowances is determined by a formula that takes into consideration of family income and the number of household members. In 2013 the retention rate to senior high schools amongst children from poor families was 89.9%, substantially lower than the national average of 98.4% (Kôseirôdô-shô 2014). It is difficult to obtain data on the poverty rate amongst migrants, since government surveys on employment, welfare receipts and income level do not differentiate migrants from non-migrants (Omagari, et al. 2012, p. 11–12). Omagari and her colleagues (2012, p. 11–12) devised ways to measure poverty amongst migrants by for example seeking data from the local association of South Americans; and concludes that South American unemployment rate was over 40%, compared with the national average of 5.7%, immediately after the Lehman Shock.

The national government implemented the Act to Promote Measures to Reduce Child Poverty [Kodomo no Hinkon Taisaku Suishin Hô] in January 2014, which requests local governments to establish concrete plans to reduce poverty (Naikaku-fu 2015). As of February 2015, 184 local governments (35 %) already began providing “learning assistance” (*gakushû shien*) in the form of academic coaching (Sato et al. 2015). They include Kawasaki, Shizuoka, Osaka, Saitama, Yokohama (Sakuragi 2013), Oita (Yomiuri-Shinbun 2013) and Kochi. The media have reported some examples of such initiatives. Shizuoka prefecture proposed four priorities in its “Plan to Reduce Child Poverty”: (1) assistance with children’s education,

(2) supporting daily lives; (3) assisting parents' employment; and (4) financial assistance (Asahi-Shinbun 2015). Kyoto prefecture formed a committee to consider measures for countering child poverty in October 2014 and proposed concrete plans for individual schools to adopt (Hatano 2015).

I suggest that the relative visibility of migrant children struggling academically at school and attending migrant-specific out-of-school programs has shed light on children from poor families who face similar conditions. Migrant children struggled academically not only because of their Japanese language inadequacy but also because parents and older siblings could not assist them with their homework. Children from poor families faced the same similar problem, although poor Japanese language was not an issue. Mainstream schools have been reluctant to provide overt institutional assistance specific to children from poor families in the past, perhaps because the dominant school culture is to treat all students equally, at least overtly (Morimitsu 2011, p. 284). Many teachers have personally assisted with homework and remedial learning after school and by paying various fees (e.g., school excursions) that their parents could not afford out of their own pockets; but these efforts were not visible to the public. Faced with some successful examples of out-of-school migrant-specific programs, attention began turning to children from poor families.

Arrival of migrant children in Japanese urban centers forced local schools to devise and implement migrant-specific programs to facilitate their integration into mainstream schooling. These programs alone were not sufficient to cater for their needs, which quickly prompted volunteers and NGOs to provide out-of-school programs. A recognition of their success, we now see similar out-of-school programs also being provided for children from poor families who also struggle at school. Schools respect these providers of free out-of-school academic coaching and value collaboration with them to a greater extent than 20 years ago.

11.11 Conclusions

One of the most pressing issues facing urban education in Japan is how best migrant children can be integrated into the mainstream schooling and the host society. Migrant children's struggles manifest themselves in both the daily practice of schooling and, more clearly, at the completion of compulsory education, where a substantially lower number of migrant children manage to gain admission to senior high schools via entrance examination.

Responses to the needs of migrant education were initially formulated and practiced bottom up in individual schools trying to provide for migrant children. As shown above, the system of education has gradually attempted to devise ways of accommodating the needs of migrant education at the levels of national government and local education boards. Individual schools have continued to create and implement programs to suit local conditions, including language assistance, cultural adaptation classes (so called "international classes"), special consideration for

migrant students in entrance examinations, separate high school entry examinations for migrants and migrant-friendly curricula.

The paper argues that out-of-school educational programs for migrants play increasingly significant roles in urban education in contemporary Japan, to the extent that some affected schools depend on their contribution. There is collaboration between local schools and out-of-school programs to differing degrees; and such collaboration seems effective in achieving the shared goal (of assisting migrant children's participation in schooling). These programs attempt to offer: (1) specific homework assistance, and general academic tutoring; (2) fulltime courses to prepare for entrance examinations, (3) academic Japanese language classes, (4) seminars on migrant-friendly schools and strategies, (5) provision of "places of belonging" outside school, (6) ethnic language and culture classes, (7) provision of regular interaction with the elderly of the ethnic group in order to nurture a sense of one's own culture. Community-based providers also attempt to promote local schools' understanding of migrant children.

The increasing number and prominence of out-of-school programs for migrant children began to direct our attention to children from poor families who experience similar struggles at school. Volunteer groups, NGOs and later local governments began offering these children out-of-school programs of a similar kind to those for migrants. There is a greater acknowledgement that schools' collaboration with out-of-school providers of free academic coaching is also effective in assisting children from poor families.

One of the concerns with these out-of-school programs is that the program and teacher quality exhibit significant variations. As they are not registered as mainstream schools (*ichijôkô*) by the Ministry of Education, these programs are not required to conform to government regulations and guidelines regarding minimum standards. But it is precisely because of the relative autonomy the programs enjoy that they can provide classes to suit the specific needs of particular groups of migrant students. Out-of-school educational programs have thus attempted to fill the gap in dealing with cultural diversity, and in ensuring access to, and equity in, the education of migrant children. How to strike an appropriate balance between these program's relative autonomy and public concern with quality is left to the discretion of individual schools and local education authorities.

Chapter 12

Multicultural Education in Korea

Insil Chang

12.1 Introduction

The dawn of the twenty-first century has been accompanied by significant new trends, such as those related to information technology and globalization. In addition to these worldwide trends, Korea has also witnessed the advent of a multicultural society. The foreign population in Korea has grown at a rapid pace; as of 2016, its foreign population, including multicultural families, was more than 2,001,828, which accounts for approximately 3.9% of registered Korean residents. This influx of foreign residents has influenced the children of multicultural families. Furthermore, almost half of these multicultural families are currently living in urban areas. There were 141,181 children of multicultural families in 2014, compared to only 25,000 in 2006, an increase of over five times in just 8 years (KOSIS 2015). More specifically, in the urban areas such as Gyeonggi-Do, Seoul, and Incheon, of the 17 total provinces, the total number of multicultural residents living in these urban areas is 694,513, which accounts for above 50% of the entire multicultural population (KOSIS 2016).

Korean society has traditionally emphasized the virtue of homogeneous ethnicity and taken pride in the so-called “pure bloodedness” of its members. As a result, it is experiencing difficulties as it struggles to adapt to an increasingly diverse society. In response, the UN Committee on the Elimination of Racial Discrimination (CERD) has expressed its concerns regarding Korea. At its 71st session, held in Geneva in 2007, the CERD noted that “the emphasis placed on the ethnic homogeneity of the State party [Korea] may represent an obstacle to the promotion of understanding, tolerance and friendship among the different ethnic and national groups living in its territory” and recommended that it “adapt appropriate measures in the fields of

teaching, education, culture, and information, to recognize the multiethnic character of contemporary Korean society” (Hankyung 2007). This attests to the fact that Korea is no longer an ethnically homogeneous society and is transforming itself into a multicultural one.

Following the Korean War, which broke out on June 25, 1950, the Korean peninsula was divided into two countries—both were predominated by one ethnicity: Koreans. In its effort to establish legitimate grounds for unification, South Korea built an ethnic identity based on the stories of Dan-Gun, a mythical figure who was believed to be the progenitor of the Korean ethnic group. In this process, it created an “imagined community” based on the notion that Koreans are of the same blood root; this point was then emphasized in school textbooks (Park 2009). Many Koreans who received such instruction from an early age grew up being proud of Korea’s ethnic homogeneity. In the late 1980s, however, this status was challenged externally, as Korea began to see an influx of foreign workers, an increase in interracial marriages, and a rising number of multiethnic offspring. Nevertheless, Koreans found it difficult to let go of the myth of single ethnicity, which took root in society through decades of education. It was not until the 2007 revision of the national education curriculum that the term “single ethnicity” disappeared from textbooks.

Kim (2005) observes two large categories of multicultural societies. The first are societies built upon immigrants, such as the United States and Canada. Such societies have consisted of people from various ethnic and cultural backgrounds since their foundations. The second are those that began as single-ethnic societies, but later developed into multicultural ones in the course of industrialization and globalization. Korea falls under the latter category, and a close look at how Korea is becoming a multicultural society and conducting multicultural education in order to adapt to this change will provide understanding worth considering for countries that are going through a similar transition. Moreover, it will provide the opportunity to contemplate the future direction for multicultural education in Korea. In this context, this study delves into how Korean society has shifted into a multicultural nation, the concept of multicultural families, the direction of studies and policies concerning multicultural education, and directions for the development of multicultural education in Korea, especially in urban areas.

12.2 Korea as a Multicultural Society

12.2.1 *The Transition to a Multicultural Society*

There exist several contending views to explain the origins of a multicultural society in Korea. The first group advocates that ancient Korean society was a multicultural and multiethnic one (Chun 2009). As shown in *Cheo-yong-ga* (*Cheo-yong’s Song*), the Silla Dynasty (57 BC–AD 935) was a multicultural and multiethnic society marked by international trade and migration. Other literature also contends that

ancient Korea was a multiethnic country, as the Goguryeo dynasty (37 BC–AD 668) began expanding its territory (Park 2009). The descendants of fallen Goguryeo later established the Balhae dynasty (AD 698–926), which was in close connection with the Mohe tribe. Later on, a number of other tribes also became assimilated into the Balhae dynasty. As a result, the combined population of other tribes exceeded that of the Yemaek tribe, which mainly made up the Goguryeo, thus making the Balhae dynasty a much more multiethnic country compared to its predecessor (Park 2009).

The modernists or constructionists, by contrast, contend that the most notable immigrants in Korea's modern history were the Japanese. They also regard the Korean nation as a modern product of nationalist ideology that was exposed at the end of Chosun dynasty (Em 2001). The Treaty of Ganghwa (also known as the Japan-Korea Treaty of Amity), in 1876, allowed Japanese citizens to move freely into the Korean Peninsula. This migration was further accelerated by Imperialist Japan's rule of Korea, which began in 1910; ultimately, the total number of Japanese people living in Korea was around 170,000 in 1945 (Lee 2006). The influx of Chinese migrants, who settled in Korea as merchants, began in 1882 after the Choson dynasty (1392–1910) signed a treaty of communication and commerce with the Qing Dynasty (Park 1981). Prior to this period, they argue, Korea was a status society with a clearly defined vertical hierarchy, that divided people into elites (*yangban*), commoners (*semin*), and slaves (*chenmin*). In this view, the Korean nation was born only with Korea's integration into the modern world system of nations and subsequent rise of ethnic-nationalist historiography (Shin 2006).

A third group of scholars argue that Korean society's transition into a multicultural society is a rather recent trend. They explain the reasons for Korea's transformation into a multicultural society by attempting to address the recent change in Korea's industry, labor markets, and globalization. After the Seoul Olympic Games in 1988, the Korean economy was faced with the issue of a labor shortage. In 1991, the government addressed this problem by introducing a training program through which Korean companies that operate overseas could invite foreign employees to Korea for industrial training. In 1994, this program expanded to small- and medium-sized companies that were not active overseas, so a large number of foreign workers could enter Korea's workforce. As a result, the number of foreign natives in Korea surged at a rapid pace. In 2004, Korea began to receive the foreign workforce as laborers, rather than trainees, as the government adopted a system permitting foreign employees, that replaced the training program completely in 2007 (Park 2008).

Interracial marriages, which mainly involved unwelcomed marriages between Korean women and American soldiers, took on a different aspect in the late 1980s as Korea experienced an acute shortage of brides. As a result of urbanization, cities became crowded, whereas rural communities lacked a sufficient female population for their bachelors. These bachelors began to seek marriages with foreign brides, and the first candidates were Chinese women of Korean descent who were able to enter Korea more freely after Korea and China established diplomatic ties in 1992. Today, these bridal candidates vary in terms of nationality; Korean men marry brides from Southeast Asia, Mongolia, and countries that were former members of the Soviet Union.

The influx of foreign workers and brides, which began in the late 1980s, is clear evidence that Korea has rapidly become a multicultural society in a short period of time. Given Korea's trends of economic development, low birth rates, an aging population, and labor shortages in the so-called "3D (difficult, dirty, and dangerous) sectors," the foreign workforce will continue to grow. Furthermore, the number of foreign workers will increase for manual labor and high-quality jobs alike. In addition, the worsening imbalance of the male-to-female ratio, and the growing number of single women avoiding marriage, means that Korea will continue to see a shortage of Korean-born brides and a rise of interethnic and interracial marriages. Despite this apparent shift into a multicultural society, ethnic Koreans are having difficulties getting along with people from different cultural backgrounds due to both the deeply rooted faith in the myth of single ethnicity and their lack of experience with multicultural families. In this respect, Korea is in great need of a multicultural education that will not only assist immigrants in adapting to this society, but also facilitate fundamental changes in how Koreans perceive these immigrants.

12.2.2 *Concept and Status of Multicultural Families*

The term "multicultural family" does not appear in other multicultural societies. It is, however, widely used in Korean society, along with the term "multicultural education". In Korea, a multicultural family can be described as a family consisting of members of different races, ethnicities, or cultures. Before adopting this term, multiracial/multiethnic children were referred to as *honhyeol* (혼혈아) or *twigi* (mixed blooded people), *Komerican* (derived from the words Korean and American), *ainoko* (a Japanese word for children born from interracial unions), *Kosian* (derived from the words 'Korean' and 'Asian') or *onnurrian* (온누리안, derived from the Korean word *onnuri* which stands for "the whole world"). To eliminate the negative connotation of some of these terms, the Citizens' Movement for Health and Family, an organization constituted of 30 civic groups, proposed the terms "multicultural family" and "second generation of multicultural families" in 2003 (Wikipedia, multicultural family). These terms became widely adopted in 2006, when the Ministry of Education and Human Resources Development officially announced its Policy for Supporting the Education of Children from Multicultural Families.

There are different categories of multicultural families in Korea. In the academic world, the term "multicultural family" covers three minority groups: the families of foreign workers, interethnic marriage families, and families who are outcomes of the North Korean refugees policy. However, the coverage of multicultural families varies according to how different government agencies utilize it. The Ministry of Education, for instance, confines this term to families of foreign workers and interethnic marriage couples, excluding North Korean refugees, for whom it provides separate support. The Ministry of Gender Equality and Family (MOGEF), on the other hand, puts top priority on social integration and thus applies the term to immigrants seeking permanent residency in Korea. On the basis of this approach,

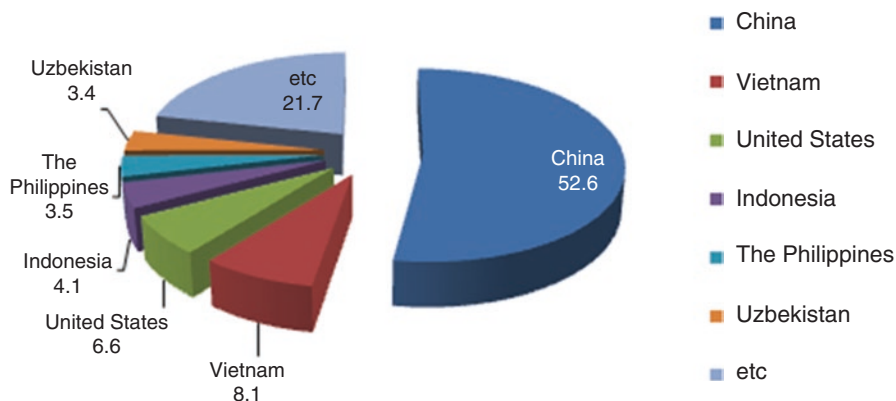

Fig. 12.1 Nationality of foreign workers in Korea. Note. Ministry of the Interior (2015)

MOGEF enacted the Support for Multicultural Families Act on March 21, 2008, and, as of 2010, only the families of marriage immigrants and Korean citizens by naturalization were subject to such support.

However, according to Banks (2001) and Sleeter and Grant (2007) “multicultural” is a term that encompasses not only race and ethnicity, but also gender, social status, culture, language, religion, sexual orientation, disabilities, and ideology. In this broader sense, “multicultural families” should refer to all families on earth. In this perspective, the distinct use of “multicultural family” in Korea is likely to breed prejudice and discrimination by drawing a line between migrants and mainstream citizens, suggesting that children are distinguished according to their parents’ countries of birth. Like the United States, the expression “at risk” is used as a collective term for students who require support for various reasons: for example, English may not be their first language, students may be unable to keep up in class, or they may be financially challenged. As these reasons often overlap with one other, such students receive support under a comprehensive system, rather than from separate ones. Similar to the United States, future Korean policies should help mitigate any difficulties individual families face and address their specific needs, rather than trying to help them simply because they are multicultural families.

As mentioned above, Korea’s academic definition of multicultural families includes foreign workers, marriage immigrants, and North Korean refugees. Among foreign residents, migrant workers were the largest group of total aliens in Korea. The total registered number of foreign workers was 608,116 in 2015 (Ministry of the Interior 2015), and the number is increasing by about 80,000 per year. The number of male foreign workers is 442,616 (72.8%), while the number of female workers is 165,500 (28.2%). In terms of nationality, the majority was from China (52.6%), and then Vietnam (8.1%), the United States (6.6%), Indonesia (4.1), the Philippines (3.5), Uzbekistan (3.4), and other states (see Fig. 12.1).

Table 12.1 Region of marriage immigrants in Korea

Province	Total	Man	Woman
Total	305,446	51,655	253,791
Seoul	74,629	19,791	54,838
Busan	11,720	1,368	10,352
Dague	7,827	871	6,959
Incheon	19,397	3,554	15,843
Gaengju	5,540	447	5,093
Daejeon	5,750	644	5,106
Ulsan	5,750	709	5,041
Seojong	741	74	667
Gyeonggi	89,877	17,999	71,878
Gangweon	6,697	421	6,276
Chungbook	8,736	808	7,928
Chungnam	14,019	1,373	12,646
Chenbook	10,291	517	9,774
Chunnam	11,316	401	10,915
Gyeongbook	13,045	867	12,178
Gyeongnam	16,836	1,405	15,431
Jeju	3,275	406	2,869

Note: KOSIS (2015)

The number of marriage immigrants, which was 93,786 in 2006, increased by three times to 305,446 as of 2015. The number of female foreign brides was 253,791 in 2015, which accounts for 83 % of all foreign-born spouses, while that of male foreign spouses is 51,655. A regional breakdown of this population reveals that a significant number of them reside in Gyeonggi-do, Seoul and Incheon—the Seoul Metropolitan area (urban areas)—followed by Gyeongsangnam-do, Chungcheongnam-do, and Jeollanam-do, which is a stark contrast to the common belief that most marriage immigrants live in rural areas (see Table 12.1). In regards to nationality, 48.4% of marriage immigrants were from China, followed by Vietnam (24.1%), the Philippines (5.1%), Japan (7.4%), and other locales (KOSIS 2015).

North Korean refugees, whose number is growing by the year, are a special group of people created from Korea's unique circumstances. Unlike any other immigrant group, North Korean refugees share similarities with mainstream Koreans in terms of appearance and language. However, the education they have received in a distinct ideological format, which has existed for more than six decades, makes it difficult for them to adjust to South Korean society (see Table 12.2).

In 2015, the total number of North Korean refugees was more than 26,000 (KOSIS 2015). Like most foreign workers and immigrant marriage families, many refugees also live in urban areas. Many of them live in the Gyeonggi-do, Seoul, and Incheon provinces. Because these urban areas have large industries and good education systems, many refugees choose to live there.

Table 12.2 Living regions of North Korea refugees in Korea

Province	Seoul	Gyeonggi	Incheon	Busan	Gyeongbook	Gyeongnam

12.3 Multicultural Education in Korea

12.3.1 *The Misconceptions of Multicultural Education in Korea*

The notion of what constitutes a multicultural education varies among scholars. Banks (2001) suggests that the central goal of multicultural education is to reform schools and other educational institutions, to allow students from different racial and ethnic backgrounds and social strata to experience equality in education. Bennett (2011) shares this view by defining multicultural education as a comprehensive approach to teaching and learning and a movement toward equal education in schools and classrooms by reforming curriculums, obtaining multicultural abilities, and eventually realizing social justice. In short, the ultimate goal of multicultural education is fulfilling the ideal of equal education by reforming the curricula of schools and educational institutions.

However, the concepts of multicultural education in Korea are distorted in several ways. The first misconception of multicultural education in Korea is that the related theories, terminology, definition, and goals are mixed with those of “education for international understanding.” Multicultural education in Korea takes on an entirely unique aspect; by combining it with the existing education for international understanding, scholars have concluded that Korea is pursuing vague concepts of multicultural education that differ in terms of its definition and goals. This is attributable to not only society’s misconceptions about multicultural education, but also the course of the discipline’s development in Korea. Multicultural education was first introduced in Korea in the 1980s by academics who studied American multicultural education (Kim 1984), but it was not until 2006 that multicultural education studies came into full swing. Following Hines Ward’s (an American football player born to a Korean mother and an African-American father) visit to Korea, the

Ministry of Education and Human Resources established the Policy for Supporting the Education of Children from Multicultural Families, which led to a number of studies and policy papers on multicultural education. In reality, however, there were not enough scholars experienced in multicultural education studies to oversee such projects, so experts of education focused on education for international understanding. Accordingly, multicultural education in Korea took the form of education for international understanding combined with multicultural education.

Education for international understanding was first introduced by the United Nations Educational, Scientific and Cultural Organization (UNESCO) in 1946, after World War II, as a means of preventing war and maintaining peace. Its main goal was world peace, rather than equal education, and it aimed at enhancing international cooperation and understanding through education. Education for international understanding was adopted to promote the understanding of the other cultures that exist outside national boundary (Park 2008), and, as is apparent from its representative Cross-Cultural Awareness Program (CCAP), its main focus was maintaining world peace through a better understanding of other cultures. In contrast, the goal of multicultural education was equal education, meaning that it concentrates on reforming educational curricula to promote critical thinking and facilitate the ability to look at a problem from different points of view (Campbell 2010). In contrast, multicultural education in Korea was broadly understood as a type of education that introduces the culture of other countries, because it is combined with education for international understanding.

The second misconception about multicultural education is that it is not for mainstream Koreans and is solely for multicultural families (Yang 2007). While multicultural education should be a type of education for both the majority and minority groups, multicultural education, especially in terms of multicultural policies in Korea, might be misunderstood as education for minorities. For instance, the government support for multicultural education tends to restrict educational support to multicultural families. The government also defines the term of multicultural education as “educational support for minorities,” while education for majority groups (who are ethnically Korean) is defined as “education for multicultural understanding.” Since the language used with majority and minority groups are different, some argue that there is cogent evidence that multicultural policies focus more on minorities, rather on the entire population.

The third misconception is derived from the belief that Korean society is completely different from other countries, in terms of ethnicity and historical conditions, and therefore Korea should take a different approach for multicultural education. It is true that multicultural education in Korea is conducted in different circumstances and conditions than elsewhere. For instance, Korea is the one of a few countries in the world that is divided into two countries. Despite their similarities in language and ethnicity, South and North Korea contrast sharply in terms of culture and political ideology. For this reason, Korea might, indeed, need its own approach to multicultural education. This, however, does not mean that Korea needs to implement a fundamentally different theory for multicultural education; it should be the actual policies and the ways the policies apply that might differ from other

countries' application of the notion. Park and Kang (2009) insist that Korea should first discuss whether its multicultural education will put more weight on assimilation or on multiculturalism, before adopting any relevant policies. Some scholars insist that the policies should focus on assimilation, because Korea is 97% pure-blooded Koreans, and thus other people should assimilate into the culture. However, studies have shown that disregarding one's own culture and language while assimilating fully into Korean culture results in foreigners ultimately having more difficulty adjusting to Korean culture (Resmik 2006). Therefore, rather than assimilation, multicultural education in Korea should focus on adapting for multicultural families, understanding the differences for Koreans, and ensuring that foreigners also keep their cultural values while adapting.

12.3.2 *Research on Multicultural Education in Korea*

In order to understand the direction of multicultural education in Korea, it is necessary to take a look at how it is studied. A search through the National Assembly Library for academic journals or dissertations published in Korea on the keyword "multicultural education" provides necessary insight. The first paper on multicultural education that was published in an academic journal dates back to the 1980s (Kim 1984). Such papers continued to appear during the period from 1990 to 2005, but it was not until 2006 that they began to become increasingly significant. Dissertations on multicultural education first emerged in the late 1990s. Like papers in academic journals, they have shown a significant rise since 2006, but most were Master's theses. This study, therefore, looks only at the papers published in academic journals to grasp the direction of multicultural education research in Korea.

Initially, most of these papers focused on introducing the multicultural education systems of other countries (Kim 1984), or on studying multicultural education concerning curricular subjects such as art, music, and early childhood education (Kim 2002; Park 1995). Around ten papers on multicultural education were published per year until 2005; their subjects ranged from civic education (Seol 2004) to case studies on *Kosian* children (Oh 2005). There were few studies on multicultural education curricula; only the 2003 and 2006 studies by Chang connect multicultural education with educational curricula.

In 2006, multicultural education studies in Korea began to increase in number and expand in range. In terms of their relevance to curricular subjects, these studies broadened in range to include not only art, music, and early childhood education, but also Korean, social studies, ethics, and world geography (Chang 2013; Cho 2014; Jung and Hwaong 2014). Such studies took the format of seeking ways to conduct multicultural education for each curricular subject in the classroom. Whereas earlier studies tended to introduce multicultural education approaches used in the United States, recent studies have introduced or compared the cases of various other countries, such as Germany, Singapore, and China (Choo 2009; Kim 2009; Lee 2014a). Some studies were centered on the difficulties faced by

multicultural families—for instance, the difficulty for their children in adjusting to school life—and delved into the specific cases of children of marriage immigrants and foreign workers (Oh 2009; Son and Park 2015), while others suggested ways to support teaching and learning for children from multicultural families (Oh 2008; Won 2009). Most recently, there have been papers that analyzed school textbooks and pointed out the problems of multicultural education in Korea (Kim 2008; Kim and Gwak 2014), or those that linked curricular subjects with school curricula (Chang 2015). Some studies that observed the awareness of a multicultural society were unique in their choice of subjects; they also selected teachers or students who were not from multicultural families, rather than members of multicultural families only (Go et al. 2015; Mo 2009). Similarly, other studies examined the effectiveness of multicultural education programs on children from non-multicultural families (Chang and Jeong 2009).

Some scholars take the lifelong education perspective, suggesting that multicultural education should develop as part of a lifelong process for all learners regardless of race, ethnicity, nationality, and class, engaging with civil society. As a way of doing this, the combined education can provide lifelong learning opportunities to immigrant families in collaboration with various organizations. Thus, they contend that multicultural education and lifelong education should be combined to form a new education approach for future society (Lee 2014b).

What is most notable of the recent trend in multicultural education studies is that scholars today are inviting a wider range of subjects compared to the past. However, most of the studies still tend to focus on the multicultural education of minority students. As a result, there are not many studies on the impacts of multicultural education for the majority group, although this is as important as educating the minority group. Furthermore, there are only a few studies that explore how teachers and students of non-multicultural families perceive a multicultural society, and much less when it comes to researching multicultural education programs for majority groups.

An overview of Korea's multicultural education studies program suggests that it is time to establish a clearer concept of the idea, so that multicultural education can take a firm root in Korean society. In Korea, the concept of multicultural education does not go any further than the notion of assimilation and tends to concentrate on assimilating multicultural families into the existing Korean culture. Some of the approaches are based on subtractive models (e.g., Valenzuela 1999), rather than additive models (e.g., Gibson and Hidalgo 2009). Policies and curriculum that adopt an additive model usually value and support the maintaining of heritage languages and cultures. Furthermore, multicultural education is not confined to a single curriculum subject. Studies of this kind were likely carried out by scholars from various areas of expertise, which might have led to diverse concepts, understanding, and foci according to who conducted the study, and a distorted direction for studies on multicultural education. This, however, often occurs in the initial stage of adopting multicultural education, so to ensure that multicultural education develops in a constructive and productive direction, scholars in Korea need to establish a clearer concept of the notion and conduct studies on this ground.

12.3.3 Policies on Multicultural Education in Korea

In Korea, the task of supporting multicultural education is shared by a number of government agencies, such as the Ministry of Education (ME), the Ministry of Gender Equality and Family (MOGEF), the Ministry of Health and Welfare (MOHW), the Ministry for Food, Agriculture, Forestry and Fisheries (MIFAFF), the Ministry of Justice (MOJ), and the Ministry of Culture, Sports and Tourism (MCST). Among the 17 ministries in Korea, 11 are involved with multicultural education and policies. Among these ministries, ME plays a central role in multicultural education, while MOGEF plays a key role in supporting multicultural families. This study will therefore concentrate on the policy direction and projects set forth by ME, while considering the projects conducted by municipal and regional education authorities and programs carried out by schools.

Before exploring Korea's multicultural education policies, it is worth examining the existing legal system concerning foreigners and multicultural families. In a broad sense, Korea has the following set of laws for foreign natives: The Nationality Act, the Immigration Control Act, the Act on the Immigration and Legal Status of Overseas Koreans, and the Act on the Employment of Foreign Workers. In regards to their treatment, the Framework Act on Treatment of Foreigners Residing in the Republic of Korea (implemented by the MOJ) and the series of laws that prohibit discrimination based on country of birth, ethnicity, race, skin color, and circumstances surrounding family (established by the National Human Rights Commission of Korea) are in place (Park 2006). In September 2008, MOGEF established and implemented the Support for Multicultural Families Act, through which it promotes the helpful treatment of foreign natives, refugees, marriage immigrants and their children, while supporting their adjustment to Korean society and improving their relationships with Korean citizens.

Policies concerning foreign natives are discussed and coordinated at a pan-government level by the Committee for Policy on Foreigners, which is chaired by the Prime Minister. In terms of education, the Framework Act on Education and the Enforcement Decree of the Elementary and Secondary Education Act prevent discrimination against children of other races/ethnicities and enables convenient school admissions and transfers for children born to foreign native for protection (Jeon 2009). Furthermore, all children's right to education is protected by a series of UN conventions on human rights, including the International Convention on the Protection of the Rights of All Migrant Workers and Members of Their Families (1991) and the Convention on the Rights of Children (1991) (Jeon 2009). To sum up, Korean society is equipped with a legal system for protecting the basic rights of foreign natives and multicultural families, yet discrimination against people of different races and ethnicities still exists. For example, although legal policies do explicitly state that there should not be any prejudice towards multicultural families, many Koreans have difficulty accepting this. Koreans were educated to believe that pure-blooded marriages are superior to mixed-race marriages. Furthermore, Koreans

have been engrained with the belief that they differ from those of multicultural families.

Since implementing the Policy for Supporting Education of Children from Multicultural Families in 2006, the ME began to show a greater level of attention towards multicultural education, and it has continued to establish various plans and policies such as the “Policy for studying and supporting ways to promote multicultural education in schools” and the “Policy for supporting education to enhance the abilities of children of multicultural families”. Multicultural education’s policy goals are: First, pursuing an enhanced capacity to educate students and parents of multicultural families; and second, improving the general public’s understanding about and tolerance for a multicultural society in Korea (Jeon 2009). To this end, the Ministry is executing various projects in connection with municipal and regional educational authorities, as seen in Table 12.3.

A majority of the programs developed in 2009 were for parents and children of multicultural families. The provinces and cities differed in terms of the programs they ran for students from multicultural backgrounds, but some were shared in common: mentoring, programs for experiencing Korean culture, Korean classes, and special classes. In addition, the main features of programs for the parents of multicultural families were Korean classes, counseling, and education for understanding Korean culture. It is apparent that the programs for multicultural families aim at helping them to adapt to Korean society, rather than trying to understand and respect their cultures.

Among the programs for non-multicultural individuals, a great proportion was for teachers. Teacher training, the operation of schools for multicultural studies, and the distribution of materials and support for study groups are representative of such programs. Yet, teacher training has its limitations, in that trainings are only offered to those who are interested in the subject. Accordingly, the level of teachers’ awareness and understanding about multicultural education remains low. Furthermore, unlike other countries, only a few Korean education universities’ or teachers colleges’ students are subject to lectures on multicultural education. As a result, most novice teachers are arriving at schools with insufficient knowledge and expertise in multicultural education.

Out of the 17 provinces and cities in Korea, only two (Daegu and Chungcheongnamdo) currently operate programs for parents of non-multicultural families, but even they fail to approach the core of multicultural education, as they are mainly training programs for parents or joint campaigns with multicultural families and majorities. When it comes to non-multicultural children, these programs—for instance, CCAP, classes for learning about the cultures of immigrants’ home countries, and book purchasing—do not go any further than introducing them to those cultures. Following the 2007 revision of the national educational curriculum, certain content on multicultural education were added to textbooks. Yet, the low level of knowledge and experience of teachers are keeping multicultural education from being fully integrated into the national curriculum.

A few of the provinces and cities are conducting comprehensive multicultural education projects that involve multicultural and non-multicultural families and

Table 12.3 Multicultural education programs conducted by provincial and municipal education authorities

	Teachers	Students			Parents		Others	Compre-hensive
		Multicultural families	Others	Multicultural families	Multicultural families			
Gyeonggi-do	Development and distribution of materials on multicultural education; teacher multicultural training	Education camp during vacation; special curriculums and extracurricular activities; partnering of teachers and students; special classes for children of foreign workers	Essay writing on subjects of multicultural; designate multicultural education week; special curriculums and extracurricular activities	Teachers' visits to multicultural families; Korean classes for parents				Five color multicultural community; mentoring between multicultural and other families; multicultural education centers
Daegu	Training program for school administrators; special lectures and presentations on model cases of multicultural education; central schools for multicultural education; development and distribution of materials; support for model schools; counseling	Mentoring by university students					Training program for parents	Multicultural summer camp

	Teachers		Students		Parents		Comprehensive
			Multicultural families	Others	Multicultural families	Others	
Daejeon	Central schools for multicultural education; operation of special classes; establishment of schools for multicultural understanding; presentations on model cases; study group on multicultural education; training of teachers; awards for teachers; special curriculums; Expert workshop	Online contents on the Korean language and culture; mentoring by university students; materials on teaching Korean culture; assignment of guardians and counseling and mentoring for students from North Korea; learning diagnosis program; Online learning	Class for multicultural understanding	Internet-based education for 20 parents; counseling; distribution of materials on school life; provide hanbok (Korean traditional costume)	ME Center; 2+2+2 Campaign for creating a happy culture; mentoring program for book reading; vacation camp	Contest on model multicultural families; Support for visits to country of birth	
Seoul	Development of materials for teaching Korean; central schools for multicultural education; teacher training	Programs for teaching Korean; camp for experiencing Korean culture; Korean class; mentoring by university students	Language program		Program for multicultural families to socialize; foster and appoint bilingual teachers		
Chungcheongnam-do	Development and distribution of materials for teachers; teacher training; presentation of model cases	Special class for students with poor performance; appointment of teachers to teach Korean in farming and fishing towns; volunteer group of teachers; online schools; mentoring; special program for teaching that all peers are brothers and sisters	Material on school life; special learning programs for parents; program for understanding Korean culture	Special class for global happiness	Joint campaign for promoting better understanding about multicultural society	Multicultural education center; MOU between Daejeon branch of the Munhwa Broadcasting Corporation (MBC) and the Rotary Club	

Note: Ministry of Education (2010)

teachers. Some programs, such as Gyeonggi-do's multicultural community and Daejeon's "2+2+2 campaign for creating a happy culture," are unique. Most multicultural education related programs administer these programs separately—multicultural families work with other multicultural families, while Koreans work only with other Koreans. The problem with such programs is also that they do not continue for a long period of time; they often end up as one-time events. It is therefore crucial that authorities introduce comprehensive programs with lasting effects by encouraging continued mentoring among multicultural and non-multicultural families and teachers.

To observe the overall trend and individual features of multicultural education programs that elementary, middle, and high schools are carrying out on the basis of relevant laws and ME policies (Cho 2008), Cho analyzed the multicultural education programs of seven schools for policy studies (five elementary schools and two middle schools), two trial schools (both elementary schools), and 29 ordinary schools (14 elementary and 15 middle schools). A significant number of programs in the elementary and middle schools were "cultural education programs." Next on the list were: language, adjusting to school life, understanding a multicultural society, building a stronger sense of identity, and raising community spirit. Results from Cho's study illustrate that most classroom programs are designed to introduce foreign cultures to students, or to introduce the children of multicultural families to Korean culture and language. Aside from cultural education, elementary schools tended to have a greater proportion of language programs, while middle schools promoted programs that encourage a stronger sense of identity. In other words, elementary schools emphasize basic knowledge of the Korean language, whereas middle schools place more weight on identity, given that adolescence is the time for building up one's identity. In terms of the length of programs, middle schools exceeded elementary schools, and the ordinary schools surpassed the policy studies schools. Such programs were usually carried out through extra-curricular activities, rather than formal classes.

Whereas schools for policy studies placed considerable weight on the goal of promoting a better understanding of multicultural society, ordinary schools focused on cultivating the ability to adapt to other cultures, fluency in Korean, and improved academic performance. Ordinary schools had a low proportion of programs for fostering community spirit, as they rarely ran programs that involved both multicultural and non-multicultural students. In contrast, most of the programs run by schools for policy studies were for all students or non-multicultural students. Yet, the subjects of these programs were limited to the food, the costumes, and the customs of other countries and failed to cover a wide range of issues such as culture, cooperation, bias, identity, equality, equity, and diversity. In some surveys, teachers' lack of knowledge and awareness regarding multicultural education were found to be the main cause for this shortcoming (Cho 2008). It is not surprising that many Korean teachers lack knowledge on multicultural education, because they have little experience with it. Since Koreans have a strong attachment to other ethnic Koreans, teachers might have difficulty in adopting more plural and multicultural positions. Thus, the first major task for multicultural education should be to determine whether

Korea can develop democratic institutions that can treat people living in Korea equally, not simply because they share the same blood but because they are democratic citizens of Korea.

12.4 Conclusion

12.4.1 Discussion

Not very long ago, Korea was still emphasizing its single-ethnic identity. Historical research, however, suggests that Korea has been a multiethnic country since ancient times. In 2006, the biracial American football player Hines Ward visited Korea and heightened the country's interest in multicultural education. Today, Korea uses the term "multicultural family" widely and provides support for the three minority groups, marriage immigrants, foreign workers, and North Korean refugees, that fall under this category. By the author's opinion, the term "multicultural families" may be at risk of triggering prejudice and discrimination, as it suggests a distinction among children according to their parents' country of birth. In this sense, it is best that it should be changed or redefined, yet currently it is used for the purpose of concentrating support for these aforementioned minorities.

Multicultural education in Korea developed in a way that is combined with education for international understanding, so it took a distorted form that emphasizes "cultural education." The ultimate goal of multicultural education is equality and equity in education, and reforming the educational curriculum to cultivate the ability to think critically and consider other points of view is an integral aspect (Bennett 2011; Campbell 2010). However, multicultural education in Korea—represented by the CCAP—centers on promoting better understanding of other cultures. Relevant policies and school programs focus on assimilating multicultural individuals into Korean culture, rather than encouraging them to adjust to Korean culture and simultaneously respecting their own. In addition, although various theories point out that multicultural education is for minority and majority groups alike (Yang 2007), Korea offers multicultural education for minorities and education for multicultural understanding for majorities. There is also the misconception that Korea's multicultural education theory is different from that of other countries, but in truth, it is only the understanding and application that differ.

To date, multicultural research in Korea has contemplated multicultural education and its connection to certain curricular subjects, introduced overseas cases, analyzed the reality of multicultural families and the difficulties they face, proposed ways to teach and support learning for children of multicultural families, studied textbooks and curriculums, and shed light on how the mainstream perceives the multicultural society, but it excludes studies of the political and social power of multicultural families. Compared to the past, the range of research is becoming diverse, but still tends to focus on immigrants' adaptation into Korean society.

Furthermore, because scholars who have little background on multicultural education carry out some of this research, it may carry misconceptions and lead to misunderstandings and a somewhat wrong direction for multicultural education.

Although Korea has laws for multicultural families and a system for protecting their basic rights, discrimination against different races and ethnicities, and prejudice against multicultural families still exists in terms of educational access, educational outlets and outcomes, employment opportunities, and so on. To resolve this issue through education, the Ministry of Education and the municipal and provincial education authorities are conducting a number of multicultural education projects. Aside from teacher training, however, most projects are concentrated on multicultural families. In short, these are projects that encourage prompt adjustment to Korean society, rather than promoting understanding about other cultures. Programs for non-multicultural students do not go further than introducing them to other cultures. This trend is witnessed not only in government policies, but in schools as well. A close look at the multicultural programs that are being run by schools shows that most of them are on the subject of “cultural education.” This is, according to Banks (1993), a contribution approach, and it is essential that the education curriculum is reformed to take a more sophisticated, additive, or transformative approach.

12.4.2 Direction for the Development of Multicultural Education in Korea

This study suggests a future direction for Korea’s multicultural education as follows: First, Korea needs to build a clearer concept of multicultural education. As mentioned before, multicultural education in Korea is combined with education for international understanding and stresses the understanding of other cultures. There is no doubt that understanding other cultures is a significant element of multicultural education, but a reformed curriculum that brings about a changed perspective that allows individuals to have critical thinking (Bennett 2011; Campbell 2010) is more important. Critical thinking means to alter one’s way of thinking. For example, when one needs to make a decision, rather than thinking only of one’s own opinion, it is necessary to look at other people’s perspectives and their thoughts. On the basis of a clearer concept, Korea should acknowledge different cultures while assisting multicultural families in adapting to Korean society, rather than pressing them to become assimilated. We must also refrain from confining multicultural education to race and ethnicity only and realize that the term “multicultural” includes a variety of factors such as gender, social stratum, religion, etc., as well as the impacts of their intersectionalities. Studies on the appropriate use of the term “multicultural family” are also necessary.

Second, multicultural education is not just for minorities, but for majorities as well. Projects conducted by education authorities or schools tended to be concentrated on minorities. Multicultural families account for almost 3 % of the Korean

population (but the proportion in the cities can be much larger), and it is essential that the government provides adequate support for them. Such efforts, however, will be successful only when the remaining 97 % show a changed mindset. In the future, there should be more emphasis on multicultural programs for majorities, in order to shift their perspective and encourage them to tolerate differences.

Third, school administrators and teachers should also be subject to multicultural education. In the United States, multicultural education emerged from efforts to resolve racial issues through education (Chang and Jeong 2009). Education not only exposes students to new experiences, it also alters their way of thinking. In this sense, the perspectives of school administrators and teachers can have a significant influence on students. Currently, there are ongoing training programs for teachers and administrators in place, but there is an urgent need to modify how they are run (Chang 2010). In addition, multicultural education lectures, which are now open in only a few education universities, should be offered to students of teachers colleges as well, so novice teachers can be better equipped with cultural knowledge and sensitivities, culturally relevant attitudes, and teaching approaches when they arrive at schools.

Fourth, a curriculum reform is required. Humans can change their way of thinking on the basis of experience and education (Chang 2002). For instance, Koreans came firmly to believe that Korea is a country of single ethnicity due to what they were taught in school. In this sense, a changed way of education, or a new curriculum, will lead individuals to have different perspectives. On the basis of the 2007 reform of the educational curriculum, textbooks now include illustrations or examples that involve multicultural education, but this is only a contribution approach. To take the more sophisticated additive or transformative approaches, we need to reform the curriculum and cultivate students' ability to think critically and consider other perspectives.

Fifth, studies on the identities of parents and children of multicultural families are necessary. The identity issues of children from multicultural families have the potential to instigate both personal and social problems. It is essential that Korean society assists these children in maintaining their identities while offering tender care for the emotional scars they may sustain in the course of adapting to society, and such support must concern their parents as well (Yoon 2008). Studies on needs of multicultural families based on their living areas are also necessary. Although the common belief is that multicultural families live in rural areas, they mostly reside in urban areas such as Seoul, Gyeonggi-do, and Incheon. Because the needs of those in rural and urban areas differ, there needs to be programs developed specifically for multicultural families in urban areas.

Sixth, it is recommended that a single government agency take the initiative of supporting multicultural education, rather than have it shared among a number of different agencies. Currently, the Committee for Policy on Foreigners, which is chaired by the Prime Minister, is responsible for pan-government discussions and coordination of relevant policies. Yet, due to budgeting issues, the involved government agencies run individual programs, most of which are for the small number of multicultural children in the country. This invites criticism regarding the inefficient

use of budgets in the bureaucratic process, and possibly reverse discrimination. To prevent overlapping programs and the waste of money, a single government agency must take the main responsibility for this issue.

Last, Korea should develop a program that can emphasize the strength of multicultural families. To date, most multicultural education programs have focused on assisting these families to overcome their difficulties in terms of culture and language. However, Gyeonggi-do and Seoul have successfully shed light on the strengths of multicultural parents by teaching them to become bilingual teachers and assigning them to kindergartens, elementary, middle, and high schools. These programs not only emphasized these parents' advantages, in terms of language and culture, but also encouraged their employment. In this regard, we must move away from the prevalent view that multicultural families require assistance and seek projects that can promote a positive view of their strengths.

Chapter 13

Rethinking Diversity in South Korea: Examining the Ideological Underpinnings of Multicultural Education Policies and Programs

Ji-Yeon O. Jo and Minseung Jung

13.1 Introduction

G. Cameron Hurst II dubbed the cultural nationalism in contemporary Korea “uri-nara-ism” (Moon 2000, p. 156). “Uri” can be translated as “our” and “Nara” as “country” in English, so the term can be translated as “Our nation-ism.” “Uri-nara-ism” is a combination of Korean nationalism and collective identity that is so embedded in everyday lives of people in Korea. Uri-nara-ism contributed to Korea’s economic recovery (often referred to as the “Miracle of Han River”) from the devastation caused by over three decades of Japanese colonialism and the subsequent Korean War; it helped to inspire extraordinary self-sacrifices among Koreans who shared the common goal of nation-building. Korea emphasized the notions of “homogeneity,” “unity,” and “solidarity” in order to strengthen the state power, which was also sustained by “uri-nara-ism” or what the authors may refer to more generally as “uri-ism.” “Uri” promotes oneness and creates a boundary between “us” and “them.” In this context, notions such as “diversity,” “heterogeneity” and “difference” have been somewhat deemphasized in the sociocultural lexicon of Korea.

However, due to recent demographic and social changes, Korea now faces challenges to maintaining a national identity based on homogeneity. As unprecedented numbers of people participate in transnational migration, Korea has become an emerging hub for receiving migrants from all around the world, especially from the inter-Asia region. The presence of immigrants has challenged the existing notion of Korean peoplehood that privileges ethnic and cultural congruity among its people.

Korea National Open University, Seoul, South Korea

In this chapter, the authors explore interplay between the ideological underpinnings that uphold the notion of “Korean-ness” and the discourse of “multiculturalism” in Korean education. We start by providing general information on urban education in South Korea, then, examine current educational policies and programs for migrant children, paying particular heed to how the Korean education system understands diversity and to how that understanding manifests in the development and implementation of policies and programs. Through policy analysis, we identify both progress and pitfalls in how the Korean education system serves migrants or children of migrants. In addition, we identify the ideological foundations underlying particular educational policies and programs, and delineate the philosophical tensions within them. We conclude with preliminary sketches of what equitable education for migrant students might entail.

13.2 Urban Education in South Korea

Urban South Korea (Korea hereafter) is an educational mecca. Private educational institutions (*hagwons*) are located on almost every corner in the residential and downtown areas of urban Korea. There are hagwons for subjects such as English and math and for enrichment activities such as taekwondo, fine arts, dance, and foreign languages. There are hagwons for almost every Korean—English hagwons for preschoolers, academic enrichment hagwons for elementary and secondary students, test-prep hagwons for high-school students and those who need to repeat their college entrance exams, and foreign-language hagwons for college students and even for adults who are already in the workforce. The ubiquitous presence of hagwons offers visual evidence both of Korean educational zeal or “fever” (Seth 2002) and of the privatization of education; all hagwons are private institutions where attendees spend time learning subjects of their choice in addition to their regular school or work.

In keeping with Korea’s national zeal for learning, Korean students have been widely recognized for their educational achievements. The Programme for International Student Assessment (PISA) assessed 15 year olds in Organisation for Economic Co-operation and Development (OECD) countries; the results, published in 2012, ranked Korea third in math and within the top 5 and top 10 in reading and science, respectively.¹ In the United States, President Barack Obama and Education Secretary Arne Duncan have praised Korea’s education system and its academic achievements in multiple public addresses (Fenton 2015; Strauss 2014). But such congratulatory international recognition reflects only the rosy side of the country’s education. It does not reflect the fact that Korea’s extreme academic competition has many adverse side effects, such as the often overwhelming burden of paying for private education and the high levels of psychological stress and increasing suicide rates among students. The 2012 PISA report notes, for example, that the percentage

¹ In math performance, Korea was tied with Hong Kong and Taipei.

of Korean students who described themselves as happy at school was the lowest among students in all OECD countries (OECD 2013, p. 21).

Nevertheless, despite the costs of privatization and the psychological burden of competition, Korea has above-average equity in education opportunities. According to the 2012 PISA report, Korea's rates of school enrollment and of advancement to higher education have improved remarkably in the past few decades. Over 90% of school-aged children are enrolled in elementary, middle, and high schools, and the overwhelming majority of high-school students pursue postsecondary education. In 1990, only 27.1% of high-school graduates attended postsecondary institutions, but that percentage increased to 62% in 2000 and 75.4% in 2010. The rate declined to 70.9% in 2014, but this may be due to high college tuition and worsening prospects for employment even among those with a college degree (Statistics Korea 2015). Overall, the 2012 PISA report and school-enrollment data published by Statistics Korea indicate high levels of educational achievement among Koreans and equity in education opportunities in Korea.

In this context, issues of equal access and of securing educational rights might seem to have been relegated to the past. However, in the shadow of Korea's education empire is a cohort of students who do not benefit from proper educational opportunities and who are therefore becoming an undereducated underclass in urban South Korea: the children of migrants. Their educational attainments are in stark contrast to overall educational achievement in Korea. Many migrant children drop out of school or choose not to enroll in schools in the first place (Hong 2009). The dropout or non-enrollment rates of migrant students are startling: 15% in elementary school, 40% in middle school, and 70% in high school (Won 2008 cited in Hong 2009). As of 2009, 26,015 migrant students were enrolled in school, but an estimated 17,000 migrant children were not, for a variety of reasons. Furthermore, while educational policy allows children of illegal immigrants to attend school, many of their parents choose not to register or enroll them in school, fearing deportation once the system discovers their immigration status (Hong 2009). The educational status of migrant children presents an urgent dilemma for urban education in Korea, not only in terms of their right to receive a proper education, but also in terms of their foreseeable disadvantage in a country so obsessed with academic achievement that social mobility largely depends on it.

13.3 Changes in the Urban Ethnoscape

In the aftermath of the Korean War (1950–1953), not only did the country remain divided into North and South, but the entire peninsula continued to suffer the ravages of that war. Starting in the early 1960s, the South Korean government began to actively promote emigration to foreign countries, hoping to overcome its impoverished economy and to earn foreign reserves. Since then, close to one million Koreans have emigrated overseas and overall seven million ethnic Koreans live outside the Korean Peninsula, which includes diaspora Koreans, recent migrants and temporary

residents. However, the migration trend shifted from emigration to immigration in the 1990s as Korea acquired status as a developed country and experienced shortage in labor in manufacturing and service sectors.

As of 2015, Korea is home to approximately 1.74 million foreign residents, who thus comprises 3.4% of the total population in the country (Korea Immigration Service 2015). Although the proportion of foreign residents to the total population remains small, the dramatic overall growth of this population merits attention: in 1990, only 49,507 foreigners resided in South Korea (Korea Immigration Service 1990), but the registered foreign-resident population increased to 210,249 in 2000 and to 918, 917 in 2010 (Korea Immigration Service 2009; Korean Immigration Service 2015). Thus, the number of foreign residents in Korea increased by a factor of 35 between 1990 and 2015. Especially in the 2000s, the annual growth rate of the foreign-immigrant population in Korea was highest among all OECD countries. Among the 1.74 million foreign residents, migrants from China comprise the overwhelming majority—Chinese (259,166) and Korean Chinese (694,256) (Korea Immigration Service 2015)—followed by migrants from Vietnam (199,950) and South Asia (86,634). An increasing number of migrants also come from the Philippines, Japan, Cambodia, the United States, and the Commonwealth Independent States (CIS).

A unique feature of the migrant population in South Korea is the presence of ethnic Koreans from various diasporas. Approximately 50% foreign residents in Korea are descendants of Korean diasporans and have lived outside Korea for decades or even for multiple generations before migrating to Korea. These ethnic Korean migrants—who arrive from countries such as China, the United States, Japan, and the Commonwealth of Independent States—may possess different levels of affective connection to South Korea than do other non-ethnic Korean foreign migrants, and some of them have even acquired Korean language proficiency and cultural knowledge while growing up in diaspora.

Another unique feature of Korean immigration is the increasing number of North Korean border-crossers. Although the two Koreas still maintain the world's most fortified borders, and although illegal border-crossers risk imprisonment and even execution by the North Korean government, more and more North Koreans are escaping their country, mainly via the border between North Korea and China. Although the majority of North Korean border-crossers live in China as illegal migrants, some of them have successfully navigated the treacherous journey to South Korea. Although only 633 North Korean border-crossers made it to South Korea after the Korean War between 1953 and 1998, the number of border-crossers increased dramatically after 1998: an average of 1,000 North Koreans defected to South Korea annually between 2001 and 2005 and over 2,000 did so annually between 2006 and 2011. As of 2015, more than 28,000 North Koreans have settled in South Korea (Korea Hana Foundation). Although the South Korean government categorizes diaspora Koreans with foreign citizenship as foreign residents or as overseas Koreans residing in Korea, the government categorize North Koreans as *Bukhan ital jumin* (North Korean defectors) or *Saetaemin* (new settlers), not as foreign residents, and thus tends to grant these migrants South Korean citizenship

almost immediately after they pass background checks and complete resettlement training. The South Korean government also provides initial financial assistance for their settlement (although the amount of such assistance has substantially decreased in recent years in response to the dramatically increased number of border-crossers).

Just as foreign residents in Korea arrive from diverse countries of origin, they also have diverse reasons for migration. According to the Korean Immigration Service (KIS) Statistics (2015, p. 351), the largest group of migrants work in the unskilled and low-skilled labor sector: 270,569 non-Korean foreigners (E-9 visa) and 282,670 ethnic Korean foreigners (H-2 visa), which comprise approximately 32% of the total foreign-resident population. Another 289,427 ethnic Korean foreigners reside in Korea with the F-4 visa, which provides quasi-citizen benefits to overseas Koreans. There are also 150,994 marriage migrants (KIS 2015, p. 728).² Marriage migrants from China form the largest group (36,059 Chinese, 24,604 Korean Chinese), followed by Vietnamese (39,725) and Japanese (12,063).³ In 1990 the international marriage rate was a mere 1.2% of the total marriage rate, with only 4,710 such marriages, but by 2007, there were 37,560 such marriages (Lim 2009). Between 2004 and 2008, the international marriage rate was consistently over 11% of the total marriage rate each year (Seol 2009; Lim 2009). Korea also hosts an increasing number of international students, business entrepreneurs with all sizes of enterprise, and employees of multinational corporations.

According to 2015 foreign-resident population data published by South Korea's Ministry of Interior, the migrant population is concentrated in the Seoul and Gyeonggi region. Of 1.74 million foreign residents, 457,806 reside in Seoul itself, and 554,160 reside in Gyeonggi Province. In both areas, the foreign-resident population constitutes 4.5% of the total population, as compared to the national ratio of 3.4%. Among the six metropolitan areas in South Korea, Incheon Metropolitan City, which is within the Gyeonggi region, hosts the second-largest number of foreign residents (91,525), and Busan Metropolitan City hosts third-largest number of foreign residents (57,801). Thus, the Seoul/Gyeonggi Areas—Seoul Metropolitan City, Incheon Metropolitan City and Gyeonggi Province—hosts approximately 65% of the foreign-resident population. Considering South Korea's extremely high proportion of urbanites (over 90% of the total population), the concentration of foreign migrants in the Seoul Capital Area is not surprising, and the issue of urban education can therefore be applied to the majority of educational contexts in the country (Ministry of Land, Infrastructure and Transportation 2013).

²Data on the foreign-resident population often differs by the institution that collected the data. For example, foreign-resident population data published by the Ministry of Interior in 2015 documents 608,116 foreign workers in total and 239,692 marriage migrants (147,382 marriage migrants hold foreign citizenships, and 92,316 are naturalized Korean citizens).

³Foreign-resident data published in 2015 includes both non-naturalized and naturalized marriage migrant population numbers. According to the data, Korean Chinese form the largest marriage migrant population, with 30,925 being non-naturalized and 34,678 naturalized, followed by Chinese (35,474/25,572), Vietnamese (38,661/20,100), and Filipino/a (10,427/6,926).

The increase in the foreign-resident population has predictably resulted in an increase in the number of children born in households where one or both parents are migrants. The Korean government categorizes them as multicultural (*Damunwha*) children. According to a report on current state of the foreign-resident population (Ministry of Interior 2015), 207,693 *Damunwha* children live in Korea, and 183,732 of them are from households in which one parent is a native Korean and the other parent is a foreign migrant; the rest are from households in which both parents are either foreign migrants or diaspora Koreans. Marriage migration tends to involve marriages between Korean men and foreign women, most of whom are from other Asian countries. Among *Damunwha* children, 57,856 are of Vietnamese heritage, 39,160 are of Korean Chinese heritage, 20,584 are of Filipino heritage, and 17,195 are of Japanese heritage. The phenomenon of international marriage between Korean men and foreign women is fairly recent; while there were only 20,180 *Damunwha* children enrolled in elementary and secondary schools in 2008, the number of school-aged *Damunwha* children has rapidly increased since then, more than tripling, to 67,806, by 2014 (Ministry of Education). Although this number includes foreign-born students who have migrated to South Korea and students whose parents are both foreign, the overwhelming majority (57,498) are *Damunwha* students, that is, born in South Korea with one foreign migrant parent, usually the mother. Among children from multicultural families, 83.4% are enrolled in elementary school, 12.1% in middle school, and 4.5% in high school (Hong 2009).

Although an accurate number is hard to obtain, the Korean Ministry of Education estimates that 50–60% of children from multicultural families are not enrolled in school at all (Song 2012). The non-enrollment rate of *Damunwha* children is in stark contrast to South Korea's overall enrollment rate, which is over 90%, for general school-aged children. The high non-enrollment rate of *Damunwha* children is usually attributed to the undocumented status of parents and to the economic cost of education. However, these explanations are not satisfactory: not only has the number of undocumented migrants decreased substantially due to recent immigration reforms and amnesty campaigns, but education is compulsory through the ninth grade and provided by the Korean government at almost no cost to the families. As the phenomenon of foreign marriage migration matures in Korea, the number of *Damunwha* students is most likely to increase both rapidly and continuously into the future. Thus, it is urgent that South Korean urban education systems find ways to provide educational access to children of migrants. However, due to an extremely intense national focus on academic achievement and privatization of education, neither the Korean government nor urban education systems are equipped to handle issues of diversity or to provide equitable educational environments for children of migrants.

13.4 Educating Children of Migrants: Multicultural Education in the Korean Way

The demographic and social transformations Korea experienced during 1990s and 2000s were accompanied by changes in the country's education system, under the banner of "multicultural education" (*Damunwha Gyoyuk*). To respond to the needs of Damunwha children, South Korea's central and local governments rapidly instituted a variety of policies and programs. For example, between 2005 and 2008, the total budget to "support education of children from multi-culture (Damunwha)" increased 6,415%, and hundreds of new education programs emerged nationwide (Lee et al. 2008). Considering the fact that, due to the country's relative ethnic and linguistic homogeneity (Hong 2009), the term "multicultural education" was almost unknown and certainly considered irrelevant to the Korean context prior to the 2000s, the sheer number of multicultural initiatives and budget increases that have taken place since then is impressive although the efficiency and educational value of those initiatives still need to be thoroughly investigated.

According to article 2 of the Multicultural Family Support Act of 2014, "Multicultural Families" are families composed of either a Korean citizen and a marriage migrant, or a Korean citizen and a naturalized Korean citizen (Ministry of Government Legislation 2014). This legal definition failed to include not only the families of unskilled foreign labor migrants, who form the largest proportion of the foreign resident population, but also the families of two foreign-migrant parents, study abroad students, and unregistered migrants.⁴ By the offering a legal definition of multicultural family that specifies at least one Korean parent, the Korean legal system demonstrates the degree to which it privileges *jus sanguinis* (i.e. right of blood; ethnic heritage)—it does so even in imagining a multicultural and multiethnic society.

As Korea's history of multicultural education is still quite brief, there has been no thorough investigation of multicultural initiatives. A decade has passed since the first major multicultural programs were implemented, and the time is thus ripe for learning from the progress and pitfalls that have taken place thus far in Korea's efforts along these lines. In this section, we discuss multicultural education initiatives implemented by local and national educational systems, looking first at programs and policies implemented by the Seoul Metropolitan Office of Education.⁵ We then examine nationwide data on and analysis of multicultural education policies

⁴Migrants who have not established legal residence status are called *Mideungrok Ijumin*, which means "unregistered migrant." In this chapter, we adopt the term "unregistered migrant," which is translated term of Korean term rather than the term "undocumented migrant," which is more commonly used in the United States.

⁵We focus on Seoul Metropolitan City due to the density of its foreign-resident population and for its centralized educational system, which operates under one Office of Education even though there are lower-level, local, district-based education departments. A close examination of Seoul will be more fruitful and more suitable for the scope of this chapter than studying provincial areas with many different cities.

and programs at both the city and province levels, as published by Korea's Ministry of Education, Science and Technology (renamed the Ministry of Education in 2013) (Park et al. 2010). By examining nationwide data we provide a macro and comparative picture of multicultural education in Korea.

According to information provided by the Seoul Metropolitan Office of Education, multicultural education is provided only in selected schools. In Seoul Metropolitan City, "Designated Damunwha-education-oriented schools (*Damunwha Gyoyuk Jungjeom Hakgyo* in Korean)" provide multicultural program to both Damunwha and non-Damunwha students. Damunwha schools are chosen from among schools that both enroll a significant number of Damunwha students and have applied for the designation. As of 2015, 15 schools provide multicultural education in Seoul Metropolitan City: 7 elementary schools, 4 middle schools, 2 high schools, and 2 alternative schools (an elementary school and a high school). Each one receives a different level of funding—5 million, 5.5 million, or 6 million Korean won (KRW)⁶ (Seoul Metropolitan Office of Education 2014a; Seoul Metropolitan Office of Education 2015a). In addition, nine Damunwha preparatory schools (*Damunwha Yebi Hakgyo* in Korean) provide transitional programs for recently immigrated students to help smooth their transition to mainstream classrooms and schools; these schools receive approximately 28 million KRW to provide Korean language and culture classes and counseling services. There are also four research schools for Damunwha families (two elementary schools, one middle school, and one high school), each of which receives approximately 10 million KRW for and conducting research and developing programs to strengthen Korean language education through Korean as a Second Language classes. Starting in 2015, Seoul Metropolitan City also provides approximately 7 million KRW each to six kindergartens for Damunwha programs (Seoul Metropolitan Office of Education 2014b, 2015b).

The selection of the "Designated Damunwha-education-oriented schools" (Designated Damunwha schools hereafter) and funding amount for them changes every year. Funding for Designated Damunwha schools decreased from ten million KRW in 2014 to five million KRW in 2015, but the number of supported schools increased from 11 in 2014 to 15 in 2015 (Seoul Metropolitan Office of Education 2014a, 2015a). The number of Damunwha preparatory schools increased from 6 in 2014 to 9 in 2015, but funding remained the same for both years. In 2014, seven different schools offered 20 special classes for students returning from foreign countries, but support for this program was eliminated in 2015. The number of research schools increased from 3 in 2014 to 4 in 2015, even though funding for each school stayed the same (Seoul Metropolitan Office of Education 2014b, 2015b).

Analysis of Damunwha school locations suggests preferential educational support for certain groups of foreign residents. Foreign residents of the same nationality

⁶Based on the exchange rate as of November 23, 2015 (1 USD to 1,158.75 KRW), 5 million KRW is equivalent to 4,315 USD, and 5.5 million KRW is to 4,746.50 USD (<http://www.usforex.com/currency-converter>).

or of similar cultural or linguistic backgrounds tend to congregate in their own preferred areas within Seoul, which have created several distinct ethnic enclaves in the city (Kim and Kang 2007). As indicated by the population distribution of registered foreign residents in each “*gu*” (borough or district), the three largest foreign-resident groups have concentrated in separate metropolitan districts (Seoul Metropolitan Government 2015). The first- and second-largest foreign-resident populations—Korean Chinese and Chinese—have clustered in two districts in southwest Seoul (*Yongdeungpo* and *Guro*), while the third-largest foreign-resident population, Americans, live in central or south Seoul districts (*Yongsan/Seodaemun/Mapo* and *Seochol/Gangnam*). The majority of Damunwha schools are located in these districts as well: of 15 Damunwha schools, 5 are in southwest Seoul and 6 are in central Seoul. However, more than 70% of foreign residents in Seoul are either Korean Chinese or Chinese, while only 3% are American. Thus, the system of Damunwha schools skews to supporting American and other foreign-residents groups who reside in central Seoul—this is hardly representative of the current status and needs of the overall multicultural student population.

A report published by the Ministry of Education, Science and Technology (MEST) (Park et al. 2010) shows that the number of Damunwha policies implemented and programs offered vary widely from one local education system to another, and that students are presented with an unbalanced offering of programs with different priorities. According to the MEST report, for example, the Seoul Metropolitan Office of Education allocated an overwhelming proportion of its Damunwha education budget to language education: 1.76 billion KRW out of a total budget of 1.85 billion KRW, or approximately 95.6%, in 2009 (Park et al. 2010, p. 48). This represented an increase from an already incredible 90% budget allocation in 2008 (ibid, p. 45). The other two areas of Damunwha education administered by the Seoul Metropolitan Office of Education—cultural education and multicultural understanding education—received a mere 2.6% and 1.7% of the total budget, respectively.⁷ In terms of the number and proportion of students who received Damunwha programs, 97% of the total budget of Damunwha programs was allocated to children of marriage migrants or labor migrants (no distinction between the two were made), with only 3% reserved for returned children from overseas.⁸

The Incheon Metropolitan Office of Education more evenly distributes its budget among three Damunwha education policies—language education (37.1%), cultural education (42.3%), and multicultural understanding (20.5%). Also, whereas Seoul provides eight programs that primarily emphasize language and cultural education for children of marriage and labor migrants, Incheon provides 14 programs with more emphasis on education for multicultural understanding.

⁷ Since the percentages calculated in the report (Park et al.: 48) are incorrect, the authors recalculated the percentage based on the budget amount given in Figure II-1 on page 49.

⁸ *Gyiguk Janyeo* (returned children) are mostly the children of study-abroad students or of employees who worked for the government or multinational companies and were thereby stationed overseas for long periods.

Examination of multicultural education policies, programs, and budget allocations in both Seoul and Incheon Metropolitan Cities suggests that on-the-ground understanding of multicultural families and children is far broader than the legal definition, which encompasses only families composed of one Korean parent and either a marriage migrant or a naturalized Korean parent. However, North Korean defectors are still neither classified nor perceived as multicultural, and the Damunwha education system therefore provides no budget for creating programs aimed at children of North Korean defectors or children who are themselves defectors. North Korean defectors and their children are supported under different policies and programs than are Damunwha children; for example, North Korean issues are overseen not only by the Ministry of Education, but also by the Ministry of Unification. It is worth noting that Damunwha children, too, come under the jurisdiction of programs that are developed and implemented by multiple ministries, including the Ministry of Government Legislation, the Ministry of Justice, the Ministry of Public Administration and Security, the Ministry of Gender Equality and Family, the Ministry of Education, and the Ministry of Health and Welfare. Communication between various ministries in order to develop consistent and efficient Damunwha programs and policies currently poses a great challenge.

Damunwha education programs and policies in Busan Metropolitan City are different in two main ways: first, Busan includes North Korean defectors as beneficiaries of Damunwha education; second, Busan's budget is well balanced in five different areas of Damunwha education—language, culture, (social) systems, vocation, and multicultural understanding. Not only is Busan's Damunwha education system more inclusive of diverse groups than are the programs of the other two metropolitan areas, but it provides the highest number of programs, 30 in total. However, like the other metropolitan areas, Busan still lacks programs that promote a better multicultural understanding of the general population. And while its overall fairness and inclusiveness are evident at the level of policy, a micro-level evaluation of program implementation is still needed.

Many multicultural families are struggling to provide proper education for their children, and “multicultural education” has become a pressing educational and social issue in contemporary Korea. Discussion needs to move beyond *whether* the educational system needs to provide multicultural education and toward *how* to provide proper education for linguistically and culturally diverse students. Thorough reflections on how the education system interprets the meaning of “multi-culture” and on how it approaches multicultural education are generally absent in both the policies themselves and in analyses of those policies. The term “multi-culture” has largely been interpreted to mean “celebration of difference” or “tolerance,” which leads to a superficial understanding of diversity. The programs implemented to provide multicultural understanding have focused on hosting “international festivals” and other similar events, and critical examinations of the lives and experiences of people with cultural and linguistic diversity are few.

13.5 Transformation of Korean Society Through Dynamic Interplays Between “Korean-ness” and “Multiculture”

Close examination of the Damunwha education policies and programs of three metropolitan areas has revealed a few important insights into the current state of multicultural education in Korea. First, Damunwha policies and programs vary widely with regard to budget allocations, prioritized areas of education, number of schools, and beneficiaries. Second, despite these differences, the programs largely focus on teaching Korean language and culture and on helping multicultural students to adjust in Korean society; these programs largely ignore the migrant heritage of these students, creating a void in heritage language and culture education. However, since the main beneficiaries of current Damunwha education are the children of marriage migrants, efforts to honor migrant parent culture and language could facilitate communication between migrant parents and their children, and thus positively influence family dynamics. Third, Damunwha education largely concerns itself with students who are already in school and does not address non-enrollment and dropout rates, which are serious issues. According to the MEST report (Park et al. 2010), children of Japanese marriage or labor migrants constituted the largest percentage of Damunwha students in all three metropolitan areas. In Seoul, for example, there were 60% more children of Japanese migrants enrolled in school than there were children of Korean Chinese migrants enrolled. Yet the Japanese foreign-resident population did not qualify in even the top five largest foreign-resident populations, while the Korean Chinese foreign-resident population was overwhelmingly large. The MEST report thus clearly indicates the existence of odd discrepancies between actual population numbers and school enrollment numbers, especially among children of Korean Chinese or Chinese migrants. Rather than investigating potential causes or otherwise drawing attention to this phenomenon, the report merely calls for the development of more bilingual materials, in Japanese and Korean, to serve the Damunwha students with Japanese heritage.

In Korea, educational systems and institutions have played a significant role in promoting and maintaining the ideal of Korea as a homogeneous society and in emphasizing the importance of national unity (Hong 2009, p. 388). At the same time, the Korean education system has repeatedly changed its approach in order to accommodate each new economic and political agenda set by the state. During previous eras, for example, anti-communist and pro-industrialization curriculums were integral to school programs. In the 1990s, when “globalization” and “internationalization” emerged as major state agendas, the Korean education system quickly adapted by expanding English education to all school levels, including the elementary level, and this was followed by a dramatic increase in the number of native English speakers hired in public schools and private Hagwons.

Given such mutability, what is the fundamental goal of multicultural education? What is revealed by the discrepancies among different educational programs in how they define multicultural students and family, as well as by the general discrepancy between such on-the-ground definitions and the legal definition of the same? Why

do multicultural programs overly privilege Korean language and culture? Why is there an absence of interest in promoting the heritage languages and cultures of Damunwha students? What might explain the apparent mismatch between the migrant population and the migrant student population, and why are there no programs or policies to address this issue?

The presence of immigrants has generated confusion and contradiction within the Korean populace, raising questions about who belongs to Korean society and who counts as Korean. The dramatic increase in the numbers of incoming migrants with diverse backgrounds has, for example, popularized the expression “multi-culture” as important to social, political, and academic discourse. “Multi-culture” has become an overarching concept that encompasses diversity, difference, and heterogeneity, most particularly challenging the bedrock notion of “Korean-ness” that emphasizes “purity of blood” and “homogeneity of culture” and derives from the constructed myth that all Koreans came from a single ethnic group (Shin 2006).

Thus, foreign migrants have not been readily accepted as full members of Korean society. They have been subjected to many layers of social, political, and legal discrimination, much of which is informed precisely by essentialized notions of Korean identity. According to Lim (2009), Koreans tend to conflate race and ethnicity, which has served to create an exceptionally rigid and narrow conceptualization of national identity, belongingness, and citizenship—to be considered an “authentic” or “pure” Korean, one must have Korean blood. Unlike the law of the United States, which grants citizenship based on *jus soli* (whereby any person born in a U.S. territory qualifies), Korean citizenship law is based on *jus sanguinis* (whereby any person of ethnic Korean heritage qualifies). Korea therefore strictly regulates the process of naturalization and citizenship for persons of mixed blood and for long-term foreign residents in Korea.

However, even having pure Korean blood does not guarantee social acceptance. The land of birth and upholding of Korean values, morals, and beliefs also influence how a person with Korean heritage is accepted in the society. For example, North Korean border-crossers are treated differently than other ethnic return migrants. Although the border-crossers face discrimination in the job market and social isolation, they are more likely to be considered authentically Korean than other ethnic return migrants.

Seol and Skrentny (2009) term Korea’s complex social and cultural system of intra-ethnic stratification “hierarchical nationhood.” While nationhood is usually understood as horizontal and equalizing concept, ethnic return migrants are stratified in South Korea according to their diasporic origins, thus, hierarchy within nationhood is formed; the hierarchy is legally determined by citizenship and immigration law and socially determined by acceptance of migrants by Korean citizens.

Before 1990, Korea had a tightly regulated immigration policy and extremely selective, largely patriarchal citizenship laws. For example, citizenship was granted only to children born in Korea to Korean fathers. In 1997 statutory revisions eased restrictions, granting citizenship to all children with at least one Korean parent, but prior to that change, mixed-heritage children of non-Korean fathers (e.g., children of American soldiers and Korean women) were denied citizenship and were not

fully accepted as Koreans. While unjust tradition that privileges patriarchy is abolished, unjust tradition still persists in the legal definition of Damunwha family, which again privileges having at least one Korean parent.

Though the legal definition of the Damunwha family encompasses coethnic migrants, social discourse often excludes coethnics from Damunwha status, as the popular image of the multicultural family involves one parent who is both ethnically and linguistically “foreign.” At least Damunwha programs are offered in the areas where Korean Chinese are concentrated. In contrast, North Korean defectors are not included in legal definition of Damunwha and they are even excluded from receiving benefits from Damunwha education in two out of three metropolitan areas, which can be a prime example of inconsistency among Damunwha programs. Thus, the term “multi-culture” functions not an inclusive term that denotes a culturally, ethnically, and linguistically diverse population, but a differentiating term that primarily signifies socially and economically underprivileged migrants, thus embedding the notion of social hierarchy in the discourse of “multi-culture.”

What is interesting and unique in the Korean context⁹ is that Koreans stratify coethnics not only according to their biological and territorial ties to Korea, but also to the neoliberal logic that is based on relative degrees of economic and political development of their diaspora homelands. Through the process of stratification, Korea has created a complex and contradictory web of power and hierarchy that privilege migrants from the developed countries and discriminate against migrants from the less developed countries. The social system of stratification influences not only the everyday lives of Koreans and migrants in Korea, but also their economic, social, and political rights and their access to justice.

Rigid notions of Korean identity have resulted in a toxic hierarchical ethnic nationalism, lending credence to Lim’s (2009) warning that “identities based on a notion of ethnic and/or racial homogeneity can be dysfunctional and even dangerous.” Identity may provide national unity in a time of crisis, but it also can be used as a mechanism to marginalize, oppress, and subordinate people and groups who do not fit neatly into the “image” of Korea. By creating imaginary categories such as “foreign” and “other,” essentialist understandings of Korean identity have engendered xenophobia and racial and ethnic hatred. By privileging Korean culture and language, a commitment to narrow definitions of Korean identity has prevented recognition of Damunwha students’ heritage cultures and languages, forcing them onto the lower rungs of the social hierarchy. Such fundamentalism is apparent in the implementation of education policies. Although many Damunwha programs emphasize language and culture education, both philosophically and financially, what they actually provide is largely limited to Korean language and culture education. Indeed, these policies and programs, which are developed and administered top-down, are largely predicated on assimilationist beliefs. There is little emphasis on the heritage languages and cultures of immigrants and their children.

⁹Similar stratification has been reported in the Japanese Brazilian context, but the Korean context is complicated by the larger size of the diaspora and by the phenomenon of North Korean border-crossers.

In this context, the state's big push for multiculturalism may seem somewhat puzzling. To understand the burgeoning, but superficial, support for multicultural education, we need to understand South Korea's agenda of globalization (*Segyewha*). Globalization has been a major state agenda since the 1990s, and it had coincided with increasing rates of immigration. Korean understanding of globalization has been congruent with advanced industrialization, a policy of openness to foreign nations, and the cultivation of global competitiveness and competency. In order to become an advanced country worthy of respect, Korean politicians argued, Korea had to globalize. Korea's globalization campaign was an elite-oriented effort to strengthen the country's market competitiveness; its agenda was predicated on drawing global attention to Korea's cultural uniqueness and superiority (Kim 2000). However, the concurrent influx of migrant populations impoverished by the effects of the global political economy did not square with Korea's globalization plans. This discrepancy—between visions of globalization that privileged the cosmopolitanization of the citizenry and the reality of a multicultural Korea in which the majority of migrants were marriage and labor migrants from less developed countries—contributed to the emergence of ethnic and racial hierarchies in contemporary Korea.

Nonetheless, the Korean government could not afford to overtly discriminate against or ignore the welfare and educational rights of migrants and their children, as compliance with international human-rights standards was a nonnegotiable precondition for acquiring status as an advanced country. In this context, migrants are treated with generosity as seen in the increase of funding for Damunwha education, but they are socially positioned as inferior. As a result, the term “multi-culture” was popularized, Damunwha policies and programs emerged, and substantial fiscal resources were allocated to these programs. Yet multicultural initiatives have also been differentiated from elite-oriented globalization efforts; the latter are apparent, for example, in high-end international schools intended to attract affluent foreign migrants and foreign study-abroad students to Korea's elementary and secondary educational programs. With an increasing number of children from diverse linguistic and cultural backgrounds entering the Korean education system, it is imperative to develop and implement equitable and effective educational programs so that migrant children of all backgrounds have the opportunity to develop into competent, contributing, and respected members of society.

13.6 Rethinking Diversity and Envisioning Transformative Multicultural Education

Debate and study of multiculturalism have been largely Western pursuits, and the majority of multicultural theories and approaches have developed in Western contexts, such as the United States, Canada, and England. The conditions, social dynamics, and history of multicultural education are different in Korea and in other

Asian countries. Thus, the task is to develop multicultural education that is suitable for the Korean context, the major challenge being how to create and implement programs that reflect an expanded notion of Korean peoplehood, one that is inclusive and equitably represents diverse foreign residents and naturalized citizens. As Lim (2009) suggests, “The most viable route toward a ‘multi-ethnic’ society in Korea should be based on developing a more inclusive definition of who belongs to Korean society.” He also argues that the issue of belongingness does not necessarily arise from the migrants’ failure or unwillingness to “assimilate.” Instead, Lim asserts, the fundamental issue is the “impenetrable barrier of a rigidly and narrowly defined conceptions of belongingness and identity” (Lim 2009). Such strict boundaries cannot be eased or dismantled overnight. Only sustained, intentional, and practical efforts will lead to an optimal educational environment and social atmosphere for both minorities and majorities.

Another major challenge will be to design and implement multicultural education programs that are versatile enough to encompass the diversity that is unique to Korean society. In Western societies, especially in the United States and United Kingdom, migrants generally do not share ethnic, religious, cultural, or linguistic characteristics with the mainstream population. Furthermore, in those countries, the overwhelming majority of foreign migrants arrive from the Global South; the economic and political power imbalances between their departure and destination countries are substantial. In Korea, however, while the migrant population does include labor and marriage migrants from less developed countries, it also includes white-collar workers from developed countries. Moreover, the immigrant population includes not only foreigners of different ethnicities and cultural backgrounds, but also an unusually high percentage of “U-turnees”—coethnic diasporans who have re-migrated from long-term, often multi-generational, residence in foreign countries—and North Korean border-crossers. Finally, there is Korea’s unique challenge around multicultural families, in that the majority of “migrant” families are in fact of mixed-heritage involving one Korean parent, one migrant parent, and Korea-born children. Thus, intrafamily diversity must be considered in the implementation of multicultural programs.

Given these circumstances, we offer a preliminary, four-part vision of what an inclusive and fair multicultural education might look like and what it might take to achieve.

1. Multicultural education should be for all students, not just for Damunwha students. In order for social discrimination and injustice to be eradicated, every student needs to develop multicultural understanding and to be respected as a full member of the society. Whereas current programs in multicultural education are generally offered as separate educational support or as additions to the regular curriculum, a multicultural approach would integrate such programs into everyday study and school life.
2. Multicultural education cannot be achieved in the context of assimilation-oriented agendas or by a one-sided emphasis on improving multicultural understanding among minority students—yet current programs privilege Korean

language, lifestyles, morals, and values, making social and cultural membership in Korean society unreachable for minority students. Multicultural education could be improved by conveying equal importance and value for both Korean and non-Korean cultures and languages to students. Furthermore, multicultural education needs to function as a bridge between minority students' non-Korean heritage and Korean heritage so that they can build their transcultural competency.

3. Students must be recognized not merely as passive recipients, but as agents of multicultural education. They can and should be empowered to construct their own learning experiences through constant interplay with teachers and the educational environment. Whereas the existing top-down model leaves little room for participatory learning, multicultural education should instead be regarded as a social responsibility, as a process that engages students both in personal reflection and in social reflection through dialogue. Multicultural education calls for transformation of wider society through critical examination of power relationships. Personal reflections are important but are not, by themselves, sufficient.
4. Investment in teacher education is essential. The role of educators in promoting multicultural understanding cannot be overemphasized. Existing teacher-education programs will require active reorganization to provide training that is appropriate for the current realities of multicultural Korea.

Considering the short period in which they have had to respond to the effects of globalization, Korea's government and education system have made impressive progress on multicultural initiatives. However, it is precisely this lack of time and experience that has led to inconsistent, inefficient implementation of multicultural education programs. Now is the time for critical reflection, wherein we have an opportunity to reexamine current educational models in order to create more inclusive, equitable, and efficient programs that serve not only Damunwha students, but also non-Damunwha students, helping both groups to understand, accept, and interact with each other.

Chapter 14

Educating All Children in Multicultural, Multilingual Singapore: The Quest for Equity Amidst Diversity

A. Lin Goodwin and Ee Ling Low

In the span of a few short decades in its post-independent era, Singapore has moved from a relative unknown, a tiny country represented by a mere red dot on the world map because of its diminutive size, to being “one of Asia’s great success stories” (OECD 2010, p. 159). Some of this has been the result of internationally benchmarked assessments of student achievement which have focused everyone’s attention on high performing countries such as Singapore, while another factor has been Singapore’s economic and meteoric leap from a developing country to a twenty-first century, fully developed, financial front-runner. Unsurprisingly, everyone is curiously asking—what is Singapore’s “secret” and how can we learn to do what they do?

Singapore’s achievements seem remarkable given the absence of natural resources other than her people—who represent a diverse mix of racial groups, cultures, languages, and origins. As a city-state, Singapore constitutes an urban nation, or urban city-state—and an urban school system—that is employing educational policy and programs to successfully enhance social cohesion and advance social mobility among its multicultural citizenry. In this chapter, we look at the universal goal to “educate all children” or to “educate other people’s children.”

We could not have pulled off this chapter without the help of two fantastic doctoral students/graduate assistants: Crystal Chen, thank you so much for your astute reading and abstracting of literature to help us get started; Kelsey Darity, many, many thanks for your uncanny ability to take bits and pieces of writing and instructions and make sense of them so quickly and clearly. Both of you have our deep gratitude.

using Singapore as an illustrative case. For most countries, this goal is lofty, often more rhetorical than actual, and perennially challenging, especially in diverse, heterogeneous contexts. Yet Singapore seems to have made noteworthy progress in addressing issues that plague many urban school environments, such as those related to curriculum, multilingualism and heritage languages, resource distribution including the distribution of quality teachers, collective versus individual identity, the role of the government in advocacy and affirmative actions, and the underpinning systemic coherence that binds the different pieces together.

We begin with a brief history of Singapore to establish a baseline, and then go on to outline the journey Singapore has taken to ensure quality education for all children, regardless of race, language, religion, culture or economic background. We offer two illustrations that allow us to ground our narrative in concrete contexts as we examine specific policies, practices, and research that have had an impact on Singapore's aim to achieve equity amidst diversity. We then move from the specific illustrations to a look across the two in order to surface possible lessons or principles that could be educative to other systems regardless of local particulars. We end with reflections about the priorities that should be focal in the continuing quest for educational equity and social justice—whether in Singapore or elsewhere in our world.

14.1 A Brief History of Singapore

In 1819, Sir Stamford Raffles “founded” Singapore and claimed it as a colony of the British Empire. Colonial rule lasted over a century until 1959 when the country became internally self-governing. Briefly, from 1963 to 1965, Singapore joined the Malaysian Federation, but became an independent sovereignty in August 1965. Descriptions of Singapore at the time indicated how much work was ahead of the new nation:

There was high unemployment and an acute shortage of public housing. Many squatter colonies sprouted out throughout the suburban and rural areas. In the 1950s, racial integration did not exist and within the plural society the main ethnic groups considered themselves as Chinese, Malays and Indians, rather than as Singaporeans. (Goh and Gopinathan 2006, p. 2)

...it was a poor, small (about 700 km²), tropical island with few natural resources, little fresh water, rapid population growth, substandard housing and recurring conflict among the ethnic and religious groups that made up its population. At that time there was no compulsory education and only a small number of high school and college graduates and skilled workers...There was no real economy, no defence¹, and simmering tensions with neighbouring countries. Moreover, it had to import most of its food, water and energy. The Republic of Singapore seemed an unlikely candidate to become a world-class economic and educational powerhouse. (OECD 2010, p. 160)

¹In this article, we quote many authors who are not based in the U.S., and who therefore use spelling based on British vs. American English.

When the PAP took over the self-governed city-state in 1959, Singapore was suffering from high unemployment problem with her unemployment rate recorded at more than 10 per cent. The PAP was also worried about the high population growth rate at 3.3 per cent. There was a serious shortage of housing facilities during that time. Coupled with low savings and limited natural resources, the foreign press was predicting a disaster for the new nation. (Sam 2003)

Thus, at the start of her history, Singapore manifested most of the characteristics typically associated with “urban,” a geographic location “inside a principal city with population of 250,000 or more” (NCESb n.d., para. 3)—densely populated, “within a relatively small spatial area...[and]...a multiplicity of...institutions packed closely together” (Dyson 2003, p. 1). According to demographic data, in 1957 Singapore’s population stood at close to 1.5 million of which 75.4% were Chinese, 13.6% were Malay, 9% were Indian and 2% were “Other” (Saw 2012). Beyond definitions of space and place,

Increasingly, the term urban is less likely to be employed as a geographic concept used to define and describe physical locations than as a social or cultural construct used to describe certain people and places... the term has attained specific socioeconomic and racial connotations. (Noguera 2003, p. 43)

In the U.S., “urban” has become code for people of color along with high levels of poverty, crime, overcrowding, housing shortages, and unemployment (Scherer 2005; Watson 2011). Urban schools are similarly defined in deficit terms: low achieving, often dangerous, with high numbers of dropouts, truants, and unqualified teachers (Ahram et al. n.d.). While these issues are not confined to urban schools, “urban school failure is pervasive. It is endemic in the nation’s largest cities” (Noguera 2003, p. 24). And as a large city-state, Singapore at the time of independence was experiencing all of these issues negatively associated with common conceptions of “urban.”

Fast forward to 2015, the year of her golden jubilee, Singapore is, by multiple measures, very successful. Between 1960 and the present, “Singapore’s real GDP per capita... skyrocketed from \$4,383 to \$55,862” (Welsh 2012, p. 114) and “For much of its history since independence, Singapore...[has]... enjoyed high economic growth rates accompanied by full employment” (Phang 2007, p. 16). The financial well-being of the nation has been strategically tied to education policy, so it is no accident that “primary and secondary school enrollment is near universal” (Welsh 2012, p. 118), literacy rates are 97% (World Bank 2015), and Singapore students have performed impressively on all the international assessments, i.e., TIMSS, PISA, PIRLS (OECD 2011). Moreover, “[a]bout 90% of Singapore’s students scored above the international median on the TIMSS tests” (Darling-Hammond and Wentworth 2010, p. 22).

Current population figures stand at 5.47 million, about 4 million of whom are citizens or permanent residents, with an ethnic breakdown of 74% Chinese, 13% Malay, 9% Indian and 3% other groups (Ministry of Social and Family Development 2015). Thus, “Singapore’s scores are based on high achievement by all of the country’s students, including the Malay and Tamil minorities, who have been rapidly closing what was once a yawning achievement gap” (Darling-Hammond and

Wentworth 2010, p. 22). For example, MOE data indicate that in 2011, 88 % of all pupils passed the GCE (General Certificate Examination) O Level (10th grade) exams, with a pass rate range of 83–91 % across the four main ethnic groups (Ministry of Education 2012). Statistics were similar for GCE A (12th grade) Level exams: 91 % of all students achieved at least 3 “A” passes with a pass in General Paper or Knowledge and Inquiry, and a pass rate range of 82–92 %; also 94 % of the primary 1 (first grade) cohort was admitted to post-secondary institutions (range 88–96 %). Thus, while an achievement gap does exist, it is fairly modest with the majority of all students achieving in the top ranges. This is in large part a function of equity-based policies and practices designed to “level up” all students and schools, some of which are described later. Another important factor to consider is GCE O Level pass rates in English—83–90 % across all ethnic groups (Ministry of Education 2012); the high percentage of pass rates in English is especially significant given the correlation of English proficiency to performance on international assessments (Low 2014).

Today’s average Singaporean is well educated, gainfully employed, healthy, and quite well traveled. The city-state is known the world over for being clean, safe, and green, with excellent infrastructure support—including IT—for commerce and tourism. There is no such thing as a “bad” neighborhood and the kinds of marginalized slum areas characterized by stark poverty, dilapidated housing, high crime, hunger and devastation, apparent in major cities around the world, are literally non-existent in Singapore. But what is taken for granted now, could hardly be imagined given the republic’s rocky beginning. While the republic’s “secret” of success was far from a single magic bullet, one important goal that underlay everything, was the understanding that “The wealth of a nation lies in its people—their commitment to country and community, their willingness to strive and persevere, their ability to think, achieve and excel” (MOE 2015a, para. 3). Thus, at independence, the newly formed Peoples Action Party government

publicly reiterated its ‘multiracialism’ creed, seeing such an ideology as the only way forward to build a new and united, plural Singapore. The principal ingredient of the ideological bent is the acceptance of the rights of different ethnic communities to practice their own ‘way of life’ within the multi-ethnic state, while expecting them to collaborate with their fellow citizens in nation-building agendas. Thus, all major government policies—from housing to education to defense and immigration—carry the imprint of this multiracial motif. (Mutalib 2012, p. 115)

Engendering commitment to country and community, as well as the ability to think and excel, require building allegiance to place through housing policies that nurture a sense of rootedness and home—and building an excellent education system to cultivate talents and minds, all guided by “the founding principles of multiracialism and meritocracy” (Tan 2014, p. 251). After independence, “schools for the different ethnic groups were brought together under a single education system where children learned English and their own language” (Mackenzie 2014, p. 39). While discussions about housing policies in Singapore are beyond the scope of this chapter, it is important to consider how notions of place-based education, such as urban education, seem equally reliant on affordable and safe housing as they are on

quality schools and teachers. In Singapore, from the start, policies in relation to both issues worked in tandem and maintained a laser-like focus on nurturing “People... our most precious resource.” Thus, “The provision of housing welfare on a large scale” has meant “The homeownership rate for the resident population increased from 29 % in 1970 to 92 % by 2000” (Phang 2007, p. 16, 21), with the construction of homes (vs. housing) accompanied by the construction of schools. In addition, government housing is deliberately integrated, a policy that continues to be publicly debated, but has resulted in multicultural communities living together as normative. National service, which is “compulsory...for all male Singaporeans and second generation permanent residents gives young men of all backgrounds the opportunity to train and live together” (Gunaratna and Mohamed Hassan 2015, p. 60), and exempts none regardless of race, socio-economic status, or religion.

Public subsidies have been consistently available, introduced over time in concert with ongoing concerns about equity, as a way to “temper our meritocratic free market system with compassion and equal opportunities” such that “all children, rich or poor, are brought to the same starting line, properly equipped to run” (Goh 1990, p. 25, cited in Tan 2014). Examples of these described by Jason Tan (2014) include: “annual per capita grants” to non-independent schools for equipment, staff or funding of educational experiences not all families can afford, such as overseas trips. In their Edusave Endowment Fund, every 6–16 year old student receives annual deposits from the government to be used for educational purposes. There are a variety of government bursaries to support equity for lower income families and students with disabilities to own computers, gain internet access, and pay for “child-care, medical services, kindergarten fees, spectacles” (Tan 2014, p. 256). Seventy-five percent of university degree study is subsidized by the government, while the indigenous Malays receive free schooling up through university. Finally, in 1999, the Programme for Rebuilding and Improving Existing Schools (PRIME) was launched to upgrade schools “to the latest standards. New and upgraded facilities will include computer laboratories, media resource libraries, IT learning resource rooms, pastoral care rooms and health and fitness rooms” (MOE 2015c, para. 2–3).

14.2 Education Goals and Commitments

Every citizen is valuable and has a unique contribution to make. Through education every individual can realise his (sic) full potential, use his talents and abilities to benefit his community and nation. (MOE 2012, para. 9)

Living up to the lofty goals of every person realizing her or his full potential meant ensuring quality education for all children, regardless of race, language, gender, religion, culture or economic background. Throughout, Singapore “has skillfully used education policy to both transform society and in that process to make education a valued social institution” (Gopinathan 2007, p. 68). Post independence from the Malaysian Federation, the urgent goal was “universal primary education ...and mass recruitment of teachers...to staff the rising number of schools” (Goh

and Lee 2008, p. 97) or “survival-driven education” (Goh and Gopinathan 2008). This gave way to “an efficiency-driven education,” designed to “produce skilled workers for the economy in the most efficient way” (Tan 2005, p. 2), thus enabling Singapore to be competitive and successfully earn multinational dollars. “Teachers and children alike were mechanically fed by a bureaucratically designated and rigid curriculum” in an effort to “[reduce] educational wastage” (Goh and Lee 2008, p. 25).

Policies changed dramatically in 1997 when Prime Minister Goh Chok Tong announced a new national vision for developing “the creative thinking skills and learning skills required for the...intensely global future” and making “learning a national culture” (June 2, 1997). *Thinking Schools, Learning Nation* (TSLN), initiated a more individualized approach, “ability-driven education...to identify and develop the talents and abilities of every child to the maximum” (Tan 2005, p. 5). Currently, the aim is to “cater to the diverse needs of Singaporeans and allow all to progress in life—not by prescribing one path for all, but to have a diversity of pathways and opportunities, regardless of background (Heng 2011, para. 17). “Student-Centric, Values-Driven Education” is now the focus, “With values, social emotional competencies and character development at the centre” (Heng 2011, para. 47).

Undoubtedly, Singapore’s education system has gone through various cycles of change and refinement. Still, central to the many policy iterations has been consistent efforts “to safeguard a baseline quality of teaching and learning for all students” (MOE 2014, para. 1), as a way of protecting and nurturing her most precious resource. We now turn to two illustrations of the deliberate intersection of equity and education in Singapore such that positive outcomes are secured for all students. The first illustration looks at educational equity in terms of language policies and language instruction. The second looks at the preparation of a quality teaching force such that all students have access to quality instruction. In the case of either, it is important to keep the Singapore context as a city-state in mind, which means, ultimately, a blurring of the distinction between “urban” and education.

14.3 Equity and Language Policies

Many of the language policies that were initiated in the late 1970s arose out of the All-Party Committee report of 1956. The purpose of this committee was to examine the issue of linguistic diversity amongst the population of a newly independent Malaya (which included Singapore) and as a result, some important language policies were implemented (cf. Low and Brown 2005). In the case of Singapore, three primary ethnic groups—Malays, Chinese, and Indians—spoke different languages from each other, but also spoke multiple dialects and languages within their own ethnic group (Dixon 2005). The British had afforded few non-whites the opportunity to learn English and “had kept the three major ethnic groups geographically and ethnically divided” (Dixon 2005, p. 27). Consequently, in the midst of inter-ethnic tensions, no common language existed to bridge the various groups, nor connect

Singaporeans to international trade. Thus, language polices were designed to unite Singaporeans and promote access to the world economy, and to technological and scientific advances (Lee 2000).

A first key policy was the designation of English, Mandarin, Malay and Tamil as the four co-official languages of Singapore (Bokhorst-Heng 1998). As Low asserts, “This policy therefore has the ingenuity of uniting us in a language that none of the racial groups can claim to be ethnically biased while allowing us to celebrate the diversity of the tongues that come along with our multi-ethnic, multi-cultural make-up” (2013), and broadcast the important message that no ethnic group took priority over another, while simultaneously underscoring the preservation of home languages. In the 1960s, learning a second language became compulsory at the primary level, sowing the seeds of Singapore’s bilingual education policy. In 1979, the *Speak Mandarin* campaign was initiated to establish some form of uniformity amongst the different dialects spoken by Chinese Singaporeans. The aim was to support them to become bilingual in English and Mandarin Chinese by providing a lingua franca—Mandarin, and therefore a largely Mandarin-speaking environment. The 1978 Goh report, chaired by then Defense Minister Goh Keng Swee, examined educational issues and recommended streaming whereby at Year 3, students would undergo a streaming examination to ascertain whether they would take English and a second language up to Year 6 (i.e., the normal or bilingual stream), or whether they would only read English as a first language in school (termed the monolingual stream). Entry to the local national university, beginning 1985, also required applicants to pass both English as a first language and their second language, a policy that gave the impetus for bilingual competence. In 1987, English became the medium of instruction, ensuring equal access to mastering English was given to all regardless of ethnic or socio-economic backgrounds. Pakir (1991, p. 167) coined the term ‘English-knowing bilingualism’ to refer to the situation with regard to bilingual education in Singapore where students have linguistic ability in the first language, English, and a second language defined as their ‘ethnically defined mother tongues’ i.e. Mandarin for the Chinese, Malay for the Malays, and Tamil for the Indians.

Overtime, bilingual education policy has changed the linguistic landscape of Singapore and the latest Population Census, released in 2010 showed that literacy in two or more languages also rose from 56 % in 2000 to 71 % in 2010 (Department of Statistics Singapore 2011). The 2010 Census also showed that 42.04 % of the population speak English and Mandarin Chinese, 12.56 % speak English and Malay and 3.3 % speak English and Tamil. While more Singaporeans are bilingual, the home language situation remains diverse across ethnic groups; 59 % of Singaporeans do not speak English at home. Yet, Singaporean students out-performed their international counterparts in PISA assessments taken in English. However, Low (2014) reports that Singaporeans who did not speak English at home did not perform as well in PISA as those who did, indicating that English language competency does impact academic achievement. The importance of competency in the English language is not just limited to the educational domain. Clearly, the ability to conduct international trade using English as an international language is crucial. However,

in the context of Asia with China and India as rising economic powers, English-knowing bilingualism serves as a critical geo-political instrument. Considering Singapore's geographical location with Malay, Chinese, and Indian speaking neighbors, English-knowing Malay/Chinese/Indian bilingualism is of essential importance in order to forge and maintain close diplomatic and cultural bonds. Indeed, in the case of Singapore, it is prudent language policy and planning that has helped to provide equitable levers for academic and economic success for Singaporeans.

14.4 Excellence and Equity?

The high performance of Singaporean students compared to their international peers has begged the question of whether excellence has been achieved at the expense of equity. However, scholars such as Robbins (2007) argue that the two concepts need not be viewed dichotomously and can indeed co-exist; the focus should be on how to achieve both. Additionally, the 2009 PISA report shows that high performing education systems (HPES) display “a below-average impact of economic, social and cultural status on student performance” (OECD 2010, p. 57).

Singapore presents an excellent exemplar of a HPES where heavy investment in education brings about educational excellence (high quality educational outcomes) and quality eventually serves as the key to achieving equity for all. In the case of Singapore, we would like to argue that educational excellence has been attained through high levels of competence in English. Studies have shown clear linkages between high levels of language competency and academic success (Butler and Castalion-Wellington 2000; Feast 2002).

Acknowledging the correlation between language competence and academic attainment, proficiency in the English language cannot be left to chance and policies to ensure stringent selection, recruitment, preparation and professional development of English language teachers are essential.

14.5 Quality English Language Teaching/Teachers

Proficiency in the English Language is a pre-requisite for any of the pre-service teacher education programmes offered at the nation's sole teacher preparation institute; candidates are required to minimally pass English Language at the General Certificate of Education Ordinary level, and/or pass in the General paper at the H1 (or A) level. Additionally, subject to the minimal grade of at least a B³, candidates are still required to pass the English language entrance proficiency test (ELEPT). Candidates can re-take the ELEPT multiple times until they pass it. The ELEPT is a locally designed test with an oral and a written component that mirrors other international English language tests of proficiency such as the IELTS.

Once selected into pre-service teacher education, student teachers who are going to teach English as a Curriculum or Teaching subject are prepared² in the following categories of content knowledge (Shulman 1986, 1987), i.e., subject matter knowledge, pedagogical knowledge and knowledge of context. Subject matter knowledge courses (categorized as Academic Subjects and Subject Knowledge courses in the programme) help student teachers to acquire content mastery and communicative competence (grammatical, sociolinguistic, discursal and strategic) in the English Language. The courses offered under this category help to provide students with a strong linguistics foundation, are school-relevant and help them in their future roles as English language teachers. Pedagogical knowledge courses (termed Curriculum Studies within the programme) help student teachers learn how to teach the English language as a subject by introducing up-to-date theories and research-informed practices in the discipline. Additionally, it is also important to help impart knowledge about the latest curriculum goals for the subject. Student teachers are introduced to the main strategies and approaches for teaching the main language skills, and instruction is differentiated according to whether the teacher is being prepared to teach at the primary or secondary levels. The intended curriculum goals of the syllabus for primary and secondary levels are also given special focus.

Finally, student teachers develop knowledge of the context or professional preparation. Courses that fall within this group of courses include Communication Skills for Teachers, which prepares student teachers with the oral and written communication skills necessary for their future roles as teachers, such as communicating with parents and other key stakeholders across the education system. Academic Discourse Skills ensures that student teachers are prepared for the conventions of academic discourse or writing required for their assignments, research reports, and later on for writing graduate theses or dissertations. Student teachers not specializing in the English language as an academic discipline but still required to teach English as a subject at the primary level, complete mandatory content and proficiency enhancement courses which will help them to achieve a Certificate in English Language Studies.

Professional development of English language teachers continues as they enter the profession; this is mainly conducted by the English Language Institute of Singapore, which is part of the Academy of Singapore Teachers (AST) and helps hone teachers further in their pedagogical skills or in curriculum development and implementation. In order to encourage a culture of excellence in English language teaching in Singapore, since 2010, the local newspaper and the Speak Good English Movement (n.d.) has offered an Inspiring Teacher of English Award. There are also scholarships tenable abroad, known as the MOE Overseas English Language Teachers Study Award, which allows outstanding English language teachers to conduct research, participate in university courses, teach and observe English language classes abroad and to hone their skills as international teachers of English.

²Please see Lee and Low (2014) for a more complete description of the ITP curriculum; the focus in this section is only on preparation relevant to the discussion regarding language development and policies.

14.6 Issues Ahead

While it is undeniable that Singapore's language planning and implementation policies, teacher recruitment, selection and professional development have enabled students to acquire a high level of proficiency in English, which has been shown to be linked to educational excellence, there are still challenges ahead (Low 2014).

The first concerns uneven levels of English proficiency related to differences in home language spoken. Obviously, those who speak English at home have an advantage over those who don't and there is a need to level this out when students come into formal education at the primary (elementary) school level. Current supports include the Learning Support Programme, which provides extra coaching for Year 1 pupils who do not score well in the School Readiness Tests for English Language and Mathematics.

Secondly, even though English has been a medium of instruction since 1987, there is still concern that the variety of English spoken leaves much to be desired and to address this, the *Speak Good English Movement* was launched in 2000. The aim of the movement was to encourage Singaporeans to speak grammatically correct English that allows them to be internationally understood. Linked to this concern over falling standards, there is also the worry that only perhaps the top performers of each cohort truly have the mastery of the English language akin to those of other native monolingual speakers of English. Given the close linkage between language competence and academic achievement, this must be addressed.

The final challenge has to do with the upholding of standards and norms—whose standards and whose norms? Alsagoff (2007) describes Singaporeans being torn between a globalist or a localist orientation, which is linked to what they associate the use of English helps them to achieve. A globalized norm helps one to attain economic and social advancement, while a localized norm helps Singaporeans to express their culture and identity. Pakir (2014) describes this dilemma poignantly where in special polities like Singapore, the local realities are such that the use of English as a working language and as a de facto official language in a multilingual, multi-ethnic and multi-cultural setting, has given rise to the term 'glocal' English. This forwards the notion of English usage that is globally appropriate but still culturally relevant, thus enabling its population to remain locally rooted by allowing them to preserve their national identity. Against this conundrum of whether to adopt global norms to demonstrate global competency or local norms for addressing local realities, empirical features-based research by Low (2010) shows that Singaporeans are showing evidence of adopting pronunciation features that are norm-developing i.e. different from those of native English-speaking countries. If local norms compromise international intelligibility and global competence, then this is a dilemma that cannot be ignored.

Undeniably, careful language planning and implementation has ensured that all Singaporeans have equitable access to an English medium education and maximal opportunities to achieve educational excellence. However, these challenges need to be addressed, otherwise, the quest for achieving equity and quality will be compromised.

14.7 Quality Teachers for (E)Quality in Schooling

PISA shows that the best-performing education systems provide most of their students with the kind and quality of education that average performers provide only for a small elite. That requires them to provide excellent teaching for all students. (OECD 2011, p. 8)

One concrete way of putting muscle behind the rhetoric of ‘people our most precious resource’ is ensuring that all children in Singapore have access to quality education, which in turn means access to quality teachers. As stated earlier, *Thinking Schools, Learning Nation*, initiated a period of education reform based on the principle that “A nation’s wealth in the 21st Century will depend on the capacity of its people to learn” (Goh 1997, para. 2). What follows here is the story of quality teacher preparation and development in Singapore, which ultimately is a story about better schools and wider access to quality schooling, in order to achieve the ultimate goal: quality education that is equally available for and nurturing of all children.

14.7.1 Recruiting and Selecting Strong Teacher Candidates

Immediately following PM Goh’s speech, the government set a new goal for education spending, raising it from 4% to 6% of the gross domestic product, spending levels equivalent to those of the U.S. and Japan. Producing high quality teachers became an explicit goal. A first move was an effort to change the perception of teaching and render it a more attractive profession: teacher salaries were increased significantly and pegged to the entry level salaries of other professions requiring a commensurate level of education, such as engineers and lawyers. However, increasing teacher salaries, while essential, are only a first step.

Policy responses are needed at two levels. The first seeks to improve teaching’s general status and competitive position in the job market, and broaden sources of teacher supply to include well-qualified people from other careers and former teachers. (OECD 2005, p. 39)

Thus, the approach in Singapore has been comprehensive, paying attention to the whole dinner, not simply individual ingredients. Higher teacher salaries were bolstered by policy measures that ensured not just capturing the best candidates, but continuing to support them through preparation and into their careers. These have included covering all preparation costs for selected candidates—tuition, books, medical co-pay insurance; paying them as MOE employees for up to 2 years, as well as bonuses tied to performance or other relevant work experiences.

Yet, financial incentives notwithstanding, there are many other powerful motivations to teach, such as meaningful work, or impacting the lives of young people. These motivations, termed “psychic rewards” by Dan Lortie (1975) ranked highly in a large-scale study of Singapore pre-service teachers’ reasons for choosing teaching (Low et al. 2011). In recruiting well-qualified young adults to teaching, the Ministry of Education employs numerous marketing strategies designed to capitalize on the many intangible reasons why teaching is a desirable choice and increase

its status as a profession. For example, the MOE Heritage Centre, opened symbolically on Teachers' Day in 2011, "showcases Singapore's Education Story from the early 19th century to the present" (MOE 2015b, "About," para. 1). Designed "to inspire those aspiring to be teachers, affirm the work of serving educators and commemorate the contributions of educators and communities that have shaped education since the founding of Singapore" (MOE 2015b, "About," para. 1), the Heritage Centre is part of every new teacher's induction experience:

During their visit, BTs...deepen their understanding and appreciation of the teacher's role in nurturing individuals and in nation-building. The visits also encourage BTs to feel a sense of pride and belonging to the teaching fraternity. (MOE 2015b, "Beginning Teacher Tours," para. 2)

This Centre is also open to the public so they too can develop awareness of the role teachers have played in Singapore's successful development. The valorizing of teachers in National Day speeches and other public addresses also drive home the message that teaching is a worthwhile career. Thus, the MOE approach towards recruitment pragmatically attends to economic realities so that prospective teachers do not turn to other professions—or leave prematurely—in search of higher remuneration, and highlights the psychic rewards associated with meaningful work, and making one's mark on society.

Because of the large number of candidates seeking admission, we regret that no telephone or personal enquiries will be entertained. (NIE 2015, para. 3)

A profession seen as desirable can be selective. MOE accepts application from the top 30% of each Primary 1 (i.e., First Grade) cohort, exemplifying Singapore's long-term view of teacher quality. From this top third of each graduating class, only one in three shortlisted applicants makes it through the selection interview. The selection process is a systemically grounded, singular, state-wide process. MOE and NIE jointly make decisions about admissions into teacher preparation in a selection process that emphasizes aptitude and motivation to teach as much as it weighs candidates' academic achievement and communications skills. Successful teacher candidates who make it through the selection interview are appointed as MOE General Education officers and are afforded all the financial supports described earlier. Similar to recruitment efforts, the teacher selection process is comprehensive, and has been recognized by McKinsey and Company (Mourshed et al. 2007), as one of the most effective among top performing systems.

14.7.2 Preparing and Sustaining Strong Teacher Candidates

The adoption of the university-based model demonstrates that teaching is a profession, where the development of teachers is underpinned by evidenced-based learning, and where teachers require the award of a degree as a pre-requisite for joining the profession. (National Institute of Education 2009, p. 22)

Unlike the U.S., there are no alternate pathways into teaching. Rather, all who aim to teach in government-supported schools (i.e., virtually all schools) must complete a university-based teacher preparation program. As the quote above states, professionals are not born but prepared, and if teachers are professionals, then they must be formally educated. Initial teacher preparation (ITP) programs are offered by a single institution, NIE, which sits within one of four top universities in Singapore. The curriculum NIE provides is (as described earlier) comprehensive, and is aligned with MOE goals and standards. At first glance, the courses and requirements do not appear too different from typical ITP in the U.S. However, there are significant differences. First, teacher preparation begins in the first year of university study; there is no general liberal arts exploration before one chooses a field. Second, from the start, students are engaged in content courses alongside content pedagogy courses. NIE offers both kinds of courses such that the traditional separation of Arts and Sciences from Education does not exist; content and teacher education faculty communicate and coordinate across subject and instructional methods. Third, students all specialize in various content areas, three on the Primary level, and two on the Secondary. Fourth, each year students are engaged in gradually increasing periods of immersion in schools. Fifth, the conceptual framework which guides all initial teacher preparation, also known as the V³SK model (NIE 2009), holds three sets of values at the core, around which knowledge and skills revolve. The first value focuses on the learner which emphasizes the “belief that all children can learn” and the “valuing of diversity” (NIE 2009, p. 45). The additional values focus on the teacher who is “passionate...ethical...professional,” and on the profession and community through “social responsibility and engagement” and “stewardship” (NIE 2009, p. 45). Once again, the messaging is clear—all children are precious, and teachers are responsible for caring for and nurturing them. Teacher candidates who successfully complete ITP begin their teaching career with an investiture ceremony, and recite the teachers’ pledge, voicing aloud their commitment to pupils, profession, country, and community.

It is common knowledge that the first years of teaching are the most challenging as novice educators gradually learn to contextualize and apply theoretical understandings in response to diverse students and classrooms. However, unlike the U.S. where brand new entrants to the profession are expected to carry the same teaching load and responsibilities as veteran teachers, the stance in Singapore is that “the teacher’s professional development journey must be seen as a continuum” because “no pre-service programme can fully prepare teachers with all the competencies of a professional teacher” (Lee and Low 2014, p. 56). Thus 100% of new teachers have access to formal induction and almost 100% participate in these programs (OECD 2014a). Data indicate that among the 34 countries participating in the OECD TALIS (Teaching and Learning International Survey) study, 39% of Singapore teachers serve as mentors, and 40% had an assigned mentor, in stark contrast to TALIS averages of 14% and 13% respectively (OECD 2014a). The same study also found that 85% of Singapore mentees work with mentors in the same subject area, compared to the TALIS average of 68%.

Key features of induction for new teachers include a reduced teaching load³, mentoring support, and the *Beginning Teachers Induction Programme* (AST 2012). This formal period of induction typically lasts two years and is planned and delivered by Senior Teachers in each school who are given release time, and targeted professional development, to support new teachers. The first year is considered the probationary year; new teachers who successfully complete the year are fully confirmed. The induction period is also a time when struggling teachers are given additional support in order to be successful, although past the second year, they may be counseled out of the profession.

14.7.3 Retaining Strong Teachers

Teachers in Singapore have access to a wide range of supports, professional development, learning opportunities, and leadership pathways (Goodwin et al. 2015). The teaching force is fairly young and so every effort is made to ensure teachers do not experience teaching as the proverbial “flat” career (Cochran-Smith 2004), but see teaching as a growth career. Thus, retaining quality teachers is an overt goal of MOE, and investment in teachers begins with recruitment and continues through retirement.

Professional Development All teachers are entitled to 100 h of PD each year, paid for by MOE. This time is considered “office time” and resources are available to hire relief teachers or substitutes so that teachers can participate in PD during school hours. *GROW* and *GROW 2.0* introduced by the government in 2007 and 2008, are professional and personal development packages designed to support life long learning. They provide opportunities for teachers to hone and strengthen content or core competencies and expose teachers to an array of career enhancements. For example, scholarships are available for post-graduate study, study abroad, study tours, and degree study at local universities. NIE, MOE and AST collaborate to offer a myriad of workshops, conferences, trainings, etc. according to teachers’ interests, school goals and national imperatives. As a result, teachers in Singapore have higher than average participation rates for several PD activities including courses and workshops (93%), education conferences (61%), in-service training (17%), teacher networks (53%) and individual and collaborative research (45%), as compared to many international counterparts (OECD 2014a).

However, PD is more than the upgrading of skills or knowledge; in Singapore, professional development is framed by changing conceptions of teachers’ work and teachers’ use of time. As indicated earlier, Singapore teachers do not spend all their

³It is important to note that instructional time for Singapore teachers is far less than instructional time required of U.S. teachers, even while the total number of hours worked per week is equivalent (OECD 2014a). Thus, a Singapore teacher’s full teaching load would already be perceived as a “reduced” teaching load for the typical U.S. teacher.

school time instructing classes. On average, 17 h are allocated for teaching; the balance of the week is devoted to professional development through classroom inter-visitations, professional discussions, collaborative curriculum development and planning on, or across, grade levels and subject areas. Teachers are also supported to conduct research as a way to learn more about and through their teaching for the purpose of continual renewal, revision, and improvement. Consequently, the majority of teachers are engaged in some kind of research endeavor whether through Lesson Study, Professional Learning Communities or Action Research projects. This PD time is built into the school day for teachers to confer and work together, dedicated time that is supported by school leaders.

Teaching, the Un-flat Career Research has shown that attrition among U.S. teachers is high (Ingersoll et al. 2014) for a variety of reasons including dissatisfaction with working conditions and professional opportunities. The profession has also been characterized as “flat,” such that advancement usually requires leaving the classroom. Although career ladders were a prominent feature of the work of the Holmes Group (1986), the past three decades since their groundbreaking report have not seen much concrete progress in trying to differentiate a teacher’s professional trajectory. Singapore addressed this problem by developing a clear career ladder that provides teachers with three leadership pathways: the teaching track, the leadership track and the specialist track. The teaching track is for those who dedicate themselves to teaching, schools, and working with teachers; the leadership track is for those interested in educational administration in schools or the Ministry; those focused on deep development in their subject area can choose the specialist track. Each track lays out a pathway to greater responsibility, authority, scope of work, decision-making, and remuneration. For instance, the first step on the teaching track is Senior Teacher, who earns the privilege of mentoring new teachers in the building, and leading the induction program. Lead Teachers work with new teachers in several schools, not just their own; Master Teachers become part of AST and collaborate with MOE to provide professional development to beginning and experienced teachers across the country. The career ladder ensures that professional advancement is clearly mapped out for teachers, but it is important to note that teachers are not required to participate. It is also important to say that teachers can, and do, switch tracks, if they decide that the track they have selected is not the one that fits them best.

Retention efforts in Singapore go far beyond what can be described here, but suffice it to say that they are holistic, comprehensive, numerous; they pay attention to every aspect of teachers’ well-being: professional, personal, financial, educational, and psychic. As a result, in comparison to international standards, the teacher attrition rate in Singapore is low at less than 3%, even taking into account the service commitment all new teachers must fulfill as a way of repaying the funding they received during preparation. According to a recent MOE climate survey, teachers’ top three reasons for remaining in the profession include a positive professional culture, good remuneration that is competitively benchmarked, and ample opportunities for professional development and career growth. Findings from TALIS

(OECD 2014b) further corroborate this evidence: 88 % of teachers in Singapore feel satisfied with their job; if they were to decide again, 82 % of them would still choose teaching (vs. the TALIS average of 78 %). In addition, the majority of Singapore teachers (70 %) perceive that the teaching profession is valued by society, a figure much higher than the 31 % TALIS average.

14.8 Issues Ahead

14.8.1 *New Roles for Teachers*

In 2012, the Ministry of Education in Singapore announced that the country had reached its target of 33,000 teachers. With the number of teachers having reached a steady state in relation to the country's needs, the purpose and definition of teacher education has also undergone rethinking, in order to support teachers to move beyond basic qualifications to the next level of professional development and growth. This re-conceptualizing of teachers' roles has focused on opportunities for teachers to assume leadership roles and grow in their careers, for the purpose of teacher retention and teacher renewal. One dilemma is to ensure that teachers who are identified and nurtured to play key managing roles in their schools can do so without leaving the classroom. Thus, MOE has been focused on defining multiple leadership pathways for teachers—beyond the career pathways described earlier—that do not simply put teachers on an administration track, but can ensure that good teachers remain connected to teaching, students, peer teachers, and curriculum (Goodwin et al. 2015).

A second aspect of “role” relates to instruction—both in terms of pedagogy and mindset. With the adoption of the *Framework for Twenty-First Century Competencies and Student Outcomes*, the emphasis shifted to “holistic education” that embraced (so-called) “soft skills” and values as the underpinnings for knowledge and skills (MOE 2015d). This shift requires a pedagogical stance and skills that Singapore teachers must develop, a shift that will take time, given current classroom practice that remains predominantly focused on subject knowledge and curriculum shaped by national examinations (Dimmock and Goh 2011). This issue will also have an impact on mentors and will naturally require them to revise what they do and know.

14.8.2 *Quality Teachers for All Students*

Singapore has recently implemented educational policy changes that will have a ripple effect on the teaching force. First, the goal to provide early childhood education for every child means that teacher preparation for this work will need to be expanded and upgraded, especially in terms of Mother Tongue teachers given the

goal to begin Mother Tongue instruction in pre-school. Second, while inclusive education is practiced in Singapore, it is a relatively new concept and much still needs to be done in terms of shaping teachers' attitudes towards inclusive education and students with disabilities, improving their skills levels, and modifying school structures and procedures such that children's needs are appropriately met (Yeo et al. n.d.).

The current emphasis in Singapore on "Student-Centric, Values-Driven" education has a particular focus on "Every School a Good School" with the intention of providing additional resources to schools that serve less advantaged students. This has been, in part, a response to the widening gap between the wealthy and the schools they send their children, and those who are working class or poor, and the schools their children attend (Davie 2014), a clear indication that all is not 100% rosy in Singapore. Ultimately, then, the key is in paying attention and working toward equity, because even in a country where academic achievement is high and achievement gaps are small, there is still a long tail of lower performers whose potential could be lost.

14.9 "Urban" Education in Singapore: Quality and Equality as a Continuous Cycle

As stated earlier, it is difficult to tease out the "urban" in urban education when it comes to Singapore, since there is no place in the country that is not urban. Yes, Singapore's history reveals that she faced many of the challenges often associated with the term "urban," or "urban education," challenges that are no longer as pervasive or pronounced. Thus, the emphasis in this chapter has been on educating diversity defined in multi-racial, multi-lingual, multi-religious, and multi-cultural terms, including socioeconomic differences. What does it mean to aim for educational excellence and equity given this context? Are there lessons that can be gleaned from across the two illustrative cases—and that might be portable?

There is no question that positive student outcomes depend on quality teachers. The most important lesson seems to be that in Singapore, the relationship between quality and equality in terms of education for all children is a continuous loop that begins and ends with quality teachers. Quality teachers means quality schooling, quality schooling means quality outcomes for pupils, well-educated pupils means a quality pool from which quality teacher candidates can be drawn, quality candidates means quality teachers and so on as the cycle continues. However, quality teachers/schooling alone does not result in equality unless policies are in place to safeguard the equal and necessary distribution of resources to ensure that all children have access to quality. In the U.S., research has shown that urban schools serving poor children of color are more likely to experience higher teacher turnover, lower retention (often due to poor compensation), greater difficulty hiring teachers, a larger proportion of teachers who are new, inexperienced, or unqualified, more teachers

teaching out of license (Alliance for Excellent Education (AEE) 2014; Hudley 2013; Lankford et al. 2002; NCEsa n.d.). This research illuminates the relationship between quality teachers and educational equity, and the devastating impact the uneven distribution of quality teacher shortages can have on the achievement of students of color.

In Singapore, policies are in place to ensure the equitable distribution of quality teachers across all schools. First, recruitment is organized according to need and shortages such that schools are assured of new teachers who are well prepared and have been specifically selected to meet their needs, while successful applicants to teacher preparation can count on employment upon program completion—a powerful recruitment incentive. Second, the same induction program is available to all teachers in all schools, resulting in 99% of Singapore novice teachers receiving mentoring and induction support, which builds teacher competence and quality, and aids in retention. A third policy is that new teachers must stay with their posting for at least 2 years, thus reducing the annual disruptive churn of new hires, a frequent phenomenon in many U.S. urban schools. Fourth, salary scales are consistent across the system, so regardless of the neighborhood or the purported reputation of any school, teachers can expect equitable compensation, induction support, and advancement opportunities regardless of the school in which they teach.

As critical as filling shortages and ensuring employment are, the climate and environment in which teachers work has been shown to influence whether they stay or leave. According to U.S. research, teachers in urban schools work with fewer or poorer resources, and have less decision-making power, support or opportunities to collaborate with other educators (Allensworth et al. 2009; AEE 2014; Hudley 2013; NCEsa n.d.). In contrast, TALIS (OECD 2013) found a positive correlation between job satisfaction and opportunities to participate in school decisions. In Singapore, 81% of teachers feel that their schools have a collaborative professional learning culture that is respectful and mutually supportive. The study also revealed that almost all Singapore teachers have the opportunity to actively engage in decision-making in their school. This brings us back to the notion of taking care of needs along a holistic continuum that attends to primary or basic needs such as how to afford higher education, as well as secondary needs connected to professional aspirations, meaningful activity, and self-fulfillment. This is exemplified by the following MOE commitment: “We will provide teachers with the resources and the environment to do their job well. We will look after their development and well-being so that they can concentrate on giving their best to their pupils” (MOE 2015a, “Teachers in Society,” para 1).

Besides ensuring the preparation and distribution of quality teachers, in terms of language policies per se, a focus on bilingualism has been integrated into the very foundation of the country and is part of the national ethos. As a densely populated urban nation that was built by immigrants who brought with them a wide variety of languages, customs, religions, and beliefs, creating a shared national identity required a both/and strategy of maintaining language diversity alongside cultivating a common “‘neutral’ language for interethnic communication” (Dixon 2005, p. 27). While an examination of language policy in Singapore would naturally raise ques-

tions about which policies achieved intended outcomes, throughout there has been an insistence on and valuing of bilingualism. This is quite opposite to language policy in the U.S. where there is ambivalence all the way to hostility towards languages other than English. This ambivalence/hostility has translated into inconsistent supports for, and even the dismantling of bilingual education. What we see is the opposite in Singapore where dual language learning supports are resulting in growing proportions of Singaporeans attaining fluency in two or more languages.

While this discussion points to things that can be done—strategies to employ, policies to enact, etc., underlying what happens in Singapore to ensure education for all within a decidedly urban setting is a national commitment to uplift across all facets of society, and to “level up” (Lee et al. 2014) in response to identified gaps and shortfalls. A closer look at high performing systems reveals that efforts are made to disburse resources according to need, such that those who need additional assistance receive it (Lee et al. 2014). Finland offers one example of such practices, Singapore another. Funding for schools or for education in Singapore does not depend on local taxes resulting in wealthier neighborhoods receiving more funding whether or not they need it. If the goal is developing all of “our most precious resource” then zip code cannot be the deciding factor when ensuring students have access to the support they need.

Part III
Eastern Europe

Chapter 15

Urban Education in Eastern Europe: Section Editors' Introduction

Victoria Showunmi

15.1 What Is Urban Education?

When I was asked about a year ago if I would consider participating as a Section Editor for William and George's *Second International Handbook of Urban Education* I agreed, in fact I felt honoured. However, as soon as I said "yes" I was filled with fear as I really was not sure what was meant by their use of the term 'urban education'. Initially, and as a person growing up in a rural area in South West England I thought perhaps it is something that I ought to know. I grappled with whether urban education was a term which was replacing disadvantage communities, and if so why make up yet another term to describe a disadvantaged community: realizing, of course, that the term disadvantaged community was itself a contested construct and based on the negative perceptions of the power elites in the society. As I was preparing the call for papers for the section on Eastern Europe I realised that there was so much to know and understand about the meaning for urban education. Alan Dyson (2003 p. 1) explanation does facilitate in understanding that 'although 'urban' and 'disadvantaged' overlap in very important ways, he does not regard them as entirely synonymous'. He does, however, agree with Balfanz (2000) that even if our focus is on educational disadvantage, we can only understand that phenomenon fully if we pay due attention to the fact that education happens in a particular 'place' – schools and families nested within communities and areas – and at a particular 'time' – constituted by the distinctive histories of those places. When one does search for a clear definition for the term 'urban education' there are reoccurring words or themes such as community, disadvantage groups, concentration of learners and geographical space. As I explore many of the words and terms used to describe urban it is clear that all of the words and terms

V. Showunmi (✉)
UCL Institute of Education, London, UK
e-mail: v.showunmi@ucl.ac.uk

connect and project very powerful meanings on the lives of learners that attend schools in urban areas. Communities, which are considered to be urban, consist of a concentration of people with similar characteristics and/or living in similar circumstances. Such concentrations may share ethnicity or faith or more-or-less clearly defined culture, or may display similar patterns of advantage and disadvantage. As I continue to contemplate the meaning of urban education from a purely English perspective I realise that globally it is a term which is contested by many. The three chapters that have are included in this section are based on research that has been conducted in Croatia. Reading through the chapters it become clear that the conversation and challenges are similar, the main critical difference being context and location.

15.2 Challenges for Eastern European Communities

The patterns of immigration have been changing rapidly throughout European countries. Although big cities such as London, Hamburg, Paris, and Rome remain the main sites of mass and multiple immigrations, other European urban and increasingly rural areas are now also receiving new arrivals from European and non-European countries. The urgency to equip layers of the EU school workforce for working effectively with children who are new to the language used in education in their host countries has been apparent for some time. The importance of engaging with cultural diversity as part of good practice in education has been largely accepted, but the recognition of the importance to engage with linguistic diversity seems to be clouded partly by misconceptions that the use of other languages will slow down the process of acquiring the host language, and partly by a lack of awareness that first language skills are the most important tools and prior experiences when learning a new language.

Every child exposed to another language in their families and communities is considered to be either bilingual or plurilingual. These learners vary greatly in terms of their linguistic competencies in their home language, and the language used in education. Some of them are fluent in their home language but not literate, some have mastered literacy too: some are new to the language used in education and others might be competent in terms of everyday conversational language but need support with academic language. The relevance of language and the young person's identity is crucial to their development in knowing who they are and how they belong in the society in which they currently reside.

Croatia is a country of duality when it comes to its inhabitants. Much of the population lives in urban areas, although it is concentrated in a few urban centres. There are 120 towns with the population of 3,016,137 (out of 4,284,889), but only the capital has the population of over 790,000 according to the last census (Popis stanovništva 2011). Around 40% of the population are located in the four largest cities: Zagreb, Split, Rijeka and Osijek. Many of the surrounding towns have around 10–15 thousand inhabitants. There are some towns that have a smaller number of

the population living there. These numbers point towards a high level of urbanisation, yet the size of the urban area highlights that there are few areas that would have social and cultural characteristics of densely populated areas. In addition, an important characteristic of Croatian society is the constant changeability, especially evident in educational policies.

For nearly two decades Croatia has been going through a process of post-socialist transition. It has been a very complex process, full of uncertainty and many difficult social changes which were made by the post war situation.

The Croatian government has recently transformed both the primary and secondary education curriculum in order to create a common learning basis for all students. Much of the change has been influenced by its commitment to European co-existence: Croatia has based its educational changes on recommendations from the Council of Europe and the European Commission. Accepting the recommendations from the European Commission and integrating them into the education system has meant a vast amount of change designed to ensure that the education policy is in line with the overall European policy.

The present education system is both regulated and sponsored by the Ministry of Education. It is free, but also compulsory in Croatia from the age of 6 until 15. Higher education is normally not free, although some universities do offer a selection of free spaces. This is referred to as the Hrvatski nacionalni obrazovni standard (Croatian national educational standard). There are both public and private schools in Croatia, but there are very few private schools. Children are able to attend kindergartens starting at the age of 1, it is however not compulsory. Primary education in Croatia (Osnovna skola) last for 8 years, from the ages 6 – until 14. This is then followed by secondary for another 4 years. The schools in Croatia are divided into three different categories; – the international Baccalaureate (Diploma organizacije međunarodne mature), The Svjedodzba o završnom ispitu, which are awarded by art schools, and the Svjedodzba o završnom ispitu which are awarded by vocational schools.

Each paper that has been selected for the Eastern European section develops and builds on the continued urban education dialogue. The papers are individually different yet have connecting themes that enable the reader to appreciate the issues that Croatia is challenged with in education. The first paper in the section written by Dijana Vican, titled *Contemporary Educational Problems and Major Challenges as part of Curriculum Changes in Croatia: A Multiple Perspectives Insight*, provides an overview of the curriculum changes in Croatian pre-tertiary education, which was influenced by modern pedagogical and didactic paradigms and new socio-cultural values. Such changes have had an impact on all factors and stakeholders of education. The purpose of the paper was to consider the different problem perspectives of educational and curriculum changes at the pre-tertiary level including the voices of teachers, pupils, parents, professional associates, and school funders. It explains the problems and suggests solutions and steps for a more successful and higher quality implementation of education and curriculum changes. Through the use of a randomly selected research sample of over 1000 participants across different parts of Croatia the research focused on the discovery and explanation of the

problem of education considering these multiple perspectives. A key theme that emerged was the problem of pupil's motivation to learn, which was of concern for teachers, parents and some pupils. In contrast to this thinking, some teachers blamed this low level of motivation on parents not giving the right support at home, while others saw the educational policy as the biggest problem for pupil motivation. Another factor which emerged from the study is the potential negative impact of shift work in schools.

The second paper, written by Andeika Peko and Rachela Varga, titled *Urban School Culture in Croatia: Student empowerment or spirit improvishment?* begins with a lengthy discussion on the way Croatia has developed over the last 20 years. The paper provides a detailed account of educational policy development, and the various reforms which have been implemented to ensure that Croatia is able to compete in the global world. What is perhaps most interesting about this paper is the focus on student perceptions both before and after the education reforms. Pedagogical style and pupil motivation was something that frequently surfaced. They report that there appears to be a much improved understanding from the Ministry of Education that a crucial purpose of the classroom teacher is to engage all pupils with learning so that they are able to think critically and develop a sense for personal responsibility and achievement. The key question is "Will the new national curriculum be able to improve student learning and teacher approaches to learning?".

The third and final paper in the section, written by Klara Bilic Mestric and titled *Habitus of Multilingual Children and Youths in Urban Areas in Eastern Croatia*, has a focus on language. The paper presents the entangled relations of language and identity in the multicultural urban areas of Eastern Croatia. The author used a 'bottom up approach' to conduct the research which included the voices of multilingual children and youth from urban areas in Eastern Slavonia regarding their linguistic habitus with the aim of studying their linguistic identity and their way of being in the world. The research considered a range of their linguistic identities: this approach explored their lived experience as a starting point, which was based on similar earlier studies (Mehmedbegovic 2011; Le Nevez 2006). The findings from the study are very interesting as they provide a voice to the meaning of urban education, and what the children think is most important. Holding onto their original language and accepting their new language whilst creating new identities, for example, was something that many of the children in the study discussed. Mestric argues that what happens with language relates directly to their habitus, their attitude, identity and relationships with the society at all levels.

The biggest challenge for countries facing population change is the integration of bilingual/plurilingual children into the mainstream schools, whose practices result in placing these children far too often in low ability sets. It is becoming all too evident that these children are not given the opportunities to demonstrate and express what they are good at and can do, which negatively impacts their self-esteem, and may lead to disengagement and truanting. These chapter show very clearly that we still have much to do to realize equity within the field of urban education.

Chapter 16

Contemporary Educational Problems and Major Challenges as a Part of Curriculum Changes in Croatia: A Multiple Perspectives Insight

Dijana Vican

16.1 Introduction

Educational reforms are areas of social, economic, cultural, political and other interests of developed countries and developing countries. The education faces twofold expectations under the influence of socio-political changes, new scientific knowledge and discoveries, development and impact of information and communication technologies, global and migration changes, economic relations, international declarations and conventions. On one hand, socio-cultural and economic development and progress depend on education; on the other hand, its effectiveness depends on constant change of the system of education and all segments within it. The effectiveness of education depends, accordingly, on simultaneous changes within and outside the education system, which provides space for criticism of education by the widest social structures. It is no wonder that education faces constant, and often noisy media criticism of different dioptries since the social structures extend from the political and economic, as well as all other relevant sectors and areas of activity, a wide range of professional and civic associations, and circumstantial factors of education – the founders of educational institutions, parents and caregivers, as well as direct factors – teachers, professional associates, principals and pupils.

Democratic principle presupposes implementation of educational changes by applying political consensus or a consensus of all participants in the education system. In developing countries, these changes are often dependent on political will, or on decision of the governing structure on what they assess to be priority and possible. Attempts of the governments to implement structural reforms in Croatian education system took place immediately after establishment of national independence and the political changes in 1990. The Study of basic education systematic reform

(The Project on Croatian Education System for the 21st Century 2002) was not accomplished due to lack of political consensus.

The period of real reform changes in the education system of the Republic of Croatia intensified in 2000. By its commitment to European co-existence, the Republic of Croatia based its educational changes on recommendations of the Council of Europe and the European Commission, as well as in finding a role model for partial change in the European Union countries. Accepting the European Commission recommendations by the governments and the competent ministry meant accepting integration of the Republic of Croatia in the European coexistence and better preparedness for joining the European Union, as well as profiling the educational policy in line with European policy (Operational Programme Human Resources Development 2013; Education Sector Development Plan 2005–2010; Strategy for the Development of the National Curriculum Framework for Preschool Education, General Compulsory and Secondary Education 2007; Nacionalni okvirni kurikulum za predškolski odgoj i obrazovanje, opće obvezno i srednjoskolsko obrazovanje 2011; Nove boje znanja, Strategija obrazovanja, znanosti i tehnologije 2014).

16.1.1 The Objectives of Changes in Croatian Education System Since 2000 Until Present

The realization of educational reforms can be found in curricular changes, initiated by the educational practice, and accepted by educational policy. It was a reform initiative of primary school teachers, known as the Croatian National Educational Standard (Vodič kroz hrvatski nacionalni obrazovni standard za osnovnu školu 2005). The teachers' project was based on alleviation of out-dated, overcrowded and redundant educational content in primary and secondary school curricula. The changes have resulted in in-depth analysis of educational content and innovation of the syllabus and teaching plan and programme for primary education (Teaching plan and programme for primary education 2006). As a consequence of the new curriculum adoption, new textbooks and extra educational and teaching resources for primary school were published and printed. Croatian National Educational Standard has also resulted in intensive training of teachers and educators at local, regional and national level. However, this project did not have a significant impact on the improvement of secondary education.

In parallel with internal education system changes at the level of compulsory education,¹ the educational policy adopted pedagogical standards for pre-school, primary and secondary education; for the first time in decades the pedagogical standards were adopted with thought and defined development activities and feasibility coefficients (The National Pedagogical Standards 2008).

¹According to the *Constitution of the Republic of Croatia [Ustav Republike Hrvatske]*, 1990, the 8-year primary school education is obligatory.

The period between 2005 and 2010 is more relevant for the level of tertiary education due to introduction of the Bologna process, and with it, the application of modern educational and curricular paradigm based on learning outcomes and competencies. The new educational paradigm at pre-tertiary level was introduced in 2010, with the adoption and publication of the National Curriculum for Preschool Education, General Compulsory and Secondary School Education (Ministry of Science, Education and Sports 2011). The process of intensive changes consisted of legislation change, professional development of educational staff, renovation of schools, equipping educational institutions with modern IT technologies, removal of architectural barriers for children and pupils with disabilities, an extension of the higher education study program for teachers and educators to 5 years (MA level), and others. Due to time range of past 15 years for profound changes in Croatian education system at pre-tertiary level, it is realistic to expect improvement in the education system, and improvements reflecting on direct and indirect education stakeholders. Measuring the quality of education and work in schools is one-sided if viewed only through statistical indicators at national level; the other side of the education quality and work of schools should be considered inductively to identify problems faced by all stakeholders in the education system.

16.2 Research Methodology

16.2.1 The Research Problem

The aim of the research is to determine measures of the implemented reform through multiple perspectives or views and opinions of direct and indirect education participants. The implementation of further changes in education system, external or internal, assumes testing of the reform goals' achievement by direct and indirect education participants. A number of questions arise, such as, has there been improvement and enhancement of education after 10 years of reforming the pre-tertiary education? Does the efficacy of the system require more of external, structural or internal reforms? Which direction should take further improvement and upgrading of education system in the Republic of Croatia? Which segments of the upbringing-educational activities (teaching) and the upbringing-educational process (learning) require deeper and more intense access? Whom and what should changes concern most?

16.2.2 The Aim and Objectives of the Research

The research is aimed at testing the problem of education from five perspectives – teachers, pupils and parents, professional school associates, and educational institutions founders' representatives. We assumed that determining and analysing a wide

range of insights into the issues by direct participants (teachers, pupils and associates) and indirect participants (parents and educational institutions founders) and their responses at a single question, shall provide sufficient dispersion of opinions and attitudes that will provide clearer insight into effectiveness of change in the last 10 years and clearer guidelines for the efficient work of educational institutions. The identification of the problem is also the basis for directing further reform guidelines at level of educational policy and practice.

The research was based on the assumption that the biggest problem teachers face is inclusive education implementation and integration of children with special needs in the regular education system (UNESCO 2005) as well as frequent and rapid changes in laws and regulations, regardless the curriculum changes in primary schools, modernized textbooks and other teaching and educational resources, and modernization of The National Pedagogical Standards. Namely, the Government of the Republic of Croatia has signed the Convention on the Rights of Persons with Disabilities (2007), and its application assumes a thorough preparation for high-quality application of inclusive education concept. The workload of teachers is related with this assumption because the centralized curriculum for primary and secondary school is provided by the competent ministry. The obvious assumption is that teachers cannot simultaneously meet the demands of educational policy and the requirements of heterogeneous groups of pupils to achieve the prescribed curriculum without changing it.

Due to intensive access to external evaluation, and implementation of various tests in elementary and secondary schools (national exams, preparing for the state graduation exam, the state graduation exams, PISA research, Progress in International Reading Literacy Study – PIRLS, Trends in International Mathematics and Science Study – TIMSS), it was presumed that pupils and their parents see the external evaluation of education and frequent testing as biggest problems.

Croatian education system is characterized by realization of teaching process in two, even three shifts, and it was assumed that some stakeholders see the shift work as the biggest problem; attending school in shifts is not only a problem for the founder, but is aggravating for busy parents and children.

Founders' activity is limited to establishment of schools and provision of educational standards. Due to recession Croatia faces in the past decade, we have assumed that the provision of high quality educational standards represents most common and almost the only problem for the school founders.

Other hypotheses have been set up ad hoc.

The objectives of the research were:

- to identify problems in education system after a series of reforms at primary and secondary education level in the Republic of Croatia, based on multiple perspectives of the tested sample – teachers, pupils, professional associates, parents and educational institutions' founders
- to consider and explain classification problems, with special emphasis on problems of teachers in primary and secondary schools by using cause-effect approach and comparison method
- to recommend further reforms for education policy and educational practice.

Table 16.1 The sample of research participants by county

Respondents	Zagreb County N (%)	Zadar County N (%)	Total N (%)
Teachers and educators	260 (30.30)	150 (34.89)	410 (31.83)
Pupils	300 (34.97)	150 (34.89)	450 (34.94)
Parents	280 (32.63)	120 (27.91)	400 (31.06)
Professional associates	15 (1.75)	7 (1.63)	22 (1.71)
Founders of educational institutions	3 (0.35)	3 (0.77)	6 (0.47)
Total	858 (66.61)	430 (33.39)	1288 (100%)

16.2.3 Research Method, Instrument and Sample

The methodological approach used in this research is based on grounded theory principles. The narrative approach to research focuses on persons with individual experiences and collection of narrative statements providing detailed and in-depth understanding (Charmaz 2006). The research approach was to set a single question – *Which, in your opinion, is today's biggest problem in education?* The interview was conducted by trained graduate students of Department of Pedagogy at the University of Zadar and adult learners enrolled to Program for acquisition of teaching competences at the University of Zadar and the Croatian Catholic University during 2013 and 2014. Interviewing was conducted through field work, by recording and transcribing interviews or by direct recording of answers.

In this research, we have decided to apply interview method on a randomly selected research sample of 1288 respondents, out of which 410 classroom and subject teachers,² and teachers of general and vocational subjects in secondary schools, 400 parents and 450 primary and secondary school pupils, 22 professional associates and 6 representatives of educational institutions founders in Zadar and Zagreb County (Table 16.1).

A sample of 1288 respondents was not foreseen at the beginning of the research, because the purpose of the study was to get results through qualitative research method which does not assume a large number of respondents (Flick 2009; Milas 2009). However, respondents' answers lead to increasing the number of categories upon completion of the first problem classification (initial categorization), and it was decided during the research to increase the number of respondents to identify as many problem categories as possible and a sufficient number of narrative testimonies to provide deeper explanation from all perspectives investigated. Common themes were obtained by using the source triangulation process (to understand the problem from many angles).

²The Croatian educational system differs teachers who educate pupils from I. to IV. grade and teachers of certain subjects, which educate pupils from V. to VIII. grade and high school pupils.

16.3 Data Processing Method: Qualitative Analysis

The data obtained in transcribed and recorded interviews were first processed in open coding procedure, which is the method of respondents' narrative statements analysis, as part of the screening process, and it focuses on categorization of the research phenomenon (identifying problems in education and school). Data obtained in interviews were classified into smaller units during the initial coding; individual sentences were analysed in order to detect the main message and the context of the narrative statement. The procedure of axial and selective coding was applied after initial and open coding (Cohen et al. 2007) (Table 16.2).

Respondents' answers were structured by coding method in a broader range of classification areas and terms than the one foreseen at the beginning of the research. The second level of the analysis applies linking of related terms, to crystallize at that level of analysis the problem categories that became clearer and have more specific meaning (Table 16.3).

16.4 Research Results, Interpretation and Discussion

After initial and open coding, or the first level of narrative testimonies qualitative analysis obtained through interviews with respondents, and the application of axial coding, which refers to the connection of respondents main messages and narrative statements context (selective coding), we got a total of 21 categories of problems, and those are: inclusive education, school culture, curriculum, professional staff support, external evaluation, support and responsibility of parents/caregivers, teacher and educator competences, pedagogical standards, policy and legislative framework, school management, educational content, teaching and learning methods, financial problems, information and communication technology, textbooks, children's rights and pupils' rights, pupils motivation to learn, discipline, teacher authority, assessment and school autonomy, and the meanings of categories (Table 16.4).

The frequency of categories was calculated for each group of samples, and comparisons were made between the most frequent categories among all test groups in the sample after analysing the narrative statements and coding, as well as classifying categories of particular problems in each research sample group – teachers, pupils, parents, professional associates and founders of educational institutions.

The results of the research show the groups of respondents in the sample and display the most frequent categories for each researched group of respondents. We used qualitative methods in interpreting the results in terms of corroboration of the respondents' attitude frequency results with attitudes and opinions supporting the considered problem.

Table 16.2 Example of open coding in the initial procedure of qualitative analysis

	Narrative statements of respondents	Notions
1.	Lack of interest of pupils, learning by heart without understanding, copying in exams, learning just for grades ... um ... I could enumerate a lot. Lack of relation between theory and practice, where, for example, practitioners represent only burden to the companies, do you think that they welcome our pupils; and the schedule, imagine physical education as first class, and mathematics as the last ... practical training and internships often have nothing to do with the rest of the program; Pupils undergo practice well, and then fail the theory... We all know that the point is not in the amount of content, and then again it comes down to the fact that pupils get too much information about everything ... it happens that because of the abundance of information they forget what is most important	Pupils' disinterest; Learning for grades; Unrelated theory and practice in vocational education; Professional practice; Curriculum; Educational facilities
2.	Individual professors lack the explanatory skills in their teaching. I don't feel like learning ... you cannot ask questions while teacher holds lecture, no one asks us whether we understand... actually we are expected to understand... They forget that they too were pupils once; they apply strictness, and think that makes them better teachers	Teaching competences; Pupils' disinterest; Prohibition of asking questions; Teacher strictness;
3.	We must adapt to the program for all, although not all pupils are equally interested in natural subjects and foreign languages. Some subjects I cram, and some I learn ... It bothers me that pupils are seldom encouraged to talk, to express their opinions ... to take part in some debates ... I know that some schools are doing that	Unified program; Pupils interest; Learning strategies; Disabling conversation; Teaching methods; Relationships at school;
4.	Some parents are burdened by their child's success at examination, so they suggest them learning via Internet; they find pages used by teachers where they find questions teachers often ask ... they induce their children to learn by heart ... and when set a clear and specific question, for example, who is the main character in the book, the child talks about the action in the book ... they do not answer to asked questions, but what they learned by heart. If warned that they learn in a wrong way, they learn even less; they lose their will and my job is at the beginning of beginnings ...	Parental pressure; Learning via the Internet; Learning by heart; Wrong approach to learning; Losing will;
5.	Anyways, pupils are insufficiently serious about teamwork and they think it's for fun ...	Teamwork;
6.	We do not have enough elective subjects, and those we have are related to courses we already have... Maybe it is useful but I don't feel like learning the same contents... it is again something obligatory, we cannot enrol what we want ...	Elective courses; Do not care about learning the Same contents;
7.	Well, currently the problem is puberty... he/she behaves frivolous... does not think about obligations at school. I noticed that she is quite indifferent, and interested in other things; sometimes forgets homework... even tries to fool me. She is interested in video games, Facebook, hides while text messaging, hides messages... avoids learning... sometimes forgetful	Schooling obligations; Lack of interest; Homework; Video games; Facebook; Avoids learning;

Table 16.3 Open coding example at II. and III. level of qualitative analysis

Narrative discourses of respondents	Terms
Pupils' disinterest;	Pupils' motivation to learn
Learning by heart without understanding, copying in exams, learning just for grades ...;	
Practical training and internships often have nothing to do with the rest of the program; Pupils undergo practice well and then fail in theory;	
It happens that because of the abundance of information they forget what is most important;	
I do not feel like learning... you cannot ask questions while teacher holds lecture, no one asks us whether we understand...	Pupils' motivation to learn
... they apply strictness, and think that makes them better teachers...	Pupils' motivation to learn
... not all pupils are equally interested in natural subjects and foreign languages. Some subjects I cram, and some I learn ...	
/pupils/... lose their will and my job is at the beginning of beginnings	Pupils' motivation to learn
Maybe it is useful but I don't feel like learning the same contents...	Pupils' motivation to learn
I noticed that she is quite indifferent... She is interested in video games, Facebook, hides while text messaging, hides messages... avoids learning...	Pupils' motivation to learn

Table 16.4 Identified concepts and categories in the process axial and selective coding

	Related concepts and themes	Basic categories
	<i>Axial coding</i>	<i>Selective coding</i>
1.	Integration of pupils with disabilities, gifted and talented pupils, pupils belonging to national minorities, especially Roma children who are Croatian citizens, and they do not know the Croatian language; then, pupils repeating the grade and poor pupils;	<i>Inclusive education</i>
2.	Relations at school, school climate;	<i>School culture</i>
3.	The burden on pupils with educational content; load of default and the prescribed number of instruction hours	<i>Curriculum</i>
4.	Support of pedagogues, psychologists, special education teachers and librarians or their absence at school	<i>Professional staff support</i>
5.	Frequent external evaluation and testing of pupils	<i>External evaluation</i>
6.	Provided help at home learning, the home assignments and preparing for school requirements	<i>Support and responsibility of parents/caregivers</i>
7.	Teacher and educator competences for knowledge transfer and development of core pupils' competencies	<i>Teacher and educator competences</i>
8.	Organizational, information and communication, technical, sanitary and other conditions at school	<i>Pedagogical standards</i>
9.	Clarity and transparency of strategies, laws, regulations; their connection and clarity regarding the responsibilities	<i>Educational policy</i>
10.	Skills and responsibility of principals	<i>School management</i>
11.	Accessibility and clarity of regulations and other legal acts, and their applicability in practice	<i>Legal framework</i>

(continued)

Table 16.4 (continued)

	Related concepts and themes	Basic categories
	<i>Axial coding</i>	<i>Selective coding</i>
12.	Overcrowding, harmonious connection with previous knowledge	<i>Educational contents</i>
13.	Traditional or contemporary	<i>Teaching and learning methods</i>
14.	Material and financial problems	<i>Financial problems</i>
15.	Purposeful and practical application of computers, software and the Internet in teaching and educational activities and processes or lack of their application;	<i>Information-communication technologies</i>
16.	Easily applicable means for pupils; contains additional means – meaningfully related workbook and exercise book; helps pupils in the independent work;	<i>Textbooks</i>
17.	Meaningfully related to pupils' obligations	<i>Children's and pupils' rights</i>
18.	Development of intellectual capacities in pupils, the development of interest in learning and self-study	<i>Pupils' motivation to learn</i>
19.	The ability to maintain a positive classroom atmosphere despite the heterogeneous group of pupils, as one of the basic prerequisites for efficient work in the classroom;	<i>Discipline</i>
20.	Professional quality of teachers personality that manifests by showing respect for the pupil, while requesting consistency and patience to achieve the pupil's success in learning	<i>Teacher authority</i>
21.	Numerical approach; unclear content of grade ratings	<i>Assessment</i>
22.	Problem solving is in freedom of management of educational activities at school level more frequently than in the strict regulation of educational policy	<i>School autonomy</i>

16.4.1 Problems in Education and School According to Teachers and Educators

The results obtained by analysing responses of primary and secondary school teachers to the question *Which, in your opinion, is today's biggest problem in education?* do not confirm the assumption that the most frequent attitudes of teachers would be the inclusive education and prescribed program syllabus at national level. Namely, the largest number of teachers in primary and secondary schools consider motivation of pupils to be the biggest problem in school. The analysis of narrative testimonies shows several different viewpoints of teachers and educators. This problem category was identified through different opinions of teachers. Their opinions are divided into four groups.

One group of teachers indicates the problem of pupils' motivation by recognizing personal problems faced by the respondent – the teacher during teaching pupils:

Teacher 1: *I find it sometimes difficult to keep pupils attention for five minute. I need an enormous amount of energy to make pupils interested in the subject; it takes a lot of patience.*

Teacher 2: *Pupils and their parents care more about grades than the knowledge. I am more burdened by assessment, than by teaching. Parents do not accept their children's failure and have unrealistic expectations from children and from us teachers.*

Teacher 3: *The grades are motivating, and not the content; there are more and more pupils who find the learning contents boring and stupid and they see no purpose in learning it.*

Teacher 4: *I studied a lot at my faculty, but I was never taught what to do when a pupil starts to cry or becomes aggressive for getting bad grades, or when he fails to be responsible towards school work regardless all my efforts, doesn't write homework, does not learn ...*

Teacher 5: *I often struggle with learning outcomes that are expected to be defined by us teachers and predict them in the preparations. I see no point in putting something on the paper that will actually look different in reality. I make the best preparation and yet the pupils' motivation is still missing.*

Teacher 6: *I see more and more indifference in pupils and lack of execution of the tasks I give them. I'm struggling to achieve developing work habits in pupils.*

Teacher 7: *Pupils are in their own world, and we in ours. We must not use the methods and means of compulsion, and backing down hasn't led us to knowledge inflation either. Someone should put an end to it. I do not know what I personally need to do from my part to make pupils accept learning as their only obligation.*

Teacher 8: *Lack of pupils' motivation is encouraged by teachers in those subjects that bring most negative and bad grades. The differences in the importance of subjects are large. Check for which subjects pupils take instructions more regularly, as opposed to school...mathematics and chemistry... they hate school and learning because of these subjects...*

Part of the selected statements show emotional involvement of teachers and the investment of their effort and energy. This result is on the trace of the conclusions of research on emotional experiences of teachers in the classroom by Hagenauer et al. (2015). Namely, the interpersonal relationship teacher-pupil plays a particularly important role in teachers' emotional experiences in the classroom. The interrelation developed between pupils and teacher is the strongest positive predictor of teacher's joy and a negative predictor of their anxiety, while the teacher's anger is best explained by the lack of discipline in the classroom. In general, the engagement of pupils is the best predictor of teachers' emotional states in general (Hagenauer et al. 2015).

There are also those among the teachers who blame pupils for the low level of motivation, which is evident in the following statements:

Teacher 1: *Pupils have no ambitions, they live with distorted values.*

Teacher 2: *... pupils have no work habits, they practice binge learning...*

Teacher 3: *I have a feeling that more and more children have doubts in the purpose of school. They see parents who lose their jobs around them, they see that educated people have no place in society and have no jobs; they simply do not see*

the difference between good and bad pupils in the future ... if you try to point out that those who have better education succeed more in life and that learning is important they keep on having their counterarguments...

Teacher 4: *If you provide students good tutorials, they will resent it by saying the textbooks are boring. If you get them workbooks, they will say that they are burdened with homework. If you introduce the power point presentation in the class, they won't take your teaching seriously, they will say that the presentment contents are not in the textbook. If you use computers, they expect to do what they want, and not what we want.*

Teacher 5: *Teachers are not special rolemodels to pupils as they used to be; pupils easily manipulate parents; parents are superficial, they do not follow consistently work and learning of their children. They will easily justify child's absence from school, or lack of learning and non-diligence. They will not wonder whether their child learns and how much should it learn.*

The motivation of pupils can also be viewed through the degree of their commitment. The commitment is shown in endurance and quality of the pupils' involvement in the learning and execution of their activities. It is observable part of the pupils' motivation and it can be viewed empirically as behaviour and/or emotion and attitude (Hudley and Daoud 2008). Studies have shown that a greater degree of pupil's commitment resulted in a decrease in discipline problems and greater efficiency in execution of school tasks (Davis et al. 2012). On the other hand, the emotional engagement of pupils around the school, reflecting one aspect of the effort, results in more positive attitudes toward school and stronger motivation of pupils for learning and fulfilling the school obligations (Skinner and Belmont 1993).

The research also identifies a group of teachers that blame parents (caregivers) for low level of pupils' motivation to learn, which is evident in the following statements:

Teacher 1: *Parents do not encourage children to work at home. When I call parents to a meeting to explain learning problems, they often tend to be arrogant and unpleasant. They feel that I should know how to encourage their child for learning.*

Teacher 2: *Parents give too many rights to their children, even when they know that they have not learned what they should have.*

Teacher 3: *First, teachers struggle with teaching and evaluation, and now they make up extra points to pupils achievement at school. So now pupils do not learn, because they look for shortcuts to get handy points for secondary school enrolment. Even parents rather run to collect points for their child ... Both teachers and pupils are lost, it seems that neither understands what pupils really need to know and what should they get grades for...*

Teacher 4: *Well I believe that parents represent the problem today ... They give in to children everything nowadays, and they act at school as if it was their own property, and not the state institution. So, they come to school without any suspension and keep pressure on teachers when it comes reasoning grades. They think we do*

not mean well to their children ... But these are, apparently, their rights ... We are deprived of the right to the truth...

Teacher 5: *Parents should be permanent link in the educational chain, but they are not at their place as parents, beside their children. They are there only when they have to justify their child for what they should not justify ... the absence, not learning, ignorance...*

Overprotective role of parents is more and more evident in the school system. Parents do not pay deeper attention to problems, they are not insisting in conversation with the child and the discovery of problems in learning. Conversation between child and parents is made up of several stereotyped words, resulting in incomplete information for parents (Juul 2013). Juul (2013) particularly emphasizes the loss of teacher authority that was stemming from more authority to exercise discipline over the pupils, when the awe caused obedience.

The Croatian educational system became used to parents seeking paid instruction outside the school system for pupils to overcome educational learning problems (Jokic and Ristic Dedic 2007). On one hand, this feature can be interpreted positively as a family investment in the education of their children; on the other hand, poor families who have the same desire for their children cannot provide individual paid instruction to children outside the school to be successful at school. The question is how this form of family investments in children's education encourages children to the true motivation and purposeful learning or just getting grades and ensuring pupils' progress to acquire a sufficient number of points required for entry into the higher education.

Some teachers associate lack of pupils' motivation to learn with the education system as demonstrated in the following testimonies of the respondents:

Teacher 1: *The entire school system is sterile.*

Teacher 2: *If we could spend less time on interpretation of unclear regulations, we would have time to devote to pupils and encourage them to learn.*

Teacher 3: *If the educational policy saves on equipment, textbooks, and educational tools and is not interested in the quality of schools, then the pupils are not interested in our demands for learning.*

Teacher 4: *Educational policy has introduced graduation that reversed the high school system ... graduation affects educational process in high school too much, and the pupils are focused solely on preparing for the state graduation and collecting points; due to the policy, school has become battlefield of success without learning...*

Teacher 5: *Uh ... just when I see who runs the education ... even if parents and pupils realize that, I doubt their interest in learning at all... . And that is a problem of us, teachers.*

It is indisputable is that the teacher plays a key role in motivating pupils to learn and develop work habits and culture of intellectual work, especially in achieving the fundamental objectives of primary and secondary education – training pupils for lifelong learning. The problem of pupil's motivation, as we have assumed, finds its

sources in the default and the prescribed educational content that makes an objective burden to teacher along with irrational schedule defined in the teaching plan. The load is correlated with motivation if it is “*healthy*” overload (Jurcic 2006). In addition to teaching competencies, personal characteristics and behaviour of teachers are relevant for the pupil’s school success, such as the authoritarian attitude of teachers and negative emotions in teaching, as well as too high expectations and demands from teachers. They result in low learning support for pupils (Simic Sasic and Soric 2010).

Teachers, however, do not consider problems of lack of pupils learning motivation through self-assessment of their work. Instead, they see aggravating factors in parents, pupils and even the education policy.

The association of pupils’ motivation for learning is seen in another result obtained by the frequency of the attitudes expressed by teachers and educators, and it refers to maintenance of classroom discipline. This category of problems is associated with the category of the rights of children and pupils, which is emphasized by teachers as third problem in schools and education. Narrative statements of teachers supporting this result are as follows:

Teacher 1: *... it bothers me as a teacher that my hands are often tied and I cannot do anything in disciplining pupils with bad behaviour ... I cannot send them away from class, I cannot scold them, and bad grades do not worry them anyway...*

Teacher 2: *Everyone thinks that we have a lot of holidays and days off, and no one sees how we deal with naughty children and harassment of their parents throughout ten and a half months.*

Teacher 3: *Withdrawing all discipline tools from teachers; that is why educational problems in the classroom and school escalate. The teacher is powerless!*

Teacher 4: *... today’s pupils are overprotected, and have many rights. The teacher does not have the respect he had in the past.*

Teacher 5: *The public, supported by the media, usually has a picture of a teacher as a mediocrity that works a little, five full hours a day, and has three famous holiday months. Even when I best prepare for classes, I get gripped by a fear and I’m getting some kind of cramp that I don’t work well because the pupil who does not learn will have greater rights than I do.*

Teacher 6: *Children have their rights. And we? Who asks us for our rights?! We are totally unprotected!*

Teacher 7: *The leaders of disorder are always protected.*

The presumption of successful teaching and quality in teaching is to maintain order and discipline in the classroom. The recent sources in the area of classroom management and climate in the classroom lead to the conclusion about the link between motivation and classroom management (Wiseman and Hunt 2013). Conclusions based on extensive empirical insights to which one can expect fewer problems with discipline if pupils are motivated for education and learning. Further on, motivation of pupils depends on the motivation of teachers to work which ultimately suggests that the quality of the pupil-teacher relation is fundamental for all

other aspects of classroom management (Marzano and Marzano 2003). A higher degree of involvement of pupils in the work, learning that is connected and meaningful results in higher motivation and lack of time, space and the need to create indiscipline at the same time. Results of our study indicate reciprocity of pupil-teacher relation. In other words, decrease in teachers work motivation is in a way a reflection of falling motivation of pupils and of weakness in an attempt to change the situation for the better. Wiseman and Hunt (2013) estimate that the teacher can expect discipline problems in the classroom or school, to be prepared to address those using developed strategies for coping with the need to discipline pupils. From the replies and arguments teachers made, we can conclude that they are deprived of the right tools, procedures and measures, and of those strategies that have their own formal footing. The argument about the seizure of tools suggests the conclusion of the need for reviewing the system of educational and pedagogical measures.

On the other hand, the results point to a problem of the rights of stakeholders in the educational process. The rights of participants, according to the teachers, are observed in their reciprocity suggesting that increasing rights of one stakeholder leads to a reduction in the rights of another. The modern view of the issues reflecting discipline, dealing with mischievous and disobedient pupils, the question of the appropriateness of choice of punishment as an educational measure that will result in good order and discipline are going in the direction of recognition of the rights of the child, the importance of their voice in the development of policies to manage order and discipline in the school. Children's rights as one of the greatest civilization legacies are not called into question in the responses of teachers, but their responses indicate a problem of responsibility of pupils in situations when there is a disturbance of order, disrupting classes and the like. Furthermore, the relationship between the rights of teachers and pupils, or who has more and who less rights from the perspective of teachers may be linked to the question of the teacher authority.

16.4.2 Problems in Education and School According to Pupils

The results obtained by analysing the response of primary and secondary school pupils, to the question is *Which, in your opinion, is today's biggest problem in education?* do not confirm the research assumption that pupils see the biggest problem in the external evaluation of education and in frequent testing of pupils. The most frequent category brought by pupils is equal to the category of problems expressed by teachers – the pupils' motivation to learn. According to the results of this study, the largest number of pupils criticizes school, teachers and educators. Pupils perceive school as boring, teachers as self-oriented rather than oriented to pupils, contents are uninteresting and inappropriate for encouraging pupils to learn. Narrative statements of primary and secondary school pupils to support this result are as follows:

Pupil 1: *I do not know what I need to know to get two, and what to get five. The teacher examines the material from all over the semester, even he does not know what is important and what is not...*

Pupil 2: *Everything is only a theory, it has nothing to do with the practice and life, we are dying of boredom ...; every teacher thinks he and his subject are most important in school.*

Pupil 3: *Teachers hold classes just to get rid of their obligations in the diary. Yes, they know the material, but they do not know how to transfer it to the pupils.*

Pupil 4: *Teachers teach something that has nothing to do with profession for which I enrolled. The gymnasium pupils patronize us, and consider us stupid butchers...*

Pupil 5: *I had the will to learn, but my "male" class considered learning unpopular. Believe it or not, it was even accepted by teachers. At the end of the school year there were ways to pass all pupils. Teachers satisfied, and so are we.*

Pupil 6: *Teachers are not trying around us. Mathematics is too much, but nobody cares. You manage anyway you can...*

Pupil 7: *The main issue is not if I really know, but how much in percentage have I scored.*

Pupil 8: *Pupils do not learn in order to prepare for their jobs when they leave school, but for evaluation grades.*

Pupil 9: *... half the class has failed in some subjects, like in physics. Is this normal? You are the expert, you tell me....*

Pupil 10: *I hate the most when the teacher writes on the board, and then calls the pupil to wipe the board after him.*

Pupil 11: *I've been learning to play guitar for 6 years and I won't get extra points for entry into secondary school, while the one who has allergies will.*

Pupil 12: *I'm being punished by threat that I would not be able to enter high school, and they do not punish teachers who do not know how to explain the bloodstream or alkalis, and who examine four pupils at the same time.*

Pupil 13: *We do not have a microscope; it is at repair for 3 years.*

Pupil 14: *Even the teacher was surprised to hear for how many years we've been learning English, and know so little; and we entered into the European Union.*

The research was approached with the assumption that frequent testing of pupils, that was unknown to Croatian education system until 10 years ago, would be the biggest problem of education and school according to opinions of pupils. Initial data processing has led to the fact that testing and evaluation represent problem for pupils. However, further data processing and analysis of interviews conducted with pupils made it clear that pupils of different ages recognize the importance, value and usefulness of knowledge and learning, but they still estimate it less important than getting enough grades to assure their advancement. On another level of pupils' narrative testimony analysis and the application of axial coding and selective coding, the frequency of student attitudes implies more lack of motivation to learn, lack of interest for the content, overturning the attitude that knowledge is value into the view that progress in education is what will meet their needs and needs of their parents. Particularly indicative result is the pupils attitude that "school teaches only theory, lacks knowledge relevant to life and that every teacher thinks that their subject is most important", which indicates the need to encourage the development of

entrepreneurial competencies of pupils and application of entrepreneurial learning model and education for entrepreneurship (Luketic 2013). Pupils face the fact that no one recognizes their extracurricular activities as educational value. The teachers' attitude in the classroom also contributes to de-motivation to learn. Pupils will rather use all available strategies to obtain ratings and points that assure their advancement, than direct motives for learning and the acquisition of true knowledge and competence development. The race for grades on each level of education has become "the hit" among pupils and young people, and pupils' attitudes towards learning and development of culture of intellectual work remains without deeper motives. By linking the testimony of pupils on problems they face with testimony of parents and teachers, motivation for learning reveals as the special problem of students, teachers and parents. From the pedagogical point of view it is relevant to note questionable achievement core competencies of learning to learn during primary and secondary education (Soric 2014), which can be a disturbing factor for the achievement of the basic objective of education in the Republic of Croatia – lifelong education.

16.5 Problems in Education and School According to of Parents

The results obtained by analysing responses of parents of primary and secondary school pupils, to the question *Which, in your opinion, is today's biggest problem in education?* mostly show that they consider motivation of children to learn their main problem. This result was confirmed by numerous testimonies of parents – respondents, among which we bring the following excerpts from interviews with them:

Parent 1: ... *how will my child learn; a child comes home and stares at the book...*

Parent 2: ... *teachers put little effort to become interested pupils...*

Parent 3: *Children are more outside school than at school...*

Parent 4: *Since teachers chose their profession, they should do it no matter how difficult...*

Parent 5: *The biggest problem is that no one knows anymore who the student is, and who is a teacher.*

Parent 6: *Why are we, parents, expected to solve problems of the school?! We are invited to school only if it has a problem. And who can help us parents when a child does not learn, when we do not know how to show them their homework?*

Parent 7: *My husband and I cannot help our children, even though we are educated people. Our children find salvation from bad grades by copying from another pupil. They copy from the Internet ... it is well known that obligatory reading is being copied from the Internet...*

Parent 8: *I feel that teachers have difficulty in dealing with discipline in the classroom. One student disrupts the whole class throughout the whole year and all the*

schooling passes without consequences. He disrupts other pupils and there's nothing to be done. When we get to the parent meeting, we listen about a nameless problem-pupil, and no one asks why our children do not learn ...

The most frequent category of respondents – parents is the motivation of children to learn. Parents point to problems that indicate impossibility of providing support at home due to lack of knowledge of the educational content, particularly if their child is in middle school or secondary school level. The views of parents are articulated particularly around technical issues related to teaching process, mastering courses and demands towards school, as well as inability to help their children sufficiently. This result can be compared with similar findings of authors Maricic et al. (2009) according to which the parents who regularly attend school reported greater satisfaction with school and are more conducive to the child's education by helping in learning.

16.5.1 Problems in Education and School According to School Professional Associates

Croatian education system has a characteristic that professional teams operate in educational institutions along with the principals. They are permanent employees of primary schools. Namely, each school must have teachers, depending on the size of the school or the specifics of the problem of school, professional staff employed in schools are pedagogues, psychologists, therapists, educational rehabilitators and librarians (The National Pedagogical Standards 2008). We assumed that professional staff sees problems with insufficient number of employed professional associates, given the intense changes in the system, and implementers of change are teachers and professional associates; then, with regard to educational problems and the application of inclusive education which requires special organization and special educational requirements.

By analysing the narrative testimony of 22 professional associates, as it seemed the sample in this research, the most frequent statements refer to the problems associated with administrative burden which brought reform of the education system. Their statements in favour of this outcome are as follows:

Professional Associate 1 (pedagogue): *There's a constant debate about pupils' overload, comprehensive syllabus and curriculum. No one sees us ... it all turned into paperwork... a meaningless paperwork... ... constant filling out forms... Pointless ... constant filling out the same patterns... does anyone read what we send...*

Professional Associate 2 (pedagogue): *I am employed as pedagogue, but I do nothing of what I learned during my study. The principal overloads me with new paperwork from ministry on daily basis...*

Professional Associate 3 (psychologist): *I do not get to deal with pupils and problems they bring to me; actually, the one who was sent to me by the class teacher*

and principal. The pupil has been harassing other pupils and teachers for 3 years, being aggressive ... neglected child in the family ... I failed because I did not repeat my letter to the social services.

Professional Associate 4 (special education teacher): *There is a lack of understanding for therapist in school and out of it. My schedule is prescribed, but no one measures my long-term work with a growing number of pupils with dyslexia.*

Professional Associate 5 (librarian): *When I made the school curriculum, there were just a few interested in it. And when I was late with a report, which, among other things, is not related to the librarians work, they watched me as, uh ... I cannot tell you how ...*

16.5.2 Problems in Education and School According to the Founders of Primary and Secondary Schools

The assumption concerning school founders in this research – that their problems are related to financing of educational institutions, has proven to be quite accurate. The founders of primary schools in the Republic of Croatia are local governments, and cities, whilst the founders of secondary schools and dormitories are regional self-government bodies, i.e. the counties (Law on Education in Primary and Secondary Schools 2008).

From six respondents – representatives of the educational institutions founders involved in the research, we have identified the problem of financing as the most frequent problem. The problem of financing is composed of a number of specific problems that we received during the interview, and they are as follows:

Founder 1: *The poor cities and poor counties were not able to bear the financial requirements to achieve the educational standards even before the recession, not to mention now in the recession times. We bear the burden of construction works and maintenance of schools, material costs, decorating of courtyards and playgrounds and so on...*

Founder 2: *Funding varies from one government to another. Our county has no income due to bad local economy. Method of assigning the decentralized funds from the competent ministry is not righteous.*

Founder 3: *The problem is cost of transport for pupils and teaching assistants. If we shut down small schools,³ we need to provide transport for pupils ... How and with what means?*

Founder 4: *We have solved all the architectural barriers for pupils with disabilities in our school. Now we are faced with different diagnosis of pupils, special programs and requirements for teaching assistants. We lack financial resources for all that.*

³Small school or district school is the name for the dislocated school premises that are located in smaller towns, municipalities, villages or islands, and fall under the management of the main school in the city.

The modernization of the education system includes continued provision of basic pedagogical conditions. Maintenance of existing school buildings assumes a constant funding, which the founders cannot provide due to economic problems of the region and across the country. Although the adoption of the National Pedagogical Standard (2008) for all levels of pre-tertiary education predicted coefficients of feasibility in order to create equal conditions of upbringing and education for all pupils through a specific planning period, the realization of educational standards is questionable. The education system still struggles with solving double and triple shift work in schools.

16.6 Conclusion

We evaluated different perspectives on the problem of education and curriculum changes in pre-tertiary level – teachers, pupils, parents, professional associates and school founders as relevant to scientific research in terms of contribution to the intense changes in Croatian education system, which began 15 years ago, especially before Croatia joined the European Union. We assumed that problem identification from different perspectives gives more specific guidelines for the effective implementation of internal or external changes in the education system, and provides results to propose specific solutions to the problems of educational policy and educational practice, and more successful and better implementation of education and curriculum changes at all levels and with all stakeholders in upbringing and education.

Based on the multiple perspectives of the research sample – teachers, pupils, professional associates, parents and educational institutions founders, we got results that do not confirm all assumptions with which we approached this research. According to the frequency of answers analysed using the qualitative and quantitative analysis of the narrative statements of respondents obtained during the interview, and the method of comparison, the research results show that pupils' motivation to learn represents the most frequent problem category.

The problem of pupils' motivation to learn appears to be most common not only among teachers, but also among parents and pupils, often due to cultural discontinuity (Bogner & Ginsburg-Block 2008). The research crystallized different views of teachers regarding this problem. One group of teachers – respondents see the problem of pupils' motivation to learn as their own problem as they do not know how to solve it and cannot find the way out of that situation. Another group of teachers – respondents blame pupils themselves for the low level of motivation to learn. Some teachers – respondents see this problem in passive parents and parents who do not give pupils the right support at home. Some teachers – respondents ascribe the problem of pupils' motivation to learn to education policy and the others see it in education policy.

The research results do not confirm the hypothesis that inclusive education represents the biggest problem to professional associates'; the most frequent statements of professional associates – pedagogues, psychologists, therapists, educators

and librarians, are related to the administrative workload. The only confirmed hypothesis is that the school founders are most often faced with financial problems.

The problem of pupils' motivation to learn is a complex problem that can and should be considered multilaterally. The program mitigation as a strategic objective of educational policy is likely to be confirmed as justified, because teachers are overloaded with prescribed educational contents, being in a trap of "uniformity of" educational activities and control of the educational work efficiency through the content implementation, and not the realization of pupils' knowledge and competence development. The result of this research can be viewed as extremely useful for policy makers in terms of quality of qualifications of the teaching profession during the initial and in-service teacher education. It is probably significant to stakeholders engaged in systematic professional training for professional development planning at local, regional and national levels. The result is particularly relevant for institutions with higher education curricula to acquire teaching qualifications.

Assumptions that the founders and parents shall be predominantly concerned about the double and triple shift work in schools did not come to the fore in this research. It seems that this problem remains "invisible" due to decades of shift work in the Croatian education system. Likewise, almost no examined stakeholder saw the shift work problem as discriminatory for pupils or family.

The research has also opened other important issues related to internal changes in upbringing and education, and these are problems of discipline in schools, the rights of children and pupils, inclusive education and the authority of teachers.

Chapter 17

Urban School Culture in Croatia: Student Empowerment or Spirit Impoverishment?

Andelka Peko and Rahaela Varga

17.1 Introduction

Croatia is a country of duality when it comes to its inhabitants. Approximately 70 % of population live in urban area, but that number is concentrated in a few urban centres. There are 127 towns with the population of 3,016,137 (out of 4,284,889), but only the capital has the population of over 790,000, according to the last census (2011). 39, 94 % of population is found in the four largest cities: Zagreb, Split, Rijeka and Osijek. 12, 35 % lives in areas of 10–15,000 inhabitants. Other towns have smaller percentage of population living there. In other words, numbers indicate high level of urbanisation, but the size of the urban areas points to the fact that there are not many places that would have social and cultural characteristics of densely populated areas or conglomerates. Such situation inspired us to inspect closely what goes on in urban schools.

Another characteristic of Croatian society is constant changeability, especially evident in educational policies. Since, there is a correlation between education and economic growth (Hanushek and Kimko 2000), there have been constant attempts to reform education system and increase the quality of education in order to create a solid platform for social and economic progress in the future. Such attempts are clearly visible in the chronology of documents issued by educational authorities on the national level. Those demands put a heavy burden on education and Levin and Kelley (2007) warn us against (too) great expectations, claiming that we need to be realistic about what education can do and what other changes are necessary to maximize the effects of education and to realize our aspirations for economic and social betterment.

e-mail: apeco@unios.hr; rvarga@foozos.hr

For more than two decades Croatia has been going through a process of post socialist transition. It is a very complex process, full of uncertainty and many difficult social changes were made even more challenging by the post war situation. Namely, the Croatian War of Independence from Yugoslavia, often referred to as the Homeland War, started in 1991. Since then pedagogical theory and educational practice have been looking for appropriate responses to the ongoing social and economic changes. Competitive markets have forced economic organisations in Croatia to be more efficient and improve the quality of their products, which had its manifestation in the demand for a reformed educational system. In 2013 the Republic of Croatia became a member state of European Union, and changes that are going on in the education system now are aiming to synchronise the Croatian educational system with those of other European countries and decentralise it by increasing the level of school autonomy.

Since the Croatian society experienced a switch from a totalitarian system to a democratic one in 1991, there have been attempts to modernise and improve the education system. The latest reform refers to a curricular reform grounded in the Strategy of Education, Science and Technology (2014), in which it is stated by the government that the Republic of Croatia recognises education and science as priorities in national development. Those are seen as the greatest contributors to social stability, economic growth and cultural identity. The nation is seen as facing dynamic transformations in social, economic and cultural areas in a globalised world where no country stands alone as an isolated community. The logic is that all this movement calls for modifications and innovations in the education system.

The required changes involve innovations that would lead to quality improvement while considering needs, complexity, feasibility, more engaged staff and increased resources, as well as continuous governmental support: all seen as required in order to create an education system that would satisfy the needs of students and change their position in the culture of education. Currently, their position is mostly determined by the school culture, and the culture of teaching that they are immersed in. The quality of contemporary education focuses on student achievement in the cognitive and affective spheres, i.e. learning outcomes, whereas input, educational resources and transformation processes are no longer emphasised (Bezinović 2010; Pastuović 2012). When placing the emphasis on output, it is also expected to promote a child-oriented teaching approach, as opposed to the subject-oriented one.

There have been numerous changes directed at stimulating teacher behaviour that would integrate all students (regardless of their dispositions and aptitude) in the teaching process, and simultaneously make the student position less receptive, but more active. The road to results expected from those modifications is very complex and time-consuming but the reward, it is argued, should be an open concept of education. The intention is to create a flexible system adaptable to the needs of every individual so that competences of all students could be developed, thus enabling them to continue their education and/or enter the labour market.

17.2 Road to Changes

Introducing change in education is a continuous and dynamic process. That process took place intensively over the last two decades and its direction was mainly top-down. There have been several concepts of necessary transformations that were planned on a large scale in order to reconstruct the entire education system. In 2002 the government issued a document called the Concept of Changes in the Education System of the Republic of Croatia (Concept 2002). In the document it is stated that education system contributes to the personal development of every individual, prepares them for a good-quality life, active and responsible sharing of common values such as humanity and creativity, but it also contributes to the development of the whole country in the scientific, social, economic and cultural arenas.

In the programme of education development the proclaimed aims in the period from 2000 to 2004 concentrated on the implementation of modern principles focusing mainly on freedom, democracy, human rights, openness, innovation, tolerance and diversity. In accordance, education based on pure memorisation of facts was no longer suitable and should be replaced with the kind of education that promotes creativity, problem-solving ability, knowledge application, and self-education (Concept 2002). It is evident that by introducing all those changes the students' position would also change and that they would play a more active role in their education.

Since those attempts have not contributed to significant changes, an even more comprehensive approach was applied. This new concept would focus on curricular reform, introducing educational standards to the Croatian system. Croatian National Educational standard (2006) is a document that does not only focus on educational outcomes but deals with other aspects of curriculum as well. It was used as a foundation for designing a new curriculum called Teaching Plan and Programme for Primary School (2006): in this document there are listed goals of education, content that needs to be taught, and expected outcomes. The main goal was to steadily and flexibly improve the quality of teaching and knowledge, as well as the students' ability to learn.

Following that the creation of the Croatian National Curriculum Framework began. Strategy for Construction and Development of the National Curriculum for Preschool Education, General Compulsory and Secondary School Education (2007) postulates the improvement of quality of teaching and learning as a goal of the new curriculum. Also, the development of the society and the individual's need to live and work in changed circumstances have yielded the call for new competences (innovation, creativity, computer literacy, team work, constant acquisition of knowledge, ability to adjust). It was noted that these competences are not sufficiently stimulated in the existing system, which focuses on the transmission of knowledge, and more precisely, on factual knowledge (*know of*). The suggested changes are meant to be implemented so that the following goals can be reached: reduced student overload due to reduction of encyclopedic knowledge that need to be remembered and repeated; lessons enable learning; teaching is student-directed and takes

into account their abilities and interests; students are introduced to exploration in the classroom; they gain permanent and applicable knowledge and abilities; problem-solving and decision-making abilities as well as a sense for entrepreneurship are being developed; students are prepared for lifelong learning; cooperation between school and local community; in school social and moral behaviour is encouraged.

In 2011 the final version of National Curriculum Framework for Pre-school Education, General Compulsory and Secondary Education (2011) was published with the intent to adapt teaching to the interests and needs of every individual student. The teacher is seen as playing a significant role in this process: it was recognized that it is important for teacher to be open-minded, and to embrace the proposed changes. They should modify all aspects of teaching (including lesson planning, organisation of activities, and assessment methods, etc.). Significantly, by giving a more responsible role to teachers, decentralisation of schooling is intended to be achieved.

Putting good intentions aside, it needs to be empirically demonstrated whether the goals proclaimed by the government have the desired effect, and to what extent. The intention stated in all the documents is to make the Croatian education system more flexible, which cannot be done without the support of teachers who are meant to implement the proposed changes. Among teachers at the time was created a saying: "Praise the new, practice the old", which illustrates teachers' resistance to change their set ways. In that sense, the whole process of reforming education reminds Sahlberg (2011) to Einstein's definition of insanity ("doing the same thing over and over again and expecting different results").

The chronology of Croatian reform documents shows that we travel down the road to change very slowly, since the same demands are constantly repeated over decades without producing significant changes. The same is confirmed by empirical studies on teachers' approach to teaching, parental expectations from school, and distributive leadership at school. For instance, a research study by Baranović (2006), which was a part of the project Evaluation of Syllabi and Development of Curriculum Model for Compulsory Education, conducted with 1,134 primary school teachers, detected the same traditional approach to teaching. Namely, teaching is highly linked to textbooks, and the teachers' preparation is based only on handbooks assigned by the Ministry of education. They rarely consult curricula from other countries and the Internet. When planning classroom activities they still follow the Teaching Plan and Programme (2006), discarding the opportunity to choose autonomously. In this way the system remains centralised, and teaching outcomes neglected (Thematic review of national policies for education: Croatia 2001; Berryman and Drabek 2002). In other words, teaching is still directed at some imaginary student with average ability without the individual approach to each and every student.

Another example is found in the study by Miljević-Riđički et al. (2011), which illustrates the fact that the expectations that parents have from schools, and vice versa, have not changed significantly over time. The study was conducted with 1,052 parents of primary school students and their results confirm that parents still mostly object to the low levels of their own involvement in school life, especially

when it comes to decision making. Parents in general also believe that schools primarily have to focus on educating and upbringing, but parents from urban areas tend to put emphasis on education, and not so much on upbringing. Urban parents have lower expectations for the school to instil in students certain values, norms of behaviour, attitudes and beliefs when compared to rural parents. The authors of the study explain this discrepancy with different school expectations from parents: they argue that urban schools are more prone to seek parental cooperation in case of discipline and misconduct and they more often stress the importance of upbringing methods that take place within the family circle. Consequently, those parents are more willing to take over the upbringing segment at home, and to be more involved in the organisation of after school activities for their children.

In the monitoring process of changes in education, however, student involvement is still insufficiently explored. Low levels of student involvement is confirmed in the study about distributive leadership in schools by Kovač et al. (2014). According to the study, the changes proposed in the political documents have not had a significant impact on the distribution of power in schools. The authors focus their analysis on the strict hierarchy and distinction of roles assumed by head-teachers, teachers, and other employees. Student involvement in decision making is proclaimed to be a significant feature of a desirable school culture, but it is still rather rarely present in urban schools.

These and other studies suggest that democracy has been entering Croatian schools much more slowly than it entered the political system in 1991. Students have their place in the school structure but their influence on educational practice and contribution to the quality of education remains insufficiently explored by scientists. That is the main reason why we approached the evaluation of the introduced segments of educational reform from the student point of view. The aim was to establish whether the roles that Croatian students play at school are still rather passive or have they become more active as a consequence of reform efforts that seek to give students a chance to influence their education as a very important aspect of their lives, which would be in accordance with democratic principles. Several questions arise in the analysis of those reform efforts. First, have the proposed changes been implemented in schools and to what extent? Second, how have those changes affected student position in school culture? In other words, are students being encouraged to take an active part in their own education and be active citizens in an urban environment or does the system still primarily seek obedience from students so that the status quo can be preserved?

17.3 Student Perception of Education Before the Curricular Reform: Research Results

The discrepancy between the proclaimed efforts to adjust the school system to the needs of students, and the neglected student voice in the empirical research on the quality of education, emphasised the necessity to conduct the extensive poll on student opinion.

In the study conducted by Marušić a decade ago, the student viewpoint on their education was explored. More precisely, it was the time of the beginning of curricular reform in Croatia and the research was directed at examining the curriculum from the students' perspective. The intention was to investigate key elements of the implementation of the elementary school curricula as seen through children's eyes (Marušić 2006). Without their opinion, we argue, it is impossible to get a clear picture of the school curricula and their implementation.

The study was conducted in elementary schools in all regions of Croatia and 2,674 students of the final year (in Croatian educational system it is the eighth grade), with the average age of 14, took part in it. Approximately the same number of male and female students were involved in it. The students from urban areas dominated the study with 78 %, made up of 11 % of students from the capital.

Student perception of a certain school subject, being rather subjective or not, is important for understanding student overall experience of education. When asked to rate their subjects, Croatian students find Maths, Croatian language and Science to be the most difficult ones. More precisely, those subjects are rather unpopular because they require the most effort on students' part, especially Maths, Chemistry and Physics. Among subjects that are hard to learn is also Croatian language.

Students were also asked to assess some features of school subjects, such as difficulty to learn, motivational effect, the amount of facts learned, correlation between subjects, student choice of topics and student influence on classroom activities.

The motivational effect of teaching is perceived as one of the major pedagogical challenges that schools are facing today. Exposing students to new information at school is far less required than equipping students with tools for autonomous search for pieces of information provided by various sources and media. It has been argued that the information acquiring and processing skills are important because the ability to become informed mirrors the level of democracy in a society (Schulz von Thun 2004).

When it comes to the motivation-raising features of a subject, only a small percent of students (26 % or less) think that school classes make them more curious about any subject. Those students who feel inspired to learn more in their spare time, channel their interest to Biology (26 %), History (26 %) and Geography (23 %) as the top three classes. The students feel most intrigued by those lessons to look up the issues that were raised in the classroom and expand their knowledge on the topic. In the case of the mother tongue, Croatian language raises motivation to learn more only for 8 % of the students.

Perhaps such findings can be partially explained by the fact that the largest number of Croatian students (51 %) find the Croatian language to be the subject that exposes them to too much factual knowledge. More than one third of students claim that the same is the case with Maths (37 %) and Chemistry (36 %). It is rather discouraging for teachers to have students who feel that they are burdened by things they are expected to learn. The reason for such student attitude might lie in their lack of ability to find a way to implement new knowledge into their everyday lives. If their perception of those subjects is assumed to be valid and that indeed school time is used to learn pure facts (and each curriculum reform in Croatia has used that notion

as a starting point), this situation can be considered alarming. Insisting on learning the facts *per se*, without the follow-up that would develop critical thinking in students, can be seen as falling short of the goal of education in its full sense.

Even the fact that subjects are seen as intertwined does not help the students to make more sense out of the facts they are learning. The most overwhelming subjects are perceived to be mutually correlated, especially Physics (51%), Chemistry (49%), Biology (40%) and Maths (37%). That means that students can see the horizontal link between different subjects, which implies that links between different parts of the curriculum make it more coherent.

When it comes to the most direct form of student power, i. e. their possibility to choose what they want to learn about at school and to determine the methods which would suit them best, the level of flexibility found in curriculum cannot be considered satisfactory. Generally, a very small number of students think they can influence the choice of topics and methods. In the case of the Croatian language, only 11% of students believe they influence the choice of topics and methods (18%). The most flexible subject in that respect seems to be Physical Education (27%), but even here almost three quarters of the students feel they have no choices.

A section of the study deals with the teaching methods. Students were asked to assess how frequently certain teaching methods are used in the classroom. Frequently used are “cooperating with other students to complete the task”, “discussions with other students” and “listening to what the teacher is saying and making notes”. Rare classroom situations refer to individual self-regulated activities, such as giving presentations; asking questions; making some objects, paintings, models etc.; doing problem-solving tasks; silent reading; sharing ones ideas and thoughts and discussing them with others; having group discussions with the teacher. Students also report that they never write their comments, reports, observations etc. and they never go on field trips.

It can be concluded that a vast number of students (40%) play a rather passive role in the classroom during lessons (Marušić 2006). Such findings suggest a negative phenomenon in school from the pedagogical point of view. What is evident is that there is a clear discrepancy between what students experience in the classroom and the experience they are expected to have according to the documents issued by the government. It might be reasonable to claim that their right to a high quality education (Convention 1989) is not being fully respected.

Apart from experiencing a rather passive involvement in the school life, students also feel a constant overload: this despite the fact that all the recent curricular reforms were intended to improve the student situation, and minimize student overload. The results of a recent study by Munjiza et al. (2016) suggest that student overload has been a constant and continuous problem of compulsory schooling in Croatia. The phenomenon can be tracked back to 1874 when schooling was made compulsory. When students’ obligations exceed their psychological and physical abilities, i. e. when the tasks cause too much exhaustion and are very time-consuming we speak of student overload. For decades the school infrastructure has been developed in a way that was supposed to make requirements optimal to students, but the curriculum still remains the main source of student overload.

Student engagement in school obligations can be easily monitored if weekly timetables and teaching plans are analysed. In order to examine the trends of student overload at school, the study analyses the teaching plans dating from 1871 to 1946 and from 1958 to 2006 (used in 2016), together with the timetables of average students. At the end of elementary schooling students spend on average 35 h per week at school. Obligatory subjects make up 27 h in all teaching plans examined, whereas hours of elective subjects show the tendency to increase over time. In the timetables it can be observed that an average student spends slightly over 7 h per day at school in his or her last year of elementary school. On the other hand, teachers who work with them are expected to spend 25 h per week in classroom. Compared to their teachers, older students spend 1.5 times longer in class, while younger students spend as much time as their teachers.

The way in which students work individually during elementary schooling is also explored in the study. It is detected that individual work at school and at home contributes to overall student overload as they find it time-consuming. Namely, 20% of the students report that they cannot fulfil their obligation because to do so they would have to study 3–4 or more hours every day.

While there is a legally regulated work overload for adult citizens this is not the case with students. Children aged 12–15 are expected to study for more hours than their teachers are expected to teach. While there have been constant attempts to decrease student overload the opposite has taken place. It must be pointed out that the research does not include extra-curricular activities or after school activities. Given that in towns those activities are more accessible and urban students are given more choice, if those variables had been taken into account it can be expected that students from urban areas would report spending even more time doing school related tasks.

17.4 Student Perception of Education After the Curricular Reform: Research Results

As far as student overload goes, a decade later the situation has not improved. The curriculum from 2006 is still used in 2016 and therefore the potential changes in the student position cannot be attributed to the various school subjects and their popularity among students.

Overall, the Croatian language was placed quite low on the popularity scale in the previous research. Students found it to be the least interesting school subject. It was perceived as rather hard to comprehend and difficult to learn. Also, students believed that they are supposed to learn too many facts during Croatian classes, and they cannot influence the choice of topics and teaching methods. All that is supported by the fact that there was a very small number of students whose interest in Croatian language has been raised due to lessons of Croatian language.

Due to this low status of the Croatian language we decided to check if student perception has changed over time, and thus determine if the reforms have yielded a positive result. The potential positive result of the reform could have been observed in the scope of active learning (Peko and Varga 2014), student initiative in classroom and everyday classroom activities (Peko et al. 2014).

Active learning is such learning that enables a high level of autonomy and self-monitoring, applies various mental strategies and specific cognitive skills to differentiate between important and unimportant pieces of information, analyse and compare, construct new knowledge on the previous experiences, and think critically. Due to all these processes, it enables long term retention of information. A study with 306 participants (students in the 4th and 8th grade of primary school) was conducted with the aim of finding out whether the contemporary classrooms serve as a context for active learning intended to develop student competences. The intention was to explore the presence of certain active learning strategies and their frequency. Peko and Varga (2014) report that most features of active learning students perceive to be taking place often in the classroom. Despite that, it is evident that the transition to learning as a construction has not been yet fully achieved. What is dominant is the transmission of the lowest level of knowledge (information) whereas functional knowledge is neglected (Peko et al. 2014).

The National Curriculum Framework (2011) has been promoting students entrepreneurial competence in education for years, and the authors were intrigued to find out whether the contemporary teaching supports its development. More precisely, the focus was on what aspects of student initiative they themselves perceive to be most frequently stimulated through the learning activities that take place in the classroom. The participants were primary school pupils in the fourth and eighth grade from urban areas. The results suggest that students perceive mutual assistance as the most frequent activity that enables them to express their initiative during regular classroom activities.

Student initiative is a segment of entrepreneurship that needs to be enhanced through classroom activities. Therefore, a study in two bigger cities (Zagreb and Osijek) and two smaller cities (Slavonski Brod and Pula) was conducted with 966 students (4th and 8th grade of elementary school). The results can be directly linked to the results obtained by Marušić (2006). Peko et al. (2014) found, for example, that 46% of students believe that they are expected to learn abstract facts during the lessons of the Croatian language, which is rather similar to students estimates before the reform (51%). Also, a majority of the students now perceive that they can influence the choice of topics and methods (74% claims it happens rarely or never, and 26% claims it happens often and very frequently). The most frequently used teaching methods are “listening to what the teacher is saying and asking questions”, “reading from textbooks”, “cooperating with other students to complete the task”, and “learning facts by heart”. What often takes place in the classroom is “individual task-solving” and “discussions with other students and with the teacher”, which is a certain improvement compared to the time before the reform. On the other hand, the majority of students still report that classes never take place outside the classroom, and that teacher is supposed to have all the answers as the ultimate source of infor-

mation. They also rarely use the Internet or go to libraries to explore topics covered at school. In addition, they very rarely look up the answers to the teacher's questions they did not know, but expect him to provide it. They are also rather passive when it comes to assuming the role of teacher in order to explain something to their classmates, for they report it happens rarely. Rare are student projects in which they would have taken control over their learning, and which would enable them to make some objects, posters, paintings, models etc.

These listed results suggest that over time student position has slightly improved making them more active in the processes of learning and contributing to classroom activities. The studies presented focused solely on student perception while putting aside the teacher's point of view and that is why the results should not be understood as the whole truth. Nevertheless, they bring to light the mostly marginalised perspective of those for whose benefit all curricular changes have been made. If students do not perceive that education makes them braver to face their future, then we cannot speak of high-quality education, regardless of the changes intended. All indications suggest that there is a lot of space for more effective encouragement of student activity and initiative: as Darling-Hammond (2007) emphasises, schools must be re-constructed from within in order to make changes sustainable, keeping in mind that grassroots are not only teachers but students as well.

17.5 Conclusion: Is New the Same as Old?

After the critical analysis of educational policies it can be concluded that all documents issued by the Ministry of education, science and sports of the Republic of Croatia demand active involvement of each and every student in the process of their education. Their position could be changed if the culture of teaching is altered in a systematic manner. The educational policies call for such a culture of teaching that would promote the active position of students. Accordingly, different teacher competences are required so that they would be able to achieve what is proposed by the government. Teachers should be able to assume the role of a mediator between students and the segments of culture that need to be learned. The teachers' task is to enable students to gain knowledge, develop their skills and abilities and shape their beliefs and attitudes by securing all available sources of information. Modern educational theories are strongly opposed to encyclopaedic approaches, formalism in the classroom, and student passivity because those hinder student learning outcomes. Contrary to that, a wholesome approach to the development of student personality must be evident in contemporary classrooms. Only such teaching that helps students to experience personal success and improve themselves in every aspect can be labelled as effective.

Nowadays, it is of vital importance that everyone receives assistance in the process of learning how to learn, as well as how to process and apply what has been learned. Every individual should be able to think critically and develop a sense for personal responsibility and achievements. Teaching aims at developing student

competences, at preparing them to assume the role of active citizens, and at stimulating positive self-awareness. Teachers are facing decisions about teaching methodology which should enable progress of every student. Apart from conventional basic knowledge, abilities and skills, it is advisable to develop their critical thinking, problem-solving abilities and digital literacy as well as help them embrace life-long learning, adaptability and accountability. That calls for goal-oriented planning that is directed toward achieving prescribed educational standards that students are familiar with. The teacher has to make decisions about teaching methods that should lead to expected results materialised in increased level of abilities. In other words, teachers help students to look for, organise and manage their knowledge by structuring lessons in a way that is adequate for students' aptitude.

In that sense, teachers represent the carriers of changes in the educational system. Therefore, they need to be given the opportunity for professional development and life-long learning in order to become competent, and professionally developed persons who contribute to the constitution of school culture. It is important that teachers on all levels of the education system take this path and consciously put effort into making changes in the existing system so that each student would become a more empowered individual. The analysed documents are intended to give impulse to initial changes when it comes to student position, but they seem to have failed to enter the everyday classroom practices in all levels of schooling.

Further attempts remain to be isolated on the political level. In 2013 the debate was initiated about the Strategy of Education, Science and Technology, which was supposed to be the first such strategy in the history of the independent Republic of Croatia. It was approved by the Parliament in 2014, with the intention to contribute to the creation of the innovative society and economy that would be able to respond to future challenges. According to the Strategy (2014), the mission of the education system is to ensure quality education available to all, regardless of their gender, origin, social circumstances, religious beliefs, sexual orientation or learning abilities. This is in line with the educational policies of the EU, as well as are the following keywords of the Strategy (2014): creativity and innovation, original problem-solving, autonomy and accountability. An individual teaching approach is emphasized on all levels of education, and it should further improve the student position.

There is the ongoing debate about how those goals should be transferred into the national curriculum, which is expected to provide all students with the opportunity to learn and to achieve success. This national curriculum is undergoing a new reform, which should be implemented in the following years. It can be argued that this new attempt will not reach its full potential, unless there is a more systematic support from the state. It is not enough to support changes in a declarative manner, but the Ministry of science, education and sports should take a more active part in it. It should not only issue the directive, but should also provide a continuous support to practitioners, and evaluate the changes in quality of education. It remains to be seen what kind of effect the current reform will have on student position. The answer to the question: "Is the new national curriculum going to improve the stu-

dent situation regarding more appropriate teaching approaches, reduced student overload, and more active student position?", will soon become evident.

Chapter 18

Habitus of Multilingual Children and Youths in Urban Areas in Eastern Croatia

Klara Bilić Meštrić

18.1 Introduction

Eastern Croatia, bordering Serbia to the east, Bosnia to the south and Hungary to the north, has witnessed numerous changes in governments and languages, either official or unofficial, and is known for the devastating consequences of the war that took place in the 1990s in this part of Croatia. However, in spite of the resulting depopulation processes,¹ in terms of demographic data, there are according to the last Census (2012) still 20 official minority languages spoken in the region. Many of these languages are nurtured either at home, in minority education models in many schools² or in numerous ethnic associations in the region.

Complex socio-historical processes have also shaped the entangled relations of language and identity in the multicultural urban areas of Eastern Croatia, and it is the aim of this chapter to present linguistic habitus of the multilingual children and youths that belong to these multilingual communities. Though this research was conducted in spring 2012 in Eastern Slavonia the consequences of the Croatian War for Independence from the 1990s are still palpable. Most of the places mentioned further in the texts were in the Croatian territory occupied by the Serbian paramilitary forces (Beli Manastir, Tenja and Vukovar) until the peaceful reintegration that

¹Osijek, the administrative and university centre of Slavonia and Baranja, has witnessed the decrease of 8 % in population between the last two censuses (Census of 2001 and 2011).

²In Croatia members of national minorities can effectuate their constitutional right via three basic models – A, B and C. The A model refers to classes in the language and script of the national minority, B refers to bilingual classes where natural sciences subjects are taught in Croatian, and humanities and social sciences subjects are taught in the minority language. The model C refers to nurturing of language and culture in up to 6 lessons a week (MZOS 2015).

took place in 1998 when Croatia regained its territory, while Osijek is the only place in this chapter that was not occupied. However, it was a city under the siege for a year with only one route out of it. It is also the city which is a regional and university centre, and most of the children and youth involved in this study are in some way connected to it.

In spite of the time lapse, as pointed out by Šundalić (2006: 13), after the peaceful reintegration neither economic nor the demographic renewal in Eastern Slavonia took place. In addition to the war, Šundalić (ibid.) makes a strong point that globalization has been one of the most important factors in this process. In a globalised world, languages are perceived as commodities with certain value and consequently will behave differently on language market (Tan and Rubdy 2008). The markets, or fields, operate in orders of indexicality. The languages that are perceived of higher value will be those at the top of these orders, while those with low status will stand at the bottom of the order and these hierarchizing processes, as this paper aims to show, are often internalised by children and youths themselves. This sort of influence of globalisation on minority identities has been described by Blommaert (2012: 154) as follows: “(...) forms of ‘hard’ socio-economic marginalization are often accompanied by forms of ‘soft’ marginalization: the marginalization of particular cultural features, identities, practices and resources such as language.” The purpose of this chapter is to describe the ways how these processes are reflected in linguistic habitus of the children and youths coming from urban centres in Eastern Croatia.

18.2 Methodology

18.2.1 *Bottom-Up Approach*

In 2012 I conducted a series of interviews with multilingual children and youth from urban areas in Eastern Slavonia regarding their *linguistic habitus*³ with the aim of studying their linguistic identity and the way of being in the world. This line of research of linguistic identities, taking the actual, lived experience as their starting point, is based on similar, earlier studies. Dina Mehmedbegović used a similar approach in her study on multilingualism in England and Wales (2011), as did Adam Le Nevez (2006) in his study of the Breton language and its status in France. Therefore, this research started from ‘below’. Pennycook (2006: 62) argues the legitimacy of such approach by insisting that “we need to look not so much at laws, regulations, policing, or dominant ideologies as at the operation of discourses, educational practices, and language use.” i.e. as Tollefson explains it (2006: 47) those processes that take part in the formation of culture and knowledge. As I have

³Bourdieu defines habitus as a durably installed set of dispositions which tend to “generate practices and perceptions, works and appreciations, which concur with the conditions of existence of which the habitus itself is the product (Bourdieu 2005: 13)”.

noted earlier (Bilić Meštrić 2015) this approach can be seen in the light of the idea that “there is a considerable policy formulation and institutionalisation of linguistic practices at the other end of the policy spectrum – that is local communities and contexts.” (Canagarajah 2006: 154). Furthermore, by having children and youth as interviewees, my hope was to gain spontaneous, politically incorrect answers the elders would avoid.

18.2.2 *The Participants*

In addition to the generation criterion, the basic criterion for the selection of the participants was the precondition that the children and youths participating in the research were growing up using a language other than Croatian in their immediate environment, i.e. a language different from the Croatian idiom typically spoken in the urban centres of the region. I was able to get in contact with the participants for the most part thanks to my colleagues and friends working in education, who introduced me to the students in their schools who speak another language apart from Croatian or another foreign language which is normally included in the syllabus.

As the notion of language in this chapter does not primarily refer to a system of signs, but rather to a form of local practice, where languages are perceived as products, as well as generators of “deeply social and cultural activities in which people engage” (Pennycook 2010: 117–118), language is primarily observed here as a social activity. This justifies the selection of pupils at Vladimir Nazor Elementary School in Čepin, a suburb of Osijek, who speak the Croatian language with a strong Bosnian element. Thanks to Lidija Šaravanja, a teacher of English and German and my colleague at the PhD study programme in linguistics at the Faculty of Humanities and Social Sciences in Osijek, I discovered that a great portion of students and teaching staff at this school belong to this particular speech community. Even though official statistical data are not available, I found out in the course of my cooperation with Lidija and her students that almost half of the pupils belong to this community.

Another interviewee, whose linguistic habitus defies the definition of language in traditional linguistics, primarily due to the fact that his mother tongue has no official status⁴ at the time of the interview, was a Roma-Bayashi student from Beli Manastir at the Faculty of Teacher Education Osijek. His native language, Roma-Bayashi, is not documented in the records in the Republic of Croatia as 1 of 20 officially

⁴The teaching of the Romani language organised at the Faculty of Humanities and Social Sciences in Zagreb is fiercely criticized by the Bayashi community, considering that Roma-Bayashi is the language spoken by the majority of the Roma community in Croatia: “The fact is that 90 % of the entire Roma community in the Republic of Croatia are Roma-Bayashi, to whom the Romani language is completely foreign, and they do not want to accept Romani-Chip as their mother tongue since the Bayashi language, which they have been passing on by oral tradition for centuries, is actually the OLD ROMANIAN LANGUAGE ...” (Balog 2015). This information confirms that the discourses of the elites generate knowledge without taking actual practices into consideration.

recognized minority languages. This is partly due to a greater issue; in reception of a non-Romani population, the Roma as a community are perceived as homogenous, whereas the reality in Croatia is that there are two major groups – Romano-Chip and Roma-Bayashi. The Romano-Chip language belongs to the Indo-Iranian language family and its speakers are believed to have migrated from the northwest of the Indian subcontinent. The Roma-Bayashi, however, do not belong to this same group, which is evident from the fact that their language is considered a sub-dialect of the Romanian language; they have traditionally populated Croatian territory along the Drava River and are either Catholic or Christian-Orthodox by denomination.

Although recognized in international and Croatian academic discourse (Jelaska and Cvikić conducted linguistic studies on children in the Bayashi community in 2009), this group officially defies traditional categorisation, which is further complicated by the fact that this language is neither standardized nor recorded.

Other participants were easier to identify and select merely due to legal status of their language and the fact that all these languages are taught in Croatian schools through some of the minority education models. All of them attended some minority education model for Albanian, Hungarian, Slovak and Serbian languages respectively, while the two girls who grew up in Germany had German as a foreign language.

The participants were the following:

One child and two adolescents growing up speaking Hungarian and Croatian.

The interview was conducted with one elementary school student and two secondary school students. All girls have Hungarian as their mother tongue, although they frequently use Croatian. The oldest girl attended the A model for the Hungarian language and culture in Osijek, while the two younger girls attended the C model for nurturing of the language and culture in up to 5 lessons a week.

Three children growing up speaking a Bosnian dialect of the Croatian language.

The interviewed children are from Čepin, a suburb of Osijek, where their parents moved during the war in Bosnia. The children speak a Bosnian dialect of the Croatian language, mostly that spoken in Croatian parts of Bosanska Posavina.

Two children growing up speaking German and Croatian.

These were two grammar school students born in Germany as refugees. Their parents insisted on speaking German at home in Germany. The girls moved to Osijek in higher grades of elementary school. They learn German as a foreign language now.

Two children growing up speaking Slovak and Croatian.

These interviews were conducted with a girl and a boy from Osijek. They both attend the C model aimed at nurturing Slovak language and culture. This is the language of their grandparents and it is not frequently used at home.

One Roma student growing up speaking the Roma-Bayashi and Croatian languages.

This was the oldest interviewee. He was still a student at the time of the interview and now he holds an MA degree in primary education. At home, his family

speaks exclusively Bayashi, which, as mentioned, is not officially recognized as a minority language in Croatia. He studied in Osijek, but he originally comes from Beli Manastir, the centre of the Baranja region.

One student growing up speaking Albanian and Croatian.

This interview was conducted with a pupil who attends the C model in Osijek. This pupil is also of Albanian descent, he speaks Albanian at home and he spends his summers with his grandparents who speak Albanian exclusively.

Six students growing up speaking Serbian and Croatian.

These interviews were conducted in Tenja Elementary School with pupils in 7th and 8th grade, and with one Osijek grammar school student from Vukovar. All children attended the A model in elementary school for Serbian language and culture.

18.2.3 Interview Questions

The research was conducted via the semi-structured interviews. Main questions were defined at the beginning (they are listed and explained below), but some questions also emerged to be of importance (as the official status of the Bayashi language, for example).

One of the primary topics I discussed with my interviewees was the question of their own language practice. This particularly referred to the question of the extent to which they use their mother tongue (if it is not Croatian) or the other language (in cases of interviewees whose native language was Croatian, but who attended the model C educational programme for Slovak or in cases where it was difficult to determine the mother tongue, as with the two girls born in Germany, whose parents insisted on the use of German at home with the purpose of better assimilation). The frequency of particular language use indicates the significance attached to this language. Mehmedbegović (2011: 34) claims that, since the parents are the primary policy makers, their decision on which language they speak at home will have a crucial impact on the linguistic choice of their children. Meanwhile, the issue of language practices bears vital importance for the research of language policies with regard to language ideologies, agencies and language ecologies (Ricento 2006: 17–19), i.e. as Ricento asserts: “Language policies are made, or are implicitly acknowledged or practiced, in all societal domains (Ricento 2006: 19).”

Since language is not here perceived as an integrated, fixed system, but rather as a form of local practice which is a product of deeply set social and cultural activities in which people actively participate (Pennycook 2010: 117), another issue I wanted to address is the matter of cultural heritage. Therefore, we discussed the cultural heritage, i.e. songs and stories from the region where their parents came from/or where they originally came from. I wanted to see if and how much they were acquainted with his cultural heritage and if they knew any songs or children stories typical of their mother tongue.

Another point of interest in my research was to establish how often my interviewees discussed their mother tongue or language spoken at home (other than Croatian) with their schoolmates and teachers at school. This question led to a significant insight into how much attention is given in schools to other languages apart from Croatian and e.g. English or German as parts of the regular syllabus during the course of education. Aside from this, it has also indicated the level of awareness of the existence of other languages in Osijek schools and the agency of teachers.

We also discussed language as a potential or real problem. This question was aimed at establishing whether these children ever experienced any problems or discomfort for using their mother tongue or due to insufficient knowledge of Croatian. This question turned out to be a burning issue for some children, since some of them perceive their mother tongue as a powerful (negative) symbolic tool in the context of recent history and the Croatian War of Independence, which has had a severe impact on this region.

All these questions were connected to the issue of language use in the future, i.e. the future of these languages themselves. I was very interested in these students' vision of the future regarding the use of their mother tongue or second language. In this respect, their answers ranged from a very assertive *yes, of course* to a complete lack of interest in the subject matter. This question, along with all previous ones, was covered with the fundamental one: do they perceive this language as an asset, i.e. a recognized value in society? This question was also a particular counterbalance to the question of language as a problem. I wanted to see whether these children and youths perceive their language as something worth nurturing and whether they viewed it as socially valuable.

18.3 Data Analysis

The interviews with children and youths have indicated that their attitude towards language and their linguistic practices are not monolithically set in the belief that language is either an asset or a problem. As these interviews have shown, language can be perceived as both; it can be a source of pride or a source of shame. Language is a site for the balance of power, most often unstable and shifting, related to dominant ideologies that play an important role in the building of the linguistic habitus, since identities do not emerge in isolation, but in specific forms of social agency described by Bourdieu (2005: 13) as a durably installed set of dispositions which tend to “generate practices and perceptions, works and appreciations, which concur with the conditions of existence of which the habitus itself is the product.”

Blommaert (2006: 238) emphasises a strong connection between language policies and identities. Ideological attitudes are reflected in the qualitative judgments these pupils and students have expressed about their native and other languages. These judgments are best confirmed in their system of beliefs about languages, i.e. about “socially and culturally embedded metalinguistic conceptualisations of language and its forms of usage” (Blommaert 2006: 241). What is at work here is the

previously described habitus which generates specific linguistic behaviours. These ideologically constructed attitudes manifest themselves as a conceptual apparatus where languages have certain statuses, values, functions etc. In children and youths, these attitudes devise their multilingual identity through a wide range of conceptual images which illustrate language as an asset, as something that belongs to a (closed) community as a form of hidden practice, but also as a part of identity whose value comes to display in another physical space, and finally as a form of resistance.

In addition to political reading, the input from linguistic anthropology and the notions of marked and unmarked identities (Bucholtz and Hall 2004) have also contributed in the data analysis as unmarked identities can be seen as those of the elite and the powerful, which in the Croatian context, as the data show, are the Croatian and English language. On the other hand, the use of other languages represents manifold and layered marked categories of linguistic identity that will be analysed in the following subchapters.

18.4 Interpretation

18.4.1 Linguistic Identity as an Asset

Most children and youths I have spoken to perceive their own multilingual identity as a personal asset, although their answers indicate that the underlying reasons can be entirely different – affective, cognitive, pragmatic or self-evident.

The children from the elementary school in Čepin, who nurture the Bosnian dialect, display a strong affective dimension through statements like the following from Marko: *“I’m happy to speak this sort of mixture of dialect, I’m really glad”*. The same can be observed in Marko’s and Ana’s wish to hold onto this *“kind of”* tradition. In this case, the asset is perceived as a form of common, albeit unspecified heritage⁵ worth nurturing. Anto, however, takes a somewhat different attitude. His conceptualisation of language is based on “monoglot” ideology (Silverstein 1996: 284), where there are “better” and “worse” versions of language (Bourdieu 1992: 26–27; Gal and Woolard 2001: 1). As opposed to Marko and Ana, who would like to maintain their language, Anto takes a different stand towards the future of their language by expressing his hopes that his children might someday *“...speak better, more grammatically, more Croatian...”* However, since identities exist as dynamic constructs, in contrast to his previous statement, he too would like for *“this dialect to persevere.”*

⁵One of the issues certainly worth investigating in further research would be to try and define this “kind of tradition”. According to statements from the interviewees, it is closely connected to the common experience of migration, exile and maintenance of common speech, yet it does not involve other cultural artefacts such as books, stories and songs. The existence of such a community brought together by common experience in Osijek can be perceived as a valuable source of ethnographic and ethno-linguistic data.

Francesca and Viktorija perceive their knowledge of German as a cognitive, but also pragmatic potential. They both offer help to their German teachers and they both occasionally conducted German classes in elementary school. Francesca considers herself to be a “*dictionary*”. Thanks to her knowledge of German, she often participates on projects and has better overall success at school. The affective dimension here is not as visible as in the statements of the children from Čepin, but these students would also like to maintain their knowledge of the language like the children from Čepin. Viktorija’s worries that she might forget it speak in favour of this. The pervasive ideology of these attitudes stems from the perception of German as a practical skill which can be helpful in factual situations – education, work and the like.

Knowledge of Roma-Bayashi also turns out to be a cognitive asset⁶; however, this will not manifest sooner than at university. Thanks to this potential, Duško participates in projects, gives lectures and is cooperating with his professor in publishing a picture book. The background ideology is the idea that most Roma do not attend university (as Duško himself pointed out, most Roma drop out of education programmes as early as elementary school).⁷ Duško’s example challenges common ideological patterns, as well as actual practices and, therefore, it represents a potential codified into a form of intellectual capital by the academic community.

The generally accepted idea that knowing a language is a self-evident asset is recognized in the fact that Duško, Melanija, Matija and even Tihana quoted a well-known Latin proverb *Quot linguas calles, tot homines vales* – you are worth as many people as the languages that you speak. The origin of the proverb, dating from as early as the Holy Roman Empire,⁸ indicates the multilingual reality of that period, whereas different variations of this proverb in multiple languages give evidence to the importance of Latin in Europe throughout the centuries. Moreover, its subsistence indicates a centuries-long multilingual reality suppressed by authoritative discourses based on Herderian idea of one land, one nation and one language (Bourdieu 1992: 27; Toulmin 2012: 521; Braunmüller and Ferraresi 2003: 1–3).

Apart from the abstract conceptualisation of language as an asset per se, the students have also pointed out several pragmatic advantages – these are situations where their language knowledge can help border police officers in conversations with illegal immigrants (Duško), the aforementioned participation in school projects (Franceska), a better overall GPA (Ivana) or employment advantages (Melanija).

The only two interviewees who did not perceive language as an asset are one of the siblings who speak Hungarian, Laura, and grammar school student, Vanja. To my question of whether speaking Hungarian is an asset, Laura provides the following

⁶Mehmedbegović (2011: 19) wrote about language as an individual cognitive asset. She points to the researches which have shown a positive correlation between bilingualism and mathematical skills in children (Cummins 1991: 84 as cited in Mehmedbegović 2011: 20), and general cognitive advantages arising from meta-reflections on language (Vygotsky in Mehmedbegović 2011: 20).

⁷The 2008 statistical data indicated 11 members of the Roma minority in tertiary education institutions (Novak 2008: 1).

⁸For more on the origin of the proverb see Braunmüller and Ferraresi 2003: 2.

answer: “*Hungarian? I don’t know if it is an advantage. Some say it is. I have never been in such a situation.*” This attitude mainly indicates a lack of metalinguistic reflections, rather than an actual attitude that language is not an asset. This is hardly surprising, considering her age. Vanja’s attitude of indifference towards the language she will speak in the future is analysed below.

The perception of language as an asset pervades all other ideas, however with certain shifts. The following subchapters will outline the ideological patterns reflected in the attitudes of children and youths with a still dominant idea of language as an asset, as well as certain shifts from this ideological matrix with reference to local context.

18.4.2 Linguistic Identity as Part of a (Closed) Community: Language as Hidden Practice

The idea of language as a community value resides in the foundations of the aforementioned ethno-cultural approach. Language is here perceived as closely related to specific, often ethnic communities and it represents a central element of ethno-cultural identity (Le Nevez 2006: 6, 24; Skutnabb-Kangas and Philipson 2008: 3–14; Lo Bianco 1987: 1; Ricento 2005: 357). The basic idea is the apprehension that the extinction of a language leads to the extinction of an entire culture and the heritage of a particular community (Fishman 1991: 116; Lo Bianco 1987: 1). Sources of law in the Republic of Croatia which regulate the use of minority languages and scripts, as well as education models are based on this ideology; the perception of language and the behaviour of children and youths often substantiate the internalisation of such ideas. However, the idea of ecological approach that perceives linguistic diversity as a community value that runs through the entire complex system, through a systematic dialogue with other communities, is evidently absent in the answers of these children and youths. Language belongs to the private sphere; it is a part of closed community and often functions as a form of hidden practice. This idea, however, completely pervades Amar’s, Ivana’s, Duško’s, Ljuban’s and Nikola’s answers. This hidden dimension was absent in Melanija’s, Marko’s, Ana’s and Anto’s answers which will thus be analysed first.

Melanija’s testimonies about Hungarian speech communities around Osijek are an interesting example of the close connection between language identity and a particular community. Her statements confirm the idea of language as a local practice (Pennycook 2010), but also reveal her language identity which differs from the “archaic” Hungarian spoken in her village and, as such, represents an entirely individual practice in that community.⁹ The ideological background of this individual practice can also be analysed in light of the belief in the existence of better, standard

⁹Later on in our conversation, Melanija, Laura and Žaklina’s father, who is the founder of a cultural arts society in Hrastin, was proud to emphasise that the Hungarian spoken in Hrastin is one of the purest and most correct forms of the Hungarian language. It might be interesting to compare

idioms on one hand, and jargons, dialects etc. as less valuable varieties on the other. Melanija was educated in the Hungarian Cultural Centre in Osijek in the standard Hungarian language through most of her elementary school and her entire high school education; the reasons for the internalisation of such practice might hence lie in the significance of standard in the education system as one of the fundamental ideological state apparatuses (Althusser 1986), but also in the effects of globalisation that enables Melanija to connect with other speakers of Hungarian through a common language and modern technologies.

Marko, Anto and Ana's statements give evidence to their language identity as a part of the community. However, as opposed to children whose language is shaped by discourse, Marko, Anto and Ana are not familiar with a single narrative, song or rhyme common to their particular language. Therefore, apart from speech, there are no other cultural elements embedded in their identity practices. The question is what will happen to their linguistic practices once they are no longer a part of the community where both teachers and the majority of pupils talk in this way.

Other interviewees also mainly perceive their language as a community value which is often connected with wider range of practices. However, as opposed to Melanija, Marko, Anto and Ana, there is a dimension of seclusion. Language is an asset, but only within given frameworks, most often those established by the community.

This background ideology suggests that Amar's attitudes about the Albanian language are also worth analysing; he considers it an asset yet uses this language "*only at home*", over the summer, which he spends with his grandparents in Macedonia and at school where he attends the model C education programme for nurturing the Albanian language and culture. Ivana and Matija, who also attend the model C programme for Slovak, gave answers which also suggest a strong connection between language and a (closed) ethnic community. Matija expresses the following idea several times in different ways: "*Slovak is not as important as English or German. That language only makes sense within the community...*" or "*Why would this matter to anyone? It's the same if I spoke, say, Hungarian.*" He further states: "*The community works for itself, and if someone joins it, it will only be because they are Slovak and not because they are interested in this.*" This reflexion on language is not general and some other languages would not have such an exclusive value. To my question if it would make a difference if an English boy was sitting in their class, Matija answers: "*Well, that would matter; after all, English and German are the main languages*".

Duško expresses the gist of the ethno-cultural approach by connecting the Roma-Bayashi language and ethnic identity; to my question on whether he plans to use his language in the future, he answers: "*Yes, of course, I'm not Roma if I don't speak Bayashi, it's a constituent part of my identity.*" However, his experience so far confirms that it is a hidden linguistic identity, i.e. a form of practice within a closed

the attitudes of Melanija's father to her decision to speak Budapest Hungarian in some future research on language diversity in Osijek and the nearby area.

community: *“I haven’t had any problems because I haven’t used it. My parents taught me not to speak it in public so that people can understand me.”*

Even though the attitude that Croatian and Serbian are the same language dominates among pupils from Tenja and the grammar school student Vanja, we also witness the practice of localizing one dimension of their speech, and this localisation of their linguistic identity is emphasised in their statements. They describe their speech in different ways. To my question on whether she speaks Serbian at home, she says they all speak in the Ijekavian dialect; when asked to define and name her language, she says the following: *“I don’t know. I went to a bilingual school; I have a svjedodžba and svedodžba (school report card in ijekavica and ekavica, respectively). You might say I speak Serbian, but it is not the same as the Serbian spoken in Serbia”*. As we have already seen, Ljuban defines his speech as follows: *“We speak the Serbian language, so there isn’t much of a difference, but let’s say it’s Serbian. We are talking about some greetings here like čao, zdravo, and some words like kruv, leb (bread); there are some differences, but all minor”*. Nikola defines the language he uses as Croatian, unless *“...relatives from Serbia come to visit – then it is lepo belo mleko”* (nice white milk in ekavian). However, he still comes to the following conclusion: *“I think it’s the same language, Croatians are just making a fuss about it”*. About the differences, Miloš adds: *“only some differences in grammatical cases, but that’s all”*. Tihana, who emphasises that knowing a language is an asset, still does not see *“much of a difference”*.

The ideological patterns behind such a perception of language are extremely complex. Here they also refer to general reflections about ontological determinations of language statuses, but also to individual decisions on appropriate language (Bourdieu 1992: 21–49) which contradict ontological definitions of what language is. In the first case, on the level of ontological perception of Croatian and Serbian as one language, the ideological patterns are deeply set into the scientific and historical discourse. They can also be analysed through Herderian ideas of one nation, one land and one language; in this region, these ideological patterns can be traced back and observed through the development of the Illyrian through the Illyrian-Slavic, the Pan-Slavic and the Yugoslavian idea (Marijanović 1984: 426) coinciding with the existence of a common South Slavic elite, which has remained only in the form of ideological beliefs after its collapse brought on by hegemonic tensions.

Yet a different ideological matrix, the one about the existence of a legitimate language, is evident through hidden forms of practice since a large number of children and youths stress that they pay attention to better adjustment, depending on the community they are in at a given time. Vanja mentions the following form of adjustment several times: *“I have to be careful when I speak, simply to fit in better, so it doesn’t turn out that everyone speaks ijekavian, and I speak ekavian. But so far, I haven’t had any problems when I let something slip”*. Ljuban, Nikola and Miloš also pay attention to adjustment. Ljuban’s statement about how *“People lost their loved ones here; I know that my language might hurt somebody: I have to be careful all the time... at the bus stop, in the shop...”* resembles Nikola’s description of his behaviour in front of people who lost their loved ones: *“... I am careful not to offend them, otherwise I normally say hiljadu, zdravo (thousand and hi in Serbian,*

respectively)”. Language is here a form of local practice, but the question raised does not concern its grammaticality but its legitimacy.

The ideological background of these attitudes and their subsequent local practice lie in more recent historical events; the Croatian War of Independence has created a symbolic field for the Serbian language which is still perceived negatively in reality, whereas the linguistic behaviour of children and youths indicates the wide acceptance of these ideological matrices and feelings of guilt connected to practices of Serbian ethnos, whereby the distinction of acceptable/inacceptable language plays a crucial role.¹⁰ Statements like: “...if I let something slip...”, “I have to be careful all the time...”, “I am careful not to offend them...” are an indicator of the fact that this is not simply a pragmatic or instrumental code switch but an affective activity; what is at work here is a kind of “local metalinguistic and language ideologies that are embedded in complex cultural and historical moments...” (Schieffelin 2000: 296).

Even though pupils from Tenja do not perceive the difference between the two languages on the conceptual level, most of them are aware of the advantage they gain from education model A, which enables them to have separate classes aimed at nurturing their language and culture. Nikola’s statement about how he feels sorry for Serbs “*who attend Croatian classes because they are missing out on so much: Serbian script, history, religion, poems, literature...*” conveys the gist of the advantage they see in this education model. Vanja’s answers, however, offer a different angle on this issue.

18.4.3 Linguistic Identity as a Form of Resistance

When asked about her opinion on education model A for Serbian language she attended and the advantages of a bilingual education, Vanja states the following: “*It would be better if Serbian was an optional subject – so that we could still learn Cyrillic script. Otherwise, why do we have to be segregated?*” As mentioned in the subchapter about language identity as an asset, none of my interviewees expressed an opinion that they did not regard language as an asset, except Laura and Vanja. Likewise, the opportunity to nurture language and script was recognized as valuable by all other interviewees.

While Laura’s reflections on language are more a manifestation of a still under-developed consciousness, i.e. a lack of metalinguistic reflections, Vanja’s situation is much more complex. Vanja comes from Vukovar, a city characterized by a deep-seated ethnic division,¹¹ where insisting on bilingualism can only be perceived as further insisting on this division. Therefore, Vanja’s statement about the future of

¹⁰For more on the importance of language in determining identity see Bucholtz and Hall (2004).

¹¹For more on ethnic division in Vukovar see Čorkalo Biriški and Ajduković (2003, 2007). For a recent short analysis of the city’s ethnic and linguistic division see DW’s <http://goo.gl/1eTmEf>.

language: *“Honestly, I don’t care. It’s of no importance to me...”* should be observed in light of background ideologies whereby the existence of one or two languages is placed on the ideological continuum with a complex history, a continuum that represents a site for growing tensions in contemporary linguistic and social analyses. Vanja’s attitude reflects the belief that the distinction between the Croatian and Serbian language is a social construct and a source of ideological division of the community, as well as actual practices where this division strongly affects life in a city such as Vukovar. Vanja’s indifference can be interpreted as her refusal to participate in the division of the community rather than her willing intention to renounce her idiom. In this case, language identity operates as “a form of resistance to imposed or assumed identities” (Vaughan 2013: 1).

18.4.4 Linguistic Identity as Somewhere Else

This conceptualisation of linguistic identity, which is somewhere else and not in the common, public area of the city, can be observed through the analysis of places where other languages are perceived as a value of a closed community and are often used as a part of hidden practices. However, besides the fact that children and youths perceive their identity in this manner, they often literary visualise their linguistic identity spatially in another place. To the question whether speaking Albanian is a personal asset, Amar says: *“Yes, in Macedonia, Albania and Kosovo, but not here...”* Miloš gives the following opinion about education in the Serbian language and script: *“We can use two scripts, if we go somewhere else, it becomes an asset.”* All the interviewed children from Tenja wish to continue their education after high school in Serbia, or in Nikola’s case, in England. Matija, who attends the model C education programme aimed at nurturing the Slovak language and culture, also wishes to study at a university in Slovakia; however, he perceives the current interest in Slovak in the city as follows: *“The community works for itself, and if someone joins it, it will only be because they are Slovak and not because they are interested in this.”*

These attitudes prove a lack of sensitivity and recognition of minority identity practices as important for the entire local community – the city itself, but also indicate the dominance of an essentialist approach where the connection between one language and one nation is the central point in ideological reflections on language. Furthermore, ideological matrices where certain languages are considered more important than others are evident in Matija’s answer to the question of whether his classmates would show more interest in a pupil’s mother tongue if they had a boy from England in class: *“Of course, that would make a difference. After all, English and German are the main languages.”* Accepting these beliefs where an important part of one’s identity bears no significance for the entire community will naturally lead people to open up opportunities and spaces where these aspects of identity will gain prominence and present a certain personal capital.

18.4.5 *Linguistic Identity as Field of Negotiation and Change*

The abovementioned linguistic identities can be universally observed through “identity orientation” as endorsed by Le Page and Tabouret-Keller (1985: 116). The focal point here is the conceptualisation of language as a repertoire of socially marked systems inseparable from actual practices, where fixed categories of ethnicities, languages, dialects and different languages are critically analysed (Lo Bianco 2004: 753). The emphasis lies on individual creative and complex variations which in fact reflect the actual perpetual negotiations of personal linguistic identities. As Grin (2003: 1) asserts, the analysis of (linguistic) policies deals with choices. Every speech act is hence observed as an attempt to project one’s “inner universe”, which is as such characterized by adjustments speakers make based on feedback from their interlocutors towards language in use. The processes of projection and adjustment (or focus) are the foundation on which linguistic identities are built (Le Page and Tabouret-Keller 1985: 181). Precisely these processes can be observed in the linguistic behaviour of the interviewees. This theory is related to Coulmas’ attitude that speakers adjust their speech depending on how they are approached and the claim that speech is a matter of choice (Coulmas 2013: 20). In other words, individuals inhabit and create a “multidimensional symbolic universe” with plentiful options of linguistic choices based on processes of projection and adjustment (Le Page 1988: 32 as cited in Lo Bianco 2004: 754).

It is interesting to observe how these processes start taking place at the earliest age. As we have seen earlier, the boy Amar completely separates his linguistic repertoire, and his choice of the language he uses is also physically completely simplified (Albanian at home, at nurturing classes, with his grandparents in Macedonia, and Croatian in public areas of the city), similar to Duško, but also to Ivana and Matija with Slovak. The only difference with the last two is that they do not use the second language with their parents, but grandparents. Besides at school, German is the language of choice for Franceska and Viktorija in conversation with their sisters and the language of contemporary technologies. The choices of other interviewees are somewhat more complex. Melanija adapts her linguistic choice to her habitus. Even though she grew up using an older variety of Hungarian spoken in her home, her choice is now something different: “... *I already speak the Hungarian spoken in Budapest and the surrounding area.*” Through the prism of their linguistic adaptations, the pupils from Tenja and the grammar school student Vanja, imply the complex consciousness of the region they live in, which is then inherently reflected in language. Linguistic choice, in this case, is a complex issue, which implies (supposed or real) phenomena of ethnicity, nation, segregation, judgment/stigma or acceptance. Linguistic choices may appear surprising on the one hand, or completely natural on the other in projections of the future; this is particularly the case with Vanja and Viktorija, who claim that their linguistic choice will depend on their future husbands, or Franceska who associates Croatian identity with turbo-folk music, as opposed to German.

It is evident that “identity orientations” are processes, as described by Lo Bianco (2004: 754), which do not take place in isolation; adaptation occurs at the subconscious level for the most part, while these very processes indicate consciousness of stereotypes and desirable norms in particular situations.

18.5 Conclusion and Recommendations

The research with multilingual youth has shown that what happens with languages is inextricably related to their habitus, that is, their attitudes, identity and relationships with the society at all levels. As we have seen through their responses, the war, the impact of globalization and the role of the English language can be found in the background of these relations rendering the issues present in the children’s and youth’s answers not primarily (or at all) linguistic, but emotional, political and global.

Emotional aspects of these interviews primarily refer to the sensitive status of the Serbian language and the vivid consequences of the war. Answers of the children who attend the A model for the Serbian minority indicate the need for additional action at a social reconstruction of the community especially in the field of education. Obviously, an educational policy aiming at the social reconciliation that will help the communities bridge the gap, both in working with children and young people, but also with teachers and parents, needs to be developed and given a thorough consideration by the relevant stakeholders – agencies, ministries and the city and the county governing bodies.

Political issues that have emerged in these answers to a large degree refer to minority education models. As the answers show, though children in general feel positive about them, one may wonder if the models based on ethnicity in the war-torn areas perpetuate divisions among the youth and teach them of the model of living where no true dialogue seems to exist. The challenge is to transform these models in a way that will respond more actively to the needs of the society.

A further challenge is intensified by global trends and the role of English visible in the answers where children and youth perceive their linguistic identity as inferior. These beliefs can also be tackled through a careful implementation of the European language policy recommendations of multilingualism that would actively support the use of other languages used in immediate surroundings. By promoting these languages actively in schools (on various occasions – European language day, International mother tongue day, etc.), the children and youths would have a chance to see legitimisation of their private practices and thus gradually change the marginalising attitudes they have internalised. By doing so, Eastern Slavonia’s burning issues of ethnic division, depopulation and identity marginalisation might stand a chance to be reversed.

Chapter 19

The 'Urban' and Education in India: Section Editor's Introduction

Geetha B. Nambissan

Urban spaces in India present a mosaic of diverse histories, cultures and social institutions, including education. From a predominantly rural society at the time of her independence in 1947, India has witnessed rapid urbanisation in the last six decades. Urbanisation in India has been a complex process, mediated by social structure, economic and social policies, civil society engagements and the aspirations of different social classes. Hence the cities that have emerged across the country present a fascinating picture of a landscape which gives many meanings to the idea of the 'urban'. Since the colonial period in India, the urban has been viewed as the site for economic betterment and social mobility through expanding occupational opportunities and social status. It was also seen as a space away from the traditional village where the link between caste and hereditary occupation could be broken, leading to possibilities of a more dignified life for the most marginalised and socially discriminated castes.

As the key pathway to economic and social mobility, schools and colleges have increasingly become the main sites of competition for mobility and positional advantage. However, educational institutions in urban India have their own histories given the multicultural nature of Indian society where language is a key dimension of identity, the politics around education and nation building, changing educational policy (keeping in mind the federal polity), and the diverse players

I thank Professor George W. Noblit and Professor William T. Pink for inviting me to edit this section. I am grateful to my authors: Divya Vaid, Manabi Majumdar, Nandini Manjrekar, Purendra Prasad, Radhika Menon and Srinivasa Rao. It has been a pleasure and a learning experience working with them to put this section together. I thank the Zakir Husain Centre for Educational Studies, Jawaharlal Nehru University, New Delhi, for giving us the space to hold a workshop to discuss our initial drafts.

(state and non-state) that participate in the funding and provision of education. More recently in the post 1990s, education (at different levels) has been buffeted by globalisation, privatisation and neoliberal ideology. These processes have played out in different ways given the diversity of urban contexts and the fact that cities are increasingly becoming aspirational spaces for much of rural India. Thus metropolitan cities, state capitals, middle and small towns, planned and unplanned townships and so on, present a diverse range of urban contexts and changing educational landscapes.

This section brings together original contributions of six authors on different contexts of the urban and education in India. Kolkata (formerly Calcutta), the capital of the state of West Bengal, is officially known as a 'mega city' located towards the far eastern part of India, near the border of Bangladesh. It has had a relatively unique socio-historical and political trajectory which has shaped the urban that marks the city today. It is within this context that Manabi Majumdar seeks to study the deeply stratified system of urban schooling and children's right to education. Metropolitan Delhi, also a 'mega city' is India's capital and is largely viewed as the political and administrative hub of the country. The city is seen to have the most sought after, exclusive educational institutions and occupations that lead to social mobility. Divya Vaid's chapter focuses on gender as a key identity mediating the urban. She looks at the mobility opportunities and experiences of young working women in Delhi from different educational and social locations as they traverse and negotiate the city. Baroda brings in a glimpse of another facet of urban India – an early city in a former 'princely state', in present day Gujarat in western India. The city of Baroda was the capital of Baroda state. Nandini Manjrekar focuses on the reforms carried out by the enlightened Maharajah of the state that led to the emergence of Baroda as a cosmopolitan city, and the centre of a unique experiment in education.

Vijaywada, the new capital of the southern state of Andhra Pradesh, is the focus of Purendra Prasad's chapter. The rapid growth of Vijaywada, especially since the 1980s, has been largely due to investments in the education economy in the city by the rich farmers of the coastal region in which it is located. The chapter offers a glimpse of the complex dynamics of transformation of a middle town. Kota was also a princely kingdom prior to 1948. The study of Kota city by Srinivasa Rao brings into sharp focus the rapid changes that a small city in the western state of Rajasthan has undergone after de-industrialisation in the 1980s to re-emerge as an 'educational city' in the first decade of this century. The last chapter in the section is about the urban fringe, characteristic of many cities in India that are pushing their frontiers to incorporate the villages in their periphery. Radhika Menon's focus is on Morpur, an urban village/emerging 'census town' on the fringe of Delhi. She explores the aspirations around education as well as the experiences of students living on the periphery of a mega city. While mapping the changing urban-education landscape and its interface, this introductory chapter draws upon the essays of the contributing authors as well as on research that provides a glimpse of the complex process of urbanisation in India.

19.1 Understanding the 'Urban' and Education in India

Scholars studying urbanisation point to the phenomenon of neoliberal globalisation that is today shaping and transforming the city into a space that is defined by the needs of global capital. For Harvey (2008), it is capitalism that propels the growth of the city and leads to the restructuring of urban spaces and the subsequent transformation of life styles within them. The business district, gated communities, shopping malls and exclusive spots for consumption and leisure mark urban spaces, which are today being produced to attract global capital and transnational professional elites. Harvey (*ibid*) emphasises the importance of power and politics in understanding the changing city. The spatial divisions that are visible in the cities – high poverty areas, the elite suburbs and exclusive enclaves as well as programmes of 'gentrification' and 'regeneration' – are shaped by the political economy of the urban. With the spread of neoliberal urbanisation, cities are characterised by '...greater social polarisation and inequality and new urban geographies of exclusion and marginalisation' (Lipman 2010:249).

Scholarly research on 'urban' education has largely been framed by the meaning of the 'urban' in Anglophone societies i.e. the 'inner city' as synonymous with schools in 'high poverty areas' catering to the poor, mainly African-American and other students of colour. However, the meanings around urban education may vary. In India for instance, urban education brings to mind provision and quality of schooling that is perceived to be far better than what is offered in rural areas. More recently there has been growing concern over the role of education in neoliberal urbanisation. Scholars have highlighted that education is integral to the neoliberal agenda and reforms in schooling are complicit in the transformation of the cities. Lipman (2010) observes 'Education is also implicated in solidifying the neoliberal urban agenda, materially and discursively, through policies that support displacement and gentrification, privatisation, democratic deficits, and the pathologising and policing of economically and racially marginalized inhabitants' (Lipman 2010: 249). However education is also a site of aspirations, contestation and resistance (Arronowitz and Giroux 1986). It is today seen as a key space in the larger struggle of inhabitants for the right to the city and its resources (Lipman 2011).

This introductory chapter attempts to present a broad overview of both the urban and education in India. The perspective that informs the discussion is that of the city as a socially structured fluid space in the making, that is produced not merely by global capital but equally by the socio-historical context in which it has emerged (See also Lipman (2010), Harvey (2008), and (Kamat 2011). Social structure, institutional arrangements including the nature of the state and policy interventions, as well as the lived experience of the residents of the city, shape the politics of space, privilege and exclusion that define the urban in diverse ways. The web of social relations that constitutes the urban is viewed as mediated by class as well as factors such as caste/ethnicity and gender. A relational framework must hence necessarily inform the analysis of the changing urban in order to explore processes of privilege and disadvantage as diverse social groups access opportunities and life styles in the city.

Coelho et al. (2013) remind us that there are also dominant narratives that ‘construct and legitimise urban imaginaries’ and normalise practices of exclusion and inclusion in relation to the right to the resources and opportunities that the city can offer. In this context, the role of the upper/middle classes in constructing hegemonic and ‘normalizing’ discourses has been highlighted (ibid:22).

Lefebvre’s (2003) distinction between the ‘city’ and the ‘Urban’ is equally important as he suggests that there can be alternative imaginaries around the *Urban* (emphasis in italics) still in the making i.e. the imaginary of the web of relations that is collective and inclusive as inhabitants envision the city to be. To build such an imaginary, the idea of ‘spatial justice’ becomes pertinent (Soja 2009). Soja calls for a ‘critical spatial perspective’ and observes that ‘in the broadest sense, spatial (in) justice refers to an intentional and focused emphasis on the spatial or geographical aspects of justice and injustice: as a starting point, this involves the fair and equitable distribution in space of socially valued resources and the opportunities to use them’ (2009:2). The imaginary of education then would also be linked to the *Urban* envisioned collectively within the frame of social justice, where all inhabitants have a right to the resources of the city, including education.

19.2 The ‘Urban’ and the City in India: A Brief Overview

Urban India¹ today officially comprises a range of spaces that have been named in a variety of ways in relation to their population, and the proportion of labour force engaged in non-agricultural activity. The broad division of statutory and census towns includes diverse urban spaces. There are the metropolitan mega cities (with over a million people), the smaller cities, small and medium towns, the census towns, and urban villages. Urban agglomerations are larger areas that include towns in the vicinity of the city, and also demark areas for urban expansion and development. There are also rapidly expanding smaller cities, small and middle towns, townships and satellite towns around the mega cities some of which are planned to reduce congestion in the latter. The cities in this section as mentioned represent some of these urban spaces: Delhi and Kolkata are mega cities with expanding urban agglomerations. Baroda was an urban centre that developed into a modern city by the late nineteenth century, and Vijaywada and Kota are former towns now rapidly expanding cities. Morpur is on the fringe of Delhi and could be called an urban village/developing census town. All the authors have highlighted that neoliberal

¹According to the Census of India 2011, an urban area includes (a) statutory towns (all places with a municipality/corporation) (b) Census towns include ‘all other places with a minimum population of 5,000 persons with at least 75% of the male main working population engaged in non-agricultural pursuits; and a density of population of at least 400 persons per sq. Km’. (http://censusindia.gov.in/2011-prov-results/paper2/data_files/India2/1.%20Data%20Highlight.pdf. accessed, January 2015).

forces are deeply impacting the cities they have studied as well as education within these spaces. Further, that education also shapes in diverse ways the production of specific urban spaces, and that the state is complicit in these processes. However, the specific economic and social trajectory of each city in this section and its interface with education points to the complexity of the urban and education in India. The subsequent discussion explores these issues by first elaborating on the urban, and then on the urban-education interface.

19.2.1 The Colonial Urban

There were cities and towns in medieval India that served as political, and trading/commercial centres. Delhi for instance was the imperial capital of Mughal India, and Baroda was an early trading centre. However, it was during British rule in India (post 1850) that the city emerged as a distinct urban space structured by the economic, administrative, and military needs of colonial rule. Scrase observes that the '... British strategy of retaining the colonies as extractive economies by suppressing the growth of industry inhibited the development of large metropolitan areas with the exception of the imperial capitals' (Scrase et al. 2015:10). The Presidency capitals of Calcutta, Bombay and Madras emerged as the main cities from where the colony was administered. Calcutta was also the early capital of British India, which later shifted to Delhi. Small and medium towns developed around agricultural, artisanal and other economic activities and became trading and commercial centres (ibid). Calcutta and Bombay were among the few urban centres with an industrial base: the jute and cotton mills respectively occupied a prominent space in these cities.

What was distinct about the colonial city was that it produced the spatially segregated urban – that between the colonial rulers (and their families), and the 'natives'/indigenous people. This segregation was also maintained to ensure that the rulers and their families lived in well-maintained, sanitised and safe spaces. Thus, there was the cantonment and civil lines (the new city) as against the 'old city' or the spaces where the locals lived (Jeffrey and Harriss 2014). The civil lines, cantonment/fort and the 'old city' can be seen in many cities today (Delhi, Kolkata, Bangalore and so on) that trace their early development to that period (Scrase et al. 2015).

Colonial rule in India brought with it lower-level administrative and professional occupations that offered secular employment opportunities largely in the cities and towns. These were distinct from the hereditary occupational structure that characterised the traditional caste-based system of stratification in India. Modern (English) education introduced during the colonial period provided, on a limited scale, a pathway to these occupations. Scholars (Kamat 1985; Seal 1968) have pointed to the emergence of a small section of Indian middle classes largely from the upper caste Hindu families who accessed formal schools and entered these occupations. The development of the administration and infrastructure (including the railways) as well as the need for basic

facilities and services created a demand for workers, which in turn encouraged migration from the villages to the city. Majumdar (this section) points out that Calcutta attracted such migration, making it a city with a heterogeneous population.

For Scheduled Caste communities (SC), who were at the lowest rung of the caste system and engaged in hereditary ‘polluting’ occupations, the city offered for the first time occupations that were delinked from caste identity. Ambedkar (the acknowledged leader of the SC) viewed the city as a modern, ‘open space’ that did not allow for practices of untouchability as was prevalent in the socially segregated villages (Chairez-Garza 2014). He exhorted these communities to move to the cities where they would have opportunities to better their life chances as compared to the villages where the SC were denied a life of dignity because of their identities as ‘untouchable’² castes. However, while economic opportunities were in theory ‘open’ in to all, SC workers tended to be largely concentrated in certain kinds of occupations. Municipal sanitation workers in the city for instance came mainly from ‘untouchable’ castes while in the cotton textile mills, SC were confined only to weaving and not permitted in spinning sections (cited in Ciotti 2010: 86–87). The segregation of Scheduled Castes in specific occupations was not merely because of lack of literacy and education but due to caste-based practices that confined them to what was seen as ‘unclean’ occupations (related to cleaning and sanitation). They were kept out of spinning in the mills for fear that they would pollute the yarn, as it had to be wetted with spit (ibid). Both the official spatial segregation as well as the compartmentalisation of communities into specific occupations raises complex questions about the ‘modern’ colonial city.

The city of Baroda was unusual for its time, and this is drawn attention to in Manjrekar’s chapter. Baroda was envisioned as a cosmopolitan city with an ‘engaged citizenry’ by the Maharajah as early as the 1870s. Manjrekar (this section) presents the efforts of the princely state of Baroda, led by its enlightened ruler and his efficient administration in the late nineteenth and early twentieth century, to produce such a city space – a city of culture (‘sanskar nagari’) with significant achievements in education, and a wider development of the region. This was in sharp contrast to the colonial state and its policies at that time.

19.2.2 *Urbanisation in Independent India*

The independent Indian state had before it the challenging agenda of economic development (after the ravages of colonial rule), national integration, and ensuring social justice to historically disadvantaged groups and regions along socialist lines. The state has been characterised as a welfare developmentalist state with socialist leanings (ideologically referred to as Nehruvian Socialism). At least until the 1970s, the state was concerned with planned economic development, the building of a strong public sector (administration and bureaucracy), heavy and small industry, as

² Under Article 17 of the Constitution of Independent India adopted in 1948, untouchability in any form has been abolished.

well as facilitating agricultural growth. The thrust of state policy saw the rapid growth of urban centres – cities, small and middle towns and townships around large heavy industry projects. This led, for instance, to Kota's development from a 'provincial small town' to an industrial and commercial city by the 1980s (Rao, this section). Majumdar (this section) also speaks about the growth of 'vibrant economic and industrial activities' in Calcutta. The early growth of Vijaywada into a major commercial centre is linked to state policy aimed at increasing agricultural productivity through investments in infrastructure and technology in the coastal regions of Andhra Pradesh. Prasad in his contribution (this section) maps how rich peasant farmers who benefited from these policies invested their surplus from cultivation into non-agricultural enterprises in Vijaywada and other towns in the region.

India was at the time of her independence a society where only a tiny fraction of the population was literate, and health indicators were also poor. Hence, building an education and health system for the entire country was a major task including in urban areas, the focus of this discussion. Urban municipal bodies with elected representatives were given the task of providing schooling, health, sanitation, and other facilities. In addition, there were the challenges that specific cities faced. For instance, both Delhi and Calcutta had to cope with the influx of a large refugee population from the partition of India on the western and eastern side in 1947. For Calcutta, the subsequent Bangladesh war in 1971 meant a continuous stream of refugees for many decades, which impinged on the development of its infrastructure and facilities. Majumdar (this section) highlights that 'The city (of Calcutta) has continued to experience the predicament of the so-called 'refugees' and the challenges of their resettlement within its confines'.

The rapid spread of urbanisation which included considerable migration from rural India, shaped the cities in the decades following the 1950s. The metropolitan cities such as Bombay, Calcutta and especially Delhi, were the destination for educated and skilled professionals. There was demand for unskilled labour as well and given widespread poverty in the villages, rural migrants comprised a growing proportion of the city population. The 1960s saw the evolution of urban planning models, and the development of city master plans. Early urban planning appeared to be informed by a larger vision of building an 'egalitarian and integrated' society (Juneja 2015:7). It is important that schools were envisioned as spatially central to local 'housing clusters' i.e. the neighbourhood community. The Master Plan of Delhi (1961–1981) notes that: 'The housing cluster' is built around the nursery school...The primary school, the high school, the community centre, and the district centre, are the order of the functional tiers around which the community structure is built up' (cited in Juneja 2005:3687).

However, ground realities were starkly different as the planning of cities and towns did not keep pace with the rapid urbanisation that followed. Only those parts of the city that were brought under the planning process had access to housing, infrastructure and other facilities. Government and public sector employees were specially privileged in that they had access to officially provided housing and other facilities. The urban development authorities were given the task of implementing housing projects for the middle and lower income groups, the benefits of which were garnered largely by the former. Exclusive spaces were also carved out for the

elite. An increasing proportion of the urban poor were however forced to live in 'unauthorised' (illegal) unplanned settlements – 'slums' and shanties that lacked the most basic of amenities and conveniences. Urban development programmes gradually led to frequent displacement and eviction of slum dwellers who initially built their settlements where construction work and other kinds of labour were in demand. A few older slum settlements were 'regularised' i.e. dwellers were given legal status. However, majority of slum dwellers faced constant evictions and displacement and were pushed to the unplanned periphery of the city. Thus, while the cities became spaces of opportunity and aspirations for vast sections of the population, especially from rural India, they were increasingly characterised by sharp inequalities – economic, social, and increasingly spatial as well.

The post 1980s saw the beginning of de-industrialisation in some of the major cities in India, and the closing down of manufacturing enterprises and industries or their relocation to smaller cities and towns. This led to significant restructuring of urban spaces. In Mumbai for instance the cotton mills that were the heart of the city shut down in the late 1970s and 1980s. Large tracts of prime land became vacant and were taken over by real estate agents leading to the displacement and eviction of workers to the periphery of the city and away from it. The subsequent gentrification of the former mill lands resulted in the transformation of the urban landscape (See Chatterjee 2013; D'Monte 1998). In Kota, Rao (this section) points to the 'sickness' of industries established two decades earlier. Majumdar (this section) also draws attention to the deceleration of business and industry in Kolkata. The reasons for the decline of industry in the cities varied and will not be gone into here. However, what is important to recognize is that key economic enterprises around which many of the big cities were built were on the decline, with important implications for the reproduction of urban spaces. Re/location of industries away from the mega cities saw the rapid growth of middle and small towns (see Scrase et al. 2015; Gupta 2015).

The post 1990s saw a significant shift in the economic policies of the Indian state leading to the implementation of major economic reforms – structural adjustment programmes and liberalisation. Though some welfare measures continued from the earlier era, a neoliberal regime was put into place resulting in liberalisation, deregulation, and an increasing integration with the global economy. A new service economy is now becoming predominant with information technology, software and services including education, emerging as key areas for high economic growth opening up for foreign investment. Economic reforms have been accompanied by new forms of governance in urban areas that in turn are leading to privatisation of formerly state-provided services, public-private partnerships, and a restructuring of urban spaces. The state is playing a key role in opening up the economy, not merely in building 'world-class' infrastructure to attract global capital but also by establishing hi-tech city districts, and setting up special economic zones, 'corridors and triangles' where special incentives are given to encourage such investments. Kamat observes that 'In India, the definitive break from a welfare developmentalist regime to a neoliberal regime occurred in 1991 when the state undertook macro-economic reform that over a period of a decade would liberalize trade barriers, privatize pub-

lic industries and deregulate markets to promote foreign investment' (Kamat 2011: 90).

One of the key themes in the chapters in this section is the impact of market forces on the production and reproduction of urban spaces. The growth of the service economy in place of manufacturing and the resulting restructuring of urban spaces are striking in Rao's chapter on the city of Kota. Here, the post-industrial economy that is yielding high returns to capital is the shadow education economy. The rapidly expanding urban sprawl is shaped by the demand for and supply of what are called 'coaching education' institutions around which the city is being built in unique ways. Vijaywada is also increasingly becoming a city in which investments in private educational institutions drive the economy. In the last two decades, it is the 'coaching industry' that is becoming prominent in the city's economy and its landscape. Both Rao and Prasad's chapters point to the movement of this form of education capital to other cities and towns where new coaching hubs are likely to emerge leading to further transformation of urban spaces.

19.3 Privilege and Exclusion in the Urban

The distinct restructuring of urban spaces and increasing spatial segregation is visible in the cities post 1990, and especially since the turn of the century. De-industrialisation, relocation of manufacturing units and urban development programmes led to the growth of a large slum³ population in the cities. Post 1990, the new urban economy with the increasing casualisation and contractualisation⁴ of work at the lower end as well as gentrification and slum clearance drives have seen the growth of high poverty slums and shanties and large displaced populations ghettoised in congested spaces or on the periphery of cities. In Kolkata, around 32 % of the population are slum dwellers; in Vijaywada the figure is around 28 % (See Majumdar and Prasad, this section). At Delhi's fringe, Menon (this section) describes the flourishing informal economy amidst and around unplanned settlements of workers, settlers and migrants. Also mentioned is that the majority of dwellers in slums are not merely poor/low income families but they also belong to disadvantaged social groups – Scheduled Castes, Scheduled Tribes⁵ and Muslims (Majumdar and Menon, this section).

³ 'Slum' is a term that is often has a derogatory connotation. I use it here as it is the official term for temporary shanties.

⁴ These include different forms of informal and temporary work contracts that are characteristic of the growing 'flexibilisation of labour' (See Srivastava 2012). Srivastava observes that '....casual/contract work does encompass the poorest conditions of work' (2012: 64).

⁵ Scheduled castes (SC) and Scheduled tribes (ST) are the official terms for groups that suffered historical injustices and continue to be disadvantaged in contemporary Indian society. They are entitled to special provisions for their protection and development as well as political representation by the Constitution of India. Scheduled Castes who prefer to name themselves 'Dalit', suffered from social discrimination because of their position as 'untouchables' in the caste system.

While spatially, there is a consolidation and marking out of settlements of the poor, there is also a growing colonisation and privatisation of new urban spaces for the elite/upper middle classes through processes of gentrification and urban 'renewal' programmes. What can also be seen especially in the last two decades as part of the spread of neoliberal urbanisation are increasingly bounded spaces for the middle classes and self-contained gated communities for the elite in the metropolis. To attract prospective buyers of property, gated communities are advertised as providing exclusive life styles as in the major cities of Europe and the USA (Paris/Rome/New York) without residents having to go to these places. The idea of a 'city' within a larger city is a new concept but one that is more recently being advertised by real estate developers. These are 'mini cities' that will allow 'privileged residents' to be a part of the metropolis and yet have an exclusive space within it for themselves. For instance, the Hiranandani Gardens in Mumbai, home to more than 4,000 families, is an entire complex with offices and residences, parks and shopping arcades and an elite private school. Built by the Hiranandani real estate company, the Gardens claims to be 'Mumbai's finest residential township that has redefined the standards of elegant living. Intelligently planned, crafted with precision and embellished with care, it fulfils the delicate dreams of many, giving rise to a new perception of life and life style.... It has ushered in an era marked by higher standards of living and global lifestyles'.⁶ The Jaypee Sports City is near Delhi and promises 'a highly secure gated community with lush, landscaped gardens, exclusive social clubs for residents,restaurants and retail spaces and an educational centre with some of the best schools and colleges' (for web link see fn. 6). Entire private cities are also being built at tremendous financial and ecological cost. Lavasa (at a three hour drive from Mumbai) is presented as 'India's first planned hill city. Integrated development at Lavasa will include five self-sustaining towns with a permanent population of three lakh (300,000) residents, who can live, work, learn and play in complete harmony with nature' (for web link see fn 6).

The planned urban development in the early post independence decades was led by the state. The post 1990s has also seen the key role that the state has played in processes of urban 'development', 'renewal' and 'gentrification' which have significantly transformed the metro cities with implications for the smaller cities and towns as well. Kamat (2011) sees the transformation of the developmental state into a 'competition' state which is proactively propelling these changes. Speaking of Hyderabad, which in a matter of two decades has been transformed into a 'hi-tech', 'cyber' city, Kamat points to the key role of the state in its transformation: "Hyderabad illustrates the socio-political and historical context that transitions the developmental state into a 'competition state' in which the state subordinates the welfare and developmental needs of its citizens in favor of the profitability of the

Scheduled Tribes or 'Adivasis' are disadvantaged because of their experience of relative isolation, neglect and cultural marginalisation. Vast sections of SC and ST are economically amongst the most vulnerable social groups in India.

⁶ http://hiranandani.com/Hiranandani_Gardens.aspx; <http://www.jaypeesports.com/jaypeesportscity.shtml>; <http://www.lavasa.com/live/the-lavasa-life.aspx> (Accessed, August 2015).

corporate sector and political elites” (2011:197). In Kota and Vijaywada, the state government changed its policy to facilitate the growth of the shadow economy as discussed by Rao and Prasad respectively (this section). As Kamat observes, ‘Ultimately, as the sovereign legal authority, the state is the most privileged institution to regulate, channel and coordinate capital and organize the economic geography of the region. Consequently, the neoliberal state becomes an agent for the commoditisation of social relations situated in a wider market-dominated field’ (Kamat 2011:197).

19.4 Urban Education in India

The neglect of education, even at the elementary stage, during colonial rule in India is well known (Kamat 1985; Chaudhury 2007). Municipalities and district boards were formed in the cities by the 1880s and were given the task of provision of primary schooling. However, the emphasis was more on secondary schooling through grants-in-aid than with state provision for elementary education. Chaudhary (2007) observes that primary schooling received barely a third of public expenditure on education while the rest went to secondary and higher education. She goes on to add that secondary education was in the interest of ‘traditional landed and educated elites’ and they ‘often lobbied the colonial government against higher spending on primary vernacular education...’ (2007: 8–9).

A striking contrast to what was happening to education under colonial rule was the achievement of Baroda state in this sphere. As Manjrekar (this section) shows, the Maharajah of Baroda saw education as critical to an engaged citizenry and integral to the development of the city and state of Baroda. Her chapter describes the efforts of the state toward compulsory elementary schooling and establishing institutions of higher and technical education. The active role of the state and the Maharajah himself was crucial for the spread of education among sections of the population that were denied it for generations because of caste and gender identity. However, Manjrekar also points to the limits that the deeply stratified social structure placed on the spread of education.

The Constitution of India directs the state to provide education to all children up to 14 years. Schools inherited from colonial rule were not only few in number but were a motley set of institutions in terms of structure and content. There was no system of schooling. The challenge was to visualise a national system of education and provide access to schooling to children in a vast and diverse country where at the time of independence in 1947 only a negligible proportion of the population was literate. The first Education Commission of India (1964–1966) emphasised the goal of universal elementary education and saw the common school system as crucial for national development and social integration (NCERT 1971). Norms were laid down, for instance that all children should have easy access to primary schools and the state, through its local bodies, was to make provision for this. The idea of neighbourhood schools/housing clusters built around primary schools was also envi-

sioned in urban planning documents, as mentioned earlier. In urban areas, local municipal bodies were set in place, and providing access to schooling was a major thrust of education policy.

Official educational statistics on school provision are available for urban areas at an all-India level and for individual states and districts. Information on specific cities is not available. Broad trends indicate that provision of schools, enrolments and educational attainment across social categories (by gender, caste, ethnicity) are far better in urban as compared to rural India. Even in 1978, the overwhelming majority of primary schools (90%) in urban India were government and state aided schools. Private unaided schools, which include the elite 'public' schools, comprised only about 10% of all urban schools (NCERT 1982). Provisioning of elementary education in terms of the proportionate number of schools and their quality, as well as the percentage of children enrolled was far better in urban as compared to rural India (Nambissan and Batra 1989). Municipal and aided schools provided free tuition and also incentives to encourage the education of the children of Scheduled Caste and Scheduled Tribes. Education was imparted in the vernacular language and often in more than one language so that children could receive schooling in their mother tongue. In Mumbai for instance, keeping in mind the large migrant population in the city, education in municipal schools was imparted in as many as seven Indian languages (Juneja 2001).

Nevertheless, access to schools was inadequate in urban India. This was partly because of rapid urbanisation, and the failure of urban planning for schools to keep pace with it. Private schooling surged rapidly ahead compared to state-run or state-aided (privately managed) schools. In 2013, for example, private unaided schools comprised 60% of schools in urban India, and 69% of all enrolments. Enrolments in private schools are far higher at the secondary stage than at the elementary level (Juneja 2015). Though city specific data is not available, it is likely that there are wide variations in the proportion of private schools in different cities. In a study of ten cities carried out in 2001, it was found that the proportion of private primary schools varied from 38% in Coimbatore (Tamil Nadu state) to 76% in Jaunpur, in the state of Uttar Pradesh (Juneja 2015).

What implications do these urban transformations that I have discussed have for education? How is education implicated in such transformations? What do these processes mean for the right to a key resource that the city offers, which is education? I briefly look at the two faces of the city that are clearly visible today – the largely illegal slums and settlements of poor and disadvantaged families increasingly concentrated in unplanned areas of the city and on its fringe, and the exclusive, privileged 'privatised', yet planned, spaces of the urban elite and middle classes.

19.4.1 Privilege, Disadvantage and Education in the City

The upper/middle classes have long dominated the city from positions of economic and social power. Comprising the professional, administrative and subsequently managerial occupations, those who occupied these positions have dominated urban spaces and are likely to have also shaped the education system, aspirations and

discourses around it. In the late nineteenth century Baroda, the upper and middle castes dominated the administration and professions and comprised the powerful social elite of the time (Manjrekar this section). In post independent India, the state bureaucratic and professional middle classes were also dominated by socially dominant caste groups. Policies of affirmative action saw SC and ST communities enter these occupations, thus widening their social base. Elite and English medium 'public' (private) urban schools have been the key to occupations that yield privilege and economic and social status. The growing private sector in education has primarily been a result of the abandoning of the state-run schools by the urban middle classes in favour of English-medium private schools. As lower class fractions aspired to follow suit, the market expanded to offer differentiated private schools in terms of cost and quality (Nambissan 2010).

Urban land was provided by the state at negligible cost to establish private schools. In 1981, for example, the Delhi Development Rules (1981) provided for allotment of land to schools on the condition that 'a proportion of seats would be set aside for the poor through providing freeships to them' (cited in Juneja 2015). Juneja points out that the 'model central legislations and model Master Plan of Delhi were adopted by other states, and parallel provisions for grants of land to private schools and colleges existed all over the country' (ibid). She notes that in Delhi, as many as 1,200 schools were built on land given at concessional rates, and at least 361 were mandatorily expected to provide freeships to poor children. However, this provision was not honored. A public interest litigation was filed in court in 2000 against the flouting of these rules (See Juneja 2005). Thus, private schools remained exclusive institutions that failed to provide entry to the poor, even though they were mandated to do so by the rules under which they were given prime urban land in the city of Delhi and elsewhere.⁷

The city has also been the site for the rural middle classes/peasant castes to build economic, cultural, and social capital. Prasad (this section) has shown that for the rich farmers in the coastal region of Andhra Pradesh, providing higher education for their children and establishing private educational institutions, and especially professional colleges in the cities, were important strategies in their quest for such capital. The culture of 'coaching' (private tutorials), and increasingly the projecting of education that is integrated with coaching as desirable and essential for success, have constructed imaginaries that have permeated to lower social classes raising aspirations that these families struggle to meet. The rapid spread of private schooling and coaching institutions has resulted from the ability of dominant groups to define the 'good' in education. Majumdar (this section) observes that while aspira-

⁷ Under the Right to Education Act (2009), 25% of children who are admitted to class 1/entry level in private schools must belong to 'economically weaker sections' (EWS). The children thus admitted are to be given education free of cost (freeships) which will be reimbursed by the government (See RtE 2009). The 25% 'quota' in private schools has been controversial and subject to considerable debate and legal contestation by private schools. However, it has been reaffirmed by the Supreme Court of India. Efforts are on to ensure its implementation.

tions are increasingly becoming similar across social classes in favour of private and shadow education, opportunities for achieving them are structurally unequal.

As the upper and middle classes seek to mobilise social and cultural resources and networks to give their children a positional advantage in a globalising world, there is a growing demand for increasingly exclusive schools. In the late 1990s when Waldrop (2004) asked parents belonging to the professional and administrative elite of Delhi as to the schools they wanted to send their children to, five well-established city private ('public') schools appeared to be most sought after. In the last decade, Delhi has seen a growing number of 'International', 'Global' and 'World Class' schools that many among the elite are opting for their children. These typically offer twinning programmes with schools in Europe and the USA, and also enable students to take examinations that will facilitate their entry into the higher education market in these countries. To attract buyers to the enclosed and increasingly privatised spaces in the cities, exclusive 'International' schools with sprawling campuses are now presented as one of their attractions. The Hiranandani Gardens mini-city in Mumbai has the Hiranandani School within its premises. Lavasa in its promotional advertisements offers the Le Mont School to children within the city, and the promise that well-known institutions and universities (Oxford was earlier mentioned on the website) will establish their branches there (see web link in fn 6). Thus, for the privileged classes, education is also embedded in privatised and exclusive spaces that they lay a claim to given the economic and social resources at their command.

For the lower classes, the working and non-working poor, the city is an aspirational space. As previously discussed, this is reflected in the growing migration to urban areas, frequent displacements followed by efforts to relocate including on the margins of the city, and the extremely difficult circumstances under which the poor live and work in and around the city. The living conditions within the slums and temporary shanties are abysmal, and children have to study and play in unsafe and unsanitary urban spaces that lack even the most basic amenities. Children are at risk where their health and safety are concerned. Rapid urbanisation, and neglect by the state of the educational requirement of children of the poor, has led to overcrowding in the negligible number of schools that are available in the vicinity of slums and shanties, including on the periphery of the city (see Menon, this section).

On the other hand, the demolition of slums (that began from the 1970s in Delhi) and the systematic displacement of the poor from the central spaces of cities have led to falling enrolments in the municipal schools that were located in these areas. 'Rationalisation' of schooling by closing down schools where enrolments have fallen is now on the agenda of the state. This is reported in the chapters on Kolkata and Vijaywada. However, there are also reports that closure of government schools may also be driven by vested interests. Juneja (2015) points to the fact that many of the municipal and government schools are in the central areas of the city where land values have escalated. She observes that 'Many such schools now face threat and are vulnerable to closure in order that their lands may be diverted for other more profitable purposes' (ibid: 24). Verma (2004) reports on the protests of activists about the closure of schools in the city of Indore as well as the kind of schools that

were opened for the poor in the slums: “Well-attended and well-equipped schools have been closed down for merger in the name of ‘rationalization’ in areas where, incidentally massive commercial development is proposed..... the administration ... has ‘opened 103 new schools’ in the city’s slums by writing ‘school’ in chalk on the door of each of the existing community halls” (cited by Juneja 2015:24).

19.5 Markets for Schooling: Restructuring the Urban and Education

The expanding market for education is a striking feature of urban India today which, as many of the chapters show, is changing both the face of the city and how education is viewed. As mentioned earlier, urban India has seen the rapid growth of private schooling, especially unaided schools which include the elite private ‘public’ schools. High fee international and global schools that provide easy access to global markets for higher education are also increasingly visible in the metropolitan cities. The market for elite schools also provides a range of services at high cost not only for academic achievement but also to give each child ‘cultural distinction’ seen as essential for educational and positional advantage. Companies that organise music, art, sports and other activities, summer schools, and visits abroad are in a booming business today. The inroads made by the private sector may vary in different urban spaces as they are shaped by the social and economic history of the city, and the institutions of education as well as state policy. This section briefly highlights some of the key trends that have emerged from the foregoing discussion.

The demand for academic after-school support for success in school examinations has seen the growth of the shadow economy of private tutorials and coaching across the county. Mention has been made of private tutorials in Vijaywada in the early 1950s (Prasad, this section). However, the growth of tutoring into a business and a full-fledged coaching industry linked to success in high stakes examinations that lead to entry into prestigious institutions of technology is a post-1980s phenomenon. It began earlier in states such as Andhra Pradesh and later in cities such as Kota, and is yet to become big business in Kolkata. Both Prasad and Rao (this section) discuss at length the complex of factors that led to the ‘moment’ when the education economy became a key site of business. While both Kota and Vijaywada are famed for providing narrow examination taking skills that are increasingly in demand, they offer different models within the shadow education economy.

West Bengal as a state has the dubious distinction of having the highest percentage of students accessing private tutorials at all grades in school. In an earlier paper, Majumdar (2014) discusses private tutoring that has become a key service in demand by all social classes in the city. The aggressive marketing of private tutoring she refers to are reflected in the advertisements and bill-boards that dot the city and are becoming part of the skyline in some localities. The tutoring market in Kolkata presently appears largely unorganised and informal, but given the aspirations for

their children's education even by the poor, and the limited supply of what is viewed as good quality schooling, it is likely that it is only a matter of time before the coaching industry takes root in the city. There is also a growing market for pre-schools and nurseries in the cities. Driven by parental aspirations for access to what are seen as good quality private schools, there is also a scramble for pre-schools which are seen as providing a competitive advantage in entering prestigious schools (Majumdar, this section). Here, again, the market caters to different social classes.

Another segment of the education economy that is becoming visible in cities today is the market for private schools targeted at low-income families. These are 'low cost' schools that are 'unrecognised'/illegal as they fail to meet the norms laid down by the State Education Acts, and more recently of the Right to Education, 2009 (RtE 2009). These schools are part of the unregulated shadow economy but they are in demand as they profess to offer English-medium education aspired to by low income/poor families. Unrecognised private schools have been reported to be growing in low income neighbourhoods and around poor settlements where state-run schools are inadequate and are of poor quality. 'Low fee' schools targeted at the poor and low income families are now viewed as a profitable business in urban India and there is a growing transnational advocacy for this segment of the education market (Nambissan 2014). Menon (this section) draws attention to the unregulated low fee/low cost market for schooling and credentials of uncertain value on the capital's fringe. In the absence of adequate state provision of education and the regulation of private schools, the market which is thriving on the aspirations of poor parents, holds them to ransom.

19.6 Conclusion

A third of India's over one billion population today lives in urban areas. The number is likely to increase manifold with estimates of 50% of the population expected to live in cities by 2050 (UN 2014). The foregoing discussion highlights the ways in which urban spaces are being produced and reproduced, how education is influenced by and shapes this process, and the implications for the right of citizens to the valued resources of the city. The urban-education interface in India has yet to be systematically explored. The authors of this section have begun to analyse the unfolding of the urban and education within the specific contexts of the cities they are researching.

It is quite clear that the urban space is today being shaped by neoliberal capitalism on the one hand, and rising aspirations of different social classes for access to the city and its resources on the other. Neoliberal capitalism is driving different forms of post-industrial economic growth, and in particular the new economy of services, and cities are the key sites where this is visible. The restructuring of urban spaces for neoliberal capital has led to infrastructure development, creation of hi-tech districts, accompanying shopping malls and leisure spots as well as the gentrification and beautification of cities. These processes have led to the eviction and

relocation of the poor in slums and resettlement colonies in specific parts of the city or they have been displaced to its periphery. The fringe of the city, as has been shown, is frequently unplanned and lacks publicly provided basic services. It is to the unregulated markets that the poor living on the margins are forced to turn to for these services. Thus, spatial inequality compounds social inequality (Soja 2009).

The market, and forms of capital within it, restructure the urban space in different ways and create a web of social relations that yields privilege and advantage for a few, while large sections of the city's public are excluded from access to entitlements of citizenship, including elementary education. The contrast is most starkly visible in the privatised and exclusive spaces in the metropolis as against the slums and poor settlements on its periphery. For those who are economically and spatially on the margins, the social segregation in the city is also reflected within schools. Government schools are overcrowded and dilapidated and are predominantly accessed by the poor and disadvantaged groups (SC, ST, and Muslims), especially at the primary level. The private English-medium schooling that has given power and status to the middle classes is equally desired by the poor for their children, and is in growing demand. While the state has failed to ensure a publicly-funded system of good quality, it has been quick to close municipal schools in the prime areas of the city and facilitate public-private partnerships, ostensibly to improve school education. Urban school governance reforms have also brought in new forms of participation that are characterised by a democratic deficit. The market has also responded to these new opportunities in urban education – both in the private school sector, and in the shadow economy.

Shadow education in different forms (private tuitions, tutorial centres, coaching institutes) has emerged as the key growth sector in the new economy, and a highly profitable investment. This appears to be a 'bubble' in the market that is unlikely to burst given the rising aspirations for access to a limited number of elite professional institutions and hence the increasingly high stakes of the entrance examinations. From the chapters in this section, we see that the spread of the education economy is likely to mark urban spaces especially where the coaching industry is concerned. The shadow industry is likely to play a key role in restructuring urban spaces and creating an increasingly narrow and instrumental imaginary around education in relation to test-taking skills. The role of the state in facilitating the accumulation of education capital and its further investment has been highlighted in some of the chapters. The fact that the coaching economy is currently unregulated, despite being a multimillion industry that directly impacts the education and living conditions of vast numbers of students, also points to the disturbing nexus between the state and the neoliberal urbanisation.

For young women who are working in metropolitan Delhi, the city is a space that provides opportunities and choices, far greater than in the villages or even in small towns to which many originally belong. However, Vaid's (this section) study shows that the city is an aggressive space for women who have to learn survival skills to negotiate space and time, both of which they experience as gendered. At Delhi's fringe as well, young women students look to the city for a life of greater freedom and opportunity. However, inadequate public schooling of reasonable quality and

an unregulated market for private education, including unreliable further credentials mentioned earlier, are severe obstacles in the path of young women of Morpur (Menon, this section) who are also far more bound by conventional norms than the working women in Delhi (Vaid, this section). In other words, while gender mediates women's experiences as they negotiate the metropolis, the urban may take on different meanings for those who are spatially located on its periphery.

'Smart cities' have been announced as the future face of urban India. Global manufacturing and trading hubs and industrial cities are also being planned along industrial corridors and parks for which large tracts of rural India are likely to be cleared. In this seemingly relentless march of post-industrial neoliberalism, it is imperative to keep in mind the rights of those who are required to give up their lands and homes for an urbanisation that is both exclusionary and unsustainable. It is hence urgent that there is collective reflection on what kind of urban is being produced. The authors in this section argue that privilege and exclusion are clear markers of an increasingly segregated urban India, and underscore that spatial justice is implicated in social justice (Soja 2009). The civic cosmopolitan that was attempted by a pro-active state in Baroda far ahead of its time, does not appear even faintly visible on the agenda of the state today. In fact, the urban spaces produced by the shadow economy as well as the privatized cities that are emerging (and the state is complicit in both) appear as caricatures far removed from the web of inclusive and co-operative social relations that is integral to the *Urban* society that Lefebvre (2003) was pointing to. It is important to revisit the idea of the 'modern city', the 'sanskar nagari,' and the *Urban Society* if we are to build social imaginaries of spaces that are inclusive, diverse, and socially just. A re-visioning of education would be critical to such an imaginary.

Chapter 20

Homogenized Educational Imagination and Polarized Educational Opportunities: Schooling in Contemporary Kolkata

Manabi Majumdar

20.1 Introduction

Keeping in mind the contextual and specific history of urbanization on the one hand and the current agenda of capitalist urbanization that spans the globe on the other, how do we understand the ‘urban’ and urban schooling in contemporary Kolkata? Does the dominant discourse and practice of schooling in the city, seemingly fashioned by a model of upper middle class control and activism, at once homogenize educational imagination and polarize educational opportunities? Taking the social and family strategy perspective of schooling as the backdrop and moving into the inner space of the schools and classrooms, to what extent do educational policies enable or enervate schoolteachers to improve children’s learning, to improve the quality of their own training and teaching, and above all to address unevenness in the distribution of quality teaching across the city schools? To put it more generally, to what extent can the schools in the city, especially the state-run schools, address concerns of justice, equity and quality in education? If seeds of such transformatory potentials of schools are visible, what bearing do they have on a critical re-examination of the test-driven, profit-driven education reform agenda that seems

Centre for Studies in Social Sciences, Calcutta; manabimajumdar@gmail.com. I am most grateful to Geetha Nambissan for the opportunity she has given me to work on this subject and for her insightful comments on an earlier version of the paper, many of which have been incorporated here. I also thank William Pink for constructive suggestions. I owe very special thanks to Kumar Rana, Sangram Mukherjee and Ranjit Kumar Guha for their helpful suggestions and their invaluable help in some parts of the data analyses and school ethnography that the paper draws on. I am indebted to Partha Chatterjee, Keya Dasgupta and Priya Sangameswaran for very useful discussions on the past and the present of the city under study.

to be overwhelming the urban educational imagination itself? These are some of the questions that are raised, though not necessarily answered, in this paper, which has a primary focus on elementary education.

In the following discussion, first, I will debate the idea of the urban in a third world setting of India. Second, I will offer a fleeting glance at the history of the city of Kolkata and its education system, its demographic features, growth and so on. Third, I will focus on how the 'outside'- specifically the class strategies of upper and upper middle classes, and the business strategies of educational entrepreneurs-shapes the 'inside', that is, the school system. Fourth, I will look into the inner workings of the school system, especially at the spatial distribution of schools, and then try to examine what schoolteachers can do in order to ensure equity and quality in education. In concluding, I will revisit the question of educational purpose, and not just of its quality, since the aim of education itself has come under the thumb of capitalist urbanism.

20.2 Understanding the Urban

There are multiple and competing meanings of the urban (Noblit and Pink 2007). On the one hand urbanity entails cultural sophistication and cosmopolitan attitude; on the other hand the urban is associated with crime, squalor and overcrowding. The urban is imagined as a problem, as a hub of poverty and inequality, but also as a desirable destination of prosperity. In a third-world setting in particular, the urban is a zone of luxurious 'gated' housing communities, at once also a 'planet of slums' (Davis 2006).

The urban in the developing world, therefore, has its own contextual specificities. In fact, the so-called 'urban bias' in policy consciousness and policy actions is found to be a typical third-world feature. The urban therefore is not just about urban poverty. There is opulence amidst poverty. Similarly, although there are degrees of residential segregation there is no stark and neat slicing of wealthy and less affluent families into impermeable zones; both intra- and inter-neighborhood inequalities persist.

But social inequalities seem to be more pronounced in urban areas as compared to rural locales. Within the same city space there are sections of the city dwellers who belong to the 'first world', 'even without applying for a visa', in terms of their opulence, living conditions and lifestyle, while there are others who live in abject poverty.

Again, in Kolkata and in many other Indian cities urban schools do not necessarily have a negative connotation usually associated with the so-called inner city schools in most parts of the Global North. There are quite a few highly reputable schools and higher education institutions in Kolkata and in other Indian cities. Neither is the city itself uniformly characterized by run-down, low-income neighbourhoods. A little over 30% of the population lives in slums in the city, as per the data from Census 2011.

Importantly, however, spatial exclusion or separation is less stark than school segregation as far as Kolkata is concerned. That is to say, streaming of children from upper class and working class backgrounds into separate worlds of education is much more pronounced. In short, polarization of the student intake of urban schools is a fact, although there is a wide range of schools in between the two poles of 'corporation' (municipal) schools peopled with children from disadvantaged backgrounds and 'corporate' (elite) schools having fees that only the hyper-affluent can afford. That the less affluent parents happen to stick to state schools- a trend visible more in Kolkata than in a city like Hyderabad, for example, where low-income parents seem to opt out of government schools in favour of low-fee private schools- does not, however, signify that the disprivileged sections of the city dwellers suffer from a self-perpetuating 'culture of poverty' or that they lack interest in their children's schooling. As we try to suggest below, educational aspirations as well as efforts of indigent parents far surpass their meager economic wherewithal.

To mention once again, in Kolkata residential segregation and school segmentation crisscross rather than overlap. No doubt, neighbourhoods within the city are socio-economically stratified, some being more prosperous than others; this by itself is not uncommon when we compare with situations in many other cities of the world. But, sometimes even within the same neighbourhood resource-starved or low-income families live next to the moneyed people. And the children from indigent families living at the fringe of a relatively posh area are often found to be attending the local resource-starved municipal school, while those from wealthy households in the same locality get admission into 'elite' schools that may be located quite a distance away from their residence. This implies that schools are rarely neighbourhood schools or socially mixed schools; rather they too are socio-economically stratified. Historically, the municipal schools, known as 'corporation schools', were set up in the city for public provisioning of educational opportunities for the children in a local area. Over time, however, and especially with increasing massification of educational participation (which meant a growing school participation of the erstwhile excluded social classes), there has occurred a more clear-cut streaming of children into government and private schools; the first-generation students are availing of publicly provided 'free' education, while those from highly privileged backgrounds are opting for high fee-charging private schools. This 'elite flight' from government-run schools is often viewed as a vote in favour of quality education. Indeed, the growing attraction of low-fee private schools even among less affluent working class parents in the country is taken as a mark of the allegedly superior quality of anything private. This perceived penchant for quality may however mask a hidden class preference for exclusivity and against integration. It is important to note, however, that the expansion of low-fee private schools is relatively less pronounced in the city of Kolkata as compared with some of the other Indian cities. Privatized school choices, as I discuss below in greater details, are no doubt on the rise at the pre-primary and primary levels and especially among the elite and upper middle classes; but a sizable section of lower and middle- middle classes in the city still seems to choose from among a wide variety of government-run or government-aided schools.

At the present juncture, to understand the urban would also require us, as Lipman (2010) persuasively argues, to focus on neoliberal political and economic processes that are restructuring cities across the globe – the phenomenon the author describes as ‘neoliberal urbanism’. This tends to cause an upward mobility of wealth and thus produce hyper-inequality between the sections, for example, of transnational and global elites living in a city and their fellow denizens who often are dispossessed farmers and informal workers living in poverty and insecurity of life and livelihood (Harvey 2010). Recent research on the reduction of multidimensional poverty (and not just income poverty) in India, for instance, suggests that such reduction is mainly owing to reduction in rural poverty and that the rate of poverty reduction in urban areas has slowed down (Alkire and Seth 2013). Such intensification of social, spatial and economic insecurities and inequalities in urban locations is bound to impact public policies as well as market-led processes that shape the contours of the present-day urban education, and is highly likely to generate new patterns of educational inequality and exclusion.

It is well to point out that these pro-market urban processes and urban schooling capture only a part of the city dynamics of education. Drawing on Henri Lefebvre’s notable idea of ‘the right to the city’ both Harvey (2010) and Lipman (2010) underline the need to look at the city space not only as a centre of hegemonic power effecting the production of urban space in an exclusionary manner, but also as a site of countervailing power and resistance generative of demands for democratic control over organizational and investment decisions that shape the life of the city, including its educational fortunes. In the following discussion I will explore whether there are any traces of such pro-democratic and equity-enhancing educational counter-currents evident in the cityscape of Kolkata.

20.3 A Potted History of the City and Its Education System

Kolkata, formerly known as Calcutta, has a rich social history, economic background and demographic setting, each having an impact on the nature and functioning of the city’s school system. The short account of such a checkered history of the city that I present here is necessarily in-exhaustive and is meant only to provide a broad-brush view of its past. Calcutta was the central axis of British-Indian administration in undivided Bengal; this had a lot to do with its demographic composition, settlement pattern, commercial features and with the formation of its social elite and their educational and professional ambitions in the late nineteenth century (Mukherjee 1977). The multi-ethnic character of the city was striking; the population estimates made in 1837 by W. Birch, the then Superintendent of Police in Calcutta, were included in ‘Vital Statistics of Calcutta’ prepared by C. Finch and it recorded the presence of a motley crowd consisting of ‘English, Euro-Asians, Portugese, French, Chinamen, Armenians, Jews, Western Muslims, Bengali Muslims, Western Hindus, Bengali Hindus, Moguls, Parsees, Arabs, Mugs, Madrasees, Native Christians, and Low Castes’ (Finch, as quoted in Mukherjee

1977). Thus, the city, having a number of networks of trade, finance and learning, attracted a heterogeneous population consisting of diverse social and cultural communities; but the majority of the population was Bengali Hindus, followed by the second largest sub-group of Bengali Muslims. From a small European settlement Calcutta gradually evolved into a bustling commercial city and as a home for merchants and bankers who in turn offered employment for clerks and petty administrators who also settled in the city. All this led to the rise of a 'new' urban class. Different types of education were on offer to cater to the interests of the *Bhadraloks*, ranging from indigenous elementary and post-elementary schools known as *pathshalas* and *toles* to English schools (Acharya 1990). The social elite were not uniformly in favour of vernacular education; some were keen to join the English education classes. They were also eager to serve on the school committees, and in the recently formed School Book Society and School Society and took an active interest in shaping the course of educational development in the city in general.

Calcutta also witnessed, as an offshoot of the divisive policies of the colonial administration, the Partition of Bengal and the consequent displacement and dispersal of large sections of the population, particularly sections of the marginalized Scheduled Caste peasants (Bandyopadhyay and Basu Ray Chaudhury 2014). Their migration from the then East Bengal (now Bangladesh) to West Bengal started from the 1950s and has continued ever since. The city has continued to experience the predicament of the so-called 'refugees' and the challenges of their resettlement within its confines. Its identity as a refugee city has influenced the nature of politics in postcolonial West Bengal. Importantly, self-mobilisation and self-settlement strategies taken up by many refugee groups in the city led to the formation of refugee colonies on the northern and southern fringes of Kolkata. What is more, their initiatives and agency amidst all sorts of hardships led to the creation of a 'civic environment' within the refugee neighbourhoods. Under the aegis of such self-initiatives, local roads were built and local schools were established (Chakrabarty 2014). The history of education in the city, therefore, is distinguished by both plebeian and patrician educational endeavours.

Coming to the more contemporary period, many parts of the world have been witnessing in recent times a massive scale of urbanization (Davis 2006). However, the situation is somewhat different in the case of Kolkata. The urban renewal initiative introduced in several Indian cities a few years ago under the auspices of the Central government has had a focus on urban infrastructural development. But the more recent drift in favour of developing the so-called 'smart' cities also entails offering new incentives to real estate developers. The new genre of urban renewal may thus imply the dispossession and removal of marginalized social groups from their residence and place of employment.¹

¹Rural land has been a major site of such dispossession in many developing countries that are going through a phase of capitalist development; in addition the dispossession of urban land for private investment is also quite visible. Some details of similar development in the city of Kolkata are discussed below.

The greater Kolkata metropolitan area has roughly about 14 million people as per the Census of 2011. Within this larger landscape lies the city of Kolkata, being under the administrative control of a municipal corporation, and having a population of about 4.4 million. Although the city has witnessed a negative growth rate of population during the period between the decennial censuses of 2001 and 2011, it is still a hugely populous, and tightly packed city, with a population density of 24,306 people per sq. km.² Kolkata is truly a State-sized city, of a country-sized State of a continent-like country of India. This scale factor constitutes one of the key features of the contextual specificities and background conditions that fashion the city's education system.

Kolkata, to mention once again, was the capital of British India till 1911, having left a distinct political and social legacy of its own. This port city also grew as a centre of vibrant economic and industrial activities that created in turn a demand for skilled and unskilled workers, attracting jobseekers from the neighbouring regions and States. Thus, the twin forces of urbanization and immigration shaped the social, political and economic life of the city for a long time; in fact between 1901 and 1991 greater Kolkata remained one of the most populous cities in India. In the more recent past Kolkata's business and industrial activities started decelerating, the rate of growth of urban population started declining somewhat and the denizens of the city started out-migrating, yielding a perception that the city was losing much of its previous attraction as a destination for cultural, educational and economic opportunities. Indeed, the metropolis that was the foremost centre of commerce and industry in the not so distant past has experienced industrial decline in recent times unlike a few other premier cities in India. This has possibly made the erstwhile middle class entrepreneurs more dependent on the public sector that itself is however shrinking in size in the State of West Bengal.³ The relatively discouraging employment scenario in the State has also likely amplified middle class anxiety about the intense competition that their children will have to face in their educational journey and beyond. It is possible that this fretfulness has driven them to opt for ostensibly 'better' quality education in private school, while at once remaining keen to have 'better' quality jobs in the public sector. This said, schooling decisions are not dominated by employment considerations alone. In fact, the dependence on private schools in Kolkata is more at the pre-primary and primary level and progressively

²The recent demographic trough, that the city experiences, is largely due to its falling Total Fertility Rate (TFR).

³Kolkata is the capital city of the State of West Bengal. The contribution of industry in the Gross State Domestic Product of West Bengal has shrunk according to recent statistics (The Hindu 2013). The trend to downsize public sector employment- employment in the Central government institutions in the State in particular- started in the 1990s. However, the share of employment in the public sector still far outweighs the corresponding share of the organised private sector in the State (Economic Review 2011–2012). Among the major States of India, West Bengal is a middle-order performer as far as employment rates are concerned (Economic Survey 2012–2013). On balance, economic performance of the State is unexceptional, neither exemplary nor miserable comparatively speaking.

less at higher levels of schooling. So there is a supply-side story too. Furthermore, there is also a self-conscious distancing of upper middle classes from the government run education institutions at a time when the masses are accessing these institutions in greater numbers. Simply put, the social processes that underpin the growing educational polarization among various social classes are far more complex than a straightforward and linear economic explanation.

The relatively lackluster school education policies of the State, during 34 years (1977–2011) of the Communist party rule in particular, have had their own imprint on its urban educational fabric. Indeed, the Left Front government focused much of its energy, for justified reasons, on wage issues and those of security of land tenure of peasants and their livelihood struggles, but remained under-active, for not so justifiable reasons, in the field of mass elementary education. Also, its decision to discontinue teaching of English at the primary level in state-run schools in the early 1980s and its reintroduction in the 1990s created a lot of controversy about the creation of a gulf between government and private schools. The Left rule's apparent lack of attention to the educational needs of the underprivileged sections of the State's population is attributed, in some writings, to the 'social conservatism' of the party's *bhadralok* – 'gentlemen' – leadership (Bag 2011). Some indications of change in official thinking vis-à-vis the educational deprivation of Kolkata's poor were evident in the late 1990s and early 2000s. This, however, mainly took the form of an NGO-led alternative mode of educational delivery to meet the special needs of children of the poor. The creation of such a parallel system contained the risk of diverting attention away from the larger context of public provision of schooling in the State and the city and its equity implications (Nambissan 2003). The need to energize the equity-enhancing potential of state schools and correlatively to facilitate professional development of teachers for such purposes appears to have dawned on the city's policy consciousness somewhat late, partly in response to the passage of the Right to Education Act in 2009 that enjoins the State government to better spread and fund education across a broader range of the population. To react to this imperative, however, the government seems to turn more and more to a public-private partnership mode that we discuss later. It is against the backdrop of the apparent twilight of the city's social shimmer mentioned above and its checkered political career that I aim to shed light on the problems as well as promises of its education system, focusing particularly on school education.

But if it is a sunset situation, it is also a moment of a new initiation. Much recent scholarly research has drawn our attention to the phenomenon of an expanding middle class in India and its cities, as a group empirically defined by income level and consumption pattern, but more importantly as a new 'moral majority', as an ideological force that dominates the discourse on what India aspires to be in this new era (Fernandes 2006; Mooij and Lama-Rewal 2010). This new middle class is, of course, not large numerically speaking, but enjoys a position of substantial influence in defining what 'good' education is. This is as true in Kolkata as in any other Indian city. In particular, learning and speaking English and a command over the

language has become the most sought after educational goal of this class. This is indeed a revival of the longing for English education that a large part of the Bengali elite displayed in colonial Calcutta. This craving is of course linked up with the issue of employability in the present neo-liberal climate. What it does is to straight-jacket and homogenize the imagination of education within a narrow range; such conformity itself spans across the local and the trans-local spaces. It is therefore unsurprising that parents from disadvantaged backgrounds in the city of Kolkata chase the same 'vision' of education, but have unequal opportunities to actualize that vision. This is the new turn of events that I will discuss in what follows.

But as an aside, it is well to flag though briefly another dimension of the new moment, particularly since this has implications for the likelihood of school closure. The growing real estate business and urban property development is trying to push the frontier of urban Kolkata, displacing residents from many of the erstwhile squatter colonies to build lavish housing apartments for its wealthy denizens. A new politics of displacement and land acquisition thus permeates the city environment; the consequent spatial re-configuration may also entail eviction of schools. A process of displacement and dispossession that Harvey (2010) claims as central to the urban process under capitalism is quite real for the city of Kolkata.

Without going into details about multiple cycles of displacement and resettlement that the squatter and slum population in the city has experienced, one or two general observations in this regard are made here. Settlements on the land without legal title are sometimes not even recognized as slums and the people settled in those areas have no formal housing rights; they also lack access to a modicum of municipal services. Even if for electoral considerations the authorities and local politicians sometimes negotiate with the squatter population (Chatterjee 2004; Roy 2002), whenever any kind of mega development or real estate project comes up, people of the area are pushed on the margins of the highways or other peripheries of the city. A quick look at the distribution of the slum population of the city across its different municipal wards (see Map 20.1) indicates that between the decennial census of 2001 and 2011 expansion, resettlement and concentration of low-income colonies have occurred mainly in south and south eastern and west-central parts of the city. Importantly, between 2001 and 2011, the total slum population in Kolkata has declined only by 1 percentage point; and yet the number of wards recording zero slum population has risen from 34 in 2001 to 60 in 2011. It is possible to conjecture that due to increased real estate activities in the city there has been gentrification of some parts of the city while other areas have witnessed greater degrees of ghettoization. To be sure, some people may have moved willingly, but many have been displaced and dispossessed, because widespread resistances are also reported from within the city.

20.4 The Urban Educational Ethos as a Trendsetter

The centrality of an urban educational ethos, itself an artifact of both local and global forces, can hardly be exaggerated in fashioning institutional, civic and familial educational goals and practices both in urban and rural areas. In India and its constituent states both access-centred policy discourse and actions as well as success-centred market-driven reform agendas are focused on urban schools and aim more generally at shaping the urban social, political and policy consciousness, which in turn is expected to percolate down to rural areas. Therefore, the way in which the idea of what is ‘good’ education is constructed in the urban education sector, and the manner in which this is sought to be provided and attained in city schools and out-of-school tuition and test-preparation centres, define to a great extent the nature and structure of the entire education system, and therefore justify a closer scrutiny. I will analyze three specific elements of the educational culture that appear prominent in many cities in the country, including Kolkata, namely, (a) a strong preference among upper middle class city dwellers for private schooling and English education, and a strong dislike for almost anything public; (b) a growing acceptance of education being a for-profit venture leading to the emergence of a new education market in the city; and (c) a test-intensive culture of education nurtured by the global and local education industry, as well as national, state and local educational authorities, signifying a new kind of public private partnership that often favours interests of private capital.

20.4.1 *Privatized Choice as an Urban (Upper Middle Class) Penchant*

India has passed the Right to Education Act in 2009, acknowledging free elementary education both as a right as well as a compulsory duty. This has set off a relatively accelerated pace of expansion of educational opportunities and infrastructure for the school-age children in both urban and rural areas of India. New state schools have been set up and new schoolteachers have been recruited such that the masses, especially the hitherto excluded children, get a wider access to elementary education. In the city of Kolkata the number of state-run elementary and post-elementary schools has recorded a sizable presence, especially after the passage of the Act (Table 20.1). Furthermore, the proportion of private schools- roughly about 22%-has remained more or less unchanged during most part of the last decade, with the exception of a higher share of 30–33% during 2006–2009. This perhaps implies that private schools continue to remain the preserve of the privileged (the elite flight from state run Bengali-medium schools became particularly noticeable in Kolkata

Table 20.1 Year-wise number of schools by management in Kolkata

	Number of schools			Percentage of private schools to total schools
	Government	Private	Total	
2002–2003	1,324	387	1,711	22.62
2003–2004	1,505	432	1,937	22.30
2004–2005	1,541	418	1,959	21.34
2005–2006	1,532	475	2,007	23.67
2006–2007	1,538	632	2,170	29.12
2007–2008	1,459	725	2,184	33.20
2008–2009	1,435	725	2,160	33.56
2009–2010	2,019	602	2,621	22.97

since the 1980s when it was officially decided to discontinue teaching of English at the lower grades of elementary school; inequality in urban education increased manifold).⁴

Private schools are of course not new in Kolkata. A number of non-profit private schools used to impart education to the city's youth alongside the state schools in the past. But over time owners of private schools demanded government takeover of schools; they put pressure on the government to provide funding for teachers' salaries and other infrastructure development. School education was increasingly seen primarily as a state responsibility, even though the state itself remained quite deficient in providing universal access to education to the children of the city. What is new is a shift in that understanding; in particular for the upper and upper middle classes state schools have lost much of their relevance. Also, private schooling itself has undergone a transformation in that they are mostly for-profit ventures now. It is important to point out here that we do not observe a huge expansion of private

⁴There are some definitional issues here too. For example, official documents mention that some of the grant receiving schools, formerly known as private aided schools, especially those that get dearness allowance (DA), are re-defined as Departmental (i.e. state-run) schools. This acknowledged, state schools are still prominent in the urban landscape in the State of West Bengal, particularly when we take note of the schooling options of the underprivileged. According to the latest NSSO survey in 2014 (Government of India 2015), in urban West Bengal (city-specific data are not available) at all levels of school education the poorest income classes send their children mainly to government run schools (about 82–92%). In contrast, about 60% of the primary school going children from the richest income classes opt for private unaided schools in urban Bengal. At the post-primary level the corresponding figure is 38%, which declines further to less than 30% at the post elementary level. Again, it is well to point out that out of all the private unaided schools in Kolkata, nearly 50% are Bengali, Hindi or Urdu medium schools. Put differently, private unaided schools cannot be automatically taken to be English medium schools.

schools and their intake in Kolkata in the recent past. This of course cannot be straightforwardly taken to be a lack of predilection for private schools. Rather, we surmise that for-profit private schools in general remain outside the reach of less affluent parents in the city and that they largely depend on state schools for their children's education. This is the area that however needs a deeper probing. Of course, what is a widespread practice in the city is a near universal dependence of all sections of students – mediocre and meritorious – from all sorts of socio-economic backgrounds at every level of school education on supplementary private tutoring which is increasingly being viewed as 'essential' even to master the basics (Majumdar 2014). This is a private supplement of a different sort that weakens the relevance of school in the life of the student, except as a certification centre. This may also be viewed as 'choosing private education through the backdoor'.

In view of the general enthusiasm for school choice in urban areas, we may note that the recent focus on the right to access seems overshadowed by a strong passion for educational success; this passion is shared by parents, planners and the global pro-market educational think-tanks, generating in turn a penchant for individuated educational choice. The shift of focus from access to success also signifies a drift away from the rights discourse towards the one on private choice. The idea of choice becomes particularly meaningful when we take note of the educational aspirations and strategies of the upper middle classes and their role, owing to their social and political weight, in sculpting the discursive space of education (Nogueira 2010; Nambissan 2010). It is their educational imagination (or its instrumentalization), their definition of 'good education', which is internalized by disprivileged classes, leading to the production of homogenization and conformity of aspirations. Yet, at the same time, in a climate of intensified and class-based educational competition for access and success, the middle class strategy of 'concerted cultivation' (Laureau 2003) of their children's skills to succeed in their career which would then be a passport to the 'good' life, leads the wealthy parents to maximally use all sorts of resources and capital at their disposal – extra coaching, use of legitimate and less than legitimate means of admission into prestigious schools and colleges- 'bribery, jugarbazi...and other forms of backstage manoeuvring' to use the phrases of Drury (as quoted in Nambissan 2010), cheating and impersonating at examination halls and so on- to the advantage of their children's education and to the maintenance of their social status. A single-minded pursuit of such class strategies is bound to be self-maximizing and thus exclusionary and ultimately to be causing reproduction of inequalities.

This turns out to be a model of upper middle class control of the school system in the sense that it is their educational activism and strategies, and not just state initiated education policies, which shape the school system, its vision and functioning and the outcomes it yields. A number of scholars (Ball 2003; Nambissan 2010;

Donner 2008, among others) have compellingly argued in favour of acknowledging their role ‘as co-producer [along with the state] of [urban] educational reality’ (Nogueira 2010). Nogueira describes this phenomenon as the ‘rise of the educational “parentocracy”’. What is more, the upper middle classes of India have come under the sway of corporate capitalist thinking like never before (Chatterjee 2010). And the corporate and technocratic classes fancy top-down solutions; as a result their pairing with middle classes has impaired the growth of democracy (Mishra 2015).

It may be well to point out here that the proclaimed **centrality** and weight of parental means and modus operandi are important forces only in case of upper class parents. Parents who have a lot of money dominate over the teachers and school administration. Parents with meager means do not call the shots in matters of urban schooling- in securing either the educational access or success of their children. Also, even the active participation of the upper middle classes in the shaping of the education system on account of their social dominance (as Nambissan 2010 forcefully argues) is not totally independent of supply-side inducement. That is to say, parental choice and demand is often supply-induced demand. The education market offers all kinds of education services and products – starting from ‘smart’ technologies to test preparation kit to study guides, to branded uniforms and shoes to branded chain of private schools – and aggressively campaigns and even coercively mobilizes parents to opt for these services often in collusion with school authorities. Thus publishing houses, textbook and study guide markets, markets for branded school clothes and shoes all flourish, so much so that private agents are known to give generous gifts (read commissions) to school authorities in exchange for their endorsement of the marketed products. The larger aim is to make parents accept and internalize the underlying market model and logic of education itself.

Education entrepreneurs aggressively market their educational products and services to upper middle class residents of the city and consciously marshal and organize their participation in the education market. For example, the newspaper dailies, billboards, bus and railway stations, school walls, and even lamp-posts in the city of Kolkata are full of advertisements for various out-of-school privately paid supplementary services and learning materials. Marketing strategies also include face-to-face campaigns, as reported by a staff of a coaching centre in the city. For example, at a time when students sit for their annual or school leaving examinations and when as a result many parents throng at the school gates, paid agents of private coaching centres distribute leaflets soliciting parents to choose their centres for supplementary coaching for their children (Leaflet 1).

Achieving success needs the right click at the right time.

PRESENTING **KRYPTON CLASSES** - (A GROUP OF J.U. ENGINEERS & REPUTED TEACHERS)

WHERE DREAMS BECOME A REALITY.

CAN U BECOME A KRYPTONITE?

We are a team of professionals (Engineers from Jadavpur University), who have expertised over the years in guiding students in Science group of Cbse Boards & Medical/Engineering competitive exams. We are now in search of those budding stars from Junior Classes. For this we are trying to build their fundamentals & create inquisitive interest in their approach to Science. Lucid but innovative methodology is followed during teaching. Career counseling are done to give them idea of their future goal.

Idea of different prospects (Engineer, Doctor, Lawyer, Teachers, Journalism, MBA) are provided. Various visits are also made from our institutes to Science city & BITM, Botanical Garden to give them the feel of Natural Science.

WE ADHERE TO THE FOLLOWING TECHNIQUES:

- ☛ *Concept building classes in short batches.*
- ☛ *Counselling of weak & shy students & special extra classes for them & Basics of Maths are taught to weak students separately by teachers to gain confidence.*
- ☛ *Twice a week MATHS class from 2 -3 text books like M.L.AGARWAL, R.K.BANSAL, A.DASGUPTA with special emphasis on Riders in Geometry and objective sums.*
- ☛ *Notes containing extra informations are provided in Physics, Chemistry & Biology.*
- ☛ *Doubts are solved individually in class room as well as detailed solving of doubts are done through e-mail (rajibkrypton@gmail.com) & sms (text in 9804862236).*
- ☛ *Questions of previous years papers of schools like Don Bosco, St.Xaviers, Julien Days, Loreto, Lycee, Garden High, A.G. Church, M.B.S.V., G.D.Birla, St.Thomas, St.Teresa, M.P.Birla, St.James are solved in class*
- ☛ *Conduction of Weekly Tests & Block Tests in each month, corrected by board examiners followed by interactive Test Analysis session.*
- ☛ *Promising students are groomed for OLYMPIAD EXAMS.*
- ☛ *Mock full syllabus tests prior to Half yearly & Annuals, pre-selections, selections and special TEST SERIES for ICSE.*
- ☛ *We also have POSTAL TEST SERIES PROGRAMME & ONLINE DOUBTS SOLVING PROGRAMME via email & sms.*
- ☛ *No advance fees nor admission charges are taken.*

TUTORIALS SPECIALISED IN : MEDICAL & ENGINEERING ENTRANCE (ALL INDIA BASIS)

CONTACT : **KRYPTON CLASSES**

20.4.2 Education as a Business Enterprise

Non-profit private schools, missionary schools, and privately managed community schools have been an integral part of the school education system in the city. At some point several of them were brought under the ambit of the governmental grants-in-aid system that assured their financial viability. The kind of high fee-charging private schools that have come into existence in more recent times are of a different genre. These are often called ‘five star’ schools, as they proudly advertise the comforts they offer, such as air-conditioned classrooms and school buses, swimming pools, rooftop synthetic turf for playing games and so on. A number of the ‘new’ private schools run on a business model in the city indeed boast of having such ‘jewels’ in their schools’ crown, as a schoolteacher has put it pithily. They also insist on their students getting branded schoolbags, shoes, ipads and so on. Gadgets like ‘smart boards’ and giant TV/Computer screens used for Q&A sessions are introduced in these schools through active promotion of such techno-savvy teaching-learning material by profit-chasing business companies. If aggressive advertisement is one side of the story, running like a business also means secrecy and surveillance. As a former teacher of a private school commented, many private schools in the city have installed biometric surveillance systems in the school, which she compared with a kind of a ‘machine’. A quick look at the websites of a number of ‘cream of the crop’ schools in the city reveals that a majority of them have been established fairly recently, in the late twentieth or early twenty-first century, signifying the arrival of a new genre of private educational institutions operating under a new model of education as an industry. Most of them have sprawling campuses and impressive school buildings; the architectural construction of these school buildings in a way shapes the construction of the subjectivity and identity of their students. Their websites proudly advertise the facilities they offer, such as the installation of CCTV throughout the school premises for safe and secure environment, amphitheatre, interactive smart boards, yoga rooms, children’s parks, fully air-conditioned classrooms, ergonomically suitable adjustable chairs for students (one school advertises that these chairs are ‘procured from West Germany’), free laptops for teachers, excursions to countries in Europe, and so on. Surprisingly, most of them have very little information on their websites about the profile of teachers who work there and their qualifications. A few of them mention that they have direct academic links with selected schools in the Global North. It is, however, hard to expect that these schools will have any contacts with those schools within the same city space that are physically nearer but socially distant in terms of their student profile. The annual school fees for a student in these corporate schools range from Rs50000 to Rs90000, whereas the annual per capita income of India stood at approximately Rs90000 in 2011, according to the Economic Survey 2011–2012 (The Hindu 2012). No doubt, only the affluent and the hyper-affluent can afford these ‘top’ schools.⁵

⁵The sample of schools for which the website analysis is done includes 19 schools.

Mushrooming of private coaching centres represents another dimension of the commercial and market model of education. There are a handful of very popular and highly expensive coaching centres that operate in the city; those who can afford the hefty fees charged by these institutions count them as must-enroll test preparation centres for admission into prestigious colleges. Getting their children enrolled in these centres is also a status symbol for many parents. The parents of more modest means also spend quite a lot on supplementary tutoring for their children to give them a competitive edge; and yet their children often remain trapped in low-grade schools as well as second-rate coaching centres. Where they face a real challenge relates to the acquisition of English language skills- the skills that are deemed essential for upward mobility in countries of the Global South (Thapan 2015). The 'respect and awe for the aristocratic virtue of the majestic English language' that Carnoy spoke about while discussing the cultural imperialist dimensions of the 'Anglicist policy' (as cited in Thapan 2015) resonates strongly with the parents of all social backgrounds in the city of Kolkata, including the working-class parents. Yet, their private efforts, enervated by the huge asymmetry of information under which they make their choices, more often than not yield unsatisfactory results.

20.4.3 Test-Intensive Education

Nowadays, there is a worldwide emphasis on student learning at each level of schooling, driven principally by various international agencies, which are advocating all kinds of performance indicators and measures for the purpose of educational evaluation (Carnoy 2007). Various international tests are being used as a standard to measure and compare student learning across nations (Darling-Hammond 2014-15). The dominant view is that to improve student scores we require more tests and more testing policies. Several educationists call it a kind of an 'obsession' with test scores (Ravitch 2014).

Many teachers internalize this obsession and respond to it by heavily relying on MCQs, which in turn are permutations and combinations of similar questions year after year, culled from question papers available in the market. The market that thrives around all these activities is described by a schoolteacher in Kolkata as a 'beehive'. It is indeed difficult to unravel the tentacles of this commercialized network.

Parents respond to these business practices in a rather resigned manner, with a TINA mentality. Preparation for entrance examinations starts very early in the life of a child, say, to gain admission into the kindergartens or first grade of a 'good' private school. As Drury observes, 'Exam culture' begins at age 3' (as quoted in Nambissan 2010). Also, parents and students sometimes join in protest marches if students are stopped from cheating. As an education administrator remarks, this is no longer a law and order problem but a social pathology.

How do the testing and technology industries respond? Starting from global players, such as the British corporation called Pearson, to local coaching centres, to

publishers of study guides—all are proactive in this field. A representative of one such popular publishing company in the city was waiting to meet the headmaster of a city-based corporation school during the time of our visit to leave samples of such guides with the school principal. Again, in Kolkata and its suburban areas there exist a number of branches of an institution called the Regional Institute of Competitive Examination (RICE) that prepare their students for all kinds of tests. This phenomenon spans across many countries. And in countries like China with a huge technological edge, “...companies sell answers and wireless cheating devices to students, and students engage in all sorts of elaborate cheating. In 2013, a riot broke out because a group of students in Hubei Province were stopped from executing the cheating scheme their parents purchased to ease their college entrance exam.” (as quoted in Ravitch 2014).

As Ravitch (2014), reviewing the work of Zhao on the school system in contemporary China, observes, the examination-based system rewards obedience, conformity and above all encourages ‘homogeneous thinking’, not critical thinking, curiosity and the ability to question and not comply with the authorities. Also, even though everyone in the race for higher scores wants to succeed on the highly competitive exams, few actually do. In fact, due to the lack of required resources the disadvantaged children suffer more from this systemic distortion and fail in greater numbers than their privileged peers. So educational thinking becomes more and more homogeneous; but there is no equalization of educational opportunities.

Self-maximizing individuated strategies of the upper classes of the society on the one hand and profit-maximizing operations of education entrepreneurs and industries on the other thus shape the contours of educational realities in the city to a large extent. The cross-class conformity of educational aspirations of parents is in fact a product of this dominant structural force. But does this entail a fair distribution of educational opportunities among children of all classes or castes? This is the question that I will now address, by focusing on the schools in the city and their spatial distribution, and more specifically on the role of schoolteachers – the routinely neglected and undervalued community in the school education system (Batra 2005; Kumar 1994) – in equalizing educational chances of their students irrespective of their social backgrounds. More concretely, to improve learning proficiencies of children from low-income households depends crucially on the quality of developing high-quality and socially engaged teacher education curriculum and training programmes, as also on whether schoolteachers are allowed to cultivate their professional skills by interacting and working together as a team rather than working in an environment of teacher isolation (Carnoy 2007; Darling-Hammond 2014–2015). Their ability to make a difference to the educational fortunes of the children suffering from multidimensional poverty and inequality requires conditions that enable them to develop the twin practices of professionalism and social justice activism (Majumdar 2011).

20.5 Are Schools Spatially and Socio-economically Stratified?

Lipman (2010) has drawn our attention to scholarship in critical geography which focuses on the 'spatial restructuring' of urban education occurring within the larger context of neoliberal urban restructuring. Among others, school closure, related in turn to issues of investment or disinvestment in schools, and inequality and unevenness in school funding etc. is one such rather extreme form of reconfiguration of schools. Admittedly, with the passage of the Right to Education Act, many new schools have been set up in different parts of the city to address the educational standards and norms required under the law. But in a brief survey of a few schools in selected neighborhoods in the city, we did come across some instances of school closure. These allegedly unviable schools, however, are precisely those that admitted homeless, street children. In one such instance, a municipal school housed in a small one-room structure that stood on the footpath itself has been pulled down. In its place now stands a small garden maintained by the same municipal corporation. Again, in some more affluent neighbourhoods there exist a few state schools that are not popular among the children of wealthy parents in those areas. And there seems to be a kind of veiled pressure on the authorities of such schools to close them down. For example, I found that a Bengali-medium state run school in a rather prosperous area of the city has been running for all these years from a rented school building on a 51-year long lease which came to an end in 2012. After years of litigation the school authorities have lost their case in the lower court and will probably have to vacate the building if the verdict in the higher court goes against the school. In the words of the school principal, the government is not taking much interest in this matter. There is a rumour circulating among the students and their parents that the school will close down in the not so distant future. The proximate causes that have created this uncertainty may appear to be straightforwardly legal, but the distal causes may have deeper connections with processes of urban property development. In a recent meeting of a group of primary teachers in the suburban areas of Kolkata (May 3, 2015), the participants expressed concerns about the declining rate of enrolment in a number of city-based state schools that may run into problems of viability in the near future.

In addition to a growing likelihood of closure of such 'unviable schools', we also find traces of the old or new geographies of schools in the city. Spatial mapping of schools and the underlying patterns of exclusion is of course a complex exercise that is not taken up here. Instead, a modest attempt is made to look at the distribution of the slum population of the city across its municipal wards in order to examine how these areas are placed in terms of the availability of state run and private schools, their respective student intakes, the extent of crowding in classrooms, and above all the proportion of enrolled students who belong to the Muslim community. This numerically large -roughly about 22% according to Census 2011 data- 'minority' population is known to be concentrated in the slum areas of the city and is known to suffer from various educational disadvantages.

It is evident from the figures presented in Table 20.2 that private schools are conspicuous by their relative absence in areas having relatively high concentration of

Table 20.2 Schools in 'Have-Little' and 'Have-Enough' areas in the city

(Municipal wards of the city classified by the proportion of slum population in the total (in %))	Share in total number of schools in the area (%)		Share in total enrolment in the schools in the area (%)		Share of Muslim students in total enrolment in govt. and private schools in the area (%)		Share in total enrolment of Muslim students in the area (%)	
	Government	Private	Government	Private	Government	Private	Government	Private
Low (1.13–27.22)	73.0	27.0	73.3	26.7	8.7	2.9	89.2	10.8
Medium (28.17–60.38)	73.2	26.8	84.7	15.3	40.3	13.0	94.4	5.6
High (61.23–100)	78.6	21.4	88.2	11.8	30.0	2.4	98.9	1.1

The disaggregated data on ward-wise distribution of slum population in Kolkata is taken from Census 2011. The percentage share of slum dwellers in the total population of the municipal corporation of Kolkata as a whole is about 30%. School data are taken from UDISE 2012–2013. The proportion of Muslims in the total population of Kolkata is about 22% as per Census 2011. Each cluster mentioned in column 1 consists of 27 municipal wards. In 60 wards out of the total of 141, no slum population is recorded in the Census of 2011

slum population; perhaps these are not attractive destinations for profit-oriented private schools for obvious reasons. It is the state run schools that cater to the educational needs of the children in these low-income neighbourhoods. Importantly, government schools on the whole have a substantial share of school enrolment in the city across all types of neighbourhoods; and expectedly this share is much higher in the relatively depressed neighbourhoods. One can also deduce from the data that there is a high concentration of Muslims in slum dominated areas of the city, resulting in a higher proportion of enrolment of Muslim students in government school in these areas as compared to that in wards that have a lower proportion of slum dwellers. This is true, although less strikingly, for private schools also. But across the socio-economically stratified clusters of neighbourhoods that are under study here, a common pattern springs out of the data: school-going children from Muslim communities mostly attend state run schools, almost entirely in the case of the cluster having the highest concentration of slum population. The school education system in the city thus carries the marks of both social and spatial segregation.

If state run schools appear more accessible to unprivileged children, and if the state seems mindful of expanding education infrastructure in low-income neighbourhoods, intriguingly, on another side of the register, there are cases of governmental activism also in favour of for-profit private entrepreneurs who are active in the education sector. For example, the Government of India has recently launched a partnership programme called the Teacher Education through School-based Support in India (TESS-India) project. Its official website states, 'The TESS-India initiative

seeks to significantly improve the classroom experience of millions of pupils in elementary and secondary schools across India. The seven focus states for the first phase of the project are Bihar, Orissa, Madhya Pradesh, Uttar Pradesh, Karnataka, Assam and West Bengal.... It is working towards improving the quality of teacher education in India.’ It is important to keep in mind that the capital city of Kolkata in the State of West Bengal, like its counterparts in the other six States, serves as the nodal point between the government and this trans-local education entity led by The Open University in the UK, and is claimed to be funded by aid from the UK government.

The project apparently focuses on the professional development of teacher educators and teachers, and on the preparation of manuals that are to be distributed widely among schoolteachers who will then just follow in their classroom practices the pedagogic techniques and tools suggested by the ‘experts’. This is a recent urban education initiative, a plan for public private partnership that encourages a direct hand of private players in education policy, the actors who are not answerable to the public for their decisions that may have wide-ranging public consequences. Lipman (2010) describes such developments as ‘the intervention of the state on the side of capital’, while Harvey (2010) describes the same as ‘the integration of state and corporate interests’.

20.6 What Schoolteachers Can Do

There is continued theoretical debate on whether schools have ‘independent power’ (Apple 2002) in bringing about social change, especially in the midst of entrenched social inequalities. Contrarily, scholars have examined the ways in which school curriculum, classroom pedagogy and achievement evaluation norms and practices reproduce rather than reduce social inequalities. In juxtaposing these opposing views it is well to ask whether the school system is a fully ‘determined institution’ or whether it can have independent effects (Apple 2002; Thapan 2015). My argument leans in the direction of the latter, although admittedly its potential to alter exclusions and inequalities cannot be taken as inevitable or automatic. The schooling experiences of children from affluent and working-class backgrounds still socially position them differentially and unequally, especially when the school system becomes a drill-driven, test-centred tedium rather than an exercise in stimulating curiosity and critical thinking. The common tedium has a damaging effect on all children, but it hurts the disadvantaged children disproportionately as their parents are starved of all sorts of capital – from economic to social to cultural- to compensate for those systemic deficits. What schools can do is therefore a complex and contingent question, but a question that is worth repeating. At the risk of oversimplification, I focus here, albeit in a limited manner, only on one dimension of this multidimensional problem, and then ask to what extent and in what ways schoolteachers and their agency can make a difference to the lives of their pupils.

It is rather disheartening to note that there is a general sense of cheerlessness about state schools in many parts of the country; what is more, in several recent studies it is found that teachers working in government schools are unenthusiastic about the government school system, even though they have seen improvements in their working conditions, professional training and in school infrastructure, including the availability of libraries, books and teaching-learning material (Ramachandran et al. 2015). A part of their indifference is perhaps due to the fact that they are treated by the administration more as employees at the bottom of a hierarchical system than as part of a professional community (Majumdar 2011; Mooij 2008). This general neglect by the system of the community of teachers and their potential intellectual contribution and the neglect on the part of the teachers of their own professional role create a serious problem as far as the goal of improving the quality of education is concerned. This is because improving the quality of learning hinges squarely on improving the quality of teaching, and relatedly on the condition that disadvantaged and advantaged children get access to the similar quality of teaching support (Carnoy 2007). Put simply, do schools that cater to the poor suffer from poor quality of teaching? In his study on the Cuban school system, Carnoy shows that there is a fair distribution of ‘good’ teachers among rural and urban schools and among schools that serve either disadvantaged or advantaged children. This basic fairness principle is routinely violated in many developing countries even within the boundaries of the same city, resulting in ‘the polarization’ of teacher quality among schools. This is linked with related questions of pre-service teacher training programmes, support and monitoring by school administrators, and professional and collaborative connections between teachers themselves. And as scholars like Carnoy (2007), Darling-Hammond (in Collier 2011, 2014–2015) and Sahlberg (2012) compellingly argue these are the most crucial and perhaps the most difficult elements and conditions to achieve in order to improve the quality of teaching and learning, requiring sustained efforts and sizable investments. It is debatable whether the teacher support programme undertaken recently in Kolkata and West Bengal under the aegis of the TESS-India project mentioned above is likely to continue as a long-term sustained programme, and not just an ad-hoc intervention.

I will briefly focus on the teachers in corporation schools of Kolkata to address the problem of this ‘teaching gap’ and teacher distribution discussed above, and then ask to what extent they can close the learning gap of their students. The discussion in this section is based on two focus group sessions that were organized in two different locations of the city on June 14, 2015, and school-visits and observations conducted during June-August, 2015.⁶ Admittedly, in corporation schools, teachers have to deal with student poverty and social inequality on a first-hand basis; in the slum areas they also face larger class sizes. Some say, ‘we are child minders and not teachers’. The difficult background conditions indeed make the task of teaching that

⁶The focus group meetings were held at two separate teacher-training centres in the city. A recent attempt is apparently being made by the Department of Education to orient schoolteachers and improve their competencies to address ‘the educational and social needs’ of disadvantaged children.

much more difficult for these teachers. Many of them internalize a strong preference for test-intensive teaching-learning practices. Some also focus squarely on the problems that the first-generation students create for them, rather than focusing on what they themselves can do to help children learn the basics against many odds, prolong their school life expectancy and in the longer term ease their journey out of poverty.⁷ There are of course deeply reflective and positive counter-voices too.

In one group the drift of the argument focused on what working-class families do not do – train children to be clean, attentive, and well-behaved in class; see to it that they complete their home tasks etc. What these parents – day labourers and domestic servants – of first generation students lack in terms of their efforts was the essence of their conversation. In short, they stressed on the ‘home environment’ of the children as the ‘roots’ of their learning deficiencies. They were also critical of many incentive schemes- like distribution of free clothes and shoes to children from deprived backgrounds- that state schools have, since these make the children, they held, a permanent clientele of charity.

In the other group the focus was on what schools and schoolteachers can do to mitigate the effects of background conditions of these children that hold back their educational participation and obstruct their school completion. One of the participants claimed, ‘Even if we can educate only a few students this will be a contribution to the society’. They indeed deal with children some of whom have already lost part of their childhood; some of them at a very young age come to school by train; earn petty cash doing some odd jobs and are familiar with the adult world. One such student used to bring a knife and some other hazardous stuff to the class. The teacher narrated how she used to ‘buy’ such stuff from the student making small payments out of her own pocket, and how she gradually persuaded the boy not to bring those items and motivated him instead to continue with his studies. Now this boy is about to complete his school education. Several other participants voiced their optimism about the growing ‘awakening’ of working-class parents to the importance and value of acquiring education for their children.

Some of them deeply reflect on their pedagogic ideas and practices too. A teacher of a state school located in the suburb of Kolkata writes (Shiksha alochona, 27–28 May, 2015), ‘Many of us think that we teach and that is why a child learns. In this manner of thinking there is a strong sense of ‘I’. It is better that we get rid of such egotistical feelings, because even if we teach, a child learns in their own way. When there is a huge gap between my teaching and their learning there is a problem. This gap has to be reduced; teaching and learning need to go hand in hand. This complementarity has to be achieved.’ During our school visits, a handful of teachers, working with children from low-income backgrounds, stressed on their students’ eagerness to learn, and their involvement in classroom activities such as recitation of poems, group play, painting, and so on. Such teachers too were familiar with the ‘family constraints’ that many of their students grapple with and their disadvan-

⁷Teachers’ unions and associations that have played a prominent role in the State’s left politics for long have however not been adequately sensitive on the whole to the educational needs of the first generation students (Nambissan 2003; Majumdar 2011).

taged social position; and yet these teachers articulated their thoughts and efforts to reach out to these students. As one of them said, 'We try to give them special attention just like a private tutor does; we assess the level of their proficiency and ability and guide them accordingly; we sometimes give them extra lessons in off-periods'. Such remarks indicate a sense of purpose that these teachers have about their own profession and about the school system they are a part of.

Part of the problem why more teachers do not share their confidence and enthusiasm in reaching out to their pupils is that teaching or learning is being treated as an isolated activity, as 'bowling alone', rather than as a cooperative endeavour built on a network of collaborations and connections. And since teaching and learning are both effectively rendered individuated pursuits, failure is 'individualized' both for students and teachers, taking no cognizance of collective or systemic deficits. To put it differently, that teaching is a 'team sport' (Darling-Hammond in Collier 2011) is inadequately appreciated. Teachers develop professionally when they find time and scope to collaborate with other teachers to improve their own work, when the system allows them to form communities and share their expertise in a sustained manner, the benefits of which then percolate among students. Both in state schools and in privately managed schools, however, the formation of teacher communities is discouraged. In state school, and in any kind of public institution in general, a real aversion has developed vis-à-vis any kind of teacher unionization, especially in the current neo-liberal climate. Again, a conversation with a former academic coordinator of a private school in Kolkata (interviewed on May 27, 2015), whose task was to monitor teachers from the side of the management, revealed that private school managements do not quite encourage teachers to work as a 'homogeneous' group. This is both for disciplining purposes and to regulate circulation of information among them about the differentiated salary structure that the school has. What schoolteachers can achieve is therefore a political and contingent question, and not an inevitable process.

20.7 Rethinking Educational Purpose: From Test-Fetish to a Taste of Understanding

In her recent influential book Nussbaum (2010) expresses some deep concerns about a 'silent crisis' in education visible in all corners of the globe that expresses itself in the form of a predominantly commercial and profit-driven model of education that is bound to enervate rather than energize the idea of education as the school of democracy. As Nussbaum compellingly argues, education should inculcate among children the values for a democratic society which include the capacity to criticize oneself as well as the authorities, the ability to appreciate the socially heterogeneous character of the society in which one lives, and the capacity to develop 'imaginative sympathy' for others.

This therefore implies that education has to be an activity pursued in a predominantly non-profit system since it has to bend the arc of our imagination away from strictly self-regarding goals and towards 'collective and relational understandings of individuals and their societies', to borrow from Harvey (as quoted in Macpherson et al. 2014).

A re-examination of educational purposes is certainly linked up with reviewing the way in which the urban education community can develop 'assessments of deeper learning', to borrow the words from Darling-Hammond and Adamson (2013). It is this community that can, in principle, think of a more creative and innovative examination system that is fun for children and at the same time a helpful guide for teachers to assess students' abilities to think critically (Rampal 2013). The importance of the urban perception on these issues can hardly be exaggerated when we consider its wider effects on educational thinking in rural areas. It is, however, disconcerting that the urban education policy apparatus does not encourage involvement of schoolteachers in developing such innovative assessment practices, thereby supporting teachers' own professional learning. If education is, as Nussbaum (2010) argues, 'preparation for life', that too an 'examined life' which includes examination of oneself and one's social and citizenship obligations to the others as well as to the health of a democratic society, then it has to be different from a life full of examinations that only encourage mechanical, academically unchallenging, drills for higher test scores. A lot depends on how the twenty-first century city, especially its counter-hegemonic voice, addresses this first-order question.

In concluding, I revert back to the contextual specificities that define the city of Kolkata. While discussing its distinctiveness, Radharaman Mitra wrote in 1970, 'If you had made an effort to look at the full face of Calcutta you would have found not only diversity but varieties of contradictions in the city. Only one of her eyes smiles, the other is full of tears' (as quoted in Sinha 1987 p. 9). Do these contestation and contradictions of the city lose their force as the market emerges more and more as the fetish of our time? More specifically, does the school system in the city unequivocally mimic the market path of growth that is visible in several other cities in the country? In one view, this is indeed the case. It is felt that there is a kind of urgency among the middle classes, let alone among the elite, for private schools. It is believed that the city is a latecomer in the marketization phase of the education sector; the market has just started responding to the seemingly growing appetite for private English medium schools. And one indication of this slow but certain transition is the expanding market at the pre-primary and primary level of education in the city. Its distinctiveness therefore seems to lie in the fact that it is a late starter in an otherwise unidirectional trail of progress of the education market.

In the late 1960s and early 1970s Kolkata played a critical role in the radicalization of politics in Bengal, as discontented middle class students went into a phase of protest and revolt. They sought alliances with marginalized groups in rural Bengal with an aim to create a movement to build another kind of society. No doubt, that radical spirit has lost some of its vigour over time, especially at a time when the contemporary urban experience is surrounded with an aura of the 'liberating' force of the market. Yet, resistance struggles against market-induced dispossession and

eviction are reported in some parts of the city. Similarly, there are a few counter-examples of non-profit models of education delivery that are functional in the city.

It is therefore possible to look at the educational experience in Kolkata through a somewhat more intricate and rounded lens. To put it more specifically, what seems to characterize the urban educational experience in the city is a kind of jostling and contestation, if not contradiction, of competing and opposing forces. The growth path of the school system in the city that I have tried to chart out here attests to this contention. While the private education sector appears to have gained some ground in the cityscape, parallel attempts to energize and improve the state run schools are also evident. And since for the underprivileged children of the city, state schools are practically the only 'entry pass' into the world of education, egalitarian and quality reforms in these schools are a first-order social justice imperative. As a corollary, it is essential to exercise a collective right to the city, to conduct public debates and action to shape educational imagination and the grand direction of education, and above all to act not as consumers but as citizens belonging to a collective community.

Chapter 21

The City, Education and Social Mobility: Women's Narratives from Delhi

Divya Vaid

21.1 Introduction

The Indian city has been a central part of conversations and debates on access to space, mobility aspirations, and in the articulation of goals and fears both before, and in the context of, the era of liberalization (Prakash 2010; Vaid 201b). For women especially, city spaces while providing some element of freedom are constraining in other ways and, identities such as caste and class location mediate with gender where access to the city is concerned (Phadke et al. 2011). For some, in cities we find an increasing “polarisation along class, gender and ethnic lines” (Banerjee-Guha 2007, p. 262). More recently, the city as a site of increased equalities of opportunity in educational and occupational choices or conversely of reproduction of inequalities and barriers to mobility has been emphasised in debates on class and social mobility (Fernandes 2006; Brosius 2010; Krishna 2013; Harvey 2008; Beteille 1991 on the family and reproduction of inequality). Here as well women's trajectories and experiences of mobility are found to be distinct from that of men, though other identities such as caste and class can mediate this difference (Vaid 2014b).

I thank Geetha Nambissan and participants of the Delhi workshop on “The Urban and Education in India” held at ZHCES JNU (March 2015) for their advice and comments. I am grateful to Diya Mehra and Ankur Datta for comments on an early draft. I also thank Tanisha Gagoi, Shobhana Sharma, Swati Saurav and Komal Yadav for their research assistance. I am grateful to all informants who spared their time for the interviews. The fieldwork for this paper was funded by a UPE-II grant (2014) from Jawaharlal Nehru University.

This chapter focuses on one city – Delhi – and explores the experiences of young women in relation to education, work, aspirations and being in the city. Delhi is India's capital and one of the largest growing metropolitan regions in the world. In the post-independence period following the partition of India in 1947 there was an influx of a large number of refugees from West Pakistan to the city, as well as an out-flux leading to major demographic changes (Zamindar 2007). Since then, Delhi has also been a major centre for migrants who come to the city for its range of educational institutions as well as job opportunities. This combination makes Delhi a 'melting pot' of people from all parts of the country (Kumar 2004) and across the region. More recently, the National Capital Region (NCR) that includes and surrounds Delhi and in effect extends Delhi to the neighbouring states of Haryana, Uttar Pradesh and Rajasthan, has grown substantially to absorb the rising population in the city (National Capital Region Planning Board n.d.). This expansion, with a daily movement of people for work within the NCR, has had important ramifications on the social life in the city. This movement has been made easier by the expansion of the network of fly-overs, connecting highways, and the metro. Not only is the distance and time needed to commute between place of work and the home changing, the differential access to resources is also seen in the increasing residential segregation seen in the city with those in the aspirational middle class withdrawing into their enclaves with further ramifications for women (Fernandes 2006; Donner 2011; Unni and Rani 2007).

Delhi has always been a site for opportunities of education and social mobility. While the city hosts preeminent and elite state sector institutions, the private sector in higher education has also grown in recent years across the city and in its outskirts. This has consequently drawn a growing population of those who wish to pursue an education to the city. In the theories of modernization as well as in everyday imagination, education is expected to play a critical role in creating opportunities for social mobility (Vaid 2014b; Vaid and Heath 2010; Treiman 1970). Through education, the link between social origins and destinations is expected to weaken, leading to assumptions of increased opportunities for the advancement for anyone who can achieve the requisite education and skills. Given the opportunities for education available in Indian cities, the city itself as a site for education and social mobility becomes crucial. This picture of increased possibility of social mobility due to education is complicated by gender. Critically, however, research on social mobility opportunities and educational experiences has tended to focus on men (Jeffrey et al. 2004; Jeffrey 2010; Kumar et al. 2002), while the experience of women has been only tangentially referred to. Furthermore, literature on aspirations too has been limited to studying young men (for an exception see Raju and Baud 2007). Some work has hinted that women in India display a distinctive pattern of occupational stability (compared to the more fluid picture in industrialised nations on which data exists, Vaid and Heath 2010). However, in a recent study for Delhi, at the level of the metropolitan city, there are hints that women's rates of intergenerational social mobility (when compared to father's occupation) are greater than that of men (Vaid 2014b), though there are increased anxieties around safety and negotiating a gendered urban space, highlighting the specificity of the city. Does the experience

of education and the aspirations associated with education and work underlie such findings?

Unlike other major metropolitan cities, namely Mumbai and Kolkata, Delhi was considered a political capital lacking the histories of commercial activity and labour migration seen in the former cities. This has changed following economic liberalization with the expansion of industry and commerce in the city and especially in the NCR. While this has increased the job market possibilities it has also subsequently followed neo-liberal economic trends of an increasingly insecure job market where contract and informal labour is on the rise leading to heightened precariousness and anxieties (Raju and Baud 2007; for more on the anxieties faced by the middle class in one city in the south of India see Dickey 2012). This increased contractual work has also begun to replace historically secure permanent jobs in the public sector (a sector that has a prominent place in Delhi).

These two changes, following the neo-liberal turn, of increased privatisation and informalisation along with the withdrawal of the public sector, have led to a shift in the class structure, especially in the composition of the middle classes (Fernandes 2006) with consequent ramifications on changing educational demands in mushrooming private educational institutions that are now geared toward jobs in the private sector (see contributions in Shaw 2007). In this context, it is critical to examine the experiences of young women in higher education and in the labour market in light of the avenues that have opened to them, though these do not always lead to secure positions, while family responsibilities and issues of security still constrain their access.

While cities have been sites of increased mobility and opportunities for both women and men, what makes Delhi distinct is that in actual practice very few women are in the active labour force according to national statistics (Directorate of Economics and Statistics 2014). This is discussed further in the penultimate section of the paper. However, despite this low participation, with recent economic changes, a change in women's aspirations for education and work is expected (discussed later). Further, education (especially English language education) has been seen as an important avenue for upward mobility not only through work but through marriage as well (Munshi and Rosenzweig 2006) as those with higher education, in particular English proficiency, have different trajectories both in terms of work choices and in terms of marriage choice. In this context, have the increased possibilities of education available to women led to a shift in their social mobility aspirations and approaches to work, in their expectations and mobility experiences in the city?

Critically, while on the one hand Delhi is seen as a site of opportunity for both women and men, on the other hand, more recently Delhi has become notorious as the "rape capital" of the country (with "18.63 reported rapes for every 1 lakh women¹" in 2014 according to National Crime Records Bureau statistics (Rukmini 2014)), and as a city considered generally unsafe for women. In this context how do

¹ 1 lakh = 100,000.

women, both those originally from Delhi and migrants to the city, view their place in the city?

In this chapter I am especially interested to consider whether education and occupational status influence women's relation to the city. Especially, whether there are diverse pathways through which women from different classes, castes and occupational locations view and approach the city. This chapter will hence explore the significance of a metropolitan "city" for increased mobility opportunities for women. This chapter is based on interviews and conversations with a range of working women with varied educational qualifications across different socio-economic strata. The chapter will consider their narratives and unpack the experiences of women and how we understand the city through their lived experiences.

21.2 Data and Method

This paper draws on interviews with 15 employed women below the age of 35 working in Delhi.² In-depth interviews were conducted in April–May 2015; with some interviews conducted over more than one sitting. A series of questions on family histories, educational experiences across generations, work experience, marriage and experiences of living, studying and working in Delhi were explored. The purposive selection of the women allows us to ensure a representation of a variety of voices across various strata (with the usual caveat regarding non-random sampling and selection bias especially as the views are clearly of women who are engaged in the labour market and not of women outside the labour force).

Table 21.1 provides details on the demographic characteristics of the women interviewed. We can see that a variety of employment and work statuses, education levels, caste and religious affiliations are covered by the study. The respondents have been arranged by occupational status to provide some conceptual leverage on categories of work. Given that employment status (contract, permanent, self-employed), employment relations (labour versus service contract) and occupation have repercussions on an individual's life-chances (Breen 2005), one of the primary criteria for the selection of respondents was based on occupational location.

More than half the women interviewed (8 of the 15) counted Delhi as their permanent home, of whom 5 were born and raised in Delhi, and one moved back to Delhi after being away a few years. Those who came to Delhi from outside had been in Delhi anywhere between 9 months and 20 years.

With regard to work, 73% of the women were in full-time work; while the remaining 27% were engaged in part-time work (of those in part-time work, two women were students working part-time in teaching positions). The study captures

²The reason for restricting the sample selection to those aged below 35 was to capture women recently out of education and those already making a place in the labour market as by 35 young people are expected to have entered the labour market and also to have achieved "occupational maturity" (Goldthorpe and Erikson 1992; Vaid and Heath 2010)

Table 21.1 Details of respondents interviewed

Name	Age	Education	Occupation	Caste	Religion	Marital status	No. of children	Migrant status/years in Delhi
Bimla	29	BA	Administrative assistant (contract)	ST	Hindu	Engaged	0	Migrant/7 years
Vishali	28	MBA	Administrative assistant (contract)	General	Hindu	Single	0	Non-migrant
Sabina	27	MPhil	School teacher (senior grades) (contract)	–	Muslim	Single	0	Migrant/14 years
Lata	23	BA	School teacher (primary grades) (contract)	OBC	Hindu	Single	0	Non-migrant
Sana	28	MPhil	Adhoc teacher (university level) (contract)	Ansari	Muslim	Single	0	Migrant/5 years
Shanti	32	9th standard school	Custodial/janitorial (contract)	SC	–	Married	2	Migrant/8–10 years
Nita	29	12th standard school	Domestic worker (informal/no contract)	SC	Hindu	Married	0	Non-migrant
Fatima	34	10th standard school	Tailor (informal/no contract)	–	Muslim	Single	0	Non-migrant
Jhanvi	34	12th standard school	Beauty parlour owner (self-employed)	General	Hindu	Married	2	Migrant/20 years
Ritika	29	BA	Architect (self-employed)	General	Hindu	Married	0	Migrant/from NCR
Mina	25	MA	Coaching (self-employed)	General	Hindu	Married	1	Non-migrant
Puja	30	BA	Catering-packaged food (self-employed)	–	–	Engaged	0	Non-migrant
Jaspreet	31	BA/LLB	Lawyer (self-employed)	Jat	Sikh	Single	0	Migrant/10 years
Shivani	29	MA	Banking – public sector (permanent)	General	Hindu	Married	1	Migrant/2 years
Sarla	25	BA	Banking – public sector (permanent)	OBC	Hindu	Single	0	Migrant/9 months

Note: All names have been changed

Age is reported in completed years as on interview date in April 2015

Education in completed grade/degree. Two respondents with MPhil degrees are currently pursuing their PhDs

Contract refers to time-bound contract that is not permanent

Religion as reported by respondent; Hindu castes aggregated to the Constitutionally recognised categories of SC Scheduled Castes, ST Scheduled Tribes, OBC Other Backward Classes. Castes in other religions as reported by respondent

Non-Migrants are those born in Delhi. This also includes one respondent who identified as permanently living in Delhi though not born in Delhi, and another one born in Delhi but educated outside for a few years before returning to Delhi

a range of locations in the labour market with three women in permanent positions (two of whom were employed in the public sector), six women holding contractual positions, three women engaged in the informal sector, and three self-employed women (one of whom worked in her husband's coaching centre). These women are employed in a broad spectrum of occupations: from lawyers, teachers, established and struggling entrepreneurs, domestic workers to skilled labourers. There is a clear diversity with regard to the educational attainment of the respondents with two women having dropped out of school by the tenth standard, and two women studying for their PhDs. Further, these women come from across religious and caste strata.

This chapter engages with the narratives of these women and maps their various trajectories though it does not attempt to draw any generalisations to the larger Delhi population. The chapter is organised as follows: the next two sections discuss the value and significance placed on education and the pathways to education, followed by a section that explores ways in which education is accessed and the role of the family and gender, the section after that studies the relation between education, work and gender, followed by a section on the "city"; the final section concludes.

21.3 Education: Its Value and Significance

Three key narratives regarding the significance of education are seen: education for survival; education for making choices; and education as providing a 'voice'. All three of these have significant repercussions in women's lives and play out differently depending on their social location as reflected in the discussion below.

Firstly, education is essential for surviving in the city. A minimum level of education is seen as necessary to negotiate everyday life in the city, from work, to economic transactions, the traffic and to public transport (Chanana 1993). Hence, as mentioned by the respondents, education ensures that one knows which bus to catch, which forms to fill in a bank and how to negotiate ones place in the public and especially in the job market. For women, given the nature of the marriage market and the socialisation roles imagined for them by their families, having an education in the city has a further advantage. The significance of these basic literacy skills should not be over looked. They provide a sense of confidence as strongly expressed by the respondents, especially by those with lower levels of education; and, this seems critical for survival in a large metropolitan city. Further, in the context of the labour market (and to an extent the marriage market) the significance of English language education, or at least a working knowledge of English, was stressed by these young women (I return to this point later in this section). English connects one to a broader clientele, and more job opportunities.

Additionally, education is seen to generally change the way of thinking, as Shanti, a 32 year old custodial worker who dropped out of middle school put it "... their way of thinking, of the upper class people, of the educated people, is different". She went on to stress that "those who are not educated have a smaller world

view/a narrower way of thinking". Education as a means of broadening ones horizons of learning how to 'be' in the world is critical. The obverse, a possible critique of the educated/upper-classes from the middle class has been reported by others (see Dickey 2012) though the women interviewed for this study did not engage with those narratives.

Secondly, education is critical for making choices. For Sabina, a 27 year old part-time school teacher, as someone who is educated she is "more aware of the opportunities that [she] would have and [she] can make better choices". This is connected to the idea of independence – a very common narrative is the belief that education frees one from the dependence on others; education gives "power". Importantly, independence is seen in terms of significant life decisions, and education goes a long way in giving women the "power" to make those decisions. This was highlighted by Ritika, a young architect, who observed a close female family member go through a divorce and surmised that the only thing that helped her relative recover and support her children was education; and, the choices education gave her to "stand on her own".

Finally, this independence is seen to influence both the familial life (the private sphere) and the women's relation to the world outside (the public) (Arendt 1958). For instance, it not only influences women's ability to make decisions on when to come and go from a house, but significantly it influences one's "reputation" within the home as "educated women's voices are not suppressed" (according to Sana, an adhoc University lecturer), and that educated women can be seen as more than "household property" (according to Fatima, a tailor).

21.4 Education: Pathways to Change

The acquisition of education as we understand it is usually seen to involve a formal trajectory – for example, through some form of formalised schooling. However, education, if seen as forms of knowledge, can also be acquired through everyday experiences and encounters. When asked about their education experience these young women most often stated the grade till which they had formally studied. However, delving deeper, stories of how "jaankari" (information) is acquired from more than formalised schooling, for example through the experience of volunteer work when interacting with NGOs,³ by acquiring information on sexual and reproductive health in discussions with organisations, by learning about rights of women, and by teaching oneself English by watching day time television came out. In sum, the women in the study acquired what they described as "education" or "jaankari" (information), through direct degrees, diplomas, distance education, as well as through official and on-the-job training, through NGOs, and interestingly through

³In the context of non-formal education and its role in women's education, "feminist action" and empowerment see Stromquist (2015, p. 60).

watching television. This ‘jankari’ then is significant for these women to locate their place within the city.

Not only are there multiple pathways to acquiring education, there is a clear sense that living in Delhi provides an edge that would not be available outside. The city then seems to be a space of ‘imagined possibility’, especially given the ‘frame of reference’ of villages and smaller cities.⁴ Hence, education is not merely limited to formal institutional education, but includes both literacy, and experience and education as “capital” (Bourdieu 1986). As Fatima, a 34 year old tailor, succinctly put it:

if you learn how to read and write (*parh likh kar*) you get a lot of information/knowledge (*jaankari*) that sitting at home does not give us.... when we go out, when we see the world and when we study, only then we understand where and how we should sit, how we should get up, how we should talk, so we get a lot of information about all sorts of things.... and sitting at home one’s mind is shut off, we do not understand anything other than cooking and feeding.⁵

This gives an expansive understanding of how education is seen. It is beyond “reading and writing”; it helps one to understand the world, to understand a public space as opposed to simply the private sphere. It seems to underline in particular how education allows one to enter into the public sphere and achieve more than what is expected from women in the private sphere (from domestic responsibilities). In these interviews the distinction between the public and the private was subtly expressed; and, education was the means to bridge the gap.

Further, these women saw education as a means of achieving some sort of “gender parity” at home and at work. At one level, women’s education helps them achieve some level of parity with men at home (discussed in the next section) and women with an education are seen as an asset in the household not only as they can help educate their children, but also as they may be able to draw upon job opportunities (see Gupta 2014 for more on “ethos” and role of women in the home). The latter allows women to also engage at the public level and is a means of achieving increased social mobility opportunities by participating in a larger world.

Related to the idea of the public, education is also seen as critical for “exposure” to the world – it teaches one how to interact with people who are most probably dissimilar and helps opens the mind and broadens the horizons. Hence, education is important for breaking stereotypes; this was further expressed by the respondents who have experienced university level education in Delhi. Studying in large universities in Delhi has opened them to a “secular” environment where they have a chance to meet and interact with people from all over the country and the world, opening them to ideas beyond what they experienced in schools or in education institutions outside Delhi. Conversely, some interviews seemed to suggest that those who do not have education (human and cultural capital) are often looked down upon as people who lack “information” on how to “behave”. For instance, a young woman in a

⁴ I thank Geetha Nambissan for this point.

⁵ Translated from the Hindi.

secure banking job felt that for people who are unable to get their kids educated it means that “their lifestyles (gesturing with her hand) are low”.

This brings us to a discussion on the ways in which education allows women to make use of two values associated with education: ‘survival’ and ‘choice’ (discussed earlier). While the importance of education was stressed by all the respondents, the role of education for survival has evolved. As seen above, education is essential to ‘be’ in the world (for example see Heidegger 1962). However, where the usefulness of education is concerned, while most women expressed the view that it lead to choice and independence in the job, a couple of them seemed to suggest that the value of education for women seems to extend to their role or responsibility of socialisation of the children, and for household maintenance. As Chanana (1993) summarised “even women’s wider access to education was unable to overcome the influence of socialisation” (p. WS30) and in studies she reported education rather than breaking the mould, seemed to lead to the “formation of a particular type of identity” (ibid.). It is of interest that this is not the predominant view among these young women – rather the dominant role of education is seen to be the broadening of horizons and opportunities of working and negotiating their space in the outside world. Further, it was felt that men and women in a relationship should be equally educated as otherwise one can “look down upon” the other and need not treat the other with respect. A gap in “thinking” can have negative repercussions for a couple (according to Nita, a domestic worker). Chanana (1993) underlined a similar idea that “Husbands appeared to be less aggressive when their wives were educated” (p. WS30).

So, while education provides independence and freedom, it also has value in the job market for survival as ‘capital’. This is seen as critical in Delhi as education provides the means to participate in the new economy; especially, as many of the expanding sectors and jobs are in the lower end of the service economy which requires some rudimentary education and some amount of cultural capital including knowledge of English (Bourdieu 1986).⁶

The absence of adequate education is looked on with regret. This regret was most often stressed by women who did not complete their schooling. This regret is compounded for these women in the context of their lives in Delhi (both for migrants and non-migrants to the city). But, as we see in the following discussion the ‘location’⁷ of these women in terms of their class and occupation influences their views on the importance of education (see also Raju and Baud 2007). Hence, for these women the value of education with regard to work was felt differently at different

⁶For example, English language skills, work and personal etiquette and grooming, rather than qualifications alone play an important role in the hiring process, as does coming from a ‘good family’ which is a cover for other factors such as caste, class and urban education (Jodhka and Newman 2010).

⁷Despite questions on caste and their experience of caste in the city, these women did not discuss caste as either constraining or facilitating opportunities. This cannot be taken to imply that caste is not important in the city, but rather that conversations on caste with a relatively unknown researcher may not be considered politically correct in the city. For more on caste and occupation/labour market see Vaid (2014a).

social locations. For instance, women at lower level positions felt that education would have allowed them to rise above their current jobs. Shanti, a custodial worker who dropped out of school after grade 9 and was married by 16, felt that if she had studied when there was a chance “we would have been saved from cleaning dirt”. On the next day she went on to elaborate this point when she said that if she had studied she could have had

a job that needed reading and writing, a job in which one could sit on a desk.... I now regret it. My father used to tell us to study, but we didn't study, he even hit us at times to make us study. He used to work in a school, in a college, and he was aware of what 'good people' (*acche log*) did, but none of us listened to our father. At that time I used to feel very bad that he is always after us for studying. But, now I really regret it and realise that my father was right. My mother never told us to study as she was illiterate herself, but my father was slightly educated, and then he sat among good people, among teachers, he had some good knowledge, he is an intelligent man.

This was echoed by Nita, a domestic worker, who believes that if she had stuck it out in school, she may now have had a better life, a better job, a better home. However, we find that among women with an undergraduate education and above, the emphasis on the value of education shifts to the value of English language education. In this regard 'English speaking' has a further decided advantage in the job market. For instance, according to Jhanvi a beauty parlour owner, missing out on a university education and the absence of adequate English knowledge has not only been a hurdle in negotiating with clients, but for her this absence is framed as an issue of dignity and confidence. A sense of humiliation when clients “talked down to her” in English and her inability to respond was felt deeply by her. Her strategy of coping with this has been to train herself to understand basic English by watching television shows. Further, this absence of an adequate grasp of English is seen strongly among the women working in the government sector, such as in banking jobs, as absence of English makes one less employable and less able to negotiate promotions.

While these issues of English language are also closely connected to issues of social class – i.e. as shared experience of an aspiring middle class – this is also an issue of gender as women require these skills to negotiate the world without being dependent on others in the family. The usefulness of English is seen not only where the relation with the job market is concerned, but also by women in their daily lives. Fatima for instance expressed her pride in understanding enough English to fill in bank papers and to not get lost while taking the bus.⁸

Clearly, education and its role in everyday life and at work is critical for women. However, this role is also mediated by women's other locations – especially their class position as seen in the previous discussion. This comes out even more prominently in conversation with Puja who sees herself as 'privileged' due to the family

⁸ We also see that the possession of English skills seems to alleviate some of the discrimination faced by migrants from the North East of the country to Delhi. The interviews found support for McDuire-Ra's work (2012) on how these migrants made a “home” and “place” in Delhi taking advantage of neoliberal growth especially in the services industry.

she comes from and the choices she has had. Puja is an entrepreneur running a packaged foods business with her partner who provides the financial assistance, while she manages the day-to-day running of the business. Rather than education being transformative she sees her education in Delhi as limiting and constraining. She came to Delhi to do her BA. As someone who has studied in international schools in India and lived and travelled abroad with her parents, studying in Delhi (at a premier University) was a huge disappointment and the reason why she did not pursue further education after completing her undergraduate studies: “coming back to an Indian system kind of really ruined it for me.... it was a very stifling environment.... rote learning is a big thing you know.... even when I was in [an expensive private] school... I have struggled with it.... which is why I enjoyed my American schools so much more because you get an understanding.... it's not memorising.... so that way college was a huge disappointment for me. Because, even if you try to question your professors, they got angry and.... I have had my professor say that, you know, anybody except her can raise their hands, so it was a lot of discrimination.... it's a huge regret, the education was very bad”. She was thus convinced that her professional trajectory would have been different if she had not gone to a University in Delhi.

Unlike, as discussed above in the context of ‘exposure’, for other university educated women who were interviewed, there was a clear sense with this young businesswoman that the opportunities that she had when younger were much broader and only a pressing personal reason meant that she could not go abroad and study – there was a sense that studying in Delhi paled in comparison with the broader canvas of opportunities that could have been available to her. This further brings out the heterogeneities within women and the diverse nature of their experiences regarding education given their social location. While overwhelmingly education is seen as important, there are also voices of dissent regarding the extent to which education can help with decision-making for women. According to Vishali, an administrative officer, women do not always have a clear choice, and even the decisions they make may often be influenced by their families. This leads us to look at the ways in which education is accessed and the role of the individual and the role of the family (see also Raju and Baud 2007 for choices around vocational education and the job market).

21.5 Ways of Accessing Education

Education has been seen as significant for women or men to achieve their potential. However, the desire to study is mediated by both financial constraints and constraints of family life. In the case of women, the ‘family’ clearly plays a key role in their opportunities. When it comes to the decision to study, including the length of study, and the subjects to study, the critical push factor for these young women was most often their family, followed by financial resources. For some women, the need to earn and support their family was the critical reason for their dropping out of school.

And, for some others, the desire to earn money, and get a good job was the predominant factor for their acquisition of higher education. This further highlights that social and financial locations are important for education decision-making.

Compounding the financial constraints, the role of the family is seen as critical for education. Significantly, in my interviews it emerged that while father's seemed to be fairly supportive of education,⁹ it was the mothers who seemed to impress on their daughters the value of education.

As discussed by Chanana (1993) in her study on multi-generational Punjabi women in Delhi in the context of the experiences of partition, mother's had a key role to play in pushing their daughters to higher education. Chanana found that

[i]nterestingly, women in general, wanted their daughters to be educated, and with the same or slightly differing motivation. They viewed getting a degree as crucial for, this would enable them to get jobs in contingencies. It need not immediately lead to employment. Further, those who had to become economically dependent after Partition were very keen that their daughters should not have to face a similar situation. They argued that daughters were unlikely to get the support of their brothers in the changed social situation when joint families were disintegrating. Therefore, they should be educated to become economically independent to face crises. (Chanana 1993, p. WS30)

We find, that in agreement with Chanana's (1993) observation there is a lingering sense of "gender appropriate education" for the young women in the present study as well (discussed further below). Families follow specific strategies for their daughter's education for not only economic benefits, but also in terms of "status production" (WS30). Further, as seen in Chanana's quotation above, education is looked upon as something that would help in the employment market and beyond.¹⁰

21.6 Education and Work

Education at one level prepares women to work; and, to work on par with men. However, on another level the value of education can be undercut by gendered family and work expectations.¹¹

The influence of mother's opinions was felt strongly, as was its gendered dimension. For instance, for Vishali, a young administrator who comes from a business family, while there was a sense that her parents were not biased about education between herself and her brother, underlying this was a feeling that the kind of education is gendered due to the gendered idea of what work a woman would do.

⁹This was true even for the respondent who was married at 16. But, while her father encouraged her to study, her marriage was non-negotiable. For her, her dropping out of school was due to her own lack of interest and due to discrimination she faced at school, and not due to parental pressure.

¹⁰As the present study did not interview mothers, their views on education could only be imputed by what the daughters related.

¹¹For a discussion on the 'choice' of subjects enrolled in/disciplines in which women predominate, and changes in these patterns over-time, see Chanana 2007 (also see Raju and Baud 2007).

Her mother, she said, put more pressure on her to study and do an MBA while this pressure was not put on her brother as he was expected to inherit the family business which would not be an option for her: "They were not biased.... they were not biased at all.... they were quite okay with whatever we want to do.... but, in my case being a girl my mother wanted that I should have the highest education qualification [rather] than my brother.... he can do the business, but she wanted me to have a good qualification".

When exploring the idea of gender bias, this narrative becomes significant. So, while education prepares one to work on par with men in theory, and there is in a sense a 'promise' of the chimera of "choice" that comes with education, this is in practice undercut or limited by gender. So, while education purports to liberate, by itself it does not liberate and as Fuller and Narsimhan (2008) have shown, all choices are "negotiated".

Going back to Vishali, when she was asked whether it helps women and men equally to have the same level of education, her answer was an emphatic "No". She emphasised that while we may imagine that women can study as much or more than men, there are hurdles that need to be crossed: "The work profile may have hurdles in qualification thing.... boys can do any kind of job, I mean... as far as family is concerned.... they will never allow girl for the marketing kind of job or sales which involves door to door marketing. They will not allow after getting the same qualification, but the boy can go for [any]thing.... time is changing but somewhere down there is still the same thinking, the family thinks.... girls should not work late at night.... she should be home by 9; but, boys can be home at 11–11.30. If they were working in a BPO they could be home early in the morning as well [sic]".

As discussed previously, for some women their choices in terms of education and career were quite openly supported by their parents; while some others had to work hard to convince their parents. For women who come from families where older siblings are educated, and parents have high levels of education (especially mothers education), doing a BA was considered to be the minimum and the choice to drop out after school doesn't exist (a majority of these women now work in the formal sector, or are self-employed). This encouragement to study from parents was especially emphasised by Sabina, a Muslim teacher, whose parents felt that "it's really important and especially for Muslim girls to get an education". On being questioned why they feel this way, she replied: "All of us know as a minority Muslims, not just that they are minority but otherwise also the education status of Muslims, both men and women, is pretty low in the country. And I think that's why, and now that we are in a 'place' [implying secure position], now you could achieve something.... through education only. And, if you are not aware of what is around then you can't actually have a serious strong say in the society. So, I think for Muslims especially to have a voice it is quite important. Not just for the community, but also for the individual members who are there". However, for some women who came from outside Delhi, convincing their families that they needed to study further met with stiff resistance especially as living in Delhi is looked upon with suspicion given its reputation as unsafe for women.

While most women interviewed were encouraged to study (at least till school completion), the application of that education in the types of jobs that they can do and the hours they can work is still mediated by the family. Further, women are expected, without that always being openly stated, to take care of the home and the family. The experience of the “dual burden” is very real for these women. For instance Vishali expressed her frustration on the inequality faced in the home as her brother is not expected to help with household chores, while she has to despite spending a full day at work: “I think a man being a man he doesn’t have that sense.... that he has to do household work or something like that.... maybe we inculcate the thing since childhood in them.... you don’t have to work when the girl is working”.

So, on the one hand, for some women, to be able to work was decided in negotiations with the family, for others ‘not working’ was not an option. Either financial constraints of their families and everyday survival forced some women into work, while for others work was a ‘given’: as Puja stated, “If not work, then what?!”. Similarly, there are diverse aspirations connected to work. For some, a job provides opportunities to grow and earn better. For others working gives a sense of freedom mirrored in the earlier discussions on the importance of education. Further, a woman who brings an income to the home gets respect from all family members: “when a woman has money with her, then her uncle, her brother, her father even, all of them respect her.... they all greet her.... they all bless her; and when the need arises then they demand the right to borrow money from her” (Fatima).

However, there is a downside to women’s participation in work. There is a strong sense (especially among those in the corporate sector) that while women are highly educated they are not able to achieve the highest occupational positions due to “male dominance”; they get passed over for promotions (though Shivani and Sarla, both women in the public sector did not support this view and felt that promotions etc. are gender neutral). More critically, there are disadvantages for women that are more subtle than outright gender inequality on the job – which has more to do with the practicalities of some jobs as seen in the discussion on ‘time’ (below). According to Vishali whose family she feels sees “marketing or sales work”, or running a business as risky for women, there is still a lingering sense that certain jobs are meant for women and conversely some jobs are best left to men. This is emphatically put by Puja working in a male-dominated field of cold food production and catering:

So, I remember the first time I went to my cold storage, like, all their jaws dropped, because I don’t think a woman had walked into it; and I remember the first day somebody from the factory had come with me, like he is basically my manufacturer Man Friday and he was very upset. So I asked,.... ‘*kya ho gya*’ (what happened?) and he was like, ‘*nhi nhi nhi, aise nhi aacha lagta*’ (‘no no no, it doesn’t look good like this’), you get a guy to [like] do all this for you. So I was like, a) I don’t have that luxury, like I don’t have anybody to kind of do my dirty work for me and.... I remember then the cold storage guy was like,, ‘just get a guy’, because ‘*aapko toh kya pata business k baare mein*’ (‘what do you know about how to run a business’), So I was like, ‘sure I don’t.... But am sure I will pick it up along the way, you know’.

She went on to say that in “order to get things done... you have to kind of do it on your own also, and I can’t stand there and like, be like, pick this up, do this, pick this up. Because I have met with lot of resistance, so the initial months, I was also like the delivery boy,

so when I was going to all these stores, I actually had to take cartons which I would take and see like a lot of men just standing there watching but not helping, but you can't kind of, ah, order them around, you have to be like 'I am okay with getting my hands dirty', I don't have an issue and I don't think it's a class thing, you know, so...that I think...eventually kind of got them to have some faith in me, that she is not one of those, you know,..... in this kind of business at least when you are dealing with factory level people, you have to asexualise yourself, so you can't be like, you know, 'I am a... , you know, delicate little petal, and like I can't do anything', kind of thing, and I have always been more tomboyish anyway.... but you really have to kind of just...just the way like you dress, the way you talk, the way everything." (- Puja, 30 year old entrepreneur)

To be taken seriously women have to deal not only with the reservations of their families, but also the reservations that their colleagues or subordinates hold. They need to go one step further to prove their competence and to be taken seriously. This vignette was supported by Jaspreet, a lawyer, who said that getting criminal cases was tough for female lawyers as clients don't have trust in them – she has felt this personally with clients from rural parts of Punjab and Haryana who have approached her chambers in Delhi.

Thus, while for some women the path towards a job has been relatively smooth, others have experienced many hurdles, among which: finance, language barriers (reported mostly by migrants to Delhi; where language includes Hindi and English), and the cultural barriers and to some extent discrimination that migrants often stated are predominant. Further, non-permanent jobs are risky and not "safe", however often there is no choice but to take them. This increases the pressures to meet targets, this leads to additional problems for women as working late is not often considered a suitable option by their families (see also the discussion in the earlier section on families and gender bias). This harks back to our previous discussion on time and space for women – while going to work is acceptable, which in a sense is a space inhabited by women, staying at work late is not acceptable. The same space becomes loaded with suspicion contingent on 'time'.

In this regard this issue of 'time' or staying out late is felt by women across the class and occupational spectrum. This restriction of "time" was underlined in many of the narratives – not only by women working in the public sector or in permanent jobs, but by women across all occupations. For some the pressures of what they call "society" regarding their freedom of movement have closed off some avenues of employment. For Shanti, a custodial worker: "we know how these 'small minded' people think. They say things like 'your wife comes late at night', this and that, they tell the husband, they tell the in-laws: 'your daughter-in-law comes at night, where does she come from, how does she come'.... that's why I do not even consider such kind of jobs."

Previous studies on opportunities of social mobility open to men have been unable to explore these limits to education and whether the benefits accrue to women and men differently. This gender inequality at work and the lower status of women is stressed by Sarla, a bank manager, who said that: "men have a different upbringing.... see if a man screams and talks they take it very easy. If a woman starts speaking in a high volume, no man would accept. He will never agree to accept the high pitch volume.... See, in anger his voice can be high, he wants it should be accepted

but if a woman speaks in anger, if her voice is in higher pitch, no men would accept it.... wherever we go.... wherever our society goes.... however far our society progresses, this thing is limited to some people.... In general I don't think [...] equivalence [sic – equality] will ever come".¹²

Further, managing the home and work is seen as a “dual” burden by all the married women in the sample; and by a few of the un-married women as well. These women felt that when men have children they are never asked to take time off from work, and consequently women's careers are not looked at seriously by employers. However, others felt that continuing to work even after children was important (Chanana 1993); an architect mentioned that one never knows how a relation goes with a husband – so the choice of being independent and taking care of oneself must always be there.

21.7 The City

I am far.... better [than] them (– Bimla, 29 year old administrator in the corporate sector)

Women's experiences of education and work are clearly mediated by their families, their role expectations, and their social location. However, being in a metropolitan city adds a further layer to the fractured nature of their experiences. Critically, most conversations on Delhi were structured in a kind of opposition between Delhi and other places. With regard to work and education opportunities, Delhi was seen in a largely positive light compared to other cities and to rural areas. With regard to negotiating the city, the views regarding comparison with other sites were mixed.

It is not an understatement that Delhi divides opinions. There are those who believe the city gives opportunities to everyone and it is up to the individual to take advantage of that; and, then there are others who believe that Delhi is not a place to spend an entire life and especially not for women. In this section, some of these views beginning with views on Delhi as a site for possibilities for women both studying and working here is summarised. This is followed by a discussion on Delhi as a ‘tough’ place for women.

Before we discuss how the city treats its women, one common narrative in all interviews was the infrastructural advancement in Delhi over the past few decades – the new and improved roads, flyovers, buildings, improved transport systems and (for some) the increased cleanliness in the city all typify a fast developing metropolitan city. The most appreciated improvement in Delhi is its metro system as it takes away some of the stress of using public transport (commuting is discussed later in this section).

With regard to job opportunities Delhi is seen as a land of opportunity. All sorts of jobs seem available according to these women – and no job is too small. If one

¹²Interestingly, this act of showing aggression (seen as a legitimate male trait) did not bode well for women according to Puja, the entrepreneur.

is hardworking, has strength and is 'aware', anything seems possible in Delhi. As Sabina, a young teacher who came to Delhi from Patna put it: "whatever I strived for, I got from Delhi"; something she felt was not possible in her home town. Additionally, a few women felt that Delhi as compared to other places has 'normalised' the sight of women working. For instance, Puja mentioned that as Delhi has more women in the workforce, it is not seen as unusual for women to work and hence women going out to work is not looked on suspiciously. Interestingly, this belief in the high rates of employment among women in Delhi contradicts official empirical data (NSSO 68th round) on workforce participation in Delhi according to which only 6.8% of the total women in Delhi are in the labour force, while this number rises to 9.2% for women aged 15 years and above (DES 2014).¹³ Put another way, the Labour Force Participation Rate for women in Delhi is 9.9% compared to 90% for men (ibid.). Clearly then, for the respondent, there was a *perception* of higher employment among women in Delhi which in turn she felt was the reason for more women working and an encouragement for her to pursue her career. She further mentioned that as Delhi is an expensive city, so to make ends meet one *has* to work, this is an advantage for women as their going out to work is not looked at negatively. Women's presence in the public as "producers and consumers" is discussed by Phadke et al. (2009) in their work on Mumbai. They state that "as Mumbai strives to take its place among the global cities of the world, the presence of women in public space, as professionals and consumers, increasingly signals a desirable modernity. As a result, even if women in general don't have unconditional claims to public space, in the narrative of the global city, women of a particular class and demonstrable respectability have greater legitimacy in public than many men of a lower class" (pp. 187). This clearly has resonance to Delhi as well.

Delhi as a site for possibilities was echoed when the provision of education was discussed. Delhi provides access to a wide choice of both public and private educational institutions and allows for the use of agency and choice in selection that is found to be missing in other cities and small towns as seen by those who come from these places. As Sabina said, "if we wouldn't be in Delhi probably we wouldn't have got the education that we have". This view is expressed especially by migrants to the city, when they compare their situation to those back at home highlighting the critical importance to their varied 'frames of reference' when evaluating their experiences in the city. For Bimla, a migrant from Assam, the difference between Delhi and her home town was as simple as the absence of good communication skills among her friends who did not leave home. For her friends at home have "no practice in speaking English", and it is a matter of pride for her and her family that she is working in Delhi. Hence, working and studying in the city seems to give a sense of pride and achievement to these women, and they feel that it broadens and opens their mind so they can meet diverse people and learn how to interact, survive and thrive in the city. Further, Delhi is also seen as a good environment educationally to bring up children. This also influences the aspirations these women have for their children. All five mothers in the sample expressed the view that Delhi was good for

¹³I thank Diya Mehra for pointing this out.

their kids – this would be a place for them to get a better job, have a better life, not to struggle.¹⁴

Other than for work and education, Delhi is seen as a site of freedom by women from other parts of the country. Cultural differences were often referred to, but the freedom that Delhi girls have to wear what they want, stay out at night, the confidence they display in talking with men, and the perceived higher level of support they receive from their families, were noted by more than a few migrant women. For instance, Fatima who spent a few years studying in Aligarh, U.P. before moving back to Delhi, said that she found Aligarh's 'environment' to be diametrically opposite to Delhi. In Aligarh according to her women cannot leave the house and *Purdah* (a system of veiling) is followed. She went on to say that the "normal" environment in Delhi is in favour of women, there is no need for *Purdah* and in her opinion at least 80 % of women go out of the house and work (again this opinion contrasts with official figures). When being questioned why Delhi provides these opportunities for women and Aligarh does not, she felt that the reason must be the larger number of organisations in Delhi that have worked with women – to train them in certain skills, to provide health services and to help increase their knowledge; this she felt is lacking in Aligarh (Stromquist 2015). She stressed the difference between a village and a city like Delhi "this is the major difference between a village and a city, there are many things in a city, many provisions that are not available in a village....". She went on to add that in a village in U.P. where some of her relatives are "a 10 year old girl was told that she can't wear a frock anymore, she will only wear a suit... as fear has settled on people's minds.... due to all the things happening to women.... which if we look at it is much higher in the U.P. side.... Delhi doesn't have so much of this, but Delhi is the one that has got the bad reputation.... women's wishes are mostly suppressed in U.P."

Delhi is hence seen as a "melting pot" and as a city that gives "exposure". As expressed by one young woman, if one lives at home one has to constantly "report to family"; living alone in Delhi gives one the freedom to do as one likes.

However, the positives of the city are quickly balanced by the negatives for these women. Delhi is seen as tough for women; especially working women. The biggest struggles are safety and travel, especially public transport. Acts of groping, of random staring, and of men always wanting to "take a chance" in public transport was reported by the majority of the women (only one respondent who has her own car said that while she doesn't experience the unpleasantness in using public transport, she has been bullied and intimidated by young men who follow her car – especially when they are in large groups).

The criticism of public transport is minimised to an extent by the introduction of the Delhi metro. Seen as a marvel of modern engineering and planning (Sadana 2010), the metro also provides women across social class lines with some sense of

¹⁴ However, the downside to bringing up children in Delhi is the issue of safety which seems to be magnified for those women who have young daughters.

security, not least because of greater surveillance and the separation of the 'women's only' compartment from the general compartments (ibid.). However, according to Sadana, while "some are relieved to have an optional, segregated space for women, ... others see it as reinforcing gender stereotypes of women needing extra protection, a step back in what was a new kind of public space for Dilliwalas" (ibid, p. 82). However, while the metro is seen as mostly positive, there is a sense among all the women interviewed that Delhi is not a city for women to travel in.

A Muslim respondent mentioned an additional disadvantage she faces – she reported an everyday experience in the metro – as she was wearing a *dupatta* (head scarf), the female guard conducting mandated security checks in the metro asked her to remove her scarf; on refusing to do so, the guard abused her and said "I don't know where *you people* come here from?" For this young woman, "women face double discriminating on the basis of not just gender but also certain other identity that [they] are carrying"; in this instance it is being a Muslim. A similar discrimination was reported by two women from the North East – they both reported being referred to by the derogatory term "chinky" (see McDuie-ra 2012), which for them is now seen as an everyday occurrence. There was the added concern that women from the North East were not respected in the city.

In addition to travel, work pressures too are high in the city – a public servant who had a posting outside Delhi before coming to the city mentioned that being the administrative capital there is always a lot of work to do, much more hectic than the towns she was posted to before. It is a more competitive space, and one needs to be 'strong' to survive it. And, some women in the corporate sector felt that women were not promoted despite their capabilities (this view was not shared by the two women in government employment).

These work pressures are seen to overflow in the everyday, as nearly all the migrants to the city identified the city as an "aggressive" and too fast paced as a place to live; and the people of Delhi as having an "attitude problem". For one woman, perhaps this aggressiveness is linked to neo-liberalism and the corporate culture that typifies the city. On the other hand, a few women felt that Delhi gets a bad reputation as anything that happens in Delhi becomes news. One migrant to the city said that she has seen both sides of the coin – people speaking out against bad behaviour against women and also people staying quiet. As she put it, "it is being called a rape city and all of that so yes it happens but I think Delhi has the potential or say it will be a city where most protests would also happen". She went on to express the idea of becoming one with the city, of being in the city despite coming to the city from outside "lot of times.... I would abuse Delhi, say it's so bad, and on the other hand if someone from outside comes and says something bad about Delhi I would defend Delhi.... 'it's not that bad!'"

For these women then their views on Delhi are mediated by their own location and their 'frames of reference'. Delhi is, for its residents, in equal parts exhilarating and frustrating, and these two emotions are amplified for women negotiating the city.

21.8 Conclusion

This chapter has focused on one city – Delhi – a fast growing metropolis that attracts students and workers from all over the country. It explores the experiences of young women in relation to education, work and being in the city using in-depth interviews. It is critical to note that previous work on aspirations, opportunities and social mobility has under-explored the narratives of women, leading one to conclude that education influences occupational pathways in a more or less linear fashion (Jeffrey 2010 does question this direct education-occupation link). This chapter argues that while education is seen as critical for survival in the city, educational choices, attitudes towards education, and aspirations are still mediated by family and gender. The city is seen as critical by many in providing opportunities and ‘choices’ unavailable in small towns and villages, and by providing a ‘voice’ to women; however, the city itself can be aggressive and uninviting for women and negotiating ‘space’ and ‘time’ with their families become crucial for these young working women.

Chapter 22

Education in the ‘Sanskarnagari’: Baroda, Provincial Capital of a ‘Progressive’ Princely State in the Late Nineteenth and Early Twentieth Century

Nandini Manjrekar

22.1 Introduction

Baroda, or Vadodara, as it has come to be renamed in recent times,¹ is the third largest city in the western Indian state of Gujarat, one of India’s most economically developed states, known for its long history of trade and commercial enterprise. The city is located in central Gujarat, about 200 km from the state’s capital, Ahmedabad, and around 600 km from India’s financial capital, Mumbai. Baroda’s geographical location, inward of a long coastline and on important trade routes to central and northern India, contributed to its position as an important urban centre from pre-colonial times. Both Ahmedabad and Mumbai (then Bombay) were key industrial cities by the mid-nineteenth century, and Bombay, as one of three ‘Presidency’ towns (the others were Calcutta and Madras) was also a centre of colonial governance. Within this geographical grid of industry, capital and labour in western India, the establishment of the railways in the late 1800s furthered Baroda’s position as it formed a key junction on western rail routes to the north. Its importance continues in contemporary times, with the city emerging as an important manufacturing hub of the two new industrial ‘corridors’ linking the region with other industrial centres both of the state as well as the rest of India.²

¹In 1974, the city was officially renamed Vadodara, or abode of the ‘vad’ (banyan) trees, drawing on various pre-modern references in the historical record.

²From the 1990s, in what is generally referred to as the ‘post-liberalisation’ era of structural economic reforms, the state has come to be associated with a particular form of capital-intensive industrial development, popularly referred to as the ‘Gujarat model’. Baroda lies in the region

From the eighteenth century up to its integration in the postcolonial nation-state in 1947, Baroda served as the capital of the Baroda princely state, one of more than 550 such states governed by hereditary rulers or Maharajas who had partial sovereignty from the British colonial administration that ruled India over the same period.³ The princely, or ‘native’ states together made up slightly more than half (52%) of India’s territory under direct British rule. At the time of Indian independence in 1947, about 89 million people, or 28% of the population of the territory, lived in these states.⁴ More than 300 of these princely states covered nearly four-fifths of the territory of present-day Gujarat.⁵ Several princely states were known for their social reform measures, in particular in the field of education, especially the larger ones, like Mysore, Hyderabad, Baroda and Gwalior – but also the relatively smaller ones like Travancore and Cochin in present-day Kerala. It is somewhat surprising that the extensive scholarship on colonial education in India, in terms of policy, ideologies and knowledge, and the various threads in the nationalist response to these, both in terms of resistance and accommodation, has largely bypassed the historical experiences of these states.⁶ This gap in the historiography of education in India under British rule is often filled by colonial, often Orientalist, accounts of despotic rulers with extravagant tastes and burdened subjects, indifferent to the need for education among their people, or indigenous reports and commentaries of the time that often invoke hagiographic accounts of ‘progressive’ rulers.

The relationship of the native states to systems of modern education are complex and varied. Many reforms were responses to the various colonial policies governing education at the time, such as the promotion of vernacular education or state support to private schools via the grant-in-aid system.⁷ Some scholarly debates on educational reforms in these states refer to rulers ‘mimicking’ colonial modernity, or using models of western education as anti-colonial resistance; others write of the adaptive and absorptive nature of educational ideas and practice.⁸ While more

known as the ‘Golden Corridor’, an industrial belt created for capital investment, especially in the chemical industry, that stretches from the north of Mumbai to Ahmedabad, as well as the Delhi Mumbai Industrial Corridor (DMIC), a mega- infrastructure project of USD 90 billion.

³The colonial government had political residents in the princely states, who, along with the Dewans or Chief Ministers, effectively ruled the state, safeguarding the political and economic interests of the Empire. The colonial governments thus governed through ‘indirect rule’ (Ramusack 2003, p. 90).

⁵Wood, J.R. (1984), ‘British versus Princely Legacies and the Political Integration of Gujarat,’ *The Journal of Asian Studies*, Vol. 44, No. 1, p.67.

⁶As examples of widely cited scholarship, among others, see Krishna Kumar (2014) *Politics of Education in Colonial India*, New Delhi: Routledge; Sabyasachi Bhattacharya (ed.) (2002) *Education and the Disprivileged*, New Delhi: Orient Blackswan.

⁷See, for example, Tharakan’s analysis of education in the Travancore princely state. Tharakan, M.P.K (1984) *Socio-Economic Factors in Educational Development: Case of Nineteenth Century Travancore*, *Economic and Political Weekly*, pp. 1959–1967.

⁸One of the only detailed analyses of university education in the princely states of Baroda and Mysore is that of Bhagavan (2003). Bhagavan forwards a thesis of ‘mimicked modernity’ and education as resistance in the case of the Baroda state. Others have been more cautious in this

research into these ideational and practical dimensions of education remains to be done, one could say that the boundary between princely state and colonial rule was a diffused one, and rulers negotiated this boundary differently, depending on how they were situated vis 'a vis colonial domination on one hand, and the social and political structures of their states on the other.⁹

Wide-ranging reforms initiated in the late nineteenth and early twentieth century saw Baroda emerge as a city associated with a vibrant cosmopolitanism and as an important centre of arts and education, giving it the epithet of '*Sanskarnagari*', or city of culture. This paper attempts to situate the *Sanskarnagari* within the discursive and material contexts of its historical making, primarily focusing on the role played by the state in promoting education as a driver of modernity and progress. The period examined here spans the years from the 1870s to the 1930s, which set the tone for developments up to independence and merger of the state with the Indian union in 1950. Intertwined in this historical narrative are several related strands that will be drawn together here to understand the relationship of the modern, democratic institution of education to the development of the city in the Baroda princely state. The first strand relates to the ways in which a provincial cosmopolitanism was fashioned through state support to the city's development as an educational centre. The second relates to education in the imagination of an 'enlightened' ruler and his administration, in terms of its role in influencing practices of modern sociability and rules of social life in the capital city as well as its contours, institutions, practices and pedagogies. A third, and crucial strand, is the way in which the policies of the 'progressive' princely state and its social structure were related to educational development, particularly within the context of the city. These intersecting strands in the historical narrative are further related to the historical contexts of colonial rule, indigenous responses to colonial modernity, and the ways in which educational progressivism was viewed by both the colonial authorities as well as the nationalist movement that was growing across the subcontinent over the same period.

22.2 Baroda: From Medieval Town to Capital City

Historical and archaeological evidence point to a few pre-modern settlements on the river Mahi whose tributary Vishwamitri bisects the modern city of Baroda (Map 22.1). Artefacts from these sites suggest that these towns had trading relations

regard, see, for example, Frenz, M. and Brekemer, G. (2006) *Colleges and Kings: Higher Education under Direct and Indirect Rule*, *Economic and Political Weekly*, pp.1261–1268. Recent work on Baroda as a centre of the visual arts and crafts tend to focus on the absorptive element, see essays in Maholay-Jaradi (2015).

⁹Ernst, W. and Pati, B. (eds.) (2007) *India's Princely States: People, Princes and Colonialism*, New York: Routledge; Hardiman, D. (1978) 'Baroda: the structure of a 'progressive' state', in Robin Jeffrey (ed.) *People, Princes, and Paramount Power: Society and politics in the Indian Princely States*. Delhi: Oxford University Press, pp. 107–135.

Map 22.1 Regions marked in *yellow* constitute the Baroda princely state (Source: Imperial Gazetteer of India. New edition, published under the authority of His Majesty's Secretary of State for India in Council. Volume 7, Oxford: Clarendon Press, 1907–1909)

with centres outside the Indian subcontinent.¹⁰ A fortified town emerged as an important urban centre in the medieval period, when Baroda's economic fortunes flourished under various trading activities. Like other such centres in pre-colonial times, this town formed the original core around which the modern city developed. The unique historical legacy of architectural and social features of the old or 'walled' part of the city can be seen in modern Baroda, where the old lakes, religious shrines and four sixteenth century gates still remain important landmarks in the city.

The Baroda princely state came into being in the late eighteenth century as a result of negotiations between the feudatory Maratha rulers of western India and the British. The area under the princely state comprised scattered territories across the territory of the modern Gujarat state. Most of these were high revenue areas, growing fruit, tobacco and cotton, the most significant cash crop in the region which earned the state high revenues.

¹⁰Imperial Gazetteer of India, Baroda, Calcutta: Superintendent of Government Printing.

The state was embroiled in a series of crises with the colonial government but its rise to prominence is closely associated with the ascension, in 1875, of Maharaja Sir Sayajirao Gaikwad III. Sayajirao, a distant relation of the ruling Gaekwads, was adopted at the age of 12 by the reigning Queen Mother who had no sons, under the supervision of the colonial government after they deposed his predecessor. He came from humble peasant origins, and was put under the tutelage of Sir F.A.H. Elliott, a member selected from the Indian Civil Service as his tutor, for six years before being coronated at the age of 18 in 1881. The first Indian ruler to have received a western education, he was given intense tutoring in Indian and European languages, the social and physical sciences, and the arts of governance, etiquette and protocol.¹¹ Elliott had a decisive influence on Sayajirao's thinking and remained a close advisor, mentor and friend over the first twenty years of his rule.

By the time Sayajirao came to the throne in 1881, the state had been managed by an able chief minister or *dewan*, Sir T. Madhavrao, who was appointed by the British Resident to oversee the functioning of the state in the absence of a king. Madhavrao had worked in other princely states (Travancore and Indore) before coming to Baroda. He had initiated a series of administrative and educational reforms in Travancore and was widely celebrated as an excellent administrator. In Baroda, he modernised the bureaucratic set-up in keeping with the colonial administrative structure, instituting an administrative service and police force, setting up a court of justice, and building hospitals, public works and schools. Independent judicial and legislative mechanisms in the state diminished the monolithic autocracy exercised by the royals. The early period of Sayajirao's reign was completely managed by Sir Madhavrao, who left the state service in 1881 ensuring that Baroda was one of the richest princely states in India, and well on its way to becoming a 'model' for all princely states.

Maharaja Sayajirao went on to rule till 1939, aided by this modern bureaucracy and a succession of experienced and efficient *dewans*, many of whom were drawn from the Indian Civil Service or from the services of other princely states.

22.3 The Making of the *Sanskarnagari*: Knowledge, the Public Sphere and Imaginations of the 'modern'

By the 1880s, Baroda city had already acquired all signs of being a culturally diverse, cosmopolitan city. Since the ruling dynasty were of Maratha lineage, there was a sizeable Marathi-speaking population, largely comprised of upper and middle castes employed in the administrative and military services. Most of the local Gujarati-speaking population was engaged in trade and commerce. Upper caste Gujarati Brahmins were in the administration or professionals like teachers, doctors and lawyers, while the Vantias, a trading caste, were financiers and promoters of small business. The religious composition of the city was also heterogeneous; apart

¹¹ Rice, P.S.W. (1931) *Life of Sayaji Rao III, Maharaja of Baroda Vol.1*, London: Oxford University Press, pp. 33–35.

from the Hindu communities of various castes, the city also housed Muslim, Parsi and Christian communities. A small group of British officers and their families employed in the colonial administrative and military services lived, as in other provincial towns, in the 'camp' and cantonment areas of the city. This cosmopolitan city was surrounded by a hinterland predominantly populated by landowning middle castes and lower caste peasants dependent on agricultural cultivation and artisanal crafts.

By the time Sayajirao ascended the throne, the economy of Baroda state was wholly dependent on agricultural revenues. Changes in land revenue laws and the promotion of industries led to migration from rural areas into the city. Census reports of the time show that the majority of migrants came as workers. Many, including women, came to the city in search of wage work or to set up small businesses like shops. These migrants were from the lower peasantry or those who did not own land; however, reports indicate that there was also migration from among landowning castes like Patidars. In 1911, it was reported that 12% of the population of the state were engaged as industrial workers, chiefly concentrated in the city of Baroda¹² By the 1920s, the city expanded to include around 16 villages that lay on its periphery. The state's revenues increased from urban taxation and industry started to develop on a considerable scale.¹³

The first decade of the twentieth century saw a veritable flood of innovation and reform of public institutions in the Baroda state, most of them the first in native and colonial India. Economic reforms had helped to swell the coffers of the state and the increased revenues could be used to finance these undoubtedly expensive reforms. The appointment of the well-known civil servant R.C. Dutt as Revenue Minister helped to support these efforts. Dutt was committed to seeing Baroda transform into a model state of India 'renowned not only for its advances in education and methods of administration but also in the prosperity of the agricultural people [and] the briskness of its trade and enterprise.'¹⁴ All vernacular education was made free and five international education scholarships were instituted. Boarding houses were constructed for students of the untouchable castes. A poorhouse, and a public park and garden was commissioned in the city, as well as public water works. A law was passed banning child marriage. In terms of political reforms, a Legislative Council of elected members with full legislative authority was instituted. Financial streamlining to manage industrial and state reserves led to the setting up of the Bank of Baroda in 1908, managed on modern banking methods. The Bank took over the work of the State Treasury and was soon opening branches in the presidency city of Bombay. In the wake of these developments, the finance and education departments were administratively linked, and senior administrators were involved in compiling

reports on education, and formulating proposals on how to improve education at all levels.

Maharaja Sayajirao III (Source: <http://www.gaekwadsofbaroda.com/content/royal-chronicles>)

These dramatic changes in the princely state's administration inevitably led to transformation of the city. A great deal of investment was made in the fashioning of the provincial capital – between 1877 and 1910, a range of administrative offices were set up to plan, manage and maintain the city. By 1892, the city municipality was set up to oversee its maintenance. With financial streamlining and governance structures being established, city plans were drawn up between 1904 and 1910, when the City Improvement Trust was set up. These plans were in congruence with the growing population in the city on account of its industrial expansion.

Sayajirao himself was known to be a connoisseur and patron of the arts, and Baroda bore the mark of his aesthetic sensibilities. New institutions with impressive Indo-European architectural styles, dotted the landscape of early twentieth century Baroda city.¹⁵ Under the patronage of the Court, eminent British architects working in different parts of India were called in to design and execute public buildings. The styles adopted were unique in their experimental features, combining elements of western and traditional architecture.¹⁶ Apart from the royal buildings, public buildings like the high schools, the government vernacular school, the teacher training colleges, the Court, Baroda museum, Baroda college and many others were designed by well-known architects from the Royal Institute.

¹⁵The Imperial Gazetteer of India: Baroda (1908, pp. 89–90) notes that with the creation of a Municipal Board in 1906, and a sizable income, high expenditure on developing the city was possible, especially with respect to road building, conservancy, street lighting and provision of free, filtered water from the Ajwa water works, a favourite project of the Maharaja.

¹⁶London, C.W. (2015) *Cosmopolitanism articulated: The evolution of architecture from Wada to Palace*, in Priya Maholay-Jaradi (ed.) *Baroda: A Cosmopolitan Provenance in Transition*, Mumbai: Marg, pp. 46–69.

The well-known Scottish town planner Patrick Geddes¹⁷ visited Baroda in 1916 at the invitation of the Baroda state to make recommendations on town planning, and was impressed by the layout of the city, with its city centre, its traditional architecture and neighbourhood *pols*,¹⁸ its gardens, tanks and impressive buildings. Education figured in Geddes' recommendations in two ways: firstly, in the larger sense of seeing the planning of the city in terms of the civic spirit which went beyond the aspirations of the city's educated elites to holistically encompass the social composition of the city, including the labouring classes. Geddes also recommended that students of the schools and colleges be encouraged to take part in civic surveys for more 'effective functioning and consciousness', whereby 'the student could become a more effective citizen and the citizen a productive student'.¹⁹ Although there is little evidence that these frameworks informed approaches to planning the city, they reflect not only Geddes' unique sociological approach to urban planning, but also the place of Baroda on the map of colonial India as a city of growth, education and promotion of civic spirit.

The Anglo-Vernacular School, Baroda (Photograph, late 1890s. From the Curzon Collection, British Library <http://www.bl.uk/onlinegallery/onlineex/apac/photocoll/a/019pho000430s24u00038000.html>)

¹⁷Trained as a biologist, and well-known as a sociologist – he was later to head the department of Sociology at the University of Bombay from 1919 -Geddes had a 'socio-biological' approach to city planning. He worked on 50 town planning reports in India (Heller 1990).

For Sayajirao, the modern city was critical to developing a particular habitus among his subjects that was suited to modern systems of administration. Education, the visual arts, crafts and architecture were widely promoted in his time, often through interventions under his direct supervision. Education in the capital of the princely state had to be designed to suit the needs of an urbanism characterised by social and cultural diversity, economic growth and efficient, professionalised management of urban affairs. The years between the 1870s and 1920s were spent on building and consolidating these efforts. By any measure, the achievements in education in the state were extraordinary. Prior to 1871, the state had no educational facilities apart from privately run schools (*pandyajini nishalo*) to train boys in priestly duties and impart rudimentary reading, writing and arithmetic.²⁰ The cantonment area of the city that housed British officers had a small Anglo-Vernacular school that was financed jointly by the princely state and the colonial government. Five schools following the ‘modern’ scheme of education were started in 1871 – the Baroda High School, which rose to become the city’s premier school that offered higher levels of education in English, and later, in 1881, got connected to the Baroda College, and four other schools (two each in Marathi and Gujarati). A Vernacular Education department was set up in 1875 to oversee the running and curriculum of schools in the indigenous languages. In the same year, several other schools were established in the city: two girls’ schools including a school for Muslim girls, Urdu schools for Muslim children and Sanskrit schools. By 1883, the city had nine Sanskrit schools, three Marathi schools, three Gujarati schools, one Urdu school, and two girls’ schools. The 1881 census reported that almost 25% of the city’s population were under formal instruction. A Vernacular College of Science was started in 1877, but unfortunately could not be sustained despite recruiting highly trained professors, due to the lack of translated materials in the modern sciences.²¹

The late nineteenth century saw the setting up of a range of institutions of modern education. By the 1890s, Baroda city had several public institutions to its credit: the Baroda State Library was set up in 1877; the Baroda College, set up in 1881, affiliated to the University in the Bombay Presidency and offering courses in Arts, Science and Law; Kala Bhavan (Temple of the Arts) a technical institute, set up in 1890, which offered courses in a range of engineering, technical subjects and specialised training focused on modernisation of traditional crafts; Baroda Museum, also set up in 1890, within the sprawling Sayaji gardens, with two large sections for the Arts and Sciences and a pedagogy section with teaching learning materials like lesson cards and models.²² A teacher training institute for women was set up in 1882 and another for male teachers in 1885. In 1886, a music school was established in the city.

Maharaja Sayajirao maintained a close association with these institutions. Those brought in to head them were people of eminence in their fields, usually handpicked by Sayajirao personally. The emphasis was on competence in modern systems of

²⁰Rajyagor, S.B. (1979) Gujarat State Gazetteer: Baroda, p. 660.

²¹Gazetteer of the Bombay Presidency 1883. Vol.VII: Baroda, p. 475.

²²Dutt, R.C. (1904–1905) Introduction, Baroda Administrative Report, 1904–1905. p. 240.

knowledge.²³ Many were British scholars either working in India or appointed from England. In many cases, Indians working with these scholars were sent abroad by the state for further studies, often to return to positions of leadership. More than 25 students were sent abroad for advanced studies between 1890 and 1915. The areas of study were engineering, industries (like watch-making, pottery, mining), agriculture, forestry, gardening, economics and sociology.²⁴

It was not only the 'western' that served as a valid indicator of knowledge. Institutions training students in classical languages like Sanskrit and traditional knowledge systems like Astrology and Logic were supported by the state. From 1893, the state set aside substantial funds for the 'Gaekwar Oriental Series'. Sanskrit scholars and scholars of other classical languages were sent to all parts of the Indian subcontinent and elsewhere to source and copy rare manuscripts in private collections. This manuscript collection formed the core of the 10,000 rare manuscripts of the Baroda Oriental Institute formally set up in 1908. Prominent Indologists were invited to study the Indian arts and their incorporation into a world art collection at the Baroda Museum and Picture Gallery. In the field of visual and plastic arts, local and international portraitists, sculptors and painters were invited to Baroda city to study local forms, train local artisans and build collections of private and public art.²⁵ Public architecture in the city, commissioned to well-known British architects from the Royal Institute, consciously combined traditional Indian elements with western forms.²⁶ At the Kala Bhavan, special attention was paid to upgrading the traditional crafts to make them suitable for global markets. Indeed, the Baroda princely state participated in all the World Fairs to showcase the products of these efforts at merging the indigenous with the modern in terms of technologies, forms and aesthetics. Key to this entire enterprise, in which the Maharaja personally invested his energy and time, was the creation of well-planned archival repertoires based on diverse knowledge systems that were consciously made part of the public sphere. This experimental, eclectic and hybrid urbanism was distinctive to Baroda's development as a provincial capital city.

Moreover, the city was seen a centre of diffusion of knowledge. A prime example is the Public Library Movement. The promotion of reading and 'love of books' was an important part of Baroda's education programme. On a visit to the United States in 1906, the Maharaja invited W.A. Borden, an American library expert from the United States to come and set up the Baroda Library Department. Under the depart-

²³Ustad Maula Baksh, for example, who was asked to set up the music school (Gayanshala) was an outstanding musician from the Mysore and Tanjore courts who introduced 'scientific notation' to study classical music and was referred to as 'Professor'. It is interesting to note that his son who took over as Principal of the college, was sent to Europe to study western classical music (Bakhle 2005, p. 38).

²⁴Pandya, T.R. (1915) *Education in Baroda*, Bombay: M.Nowrojee, p. 161.

²⁵Most notable of artists in Baroda was Raja Ravi Varma, a prince of the Travancore royal family. Varma's studio was established in the Palace grounds. His work exemplified the possibilities of artistic crossovers from traditional depiction of Indian epics with western forms of figurative art in an era of mechanical reproduction.

²⁶London discusses this in some detail. See C.W. London (2015), op. cit.

ment, a Central Library was set up in 1910 along the lines of the New York Public Library. Apart from the Central Library in the old city, all towns and villages in the state were to have libraries and reading rooms. By 1912, there were 9 town libraries, 265 village libraries and 60 reading rooms throughout the state, making it larger than the American public library system.²⁷ This led Borden to remark: 'I am determined to introduce into Baroda what we in the United States have recognised as a goal to be ultimately attained... What America could only dream of, Baroda could do, and in a measure has done.'²⁸ A good library system was seen as part of mass education, an 'essential supplement' to keep literacy alive, and to reach knowledge to those outside the small, English-knowing elite in the city. Vernacular libraries were given importance, as well as translation of works in English. The Central Library housed a separate women's library and a children's library. A unique aspect of the library system was the travelling library that covered rural areas which did not have libraries or reading rooms. Village school teachers were expected to assist in the running of libraries. The approach guiding public libraries was to see them as literary clubs, spaces for social and intellectual interaction and exchange of knowledge. By 1924–1925, there were 43 town libraries, 618 village libraries, 87 reading rooms, and 47,506 registered readers, apart from those who availed of the travelling libraries. The Central Library in Baroda issued 83,000 volumes in the year 1925 alone.²⁹ The place of the Central Library in public memory is borne out in narratives of long-time residents of the city who recall how weekend visits to the Library were part of their growing up years.

Scholars associated with these institutions, principals, teachers and former students, along with those higher up in other state services like the judiciary, administration and medical services came to constitute the 'meritocracy' of the Baroda princely state. Many of these people were involved in the setting up of educational institutions and went on to make their mark in the history of the nationalist movement and in post-independence India, in the arts, sciences and administration.³⁰

²⁷In 1927, the Central Library had some 88,764 books in 1927, 20,000 of which were donated by the Maharaja from his personal collection, largely covering subjects in history, biography and social sciences; the travelling library had 16,739 volumes. These were apart from the Sanskrit collection, which were transferred to the Oriental Institute. (See Dutt, N.M.(1928) *Baroda and its Libraries*, Baroda: Central Library.)

²⁹Sargeant, P.W. (1928) *The Ruler of Baroda: An Account of the Life and Work of the Maharaja Gaekwar*, London: John Murray. pp. 303–4.

³⁰For example, the school for Muslim girls, that is still an important institution in Baroda, was set up in 1875 by Ameena Tyabji, the wife of Abbas Tyabji, Chief Justice of the Court, who had close links with the royal family and was later closely associated with Gandhi in the nationalist movement.

The list of people who went on to make their mark in the nationalist movement and independent India in the areas of academic and administration is too long to be elaborated here. However, a few well known examples are: Hansa Mehta, a graduate of Baroda College, and the daughter of Manubhai Mehta, one of the Dewans of the state, went on to become a member of the Constituent Assembly, represented India at the UN Declaration of Human Rights, and chaired an important

22.4 Free and Compulsory Education

Baroda's real claim to modernity, however, drew from its unique interventions in mass education at the school level. For Sayajirao, compulsory education was to 'place the three R's within the reach of every child in Baroda'.³¹ Breaking the stranglehold of traditional control by higher castes on knowledge could only be achieved by delivering mass education: 'Give the mass of the people elementary education and the demand for more will follow.' In 1893, an experiment was initiated in Amreli, one of the backward pranth (regions) of the state. In 1906, the silver jubilee year of the Maharaja's coronation, free and compulsory education was extended to the entire princely state under a legislative sanction passed, making it the first state in colonial India to do so.³² The free and compulsory education law covered all boys in the state between 7 and 12 years and girls between 7 and 11 years.³³ The state committed to providing funding for the setting up of schools, equipped with libraries and museums. Expansion of female education was a priority so that female teachers could be appointed to girls' schools. Funds were put aside for preparation of reading materials in both English and the vernacular. Towards making schooling compulsory, parents were fined up to a maximum of 10 rupees for a graded period of 'offences', or absenteeism from school for specific periods, and liable to be brought in for enquiries by local administrators. Exemptions were granted in certain cases, depending on the circumstances of the child. Fines had to be paid within 15 days, or adjusted as arrears from land revenue. Employers of children were also liable to being fined. Of the money collected by the state in fines, 65 % was spent on school buildings and 35 % on books for poor children.³⁴

Curriculum in Baroda's schools was not very different from those in British India. Distinctive features of the Baroda 'experiment' included the incorporation of a 'before school' or pre-school year with a structured curriculum, a vigorous

committee to look into education in 1964,; she was also Vice Chancellor of the SNDT Women's University in Bombay; Dadasaheb Phalke trained in photographic methods at Kala Bhavan, and was sent to England for further training by the Maharaja; Phalke went on to become India's first filmmaker.

³¹ Sargeant, *op cit*, p. 207.

³² Bhagavan (*op cit*, p. 50) observes that in 19604 Sayajirao began a "campaign of comprehensive reforms that would, he believed, either uplift and strengthen his people or lead to his reprimand [from the British government], the latter exposing British hypocrisy, and both striking at the heart of colonialism." He describes his reforms as a process of reclamation: "the possession and usage of Western practices in a structurally altered Indian way such that the transboundary object was no longer foreign but native." (p. 58).

³³ Amendments to the law were periodically made, and by 1940 the law extended to all children between 7 and 12.

³⁴ Some of these were: (1) if their presence at home was indispensable owing to sickness of infirmity of the parents; (2) impossibility of learning because of physical or mental defects (*sic*); (3) if the school was more than a mile from home (Pandya 1915, p. 56). At a later stage there was a proposal to review the timings and vacations of the school to fit the seasonal calendar for agricultural operations in which children of farming communities were inevitably involved.

programme of translation of Hindi, Sanskrit and English works into Gujarati and Marathi, and the early introduction of arithmetic. The English schools set up in the state followed the colonial curriculum more closely, although they were also required to offer some education in the vernacular and in Sanskrit. Reports indicate that school learning relied a great deal on memorisation and drill, and reading levels in particular were too difficult for first generation school-goers. There was a strong view, particularly at the time of industrial expansion in the cities, in favour of having separate curricula for urban and rural children, and focus on vocational education to enable children, especially boys, to seek employment.³⁵ Breaking the 'stranglehold of tradition' in the rural areas as a social commitment of the progressive regime could not match these pressures; the hope was that a wider base of education at the lower levels would draw in more students of 'merit' into college and university education in the city of Baroda.

Under British principals, teacher training colleges in Baroda sought to deliver 'modern' courses in different subjects. All graduates were appointed as teachers in the state school system after their 3-year training. However, much as Kumar (2014) has described the construction of the teacher as 'meek dictator', embedded in regimes of surveillance, teachers in Baroda schools were subject to the constant gaze of revenue and education officials. T. R. Pandya, who did his PhD at Teachers' College, Columbia in 1915, and returned to Baroda to serve in the Education Department,³⁶ noted that one of the problems of the school curriculum was the involvement of officers rather than teachers in framing the school curriculum. This centralised mode of bureaucratic control over education, even as it supported local level administration, appears to have pervaded educational reforms in the state.

The expansion of education over the first three decades of enforcement of the law are reflected in the remarkable progress of education in the state (Table 22.1). The decadal census reports from 1891 show a gradual increase in the literacy rate in the Baroda state as compared to British Gujarat. Comparisons to Bombay, a Presidency city and emerging metropolis, were even more dramatic. In 1891, Baroda city had 21% literacy as opposed to 24% literacy in Bombay city. By 1921, the literacy percentage in Baroda city had crossed that of Bombay.³⁷ By 1931, while Bombay's literacy rate remained at 24%, literacy in Baroda city had risen to 41%.³⁸ The Census Commissioner noted that the threefold increase of literacy among the two major communities of Hindus and Muslims in the 15–30 age group could be attributed to the effect of compulsory education.³⁹ Moreover, the spread of education had

³⁵ Baroda Economic Development Committee 1918–1919.

³⁶ Pandya later headed the Secondary Teachers' Training College when it was set up in 1935, on Littlehailes' recommendation. The college later became the Faculty of Education and Psychology of the University in 1949.

Table 22.1 Comparative picture of education in Baroda princely state 1904–1905 to 1938–1939 (From Naik 1941, p. 1)

		1904–1905 (before compulsory education)	1938–1939
1	Number of schools	1,243	2,439
2	Number of pupils	81,649	2,59,288
	Boys:	68,536	1,50,993
	Girls:	13,113	1,08,290
3	Percentage of pupils to population	4.3	10.6
	Boys:	6.7	12.0
	Girls:	1.4	9.1
4	Expenditure on primary education	4,00,000	2,202,000
5.	Percentage of literates (age 5 and over)	9.4	20.9
	Males:	18.0	33.1
	Females:	0.9	7.9

its most dramatic effects on girls' and women's education. By 1937–1938, the number of girls to 100 boys was 61.2%, the highest in all of India.⁴⁰ Reports suggest that this was not only because of compulsion but also because of strict enforcement of the law against child marriage.

The expansion of education was achieved through a combination of competent planning and administration and scientific systems of monitoring. The state made revenue officials available to the education department at three important stages: preparing the census of school-age children, prosecuting and fining defaulters and in recovering fines.⁴¹ Periodic reviews of the programme were done from the inception of the programme. From 1927, local Deputy Educational Inspectors were expected to make annual studies of one village on their beats to examine the lists of schoolgoing children, exemptions from fines, causes of withdrawal, lapse into illiteracy and whether parents had advanced in their appreciation of education. These studies were periodically compiled and published as a Compulsory Education Studies series by the Baroda state.⁴²

The inspectors' reports provide insights into the ways the social structure of the state intersected with schooling. By the late 1930s, despite the expansion of educational infrastructure, many children continued to be out of school. Girls in general and the lower artisanal castes and Muslims showed the maximum rates for illiteracy, either after completing the mandatory 5 years of the 7 year elementary course, or from withdrawing altogether. Moreover, it was clear by this time that although revenues were being obtained from fines, compulsion on the whole was not a success, given the overall situation of poverty. Reports of education inspectors describe how

⁴⁰Naik, op cit, p. 9.

⁴¹Saiyidain, K.G., Naik, J.P. and Husain, S.A. (1966) Compulsory Education in India: Progress of Compulsory Education in India 1951–1966, New Delhi: Universal Book and Stationery Co., p. 29.

⁴²Naik, op cit., p. 4.

upper castes prevented lower caste children from going to school through threat and coercion. As one education inspector reported: ‘Lapse into illiteracy has no meaning in their case; the forward classes are very careful to see that the backward classes should not learn anything and thereby remain under subjugation as of yore. Poor backward classes are the only people to be fined and often their forward overlords do not hesitate to pay up their fines.’⁴³

22.5 Sayajirao’s Vision of Education as Social Reform

Extensively travelled in England, Europe and the United States, Maharaja Sayajirao had great faith that institutions fashioned on western lines could provide the framework to plan and engineer reform in his state to increase its power and privilege and further social progress. His many speeches and addresses amply illustrate his fascination with western science and technology and their significance to planning modern education in the state. The adoption of ‘Western’ ideas was matched by the belief that the princely states, rather than being autonomous entities, were part of a greater nation that had the ability to absorb ideas from wherever they emanated. In his view, the princely states provided the space to further ‘national interests’ through the adoption of ‘altered, Indianised concepts’.⁴⁴ In his speeches, colonial rule was often faintly and sometimes more explicitly referred to as the source of bondage that only reforms could address. According to Bhagavan, for the Maharaja, the ‘Western’, or rather as he saw it, the ‘Modern’, had to be reclaimed as a tool of resistance. Bhagavan argues that Sayajirao’s commitment to modern institutions constituted, in itself, ‘resistance to the paramount power’. This discourse of modernity, in particular the vision of education and its crucial place in social reform that was inextricably linked to the way in which Baroda came to be seen as an ‘ideal progressive’ princely state.

Writing at a time when nationalist demands for increased political freedom were being articulated, Sayajirao viewed education as the only means to move away from traditional ways of life that bound men to unfreedom. His experiences in the West convinced him that education was linked to economic progress. In one of his articles, he writes, ‘..Every additional ounce of brains may tell for an incalculable amount in the final apportionment of success and failure... That nation, therefore, is likely to outstrip its rivals which gives the greatest educational advantage to every individual citizen without distinctions of class or respect of persons.’ His own state, he often asserted, saw the provision of universal education as the first duty of a government. As he writes, ‘In the old days, when people were expected to pay taxes, to obey the law and to till the fields, the necessity of educating them was not felt. But in these days, when more and more value is attached to public opinion and a

⁴³ Naik, op cit, pp. 17–18.

⁴⁴ Bhagavan, op cit, p. 51.

fuller and fuller measure of free and responsible activity is conceded to the people, universal education is needed to equip them for their new destinies and responsibilities.⁴⁵

In his large collection of speeches and addresses to educational institutions, social organisations and other groups, Sayajirao repeatedly reiterates the importance of education as the only solution to India's chronic social backwardness, particularly as exemplified by the social and economic humiliation of the untouchable castes and the low status of women – two areas he was particularly committed to improve through social reforms in his state. Many of Sayajirao's ideas on education, particularly those related to women, reflect the 'homonymy' between colonial and nationalist discourses on education. Education for women, for example, was essentially to prepare them to enhance their roles as mothers of an educated and aware citizenry: 'Women regulate the social life of a people and men and women rise or fall together.'⁴⁶ However, girls and women in Baroda greatly benefitted from state support to female education. Between 1881 and 1901, the number of girls attending primary schools rose dramatically, from 600 to 8,360; by 1921, the total number of girls in coeducational and girls schools was 67,000.⁴⁷ Efforts were made to widen educational opportunities for girls and women, such as hostels attached to girls'schools. 'Zenana' classes, where women could study in seclusion, were added to the female training college in Baroda city. Although these classes basically taught, in addition to English and local languages, the 'feminine arts' (embroidery, stitching, etc), they helped women, and especially young widows, to access reading and writing and a social world beyond the familial, and even seek some 'respectable' employment.⁴⁸ Along with free and compulsory education, the abolition of child marriage (passed as a law in 1904) was seen as critical to getting girls to school.⁴⁹ The publication, in 1910, of his wife Maharani Chimnabai's book 'The Position of Women in Indian Life', which advocated that the 'new, educated woman' come into the public space to take up the feminine professions opening out in the city's new economy furthered public discourse around women's status and their education.

A firm commitment to the education of the untouchable castes led to the setting up of 'Antyaja' ('low caste') schools across the state as early as 1883. Sayajirao's critiques of caste are broadly encapsulated by a liberal discourse that views caste as an antiquated structure acting against intellectual growth and social engagement.

⁴⁵ S.R. Gaekwad, *Articles on Education*, cited in Pandya, *op cit*, pp. 53–54.

⁴⁶ Kumar, *op cit*, p. 35; Sargeant, *op cit*, p. 208.

⁴⁷ Sargeant, *op cit*, p. 207.

⁴⁸ One respondent in a recent study spoke about how these classes helped two generations of women (upper-caste but poor) gain economic mobility through education (Varsha Chitnis, unpublished PhD dissertation, University of Ohio).

⁴⁹ Under the provisions of the Baroda Child Marriage Prevention Act (1904), all marriages of children under 8 were declared void and all those responsible Age of marriage was fixed at 18 and for girls at 16, and all those associated with marriages under this age were liable to imprisonment or fines of Rs 1,000 or both. (Naik 1941, p. 10).

His commitment to the education of the lower castes is often attributed to his espousal of western liberalism, and influence of his experiences of social life in western countries in which he resided for extended periods of his reign. However, a contrary view is that he was influenced, as a child growing up in the bordering state of Maharashtra, by the strong anti-Brahmin movement of the Satyashodhak Samaj led by Jyotiba Phule (to which he generously donated) and Chhatrapati Shahu Maharaj, ruler of the princely state of Kolhapur who worked for the cause of Untouchable castes and was related to him by marriage.⁵⁰ Many of the Antyaja schools had hostels attached to them, and all students received scholarships. Opposition from higher castes to admitting these students (for example in Kala Bhavan, which had students from the artisanal castes) were, according to official records, dealt with sternly by the administration.⁵¹

22.6 Education as Resistance?

Sayajirao's emphasis on social reforms, particularly those related to uplift of the untouchable castes and women, was widely lauded, even by some colonial administrators. Nonetheless, the historical juncture in India at which his reforms were initiated – the ascendance of nationalist sentiments and anti-colonial mobilisation – meant that he frequently found himself at the receiving end of punitive colonial power. Sayajirao had several conflicts with the colonial state which saw in his actions wilful resistance and potential subversion of its authority. Free and compulsory education, in particular, was a source of much anxiety at a time when the colonial administration was under pressure from the nationalist movement.⁵²

With innovative and wide-reaching reforms across the state, and administrative and educational structures to oversee and monitor their implementation, the Baroda princely state was seen as a threat to the paramountcy of an imperial power that was hesitant to implement reforms on that scale. The period in which free and compulsory education was introduced was a turbulent one for the colonial regime. Britain passed its free and compulsory education bill in 1870, leading to a demand for its application to the colonies. In 1882, in their appeals to the Indian Education Commission, Indian leaders demanded mass education and the passing of a

⁵⁰ Mehta, M. (1993/1994). 'Princely ruler as an agent of change: A study of Maharaja Sayajirao Gaekwad's policies towards untouchability, 1882–1915.' *Proceedings of the Indian History Congress* 54, pp. 403–8.

⁵¹ *Ibid.*, p. 404.

⁵² His support to certain strands of extremist nationalism in the early twentieth century when it was taking hold in other parts of the country invited intense political vigilance by the colonial rulers and he was dangerously close to being accused of 'sedition'; his famous 'defiance' of protocol at the Coronation Durbar of 1911 creating outrage and calls for being deposed (Bhagavan 2003; Copland 1978). His frequent trips to Europe where he was suspected to be in touch with nationalists based in England and France kept him under the constant surveillance of British intelligence and the Scotland Yard (Gaekwad 1989).

compulsory education act. The Swadeshi (national self-reliance) movement was at its peak after the first partition of Bengal in 1905. British goods were being boycotted and there was a demand for domestic production. The Indian National Congress (which was formed in 1885) and other nationalists were asserting their right to control educational institutions. This was the time that the Amreli experiment had been proved worthy of expansion and the Baroda free and compulsory law was being formulated.

It is worth mentioning that Baroda city was also the site of one of the first nationalist schools in the country, set up by the Cambridge-trained Aurobindo Ghosh,⁵³ (who in 1902 had been appointed Vice-Principal of Baroda College and was later the Maharaja's private secretary), his brother (one of the early revolutionary nationalists) and two members of the Baroda state service. The school was associated with extremist training, and publications against the colonial regime were printed there. A famous 'sedition' case was initiated against Maharaja Sayajirao, a dramatic case of intervention by the colonial government against a native king.⁵⁴

Free and compulsory education in the Baroda state was being lauded as a singularly remarkable achievement by the nationalists and questions were being raised on why such a model could not be implemented across the country. In 1911, Gopalkrishna Gokhale, the nationalist leader, cited Baroda's vision and success in a private members' bill tabled in the Imperial Legislative Council.⁵⁵ The bill, which argued for a law on free and compulsory law on the lines of Baroda, was rejected on the grounds that the 'conditions were not ripe' for it.⁵⁶

⁵³ Aurobindo Ghosh (1872–1950), who grew up in England, was an Indian nationalist highly respected within literary and nationalist circles. He left Baroda to take part in a revolutionary nationalist group. He later became a spiritual figure, establishing his own ashram in Pondicherry in south India.

⁵⁴ Initially, even as other princely states cooperated with the Raj (the colonial government) in dealing with the activities of extremist nationalists, Sayajirao chose to focus on his own state. Speaking to his Dewan he said: 'It is a storm in a teacup and the logical outcome of certain forces. To realize them one must visit other civilized countries. What India requires is a more liberal government. I think we need take no steps in our own State to pacify the exaggerated feeling of uneasiness. Our attention should be concentrated on progress in our Raj' (cited in Copland, op cit, p. 33).

⁵⁵ Echoing Sayajirao's appeal that the yardstick of western modernity be used to improve institutions in India, Gokhale stressed the need for mass education as beyond mere literacy, giving people 'a keener enjoyment of life and a more refined standard of living... a greater moral and economic efficiency of the individual... a higher level of intelligence for the whole community in general...'. He went on to add: 'Within the borders of India itself, the Maharaja of Baroda has set an example of enthusiasm in the cause of education for which he is entitled to the lasting gratitude of the people of the country... one great need of the situation, which I have ventured again and again to point out in this Council for several years past, is that the Government should enable us to feel that, though largely foreign in personnel, it [mass education] is national in spirit and sentiment; and this it can only do by undertaking towards the people of India all those responsibilities, which national Governments in other countries undertake towards their people' *Speeches of Gopal Krishna Gokhale* (1916), Madras: G.A. Natesan and Co., p. 718.

⁵⁶ For a detailed discussion on the political and historical context of Gokhale's bill, see Kumar, op cit, pp. 118–122.

By 1905, even before free and compulsory education was extended throughout the state, the Baroda state was estimated to be spending around five times per student as the British government.⁵⁷ Even though revenues were a source of concern, especially after the region had been ravaged by a plague epidemic followed by widespread famine between 1896 and 1900, the state was committed to seeing through the experiment. Many in the colonial administration viewed as an affront to their power that a princely state could set itself up as a model to be revered and emulated; free and compulsory education at the school level was seen as fundamentally unattainable by inferior natives. The historic moment at which these events unfolded – the nationalist upsurge at the time, the sedition case against the Gaekwad, and Gokhale's bill, set off alarm bells in the colonial administration. Between 1912 and 1915, the 'Baroda experiment' became the centre of political intrigue as the colonial administration at the highest levels in India and Britain enquired into its functioning. Confidential reports suggest that the colonial regime was determined to discredit it as a failure, for fear of a nationalist demand for its implementation across the country.⁵⁸

22.7 A Modern Sociability in the City? Limits of Educational Reform

Most writing on education and other social reforms in Baroda city and the princely state have focused on Sayajirao's ideas and actions as an 'enlightened monarch'. He is often glorified as a forward looking anti-colonialist whose educational policy and putative support of nationalist causes brought on the wrath of the empire. Manu Bhagavan's scholarly examination of the setting up of Baroda University locates Maharaja Sayajirao's educational interventions within a narrative of subversion to colonial authority, terming the university itself as a 'rebel academy'.⁵⁹ It is undeniable that Sayajirao was an energetic and opinionated maverick, one for whom many of his contemporaries and later historians have expressed admiration. But while his personality – one, moreover, whose actions and thoughts are richly documented in his own speeches, contemporary biographies as well as colonial records – make him a tempting character to study, one must be wary of painting too facile or personalised a picture of his times.

Free and compulsory primary education was a radical initiative at a time when education was the preserve of the upper castes alone. Yet, for the same reason,

⁵⁷ Baroda Administrative Report 1904–1905, p. 205.

⁵⁸ For details, see the two documents related to the enquiries into Baroda's education programme: Confidential report regarding the Baroda system of free compulsory primary school education India Office Records, Judicial and Public Department, 1915, L/PJ/6/1382; Parliamentary question regarding compulsory education in Baroda, India Office Records, Political and Secret Department, 1912, L/PS/11/15.

⁵⁹ Bhagavan, op cit.

it came up against traditional hierarchies of power within the social structure of Baroda. With persons from the higher castes in positions of power and authority, caste discrimination was widespread in the city. The earlier *sardars* or courtiers of the Gaekwadi regime resisted the idea of 'open' schools, refusing to send their children to these institutions and defiling their caste.⁶⁰ Since caste Hindu teachers would not teach untouchable children, schools employed Muslim and Christian teachers. The reformist Hindu organisation Arya Samaj, which did not practise untouchability, was invited to come and teach in these schools in Baroda.⁶¹ A poignant case is that of Dr Bhimrao Ambedkar, a towering figure of the Indian freedom movement who headed the drafting committee of the Constitution of independent India. In 1913, Ambedkar, who belonged to an Untouchable caste, was identified by Maharaja Sayajirao for a scholarship to do his Masters and PhD at Columbia University. As part of the terms of his scholarship, Ambedkar returned to the city to serve the administration. Although undoubtedly one of the most qualified persons in the administration, Ambedkar experienced severe discrimination on account of his caste and was forced to leave the city.⁶²

The historical archive on education in the *Sanskarnagari* and the larger Baroda princely state primarily comprises of state administrative reports and speeches of Maharaja Sayajirao. This historical record fails to adequately capture the realities of a state that was organised around the absolute authority of a feudatory ruler, with financial and political power concentrated in the bureaucracy. Sayajirao's visionary ideas about education and social reforms derived their legitimacy from the need for instituting a new social order based on the development of this modern bureaucratic system. As discussed earlier, by the late nineteenth century, Baroda had moved from being a feudal state with its wealth derived solely from land revenue from villages. Cautious and strategic restructuring of the land revenue system, without upsetting patterns of traditional dominance, saw increasing migration to the city. The region's small landlords came to the city for employment in the bureaucracy, the professions and commerce. The modern bureaucracy instituted in the Baroda state replaced the older 'patrimonial' order, in which traditional power holders gave way to officials appointed on merit and paid state salaries.⁶³ Reforms in state structure necessitated

⁶⁰Rice, op cit, pp. 57–58.

⁶¹In a 1903 address to the reformist Hindu Arya Samaj in Lahore, he invited them to come to Baroda to become teachers at the schools for untouchables "instead of criticizing Muslims and Christians for proselytizing their 'brothers'" (Mehta, op cit, p. 406)

⁶²Among Dr Ambedkar's teachers in Columbia was the philosopher John Dewey whom he greatly admired as a scholar and whose ideas deeply influenced his own. In 1917, Dr Ambedkar returned, by the terms of his scholarship, to serve the Baroda administration. His stay in the city for a short period of 11 days, was full of tragic humiliation. Because of his low caste status, lodgings were impossible to find, and the administration kept his official accommodation in abeyance. He was attacked in the dingy Parsi hostel he managed to find a room in. Many years later, he writes that being in the United States had made him forget he was Untouchable, and that the remembrance of those times cannot be recalled without tears. (Vasant Moon, Dr Babasaheb Ambedkar: Writings and Speeches, Vol. 2, pp. 661–691).

⁶³Hardiman, op cit p. 115.

the acquiescence of the landowning peasantry, and the ascendance of the bureaucracy as a major sector of paid employment by the state, based on competitive examinations, led to support of these influential sections to opening schools in villages.

Modernisation of the state bureaucracy and the setting up of modern institutions of learning required the cultivation of certain classes to man these institutions. These classes mainly comprised of the upper and middle caste groups who had benefitted most from the expansion of education in Baroda. By 1910–1911, participation of children from the landowning peasantry was highest (almost 50%), followed by traders (10.3%) and state officials (7.6%).⁶⁴ Caste-wise data from the Census reports of 1921 and 1931 show that that children from the the upper castes (Brahmin, Kshatriya) and landowning peasantry (Kunbi/Patidar) castes had the highest representation in Baroda's schools. The participation of these groups is reflected in their literacy levels as well. These high and middle caste groups benefitted from the education and economic reforms of the Baroda state, and the opportunities created for an educated literati within the public administration, trade and industry. The demographic shifts in bases of social power as a result of the reforms are best illustrated by the decrease in domination of Marathi-speaking sections at the upper levels of the bureaucracy who were concentrated in the city of Baroda since the beginning of Gaekwadi rule in the eighteenth century. Positions in the modernised bureaucracy, civil, judicial and police services, came to be filled by dominant sections of the local population like Gujarati Brahmins, Patidars, Vaniyas and Muslims.⁶⁵ The highest percentage of administrators and professionals like lawyers, doctors and professors in the Baroda College, who were largely high caste Brahmins, were those who had availed of English education.⁶⁶ Despite all measures by the administration to promote a sense of sociability in the city based on rules of citizenship over ascriptive status, education continued to serve the interests of the wealthy and upper castes.

Obviously, given the times, this socially and economically privileged section in the city was represented solely by men. Women belonging to these communities were encouraged to access education, especially higher education, and census reports testify to the high levels of literacy among upper caste Hindu women. For these women there was an expectation of involvement in public life through affiliation with the many clubs, associations and institutions for women in the city which were involved in social 'causes'. In her memoirs, Shardaben Mehta, who was married to Dr Sumant Mehta, the personal physician to the Maharaja, writes about the elitist culture of these circles and her sense of claustrophobia at their isolation from the real social problems affecting the city – poverty, the condition of workers, and poor women.⁶⁷

⁶⁷ Shardaben Mehta (1882–1970) was, along with her sister, the first woman graduate in Gujarat. She was active in the Gandhian movement. Her husband Dr Sumant Mehta was part of the Baroda

For the lower and untouchable castes, a degree of upward mobility was, however, made possible through education, as many gave up their caste-based occupations when they moved to the city in search of semi-skilled work in the wake of industrialisation. By 1920, there was huge expansion of cotton mills and chemical factories, and incentives were being offered to private capital to invest in organised industry. The Kala Bhavan's courses reflected these developments, with a course in weaving introduced in addition to the existing courses in carpentry, dyeing and mechanical engineering. Apart from attracting students from many parts of the country, there was a particular focus on bringing in students from the artisanal castes from in and around Baroda city.

However, as elsewhere, industrialisation also brought changes in the city's class structure. The large proportion of the city's population was engaged as labourers and industrial workers, illiterate and semi-literate migrants, who had to work under appalling conditions of exploitation.⁶⁸ It was these sections who had to bear the brunt of legal offences under the compulsion clause of the free and compulsory education law. Moreover, it is clear from educational reports that access to schools for the lower and untouchable castes was fraught with threat and subversion of rules by upper castes. Traditional caste practices, especially regarding the untouchable castes, continued to dominate the everyday life of the city, as Dr. Ambedkar's own experience clearly shows. In the early years of the twentieth century, the fashioning of an 'alternate modernity' through mass education came up against the solid edifice of tradition, albeit in transition.

22.8 Concluding Comments

As this paper has attempted to show, education pre-eminently figured in the emergence of Baroda as a city of 'culture'. Largely due to the philosophical approach of an 'enlightened' ruler, the provincial city of Baroda and the princely state it represented was invested in the creation of an educated and engaged citizenry marked by a distinctive cosmopolitanism. In the extant discourse on Baroda's educational 'achievements' – its impressive institutions and innovative practices – we find the intertwining imaginations of education as a social, public good, a transformative experience to be made available to all persons across social hierarchies of class, caste, gender, region, and religion. The particular form of modernity engendered by

Praja Mandal, or people's association, made up of the city's intellectuals, almost all Gujarati Brahmins, who aligned with the nationalist movement but were not effective in bringing its concerns to the princely state (Hardiman, p. 127–8).

⁶⁸ Patel (2011) notes that it is interesting that a state as invested in reforms on caste, gender and education as Baroda, offered little guarantees of workers' rights, even passing a basic one such as the right to unionise as late as 1938, 12 years after the British government had passed the law. See Patel, P.J. (2011) 'Trade union movement in a princely state,' *Contributions to Indian Sociology* Vol. 45, No. 1, pp. 27–54.

such an imagination was related to the development of a capital city infused with possibilities of knowledge acquisition, a space signifying the aspirations not only of its ruler, but of all state subjects.

However, the evolution of the city was not removed from larger contestations of social power. The focus on modern education fitted into the longer term requirements of fashioning a new educated urban elite – the new class of industrialists, and professionals like doctors, teachers, lawyers and bureaucrats. In this paper I argue that a study of education in the context of the princely state not only requires the intentions of the ‘policy makers’, in this case the ‘reformed’ feudal monarchy, to be taken into consideration, but also historical shifts in society that gave rise to the need for such policy, and at the same time imposed certain limitations on its implementation. Baroda’s educational reforms, in particular the Baroda ‘experiment’ of free and compulsory education, was set against a matrix of contestations between ideas and social structures, colonial rule and nationalist assertions, domination of the upper castes and landed peasantry who seized educational opportunities, and the aspirations of those who migrated to the city in search of work in the new industries. Attempts to extend mass education were enforced through a modern bureaucratic machinery of a benevolent and liberal monarchy, but remained unachievable without measures aimed at social amelioration. A comparison with Travancore, a princely state which passed a free and compulsory act as late as 1945 shows that different historical conditions can give rise to the spread of education. Unlike Baroda, Travancore was socially, economically and politically embedded in upper-caste dominance, and social life was characterised by extreme forms of caste discrimination and violence. This situation led to education for emancipation and dignity becoming the rallying call for mobilisation of the untouchable castes. Reports often refer to the Travancore example where community mobilisation for entry into this important public space worked better than fiat from above.⁶⁹ Baroda, guided by the progressive paternalism of an enlightened ruler, witnessed no such movements, even through the years of the nationalist Gandhian movement that originated in Gujarat. Educational ‘experiments’ like the public library movement and free and compulsory education, the focus on skills and learning, the application of reason and ‘scientific’ principles to knowledge generation and dissemination, and

⁶⁹The princely state of Travancore is an interesting counter-example to Baroda. Even though it officially passed a free and compulsory act as late as 1945, social movements by the untouchable castes to access education for dignity and emancipation saw Travancore far ahead of Baroda in all educational indicators. (Saiyidain et al., *op cit*, p. 29; Tharakan 1984, *op cit*)

In fact, a section of nationalist opinion held that the Baroda state was prominent on the education front because it projected its western modernity through ostentatious expenditure. The Servants of India Society, led by the same Gokhale who had drawn inspiration from the Baroda experiment in proposing free and compulsory education in the Imperial Council in 1911, published a scathing article in its journal on the comparison between the two states, showing how Baroda amassed its wealth from land revenue (thereby keeping its subjects in poverty) while Travancore, which had similar if not better institutions, focussed on social development. See Vaze, S.G. (1923) ‘Travancore and Baroda’, in *The Servant of India*, Servants of India Society, Vol. 6, No. 9, pp. 101–103 (May 29, 1923).

most importantly, the setting up of institutions accessible to all to support these efforts helped create a sense of an 'educated public' in the city. The dynamics of urbanism in Baroda city helped to sustain education at all levels, but in other small towns and villages in its hinterland, these efforts could not sustain their energy after Sayajirao's death in 1939.

Even today, almost 70 years after the princely state of Baroda was merged into the federal union of India, belonging to Baroda registers one's difference from being a resident of any other of Gujarat's many towns and cities. The city's landscape is much altered with institutions set up in the late nineteenth and early twentieth century having adapted to the needs of post-independence demands for public education. The Maharaja Sayajirao University, established in 1949 from the Baroda College, with its impressive Indo-Saracenic architecture and list of illustrious alumni still occupies an important place in the identity of Baroda as an educational centre. Many of the educational institutions set up in the 1880s were brought into the university when it was formed, like Kala Bhavan which is the Faculty of Engineering and Technology, and the Faculty of Performing Arts, which was earlier the music school. It is the only state university in Gujarat that offers higher education in the English language. The university's 13 Faculties, spanning Languages and Literature, Engineering, Medicine, Sciences, Commerce, Home Science and Performing Arts have produced scholars of national and international repute. Its Faculty of Fine Arts is considered one of the foremost in the country, having among its alumni many of India's best-known contemporary artists. The university continues to stand among an urban complex of institutions of learning – the museum, the central library and the teacher training institutes. Some of the state schools set up in the 1880s up to the 1930s were brought into the local public school system in the 1970s, their impressive architecture marking them from their later counterparts. All these institutions remain important sites of memory within the city.

Over the past century, like all cities of the world, the dynamics of economic development have changed the character of Baroda. The city continues to be known by its honorific epithet *Sanskarnagari*, although more in terms of spectacle than substance, through ritualistic registering of its provenance through city festivals and state-sponsored events. Within the context of the aggressive corporate-led and capital-intensive 'Gujarat model' of development adopted by the state since the late 1990s, policies favouring the privatisation of education have seen the city emerge as an education 'hub' in the state, with two private universities and a range of international schools catering to local elites as well as those from the Gujarati diaspora. Commercialisation of education has accompanied the intractable changes in the cityscape – hyper-visibility of commercial complexes like malls and multiplexes, shrinking of public spaces, increased urban displacement and poverty and last but not least, the rise of social violence. Those who have been witness to these transitions may invoke the *Sanskarnagari* with more than a tinge of nostalgia. In these much-altered configurations of the city, revisiting its history becomes relevant to reinstate its provenance in public memory.

Chapter 23

Closed City ‘Spaces’: Differential Access to Education in Vijayawada, South India

N. Purendra Prasad

23.1 Introduction

Vijayawada is a city located on the banks of the Krishna river in the Indian state of Andhra Pradesh, which is one of the five South Indian states. This city was one of the few important provincial cities even during the colonial period. Vijayawada today is a high-growth city as it is part of the new capital city region, where the new capital ‘Amaravati’ is being built in about 50,000 acres by the new state of Andhra Pradesh.¹ In order to understand Vijayawada city and its transformative phases, it is important to analyze the coastal Andhra region where it is located. The agrarian economy primarily revolved around the two river basins – Krishna and Godavari (comprising four districts Krishna, Guntur, East and West Godavari) contributing 60% of the agricultural produce in erstwhile Andhra Pradesh. As the region has adequate canal irrigation facilities, it is economically well developed. Scholars have traced a significant increase of cultivable land both in Krishna and Guntur districts at two intervals, first, when the barrage was constructed across the Krishna river by Arthur Cotton in the year 1852, and secondly when the Nagarajuna Sagar dam was constructed in 1960s (Rao 1985; Reddy 1989). The region’s growth curve

¹ Andhra Pradesh state has been bifurcated into Andhra Pradesh and Telangana on 2nd June, 2014. Hyderabad was the capital of united Andhra Pradesh, while it is now the capital of Telangana. The state of Andhra Pradesh is building the new state capital in Amaravati, which is located adjacent (25 kms) to the Vijayawada city.

The author expresses thanks to Professor Geetha Nambissan, the Editor of this India section, for her encouragement and valuable inputs, and Prof William T Pink, the editor for substantive comments that helped improve the chapter.

N.P. Prasad (✉)

Telangana, India

e-mail: Purendra.prasad@gmail.com

took another major turning point with the green revolution since mid-1960s, intensifying commercial crops and generating surplus from the agrarian economy. This process subsequently led to rapid urbanization, as a result of which number of urban centres – Vijayawada, Guntur, Mangalagiri, Rajamundry, Kakinada, Tenali, Machilipatnam emerged in the region. The nexus between land and water played a significant role not only in economy but also in politics and the social sphere (Parthasarathy 2004), thus contributing to the development of social and cultural capital to use Bourdieu's concept (Jenkins Richard 1992). The economic, social and political networks constituted the basis for the upper castes to emerge as educational entrepreneurs in and outside the region by 1980s.

The period 1965–1980 formed an important growth phase for the coastal Andhra region. Economically, a rich peasant class² emerged with the agrarian surplus due to the green revolution. Secondly, distinct social and cultural strategies were adopted by the upper castes that contributed to class formations in the region (see Upadhyaya 1997; Prasad 2015b). In the next phase during 1980–1994, a dramatic transformation occurred in the deltas of Coastal Andhra. The surplus generated by the class of rich peasants was channelled into aquaculture, large coconut farms, rice milling, petty investments (e.g. in Cinema Halls, Hotels, and Restaurants) in both the semi-urban and urban towns in the region. Later, this class reinvested their surplus in Hyderabad in various 'new economy' enterprises (e.g. shares in IT, and Pharmaceuticals). Also a significant investment took place in education (engineering and medical colleges) and health (corporate hospitals) across the urban centres in the region and Hyderabad (Prasad 2014).

When the rich peasant class diversified their economic activities in 1980s, this period also marked two parallel developments. One, Telugu Desam, a regional political party emerged in 1982. Within a short period of forming the party, it came to power in Andhra Pradesh. This facilitated the upper castes³ to assert themselves socially, politically, and of course in consolidating their economic base. Second, the Indian information technology (IT) industry which was a marginal entity that catered to domestic needs in 1970s rose significantly in 1980s as major industry and later acquired a global software companies' status by the year 2000 (Nasscom 2012). This rise in this software industry has promoted educational entrepreneurship across south India, and in the coastal Andhra region in particular.

English medium education and strong motivation to pursue science and mathematics at school and college level have been the major 'advantages' for the southern states of Andhra Pradesh (A.P), Telangana, Karnataka, and Tamilnadu. As a cultural attribute, education, especially at the higher education level is highly valued in south India. The proportion of the urban population is also higher in south India (33 %) compared to the national average (28 %). Therefore, cities such as Bengaluru,

² *Kamma, Reddy, Rajus* and *Kapus* constituted the rich peasant class further consolidated their economic and political power, controlled the economy not only in the region but also in Hyderabad. They also constituted the interlinked moneylender-merchant-input agent class that managed all kinds of agricultural transactions related to commissions, inputs, credit, marketing of agricultural produce of the Coastal Andhra region.

³ *Kammas* in particular gained from this political momentum.

Chennai, Hyderabad and Coimbatore in south India have developed as software hubs. Given this scenario, this chapter analyzes how the rise in the IT industry contributed to the ‘entrepreneurship in education’ leading to the corporatisation of school and college education in coastal Andhra region. A particular mode of education (enabling the decoding of competitive entrance examinations for obtaining seats in the increasingly sought after IITs) spread across the urban centres in erstwhile Andhra Pradesh, covering all the major cities – Hyderabad, Vijayawada, Visakhapatnam, Tirupati and Warangal.

This chapter primarily uses a political economy perspective to analyse the issues of ‘access’, ‘quality’ and social differentiation that is emerging among different classes of learners in urban India. This is conceptualized in terms of closed ‘spaces’. Here space is used the way Lefebvre (1991) defines it as one of the privileged instruments of the state in its efforts to control social relations among individuals, groups and classes. Lefebvre argues that the state is reconfigured in a new set of relations as necessary to the working of globalization. Lefebvre understood this reconfiguration of state as “production of space”. Thus, state is conceptualised not as fixed entity or container which holds both the market and society but as an ensemble of social relations that form a complex, intertwined temporal and spatial grid (Brenner 2004). Here in Vijayawada, the city space excludes certain social groups from gaining access to housing, basic amenities, and other critical resources including education. Under Jawaharlal Nehru National Urban Renewal Mission (JNNURM) or Atal Mission for Rejuvenation and urban Transformation (AMRUT) the lower classes located in the core or inner city of Vijayawada got constantly displaced, raising questions about access to education. Inequality in the Indian city is not simply a legacy of the past but is produced and reinforced by the state, a result of active policies and practices that result from its institutional character (Heller and Mukhopadhyay 2015; Kamat 2011). Of course, David Harvey (2012) places the city at the forefront in terms of its position as a generator of capital accumulation and absorption of surpluses (of both capital and labour). Harvey explains that urbanization is very crucial for the capitalist production process and has an inherent tendency towards over accumulation. It is within this framework that the findings of the study are analyzed.

Primary data was collected through field work in Vijayawada and Guntur in February, 2015. Individual interviews and group discussion was conducted with the current and retired teachers from the coaching institutes, government and private schools, and colleges. In addition, municipal officials, members of the private college teachers’ association, and political activists were also interviewed. This chapter is divided into four sections. The first section traces the historical trajectory of Vijayawada city, its growth, and how urban reforms and governance through JNNURM (renamed by NDA government as AMRUT) impacted educational and other services. The second section provides a macro narrative explaining how Vijayawada emerged as a corporate educational model that transformed school, college, and professional education. The third section talks about the present situation of schools and education run by the Vijayawada Municipal Corporation to draw a comparative social class analysis of municipal and private (both aided and unaided)

Table 23.1 Demographic details and the decadal growth rate of Vijayawada City

Year	Population (in lakhs)	Growth rate
1961	230,397	42.93
1971	317,258	37.70
1981	461,772	46.95
1991	701,827	51.99
2001	845,217	20.43
2011	1,048,000	23.99

schools and colleges. The fourth and final section analyses the findings and raises questions on differential access to education, educational aspiration and mobility of different social groups, and the role of the state and market in transforming the city spaces in India.

23.2 City Growth and Educational Governance

Vijayawada city is located on the banks of river Krishna. It is considered as the agricultural and commercial capital of Andhra Pradesh. The Vijayawada urban agglomeration consists of Vijayawada municipal corporation (VMC), Mangalagiri municipality and four Panchayats and has a population of 1.04 million as per 2011 census (see Table 23.1). Vijayawada became a municipality⁴ in 1888 with an area of 30 sq kms which was upgraded as a selection grade municipality in 1960 and further to a municipal corporation in 1981. In 2011, VMC has an area of 61.88 sq kms and Vijayawada Urban agglomeration has 110.44 sq kms. An important feature is that areas around the VMC experienced higher growth indicating the dynamic growth of the city. The city development plan prepared by VMC predicts a two million population in less than a decade (Government of Andhra Pradesh 2010a). Vijayawada is a major railway junction and has good road connectivity between north and south India, linking Chennai, Delhi, Kolkata and Hyderabad. As a commercial centre, Vijayawada has specialized in agricultural produce, edible oils, machinery & metal goods, transport, automobile spare parts, and numerous small scale industries, employing a large proportion of labourers (Baken 2003).

The city has witnessed a rapid growth over the past six decades with an average decennial growth rate of 40%. During the period 1981–1991 the net growth has been about 52% attributed to a large influx of the rural population to the city. However, during the past two decades 1991–2011, the growth has stabilized with a

⁴ Vijayawada's locational advantages can be traced back to the construction of railway bridge across the river Krishna in 1892. The bridge effectively made Vijayawada the 'gateway to the south'. All the south-bound trains from the north and north-west India pass through Vijayawada. Later on, road and railway networks were substantially expanded and improved.

decennial population growth of 22 %. The population growth can be attributed to the in-migration from the surrounding villages and towns in the region due to the growth of commercial activities. It includes: agricultural market centre, a host of wholesale and retail activities dealing in consumer goods, textiles, automobiles, industrial products etc. It is also a major trade centre for processed Virginia Tobacco, Cotton, and Turmeric. The agricultural commodities produced in this part of Andhra finds its market in Vijayawada both for local consumption and export. Vijayawada is also known for its Mango exports generating millions of rupees annually. Steady growth in the education sector (e.g., a large number of private schools, colleges, coaching institutes, professional colleges) also significantly contributed to the migration of students and their families into the city.

The Municipal Corporation's administrative area is divided into 59 wards⁵ for the purpose of governance. The slum⁶ population has grown from 169,043 in 2001 to 287,983⁷ in 2011, constituting about 28 % of the entire city population (Vijayawada Municipal Corporation 2013). If one looks at the city's land use pattern, it indicates that about 26 % is residential, with a significant part of the city's land use, i.e. 21 %, assigned towards the transport activities, about 10 % towards commercial activities, about 11 % is towards the public use, 15 % towards the slums (9.27 sq kms), and the rest, 17 %, of city land use which is not clearly demarcated (ibid:7). However, the city is facing severe land use problems like scarcity of disposal sites for garbage whose daily production is around 600 metric tonnes.

As a city's development and welfare is directly linked to the functioning of urban local bodies, it is important to understand how different development projects influenced the urban governance mechanism in Andhra Pradesh. The major urban governance reforms, programmes, and projects initiated in Andhra Pradesh since the early-1990s include urban poverty programmes, such as the Urban Basic Services programme (UBSP), Swarna Jayanti Sahari Rojgar Yojana (SJSRY), and UK's Department for International Development (DFID) supported Andhra Pradesh Urban Services for Poor (APUSP) and urban reform and restructuring such as the Jawaharlal Nehru National Urban Renewal Mission (JNNURM),⁸ Mission for Elimination of Poverty in Municipal Areas (MEPMA),⁹ and the World

⁵Every municipal corporation in India classifies a particular size of population into wards for administrative and political purposes. Each ward will have an elected representative (corporator), who in turn elects a mayor to govern the city. In Vijayawada, each of these 59 wards has about 18,000 people.

⁶A slum is heavily populated urban informal settlement where a large number of below poverty line (BPL) people live in substandard housing with inadequate facilities.

⁷This figure includes only the population from the notified slums. If one includes the estimates of non-notified slums, the slum population constitutes about 35 % of the city population.

⁸The Indian government launched its largest post-independence urban planning initiative JNNURM in December 2005. Four cities – Hyderabad, Visakhapatnam, Vijayawada and Tirupati have been identified in A.P. In order to access JNNURM funds, these ULBs will have to commit themselves to several mandatory and optional reforms.

⁹MEPMA has been initiated in A.P. in the year 2008

Bank-sponsored AP Municipality Development Project (APMDP).¹⁰ Starting from 2005, the Indian state justified urban reforms through JNNURM that it wants to make select cities as “world class”, “smart¹¹” & “slum-free”. The assumption is that all the above reforms initiated in post-1990s will enable the cities to emerge as more livable, secure and of course, global in character.

The JNNURM and APMDP Programmes come under particular scrutiny, the former being referred to as the “official carrier of neo-liberal urbanism,” (Banerjee-Guha 2009:96–7), which conceptualizes cities primarily in economic terms, as engines of economic growth, while also creating a “modern” homogenized society. JNNURM also comes in for a great deal of criticism for the manner in which it advocates the aggressive pursuit of outsourcing, privatization, and public-private partnership, thus reducing the state to the status of a mere facilitator rather than an actual delivery agency when it comes to social necessities and essential urban services. Andhra Pradesh First Referral Health Project (APFRHP) supported by the World Bank, and the District Primary Education Project (DPEP), supported by the Department for International Development (DFID) and the World Bank, have been the flagship programmes in the health and education sectors in Andhra Pradesh, which became integral to urban governance. As part of this neo-liberal governance framework, Vijayawada municipal corporation was also compelled to implement several measures such as mortgaging vacant land, buildings, generating revenue through a hike in property taxes, casualization of work force,¹² outsourcing day-to-day running of parks, and street lights through public-private partnerships etc. Urban local bodies such as Vijayawada, Visakhapatnam and Tirupati in A.P visualized a huge opportunity in JNNURM and other reformist agenda to overcome their financial crisis and improved governance, but the studies indicated the contrary to it (see Prasad 2014).

The school witnessed a paradigm shift in the education policies of the last decade due to a new governance framework adopted by the state. Several studies indicated that the urban mission agenda under JNNURM is to privatise/commercialise basic services, including education through public private partnerships (PPPs). Vijayawada, one of the 63 cities identified under JNNURM indicates this trend clearly. Apart from running the municipal schools through contract teachers, *vidya*

¹⁰This project is for a period of 5 years starting from 2010 with a grant of Rs 1800 crores (\$405 million) and is aimed at improving basic services for people by strengthening ULBs (News Reporter 2009).

¹¹The union government is planning to develop 100 ‘smart’ cities. Under the city challenge method, the centre will contribute 50 % of the funds needed to develop a smart city and the state will chip in with 20 % and the selected city the remaining 30 %. The selected city should be levying user charge or ready to impose them on its residents. State governments will have to give an undertaking that they will float municipal bonds and to make up for the shortfall funds, the selected municipalities will have to contribute their share. State governments can go for public issue as well.

¹²Casualization of workforce occurs whenever workers are employed in a casual, temporary, contract or otherwise non-permanent and non-full time capacity.

(education) volunteers, the private entrepreneurs have been invited by the urban local bodies to participate in school development, thus opening the window to use prime government land for commercial purposes (*ibid*:89).

23.3 Education Through Coaching Institution

During the pre-Independence period the coastal Andhra region, particularly Guntur and Vijayawada cities, witnessed a lot of charity and philanthropic work in the education sector. Credible private (not for profit) educational institutions such as Loyala, Stella Mary, Satavahana colleges located in these cities attracted talented and meritorious students from different urban centres across south India. The education was highly valued in the region due to the schools and colleges established by the British as well as Christian Missionary efforts, and of course the intense literary reform movement¹³ in Rajamundry and other towns (Ramakrishna 1983). In supplementing some of these efforts, an educational entrepreneur named CVN Dhan started a 'coaching centre' in 1957 in Guntur. The purpose was primarily to help those students unable to academically cope with school education. The fee structure of this coaching centre was modest, and hence also affordable for the lower middle classes. He continued this initiative for about two decades resulting in reasonable profits. This coaching centre model became popular from then onwards and was considered as a successful experiment in the region. Subsequently several entrepreneurs explored different business models in the education sector building on the idea of coaching centres.

By the 1980s the rich peasant class in the region consolidated its social and political power, by diversifying its portfolio from agriculture to non-agricultural enterprising sectors, particularly the entertainment industry, education, and health sectors. As the regional economy flourished and diversified, provincial towns such as Guntur and Vijayawada became centres not only of trade and finance but also for education, drawing many students from rural areas. The emergence of this rich peasant class, the Telugu Desam Party, and the political and social consolidation of upper caste Kammas in the region, provided a basis for this entrepreneurship in several sectors, including education. The region also had a long history of caste associations which started hostels for lower classes within each caste group. For example, Vasihya, Kamma, Reddy, Kapu communities established hostels, community halls in several towns and cities, largely reflecting educational priorities.

¹³Reforms include: spread of western education through the medium of English, establishment of schools and colleges by the British government and Christian missionaries; rise and growth of journalism, the first Telugu journal Satyadoota appeared in 1833; rise of socio-political associations particularly literary associations like Vijnanachandrika, Andhra Bhashabhi vardhani Samajam of Masulipatnam, Saraswatigrantha Mandali of Rajahmundry etc awakened people through numerous publications and activities.

These caste associations were not formed by rural farmers but by educated caste members or lawyers living in towns (Washbrook 1975). These educational initiatives by the caste groups helped the mobility of lower classes over a period of time.

In the education sector, the entry of private capital went initially into the 10+2 educational coaching but later expanded to 10+2 (intermediate) colleges and subsequently to engineering and medical colleges. Thus the flight from government to the privatisation of education happened by the 1980s, when professional education became highly valued. Moreover, when this professional education fulfilled the aspirations of the rich peasant classes from coastal Andhra to migrate to North America, then the significance of coaching centres increased enormously. Now a different class of students became eager to get into these coaching centres to access the limited seats in government engineering and medical colleges. While the Dhan coaching centre was the first, the next generation of coaching centres that emerged in 1980s (Vignan, Vikas, etc) were of a different kind altogether. Coaching centres were seen as a big business from then on.

The privatisation of education became intensified with the rising demand for professional education from late 1970s onwards. With the growing number of jobs in the Information Technology (IT) sector, the coaching centre managements were able to market themselves as the most viable option for affordable and aspiring students. This process further proliferated when the educational entrepreneurs from the region lobbied successfully with the TDP government to receive grant aid money and other incentives for private educational institutions. It was only after this government intervention that both college and school education got commercialised, and subsequently the coaching centre business got concentrated in Vijayawada. This was later expanded to Nellore, an adjoining urban centre. With the shift from Guntur to Vijayawada, large entrepreneurs entered into the field. As a result several coaching institutions and schools such as Chaitanya, Narayana, Ravindra Bharati, Bhashyam, Keshava Reddy, Gautam, Krishnaveni Schools emerged and later acquired a particular brand for themselves. These institutions have scaled up the cost of education several times higher, and also accelerated the privatisation of education. The coaching institutions have become attractive for upper and middle classes to receive individualised tutoring while it restricted access to the lower classes further.

Similarly, the private capital also went into establishment of several engineering colleges. Sidhartha, an engineering college, was established in 1977, and was the first private technical institution in Andhra Pradesh. Then came V.R College of engineering, Vignan, KL University etc. Vignan foundation for science, technology and research transformed coaching centres into intermediate colleges and later expanded his enterprise into a diversified educational group. KL engineering college and Vignan college have all now become deemed universities. Similarly, NTR health university, 'pinnamaneni' Siddhartha institute of medical college, Gannavaram, Gudlavalleru college, NRI Institute of technology, Bapatla engineering college, Tenali engineering college etc all came up. Majority of engineering colleges are owned by kamma regional elite.

By 1990s, the entrepreneurs focused their investments on aqua-culture, arrack,¹⁴ sericulture, and also on education. The education sector came to be seen as one of the best investment options to get higher returns. Over a period of time, the 'provincial propertied classes' to use Balagopal's (1987) phrase controlled education through these coaching centres. These classes lobbied tax concessions, recognition, financial aid, and other incentives from the state for private colleges and schools. Along with these entrepreneurs, the growing Non-Resident Indians (NRIs), who are highly educated migrants from the region, also played a major role in investing and promoting professional education.

By 2000s these coaching centres focused not only on professional engineering and medical education but also usurped school education. This was achieved by re-conceptualizing school education in a more 'technical' and 'innovative' way, i.e. through concept schools, techno- schools, and foundational schools etc. These 'new' schools were packaged as early stepping stones to successfully crack the entrance examinations of Indian Institute of Technology (IITs) and Engineering, Agriculture, Medicine Common Entrance Test (EAMCET) after 10+2 education. This is one process by which the coaching centres adopted the 'backward integrative strategy' by including the school education into their fold. It was emphasized that in order for competitive examination coaching to be effective, students should enrol themselves from sixth grade onwards so that their basics will be strong particularly in the science stream. On the other hand, they adopted the 'forward integrative strategy' by including the NRIs, educational consultants to help students get admissions in foreign universities. This is how coaching centres attracted students from secondary school onwards to engineering education. As Carol Upadhyia (2014) points out with the movement of many young people to the US and other countries via the IT route, the 'IT craze' swept the region, enhancing the choice for engineering degrees and spurring the restructuring of education all the way down to the primary school level.

By 2010 the competition among the coaching centres reached its peak. This is when Narayana and Sri Chaitanya went into the mode of typical business mergers, out-right buying up the smaller or medium units.¹⁵ This also involved weaning away the good teachers from other institutions in order to establish their monopoly. This is evident with the fact that the two institutions – Narayana and Sri Chaitanya emerged as the top two and have been dominating the school, college, and professional education sectors. These two institutions have opened several branches not just in Hyderabad and Vijayawada but in every possible urban centre across 13 districts in Andhra Pradesh, and 10 districts in Telangana. They have also opened branches in urban centres in the states of Karnataka, Tamil Nadu, Pondicherry, Maharashtra and Delhi in the last 5 years. In order to avoid competition and retain

¹⁴ It is a local alcoholic beverage that is distilled from a fermented mash of malted rice with toddy or molasses. Arrack contracts provide an important economic avenue for upper castes to earn profits.

¹⁵ Kesavareddy, an established chain of schools in Rayalaseema region in Andhra Pradesh have been bought by Sri Chaitanya educational institutions in the year 2015.

their monopoly in the education sector, these two institutions, partially merged into one entity called 'Chaina' (meaning both Chaitanya and Narayana) batch¹⁶ for the 'most talented students in accordance with capitalistic accumulation strategies. This of course led to a significant branding activity, and pricing the 'Chaina' batch to attract the students to the many coaching centres situated in all the urban centres. When the student enrolment increases in the coaching centres, then students are graded every week to classify them into different batches creating a hierarchy among students in terms of merit. The most talented are kept in top batches and are treated differently. The top few batches of students become privileged with the best infrastructure, air-conditioned class rooms, efficient teachers, and comfortable hostel accommodations, etc. These identified students in the top batches potentially become the top rankers in subsequent testing, thus giving credibility to the coaching centres. This success further contributed to the business model. Students in the Chaina batch are charged about Rs 300,000 (\$4384) each. The turnover of these two colleges today is estimated to be more than 50 million rupees (\$730,606).

The significance of these coaching institutes has been to prepare the ground for gaining entry into the software (Information Technology) industry in India. As the IT industry provided increasing job opportunities to a large number of people, coaching centres and professional education institutions also multiplied. At present, there are about 275,000 students in Sri Chaitanya, 140,000 students in Narayana, and another 250,000 students in all the other similar coaching institutions. From a mere 27 engineering colleges in 1996, the number grew to 540 colleges in 2009 in Andhra Pradesh. According to the economic survey 2004–2005, information technology (IT) and IT enabled Services (ITeS) make up the single largest contributor to India's service exports. IT, ITeS including Business Process Outsourcing (BPO) continues to be one of the largest employers in the country directly employing nearly 3.5 million people. Indians constituted 74 % of all computer related H1B visa holders in 1998–1999 in the united states of America (USA) and 78 % of all the foreign information technology (IT) professionals entering the UK in 2002 (cit in Xiang 2007). In 2011–2012, the sector employed 2.8 million IT professionals and contributed 7.5 % to India's GDP (Nasscom 2012). A.P accounts for about 23 % of software professionals from India in the U.S as per Nasscom survey in 1998. Also the way software technology parks (STPs) of India, set up in 1991–1992 in Hyderabad grew from 7 to 112 in 1997–1998 to that of 1300 in 2001–2012 (Ramachandraiah 2003), and about 4000 in 2012. A significant fact concerning the software engineers in USA and other European countries is that a large proportion of them are from the coastal Andhra region, indicating the impact of these coaching centres and professional education institutions. The ultimate markers of success of the coastal Andhra people is to have 'land in Andhra, a house in Hyderabad, and a job in America (Xiang 2007: 30)

The tangential growth of engineering colleges is evident from the way colleges rose from 107 in 2001 to 238 in 2004, and to 700 colleges by 2013. The four districts of south coastal Andhra alone have nearly 200 engineering colleges offering

¹⁶ A number of students grouped together is called a batch.

100,000 admissions. While the first generation of IT migrants were from the dominant castes and classes, the next generation of migrants in the last two decades are much more diverse. With the explosion of engineering colleges, the owners of these colleges lobbied the state government to provide fee reimbursement to the lower classes. The fee reimbursement scheme was introduced in 2008 by the A.P government, which covered the fees of students belonging to the backward castes (OBCs, SCs & STs). In 2009, the scheme was extended to below poverty line (BPL¹⁷) families, defined as those who have ‘white cards’. A critical scrutiny of the ‘fee reimbursement’ in education sector and ‘Arogyasri community health insurance scheme’ in health sector started in the year 2007, indicates how state resources have been effectively allocated to private engineering colleges and hospitals in Andhra Pradesh (Prasad 2015a).

23.4 Education Through Government Institutions

Government schools and colleges were highly valued until the 1970s due to the talented teachers, reasonably good infrastructure, and pedagogy. From 1980 onwards, however, coaching centres started attracting the talented teachers from government schools and colleges by paying higher remuneration. This is one process through which government educational institutions have been affected, thus leading to falling standards and ethics. Key respondents revealed that teachers who received a salary of Rs 240,000 (\$3506) per annum were offered Rs 500,000 (\$7306). In exceptional cases, such as KKR, a private residential School in Vijayawada pays 3.5 million rupees (\$51,143) per annum for a math teacher. Thus, several talented teachers have left their jobs and joined the private coaching cum residential schools and colleges across Indian states of Andhra Pradesh and Telangana, thus affecting quality education in government schools.

Similarly, the concept of ‘residential school’ and ‘residential college’ was a successful attempt by the state not only to attract talented rural students from different social backgrounds, but these schools also gained a reputation for providing high quality education. In 1971–1972, three residential schools¹⁸ were established by the Government of Andhra Pradesh. These schools achieved top ten ranks in secondary school certificate (SSC) board exams for several years, acquiring reputation for its high quality. Similarly, in 1972, on the eve of 25 years of Indian Independence, a silver jubilee residential degree (undergraduate) college was established in Kurnool, and later in 1982, Nagarjunasagar a residential college in Nalgonda was opened in

¹⁷ Below Poverty Line is an economic benchmark and poverty threshold used by the government of India to indicate economic disadvantage and to identify individuals and households in need of government assistance and aid.

¹⁸ The three residential schools established during 1971–1972 are: Sarvail in Nalgonda district, Tadikonda in Guntur District and Kodegenhalli in Anantapur district. In 1998, Gurukulams were established to enroll and retain tribal children and improve the quality of education.

the district. These two colleges' recruited teachers and students¹⁹ based on merit, making these colleges highly credible. In fact these colleges were credited for producing IITians, civil servants, and high ranking professionals. The private coaching centres effectively used this same concept in 1990s to start the residential schools and colleges. The only difference is that government residential schools and colleges were for the rural poor, provided education free or at highly subsidized rates, while the private residential colleges charged heavily ranging from Rs 60,000 to 300,000 (\$ 877 to 4384) per child.

During the early 1990s, the software industry was in a boom. The most typical educational route students took in Andhra Pradesh was to go through the private residential colleges cum coaching centres, pursue engineering education, join the Software Industry, and then look for opportunities to go to US. These coaching centres offered comprehensive tailor made packages to the students: this provided an engineering degree and support for them to migrate to US. In this manner, they have successfully captured the whole 10+2 and under-graduation college system. Prior to the private residential colleges, there were several government aided residential colleges in the form of Loyola, Stella and Satavahana in Vijayawada. In these government and government aided colleges, regular teachers constitute 20%, while the remaining 80% of them are on contract. The contract teachers were paid Rs 10,000 per month (\$146) till 2014 but for the series of struggles and negotiations by the teachers' associations, they are now paid Rs 21,000 (367) per month.

These aided colleges, once reputed for attracting the best talent from all over the state, today have to contend only with the socially and economically poor students. Discussion with the aided college teachers in Vijayawada revealed that about 30% of the students do part-time jobs to pay up annual tuition fees of Rs 20,000 (\$292). Most of these students are enrolled in social science and humanities courses. The teachers commented that it is the lower classes who sustain social science and humanities streams through government and government aided colleges. On the other hand, the private coaching colleges have focused only on the professional courses like engineering, medicine, bio-technology, pharmacology etc.

The coaching cum residential colleges and schools' have increased their enrolment by using a range of different marketing strategies. For instance, these colleges employed public relations officers (PROs), whose job is to persuade parents to enrol their children in the institution. In this process of persuasion, they have promoted technical courses only. This entire process has supplanted the government schools, government aided²⁰ and municipal schools.

The entry of private capital into the school and college education has been substantial in the last two decades. Although the private bodies are dominating the collegiate education, in terms of schools in the Krishna and Guntur districts, 59% of students are still in the government schools. The rest, 41%, are in the private schools.

¹⁹Students are recruited with due reservation to scheduled caste, scheduled tribe and backward region. Accommodation, food and tuition fees is highly subsidized.

²⁰Despite the huge impact of coaching centres, a few government and aided schools such as Nirmala, MSM, Siddartha, Montessori in Vijayawada are still running a credible school system.

Table 23.2 Schools under the Vijayawada Municipal Corporation

Type of school	No of schools	No. of students (boys)	No. of students (girls)	Total no. of students	No. of teachers	Teacher-student ratio
Primary (1–5)	75	4905	5539	10,444	311	1:34
Secondary (1–7)	2	120	114	234	11	1:21
High School (6–10)	28	6109	7012	13,121	460	1:29
	105	Total students 23,799	782	1:31		

Source: Vijayawada Municipal Corporation community development office (2015)

Students in government schools are mostly from the scheduled caste, backward caste and minorities. The upper castes Kammas, Reddys, and Kapus do not send their children to the government schools any longer. In contrast, a small proportion of students belonging to the lower classes from the slums go to the private schools. Field data indicated that government high schools are faring much better than the primary and secondary schools. There are 360 schools in Guntur and 350 schools in Krishna district. Among them, 28 high schools each are under the purview of municipal corporations. Due to state intervention, especially through the Sarva Shiksha Abhiyan²¹ (SSA), municipal elementary and high schools became much more accessible. However, due to widespread private education, a ‘cultural value’ has been set in the minds of parents that school going children should wear a dress code. In order to make education more accessible to the lower classes, the SSA has removed the dress code and other accessories, which in fact had negative repercussions on the student’s enrolment. This aspect became an advantage for the private schools to attract students. In the last decade or so, there has been a consistent increase in enrolment in private schools. While this was always high for urban areas, it has now been estimated to have grown to 29% in rural areas as well (Karopady. 2014).

A close scrutiny of the Municipal schools in Vijayawada city is undertaken here as these schools are the key sites for the lower classes of students who are increasingly neglected by the local state. The discussion with key respondents in Vijayawada city revealed that private schools have made significant inroads into primary and secondary level, while high schools in the government sector are still able to retain a reasonable student strength. This is quite evident if one looks at the 105 municipal schools in Vijayawada city. At the primary level: on average there are 139 students per school, at the secondary school level about 60 students, while at the high school level, there are 469 students per school (see Table 23.2). The teacher student ratio in

²¹ Sarva Shiksha Abhiyan (SSA) is Government of India’s flagship programme is implemented in partnership with state governments. SSA is aimed at achievement of universalization of Elementary Education in a time-bound manner as mandated by 86th amendment to the constitution of India making free and compulsory education to the children of 6–14 years age group, a fundamental right.

Table 23.3 Students intake based on medium under the VMC

Type of school	Telugu medium		English medium		Urdu medium		Total
	Boys	Girls	Boys	Girls	Boys	Girls	
Primary	3836	4342	677	694	392	503	10,444

municipal schools is 1:31 while it is 1:50 or more in most of the private schools. This ratio was in the reverse direction until the 1980s but today the enrolment in the government sector is falling whereas the private sector is increasing. Of course, the lower classes and caste enrolment is higher in government schools while it is marginal in private schools.

One of the main reasons for the increasing enrolment in private schools is because of the medium of instruction. In private schools, English is the only medium of instruction, whereas in the Municipal schools students are taught in Telugu (81 %), Urdu (7 %) and English (12 %), (see Table 23.3). As the English medium provides greater access to educational and employment opportunities, private schools have an advantage over the municipal schools. Even if the lower classes aspire to send their children to private schools, because of high opportunity costs (school fees, hostel expenses etc), they are able to send them only to municipal schools.

If one looks at the disaggregated data of English medium students in terms of caste, three fourths of them are from upper castes and OBCs while the remaining one fourth are from Scheduled castes, Scheduled tribes and minorities (see Table 23.4). It is true, however, that even the upper castes and OBCs are from the lower classes and those who could not afford private schools joined the municipal schools. Upper castes and OBCs are able to pursue English medium schools as they have social and cultural capital compared to SCs, STs and minorities.

Caste-wise enrolment of students under VMC indicates that 81 % of them are OBCs, SCs and STs, while only 19 % from upper castes (see Table 23.5). Even among the non-upper castes, it is OBCs who are predominant indicating the lower enrolment of STs (3 %), minorities (9 %) and SCs (17 %).

Table 23.5 Caste wise distribution of students in high schools under VMC

S No	Caste	Boys	Girls	Total
1	Upper castes	1158	1331	2489 (18.9%)
2	OBCs	3153	3769	6922 (52.8%)
3	SCs	1109	1077	2186 (16.7%)
4	STs	192	158	350 (2.7%)
5	Minorities	497	677	1174 (8.9%)
Grand total	6109	7012	13,121	(100%)

Discussions with the Vijayawada municipal school teachers indicated that the municipal schools located in the prime area of the city are facing stiff competition with the private schools. As private schools offer English medium instruction, there follows a lower enrolment in the municipal schools. There is tremendous pressure on these municipal schools to switch over to the English medium in order to retain the students, and also to justify the student-teacher ratio. Beginning in 2011, two municipal schools (Darsipet corporation school, and the AKTPM school) did start teaching only in English. However, there continues to be a decline in the enrolment of students in these schools due to eviction of the slum population in the prime area: their housing, it is claimed, is located on ‘illegal’ sites. On the other hand, municipal schools located in the periphery of the city are oversubscribed in terms of student enrolment.

There is a tendency for parents to put their wards in the private schools at the primary school level while at the secondary and high school levels, students are admitted into municipal schools because of the high fee structure. There is wide range of choice at the primary school level for all classes of people as low-budget private schools are available in every urban centre in India. In terms of teachers, government schools recruit only qualified teachers, while private schools do not follow this norm. Discussion with the teachers indicated that it is quite demotivating for them to work in municipal schools because of the decline in students’ enrolment, irregular attendance, and lack of social diversity etc. They also pointed out paradoxically that the teacher quality is very poor in most of the private schools at the primary level, despite the high enrolment and popularity of these English medium schools.

There is thus a combination of educational, economic and social issues involved in the decision of parents to send their children to private schools. Parents preferred private schools because they want the school to fulfil their expectation of quality. The underlying premise was that government schools do not offer quality education and private schools were therefore a better choice (Mehendale et al. 2015). In Vijayawada, a few municipal schools such as Darsipet school are in high demand for admissions while few other schools in the periphery of the city have very few students. There is no uniform quality across municipal or private schools in Vijayawada. The discussion with the municipal school teachers indicated that about 20% of the children from private schools seek admission in the ‘select’ municipal

high schools because few of these high schools are rated by parents as efficient schools. The effectiveness of private schools, however, appears somewhat exaggerated. Chudgar and Quin (2012) pointed out that though private schools on the surface seem to perform better than government schools after more detailed analysis their benefits seem to become statistically insignificant. Emphasising the impact of lower standards in both private and government schools, Romila Thapar (2015) argues that students with substandard schooling cannot cope with higher education. Without good quality schooling, the institutes of higher learning are handicapped. Schools whether municipal or private, play a very important role in shaping up the children for higher education and hence they should maintain diverse student ratio.

There is a shift in the education policies recently due to a new governance framework adopted by the state. Two things became apparent with the new policy. One, government is in the process of rationalising the schools, implying closure of schools which are unviable (1 teacher: 20 or less students). Second, the government is planning to privatise the schooling system in the same way it has privatised the street lights, parks, sanitation etc. The A.P government has formulated policy that does not differentiate between public and private institutions. This is evident in the way the Government of Andhra Pradesh (GoAP) recently announced the setting up of international schools through public-private partnership (PPP). The GoAP will provide land while the private partners will be asked to operate the schools (Times of India 2015).

The AP government's policy of reimbursing the tuition fees for the students in private engineering colleges supplants the severely underfunded government educational system. As a result, private colleges gained from the state's allocation of resources. For example, the fee reimbursement scheme for OBCs, Dalits and economically backward students was a boon for the growth of private engineering colleges who effectively reaped the benefits from the government's educational resources. The network of private engineering colleges and coaching institutes, have lobbied successfully in making the government recognize a legitimate share for private sector in the state's resources. This has been possible mainly due to the neo-liberal framework that Indian state is pursuing, thus promoting the interests of the private over the public good.

23.5 Discussion

This paper traces the socio-historical trajectory of the coastal Andhra region, particularly the way surplus generated from agriculture was reinvested in enterprising sectors which significantly shaped Vijayawada city as a commercial and educational hub. It is quite evident that the commercialisation of education has pre-dated globalisation and has emerged from the changing economy, peculiar interfaces between class-caste, economic and social interests, and state policy. The city itself, over time, has been re-imagined around professional education, coaching, and its business interests – creating a new aspirational culture.

The large-scale accumulation of capital from the education sector in Andhra Pradesh and Telangana established a new corporate model of education for the country. The ramifications of this model have been huge for the re-imagining of education within the city space. In the education sector, drastic changes in pedagogy through coaching institutes actually redefined the student learning methods, outcomes, and of course parental desires. Technical education, through self-financing, became the norm while other courses in humanities, social science, and the liberal arts got completely undermined. As education is available only for the affordable groups, the middle and lower classes are forced to sell land and other assets to get access to education. Educational entrepreneurs have now entered into the political domain²²: and have become key players in influencing the policies and governance of education in the state.

This emerging corporate model of education promoted by both the market and state effectively created ‘closed spaces’ in the cities, denying access to diverse learning environments and socialization in the educational system. The credible government colleges and not-for-profit private educational institutions which attracted students and teachers from diverse social backgrounds and economic classes until the 1980s have now given way to corporate colleges. The state has not only reduced the resources for the government and aided colleges but diverted substantial finances to private and corporate colleges through the ‘fee reimbursement scheme’. At the same time the municipal schools have been facing significant challenges in terms of student enrolment, irregular attendance due to displacement of slum population, migration etc. Education, then, has witnessed a paradigm shift in the last decade due to this new urban governance framework adopted by the neo-liberal state. The state led ‘smart cities’ are on an urban renewal mission basically to privatize the public goods, including education, through public-private partnerships, rationalisation of schools, which work to create further inequalities and exclusions.

In sum, it is clear that from 1980 onwards the state has played a crucial role in accelerating the entry of private capital into education sector, consequently restructuring the ‘social space’: while this has facilitated the global mobility of students belonging to certain social groups, it has also restricted the accessibility to higher education for other social groups.

Chapter 24

Production of an ‘Educational’ City: Shadow Education Economy and Re-structuring of Kota in India

S. Srinivasa Rao

24.1 Introduction

Kota, a provincial city in the western state of Rajasthan in India, located approximately 250 km south of Jaipur, traditionally known for its royal princely culture, typical Kota stone, textiles and other manufacturing industries, shot into prominence in the first decade of the twenty-first century, due to its evolution as a hub for shadow education,¹ which trains students to succeed in the admission tests to elite higher education institutions such as Indian Institutes of Technology (IITs), National Institutes of Technology (NITs), and the All India Institute of Medical Sciences (AIIMS). About one third of the selections for undergraduate courses in IITs in particular are said to be from those who went to these cram schools in Kota, designating the city as the ‘cram school capital’, ‘coaching capital’, ‘Kota factory’, ‘Kota System’, ‘mecca of private coaching’ by many commentators.

The author expresses a deep sense of gratitude to Professor Geetha B Nambissan, the Editor of the India section for providing him an opportunity to explore the Kota story. Without her encouragement this paper would not have seen its completion. The author expresses gratitude to Mr. Sanjay Kumar, an old student of ZHCES, JNU, for facilitating his fieldwork in the city of Kota. He also thanks his doctoral students, Ms Smriti Singh and Ms Sriti Ganguly, for offering constructive criticism on the first draft of the chapter.

¹According to Bray and Lykins (2012), the metaphor of the shadow is used because much of the private supplementary tutoring mimics the mainstream. They argue that, as the curriculum of the mainstream changes, so does the curriculum in the shadow. ‘And as the mainstream expands, so does the shadow. Shadows may of course be both useful and problematic. The shadow cast by a sundial can tell observers about the time of day, and the shadow of an education system may tell observers about the features of mainstream school systems’ (Bray and Lykins 2012: 1).

Thousands of students² (rough estimates suggest that more than 100,000 students³) migrate to this city every year, sometimes alone and sometimes along with their parents and siblings, to prepare for highly competitive entrance examinations, with an intent and dream of making it through the portals of higher education. For these students and their families, the city of Kota represents an aspiration, a pathway to success, and a necessary stop-over in reaching their career destiny or life goal.

The transformation of Kota from being a traditional provincial small town to an industrial and commercial city to an educational city is unprecedented in the history of urban growth in India. Evidences of towns and cities shaping up as centers of education are all well documented by many historians in the past. However, instances of production⁴ of a city space that is wholly built around a particular ‘non-industrial’ – rather post-industrial vocation of training of young minds for higher social mobility through a provision of what is known as ‘parallel’ or ‘shadow’ education is refreshingly rare and new. This new phenomenon is yet to catch the attention of geographers, sociologists, educationists and other social scientists and thus makes it a curious case to explore the factors that made the city a household name among the aspiring middle class families in the entire country in general, and in the Northern parts of India, in particular.

What is even striking is that the city of Kota never had a culture of coaching institutions prior to the 1990s, except for a few home tutors that were available for local children who wanted an additional academic support, along with their regular classroom learning in the mainstream schools. The evolution of shadow education occurred at a time when the city was struggling to find ways to sustain the de-industrialization as a result of industrial sickness and closure of a large number of manufacturing units which threw a significant chunk of labor (manual, scientific, technical and managerial) out of jobs making their life difficult to lead. It is at this juncture in the late 1980s and the early 1990s that the city innovated itself with the help of some successes in private tutorials offered by some such retrenched workforce of the sick industries of Kota town. The successes of small town children in

²There is no authentic enumeration of total number of students arriving in the city. However, there are various estimates. The figure of 100,000 is also a conservative figure to me. In reality the number of students in the city Kota at any point in the year could be more than this number as there is no count of students attending many smaller institutes as well as individual subject based tutors who handle a large chunk of students. Further, there could also be under or over reporting of these numbers by the coaching institutes themselves for various reasons.

³<http://www.openthemagazine.com/article/nation/the-kota-system-rs-600-crore-coaching-industry>, July 17, 2,015.

⁴We use the term ‘production’ in the sense that Lefebvre used in his seminal work on ‘Production of Space’ (1991). To him, ‘production’ or ‘producing’ space have both the elements of real as well as abstract universality. He argues that there are both the dimensions of ‘logico-mathematical space’ (Abstract) on the one hand and ‘practico-sensory’ (Absolute) realm of the space, which are important to understand how and why an empty space gets filled up the way it does. The paper aims to consider primarily the latter aspect of the production of urban space in Kota city by engaging with the particular (case) descriptions or what Lefebvre calls as ‘cross sections of social space’.

gaining admission into the dream institutions such as IITs soon travelled to other small towns and cities around Kota in the state of Rajasthan, and in the neighboring state of Madhya Pradesh. In no time, coaching institutions sprung up in the city of Kota as the demand for shadow education and private tuitions grew and the city thus became an aspirational hub for middle class families from small towns of not just Rajasthan, but from a large number of Northern states such as Uttar Pradesh, Bihar, Punjab, Haryana, Himachal Pradesh, Jammu and Kashmir, the Eastern states of Orissa and West Bengal, Jharkhand, and the North Eastern states as well.

In addition, the potential market for shadow education caught the imagination of potential investors from across the country and from abroad to invest in the burgeoning education economy of Kota city. There have been mergers and acquisitions, joint ventures, venture capital investments and investments by the multinational companies, which made the transformation of the city which was previously thriving only on the tuitions by individual teachers or groups of teachers who then turned into local education capitalists, bringing Kota onto the global education economy map. Investments by Milestone Religare Investment Pvt. Ltd (MRIA), Franklin Templeton, Nadathur Group, CLSA Capital Partners⁵ and more recently, by the Korean company called Etoos Academy (of Korea's S K Group, which is one of the top four conglomerates), are some of the examples of interest displayed by the economic capital in the investment in shadow education economy of Kota. As per one estimate, India's market potential of shadow education is to the tune of USD 2308 millions⁶ (roughly Rs. 150,000 millions).⁷ Others like CRISIL, the credit rating body in India, pegged it at even much higher figure of USD 6179 millions (roughly Rs. 401,870 millions) as per their 2010–2011 study and expect this to grow to USD 11,640 millions (roughly Rs 756,629 millions) by 2014–2015.⁸ Thus, as a report by Bray and Lykins (2012) rightly claim, the issue of 'shadow education can no longer be ignored' (p.67) as it shows signs of growth throughout, and also the promise of further growth in the years to come. The city of Kota is a nerve centre of this shadow education economy in India, and thus it is an interesting case of urban transformation in recent times.

The transitory migrations of students and their families to Kota, on the other hand, transformed the city geography, economy and social life. This chapter thus seeks to examine how this transformation had occurred in Kota and what are the contexts, causes and consequences of such urban innovation that places post-

⁵CLSA Capital Partners, an independent brokerage and investment group with \$2.7 billion in funds under management is said to be the lead partner with an investment of almost Rs. 1 Billion into Kota based Resonance Eduventures Pvt. Ltd. (<http://www.vccircle.com/news/general/2011/06/17/clsa-capital-close-putting-rs-100cr-resonance-coaching>).

⁶Conversions from Indian Rupee to US Dollar is done at the rate of Rs. 65 to one USD. This value keeps varying on day to day basis.

industrial ‘educational’ service in the centre of capital accumulation and circulation. The chapter explores in-depth the city-state-market-shadow education dynamics that are at play to make Kota a brand,⁹ and give it a unique identity.

24.2 Urban Growth, Transformations, and the Rise of Small Cities

All over the world, the twentieth-century has been the ‘century of urbanization’, declared David Harvey (1996), though it does not mean that urbanization is a phenomenon of only the twentieth-century. What it does mean is that the nature, extent and scale of the process of urbanization had been widespread and different from the urbanization of the past centuries. In the eighteenth and the nineteenth centuries, the urbanization process was restricted to a few newly industrializing countries of Europe, but as Harvey suggests, ‘the latter half of the twentieth century has seen that the localized breach (*of urbanization in Europe*) turned into a universal flood of massive urbanization’ (Harvey 1996: 403) (emphasis added). As Harvey rightly points out, ‘the future of most humanity now lies fundamentally in urbanizing areas’ (ibid). Some countries have more than 50% of their populations living in urban centers and many more are racing towards higher proportions of their populations living in towns, cities and metropolitan areas. Undoubtedly, the world today is ‘experiencing an unprecedented level of urbanization’ (Lipman 2010: 242). The root of this lies, as many had pointed out, in the way financial capital is generated, accumulated, and transferred as a principal driver of capitalist society.

Though there is no consensus or one explanation to understand how capital operates over space and how it affects urban development (Savage et al. 2003), David Harvey (1985a, b, 1996), Henry Lefebvre (1991) provide a useful political economic explanation as to how urban spaces are produced and transformed under capitalism.¹⁰ This framework may help us in understanding what has been happening in the city of Kota, and how it transformed within a period of the past two to three decades. While there may be certain limitations of applying in toto¹¹ the arguments of Harvey and Lefebvre to the case of Kota, they indeed give us a handle to understand, first the process of industrialization in the 1960s, later de-industrialization in the 1980s and 1990s and then the innovation towards the post-industrialized

⁹Some scholars from management may prefer to use the term ‘branding’ to describe particular identities cities acquire over time. An interesting work by Popescu (2012) discusses how cities are branded as educational cities, primarily by taking the growth and location of higher education institutions as part of the branding strategies.

¹⁰The non-Marxist perspectives stress on the temporal explanations, which believe that cities are related to particular stages of historical development. On the other hand, the Marxian perspectives focus on time, money, space and this therefore provides a comprehensive framework to look at the contexts of urban growth.

¹¹Economic reductionism is one such possible limit to the Marxist framework of understanding urban process.

condition in which provision of educational services has been the trigger for accumulation and circulation of capital in the city. Lefebvre (1991) calls this as the process of 'production of urban space'. Cities, including Kota, are thus 'molded by the social and economic processes that occurred in the course of industrialization and the subsequent transition to post-industrial economic activity' (Emden et al. 2006: 11). Education is one such post-industrial and post-manufacturing economic activity that Kota had made as a mark of its identity, which in turn is a result of the onset of neo-liberalism and the globalization of financial capital that pervaded all walks of life, besides the economic systems.

Harvey and Lefebvre seek to understand the urban process essentially as a process of capital accumulation, and class struggles. For Harvey, 'the very existence of money as a mediator of commodity exchange radically transforms and fixes the meanings of space and time in social life and defines limits and imposes necessities upon the shape and form of urbanization' (Harvey 1985a: 1). This is the reason why capitalism, as a system of 'economic order' in which 'production is organized around the search for profit' (Savage et al. 2003: 4), had survived. For Harvey, the urban process is fundamental to both the perpetuation of capital and also to the expression of its inner contradictions. In the case of Kota, it is the capital – state owned or privately owned – that had made it an industrial city and assisted it to grow demographically and spatially. However, the internal contradictions of struggles of labor and the responses of the managements and the state, besides other reasons, led the city towards the path of de-industrialization in the subsequent decades. The production of Kota into an educational city is thus a consequence of what Harvey calls 'urban structuration' (1985a: 273), which occurs at different moments in history of the urban transformations.

In India, the level of urbanization had increased from just 10% in 1901 (Sandhu and Sandhu 2013: 177) to 27.8% in 2001 to 31.1% in 2011 – an increase of 3.3 percentage points during 2001–2011 (Kundu 2013: 154). This proportion is expected to reach 70–75% by 2030, as per the Eleventh Five Year Plan of the Planning Commission (now changed to Niti Ayog) of the Government of India. In 2011, some scholars pointed out that the process of urbanization, measured in terms of the rise of urban agglomerations, has been sluggish, at a rate much lower than the growth of the urban population (Kundu 2013, 2011). The process of urbanization in India is, however, not uniform throughout the country. Some states are ahead of others in the urban growth trajectory. For instance, as Debolina Kundu points out, '.....the economically advanced states more or less show higher levels of urbanization. The states of Punjab, Haryana, Gujarat, Maharashtra, West Bengal and the Southern states of Kerala, Karnataka, and Andhra Pradesh have higher urbanization levels than the national average. States like Himachal Pradesh, Bihar, Assam, Odisha, Uttar Pradesh, Rajasthan, Madhya Pradesh, Chhattisgarh and Jharkhand, exhibit lower level of urbanization than the national average. These are essentially backward states' (2013: 154–55). Further, Sandhu and Sandhu (2013) suggest that this process of urbanization is oriented towards metropolitan and Class I cities. According to them, the metros constituted 26.41% of the total urban population

in 1981, which increased to 37.81 in 2001 (p. 177). Kundu (2007) also supports this argument that the urbanization in India has been large city oriented.

However, the period between 2001 and 2011 witnessed a huge change in terms of the rise of the small towns and urban areas. Scholars examining patterns of urbanization do concede to the point that the number of census towns¹² have increased tremendously (Premi and Das 2011; Kundu 2013; Guin and Das 2015). Guin and Das (2015) call this growth of new census towns as 'startling' and it is indeed so as the number of census towns had increased from mere 1362 in 2001 to 3894 in 2011 (Premi and Das 2011: 93). Further, there has been an expansion and growth of the small cities in India during the past decade or so. And the rise of Kota city from being a small town to a Class I city with a Municipal Corporation or a small city represents one such example.

Annapura Shaw (2007) attributes this growth of urban India since the last decade of the twentieth century to the opening up of the national economy to international trade and competition, which according to her had accelerated the economic growth. In such a context, cities have become especially important as most of the economic reforms such as industrial deregulation and financial and capital markets reforms were focused on the urban sectors of the economy. Shaw notes that 'From the slow changes that characterized the pre-colonial and colonial periods, to the quickening of change that followed independence and gradual modernization, we are now witnessing profound change, particularly in those urban regions of the country that have experienced rapid economic growth. ... Moreover, this change is of a qualitatively different order from that of the past' (Shaw 2007: xxiii).

Nigel Harris (2007) explains the features of this qualitative difference in the way cities have transformed. According to him, globalization has created new city economies and a new agenda of urban management. He argues, cities emerged as 'management or logistic centers for the world economy' (p. 14), and the emerging economy is of course rooted in the spread of service economies all over the world, and in India in particular. Harris enumerates a number of processes that pervaded the Indian cities, which transformed their economies and the societies (2007: 14–16):

1. Opening cities to world economy has restored the idea of cities in continual change.
2. Liberalization, macro-economic reform has not merely opened the city to external competition, it has led to the privatization and restructuring of urban public sector enterprises, and in some cases, the privatization and reorganization of city public services.

¹²According to 2011 Census, areas with a minimum population of 5000; at least 75% of the male main working population of that area is engaged in non-agricultural pursuits; and has a density of population of at least 400 persons per sq. km are designated as Census Towns. Another category is known as statutory towns, which include all places with a municipality, corporation, cantonment board or notified town area committee, etc. These towns are notified under law by the concerned State/Union Territory Government, irrespective of their demographic characteristics.

3. The long term process of de-industrialization – whether the closure or relocation of city based manufacturing – has been accomplished to different degrees in different cities.
4. The information revolution is transforming many city activities in ways which are not easy to anticipate, in some cases, changing non-tradable services (for the local population) into the tradable (for export) ones – for example, health, cultural, higher education services – as well as creating new sectors of activity (for example, information loading and processing, software processing, etc.).

As Harris notes, the above processes do overlap and at times exaggerate their effects as well. It is the fourth point in the list that merits our attention in order to place the context of Kota. As mentioned earlier, Kota had innovated itself into a city that began to rely on the provision of educational services, which help generate economic capital and restructure the city space, that becomes emblematic of the global economic as well as cultural influences. The competition between the cities to make themselves the hubs of some service makes the process much more interesting and produces the urban space as a perfect representation and site of neoliberal function and ideology. Kamat (2011) for example, examines the emergence of Hyderabad as a hub of the global information technology revolution. She in particular makes connections between the growing service industry, education economy, and the production of what she calls a 'new geography and sociality of the city' (Kamat 2011: 188).

Further, neo-liberal capitalism and modernity had also demolished the erstwhile ideas of the colonial town and city as also the post-colonial urban processes. Bhat and Joshi (2013) argue, in the case of Allahabad – a centre of higher learning in the Northern state of Uttar Pradesh - that 'the systematic liquidation of the colonial town and the gradual demise of its cultural elite may not itself constitute sufficient ground for loss and mourning, but...provide us with a vantage point to examine the claims made by the post-colonial state about the planned development of urban India' (p. 219). They further state that, 'it also gives us an opportunity to understand the ways in which contemporary capitalism, driven by ruthless greed and competition, has forced to the brink of extinction forms of colonial modernity' (ibid). It may, however, also be noted that the colonial modernity itself was a product of such ruthless greed which destroyed the rich cultural and traditional identity of the native cityscapes. Thus, this chapter examines the production of Kota as an educational city within this broad theoretical framework and social context. As I will argue in the next section, Kota provides a prime example of the destruction of the rich cultural legacy of the native by the colonial and the post-colonial industrialization, modernity, and urban development.¹³

¹³The colonial urban development in India, Sandhu and Sandhu (2013) note, was mainly in the form of the Presidency or chief provincial cities which emerged along the main railway systems or hill stations.

24.3 Kota City: History, Transformation, Demographic and Spatial Development

24.3.1 *Historical Antecedents of Kota City*

Kota, historically, had been a seat of Royal House and an old kingdom of Kotah in the South Eastern part of Rajasthan, originating from the integration of 22 big and small princely kingdoms at the time of the Independence of India. As Metzger and Singh detail, 'This part of eastern Rajasthan, comprising the old kingdoms of Bundi and Kota, is known as Hadaoti, i.e. the land of Hadas' (Metzger and Singh [undated](#): p. 13). In 1948, the kingdom of Kota covered an area of 5688 miles. Metzger and Singh write, 'though Kota had started as an off-shoot of Bundi in AD 1624, it ultimately superseded its parent in power, economy, and cultural grandeur' (*ibid*). And at the time of the integration of the Indian princely states with the Union of India in 1948, Kota was the fifth largest state of Rajasthan.

Numerous accounts of Kota's history suggest that the city, lying on the banks of the river Chambal, one of the most ancient and non-snow fed perennial rivers of India flowing into Yamuna, had been the main granary of Rajasthan. The climate of Kota is much like the rest of the Northern parts of India, 'with scorching hot summers, delightful cool summers and crispy cold winters' (Metzger and Singh [undated](#): p. 13). There were large tracts of deciduous forests around Kota and the wildlife too was plentiful. This, according to Metzger and Singh, was the case until the early 1950s, till the point that Kota was a princely state and the city was still a royal city. But after 1950s, the habitat of the city of Kota underwent a sea change and it became a centre of cultural, administrative and commercial significance for the villages and small towns in the South-Eastern part of the newly formed state of Rajasthan.

It is important to note that the erstwhile Kota state had an income of USD 0.19 million (roughly Rs. 12.5 million) in 1948 and had left around USD 0.38 million (approximately Rs 25 millions) in cash for the successor Government of Rajasthan in 1950 (Metzger and Singh [undated](#): p. 24). This suggests that the city of Kota had a surplus of revenues, and was in a sound financial condition. The last of the heirs of the Kotah princely states, Sir Bhim Singh II, who was at the helm at the time of the merger of Kota, was made the Deputy Governor of Rajasthan, which he served till 1956. During this tenure, the city of Kota witnessed some developments such as creation of an aerodrome which gave impetus to the modernization, and initiated and explored hydro electric possibilities of the river Chambal, which was subsequently completed and inaugurated in 1960.

24.3.2 *Structuration of Kota as an Industrial Town and Its Decline*

Subsequent to the onset of modernization of the city of Kota in the 1950s and early 1960s, the city underwent a massive process of structuration. Urban structuration, according to Harvey (1985b), occurs mainly along the twin aspects of accumulation and class struggle. This was the case with Kota since the roots of industrialization began to take shape. The infrastructure, water and energy resources, already functioning commercial hub (mainly of Kota Doria sarees and the unique Kota stone¹⁴), and the rail and road connectivity, along with an aerodrome facility, made the city a natural choice for private capital investment and for furthering the interest of capital accumulation. In Marxian terms (Harvey 1985a, b), accumulation is the means whereby the capitalist class, which includes the private entities and the state as a partner and as a representative of the capitalist class, reproduces itself and its domination over labor.

The actual process of industrialization of Kota began in 1961 when several large-scale industrial units were established by private capitalists, and also by the State. In the entire state of Rajasthan, the average size of industrial units measured in terms of fixed capital was significantly higher in Kota than in any other district of the state (Government of India 2006: 95). Prior to 1961, and when the state of Rajasthan was formed in 1950, it may be mentioned, industries such as textile units, existed only at two places, namely, Ajmer (at Beawer) and Kota. The notable large industrial units set up after 1961 were J K Synthetics by private capital, and the Instrumentation Limited (IL) by the Federal State. As of March 31 2000, there were 7560 Small Scale Industrial (SSI) units and 88 non-SSI units in Kota (Government of India 2006: 99). Out of the large industrial units, J K Synthetics (in the private sector) and Instrumentation Limited (IL) (in the public sector) became sick (in the sense that it became a non-performing unit) in the 1980s and subsequently the former was closed down and the latter reduced its operations and closed down major portion of its industrial production.

Despite the collapse of industries that were set up in the initial phase of industrialization of Kota, the city still has some traces of big industries, which are doing fairly well. Instrumentation Limited continues to manufacture pipes though in a limited way, DCM Group has a fertilizer unit (mainly of urea) and a textile plant running successfully, SIMCORE has its glass manufacturing unit, and Chambal Fertilizers and Petrochemicals has its unit in and around the city of Kota. Some of these industries also necessitated production of power and energy, by way of thermal as well as nuclear energy. As mentioned earlier, Kota has been known for its unique stone that is used in house constructions, and the polishing of Kota stone is

¹⁴Kota Doria saree is a textile variety made of hand weaving, a product unique to Kota city, worn by the Indian women. Kota stone is a stone that is found in the surroundings of Kota, mainly used in the housing construction all over the country.

another major industry which is in the category of Small and Medium Scale (SMS) Industries. However, by 1990s, most of these SMS industries, like some of the big firms like JK Synthetics and Instrumentation Limited, went sick or were closed down.

The Rajasthan Development Report explains the Kota situation of the 1980s and 1990s: 'Most of the sick industrial units are mini-cement plants, granite cutting and polishing plants, yarn spinning mills, etc. Their sickness can be attributed to the non-availability or shortage of raw materials and power, though overstaffing and related high establishment costs as well as financial management and labor problems are also factors in some cases' (Government of India 2006: 99). Asghar Ali Engineer (1989) provides another angle to the labor unrest by drawing attention to the communal divide of the labor and the management. He suggests that the emergence of CPM (*Communist Party of India, Marxist*) controlled trade union on the trade union scene had increased the number of strikes and militant trade union actions in Kota, which then brought a hiatus between the capitalist and the working classes. This in turn had altered communal relations within the city due to the fact that Muslims who constituted around 9% of Kota city in 1989 were mostly workers while the employers on the other hand were mostly Hindus. These factors in the context of a town which is largely shaped out of the industrial workforce in the post 1960s era, contributed to the exacerbation of communal as well as industrial relations, thereby creating both social and political fissures within the city society.¹⁵

A senior Director of the State owned Instrumentation Limited, in an interview I conducted, suggested that the politics around the labor unrest were the reasons for the decline of Kota as an industrial city in the 1980s and 1990s, but he had other reasons to suggest for the decline of work culture among the workforce which, according to him, led to a further deterioration of the industrialization process. According to him, the state sided with the political class, which was interested in raising slogans like 'insider – outsider', to invoke and appropriate local and native sentiments into their electoral fortunes. From the workers perspective, by contrast, they blame the state and the firm for not redressing their genuine demands and concerns. The Rajasthan Development Report also makes the observation explicit namely that the state and the central governments have not made any attempts to diagnose the problems of this industrial sickness or work out solutions to improve the subsequent competitiveness of these sick industries.

To elaborate further, the declining work culture among the industrial workforce was, in part, also due to the increasing withdrawal of the state, either through withdrawal from further investments or by way of disinvestments, at the time of the onset of the neoliberal era of the early 1990s. According to some, though the post liberalization era had opened up some opportunities for private capitalists to set up

¹⁵ Kota witnessed communal tensions in 1943, 1953 and 1956 as well. After 1956, it was only in 1989 that the city witnessed communal carnage. Engineer (1989) argues that a large number of Muslim families in Kota had sent at least one of their family members to West Asia and therefore acquired some measure of prosperity, which in turn had deepened the divisions between contending religious communities and their economic and social relations within the city.

new units and firms, the poor work culture of Kota together with the series of lock-outs deterred them from pursuing those goals and promoting Kota as destination for investments. Thus, in a way, the city underwent contradictions of its renewal in the face of a strange social and economic situation, and had to innovate its spatial and economic expansion.¹⁶

The rise of the neoliberal city and the astonishing reproduction of neoliberalism as an ideology all over the world is most vividly and aggressively witnessed after the year 2000. The new ideology has now become a *mantra* of urban development, and the state became a partner in believing in and practicing this *mantra*. Hackworth writes, 'Neoliberalism increasingly came to be seen as a salve for the economic crisis that had emerged with this unraveling' (2007: 9). He defines neoliberalism as an 'ideological rejection of egalitarian liberalism in general and the Keynesian welfare state in particular, combined with a selective return to the ideas of classical liberalism' (ibid). These trends of neoliberal belief systems became naturalized in countries like the United States by the 1990s, as Hackworth argues; but they have also begun to take roots in countries like India, as a popular mode of governance for a variety of geo-institutional contexts. More specifically, the boundaries and policies of urban governance have shifted dramatically due to this shift towards neoliberal governing practices (Hackworth 2007).

24.3.3 Demographic and Spatial Development of Kota

The urban growth trajectory of Kota can be understood better with the help of the demographic change the city had experienced over a period of a century. Table 24.1 provides data from the first census India had enunciated in 1901 till the most recent one, namely, 2011. We find that the population of Kota has grown in almost all the decades except in the first two decades of the twentieth century, namely 1901–1921. The population growth had been steady till the point when the city was under the rule by the Princely State of *Kotah*, and suddenly and steeply increased after it was integrated into the state of Rajasthan, becoming an important centre for commercial and administrative purposes.

¹⁶In spite of this situation, it may however be said that while many cities including Kota have de-industrialized or are in the process of doing so, it does not at all end the significance of manufacturing for cities (Harris 2007). As Harris observes, 'urban areas may lose industry, but often the factories are located in a string of smaller settlements or Greenfield sites up to 100 miles from the city' (2007: 18). Now we have what is called industrial corridors and zones or parks that are designated sometimes too far from any particular cities. These industrial corridors/zones/parks subsequently develop into new townships and urban centers in due course of time. In the case of the state of Rajasthan, an agency called Rajasthan Industrial Infrastructure Corporation (RIICO) oversees such industrial development in the state and marks areas and zones that are called RIICO Industrial Estate, where numerous industries are pooled together and allotted land to start their production and manufacturing units. Kota also has large tracts of land under RIICO that from time to time is allotted and distributed among the investors in the manufacturing sector.

Table 24.1 Population growth, Kota city (1901–2011)

Year	Total population	Rate of growth
1901	33,657	0
1911	32,753	-2.686
1921	31,707	-3.194
1931	37,876	19.456
1941	47,339	24.984
1951	65,107	37.534
1961	120,345	84.842
1971	212,991	76.984
1981	358,241	68.195
1991	537,371	50.003
2001	694,316	29.206
2011	1,001,694	44.271

Fig. 24.1 Decadal growth rate (in %) – 1901–2011

The total population increase almost double in the decades of 1951–1961, and 1961–1971, the period when the modernization and industrialization of Kota began. The population increase was sustained until 1981, after which sharp declines in the real numbers and also the rate of growth are witnessed. The decade of 1991–2001 has been the worst as it saw the culmination of what I have discussed as the de-industrialization of Kota. The decade of 2001–2011, however, reversed the declining rate of growth of population of the city. The Fig. 24.1 shows that the population growth rate had taken an up-turn post 2001 and it is this first decade of the new century that marked a distinct phase of restructuring of the city.

What is peculiar about Kota’s urban spatial restructuring is that within one decade (2001–2011), the city’s area had more than doubled (from 221.36 to 527.03 km²), registering a growth of about 138 % (Table 24.2). The total number of households and population had also witnessed a significant jump. However, the population density has fallen significantly (from 3137 to 1901). This suggests

Table 24.2 Physical and demographic expansion of the city (2001–2011)

Year	Area (km ²)	%Growth (area ²)	Total households	Total population of the city	Population density per km ²
2001	221.36		130,266	694,316	3137
2011	527.03	138.46	210,135	1,001,694	1901

clearly the urban sprawl during the period 2001–2011 and the reshaping of the city from being a thickly concentrated habitation to unevenly spread urban geography. It also means that the city has been undergoing 'poly-centric urbanization',¹⁷ but not a random development of the city (Hackworth 2007: 85). Garnett (2010) suggests that this happens when, what he calls 'successful cities' become home to a 'growing upper class and a large, although slightly declining lower class' (p. 211). These conurbations are developed by the city in order to diversify its economic activities as well as the residential concentrations. This phenomenon, as Hackworth (2007) notes, is the hallmark of a neoliberal city.

The expansion of the urban sprawl of Kota city and its declining population density during 2001–2011 suggests that the city has begun to acquire the characteristics of a 'neoliberal city' during this period. The development of the city has now moved from what was regarded as 'core' or 'old' or 'quintessential' or 'traditional' a couple of decades ago to what is regarded today as 'industrial' or the 'happening' or the 'modern' city. This transition cannot, however, be solely attributed to the onset of the neoliberal era, but its origins can be attributed to the phase of industrialization of the city in the past. What is new in the development of the city in the neoliberal era is that it had redrawn the cityscape beyond the original boundaries of the industrial township areas of Kota.

It may be pointed out that the old city of Kota was built within the walled areas around the Royal Fort, along the banks of Chambal, which even today is inhabited by generations of native inhabitants of Kota. The population grew with the modernization of the city, increasing rail and road connectivity with the major cities of the country like Delhi, Mumbai, and Jaipur, establishment of electricity generating power stations, etc., and the accompanying employment opportunities, which required the city to expand and extend beyond the old walled city of Kota. The initial areas that were developed in Kota, as it moved out of the walled spaces, are Bhim Ganj, Gumanpura, Jheel ki Nagri, Burj Vilas, Nayapura and Kheriwal. The building of a barrage on Chambal, called the Gandhisagar bridge, in 1961, was a watershed in the urban growth story of Kota. In the North West part of the city, for the first time, an industrial zone was created, and later on the Southern parts, along the Jhalawar road, another zone of industrial development was marked with the setting up of Instrumentation Limited (IL). IL developed its own township alongside the industrial plant and this area then became the growth engine for the city of Kota

¹⁷ It means that the centre does not rely on one core centre, but on many such areas as the city moves outward from the centre.

Table 24.3 School infrastructure in Kota city (Census 2011)

Primary schools (numbers)		Middle schools (numbers)		Secondary (numbers)		Sr. secondary (numbers)	
Govt.	Private	Govt.	Private	Govt.	Private	Govt.	Private
87	221	87	221	78	221	42	157

in years to come. The Master Plan¹⁸ of Kota city (2001–2023) suggests that the city could not expand in the West due to the prevalence of the river Chambal.

The tremendous growth in population of the city during 1961–1991 required the city planners to make more serious attempts to plan a more structured approach to the development of its urban regions. The growth has also made planners to develop Kota as, what the Master Plan (2001–2013) calls, a ‘counter magnet city’ to the national capital of Delhi. As a first step, the Urban Improvement Trust (UIT)¹⁹ of Kota acquired around 2500 acres of land from the Forest Department and along with the areas that were converged as part of the Master Plan of 1971–1991, in order to expand and delimit the urban areas of the city (Government of Rajasthan, undated: 3).

Residential, industrial, and institutional areas were then marked in the zone of Jhalawar Road and the Rawatbhata Road, where already the major industrial establishment of Kota, namely, Instrumentation Limited and its township are located. In the same zone, a medical college and an Open University were opened making that part of the city ‘educational’. However, this connotation is applied to the entire city subsequently as a result of the coaching and shadow education industry boom in the post 2000s, which is discussed in detail in the next section. But, at that stage of development in the 1980s and 1990s, in the newer areas of urban sprawl, numerous schools at the primary, middle and secondary stage were also set up.

Table 24.3 provides a glimpse of the schooling infrastructure in the Kota city. As per the 2011 Census, there were 87 schools each run by the government, and another 221 each run by the private sector at the primary and middle levels of schooling respectively. There were 78 government and 221 private schools respectively in secondary education, and about 42 government and 157 private schools offered education at the senior secondary level.

However, it is argued by many in the city that most of the senior secondary schools that came up in Kota are in fact serving as what they call as ‘dummy’ or ‘shadow’ to the shadow education institutions. In other words, ‘regular’ or ‘mainstream’ schooling has now become ‘dummy’ to the ‘coaching’ or ‘tuition’ or ‘shadow’ industry in Kota. These schools are used as ‘shadow’ to the shadow education to make it possible for students to enroll and appear in the qualifying school

¹⁸This was the second Master Plan of the City. The first one was prepared in the year 1971 and it converged 50 Revenue Villages to expand the city limits. The urban planning of Kota was based on the population estimates for the period 1971–1991.

¹⁹UIT is the agency responsible for town planning in Kota.

leaving examination²⁰ for any entrance test to engineering or medicine courses in higher education. The next section discusses the evolution of 'New' Kota as a shadow education hub, and how coaching and shadow education industry had indeed shaped spatial dynamics of the city.

24.4 Emergence of 'New' Kota as a Shadow Education Hub

The shape, form and structure of the city changed drastically towards the close of the century and in the first few years of the new century. This change, interestingly, began with the success story of an engineer-turned-teacher-turned-education capitalist, called V K Bansal, who had to leave his job at J K Synthetics, a chemical firm producing nylon, which became a sick unit and subsequently closed down in 1983. Bansal's problem was not with the closure of his firm, but with the Muscular Dystrophy that hit him in the early years of his joining J K Synthetics: he had earned a bachelor's degree in mechanical engineering from Benares Hindu University. Bansal, a native of Jhansi in Uttar Pradesh, had to look for new ways to fend for his livelihood and found teaching as the most convenient vocation for himself. One account suggests that he was advised by the doctor examining him to make teaching an occupation as he was wheel chair bound due to Muscular Dystrophy. It is an undisputed fact that Bansal's venture into private tuition was the corner stone of the revival of Kota – from the slumber industrial sickness, closures and lock-outs, and social and communal tensions brought upon the city in the 1980s and early 1990s.

Bansal recounts in one of the interviews he gave to an educational network called PaGaLGuY²¹: 'I wasted no time in taking the teaching suggestion seriously and hunted for students.I used to go to the play grounds in the J K Synthetics housing colony where I stayed and found children to tutor. Those days, tuitions were still a novel thing'.²² He stated further in that interview that he did not start tuition classes for making money at that point in time, but had seen it as a route to survival. It is interesting to note his humble beginnings. In his own words: 'I always loved teaching and loved learning too. I have studied under street lamps because my family could not afford electricity back home in Jhansi.I know the value of education and what it takes to get a good education'.

Mathematics was the subject which Bansal taught to a small group of students in the neighborhood initially. Punit Pandey, a 48 year old Executive Vice-President of a firm today, a child next door in the J K Synthetics colony then, was said to be

²⁰Namely, 10+2/Intermediate Board Examinations of either the Central Board of Secondary Education (CBSE) of Government of India or the Board of School Education of Government of Rajasthan.

²¹PaGaLGuY is a pioneer in producing massive online educational communities to cater to the coaching needs of various aspirants – management, engineering, medicine and other competitive examinations.

²²www.pagalguys.com, accessed on 15/8/2015, at 11.55 am.

Bansal's first student as a child of 12 years. Bansal is said to have tutored first at Punit's residence but as the Muscular Dystrophy progressed and became severe, the classes were shifted to Bansal's residence. Punit recalls, 'It was an informal atmosphere..... But uncle Bansal was strict when it came to teaching us'.²³ Slowly, the strength of the students increased and more and more students sought private tuition from Bansal to supplement their everyday learning in the regular school these students attended. Most of the students were from the same residential colony where Bansal lived in Kota, namely, J K Synthetics housing colony.

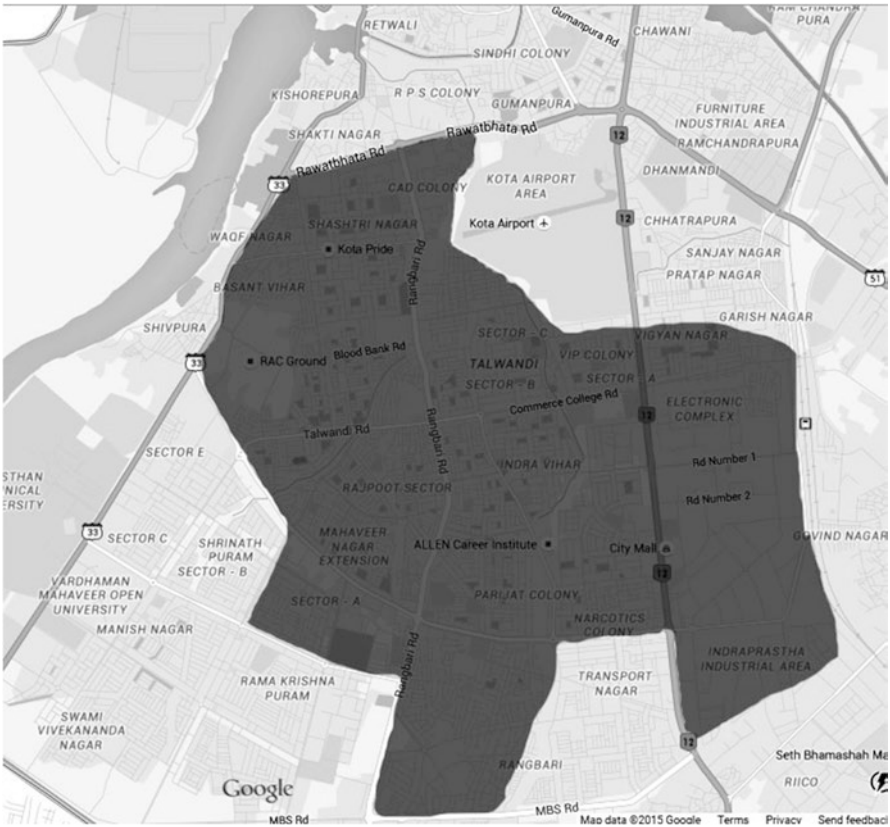

Once the industrial unit of J K Synthetics was closed due to what was said to be disruptions by the labor unions and loss making, Bansal, along with two of his colleagues, who were engineers and scientists like him and who had lost their jobs to the lock-out, started full-fledged tuition and coaching classes. This culminated in the setting up of M/S Bansal Classes as a private limited company.²⁴ What began as an informal tuition centre has now become a full-fledged business and commercial venture. As the numbers of students seeking coaching and the aspirations of the founders of Bansal Classes grew, the parent institute Bansal Classes split and both the partners who joined Bansal initially went their ways and set up their own coaching institutes as companies or partnership firms.

Today, as per the records of the District Administration, there are around 130 registered coaching institutes in Kota. This number is a gross understatement as many more hundreds of coaching institutes thrive without any sort of registration or formal licensing. They function as unorganized business entities (in other words as teaching shops) in the city. If we take into account the individual teachers who independently provide tuitions in their area of expertise in a particular subject, then the number of such entities is enormous.

Most of these institutes and tuition centers are located in the length and breadth of the city of Kota, but heavily concentrated in what is now, in popular parlance, called 'New' Kota, namely the areas in the South of the city, along the Rawatbhata and Jhalawar Roads and around the industrial township of IL (Map 24.1). Some of the popular and densely situated areas for shadow education, to list a few, are Talwandi, Indra Vihar, Vigyan Nagar, Jawan Nagar, Jawahar Nagar, Mahavir Nagar Phases I, II and III, Indira Nagar, Rajiv Gandhi Nagar, Ladpura, Dadabari, Vallabhbari, Dadwara, Gulabbari, Shastri Nagar, Teachers' Colony, Nayapura, Jhalawar Road, Garden Road, New Post office Road, etc. Most of these areas developed in response to and with the demand from the growing shadow education boom which began to shape the urban land use and town planning policies, and measures which are discussed in the next section. However, it is important to stress that this expansion of shadow education areas in the new city of Kota made it characterized as an 'educational city'. The State agencies, the media, the public at-large in Kota designate their city today as 'educational' (a reflection of this can be seen in Plate 24.1)

²³ www.pagalgu.com, accessed on 15/8/2015, at 10 am.

²⁴ M/S Bansal Classes was registered subsequently with the Sales and Commercial Tax Department of Kota with the registration number 102/Kota/ST/CTC/2003.

Plate 24.1 Welcome board on the road highway at an entrance to the city

24.5 City Re-structuring Through Shadow Education Economy

It is important to see how Kota became a hub for shadow education, and how the creation of infrastructure for this shadow education facilitated this development. First, when the successes in coaching centers occurred in the mid 1980s onwards, beginning at Bansal's tuition, and the first success stories reported the cracking of the toughest entrance examinations in the world by any means, namely, Indian Institute of Technology – Joint Entrance Examination, popularly known as IIT-JEE²⁵ - it caught the imagination of the middle classes of Kota. Subsequently, the number of students began to increase at his tuition center. Initially, Bansal Classes catered to local Kota students, but from 1994 the doors of Bansal Classes were opened for those coming from outside the city as well: students came mainly from the neighboring small towns such as Ganga Nagar, Sawai Madhopur, and little distant Jaipur, Indore, etc.

The shadow education hub in Kota began with the coaching of students for IITs first, but soon it incorporated the coaching for entrance examinations for prestigious institutes in the medical field, such as the All India Institute of Medical Sciences, etc. The Allen Coaching Institute, which currently is said to be the largest institute in Kota with around 80,000 students, started coaching not just for IIT-JEE, but for the medical entrance examinations as well. This shift made it a pioneer in producing largest number of successful candidates in medical admission tests across the country.

To give a sense of the successes in the IIT entrance examination, Table 24.4, details the increasing numbers of students enrolled and the successes achieved in one institute, namely Bansal Classes. The numbers are given for the entire period from the beginning of the individual and unorganized coaching by Mr. Bansal, through the establishment of the organized firm, Bansal Classes Private Limited, and beyond.

What we see from Table 24.4 is that the institute had not just grabbed a number of selections year after year, but it did claim top positions in the entrance examination. The performance of the institutions in Kota in IIT – JEE in the year 2015 reveals that the Kota story, not just that of the Bansal Classes is outstanding (see Table. 24.5²⁶).

²⁵ It must be mentioned that IIT-JEE facilitates entry of students into globally reputed brand of IITs, which became more popular in the aftermath of the era of neoliberal reforms and globalization as this most talented pool of skilled workforce made Silicon Valley in the United States what it is today.

²⁶ The data is culled out from the claims made by the Institutes in their Media advertisements and the number may include those who underwent regular classroom as well as distance learning modules. Therefore, there can be repetitions of names in more than one institute. For instance, a candidate may attend regular class coaching in one institute and may get enrolled for distance mode in another. These are common practices in Kota and also other parts of the country. So, it is difficult to ascertain which selection is to be counted from which institute.

Table 24.4 Total enrolled and selected for IIT – JEE (1997–2012), at Bansal Classes

Year	Number of students enrolled (approximately)	Total selections	Ranks in top 100
1997	200	101	4th, 6th, 23rd
1998	300	156	5th, 42nd, 48th
1999	400	209	10th, 14th, 17th
2000	600	279	1st, 2nd, 7th
2001	700	342	2nd, 3rd, 12th
2002	950	479	1st, 2nd, 8th
2003	1200	611	3rd, 5th, 10th
2004	1800	827	3rd, 7th, 9th
2005	1960	784	3rd, 4th, 7th
2006	2400	955	2nd, 3rd, 11th
2007	6100	1538	1st, 2nd, 5th
2008	7350	1609	1st, 3rd, 7th
2009	9000	2175	2nd, 7th, 10th
2010	9800	2204	23rd, 28th, 35th
2011	8600	2122	16th, 40th, 41st
2012	6600	1657	17th, 29th, 37th

Source: www.itbhuglobal.org/chronicle/VKB-PROFILE.pdf; accessed on 22/8/2015

Table 24.5 Total number of those eligible for admission in IITs after clearing IIT – JEE (Advanced) from six major shadow education centers of Kota in the year 2015

Institute	Total number of those eligible for admission into an IIT	Total number of ranks in the top 100
Bansal	930	4
Resonance Edu Ventures Pvt. Ltd	3955	3
Allen Career Coaching Institute	2361	14
Vibrant Academy	1250	10
Career Point Coaching Institute	937	2
Motion Education Pvt. Ltd.	578	3
Total	10,011	36

It is important to note that the total selections of 10,011 from just six institutes in Kota make up around 35% of the total number (26,456) of those eligible for admission in IITs from across the country, for 2015. If we take other institutes in Kota and their number of candidates who were successful, the proportion make up close to 50%. This is what makes Kota the hub for shadow education first and foremost in India.

Second, in the mid 1990s, Delhi was the destination for aspirants of IIT-JEE and medical entrance examinations in North India. Living in the city of Delhi, however,

was very costly and was out of reach for the middle and the lower middle classes from small towns and cities in the Northern states of Rajasthan, Madhya Pradesh, Uttar Pradesh, Haryana, Punjab, Bihar, Chhattisgarh and Jharkhand. The increasing number of those who cracked the IIT-JEE at Kota offered middle and lower middle class parents another option for their children to enter into the prestigious institutions of higher education. By the year 2000, the numbers seeking entry into IITs all over India grew, and it became increasingly necessary for these aspirants to undergo tuition and coaching, without which it was believed that cracking a tough and highly competitive examination like IIT-JEE was next to impossible. That means, by the year 2000 or so, coaching or shadow education became a necessary and even essential activity for the regular students if they wished to make it big in their higher education aspirations and occupational life.

Third, Kota, except for the year 1989, was a largely peaceful and affordable city for the small town parents seeking a better future for their children. Moreover, the Kota town of the 1990s was so much cheaper in terms of accommodation and rentals, and was well connected to the main cities of India through a very busy network of railways and road highways. Added to this was the prospect of the town being a 'sleepy' small town, which had many facilities, and yet not affected by the changing cultures, life-styles, values and distractions that may divert the academic attention of the aspiring young minds.

Fourth, Kota provided an alternative to the shadow education model of Andhra Pradesh, from where even today a large number of students get selected to the elite institutions. The coaching at towns and cities in Andhra Pradesh, such as Guntur, Nellore, Vijayawada, Visakhapatnam and Hyderabad, was far from the homes for the 15–18 year old students. Furthermore, these places in Andhra Pradesh were culturally, particularly in terms of food habits, very different, making life of those children who went there difficult to survive: many found this a difficult transition and were forced to leave their courses midway. Such dislocations had led some parents to seriously think and avoid further problems or disruption in the education of their ward. For all such parents, the emergence of Kota as a shadow education hub was a 'blessing', as some parents put it, and it is this that made them to opt for the city. Now their children need not undergo cultural shocks as they know the language of the town of Kota, they can eat what they normally eat at their homes, and most importantly they are not too far from their home towns. In other words, the 'ambience' in Kota was just right for children and their parents from the North of India, making it the ultimate 'destination' or 'hub' for shadow education.

The shadow education boom in the city brought with it a huge demand for a new build environment, which in turn changed the nature of the urban infrastructure and economic activity in Kota. Every year, thousands of students arrive in Kota and the city is required to accommodate them at least for 2 years, if not more.²⁷ The statistics are astounding: Every year, something like 70,000–100,000 students arrive in

²⁷A student arrives in Kota after completing his/her Class X and lives in the city for next 2 years to undergo coaching. Student stays for more than 2 years, if he/she does not make it within those 2 years.

Kota city for shadow education. Another 70,000–100,000 students would have already been in the city who are into their second and third years of stay in the city: it takes 2–3 complete years of preparation and coaching, to try their 'destiny' through the examinations. That means, close to 150,000–200,000 students live in the city during the period of April of a year, when the fresh classes begin, to the month of March next year when they complete the annual cycle.²⁸ The city and the institutes need to ready classroom spaces, provide accommodation and other ancillary services to enable students to stay comfortably and focus on study.²⁹

All this means that there are avenues for income generation, additional labor inflow and employment market to accommodate such organized as well as unorganized employment. To give an example, on a conservative estimate, bicycle³⁰ sales have surged from just a few years ago. This also placed a high demand for bicycle repair and accessory shops, further adding to the employment of an unorganized kind. There are also examples of those who were earlier working as domestic maids who have left their jobs and set up a service to deliver boxed lunches and dinners to the students in their rented rooms and hostels. Some have also set up mobile eateries to cater to the taste buds of the young students on the road-side *en route* to their hostels and coaching institutes.

All of these services noted in Table 24.6 require built-in space and human resources, which made a boom in the real estate industry, and also led to migrations of different kinds of human resources into the city of Kota. New residential areas appeared across the city, and along with them the commercial zones also got set up triggering the further expansion of the support services for the shadow education

²⁸ Usually admissions to the shadow education institutes take place around April of any year as it marks the beginning of the academic year.

²⁹ A student typically shells out anywhere around Rs. 60,000–100,000 as tuition fees to the coaching institute; anywhere from Rs. 24,000 to even Rs. 360,000 (depending on the luxuries offered and sought) towards the room/hostel rent; and another Rs. 50,000–100,000 on food/boarding; somewhere around Rs. 20,000–30,000 on stationary, travel and other miscellaneous expenditure. That means a student and his family spends anywhere between Rs. 300,000–500,000 on an average or even more per annum depending on one's affordability and nature and type of coaching and accommodation and facilities sought.

³⁰ Bicycles are the primary mode of transportation for students from their residential accommodation to the coaching institutes in the city. The opinion on surging sales of bicycles in the city was expressed by the bicycle shop-keepers themselves.

Plate 24.2 Location of shadow educational infrastructure in the industrial areas of Kota

industry. This expansion obviously went hand in hand with the actual infrastructure for the coaching institutions themselves. The institutes had to ready teaching-learning spaces to accommodate such large number of students. For example, the largest institute in terms of student strength in Kota, the Allen Coaching Institute, which currently has an approximate strength of 80,000–100,000 as of December 2014, projects a growth of 200,000 by the year 2020, built huge buildings in the new Kota city. As of now, they have 11 multi-storey buildings: each of these buildings is given unique names such as *Samanvay* (coordination), *Sankalp* (Determination), *Samarth* (Ability), *Safalya* (Success), *Sabal* (Empowered), *Savinay* (Respect), *Sanskar* (Value), *Sadhya* (Possibility), *Samayik* (Contemporary), *Sarokar* (Interest) and *Saddh* (Aim).³¹ All of these purpose built spaces for teaching-learning-administration for Allen are spread across the new Kota city space.

What is most intriguing about this story of the transformation of the city through shadow education infrastructure is the way the State and its agencies accommodated the demands generated by the burgeoning education capital. There are two ways in which land was acquired by the shadow education industry in Kota. First, huge unused land previously occupied by the public sector manufacturing industry, the Instrumentation Limited, was transferred to the provincial government who owned the Rajasthan Industrial Infrastructure Corporation (RIICO), which in turn made allotments to the coaching institutes as commercial organizations (Plate 24.2).³²

Some parts of the land were transferred to the Urban Improvement Trust (UIT), which holds the key to the growth and planning of the city of Kota. UIT in turn

³¹One can see the very idea of physical space is symbolized by a particular trait/virtue a student is expected to imbibe and internalize in order to succeed in the competitive examinations.

³²This conversion helped IL in mitigating some of the problems that arose due to its sick-condition. By transferring excess land to RIICO and UIT, IL earned some financial capital that allowed the firm to sustain.

redistributed the land acquired from IL and RIICO among the private individuals for residential purposes. That means, simultaneously, the growth of commercial educational spaces for the shadow education industry as well as the private residential colonies was facilitated in the post 2000, which as I've detailed triggered the unprecedented expansion of the city. The residential areas primarily served as hostels, paying guest accommodations, small shops, restaurants, and mess facilities: this land also served as residential colonies for parents who migrated to Kota to get their ward admitted to these institutes for coaching.

Second, UIT had changed the previous policy of not allowing commercial activities in residential areas. As a result of this new and more relaxed policy, residential accommodation is hired out to students, tuition centers and other ancillary service providers which in turn supports the shadow education economy of the city. This move has also facilitated economic returns for the families living in the new city. Many of the employees of the IL have bought plots of land and converted them into hostel accommodations for students, thereby generating additional avenues for income to their otherwise meager salaries.³³ This also triggered further investments of these families into the real estate boom of the city, which in turn had generated demand for built-in space and creation of new residential colonies in and around the shadow education hub of New Kota.

Third, the real estate boom led to the conversion of agricultural land on the fringes of New Kota into commercial and residential areas to accommodate the increasing demand for built-in space. This pushed the geographic boundaries of the city further and further out making it a centre of investment primarily to make profits through the educational and allied infrastructure. It is also worth noting that there have been instances where the coaching institutes triggered development of new residential areas in some sub-urban areas of the city as well. For instance, Allen Coaching Institute opened a new campus in Kunhari, about 15 km from the main city centre, and this has triggered growth of Kunhari as another hub for shadow education in the city besides the South of the city that has already made its mark as an educational hub (Plate 24.3). The real estate firms now market their products in the name of the burgeoning shadow education industry in the vicinity. For instance, I approached a real estate company as a potential buyer and found that the entire marketing of the housing flats is in terms of how a flat in their residential project would bring about returns through rentals to students.

Thus, the emergence of Kota as an educational hub has clearly made the city restructure itself spatially. The characterization of the city as 'educational' from being 'industrial' is now complete. As one respondent put it, the whole city is now like a university campus and there are only movements of students in these new city spaces: the presence of students has served to regenerate the social and economic

³³In all the areas mentioned above, the flat/house owners prefer to give their houses on rent to students than to families as it would offer them bigger profits. A small room in a flat or a house costs anywhere from Rs. 2000–15,000 depending on the kind of facilities offered. A house with five rooms of space can yield something like Rs. 30,000–60,000, which otherwise would only Rs. 5000–10,000 maximum, if it is offered to families instead of students.

Plate 24.3 Construction under way in a new Real Estate Hotspot, Kunhari (Proposed Site for construction of a new Infrastructure by Allen Coaching Institute)

life in the city of Kota, which was once doomed due to de-industrialization. The popular image of Kota city has been re-structured and reformulated, and its sprawl clearly is rooted in the educational economy.

24.5.1 Impact of Education Capital Generated in Kota on Other Small Towns

The transformation of Kota as a shadow education hub did not remain restricted to Kota only. While the economic transformation of the city changed the value of the land, the demand for land, and the very nature of land transfers between the state institutions and the citizens of the city and outsiders to the city, it did serve as a potential model to be replicated elsewhere by the flight of education capital from the city or into the city. Those who seek to appropriate land found the growth of the education economy as a promise for future capital accumulation as well as reinvestment. The education capitalists of Kota have reinvested the surplus at their disposal in spreading their brands across India, and also by way of selling franchise of their brands to prospective investors in other parts of India. The economics of capital accumulation in Kota now travel to other small towns and begin to transform those urban spaces as well, making them sub-regional hubs for the shadow education economy. Now, those students and families who cannot afford living in Kota are served with Kota brands of the shadow education in their own small towns.

Bansal Classes Private Limited today has branches in 17 towns and cities, besides Kota, spread across 9 states of North India. In their business promotions, Bansals claim that the shadow education sector is 'recession free' and that one can get 'excellent returns on one's investment', with what they call 'satisfaction of serving the society'. The marketing of Kota brands such as Bansals' can be better under-

stood with what they claim in their effort to seek more franchises³⁴: “For 27 years backed by trust of 113,000 students, the group has forayed into.....”. This emphasis on gaining the trust of 113,000 students is a crucial marketing strategy to sell the brand. Besides, it is claimed that shadow education economy is not affected by business cycles. The growing market and the least risks involved unlike those involved in manufacturing economy add to the advertising strategy of the education capital. Further, in the education economy there is said to be no stress of recovery or loss of revenue, which helps selling the brands to educational investors from within the country as well as from among the multinationals interested in investing in shadow education economy of Kota. These strategies and dynamics of the educational market emanating from Kota work to transform the ideas of urban space and sprawl: going by what is already known by the way the small towns and cities, such as Patna, Jaipur, Aurangabad, Meerut, Agra, Bhubaneswar, etc., have transformed as centers of shadow education sub-regionally in the recent past, triggering urban sprawl in those urban centers as well. Thus, the working of the education economy in this sense is no different from the working of the financial economy. It is different in the sense that its spread is guaranteed as the demand for shadow education is ever increasing, and the sector appears to be ‘risk’ or ‘recession’ free. Though it is never recognized by the state as a potential driver of economic as well as spatial growth in urban India, and in the absence of any regulation of the sector by the state, this shadow education economy is bound to produce many more educational cities across India.

24.6 Concluding Remarks

This chapter presented how urban sprawl and restructuring of space is produced as a result of the rise of a post-industrial education economy of shadow education. As we have seen, and finding concurrence with what Lefebvre argued in his work on ‘production of space’, the urban space of Kota is structured in different periods in history depending on how different social as well as political-economic forces shaped that urban space. According to Lefebvre space takes on, ‘within the present mode of production, a sort of reality of its own, a reality clearly distinct from, yet much like, those assumed in the same global process by commodities, money and capital’ (Lefebvre 1991: 26). Though this claim may appear paradoxical, as is also acknowledged by Lefebvre, the case of urban transformation of Kota does present a curious case that makes this paradox look real. The chapter provided evidence to show that the space thus produced also serves as a ‘tool of thought and action, that in addition to being a means of production it is also a means of control, hence

³⁴The expected investment for franchise is Rs. 2.5–5 million, which includes the Franchise fees and faculty training. The total capital investment required is something like Rs. 5 million, which includes rental advance, furniture and fixtures, advertisements and promotional activities, interiors, signages, start-up events, power back up, etc. The typical built-in space requirement is 4000–5000 ft² and the premises shall be semi-commercial/residential with ample parking space, etc.

of domination, of power' (ibid). The state and its agencies contribute to the production and reproduction of the urban space, but they fail to control it beyond a point as the forces of the market takeover and exert 'uncontrollable autonomy' in matters of spatial sprawl. In the case of Kota, this has precisely happened and, as the chapter has argued, education capital had taken over further spiraling the growth in the city space, leaving the state and its agencies to follow rather than to control particular models of growth³⁵: such an outcome may, over time, distort the actual Vision/Plan.

What the chapter also sought to demonstrate, with the help of the case of Kota, is how cities undergo struggles of various kinds – social, political, cultural and economic, which then lead them to innovate their urban spaces (Lefebvre 1996; Harvey 1985a, b, 1996; Bridge and Watson 2000). Single factors or combinations of these struggles produce a variety of innovations for the cities to restructure themselves in particular ways, which in turn may produce newer kinds of struggles between the social relationships, labor processes, capital accumulation, state, and the very urban public itself. As Harvey (1996) points out, each bundle of innovations has allowed a radical shift in the way space is organized and therefore opened up radically new possibilities for the urban process. In the case of Kota, over the past two decades, the education economy in general, and the shadow education economy in particular, has become integral to these struggles and innovations. It is important to see how production and the culmination of a particular urban restructuring and innovation process result in shifts in the way city of Kota experienced changes in its social and cultural realms, and how these changes, in turn, open up new vistas for further possibilities for urban innovation in the future. Further, it remains to be seen how long the bubble of shadow education will continue to trigger urban sprawl and innovation in Kota city, and when it would seek to transcend to another stage in the global as well as local economic transformation. It is likely, as many education capitalists of Kota believe, that since it is 'recession and risk free', the bubble may never burst, but rather acquire proportions that may trigger similar urban transformations across the country: it is argued that it may even travel to other Asian and African societies where shadow education indeed flourishes – a possibility which the chapter indeed brought forth in unambiguous terms.

Chapter 25

On the Margins of ‘Opportunity’: Urbanisation and Education in Delhi’s Metropolitan Fringe

Radhika Menon

25.1 Introduction

In the last few decades India has been going through a rapid rural-urban shift. While 32% of the total population already live in the urban areas, by 2050 it is expected to go up to 50% of all population. Most of this growth is still accommodated in the existing cities that have witnessed increasing density of inhabitation. In addition, there also has been territorial expansion of the cities as new urban agglomerations came up at the periphery of the city. The National Capital Region (NCR) of Delhi, has been at the forefront of India’s urban shifts. Delhi became the second most populous urban agglomeration in the world, after Tokyo, in 2014. The NCR has a population of 25 million (United Nations, Department of Economic and Social Affairs, Population Division 2014), and estimates suggest that by 2030, this is likely to grow up to 36 million. With a heavy population density (11,297 persons per sq. km. as per Census of India 2011) and growing urban agglomerations in the National Capital Region, Delhi has become an important site of urban shifts and imaginations.

Delhi as a city dates back several centuries and it has been what Lefebvre (2003, p. 8) calls a ‘political city’, with its share of kings, princes, warriors, artisans and wandering merchants. The colonial government also maintained its political headquarters in Delhi for 36 years. In the post-Independence period, it retained its position as the national capital, thus encouraging both national and international institutions to establish offices here. While this initiated infrastructural growth, the significant push has come from the country’s urban centric growth and planning

Urbanisation as opportunity continues to be a normative question in India and it is put here in quotes to highlight the peculiar meanings that opportunity assumes in the urban fringe.

R. Menon (✉)

Mata Sundri College, University of Delhi, Mata Sundri Lane, New Delhi 110002, India
e-mail: radhikamenon1@gmail.com

(Nath 2007, p. 21). Industrial growth around the city led to new urban agglomerations as public facilities and markets of the political city were proximal (p. 9). This led to the colonisation of rural areas on the periphery of the city, and emergence of several townships, an urban categorisation based more on population rather than public facilities or administrative structures. In India, for that matter, of the 7935 recognised towns (Census 2011), as many as 3894 are Census towns, based on density of population, non-agricultural occupations, and a population strength of 5000 and above (Census of India 2004). The National Capital Region of Delhi and its urban agglomerations hence follow this national pattern. Many of Delhi's Census towns are spread across four states and part of its extended urban fringe.

The urban fringe has been characterised as a dynamic space (Pryor 1968; Nath 2007), with a significant increase in population density; change in land-use, employment, utility services; and social orientation (Rao et al. 1991; Dahiya and Thakur 2007; Yadav 1987). The fringe was earlier understood as a rural area whose residents were rooted in the village but participated in the economic and political activities of the city (Rao et al. 1991, p. 392). A recent commentary however observes an all India phenomena of rurbanisation, where rural people are increasingly involved in urban occupations, that leads to a change in consumption patterns and increased access to urban amenities that eventually leads them towards an urban future and imagination (Gupta 2015). Around the larger cities of Delhi, Navi Mumbai, Bengaluru however, the changes have been far more rapid, and is not restricted to participation in the city. The traditional village landscape has transformed and the agricultural economy now assumes only a marginal role with majority of its population engaged in urban work. Moreover, a crucial feature of the fringe is the inward migration from other rural areas, along with outward migration from the city centre (Desai and Sengupta 1987, p. 208).

Delhi and its census towns at the periphery, are attractive destinations that offer political, economic, social and educational opportunities. In the past, there have been periods of a sudden spurt in population that have led to the city's expansion and growth of census towns. The first such transition in post Independence period was in 1947 at the time of the Partition of the sub-continent, when politically displaced people came as refugees and settled in the city. Later on, between 1981–1991, the city's population rate increased by 51.45%, as workers were brought into the city from various north Indian states to build infrastructure for Asian Games (1982). Many of them stayed back in Delhi or returned to it with their families. While population growth has declined in recent years, at 20.96% (Census of India 2011) it is still significant as people continue to move in search of livelihood and economic reasons (NCPRB 2012), pushing the boundary of the city wider. As in other developing countries, migration to Delhi is associated with pull-in factors such as hopes for higher incomes, livelihood options, availability of public services and better living conditions. In addition there are also push out factors such as low agricultural productivity in the villages (Dudwick et al. 2011). For people involved in this urban shift even when it is to the city's periphery, Delhi's numerous schools and colleges suggest educational opportunities, while the manufacturing sector in the urban agglomerations, the large state sector of the 'political city', the unorganised

and private service sector offer possibilities for employment. Together they provide a possible landscape for individual and social mobility.

The urbanisation of the city's rural periphery, the re-designation of its population as residents of Census towns and the opportunities for mobility provide a critical site for investigating urban educational opportunity and social mobility. This paper, looks at one such dynamic urban fringe of Delhi, to examine the social-spatial distribution of educational opportunity and the possibilities for individual and social mobility. It is based on the understanding that formal education is a non-negotiable in the urban shift towards non-agricultural occupations and expectations of security, better living conditions and higher incomes. It is informed by primary sources including ethnographic data, questionnaires and land records obtained by the author from an urban fringe of Delhi that has been given the pseudonym of Morpur.¹ Reflections made here are on the basis of school reports and longitudinal findings from detailed interviews conducted between 2005 and 2012, with 85 students and their families who live in the area.

This paper first locates the urban fringe vis-à-vis other settlements of Delhi before establishing the case of Morpur. It points to the peculiarities of urbanisation in the metropolitan fringe, where the participants of this study lived. This is also one of the spaces which offered Delhi's urban dreams and opportunities and the second part of the paper explores educational opportunity through an exploration of the educational institutions, services and information available to the people living in the area. In the final section, drawing upon the space and social configurations in the locality, it situates the urban fringe as being on the margins of 'opportunity', bringing back concerns about educational inequality, as urbanisation expands its roots in India. Finally there is a deliberation on ways to widen access and improve quality of educational opportunity.

25.2 Delhi's Rural-Urban Fringe

What is known as Delhi today, is a spread of several urban settlements that have emerged at different historical junctures and hundreds of rural settlements amidst or surrounding the urban quarters of the city. Among the prominent urban settlements, those within the fortresses of the pre-Mughal era remain today only as heritagesites, as the political decline of its founders also routed out its urbanism till they finally settled into the pace and life of adjoining rural areas. However, the settlements of the Mughal era, have had a continuous urban existence and thrives even today as Old Delhi, with a bustling mix of heritage buildings and densely packed residential quarters and commercial activities. The colonial settlements of the empire distinguished its political power with a new aesthetics of grandeur and expansive spaces designed by Edward Lutyen. After Independence, Lutyen's New Delhi was

¹In order to maintain the confidentiality of the respondents pseudonyms have been used in this paper.

taken over to house the Republic's institutions of democracy and became the city centre. The density of population increased as political, economic and social institutions established their presence in the capital. The surrounding areas were developed in planned phases to accommodate office complexes, public sector housing colonies for government employees, institutional and diplomatic areas. The planned measures also accommodated residential requirements of the growing capital city. Areas were earmarked for providing independent bungalows for the city's rich and wealthy, housing societies for the middle classes and basic apartment blocks for the lower middle classes built by the Delhi Development Authority (DDA). However, urban planning did not keep up with the migration to the city and the housing needs of the working poor, who settled in places close to their areas of work and devised their own means for living in the city. The areas where they settled eventually became classified as slum and Jhuggi Jhopri Clusters (GNCTD 2015). Planned interventions to provide housing for them often meant displacement and relocation to distant resettlement colonies in the city's periphery.² The rural areas thus, began to accommodate those who were left out of planned urban living. Delhi's villages and its land, private and community land as well as agricultural and residential areas, began to transform without official permission of the concerned authorities into urban townships. As many as 135 of Delhi's villages are now 'urban villages' (GNCTD 2008) and accommodates hundreds of 'unauthorized colonies'.

The planned and unplanned incursions into rural areas have led to a 40% increase in the urban areas of Delhi over a 40 year period (1961–2001) and 44 of its villages are now classified Census Towns. Urbanisation of Delhi's most populous districts such as North East, North West and South Delhi have been led by unauthorised colonies. This makes Delhi significantly different from other major cities of the world, as its urban population is spread on the periphery in its many unauthorised settlements and squatters (Kumar 2000, p. 154), while its spacious centre is relatively less populated. This periphery is mainly populated by the displaced poor, migrants, workers, and lower middle class populace (GNCT 2011). Studies on asset ownership and consumables also confirm these spatial inequalities between the city centre and periphery (Bhan and Jana 2015; Sidhwani 2015). Delhi's suburbs hence are not like European and American suburbs, which have a higher concentration of the middle classes living in neatly planned areas and thriving on commuting economies. Instead, its urban fringe is less resourced, more densely populated and with a greater concentration of people belonging to working class and lower middle class backgrounds. The planned city periphery of middle classes and wealthy based on a 'commuting economy', neat area plans and gated communities do exist in Delhi, but these are still too few and not representative enough of the urban fringe.³

²The resettlement colonies refer to 44 colonies that were dislocated from the city's centre to rural peripheries of the city between 1960 and 1985 (GNCTD 2015) and later on in the years leading up to the Commonwealth Games (Datta 2013).

³The unauthorized colonies of Delhi include farm houses belonging to the city's wealthy, who in a bid to avail benefits of village life have set up exclusive communities without authorisation. However the spatial inequalities in asset ownership and density of population in the urban

Education in Delhi's urban fringe hence is being located within this backdrop of inadequate urban planning for the working poor and migrants; spatial distance from the city's political, economic, and social institutions; high population density; and lower asset ownership.

25.2.1 Morpur and Its Urban Space

The area of Morpur, lying towards the South of Delhi, is a typical urban fringe. On the outskirts of Delhi's metropolitan area, it lies close to the urban agglomerations of Faridabad (Haryana), Gurgaon (Haryana) and Gautam Budh Nagar (Uttar Pradesh). The Morpur area, covers the residential, agricultural and community land of more than three villages, which are now re-designated as three Census towns (Census of India 2001, 2011). Currently there are several dozen unauthorized colonies and squatter camps here.

In the 1990s, when unauthorized colonies were being carved out on undeveloped agricultural land of Morpur, people from lower income groups exhibited willingness to settle here as it was seen close to the manufacturing industries of Faridabad, real estate development work in Gurgaon and Gautam Budh Nagar, even while retaining a Delhi residential address. As these unauthorized colonies did not have necessary infrastructure for setting up a residential colony, land was cheap and affordable. A study of the land records shows that the first sale of private land for building a residential colony began in 1985; and that by the 1990s there was a spread of unauthorized colonies from each of the three villages. As land transactions started creating super profits, people with large land holdings, who also wielded clout over traditional networks of caste, started trading in land. Builders from the city also entered the trade and apart from sale and purchase of private property business extended to capture of community areas and public spaces. The Delhi Development Authority reports that some of the colonies were built on vested gram-sabha (village government) land, shrub land and even vacant land in the possession of government departments. On the Delhi side of the border alone, 38 unauthorized colonies got built on the banned eco-sensitive river front zone (DDA 2010).

In the absence of plans, the constructions in the area have emerged as per the whims of the builders and budgetary concerns of the settler households. These include temporary shelters and camps, haphazard semi-pucca and pucca structures that left little space for public and community needs such as parks, hospitals and commercial complexes. Land disputes have been common and a large number of civil and criminal offences have been registered in the area police stations. Constructions have rarely followed safety principles and more than once buildings have collapsed because of unprepared land and poor foundations. In one such accident in February 2009, a building ended up burying ten people in its debris.

fringe, indicate that even though farm houses have taken over large tracts of land, these non agricultural gated communities do not typify life in Delhi's urban fringe.

However settlers have ignored these hazards, in the absence of other housing options and investment of their life's savings for a Delhi based house; seeking strength instead in numbers and mobilisations to avoid demolitions by the municipal authority.

In Morpur, 'urban development' for the low budget settlers stand cheek by jowl with the growing wealth of the builders and villagers who have profited from some of the land transactions. Hence, it is not unusual to find roughly built houses on small plots of land on narrow streets, adjacent to large mansions. Luxury cars and sports utility vehicles of these mansion owners stand parked on dairy farms and other dilapidated structures hurriedly converted into barracks for workers who live here on rent. There are no distinct areas marked as residential and commercial in Morpur, and shops and trading areas have come up in buildings close to the main roads. The outgrowth of unauthorised colonies from the three villages of Morpur, now makes the territorial distinction of the villages faint, connected as they are by lanes, houses, shops, private schools, clinics, wedding halls, equipment laden gymnasiums, wrestling arenas of the traditional *pehelwans*, warehouses and dairy farms. Piles of cow dung cakes and hay stack sit alongside coaching institutes and computer centres, announcing a mix of the rural and urban milieu. Traffic is thick on the streets with vehicles, pedestrians, cows, auto rickshaws, cyclists, goods carriers and an occasional state transport bus.

In August 2012, the long standing demand for regularisation of unauthorised colonies by the residents was fulfilled by state authorities for the pre-2002 colonies (GNCT 2012). This enabled those who built their homes in these colonies, to register their houses for a fee and escape demolition. These colonies are also now entitled to grants and funds for infrastructure development in the area. However, the possibility for developing public spaces and resources, road widening and laying of sewers for waste management appears bleak, as is apparent from the experience of colonies that have been regularised in the past. As a testimony to this bleak future, road widening measures between one of the colonies and the local school got stalled thrice by a wealthy local resident who refused to allow his property at the mouth of the road to be touched. However, even the limited hopes from regularisation are denied to the residents of the camps, squatters and colonies that came up after 2002, and they continue to live in fear of demolitions and displacement.

Morpur's urbanisation patterns and emergence as set of census towns in the urban fringe of Delhi is neither unusual nor specific to it and it is a pattern being widely replicated in the surrounding urban agglomerations. This follows the urban dispersion strategy being followed in the large cities, to remove people from the central part of the city to its periphery. These urbanisation patterns are hastened by the availability of work in the manufacturing, real estate and service sectors on the fringes of the city. The urban fringe itself gradually shifts from rural life to an urban pattern of existence, without maintaining any norms of planning. People are left to their own devices to develop a residential colony in association with local land dealers and lobbies of builders. The small economic means of the people has often meant that they have little voice in deciding the nature of development around them. Most areas are devoid of urban public spaces and the urban growth stands out

as a jumble of haphazard unsafe buildings. Essential amenities for living such as water, electricity and sanitation become prized services requiring a daily struggle for access.

25.2.2 Social Relations in Morpur

People moving to settle in Morpur have been from various parts of North India, with most being first generation migrants who arrived in Delhi for work, from Uttar Pradesh, Bihar, Uttarakhand and Rajasthan. Migrants from Nepal, refugee Kashmiri Pandits and post partition Punjabis are also present in large numbers. Residents of *jhuggis* (squatter settlements) located in affluent areas of South Delhi, have also settled here after being displaced by authorities, following eviction campaigns. While few of them bought land and built houses, most have set up temporary shelters in the camps for the displaced.

The house owners in the unauthorised colonies include workers and lower level office employees in the adjoining factories, private and government offices; self-employed artisans, vendors, hawkers and other unorganised sector workers. Those living on rent mainly include, casual labour and factory workers. Their houses are single rooms or shared barracks built in the large buildings of the disused dairy farms. Multiple tenants in a single room are also common, with independent rooms being rented only when families arrived. A large proportion of the workers are engaged in uncertain, irregular and "invisible" work, without any security of tenure. According to one factory union, three-fourth of the workers were not on the company's records, 85% were hired through contractors, 80% were not paid the statutory minimum wage and salary delays were common with legal dues being denied even 15 years after closure of the factory (Faridabad Mazdoor Samachar 2007).

The original villagers of Morpur are mostly families belonging to Hindu Gurjar, upper caste Brahmin and Scheduled Caste(SC) households. Traditional occupation in the villages of Morpur and its adjacent areas have revolved around agriculture, animal husbandry and quarrying (Soni 2006; Dabral and Malik 2004). Upper caste villagers had access to some land and education and hence had greater participation in the city as workers and employees of the public sector. Numerically the Gurjars have dominated the area. They have been mainly involved in dairy farming and have controlled the land around Morpur. The colonisation and escalation of land prices have increased their economic clout. Many of the Gurjar families are also those dealing in land. They have subsequently gained wealth, acquired school and college education and diversified into transport, trading and setting up of retail showrooms. Acquired wealth is displayed through palatial homes and expensive cars. Some of these families have also lost wealth to alcoholism, drug addiction, land disputes, legal battles and poor investments. Nevertheless the overall financial gains made by the community, their numerical significance, knowledge of the area and traditional social networks, have given them political strength and won them representatives at various levels of the government. This has also increased their muscularity in social relations.

The Scheduled Caste(SC) community earlier lived in the periphery of the main villages, now known as Harijan bastis and Ambedkar colony, but urbanisation has integrated their residential quarters with the main village through a continuous stretch of unauthorized colonies. Sections of the settler population from other castes now stay here as well. The members of SC households have in the past been engaged as sanitation workers, quarry workers, agricultural labour and sharecroppers. The absence of agricultural work has led to a shift towards urban occupations in construction, real estate, municipality sanitation work and property dealing.

The urbanisation of the fringe has also generated new jobs but mostly in the local informal economy. Settlers have started dealing in land as commission agents for bigger builders and in the absence of basic amenities and adequate infrastructure, people have started working in the large market that provides drinking water through tankers, electricity through generators, para-medical services, documentation services and petty trading. Retail shops have been started from houses for vending groceries and other household requirements. Garment factories give out contract work for minor sewing and stitching on piece rate basis to women. Shops, parlours and clinics have opened up, which hire casual workers. Those with some education have started tuition centres, coaching classes and private schools. Non-governmental organizations also have set up offices in the area and periodically carry out surveys for which young people are hired. It is only in land where construction is yet to start or in areas not yet colonised, that farming is still practised. Most of this land is leased out to share croppers and cultivated with the assistance of seasonal labour.

Thus, urbanisation of the fringe has changed the social dynamics of the area, as farm employment has become confined to the outskirts of the fringe and urban occupations have assumed a central place. While earlier the upper caste communities of Morpur were commuting to the city and engaged in urban occupations, it is the middle castes such as the Gurjars who have benefitted the most from urban growth and escalation of land prices. They gained particularly when they acquired education and shifted to new occupations. The spatial segregation of SC groups became less significant in the concrete outgrowth, and they also shifted from rural casual work to urban casual work. However, substantial upward mobility is still not seen. The migrants to the area have been the relatively disadvantaged sections of the city involved in the lower echelons of the manufacturing and tertiary sector, which are increasingly becoming informal. Thus, despite the overall infrastructural disadvantage faced by the people living in the fringe, there were some who were more vulnerable than others. Positions in the caste hierarchy, migrant status, nature of work affected their overall position within the fringe. Nature of work available to the women was also mainly in the casual sector and in the local informal economy.

25.2.3 *Hopes from Education*

In pre-urbanised Morpur, as in other villages of Delhi's metropolitan periphery, the state supported secondary school was located in a spacious complex with a large playground. It was well connected by road to the three villages of Morpur and also with those in the bordering state of Haryana. Established in 1960, most of the villagers who had attained secondary education, had attended this school. Once colonisation started, the first flush of urban growth also started around the school. It became an important landmark in the area and new plots were identified by its distance from the school.

Increasing non-farm occupations, increased the value of education and that of the school among all social groups of Morpur. Families of the local landless and those settling in the area particularly saw in the school a place that could offer a better future for their children. The decline in prospects from industrial, agricultural and animal husbandry work made education a possible entry point for chalking out an alternate future in the city. Educational credentials were perceived as a means for attaining a secure government job that could lead to vertical mobility. In the industrial environment of increasing casualization of workers, retaining jobs in the manufacturing and tertiary sector was also linked to education. Interviews have indicated that for the younger people of settler families, education meant greater possibilities of survival in the city, higher incomes, new professions and occupations, departure from traditional social rigidities of caste and gender roles, urban life styles as well as access to a more wholesome socially engaged life. Girls in particular looked at education as a means to transform their own lives and society.

For the socially dominant groups in the villages, education was a means not only for greater vertical mobility in the city but also a way to secure their political future and dominance in the area, as local social profile rapidly changed. An earlier study (Tyagi 1982) on Delhi's fringes also shows that conversion of land to cash through urbanisation led to income increases through adoption of non-agricultural work such as transport, retail, education or land purchases in newly emerging areas. On the other hand, wealth was swiftly lost when social dominance was being retained through legal battles, ostentatious expenditure, unwise investments, alcoholism and addictions. As metropolitan Delhi's urban fringes undergo changes, these experiences have become part of people's larger popular understanding. Education thus was seen as a tool that could offer hope in a rapidly changing landscape of work and social relations. It was seen as a means for dealing with a future that made traditional life unpredictable.

25.3 Educational Opportunity

In the background of the hopes from education in Morpur, it is important to see the kind of educational opportunity actually available to the people and its access by various social groups here. References to educational opportunity has often been portrayed through indicators such as enrolments, attendance, level completion rates, as well as reading, writing, arithmetic and comprehension of students at various school levels. While this does provide a broad representative picture of opportunity, the marginality of the fringe both spatially and in terms of the people living here requires educational developments in the area also to be seen through a relational perspective. Delhi has a sharply stratified school system that practises extreme levels of social and ‘meritocratic’ selection, not only by private schools but also by government and government aided schools (see Waldrop 2004; Juneja 2011; Menon 2006, 2014a, b). This poses questions on the kind of educational opportunity, be it institutions, information or services, that is available to the children living in the urban fringe and also to various social groups therein.

25.3.1 *Schooling the Urban Fringe*

The state funded secondary school, as mentioned earlier, held a special place in the landscape of Morpur. It was the only school in the area that offered secondary education. Even so, student enrolments up to the late 1970s and early 1980s in the school, according to retired teachers, never surpassed 350. The teachers were familiar with all their students and the school had the life and pace of a ‘village communal’ school (Brint 2006, p. 135).

A surge in Morpur’s urban growth also transformed its school. Enrolments grew and school authorities responded with multiple rounds of ‘upgradation’. The middle level school was upgraded to the status of an independent secondary school and the secondary level upgraded to that of a senior secondary school. Upgradations, only reflected on the levels of the school and they continued to function out of the space and complex that existed before. Each upgradation infact restricted the space provided to each school, as classrooms and playgrounds were partitioned off between the middle, secondary and senior secondary levels. As more colonies emerged, student enrolments continued to increase. The school (by now schools) introduced shift based sex-segregation of students, with morning school(s) for girls and evening school(s) for boys. In a span of 10 years, 2005 to 2015, the school underwent four more upgradations. The original school campus today accommodates ten schools in five buildings. Each school has its own administration but the schools are yet to have permanent classrooms, with many functioning out of semi-permanent structures.

25.3.2 *Slumming of School and Herding of Children*

If schools in the complex increased ten times, the enrolled students increased by 85 times. In 2012, more than 20,000 students were being provisioned by these schools. By 2015, it had increased to nearly 30,000 students (29,752). These enrolments are likely to grow in the coming years as the density of the settlements continue to increase and a concerted move is on to widen enrolments at elementary level as part of Right to Education Act, 2009. Notably, while new sections of students were being brought to the school, they were being accommodated in the old buildings and classrooms. The upgradations enabled each school to have a manageable administrative strength but the classrooms and buildings remained more or less the same.

Over the years, the academic structure, teacher-pupil ratio and classroom student ratios have worsened. In one of the boys' school, for example, the classroom pupil ratio was 1:268 at the senior secondary and 1:328 at the secondary (after upgradation). In the girls' school the classroom student ratio was 1:188 at the senior secondary level. This is not unusual in the urbanising fringes of the city where these kind of ratios and failure of educational planning has left schools to devise their own ways to cope with numbers. In some places students have been asked to come on alternate days to school, while in others school services are available to a child for less than 3 h a day, instead of the usual 5 and 6 h school day. In the Morpur school(s), the attempt to initiate an integrated school system from classes I–XII, have further added to the school's infrastructure woes as permanent buildings in the complex had to be handed over to primary classes.

The teaching-learning processes at senior secondary classes have also been affected by adverse teacher-pupil ratios, sometimes as high as 1:99 and 1:97. According to an elderly teacher of the school, this has led to a change in not only the school's character but also the nature of their jobs. He observed that "*we are not educators anymore, we are herdsmen (gwale)*". Teachers in the staffroom often talked about themselves in this role and children as their herd. This had repercussions on how children were treated in school, as coercive and persuasive measures began to be deployed to keep children back in school. Teachers held on to students in a bid to prevent them from escaping school, while a section of them nevertheless scaled the walls and ran away. The desire to retain students in the school often had more than academic concerns as teachers worried that some of the students after marking attendance would get involved in some crime and get everyone into trouble. However, the numbers in the classes made creatively engaging students a challenge.

Town planners have pointed to overcrowding of city areas, and unplanned urbanisation as a significant reason for the degradation of an area's ecology and environment leading to its eventual slumming (Verma 2002). It has been observed that even elaborate city infrastructure and built environments get dilapidated in the process (Naidu 2009). Slumming and dilapidation is clearly visible in the Morpur school complex. Ironically while more and more buildings were coming up in the area, there was no significant expansion in the state provisioning of school buildings

eventually leading to the slumming and dilapidation of the existing structures. According to one of the school's principal, these schools have ceased to be "a rural school" and are now more like a "slum and resettlement colony school". The dilapidation has eroded the academic life of the school, as it once had been a resource centre for primary and middle schools, but was now reduced to coping with the growing numbers and its management.

Even so, these schools held out hope to large sections of the enrolled boys and girls who felt that their individual, family and community's social mobility lay in realising the benefits of formal school education. Increasing integration of the schools with urban life, however also brought forth realisation of the disparities in schooling. Some boys went to study in state funded schools outside Morpur, where they felt they had access to a more wholesome schooling experience. However, few girls were allowed to do so as their mobility was restricted by patriarchal ideas of their families and immediate neighbours. Some of the girls who were allowed to attend elsewhere, sometimes volunteered out of it as they felt harassed by lack of public transport and security. The costs involved in transport also made it unfeasible for most students. Those who had moved in from other parts of the city to the area also felt that schooling could be more than herding and aspired for better conditions in their schools. Girls particularly resented the inadequate provisioning of good schooling in the area and worried that their future was being jeopardised by poor schooling.

25.3.3 Invisible Barriers to Schooling and Negotiating Through 'Jaan Pehchans'

Official policies claim widening of school access, but in practise state schools frequently put up invisible barriers to school. Often it was an informal attempt at curtailing enrolments. A teacher explained the reason stating that, "*We don't have teachers, boys are sitting in the corridors, there is no space, where do we keep these children?*" New admission seekers, migrating to the city or moving in from other areas, were often the ones who were dissuaded from joining the school to keep student strength manageable. Admission was denied on the grounds that enrolment seekers did not have valid identity papers, residential proofs and migration certificates. Other tactics included not allowing students, returning late after vacations, an entry back in school. These mainly affected children of poorer migrant families, who travelled more often to their villages because of community ties, illness and loss of jobs in their family. The immediate impact of these barriers included an exit from the school system for children of vulnerable families, and their early entry into the labour market. The presence of a large number of child casual workers in the area, points to the large sections of children who should have been in the school, but remain outside it. The case of 11 year old Ravi, is an indicator of these barriers. He and his mother migrated to Delhi and settled in a squatter settlement of Morpur. The

school turned them away for "some paper", which they were unable to produce, thereby losing a chance to secure admission in the school. The boy consequently left studies and started working in a general store opposite the school complex. For Ravi, this exit meant the denial of even a hope. that things would change for him and reconciling with the thought of being an unskilled casual worker all his life.

Ravi could have found his way back in the school had he come across a '*jaan pehchan*', or a contact in a relevant social network, who could have facilitated an entry into the school and eased a way out of the invisible barriers. '*Jaan Pehchans*' in the fringe included local political leaders, workers of non-governmental organisations and educated members within community networks. In recent years, with a number of welfare schemes available through the schools, an informal market of '*jaan pehchans*' have also emerged, which include ex-school students offering assistance and support for a fee. However, for families like that of Ravi, being strangers in the area activating these social networks was difficult.

The need for '*jaan pehchans*' continued over the school years. The high teacher-pupil ratio meant students received less attention throughout their school life. This aggravated the difficulties at the secondary and senior secondary level when first generation students had to make critical educational decisions on subject choices and streams, often with no reference points. They were unfamiliar with subject selection procedures and disputes over these were common. Students by this time had also learnt that streams like English, Commerce and Science were popularly perceived as more valuable for a chance at urban middle class occupations. Faced with another selection round in the school, families sought out '*JaanPehchan*' to resolve their grievances and to get a hearing in the crowded school. Families with greater clout and networks gained at each of these stages.

25.3.4 Bussing

Slumming, dilapidation of existing school infrastructure and consequent herding have forced families towards individual, household centric family responses for realising urban hopes from education. 'Bussing' students from homes to school and back is a widely prevalent practise among Delhi's middle classes, where children are transported across the width and breadth of the city in private and school transport. Though policies of admissions at the nursery have begun to encourage admission of students from neighbourhoods, bussing continues to be widespread as parents seek good schools for their children. In Morpur, where even 10 years ago, most students across social groups attended the neighbourhood state schools, in the recent years its slumming and dilapidation has led to bussing of children to private schools located outside the fringe. Interestingly, these private schools were neither the best of schools nor reputed for any particular reason. Their only promise was English-medium education and good examination results, which some parents saw as necessary for succeeding in the city. However for most parents, the only privilege the school endowed upon their children was greater attention, which was scarce in

the crowded state schools of Morpur. The option of bussing, however, was available only to children from the socially dominant sections, such as the Gurjars and upper caste families; or those from financially secure backgrounds. Even among them it was mainly the male child who got a chance to be bussed around. This led to a concentration of children in the state school from among the poorer households as explained by a teacher who felt that “*only (children of) labour (households) studied in the (state) school*”. Social class homogeneity of the students thus began to crystallise in the schools as a result of these practises.

25.3.5 Private Interventions in Schooling

The gaps in school provisioning within Morpur has been filled by cottage-industry like low-cost-for-profit-private-schools. Operating out of the residential areas, from houses, these were mostly elementary schools managed by educated members living in the area. Initial investments were low and they flourished mainly because of their local social networks and ability to ensure transition to the state secondary schools in the higher classes.

These schools thrived at the elementary level, as securing admission to the government school was difficult. Families found it safer and manageable to send their children to a school in the immediate neighbourhood than to a large school. All these schools claimed that they were English medium schools, which as mentioned earlier was considered as highly valuable. It was another matter that it was more of an advertising strategy. These schools also presented themselves as offering quality education, which several parents agreed with primarily because school rituals were maintained and children were given greater attention than they would have in the crowded state school. The teachers here were mainly young women and local residents who could be approached by the parents, when required.

At the secondary level, private schools in Morpur were few as they were unable to get necessary recognition from regulatory bodies for offering education up to class X. Those that were there did not operate in full capacity because most households had low income levels and had already exhausted their capacity to pay fees after educating their children for a few years in the private elementary schools. For these economically stressed households, a private school was considered as good so long as it could ensure a smooth entry into the state schools in later years.

25.3.6 Private Tutoring

Once students were in the school, families began to realise that school success could not come without academic support at home. Unable to provide the same, families sought out academic support in the form of after-school private tuitions. Tuitions were provided by educated youth either individually or in smaller groups, for a fee.

Several coaching centres had institutionalised these tutorial assistance and offered services through a network of youth.

In a cohort of 85 students studying in class IX, 50% of the students had taken tuitions at the elementary level. This included students who had been to private as well as state funded schools. For the former, however, this implied that families had borne additional costs of tuitions besides the school fees.

Different reasons contributed to private tuition taking. Parents who were educated nonetheless had to hire tutorial assistance for their children as they worked long hours. They spent considerable time travelling back and forth from work in the city to their homes on the fringe, which left little time for academically assisting their children. Families engaged in factory work were mostly from socially and economically disadvantaged families and they also had little time to assist their children at home. They were also less educated and unfamiliar with the language and content of the school texts. Tuition enrolment was the highest among these children as households saw tuition as seen as a means to get past disadvantages posed by the home situation. A mother of one of the students, Raunak, explains:

We were born with a sickle. As soon as we opened our eyes we were sent to the fields to cut grass and feed cattle. School and what happened there was not important. It is only now that we realise our children can't survive if they don't study. Raunak's father has done class III, what can he guide? We have to send him for tuitions. At least with other children he would know what he has to study.

In some of the labour households, tuitions ensured children had an academic time table and structured schedule at home. This also kept them busy, out of trouble, and offered a safe place to study since houses were crowded. Families thus looked at tuitions as an essential aspect of urban life. However, the cost of private tuition was considerable and in some households, almost 10% of the family income was spent on it. As a consequence, the distribution of private tutoring was less dependent upon the need for academic support at home and more impacted by costs that could be afforded. Hence even though students from casual labour households felt the highest need for tuition taking and started out with it the most, they could only afford it 'intermittently' rather than as a continuous support. Similarly, across a section of social and occupational groups, girls availed tuitions only intermittently.

25.3.7 Vocational Preparation

Upon school completion most students, irrespective of their family backgrounds, expressed a desire for professional qualifications and service sector jobs. They rejected agricultural work and expressed a disinclination for industrial shop floor work. They felt that in metropolitan areas factory jobs did not bring the kind of job respectability that they were seeking as school pass outs. Moreover, it was considered as less appealing because of the absence of work security, hard physical labour, poor remuneration and casualisation. Urban middle class professions were the

dream jobs and boys aspired to become pilots, doctors, lawyers, engineers, teachers, and bank employees. Those unable to think of a specific desired profession, said they wanted to do just about any office based computer job. If nothing worked out, the boys proposed they would do some business locally in the retail sector or join the army or police.

In the case of the girls, schooling had fuelled aspirations for vocational preparedness and economic independence. Many of them were willing to take any job that would help them avoid patriarchal–family restrictions on mobility. Living the urban dream for them was about fulfilling individual aspirations and establishing their own identity, which they felt the community in the urban fringe would not permit because of its patriarchal mind sets and close supervision of women’s mobility. They felt that the metropolitan city offered them greater freedom, and expressed fears of getting married in a rural area. Most girls wanted to become teachers as they felt they could balance both work and home, while winning the freedom and respect of being a working woman.

Schooling enabled students to dream of an urban life but vocational information and preparation was available only outside the school. While most nurtured aspirations for upper middle class professions they had no idea which course would qualify them for these occupations. Students thus, sought information about courses and made career choices after consulting local tradesmen, non-governmental organisations, commercial centres offering computer courses and private coaching centres offering distance education programmes. They also relied upon their friends and tutors regarding information on examinations, jobs, courses and higher education prospects. However, decisions on courses were ultimately decided by the proximity of the instructing centre to their residence (in order to avoid transport expenses), course fees, and friends willing to join the course. Boys from both labour and employee households enrolled for mobile repairing, hardware training, spoken English and basic computer courses in MS office and Excel. While these courses, offered by private agencies and commercial set-ups, did not come cheap these were taken up mainly because other courses were even more expensive and beyond their budget. Courses such as Tally and other accounting software were considered as desirable but more expensive. Similar opinions were held regarding coaching for medical and engineering entrance examinations. While these were out of reach for students from labour and lower income employee households, students from the socially dominant groups did take them up as they possessed a wider social network, greater financial clout and supporting relatives. Polytechnics, which are vocational training institutes for providing skilled industrial training, were opted mainly by students from families who were already familiar with these trades.

The courses offered to girls by the more affordable non-governmental training institutes, followed a gendered chart of beauty services, sewing and stitching courses. Some commercial institutes offered nursery teacher training and call centre operator training programmes. Courses offered by non-governmental organisations were seen to typically enhance domestic skills and most girls had completed these programmes. However their professional worth was perceived as negligible. Vocational programmes, such as fashion designing and air hostess training, meant

incurring high costs and were hence ignored or taken up only by girls from families with secure sources of income. Courses related to the hospitality sector, such as airhostess training, were aspired by the girls but their encounter with the training institutions had also introduced elements of a metropolitan life, life styles and social norms that was disconcertingly unfamiliar. The cultural shock of these encounters and the exorbitant fees stopped any further pursuit of these courses.

The decision to do a course and its completion did not always translate into a vocation. Market determined courses were often hyped about the prospects in the job market. The non-governmental organisations offered only introductory lessons in beauty treatment, fashion designing and dress designing. The experience of the youth in finding work with the acquired training had often been demoralising, as the market considered them untrained even after certification. Some of them realised that the courses they had enrolled in, such as computer hardware training and mobile repairing, were already obsolete by the time they had finished their courses. The girls who had spent considerable fees in doing short-run nursery and primary teacher training courses, realised after completion that these were not even recognised by the regulatory bodies. Similarly, computer courses that they could afford to do were too basic to be of any use in the market. Those who had opted for coaching classes to help them prepare for entrance examinations to professional programmes, learnt that many of these courses were module based and a number of such modules had to be done to execute the test successfully. The fees required to do so was beyond their family income. Most youth from labour households had not even attempted to do the vocational courses, while those from employee families either attempted trial courses or abandoned programmes mid-way as they exhausted their budgets. Only youth from families with steady incomes, smaller families, educated parents who had familiarity with the vocational routes were able to find a job in the field of their training. In the cohort of 85, only three students had actually made the transition from a vocational course to a profession. While two of them came from families who were already familiar with the trade and had been prepared for polytechnic training, only one student had actually managed to make the shift to a middle class profession on the basis of his vocational training and education. This young man, from the socially dominant Gurjar family, had acquired an engineering degree from a private college, facilitated by his family's economic and social clout.

25.4 Urban Fringe: On the Margins of 'Opportunity'

An increasing proportion of the population in India is getting 'urbanised'. While this involves a shift towards the nearest urban settlement, it is the largest cities of India that have become the most popular destination for those seeking a livelihood and an urban life. Consequently rural-urban shifts around the big metropolises have become integral to city expansion processes. The discourse of these shifts have focused often on the middle class suburbs and gated communities but the peculiar

pattern of Indian cities with a posh centre and poorer peripheries raise important questions concerning the nature and promise of the urban.

The urban periphery or the fringe is deeply connected to the metropolis and its geographical, economic, and social growth. The city thrives on the workforce that stays at its periphery. The energies of the settling and local population here are channelized towards building the resources of these areas, in making them habitable urban settlements and sustaining urbanisation process. When left to its own devices, and that of land lobbies, the urban fringe undergoes congested, unplanned and unauthorised development. The spatial distribution of resources become lopsided with a high density of population having low entitlements to opportunities and resources of the city. Unlike the fake farm houses of the rich, which are actually posh urban houses in vast lush surroundings, the unauthorised colonies of the poor in Delhi's metropolis are high density settlements with disproportionately low distribution of resources. The people live here out of compulsion imposed by their economic means rather than decisive choices on where to stay. Their settlements reflect a deliberate lack of state planning and *laissez faire* urban growth that becomes guided by builder lobbies, land dealers and dependent upon the informal market for fulfilling the needs of the people living here. Thus the nomenclature of an unauthorised colony, places the people here in a situation where they themselves get blamed for non-provisioning of necessary urban amenities, including inadequate access to schools.

By the time the urban fringe and its unauthorised colonies gain regularisation from authorities, the area and its schools have undergone a slumming and dilapidation process, making renewal of these areas a complex process. For the landed rural people living here, urbanisation promises to introduce the possibility of mobility and attainment of a metropolitan life; while for the poor it is often accompanied by sudden dispossession of earlier livelihoods or from a dispossession of their homes as in the case of the evicted.

Hope, however, thrives as urban growth makes the earlier spatial segregation of dalit settlements vis-à-vis the village irrelevant; girls begin to find reasons to shake off patriarchal restrictions as they search for individual identity and mobility; and better urban amenities and public services begin to be expected with colony regularisation. The proximity to the city, even if it is at the fringe, makes resources seem closer and education as a means for future vertical mobility, better living conditions and higher incomes. Thus the urban fringe also offers a means to escape social hierarchies, caste rigidities and patriarchal restrictions.

The educational credential become increasingly relevant to life in the urban fringe, as life chances get linked to them. There is hope especially for those who have no other financial and social clout, who see possibility for transcending immediate restrictions, with educational degrees and qualifications. For the socially dominant sections of the urban fringe, educational opportunity is a means to consolidate the economic gains and secure it. There is also a compulsion posed by the changes in occupations, land use changes and new aspirations. For people in the fringe, urban shifts require new cultural capitals for thriving in the city; and eagerness for

schooling, expenditures incurred on private schools, tuitions and vocational courses are attempts to cope with this shift.

There is no infrastructure ready to absorb the influx of settlers into these fringes. And when changes begin to happen because of colonisation, there is a tremendous pressure on whatever exists of the rural public services. The state schools are also caught unprepared for these changes, and it is on the verge of a crisis that demands begin to be addressed. However responses such as school upgradations that is beyond capacity, remain ad-hoc and there is a gradual slumming and dilapidation of the schools. The state schools instead of becoming sites that could prepare people for the urban shifts, become sites that represent its collapse. Schools start operating as per the erratic demands of the crisis, high pupil-teacher and high student-classroom ratios becomes the norm, where children from poor families are 'herded'. Social transformation is substituted with social control in this entire exercise, where discipline focuses on teachers becoming herdsmen/women and children a mass of restless energy waiting to escape from the confines of the school.

The hopes of vertical social mobility forces people towards individual and family based responses, like bussing children to schools outside the area, private schooling, private tuitions and private vocational courses. Access to scarce educational resources become activated through '*jaan-pehchans*' and social networks, both paid and altruistic. While they plug the immediate gaps, they do not suffice for the needs of the most vulnerable sections of the fringe, and consolidates the dominance of the economically and socially well endowed. The private educational providers, fill the gap, but do not necessarily reflect quality, repute or relevance. They are simply yet another part of the informal economy of the fringe that is making profit and business out of the vulnerabilities. Often, as in the case of vocational courses, they also misrepresent, create hype and withhold relevant information. Notably, it is the unregulated educational market for the poor that is even more unpredictable and unreliable. Instead of mobility, existing inequalities gets wider between social-occupational class and caste groups. Within families, gender variations widen, as scarce opportunities such as bussing, tuitions and vocational courses remain less accessible to the girls. When these are available they assume the form of gendered courses and intermittent tuitions, placing girls from all families, and boys from labour households at par. Mobility as and when it exists is restricted to a few and powered by social networks and economic capital. For most others, living on the urban fringe is also about living on the margins of opportunity.

Clearly, the geography of the urban fringe enhances the inequalities faced by the socially vulnerable. Turning this situation around requires both a political and social will that questions the kind of urbanisation that is being encouraged in and around the Indian cities. Unplanned urbanisation of the fringe is a fall out of the planning and policy processes that avoids concerns of the lower income groups and the poor. Moreover, if cities continue to evict the poor from developed areas of the city and keeps them on the urban fringes and city periphery, it only perpetuates inter-generational disadvantages and restricts their opportunities and chances for mobility.

Educational planning clearly needs to pay attention to urban fringes before it reaches a point of crisis. Notably, state funded neighbourhood common schools, where thousands of students study, still hold out hope for ensuring equal opportunities. Strengthening these schools is critical for school revival and this requires not only school up-gradations but also commensurate infrastructural expansion in the newer colonies. Lowering teacher-pupil ratios and maintaining classroom-pupil ratios is critical for any revival plans.

Inclusion of an unauthorised area into the planning process has mainly been through regularisation of colonies, which is a protracted process of mobilisation and campaigning. However, these calls for regularisation also need to earmark areas for school expansion and public services. At the same time it is important that state's educational provisioning also becomes independent of urban regulatory authorities so that they may prepare plans as per the need for a particular area.

There is a great need for institutionalising community youth and child services. This is particularly important in camps and localities where the most vulnerable population live, since they neither have requisite social networks nor feel equipped to seek these services. Effective measures hence need to be taken to ensure that youth are not dis-privileged because of lack of access to relevant information. This calls not only for digital information provisioning but also human interventions through counsellors appointed in the schools.

The crowded localities are bereft of public spaces for learning and developing them is critical for the health and ecology of the neighbourhoods. This is essential so as to create spaces where young people can access information and obtain after-school-academic support, since families can barely provide it to those who need it the most. While several non-governmental interventions have demonstrated the positive impact of such measures, including in Delhi's fringes, the scale at which urban changes are taking place requires a far greater and concerted effort that only state agencies are in a position to plan and provide.

Educational provisioning through an informal market has mainly been the policy direction for urban fringes, however it is clearly not ensuring equal opportunities to various social groups either for school or for vocational services. Active state intervention is required in regulating the vocational services offered by the market to prevent them from exploiting the vulnerability of students who are enrolling for courses without promised gains. Given the demographic profile of the cities and the urban fringes, direct state provisioning of gender-neutral vocational courses through professional institutes also has to be initiated.

People on the other hand are willing to mobilise and demand their rights to opportunity. And here the Constitutional measures and relevant legal provisions, be it the Right to Education Act, 2009, or the Right to Information Act, have encouraged people to seek information and approach the courts for staking their claims for equal access to educational opportunity. Gradually thus, even through these small individual and group acts, a new sense of urban community emerges.

Acknowledgements This paper draws upon data collected during the fieldwork for my doctoral thesis (Menon R. *Social Access, Participation and Attainments: A sociological study of two secondary schools in Delhi*, 2014), which was supervised by Professor Geetha B. Nambissan, ZHCES, JNU. I would like to thank her for the questions flagged off as the editor of this section and also for her comments that enabled writing of this paper. The review comments by Professor William T. Pink helped in finalising this paper. Questions raised by Professor Purendra Prasad and Professor Nandini Manjrekar on the abstract of this paper have helped me deliberate on them. Discussions with Mr Rajendra Pratholi, Mr Jung Bahadur, Mr Kushwaha and with numerous youth from Morpur have provided insights on Delhi.

Part V
Latin America

Chapter 26

Urban Education in Latin America: Section Editor's Introduction

Belmira Oliveira Bueno

Latin America is part of an even larger continent, made up of countries with a variety of territorial sizes, cultures, languages, and histories. It encompasses Mexico and almost all countries from South America and Central America, including a few islands from the Caribbean, such as Cuba, Haiti and the Dominican Republic. Such geographical extent and the cultural diversity which characterizes the area indicate how inappropriate it is to conceive and treat Latin American as a homogeneous whole (cf. Bueno 2007). Amidst variety, there is however a point where these countries converge to: their enormous social inequality. In spite of its extraordinary beauties and natural wealth, Latin America is among the poorest regions in the world. In it, wealth and poverty live side by side, mainly in the metropolitan areas, where social contrasts pop out all the time.

Understanding education in Latin America requires a two-way analysis to include, on one hand, the processes with the school systems and, on the other hand, the processes concerning society at large, which involves not only the domestic context but also what takes places beyond each country's borderlines. The geopolitical changes affecting all nations in the late twentieth century moved a great deal of the decision-making processes away to the centers of power of supranational character. Regarding Latin America, a number of bodies and agencies play this role, including the World Bank, the Inter-American Development Bank (IDB), UNESCO, as they provide the funds and/or are the fosterers of policies in the region. ALCA – the Area of Free Trade of the Americas and MERCOSUL – the Common South Market should not be forgotten either, because they work as blocs that attempt to reposition the regional economic forces into new basis.

e-mail: bbueno@usp.br

Comprehending the relations between local and global has thus become an imperative in dealing with the educational policies in Latin America, due to the perspectives glimpsed by the countries to tackle the social inequalities through reforming the school systems. In this region, reforms have been guided by models nurtured elsewhere, adopted without taking into account the real needs of each nation and their populations. Consequently, such reforms have not so far envisaged the necessary and urgent remake of the school model currently in force, whose social functions met in the past expectancies that were very different from the ones faced today by the Latin American governments (Tiramonti 2005).

Thinking over the school's role in today's society demands, as emphasizes the Argentinean sociologist, "to consider the whole changes that contemporaries societies have been going through and realize the specific aspects that such phenomena take in peripheral places as the ones we are part of" (Tiramonti 2010, p.15). In her analysis, Tiramonti goes back to the model of a *centered state* which prevailed in the organization of Latin American countries and to which the setup of the educational system responds; she demonstrates that the changes undergone by today's societies have caused a loss of meaning. In the educational field, this resulted in the "loss of the school's potential to institute identities", whose process is associated "with the death of the Nation State and the law as the founding instance of citizenship" (p.19). Although the interpretations about these facts abound, it is important to stress such aspect, because it is a key element to understand the role of schooling in Latin America.

This section was organized in order to contribute to his perspective of analysis. Considering the time elapsed after the first edition of this Handbook (Pink and Noblit 2007), one wonders what has changed Latin America education along the last decade. Which advancements have marked this period and what problems have persisted? For such, I have selected a set of themes that may provide an overall view, a picture of the challenges faced in the field of education by the countries from this part of the world. Public schools in Latin America – which in several ways are similar to urban schools in the United States and in the United Kingdom – has an attendance consisting mostly of children and youths from this region. As a result, I understand that they should be treated within the frame of public policies guided by the principles of democratization, quality and equality.

According to this point of view, this Introduction is structured in three parts. The first part presents some data about inequality in Latin America, the second part brings a discussion on the meaning of the public school in this region, listing a few relations of proximity with the notion of urban school employed mainly in the US and in the UK. And the last part is about the contribution of the eight chapters included in this section, which is preceded by considerations about some possible views of these texts, as a way to stimulate future studies in a compared perspective.

26.1 Inequalities and Contrasts

It is virtually impossible to talk about Latin America without a reference to the inequalities that characterize the countries from this continent. The interpretations of this historical feature usually take the path of political and ideological explanations, highlighting the relationship between the economic policies set forth in the central countries and the public policies employed by LA countries, under the constraints following agreements and impositions. Boron (2003, p. 25) remarks that, from the 1990s on, under the pressure of the Washington Consensus, there was a rhetoric change in the region, when Chiefs of State began to define as fundamental goals of their policies the reduction of poverty, and education and the good forms of governance. However, this standpoint collided with economic growth, whose purpose remained as part of the government agenda. The facts observed explain, according to Boron, why “there has been so little progress (at best) in the battle against inequality and equal distribution”. Another author shows that the topical social policies did not turn out to be “sufficient to reverse the increase in the social costs arising from the economic restructuring imposed by globalization”. Because of that, the vulnerability of the disadvantaged groups in society has worsened “and the final outcome is the maintenance of the ancient and structural inequality all over the continent” (Mendonça 2009). Di Virgilio and Perelman (2014), in *Ciudades Latinoamericanas* (Latin American cities), polish such assumptions by analyzing the segregation and social inequality that is manifest in the urban territories. Such process, they say, “are built on the grounds of material and symbolic elements, historically produced and territorially contextualized” (p. 9). This viewpoint allows the authors to look at the everyday practices and the several spheres of changes and interactions, on the side of traditional studies of urban segregation.

The Economic Commission of Latin America and the Caribbean (CEPAL) – a section of UNESCO – has engaged in collecting data about poverty and equality in the region and disclose such data in its annual report *Panorama Social da América Latina* (social overview of Latin America). The last report, released in 2014, says in its initial lines that, “beyond the advancements achieved in the last decades, poverty remains a structural phenomenon which characterizes the Latin American society.” CEPAL proposes a development agenda for the countries in question by advocating that “equality must be the primary normative ethical principle and the ultimate goal of development.” (CEPAL 2014, p. 11).

The drop in the poverty rates recorded between 2005 and 2012 took place mainly in the urban zones, demonstrating that monetary poverty is the greatest item among all the hardships faced by Latin American people. It affects however in unequal fashion the groups in several categories – age bracket, gender, years of schooling and activity (with or without a job). In that respect, youths appear as group with specific vulnerability, since they are socially excluded as a result of close ties between education and employment. In the aforementioned *Panorama Social da América Latina*, CEPAL (2014) dedicates an entire chapter to Latin American youth, whose population was 30 million people in the age bracket of 15–24 years old, in 2012.

A number of countries in the continent, such as Argentina, Mexico, and Brasil, have paid special attention education in the high school level, since this stage of schooling has turned to be a narrow bottleneck in most nations, which creates a double gap – with higher education and with the labor market – and causes serious compromises both to the life of youth as well as to the development of those countries.¹ High-school drop-out rates are a symptom of the high levels of exclusion noticed in the age bracket from 15 to 29 years old. Encompassing 18 LA nations, the chart below provides an idea of this situation by showing the evolution of percentages of students completing primary, secondary and higher education between 1990 and 2012.

Latin America (18 countries): evolution of the proportion of youths between 15 and 19 years old who completed primary, secondary and higher education, according to their age bracket in 1990, 2002 and 2012 (in percentage)²

Even though a positive evolution has occurred along the last two decades, a strong concern remains about the permanence of a high percentage of youths who, in 2012, stopped going to school in secondary education. It is important to note that this evolution is not heterogeneous, with great disparities among the nations placed in both ends of the chart. Higher percentages of students completing secondary schooling were found in Chile and Peru (80 %) in contrast with Honduras (36 %), Nicaragua (36 %) and Guatemala (25 %), where the lowest rates were noted. There is no doubt that this situation has an impact over the social insertion of youths, their emancipation and autonomy and, finally, over their citizenship.

Other data provided by CEPAL helps us see more clearly the situation of exclusion and vulnerability faced by the Latin American youth, and for this reason the Economic Commission emphasizes the importance of designing inclusion policies

¹In this regard, see Chap. 30, by Nora Krawczyk and Edna Taira, covering the inclusive potential of secondary education in Brazil.

²This charter was reproduced from CEPAL (2014, p. 131), and translated into English.”

and programs.³ The 2014 report brings a series of recommendations including to avoid the label that stigmatize youths, such as the badly named expression “generation nini”⁴ (which associates youths with delinquency, alcohol and drugs, homelessness. The report also draws attention to how important it is to understand the reasons why youths do not go to school. But, in addition, “it must be acknowledged that there are other ways for social integration being taken by this population.” (p. 137)

The last issue to be highlighted is the violence affecting youth in Latin America, under different angles. Certainly, it is not easy to define a precise concept of violence due to its multidimensional nature, that is, the various ways through which it becomes visible, whose causes and consequences are also diversified. Galtung (1990, quoted by CEPAL) classifies the phenomenon in three types – direct violence (physical acts that are violent or verbal); structural violence (the fact that there are groups socially excluded), and symbolic violence (imposition and reproduction of a system of thinking) – mas, definitely, this classification does not cover all forms of violence. Data collected by CEPAL concerning direct violence in the schools, in the families, between neighbors and between gangs, shows that Brazil bears the highest numbers in these four areas of conflict (52, 40, 42 and 38, respectively). If we take school only in consideration, Brazil is followed by Colômbia, Costa Rica, Guatemala and Mexico, all of them with the same indicator (33). This situation leads us once again to wonder about the place that schooling has in the life of Latin America young people. Social exclusion is a great deal responsible for this state of affairs, which calls for urgent political policies in hand with policies for employment, housing, transportation, among other that are intended for social change in Latin America towards a fairer and more egalitarian society.⁵

26.2 Public Education, Urban Education

The remarks above may help understand the several meanings and nuances that the term public education has attained in Latin America over time. Just like the term urban education, which implies quite different meanings and senses, the same happens with the term public education in this part of the world.

Campbell and Whitty (2007, p. 929), going deeper in the analysis of the term urban education in the context of the United Kingdom, say that “there are different policy nuances in different parts of the UK”. According to the authors, the game of

³ See proposals for inclusion in several chapters in this volume. Silvina Gvirtz and Esteban Torre (Chap. 31) talk about inclusion in secondary education in Argentina based on Information and Communication Technologies. Marcelo Andrade and Pedro Teixeira (Chap. 32) discuss religious teaching and present a proposal aligned with an intercultural perspective. In Chap. 33, Leonardo Peluso, Juan Andrés-Larrinag and Ana Cláudia Lodi focus on the education of the deaf.

⁴ In English, the “neither-nor generation”, describing those who neither go to school nor have a job.

⁵ See Chap. 34 in this volume, where Cristián Cox, Carlos Beca and Marianela Cerri also deal with the issue of violence in the school as they discuss teaching as a profession in Latin America.

power between the central government and the local authorities result in a variety of ways to deal with curricula, testing, inspection and budget, “leading to the creation of quasi-markets among local schools and the potential for the atomization of urban education” (p. 930). Campbell and Whitty argue at great length about the definitions of urban education in attempt to show that the use of such term is problematic. This is clear if we consider, for the example, the spatial issue, the diversity of urban contexts, the difference between inner cities and other urban areas. The variety of educational experiences taking place in these contexts leads us to see that the generic characteristics of urban education are inadequate, according to those authors.

In the United States, a number of authors have also pointed out the various meanings of urban, under several angles. Michele Foster (2007) shows, in a lexical analysis, that in the seventeenth century the word urban had a positive connotation. However, this has changed over time, although no one knows exactly at what time such change started. What one can say for sure, says she, “is that by the early twentieth century, negative connotations associated with urban, exemplified in the euphemism inner city were widely accepted” (p. 765). Leonardo and Hunter (2007), based on Berger and Luckmann (1966), say that urban is related to a reality that is much imagined. That is, “the urban is socially and discursively constructed as a place, which is part of the dialectical creation of the urban as both a real and imagined space” (p. 779).

Other meanings may be added to those mentioned above, referred to the historical and local specificities of each nation where the term urban education is familiar. However, this is not our scope, which is merely to point out the complexity of such term and, at the same time, draw attention to the fact that in Latin America, the term that best translates it is “public education”. Thus, it equally bears several meanings which have changes over time. Such variety of meanings includes two that are more widespread. One of them is to distinguish public education from rural education; and the other, to distinguish by contrast public education from private education.⁶

The idea of public education in Latin America and the meanings it has gained over time share a close tie in relation with the making of Latin American states and with the place that the school has taken in those societies. Even if the education system had developed quite differently in each country, public school was in the

⁶ It should be noted that rural education and private education are terms whose meanings have also changed over time. In the past, private education widely associated with the education provided by religious institutions, since most of the religious orders settled in Latin American started a school. Today, unlike it was in the past, these schools make up large networks managed by private businesses, and most of them are secular, not religious. As for rural education, there are also meanings and senses that have altered over time, mainly due to the processes of colonization and urbanization. It is important, for example, to pay great attention to how inappropriate it is to categorize indigenous nations as exclusively rural, since in the past many of them built cities and inhabited those cities for centuries. The discussion presented by Gabriela Czarny in Chap. 27 in this volume sheds light on the issues involving the relations between urban and rural.

past a symbol of distinction in all of such nations.⁷ However, this status undergoes a collapse after the dictatorships had settled in several countries in the region by the end of 1960s, and then they turned out to mean “low-quality school, intended for the students from the most deprived layers of the population” (Bueno 2007, 563). In several countries, including Brazil, from that moment on, policies were implemented to expand the access and permanence of children and youths in the school, because of the high indicators of exclusion. However, such policies were not followed by investments to ensure the quality of public education, and we have seen in most cases is an increasing deterioration of public education. Even in countries such as Chile, Argentina and Uruguay, which in the 1960s had high rates of growth and education, suffered such deterioration from the 1980s on (Puiggrós 1999).

Alongside this process, the private school networks began to rocket. It is necessary, though, to point out that those schools and, the public schools more so, are not homogeneous, as there is within each group a spectrum that leads to classifications which create new forms of social and school segmentation. As parents have to choose a school for their children, conflicts and competition arise and they are a clear example of the educational policies currently in force in Latin America.⁸

In Brazil (in the state of São Paulo), one finds, for instance, public schools with different administrative ties – state, local and federal institutions– which, in addition, may be either a “common” or a “selective” school (Basílio 2016). The former are legally responsible to provide basic education. “Selective” schools include those from the private system whose principle for being chosen is the economic factor, and public school in which new students are admitted through a selection process, as the number of vacancies is quite small. Basílio (2016) notes that recruiting teachers is also an differentiating element between “common” and “selective” school. For the latter, teachers are recruited on a per school basis, while in the “common” schools selection is conducted by public contest and the teachers who have been approved can choose the school where they will work. Considering this classification, we may identify a *continuum* in which one of the ends are the “common” public schools, exclusively from the public system; in the other end lie the private schools, exclusively; and between the two edges are the “selective” public schools.

Amidst such differentiation, we find one of the most detrimental strategies for public education in Latin America: the privatization of public schools. As part of the neoliberal policies settled in the region since the 1990s, the purpose of such policies is to reduce or withdraw from the hands of the State the responsibility for providing education; for that most of the public funds aimed at education are drained to the private system. Although in each country privatized schools are called with a specific name, all of them are inspired in the American experiences with charter and voucher schools (Cf. Calvo 2007; Raczynski and Muñoz-Stuardo 2007).

⁷Concerning this issue, see Faria Filho and Vidal (2007) and Tiramonti (2005), among other authors.

⁸About the Chilean case, see Raczynski and Muñoz-Stuardo (2007) and, in this volume, Donozo-Díaz and Castro-Paredes (Chap. 28) and Quaresma and Valenzuela (Chap. 29).

The privatization process affecting public education has give rise to an educational market which has contributed to aggravate social segmentation in Latin America. As I had pointed out a decade ago,

the privatization strategies introduced by the current Latin American reforms are clouding the idea of public school. With the coming of such policies along the last [twenty five] years, the perception and meaning of what is public, as well the difference between public and private in education, has become more and more faded. (Bueno 2007, p. 570)

The privatization tendency has been enhanced over the years, but the situation is not peaceful. In the last decades there appeared reactions of discontent in Chile, by means of great demonstrations involving several sectors of civil society, who demand the State to reassess the proposals implemented since the military dictatorship, as Donoso-Días and Castro-Paredes examine the issue in this volume (Chap. 28).⁹ This is one of the most important changes to be highlighted in the past few years.

26.3 The Contributions of this Section

The chapters that make up this section convey contributions quite relevant to the debate and the interchange of ideas about public education in Latin America indicated above as well as about the educational policies and practices from other parts of the world, especially those included in this handbook. Here, I outline a few suggestions of reading and analytical perspectives that may unfold from the texts.

26.3.1 *Towards a New Understanding of Education in Latin America*

Looking at the local specificities and seeking to connect them with broader contexts seems fundamental to me today, even more than in the past. The texts included in this section stimulate different views, in several directions, such as the perspectives adopted by Stephen Ball in his works. One of them is the idea of a cycle of policies, referred both to the context of each country and to the region as a whole, another perspective concerns the relations between macro and micro educational policies (Ball 1994, 2015).¹⁰

⁹It is interesting to note how pioneer Chile has been in this issue. In one case, the State, in the implementation of the educational reforms guided by the neoliberal principles; in the other case, civil society, in the objection of those policies. This makes one think that perhaps similar reactions may take place in other countries.

¹⁰See also Avelar (2016), Beech and Meo (2016), Bocchio et al. (2016) and Verger et al. (2016) who took part in the Dossier Stephen J. Ball y la investigación sobre políticas educativas en América Latina, *Education Policy Analysis Archives* journal.

As if utilizing a magnifier, each text allows the reader to get closer to the educational reforms of each country, its challenges, problems and proposals, through different approaches, themes and analyses employed. The chapters may also be put in dialogue with the authors who participated in the first edition of this handbook favoring an analysis of longer spectrum about the reforms in the Latin American region. Establishing the dialogue in such fashion, they may expand the view over the education situation in this area in a significant way. As a mosaic, they allow to identify the similarities and differences between the policies and practices adopted devoted to public (urban) education in the region as well as the theoretical and analytical advancements that those very reforms eventually gave rise to.

Movements of this kind, which go back and forth between analysis of small and large scale request analyses which go beyond the outlines and specificities of the region in question in order to question, in our case, what is common and what is different between Latin America and other parts of the world, especially those included in this handbook. This direction opens the way towards the domain of the compared studies, and this is one of the remarkable contributions that the chapters in this section may provide. In effect, geopolitical changes in the last decades brought a new breath to this area with the challenge of comprehending the relations between the global order and the local contexts, between the center and outskirts, whose analyses also imply comparing and understanding the similarities and differences between the local contexts themselves. António Nóvoa (1995) summarizes today's challenges in compared education with the following trilogy: "new problems, new models, new approaches" (p. 51). His thinking is inspiring as he highlights that:

compared education must look at the world as a text, in an attempt to understand how discourses take part in the powers that unite and divide men and societies, how they unleash situations of dependency and logics of discrimination, how they construct ways of thinking and acting that define our relationship with knowledge and investigation. (...). The main argument is that comparative research interprets and builds facts, and is not limited to discover or describe such facts. (p.52)

This kind of demand, increased since the early 1990s, multiplied the objects of compared education indefinitely. Today, it is assumed that every object in education can be compared beyond the comparison between the educational systems (Groux 2009). These new horizons allow to enlarge the methodological repertoire for the comparative effort, as the studies utilize both the macroeconomic and political analyses as well as the everyday microanalyses. According to this viewpoint, urban education must take an outstanding position. And the possible approaches and gains are many.

According to Groux (2009) comparison in education is intended to get to know the macro system, the elements that make it up and its didactic micro-units. In addition, comparison correspond to an heuristic need which seeks a better understanding of the system, but it also plays a pragmatic role, as it is aimed at improving and changing the systems through the links that the experts attempt to establish between the governments and the international bodies. Understood this way, comparison –

either of models, experiences, policies and practices or something else – is mainly intended to raise questions on the part of those who analyze such elements.

The notion of “connected histories”, devised by Subrahmanyam and resumed by Roger Chartier (2007), is also valuable here in order to see the links between populations, cultures, economies, and powers. Chartier says that

one of the possible practices in global history clings to the gateways between worlds that are quite different from each other (Davis 1995) or even to acknowledge in more local situations the interdependencies that connect them far away, and actors not necessarily share a clear perception of it. The inseparable union of global and local took some authors to the notion of “glocal”, which is a correct, if not elegant name for the processes by which common references are appropriated, models are imposed, the texts and goods that circulate around the world, to make sense in a concrete time and place. (p.57)

Reiterating our conviction, the chapters in this section may provide valuable contribution under this perspective, as can be seen in the following presentation.

26.3.2 *The Themes Under Discussion*

Gabriela Czarny, from México, offers an interesting question in Chap. 27 which helps clarify the nuances of meaning in the expression “urban education” in this geographical region, which has been inhabited by several indigenous peoples before the Spanish set foot on it. She also reminds that most of these peoples lived in cities they had built themselves and the association of these populations to the rural aspect is something that will happen afterwards, mainly when the State begins to conduct census and, as a result, social representations are shaped to link the ethnic component to the image of the indigenous as illiterate and underdeveloped peoples. Czarny remarks that the mention of indigenous education in the cities, as part of the public educational system is a recent issue in México, starting some 20 years ago. However, she notes, although this education is not characterized as intercultural and bilingual, it has been important for the recognition of the indigenous presence in the cities and to raise questions on how to serve this population in the schools, taking into account their particularities, tongues and cultural practices. In this perspective, the author examines the notion of migrant Indians and the processes of discrimination these peoples have gone through over time, drawing attention to some of the proposals provided for the education of this population. She concludes with questions about the way today’s societies and public educational systems recognize themselves as multicultural and multilingual, as is the case of México, and how they deal with the education of these peoples.

In Chap. 28, *Sebastian Donoso-Díaz* and *Moyra Castro-Paredes* take the path of the current reform of Chile’s educational system, marked by great discontent which led to the students demonstrations in 2006 and 2011. Both authors show that these movements increasingly catalyzed the dissatisfaction of citizens and civil society with the model imposed by the dictatorship in the 1980s, which had not been resolved by the following governments in the democratic period. In Latin America,

Chile is a paradigmatic case of the education being privatized, in strict compliance with the principles of neoliberal policies which ended up prioritizing the market and tarnishing the limits between public and private education. The authors of this chapter seek to show that the results of this model can be measured by the index of dissatisfaction on the part of several social sectors, mainly due to the social inequality and inequity it has caused and the asymmetries in exercising power. Nevertheless, Donoso and Castro note that the fact that education has been the catalyzer of such discontent reveals that education is still the great hope of a better quality of life for the community. They also consider that the 2013 presidential campaign and the resulting changes in government policies are the sign of a society that looks for significant transformations, one of which is education. A dilemma still remains, though: keeping the market model with corrections or introduce changes that imply a different ways of thinking and doing? These are the aspects around which this chapter unfolds, which is an indisputable contribution to the debate about the future of public (urban) education.

Maria Luiza Quaresma and Juan Pablo Valenzuela, bring in Chap. 29 one of the most controversial topics of today: large-scale assessment applied to schools and students. Their analyses set a dialogue with the dissatisfactions mentioned by Donoso and Castro in the previous chapter. Here, the accountability model is examined as it emerges from the neoliberal policies and settles a culture of competitiveness based on the principles of merit, of quality and of excellence, with serious consequences to the public schools. The authors warn that the rhetoric about the crisis of the public education systems is an instrument to stigmatize the public schools, similar to what happened in other countries. Their discourses result in the appraisal of the results and the academic achievements; middle classes, as they feel insecure, seek a good school for their children. Consequently, the Chilean system goes hand in hand with the market. The starting point of the analysis takes the 1980s, when Chile begins to implement SIMCE (National System of Learning Results Assessment) which measures students' performance at fourth, eighth and tenth grades in reading, mathematics, and science. The text also examines the role of the quality assurance system currently in force in Chile, where standardized tests are major source to assess school performance. The evidence accumulated about the Chilean case urges the authors to recommend that the quality assurance systems must focus less on the information given to the families on how to choose a school for their children and more on supporting the school's abilities for the development of good learning practices and on following the impact of quality and equity in the various policies intended to support education.

Nora Krawczyk and Edna Taira go over in Chap. 30, under an original angle, secondary schooling in Brazil, as they examine the inclusive potential of such level of education. The topic of secondary school has been gaining increased attention in several countries of Latin America because this level is one of the greatest bottlenecks for the education of youths. Drop-out and failure rates are high and appalling. The main contribution of this chapter lies in its focus and in the great number of statistic data presented. The authors say that in 2013 50% of population aged 17–28 years old worked only and just 23% had graduated from high-school. In their view,

one of the arguments to explain the difficulty to reverse drop-out rates in the senior years of high-school is the lack of motivations for youths to study, resulting among other reasons from the scarce opportunities that this level of schooling provides in terms of transition to work. However, they note that there is little knowledge of the labor market's behavior in relation to the requirements of schooling associated with competences and certification. This gap was decisive in choosing youths' educational and job itineraries as the object of research. Analyses led the authors to formulate several inspiring questions which may result in new studies. To what extent the expansion of high-schools and the entry of new social sectors in this level of education has been producing some degree of progressiveness in the labor market, both in the type of occupations and in the salaries? Is it correct to insist on the professionalization as the driver of high-school education? Or this level of schooling should recover its cultural function in the formation of youths in a broader point-of-view, including the preparation for the transition to work, but without the emphasis (almost the exclusivity) that sometimes is advocated?

In Chap. 31, *Silvina Gvirtz and Esteban Torre*, from Argentina, also discuss the issues of secondary school, however, in the perspective of technologies. They note that the inequalities that had acted before as a barrier to the entry of youths in secondary school are now displaced to the trajectories of the students. One of the most envisaged strategies in many countries to tackle this problem and promote inclusion has been the adoption of Information and Communication Technologies (ICT) in public schools. This is the case of Argentina, through the program *Conectar Igualdad* (connect equality), which hands out netbooks to all students and teachers in the public secondary schools, in special education schools and teacher training colleges. The authors deal with the integration of technologies as a policy aimed at two issues of significant relevance in the public agenda of the first decade of the twenty-first century: the situation of the public secondary school and the perspective of universal access to the Information and Communication Technologies. Gvirtz and Torre acknowledge that the presence and availability of technology in the classroom is necessary, but it is not sufficient to improve the educational change. In addition, there are differences in the time that each school takes to integrate the technologies, since this process is affected by several factors such as the leadership of the school principal, teacher training; the wish of teachers to embrace the technologies in their pedagogical practices, the previous level of digital literacy of teachers and students; the school infrastructure. The authors conclude that the implementation of the 1-1 Model has brought a great contribution to schooling in Argentina, by not only reducing the digital gap but also expanding time intended for study.

Marcelo Andrade and Pedro Teixeira, authors of Chap. 32, deal with religious instruction in Brazilian public schools, an issue that has more and more catalyzed the attention. They discuss the complex and conflictive relationship taking place in Brazil between the concepts of lay state, tolerance and secularization to analyze the challenges that the presence of religion presents today to a proposal of secular education in the public schools. How and why should religion be present in school? How and why the relationship between school and religion has currently become an

issue involving everyday conflicts? How and why must these conflicts be urgently negotiated? These questions guide the way this topic is treated leading to an examination of the legislation about education and religion, and to the domain of ethical and philosophical fundamentals. The description of events where religious intolerance appears allows to point the difficulties of conviviality with different religious beliefs and disbeliefs in the everyday routine of public schools in Brazil. The analysis intends to understand how religious intolerance has been fueled and why it has increased in the daily activities of urban public schools. These cases take the authors to examine the challenges of secularism, which is the grounds for the proposal of intercultural education presented by the authors. Advocating secularism is the starting point for a bet they make on intercultural dialogue with the purpose of overcoming intolerance in the schools' life. For them, ethical and philosophical thinking based on "minimum ethics", not only is the grounds for the analysis of the presence of religion in the school, but also it appears as a possible key to read and act upon religious intolerance that currently defies public school in Brazil.

Special education is another issue that has been taking part of the inclusion policies Latin America. In Chap. 33, *Leonardo Peluso, Juan Andrés-Larrinaga and Ana Cláudia Lodi* examine the policies implemented in Uruguay and Brazil concerning the education of the deaf. The authors show that the education of the deaf has been historically understood and organized as a branch of special education, whose effects can be felt to this day in the official documents in both countries. Thus, whereas from the discursive viewpoint the two nations recognize their respective sign languages and the need to provide education for the deaf, the policies adopted do not actually implement a bilingual and bicultural education. When describing the evolution of the models adopted in the different levels of schooling in both countries, the authors review how this evolution sets a dialogue with the changes that have occurred in three intertwined plans: the theories that deal with the relations of the deaf with the language; the educational and linguistic ideologies that exist about the deaf and their languages, and the public policies that originate from these changes; and legal landmarks that deal with the issue of languages, the deaf and education. As there is a fragmentation of the policies adopted in both contexts, the article advocates the need to start an in-depth discussion and an enhanced communication between the designers of educational proposals, those who implement the linguistic policies and the deaf communities, which are ultimately the purpose of the proposals and those who suffer or enjoy such proposals and who, in most cases and paradoxically cannot intervene.

This section closes with the text by *Cristián Cox, Carlos Beca and Marianela* (Chap. 34) which focuses the region of a Latin America as a whole and not a specific country. Thus, this chapter may be taken as the background to interpret the other chapters, beyond the relevance of its own topic, the teaching profession. Authors argue that urban education in the Latin American metropolis have to face the challenges arising from poverty and social segmentation which have built up over the centuries. These tasks are added to more recent challenges, such as the new groups that today reach the final stages of secondary school in Central America, and

which bring to within the school environment the realities of violence by juvenile gangs. This affects the teachers, as they are in the center of the schooling processes and at whom everyone looks when attempting to respond in a constructive way such realities. This chapter deals with the recent evolution of teaching as a profession in Latin America and seeks to describe its distinctive marks and pressures for change currently underway. The strongest and most unequivocal of such pressures comes from the changes in educational policies, formerly directed at an easier access and expansion of the school system, including the building of new schools and the hiring of a greater number of teachers, and today they are guided by more demanding criteria, as those aimed at the quality and the requirements for change in the institutions and their practices. The chapter attempts to characterize the educational agenda in Latin America regarding early and continued teacher training as well as the organization and regulation of the profession as a whole, questioning if the particular requirements of an effective education in urban contexts are being fulfilled.

Chapter 27

Schooling Processes and the Indigenous Peoples in Urban Contexts in Mexico

Gabriela Czarny

27.1 The (In)visibility of Indians in Urban Contexts

Until the 1990s studies of “Indian education” in Latin America and Mexico in particular centered around a focus on rural areas where traditionally indigenous peoples have lived and still live. However, and taking into account that these regions have been the historic settlement areas for this population, this way of defining “indigenous” as related to rural, has been a contributing factor to ignoring the existence of Indians and communities who live and attend schools in different parts of the country, for example, in urban areas. As part of this perspective we have included the socio-anthropological view, which up until the mid twentieth century, was characterized by the fact that “anything Indian” is necessarily associated with a rural, community-based and peasant way of life. This contributed to a lack of recognition of long-standing socio-territorial mobility processes and the conformation of communities with an Indian identity where you can be Indian and recognized as a member of the community even if you live elsewhere, a phenomenon known as *extraterritoriality* (Oehmichen 2005), or as *moral communities* (Martínez Casas 2007). Nonetheless, discussions over the past few years related to a redefinition of the indigenous peoples, the topic of migration, as well as their rights, open up these areas for public policy to begin to be concerned with the indigenous communities that reside in small and large cities.

Changes in Mexico’s Constitution at the beginning of this century highlight the country as a multicultural and plurilingual nation and recognize the fact that this diversity is based on the existence of the Indian peoples who have lived throughout

G. Czarny (✉)

the territory since before the Spanish Conquest. This recognition is the result of struggles and demands by indigenous organizations that have shown a strong presence since the second half of the twentieth century, as witnessed by international agreements and changes in the Constitution and laws in the countries of the continent.

The presence of indigenous peoples in the socio-demographic and cultural composition of the nation is so important that some studies note, from the total number of countries that make up the American continent, Mexico is the nation that is home to the largest number of indigenous peoples (Pueblos Originarios 2007). The latest census data on Population and Housing (XIII) (INEGI 2011), states that of the 112 million inhabitants in Mexico, 15.7% is defined as of Indian descent of the overall population in the country. What is particularly worthy of note is the fact that around 30% of this population lives in cities with more than 100,000 people, and about 50% in small cities and towns with a population between 2500 and under 16,000 people.¹

Visibility and identification of Indian peoples in Mexican cities is the result of several processes that have come on the scene since the 1990s: Progress made in Indian organizations after having their rights recognized under the International Labor Organization (Convention 169) and the 1994 uprising of the Zapatista Army of National Liberation (Ejército Zapatista de Liberación Nacional) with its demands for recognition and the right to live with justice and dignity placed on the national political forefront citizens' concerns with the many faces behind the use of the concept *Indian*, not only in regions considered to be indigenous, but also in Mexican cities.

For decades, the criteria for identifying this population in national censuses has been whether or not they speak an Indian language. As of the year 2000, other criteria have been included, such as self-recognition or self-adscription in the sense of being part of an indigenous home or community.² Comparatively speaking, one could say that even when broadening the criteria for identifying this population in terms of percentages, there are fewer Indians than non-Indians in the country, as was mentioned in the previous section. However, this last statement has explanations which are not of a quantitative nature. To assume the identity of an individual who belongs to an Indian group or community has not been nor will be easy. The discrimination individuals have been subjected to, having to hide one's identity and go unnoticed, and being able to survive in environments hostile to indigenous peoples, are processes that have been internalized for several generations and are not easy to turn around quickly. As various studies have shown, masked identity and self-denial

¹ The National Institute for Statistics, Geography and Information (Instituto Nacional de Estadística, Geografía e Informática [INEGI]) uses 2500 people as a minimum number of inhabitants to refer to urban areas or rural areas, while other institutions like El Colegio de México, for example, propose 15,000 inhabitants. Undoubtedly the same notion of *city* forms part of this debate and areas which 50 years ago could have been considered rural are now considered to be small cities.

² In Mexico there are some 68 language groups made up of 364 dialectal variants (INALI 2006).

with respect to belonging to an ethnic community are processes that are present in multiple indigenous sectors and it is for this reason that we know the census data do not capture under the denomination “indigenous” the multiplicity of processes this population is subject to at present, marked by a change of individual or community residence and the use of the Indian language, among others. At present Indians, just like many other sectors in the country, change residence and migrate for different reasons and in different directions. We know of Indian populations that have settled for generations in various cities around the country, and in these cases their insertion in the labor and educational sectors is very different from the first generation indigenous population that goes straight from their communities to the cities.

27.2 Educational Policies and Indigenous Population: A Look to the Cities

Under the concept of progress and development adopted by Latin American countries at the turn of the nineteenth century, the role of the school was of central importance. School was thought to be a place to bring together under a mestizo ideology based on the notion of citizenship for all sectors of the population, one of which were the indigenous peoples. Behind this search for “integration”, the rights of the indigenous peoples to live under projects that are part of their own civilization, known today as community-oriented, were denied.

Public schooling for Indians in the cities, as an educational project encouraged by the Mexican government, was preceded by a federally sponsored pilot project introduced in 1925 in Mexico City, known as The Home of Indian Students (La Casa del Estudiante Indígena). The purpose was to prepare indigenous youth from different parts of the country to take charge of education and cultural brokering in their home towns and communities. The project expected them “to complete their primary education, receive pedagogical training and training in the arts and trades” and then go back to their communities of origin (De la Peña 1998). The program was cancelled 7 years after it began, but led to boarding schools located in indigenous rural zones, which initially attempted to train professors without uprooting them from their communities. Since then, many educational experiences and projects have promoted a type of education that takes into account the languages and cultures of the Indian communities, mainly in the rural indigenous communities, which is an aspect that we cannot deal with specifically in this chapter. By 1978, with the establishment of the General Office for Indian Education (Dirección General de Educación Indígena [DGEI]), under the Secretariat of Public Education (Secretaría de Educación Pública [SEP]), an official national indigenous education project, open to this population and the public as well, an educational sub-system was instituted for Indians at the pre-school and primary school levels. This sub-system was linked to indigenous policies –known as *políticas indigenistas* – that have since been reformulated in light of other changes engendered in Latin American

indigenous people.³ The school structure, with indigenous teachers trained along the way through various teacher training programs, has grown at the preschool and primary school levels under the denomination of *Indigenous education*, at facilities located throughout different regions, mainly in rural and semi-rural areas.

It is important to point out that the notion of what the curriculum has been over the past decades is known as basic education, and is the sole program for all Mexican children and youth since the establishment of SEP, in 1921.⁴ In other words, the curriculum design in place since then as the national curriculum is common throughout the country and also operates in public Indian education schools. This is also the case in the rest of the region; Central and South America have developed educational programs for Indian communities from the 1970s, known first as Bilingual-Bicultural Education (Educación Bilingüe Bicultural [EBB]) and then in the 1990s as Bilingual Intercultural Education (Educación Bilingüe Intercultural [EBI]), and Intercultural Bilingual Education (Educación Intercultural Bilingüe [EIB]).

If we consider the latest results regarding the level of *school achievement* attained by children in basic education in areas such as Spanish and Math, indicated by tests and evaluations applied by the National Institute of Educational Evaluation (Instituto Nacional de Evaluación Educativa [INEE]), we observe differences that have always existed among the different modalities offered for primary school under basic education (urban, indigenous, rural). It has been detected that for sixth grade in the area of Spanish, primary schools that offer public Indian education were 75% *below the level of achievement* in contrast to 37% *below the level of achievement* obtained by students in the same grade under the modality known as public urban schools. In the area of math, public indigenous primary school student were 65% *below the level* obtained by student in the sixth grade under the modality of public urban school (INEE 2015).⁵

Public indigenous education with an intercultural and bilingual approach has not been extended to secondary and high school education, nor has it been offered to indigenous urban populations. In recent years some projects have appeared known as community high schools as well intercultural universities. These projects

³Indian education in Mexico has undergone various stages, just as has been the case in other countries of the region and is under DGEI-SEP. From this office proposals and educational materials have been designed to educate in the Indian tongues and in Spanish, as well as to update the teachers in Indian education. Indian education schools, mainly located in rural areas, generally include several grades, which means that the teachers have to cover more than one grade in the same classroom and sometimes serve as the principal of the school as well.

⁴Generally, private schools recognized by the SEP also have to meet the national Curricula criteria.

⁵In the INEE's official statistics they mark a difference between public urban schools, rural public schools, Indian education, community courses and private education. There is no indication of the presence of Indian children in the modalities that are not defined as Indian education, which does not imply that Indians are not present. To the contrary, in what is defined as rural public education and community courses, it has been recognized in educational research that a high percentage of the students are of Indian descent.

have different origins and conceptions regarding the meaning of schooling for indigenous peoples. In some cases, they represent attempts to promote processes of autonomy, while in others they depend on the State for subsidizing these efforts under different modalities.⁶

Similarly, it wasn't until the beginning of the twenty-first century that an educational policy aimed at providing services to indigenous children in public schools located in urban contexts was proposed. With the establishment of the General Coordination of Bilingual Intercultural Education (Coordinación General de Educación Intercultural Bilingüe [CGEIB]) and through the National Plan for Education 2001–2006 (SEP 2001) a policy was created that distinguished between *Intercultural Education for All* and *Bilingual Intercultural Education for Indigenous Zones*. This policy of *Intercultural Education for All* is official but in juxtaposition with the other educational concepts.⁷

Currently, there are two governmental bodies that foster intercultural and bilingual education. CGEIB, which until a few years ago was the agency in charge of the program for a sector of primary public schools and which, according to the INEE classification, would include public urban schools in Mexico City. The public urban schools receive migrant Indian children from different communities around the country. States such as Nuevo León and Guanajuato have also promoted similar programs but as yet there are no evaluations available or descriptions of these programs.

In the face of limited structural conditions to cover the needs for basic education in rural and indigenous zones, migration –abandoning the community to continue studying secondary school, high school and, in some cases, the university– is a common experience in many indigenous communities. To gain access to higher levels of education –technical or university– those who have been able to pass previous levels (basic education) have had to migrate at an early age. This means that Indian children and youth attend public schools that do not focus on the indigenous population, and do not officially provide bilingual and intercultural programs. Thus for decades, as shown by different studies, there is an official and practical *invisibility* of the indigenous population in public urban schools (Czarny 2002, 2008; Martínez Casas 2007; Martínez Buenabad 2008).

⁶Support refers to the fact that the maintenance of the institutions, as well as the salaries of the teachers, is the responsibility of the State. To date only the educational proposal of the Zapatistas in one region of Chiapas has been defined as autonomous education sustained by organizations independent of the State (González Apodaca 2004; Baronnet 2011).

⁷For example, under the last educational reform, Agreement 592 (SEP 2011) for basic education (pre-school, primary and secondary levels), refers to the constitutional changes and the rights of the indigenous peoples to receive education that respects and takes into account their cosmovisions. The design of the curriculum of that reform separates the topic of *diversity* in different ways, such as special educational needs, manners and paces of learning, and for the case of indigenous peoples and migrating Indians in the country, makes reference to intercultural education.

27.3 Indians and Schools in Urban Contexts

Changes in migratory intensity and the demand for recognition of the rights of the indigenous peoples has meant that during the decade of the 1990s public policies moved forward with new programs,⁸ including some educational programs in the cities. These programs were put together specifically for “Indians migrating to the cities”.

The topic of indigenous migration to urban centers is not a new phenomenon in Mexico. In the literature and socio-anthropological research, the notion of indigenous migration that addresses the issue of *pendular movements from outlying areas* by these groups dates back to the 1960s, as mentioned in Arizpe’s study (1978). Later on the use of the concept “migrant” was introduced to refer to the Indian population that leaves their communities and home regions and moves around the country, even crossing international borders. This constitutes a problem that has been alluded to by different indigenous organizations that operate in the cities. For example, in Mexico City the Assembly of Indigenous Migrants (Asamblea de Migrantes Indígenas)⁹ has attempted to talk to city government authorities in an effort to gain recognition as indigenous peoples with their own rights, among which is the right to an education that respects their traditions and languages, and at the same time treats them as Mexican citizens. Along these lines they point out that they cannot be thought of and treated under the label of “migrants”, as though they were “foreigners” in their own country, since leaving their communities of origin in the various states is a right that all Mexican citizens have to freely move about different parts of the country.

However, the identification of Indians living in urban contexts turns out to be a topic of particular relevance, in certain states and cities. It is clear that only some states have moved forward in this regard: studies show that an indigenous presence has been identified only in the Mexico City and metropolitan area, Guadalajara and its surroundings, Puebla and its outskirts, and Mérida with its suburbs (Martínez Buenabad 2014).

The fact that the presence of Indians has been detected in these cities does not mean that there is no Indian population in other urban areas of the country, particularly if we take into account cities in states like Oaxaca and Chiapas, where we see the largest concentration of Indian population.¹⁰

⁸ Some of these social programs have been implemented by the Commission for the Development of the Indigenous Peoples (Comisión para el Desarrollo de los Pueblos Indígenas [CDI]) and various agencies that have made other proposals within the framework of the authorities of the various states.

⁹ This denomination was a way of showing and making visible ethnic differences and thus part of the search for the recognition of rights as Indian groups in the face of city government’s authorities.

¹⁰ States report that report a higher percentage of Indian population, even though they do not differentiate between urban and rural areas, are Chiapas, Oaxaca, Guerrero, Veracruz and Puebla. In these states there are no educational nor research programs on school processes for indigenous children and youth in public schools in urban areas where they undoubtedly are in attendance.

Likewise, systematic data are not available on school performance by Indian children in regular public urban schools. However, in a report on schooling for the Indian population (Schmelkes 2013) – and in spite of a lack of information on this specific population that attends regular urban schools – it has been estimated that 30% of school-age children from indigenous families in pre-school and primary school are attended in the regular school system and not under the sub-system of Indian education.

There is not much recent investigation on schooling for Indian children and youth in public schools in cities, and the studies carried out mainly report on Mexico City and its metropolitan area; Guadalajara and suburban areas; Puebla in the state of Puebla; Pachuca, in the state of Hidalgo; and the city of Monterrey in the state of Nuevo León (Czarny and Martínez Buenabad 2013). The largest number of studies of schooling for Indian children in cities are in Mexico City and its metropolitan area. These research studies are centered on the situation of school insertion for indigenous communities with the largest number of representatives in the cities, among whom we could mention the Zapotecs, Otomis, Mazahuas, Triquis, and Mazatecs (Bertely 2006; Czarny 2002, 2008; Rea 2009; Rebollo 2007; Santana 2014). They report on the complexity of the processes, as do Molina and Hernández (2006), in their sociodemographic study of the Indian population in the metropolitan area of Mexico City. These studies also point out that even under the labels of “mazahuas”, “zapotecs”, “triquis”, “otomís”, etc., these groups are not homogeneous. The common ethnic denominations refer to migrants from different communities, also the way in which they insert themselves in the city varies among the groups and within the same group. Moreover, many urban sectors are composed of second and third generations living in the cities.

These analytical references regarding the type of Indian population that resides in Mexico City are important because they allow us to propose that work in public urban schools cannot be carried out in the same way for all these groups in terms of a sole approach to implement and develop academic proposals. It is not the same thing to formulate an intercultural and/or bilingual proposal (Indian language and Spanish) at schools where the Indian population is second and third generation and born in the city, as it is for those designed for the first generation population that has arrived only recently from their home communities. Along these same lines, quite a few of the studies from Mexico City report that this population found in certain boroughs and districts where children from various indigenous communities attend school, may or may not be speakers of an indigenous language as well show different settlement patterns. At these schools we see a mixture of boys and girls recognized as “mestizos” (in contrast to “indigenous”) and also as “migrants”. In many sectors of Mexico City they are mixed with those who form part of the so-called “original” settlers and who, as descendents of the Náhuatl culture, are characterized by historical collectivities with a differentiated territorial base and cultural

identification and live in the various boroughs that make up Mexico City and its greater metropolitan area (Sánchez 2004).¹¹

All of these population reconfigurations make these schools true multiethnic and multilingual sites that go beyond the picture the censuses try to paint, and based on them, public policies attempt to design programs for peoples and communities identified as indigenous. Research on indigenous schooling in urban contexts once again touches upon the age-old topic in this field of study in the sense of how schools are used and what formal schooling means for the indigenous peoples.

27.4 The Meaning of Schooling

Research has shown that access to different levels of schooling in the regular public education system has several different meanings for members of indigenous communities. Some feel that access to higher levels of schooling for members of indigenous communities has meant the introduction of intracommunitary *hierarchization and distinctions* based on levels of schooling experience, an element that did not previously form part of epistemological horizons in many of the communities. In other words, “to be somebody” by way of obtaining academic credentials marks differences among members of these indigenous communities that plays out in many different ways (Czarny 2008; Martínez Buenabad 2008; Chávez 2010; Santana 2014). Studies in the 1980s, such as Vargas (1994), pointed out that indigenous teachers had turned into a type of “elite” within their communities, not only by becoming literate in Spanish—a sign of prestige in the national mestizo society—but also by having become *intermediaries* between the community and local and federal governments.

Over the past few years, access to higher education for those populations which historically were excluded from this level—like the indigenous peoples—has allowed for new Indian professionals to become visible. This is not only true for teachers of basic education in Indian areas, a policy that had been promoted since the 1970s, but research reports on other aspects as well. We could mention stories and narratives on schooling formulated by indigenous youth from different cultures, communities and linguistic groups, that show the advantage of becoming more professional and having access to different legitimate arenas and discourses allowing them to address and work for recognition of their rights, and denouncing inequalities, racism and discrimination (Martínez Buenabad 2011; Czarny 2012; Rea 2009; Flores 2015). In the same way, several of these professionals head civil organizations, and educational and political projects designed in their communities, where they are seeking a type of education that matches their own interests and demands.

Research has also reformulated and shown the way in which cultural identities are approached and understood in the process of their formation. The *resignification*

¹¹This line of research on the indigenous population that originally settled in the valley of Mexico City and schools is not well developed, see Ornelas (2002).

of the subjects themselves and their indigenous communities, has taken place through their every day life and interaction in cities and schools; through the use of identity and indigenous languages present in contexts with different players and with ethnic tensions (Martínez Casas and Rojas 2006; Domínguez 2010; Martínez Casas 2007). Undoubtedly language displacement faced by indigenous languages during migratory processes and population movements is a topic that merits special attention under the multilingual scenarios in the cities and particularly in the schools (Martínez Casas 2012).

Studies carried out in public primary schools in different cities where intercultural proposals were fostered and came on the scene as part of the latest educational policies¹² mention the discrimination that this population suffers, both at school as well as in metropolitan areas where they reside (Saldívar 2006; Barriga 2008). Others also show that what has been called “learning problems” attributed to Indian children are not this at all, but rather the result of cultural and communicative distance linked in some cases to the use of Indian languages by the children and the lack of knowledge of these languages by the teachers. In addition, differences in the so-called school culture and cultural practices affect different modes of learning, interacting and ways of being children in indigenous communities (Rockwell 2008). These tensions between school culture and the culture of migrating indigenous children are expected to be resolved through an intercultural approach that centers on the indigenous as “what is different”, which, ironically, tends to reinforce stereotypes. In this sense what we see is a concept regarding the attention given to a population known as “migrating Indian” and generally associated with the notion of cultural differences as a situation of “poverty” and “disadvantage” (Saldívar 2006; Rebolledo 2007; Raesfeld 2008; Czarny 2010). In addition, these studies leave open the lack of potential of this type of intercultural educational discourse by conceiving it as a compensatory action, a proposal to provide for “what is different”, and although this program is not announced as such, it suffers from a disadvantageous bias in its pedagogical proposal.

The overriding need to open educational institutions to old-new actors who now, under the theme of diversity and interculturality, demand the right to be recognized as different, poses a central challenge that this “difference” should not be translated as inequality. Also, and taking into account the poor academic results shown in the evaluations at primary indigenous schools (DGEI-SEP), where this bilingual and intercultural proposal is or is not in force, several indigenous organizations have posed the urgent need to *change schools*. This change not only refers to real conditions of equity with respect to schools with infrastructure and teachers trained to work with diversity in different contexts, but also to the fact that people should be able to contribute their knowledge to the construction of broader scope and more democratic school experiences (López 2009).

¹²I am referring to the programs mentioned in previous paragraphs and promoted by CGEIB known as the Program for Bilingual Intercultural Education for migrating indigenous children that was applied in some public primary schools in Mexico City.

27.5 Challenges for Schooling in Societies That Enjoy a Reputation for Being Multicultural and Plurilingual

Working with diversity in the field of education presents many challenges. In this case I refer to the school experience of indigenous populations in urban contexts (regular school). One level refers to the conceptualization present at schools regarding diversity centered in indigenous students. Going beyond the legal framework and policies, there is a performance criterion and agencies that facilitate or hinder diverse processes that impact life at school, learning and becoming citizens with rights. Another level refers to the reformulation of the notions of citizenship to remedy the socio-cultural fracture between Indians and non-Indians that has persisted since Colonial times in order to reconstruct the multicultural and multilingual map of contemporary Mexico. I will describe these two levels in the understanding that they integrally cover the implications for political, social, pedagogical and cultural studies.

27.5.1 Conceptions of What Is Indigenous at Schools in Urban Contexts

There is no doubt whatever that the ways of looking at the differences in the educational system, which in this paper center around indigenous peoples and basic education, have an impact on processes that are unleashed at many institutions. These processes work to both reach and diminish the potential of identities and thus open or close learning opportunities with multiple meanings.

Education under the label of intercultural as envisioned for public primary schools in some states and cities, has the indigenous population as its target, although this is not proposed for all levels of the system. Although, the obstacles these programs face can be attributed to different dimensions, the shared central issue is how the migrant Indian population in urban school settings is perceived.

Once again, it is undeniable that the topic of teachers and their conceptions are a key issue to be included in any educational program that attempts to transform and change the situation at school. Teachers from public urban primary schools who receive Indian children from diverse communities and linguistic backgrounds, recognize the complexity of schooling in a “diversified classroom”, given their particular features, whether they be physical, cognitive, linguistic, cultural or gender considerations. As has been mentioned by many critics of educational reforms during the 1990s, these reforms have made the teacher shoulder the demands for change. More abilities are needed and more time as well in order for them to do their job in the classroom (Hargreaves 1998). In spite of this, the regulatory and conceptual school structure has not changed, nor have the ways of generating participation by teachers and communities in defining school projects, among other considerations.

Teachers in urban regular schools have trouble recognizing “differences” among their students. When they are recognized as belonging to an Indian ethnic group, these differences are often understood to be “problematic” for learning. Emphasis is placed on the word “problem” when, for example, the mother tongue of indigenous children, as well as their cultures, are identified as obstacles for academic achievement.

Also, the results of intercultural educational policies for all implemented in certain schools in Mexico City where Indian children are enrolled had not been considered previously; the introduction of this topic has meant that many teachers “rediscover” both their country as well as their own origins. We start to hear comments from the teachers like “*For me the topic (of Indian peoples) affects me a lot... I was never able to accept that my grandparents come from a community...*” “*...until only a while back I thought that there were no Indians in Mexico and if there were some, they were way up in the mountains...*” (Czarny 2010: 211). These statements indicate that “intercultural” programs that center on ethnicity have had an impact on the school community and on teachers in particular. I identify at least two tendencies among teachers and administrators when they have an indigenous presence at school.

- (a) Teachers “see” communities with “low expectations”. In terms of achievement at school being Indian represents a “shortcoming”. In other words, if the children are Indian this is considered to be a stumbling block and we hear comments by teachers and administrators like “They don’t speak Spanish well and that’s why they have so much trouble”, “Their parents don’t care about school, they only want them to help out at their market stand”. These attitudes, along with the fact that they are usually poor and marginalized, increases teachers’ low expectations for their success at school.
- (b) To the contrary, teachers try to situate indigenous children and their parents in a position of “equality”. They take into account that these communities do have expectations about schooling, just like other non-indigenous children and parents. In some cases, they recognize that Indian children have the same abilities and place a high value on school as do other children and their parents. This has been expressed in statements such as “Indigenous children are like all the other children at school” or “Indigenous parents are always attentive to what the school asks them for”. Under this vision of equality between indigenous and non-indigenous children, differences are hidden or minimized.

Undoubtedly group work and collaboration with the teachers are key ingredients for educational transformation at school, where differences should not be understood as a “disadvantage”. Instead, it is important to recognize that we live in multicultural and plurilingual societies crosscut by deep social and cultural inequalities, an aspect that has to be borne in mind for the undertaking of any educational development program.

27.5.2 *Reformulation of the Perspective of Citizenship*

Instead of designing educational programs for minorities –in this case those considered to be indigenous and in public urban or general schools– what is needed is a complement in the form of policies, like the social actions by means of changes in the laws that have been introduced in Mexico over the past few decades.¹³

The Indians of the Americas cannot be treated simply as ethnic minorities, but rather as people with special rights who have been able to place their demands in international arenas and within their own countries, seeking recognition as the original settlers who inhabited these lands before the arrival of the Spaniards. The present, after 500 years of imposition first by the Colony and during the period of Independence and the establishment of national states, finally finds Indians in different contexts, both rural and urban within the country. Some are speakers of their Indian tongues and Spanish, while others only speak Spanish, but maintain Indigenous cultural practices. Therefore, to introduce an approach known as “inter”, “multicultural” and “bilingual” (Indian language and Spanish) in education, does not provide one single answer to what is a right. As some authors have proposed, what is needed is an approach –at present known for some as an intercultural approach– that will allow for the construction of what in some contexts of the region has been called democratic and pluralistic intercultural education (López 2009). This approach implies the notion of plural and democratic intercultural citizenship, where the indigenous peoples are not treated as minorities with rights but as part of a society which is recognized as pluricultural and multilingual. It follows that under this reformulation at school we are betting that indigenous peoples can contribute their knowledge and practices to a new societal formation.

There are Indian youth who want to study at schools that offer different levels, including the university, in cities or in places closer to their communities, where they can share with other non-indigenous youth what could be called a youth culture where music, internet and their bodies are languages that bring them together beyond ethnic considerations (Urteaga 2011). Thus, we speak of contemporary indigenous youth, with identities that go back to the past, but who live in the present, images that turn out to be complex even without thinking about schemes where mestizaje has played and continues to play a central role in the formation of a unique historical statement on how national identity is defined.

In the debate on indigenous organizations and different collectivities where indigenous youth participate, the right to equality is proclaimed, while at the same time they want recognition of the fact that they belong to ancestral communities. Part of the discussion has evolved around the search for a plural citizenry where “we all fit in” (Villoro 1999). Nevertheless, there is a deepening of social inequalities, expressed in part because of the lack of access to basic quality services such as

¹³For example, the Law of Linguistic Rights promulgated in 2003, under which the indigenous languages are recognized as national languages, mentions that Indian peoples and communities are entitled to receive education in their native Indian language, as well as to participate in the development of educational programs throughout the national territory (INALI 2006).

education and health, among others, as well as growing political repression in their communities. As a result, we see a greater polarization in discourse and in political and pedagogical practices which in the twentieth century have tried to reach an articulation between the State and indigenous organizations and communities. This is related to a rise in the number educational proposals generally designed for rural Indian regions under the notion of “their”, “alternative” or “autonomous” attempts to reformulate and correct inequality and cultural injustice in the field of education. These proposals range from the redefinition of academic objectives and content that includes curricular design and educational materials, to the profile of the teachers who work with indigenous groups, including how to finance these projects with greater or lesser dependency on the State.

All of the preceding reminds us that even if formally we are all equal citizens under the law, in practice socio-cultural fracturing exists. Taking this into account and picking up on what Tubino (2005) has stated, we have to highlight the fact that policies of recognition – be they multicultural or intercultural – are not enough. We must also consider distributive policies that complement them. The demand for justice and socio-cultural equity regarding indigenous schooling in urban contexts is a point that has undoubtedly become a common thread in these debates: the urgent need to recognize cities and schools as multicultural and multilingual environments that characterize present-day Mexico.

27.6 Conclusions

As described above, research on school processes for the indigenous population in Mexico is a field of studies that has developed over the past 20 years. Its development is attributable to the fact that up until the beginning of the twenty-first century the existence of Indians and communities who have settled in the cities was not officially recognized by the public education system. In spite of this bias regarding who is Indian and who is not is still present in the national imagery. The perception is that Indian people supposedly live in rural areas, are monolingual in their indigenous languages and wear traditional attire.

This is why socio-anthropological and educational research have pointed to *invisibility* as a way educational institutions deny the presence of people who belong to indigenous communities and who live in cities. Many of this population are second and third generation families and students who reside in cities and attend regular public primary and secondary schools. They do not attend schools that are part of the public educational sub-system that traditionally has provided services to the Indian population, mainly in rural areas.

Studies carried out on the presence of Indians in regular public schools in urban contexts have reported discrimination against children and adults from different ethnic groups and also those considered to be mestizo. Studies also point to the reformulation of identities of these Indian communities, allowing them to position and maintain themselves with a new life in the cities and to change modes of

socialization and language displacement processes. Moreover, teachers have been challenged to change the way they look at diversity, in this case regarding their expectations of Indian students, as well as the implications involved in generating significant teaching processes and learning.

Some analyses with regard to programs known as intercultural that provide schooling for the Indian population show that they do not always operate from a cultural relevance and equality standpoint. These proposals, when they form part of school programs in the urban contexts denominated “regular”, underscore the “cultural disadvantage” of Indian children by placing ethnic and cultural dimensions as a difference that is frequently considered problematic. Criticism of inter or multicultural approaches heard in Mexico and in Latin American have made it possible to highlight the urgent need for these proposals to advance in the recognition of rights with equity, social and cultural justice.

We need to understand the role of public schools as a means that allows thousands of people to gain access to education. Nevertheless, with the increase and spread of public education systems, different modalities have been offered, such as schools for Indians, technical secondary schools and televised schooling, that have often led to inequalities due to structural conditions affecting these schools.

The demand for *changing (transforming)* schools presents some knotty problems. While public policy and educational programs are trying to define their agendas, the fact is that Indian children, together with their families and their communities, are attending schools that are part of the national public education system and are undergoing conflictive experiences marked by discrimination yet they are also, at the same time, opening and shaping new spaces for inter and multicultural production.

The discussion remains open, as does the need for more research on the implications of what is meant by an educational proposal to provide services that take into account diversity without suppressing cultural differences and without turning them into a “disadvantage”. The field of studies on curriculum design, the formulation of course materials and proposals to work in multiethnic and multilingual societies, still maintain mechanisms that under the guise of interculturality frequently mask societal and cultural inequalities.

Chapter 28

Public Education Policies in Chile: Tensions and Conflicts in the Ongoing Reforms

Sebastián Donoso-Díaz and Moyra Castro-Paredes

28.1 Introduction

Education has been a matter of increasing relevance for Chilean society, to the extent that today it is an unavoidable topic of public discussion. The reforms of the education sector, which started in 2014 under the new State administration, took into consideration – nominally, at least – an important part of the social movements' demands from the year 2006 and those from 2011, which efficiently catalyzed the discontent of the population with the sociopolitical model imposed by the dictatorship at the beginning of the 1980s, which was administered without sufficient corrections by the democratic governments that followed (Concert of Parties for Democracy, 1990–2009, and Alliance for Chile, 2010–2013), the first of such coalitions a center left, the second clearly a right wing.

The social covenant in force during this democratic quarter of a century (1990–2015) faced an enormous crisis, impossible to measure in its full extent, as a result of the neoliberal model that, in its most significant scopes, has increased the social inequality and inequity, involving education within this dissatisfaction, because it has not had the prescribed impact on the class mobility of the population. Thus, the imbalance between public and private education have deepened even in democracy, alongside the progress of social differences, which are also reflected in the growing gaps between urban and rural education, accounting for a structural phenomenon of inequalities of high complexity.

Text of the project from the National Fund of Scientific and Technological Research of Chile (Fondecyt) N° 1150350

Education has been the catalyst agent for the large social dissatisfaction, which has a wide variety of expressions. Nonetheless and despite the manifest crisis, education continues being for many the great hope of reaching a better quality of life in the near future – sufficient reason to explain its importance.

The student movement of 2006 put educational issues on the public agenda, achieving an important presence in Chilean politics. Another turning point was the big student movement of 2011, which resumed and deepened the previous movement's demands, many of which were fully in force – clear evidence of the public education crisis, extending the phenomenon to a crisis of the whole social system and exceeding the education sphere, although education remains the binding element.

The presidential campaign of 2013 and, as a consequence of that, the government's shift in focus from 2014, renders an account of a society that is looking for significant transformations, one of which is education. Nevertheless, there are different views on the depth and meaning of such a shift in focus. Essentially, the dilemma is either to maintain, with corrections, the market model in the Chilean society or, alternatively, introduce major transformations oriented at assuming it as a social right, implicitly demanding the installation of a new paradigm in this regard. The political debates on Chilean education during this decade have revolved around these aspects, with nuances and incidences that make the phenomenon analyzed a significant case study.

Essentially these reflect an issue in which at least three components can be identified. One, the understanding that it is not by chance that the problem has reached its present state, but that it is the consequence of a sociopolitical model that requires the market to reach, precisely, the results that have been achieved. Second, the system has reached a critical point, consistent with the weaknesses shown by the social covenant governance, that requires strategic decisions, paths which imply completely different impacts when intending to correct the market or, finally, to withdraw education from the market and treat it as a social right. Three, this disjunctive renders accounts of different content, for which there are different analyses and proposals, not completely accomplished and consistent, highlighting the role of the State, the meaning of public education and the freedom of teaching, among others.

The chapter is built from the tensions of Chilean society originating in the disjunctive orientations of the transformations of the educational sector, contextualizing them within the framework of the principal social conflicts that currently find expression. The text is sustained by the bibliographical analysis of the subject matter whose organization requires the central conflict of the tensions, the dominant logics of the proposals being discussed, and analyzing the views directed to regulate the market as well as those seeking to replace it sustained on the social right, in order to, finally, associate these matters with the theoretical challenges that burden education in its disciplinary development, but conceived of in their capability to solve the problems of the sector.

28.2 The Conflict: Adjustments of the Market Model or a New Paradigm in Education?

The student movements of 2006 and 2011 are unavoidable benchmarks in the analysis of educational policy and even more so for public education. Their ambitions and dimensions are the subject of study. Although the analysis of the trajectory of the main themes of Chilean educational policy can be referenced to the beginning of the present millennium, the social crisis of 2006 clearly exemplifies the end of what Burton (2012) called the period of “limited representation,” characterized by the hegemonic paradigm operating without counterbalance and the weaknesses of the social movements, which presents itself in the post dictatorship political model as “a total suitability between the forms of the State and the state of the social relationships” (Ranci ere 1996: p. 129), also defined by others as the unfinished transition toward democracy and its effects (Garret on y Garret on 2010).

The students’ mobilizations in 2006 broke with what had been a situation of full agreement between the groups of dominant power in society, essentially political/economical, creating as an institutional response (by the executive) the Presidential Advisory Council for the Quality of Education, whose final report (2006) presents fundamental elements to understand the recent past (since 1980) as well as current events; summarizing for Corval an (2013), the convergence of great part of “the accounts” about the educational problem include the statist-centre, the market, and the attempt to synthesize both, incarnated by the Concert’s policies. Elements of continuity are discussed within the Advisory Council – education as an instrument of equality in unequal societies, the State’s responsibility in the provision of access to education and for educational content – and also those of the changes, representing rupture and innovations such as the self-limitation of State action as provider, the cession of attributions to private actors, and the profit. Large scale transformations are also mentioned, namely: the redefinition of the relationship between the State and society regarding the provision of education, through the transfer of an institution based on the central State to the market mechanism, and the transition of the fiscal to the municipal (Corval an 2013).

The year 2006, then, constitutes the “deliberation stage” of Chilean education policy (Burton 2012), the turning point that opened the space for the “restricted representation” phase (from 2007 to the present), understood as a manifest expression of the simmering tensions which had not been recognized nor resolved before the mentioned Council (2006), during the “agreements democracy” that neutralized the existing tensions and kept political and social stability. Such tensions, expressed with renewed spirit, divided the political coalitions and social groups, on the basis of three areas which have been the source of conflict: the profit in education, the (re) definition of the role of the State, and selectivity/segregation within the educational system. Areas linked with free education (including the tertiary), were strongly upheld by the social movement of 2011.

The relevance of both social processes and their progressive impact on the political agenda of the governments since then offer glimpses that they were major transformations and may reach paradigmatic traces as education – since 2006 – became the binding element of unfinished social processes, drawing most of the public attention.

The social movement on education of 2011 questioned the market as the best organizer of the educational system. Its evolution severely undermined the market operation, but it was not enough to replace it as coordinator of new social relations. The fact that education is considered merchandise in Chile and as such is distributed according to the rules of the market is a much more difficult problem to tackle than was originally expected. It was not enough to expose the market in its pattern of relations, as it is an intricate network of social phenomena with diverse holds on political, economic, religious, and philosophical enclaves built on more than three decades of hegemonic operation. It also has an ideological/explanatory framework that protects it – until now – from the reformist brunt, including some attempts that took place in democracy, quite convincing at the beginning, and more testimonial afterwards.¹

The increasing criticisms against the market, intended to change the paradigm under which to organize and distribute education, implied that those upholding neoliberalism no longer defended the market as a guarantor of efficiency and freedom, sustaining, on the contrary, that Chilean education does not operate as the market, sheltered in the constitutional articles which regard education as a right (Article 19, N°10). Society (the State) provides education to those that cannot or are not willing to pay for it, which would be proof enough to demonstrate that it does not operate as the market. This reasoning is incorrect for its occurrence is not only politically unacceptable (those who cannot pay are left without education), but it is also at odds with a democratic society. Secondly, the fact that the State offers a basic level does not imply that those pursuing a better quality must not pay for it. On the contrary, in the educational market different “qualities of education” are traded. This means that when one pays a higher price one should get a better quality of education, which is being questioned and for which the defenders of the market do not have an answer other than the one mentioned.

Conservative groups saying “that public education is poor quality education,” sustain that changing the provision of education is not the problem, but improving the quality of free education. The neoliberal argument omits the fact that if there were no different qualities of education for which families could pay, the market would make no sense. For private education to be attractive to investors, and families to opt for paying, it is necessary to provide a low quality public education for the poor. In view of the foregoing, the dilemma takes two aspects (Sandel 2012): Can different criteria apply to the “market” for a society to distribute education?

¹ The more convincing attempts at change took place in the 1990s, with the unsuccessful attempt to change the Constitutional Organic Law on Teaching (LOCE). Those we called “testimonial” correspond to the draft bill on Strengthening Public Education from the year 2006, which had virtually no parliamentary discussion and was finally withdrawn from Parliament.

What would such criteria be? Knowing Chile represents an extreme situation in which the market distributes virtually all goods.

Within this context, in view of the demands being discussed and their incidence in the political agenda, it was possible to believe an important social change stemming from education was approaching. It would involve a paradigmatic transformation of the Chilean State, sustained in the generation by a new bond between the citizens and the State drawn from basic social rights.

In the meantime, the conservative argument in this matter was changing – point at an issue not entirely foreseen by the social movement in the euphoric days of 2011 – thus demonstrating that neoliberalism was far from “extinction,” doing away with all libertarian slogans as long as it was useful to the objective of saving the market at all costs, as its “deconstruction” is more complex than its construction. The situation gets even more complex when intending to install this transformation only from the education perspective, relevant though it is. Additionally, the market requires few and simple principles to operate, yet its replacement implies a much more elaborate and complex pattern to function. It needs precision and clarification at a higher level than just a political agreement on basic principles (as was the government programme of the current State administration – Bachelet, M. Programa de Gobierno, 2013), expressed on the slogans of the social movements in reference, though not enough to guide its implementation.

Finally, it is essential to recognize that in these decades neoliberalism positioned itself in such a way that there are people ready to defend the education market and demand “the right to pay for education,” which became “a discrimination tax” charged by the school to the families (guaranteeing the selection of the students), to ensure their offspring share just with “equals”, because in Chile the educational results for all the population have been proved beyond any doubt to be linked to the socioeconomic contribution, parallel to the insignificant difference of contribution paid in the subsidized private education over the public (Drago and Paredes 2011) and the low added value of the schools (Treviño and Donoso 2010). That is why it is so important for private schools and for families who ascribe it to this model, that there certainly is the possibility to select students.

In spite of the debates that have taken place, it is evident that discrediting the market was not enough to provoke its collapse. In Chile, after decades of supreme operation, the market is validated for many citizens that only know this rationale. Expected actors have come forward to defend it (laity and religious businessmen, politicians and private sector leaders) as well as unexpected actors, namely, some families from what has been denominated as “the new (social) emerging sectors” demanding their right to pay for education. They demand the possibility to buy education in the market, affirming that their interest does not lie in a system that guarantees a free better education. They want to make sure themselves, as they do not trust the State nor society: do the best you can, it is therefore the great success of neoliberalism.

The critics from the 2006 and 2011 movements to the prevailing model did not reach the degree of strength and coordination required to disjoint the networks of power built by neoliberalism. Their weaknesses as a social movement started when

they concentrated their demands in the field of education² (Oct/Nov 2011), assuming that “all reforms would gather” around it, which was not the case, as demonstrated by the development of the political events from 2014 to date (mid 2015). In this last period, there has been a switch in the language and content between the first and the rest of the announcements from the Government, each time looking for greater consensus from the groups of power and less reference to the initial slogans of the social movements.³

In the meantime, it is clear that the thematic links between the political parties and the social movement were devised in order to adapt the model rather than change it, integrating different social actors without having previously set up a project of a society. The education problem was limited to the educational sector, and not open to become a social decision on how to distribute the assumed public goods (Sandel 2012; Roemer 2000). Within this framework, the major social changes have been hampered. This added to the conservative’s argument, to avoid that the public education solution calls into question the market’s existence, and evidenced the legitimacy reached by neoliberalism in the daily behavior (conscience) of the people (Solano 1999). It looks like the major change – in case of indeed being the desire of the majority of the population –, is in question, until other issues are solved – amongst them the ongoing reforms and the key players’ actions in this regard.

28.3 Tensions: The Logic of the Change in Strategy

The debates about strengthening public education, it is understood, imply first defining the sense of the transformations, and then determining measures and strategies to implement it. The Chilean case does not follow this itinerary, this being perhaps a distinctive feature of the logic behind its installation. Rather, there is a mixture of political timing and the viability of certain changes, without a serious discussion of the subject. They explicitly expect to reform the market, correcting its main imbalances or making a change in the paradigm of the State, as this issue implies important decisions for the government alliance they may not face, without an important burnout cost, questioning the change in paradigm, thus causing new social unrest.

The improvement of the market attracts – initially – less tension in different sectors of the ruling powers, whereas the change in paradigm undoubtedly generates more uncertainty. The improvement is simpler to implement – deepen some

²Some specialists indicate, without necessarily having an empirical base to endorse it, that the new middle layers of Chilean society is moved by two themes: consumption and education. That would indicate belonging to the “new middle class”.

³An example of this were the initial announcements, in view of their negative to adopt reforms on profit control, about the Government purchasing private schools, which yield to pressures and was changed by a rental system and finally by a leasing system as a formula to amortize resources, all that in a 6 months period.

corrective measures to the subsidies with emphasis on the public institutions' leveling on the socioeconomic components of the population and their impact on the educational service, and adding some regulations for the private sector.

As indicated, the change in paradigm means conceiving education as a social right, which implies providing it under the sole reason of "being a citizen," namely: a person with equal rights to his peers. This is what the defenders of the market do not accept because it means its disappearance. Under the paradigm of social rights, this is a public issue, because everyone has the right to the same prerogatives. The system should organize itself to fulfill this function based on "society's wealth," expressed by the financial resources that it is capable of assigning to this task (Atria 2014).

This issue with all its nuances has not been discussed in a public debate. Although, the Government has boosted corrective initiatives to the market, directed to the private sector that receives public funding, achieving certain important changes in their behavior, leading to the passing of the Law of Educational Inclusion in January 2015, that partly regulates profits, copayment and the students' selection processes, and as a second line of proposed reforms for 2015–2016, deals directly with strengthening public education.

28.3.1 The Corrective Proposals to the "Market Model" at School Level

The orientation within this field is related to the private sector that receives public funding, which has large enrollment coverage (54 %) in Chile (Mineduc 2013). The debate in this case is not whether the private sector should exist; any attempt to put it under State control would be politically unfeasible. Furthermore, that is not the central problem: the main issue is that education is not distributed according to the rules of the market. So the idea is to fill the lack of measures that allow regulating the private providers of education with public resources, also matching their rights and duties with those of public education.

The discussion is not either on freedom of education and/or on the educational projects of private institutions, as has been stated by some defenders of the market. Freedom of education in Chile means not all the education is to be provided by the State. But, that does not mean that anything can be taught under any standard. Freedom of education must consider the educational projects of the (civil) society in their different expression, as long as they are consistent with the project of the society (Atria 2014). This is not the problem today, to insist that contributes to deflecting attention from the fact that education operates according to market criteria. The objective of the reviewed changes is to restructure the Chilean educational system, for education to cease being a commodity and become an effective right of all the citizens.

Beyond the programme proposal of the present Government – which essentially talks of changes rather than reforms, although it is referred to as one of the great reforms (MB Programme 2013) – the first law drafts deal with the debated issues and are mainly related to the privates: free schooling, understood as ending family copayment; stopping students' selection processes and ending profit-making by educational entrepreneurs, expressed finally in the Law of Inclusion of January 2015.

The principle of free schooling⁴ is closely related to equity in regards to access as well as to the educational processes, and it must be understood in terms of those objectives. In the Chilean case, free schooling is a key principle when viewing education as a social right; it is the way to make equal opportunities a reality. Replacing copayment is based, for the family – not for the educational entrepreneur who will now get his income from the State itself –, on the fact that it ended up being an efficient instrument of students selection, thus increasing discrimination and social exclusion (Valenzuela et al. 2008; Bellei et al. 2013), perverse effects conflicting with the objectives of a democratic society that finances its educational system with public resources. On the other hand, copayment or Shared-Financing⁵ has been a relevant financing instrument for private institutions; that is why the proposal assumes its gradual elimination, considering also public treasury resources. It would also generate positive externalities for the educational entrepreneurs by reducing management costs.

As indicated, its public debate was extremely ideological and, was sometimes regarded by groups from the opposition as an attempt against freedom of education, which as to substance and form is inconsistent with facts and circumstances. Opposition to this initiative from the private business sector is based, more than on its financial impact, on their understanding that in the mid-term private institutions will be forced to accept any student, independent from social condition, which will impact their educational results, leveling them to those of public schools, as a result of the “social mixture” generated by non-selection.

These effects, identified by power groups, influence the activity of private educational leaders gathering their political support to impede copayment elimination. On the other hand, this decision could also have a negative impact in the short term for the public sector, as copayment has been a barrier for the non-migration of students who, willing to move, cannot afford it and have to remain in public education. Eliminating the restriction may produce a migration to the private. In order to reduce this effect it is necessary to strengthen public education in the short term.

In view of the foregoing, the principle of free schooling is closely related to equity of access and of educational processes, central scopes in the Chilean case, because the universal coverage achieved – with the exceptions indicated – does not imply equity in the educational processes. Therefore, this is an important issue to address, for if there is not quality of education, which implies equity in the pro-

⁴This proposal understands free schooling as the provision of a service paid by the State.

⁵Shared-financing was approved in 1988, but it was corrected upward in 1993, during the first democratic government. It was defined as a copayment mechanism, structured in sections, to which schools apply (mainly privates). It entails a monthly fee per student paid by the family.

cesses, effective equity will not be achieved, with a negative incidence on the most vulnerable population.⁶

Closely related to the above is the student selection, because of its incidence in the social segregation as well as in validating profits made by some businessmen using public resources.⁷ Approved new legislation prohibits student selection up to eighth grade (from a 12-year total). It is known that restrictions have not impeded an important number of private and some public schools to select students, although this was restricted to sixth grade by previous laws.⁸ At some point the Constitutional Organic Law on Teaching (LOCE), in effect from March 1990 to August 2009, facilitated this process for privates though denied it to public schools. The latter is correct, though interesting as it legitimized private selection and avoided an eventual social conflict. An important part of the results achieved by subsidized private schools was the students' social capital, more than the teaching added value provided, the result of less poor students migrating from public schools (Treviño and Donoso 2010; Mizala and Torche 2012).

Student selection through copayment and/or merit reasons, both related to the socioeconomic background of the population, guarantees in the Chilean case better educational results thanks to the decisive effect of the "social cradle." That is why it is essential for private entrepreneurs to maintain, overtly or covertly, the selection criteria operational. Moreover, because it allows private schools, considering their better results, to charge the families an additional amount for taking part, legitimizing profits as a fair earning resulting from efficiency and educational service quality, even though this is not finally generated by the school (Atria 2014; Donoso 2013).

The third line of intervention is profit regulation, a complex criterion to install in a system characterized from the beginning by its deregulation. Although in democracy some subsidies matched their goals, during these years the private educational system, according to its founders expectations, was in fact quantitatively strengthened (enrollment from 15% to 55% and the number of schools more than tripled), enabling a significant management of resources, which led to the creation of an important group of business enterprises (Corbalán et al. 2009). Any regulation initiative in this matter is a very complex issue, as shown by the debates in this field. The Government's idea was to do away with figures such as a related company and practices like purchasing or rentals at out-of-market prices, so common in the profit making Chilean higher educational system,⁹ establishing criteria for those items, which has created tension between the government and some business groups.

⁶The review of national examination results (SIMCE) or the international (PISA), evidence processes/results.

⁷Some profit making educational entrepreneurs and educational businesses have been criticized for making profits with public resources, at school as well as at tertiary level, though the latter is forbidden by law.

⁸Selection must apply when there are more applicants than vacancies. The criticism arises as selection is related to the socioeconomic background of students' families, thus there are not real equal opportunities.

⁹www.ciperchile.cl Report on profit in Chilean higher education.

The three matters included in the law that intend to correct the market are substantive items and as such will be basic for major changes, although these require time to come into force. As can be observed, the nature of these measures, the interests at stake, the powers involved and the depth of their incidences evidence the political obstacles contained.

28.3.2 *The Proposed Change in the State Paradigm*

Changing the State paradigm should be the core of the strategy for strengthening public education; however, measures introduced in this area do not seem to be directly binding to the objective, which does not imply judging its importance either, as some of them were crucial to undertake such an enterprise.

As mentioned, strengthening public education requires direct measures to support the sector, some of them urgently, others less pressing, as well as regulating and controlling the private sector with public subsidy. Otherwise public education will not be able to do its job, given the asymmetry of rights/duties with privates. Even if the relative situation of public education may improve once the urgent as well as less pressing measures start to show their effects, including the impacts of the educational inclusion law, in order to consolidate its recovery, it is essential to implement major transformations, difficult though to install without jointly installing the basis for a change in the paradigm of the sector.

Within this framework, an unavoidable and imperative step is to increment directly and substantially the financial resources assigned to public education. The 2014 budget, tied up by the right wing government, allowed only some adjustments, although the 2015 budget made advances. However, indispensable new financial instruments are more fundamental than the present welfare subsidy system for students.¹⁰

These mechanisms must be consistent with education as a social right, that is, fundamental contributions based on the socioeconomic needs of the student population and coherent with educational objectives (OCDE 2004; Donoso 2013).

Secondly, within the unpredictable, it is necessary to provide education with a new organic institution and a normative integrated to the financial reforms, called the new architecture, to take care of “*di-counseling*”¹¹ demands from different sectors and solve structural problems at that level, otherwise the sector’s future may be in jeopardy (Bellei et al. 2010; Cepepe 2011; Elacqua et al. 2010; Eyzaguirre 2012; García-Huidobro 2010; Marcel and Raczynski 2009; Martinic and Elacqua 2010). This is, a true and real strengthening public education proposal (Donoso et al. 2015).

These changes are also an opportunity to decisively advance toward a technical and administrative decentralization of education, shifting attributions from the central

¹⁰ A detailed review of financial instruments, foundations and critical aspects is presented by Donoso (2013) Chapter III, pgs. 87–170.

¹¹ Withdraw school from council administration (translator’s note)

government to regional governments (Finot 2007), generating more autonomous public institutions linked to macro-territories, providing them with corporation governing bodies, technical and managerial capacity and competence to develop long term educational projects, and finances consistent with these goals (Marcel 2012; Bertoglia et al. 2011; Mejías and Anastasio 2008). This task is also a challenge to test the capacity of an excessively centralist country demanding transformations in this field to reach development.¹²

Third, facing project sense transformations, it is necessary to analyze some urgent and substantive matters, even though their impact may be mid to long term, namely:

- (i) Radically modify the teaching training system, considering that beyond determining socioeconomic elements in education, there is an all-inclusive problem of teaching quality in Chile, worsened by a low added value in education that implies facing this strategic problem, whose solution will impact the next decade, which is why it is urgent. This is a State concern, important for different institutional actors, and requires a solid social agreement not yet explicit.
- (ii) A second task is to design a new teaching career and school directive, consistent with the new educational normative, complex objective due to teachers' historical demands. This normative should transcend the public sector and involve privates receiving public subsidies – as used in other countries – this obviously implies a political agreement with private entrepreneurs which does not look easy.

The advantages are considerable for teacher development and stability, with a positive impact on teaching quality and school management. It is, therefore, important to move forward soon with its discussion, in spite of difficulties in their processes and implications at different levels.

On third level transformations, structural type, consistent with the proposed paradigm, should be undertaken at different fronts and matters. On the political front, it is very important that a change of this magnitude be a legitimate answer to the original problem. For this reason there should be a broad social agreement on education, reinforcing the role of the State as a democratic articulator of its citizens, from their weak situation in Chilean society to a new proper role of their social rights demands.

Consistently, a wide constitutional recognition of the right to education is necessary in this area, assigning it top priority and unfailingly committing the State to implementing it as a public law.

In the field of public management, the Chilean State is under-capacitated to efficiently meet the population's demands. The current educational institutions, more fragmented than in the last decade, evidence a patched together design of solutions more than a systemic design. In this scope it shows its weakness as a result of its

¹²In September 2014, an ad hoc commission handed to the government a proposal considering from direct election of political authorities to greater autonomy for the sector. The itinerary would start in 2015, though relevant educational measures are proposed as of 2018.

reduced size and attributions. The present model of the State is not consistent with the support required in this respect by education as a social right.

Likewise, the institutions and the State management processes should adjust to the new design of public education at the subnational level, which needs to articulate itself wisely to avoid further fragmentation and bureaucracy. Along this line, a wider technical and financial autonomy would be a strong element to reduce that possibility, but complex political issues are conjugated to make that decision in such a centralized State as the Chilean (Eaton 2012).

To take the market out of education will require significant powers to regulate offer and demand at the territorial level, not available today because of the “dogma” of not attempting against freedom of teaching besides limiting the market, widening this function to regulate offers at the tertiary level, that in the case at issue, given the wide population coverage (more than 40% of the population at respective age groups), will imply analyzing the situation in some areas with a surplus of professionals.

It is important to understand that introducing greater public regulation in different areas and at different levels does not directly imply less market – as has been pointed out by some private officials. It is necessary to transform the foundations of the model, incorporating a number of elements, otherwise the public will end up being inevitably “controlled” by the private, as has happened in these years.

Main transformations toward a new paradigm inevitably imply changing the financial system of compulsory education, public or subsidized private, considering the higher costs involved in improving quality. More resources include adjusting to operational standards costs, studies of schools according to their size, social and cultural capital of the students’ population, location and goals to be achieved. This means new principles to sustain financing and mechanisms and instruments coherent with the social right to education.

This design should be arranged by public education new subnational institutions, substituting the failed “*counciling*” (or putting education under council administration) which requires a very fluid dialog between its both components (financing and institutions). An unbalance between them could have negative consequences in the mid and long term, as the Chilean experience itself has demonstrated. New institutions will advise, by aggregate effect, redesigning the national education system, or at least its Ministry; a good occasion to update it, as its institution is behind in many aspects (Núñez and Weinstein 2010).

This matter also requires fine tuning, from the decentralizing policies, the central government articulation of functions with subnational entities, and providing them with administration and technical powers. In this perspective a pro-democracy institutional organic structure is required to manage education in its mid and long term tasks, namely: install new ways of designing and implementing education policies in a centralist country, unused to democratic management processes, besides overrating technical options encouraged in these decades. That is why it is necessary to empower the citizens’ validation practices of the mid and long term processes and strategies in the sector at various levels, subnational and national, with their respective legal support, consistent with the paradigm in its entirety.

28.4 Public Education Policy in Light of New Horizons: Challenges

Within the scenario at hand, educational policies face a growing complexity arising from the visibility and importance education has for participants, institutions, political and social projects, and citizens themselves. The appearance of some education endogenous elements taking part of the demands, aims at giving an account of new constitutive elements of the design and implementation of guidelines to install the new educational paradigm.

In less than four decades Chilean educational policy went from being thrown in the “useless junk courtyard of the State,” where it was confined by the dictatorship in structural alliance with the neoliberalism, to locate itself in “society’s prominent places” where it currently resides. The path was not easy; high costs were paid for the social devaluation education was subjected to, and for the weaknesses of the policy makers in the technical and political mastery of a complex field like this one, where its theoretical-epistemic nor its methodological understanding are enough, but it is necessary to have an empirical knowledge of its situation, considering the diversity of experiences, players and situations that explain their day-to-day routine at school and in the whole educational system. It is essential to have an intra-system experience that questions political, economic and other pressures from different power groups, including international financing agencies.

28.4.1 *The Positional Switch of Education and the New Concepts in Debate*

The relevance achieved by the educational sector has meant a substantive transformation of its focus of attention, procedures and objectives, and of the resources framework within which it operates. This has been similar to its increasing vertical and horizontal complexity, as well as to the contents and instruments it uses, to the players involved and to the public scrutiny it presently attracts.

Educational policy in the time of the dictatorship focused its action on the school, treating it essentially as an object isolated from its social context, under a management reduced to the scope of administrators, namely: a bureaucrat, not a teaching professional leader. Moreover, they were protected with security of tenure, which made dismissal impossible, even after a decade of democratic period, with the evident damage this would cause to any society subject to such rules. The slow and complex change of the educational system at the beginning of the recovered democracy was caused more by exogenous than endogenous factors, a tendency that continues today although with an emphasis on the endogenous.

The elements that have contributed to making this change more evident are society’s educational system increasingly growing unsatisfied with demands, requirements of articulating the educational system with the social covenant and society’s

governance, and availability of financial resources in volumes unknown in recent history, such as in the 1980s, when public contribution to education fell by nearly 25% (González 2003: 610). In that decade of installation and consolidation of the education neoliberal model, educational policy was mainly oriented to privatize, overtly or covertly, the educational system. There was no other policy and, within this framework, the market was in charge of its articulation. The public sector was there just to balance the market; public educational policy was reduced to keeping the system going unaltered and to synchronizing it with the privatization tendencies (Jofré 1988).

The first democratic governments tried to install some “educational dreams” begotten during the years of the dictatorship, but amongst the political demands agreed for the transition and the demands from the World Bank, the “public education *counciling*” imposed in the 1980s. Added to their own mistakes such as Shared Financing, the results were slow, supported by interesting initiatives like school reinsertion and expansion of coverage at all levels, that as a deficiency corrective methods only mitigated the negative effects of the model regarding inequality and educational segregation (Picazo 2013; Bellei et al. 2013).

In the educational field, the second democratic decade ended up with big demonstrations of social protest and less new ideas for the sector, too much technocracy in education policy-making, a limited approach toward the social movements and the acute problems faced by the system. These increased at the beginning of the present decade by the skimpy assertiveness of the rightwing government to social demands, related essentially to strengthening public education, and created the critical situation that took us to today’s turning point: improve the market or change the paradigm toward social rights.

28.4.2 New Time Limit and Components for the Design of Educational Policies

The educational system horizon has undergone meaningful transformations. Short and midterm results – not always substantive – tend to postpone long term actions. The nationally and internationally generated “learning achievements rankings” have contributed to focusing attention on short term results and have had an incidence on shifting public system concern from a full formation of their students toward a restrictive approach on learning and measurement standards.

From the turn of the millennium onward, cultural transformations in the Chilean education have been too fast, (i) almost without time to see results, (ii) without sufficient technical, empirical and scientific support, (iii) included numerous demands from different sectors (iv), plus a massive incorporation of payers with a range of viewpoints on the subject.

This situation is the result of an increased social and political valuation of education, from the State management at its different levels as well as from the citizens

themselves. It has not been by accident that the massive social conflicts during the last decades have evolved around education, evidencing its importance.

Likewise, education faces huge challenges regarding its functionality as a pro-governance agent for societies. The area complexity is expressed at all levels, in its institutions (norms, resources), in its aims and objectives, in the players from different levels, and finally, in direct demands to improve quality with efficiency/efficacy.

The context in which policies are inserted – finally taken as territory and culture – has increased its importance. In the Chilean case, this is not yet a fully incorporated element, due to the historic centralization of the macro educational political processes, in which the visualization of the territories was always “unified” as similar entities in their most relevant dimensions. It has been mistakenly established that the territory is a third-rate player; even in the most recent and massive decentralization processes it has not been a relevant player (Castro 2012).

From a conceptual stand point, the neoliberal vision explicitly sought to weaken the border between public and private education, the product of the installation without constraint of this homogenous vision, whose overt intention was to weaken the role of the State as a corrective agent for inequality, reducing its performance and diminishing its responsiveness, which enabled them to first overtly privatize and then covertly continue with the process (Ball 2009).

Accordingly, demands for more efficiency and efficacy from the most technically and politically conservative sector of society are essentially focused on the allocation of financial resources, as the need for a substantial increase is evident.¹³ Nevertheless, the provision of education with social right is also going to change the evaluation/allocation criteria, as well as the understanding of other instruments, such as national evaluation tests, mainly in the use of its information for educational purposes, frequency and public outreach, emphasizing its contribution to the design of teaching strategies, maintaining transparency and result disclosure, and reducing the ranking effect.

28.5 Final Reflection

In today’s Chilean society education is a theme with driving power, in which very different views are expressed on social sense, individual and socioeconomic development. That is to say, about the very purpose of education. However, one of its key missions, iteratively claimed at critical moments, is its contribution to governance. At present, this governance seems to require major changes to meet these needs, related to integrating democratic processes in the organization and system management, with an appropriate technical soundness in the search for relevant and

¹³ Although education expenditure in Chile is approximately 7%, public expenditure it is slightly higher than 4%, thus there is a need to increase it, not counting the debated private expenditure replacement in some areas at school level (Gobierno de Chile 2014).

efficient solutions, with pre-eminence on circumstantial factors, with major challenges on decentralizing management and decisions and, equally, on making a substantial contribution to installing in this area a society without rooted practices in this field. This means people understand the reasonableness of the State, of representative democracy, its rights and duties on the described framework, namely: a major structural change in education and of the sense of public in this new scenario.

However, the problems of the Chilean education system, deeply rooted in a very unequal and segregated society, and the weaknesses in correcting these difficulties, have led the very system to a critical point in which substantial decisions must be adopted regarding its orientation, which, incidentally, imply very different ways.

This scenario in which education reforms are installed, especially public education reforms, implies facing these conflicts and tensions, understanding that results show much more than the collapse of the model, that posed contradictions were not “system failures” but an integral part of it, and that market failures are not, essentially, malfunctioning but necessary steps to reach the results achieved. Therefore, the way the education system developed, despite the promises, was not a mechanism to moderate social immobility and elite privilege, but one of its main causes.

In this endeavor, educational policy, beyond the adopted directions, faces significant and complex challenges to integrate approaches and levels, defined as micro and macro policies, a relevant task in itself. This is directly related to its contribution to society and to the current and sought social covenant.

It is about a substantial self-transformation, as well as transforming its epistemology, its field, and, certainly, about its direct or indirect implementation object.

Chapter 29

Evaluation and Accountability in Large-Scale Educational System in Chile and Its Effects on Student's Performance in Urban Schools

Maria Luísa Quaresma and Juan Pablo Valenzuela

29.1 Introduction

Over the last few decades, education systems of western countries have undergone profound changes. One of the most relevant features of the public policies implemented is the assessment of schools and students. This tendency emerges in the context of a growing pervasiveness in the scholarly field toward the “neoliberal impetus” (Ball 2010, p. 486) which has promoted a culture of competitive performance in the educational universe and has given privilege to the principles of merit, quality and excellence at the center of educational concerns.

The discourse on the “crisis of public schools” – that some researchers say must have been “manufactured” to expose education to the interests of the private sector (Berliner and Biddle 1995) – will legitimize these demands to the school of a culture of scholarly rigor, exigency, and meritocracy that, according to some critics, would have been lost and would have left nations and their citizens incapable of responding to the challenges of the growing competitive existence in the market and in society in general. Benefiting from the strong adhesion to the old school, along

with nostalgia for the “black board” (Dubet 2000, p. 83), the rhetoric of crisis in public educational systems has become a priority in global education agendas.

In this setting, the social pressure on academic performance intensifies, transforming it into a high priority in school education. Opening schools to social and cultural diversity demands that education confront new missions, as well as tensions between objectives that are difficult to reconcile, such as the guarantee of more schools or better quality schools. In the 1980s, under the pressure of a culture of competitive performance, a reconfiguration of the public school mandate took place (Maurin 2007), with the aim of putting less emphasis on consolidating school democratization and more on the quality of academic results.

In the following piece, we develop a review of the literature produced in recent years on the policies of accountability and their impact on the configuration of the educational systems of different countries. Furthermore, we will center our focus on the Chilean school system, one in which market mechanisms have higher incidence relative to other school systems internationally, and in which there is empirical evidence on the modest positive impact of the market based-reforms on the quality of urban education, namely on the distressed urban schools serving low-income and ethnic and racial minorities, that were faced with the aggravation of their problems (McEwan and Carnoy 2000).

29.2 The Model of Accountability: Practices and Scientific Debates at the International Level

The importance acquired by the forms of regulation based on results is inseparable from the loss of confidence in the school system and the subsequent need to “diminish the opacity of the given service” (Maroy 2012, p. 64). But the obsession with the production and measurement of results is also inseparable from the affirmation and consolidation, in the educational field, of the system of “accountability”, which, in its most complete model, contemplates four stages: establishing goals, evaluating achievement, publishing their results and, eventually, determining their consequences (Herrington and Mac Donald 2001).

Imported from the business world into the schools, in accordance with the assumption that everything which works in business will also work in education and in society (Down 2009), the concept of accountability came to impregnate educational agendas of different countries, beginning in the 1970s in a process marked by two stages (Maroy and Voisin 2013): the “old accountability” (1970s and 1980s) and the “new accountability” (1990s and 2000s), both of which are distinguished “less by the principles or philosophies they invoke to legitimate themselves than by the tools that they implement” (p. 896). According to the two researchers, there are many common features in the result oriented regulatory policies adopted by various countries in the area of “accountability”, including: the objectives of “improving efficacy, reducing inequality and performance differences between groups of students (equity) [...] controlling or reducing costs, that is, improving efficiency” (p. 882); also the concept of the school as a productive organization and the centrality

given to quantified data and to the “different assessment tools to evaluate student performance (testing)” (p. 885).

There are, however, differences in the way the model of “accountability” is developed in different countries, ranging from the “harder” measures to the “softer” ones; the first, favored by Anglo-Saxon countries, provides incentives and punishments (carrots and sticks) to ensure compliance, as happens in the United States or in England; the second, more frequent in Continental Europe (Maroy and Voisin 2013) uses results as mere indicators.

Among the accountability tools, there are tests, national and international exams, school rankings, teacher performance evaluations and evaluations of learning centers. The national tests are the most important in accountability processes, since it is from the measurable results obtained from external evaluation that the parameters are defined for the evaluation of teachers, schools, and even educational systems (Lee 2008).

But the evaluation processes are not restricted to students, they are also apply to teachers and schools. The evaluation of teachers is perceived as a “(...) vital step in the drive to improve the effectiveness of teaching and learning and raise educational standards” Organisation for Economic Co-operation and Development (OECD 2009, p. 3), which accomplishes two objectives, according to the same study: first, “to improve the teacher’s own practice by identifying strengths and weaknesses for further professional development – the improvement function. Second, it is aimed at ensuring that teachers perform at their best to enhance student learning – the accountability function” (p. 7).

As for the evaluation of the learning centers themselves, their legitimacy is strengthened by the conclusion that “school matters”, a concept that has supported movements like School Effectiveness and School Improvement. There are few countries in the OECD that do not perform systematic evaluations of their schools (Faubert 2009); these evaluations, according to the same study, focus on four fundamental areas: outcomes (mostly based on national test results), practices at the course and institutional levels, and school environment.

Regarding the consequences of evaluations, the same study points out that these vary from country to country, ranging from offering recommendations to denying funding, and even, to threatening of school closures. There is significant controversy over the impact of these assessment practices and ample literature that problematizes their pros and cons, which makes the exhaustiveness of their discussion and revision untenable.

For some of the authors, standard assessment of students allows for improved results and reduction of academic inequality, essentially because the setting of common standards forces teachers to impose uniform expectations over all students, independent of their social or scholarly profile (Hong and Youngs 2008). Other researchers like Burgess et al. (2010) account for the positive effect of league tables over academic results that worsen when they are abolished. As for teacher evaluations, opinions are divided between those who identify with a positive impact on student learning (Danielson 2007) and those who are skeptical towards the empirical evidence of such associations (Hallinger et al. 2014).

However, for some researchers, the perverse effects of various assessment tools are countless: the performance of teachers “can come to be experienced as inauthentic and alienating” (Ball 2010, p. 488); schools are pushed to narrow the curriculum (Gerwitz 2002) so that only content is assessed, leading to a devaluation of fundamental areas in a complete education, like social studies, music, or art (Osborn et al. 2000); teachers are pressured to teach to the test (Hannaway and Hamilton 2008), sometimes leading to extreme cases in which there are fraudulent practices to improve the scores of students (Jacob and Levitt 2003).

Cassasus (2010) is also against the educational model which is based on the premise that underperforming students and schools, when publicly exposed for their low results and threatened with sanctions, will feel a shame which mobilizes them towards improvement. Criticizing the model of standardized tests, he points out that the model is unable to provide valuable information to measure the quality of the education, that is to say, unable to give evidence that “the students are well educated” (p. 86) or that “they become good or bad people or citizens” (p. 86).

Besides this impoverishment of the educational mission of the school, the “neopositivist evaluocracy dominant today” (Afonso 2014, p. 488) contributes to the rise in inequality of socio-economic and racial nature (Au 2009): some schools which select students choose to exclude those who, because of their social and academic profile, could put the position of the learning center at risk in terms of rankings (Darling-Hammond 2007). Moreover, these students receive less attention from teachers who begin to see them as a threat (Cassasus 2010) and therefore, prefer to concentrate their efforts on the more promising kids who will perform better on the tests (Booher-Jennings 2005). Under such circumstances, the necessity of believing in the “utopia” (Afonso 2014, p. 502) of building another model of accountability to rescue the current “unidimensional constraints” gains force.

29.3 Lessons and Learning: The Case of Chile

Given that the Chilean school system has had generalized performance assessment mechanisms for primary and secondary education since the end of the 1980s, the learning, effects and challenges stemming from its implementation, are an opportunity not only to improve the experience of countries that are beginning to raise their levels of assessment, public accountability and standardization of outcomes in the academic system, but also those which are strengthening the mechanisms of school choice for families between different educational providers, and opening the field of children and youth education to private entities.

Chile has a school system with 13 years of mandatory education, 1 at preschool, 8 in the primary school level, and 4 at the secondary level. Secondary level is divided into two parts, the first 2 years cover a general curriculum, and the last 2 years offer the choice between scientific-humanist instruction and vocational instruction. The greater number of schools specialize in one of these two alternative options. The majority of schools, as the majority of the inhabitants, are located in urban areas, according to

Raczynski and Muñoz-Stuardo (2007), who remember that almost 40% of the population live in the capital city. In 2013, only 13% lived in rural areas (Instituto Nacional de Estadística 2013). The gap between the number of students in the urban and rural schools is enormous, as the *Estadísticas de la Educación 2013* (Centro de Estudios Mineduc 2013) points out: 1.895.879 and 222.064, respectively.

On the other hand, the Chilean school system is known for having one of the highest rates of private participation in education, at primary, secondary and post-secondary levels. The process of expanding private participation began in 1981, in the midst of the military dictatorship, with the creation of a subsidy on demand paid per student and of comparable size both to private and public schools. This policy was accompanied by the transference of public schools and academies from the central government to the municipalities – administrative entities that until then did not have adequate financial or professional resources for that and did not have the necessary skills and competencies to handle public functions—and at the same time was reauthorized that profit entities could participate in the educational system (it was prohibited at the end of 1960s). This group of incentives implied that private market share went up from about 20% of the total of educational offerings to about 35% in less than a decade (Hsieh and Urquiola 2006); however, the sustained expansion of private offerings, mostly financed by state contributions into for profits (Elacqua 2011) continued growing over time and even strengthened in the last decade; while in 2004, 50.5% of urban school enrollment was in private hands, in 2013 this percentage was 62.9%, with 55.2% of this share publicly financed and another 7.7% financed only by family contributions. The Santiago Metropolitan area was particularly affected by the dramatic decrease in public schools enrollment, as Portales and Vazquez-Heilig (2014) have pointed out.

Chile has thus been transformed into the country with the second most private coverage among the countries of the OECD (surpassed only by the Netherlands), which presents a strange situation at the international level and also in the context of Latin America, where the average enrollment covered by private entities is only 19.6%. Along with Peru and Brazil, only Chile shows a tendency towards growth in private participation in the last decade United Nations Educational, Scientific and Cultural Organization (UNESCO 2015).

On the other hand, the Chilean school system does have a high educational coverage, where the percentage of youth who complete their secondary education and those that continue on to post-secondary education is similar to the average of OECD countries (OECD 2014); furthermore, Chile is notable for consistent improvement in all international evaluations based on standardized tests. Because of its good results on the Programme for International Student Assessment (PISA) exams (OECD 2010, OECD 2013a), Chile was identified as having one of the few school systems on an improvement trajectory at an international level (Mourshed et al. 2010). A similar situation can be seen in the results of the Trends in International Mathematics and Science Study (TIMSS) test of science and mathematics (TIMSS 2013) and more recently in the Third Regional Comparative and Explanatory Study (TERCE) test (UNESCO 2015) -a test which evaluates performance in the third and sixth grades curriculum in reading, math and sciences in 15

countries of Latin America and the Caribbean. Chile took first place amongst the participants, showing improvement in three of the four comparable tests applied in this study compared with the 2006 evaluation.

Despite this trajectory of improvement, the Chilean school system is characterized by an important breach in the quality of its academic results with respect to the countries of the OECD. For example, even maintaining the improvement rate observed in the last decade in mathematics and science on the PISA tests, it still would take 40 years to achieve the average performance level of the other OECD countries.

Similarly, Chile is one of the countries where socio-economic variables, at both the individual and institutional levels, explain an important part of the student performance; it also has one of the most segregated school systems in the world (Valenzuela et al. 2014; Arteaga et al. 2014). This social segregation is accompanied by a significant social and administrative segmentation of its educational offerings: public schools have a high concentration of vulnerable students, and private subsidized schools educate the majority of the middle class - even if the percentage of low socioeconomic level students grows every year while private schools take mostly students from the top 10% of the country.

29.4 The System of Measurement of the Quality of Education (SIMCE): Characteristics, Effects and Challenges in the Context of an Academic Improvement System

29.4.1 Principal Characteristics of SIMCE

The market orientation of the Chilean school system during the dictatorship was one of the main motivations for the early incorporation of massive information systems of schools' performance – the first one was in 1982, although this was discontinued until 1988 when the current measurement system, SIMCE (System of Measurement of the Quality of Education), began. This policy was based on the weak assumption that with information about the relative performance of the different educational alternatives, families would tend to reward and punish the different educational projects with their preferences, discarding those schools with the worst results.

During the 1990s, SIMCE was applied in a census form to fourth, eighth and tenth grade students, although each year it was applied intermittently to one of these grades, with curriculum coverage in the disciplines of reading, math and science. Despite the fact that the main focus of the testing was to generate information for families to guide them in the school choice process, one of the first policies that used this information affected teacher salaries. Since 1996 there have been economic incentives delivered for 2 years to the teachers of the top third of best-performing schools, relative to groups or clusters of comparable public and private

schools with fiscal contributions. The National System of Educational Effectiveness, National Performance Assessment System (SNED) gives out approximately one additional monthly salary per year to each teacher from the favored schools, and despite the evaluations of this collective incentive accounting for its legitimacy among teachers, it has not generated a process of sustained improved effectiveness in primary and secondary schools.

In regard the measurement system, SIMCE advanced in its technical characteristics during the end of the 1990s and beginning of the 2000s. On one hand, from 1999 its results at the school level have been comparable across time, and from the mid-2000s they have identified standards associated with determined levels of achievement or performance of the students—later known as performance standards—which define minimum score levels associated with determined performance disciplines. These technical changes facilitated the completion of two of its main objectives: determining the trajectories of improvement in the schools and permitting the evaluation of educational policy impact directed at groups of schools or specific students.

In the same context, from the beginning of the 1990s the standardized scores of the schools have served to identify priority schools where focus programs of technical support were directed, some of which were implemented directly by the state, others with external technical consulting. The accumulated evidence shows that these did not have an effect on the children's learning or even if they reached a positive effect, this tended to disappear after the external consultancy to the school finished, reflecting the fact that in the majority of the cases the strategies of support did not change the management nor the permanent institutional framework of the supported schools (Bellei et al. 2010).

29.4.2 SIMCE as an Orientation for Family School Selection

In the same way, the 2000s saw a substantial advance in the strategies for satisfying the main objective in the creation of SIMCE in Chile, its transformation into a mechanism of information for family decisions, regarding the performance of different educational alternatives available in the local markets. The publication of SIMCE results in public media, in newspapers, as well as on the Ministry of Education's own websites, and the development of complete data sheets on each school by the Ministry or the schools themselves, has become more complex over time. This was motivated by the assumption that the lack of information for families has explained the persistence of schools with low performance and low educational effectiveness.

These policies reached an extreme in 2010 with the creation of “stoplights”, which intended to catalogue the performance of Chilean schools through different colors (green for good performance, yellow for intermediate and red for low achievement) but which ended up reflecting social segregation of the territories where the schools were located, as well as reinforcing the social and cultural

distribution of the schools' families which determine the educational opportunities for their children. Thus, half of the counties in the country did not have any "green" schools, 90% of the poorest-performing schools were from the low or medium-low socioeconomic levels (the most vulnerable), and two-thirds of this group of schools were public, while only 10% of the best-performing schools were administered by the municipalities (Valenzuela 2010); that is to say, the measurement indicator only replicated a bias against the public and vulnerable schools, along with reflecting the enormous territorial inequality of the educational opportunities of the country, a situation that led to the withdrawal of this instrument only a few months after its implementation. Urban counties tend to present schools with a more complex social environment than rural counties, due to a number of different factors: the larger concentration of poverty and low income immigrant population, the racial, ethnic and linguistic diversity and the more frequent rates of student mobility (Kincheloe 2010).

Despite the fact that comparative evidence indicates the existence of some positive effects in the delivery of better information to families (Hastings and Weinstein 2008; Gallego et al. 2008), these effects are reduced and limited to groups of families with greater social and cultural capital who are more worried about the performance of their children, and also when the change of schools means fewer emotional and academic consequences for the children. On the contrary, for the Chilean case, there is growing evidence that it is not the results of standardized tests that explain to the main reasons for a family's choice of a particular school when starting a child's schooling or changing a child's school. The work of Elacqua et al. (2006) and Elacqua and Fabrega (2006) recognized that the distance from home and socio-demographic attributes were the most relevant attributes for the selection of basic education among Chilean families.

Recent studies about demand factors have consistently recognized the distance of the schools from family residences, discipline and social status as critical factors when choosing a school for children (Raczynski et al. 2010; Canales et al. 2015). These studies also argue that the restrictions on the supply side, such as mechanisms of selection and payment in schools with public funding, operated as entrance barriers for families from the middle class and vulnerable groups by certain groups of schools (Flores and Carrasco 2014; Carrasco et al. 2014; Contreras et al. 2010; Godoy et al. 2014). Upon being lifted these barriers would make it possible for families from vulnerable groups to choose between different school alternatives. As Valenzuela et al. (2015b) show, it happens with the widespread use of the preferential school subsidy (SEP)¹ since its implementation in 2008. Eliminating the funding shared by vulnerable families has made it possible to more than double the 40% rate of migration of the most vulnerable students from urban public schools to subsidized private schools with co-pay.

¹The preferential school subsidy (SEP) is a monthly per-capita complementary voucher financed by the state, targeted to the 40% most vulnerable students enrolled in public and private subsidized schools. It represents up to 70% more resources per student.

Similarly, the national evidence is consistent in signaling that the majority of students that change schools during the academic year change to schools of equal or poorer academic performance, reflecting that the majority of SIMCE's public information does not allow for better academic choices for many students; likewise, these studies note that the changes are more frequent among low-performing students and students who repeat grades, reflecting a high percentage of students that change schools in a reactive manner (Canals et al. 2015; Peticara and Sanclemente 2012; Zamora 2011; Roman and Peticara 2012). The fact that the results of SIMCE score at school level are public and have an impact on the ranking of schools, as well as on incentives for teachers, brings with it a tension regarding the renewal of enrollment of low-performing students and students with disciplinary problems.

29.4.3 SIMCE as a Benchmark for Processes of Scholastic Improvement at the School Level

In this sense, the national experience regarding the use of SIMCE as a synthetic indicator of school quality, or of curricular performance of the students in some disciplines, shows the injustice of an instrument that does not control for students social composition of schools, and adds to the multiple problems identified in the comparative literature when these indicators acquire more relevance in public policies.

On one hand, since SIMCE considers information such as attributes of the families of each student, allowing the comparability and control for individual attributes to determine the heterogeneity in the performance at the individual level, the enormous gap of SES between schools increase. This is replicated in accordance with institutional dependence – substantially favoring private schools without fiscal contributions above private subsidized schools, and these above the public schools. In addition to this, the difference disappears completely when you control for SES at the student and course levels. These results are consistently estimated with international PISA datasets or national test scores (McEwan 2001; Bellei 2007; OECD 2010) and have led to the conclusion that the development of schools rankings, according to their performance on SIMCE, is completely unjust. It is simply replicating a system that is based on the SES average of the school (Mizala et al. 2007).

On the other hand, many sampling and qualitative studies in the schools, as well as the recent report of the commission of experts regarding SIMCE (Ministerio de Educacion 2015), have indicated that SIMCE has become the main indicator of quality evaluation. One of the positive effects recognized is that it allows primary and secondary schools to be provided with an external evaluation regarding their advances and achievements. However, in some cases this takes the place of a school's own internal reflection regarding the processes of learning and achievements that students obtain through the school's own instruments of evaluation regarding learning, competency and values. Thus it is common to observe in the

schools – including the high-performing ones – a systematic preparation for the SIMCE test, the application in multiple disciplines of formats in the evaluations similar to SIMCE, an exaggerated extension of hours in the weekly curriculum for the evaluated disciplines, a perception of less time dedicated to extracurricular activities, and inclusively the temporary replacement of other disciplines in order to have a greater number of hours for the practice and preparation of the disciplines that are evaluated (CIAE 2014; Bellei et al. 2014; Manzi et al. 2015). Prizes and special recognition are also observed for teachers and courses that obtain higher averages on the tests relative to their peers, as well as within school sorting of teachers and students according to strategies to maximize these results (Flórez 2013; Manzi et al. 2015).

The inefficiency of SIMCE as a mechanism for school improvement can be seen in the tendency of schools with lowest performance to remain systematically in the same condition for long periods. The research of Roman and Peticara (2014) showed that the 1000 lowest performing schools on the SIMCE test in primary education – around 20% of the total schools – tended to persist in this condition systematically. In a recent report, Valenzuela et al. (2015b) concluded that only 9% of the total schools of basic education showed trajectories of sustained improvement in the last decade, both in reading and in math. The difficulty in achieving a greater percentage of schools that develop regular processes of improvement is due to the lack of the indispensable generation of endogenous abilities in the primary and secondary schools by the teachers and management teams, and to the transitory programs of support or effort that are neither sustainable nor institutionalized in the daily life of the school, tending to show non-persistent effects.

Additionally, the Chilean school system presents notable gaps in the resources and the management abilities between schools depending on the socioeconomic level of the school. Besides the enormous segregation in the social composition of the schools, the management abilities of principals and the competences and skills of the new teachers present enormous challenges, creating an asymmetric distribution of resources between schools, mostly distributed according to school average socioeconomic level and prior school quality. The consequence of this feature is the accentuation of gaps in the social composition of students in different schools.

In this context, a set of structural reforms is essential to reduce the gaps in educational performance, where the information systems should only be considered to identify the problem, its magnitude, and whether the proposed solutions are meeting their desired objectives. The implementation of the law of preferential school subsidies (SEP) has demonstrated in a robust way that allocating more financial resources to the most vulnerable schools, with greater autonomy in their use, was necessary to reduce the enormous gaps in performance between the schools according to their SES average (Mizala and Torche 2014; Nielsen 2013; Valenzuela et al. 2013, 2015a). The magnitude of the impact of this reform is observed in the evolution of the performance gap reaching well-managed schools: Haberle and Isla (2014) estimate that the average performance gap between those well-managed schools from SES Low and Middle-Low, compared to those from SES Middle-High, was reduced from 2.0 standard deviations in 2006–2007 to 1.0 in 2011–2012.

29.4.4 Intensification of Evaluations and Social Rejection of SIMCE

Despite the accumulation of evidence that realizes the weaknesses of SIMCE to orient processes of sustained improvement within schools, and the system as a whole, during the 2011–2013 period the levels evaluated and the number of tests given in the schools were increased. If by 2008 students from grades 4th, 8th, and 10th were evaluated, in the following years students from grades 2nd and 6th were included, moving from 8 to 15 annual tests, implying that for the schools, especially at the primary level, 1 month of the year was designated in large part to this evaluation process.

The intensification of the evaluation processes and the increase in the expected effects in schools due to these results, along with the growing imbalance between the evaluation processes and pressure for improvement, carried with it a growing discomfort with respect to standardized evaluations, both in students and social organizations, such as some research centers, including some of the institutions demanding the elimination of their application (Ministerio de Educacion 2015). However, the majority of managers of the education centers continue to have a positive opinion of this instrument (Manzi et al. 2015). This context motivated the development of a technical committee that analyzed the situation of SIMCE among 2014–2015 and made recommendations to the Ministry of Education for the entire evaluation process among 2016–2018.

29.4.5 Recent Reforms and Challenges: Toward a System of Quality Assurance

In the year 2011, SIMCE became part of a System of Quality Assurance in School Education, the goal of which is to improve the quality and equity of education. The system is composed of four institutions: (a) the Ministry of Education, with a governing and normative function, dictates educational policy, but is also in charge of technical-pedagogical support to schools, beyond they can contract it directly with private entities; (b) the National Council of Education, in charge of defining the curricular bases; (c) the Superintendent of Education, entity in charge of monitoring supporters and schools in such a way that they comply with the law and regulations and that they adequately use financial resources and respond to problems identified by families and students on their rights; and (d) the Quality of Education Agency, a body responsible for evaluating and orienting the educational system, for which it evaluates the degree of fulfillment of the learning standards. This is estimated based on the results of the SIMCE tests- and of other indicators of educational quality at school level, and also it estimates the indicative performance standards of their administrative owners.

It is in this way, the Agency of Quality plans and coordinates the application of the SIMCE tests, and based on students' scores by school, the Agency estimates the percentage of students that pass the Insufficient level and reach the Adequate level (the two extreme levels of performance) in each subject evaluated. With these results and other indicators,² the Agency estimates an Index of Performance for each school, which controls for the individual social attributes of the students –although not for the average SES of the school– with the goal of partially mitigating the social characteristics of the families regarding learning opportunities, and organizing the schools in four groups or classes based on their performance: High, Middle, Middle-Low and Low.

Although educational actors recognize the relevance of also including, beyond the results of the SIMCE test scores, indicators related to school processes and management to estimate the Ranking Index allowing comparisons between school performance, they do not support the extreme weight that SIMCE scores have in the total Index. The law mandates that this variable represents at least 67 % of the total, along with the inclusion of several other directly related indicators to test score, as the average and the tendency itself, contributing to increase its relative weight up to 73 % of the total value of the index.

For the improvement of education, the Agency of Quality performs Orientation Visits to the schools with the lowest performance, which should be conducted regularly and are designed to strengthen abilities of internal reflection and generate strategies to set up processes of improvement that allow them to advance from their original conditions. Schools that do not advance steadily from the Low performance level should implement a program of improvement with external support, which includes informing the families of the school's enrolled students in this negative categorization; schools remaining in this condition for 4 years more could be closed and lose official recognition from the Ministry of Education.

Given the important change associated with the evaluation system of schools, the Agency of Quality began a trial run of this experience in 2015, and instead of delivering public rankings of schools, delivered this partial information to the schools and prioritized the completion of more than 500 orientation visits to each of the schools defined in the category of lowest performance. The Agency's focus changed from accountability with high stakes to support and collaboration, based on the principle that its mission is "to improve the quality and equity of schools," which is in line with the guidelines of the OECD for these systems (OECD 2013a, b). Additionally, the international evidence notes that the focus on the generation of information in these systems should be much more oriented to the mechanism of quality assurance and of orientation of the process of schools improving and to the follow up and evaluation of the school system as a whole as well as the public policies implemented (Eurydice 2012).

²Among them are the gender equity of the SIMCE results, the school attendance and the school retention rates, the level of school conviviality, the healthy habits for life, the citizen education and participation, the level of self-esteem and motivation, and the graduation rate of students attending technical-vocational high schools (Agencia de la Calidad 2014).

29.5 Concluding Notes: Challenges for the Chilean School System and Lessons for Other School Systems

The analysis of the Chilean case demonstrates the important challenges that the system of educational performance evaluation presents for national schools, to move from a focus on information to families and accountability, toward one of more systematic quality assurance and the creation of capacities for sustainable improvement. Additionally, this experience delivers valuable lessons at the international level, given the sustained increase of countries implementing systems of quality assurance in which standardized evaluations are essential (OECD 2013a, b): for example, six of the seven Latin American countries that regularly participate in PISA feature census-like standardized tests, the majority of which were developed after 2000 (Rivas 2015).

The results of reviewing the Chilean experience show the insufficiency of information as a mechanism to promote demand and linking of families with better school choices, particularly if, at the same time, there are institutional and schools management barriers, such as selection tests, financial charges or interviews with the families of new students, intended to skim for the best students or to condition the renewal of enrollment in the same institution for incumbent students, as regularly occurs in schools financed with public resources (public and private subsidized schools). In this context, public education is incapable of complying with one of its most important challenges: guaranteeing equality of opportunities between students and eliminating any discriminatory bias in the process of parents' school choice for subsidized schools. In this sense, the recent Education Integration Law approved in January 2015 is going in the right direction. It eliminates shared financing, the mechanisms of selection and better regulates the expulsion of students from public financed schools. In this way, this law adopts mechanisms that allow for the strengthening of the public system, decreasing segregation between schools, and improving the impact of SIMCE information for families making their school choices.

On the other hand, the accumulated evidence for the Chilean case reflects that quality assurance systems should trust less in the improvement of education coming from the information given to families to choose a particular academic school, and focus more on supporting the development of the school's own abilities (Florez and Sammons 2013) on learning through best practices, and on monitoring the impact of quality and equity of different policies that seek to support education. Many of these should have a structural character for the entire academic system.

Likewise, its efforts should give a greater balance between a rise in evaluation and pressure on schools, with the policies, tools and strategies of support and development of its abilities, especially among the most vulnerable and lowest-performing schools – essentially public schools – where the closing of gaps in different result indicators, abilities and processes between different types of schools should themselves be part of the evaluation in the fulfillment of the functions and objectives of the responsible institutions of assuring quality in the school system.

Chapter 30

The Inclusive Potential of Secondary Education in Brazil. Contributions for an Analysis of Juvenile Trajectories After Secondary School

Nora Nora Krawczyk and Edna Y. Taira

30.1 Introduction

When it comes to reflecting on the Brazilian education system, there is a consensual perception that secondary education¹ is the stage of schooling that raises the most heated debates, both because of the peculiarities of its expansion process, and in view of the few future opportunities it offers to youngsters.

Secondary education in Brazil is, and has always been, predominantly urban. In 2013, more than 95 % of enrolments in secondary education were concentrated in urban areas, mainly in the big cities. Approximately 85 % of these enrolments are in public establishments (INEP 2014).

Historically, indexes of inclusion in secondary schooling in Brazil have always been disconcertingly low, but since the mid-1990s this level of schooling has been expanding within the public education system, and in 2009 basic education became

As Oliveira Bueno affirms in this Handbook, the phrase *urban education* has not been used in Latin America in the same meaning that it has in North America and Europe. However, the author reminds us that public education in Latin America is carried out mainly in big cities and metropolises, and caters for the largest number of students. This allows us to observe important similarities between the two phrases, although they are not totally equivalent.

¹ Basic Education is the first level of schooling in Brazil. It comprises three stages: Early Childhood Education (for children up to 5 years old, in Portuguese: *Educação Infantil*), Primary Education (for pupils between the ages of 6 and 14, in Portuguese: *Ensino Fundamental*), and Secondary Education (for pupils between the ages of 15 and 17, in Portuguese: *Ensino Médio*).

mandatory and free between the ages of 4 and 17 (IPEA 2010). This is a very important fact because it gives secondary education the status of a right of every citizen. The inclusion of Secondary Education within Basic Education, and its progressively mandatory status, demonstrates the recognition of its political significance – it is no longer acceptable to live in a country with such educational inequality; social relevance – it is a concrete and growing demand in view of the devaluation of certificates and the need to compete in a strict labor market; and economic importance – socialization and the new labor logic (Krawczyk 2008).

During the last 15 years, the country has undergone a process of expansion in the enrollment of Secondary Education, but is still far below expected values, and maintaining important rates of age-series gaps, school failure, regional and race inequalities. In 2013, we still find reasons for concern when we analyze the situation of study and work of the overall population between the ages of 17 and 28. Out of the 38,886,153 youngsters, only 50% work and only 23% have finished secondary schooling (PNAD 2013).

Looking at the configuration and consolidation of the national education systems, we observe that their history is permeated by the dispute between different social groups for the appropriation of parts of the socially constructed knowledge, for a space in the labor market and for the participation in higher education. One observes a twofold process of democratization of a certain level of schooling, and loss of its value, both economic and symbolic, produced by the devaluation of certificates (Viñao 2006; Krawczyk 2014).

The significant increase in the number of youngsters that finish secondary schooling in Brazil has produced new mechanisms of socio-educative differentiation, among which the devaluation of higher and higher certificates, a greater stratification of the qualifications required by the labor market, and the frequent changes in those same qualifications.

One of the arguments to explain the difficulty in reducing dropout rates in secondary education is the lack of motivation by the youngsters due to, amongst other reasons, the few opportunities that this level of schooling offers them later (Sposito 2005). However, little is known about the behavior of the labor market with respect to demands for schooling (competences and certification).

30.2 Secondary Education: Certification and Labor Market

The absence of this kind of analysis precludes the understanding both of the real potential of schooling in the lives of youngsters, and of how the secondary school certificate has or has not suffered a devaluation process as more and more youngsters have access to it. In an attempt to contribute to advance this question, this chapter seeks to sketch a panorama of the situation of Brazilian youngsters between the ages of 17 and 28 who have finished secondary schooling in 2013, building therefore conditions to identify and analyze the relation between the school certificate and the demands of the labor market and the potential of secondary schooling

Table 30.1 Population between 17 and 28 years old, according to level of education and situation of attendance to school and labor situation (Brazil 2013)

Total population between 17 and 28 years old	Absolute numbers	Percentage
Total	38,886,153	100.0
Primary education complete or incomplete	11,303,011	29.1
Secondary education incomplete	2,753,568	7.1
Attending secondary education	3,564,505	9.2
Secondary education complete, not attending school	12,781,614	32.9
Not working, not looking for work	2,542,833	6.5
Not working, looking for work	1,252,765	3.2
Working	8,986,016	23.1
Secondary education complete, attending school	1,634,709	4.2
Higher education complete or incomplete	6,685,291	17.2
Level of education indeterminate	163,455	0.4

in the labor trajectories of youngsters. The study is based on statistical data of 2013, since they were the only ones made available by the Brazilian National Institute of Educational Studies and Researches – INEP.²

The source of the data is the National Survey of Household Sampling (*Pesquisa Nacional por Amostra de Domicílios*), PNAD, conducted by the Brazilian Institute of Geography and Statistics (*Instituto Brasileiro de Geografia e Estatística*), IBGE, the main Brazilian provider of data and information.

PNAD is a household sampling survey that contemplates chiefly the large metropolises or areas of greater urban concentration. Therefore, it may be inferred that the youngsters object of this study are essentially originated in public urban schools.

The National Survey of Household Sampling, PNAD, has existed since the 1970s, and has the objective of producing basic information for the study of the socio-economic development of the country. It is a system of surveys which, because it has multiple purposes, investigates several socio-economic characteristics, some of them permanent in the survey, such as general features of the population, education, labor, income and housing, and others of variable periodicity, such as characteristics of migration, fertility, marriage, health, nutrition, and other themes included in the system according to the country's needs for information.

A brief characterization of the educational situation of the Brazilian population between the ages of 17 and 28 (Table 30.1) allows us to observe that the policies of education expansion of the last 25 years have failed to deliver the universalization of secondary education. Within the population between the ages of 17 and 28, 29.1% have only complete or incomplete primary education, and 7.1% have not finished secondary schooling. Those outside the education system and with a level

²Instituto Nacional de Estudos e Pesquisas Educacionais Anísio Teixeira – INEP. www.inep.gov.br.

Table 30.2 Employment and unemployment rates of the population between 17 and 28 years old, according to level of education (Brazil, 2013)

	Percentage
Employment rate of population between 17 and 28 years old	87.9
Unemployment rate of population between 17 and 28 years old	12.1
No education or incomplete primary education	12.0
Complete primary or incomplete secondary education	14.1
<i>Complete secondary education</i>	<i>12.5</i>
Complete incomplete higher education	8.4

Source: National Survey of Household Sampling – PNAD (2013) – IBGE. Our compilation

of education up to incomplete secondary education represent 31.2 % of the population between the ages of 17 and 28. At the other extreme, with at least complete secondary education, we have youngsters who have continued studying, representing 21.4 % of the total population at this age group. Data also show that 9.2 % are attending secondary education at an age outside the expected range, and that 6.5 % belong to a group that have complete secondary education but are neither studying nor working.

In this chapter, we focus only on the 23.1 % of the overall Brazilian population that belong to the age group between 17 and 28, that have completed secondary education, do not attend school and are inserted in the labor market.

The unemployment rate in this group offered slightly more optimistic numbers in 2013, although it was still much higher than the average unemployment rate of the country for the same year (6.5 %) (PNAD 2013). As we can see in Table 30.2, the rate of employment of the population between the ages of 17 and 28 is almost 90 %.

At first sight, the unemployment rate decreases as the level of education increases. However, this relation is only observed after the complete primary education cycle. The first two segments indicate that youngsters with complete primary education or incomplete secondary education put more pressure on the labor market than those who have no education or have only incomplete primary education, with unemployment rates of 14.1 % and 12.0 %, respectively.

On the other hand, the youngsters least affected by unemployment are those with at least incomplete higher education. This indicates a higher demand from the labor market for this kind of education, and explains to some extent the increase in the demand by youngsters to attend this level of education, and the expansion of the higher education system. At the same time, this situation is important to analyze political-educational proposals of formation at secondary education level.

Table 30.3 affords some reflection on the hypotheses used to understand school dropout rates that relate the type of family with the education trajectory of youngsters, either because of the responsibility they have to assume as heads of their original nuclear family, or in view of the situation of being a parent during adolescence, considered premature.

Table 30.3 Type of family of employed people between 17 and 28 years old with complete secondary education, not attending school (Brazil, 2013)

Type of family and age group	Total (individuals)	%
Total	8,986,016	100.0
Young couple, with children and/or other relative	1,983,995	22.1
17–19 years old	37,376	0.4
20–24 years old	623,098	6.9
25–28 years old	1,323,521	14.7
Couple only	1,227,029	13.7
17–19 years old	78,924	0.9
20–24 years old	560,532	6.2
25–28 years old	587,573	6.5
Young head of family, with children and/or other relative	311,728	3.5
17–19 years old	10,162	0.1
20–24 years old	115,098	1.3
25–28 years old	186,468	2.1
Young head of family, alone or with other relative	438,879	4.9
17–19 years old	33,690	0.4
20–24 years old	207,964	2.3
25–28 years old	197,225	2.2
Youngsters who are neither heads of family nor married	5,024,385	55.9

Source: National Survey of Household Sampling – PNAD (2013) – IBGE. Our compilation

We can observe that more than half of the youngsters between 17 and 28 do not have responsibilities as heads of family; neither do they share this responsibility with a partner. Around 26% of these youngsters have children, but when we split this age group in three different ranges, it is possible to see that most cases are concentrated on the age group above 25 years old. From the youngsters between the ages of 17 and 28 who have children, only 0.5% are youngsters between 17 and 19, weakening the hypotheses that the need to assume responsibility for a family or for children can be a significant aspect in the decision to forego higher education. Having said that, it would be important to observe equivalent data in the same age group within the population without secondary education or with incomplete secondary education, which, however, is not the object of this study (Table 30.4).

The first questions raised when we think about the insertion of youngsters in the labor market are about their employment situation, their degree of stability in the job, and the possibility of access to labor rights. If we analyze the employment situation of youngsters between the ages of 17 and 28 who have finished secondary education and did not continue studying, according to race and sex, we can observe that from the total segment of people in registered employment there are a higher percentage of Black youths (more than 10%). Even when we consider the total number of Blacks and Non-Blacks separately, we still see that there are a slightly larger percentage of people in registered employment among Blacks than

Table 30.4 Distribution of employed people between 17 and 28 years old with complete secondary education, not attending school, by employment situation, according to race and sex – absolute numbers and percentage (Brazil, 2013)

^aIncludes statutory civil servants, domestic workers with or without registration, employers, military personnel, and other occupational situations

^bIncludes those who declined to declare race. The Black category includes Blacks, Browns and Indigenous people; the category Non-Black includes Whites and Yellows

among the Non-Blacks. When considering the total number of men and women separately, we observe a higher presence of women in registered employment (approximately 7 %).

In a more detailed description of employed youngsters between the ages of 17 and 28 with complete secondary education, we can observe that 64.3 % of youngsters with complete secondary education, not attending school, were registered employment in 2013; 15.7 % had an informal job, in other words, they were in non-registered employment; and 9.4 % work by themselves – developing their own business, either alone or in a partnership, (Table 30.5). Splitting this segment of the population into three age groups, we can see that the percentage of youngsters in registered employment does not change with increased age; however, the percentage of youngsters in non-registered employment decreases and the number of youngsters working independently increases. The data allow us to observe a migration of youngsters working in non-registered employment to self-employment as

Table 30.5 Distribution of employed people between 17 and 28 years old with complete secondary education, not attending school, by employment situation, according to region and age-group – absolute numbers. (Brazil, 2013)

^aIncludes statutory civil servants, domestic workers with or without registration, employers, military personnel, and other occupational situations

their age increases. This could be a consequence of various factors: they may have difficulty in inserting themselves formally into the labor market and/or they may choose an independent work and decide to set up their own businesses, or still they may enter as a third party in relationships with businesses.

Even if in the country as a whole there are a significant percentage of youngsters in formal employment, it is also important to emphasize that one of the indicators of regional inequality in Brazil is the characteristics of the labor market in each region, which can be observed by the employment situation of youngsters.

The data show that around six million people work in registered employment, with more than half of them living in the Southeast region. Looking more closely into the different regions of the country, we observe that the Southeast and South regions (the more economically developed regions) are above the average for the country in the percentage of youngsters between the ages of 17 and 28 that work in registered employment; the Midwest region fits approximately the average. The North and Northeast regions have a percentage of youngsters in formal employment well below the average for the other regions, with a slight increase in the age group between 25 and 28 years old.

It is worth recalling the regional differences in terms of sector production, and their impact in the employment situation of their populations. In terms of GDP distribution in 2007, agriculture represented 5.5%, whereas industry represented 28.7% and services 65.8%.

The Midwest region is characterized by its eminently agricultural economy, producing soy, corn, rice and cotton. The Southeast region also has a high position in the agribusiness, because of its production of sugarcane and raising of cattle, but other sectors deserve notice, such as aircraft construction, the oil industry, and automobile production.

In the South region important sectors are agriculture and cattle, associated to the food, drink, and timber industries. In the North region there are electro-electronic and automobile industries, with an important participation of the agribusiness. The

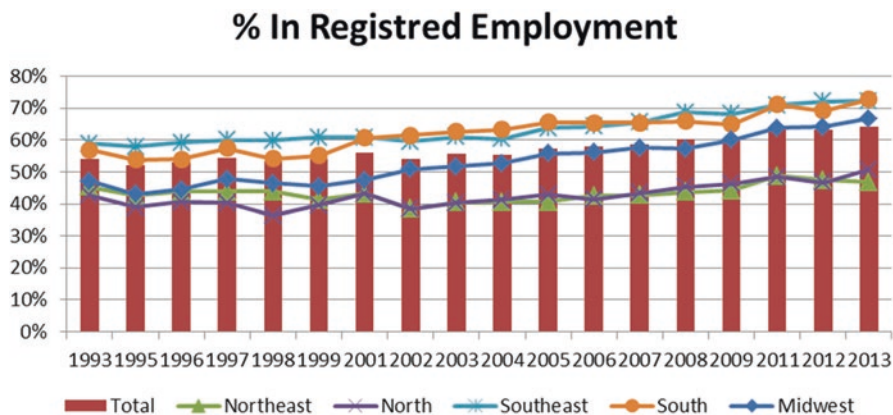

Fig. 30.1 Proportion of registered employees between the ages of 17 and 28 with complete secondary education, not attending school. (Brasil, 1993–2013) (Source: National Survey of Household Sampling – PNAD 1993–2013 – IBGE. Our compilation)

Northeast region produces sugarcane, associated with the industrialization of products based on it; of special importance are also the automobile, textile and shoe industries, apart from tourism (Fig. 30.1).

If we look at the time series between 1993 and 2013³ of the distribution of employment situation of youngsters in the country, we observe a progressive increase of the formal labor market with an important jump in 2009. Until 2005, the percentage remained between 53 % and 57 %. After 2009 there is an increase in the percentage of youngsters in registered employment, reaching 64.3 % in 2013.

Regional realities are rather unequal, but we find a trend of increase in formal employment since 2000 in the Southeast, South and Midwest regions, and later in the North and Northeast regions, where after 2008 it is possible to observe a tendency of growth in the formal labor market for the population under study here. In the Southeast, the percentage of youngsters in registered employment was 60.9 % in 2001, reaching 72.3 % in 2013. In the South region, the trend of growth can also be observed since 2001 (60.8 %), and in 2013 it reached the level of 72.8 %. In the Midwest region, there is also a trend of growth in the number of youngsters in registered employment, with 50.8 % in 2002, reaching 66.7 % in 2013. In the North and Northeast regions, we can observe a trend of growth in the formal labor market for youngsters only after 2008, and even then less pronounced than in the rest of the country. In 2008, the formal labor market in the North region absorbed 45.3 % of people in the age group of our study, and in the Northeast region this number was 43.7 % (Table 30.6).

In order to identify the types of employment taken by youngsters between the ages of 17 and 28 with complete secondary education and who are not studying, we used as a reference the occupational grouping that originally employs the Brazilian

^aIncludes managers in general, professionals of the sciences and arts, agricultural workers, members of the Armed Forces and auxiliary forces, and poorly-defined occupations

Household Classification of Occupations (*Classificação Brasileira de Ocupações Domiciliar – CBO-Domiciliar*), and reassembles some occupational families, sub-groups and main subgroups.⁴

We found youngsters working in different occupational groups, with the largest numbers working in the production and/or repair of goods and services (25.6%) and in administrative services (21.4%). At the other end, the group of technicians has the lowest percentage of youngsters in employment (9.2%), an issue that we shall analyze alongside that of the income from work (Table 30.7).

The category ‘Others’ (10.5%) is composed of managers in general, professionals of the sciences and arts, members of the Armed Forces, and agricultural workers, where almost 50% of the youngsters in this group are to be found.

If we look at the different regions, we observe that throughout the country the work in the group of productions of goods and services and of repair and maintenance is where the largest percentage of youngsters between the ages of 17 and 28 with complete secondary education and who do not currently study are situated, even if the South and Southeast regions have the largest percentages of all regions. In the group of administrative work, we find important regional differences: in the North and Northeast regions, youngsters have a smaller presence than in the South, Southeast and Midwest. On the other hand, among youngsters in the North and Northeast the proportion of youngsters working in commerce (salespeople or in third-party service) is higher when compared to the proportion of this occupational group in the total of all regions.

The highest average income is that of technicians, which have a smaller percentage among youngsters between the ages of 17 and 28 with completely secondary education who did not pursue further studies, and that of the workers in the production of goods and services and of repair and maintenance, which bring together the major proportion among these youngsters. Once again we find regional inequalities within each of the occupational groups. Despite the fact that, for each region, the average income is higher for technicians and for workers in the production of goods and services and of repair and maintenance when compared to the other occupational groups, values observed in the North and Northeast regions are still below the national average. On the other hand, the South and Midwest regions display higher than average values for these groups. In particular, the Southeast region shows values close to the average of the country for these groups; however, the workers in the ‘Others’ group (which includes managers in general, professionals of the sciences and arts, agricultural workers, members of the Armed Forces and auxiliary forces, and poorly-defined occupations) stand out with higher average income for this region.

In all cases, average income increases with age. Surely, experience and/or years on the job are an important variable here (Table 30.8).

When analyzing the average income by race and sex, the highest values continue to be those of the technicians between 17 and 28 years old with complete secondary

^bIncludes those who declined to declare race. The Black category includes Blacks, Browns and Indigenous people; the category Non-Black includes Whites and Yellows

Fig. 30.2 Distribution of actual monthly average income (in R\$) of technicians by level of instruction (Box-Plot). (Brazil, 2013) (Source: National Survey of Household Sampling – PNAD (2013) – IBGE. Our compilation)

education who are not attending school. However, Black youngsters have a lower average income than other occupational groups, when compared to those who are qualified as Non-Black.

The average income of young women between the ages of 17 and 28 with complete secondary education and who are no longer studying is always smaller than that of corresponding males in all categories of occupational groups. The highest average income of young women is still that of technicians and, after that, differently from what was observed before, the second highest income is that of women in administrative services (Fig. 30.2).

Resuming the analysis of the information about the average income on the main job of employed people between the ages of 17 and 28 who do not attend school, by their level of instruction, the income increases as expected according to the level of education. But, it is important to note that if we take as a reference the overall average level of income by level of education, we observe that the difference between those with complete fundamental or incomplete secondary education and those who have completed secondary education is smaller (14.5%) than that observed between the latter and people with complete or incomplete higher education (113.4%).

The same difference, taken now between those with higher education and those who have completed secondary education, taking only technicians, is around 60%. It is not the case of asking here if the young population with higher (complete or incomplete) education who work as technicians could be devaluing the secondary education certificate (creating a trend to decrease the income of youngsters with complete secondary education) in this occupational group.

Besides, the graph shows that the difference in monthly average income among technicians according to the level of education results from the concentration of income of the 50% of these youngsters who have secondary education in the range between R\$703 and R\$1400, whereas 50% of youngsters with higher education have a monthly income in the range of R\$1100 and R\$2600; in other words, the amplitude of income variation is higher among those with more education. The graph also shows important differences among the remaining 50% in both cases. Among youngsters with complete secondary education, 20% have a monthly income of up to R\$678, equivalent to one minimum salary at the time, and another 20% with better income situations have salaries above R\$1500; among youngsters having complete higher education and working as technicians, 20% have a monthly income of up to R\$1000, and the remaining 20% with higher income in this category earn above R\$3000 a month.

Because it is an occupational category of secondary education level with a professional emphasis, it is quite possible that part of this group have a level of schooling above the minimum required. However, those youngsters who finished a professional course and did not pursue further studies may be working in jobs similar to those with higher education, and receiving a lower salary.

30.3 Final Considerations

The present text shows the first results of a research on educational and labor trajectory of young people.⁵ In this case, we have examined the work opportunities of youngsters between the ages of 17 and 28 who have finished secondary education and did not pursue further studies. The purpose here was that of, based on census and sampling data, offering elements to a more complex and detailed analysis of the role of education in social inclusion and mobility.

The majority of studies dealing with this issue concentrate on inter-generational mobility and not on mobility within a single generation, separating by level of education. They also agree that the level of education achieved by an individual is the single most important means of mobility in current societies. We considered it to be necessary to go beyond these approaches in the study of statistical data, to identify both the potential and the limitations of each level of education within a given his-

⁵Krawczyk, "A democratização do ensino médio no Brasil: análise das trajetórias educacionais juvenis e do potencial inclusivo de inovações em curso". Research productivity scholarship CNPq, 2014–2017.

toric period. In the case of our study, we referred to youngsters in Brazil with secondary education in 2013.

Analyzing specifically the potential of the secondary school certificate to youngsters is important, among other reasons, for the fact that during the last decades we have been insisting on the possibilities of this certificate to afford the youngster a better insertion into the labor market, and on the importance of expanding technical secondary education as a mechanism of mobility for the working classes. Public policies for the expansion of public and private higher education have been controversial subjects, as have also been the policies for the insertion of youngsters in the labor market.

We have chosen the age group between 17 and 28 years old because it includes the age expected for the conclusion of secondary education (17 years old) and an age group in which the age/series gap, an important aspect in Brazil, would also appear, and/or a period of participation in the labor market that might have afforded professional experience and improvement in the work curriculum of youngsters.

During the last 30 years, Brazil has been going through a clear and unprecedented process of expansion of the access to different levels of education. This has placed new conditions and demands on the population and on the labor market. At the same time, the relationship between educational policies, population behavior and labor market has been influenced by a set of circumstances that cannot be overlooked. On one side, expansion policies do not always generate the expected increase in the educational level of the population, since they are not always followed by people's motivations and possibilities to benefit from them. This is the case of Brazil where, alongside expansion policies, we observe different rhythms in the access to the different levels of education, and elevated rates of school failure, and low performance of the education system.

On the other hand, the behavior of the labor market does not necessarily follow the intention of educational policies of expansion of access and permanence at schools. On the contrary, many authors have analyzed the process denominated 'devaluation of certificates' as a consequence of an increase in the offer of workers with a given level of education, producing higher demands for the same working posts independently of the necessary competencies.

The main evidences in the present work show some behaviors of the labor market with respect to youngsters that can help in repositioning public efforts in the problematization of education issues.

From the total number of youngsters between the ages of 17 and 28, 42% study in secondary education or have already completed it, with 21.4% of the total number of youngsters having some kind of experience at higher education level. Data show that the biggest bottleneck seems to be at secondary education, either because youngsters never attended it (21.8%), because they left school before completing it or are still attending it (18.5%), or, still, because they finished it and did not pursue further studies (32.9%).

Historically, secondary education has had the peculiarity of being a producer of educational inequalities and, therefore, a factor of deepening of social inequalities,

and particularly sensitive to social, economic and political tension and changes (Fernández Enguita 2014).

As we have seen, out of these 32.9% of youngsters, 23.1% are inserted, in different forms, in the labor market. Data corroborate the idea that the population most affected by unemployment is that of youngsters. In the case of youngsters who have completed secondary education, unemployment rate is 12.5%, approximately twice the overall average for the population (6.5%). At the same time, we observe that higher education studies have a much larger impact on the possibilities of employment for youngsters, significantly more than fundamental and secondary education certificates.

It is worth adding here that we have worked with data from 2013, a year marked by low unemployment rates. Therefore, we might ask what happens to a young worker when the economic cycle is reversed, as is happening in 2015, a year that has been characterized by increasing unemployment rates. Our hypothesis is that these trends will be accentuated. In other words, that the difference between the average rate of unemployment and the unemployment among youngsters should still grow. That the level of unemployment within the groups that go from those without any instruction up to those with complete secondary education continues without major change, and that youngsters with complete or incomplete higher education present still greater advantage in terms of employability.

A similar hypothesis can be made with respect to level of income. That is, it is to be expected that in times of growing unemployment the fact that youngsters have finished secondary education continues to be of little significance to increase their income. And that this fact will only be reversed from the moment they start to pursue higher education.

Naturally, these hypotheses still remain to be proved, after data relative to 2015 become available in 2 years' time. However, what can be observed with data already available can offer a basis for a better discussion about the significance of secondary education in the life of youngsters, and about the perspectives that this level of education open for their insertion into the economy.

The conditionings of the type of family to which they belong and of their degree of responsibility towards family income seem to be rather relative after completion of secondary education. Among youngsters, only 1.4% are between 17 and 24 years old and are heads of family, living with a spouse and their children; and 2.7% are within that same age group and are heads of family living alone or with another person who is not a spouse or a child. 4.3% are between 24 and 28 years old and are heads of family living without a spouse, having children or not.

Within the segment studied here, we observed, when analyzing in more detail the relation between youngsters and work, that regional inequality is very significant. Race and sex inequalities are, generally speaking, much smaller, and, in some cases, favorable to women and young Blacks, contrary to what could be expected. We must consider, however, that our universe comprises only youngsters who have finished secondary education and have not pursued further studies, so that the present study should not be taken as revealing of the general level of inequality; other

dimensions of analysis (economic, educational etc.) would be necessary, which are outside the scope of this work.

Among youngsters with complete secondary education who do not attend school, 64.3% were working in 2013 in registered employment, but this data should be qualified after considering that more than half of them are concentrated in the Southeast region.

There is another important trend within this group of youngsters. As age group increases, there is little increase (still with large regional differences) in the percentage of youngsters working in registered employment, which may lead to infer the small influence of experience and/or age between 17 and 28 and the low mobility in their working situation. At the same time, we observe the increase in the number of youngsters working on their own, and a process of change in the profile of the worker.

Lastly, in the analysis of the participation of youngsters in different types of occupation and their average income, the most important elements to study the processes of socio-educative differentiation can be found. They are the devaluation of ever higher education certificates, and the changes and greater stratification of qualifications required by the labor market.

As we have seen, the areas of Production, Repair and Maintenance of goods and services and of secondary education Technicians are those who absorb the highest percentage of workers in the age group between 17 and 28 years with complete secondary education who did not pursue further studies. There are no data that might help us to understand the relevance of secondary education to the concentration of youngsters in these areas.

However, other data available indicate a rather perverse reality for youngsters with complete secondary education working in occupations as secondary education Technicians, proper to their certification. Their average income is much lower than those of youngsters with complete or incomplete higher education occupying the same positions as secondary education technicians.

The devaluation of certificates is not a new phenomenon in economic and social dynamics. On the contrary, it has followed the development and expansion of education systems since the second half of the twentieth century. A permanent tension exists as one level of education expands and incorporates new social segments, its knowledge and credentials losing symbolic value in society and real value in the labor market. It is a permanent tension characteristic of the relation between democracy and capitalism.

One of the relevant questions put forward by this study, which is left to be answered by future investigations, is this: to what extent has the expansion of secondary education to include new social segments hitherto excluded from the system resulted in some degree of progress to the labor market, both in the kinds of occupations and in average income? In other words, to what extent are new social segments ascending to more qualified occupations and working posts of superior hierarchy and income by the fact of having finished secondary education?

Other questions can be made to help thinking and rethinking current educational policies in Brazil. Is it correct to insist on professionalization as the driving force of

secondary education? Or should this level of education recover its function in the cultural formation of youngsters from a broader point of view, which also includes preparation for the world of labor, but without the (almost exclusive) emphasis that is sometimes argued for? These questions can also offer a point of departure for the discussion about secondary education level technical schools and what we intend to do with them.

Naturally, there is need for more studies on the school and professional trajectories of youngsters. However, it seems to us that the main objective of the present work has been fulfilled, namely, that of initiating the groundwork for the discussion with quantitative data, and of alerting to the lack of such data in a large part of the discussions happening today about the future of secondary education in Brazil.

Chapter 31

1-1 Model and the Reduction of the Digital Divide: *Conectar Igualdad* in Argentina

Silvina Gvirtz and Esteban Torre

31.1 Introduction

Latin American education systems have entered the twenty-first century witnessing a sustained increase in enrollment in public secondary schools. According to the UNESCO Institute of Statistics (UIS), the average enrollment rate in the secondary level in Latin America increased 15 percentage points between 2000 and 2013: from 60.7 to 75.6%. Originally conceived as a space for the education of the elites, now secondary schools receive in their classrooms first generation students. This challenge is faced by most states in Latin America, and they are taking an active role in meeting it through educational investments, laws and policies.

Nowadays, because of these necessary and active policies, inequality is less related to access to education than with the school trajectory of students. The right to education is associated with the 4 – A scheme (Tomasevski 2001) that defines the obligations of each state: (1) Availability: to ensure that education is available; (2) Access: to secure access to free-of-charge education for all children and young people in the compulsory education age-range; (3) Acceptability: to guarantee a quality education; (4) Adaptability: to provide an education best adaptable to all students. However, relatively high rates of repetition and dropout and low rates of graduation are reported in most Latin American countries. Moreover, these situations have a greater impact on students from disadvantaged social backgrounds (SITEAL 2008).

Upon realizing this problem, many countries created different policies to address it. Some of them are compensatory programs implemented when the failure has already happened (school completion programs, for example). Some of them are trying to prevent repetition and dropout through the inclusion of Information and Communication Technologies (ICT) in public schools. Today there is a common certainty across the education agendas of Latin America about the fact that digital inclusion implies social justice. From this perspective, digital inclusion must be thought of as a collective issue, not as an individual one. The reduction or elimination of the digital divide would not benefit only the individual through direct access to technology but also the society as a whole. The society benefits from the strengthening of social capital in the form of shared values and cultural content and from the potential of the education system for increasing labor productivity.

This chapter will focus on *Conectar Igualdad*, a program of distribution of notebooks addressed to students and teachers of public secondary schools, special education schools and teacher training colleges in Argentina in order to enhance public schools and improve the quality of education. Argentina is essentially an urban country where more than 90% of its population lives in cities (National Population Census 2010), thus education policies have an important impact on urban areas. The chapter is divided into three parts. The first will address the context of the integration of technologies as a policy that seeks to address two issues that occupy a very important place in the public agenda of the first decade of the twenty-first century: the situation of public secondary schools and the prospect of universal access to technologies Information and Communication Technologies (ICT). The second part will firstly present a general overview of the integration of ICT in public education in Latin America and then it will offer a description of the Argentinian case. The final section will describe the implications of *Conectar Igualdad* and its potential as a tool to reduce social gaps and improve student learning, using a qualitative approach.

31.2 Public Secondary School in Latin America: An Overview

Public secondary school has been at the center of the education debate in Latin America in the last decade. This importance can be attributed, in part, to the intensification of a phenomenon that has been happening since the 1960s: the increase in the enrollment rate of secondary school. Chart 31.1 shows the increase between 2000 and 2012. While Peru is the country that had a greater increment in this period (from 58,9 to 79,8), Argentina is the country with the greatest enrolment rate at the secondary school with 83,9.

Moreover, the sustained increase in enrollment reflects important progress in the democratization on access to education, as its impact was greater in the first quintile of the population, i.e. the 20% poorest population. Chart 31.2 reflects this phenomenon.

Chart 31.1 Enrollment rate of secondary school (2000–2012) – Latin America (Source: Rivas 2015)

The growth in net enrollment rates at the secondary level experienced by Latin American countries was in part attributed to national policy changes requiring compulsory education that favored the inclusion of disadvantaged groups (see Chart 31.3). Chart 31.3 shows the years of compulsory education in Latin America in 2000 and 2015. The average increase from 10 years of compulsory education in 2000 to 13 in 2015. In Argentina, these policies began with the Federal Education Act of 1993 which established the obligation of the first years of secondary education, and then continued with the enactment of the Law of National Education in 2006 which determined mandatory the comprehensive secondary level.

The combined efforts of families to provide pathways for upward mobility for their children and public policies aimed to expand coverage of education generated a strong demand which resulted in the significant increase in enrollment at the secondary level of education as was shown in Chart 31.1. In 2014, 2,786,329 students attended public secondary schools in Argentina (Ministry of Education, Statistical Yearbook 2014), where a 90,56 % of this group belongs to urban areas.

Beyond the differences between countries, secondary school was historically conceived as a mechanism of selection and social distinction. Thus, a main challenge of the region was to break the selective component of the secondary level. Many problems that were seen only in primary school or problems located outside schools today have to be assumed and confronted daily by secondary schools (Dussel 2015).

Chart 31.2 Enrollment rate in secondary school per quintile (2000–2011) – Latin America (Source: Rivas 2015)

Chart 31.3 Years of compulsory education – Latin America (Source: Rivas 2015)

Country	2000	2015
Argentina	10	14
Brazil	10	14
Chile	8	13
Colombia	10	12
Mexico	9	15
Perú	12	12
Uruguay	10	14
Average	10	13

This implies significant challenges for the educational system in terms of retention and graduation of students and the quality of learning. In fact, despite the increase in enrollment, inequality problems arose within the education system. As an example, we observe the behavior of the repetition rate (Chart 31.4) and dropout rate (Chart 31.5) in Argentina.

Repetition rates have remained fairly constant in the second Cycle of secondary school while have increased in the first Cycle during the last decade. In Argentina,

	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012
1st Cycle	9,36	10,38	12,28	12,82	11,66	12,18	12,45	11,81	12,40	11,43
2nd Cycle	6,86	7,58	8,07	8,09	7,62	7,73	7,41	6,70	6,79	6,18

Chart 31.4 Repetition rate in secondary school (2002–2012) – Argentina (Source: Ministry of Education, Argentina 2014)

	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012
1st Cycle	7,5	8,4	8,5	9,9	9,9	8,7	8,4	9,3	9,6	8,6	8,6
2nd Cycle	15,5	18,9	19,8	19,4	18,6	18,0	17,4	15,4	15,8	15,8	14,8

Chart 31.5 Dropout rate in secondary school (2002–2012) – Argentina (Source: Ministry of Education, Argentina 2014)

repetition is at high levels in both cycles of secondary school and above the average rate in Latin America, 7.1 % in 2012 (UNESCO 2015). This is particularly alarming considering that grade repetition is often a prelude to student dropout.

The dropout rate had an oscillating behavior with ups and downs in the period of 2002–2012, however, it remains at high levels in both the first and second cycle of secondary school.

In a comparative study of 18 Latin American countries, Gabriela Itzcovich (2014) notes that Argentina still has a high level of discrepancy between the access to and the completion of secondary education: 32.8 %, a high percentage when compared with other countries in the region such as Chile, which has 17.7 %, and Peru, which has 20 % (Dussel 2015). The difference between access and completion can be seen with the reduction of repetition rates concurrent with the marked increase of dropouts in the second cycle. Moreover, other studies reflect how these phenomena affect differentially according to the socio-economic sector. According to data provided SITEAL, in 2008 only 13.1 % of young people from the most disadvantaged sectors finish secondary school, while the graduation rates of upper classes is 96.2 %.

These challenges were faced by most states in Latin America and they took an active role in the education arena. Specific laws aimed at the secondary level are complemented with policies that have as a main objective the reduction of inequality. In this context, the integration of ICT became part of the political agenda of most countries in Latin America. Digital inclusion is related to social justice.

This has been precisely the inspiration that has led to the creation of *Conectar Igualdad* in Argentina, a policy in which we can recognize at least two major aims. A social aim: reducing inequality in terms of access to technology for young people (“Social Justice”). An educational aim: improving the quality of public education and increasing learning outcomes (“Educational Justice”).

31.2.1 *Digital Literacy*

Technologies, in the words of Manuel Castells (1999), are not only tools to apply, but also processes to develop. It is the first time in history, the Spanish sociologist states, that the human mind is a direct productive force, not only a crucial link in the production system. In this line, Juan Pablo de Pons (2008) argues that technologies are the “creative force of the moment” and, therefore, permanently referred to the future.

It is possible to argue that digital literacy is to the twenty-first century what the literacy process was to the nineteenth century. Juan Carlos Tedesco (2012, p. 1) argues that digital inclusion policies can be considered equivalent to traditional literacy campaigns designed to universalize the ability to read and write:

Before the invention of the print it was not necessary to be literate to enter into the circuit through which circulated the most socially significant information. With the print, the need and right to read and write demanded universal policies of literacy. Today, besides being literate, it is necessary to be digitally literate to access information and to exercise citizenship. But it is not enough to have access to the instrument. It is necessary, however, to dominate the device in a way that allows each person to understand the world and to express themselves.

A report by the United Nations Economic Commission for Latin America and the Caribbean (ECLAC), 2010, directed by Ruben Katzman (2010), titled “Social impact of incorporating information and communication technologies in education (ICT)” warns that the centrality of the new technological skills revealed the way they promote the acquisition and accumulation of different types of capital:

- Human capital, meanwhile, technologies increase autonomy in seeking information processing.
- Physical capital, to improve opportunities for entering the labor market.
- Social capital, as a result of the operation of the interactive potential and the decentralized nature of the technologies.
- Citizenship capital, multiplying the means for exercising rights of those who are fluently transiting the digital world. (p. 6)

The impact that technological skills have in the Knowledge Society requires a reflection on the school as the privileged space to democratize access to this knowledge (Dussel and Quevedo 2010). In “Technology and school: what works and why,” Francesc Pedró (2011) has identified four groups of reasons to justify a greater and more intensive use of technology in classrooms.

The first group has to do with the demands of a globalized economy with dynamic technological developments, in which the level of training of the workforce (human capital) has great impact on the future development of countries. The initiatives of ICT integration in education that are designed mainly following an economic rationale are those that emphasize the development of ICT skills which would enable students to improve their competitiveness as workers – and thus, also improve the competitiveness of firms and the whole economy of their countries.

This approach was present from the beginning of the educational policies that contemplated the inclusion of technology, particularly in technical education at the secondary level, accompanying the development of PCs in the late 1980s and early 1990s. It is closely related to the rapid expansion of computers at work, first, and, at home, later. The incorporation of computers in the workplace resulted in a rapid demand not only of specialists in systems but also of competent users. This created a need for training for work and caught the attention of governments on the importance of their inclusion in the educational system.

The second group of reasons lies in what Pedró (2011) called “social needs” and are related to a social justice aim. The author highlights the effect that the inclusion of technology in schools can have in reducing the digital divide, i.e., the inequality in the access to technology that exists in society. This is a particularly important aspect in Latin American countries that are characterized by high levels of social inequality. In this region, public policies of universal access to technologies throughout the education system have a different weight than they do in other countries where access can occur in alternative ways (Tedesco 2007). Hence, the school is called upon to play a key role in ensuring the democratic ownership of new sources of knowledge.

School is the institution chosen to play a central role in reducing the digital divide, as responsible not only for the distribution of technological devices, but to operate on the quality of its educational use. From this perspective, ICTs are presented as a social good to be democratized by ensuring their access, and as a medium that may influence resolving some aspects of dropout, especially those related to the difficulty of broad sectors of the population who, for various reasons, face barriers in access to schooling.

The third group of reasons that identifies Pedró (2011) is related to the cultural changes that characterize the Knowledge Society. From this perspective, schools cannot remain outside the cultural transformations and must live within the digital culture, actively participating in their new formats and contents (Pedró 2011). This participation has become imperative because, as David Buckingham (2006) has pointed out, although schools have often remained immutable to the advent of technology, the same can't be said of the lives of children outside school: television, video games, Internet and cell phones are devices that have widely penetrated the daily life of children and youth. This mismatch between the use of technology in schools and outside them is what Buckingham (2006) defined as a new digital divide. Filling that gap is a task that schools must carry out. In this line, Myriam Southwell (2013) argues that it is not only to incorporate new languages and media, it is also necessary to undertake a review of the modes of use, new intellectual paths that are proposed, the potential of the new languages, the relationship with the knowledge they generate and social practices that are enabled with them.

Indeed, the fourth group of reasons is related to pedagogical expectations around the inclusion of technology in the classroom. The traditional school we know, which arose in 1880, was the unique distribution center of information – information that students could not access otherwise. The current situation is significantly different: the school no longer has the monopoly of information and sources to acquire it are

manifold. In these times, highlights Flora Perelman (2011), students conceive the Internet as a natural source of primary information. They consider the process of selecting information easy, fast, reliable and economic. And in this “face to face” says Anne Marie Chartier (2004), young accepted without discussion restrictions and verdicts of the machine, which appears as a neutral third party without emotion or value judgments, tireless in repetition, specially adapted for all managerial and automation. A scenario like this is one of the major challenges facing the school in the Knowledge Society: to process the information that flows through the Internet and teach how to discern what information is relevant and useful. In this regard, Nicholas Burbules (2011, p. 22) argues that “as students get older, they begin to find sources of information they consider valuable and useful, beyond the teacher; and in this sense, the teacher is important to help students assess their search results and make better decisions.” To successfully meet these new demands the school system must adopt new methodologies, new content, new organizational models and methods of interagency collaboration; in short, it must lay the foundation for a new school.

To summarize, we understand that digital literacy refers not only to the ability to read and write, but to create new formats from this knowledge. More specifically, the technologies allow the educational process to concentrate on complex skills: comprehension and production of written and visual texts; solving mathematical and scientific problems; intelligent processing of information; communication skills such as expression in the new formats and participation in collaborative and social networking spaces. Cobo and Moravec (2011), Chilean specialist at the University of Oxford, draws attention to the “invisible learning” (Cobo and Moravec 2011, p. 22) that technologies enable. With this concept, Cobo refers to skills such as the ability to connect contents, hypertext reading, transfer of knowledge to other platforms. Moreover, Nora Sabelli (in Gvartz et al. 2011) emphasizes that, through the integration of technology, the role of memory decreases to be replaced by the ability to “learn to learn.” (Sabelli 2011, p. 143) This is a skill indeed essential for students to construct their own knowledge within the framework generated by a school in tune with the educational needs of the Twenty-First Century.

31.3 Integration of ICT in Latin American Education Systems

In recent years, Latin America has become one of the most proactive regions of the world in relation to the integration of ICT in their education systems, in order to contribute to social inclusion, democratization and the reduction of the digital divide. This process of developing policies that promote the integration of ICT in the education sector is based on the experiences of digital inclusion that were already developing in the countries of the region (Sunkel and Trucco 2012). These experiences recognize, at least, three common elements:

- The consideration of education as a strategic area for reducing the digital divide.
- The use of the formal education system as a privileged sphere for the implementation of public policies to promote the democratization of access to ICT field.
- The recognition of the different stages and levels of development in the process of digital inclusion.

The inclusion of ICT through different modalities forms a heterogeneous mosaic. The alternatives for the incorporation of ICT (laboratory model, mobile classrooms or 1-1 model) respond, in many cases, to different stages of introduction of new technologies in the education system. Thus, the laboratory model, for example, represents the initial phase, although it may continue to live with other models. In settings where resources are scarce it is common to find staggered strategies, including the coexistence of more than one model, even in the same school. However, it is possible to observe a trend towards the adoption of 1-1 models, that is, to initiatives that promote the provision of individual devices for each student.

ICT Programs in Latin America

Uruguay announced in December 2006 the creation of the Plan Ceibal (Basic Computer Educational Connectivity for Online Learning), under the OLPC program, created by the MIT professor Nicholas Negroponte in 2002. OLPC's contribution has been very important in lowering the cost of computers. The design of an inexpensive and portable computer specially designed for students produced, firstly, important market incentives for production technology at low cost and, secondly, it allowed different countries envision an opportunity to address delivery policies mass. Plan Ceibal was developed in stages. The primary level was the originally recipient of Plan Ceibal, but in 2010 was extended to the basic cycle of public secondary schools (first to fourth year).

Peru also followed the path of the OLPC program, starting with their rural primary schools. The Huascarán Program was launched in 2001, was then merged with the Ministry of Education in 2007 and reached to distribute more than 800,000 computers. Their high initial costs and maintenance, coupled with some resistance and criticism, did slow the momentum towards universalization of the proposal.

In **Venezuela**, the Canaima project is the 1-1 model implemented jointly by the Ministry of Popular Power for Education and the Ministry of Popular Power for Science, Technology and Innovation. Initially, recipients of the program were students in public primary schools and those subsidias by the state. The first embodiment of the plan was conceived as part of the school (Canaima School Education) and the computers remained in mobile cabinets at school. The second phase of the program is known as Canaima Education "Go to my house," and the students take the computer home to provide full-time educational content and also to involve family in the learning process. To the date Canaima has delivered over 3,900,000 computer (Canaima Educativo webpage, 2015).

(continued)

Chile was a pioneer in the integration of ICT, although it wasn't under the 1-1 model. In the early nineties, Enlaces, the longest-running program in the region in the use of technology for education was launched in Chile. Enlaces evolved through different strategies, from the delivery of equipment to schools to the development of educational software. Digital materials directly related to the curriculum and courses for teachers with the same practical guidance developed. Chile concentrated its efforts on promoting educational adaptation of ICT rather than mass provision of equipment to schools and students (Jara 2013). This strategy allowed for convergence with other areas of the Ministry of Education and the focus on the pedagogical intervention stimulated innovation. However, the reduction of the digital divide was greater in countries that invested heavily in the distribution of computers.

In **Brazil**, ICT projects emerged in some states of the country or by initiative of private actors. A recent innovation is the national policy of distribution of tablets for teachers. In 2012, the Ministry of Education and Culture of Brazil launched the "Digital Education" project that distributes tablets to public school teachers. Tablets include different content as educational journals, books by renowned teachers, the main national newspapers and videos of classes in physics, chemistry and biology.

The *1-1 Model* involves a student and a computer, so that each person can perform multiple tasks; get a personalized, direct, unlimited and ubiquitous access to technology information, giving rise to a simultaneous link between them and others, in a time that exceeds that of school attendance (Sagol 2011). This modality rests on principles based on universal access to technology both inside and outside the school environment. The portability of the device favors the home use of computers both for leisure and for doing homework. OECD studies from the results of PISA 2009 reveal that the frequencies of computer use at home as part of leisure time is positively related to the acquisition of digital reading skills. This is particularly important as it allows to extend school time in countries, as Argentina, where the effective hours at school are relatively low.

Portable devices also make a contribution to the home environment as they can be used by other members of the family. Ruben Katzman (2010) argues that "the home is seen increasingly as a major site of learning new technologies, not only because under certain conditions can give children an early digital literacy, but because they can play a complementary role in transforming school virtual learning in a process that continues beyond the limits of classrooms."

At this point, it is interesting to stop at the decision of choosing laptops over other mobile technological devices such as tablets. This decision reflects the fact that devices like tablets have limitations to accomplish some of the goals expected from school, as the encouragement of written production. In some countries where

a second technological device is available to children and youth, the tablets are used both at home and at school. In Latin America in general and Argentina in particular, it is often the case that laptops are the only device to which students have access. In this context, it is necessary to provide a device that facilitates not only cultural consumption, but also production.

31.3.1 Conectar Igualdad in Argentina

In Argentina we can trace the first pilot project of distribution of computers to 2008. At that time, about 1,000 laptops were given to students and teachers from 14 primary schools in different provinces (Buenos Aires, Chubut, Mendoza, Misiones, Salta, Santa Fe, Tucuman, Cordoba and Catamarca). The schools were selected from different contexts: rural and urban; schools with multigrade classrooms and a school with an Aboriginal population. Training sessions for teachers and technological references were made and the first work proposals were evaluated by a group of specialists from the University of Buenos Aires (UBA).

In 2009, the Ministry of Education announced the program “A computer for each student” aimed to public technical secondary schools. Specific recipients were teachers and students of the second cycle of the technical modality of secondary level. In the first phase of the plan, between the second half of 2009 and throughout 2010, it reached 231,164 students and 25,680 teachers in 1,156 schools. This program is the immediate predecessor of *Conectar Igualdad*.

In April 6, 2010, President Cristina Fernandez de Kirchner announced the signing of the Decree 459/10 that created the program, *Conectar Igualdad*. The articles of the decree state the scope of the program, its governance and financing. In first place, the decree establishes the creation of the program in order to provide a computer for each student and teacher at public secondary schools, special education schools and teacher training institutes. Regarding the government structure, the Executive Committee of *Conectar Igualdad* is chaired by the Executive Director of the National Administration of Social Security (ANSES), coordinated by the General Executive Director of *Conectar Igualdad* and composed of a representative of the Ministry of Education, one of the Cabinet of Ministers, and one of the Ministry of Federal Planning, Public Investment and Services. The Ministry of Education is the agency responsible for the education strategy of the program. The Cabinet of Ministers is responsible for defining the physical security of computers and school networks. The Ministry of Federal Planning has among its objectives to provide connectivity to schools through the deployment of the federal network of fiber optic and satellite service. ANSES is the agency responsible for purchasing the equipment (netbooks and technological infrastructure) and coordinating the logistics. Regarding the financing of *Conectar Igualdad*, the legislation states that the program is funded by the National Treasury and creates in the field of ANSES a budget program that provides financial assistance for the plan.

To ensure the necessary integration of technology into the teaching and learning process, *Conectar Igualdad* is based on three components:

- I. Netbooks and technological infrastructure.
- II. Content and educational software.
- III. Teacher training.

31.3.1.1 Netbooks and Technological Infrastructure

The netbooks that are distributed by the *Conectar Igualdad* are “classmates.” It is a machine designed to work in the classrooms, which means that it has a resistant casing, concave corners to resist strokes and falls, and is waterproof.

The distribution of netbooks in schools is also accompanied by the installation of an infrastructure package setting an internal network in buildings (Intranet). An essential component of the technological infrastructure is the school server to which all school netbooks are linked through Access Points (APs). The Intranet allows the access to a large set of files and contents that the server stores. This is particularly important given that, contrary to widespread belief, Internet it is not essential for schoolwork in an ICT policy. Through the internal network, users can, for example, perform collaborative tasks and use shared folders.

Netbooks have progressively incorporated improvements in both hardware and software in order to accompany the incessant technological development. Currently, netbooks have 4GB of RAM, more storage space on the hard disk, a reversible webcam and includes a TV tuner for watching the Open Digital Television (TDA) channels.

However, the evidence suggests that infrastructure investments are necessary but not sufficient, and that they need to be complemented with content, teacher training and guidance about pedagogical uses.

31.3.1.2 Contents and Educational Software

The provision of digital content is a necessary condition for the effective use of technologies in schools. According to Arias Ortiz (2014), there are different aspects related to content that important to define in an ICT program. First, it is necessary to perform initiatives related to the implementation and adaptation of the curriculum content of ICT or their cross-cutting use to support different subjects covered in the curriculum. Second, digital material for teaching and learning with technological tools should be provided including encyclopedias, manuals, textbooks, guides and videos. Third, it is useful to provide software to support teaching and learning processes including productivity applications, platforms and virtual simulators. *Conectar Igualdad* covers these three aspects.

The netbooks of *Conectar Igualdad* include numerous educational software to be used in different subjects. For example, to work in natural science classes, the netbook has different applications preinstalled. One is the Avogadro, which allows

users to draw molecular structures and chemical bonds in 3D. Molecular technology 3D visualization helps improving the understanding of the three-dimensional structure of molecules and many physical and chemical properties derived. In this sense, technological applications allow easy access and manipulation of different functional models favoring better learning of the contents of science. Using computerized molecular models, students can see an increase in their capacities to understand the concept of scientific model and to apply transformations of molecular representations of a two or three dimensional molecular and vice versa (Joselevich 2015). Simulations can turn the netbook into a virtual lab, promoting the idea of learning through research (Cañizares et al. 2008).

Another interesting software is Celestia, enabling the exploration of the universe in three dimensions and simulation of a trip through the solar system. To do this, the program includes a catalog of stars, galaxies, planets, moons, asteroids, etc. The netbook also has built-in applications to use in math classes. For example, GeoGebra, a software that combines various elements of mathematics in an interactive and dynamic way. It allows constructions with points, vectors, segments, lines and functions that can be changed dynamically. GeoGebra is a program designed as a teaching tool, seeking to promote exploration and research as a mean to learn mathematics.) The potential of a technological tool like GeoGebra is manifested in two transformations: it opens the possibility of addressing issues that would be impossible without its help and it allows to take an experimental approach to mathematics that changes the nature of learning (Novembre 2015).

The netbook also includes different multimedia tools to edit and play texts, videos and images. One of the most used applications is Audacity, a multitrack audio editor that can record live audio, convert audio files to different formats, cut and paste or splice audio tracks to mix sounds, etc. Cheese is software to manage webcam that allows to take pictures, record videos and apply various special effects.

Numerous are the resources available to each student for programming and game development. Pilas Engine is a tool to build simple games in a didactic way that is primarily intended for those who are making their first steps in programming. The netbook also has installed Alice, a software developed by Carnegie Mellon University (Pennsylvania, USA) for programming, which uses a simple model based on “drag and drop” objects to create animations using 3D models environment.

Since its origins, *Conectar Igualdad* has “double boot” as it offers the possibility of using a free operating system (Linux) or a proprietary system (Windows). In a boost to technological sovereignty, the program developed Huayra, its own operating system based on Debian GNU Linux. Huayra has three main features: it is free, public and no-cost. It is free because it is open source and allows anyone to reprogram, invent and work with more than 30,000 programs available to download and share. It is also public because it is an operating system developed by the Argentine state itself and it can be extended to the entire public administration. Finally, its installation and use is no cost to the user and free of license fees. Open source software has interesting educational potential as it gives the opportunity to use a tool, observe and learn how it is made, ensuring the possibility of modifying and appropriating it.

***Conectar Igualdad* and Special Educational Needs**

One of the principles guiding *Conectar Igualdad* is social inclusion. Through the netbooks, many young people have their first approach to technologies. A milestone in terms of inclusion has to do with the distribution of adaptive technology for special education schools, complementary to the netbooks. The kits are composed of external technical devices which facilitate access for students with special needs.

For many students in special schools, their first drawing, its first brief, his first independent communications are performed with a computer. Therefore, technology becomes an important element for their socialization. Access to information allows students to be on similar conditions to their peers, talk about the same issues and share experiences, chat, listen to music, play video games, etc.

But computers, being, in general, designed and made by people for people without disabilities, can represent an obstacle. Indeed, any functional limitation that hinders pressing, the precise movement or the vision of small elements, among others, creates a “barrier to entry” that can bind to renounce to their use. Francisco García Ponce states that:

Inclusion has to identify the digital divide present in the classroom. These barriers are related to access to devices with educational software and web browsing. Once identified, it is necessary to give an answer. Sometimes these answers go through the design of educational policies that are aimed at eliminating those digital barriers: policies for R & D in the accessibility of ICT that facilitate the implementation and use of technical assistance best suited to the characteristics of students depending on their special needs. (p. 18, Garcia Ponce 2011)

In order to overcome many of the difficulties caused by the current design of computers, *Conectar Igualdad* has incorporated different hardware devices that give access to the use of netbooks. The composition of the kits varies depending on the type of disability of students. For example, students with visual disabilities receive Braille printers. These are printers that allow any scanned text to be printed in Braille. The schools where attend students with motor disabilities receive switches, devices that simulate a mouse click and vary in shape and size to allow them to be operated with the body part that the student manages voluntarily (e.g., elbow, foot, chin, etc). These schools also receive “mouse with buttons”, a device that fulfills the same function of the classic mouse but it has four buttons to guide the cursor in their basic positions (up, down, left, right). Additionally, protective keyboards are distributed, which have a protective acrylic dividing the keys, allowing access to each other without pressing involuntarily. The comprehensive list of devices that receive special education schools is completed with computers all-in-one, projectors and screens.

31.3.1.3 Teacher Training Actions

The integration of ICT in schools makes it essential to work with key actors in the learning process and coordinate their actions within education systems. First, teachers must have the support they need to make teaching more responsive to students' needs, and should be trained to teach in the new technological environment. The teacher has been, is and will remain the key actor in the education process. At the same time, it is necessary to recognize the management role that the school principal has in the integration process of ICT at schools.

The technological revolution, says Finnish education specialist Pasi Shalberg (in an interview with the *Huffington Post* 2013), will gradually remove the monopoly of knowledge and information to teachers, and place them in a new role which involves bringing the students at its main source of curiosity and passion to discover "what they really want to be." Thus, reflecting on the role of teachers in a Knowledge Society leads us to believe the teacher not as a mere transmitter of information and knowledge.

In this sense, Michael Fullan (2013) suggests exploring the role of teachers as "activators" (Fullan 2013, p. 11) of experiences. That is, a teacher who designs learning experiences where the curriculum expectations align with the context and the personality of each student, and generates didactic situations in which students learn to critically assess the knowledge that culture offers.

A study by Damian Bebell and Rachel Kay published in the *Journal of Technology, Learning, and Assessment* (2010) concluded that 1-1 programs are effective only to the extent that teachers who carry on in the classroom are trained. The authors note that teachers are almost always those who control when and how students access technology during school hours. They must make large investments in time and effort to adapt their teaching materials to "room 1-1" practices. Consequently, to the extent that 1-1 programs increase in popularity, the quality and depth of preparation that teachers receive for their implementation will become a central element in predicting the success of the program.

Therefore, it is crucial to develop teachers' capabilities to help them make appropriate use of technology. According to Arias Ortiz (2014), there are three dimensions of capabilities that can be developed:

Capability	Description
General	Competence to operate a computer, manage files, use productivity software (word processors, spreadsheets, production of presentations) and Internet tools such as browsers and e-mail. With these capabilities, teachers can incorporate technology into their planning, administrative activities and communication with parents, students and peers
Use of specific software	The capacity to use software targeted to a specific academic area. The training focuses on knowing how to use the application and solve any problems that may arise. The time needed to develop this capacity will vary with the application, but is generally relatively short given the limited objective
General educational use	General knowledge of various educational applications that can be used for different subjects and grades, along with appropriate teaching strategies

Source: Arias Ortiz (2014)

As said before, the school principal has a central role in ensuring the integration of technologies in the context of the continuous improvement of the school. The management of this process has an administrative dimension and pedagogical dimensions.

Administrative aspects include ensuring the operating conditions of technological tools and promoting a “culture of care” of computers and technological infrastructure at school.

In the pedagogical dimension (most important), it is possible to identify three activities that school principals should do to enhance the integration of ICT. First, encouraging the use of computers at schools. Initially, it would be a basic use, a condition for achieving a more complex use. Simple practices allow exploration, with trial and error as a method to approach technologies and a willingness to share findings and experiences. Second, school principals should assist teachers in reviewing the annual planning and discussing of the possible uses of technology in their subjects. Also, it’s important to offer teacher training instances in order to strengthen skills and knowledge that new practices require. A third activity related to the pedagogical dimension implies installing institutional spaces in the school for collaborative work among teachers. Schools that share teaching materials generate better living but also enhance the possibilities for learning among teachers and students and the sustainability of the improvement process.

31.4 Concluding Remarks and Challenges Ahead

In 2012 the Statistical Office of UNESCO published the survey “Use of ICT in education in Latin America and the Caribbean. Regional analysis of the integration of ICT in education and the digital fitness” (2012). The questionnaire collected data on different areas in the countries of the region: (a) policies and program of study; (b) integration of ICT in schools; (c) enrollment in programs that use ICT; and (d) teachers and ICT. The report allows us to draw attention to the impact of *Conectar Igualdad* on the access to technology for secondary students in Argentina. In 2009, there was a relationship (ratio) of 12 students per computer in public secondary schools. Since the implementation of *Conectar Igualdad*, the picture is significantly different and Argentina is moving toward a scenario of reducing the digital divide. At the end of 2014, all students in public secondary schools had a computer, so this relationship was one computer per student. Moreover, with over 5,300,000 distributed netbooks in 11,585 public schools, *Conectar Igualdad* is the largest 1-1 initiative in the world. More than 90% of this netbooks were given to students that live in urban areas.

The evaluation report of *Conectar Igualdad* led by Bernardo Kliksberg (2015) describes the impact of the program on a specific population – recipients of the

Universal Child Allowance (AUH)¹ – regarding the access and use of technologies inside classrooms and outside them. The study was conducted in urban areas. The results presented focus their attention on the universe of households where at least one child or adolescent receives the AUH, meaning the most vulnerable families in the country and found in the lower strata of the income scale (equivalent to the first quartile of household per capita), with the implications that this entails: increased susceptibility to poverty and exclusion.

The report (Kliksberg 2015) shows that nine out of ten students use the netbooks of *Conectar Igualdad* and 77.8 % say that they use them either at school or at home. Information on the frequency of use of computers in schools sheds light on one of the challenges of the program, that is, to encourage greater school use. While a significant percentage (45.1 %) of students answer that netbooks are used every day in schools, 44.3 % once a week, as 6.6 % and 2,3 % said the use was occasional (once a month) or almost nonexistent, respectively. One interesting finding is that nearly nine out of ten students who reported using netbooks, expressed doing it at school in different subjects.

Domestic use of netbooks reaches levels of 85 % and becomes more significant the smaller the size of the town, that is, where the possibilities of access to ICT is more difficult. And although the frequency of use is somewhat lower than in school, the percentages are not negligible, since practically eight out of ten young beneficiaries used the computer program at home at least once a week, while almost half do so daily. Moreover, the fact that netbooks can be carried home has a positive externality as it multiplies the recipients of the program through access to technologies to other household members. All students included in the report declared that they teach other household members how to use the netbook.

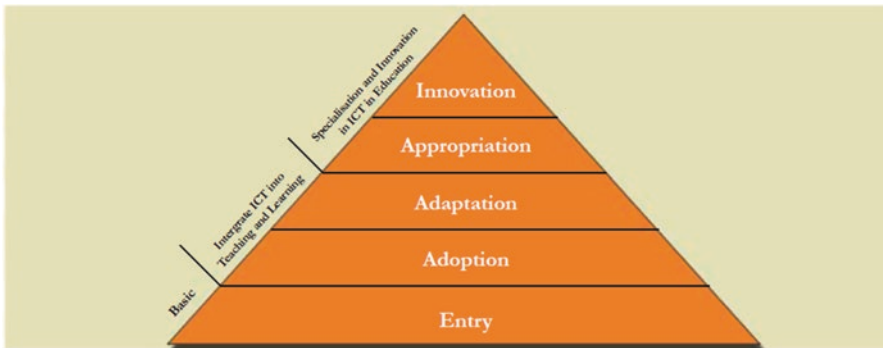

Another factor with a clear influence on the frequency of use is whether the netbook is the first technological device for the family. In the case of recipients whose first computer was the one received by *Conectar Igualdad*, the use at home is more frequent than for those who already had a computer. The difference is about 10 percentage points.

The evaluation report directed by Kliksberg also highlights a positive impact of *Conectar Igualdad* in a group of problematic aspects that are present in public secondary schools: assistance, retention and institutional environment. Receiving the netbook is a factor influencing the desire to go to school particularly among the younger recipients (12–14 years students) and among those for which the netbook is the first technological device. This population identifies the capacity of the program of encouraging school assistance, as well as reducing school violence expres-

¹In November 2009, the Argentine Government, through Decree 1602/09, implemented the Universal Child Allowance Program (AUH). The government incorporated a non-contributory subsystem intended to provide monthly cash transfers for informal or unemployed workers with children under 18 years of age. This new conditional cash transfer program reaches an important population segment mostly belonging to the lower income socio-economic strata. Their current coverage amounts to 3.5 million children and 1.9 million households.

sions, generating greater engagement with homework and promoting improvement of the institutional climate in general.

As argued in the first chapter, the integration of technology in classrooms is accompanied by large educational expectations. Technologies allow for concentrating the educational process on the development of complex skills and abilities and, therefore, are valuable tools to better serve the educational needs of the twenty-first century. Now, this process of integration of technology in schools is not manifested in a linear way. The graph below – taken from the “White Paper on e-education” 2003 the Department of Education, Government of South Africa – allows us to think this process of integration of technology in different theoretical stages:

Source: Department of Education, South Africa, 2003

The first stage involves the *Entry* of technology in the classroom. In *Conectar Igualdad* this stage consists in the distribution of netbooks at each school. There is a basic use of technological devices: the netbooks are integrated as an additional didactical resource.

The second stage involves the integration of technology in teaching and learning. It is the time of *Adoption* of technologies in the daily life of schools. Students and teachers explore the basic functions of computers and become familiar with them through a “trial and error” method.

The third stage represents the moment of *Adaptation* where technologies are integrated into teaching and learning through the use of the simplest software as a teaching resource.

The fourth stage is presented as the phase of *Appropriation* of technologies. Teachers incorporate them as a tool to enrich their practices and students use the various applications provided by the devices to enhance their productions.

Lastly, it’s the time for *Innovation* where technologies become flexible tools for building collaborative and interactive learning environments. Students develop the ability to use the most complex software and are formed as producers of information and knowledge.

What are the implications of this classification? Firstly, technologies in schools do not generate magic effects. It is impossible to expect teachers to innovate with technology without having previously transited the stages of adoption and adaptation. The presence and availability of technology in classrooms is a necessary but insufficient condition for improvement and educational change (Area Moreira 2011).

Secondly, it is also necessary to understand that the time of integration into each school can be very different. This process is affected by different factors as can be inferred from the argument of his chapter: for example, the support and leadership of school principals; the teacher training offered; the willingness of teachers to incorporate technology into their teaching practices; the prior level of digital literacy of teachers and students; and the school infrastructure.

Recently, UNESCO published a report of TERCE² where the impact of the use of technology on sixth grade (primary school) students' learning is analyzed. The report shows that the intensive use of computers (more than twice a week) has a negative impact on students learning in reading, math and science. On the contrary, the domestic use of computer promotes higher academic performance. Even if the report focused on primary school, it's interesting to make some considerations. On the one hand, the relation between use of computers and students' learning placed the discussion on: what kind of impact of technology is measurable? The idea of the integration of ICT in schools as a process with different stages brings us to expect, in a first moment, improvement in the digital skills of students. Improvement in the students' learning in reading, math and science can be expected in a second moment when the integration of ICT has reached an important level of institutionalization within schools. This conclusion takes us to another consideration. High levels of institutionalization of an ICT process in schools are directly related to the active role of school principals. Management positions are key for the sustainability of the improvement process where students and teachers are involved. On the other hand, the report on TERCE highlights the positive impact of the use of technology at home. This is particularly remarkable as the use is more intensive where the computer is the first technological device in the family.

As a final reflection we can say that, in the contemporary world, being "digitally literate" has become a key component of the full exercise of the rights of citizens. The implementation of the 1-1 Model is doing a great contribution not only in reducing the digital divide, but also in extending the time for studying. Digital inclusion is related to social justice. This is an approach based on the notion that young people have rights: the right to the full exercise of citizenship and the right to

²The Third Regional Comparative and Explanatory Study (TERCE) is the third learning achievements study in primary education conducted by LLECE since its creation in 1994, and it's preceded by the First Regional Comparative and Explanatory Study (PERCE) in 1997, and the Second Regional Comparative and Explanatory Study (SERCE), in 2006., the study measures learning achievements in mathematics and language (reading and writing skills) in third grade students, and the same subjects plus natural sciences in sixth grade students in 15 countries round the region. In addition, it identifies the associated factors that influence these results.

a quality education. Moreover, this approach generates obligations for the State as it requires active policies to make them enforceable and to promote its compliance. *Conectar Igualdad* is moving in this direction.

Chapter 32

School, Religion and Intolerance: On Laic School and Religious Conflicts in Brazil

Marcelo Andrade and Pedro Teixeira

32.1 Introduction

Religion has always been present in Brazilian urban schools. This may be one of the few consensuses on the subject among researchers and the school community in Brazil. Nevertheless, such consensus immediately falls to earth when we ask ourselves how and why religion should be present in urban schools in the first place. At this point, we leave behind the mere description of a social phenomenon and we place ourselves in the realm of rational justifications on the relationship between school and religion. To move from the description to the justification of a phenomenon means to present sufficient reasons so that it may be guided this or that way.

When we describe an event as being a person's action, we know for instance that we describe something which can be not only *explained* like a natural process, but also, if need be, *justified*. In the background, there is the image of persons who may call upon one another to account for themselves, who are naturally involved in normatively regulated interactions and encounter one another in a universe of public reasons. (Habermas 2013, p. 12)¹

Why and how should religion be present at school? Why and how the relationship between school and religion has become a topic that involves such ordinary conflicts in Brazil nowadays? And, why and how should these conflicts be immediately dealt with? These questions take us to the sphere of the ethical-philosophical foundations of the religion-school relationship. In order to justify these ideas, a speculative or even a legal approach could be opted for. On the one hand, the concept of laicity (*laïcité*) as the removal of religion from public institutions, including urban

¹ NT: translated by Hella Beister and William Rehy.

M. Andrade (✉) • P. Teixeira
Pontifical Catholic University of Rio de Janeiro,

e-mail: marcelo-andrade@puc-rio.br; teixeirapp86@gmail.com

schools, could be insisted upon. On the other hand, it could be argued that Brazilian laws are contradictory as, at the same time, they state the laicity of urban schools and ensure the provision of religious education.

However, the option is to enter into this debate by using the analysis of reported real life events on the phenomenon of religious intolerance. According to Habermas (2013, p. 3), intolerance – and its most visible aspect, fundamentalism – “is an exclusively modern phenomenon”. With causes and effects that are too contemporary, though. In this sense, although religious intolerance may supposedly take us back to ancient times, it is a challenge we face more and more these days. And we enter into the debate about school and religion based on the reports about intolerance, because we consider that they bring some possibilities to discuss both theoretical concepts and judicial decisions regarding the topic.

In this sense, this article is organized into five distinct parts. Firstly, it presents some historical notes about the school-religion relationship, focusing on religious education as a curricular subject, taking into consideration its impact on Brazilian education laws and regulations through history. This is a brief historical background designed to understand the present moment and to base the reflections on the school-religion relationship. Secondly, it presents recent events about the difficulties in dealing with different beliefs and disbeliefs in the routine of urban schools. There are reports about religious intolerance which will be taken as valid experience to be told and understood (Larrosa 2002). Thirdly, it seeks to understand how religious intolerance has been gaining power and why it has been growing in the daily routine of Brazilian urban schools. In this sense, it is highly important to learn with what has been experienced and told. Fourthly, an analysis is given of the challenges of the concept of laicity (*laïcité*), its potentialities and limits, as well as an intercultural education proposal. It is worth highlighting that this analysis takes into consideration the advocacy of laicity as a starting point and it believes in an intercultural dialogue as a possibility of overcoming intolerance in the daily routine of schools. Fifthly, we discuss the concepts of “ethics of minima” as a justification for religious tolerance. This article’s aim is to show that the philosophical-ethical reflection about tolerance, besides giving support to this analysis about the presence of religion in Brazilian schools, shows itself as a possible way to understand and take action against religious intolerance, which challenges schools today.

32.2 School and Religion in Brazil: Historical Notes

According to Cury (2004), the controversy about religious education in urban schools is not exactly a new topic in the Brazilian education. If one establish a very brief background about the church-state relationship, with a special focus on formal education, it is possible to see that the presence of religion in school education has been constant over the centuries (Cury 1993).

Brazil has inherited its first experiences of formal education from the Portuguese colonization, under the direction and conceptions of the Society of Jesus. In a sense,

the aforementioned society started the umbilical relationship between school education and the Christian religion in the history of the country. In the mid-seventeenth century, with the Pombaline Reforms² and the expulsion of the Jesuits (1759), there was an attempt to separate school from religion and make it more illustrious and modern. However, only by the end of the nineteenth century, 130 years after the attempt of the Marquis of Pombal,³ there was the juridical separation of church and state. Brazil became an officially laic state when it adopted the republican form of government, having this act been regulated by the Constitution of 1891.

Nonetheless, the advocacy of a public and laic school for all would strengthen with the “Manifesto dos Pioneiros da Educação Nova” (Manifesto of the Pioneers of the New Education)⁴ in 1932, in the beginning of the twentieth century, a time when there were historic discussions between “liberals” and “catholics”. The first were in favor of laicity in public educational institutions; the latter defended the perpetuity of the catholic religion origin as a formative force for new generations and under the control of the state. In this historic debate, intellectuals such as Anísio Teixeira⁵ and Fernando Azevedo⁶ were erroneously called communists and materialists.

The catholic congregation won that battle, making its opinion prevail in the education laws and regulations at that time. Thus, the 1934 Constitution, already with a “New Republic” look, once again validated the connection between church and state in the education sector. Brazil witnessed then the rise of an authoritarian state and a church that once more recovered its free and direct access to power, after having been trying for 40 years to establish a laic and positivism-inspired republic.

²This the educational reform implemented by the Marquis of Pombal in 1759 throughout Portuguese lands. Among other initiatives, the Marquis of Pombal expelled the Jesuits from Portugal and its colonies, implementing an education system without the presence of religious orders.

³Sebastião José de Carvalho e Melo (1699–1782), the Marquis of Pombal, was a Portuguese statesman. He was Secretary of State during the reign of Dom José I (1750–1777) and was considered one of the most controversial characters in Portuguese history. He was a representative of the enlightened despotism in Portugal and started several administrative, economic, social and educational reforms based on the Enlightenment ideals.

⁴The Manifesto expressed the view of a segment of the Brazilian intellectual elite who, albeit with different ideologies, intended to interfere in the organization of the Brazilian society starting with education. It defended, among other proposals, a school which was public, full-time and laic with a renewed methodology and in contrast with what used to be called “traditional school”. It was written by Fernando de Azevedo and signed by 26 intellectuals including Anísio Teixeira, Afrânio Peixoto, Lourenço Filho, Roquette Pinto, Delgado de Carvalho, Hermes Lima and Cecília Meireles.

⁵Anísio Spínola Teixeira (1900–1971) was one of the main Brazilian intellectuals in the twentieth century. He was an educator, a school administrator and a writer. As a fundamental character in the history of education in Brazil, in the 1920s and 1930s he disseminated the postulates of the Escola Nova (“New School”) movement, which had as a principle a reflective and practical teaching over a bookish and memory focused teaching.

⁶Fernando de Azevedo (1894–1974) was a Brazilian professor, educator, critic, essayist and sociologist. He was one of the main articulators of the “Manifesto dos Pioneiros da Educação Nova” (Manifesto of the Pioneers of the New Education) (1932).

According to Cury's (1993, 2004) analysis, by examining education laws in the last 60 years, in addition to the Brazilian education historic milestones, it is possible to see that religious teaching at urban schools has been through little legal changes, but it has gained a lot of strength. In the last 10 years, it has been one of the most controversial and recurrent topics among Brazilians.

Thus, according to the LDB⁷ published in 1961, religious education is presented as a common thread from a confessional-theological perspective and is explicitly considered a school subject. According to the LDB published in 1971, this common thread about religious education – already established in the curriculum – tries to take an anthropological and axiological perspective, recognizing religion to have a human and evaluative dimension. The present version of LDB, published in 1996, formally takes the phenomenological perspective as a common thread of religious education, which confirms the tradition of understanding education and religion as articulated dimensions.

If, in the Brazilian context, the relationship between religion and education is historical, consolidated and legitimized by current laws, why would this topic be new? The hypothesis here is to consider intolerance as a phenomenon that has strengthened and has to be better understood. Maybe it is not new as something unique. But it has certainly been a current, recurrent and worrisome topic.

32.3 Religious Intolerance in Brazilian Urban Schools: Experienced Events

We are going to present some events which were widely reported by the print and broadcast media in Brazil. They tell us about adverse experiences involving religion in urban schools, according to some students and their families. In fact, they are more than adverse experiences. They are actually instances of religious intolerance as a *relatively new* phenomenon in the school context. We use *Relatively new* since they entertain a doubt and because it is impossible to dispel it at the moment. In other words, it is not possible to determine if religious intolerance at school has truly increased or if it is simply more reported nowadays. It is a simple question which is difficult to answer. Anyhow, it is important to analyze the reports about these events and to understand what is possible – especially for teachers – to do in such situations. It is worth reminding once again that what is being considered is religious and fundamentalist intolerance as current phenomena, which is a challenge nowadays (Habermas 2013).

It is well known that there are limits to an event analysis because the work done is based on experienced events which are reported as versions, and not on the absolute truth. There is a series of variables that should not – and, in fact, are not intended to – be controlled, since they are reports about experiences. It is not in our interest

⁷Lei de Diretrizes e Bases (Directives and Bases for National Education Law, the bill that regulates education in Brazil).

to investigate what has happened in order to “sift through the facts”. According to Larrosa and Kohan (2002, p. 5), reporting an experience does not show the truth of the facts, but it “is what gives meaning to what is written”. When people write about circumstances reported as experienced events – by them or by others – they seek to understand and transform what they know and not exactly report what happened. “What motivates us to write is the possibility that this writing, this experience in words, enables us to break free from certain truths” (Larrosa and Kohan 2002, p. 5).

In this sense, the events are presented through an exercise of summarization and were transformed into brief accounts. It is well known that in every report there is a dispute over whether exaggerations and/or omissions occur in the reports. In addition to the disputes, it is assumed that the analyzed events may teach something about the relationship between school and religion. Thus, the questions presented to the analysis of the events are: Can we “break free from certain truths” with the religious intolerance cases at school, which are reported as significant experiences for those who tell them? If so, what lessons can be learned from them?

Having clarified that situation, the events will be analyzed and possible focal points among them will be sought. The intention here is also to understand our place and what we do in education, for as Larrosa and Kohan (2002, p. 6) indicate, in a parallel between writing and education,

What makes education make sense is experience, not truth. We educate in order to transform what we know, not to teach what is known. What motivates us to teach is the possibility that this act of education, this experience in action, allows us to break free from certain truths, so that we can leave behind what we are in order to be something else in addition to what we have been.

Then, we set out to report the six events involving religious intolerance in school everyday life. They are cases of proselytism and religious harassment against atheists, nonbelievers, Jewish and Candomblé⁸ practitioners. The events report conflicts that place teachers, principals and employees on one side and students and their families on the other.

The first event happened in 2009 in Aimorés, Minas Gerais. A 17-year-old high school student was suspended from an urban school because he was wearing a cap. According to the student, he was not suspended because the cap was not a uniform item but because he had not taken it off when the class was saying the Hail Mary prayer, which happened every day during the first class. The prayer was said through the school PA system and everybody should leave their heads free from accessories. The student was removed from the classroom under laughs from schoolmates, was suspended for a day and missed a chemistry test arranged for the first class. The student’s mother, a catholic, went to the school to try to understand the punishment inflicted upon her son. The principal insisted that there had not been any form of religious intolerance, but the school rule (“you should take off your hat at prayer time”) had been applied. Students were allowed to wear caps at school, but not at prayer time. The student claimed that making somebody pray at an urban school

⁸ African-Brazilian religion, originally practiced by slaves.

was forbidden and the headmaster told him “there was no such law”. The student, who dates the parish youth group coordinator and would have already been visited by the parish priest, claimed that he respects his girlfriend’s, his mother’s, his family’s and his teachers’ faith. However, he felt humiliated when he was removed from his classroom for not taking off his cap in reverence and was aggrieved for not being able to take the test.

The second event happened in Rio de Janeiro in 2011. A 13 year-old student was attending an art class and had made an Egyptian pyramids model. He was talking to his classmates when the Portuguese teacher, who had entered after the art class, removed him from the classroom shouting names such as “Satan” and “Son of the devil” at him. The attack “seemed” nonsensical, since there had been no previous or explicit conflict between the student and the teacher. The student was wearing beaded necklaces, which is a symbolic representation of the Candomblé Orishas,⁹ under his uniform. By wearing an ornament that openly manifests his religious faith, the student would have irritated the teacher, who was a Protestant. She forbid him to attend her classes and got her other Protestant students not to talk to him anymore. Little by little the student lost the will to go to school. He failed that year and had to change schools. According to his mother, this event modified her son’s personality and left its marks on his school record. Before taking the case to court, she tried to solve the problem at the school but the administration was silent according to her. Then she decided to go to the police station to file a police report against the teacher.

The third event happened in Miraf, Minas Gerais, in 2012. A geography teacher at an urban school decided to start her classes saying the Lord’s Prayer. One of her students decided to keep silent. When she noticed the student’s reaction, she told him, according to some reports, that “a young person who doesn’t keep God in their heart will never be anybody in life”. The 17-year-old student said that what she was doing was illegal according to the Constitution. Then, the teacher replied that “there wasn’t such law”. Both had a strong argument and the case ended up in the school administration office. Due to his resistance to pray, the high school student became a victim of some classmates, who started picking on him saying he “belonged to the devil”. On one occasion, the young man recorded part of the prayer on his cell phone and made it available on the internet. It is possible to hear the Lord’s Prayer in the video. At the end, instead of saying “but deliver us from evil”, some classmates said “but deliver us from [student’s name]”. After having heard of the video his mother went to the school. According to her, the teacher excused herself saying that what she had meant was to warn the young man he would not be anybody “spiritually”. “My boy has always been a good student, an ethical kid with moral values. I even cried when I saw the video”, said the mother, who is a Kardecist.¹⁰ The principal said the teacher was “misunderstood” and she always had the “good habit” of praying. It was agreed the teacher would not teach this group the first class

⁹Transcendental entities that influence Candomblé believers’ lives and attitudes.

¹⁰Kardecism is a religious doctrine developed by Alan Kardec, who lived in France during the nineteenth century. It believes in the existence of spirits and reincarnation.

anymore. Consequently, he would not have to hear the Lord's Prayer, which was a part of the teacher's routine avowed by the school administration.

The fourth event happened in Brasília in 2012. According to some parents, an urban elementary school in the North Area of the capital operated "as a religious school without families knowing anything about it". The children had to pray before classes, sing religious songs, thank "our Father in heaven" and bless the food and the teachers. Some parents denounced the school administration to the Department of Education. The principal admitted that the kids were motivated to say a "spontaneous prayer": "Every day one of them is responsible for thanking God for something". The school administration was reported for subjecting kids to religious proselytism without parents being consulted on, and not being concerned with their beliefs or disbeliefs. One of the parents could not understand why the day care center taught his daughter that God was male and the world's creator. It is not what he had planned to teach her. A student's mother thought it strange when her son started singing Christian songs. Some parents, however, defended the school and signed a petition asking that prayers should be kept. One argued that "love is built" at school and nonbeliever parents wanted to stop that. The day care center was part of a pilot plan that would include other six urban elementary schools. All of them, after investigation, were reported for the same problem, which demonstrates that maybe it was not an isolated attitude coming from certain teachers, but actually a guideline that probably came from the childhood education political administration in Brasília.

The fifth event happened in Engenheiro Paulo de Frontin, Rio de Janeiro, in 2014. A ninth grade Jewish student was being forced to say the Lord's Prayer at the beginning of classes. It called attention of the media when the president of the Israeli Federation of Rio de Janeiro submitted a request for explanation to the school administration as well as the Department of Education. The request was based on the family's report that their son was being subjected to proselytism. According to the father, his son started to have problems at school, but the family could not identify what it was exactly. Eventually, the boy came back from school and said he could not stand having to pray every day anymore. The boy was criticized by his colleagues when he refused to pray with everyone else. One of the school officers asked him to get back to the prayer, claiming it was "a universal prayer and that he could certainly say it". Although the student had claimed several times that it was a Christian prayer and it did not represent his particular faith, she insisted that he had to stay during prayer, which gave rise to more criticism from the other children. In the end, the case was reported to the Child Protective Services and to the police. The school administration informed that prayer was an optional activity that some employees, teachers and students would engage in. They reinforced that it was not an activity imposed on everybody. However, in an agreement with the Department of Education, the boy's family decided on his changing schools and keeping his name undercover.

The sixth event happened in Rio de Janeiro in 2014. A 12-year-old boy was initiated into Candomblé and, according to his *Babalorixá* (higher priest in Candomblé), he should wear white clothes, beaded necklaces and cover his head on the following days. He wore the beads under the school's uniform which did not seem like a

problem to the family, since other children wore colorful pants, sneakers and other types of accessories (necklaces, bracelets and rings). However, the boy was not allowed to enter school allegedly because he was not wearing the uniform properly. “The principal, with her hand on the boy’s chest, said he couldn’t enter wearing his beaded necklaces, which were under his shirt”, claimed the mother, who was accompanying her son to school. According to the family’s report, the boy cried a lot and did not go to school for 30 days until he got transferred to another one in the same neighborhood. The Public Defender’s Office of the State of Rio de Janeiro, via its Human Rights Center, is working on the case. Social movements groups and religious freedom leaders held a demonstration in front of the school on the following days, but there was no official statement from the principal, even though the family received support from the Department of Education.

Are these events isolated cases or could they be interpreted as the current state of the relationship between school and religion? Apparently, there are lessons to be learned from these cases and that is what this third part of the article is about.

32.4 Reporting and Learning with Experienced Events

Considering the given events, what can be learned from what was experienced and reported? In a letter to her professor Karl Jaspers, Hannah Arendt talks about reporting and learning with experienced events:

I can understand history only from the perspective which I occupy myself. I try to interpret history, try to understand what is expressed in it, from the perspective I have gained through my own experience. What I am able to understand in this way, I make it my own; what I cannot understand I reject. If I have understood your view correctly, then I have to ask: How is it possible, on the basis of this view of the interpretation of history, *to learn something new from history?* [...] To submerge oneself in history would thus mean no more than finding an abundant source of appropriate examples.¹¹

Larrosa (2002, p.21), in turn, defends that the reporting of experienced events tells us about “what goes past us, what happens to us, what touches us”. The report of an experienced event is not about what really happened, but what touches us. This is the analysis work here: to understand what touches us in these events. “Never have so many things happened, but the experience is rarer each time” (Larrosa 2002, p. 21). The proposal is to focus less on what happened and allow experienced and reported events to touch us more, to tell us about a phenomenon that cannot be reduced to these six specific cases. To that goal, it will be necessary an exercise of interpretation, in addition to information and opinion.

The modern individual is informed and, moreover, plenty of opinions. It is somebody who has a supposedly personal opinion, which is also supposedly his own and, sometimes, supposedly critical of everything that happens, of everything he is informed about. Opinion and information has become essential for us. In our arrogance, we spend our lives giving

¹¹ Correspondence between Arendt and Jaspers, extract from Adler (2007, p. 33).

opinions about anything we feel informed about. And if one does not have an opinion, if they do not have their own point of view about what is going on, if they do not have a ready assumption about anything that is presented to them, they feel fake, as if something essential was missing to them. And they pretend they have to have an opinion. Following that process, information becomes opinion. However, this obsession for opinion also nullifies our possibilities for experience. It also makes sure that nothing happens to us. (Larrosa 2002, p. 22)

In this sense, more than give simple opinions about the abundant information related to the events reported here, there will be an attempt to listen to them and dig them out for convergent interpretative clues. Thus, from Arendt's perspective, it is necessary to "submerge in an abundant source of appropriate examples". And, as an interpretative work, it is necessary to question what these cases may teach us. It is possible that there are a number of different ways to interpret them, but six aspects have touched us more deeply.

Firstly, it is possible to admit the hypothesis that religion is present in urban schools, from elementary school to high school, disregarding religious education classes. The experiences reported here happened in core subject classes: Geography, Portuguese, Art and Chemistry, as well as at playtime, lunch break, breaks in between classes or at the beginning of activities early in the morning. Even though religious education is a complicating factor for the discussion of the experiences that have been lived in schools, the objective of this article is to shift the attention to the presence of religion in school routines (Andrade and Teixeira 2014). It is not concerned, for the time being, with the disciplinary knowledge of religious education. What it is concerned with is the experienced and reported events by these students and their families which are about how religion has been dealt with in school routines. In other words, in addition to the quarrel about the curricular teaching of religious content as a specific subject, religion is present in the everyday life in schools.

Secondly, it is possible to admit, once again by what was experienced and reported, that religious faith has been a reason for an increasing number of cases of intolerance in the routine of schools, involving several different individuals: teachers, employees, students, family members and authorities (police, Child Protective Services, Public Defenders). In all the experienced events reported before, it calls the attention that at first the families tried to negotiate the end of religious proselytism and/or asked for the religious harassment to stop. According to Camps and Valcárcel (2007, p. 127), religious intolerance "defies reasoning" and "is a problem of lack of moral sense". In other words, it is the interruption of the most basic moral values that were built throughout history for, according to these thinkers, religion condones neither intolerance nor hate speech against different faiths. However, this has been a painful experience reported by children, adolescents and young people and, in an effort to protect them, families try to negotiate at first and then move on to reporting them to the competent authorities (Silva and Ribeiro 2007). It is also worth highlighting the absence (or the collapse) of school authorities to deal with the situation and the increasing judicialization of the events involving religious intolerance. It seems that teachers, employees and principals dismiss the reports of

students and their families and, even worse, it does not seem to be any teaching about or learning from the reported events. The families defended their children through a lawsuit and/or transferring them to other schools. What does it tell us, as educators? Why can't we consider them, as well as learn and teach by using them?

A third aspect to consider from the reported events is that intolerance is mainly revealed as a confrontation between Christianity and the other religious beliefs or disbeliefs. In other words, the reports speak about the resistance of certain Christian groups in face of non-hegemonic ways to experiment and experience faith and knowledge expressed in schools (Habermas 2013). It is worth reminding that Voltaire (2000), in the eighteenth century, had already claimed that Christianity, both catholic and protestant, is organized in the West as a competitive, expansionist and proselytistic religion. These conclusions were presented in *Treatise on Tolerance* in 1763, due to innumerable cases of religious intolerance that had scandalized the Enlightenment thinkers in Europe (Locke 1965). Proselytism is not exclusive of Christianity, but in the Brazilian context and especially in our urban schools, the Christian religion is the one which has had difficulties to deal with other religious beliefs or disbeliefs most of the times (Silva and Ribeiro 2007).

Fourth, it is possible to notice, by analyzing some events, that the presence or prohibition of the expression of religious faiths in school routine is not consensual among teachers, students and families. Those who try to question the hegemonic religious expressions are stalked, ridiculed and nicknamed "children of Satan", "people without love" and "people without God". Sometimes, those who wish to impose the hegemonic religion offer the argument that they have the right to religious expression. Oro (2012, p. 183) claims that historically in the Brazilian context both Kardecists and Protestants have always advocated and benefitted from freedom of religion, because they saw in it the possibility to challenge Catholic hegemony. On the other hand, practitioners of African-Brazilian religions and nonbelievers are among "the most reticent about the free exercise of religion" (Oro 2012, p. 185). That happens because they know the freedom given to others could be, in fact, a chance for the minority groups to be persecuted. In the reported events, it is worth noticing that five out of the six cases involve these two groups. Thus, if only minority groups – such as atheists, nonbelievers, Jews or practitioners of African-Brazilian religions – need to negotiate their presence in schools and/or report proselytism and religious harassment, it seems clear that urban schools allow only religious expressions from the hegemonic groups (Catholics and/or Protestants), with the consent of other students, teachers, employees, principals and families and, as shown in one of the cases, with the support of those responsible for the educational public policies.

A fifth aspect calls the attention for bringing out into the open the deficiency of republican experiences (Larrosa 2002, p. 22). It refers to the fact that school personnel, mainly teachers and principals, deny students their rights to freedom of religious expression and claim not to be aware that religious diversity should be respected in urban schools. In other words, they do not know that schools, being a public space and for all, should be laic (Cury 1993, 2004). They also deny that forcing children, adolescents and young people to accept a certain religious expression is a disrespectful, immoral and illegal attitude (Camps and Valcárcel 2007). It is also

worth reminding that, as Andrade and Teixeira (2014) warn, the experienced and reported events have nothing to do with religious education as a curricular subject which would be offered to those who freely wanted it. In our point of view, what makes these experienced and reported events more worrisome is the fact that intolerance is shown as a pervasive practice which permeates different aspects of school life, regardless of a curricular subject and with a high level of unawareness coming from school personnel about their moral (Camps and Valcárcel 2007) and juridical (Cury 1993, 2004) duties towards the defense of religious plurality in school routine.

The sixth aspect refers to a question which deserves emphasis: why is religion in schools and why does it provoke intolerance? We dare to ask this question in a different way: what is religious intolerance taking the place of in schools? Is it occupying some kind of “empty space”? Is it there because we do not offer something that should be in schools, but is not? Our hypothesis – and in this article we present it as just a hypothesis – is that religious fundamentalism is in schools in the absence of a more resolute discussion about ethics, moral, justice, tolerance, freedom and equality. Religious intolerance has its place when there is an absence of a philosophical (Habermas 2013) and sociological (Oro 2012) discussion about the religious phenomenon and occupies the place of a clearer educational project to foster ethical and moral values (Camps and Valcárcel 2007). The argument for the presence of religion in schools – especially, religious education – is also invariably based on the fact that it supposedly corroborates a teaching of values, disguising how perverse and in favor of fundamentalism, proselytism and religious minorities harassment this argument can be. The key question to ask the advocates of religious education in urban schools is: who should define which values will be used in schools and will be legitimated in the curriculum, which should be to all, with all and for all? We do not argue that religion should have the prerogative to teach values and we insist that we have enough curricular subjects (philosophy, sociology, history, art, literature, among others) to teach these values and to also question fundamentalism, proselytism and religious harassment.

To interpret these events is trying to give a different meaning to the educational experience, its times, its individuals and its knowledge.

In the generalized destruction of experience logic, I am more and more convinced that the educational apparatus also works more and more in order to make it impossible for something to happen to us. Not only, as I said before, by the perverse and generalized performance of the information/opinion combination, but also by its speed. We spend more and more time at school (university and teacher training courses are also part of school), but we have less and less time. [...] And the curriculum includes more and more and is, however, briefer and briefer. Consequently, in education we are also always in a hurry and nothing happens to us. (Larrosa 2002, p. 23)

It is worth questioning if we are inclined to consider the reports of religious intolerance in school. And, more importantly, if we can protect those who tell us their experiences of blatant violations to their right of being free and having different religious beliefs or disbeliefs. If it is true that religion is present in schools, independently from religious education, it is also true that it has been the reason of

persecution and humiliation to several children, adolescents and young people who profess a different faith from the majority or who do not profess any particular faith. Trying to consider and interpret these events – both experienced and reported –, will be necessary to move on in the conceptualization of laicity, as proposed below.

32.5 Potentialities and Limits of Laicity in the Brazilian Context

In this third part of the text, the objective is to analyze some conceptualizations which have contributed to overcoming intolerance in the urban school routine. This will be done by listening to and interpreting the reported events and by considering the necessary and urgent complaints. In this sense, there is no doubt that the concept of laicity has been tremendously useful. We want to examine it and identify its potentialities and limits. The objective here is to take laicity as a starting point and to assume interculturality as our proposal.

Therefore, in order to justify the arguments here presented, it is worth noting that different Brazilian researchers in the education area and renowned advocates of urban education have defended laicity (Cury 1993, 2004) and the end of religious education in urban schools (Caputo 2012; Cunha 2013). We fully support the legitimacy of what they defend and we believe it is fundamental to add to the discussion about laicity in urban schools an approach that also supports interculturality. In our view, this analytical perspective offers an understanding of secularity and laicity in a more compatible way to the demands of religious diverse societies, such as the Brazilian one (Jacob et al. 2003).

We will try to show why we understand that the advocacy for laicity in urban schools has to be linked to an intercultural analytical perspective, in order to overcome intolerance as one of the challenges that urban schools face nowadays. However, before proceeding to the defense of interculturality, we will have to carefully discuss the concept of laicity.

Laicity (*laïcité*) is a polemic term which was coined in the modern era. It has a strong liberal inspiration and, it seems, has little support from a significant part of the Brazilian society, who still defines itself as deeply religious, according to different surveys (Jacob et al. 2003; Oro 2012). So, we believe it is appropriate to understand why and how the concept of laicity is born in the Western world and how it becomes one of the most controversial banners in the discussion about the relationship between school and religion. The analysis exercise defined here should follow two guidelines. On the one hand, to understand the historical birth of the concept and, on the other hand, to understand its potentialities and limits in order to make us understand and take action in a context that is characterized by religious diversity, but also by religious intolerance, fundamentalism and proselytism, as we tried to demonstrate with the experienced and reported events in the previous section.

Laicity is strongly influenced by the birth of the concept of secularization, although they have historical and semantic differences (Glasner 1996a, b; Habermas 2013). According to Glasner (1996a), laicity was coined with a meaning close to secularity, that is, as a “doctrine of non-interference” between church and state. Sarmiento (2007), in turn, helps us understand that the State laicity, which comes from the idea of secularism, works in two ways. On the one hand, it protects the different religious denominations from the state abusive intervention and, on the other, it protects the State from improper influences from any religious groups. Secularization does not move in an exclusive or unequivocal way as one could erroneously believe at first. Secularization is not only about protecting the state public sphere from the influence of religion, but it is also about protecting the religious private sphere from state interference. From this point of view, secularity and laicity depend directly on the concept of religion adopted. In other words, they work as two sides of the same coin (Glasner 1996b).

To Berger (1985), taking a specific point of view from the Western world, secularization is the process which takes society and culture from the dominion of religious institutions. From a sociostructural point of view, it comprises three decisive actions: (i) separation of the church and the state; (ii) expropriation of church’s lands; (iii) emancipation of education from clerical power. From a cultural and symbolic point of view, it is also reflected on the removal of religious themes from the arts, philosophy, literature and, last but not least, on the ascension of science as an autonomous and entirely secular view of the world.

The word “secularization” initially had the juridical meaning of being a compulsory transfer of church possessions to the secular public authorities. This meaning was changed with the appearance of cultural and social modernity as a whole. Opposing views have been associated to “secularization” since then. It will depend on whether the successful control of the clerical authority by the secular power is placed first or the unlawful appropriation. (Habermas 2013, p. 5, emphasis in original)

Berger (1985) adds that there is still a subjective dimension to this process which results in the secularization of the consciousness. In this way, in the modern Western world, an increasing number of individuals conceive reality without having to resort to faith interpretations and they guide their private lives without or with very little interference from religious organizations. In summary, religion is more and more restricted to its specific practice, that is, the union (or reunion) between what is human and what is transcendent. In this conception, religion (*religare*, reconnect) would do what is particular to it or what no other aspect of human life could do; and only to those who would freely and privately look for it.

We must not forget that the origin of secularization takes us back to the Enlightenment. It was the first movement to propose that science and reason should substitute religion’s “superstition” and “magic” (Peres 2006). The Enlightenment was an European thought movement characteristic of the second half of the eighteenth century which comprised not only philosophical thinking, but also the arts, political theory, legal principles and epistemology (Marcondes 2002). The idea of the Enlightenment itself indicates – through the metaphor of light and clarity – an opposition to darkness, obscurantism, ignorance and superstition. In other words, it

is opposed to the existence of something occult and obscure and emphasizes the need for reality, in all its aspects, to become transparent and lucid, in the sense of more intelligible to reason.

Thus, the most important element of the Enlightenment is individual consciousness, which is considered autonomous in its capability for knowing what is real. Therefore, knowledge, science and education are its weapons. In this sense, the Encyclopedia's project of synthesizing the knowledge of that age making it potentially accessible to all individuals (or consciences) is very representative of this concept. It precisely bestows on knowledge the capability for freeing the human being from the shackles that are imposed on them by ignorance and superstition (Marcondes 2002). Here, as we know, is the famous and historical dispute between how religion and science understand the world. And this dispute not only involves consciousness, but, above all, epistemology and education.

The idea of humanity's rational progress – here also called Enlightenment – is, therefore, one of the central characteristics of the Enlightenment movement (Habermas 2013). On the other hand, the elements that would prevent such progress should be identified for they oppose reason. Among these elements is mainly religion, once it subjects the human being to its irrational beliefs and to a kind of authority that is external to the individual consciousness, that is, to the Church, which is an organization based on superstition or, at best, on non-rational principles.

Therefore, according to Marcondes (2002), the Enlightenment thought appears with a very strong laicist or secular characteristic or, in other words, with an antireligious characteristic. It is important to notice that, little by little, one of the repercussions of the Enlightenment is the questioning of authority and the role of religion in everyday life, in the most prosaic routines and in the individual consciousness, which turned out to be one of the central features of the modern world. Then, the human being becomes the measure of all or almost all things in the world. In a certain way, this movement will result in the bourgeoisie ascension, more rational and individualistic. It also resulted in the fall of the absolute monarchies whose power was legitimized by God, which was an external force to the individual consciousness.

When describing post-secular societies Habermas (2013, p. 5) presents two different readings about the relationship between faith and reason which are both mistaken:

According to one version, religious ways of thinking and living are replaced by rational, but in any event superior equivalents; according to the other version, the modern ways of thinking and living are discredited as being possessions that have been purloined illegitimately. The ousting model suggests itself as an interpretation of the demystified modern age that is optimistic of progress, while the dispossession model suggests itself as an interpretation of the theory of the decline of the homeless modern age.

According to Habermas (2013, p. 6), “both readings make the same mistake” because they consider secularization a zero-sum game between faith and reason. On the one hand there are the productive forces of science and technology. On the other hand there are the conservative forces of religion and the church. In this game there

can be only one theory as the winner and, according to the philosopher, this is the mistake of a dualistic and simplistic opposition, even if the “liberal rules of the game” clearly favor “the driving forces of modernity”.

It is worth noticing that the revision of dualistic and simplistic readings between faith and reason has been recurrent among some thinkers. Berger (1985, 2001), for instance, demonstrates a change of mind in his writings. In *The Sacred Canopy* (Berger 1985) the author presents the theory of secularization as an unavoidable process to the Western world which would consequently imply a more and more significant decrease to religion. Years later, however, in *The Desecularization of the World* (Berger 2001) he recognizes the limits of his previous argumentation. In this sense, he emphasizes that modernity and secularization would be a phenomenon quite restricted to the West. This specific function of religion as something which should deal only with the supernatural, ethics, the idea of God and salvation is specific of the modern Western world.

In a revision of his first argumentation, Berger (2001) claims the belief that modernization leads to the decline of religion, which is found in the Enlightenment and in the sociology of religion works from the 1950s and 1960s, would be mistaken. Secondly, he claims that the world today, with a few exceptions, is “as furiously religious as it ever was, and in some places, more so than ever” (Berger 2001, p. 10 1999 p. 2). He admits then that modernity has had secularizing effects, but it has also provoked powerful movements of counter-secularization. Besides that, secularization on the societal level is not necessarily linked to secularization on the level of individual consciousness, as the Enlightenment had predicted. Berger (2001) seems to call the attention to a typically Western phenomenon, that is, the coexistence of strongly secularized societies and deeply religious individuals, without meaning something necessarily contradictory.

Thus, Berger (2001) proposes what he calls the process of desecularization, in other words, the inverse process to secularization, which would be religion taking back the place which it has never truly left. He points out two basic reasons for this phenomenon: (i) modernity tends to undermine the certainties people had throughout history (which is quite uncomfortable for some) and religious movements that promise certainties are more attractive and comforting than the insecurities of the individual consciousness and (ii) a purely secular view of reality finds its principal place in a cultural elite which, predictably, influences people who are not members of this elite, but is still restricted to some social circles.

From this point of view, religious movements with a strong counter-secular tendency may then attract people with grievances which sometimes are clearly not motivated by religion, but are ideological or identity-related. Berger (2011) exemplifies this phenomenon through the radical Islamism in several African and Middle-Eastern countries and the fundamentalist Evangelical boom in the last decades in the USA and other American countries. All the evidence suggests that such phenomena are not only religious, but they also involve many other aspects of life. Religion per se could not be the only reason. According to Habermas (2013, p. 4 p. 328) there are “orthodoxies” in the Western world and in the Middle-East among Christians, Jews and Muslims, and “if we want to avoid a clash of civilizations, we

must keep in mind that the dialectic of our own occidental process of secularization has yet not come to a close”.

Berger (2001) also makes a counterpoint which shows exceptions to the secularization theory. The first case is that of Western Europe where a strong secularization is verified in what concerns clerical behavior and the codes of personal behavior imposed by the Church. The second case is represented by an international subculture which comprises people with higher education level in the Western world model. This subculture has been until today the main vehicle of Enlightenment and progressive beliefs and values. Although their members are relatively few they are very influential because they control the institutions that “officially” define reality, mainly the education system, mass media and the highest ranks of the legal system. However, once again it is worth reminding that this subculture’s convictions are restricted to the intellectual elite, howbeit powerful and influent over other social groups.

However, Mariz’s (2001) criticism of Berger (2001) problematizes the concept of desecularization. According to that sociologist, if the decline of religion did not come to pass, it would not be appropriate, initially, to propose a term such as desecularization. This should be reserved for very specific situations in which secularization had effectively been implemented and reversed. Berger (2001) would not deny then the process of secularization per se, but the belief that modernity will necessarily generate the decline of religion as a whole and in different levels, both social and individual. According to Mariz (2001), it makes more sense to think about the process of secularization as a movement full of ups and downs. Thus, a strong religious feeling could be understood as something that has never been eradicated from society and there are no reasons to say 1 day it will be.

Taylor (2010) also agrees that the idea that we live in a secularized and laic world is a big mistake. The Canadian philosopher analyzes, with a few reservations, the modern advocacy of a secular world and a laic state. In *A Secular Age*, Taylor (2010) analyzes first the claim that we live in secular times; and second, why we changed from a kind of society in which it was almost impossible not to believe in God to one in which faith represents only one among many possibilities in human life.

Taylor (2010), a philosopher who dedicates his time to understanding multicultural societies, presents three possible ways to understand secularity. The first one is the traditional separation between church and state, characterized by the principles of modern rationalism and liberalism. It is worth reminding that it is from this point of view that the discourse of the laicity of the state and its institutions (school; Legislative power; juridical deontology) originates. The second one defends that secularity consists of forsaking convictions and religious practices as the only things that would give meaning to social life. Thus, it is possible to observe a certain decline of religion and its practices, but not necessarily of non-institutionalized religious faith. Finally, the third way to understand secularity, to which Taylor (2010) is especially dedicated, is the understanding of faith as one among many other identity related elements. It is one option among others that give meaning to life, the world, human relations and society.

Taylor (2010), strongly criticizing the Enlightenment, assumes a critical intellectual attitude towards modern values, but not forgetting to address them for what they have as their best, most reasonable and, last but not least, most inevitable. According to our analysis, the most important is the fact that the philosopher does not assume a merely controversial attitude against secularization or the dramatic rise of new religious phenomena, Berger's (2001) desecularization. Taylor (2011), who corroborates Habermas' (2013) opinion, disagrees with the position that defends that only pure (or laic) reason should have a place in the public sphere. He claims that such proposition is based on the assumption that the "secular language" is "spoken" by all and then everybody could discuss and be convinced through the use of it. "Religious language", in turn, would operate outside this discourse, bringing assumptions that would be uncommon to it and only religious people would accept them. There would be, in this sense, an epistemological difference: on the one hand, secular reason, which everybody uses and may reach conclusions that are understandable to all; on the other hand, religious reason, which would not be able to be used by all and would only convince those who have already used it. Thus, Taylor (2011) and Habermas (2013) agree that dualistic oppositions between faith and reason, so much evoked to delimit modernity, do not work anymore in post-secular societies (Habermas 2013) or in a supposed secular era (Taylor 2011). Now, why is this argumentation important to this debate? Simply because these non-dualistic distinctions between faith and reason threaten the concept of the laicity of the state and, consequently, of a public and laic school, as we will see next.

From this point of view, Taylor (2011) warns that neither could a law be justified with arguments like "*the Bible says...*", nor could it have arguments like "*Marx said that religion is the opium of the people*" or "*Kant demonstrated that the only thing that is good without qualification is the good will...*". Thus, the state cannot be Christian, Muslim or Jewish, but it also could not be Marxist, Kantian or Rawlsian. The state will certainly have to take decisions which will reflect its citizens' opinions (Christians, Jews, Muslims, Marxists, Kantians, Utilitarians or of any other worldview), but these decisions could not be reached by giving special recognition to any of them. Taylor (2011) admits that the state – and schools are included – has an extremely difficult mission in present times (a non-secular and nonreligious age). However, he defends this is the job of the contemporary state. In other words, more than being laic, the state should be the one to listen to everybody and consider the best arguments, a priori not disqualifying any of them. Taking the same point of view, Cortina (2005) adds that the only arguments to be disqualified are those which disrespect the minimal ethics socially agreed upon in favor of human dignity.

Taylor (2010, 2011) and Cortina (1996, 2005) go beyond a mere objection to laicity or religion because they consider, on the one hand, that this is the ethical attitude that is more appealing to rational and reasonable people and, on the other hand, that religious experience presents a certain setting that is, in fact, already part of a world (insufficiently or not at all secularized) which few of us would be willing to completely renounce.

Thus, in a deeply multicultural (Cortina 2005) and multi-religious society, it seems that the concept of laicity shows, on the one hand, potentialities and, on the

other hand, argumentative disadvantages. In our judgement, however, laicity should be more and more reinforced by operation of law, which corresponds to the first sense of secularization given by Taylor (2010) as well as Glasner (1996a). In other words, church and state need to be separate in order to guarantee their autonomy and isonomy in their specific spheres of citizen and religious lives. Nonetheless, our argumentative choice is not only juridical but, above all, philosophical-ethical as well as pedagogical.

Thus, following Berger's (2001), Taylor's (2010, 2011), Cortina's (1996, 20005), and Habermas' (2013) argumentation, we consider religion – or its denial – to constitute the individual's identity. In this sense, it is impossible not to also think of our schools routines. A teacher and/or student who enters the school space will not abjure – and it would not be convenient that they did – their religious beliefs or disbeliefs. We believe that when one enters the school space he or she is entirely there, with their skin color, gender, sexual orientation, generation, culture, origin, political and pedagogical convictions. Thus, we recognize that there are argumentative potentialities in secularization as a legal defense of a laic school, but, at the same time, we understand there are argumentative limits, from a practical point of view, to defend a “colorless”, “non gender”, “asexual”, “pedagogically neutral” or “politically impartial” individual. In other words, the argumentation of a supposedly neutral individual, based on the ideals of modern liberalism and of individual consciousness may lead to a concept of laicity as a form of “religious neutrality”, as if it were possible for someone to totally abjure their religious beliefs or disbeliefs in order to have a place in the public or in the school space.

Finally, we would still like to put forward the hypothesis that the term “laic” could be understood as “without religion” or, maybe even worse to maintain minimum social coexistence, as “anti-religious”, which would place us in direct confrontation to those who sincerely express their religious faith in an age that, according to Berger (2001) and Taylor (2010, 2011), has nothing to do with secular. Nonetheless, we hope it is clear that – when advocating that someone may express their identity as it is – we are not advocating racism, sexism, homophobia, xenophobia or political repression. Thus, in the same sense, when we present the limits to identity neutrality from a religious standpoint, we are, under no circumstance, advocating religious intolerance, fundamentalism and proselytism in urban schools. This is the complex task that schools have nowadays, as Taylor (2011) warns.

Our choice has been to discuss how religion is present in schools. As we have tried to show, it is present in schools apart from any legal regulation about, for example, religious education as a school subject. We believe in the multicultural dialogue among the different identity expressions found in schools, that is, the dialogue among the different possibilities to understand genders, sexualities, ethnicities, cultures and generations. And among these different identity expressions we also recognize religion. Thus, the focus has been the intercultural dialogue in order to guarantee religious tolerance. Therefore, it will be necessary to make the last movement intended in this text, which we will present next: the advocacy of tolerance as an intercultural ethical minimum.

32.6 Tolerance: Our Belief in an Intercultural Ethical Minimum

We have to admit that intercultural education is our main assumption at this moment. We understand interculturalism as an educational perspective based on difference, be it gender, ethnicity, sexual orientation, origin or religious identity differences. In this sense, we consider “difference as the Gordian knot” (Semprini 1999, p. 90) of the discussions about interculturalism, which we believe is an indispensable guide of an educational proposal to our times and to pluralist societies, as the Brazilian one.

Thus, we endorse Candau’s (2002) perspective, in which the concept of multiculturalism produces but one evidence: we live in a pluralist world. Interculturalism – which could be described in different typologies or shades of meaning – in turn, is more than an evidence, for it presents a proposal: in multicultural societies it is necessary to establish interaction, dialogue and exchange among the different coexisting – and, why not, competing and divergent – groups in the public space.

We are aware of a highly pertinent critical analysis of our belief: in multicultural societies not all groups and individuals are prone to dialogue. Dialogue has its limits. The indisputable question is: if not by dialogue or argumentation, what would be the alternative to different and divergent groups or individuals coexist and interact in the public space? It definitely would not be violence. Thus, we have a few alternatives such as juridical coercion. However, if we advocate pluralist as well as democratic societies, it is an ethical impossibility to discard dialogue as a method and as an aim. Then, we insist on it as a method and as an aim, that is, as a morally justifiable alternative to be able to coexist – albeit not without conflict – for those who legitimately advocate different, divergent and opposite identities in a pluralist society. In fact, like in many other topics in dispute, if dialogue fails, juridical coercion is the subsequent alternative.

Nonetheless, understanding how the interaction and the dialogue should be, may lead to a proposal about interculturalism before resorting to juridical coercion. Thus, assimilationist, formalist, differentialist, critical or revolutionary conceptions among others could be argued about. Being aware of these distinctions and specific disputes over a field of research, we believe that, for now, it is important to point out that we understand interculturalism as a process that seeks – through dialogue and having it as a goal – to establish processes that promote equality as a right and the acknowledgement of differences. It is neither about equality as uniformity nor difference as discrimination. But it is about “the right to be different when equality homogenizes us” and “the right to be equals when difference makes us inferior” (Santos 2003, p. 56).

Having considered these preliminary clarifications, we will focus on why and how we understand the importance of the concept of tolerance to be able to reconsider the dialogue as an alternative in face of the religious phenomenon which is present in schools nowadays, in a multicultural point of view. In this sense, an aspect that deserves emphasis is the necessity of the educational sector think about what

the minimum values and attitudes to be taught in urban schools are. Which values and attitudes do we already share to be able to live in a pluralist society? Which values and attitudes can or should we establish minima of common understanding about in order to make a proposal of intercultural education?

Educators should also know which are their “decent minima of morality” when they are conveying values and attitudes, most of all in what concerns urban education in a pluralist society. Because it is certain that as educators they do not have legitimacy to convey only the values that seem appropriate to them. [...] Would it not be urgent to find out which values we may share and that are worth teaching? Is it or is it not urgent to find out the “decent minima” of values already shared?¹² (Cortina 1996, pp. 57–58)

We wish to establish, then, a link between these questions and the previous considerations in the first part of this text. In other words, how these questions help us re-signify the advocacy of secularization and laicity as well as their potentialities and limits in an intercultural approach. We have already said that the concepts of secularization and laicity help us partially, but in our view they face limitations that in a perspective that aims at going beyond the discourse of modern rationality may take us to aspects of the discussion about the school-religion relationship which are rarely considered. Thus, the problems about the shared minima seem to be appropriate in order to avoid two errors. The first one would be to minimize the role of the school as a public space in which religious discourse enters with an uncommon strength. The second one would be to identify the arguments about secularization and laicity, which are based on the logic of modern rationality, as the only possible ones to solve the religious conflicts that schools face nowadays.

Thus, we believe it will be important to understand what the common minima we share are. It seems essential to devise strategies which will guarantee these requisite moral minima, that is, the few ones which reveal something that is fundamental. And what is fundamental, actually, is no small thing. In fact, it is the most important thing (Andrade 2009). According to the minimalist – and never simplistic – aphorism “less is more”, in other words, less can be fundamental or indispensable, that which by no means can be missing. Only in this specific sense does the argument of Cortina (1996) about the decent minima of morality make sense, because they indicate some principles to be respected in order to behave with justice in a pluralist society. When we say “decent minima” we are fundamentally facing a question of justice, in other words, how to equally meet the different demands and necessities of multicultural societies.

According to Cortina (1996, p. 57), the task of “establishing a decent minimum of shared values so that decisions are respectful of plurality” is found in the distinction between “ethics of justice” and “ethics of happiness”. In this sense, it is important to establish the distances and convergences of what is just and what is good. “It

¹²It is important to notice that, according to Adela Cortina (1996), “decent minima of morality” are related to the moral duties of justice, that is, morally valid standards that are historically and socially established. It has nothing to do with the word “decent”, which is usually used as “moralism”. In her other works, the philosopher also uses the term “morally demandable minima” as a synonym of “decent minima”.

is almost impossible to determine what is just if we do not have a previous idea of what a dignified or good life is. In this sense, if we disregard the demands of justice it will be impossible to outline an ideal of happiness,” (Cortina 1996, p. 60). Without denying the interconnection between good and just, the Spanish philosopher defends the delimitation of the concepts. She argues that just has to do with what is requisite and, as such, becomes a moral obligation to any rational being who wants to think and act morally, “whence we may conclude that morally just is that which satisfies what can be made universal” (Cortina 1996, p. 62).

What is morally just is necessary and, thus, can be made universal to every rational being who intends to be moral. From this point of view, necessary and universal mean mandatory, which is requisite and not contingent. In turn, good is what causes happiness, that is, self-fulfillment for reaching the aimed goals, intentionally or not. Good cannot be required from other rational beings because it is fundamentally a subjective fulfillment. As we know, what is good for one may not be good for the other. What brings happiness to some may not bring to others. Good, in this sense, is in the sphere of possibilities and never in the sphere of requirements.

Ethics of justice or ethics of minima are concerned with the dimension of the moral phenomenon that can be made universal, in other words, of those juridical responsibilities that can be required from any rational being and that are only effectively constituted of minimum requirements. On the contrary, ethics of happiness intend to offer the ideals of a dignified and good life. Such ideals are hierarchized and encompass the collection of possessions that men enjoy as the source of the greatest possible happiness. Then, they are ethics of maxima, which advise us to follow the model and invite us to take them as a code of conduct, but cannot require to be followed, since happiness is a subject to be advised about and invited to, not to be demanded. (Cortina 1996, p. 62)

Coming back to the religious phenomenon in urban schools, we may understand it as a type of “ethics of happiness”, in other words, as an invitation and advice. It is a set of values which are publicly presented as rules of conduct that work as self-reference. Because of that, if pursued according to individual free will, it will provide self-fulfillment and happiness.

The crucial question is: would the urban school be the ideal place where this invitation to happiness could or should happen? The answer seems to be a strong ‘no’ for several reasons. The main one is the fact that there are other public non-state spaces more appropriate and specific, such as religious temples, in which religion can present itself as an “ethic of happiness”. Moreover, there is no consensus among the several individuals involved – public administrators, teachers, families and students – about which religious discourses could or should be presented in schools. However, this lack of a consensus view will be considered and solved next.

Nonetheless, can the school retire into itself pretending not to see the religious phenomenon and intending to have a secular and laicist attitude as if such posture meant neutrality or the denial of the religious phenomenon in a democratic state and in a non-secular age (Berger 2001; Taylor 2010)? It seems that once again we will have to answer with a resounding ‘no’ both because of a practical impossibility and an argumentative incoherence. First, because religion – as a socially valid discourse (Taylor 2011) – will claim its public legitimacy in all public spaces. Second, because

if we defend, in an intercultural perspective, that each and every identity – ethnic, gender, sexual orientation, generation, origin – has to be received in the school space, then religious identity could not be banned from this public space based on the argument of secularization and of a laicist state.

If this question was simpler and more direct – whether religion should be present in the urban school space – we would be facing an *aporia*. In other words, it does not seem that either a positive or negative answer is completely valid or completely reproachable. Thus, we notice that the presence of religion in urban schools will have to be delimited but by the use of other arguments, since neither the advocacy of its presence in schools nor the advocacy, on its own, of laicity as neutrality seem to appropriately solve the problem. In this sense, the tension between “ethics of justice” and “ethics of happiness” turns out to be once again a feasible alternative, since it does not deny either the juridical laicity of the state (and, certainly, of the urban school) or the validity of the religious discourse in public spaces, but in turn imposes limits to such presence, as we will see.

It is worth noting that religion, as an ethic of happiness, should not be demanded or imposed anywhere, let alone in the school space. No one can demand that someone should act in this or that way because “we are all God’s children” or because “we are all brothers and sisters in Christ”. Religion and its different expressions may be understood then as possibilities and as an ethic of maxima, of invitation and of advice and anyone can either accept or refuse an invitation. However, we understand religious tolerance based on the minimum demands sphere. In other words, we understand it as a minimum agenda of justice which is necessary and morally demandable to coexistence in pluralist societies, especially in urban schools. Ethics of justice is not a piece of advice but a moral commandment, that is, a rule which cannot be refused without relinquishing our own moral and human conditions. Thus, what is inhuman and undignified is not to say ‘no’ to a religious invitation but to impose one’s religious conviction by intolerance.

We do not wish to state that minimum demands are better than maximum possible ones, or the contrary. What we advocate is that a minimum agenda for action should be sought and understood as an obligation of the ethics of justice; and because of that, it is demandable from any rational being who intends to be moral in a pluralist society. We believe much more in a dialectical relationship between the just and the good, the demandable and the possible, the minimum and the maxima, than in a dualistic opposition between these concepts. However, we insist that it should not be morally demanded that we fraternally love each other because “we are all God’s children” or because “we are all brothers and sisters in Christ”. These maxima could only work as invitations and pieces of advice in their own spaces, which we regard is not the urban school. On the other hand, such discourses should be neither prohibited nor disqualified a priori because of the arguments already presented by Taylor (2011) and Japiassu (2009).

Thus, the alternative once again seems to be the search for the “decent minima” already shared in a pluralist society. In this case, between believers and non-believers, Theists and Atheists, Kardecists and Candomblé practitioners, fundamentalists and Pentecostals etc. Would it be possible to find “decent minima” among

such diversity and – even more – such divergence of religious conceptions? Here is the question that each and every religion that wishes to be in the pluralist public space should answer. In other words, there should be both availability and commitment in the search for common decent minima. Otherwise, there would be indeed a reasonable argument to defend the removal of any religious group that wishes to force itself on others by coercion, by persecution, by discrimination or by intolerance.

It is worth reminding that “tolerance has its limits” (Cardoso 2003), that is, defending tolerance is not allowing racism, sexism, homophobia or religious intolerance. If a certain religious group does not want a public debate about its ethics of happiness, but it wants in fact its imposition, it should be removed from the public space because the option here, as already discussed, is the public dialogue and the search for coexistence. Tolerance is, in fact, one of the golden rules of public dialogue (Andrade 2016). Without it, the option of the search for shared “decent minima” makes no sense and those who break this golden rule are not worth of the debate.

In this sense, the best to do is to devise strategies that guarantee tolerance as a minimum requirement – in the sense of being fundamental and indispensable – for coexistence. Tolerance proposals stop being an invitation or piece of advice – which we agree we should not let go of, for the happiness dimension is inherent to human beings – to find some morally demandable solution in the socially equitable contract sphere.

It is worth noting that a question could now be raised: why tolerance as a minimum agenda? Why put faith in this value-attitude? We provide the answer to these questions: because intolerance has become a common practice when faced with diversity. Tolerance as a value-attitude towards diversity shows itself like a minimum agenda which is urgent and absolutely necessary in multicultural societies characterized by prejudice and several types of discrimination (racism, sexism, xenophobia, homophobia, religious intolerance). “When we talk about tolerance it is actually intolerance we are dealing with”, states Augras (2007, p. 78).

The concept of tolerance is more and more at the top of the agenda because intolerance towards diversity has been recurrent in the history of humanity and in our society until now. We are undeniably characterized by diversity and, however, it seems like we do not know how to deal with it. “Intolerance is not only a question of not being able to tolerate divergent opinions; it is aggressive and frequently destructive in its hate towards the diversity of others” (Menezes 2007, p. 46).

Menezes (2007, p. 41) recalls that the term tolerance occurs for the first time among the Enlightenment thinkers. Locke was one of the first to talk explicitly about the theme in “*A Letter Concerning Toleration*”. The concept was formulated in the aftermath of the religious fights, the reciprocal massacres between Protestants and Catholics. The free-thinkers, who were followers of the Enlightenment, felt discriminated and persecuted by all forms of fanaticism. They were the ones who mobilized the public opinion against the horrors of intolerance by proclaiming the right to disagree.

The concept of intolerance has to be placed in its historical perspective in order to gain its own importance. In fact, tolerance occurs historically as a fight against intolerance and, such as the fights against discrimination which came later – the black movement, the feminist movement etc. – it has a clear activist attitude. It is not the first attitude. It is, first of all, a reaction against a given situation; against intolerance; it is the protection of one of the most sacred human rights; the right to diversity. It is equivalent to declaring that what is really intolerable is intolerance. It is a reaffirmation or a repositioning of the individual when faced with intolerance, which wishes to deny them; when the individual validates themselves against their denial, they do it as a right to be who they are; and they refuse to give the intolerant the right to deny them. (Menezes 2007, p. 42)

The concept of tolerance appears as an answer against intolerance to difference. Thus, it is fundamental that when we discuss tolerance we think of the nature, the causes and the consequences of intolerance. Menezes (2007, p. 45) states that “intolerance not only rejects the opinion of others but also its existence or, at least, what is worth living for: the person’s dignity and freedom”. Intolerance towards what is different has imposed a number of abuses and merciless massacres to stigmatized groups who carry a supposedly shameful and socially rejected sign. Remember black slavery, the Jewish Holocaust, the submission of women, the criminalization of homosexuality, and the persecution of the temples of African-Brazilian religions, among others.

Eco (2001, p. 114) calls our attention to wild intolerance, the kind which has no explicit reason or doctrine to support it:

Intolerance is placed before any doctrine. In this sense, intolerance has ideological roots and is manifested among animals as territoriality. It is based on emotional relationships which are often superficial – we do not tolerate those who are different from us because they have skin of a different color, because they speak a language other than the one we understand, because they eat frogs, dogs, monkeys, pigs, garlic, or because they have tattoos...

Intolerance researchers are often occupied with doctrines about difference, but not enough with wild and murderous intolerance, because it escapes from any possibility of discussion and criticism for the reason it is not a rational but a visceral value. It is generally angry, uncontrolled, inexplicable and impulsive. “The most dangerous kind of intolerance is exactly the one which shows up in the absence of any doctrine and is driven by elemental instincts” Eco (2001, p. 116).

Concerning the presence of religion in urban schools, the defense of an education towards tolerance is more about the defense of ethics of justice minima. Religious intolerance happens more often than we imagine in our schools. The age of children and adolescents, the religion and the reason of the conflicts may vary, but these conflicts happen on a daily basis.

Nonetheless, we believe it is necessary to coordinate in a more powerful way the ethic based on justice demandable minima and on the decent minima already shared. Notice that the argument for the ethics of demandable justice minima does not seek to convince us that we are all equal or that we should love each other. It “only” defends – and this is no small thing – that we tolerate each other, that is, that we can coexist without conflicts that lead to physical abuse and the discredit of others. This justice intervention would be framed in an argumentation that claims for a minimal,

albeit urgent and necessary, behavior. This is about ethics of justice minima, that is, the ones which are morally demandable.

We do not intend in any way to provide a magic formula to fight religious intolerance, which has challenged our schools, but only to highlight how a certain discourse can emphasize the arguments that seek to accommodate possible attitudes. An educational strategy of tolerance leads us to acknowledge that the feeling towards others may not even be the best, but that we should always be committed to the best attitude. Whenever we tell a child or adolescent not to feel anger, hate, disgust or rejection for others we are actually asking them not to feel something that they probably cannot or may not know how to control. We hate others. We feel disgust and rejection sometimes. To repress is not the best strategy in education. It would be better to recognize such circumstances, accept them and, despite them, pledge to seek the best attitude in the relationship with others. This is expressed in the fact that I do not need to like or love or accept somebody, but what I need to do is to respect and treat them with dignity.

In this sense, we take education out of the exclusive scope of ideals (happiness and advisable maxima) and we begin to try to also understand it in the scope of attitudes and real everyday life (justice and demandable minima). This is not about an option between the dreamed of ideal and the possible real, between teaching values or teaching attitudes. It is about coordinating these two dimensions. Finally, contrary to what people may commonly think, tolerance is no small thing. In fact, it is fundamental. And maybe it is even more necessary and urgent than what is initially imagined, because it seeks to touch our actions and attitudes – as an ethic of justice which is morally demandable – and not exclusively our feelings and intentions – as an ethic of happiness which is morally advisable.

Chapter 33

Public Policies on Deaf Education. Comparative Analysis Between Uruguay and Brazil

Leonardo Peluso Crespi, Juan Andrés Larrinaga,
and Ana Claudia Balieiro Lodi

33.1 Introduction

In this chapter we present the forms taken by the education of Deaf people in Uruguay and Brazil and the scientific debate – political and philosophical as well – that is instituted around. We understand by Deaf people those who speak a sign language as their natural language (Uruguayan Sign Language – LSU, for Uruguay and Brazilian Sign Language – LIBRAS, for Brazil), and an oral language (Spanish for Uruguay and Portuguese for Brazil) as a non native language, due to their inability to listen; and who develop their processes of identification and make their linguistic communities around a Sign Language (Erting 1982). Being Deaf is primarily an identity, not a peculiarity of the body.

Even though Brazil and Uruguay experienced similar problems, the organization of the education of the Deaf was quite different throughout history. In this sense, this work intends to describe the educational models at different levels of education in both countries, and then analyze how their evolution interacts with three formations: the theories that deal with the relations of the Deaf with language; educational and linguistic ideologies that exist on the Deaf and their language, and public policies that they spawn; and legal frameworks that address the issue of languages, the Deaf and education.

Thus, in this work we want to underline two tensions currently apparent in the arena of struggles of Deaf education. On the one hand we are talking about the

tension between the (neo) oralist proposal and the bilingual-bicultural proposal. By oralist proposal we mean the one originated at the infamous *Milan* Congress, held in that city in 1880, which completely prohibited sign language and its use in the classroom. Sign language was seen as *gestures* that were even labeled as erotic and their approach consisted in denying and/or rejecting the importance of sign language in the constitution of Deaf subjectivity. This oralist model argued that Deaf people should be trained in lip reading and articulation to speak and write an oral language, as *normo-hearing* people. Therefore, this form of oralism is an educational proposal that is to be placed as a clinical perspective which aims to cure the Deaf and to work to make them similar to *normo-hearing* people.

The bilingual and bicultural proposal, meanwhile, approaches the Deaf in terms of linguistic minority. It promotes a bilingual and bicultural education in which sign language is defined as the first and natural language of the students (as well as minority language that underlies Deaf identity) and the oral language is seen as a second language, very difficult for the Deaf to access above all in its oral channel (as well as the majority language, historically associated with literacy and activities of social prestige). This model is, from the theoretical and political perspective we assume in this paper, the only one which guarantees respect for linguistic and socio-cultural differences of the Deaf. We also show how, in some contexts, pseudo bilingual education proposals have been developed, which transform sign language into an educational resource that is a tool to facilitate Deaf students' access to the majority culture and oral language.

Within the frame of the tension between the oralist and the bilingual-bicultural proposal, another tension emerges, dialectically related with the first one: the struggle between Special Education and inclusion.

Special Education has been understood historically as an area of education which includes what the system calls *disabilities* and it was developed, due to its specialization and need of contact with health centers, in urban areas, mainly in the capital of the two countries focused in this chapter. In this educational framework, sometimes, the boundaries between education and therapy are faded out, and generally it is a strongly stigmatized educational space. So much so that many families struggle to avoid their children attending such schools. Even though Special Education has the advantage of offering its students a specialized education focused on the needs that are attributed to these *different* bodies, this advantage seems canceled by the fact that this *difference* is mostly seen as a deficiency and a disease (a *disability*).

Contrary to Special Education, inclusive and/or integration models also exist. These models foster the elimination of such specialized spaces within education systems and promote attendance of all students to the same schools and classes. By doing that, education spaces gain in de-stigmatization, but students lose in specialization and in the possibility of developing positive and counter-hegemonic identities.

Despite the differences of ideological and theoretical views of the Deaf and, therefore, of the educational objectives developed in both perspectives, it is recognized that the education of the Deaf in Uruguay and Brazil has always been offered, exclusively, for urban schools. This is so, for several reasons. From the oralist

perspective, developed in the frame of Special Education, schools for deaf people were founded in capital cities to have better contact with specialized health centers. School and health centers catering for the deaf were developed in parallel and received students from diverse backgrounds. In both countries, boarding schools were instituted in which deaf students from distant places could stay throughout the week, and if they came from very distant locations, they could stay throughout the school year. These spaces were an important context for the transmission of sign language and Deaf culture. At present there are no longer boarding schools, but still under the oralist perspective the deaf must go to capital cities to be attended.

In the case of bilingual and bicultural schools, the reasons why Deaf education is essentially urban are different. In this bilingual and bicultural education, school must maintain close ties with the Deaf community, which only thrives in urban environments. Besides, bilingual and bicultural Deaf education also requires that the schools have a significant number of Deaf students who can build together the Deaf community within it. Therefore, this kind of education needs several Deaf students and a permanent and fluid exchange with an external Deaf community.

For this chapter, a qualitative methodology is adopted, which allows a survey of institutional contexts that deal with the Deaf in the three branches of education of our public system. Then, we rely on official documents, on publications made by the institutions involved and on our participant observation. We also analyze the legislation – of both countries – that deals with education and languages, as well as the statements made by recognized national and international organizations that, in turn, influence the educational proposals for the Deaf. We intend to show the ways in which the institutional framework, the legal framework and the dominant ideologies shape a public urban education system for the Deaf that is generally fragmented and inconsistent, and whose development and evolution underlies the different education models for this group.

33.2 The Deaf in the Three Branches of Education System

33.2.1 In Uruguay

Uruguay is a small country, divided into 19 departments, each of which has a capital. Montevideo is the capital of the homonymous department and of the country. Half of Uruguay's population lives in Montevideo. This situation imposes a highly centralized logic in terms of public policies, public education policies for the Deaf included. Thus the first steps in education for the Deaf took place in Montevideo. Thus Deaf education was created in an urban context.

All educational policies in Uruguay from Elementary to Secondary School depend on the National Public Education Administration (ANEP), which is a decentralized institution that belongs the Ministry of Education and Culture. In this context the educational system is divided into: Elementary (0–5 years) and Primary

(6–11 years), and Secondary (Basic: 12–14 years and Higher: 15–17 years). A Tertiary stage (18 and over) is offered by the University of the Republic – the only public University of Uruguay -, which is completely autonomous from central government. Education in Uruguay is compulsory through Secondary Basic.

At the primary level, the first institution that operated in Uruguay for the Deaf, obviously in Montevideo, was called *National Institute for the Deaf-Mute*. This Institute was founded in July 1910 in the orbit of Special Education. In fact it can be said that its foundation was part of the consolidation of this area within the ANEP. Prior to this, some Deaf students went to Buenos Aires (Argentina) or Rio de Janeiro (Brazil) to enroll in specialized institutions that already existed there. The *National Institute for the Deaf-Mute* started working with teachers who had been specialized in Buenos Aires and brought a strong oralist model, heir of the Milan Congress. Subsequently other three schools for the Deaf, in different departments of Uruguay were founded. So, at present there are four schools for the Deaf, distributed in capital cities situated in the four corners of the country. In the other departments of the country, groups for Deaf students were open in some regular schools also situated in important cities, mostly capitals. All four schools and the groups for Deaf students were oralist until the late 1980s. After a long debate, an official document was published in 1987, in which the theoretical foundations and some methodological guidelines of the current proposal of bilingual education for the Deaf were set (Uruguay 1987, 2008, 2009; Behares 1989; Behares et al. 2012).

At present, the public system is torn between an education proposal that aims to be bilingual and bicultural against a neo-oralist proposal (misnamed inclusive), which maintains some vestiges of the old oralist school.

The bilingual and bicultural model takes different forms depending on the educational stage in question. In primary school, both in the four schools for the Deaf and the Deaf groups within regular schools, hearing and Deaf teachers work without interpreters offering a bilingual curriculum, with varying degrees of success. Although these are bilingual spaces, they remain within Special Education (for disabilities), because the education of the Deaf began in this area. This mark still stands, even though the education of the Deaf has been moved, discursively, away from the clinical approach and *disability*.

At the secondary level in various departments (starting in Montevideo), the possibility of Deaf students attending classes with interpreters was set. This cannot be considered a true bilingual and bicultural education but, at least, Deaf students can access the information in the curriculum in their own language (Larrinaga and Peluso 1997, 2014; Peluso 2010).

In Montevideo, and exclusively in the first 4 years of secondary school, there are Deaf classes, in contexts that serve their linguistic diversity. Some subjects are taught by hearing teachers who do not speak LSU, but with an LSU-Spanish interpreter; other classes have hearing teachers who speak LSU and dictate their classes directly in that language; and still other classes have Deaf teachers. There was also a change in relation to the languages to be taught: the Deaf classes started to have LSU as a subject – equivalent to the subject Spanish that deals with morphosyntax

of the Spanish language for the hearing students. These Deaf groups started to have Spanish language as a second language and English as a foreign language (both oral languages taught exclusively in their written form). In turn, for hearing groups of the same school, LSU teaching has been implemented as an extracurricular subject since 2004. In the last 2 years of Secondary in Montevideo there are still very few Deaf students and they attend classes with hearing students. In that case all classes are given in Spanish and the Deaf have an interpreter.

In the remaining departments of Uruguay, where there are fewer Deaf students and where the attendance of Deaf students to the Secondary is much more recent, there are no groups for them. From the beginning to the end Deaf students are integrated in classes with hearing students and an interpreter. As the tradition of Deaf education in Secondary is very recent, it has not been affected by the medical-clinical discourse and the oralist tradition. Therefore, it has remained outside the Special Education.

At the tertiary level, the University of the Republic has Deaf students and interpreters since about 2003. The entrance of Deaf students into the University of the Republic and the subsequent demand for interpreters clearly respond to the educational policies carried out in the previous education stages. Deaf students began to graduate from Secondary and had a need to continue their studies with interpreters. At the beginning many isolated experiences in various University services were made, without any planning, but from 2006 onward the interpretation service became a central policy of the University (Alvarez 2013). Thus, the University has now a permanent team of interpreters.

This is a significant change: in the 1980s Deaf people were not expected to study at the University and, if so, it was not imaginable they could have their classes in LSU. Today the University becomes another stage of what they expect – and also the community expects – in their education.

In 2009, the University started offering the degree in Interpretation LSU-Spanish (TUILSU). This degree puts LSU inside the University as an object of study and teaching, and Deaf culture as well. This is different from what happens in other studies at the University in which the LSU is simply a vehicle for transmission of curriculum content. In 2016, and as effect of a change in TUILSU's curriculum, Deaf students will be able to study in order to become translators (UdelaR 2014).

But it is not enough to say that the Deaf have become students, with linguistic rights in the three levels of the national education system. The Deaf are also involved, since the beginning of bilingual education in primary school, as teachers in this area. First, in the 1980s, they were hired as instructors to take over the teaching of LSU and Deaf culture in the schools for the Deaf that had turned bilingual. Late last century, they entered as teachers in Secondary schools to participate in the bilingual teaching experience, teaching the subjects LSU and Deaf culture. At the University, TUILSU hired Deaf teachers who deal with tasks of teaching, research and extension and have fostered the development of a linguistics of LSU in our country.

This entrance of the Deaf and their language into the University of the Republic, as students and teachers, is very relevant to their community. On the one hand it is

important for the process of intellectualization of LSU that will occur, naturally, in certain scientific areas. On the other hand, entering the university is certainly revolutionary in the expansion of the Deaf community in terms of the incorporation of new spaces of socialization, with all the social and identity effects that this entails. But it also has a political value, both toward the outside, for its effects on the display of the LSU in new areas socially valued, and toward the inside for the concomitant change in their possibility to occupy new spaces to which LSU had no access.

At the same time the bilingual model was introduced, Uruguayan public schools also adopted the integration model that a Deaf child – isolated from its community – to the majority, in a class for hearing students, without sign language and supported by a *special* teacher in the use of the oral language. This model grew stronger because many parents did not accept their Deaf child's going to a School for the Deaf after it become bilingual and perhaps, also, because these schools remain within the orbit of Special Education.

The cochlear implants as an equipment for the Deaf and the concomitant medical discourse which states that the implant should be accompanied by a strong training in Spanish without contact with LSU – because LSU could be harmful – further fostered the inclusion/integration model as an educational methodology. Many parents, especially those of middle and upper classes choose to educate their children outside the public school system under the regime of integration.

Also some parents choose integration within the public system, having had their children implanted. As noted in Peluso and Vallarino (2014), implanted and integrated students in the public system have very high failure rates, and many of end up going to the school for the Deaf.

This model, which was called neo-oralism, represents the most radical form of oralism. Its aim is only to teach non hearing students Spanish language, but unlike the old oralist school, which to do so joined the Deaf in the same space and ended promoting LSU transmission, the integrationist or inclusionary proposal isolates, explicitly, the Deaf students, not allowing their interaction and, therefore, obliterating any possibility of transmission of the Deaf language and culture.

There is, therefore, an important debate within our public education system about the two current models, developed in two fronts. On the one hand there is the debate between bilingual education and neo-oralism, in which the principal issues are what languages must be taught and what conceptions about the Deaf are implied: the Deaf as speakers of a minority language or the Deaf as sick/disabled people to be cured, in the sense of turning them pseudo-hearing. On the other hand, there is the debate between Special Education and integration. This debate goes beyond the issue of the Deaf and it is located in the discussion about the *school for everyone* that implies the idea that specialization or differentiation of school contexts could be the basis of discrimination or inequality. This discussion probably also involves a comparison of both models in terms of economic costs for the system.

33.2.2 *In Brazil*

The Federative Republic of Brazil is a country of vast territory. It is divided politically and administratively in 27 federal units (26 states and the Federal District), which have significant differences in territorial, demographic, economic and socio-cultural terms. Given the country's characteristics, it is impossible to generalize educational activities in the different states and municipalities.

The educational system is divided currently into basic education, compulsory and free from 4 to 17 years of age, and higher education. Basic education is made up of the early childhood education (children under 5), primary (initial: 6–10 years, late: 11–14 years) and high school (15–17 years), which may still turn into a technical vocational training.

Deaf education began in 1857 with the creation of the Imperial Institute for the Deaf-Mute (since 1957, the National Institute of Deaf Education, INES) in city of Rio de Janeiro. Deaf education again is an urban policy. The Institute received students of both sexes as a boarding school and had a grant from the Empire, which also provided scholarships for those students who could not pay for education. There is no record of teaching methods and various contents taught in this period; it is known only that in this space, Sign Language was allowed (Rocha 2008). This situation began to change in 1897, when, influenced by determinations of the Milan Congress and other European institutions, the Articulated Language course became mandatory. In 1911, during the First Brazilian Republic (1889–1930), the Pure Oral method was imposed in the institution (Rocha 2008).

Deaf people from other provinces of Brazil lived a different reality because there are no records of education assisting students with disabilities (where the Deaf would have been included) until the mid-1920s. In 1930, the civil society began to organize the creation of associations and special charities focusing on education of the disabled in some capital cities, and in the public sphere there was the planning actions for the creation of special classes within mainstream schools (Jannuzzi 2004). Special schools and institutions specialized in the Deaf, public and private, began to appear in 1950 also in important cities, but they followed the same ideology that pervaded the work on INES, as Special Education, at this time, understood that the focus of any service should be at the disability. Few actions or changes occurred in educational terms and, therefore, therapeutic practices maintained strong predominance in relation to education. The normalization of the disabled, then was sought so that they could live as normally as possible. In the case of Deaf students, that involved the learning of oral language and then written Portuguese.

In this context the school integration movement advocated the acceptance of the disabled in school and in society considered it necessary to establish a link between the regular system of education and Special Education through the planning of complementary services, to ensure the permanence of these students in the regular system (Jannuzzi 2004). However, due to little integration between the two systems and the small number of trained teachers, the initiatives did not yielded the expected results.

The integration of Deaf students in regular education was justified by the belief that their daily contact with hearing children and teachers could contribute to their oral language acquisition, since they were required to use only this language at school. In addition, they would be encouraged to face their difficulties to keep up with school activities designed for hearing students, a fact that would contribute to their future integration into society.

Despite the integrationist movement, special classes for the Deaf in schools for hearing students were maintained in many public facilities. This was a more economic organization for the states than the creation of special units for the Deaf. In those special classes, students with different ages were enrolled, and the teacher had to manage with the different educational levels of the students. At times, the children attended remedial classes to improve in the subjects that were more difficult to them (Harrison et al. 2005).

The special schools for the hearing impaired gradually expanded the educational levels offered. These, however, had a reduced curricula as compared to the same grade of regular school and used simplified educational materials, both in terms of content and in the language used. They understood that Deaf children, because they are disabled, were unable to learn the same way that hearing children learned if the processes were not adapted to them. In the 1980s, these schools, initially oralist, became bimodal, i.e. although the emphasis was still on oralization processes, they started to use signs removed from sign language, which were organized in grammatical structure of Portuguese.

This situation continued during the 1990s, when studies about Brazilian Sign Language (Libras) started to be known and so were the discussions about bilingual education which was being used by a small number of Special schools for the Deaf, though partially. It is also in this period that discussions on the inclusion movement began in the country, forcing schools to meet the challenge of setting up to meet the diversity of students. This movement held that it was no longer up students to fit in the normal patterns.

During this period, the new Law of Directives and Bases of National Education – LDBN (Law No. 9.394/96) establishes that special education, as a form of primary education, should be preferentially within the regular school facilities, offering specialized support services when necessary. The law admits, however, that this education may also be held in classes, schools or specialized services, when the integration of students in regular classes of mainstream education is not possible, according to the specific conditions of students (Brazil 1996, Art. 58). These same provisions are still in the latest edition of the Law, published in 2014.

Several other laws and some government programs have been created over the years following the publication of LDBN, aiming to transform education systems in inclusive, ensuring access and persistence of students with disabilities in regular schools. However, despite the federal government's efforts, it was acknowledged in 2007 that the transformations that occurred were still very insufficient (Lodi 2013). Thus, in the same year, a working team was appointed to review the National Policy for Special Education, in force until the present day, which advocates the inclusion of all students in mainstream schools, offering specialized educational services to

students enrolled in public schools. This move led to the closure of special classes and of most of the public Deaf schools in the country.

In order to ensure the education of Deaf students, this policy provides for the presence of translators and interpreters of Libras – Portuguese (TILS) at all levels of education, understanding that in this way, bilingual education for the Deaf is guaranteed. However, this policy disregards the development of language/appropriation of Libras by Deaf students (who come to school, most of the times, without ever having had contact with this language), the differences, inherent to each education level, and the level of knowledge that TILS should have to act in different stages of education (Lodi 2013).

In this sense, we question if there was really an ideological shift in the way the Deaf are conceptualized by the current Special Education policy. This policy disregards the process of appropriation of Libras by Deaf students, which should be provided in the established relationship with Deaf adult users of Libras. So, the educational system denies, covertly and from another discourse, the possibility of participation and equal learning between Deaf and hearing, a principle of inclusive education. The difficulties faced by Deaf students who continue in school without a shared language with their teacher and with colleagues (and often with TILS). Further, depending on age, there is not a clear idea of the role of the teacher and the TILS, and students turn to the fact of being Deaf as a handicap. It can be seen therefore that the hearing loss overcomes the perception of the Deaf as users of another language. The disability discourse prevails in the educational organization of these students.

A contradiction is recognized, however, with the provisions of the Salamanca Statement (UNESCO 1994), document that interacts with Brazilian national special education policy, insofar as this one recognizes the linguistic difference within the classroom and so, the most appropriate education to the Deaf should be the one organized in special schools or classes or units in mainstream schools (Lodi 2013). This orientation, we have to point out, is also present in the Federal Decree No. 5,626/05, with regard to the education of the Deaf in early childhood and early years of elementary school. This document also ignored in the inclusive approach that most states and municipalities are developing.

The few remaining Deaf schools in Brazil, public and private, gradually adhere to the bilingual education approach and strive to implement it, through the hiring of Deaf teachers/instructors to work in these spaces, but they still have, however, an ill-defined role in most cases. Other initiatives, contrary to the provisions of National Special Education Policy, but following the provisions of Decree No. 5,626/05, also began to be developed within a few public schools, especially in cities where the schools for the Deaf have become extinct. Though still few in number, these initiatives seek the implementation of spaces in which Libras constitutes the language of instruction and interaction (then classes that are not for the hearing), respecting thus the intrinsic linguistic and sociocultural differences of Deaf students in kindergarten and the early years of elementary school (Lodi 2014).

In 2000, with the publication of Law No. 10,098, the Government undertook to eliminate barriers to communication in order to guarantee the right of all to have

access to information, education, work, culture, sport and leisure. Then, the presence of TILS in all social spaces where there are Deaf people became guaranteed, a fact that made it possible for many Deaf to enter higher education – undergraduate, and graduate *lato sensu* and *stricto sensu* – in various public and private institutions of the country.

With regard to the Brazilian public universities, other debates have been appearing, particularly concerning the need to include Libras as a compulsory discipline in teacher training courses and for those who will become speech therapists, and as optional discipline for the other university courses (Brazil 2005); TILS hiring for the Deaf freshman in college (Brazil 2000); and the creation of courses for both the training of TILS and for the teaching of Libras as first and as a second language (Brazil 2005). Important to note in this process, is the opening of a course aimed at training teachers of Libras and then Deaf culture, offered primarily for Deaf (BA in Libras) in 2006.

Since 2011, through the *Program Living without Boundaries*, the federal government stipulated the creation 27 university BA Degrees in Libras and 12 courses of Bilingual Education and the opening of 690 vacancies for Universities and Federal Institutes of Education to hire professors and TILS (Brazil 2011). These universities and institutes have prioritized the offer of undergraduate courses and training courses for interpreters- translators (BA), which has entailed the hiring of Deaf professors and hearing professors fluent in Libras in public spaces of higher education. Although still in progress, the visibility of Libras in academic spaces has had a significant increase.

33.3 Critical Analysis of the Processes and Perspectives in Public Education for the Deaf in Brazil and Uruguay

Education for the Deaf in Brazil and Uruguay went through similar but also different processes. In Brazil it began half a century before than in Uruguay and, due to the historical moment in which it occurred, this beginning was linked to an educational proposal that included sign language in the classroom. We can even find, in that period, the first studies and notations of Libras (Gama 1875), while for LSU in Uruguay, it took about one more century (Behares et al. 1987).

The prohibition established by the Milan Congress in 1880 (Congresso de Milão 1880) had an impact on the education of the Deaf at the global level, so it obviously affected our countries. Thus, in 1910 when the education of the Deaf in Uruguay began, and in 1911, when a major transformation of the education of the Deaf in Brazil occurs, the approach taken by Public Education to the Deaf in primary level in Brazil as well as in Uruguay was marked by a clear oralist proposal. It was understood, as noted, that the only language was the spoken language (Spanish or Portuguese depending on the case). Therefore, the Deaf were to be trained in its use both in the oral modality and in writing. Obviously this is strongly anchored in

conceptions of the human being, of language, but also in the fact that in these new countries citizens who did not speak the national language were seen as a threat. The old modernist model was followed: one nation – one language.

The global oralist model put the Deaf together in schools or institutions that specialized in their approach. These institutions were placed within the area of Special Education, which is the area in which our public education systems put students diagnosed with disabilities. Thus, Special Education acquired the mark of disability, clinical discourse pervaded the approach, classrooms became *resource rooms*, and finally a stigma was imposed on students belonging to this area: that of the *abnormal*.

In this period, legislation on the Deaf and their languages was scarce which put them at risk of being legally declared unable. That is no longer possible for the Deaf in the Brazilian legislation, but endures with attenuations in Uruguayan law.

In the late 1980s, but mainly during the 1990s, two antagonistic models that also oppose the proposal of the oralist school become consolidated in the field of Deaf Education: the bilingual model and the integration model. The first one came as a consequence of the political struggles of the Deaf and of important works in linguistics of sign languages and cultural studies that took to the Deaf community as a research topic. The second one came as a consequence of the integration educational models that were first imposed after the Salamanca Statement (UNESCO 1994).

Uruguay's public education adhered strongly to the bilingual model, while maintaining schools for the Deaf within Special Education. Simultaneously, the integration model has been consolidated outside the public system and in opposition to it. The integrationist model is the dominant model in the private system.

In contrast, Brazil officially seems to have chosen the integration model. Therefore, special education becomes integrated within the normal/regular schools and their proposals, at all educational levels, promoting the assistance to students with disabilities as a complement to regular education. However, although most schools for the Deaf have disappeared, there are classes for the Deaf that aim at following the bilingual model.

Also, in Brazil and in Uruguay intermediate proposals appear as there are classes with interpreters, which would be placed conceptually somewhere between bilingual education and integration. In Uruguay, this proposal appears in first year of secondary school, but keeping groups only for the Deaf that sometimes have a hearing teacher and an interpreter. Starting in the last 2 years of secondary school, and at the university level, Deaf students are integrated in hearing groups, with an interpreter. In Brazil, this proposal of integration of Deaf students into classes of the hearing with an interpreter has been implemented throughout the educational levels.

In secondary school and at the university level debates are different. As we no longer have the critical period of development that challenges education's early years, the discussions fall into less essential cores, such as the rights to have an interpreter in the education area. In Uruguay there is no longer the problem of special education at the secondary level and the same is true in Brazil at the level of

higher education. At this level of education both countries have very similar realities as they struggle to have Deaf students in the various educational contexts.

At the public university level, Brazil currently has many Deaf students and many Deaf professors as an effect of the federal incorporation of Libras in the curricula of all teacher training programs and speech therapists' programs and the possibility to follow a BA in Libras. In Uruguay there are no such university spaces for LSU and Deaf culture. Just next year, 2016, Deaf students will be able to enter TUILSU in order to become translators which will be the only public university area that will aim to the Deaf, their language and culture. So in Brazil there are already several Deaf doctors and masters, while in Uruguay the first university graduates are coming out. In Uruguay the tradition of postgraduate studies is very recent (e.g., the School of Humanities and Education established the first PHD program in 2014 and the School of Psychology in 2015), but we do not think this has been a decisive factor in this lack of Deaf graduates from Uruguay.

The education programs and changes described dialectically interact with processes occurring in the ideological, discursive, political and legislative fields. If we compare the array of laws in Uruguay and Brazil, we see the relationship with the public policies imposed on Deaf education. In both countries and almost simultaneously, laws recognizing the respective sign languages as languages of Deaf minorities (Uruguay 2001; Brazil 2002) are enacted. With the enactment of these laws, the governments echo the perspective that the Deaf are speakers of a sign language and undertake certain actions, among which the promotion of bilingual education.

It should be noted that this occurs in two very different traditions of language legislation regarding the explicit determination of an official language of the country. While Brazil declares that Portuguese is the official language of the country (Brazil 1988), Uruguay takes Spanish for granted without explicit mention. Uruguayan legislation never made explicit mention of an official language until LSU was recognized as the sign language of the Deaf communities. This is why in Brazil there exists a certain official primacy of Portuguese over Libras, especially in terms of writing, which does not occur in Uruguayan legislation, where the languages are at the same level – the primacy then occurs in the ways that groups become related, but not at the legal level.

However, at the time sign languages are recognized in our countries, new laws and documents dealing with the Deaf and disabled people and their languages as compensatory devices are issued (Uruguay 2010; Brazil 2008). These laws/documents end up promoting social inclusion practices seen mostly in terms of integration and the search for the *cure* of a disability and, ergo, extermination of the Deaf as speakers of a sign language.

This contradiction that appears in our legal systems, which is expressed in very similar ways, shows the contradiction in ideologies and discourses that deal with the Deaf and their languages. They are at the same time included within the territory of disability, of the incapable or unfit, on the one hand; and on the other they are seen as a minority, speakers of a minority language, ranking with indigenous groups in Brazil or Lusophone groups in Uruguay. Is it an issue of language rights or one of disability and disease? It is in this contradiction that the education of the Deaf

unfolds in our countries, with frankly opposed models as integration versus the truly bilingual and bicultural education. But there are also models where this contradiction is embodied without being resolved, where everything is entangled and sign language ends up being a teaching device, useful for better transmission of curriculum content.

Finally, in this chapter we have shown the development of educational ideologies and policies related to the Deaf and their languages and cultures in our two countries, which have much in common even though they have had little communication at that level. We also point out how this development is strongly related with the development of linguistic ideologies and policies about sign languages and the concomitant legislation.

We believe it is necessary to establish, in the field of the Deaf Studies, further discussion and communication between those who plan educational proposals, those who are carrying forward language policies and the Deaf communities, who are, ultimately, the aim of these proposals and suffer or enjoy them, and that in most cases, paradoxically, can not intervene.
