Education and its development go hand in hand with the improvement of living conditions in society. During the last quarter of a century in Latin America, such conditions have significantly improved along with economic growth and democratic development. Three decades have already elapsed since the end of military dictatorships in a region once characterized by its democratic failure, and from the beginning of the 1990s the economy has evidenced sustained growth. In the 2000s, this growth averaged 5 % of the per capita GNP per year. In the same period, most of the countries in the region moved from an “average” to a “high” level according to the United Nations Development Program, human development indexes (UNESCO-OREALC 2013a). Evidence of growth and improvement in the human development indices has not, however, changed the fact that the region still shows the largest inequality in income distribution in the world (CEPAL 2014).

In spite of structural inequalities in the last two decades there has been a marked progress in the proportion of the young that complete primary and secondary education. In primary education the percentage of youth that completed this cycle passed from 60 % in 1990 to 94 % in 2012. In secondary education, the percentage of the 20–24 years old that completed their studies went from 26 % to 59 % in the same period (CEPAL 2014).

Public policies throughout the region have in the last two decades prioritized education, increasing sectoral expenditure from an average of 4.5 to 5.2% of the GNP between 2000 and 2010 (UNESCO-OREALC 2013a) and creating numerous improvement programs and reform initiatives relating to educational systems' governance, the role of the public and private sector, centralization and decentralization, the curriculum, the social distribution of learning outcomes, and teaching policies (Schwartzman 2015; Schwartzman and Cox 2009). At the same time there has been a visible shift in the general aim of educational policies, from expanding access and achieving universal coverage, (reached for the primary level by 2000), to an emphasis on the quality of the learning opportunities offered by the school experience to all. This quality agenda places teachers at the very core of policy considerations.

There are marked differences in socioeconomic development across the countries in the region, which makes generalizations problematic. Variations in per capita GNP (2014) range from US\$ 16,360 and US\$ 14,900 (Uruguay and Chile) to US\$ 1830 and US\$ 2190 (Nicaragua and Honduras).¹ The poverty rate in Latin America reached 28.1% in 2013 (down from 43.9% in 2000), whereas extreme poverty stood at 11.7%. These percentages involve 165 million people living in poverty, out of which 69 million are in extreme poverty. Here again there are large differences between countries, with Uruguay and Chile exhibiting 6.6% and 10.3%, respectively, in contrast to countries such as Nicaragua and Guatemala, where poverty rates are as high as 87.8% and 83.9 (CEPAL 2014).

We see the requirements of an education able to break the cultural reproduction of poverty and exclusion in urban contexts as inextricably linked to the capacities of teachers and these as dependent on the recent evolution of the teaching profession in Latin America. We thus shall attempt to characterize its distinctive features and account for the pressures for change it is undergoing. The strongest and most unequivocal of these pressures arise from public policies, which are increasingly shifting from the 'easy' policies of expanding access and its accompanying building of schools and creation of teaching jobs, to more demanding ones such as those aimed at quality and its requirements of changes to institutions and practices (Navarro 2006).²

This chapter will first make a general sociodemographic characterization of the teaching profession in Latin America and then will make reference to initial teacher training. The third section will describe the constitutive features of continuous teacher training in Latin America. The fourth section will describe how regulations relating to the teaching profession have gradually evolved and what key trends may be identified in this crucial dimension of educational quality policies. In each of them we shall raise linkages with issues of urban education. A closing section offers a reflection on the trends observed in the teaching profession in the region as well as in the policies aimed at improving and transforming it.

¹ See: <http://datos.bancomundial.org/indicador/NY.GNP.PCAP.CD>

² The marked diversity in the socioeconomic and educational development levels among the countries in the region affect the generalization about the shift from an access to a quality agenda. Some Central American countries, as well as Andean countries, still have challenges to meet in terms of school coverage and permanence among rural children – still a sizeable proportion of enrolments.

34.2 Teachers in Latin America: Sociodemographic Features

There are approximately 7.8 million teachers working in the school system (pre-school, primary and secondary levels) in Latin America and the Caribbean. Out of this total, 14.6% are engaged in early childhood education, 37.8% in primary school, 26.6% in lower secondary school and 21% in upper secondary school, even though the names and durations of these levels vary across countries. In some cases, the primary and secondary level structure is 6–6 years, in others it is 8–4, and still in others it is 9–3 years (UNESCO-OREALC 2013a).

A characteristic trait in Latin America, as in the rest of the world, is the feminization of the teaching force: 71.6% of teachers are women, a percentage which rises to 95.8% in the case of early childhood education, stands at 77.6% in the case of primary education, and at 59.3% in the case of secondary education (UNESCO-OREALC 2013a).

In Latin America and the Caribbean, the student-teacher ratio in 2010 was 19 students per teacher in primary education and 16 students per teacher in secondary education. Under these regional averages, there is a vast heterogeneity of situations. Some countries such as Nicaragua have nearly 30 students per teacher both at the primary and secondary level, while Cuba features nearly 10 students per teacher in both levels (UNESCO-OREALC 2013b). In the case of early childhood education, the situation is extremely heterogeneous depending on the country and the age of the children. Thus, in the case of 3-, 4- and 5-year-olds, student-teacher ratios range from 10 to 12 in Cuba and Venezuela, respectively, while in Guatemala they stand at 35–40 students per teacher, and in Chile the regulatory framework allows up to 45 students per teacher (UNESCO-OREALC 2015a).

In the case of early childhood education staff, there is a considerable gap between those working with 0- to 3-year-olds and those working with 4- to 6-year-olds. Those engaged in working with younger children are themselves observed to be younger, less experienced and less qualified; while those working with the 4- to 6-year-old population tend to be better qualified, more experienced and older (UNESCO-OREALC 2015a). In general, older, more experienced teachers concentrate in urban areas and younger, less experienced ones work in remote or rural areas (Bruns and Luque 2014).

As to the quality of the teaching staff preparation, aggregate regional information shows that in 2010, 78% of primary school teachers and 70% of secondary school teachers had certified teacher training (UNESCO-OREALC 2013b). The TERCE³ survey given to 3rd and 6th grade teachers whose students took the 2013 test shows that 82.1% and 85.7% of the teachers, respectively, had a teaching degree.

³The survey given to teachers participating in TERCE forms part of the Third Regional Comparative and Explanatory Study (TERCE) implemented by UNESCO-OREALC in 2013. Its main purpose was to assess the quality of education in terms of learning achievements in countries in Latin America and the Caribbean and to identify the associated factors. TERCE measured learning achievements in Language and Mathematics in the third and sixth grades of primary school, plus Natural Sciences in the sixth grade (UNESCO-OREALC 2014b).

Teachers in the region share the view that their work is not sufficiently valued by society, an opinion evidenced in the political world and in the media, beyond the appreciation they generally receive from their pupils, parents and school communities in general. In addition, teachers are becoming ever more aware of the increasing demands of society on schools, so that while practitioners are required to produce better learning outcomes, they are forced to take on roles other than teaching, such as care, health, nutrition, containment, guidance, drug and alcohol prevention, among others (Tenti 2009).

The transition to a professional conception has become difficult in the region due to the social pressure to expand educational services, a phenomenon that characterized the closing decades of the last century. This often required that teachers with significant training deficits be hired in countries such as Argentina, Brazil or Mexico, among others (Tenti 2009).

34.3 Initial Teacher Education

As in any profession, the training of teachers is intimately related to the views about the profession held by practitioners and society. In the case of the teaching profession, there are different views coexisting in the region: the teacher as a 'missionary', as a technical, as an artist, as a worker and the teacher as a professional. All these definitions have a significant presence in the region, although the view of teaching as a profession dominates the official debates, policies and regulatory frameworks (Louzano 2015). The growing presence of the view of the teacher as a professional does not imply that the other views have disappeared or that all countries follow the same conception of professionalizing teaching, or even that several views do not coexist within a country. Perhaps the greatest challenge currently facing teachers' union organizations in the region is a new identity narrative which, without rejecting the original tradition, incorporates the professional view as foundational, i.e. one that is functional to the requirements currently made of school teaching by society. In other words, to face the transition from a semi-profession to a profession, with distinctive high-level knowledge and competencies, with significant autonomy, and with control over a domain of practices undisputed by other professionals.

In relation to the initial training and certification of Latin American teachers, the situation varies widely according to country and also within single countries, depending on the education levels for which prospective educators are trained and the type of teacher training institutions. Thus, the training of primary and early childhood education teachers is in many cases provided by the so-called higher normal schools (Mexico), or by higher teacher-training institutes (Argentina, Peru), or by secondary education normal schools (Guatemala, Nicaragua, Honduras), while in other countries training is mostly provided by the universities (Brazil, Chile). By contrast, the training of secondary school teachers is mainly provided by the universities, although in some cases it is also provided by higher teacher-training institutes.

Considerable differences are also found in the duration of studies, possibly linked to different levels of depth of knowledge. In some cases the duration is 4–5 years for all levels (Argentina, Chile, Mexico and Peru), while other countries make a distinction between training programs for primary teachers, lasting about 3 years, and for secondary teachers, which require a first degree (*licenciatura*) and a longer duration (Colombia). For the training of secondary teachers, as is the case worldwide, the coexistence of two models in different countries or within a country is worth noting: the concurrent model, which trains teachers from the time they graduate from secondary school (*bachilleres*) integrating discipline and pedagogical training; and the consecutive model, which offers 1 or 2 years of pedagogical training for first-degree graduates in specific disciplines. One of the most salient features of initial teacher training in Latin American countries is its low academic selectivity and the low level of preparation of those entering pedagogical studies. This phenomenon has to do with the low value that societies attach to the teaching profession, as is evident from low salaries, among other factors; this deters many young people with a vocation and a good school-performance record from taking up a teaching career. Consequently, it so happens that normal schools, higher teacher-training institutes and universities admit students with serious shortcomings in terms of knowledge and basic skills (language, mathematics, and general knowledge) which are essential for taking on higher studies (UNESCO-OREALC 2013a). This situation is intensified by the expansion of secondary education and subsequent growth of higher education, which is strongly channeled through teaching careers, traditionally considered to be less demanding.

Another characteristic of teacher training in the region is the poor quality of training programs and formative processes which, in the case of universities, assume academic-like features which make it very difficult to center on practical training and relate to the demands of actual school life. Although there is a tendency to give more weight to practical training and to bring it forward from the beginning years of study, it is clear that there is a long way to go in this direction. Thus, it is often the case that primary education teachers graduate without sufficient mastery of strategies, methodologies and tools for teaching the basic skills of reading, writing and mathematics.

The mentioned increased capacities of the schooling systems of the Region to include new social groups in secondary education has transformed the pedagogical requirements of this level, without the teacher education institutions having answered consistently to these new and demanding requirements. On the contrary, what predominates is a generic preparation that does not take into consideration key features of the contexts and student bodies with which the future teacher will have to work. A major review of the issue by UNESCO, concludes that “a critical issue in teacher education is the achievement of capacities and attitudes that allow them to understand the world of poverty and generate learning in students from those contexts” (UNESCO-OREALC 2013a: 53).

For Ball and Cohen (1999), teacher training should be “practice-centered given that although disciplinary and pedagogical knowledge are fundamental, they are not

capable of prescribing an appropriate teaching practice for each context” (Louzano 2015). According to this author, true professional education should be able to train in the practice of a profession and, in the case of teaching, this would mean “to experiment with the tasks and ways of reflecting which are typical and essential of the teaching profession” (Ball and Cohen 1999 p. 12). Therefore, teaching education programs should be underpinned by “pedagogies” that enable such experimentation and reflection (Louzano 2015). Levine’s (2006) assertions about Education Schools in the United States are applicable to Latin America when, as a conclusion of a study on such institutions, the author states that although some programs integrate theory and practice, most of them prioritize academic studies over practical work. Not only do students spend a short time at schools, but there is little connection between what they see there and what they learn at the university. Also, many of the schools where teaching practice takes place are not suitable and, as teacher trainers’ involvement with them is minimal, student teachers are not supervised in their practice (Levine 2006 cited by Louzano 2015).

On the other hand, the lack of specialization in the training for primary education teachers seriously jeopardizes teaching in the higher primary grade levels where discipline contents are more complex. By contrast, in the training of secondary teachers, education in the disciplines becomes more important, but tends to become dissociated from discipline-specific didactics and teacher training, which is undervalued (Avalos 2011; UNESCO-OREALC 2013a; Louzano 2015). At the specific core of professional knowledge in this sphere is an overlaying of discipline-related knowledge (associated with each content area of the school curriculum) and pedagogical and didactic knowledge (or the knowledge of those training to be teachers) and the appropriate ways of teaching). The difference between good, average and poor opportunities for learning how to be a teacher lies in the quality of each of these components and how they are interrelated. The concept of ‘pedagogical content knowledge’, coined by American Lee Shulman, is enlightening in this key dimension of renewal (Shulman 1987).

One issue worth discussion is the weak preparation of teacher educators and the low selection requirements in the context of expanded higher education. The pre-eminence of faculty hired for a given number of teaching hours and the hardly existing full-time staff positions hinders the creation of work teams with a shared view of the training that should be provided. In the case of universities, pedagogical training ranks lower than other disciplines and there is no recognition of the scientific and academic validity of pedagogical knowledge (UNESCO-OREALC 2013a; Louzano 2015).

In the context of social inequality that characterizes the region, a critical problem is teachers’ insufficient preparation to foster learning among poor urban and rural students, who have greater difficulties as shown by measurements of learning outcomes in the various countries. Likewise, despite efforts made in many countries, limited progress has been ascertained in training for intercultural bilingual education (UNESCO-OREALC 2013a; Darling-Hammond and Lieberman 2012).

Finally, regulation of the sector by the State is weak: this is a complex issue in countries with a high incidence of private higher education and high degrees of

university autonomy. Thus, the paradox arises where states set curriculum frameworks and student learning expectations, but have no say in how the teachers responsible for curriculum implementation and learning outcomes are to be trained. In this regard, the already mentioned formulation of standards and accreditation systems for teacher training institutions and programs becomes especially interesting.⁴

In response to some of the challenges confronting the countries in the region with respect to initial teacher training, different initiatives have developed such as strategies to attract good college students to teaching (Chile and Peru); development of graduation standards and/or assessments (Brazil, Chile, El Salvador and Mexico); and a guiding institutional framework for teacher education (Argentina) (UNESCO-OREALC 2014a). The majority of these new instruments distinguish the centrality of context for the effectiveness of education in general and teaching in particular, a development that signals towards a renewed and more potent recognition of the particular requirements and supports demanded by the education of the poorer and marginalized in the region's cities.

34.4 Continuous Professional Development

As is the case the world over, Latin American teachers generally have access to various types of professional development opportunities, although this varies according to the country, and participation depends on personal conditions and options. According to data from the TERCE survey (UNESCO-OREALC 2015c), 79 % of Grade 6 teacher respondents completed a 60-h or longer professional development activity in the last 2 years.⁵ This participation is markedly lower when the areas considered in the TERCE tests are involved, where it reaches 24 % in Language, 31 % in Mathematics and 15 % in Sciences.

The large number of teachers and the costs associated with wide coverage programs, as well as teachers' difficulties in finding time to participate, have resulted in lowered attention being given to this important dimension of teaching policies (Terigi 2010; Barber and Mourshed 2007; UNESCO-OREALC 2013a).

Just like in the case of other professionals, collaborative learning among teachers has a powerful impact on skills development, on the configuration of beliefs and values, and of habits which have a strong bearing on professional practices. In the case of teaching, the need for this kind of learning becomes stronger because it is a

⁴Chile is a country which has progressed in the formulation of initial teacher training standards, see "*Estándares orientadores para egresados de carreras de Pedagogía en Educación Básica*" (MINEDUC 2011).

⁵For comparison purposes, it should be borne in mind that according to data from the TALIS survey given to lower secondary teachers from 33 OECD countries and others, 88 % of the teachers report having participated in a professional development activity in the previous year (OECD 2014).

collective type of work. Student learning is the result of interventions by a group of teachers who either diachronically or synchronically works with the same students (Avalos 2007).

The central idea of collaborative professional learning is to recognize that teachers learn from their instructional practices: they learn how to learn, to search, to select, to experiment, to innovate, in short, how to teach. To achieve this, collaborative professional learning combines different strategies that involve actions between peers, such as learning new ways of teaching and evaluating, the reflection on what happens in the classroom, and the formulation and review of institutional education projects (Calvo 2015).

According to Little (2001), Hargreaves and Shirley (2012), and Hargreaves and Fullan (2012), the hallmark of the new professionalism is team work and team learning. According to the latter, *professional capital* is largely a function of *social capital*,⁶ that is, of the teams, networks and relationships in which each teacher's performance is embedded. The concept of professional communities of learning, where collaboration is a systematic process whereby teachers work together interdependently with the purpose of impacting classroom practices to elicit more effective learning, is widely disseminated. 'Communities of learning' are directly a high expression of 'social capital'. From this new perspective, collaborative professional learning as a strategy for teachers' professional development is associated with larger goals relating both to the institution and the education system, and feeds back into school practices and assessment (Calvo 2015).

Recent international literature coincides in ascribing special value to professional learning tailored to the needs of each educational community, as well as to learning stemming from collective reflection, from a critical exchange of experiences between teachers, and from a joint search for better strategies to solve problems as they arise in day-to-day instructional practice (Calvo 2015; Fullan 2010; Vaillant 2009; Villegas-Reimers 2003).

Several authors have also highlighted the low impact of public policy-driven actions in countries in the region (Avalos 2007; Martínez 2009; Voelmer 2010), whether on account of the small number of teachers involved or of the predominance of academic offerings based on traditional courses unrelated to the school context. The persistent application of traditional training methodologies does not contribute to a critical reflection that may relate with the participants' experience and motivations. Even the recent use of new technologies to create online training courses offering massive coverage tends to propose general content which do not meet the schools' specific needs. The existence of incentives rewarding attendance at training courses rather than effective learning does not contribute to the impact either (UNESCO-OREALC 2013a).

On the other hand, the lack of awareness of teachers' diversity both in terms of training and of the various stages of their professional pathway and the contexts in

⁶It also depends on the 'human capital' and 'decisional capital', that is, on each teacher's talents and training, as well as the experience he has accumulated in action, which allows for informed decisions to be made 'on the spot'. See Hargreaves and Fullan (2012).

which they serve is worth highlighting. Continuous training programs tend to be designed for large heterogeneous groups of teachers, without consideration for their personal differences. It is difficult to find in the region, for example, sustained support programs for the incorporation of beginning teachers. Recent research stresses the fact that the guidelines given to beginning teachers by specialized mentors or school directors have a significant influence on the construction of their professional identity and on their motivation to move forward in their profession. On the contrary, the lack of said support contributes to a passive adaptation to traditional teaching routines or to young promising teachers abandoning classrooms or the profession, because when confronted with such difficulties they prefer to look for more attractive professional horizons (Marcelo 2009; MacBeath 2012).

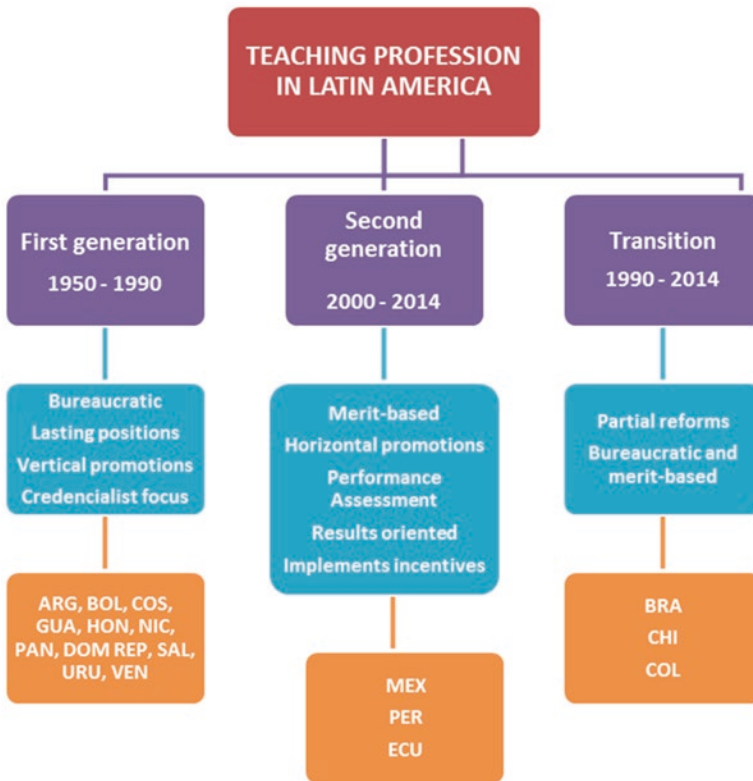

A characteristic trait of education systems in Latin America is the lack of relevance of many course offerings for in-service teachers. At the core of this problem is the fact that teacher development actions arise from the confluence of individual teachers' demands and the offerings by numerous public and private agents, which are not always guided by the learning needs which are a priority for teachers and the schools where they work, nor do they prioritize collaborative learning which is much more demanding to organize and effectively provide.

The same shortcoming observed in initial teacher education is verified here: there is a deficit of opportunities for professional development that is relevant for, and specialized in, contexts of urban poverty and marginalization. This deficit is quantitative (insufficient opportunities) as well as qualitative, in the sense that there is an evident lack of accumulation and convergence on which are the best approaches in terms of effective pedagogies and contextual supports. Risking oversimplification it could be said that the pattern of existing practices here present two approaches: one that poorly identifies the specificity of the contexts of poverty and exclusion and their translation into educational requirements, homogenizing conditions and types of students to general features of the national educational system; the other that rightly focus on these contexts' specificities, but translate into pedagogies that in their respect and celebration of these contexts language and culture, do not produce learnings that transcend them, thus paradoxically reproducing the closure they purport to break. There are no visible traces yet, neither in the policies nor in practices of teacher professional development (nor in initial education), of the 'third position' which in our view represent the theorization of Basil Bernstein in Britain and Lisa Delpit in the USA, on the relationships of poverty with the languages of power and knowledge which the schooling experience should provide access to (Bernstein 1975, 1999; Delpit 1988, 2012; Bourne 2004).

34.5 Professional Teaching Career and Working Conditions

A fundamental dimension within an overall view of teaching policies is a teaching career, understood as the set of regulations relating to the exercise of the profession (entry and permanence), working conditions, promotion, salary and incentives

structure, performance evaluation, professional development opportunities, and retirement conditions at the end of the career path.

Teaching Careers models in Latin America. Source: Ricardo Cuenca (2015)

The above typology of teaching careers provides a framework for the analysis of some specific elements such as career access mechanisms, work promotion strategies, teaching assessment processes, and procedures for exit from the career.

Political-legislative decisions and the implementation of teaching careers have been strongly marked by dialogues and conflicts with teachers’ unions, which in most countries in the region are strong and hold significant social power. Thus, by virtue of prolonged teachers’ strikes, many governments’ initiatives to advance career processes, including performance evaluations, have been frustrated. On the other hand, initiatives arising from a wide-ranging social dialogue, including teachers themselves, have been more easily implemented (Palamidessi and Legarralde 2011).

The construction of attractive teaching careers is generally considered from the perspective of teachers’ labor rights, but the truth of the matter is that there is another dimension that makes this issue a crucial element of educational policies. In fact, it

is not viable to think of improving the quality of initial training, or raising entry requirements for a career in teaching, unless such professional career is able to motivate young candidates with good academic prospects and aptitudes to go into teaching. The creation of adequate professional development opportunities requires the existence of certain working conditions guaranteed by the regulations governing a teaching career.

In general, selection methods continue to be the traditional procedures (UNESCO-OREALC 2006, 2013a; Iaies and de los Santos 2010), with the most prevalent being merit-based prequalification, followed by competitive examination. However, more recent teaching careers such as those of Mexico, Ecuador and Peru expressly provide that competitive examinations should be supplemented with actual demonstrations such as sample lessons and personal interviews.

Holding a degree is the most important requirement. In most countries, those who can access the career are professionals holding a teaching degree. In other cases, it may be that under special circumstances individuals with no professional degree enter the teaching career. At the same time, in a few countries supplementary rules provide for professionals in discipline areas other than education to specialize in teaching (Cuenca 2015).

Work promotion strategies are a core aspect in career development. Vertical promotion (UNESCO-OREALC 2006; Vaillant 2011) continues to be the preferred promotion strategy among Latin American teaching careers and includes mobility toward leadership roles (school directors, assistant directors, etc.) or outside the school (supervisors, monitors, etc.). Horizontal promotion is understood as an improvement in a classroom teacher's economic or working condition. Salary increases due to special allowances for specific work locations (rural or border areas), temporary leadership responsibilities or an improvement in professional education form part of horizontal promotion (Cuenca 2015).

The above referred norms that regulate teaching in Latin America, consider teaching in general and do not take into consideration the particular and highly demanding conditions in which teaching takes place in contexts of poverty, social segmentation and exclusion, which characterize urban education for the lower income groups in the majority of cities in the Region. Only exceptionally some normative frameworks provide incentives for teachers that work in these contexts, like those of Chile and Peru, but these incentives typically do not reach a level as to attract, and specially maintain good teachers working in these demanding conditions. In an opposite direction, it is a common feature of how the teaching career is traditionally organized in Latin America, that beginning teachers start in rural areas and after five or more years move to cities, but in this, a *de facto* stratification takes place whereby urban schools of marginal or poorer areas do not obtain the better qualified teachers, or if they do, they are not able to hold to them for long enough to make a difference. This happens as a result of the combined effect of particularly challenging teaching conditions in schools where residentially segmented social groups of the poorer quintiles of the income distribution concentrate, together with insufficient conditions, specialized supports and material and symbolic incentives and recognition.

The teaching profession has difficulty in attracting and retaining good teachers. This matter, of strong concern in developed countries, also emerges as an issue in the Region, especially as regards retention to the extent that other employment opportunities open up. This problem is undoubtedly related with salary conditions, but also with schools' work environments, which may be a very strong determining factor in a young professional's decision to remain teaching or not.

On the other hand, research shows that the exercise of the teaching profession undergoes significant changes according to the stage of a practitioner's professional life. Just like it is necessary to pay careful attention to the initial stages where a professional identity is forged (Marcelo 2010; Vaillant 2009), it is also necessary to consider the teacher's personal and professional development needs as he or she experiences them during the successive stages in his or her career through to retirement (Hargreaves and Fullan 2012).

Salary differentiation is an important career element: the main point here is how to prioritize the factors that assign value to performance that improves instructional practices, and consequently student learning – including professional development actions pointing in that direction – rather than just seniority or credentialism.

Teachers' salaries in Latin America are comparatively low in relation with other professions. In monthly figures, teachers' salaries in 2010 were between 10% and 50% lower than those of other "equivalent" professionals, and this proportion remained stable through the 2000s. At the same time, salary evolution is much flatter than that of other professional and technical employees (Bruns and Luque 2014).

An analysis of early childhood educators' salaries shows that in some countries (Brazil, Chile and Dominican Republic) these professionals' salaries are lower than those of primary school teachers, whereas in others (Argentina, Colombia and Mexico, among others) their salaries are equivalent to those of their peers in primary education (UNESCO-OREALC 2015a).

Remuneration comprises a basic salary and other specifications which grant bonuses for different reasons, among which seniority is often the most important. In several cases, the basic salary may substantially increase with the addition of incentives, even though the latter are often highly selective (Morduchowicz 2009).

The introduction of incentives into the teachers' remuneration system faces the challenge that teachers unions' demands have traditionally centered on the defense and improvement of common salaries rather than on individual performance-related differences.

The design of teaching careers involves an understanding that teaching is a complex and demanding activity, as discussed by Schmelkes (2015:138): *"The circumstances under which teachers make decisions on a day-to-day basis are quite variable. The process of teaching requires a deep understanding of the working context, appropriate mastery of the content to be taught and, particularly, of pedagogical content knowledge (...), as well as a large repertoire of instructional strategies. It implies the ability to interact, communicate and elaborate upon knowledge with its practical components in and with others, and to do so in contexts of freedom, trust, mindfulness, well-grounded decisions, empathy and authority (...).*

It entails the ability to reason and judge with respect with what is or is not appropriate during his teaching (...). All the foregoing requires high levels of teaching competencies”.

The evaluation of the teaching role is one of the most intensely discussed policy issues in education in the Region. The various types of evaluation associated with career entry, promotions, and performance itself are present in all teaching careers in the region (Vaillant and Rossel 2006), although they are more prevalent and sophisticated in those careers schemes based more on merit than years of service (Cuenca 2015).

Assuming that an evaluation process is required in order to determine the extent to which outcomes-based teaching criteria or standards are met, the central issue of this dimension of the educational agenda, is how to reach consensus to achieve these ends. International reports (OECD 2009, 2012; UNESCO 2006) show that successful performance evaluation systems have been the result of agreements among representative stakeholders, primarily including teachers themselves.⁷

The prevailing trend among specialists highlights the main purpose of evaluation, i.e. to improve teaching practice and, as a consequence thereof, to improve student learning. In its ‘formative mode,’ teacher evaluation provides for identifying strengths and weaknesses in what the teacher knows and does, in order to encourage improvement in his knowledge and practice as a professional (Meckes 2015). Evaluations by themselves do not provide for improving the quality of teaching practice, but they can contribute to it, and therefore to better student learning, insofar as they are associated with effective formative processes (Schmelkes 2015).

There is also consensus in the academic community that evaluation has to be based on clear parameters of what is understood as good teaching (standards), and that these are to be developed with teacher participation (Danielson 2011; Vaillant 2010; Vaillant & Rossel 2010) so that practitioners can take ownership thereof both for evaluative and formative purposes.

An important aspect for evaluation to be a fair process, and to be perceived by teachers as such, is to take into account the context in which teachers work and the problems that arise from it. Even though, it is certainly not a question of expecting less from teachers who work in difficult contexts or deal with disadvantaged students, it is essential to take such contexts into account when comparing and judging and defining support strategies (Schmelkes 2015).

In Latin America, external evaluation systems have been implemented to make progress in raising the quality of teaching. Mexico had a negative experience with teacher evaluation in the 1990s and has now redesigned its evaluation system; Chile began implementing its system in 2003; Ecuador did the same in 2007; Colombia enacted a law that creates the teacher performance evaluation system in 2015 and

⁷In the case of Chile, where a complex teacher evaluation system has been in place since 2003, this was possible on the strength of an agreement between the Government, the Teachers’ Association (teachers’ union) and representatives of the municipalities, i.e. the entities responsible for managing public schools (Manzi et al. 2011).

Peru is currently designing an overall system similar to Chile's.⁸ The rest of the countries in the region feature some elements, but these are less far-reaching and systematic (Bruns and Luque 2014).

Some of the answers to the challenges confronting the countries in the region in terms of teacher evaluation may be approached through the developing experiences with teacher evaluation of Chile and Mexico, the most advanced countries in this regard of the region.

The Teacher Evaluation System for the Chilean public sector evaluates teachers every four years, and is based on good teaching criteria agreed upon between government and the teachers union. Evaluation is carried out through four instruments: a report by the school director and head of the technical-pedagogical unit; evaluation by a peer evaluator from another school; self-evaluation, and a portfolio of written and video evidence on actual classroom teaching. Those teachers which reach the higher level of performance can apply to an economic incentive and the ones with poorer results are provided with professional development opportunities. If after two cycles of support a teacher fails for a third time in its evaluation, he or she has to leave teaching in the public sector (Manzi et al. 2011).

In the case of Mexico, performance evaluation is meant to be carried out every four years starting in 2015. Evaluation is based on a teacher profile, with parameters and performance indicators developed by the Ministry of Education (*Secretaría de Educación Pública*) and validated and approved by the National Institute for Educational Evaluation (*Instituto Nacional para la Evaluación de la Educación*). Evaluation envisages four consecutive stages, associated to the application of four instruments: (i) a report regarding compliance with professional responsibilities; (ii) a portfolio providing evidence of work by students and analysis of it by the teacher; (iii) a test covering knowledge and didactic competencies; (iv) a well-reasoned didactic plan, including a reflection on what students are expected to learn and the way the learning will be evaluated (Instituto Nacional de Evaluación Educativa 2015). This teacher performance evaluation is mandatory and conclusive for entry to, advancement and permanence in the Mexican teaching career, and its implementation is taking place, in a political context of a major reform and power transfer between the most powerful teacher union of Latin America, the *Sindicato Nacional de Trabajadores de la Educación* (SNTE), and the Ministry of Education.

We may conclude that the passage from bureaucratically regulated careers to careers based on the evaluation and recognition of differential performance between teachers is a major cultural change in the education sector, hence the difficulties encountered. In those countries where this process is more advanced, such as the two cases described above, union leaders' acceptance that teachers cannot ambition to be socially recognized as a profession (rather than a semi-profession) unless they accept performance evaluation and participate in its construction, has far-reaching consequences in terms of change and its legitimacy among educators. Throughout,

⁸ Teacher evaluation was legally established in Peru in 2012; some of its elements are being implemented, while others are in the design phase (UNESCO-OREALC 2013a).

the evaluative framework-building efforts have struggled with the trade-offs between impartial and legitimated general rules and instruments, and the need to recognize in evaluation's criteria, instruments and processes, the special requirements to teaching that poverty and exclusion, be it in rural, but nowadays particularly in urban settings, represent.

34.6 Conclusion

The quality of an educational system is crucially dependent upon the quality of its teachers. This common-sense truth may be said to be increasingly shared by the political elites in Latin America, where despite significant differences between countries, there is a distinctive trend towards teaching policies that focus on the key dimensions of capacity building and increasing public regulation of the profession. In a continent historically marked by strong inequalities, these double-pronged effort does not yet show enough signs of distinguishing the special requirements that effective teaching demand in contexts of poverty and exclusion, and the implications of this for the preparation of teachers and the organization of their professional careers.

The greatest challenge facing initial teacher education is to attract the best talent to the profession and consistently raise the quality of formative processes. This seems to be inseparable from the development of national teacher education standards which clearly set forth, for teacher training institutions, a definition of what a graduate should know and be able to do, along with an institutional framework that ensures the quality of the processes through which this may be achieved. As to continuous training, as discussed earlier, the horizon for change points to the higher value of formative processes founded on collaborative and professional development strategies which are more strongly based on school teams than on individual teachers. In addition, change in this sphere rests on methodologies capable of linking, much more consistently than hitherto, the realities of day-to-day teaching with the innovation courses, workshops and experiences offered by continuous training programs in the various countries.

Regarding both initial and continuous preparation of teachers, policies that take seriously inequality and the potential of education for levelling the social distribution of key capacities and contributing to a common cultural basis conducive to more cohesive societies, should privilege strategies and contents that explicitly seek to answer to what it takes to produce learning and growth among the children and youth of marginalized and poor areas and communities. This is not part of the patterns we have identified and this vacuum constitutes a major challenge ahead.

Finally, as already pointed out, it is evident that the core of the relationship between society and the political system, on the one hand, and the teaching profession, on the other, rests on renewed forms of public regulation and accountability of the latter, expressed in professional careers based and structured according to

merit and performance evaluations, and not only years of experience as was traditionally the case.

These three dimensions of change make renewed demands on the quality of teaching policies in the region. Such policies, however, are characterized by the paradox that while no one disputes their importance and priority for the education quality and equity agenda, in actual practice they face great difficulties and tend not to have the declared priority, nor do they have the coherence and system-like features required by the changes reviewed. Teaching policies in the region are problematic because of their high cost; their goals are not achievable within the terms of one administration, and their implementation is typically through processes (such as initial and continuous teaching capacity creation and enhancement) which are neither visible nor attractive in terms of media communications and short-term political impact. The foregoing is compounded by the fact that consistent policies involve coordination by several ministries, the government's institutional capacity to engage the participation of the universities, and the difficulties inherent in the achievement of political consensus and intertemporal government-opposition alliances which may ensure a coherent and long-lasting course of action (Weinstein 2015; Stein and Tomassi 2008). These factors are not insurmountable, however, as demonstrated by the national cases of deep reform of public regulation of the profession and the analysis of reforms achieved in the education sector, 'despite the odds' (Grindle 2004). The wave of reforms affecting the teaching profession in Latin America feeds on the reforms partially achieved in countries such as Chile and Mexico, where consensus between the political and union elites has ensured a fundamental step along the long road towards the professionalization of the sector in the region. In these cases, achievements are instances of learning for other countries' reform policies and an improvement in the probabilities of change.

Part VI
Nordic Countries

Chapter 35

Urban Education in the Nordic Countries:

Section Editors' Introduction

Elisabet Öhrn and Gaby Weiner

35.1 Introduction

Urban education is an unfamiliar term in the Nordic countries, and generally in Europe overall, but what we want to argue in this introduction is that the concept has a theoretical cogency which is useful in illuminating Nordic, urban, educational and other settings. Urban education as a concept is a recognizable phenomenon but is used in different ways based on geography, history and political perspective. For example, in the Nordic countries, inner city areas are often associated with good schooling, whereas rural areas are considered more problematic (Gordon 2007), and even more so, the outskirts of major cities (e.g. *ibid*; Beach and Sernhede 2011). As a concept, urban education has been applied in a number of ways: to identify the cultural demands of the urban sophisticated and rich, associated with the arts and business; as a signifier of school failure and social class disadvantage (Nolan and Anyon 2004); in theoretical discussion involving bodies and spaces, as in understandings of how urban citizenship is constructed and supported or restricted by education (Gordon et al. 2000); and for the purpose of learning civil manners required in urban contexts (Gobbo 2007).

The aim of this section introduction is to provide a rationale and overview for the contributions that follow; however, we also draw substantially on our previous introduction to urban education (then for Western Europe), which we wrote jointly in 2007 (Öhrn and Weiner 2007). In reflecting on the Nordic context and as an

introduction to the section chapters, our aim is to dismantle or deconstruct the phrase ‘urban education’ as a means of revealing its complexity and multiple usage. We draw on our own work related to this topic, e.g. Öhrn’s empirical work on gender, ethnicity and class in urban schools and Weiner’s treatment of gender, ‘race’ and ethnicity (e.g. Öhrn 2009, 2011, 2012; Weiner 2001, 2003, 2010). We begin with a consideration of what being Nordic means followed by an exploration of how we might better understand the concept of urban education in Nordic settings. We then propose shared themes applicable to education in Nordic urban contexts such as gender; ethnicity, migration and racism; identity, disaffection and critique; social class; democracy, educational restructuring and marketisation. The introduction ends with an overview of the individual articles that make up the Nordic section of the Handbook.

35.2 What Is Nordic?

The Nordic region contains five countries, Denmark, Finland, Iceland, Norway and Sweden (and also the Faroe Islands and Greenland in Denmark, and Åland in Finland). Together they have a modest population of 26 million (Nordic Council of Ministers 2014). The five countries are geographically close and have a shared historical, political and language background as well as enjoying friendly contemporary relations. The latter are manifested in various official cooperations, such as the Nordic Council (the official inter-parliamentary body of the Nordic region) and the Nordic Council of Ministers (the official inter-governmental body for cooperation in the region). Consequently, formal efforts have been made over the years to strengthen the region such that ‘the continuance of Nordic identity does, then, rely upon intergovernmental organization, which the Nordic states themselves maintain’ (Parker 2002, p. 359).

35.2.1 *Nordic Welfare States*

‘Nordic’ has come to mean both an identity and a model, with the latter emerging especially during the Cold War with regard to advocacy of peace, international solidarity and egalitarian social democracy (Browning 2007). In this respect, the Nordic countries could be seen as having negotiated and made the most of their marginal position at the edge of Europe and ‘scope for autonomous action and thus potential gain’ (Parker 2002, p. 356). Marginality can imply weakness, but is also able to exploit opportunities derived from a loose relation to the centre, such as non-involvement in central actions and advantages in diplomacy:

Broadly speaking, the advantages can be grouped under two headings: those that derive from avoiding penalties of centrality (costs of major military responsibilities, prominence as a target of attack or criticism, the need to maintain authority over one’s periphery); and

those that derive from opportunities inherent in being on the edge (acting as intermediary for what lies beyond, demanding benefits from the center(s) for staying in the group, pursuing and/or proclaiming alternatives on the strength of not being the same as the dominant center. (Parker 2002, p. 356)

It has been suggested that the Nordic model has weakened and become less exceptional in recent decades, primarily because it offered a third, social-democratic midway point between capitalism and communism in Cold War Europe (Wæver 1992) and also because elements of Nordic policies and practices have become increasingly Europeanised, i.e. adopted by the European Union (Browning 2007). Others consider that the marginal status of the Nordic countries continues and enables them to be 'better placed than most to reformulate their distinctiveness in an advantageous relationship with the pull of the bigger Other, Europe and/or the West' (Parker 2002 p. 369).

Sweden, Finland and Denmark are members of the European Community; Norway and Iceland are not. However, both groups are part of the European Economic Area (EES) that provides for inclusion in EU's inner market and legislation in a range of policy areas. Also more generally, the EU influence is wider than its member countries. For instance, Norwegian researchers Karseth and Dyrdaahl Solbrekke (2010, p. 563) emphasise with reference to Ravinet (2008) that countries both within and outside the EU play 'the Bologna game', and Dysthe (2007), that Norway has been in the forefront of implementing the Bologna principles.¹

35.2.2 *Nordic Models of Education*

Education has been vital to the development of the Nordic welfare state. For instance, Antikainen (2006) considers Nordic education systems to be a main social precondition of Nordic welfare systems, together with a distinctive labour market model, involving a high degree of employer-employee organisation, collective bargaining, and agreed legislation between government and labour organisations – as well as sustained economic growth. There has been a strong emphasis on providing equal educational opportunities for a variety of diverse social groups, which has meant longstanding adherence to state funding for educational provision and attendance, even at tertiary level – and stress on education as vital for social cohesion and inclusivity. The development of a democratic citizenry was a core idea of post-war Nordic educational reform and remains a feature of current national curricula and educational legislation (Arnesen and Lundahl 2006).

However, there are evident differences between the education systems of the Nordic countries and some suggest it would be more useful to refer to Nordic *models* or *patterns* of education rather than to *one* single Nordic model (e.g. Antikainen

¹The Bologna Process is a series of ministerial meetings and agreements between European countries designed to ensure comparability in the standards and quality of higher education qualifications.

2006). Others remain committed to a single Nordic model because of the perceived, shared characteristics of Nordic school systems. For instance, in Telhaug et al.'s (2006) analysis of the last half-century, a single Nordic school model is proposed, which however, has three distinct phases or eras denoting evident and visible changes to educational ideology: the golden era of social democracy (1945–1970), an era of radical left influence (1970–1985) and thereafter an era of globalisation and neo-liberalism.

Specifically, the period from 1995 is characterized 'as an age of restructuring' (Antikainen 2006, p. 238), during which neo-liberal ideas took hold with strong moves towards deregulation, decentralisation, marketisation, and 'a development from collectivism to individualism' (Telhaug et al. 2004, p. 157). Nevertheless, Arnesen and Lundahl (2006, p. 297) maintain that as late as the early 2000s the Nordic countries continued to retain important aspects of welfare state policies and, 'that it is still justified to speak of the five Nordic countries as a rather distinct group regarding education politics from a welfare perspective.' Similarly, Telhaug et al. (2006, p. 264) claim that '[e]quality and justice continued to be core values [of the Nordic countries] but they were referred to less frequently than previously, while the debate on efficiency, quality and skills became more prominent'. Responses to such shifts have varied as we shall see later in this introduction and also in Lundahl's and Lappalainen's chapters following.

35.3 Urban Education

As pointed out earlier, immigrants and poorer groups in the Nordic countries are suburbanized, that is, pushed to the *outer borders* of the city, whereas in many other European countries, minorities and working class cohabit *within* the city – although sometimes residing in different parts. Urbanities and sub-urbanities are thus differently constructed and realised. There is a general tendency for lower-class groups to be driven out of big European cities by rising housing market prices and the development of business districts. This is enhanced by a process of gentrification which transforms previous lower-class and industrial areas into settings adapted to middle-class interests and tastes (see van Zanten 2005). Similar tendencies are seen elsewhere. For example in the USA, Nolan and Anyon (2004, p. 136) note the 'new economic and spatial arrangements found in urban areas as a result of globalization' with interconnectedness between concentrations of poverty and 'glamour zones' (Sassen 1998, quoted in Nolan and Anyon 2004 p. 137; see also Sassen 2000, p. 152). Gordon (2007) reminds us that those most likely to operate as global or 'glamour' *flaneurs* are white, middle-class men.

Cities and urban areas have become a focus of social and political concern in the Nordic countries due to migration in the course of globalisation with excluded groups moving west- and north-wards. However, migration has different meanings compared to earlier times. Whereas early post-war im/migration policies were framed by labour shortage at a time of development and growth and were relatively

permissive, im/migration more recently has been perceived of more as a problem demanding tight controls. Individual countries also have specific 'internal minorities' or indigenous peoples (for example Sami or Laplanders in the Nordic countries or Roma throughout Europe), who demand different policy solutions to those of other minority groups (Selling 2013).

35.3.1 Urban Plus Education

As already mentioned, urban education is an under-explored phenomenon in Nordic and European research, though is more common in the United States where it is perceived of as characteristic of the interrelationship of poverty, immigration, poor schooling and so on, in inner-city areas. Location and space are thus important. Migrants to the Nordic countries identify major cities as their most attractive destinations, and typically reside on the outskirts (see Andersson et al. 2010). As Gudmundsson (2013, p. 4) points out, such areas were often built as part of welfare housing plans in the 1950s and 1960s, which aimed to provide 'the rising working-class with decent housing and good facilities for cultural and leisure activities and spur their social mobility'. However, gradually other aspects became prevalent, areas were segregated and stigmatised as providing housing for those without other options, and thus inhabited almost exclusively by migrants, working-class and others with low incomes.

Residential segregation (as will be discussed especially in Sernhede's and Lundahl's chapters), decentralisation and school choice reforms, have contributed to increased performance differences between schools. The social and ethnic composition of urban schools is thus crucially important. Studies suggest that parental school choice is related not only to individual (educational) background, but also to the area in which families live. The 'area effect' is exemplified by the parental tendency to echo choices of the majority in the same area; thus, 'Middle-class parents living in working-class neighbourhoods choose private pre-schools significantly less often than on average. Working-class parents in middle-class neighbourhoods do the opposite' (Pérez Prieto et al. 2002 p. 57).

Within mainstream education, location also structures pupil expectations and is thus used as an individual marker of economic capital and status (in Britain, known as post-code selection). When accounting for patterns of pupil behaviour and achievement, the location of neighbourhood remains connected to social and cultural origin, as we see in Arnesen and Tolonen's chapters following. This has led, it is argued, to the lack of welcome to 'a certain kind of child', perceived as most likely to come from a deprived background (Gitz-Johansen 2003 p. 70). Alternatively, location is romanticised, symbolising the longing for an order or local culture, long gone. Stories draw largely on the presumed advantages of a former culturally-homogenous population (as opposed to the perceived present condition of ethnic diversity). Problems of earlier days may well be acknowledged, but they are portrayed as more manageable and acceptable than those of today (Arnesen 2002).

As argued throughout this section, the complex concepts of ‘urban’ and ‘urban education’ are difficult to apply across national settings, additionally because they create a silence regarding rurality (non-urbanity), even though non-urban or rural areas may experience problems similar to or greater than those in urban areas (e.g. inadequate teaching resources, low academic achievement). Thus, it is argued that to focus exclusively on the urban, leads to the neglect of needs not visible in cities, such as distance education provision or small, expensive, teaching units necessary in low density population areas. In some cases, access to education for children in rural areas means having to leave home, family and neighbourhood, at least for part of the week. The concept of rurality here speaks to the neglected silence at the heart of urban education, where rural settings are regularly normalised as monocultural, non-complicated and safe. Such a silence thus obscures the importance of categorisations of location, social class, ethnicity and gender as they are experienced across socio-spatial settings.

Urban teacher education constitutes yet another silence in the sense that discourses of teacher education are largely national rather than local or urban/rural (Garm and Karlsen 2004). More so, recent educational reforms and rhetoric in the Nordic countries and more widely, indicate the influence of globalisation, which on the one hand aims at homogeneity and harmonisation (say, across the EU), and on the other, advocates individualism, competition and fragmentation.

35.4 Current Themes in Nordic Research

There has been a wide variety of research addressing urban education in the Nordic countries in recent decades, the main themes of which are the following:

35.4.1 *Gender*

It has often been pointed out that the Nordic countries take pride in their assumed gender equality, for instance, by inclusion of gender in policy documentation and public presentation, and one could indeed argue that gender plays a central part in Nordic national identity formation (Arnesen et al. 2008). Gender equality stands out as a symbolic marker of the progressive state of these societies, in contrast to other European countries where concern for gender equality is less apparent (Forbes et al. 2011).

There is a long-standing tradition of joint Nordic theoretical development and shared research into gender and education. Gender and education emerged as a field of research in the late 1970s as a result of close collaboration especially between Denmark, Norway and Sweden. Research relations also developed gradually with Iceland, whereas Finnish research on gender emerged later and grew rapidly in the

1990s (simultaneous to a decrease in Danish research on gender).² Early research on gender was influenced theoretically by feminist sociology, for instance the work of Norwegian sociologist Hildur Ve (e.g. 1982), and focussed on the gendered upbringing and the reproduction of female subordination through schooling.

Parallel to this Nordic development have been important influences from abroad; from the United States in 1970s, from Britain from the 1980s onwards and later from Australia. As discussed elsewhere (Lahelma 2015; Öhrn and Weiner 2009), such international work was valuable, but also perpetuated an 'othering' through the hegemony of Anglophone interests and issues. International factors – though not primarily derived from research – also paved the way for renewed concerns and debates about boys' 'underachievement' in the Nordic countries in the 1990s. This 'travelling discourse', initiated in the Anglophone countries, had considerable impact on public debates and educational policy, though was less hostile towards feminism and gender research than for instance in the UK (Arnesen et al. 2008). Such a position enabled Nordic gender research to form a more relational view of gender issues than say in Britain where male performance and masculinities developed as a dominant research and policy theme (see Weiner and Öhrn 2009). Consequently, the Nordic countries did not experience the silence on girls, women and femininities that was observed in Britain (Archer and Leathwood 2003).

However, in problematising Nordic urban and youth cultures, research perhaps inevitably targeted boys and young men. Thus, interest in formal and informal urban education mainly focused on (post-industrial) fears about out-of-control males running wild in inner cities, and the role that schools have in civilising them. Young 'immigrant' men continue to be demonised throughout Europe, as in the USA, where 'Dominant media representations ... depict urban youth of color as dangerous criminals and the source of urban chaos' (Nolan and Anyon 2004 p. 134). European research literature likewise constructs young, non-European men as more violent than others, particularly with respect to sexualised violence and violence against women. This has coincided with the so called 'moral panic' in many countries surrounding boys' underachievement in schools (Epstein et al. 1998; Lahelma et al. 2000; Weiner et al. 1997).

Research on boys and masculinities has also emphasised the various constraints on their present situation. Young men, particularly from urban areas, are portrayed as deprived of the traditional male options available to earlier generations, affecting their identity formation (see Weis 1990); the situation for young working-class girls has received less attention. Girls and boys were treated by gender researchers in different ways from the 1990s onwards: highlighted for boys were low achievement, poor behaviour and lack of work opportunities and for girls, agency and subject positioning, various forms of femininity, and subjectivity. However, in the twenty-first century, Nordic researchers have increasingly turned to analysis of the intersections of gender with ethnicity especially, and also with social class and sexualities. There is thus a growing body of gender research on within-group differences with

²See professor Nina Lykke on the backlash in gender research in Denmark from the 1990s, <http://www.genus.se/meromgenus/teman/teori/portrattetDOUBLEHYPHENnina-lykke>.

respect to teaching methods (e.g. Dalland 2014), social class, achievement and positioning (e.g. Nyström 2012; Berg 2014), homophobia (e.g. Lehtonen 2003), and consequences of individualised and neo-liberal governance (e.g. Asp-Onsjö and Holm 2014; Hjelmér et al. 2014).

35.4.2 *Ethnicity, Migration and Racism*

The presence of racism and various forms of discrimination is a relatively recent addition to the policy agenda of the Nordic countries though racism has been a longstanding feature of European culture, and indeed, it is rightly argued that ‘racism’ was invented in Europe (MacMaster 2001). Certainly its manipulation by political elites has extended over several centuries with often horrifying consequences, such as recently, in the post-communist Balkan civil wars of the 1990s (Glenny 1992). As we noted in 2007 (Öhrn and Weiner 2007), a key feature of EU policy has been to eliminate as much as possible, the overt and destructive racisms which have laid Europe so low in the past, and to use education as a means of so doing.

Europe has become a novel experiment in multiple, tiered, mediated multiculturalisms, a supranational community of cultures, subcultures and transcultures inserted differentially into radically different political and cultural traditions. The consequences of this re-imagining and re-making of a new Europe are seen variously to be threatening or utopian. (Modood and Werbner 1997 p. vii)

A contradiction currently facing Europe including the Nordic countries, is the twin policies pursued; on the one hand of legislating against anti-Semitism, racism and other forms of discrimination, and on the other, of restricting immigration, tolerating explicitly racist parties and failing to take action against everyday racism. The recent crisis within the European Union concerning the non/reception of migrants from Syria and Afghanistan clearly demonstrates the complexity of this positioning. Thus, as Van Dijk shows, racism is a political object to be exploited and fought over.

In Italy, Austria, Denmark and Holland more or less explicitly racist parties may win up to 30% of the vote and even become partners in government coalitions. On the one hand, such developments are at first officially condemned and decried, on the basis of the prevalent non-racist norm, as happened with Haider in Austria. But on the other hand liberal principles or Realpolitik usually get the upper hand, and tolerate racist parties as part of the ‘democratic’ consensus – as one opinion among others, as is the case in Denmark, France and Italy. (Van Dijk 2005 p. 13)

This twin approach – condemnation and tolerance of racism – makes discourses of democracy and antiracism difficult to defend in schools, in particular, when racist messages, say from the hyper-nationalist True Finns party described by Lappalainen later in this section, are visible and to some extent approved in political discourse and pamphlets, on the Internet and in everyday speech and interaction. So, it will come as no surprise, that many (though by no means all) teachers in the Nordic region and across Europe, when confronted with the necessity of dealing with overt

racism, tend to do little – preferring to concentrate more on what they consider to be their core work as subject teachers. Teachers offer a range of arguments for non-engagement: e.g. not part of teachers' job description, no problem of racism in their school or classroom, not enough time available, too complex an area, lack of training to deal with issues (Gaine 2005) or that the focus of teaching on values takes time away from the 'real' teaching of content and 'objective' facts (Rosvall and Öhrn 2014).

Structural factors are also important. For example, one shared concern is that initial and in-service teacher education offers neither a sufficiently comprehensive introduction to the field of multicultural/intercultural/antiracist education nor strategies to deal with racial conflicts and disputes when they arise in the classroom. Another concerns the failure of politicians and policy-makers to recognise the importance of allowing the establishment of faith (or religious) schools for religious groups other than Judo-Christian. The argument is that this failure creates feelings of grievance, unfair treatment and victimisation, which sharply impact on other areas of social life (Modood 1997). The general failure also to recruit minority ethnic teachers, another structural factor, has proved difficult to resolve; possibly due to the traditional role of the teacher (and school) as transmitter of a nation's culture and traditions (Basit and McNamara 2004). Controversies over the curriculum and its cultural base have also arisen, with preference among educational curriculum policy-makers for classical Greece and Rome, and western European Christianity as cultural influences rather than seeking out more plural, inclusive curriculum models (Shah 2000).

Moreover, the existence of different *forms* of racism has added to the complexity of schooling. Modood (1997) identifies three predominant European racisms: anti-Semitism, Islamophobia and white supremacy, although locally-targeted racism, say against Roma, is also evident. These different forms have emerged in different countries at different times with varying degrees of force and danger, to some extent the consequence of national histories and political cultures.

If, as in Scandinavia, it is possible to identify related but different forms of racism (anti-Semitism, Islamophobia, white supremacy), these are.... related to national histories and national political cultures. The Nazi invasions of Denmark and Norway in the 1940s make it close to impossible to be a Nazi nationalist in these countries today in the way that is possible in Sweden. So, similarly, there are different forms of anti-racism, different conceptions of racial equality and different forms of multiculturalism across Europe. (Modood 1997 p. 4)

Thus Modood suggests that as the forms of racism and history of racism differ, so too will the strategies and educational policies needed, if they are seriously to challenge or eliminate racism where it exists and flourishes in schools. So, one-size-fits-all policy-making is clearly not an option. The implications of the different Scandinavian experiences of the Second World War as noted by Modood also change with time. Today, only the elderly have first-hand experience of war-time Nazism and extremism takes on new and different forms (see Kuure 2003). For instance, Fangen (1998, p. 33) concludes that the skinhead subculture is similar to (Second War) Nazism only in certain ways and should be understood 'as a bricolage

consisting of elements with contrasting connotations'. At present, populist parties, critical of immigration or explicitly xenophobic have gained strength in all the Nordic countries; the Sweden Democrats, the True Finns, the Danish People's Party, in Norway the Progress Party and in Iceland the Progressive Party (see Bergmann 2015).

Terminology is of considerable importance in this context. Central to the Nordic situation is the co-existence of people from different ethnic backgrounds in marginalised urban settings. While constituting a highly diverse group, individuals are frequently homogenised as not belonging to the majority, mainly on account of skin colour or language of origin. Thus the divide between having or not having Nordic nationality, becomes crucial. Minorities are frequently referred to as 'immigrant', however lengthy their period of residence. In contrast, young people themselves often claim a positive meaning of 'immigrant' as a unifying concept. Such a perception signals a critique of mainstream society and the immigrant position within it, and a form of political action and practice (Schwartz 2013; Sernhede 2007).

35.4.3 Identity, Disaffection and Critique

Aesthetic practices are central to the lives of youth today (McCarthy 2004). Music, dance, and clothes are used by youth to define themselves, to develop a sense of community and also, as for instance in rap and Hip Hop music, to develop and voice social critique (Nolan and Anyon 2004). Through this, they connect to other urban areas across the globe. Sernhede (2007) discusses the 'glocal' consciousness of Hip Hop where north European youth relates to, and identifies with, Afro-American culture especially in urban areas. Such global yearnings indicate the political potential of youth cultures; and their importance for the ethnically-differentiated sub-proletariats in European urbanities such as London, Paris, Amsterdam and Stockholm for expressing social criticism (Sernhede 2002). However, we suggested in 2007 (Öhrn and Weiner 2007) that in drawing heavily on Afro-American experiences and struggles, young people also bring about a form of globalised 'Americanisation'. For example, Sernhede's discussion of the influence of American 'gangster-rap' reveals a critique of racism yet also a contempt for women and a romanticisation of violence. Thus, identity and understandings are 'exported' to areas with different material and social problems, where they crucially affect perceptions of neighbourhood, gang conflict, peer and gender relations etc. Furthermore, as Jensen (2013, p. 54) suggests, 'misogyny can be thought of as a dimension of constructing a public image as a dangerous young black man.'

Following Willis (1977), much research in the Nordic countries has focussed on urban working-class boys, both 'Black' and 'White', and their continuing rejection of the intellectual ideals of schooling, perceived of as largely 'feminine' and middle class (Kryger 1990). However, recent research indicates that this understanding is dated; young working-class men are far more aware of contemporary demands for educational qualifications than previously assumed (Rosvall 2011) and therefore

cannot be said to reject school overall (e.g. Godø 2013; Lahelma and Öhrn 2003). Also, we can see informal learning taking place in the sense of identity work which challenges hegemonic understandings related to class, 'race' and gender. Systematic attempts to foster non-hegemonic understandings are evident in the work, for example, of Reay and Mirza (1997) who studied Saturday and evening schools in London, run locally by groups in the community; and in the Helsinki teachers with a trade union background mentioned in Lappalainen's chapter. Sernhede (2007) likewise reports the existence of informal teaching and learning whereby young men in Swedish cities inculcate the younger ones into 'Black' or native Latin American history and religion. In so doing, such informal teaching enables understandings of the present and the past, and of the national and the global, that often challenge the formal content of schooling.

In the Nordic countries, democratic education is traditionally defined as the teaching about, for and through democracy, including active participation of students. Despite this, empirical studies show that students have limited options in terms of influencing their schooling. They are often granted a say about the timing and sequencing of assignments, yet rarely offered the chance to take decisions on choice of content (e.g. Anker 2014; Rönnlund 2014). Ways of teaching about citizenship and democracy focus mostly on individual rights vis-à-vis the state and factual knowledge rather than on adopting a critical, political literacy approach (Englund 2003; Öhrn et al. 2011). Where democracy is consciously taught and activated, it focuses similarly on the means by which individual students can self-monitor, for example, their academic performance (Dovemark 2004). While largely marginalised, some collective democratic forms are evident which, for example, draw attention to the lack of equal rights among school students, the situation of subordinated groups in schools and/or the existence of and struggles against, racist and other oppressive practices (Öhrn 2012).

35.4.4 Social Class

Analyses of social class have largely disappeared from the mainstream educational agenda, weakened by criticism of grand theories that 'championed' social class (Archer and Leathwood 2003 p. 228). However, in recent years there has been a renewed focus on theoretical analyses of social class, in particular, studies which address prevailing social and economic inequalities (Walkerdine 2003). Social class is a major theme of the chapters that follow, reflecting an increased interest in Nordic research more generally. Skeggs (2004, p. 47) noted some 10 years ago for the UK, that 'more recently [there has been] ... a resurgence of interest in class in feminist theory, queer theory, geography, media studies, history, and in some parts of sociology', while Ball (2003, p 5) suggests that there are three main debates: 'class theory, the attempt to define classes theoretically, and recently to incorporate race and gender within such definitions...'. The latter is evident in recent gender theories which emphasise issues of intersectionality (Crenshaw 1995). It is argued

that social class needs to be understood in relation to ethnicity and ‘race’, as the latter become increasingly relevant:

Within this new principle of urban organisation, the forms of socio-economic integration can no longer be understood solely in terms of class. More and more, class tends to be combined with ethnicity. This can be seen in France where debates over the poor suburbs and the efficacy of urban policy are systematically linked to the presence of immigrants of North African origin and their social and economic problems. (Cesari 2005 p. 1016)

Categorisation of class also differs between countries (Weiner 2001). In Sweden, for instance, it has been noted that social class as a concept is rarely used in everyday life; for example, workers do not see themselves as belonging to a specific class (Ahrne et al. 1985). In the 1990s there was a dramatic rise in working-class identity (Cigéhn et al. 2001) following a period of economic restructuring which resulted in reductions in the welfare state, increased unemployment and a widening gap between rich and poor (Bunar and Trondman 2001). Notwithstanding, the lack of explicit reference to social class in everyday life should not be taken as an indication of its conceptual irrelevance to Nordic societies. As noted above, social background and ethnicity are identified and communicated through a variety of concepts. For example, location appears to be a key signifier of social class and ethnicity, as shown in studies in which teachers refer to students as ‘typical’ or ‘atypical’ of a certain neighbourhood rather than explicitly identifying them as ‘rich’, ‘working class’ etc. (Arnesen 2002; Gitz-Johansen 2003). Similarly, students refer to specific urban areas as a means of identifying groups from specific social and ethnic backgrounds (e.g. Andersson 2003; Gordon 2007; Öhrn 2011).

The centrality of social background is evident in its continuing impact on student achievement and educational success (e.g. Bakken and Elstad 2012; the Swedish National Agency for Education 2012). Researchers have emphasised the importance of incorporating social class factors in public and policy debate rather than, as is presently the case, focussing almost exclusively on gender as a decisive academic factor (e.g. Lahelma 2004).

35.4.5 Democracy, Educational Restructuring and Marketisation

Democracy has been a *leitmotif* for the Nordic countries as well as for the European Union. However, encouragement to be democratic is not evident in schools whether urban or rural, with much more focus on restructuring of educational systems, in particular, implementation of decentralisation and deregulation, changes in governance and advocacy of life-long learning. Discourses of creativity, choice, flexibility and enterprise as well as of achievement and performance measurement, have emerged alongside development of individualised, market-oriented educational forms (Beach and Dovemark 2005; see also Lappalainen’s chapter in this section).

Marketisation is currently a key theme in Nordic research, signifying a shift away from past commitments to comprehensive education and 'equality for all'. This shift makes the analysis of Nordic education systems all the more interesting.

The Nordic countries provide a particularly interesting location for exploring the advent and onward march of the New Right in education. These countries have had a far stronger commitment to social justice and to policies for ensuring equality than for example the US and the UK. Educational rhetoric still emphasises equality – But a new rhetoric of accountability standards and efficiency has begun to occupy the centre stage in politics and policies. (Gordon et al. 2000, p. 4)

Considerable similarity has been observed in the restructuring of education in different Nordic countries (e.g. Johannesson et al. 2002), but there have also been clear differences. For instance, Sweden lies at one extreme of what may be called the neoliberal agenda with its promotion of school choice and marketisation in the form of the 'rapid growth of tax-funded, privately-run school companies ... allowed to extract profits for their owners' (Arnesen et al. 2014 p. 3). Here, independent schools – whether run by non-profit organisations or commercial companies – are publicly funded, yet allowed to retain any profits gained. As Arreman and Holm (2011, p. 226) note, and will be explored especially in Lundahl's chapter, '[f]or these reasons, Sweden is now considered to be a pioneer of marketization and privatisation practices in education'.

The path taken by Sweden is somewhat puzzling, considering its previous long-standing commitment to welfare policies and inclusive education and in the Nordic region overall, and particularly because its 'radical' restructuring attracted so little public criticism from educational actors and voters. Johannesson et al. (2002) conclude that the reason for this is that competition and marketisation were accepted as a legitimate price to pay for getting a better education system, but also that such changes were perceived as inevitable. Their analysis of policy documents and interviews with school actors in Finland, Iceland and Sweden 'present the changes of restructuring, decentralisation, budget reform, school-based evaluation and so on as if there is no other alternative' (Johannesson et al. 2002, p. 332).

The consequences of such educational restructurings have been severe as Arnesen and Lundahl concluded in 2006. They found an increased influence of market logics in education during previous decades.

Financial cuts and reforms aimed at increased freedom of choice, competitiveness and effectiveness are reported in all the Nordic countries as having counteracted or redefined policies of inclusion. Equality and uniformity are gradually replaced by diversity and, at least in Sweden, increasing school segregation and growing performance-related differences between pupils and schools. (Arnesen and Lundahl 2006 p. 296).

Thus following the advent of neoliberal policies, substantial differences have opened up between individual schools and between students in the Nordic region. This is particularly evident in Sweden, but differences between schools have widened also in Finland as school profiling and specialisation have increased, with middle-class students tending to opt for specialist courses in foreign languages or sciences (see Arnesen et al. 2014).

35.5 Introducing the Section Articles

The five chapters which constitute the main text for the Nordic section come from three of the five countries in the Nordic region – Sweden, Norway and Finland. The chapters draw on recent empirical work, mainly ethnographic and qualitative, and are pioneering in the sense that they offer an insight into Nordic urban education, although as already noted, the concept is rarely used.

The collection opens with a discussion of the increased influence of neoliberalism and marketisation on Nordic education, and particularly, on Sweden. The chapter, by Lisbeth Lundahl from Sweden, is entitled; *Marketization of the urban educational space*. The argument is made that over the last few decades Swedish education has been systematically transformed, paralleling developments in other OECD countries. However, the shift from a uniform and centrally-regulated to a decentralized and marketised, school system, including e.g. school-choice, competition and for-profit education companies, has been more radical and more speedily implemented in Sweden than in other Nordic countries (Bunar 2010; Lundahl et al. 2013). While the changes are not confined to urban areas, it is argued that their expressions are most tangible there, as large numbers of urban municipal and ‘free’ compulsory upper-secondary schools compete over students and economic resources. Lundahl defines the contours of the new educational landscape, especially in urban areas, and discusses the consequences of the changes in terms of, e.g. growing performance gaps, increased social segregation and changes to schools’ work.

The second chapter in this section, entitled *Social class, inclusion and exclusion – teacher and student practices in Norwegian urban education* and written by Anne-Lise Arnesen from Norway, focuses on problems of underachievement, segregation and exclusion in urban settings. The chapter examines how social class in particular is played out in urban education and how schooling maintains class hierarchies. It offers a response to a claimed deficiency in attention paid to social class in educational research, and explores the processes of class, inclusion and exclusion in urban classrooms. Arnesen adopts a notion of class, not merely as a dimension of educational stratification, but as a multi-dimensional (gender, minority status and special needs) and dynamic configuration, played out within tensions of inclusion and exclusion. The chapter draws on an ethnographic study of urban schools, which enables consideration both of the implications of standardized teaching and assessment practices and the subtle relations of differentiation that occur between teachers and students.

The third chapter in this section is entitled *Educating ‘Euro-citizens’: A Study of a Vocational Upper Secondary Programme in Health Care and Social Services in a Finnish (Sub)urban Setting*. Written by Sirpa Lappalainen from Finland, the chapter opens with a discussion of how education, formerly largely a national project, has more recently become implicated in transnational, especially European policy-making. It is argued that education is now designed primarily to produce citizen-workers for the trans-national labour market. Analysis focuses on the creation of the

ideal labour market citizen through participation in upper-secondary vocational programmes in Health Care and Social Services with the focus, in particular, on the core subject of 'Social, Business and Labour Market'. The chapter draws on a 3-year ethnographic study of one upper-secondary vocational college located in a metropolitan area, in which the average person's income is low and unemployment rates are high. Both from a social and physical point of view, the college provider is the obvious educational choice for its working-class students. The analysis is guided by poststructuralist and material feminist theorizing, intertwined with contextualised ethnographic perspectives. The final discussion points to the importance of Europeanisation in Finnish urban vocational education but also the power of the teachers and students to disrupt the discourse of European neoliberalism and the consequent implications and spaces available.

This is followed by Ove Sernhede's study of new, emergent forms of suburban mobilization in a chapter entitled: *'Knowledge should be put in motion'... Young adults, social mobilization and learning in poor, multi-ethnic suburban neighbourhoods in Sweden's metropolitan districts*. Sernhede shows that Sweden's biggest cities contain neighbourhoods where the majority of children grow up in families living below the poverty line, where more than 40% of people between the ages of 20 and 25 years are neither in work or education, and where more than half of pupils leave school without qualifications. He argues that over the last two decades, Swedish cities have become Europeanized in the sense that they exhibit increasingly similar social and economic disparities and threats to social cohesion to that of other European cities. The riots in the suburbs of Stockholm in the Spring of 2013 is a telling example of this. However Sernhede found in his research that parallel to the riots, there were hopeful signals from young adults living in the poorer, ethnically-diverse suburbs, of a new agenda for social and political mobilization. This agenda includes a wish for knowledge and for constructive dialogue as an alternative to confrontation with the police. Historical parallels are drawn especially with early twentieth-century temperance and labour movements in Sweden but also with the civil rights movement in the USA, and Arab Spring more recently. Sernhede identifies several organisations and reports from the study of one of them 'The Panthers for the Restoration of the Suburb' (of Gothenburg). The chapter draws primarily on an ethnographic study involving participant observation and interviews.

The final chapter of this section, drawing again on ethnographic methodology, explores young people's relationship to educational and city spaces from the perspective of everyday experiences of inclusion and exclusion. Entitled *Young people and local power geometries – the intertwining of social class, gender and ethnicity in public spaces*, it focuses on the sense of belonging and marginalization of young, immigrant men and women in Finnish society, and on 'the everyday gendered and ethnic orders' produced. Tarja Tolonen analyses processes of building 'urban citizenship' (Gordon 2007) through power geometries, in different urban spaces such as schools, youth clubs, shopping centres and the streets. What kind of masculinities (and femininities) are produced and presented? How do they relate to young people's

sense of belonging to Finnish society more widely? The chapter draws on youth studies as well as studies of social class, gender and ethnicity.

The primary data consists of interviews with young people of 13–17 years from various backgrounds and also observations, and discussions with teachers, youth workers, a policeman and parents. The research was carried out mainly in youth clubs in Helsinki in 2008–2009 and in connection with two research projects.

It is our hope, from the introduction and chapters that make up the *Handbook's* Nordic section, that readers gain a sense of the specificity of different urban places and spaces, and the range of identities, demands and aspirations available to young urbanists and their teachers. While not as defined and accepted a field as in the USA, we have found that raising questions about the urban in Nordic education, has been highly productive in concretising and fusing issues of race and ethnicity, gender and class, inclusion and exclusion, and in enabling the theorization of urban (and rural) educational settings, in innovative and productive ways.

Chapter 36

Marketization of the Urban Educational Space

Lisbeth Lundahl

During the last few decades school choice and competition have been introduced all over the world. Similar arguments have been used to justify the change: choice and competition help raise the effectiveness and quality of education by allowing ‘the best’ schools to outperform ‘the worst’, and compel schools to improve their results by renewing instruction and leadership (Ball and Youdell 2008; Waslander et al. 2010). Such developments and modernization are commonly regarded as decisive for achieving economic growth and national competitiveness. The school choice reforms have also been aimed more principally at strengthening parents’ and young people’s right to choose education. They have further been regarded as means to reduce social segregation and unfairness by giving children and young people in socially exposed areas the chance to go to good schools elsewhere. Meta-analyses of the effects of school choice reforms have, however, given cause to critically question several of these assumptions (Lubienski 2009; Waslander et al. 2010). The point of departure of the analysis undertaken by Waslander et al. (2010) on behalf of the OECD is telling: *The question this review tries to answer is not whether parental choice and school competition have any of the intended effects, but why research finds effects to be so small or absent entirely* (*ibid.* p. 8).

For a long time distinguished by their universal and egalitarian education systems, even the Nordic countries have carried out education reforms with neoliberal features, albeit to varying degrees (Arnesen and Lundahl 2006; Blossing et al. 2014; Telhaug et al. 2004). Sweden has undoubtedly gone the furthest in a neoliberal direction; here the shift from a centrally regulated, uniform school system to a decentralized one with strong market elements such as aggressive competition and profit-making, has taken place faster and more radically than in most other places (Bunar 2010; Lundahl et al. 2013).

L. Lundahl (✉)
Umeå University Sweden, Umeå, Sweden
e-mail: Lisbeth.lundahl@umu.se

In Sweden the marketization of education, here defined as the promotion of quasi-markets with various actors competing over the running of schools, has been enabled by a combination of liberal rules for the establishment and running of private schools¹ and full funding by municipal and state tax-funding of such schools. Even though marketization of education is not confined to urban areas, it is most tangible there, with large numbers of municipal and free schools fighting over students and economic resources.

Despite sharing many global features, school choice reforms and marketization cannot be discussed independently from their context. They differ significantly between and within welfare regimes, related to nations' unique historical, cultural and political characteristics. This is for example evident in the Nordic countries; while Denmark and Norway have been relatively hostile to neoliberal policies, Sweden has been more eager to incorporate them (Wiborg 2013). While municipalities in Finland are allowed to provide choice opportunities within the public sector, Sweden has opened up such alternatives to the private sector (Varjo et al. 2015). Differences within the Nordic region are elaborated further in the next section. The expressions of marketization also vary between local environments, something which is rarely highlighted in the research literature. In education and youth research the urban context is often so taken-for-granted that it does not even have to be explicated (Farrugia 2014). Even the question of how education in rural areas is affected by school choice and competition is seldom addressed.

This chapter firstly aims to add to our knowledge of how the restructuring of the educational field into a quasi-market affects schools, neighbourhoods and students by analysing the full-scale Swedish experiment; secondly, the chapter critically examines this as an urban phenomenon and also discusses the consequences for rural areas.

I initially give a brief background to the transformation of Swedish education in the 1990s and early 2000s by situating it in a wider Nordic context; I then outline the contours of the new Swedish educational landscape. The major part of the chapter is devoted to a discussion of the consequences of the school choice reforms and the resulting market² situation at three levels: (a) *the societal level* – by giving a brief recapitulation of research findings on the effects of marketization; (b) *the institutional level* – the adoption of new priorities in schools and the professional dilemmas experienced by teaching staff; and (c) *the individual level* – young people's often problematic transitions between compulsory and upper secondary school when they have to navigate a dense jungle of options in the education market. The chapter is based on original research, national statistics and public reports, particularly the annual reports from the Swedish National Agency for Education (SNAE) which describe and analyse the educational situation. SNAE also ran a project on the marketization of Swedish education (for a synthesis, see SNAE 2012a). The

¹ A new Education Act of 2010, however, reduced the degrees of freedom somewhat.

² For the sake of simplicity I use the term 'market' even if it would be more correct to speak of a quasi-market, as the state regulates and finances educational services, and it is not possible to compete purely via the price mechanism.

sections on the market situation in schools and on young people's experiences of the school market are largely based on two research projects undertaken at Umeå University and funded by the Swedish Research Council: *Upper secondary school as a market*³ (project I), and *Inclusive and competitive – upper secondary school between social inclusion and marketization*⁴ (project II). Both projects included larger surveys and case studies of municipal and free schools at upper secondary level, situated in varying geographical contexts. The case studies were mainly based on interviews with head teachers, teachers, career counsellors and students.

36.1 A Nordic Educational Model (?)

A distinct Nordic educational model has sometimes been talked of, a discourse that stresses important parallels between the educational systems of the Nordic countries since the 1950s (Telhaug et al. 2004). The Nordic school systems rested on commonly shared ideas, and were framed by active, redistributive welfare policies, simultaneously aiming at social justice and cohesion and (a fact which is sometimes forgotten) economic growth that could allow for necessary resource allocation. Comprehensive education of equal standards with no or little streaming was regarded as a royal road to accomplish the reform aims. After a 10-year experimental period, Sweden was the first Nordic country to introduce the 9-year comprehensive school in 1962, followed by the other four countries.⁵ Prevailing egalitarian and inclusive aspects (e.g. free education from compulsory to higher level, early childhood education of high quality, late division of students on different tracks, and extensive integration of special needs students in 'ordinary' classes), have led researchers to conclude that it is still justified to speak of the five Nordic countries as a distinct group while conceding that they are affected by ideas of public choice and new public management (Antikainen 2010; Arnesen and Lundahl 2006; Blossing et al. 2014). If we specifically focus on choice and privatization policies, then it will be seen that Finland, Norway and Iceland still have very little private education and few possibilities for profit-making in this field. Denmark, in contrast, has historically had a much greater number of private schools than the other Nordic countries, based on a long-pervading ideology emphasizing parents' rights to choose education for their children. Even here, however, it is not possible for private school-owners to use a financial surplus for profits. In Norway, the Social Democratic Party has not only opposed the initial efforts from the political right to allow all kinds of private educational alternatives (not just schools with a certain pedagogy or

³Ref. no. 2007–3579. See e.g. Erixon Arreman and Holm (2011), Lidström et al. (2014), Lundahl et al. (2013), (2014), and Lundström and Holm (2011).

⁴Ref. no. 721-2011-5509.

⁵After a 15-year experimental period Norway decided on 9-year compulsory education in 1969 and abolished tracking from 1974. Denmark introduced comprehensive compulsory education without tracking from 1975, Iceland in 1974 and Finland in 1978 (Marklund 1985).

religious orientation), resulting in the 2003 Free School Act, but also stopped the realization of the Act when returning to office. Furthermore, a symbolically important change of terminology from ‘free schools’ to ‘private schools’ was decided upon (Berge and Hygge 2011). In Norway,⁶ Finland, Denmark and Iceland there is political consensus that education should not be opened up for private profit-making companies.⁷ The initial plans in Finland to follow the example of Sweden by introducing free schools were abandoned when the first PISA⁸ results were published in 2000, ranking Finland at the top. However, school choice possibilities have emerged, especially in the larger cities; public schools may be allowed to offer subject profiles (Bernelius and Kauppinen 2011; Varjo et al. 2015). Iceland’s education policies became influenced by neoliberal ideas when the country performed worse in international comparisons than expected. Decentralization and the possibilities of competition were introduced in the 1990 Education Act. Despite these changes, the proportion of private schools is still low (2% of all compulsory school students). As illustrated in the next section, Sweden is the Nordic country that has gone furthest in the market orientation of education.

36.2 Choice Reforms for ‘Modernization’ and ‘Vitalization’

During the 1970s and 1980s, a period of economic and political instability, the Swedish welfare state was criticized for being expensive and inefficient by the political right, and for being governed top-down by the left. As a response, the first steps were taken towards increasing local influence and introducing new forms of management in order to modernize the public sector. Often used to exemplify the alleged shortcomings of the welfare system, education was subject to such reform efforts from the very beginning. Aiming to secure fair and equal conditions of education, the comprehensive school reforms of the 1950s and 1960s had resulted in a host of fine-meshed state regulations that concerned most aspects of school life. The policy turn from the 1980s meant a swift break from centralism and management by rules; these quickly gave way to decentralization and management by objectives and results, giving Swedish elementary schools more autonomy than most other OECD countries (Lundahl 2002).

⁶Interestingly, the same red–green government that abolished the Free School Act took a quite different stand concerning pre-school education; profit-making companies were welcome when the existing municipal and private providers – the latter running almost half of all pre-schools – could not expand rapidly enough to meet the needs of the populace. In 2010 almost 60% of the private pre-schools were run by companies that could extract profits.

⁷Party leader Erna Solberg in a radio interview before the 2013 election.

⁸Programme for International Student Assessment.

Based on neoliberal ideas of freedom of choice and market solutions, the non-socialist coalition government in office from 1991 to 1994⁹ initiated reforms to enable parental choice and stimulate school competition, based on arguments that are recognizable from many other countries; such reforms would ensure that parents and children had the ‘greatest possible freedom’ to choose a school, improve municipal education by ‘stimulating competition’ and raise cost efficiency (Govt. Bill 1991/92:95; Govt. Bill 1992/93:230). In an interview¹⁰ some years later, the responsible minister, Mrs Beatrice Ask (Conservative), summarized the mood for change thus:

It was the need of modernizing and an associated wish for variation. During the same period there was a rather strong movement for cooperative daycares – a movement for freedom of choice and a liberty ethos that sought alternatives. (Nov. 1998. Author’s translation)

The reforms were surprisingly little questioned at the time, and were only marginally adjusted by the subsequent social democratic government (1994–2006), in spite of the fact that they meant a veritable system shift. Sweden went from highly restrictive policies to a highly liberal approach with regard to private schools, including high-level tax support for independent or ‘free schools’¹¹ (initially covering 85 % of the costs, now 100 %). In principle, all kinds of non-public providers could be accepted after being licenced;¹² free schools were to be open to all children and fees were not allowed. I, however, want to emphasize that the school market is not just about free schools; the whole education sector has been remoulded after a market model.

36.2.1 Rapid Expansion and Restructuring of the Free School Sector

Initially, the growth of free schools was rather modest; in the early 1990s less than 1 % of all students attended a free school, while 10 years later the figure stood at 3 %. At present, 14 % of all compulsory school students and 26 % of upper secondary school students attend a free school (see Fig. 36.1). The most dramatic development has taken place at upper secondary level and in the urban regions. In Stockholm, the largest city in Sweden, more than half of all upper secondary students attend an independent school; in Gothenburg and Malmö (the second and third largest cities) the figure is roughly four out of ten (SNAE 2015). The expansion of upper

⁹ With minor exceptions, the Social Democratic Party held power from 1932 to 1976. Since then, social democratic governments have alternated with various constellations of right-wing, liberal and centre parties. The latter held office in 1976–1982, 1991–1994 and 2006–2014.

¹⁰ Interview conducted by the author.

¹¹ The legislation uses the term *independent schools*, but *free schools* is commonly used in everyday language.

¹² Originally, the SNAE decided such matters. The Swedish Schools Inspectorate (SSI) later took over this responsibility.

Fig. 36.1 Students in compulsory and post-compulsory free schools, Sweden and Stockholm, 1999–2013 (percentage of all students) (Sources: Statistics Stockholm and SNAE 2015)

secondary free schools in the three big city regions accelerated, especially when the large youth cohorts born around 1990 proceeded to upper secondary school. New independent upper secondary schools benefitted from this expansion space, almost springing up like mushrooms in and around Stockholm, Gothenburg and Malmö. Within 3 years (2007–2010), the number of students in the upper secondary free schools in the big cities increased by almost 40% – in the municipal schools in the same areas the increase was 8%. The 2008 ‘free search’ rule meant that young people could be accepted to an upper secondary programme anywhere in Sweden, the educational costs being covered by the home municipality. The reform accelerated the ongoing increase of student commuting within/to urban areas. At present one-third of the youth in urban regions commute to a school in a municipality other than their own.

Initially, the free school sector largely consisted of single small schools run by parental and staff cooperatives and organizations with a religious or specific educational orientation; by and large they were non-profit institutions. Parallel to the growing numbers of free schools, a fast restructuring of the sector took place from the millennium shift. Realizing the profit-making potential of ‘the school branch’, big firms and groups of companies entered the scene (Erixon Arreman and Holm 2011). The combination of generous tax-funding, weak regulation and the possibility of profit-making made the system more market-oriented than, for instance, the U.S. system of charter schools (Chubb 2007; Björklund et al. 2005; Lubienski 2009). The growth of the free school market included both opening of new schools and the private acquisition of public schools. By 2010 almost nine out of ten upper secondary free schools were run by providers entitled to distribute revenues to their owners. The surplus was mainly generated by lower teaching costs per student (SNAE 2011), but lower costs for premises, libraries, school canteens and suchlike also contributed. Free school companies were on average more profitable than other

businesses, and the associated risks and investment costs were relatively low (Erixon Arreman and Holm 2011; Vlachos 2011). Within a few years three of the four largest Swedish companies in the upper secondary sector were purchased by foreign venture capital companies,¹³ none of them previously engaged in education. Owner concentration particularly took place in the big city areas.¹⁴ Several of the large Swedish free school companies have also expanded abroad or intend to do so (Lundahl et al. 2013). In 2015 the largest company, AcadeMedia, comprised 450 pre-schools and schools from pre-school to adult education level, 12,000 employees and almost 90,000 students across Sweden¹⁵ and in Norway.¹⁶ In 2013–2014 its annual turnover was 679 million euros, with a profit margin of 7.1 % (AcadeMedia 2014).¹⁷

The rapid growth and restructuring of the upper secondary free school sector was mitigated after the record year 2011, shrinking student cohorts and new legislation meaning stricter rules for the establishment and running of free schools being the main reasons.¹⁸ In 2013 JB Plc, one of the largest free school companies, owned by venture capital company Axcel, suddenly went bankrupt and left more than 10,000 primary and secondary school pupils and 1,600 employees without schools and jobs. The bankruptcy resounded both in Sweden and abroad, and raised awareness among people that the school market had its risks and downsides (Lundahl et al. 2014).

When profit-making and other aspects of the emerging school market became highly visible in the early 2000s, politicians seemed to be taken by surprise, as illustrated by the quotation below from the biggest Swedish daily newspaper:

It was in the wake of the struggle of the parents in the little village Drevdagen in Älvdalen municipality that the free school reform emerged. The parents kept their seven children at home instead of sending them to Idre. Thanks to the reform, the parents could start their own little school.

Probably no one envisaged big companies. The discussion was about the need for alternatives to the public school. There should be schools run by the parents, and Drevdagen was still current, the former school minister Beatrice Ask (Conservative) says. (Dagens Nyheter 16 April 2003. Author's translation)

¹³ The purpose of venture capital companies is to generate profits within a short period of time.

¹⁴ The growth has been especially strong among upper secondary schools run by large companies, which have seen an increase of 280 % since 2005. In 2009 more than 9 % of all schools, or 45 % of schools with private owners, were run by firms that are part of company groups (SNAE 2011).

¹⁵ This figure may be compared to the average size of a Swedish cohort of approximately 100,000 children.

¹⁶ 7000 Norwegian pre-school children go to Espira kindergartens, owned by AcadeMedia.

¹⁷ AcadeMedia's homepage, <http://www.academedias.se/om-academedias>

¹⁸ Until 2011 free schools enjoyed far more freedom than public schools in a number of spheres, e.g. with regard to employing formally qualified teachers and other staff. They were also allowed more freedom in constructing their curricula. By and large, the 2010 Education Act meant that a common legal framework was introduced in these respects. However, important differences still exist. For example, financial transactions and ownerships of affiliations do not undergo public scrutiny since free schools are privately run (Erixon Arreman and Holm 2011).

In retrospect, it is ironic that the needs of parents and children from sparsely populated inland of Sweden allegedly were the original motivation for school choice reform, considering that this reform would affect the urban regions of the country the most.

36.3 Overall Effects of the School Choice and Market Reforms

The hopes and ambitions of those who instigated the Swedish school choice and marketization reforms were high, but today, 20 years later, few would argue that the reforms have produced the intended effects. While early studies (e.g. Björklund et al. 2005) found that the proportion of free schools was positively associated with academic performance, later research did not point to such positive, enduring effects (Böhlmark and Lindahl 2008; Wondratschek et al. 2013; Cf. SNAE 2012b). Compulsory schools have become more homogenous, and consequently the differences between schools with regard to students' results have increased – there has been a doubling over the last two decades (see Fig. 36.2), with the largest variations in the big cities and urban areas; the situation has remained more or less unchanged in the rural areas (SNAE 2012b).

In international comparisons, the academic performance of Swedish schools has declined markedly (e.g. OECD 2014), which hardly indicates a general positive effect of the choice reforms. In Sweden, as in other investigated countries, the innovative effects of marketization of education mainly seem to have been of an administrative and symbolic kind, while educational innovation is much rarer (Lubienski 2009). It is unclear if the hopes for increased cost effectiveness have been realized; more studies are probably needed to settle this point (Lindbom 2010).

Sweden has clearly become a more divided society during the last two decades, both economically and culturally. For example, Sweden was the OECD country

Fig. 36.2 Variation in average performance (*marks*) grade 9, compulsory school, 1998–2011 (Source: SNAE 2012b)

with the lowest average income inequalities in 1985, but it had the quickest widening gaps among 34 OECD countries in this respect between the mid-1990s and 2010 (OECD 2011, p. 45).¹⁹ Originally displaying very small variations in international comparisons,²⁰ a parallel development has emerged in the field of education (c.f. SNAE 2012b). International research indicates that school choice and marketization of education contribute to social segregation (see e.g. Waslander et al. 2010). The extent to which the school segregation trend in Sweden is primarily related to school choice policies or mainly depends on housing segregation has been a matter of debate and disagreement among Swedish researchers. Recently, however, *inter alia* geographic researchers have convincingly demonstrated that parental school choice contributes to increasing differences between schools; the underlying mechanisms of this phenomenon have also been analysed (Östh et al. 2013; Trumberg 2011. See also Böhlmark and Holmlund 2010). It is concluded that the social composition of the neighbourhood seems to be a crucial factor in school choice. Privileged groups, i.e. parents with considerable economic and/or cultural capital, tend to move their children away from the nearest school when they perceive a risk of an increasing presence of underprivileged groups in the neighbourhood. Conversely they tend to stay when the proportion of privileged groups moving into the area increases (Andersson et al. 2012).

Practically all recent Swedish large-scale quantitative and most in-depth qualitative studies have investigated school segregation *at compulsory level*. The research project *Upper secondary education as a field of competition* (Broady 2000; Broady and Börjesson 2008) constitutes an exception.²¹ Broady and Börjesson (2008) concluded that the choice reforms of the 1990s had improved the opportunities for different elites to find educational paths for their children. However, the free school sector has diversified since the 1990s and become more heterogeneous, in effect addressing different social strata – not just the elites (see next section). Also, many municipal schools in urban areas have been forced to offer more varied profiles and other special features in order to compete successfully. In our studies we can clearly see how two kinds of interests interact in the urban Swedish school market: the schools' or school companies' interest in attracting students, and the needs of young people to construct their careers and identities (Lidström et al. 2014; Lundahl et al. 2014; Also cf. Lund 2006). There is reason to believe that upper secondary school students are being sorted and separated in more ways than ever before – even if upper secondary education always has been highly divided along gender and social class lines.

¹⁹ Measured by the Gini coefficient.

²⁰ Compulsory schools (lower secondary level) in Sweden and the other Nordic countries were earlier found to be among the least socially segregated among the OECD countries, as measured by PISA-results (Jenkins et al. 2006).

²¹ Large-scale analysis of the social recruitment to upper secondary education has also been conducted at the University of Gothenburg over a range of years (e.g. see Svensson 2007).

36.4 Contours of the Urban Educational Market Landscape

Since the millennium shift the Swedish education landscape has changed radically, especially at upper secondary level and in the big city regions and larger cities. Here, gigantic *smorgasbords* of programmes and schools are offered. For example, in 2015 youth in the Stockholm area could choose between almost 100 upper secondary schools in Stockholm city, three-fourths of which were independent,²² and more than 560 programmes. In Stockholm county²³ 134 upper secondary schools (24 municipal and 110 free schools)²⁴ offered more than 1500 educational paths. Sweden's third largest city, Malmö, had 37 schools at upper secondary level (13 municipal and 24 free schools), providing 320 education programmes.

The municipal upper secondary schools are often large and offer a broad range of programmes, while most free school units are small with more limited and profiled educational offers (they are, however, often part of larger firms and company groups). Their appearance may differ considerably from the picture of a traditional school; they may be located in more insignificant and nondescript buildings of various kinds, and lack school yards, school canteens, school libraries and sport halls. Instead, they may have agreements with nearby public restaurants, gym complexes and other providers. The proportion of free schools with a certain educational orientation has decreased, both at compulsory and upper secondary level, but many free schools market themselves by offering autonomous studies – fewer hours in school and more freedom to study at home or elsewhere.

The competition between schools over students and related resources is razor-sharp, particularly in the school-dense urban areas. In principle all schools compete with one another, but it would be more correct to speak of competition within different market segments addressing different kinds of students.²⁵ In the late 1990s the upper secondary free schools mainly arranged academic and media programmes, and students from culturally and economically resourceful homes were markedly over-represented (Broady 2000). Ten years later a significant broadening and diversification had taken place, which also meant that the students represented the whole range of social strata. Now, vocational programmes constituted a niche for a couple of the largest school company groups. The number of free schools addressing students in need of special support²⁶ has grown steadily.²⁷ These schools are often very small (they have a total of 1300 students) and are above all located in the Stockholm region (SSI 2014).

²² See e.g. www.skollistan.eu

²³ Stockholm city has one million inhabitants, the county of Stockholm roughly twice as many.

²⁴ Statistics of the three cities and <http://www.gyantagningen.se/>

²⁵ Also cf. Aurini (2006) and Davies and Quirke (2007).

²⁶ E.g. students with dyslexia, ADHD or psycho-social problems. Many of these schools are connected to treatment institutions for young people.

²⁷ The 2010 Education Act allows free schools to limit their intake to special needs students. Previously, free schools could have such a profile, but still had to provide open access to all potential students.

Nearly nine out of ten upper secondary schools market themselves actively, spending considerable resources (time and money) in doing so – municipal schools spend even more than independent schools.²⁸ A variety of channels are used to attract potential students, open houses, webpages, printed matter and participation in school fairs being the most common ones. For example, the upper secondary school fairs that are arranged in many of the big and larger cities are imposing and resource-demanding events. In 2014 around 220 upper secondary schools and 25,000 visitors attended the annual 3-day Stockholm fair.²⁹ In Gothenburg the corresponding figures were 112 exhibitors and 20,000 visitors. According to our survey, special offerings (for example laptops, driving licences, reduced gym fees and cinema tickets) to students who enrolled in a school were common (Lidström et al. 2014; Lundahl et al. 2014).

36.5 Three Institutional Responses to the Market Situation

Recent institutional theory talks about how the interaction between organizations within so-called *organizational fields* shapes their policies and work. Empirical research taking the existence of private actors into consideration when, for example, educational leadership and school development are analysed is, however, still rather uncommon (Burch 2007, 2009). In project I, interviews with head teachers, teachers, career counsellors and students³⁰ in eight city, suburban and rural upper secondary schools (municipal and free schools) were analysed from just such points of departure. Three major institutional responses to the school market situation were identified, both related to the number of adjacent potential competitors and the popularity of the school, i.e. how successful (or not) it was in attracting and retaining students. In addition, the culture or tradition at the school seems to be important; in newly established free schools with young staff (sometimes without socialization from teacher training), one tends to have a more positive approach to enterprise and competition than in older, public schools with more traditionally socialized teachers and other staff. One group of case schools falls within the category *Competition is recognized but does not dominate work*. City Public, a public inner-city school with a previous history of being a grammar school, belongs to this group; it has no difficulties in recruiting students thanks to its long-standing good reputation. West Public, a big public school in a sparsely populated region, also falls within this group. Here, competition is largely absent because of few nearby competitors. In the second group, also consisting of public schools, the reactions to the new situation are different: *Competition is negative and hard*. Located in a larger city with many competing public and free schools, the old and formerly well-regarded North Public fights an uneven struggle to attract enough students. This is also true for East Public,

²⁸ Survey in approximately 60 municipalities situated in two regions (project I).

²⁹ <http://www.gymnasiemassan.nu/press/pressmeddelanden/sm/2014/11>

³⁰ Eight head teachers, 58 teachers, 13 career counsellors and 77 students (N=156).

a small public school. Without competitors in the municipality, but with several ones at commuting distance, East Public is literally struggling to survive. The schools in the last group, *Competition is tough but offers possibilities*, mainly consist of free schools (City Plc, South Plc, North Plc), but also includes a public school in a smaller city (South Public) that has been a winner in the regional competition over students. The approaches to the market situation in the three groups of schools are described briefly in the next section.

36.5.1 Competition Is Recognized but Does Not Dominate Work

At City Public, a school of ancient lineage, it is mainly the head teacher and the career counsellor who have to deal with the competition situation; most teachers do not feel directly affected by the presence of ‘competing others’. The school does not have to fight over students; rather it strives to attract the ‘*right*’ kind of students, i.e. high-performing students. This is mainly accomplished by informal communication between new and former students (peers, siblings, parents and relatives). At West Public, one perceives the competition within the sparsely populated region as weak, but new regional cooperation agreements may constitute challenges. The head teacher thus describes a pressure to develop and offer programmes in accordance with the students’ wishes, and being able to recruit students from the whole region. The teachers also speak about a resulting increase in their workload. In contrast to her colleagues in the urban schools the head teacher is explicitly critical of the market situation, and emphatically rejects *spectacular gimmicks* and short-sighted recruitment tricks. Also, one of the counsellors describes how she teaches the students to critically evaluate schools’ marketing.

36.5.2 Competition Is Negative and Hard

The head teacher at North Public argues that the school choice reform and resulting competition is what has affected the work most during the last decade. As with the head teachers in most other case schools, he accepts the situation and regards marketing as a necessity; *now everyone realizes that it is mine and the school’s existence that is at stake*,³¹ he argues. Considerable resources – money and above all working time – are invested in profiling programmes and marketing activities of various kinds. The career counsellors at North Public are openly critical of having to ‘sell’ their school, *standing shouting in the town square*. The teachers also feel that their everyday work is affected to a considerable extent by the market situation.

³¹ All quotations in the following sections are translated by the author.

The head teacher and staff at rural East Public express frustration and powerlessness over students going to schools in the neighbouring cities despite strenuous efforts to get them to choose East Public. Among other things, the school developed and marketed a new orientation programme that it was believed would be attractive, but success proved elusive. Both staff and students emphasize that youth prefer city schools because there are more young people – not because East Public lacks quality and a good social climate. The cooperation agreement between the municipalities in the region, introduced several years before the 2008 free search reform, increased the competition. Now several teachers have been given notice that their jobs will be terminated.

36.5.3 Competition Is Tough But Offers Possibilities

The three free schools and one of the public schools, all located in cities, have a strategy to use the competition situation to their own benefit. Business thinking is not confined to the head teachers but is also incorporated and practised by the teachers, career counsellors and students. Both at South Plc and North Plc the staff describe living under hard competition. At South Plc, the challenge comes from South Public that has announced a new educational programme similar to the major profile of South Plc. North Plc has a large number of nearby competitors. At City Plc competition is described as a natural part of everyday life. All employees realize the importance of having satisfied students and parents who give the school a good reputation, but the school's marketing is rather limited. School leaders and staff at North Plc point out that the pressing competition situation basically is sound; you develop most when you have to shape up, they argue. South Plc and North Plc are marketed intensely, locally and by their companies via different channels (e.g. advertisements in radio, TV and cinemas) and 'events' engaging most of those who work at the schools. The head teachers of City Plc and North Plc both emphasize that their working methods, 'educational platforms', distinguish them from other schools. Large South Public is almost 'King of the hill' in its municipality and is increasingly successful in attracting young people in the region. Strategical investments in the school environment, new programme profiles and active marketing have contributed to this success. The head teacher argues that one has to accept and live with the market situation, and he involves teachers and career counsellors in marketing the school. Several teachers maintain that competition makes them try harder to make students feel pleased with the school and the education it offers them.

In sum, the school market is not confined to the urban areas of Sweden, but it is here that competition is most aggressive and the various forms of marketing flourish most luxuriantly. However, the schools with the strongest reputations – especially among highly educated and well-informed parents – to a certain extent can stand above the noise of competition and marketing. In contrast, younger, lesser-known schools – not least upper secondary schools in the suburbs and neighbouring

municipalities – struggle for their very existence, which affects the daily life of the school in multiple ways. What is evident from our projects I and II is that upper secondary schools’ success or lack of success in recruiting students depends on a whole range of factors, academic performance just being one of them and in many cases, not the most important (Lidström et al. 2014; Lundahl et al. 2014). I return to this in the next section.

36.6 ‘It Is Easy to Find It Difficult’³²

And then one day about one or two years ago, I felt no-o, now I cannot take it anymore. I didn’t manage to get an overview of all the choices available. And I thought that was a bit scary. (...) It was too much. (Career counsellor, City Public)

Previous research has mainly focused on parental choice at the compulsory level, and the social consequences of these choice patterns. Based on quotations that illustrate common denominators from the student interviews, this section particularly highlights young people’s experiences of urban upper secondary school markets, and if and how they influenced their decisions. In the following, concluding section, the wider social aspects of parental and youth choice will be discussed.

A number of international and Swedish studies have shown that parents, teachers and career counsellors are important sources when young people choose educational and vocational paths, while the role of peers and the media is somewhat less unequivocal (Blenkinsop et al. 2006; Dresch and Lovén 2010; McCrone et al. 2005; SNAE 2013). However, a significantly higher proportion of Swedish youth than young people in other EU countries regard the Internet, social networks and fairs as important information sources when they make their educational choices, and teachers seem to play a smaller role than in other countries (EC 2011). These findings may be related to the fact that Sweden, in contrast to the other Scandinavian countries, does not have career learning as a curriculum subject; schools’ support for young people’s choices is mostly confined to information meetings and single conversations with career counsellors. Otherwise, young people have to rely on the sources mentioned above that in many cases are *covert recruitment marketing, that is fragmented and lacks the wider perspective that young people need in order to make well-founded educational choices* (Dresch and Lovén 2010. Author’s translation).

Several Swedish studies indicate that parents and young people view the multitude of educational choices – schools and programmes – with mixed feelings; the range of choices is seen as positive but difficult to manage, and often it has provoked a sense of anxiety among many students (Dresch and Lovén 2010 p. 57; SNAE 2013). For example, Dresch and Lovén (2010) found that one-fourth of all students – and one-third of young women – felt lonely and abandoned when making their choices. Also, young people of immigrant background perceived the choice

³² Student, City Plc.

situation and the abundance of information as particularly frustrating and overwhelming. The students in the case schools in projects I and II confirmed the picture of young people taking the educational choices seriously and finding the urban school market huge and often bewildering – but also positive, according to several students.

It felt so huge (...) it was such a big choice. You had so many alternatives; there were no limits. (Student, City Public)

(Student A) It would have been better if it was like ... (Student B) ... five schools. (Student A) Yes, five schools ... Now there are an endless number of schools ... [Interviewer informs about the number of schools in City]. (Student B) It is crazy. (Two students, City Beach Plc)

But I think that's great, that there are so many ... the big freedom of choice, that there is so much to choose from. (Student, City Beach Plc)

Several students in project II had attended a programme at a free school that was suddenly closed down because of bankruptcy. In spite of this negative experience, most of them still preferred to study at a free school.

I was astonished that it happened so fast and we hadn't got any signals about it at all. And of course some anger as they just sent us out and did not let us finish our courses (---) One has to take the bad things with the good ones, I feel. I think the selection of schools and programmes and niches grew much bigger when the private schools entered. Then it has its bad sides too, of course. But I still believe that the good outweighs the bad. (Student, River Plc)

36.6.1 *Intense Recruitment Efforts*

The students gave lively descriptions of the marketing efforts from the upper secondary schools. Using words like 'bribes', 'fakes' and 'sham', they criticized many schools for giving frivolous and misleading information. *They never bring up the negative sides, because then the marketing idea would get lost.* Many students asked for honest information about the contents of education rather than flashy offerings.

I can clearly see it, for example, at the upper secondary school fairs (...) 'Yes, come here, start here, and then you'll get a laptop, and when you graduate you can buy it for 500 / Swedish/ crowns' or 'Come over here and have some Red Bull' (...) is it is a little like this 'You will get this if you start here', so actually it does not work as a school. (Student, City Plc)

It was commonly believed that above all small, bad or unpopular schools used almost 'desperate' methods to recruit students, while larger and well-regarded schools were not forced to market themselves with offerings and advertisements – an assumption well in line with what we saw in the case schools *Competition is recognized but does not dominate the work* (see above).

And the large schools don't do that, but get students because they are known to be a good school. (---) At XX [popular school in North City, author's comment] (---) they don't have any gadgets that attract, no travels, no laptops, nothing. (---) They have so many applicants, so they don't try anything. (Student, North Public)

The students denied that they themselves were affected by the marketing, but commonly added that other students, especially those from less resourceful homes and less mature students, were easier to attract by purely commercial offerings. Students at City Plc also discussed the fact that their own school might recruit students whom, if they lacked support from their family, risked failing because they had misunderstood the messages about highly individual and autonomous work and study methods and believed that they could relax and take it easy.

36.6.2 *Choice of School, Education and Identity*

At (school) A there are only emos³³ and self-destructive people. At our school there are only nerds, at B there are just immigrants, at C only very, very bright ones and at D just sort of vehicle people, 14-year olds and bikers and suchlike. (Student, North Plc)

In much of everyday life and politics, and sometimes in academic disciplines, education and career choices are believed to be based on highly rational deliberations on educational quality and expected outcomes in terms of income and status. A host of studies, however, show that career choices rather are pragmatic-rational (cf. Hodkinson and Sparkes 1997); they are based on incomplete information, sometimes serendipity, and are highly dependent on the young person's social position and resources. Lund (2006), who analysed students' educational choices in the local school market of a Swedish mid-size city, *inter alia* concluded that the widening range of local educational alternatives had increased the space for social choices where students' perceived similarity or lack of similarity become important factors. The student interviews in projects I and II clearly support this conclusion. Apart from input from parents and other significant people, the choice (or not) of a school was often based on rumours about its character and students, rather than information about its academic performance. Its geographical location also mattered; the centrally situated schools were often preferred because of their close proximity to shops, cafés and other valued places.

It also depends on the sort of people who study at the school, if you feel that you fit in, if they are people of your own kind. That's the most important thing, I think. (Student, City Public)

I turned to the wrong school ... the people there were not like me at all. (---) you usually apply to ... the schools where you are equal in behaviour and opinions and the like. (Student, City Beach Plc)

One of the students at City Beach Plc explicitly related the choices to economic resources and social class, which was *not* common in the interviews:

and here it is rather higher middle class, and I believe that many look at where they are positioned (---) and nowadays it seems that class differences are very decisive for where you go (---) how your situation is ... regarding the economy. (Student, City Beach Plc)

³³ Emo as in emotional: A music style ('emotive-hardcore') in the 1980s, later also denoting young people with a certain appearance (e.g. black clothes and flat black hair) and personal characteristics like sensitivity or emotional fatigue.

In contrast, the students in West Public – a school in a sparsely populated region – argued that most of the young people had chosen the school because it was situated close to their homes. They neither referred to the kind of students, nor to special educational orientations or methods of the school.

It isn't precisely an exclusive school that people far away think of as: 'Yes, I really want to go to West Public!' It is a good school, but nothing that makes it different so there is probably no one who applies there. (Student, West Public)

36.7 The Marketized Urban Educational Space: Some Final Comments

In this section I want to elaborate on some of the consequences of the geographical or spatial gaps that have become visible when competition and choice have been introduced as central organizing principles of the school system – consequences that are seldom discussed in the literature or, indeed, in public life. Initially, I briefly return to the Nordic space, but after that I focus on the local aspects.

36.7.1 Hardly 'A Spearhead into the Future' Any More

Sweden acted as a spearhead internationally when it introduced a 9-year comprehensive school in 1962. The other Nordic countries followed the example of Sweden in the 1970s, and the resulting 'Nordic educational model' was – and still is – regarded with admiration in other parts of the world. Initially, the Nordic neighbours, particularly Norway and Finland, were prepared to follow in the steps of Sweden once more when introducing its school choice reform and publicly funded free schools in the 1990s. In the 2000s, however, when the downsides of Swedish school businesses – including venture capitalism and tax flight – became visible, and when Sweden's performance in the last PISA assessments deteriorated, the enthusiasm cooled down considerably. Indeed, Norwegian, Danish and Finnish politicians have openly declared that they are not going to copy the Swedish model of educational marketization.

36.7.2 Distinction and Image-Making

At the local level, new forms of pedagogic identities (Bernstein 2000) and behaviours of staff and students become visible, and teacher–student relationships change in the competition-driven urban schools (especially the ones of the second and third type described above). Teachers and other staff describe how they often experience

professional dilemmas, for example when head teachers expect them to give students higher grades than they earn so the school's reputation won't be damaged and students will not opt to 'vote with their feet' (Lundahl and Olson 2013; Lundström and Holm 2011). Successful competition is built on *distinction* in some respect or other, and many urban schools, whose survival and flourishing are directly dependent on their ability to attract and retain students, eagerly try to find out what young people are looking for, an approach which may result in short-sighted orientations. As one teacher put it: ... *one has to adapt to young people and what they want, (---) styling, make-up or spa, or whatever*. Students are often addressed personally and urgently: 'you who plan to work abroad – come to X-school which has excellent international contacts'; 'if you wish to continue to university, Y school is the perfect choice'. Such calls coincide with and are likely to amplify young people's strivings to find 'their kind of school' and 'their kind of peers' in ways that strengthen choices based on social class, gender, religion and ethnicity. We do not see the same kind of changing identities and behaviours in the rural schools: here schools have not become used to emphasizing their distinguishing features when addressing potential students.

36.7.3 What About the Aim of Educational Equality Regardless of School Location?

If the Swedish urban educational landscape until the mid-1990s could be likened to large-scale agriculture consisting of easily overviewed fields and standardized crops, then the landscape of the early 2000s rather appears as a rapidly growing, swarming and noisy jungle. It was hardly by accident that the SNAE chose a jungle illustration for the cover of its general recommendations concerning study and vocational counselling in schools 2009–2013 (see Fig. 36.3).

In contrast, the image of the situation in rural areas is quite different and more reminiscent of the traditional one with fewer and less profiled schools, even if all municipalities nowadays have at least one free school. According to current legislation, the aim of the Swedish education system is still to provide all young people with an equivalent education *regardless of where in the country it is arranged* (2010 Education Act, par. 9. Author's translation), but the findings of this research suggest that this has in practice been abandoned; I elaborate on this question below.

Even if the school market is far more visible and has a much stronger impact in the big city areas than in less densely populated regions, schools and youth in the rural regions are far from unaffected. There is little doubt that the winners of the new marketized system are urban young people from resourceful homes – the ones who can get advice and support from family and relatives when they make their educational choices at the end of compulsory school. There are two kinds of potential losers: firstly urban youth without such socio-economic resources, especially those with a history of various break-ups and school failures who are highly con-

Fig. 36.3 Cover illustration of the national guidelines for study and vocational counselling (SNAE 2009. Illustration: Tobias Flygar)

fused when confronted with the upper secondary school market. They run a marked risk of making erroneous choices and switching between schools and programmes, which may lead to prolonged studies or school dropout (cf. Lundahl et al. 2015). Secondly, the rural youth is often confronted with two not very attractive alternatives: to commute or even move to the *smorgasbord* of the cities, or to stay put, in many cases having reduced educational opportunities. The city schools increasingly function as magnets, especially for young people in the neighbouring municipalities but also for youth living at a larger distance. This and the currently shrinking cohorts of 16–19-year olds tend to reduce the possibilities outside the urban centres to offer all national programmes in accordance with the legal requirements. Even municipal collaboration in order to enable this may simultaneously increase the competition in the countryside, as was shown in the cases of the West Public and East Public schools. Small and rather poor municipalities have to fund the young people who attend schools – public or independent – elsewhere, but the total educational costs for the remaining youth are largely unaffected, as costs are related to schools and classes rather than to individual students. The problems of the rural municipalities in financing schooling have existed for a long time, but the emergence of a market system in education has certainly not improved the situation. Rather, the magnificent and overwhelming *smorgasbords* of schools and programmes in the cities may contribute to school death and educational depletion in the regions outside of the cities and urban areas.

To conclude, school choice and competition affects education in numerous ways – increased differentiation of students over different kinds of schools and along a multitude of dimensions (social class, ethnic-cultural background, taste and lifestyle, agency and motivation, etc.) being one of the most serious as it contributes to a considerably more divided Swedish society. Such a division is, as has been

shown in this chapter, most visible in the landscape of urban education. However it also takes place between urban and less densely populated regions, contrary to the aim of providing equivalent education regardless of geographical location. Hitherto the major political response to increasing differences and fragmentation has been to introduce a plethora of control mechanisms – more tests and grading, sharpened inspections, quality assessments – but without improving the situation substantially, and with a number of negative side effects such as increased stress on and reduced attractiveness of the teaching profession. Few, if any, serious efforts to change the market situation *as such* have to date been made. The idea of reducing parental choice and competition seems to be almost unthinkable, as if marketization is an irreversible natural process, or a genie that cannot be put back into the bottle once it is opened. It is indeed neither/nor. It is rather a political matter that has to be subject to extensive investigations, analysis and reforms if we are to master the negative sides of the new ‘Swedish model’ of education.

Chapter 37

Social Class, Inclusion and Exclusion: Teacher and Student Practices in Norwegian Urban Education

Anne-Lise Arnesen

37.1 Introduction

Inclusion has been a central aim of recent Norwegian educational reform, underpinned by a rhetoric of ‘schooling for all’. Reforms in recent decades have thus introduced measures to ‘level out social inequality’ (NMER 2006, p. 1), and increase access to ‘good quality’ education to all ‘regardless of gender, age, social, geographical, cultural or language background (...) in an inclusive learning environment’ (NMER 2007, p. 5). Despite reforms¹ and adjustments of the school system, social hierarchies continue to be produced and reproduced, and disadvantaged and vulnerable children are still marginalized in schooling (Bakken and Elstad 2012; Bakken 2007; Birkelund and Mastekaasa 2009; Frønes and Strømme 2010).

The aim of this chapter is to shed light on the ways in which the processes of inequalities and classed relations are played out in and through the curriculum and pedagogy in schools as a whole and in individual classrooms. I argue that, despite reforms such as above, the pedagogical and social relations of classrooms have not *fundamentally changed*. As Reay (2006) states, ‘against a policy backdrop of continuous change and endless new initiatives it appears that in relation to social class the more things change the more they stay the same’ (Reay 2006, p. 304).

¹At the national level several major large scale education reforms have been introduced implying changes in rights, content and structure at all levels of education. From the 1960s through to the 1980s social justice, equality and inclusion in and through education were in the forefront. The common goals of the reforms introduced during the last two decades have mainly emphasized education as a pivotal tool for economic growth and for meeting the requirements of international competition and the ‘knowledge society’, contributing to renewal and more emphasis on students as human capital, privileging academic knowledge and accountability (NMER 2003; Arnesen 2011; Arnesen and Lundahl 2006).

Urban studies emerged as an area of research through the Chicago school of sociologists in the 1920s, who primarily addressed the increasingly racial complexity of cities (Park 1928; Simmel 1971), the ‘stranger’ and ‘marginal man’, and urbanism as a way of life (Wirth 1938). Wirth argues that while the city is the characteristic locus of urbanism, the urban mode of life is not confined to cities. Research on urban education thus comprises a multitude of approaches in the international literature (see Irby 2015). The dominant body of research focuses on social problems, for example, alienation, social inequality, crime, poverty, segregation, and marginalization, but also includes the more attractive sides of cities, as economic and productive innovative spaces which provide access to resources and services, as well as opportunities to enter social, legal, economic, cultural and environmental fields.

Urban education, as opposed to rural,² has a different meaning in the Norwegian and Nordic contexts from countries with greater social and economic inequalities and higher levels of urban segregation (OECD 2015).³ Nordic research into urban education, is relatively sparse, focusing mainly on multiculturalism, identity formation, injustice, immigrant youth, segregation, disadvantage and stigmatized urban areas and their schools, and, more positively, symbolic and creative use of urban space (Alghasi et al. 2012; Andersen 2014; Beach et al. 2013; Beach and Sernhede 2013; Fangen and Frønes 2013; Möller 2013). Hence, research on urban education in the Nordic countries has come to mean a cluster of research domains, theories, and methods focusing on ethnically and racially diverse students, schools, and classrooms within metropolitan centres.

Following Buendía (2011), city space here is perceived not merely as a container for diverse populations and human activities, but as something continually produced, practised, and created within the myriad of relations that constitute the built environment and social representations of place and people. Hence, urban education is envisaged as the process whereby city space, including schools, is realized through symbolic significance, construction of difference and the complex social relations of those who daily occupy such a space. Two overarching questions are posed in this chapter: How are processes of inclusion and exclusion played out in urban classrooms? What is the significance of social class in these processes?

²The urban/rural dimension has been an important issue in Norway, as the state has had an active regional policy since World War II. Through legislation, regulations and subsidies, the same educational resources for education in urban and rural areas have been guaranteed, based on the principle that all pupils should receive the same quality of education regardless of where they live.

³It is recognized that the generous welfare system together with active housing, work and education policies in Norway after World War II, have helped raise better life conditions and well-being among people. Norway is, as other Nordic countries, preeminent in terms of combining a high standard of living with equality and an extensive public welfare sector (Arnesen and Lundahl 2006; Bart et al. 2003). It is at the top of UN ranking regarding human development, with comparatively small socio-economic differences (UN 2014 Human Development Index; OECD 2015). Despite this favourable review, social inequalities persist and hierarchies are produced and maintained, not least in urban schools.

Due to the complexity of institutional and social relations within schools, this chapter focuses in particular on pedagogic and relational aspects of classroom practice; how they are experienced and communicated by students and teachers. These practices are explored through the lens of social class, and as intersecting with gender, minority background and special needs.

37.2 Social Class, Inclusion and Exclusion

In recent years, several initiatives have been introduced by the Norwegian state and municipalities to alleviate what is perceived as the widening gap in performance, access and participation between students of different social backgrounds – however, without much success (Bakken and Elstad 2012). The gap appears to be growing, with research showing that high achieving middle-class students are the main beneficiaries, compared to lower achieving working-class and disadvantaged students⁴ with less cultural capital. Social class is seen to operate in the complex interplay between economic and cultural configurations. Bourdieu (1984) argues for an analysis of social ‘classes’ that simultaneously capture *multiple dimensions* of inequality (Ljunggren and Andersen 2015) with gender, minority status and disability as part of such a multidimensional concept. Wacquant (2013) carried out a review of key conceptual shifts in Pierre Bourdieu’s work, for example, from class structure to social space, from class consciousness to habitus, from ideology to symbolic violence, and from ruling class to fields of power (pp. 274). These shifts, taken together, underpin the relational feature of social class in a terrain or ‘social space’ of power. Individuals can be seen to act according to the amount and composition of cultural capital, which is embodied, objectified and institutionalized, and where a common denominator is the ‘mastering’ of a legitimate culture (Ljunggren and Andersen 2015, p. 307).

Following Bourdieu, in this chapter, the urban in urban education is *embodied* within schooling through a ‘culturally loaded’ concept of class; that is, what students and teachers ‘bring’ with them in terms of social background and experiences (capital, habitus). It involves how students make sense of and adapt to school culture, and how teachers make sense of their students and, in particular, their capacities to learn. Thus, taken-for-granted exchanges between teachers and students operate to provide some students with a sense of achievement and others, with the knowledge that they have been judged and found wanting. Lynch and Lodge (2002, p. 181) argue that failure to recognize different forms of social and cultural resources other than those held in esteem by schools, is a form of ‘cultural domination,

⁴In using the concept of ‘disadvantaged’ students here I refer to students who are victims of troublesome family circumstances such as poverty, abuse or inadequate care, and students who for other reasons (e.g. conflicts with school) may face considerable risk of stigmatization and marginalization in school (Frønes and Strømme 2010). Ethnicity/race, religion, citizenship status, gender, disability and class are not by themselves contained in this definition.

symbolic misrepresentation or non-recognition'. Such forms of cultural domination which embrace also normalization and hierarchy, constitute material and symbolic processes of inclusion and exclusion associated with social (in)justice, (un)equal access to goods and resources, and different levels of participation and belonging (Arnesen 2012; Arnesen and Lundahl 2006; Arnesen et al. 2007). Examples of this are provided through the case study.

37.3 Research Context and Methodology

This chapter draws primarily on an ethnographic study entitled *Difference and marginalization in school with reference to gender and social background* (Arnesen 2002, 2003; Arnesen et al. 2007) based in Oslo, the Norwegian capital. Oslo has a population of about 650,000 with its spatial arrangement an important form of social organization with connotations of class divisions. However, there are no poor ghettos as defined in literature from US and UK. The city is divided to be sure, but there are few confrontations between populations (Andersen 2014).⁵ In fact, it is argued that young people from the most minority-dense suburbs, particularly those of second generation immigrant background, though born in Norway are as well integrated as the rest of the young population in the city in terms of their engagement in education, work and leisure activities (Andersen and Biseth 2013).

The study focused on three public⁶ lower-secondary schools (ninth grade), situated in three different catchment areas in Oslo: *City Park School* in a traditional working-class area with a substantial presence of 'immigrants', most of which are from working-class background or are newcomers with parents with little education. In addition there is a relatively new influx of so-called 'resourceful' families, *Church Hill School* in a residential area with a relatively homogeneous population and with a mix of apartment houses, townhomes and villas, i.e. lower-middle class, with only 10% middle-class minority-ethnic students, and *West Side School* in an affluent part of the city dominated by villas, and few students from less affluent neighborhoods.⁷ The students attending the schools reside in their respective neighbourhoods. The analysis for this chapter draws on a re-reading of the material with the research gaze primarily directed towards social class and the urban.

⁵This is due to almost full employment, low youth unemployment, transition policies and measures oriented towards early school leavers as well as police intervention, the presence of social services and active work of organizations in the local communities directed towards young people.

⁶There are very few private schools in Norway.

⁷Differences between the schools, and the social and discursive practices of teachers and students were analysed earlier on the basis of a multi-methodical- and theoretical design (Arnesen 2002, 2003).

The ethnographic design of the study involved fieldwork in schools and in individual classrooms carried out between 1997 and 2000,⁸ and thematic interviews with 58 students and 28 teachers as well as with principals, deputy principals, counsellors and pastoral care teachers. Short narratives provided by 215 students were also collected. The student interviews focused on interests, relationships to school, peers, subjects and teachers, and the student narratives on accounts of themselves, their school experiences, the practices of teachers, their class ethos and incidents that had made an impression on them. Similarly, teacher interviews focused on the school and their teaching and on their perception of individual students.

The chapter draws also on recent research which shows that, despite the introduction of change and reform (NMER 1997), the education system has remained much the same in terms of teacher-led classroom practices (Klette 2003; Markussen and Seland 2013). Oslo however has changed over the years, both as one of the fastest growing capital cities in Europe, and in its adoption of neoliberal educational policies, such as increased emphasis on academic achievement, standardisation and testing. Since 2000, increased numbers of students have received special education provision which involves either being taught alone or in groups outside the classroom (Nordahl and Hausstätter 2009; Statistics Norway 2015). It is suggested that this is due to the emphasis on academic subjects and performance. It is also a concern that more students than previously leave compulsory school without a complete leaving certificate covering all compulsory subjects. The increase of students without a complete leaving certificate has a distinct relationship to low socioeconomic status (Bakken and Elstad 2012). Through processes of neo-liberalism, it is argued, the school system retains powerful remnants of prejudice towards working-class and disadvantaged students, and a preference for middle-class rather than working-class cultural capital such that the educational resources of families have a profound impact on student performance (Bakken and Elstad 2012; Reay 2006). In this chapter, examples are given of the significance of social class difference as it intersects with gender, minority status and special needs, by means of situated fine-grained empirical detail (Connell et al. 1982), with the intention of understanding the making of social classed hierarchies and inequalities in and through urban education. The concept of social class used here is drawing on Bourdieu's notion of 'social space' of power, which encompasses both references to parents' socioeconomic and cultural status, i.e. type and length of education and occupations in terms of economic, professional and cultural professions, skilled/unskilled work, unemployment and recipients of welfare benefits/social security (Ljunggren and Andersen 2015). This is in line with differences referred to in descriptive statistics on social background and school achievement. However, social class is rarely explicitly referred to by school staff, so the notion of class with respect to individual students is in interviews displayed through statements referring to the student's relation to

⁸See for example, Arnesen and Sollie (1992/2003) and Arnesen et al. (2013) which confirm the argument on the relative stability of curriculum and classroom practices in Norwegian lower-secondary schools.

school, home background and forms or place of residence (more/less affluent) (Arnesen 2002).

The following analysis revolves around one school, *City Park*, and one classroom. The school was selected on the basis of its prominence as a diverse school close to the city centre in having to deal with the urban and processes of inclusion and exclusion. It can be argued, however, that the same ‘inclusion/exclusion’ processes such as shortchanging of students, hierarchization, categorization, and differential attention by teachers, can be found in other schools with different compositions and class configurations. In order to foreground internal relationships, one case is presented here which, following the ‘thick descriptions’ of Geertz (1973), gives attention to detail and context. The analysis neither presents a comprehensive picture, nor is representative of urban education in general, but should be understood as fragmentary evidence of processes of inclusion and exclusion in urban education context.

City Park is one of the oldest schools in Oslo, dating from the late nineteenth-century, and is located in an area of ‘solid’ industrial and working-class families. The school is situated near a park, in which it takes much pride, and has a choir, brass band and theatre group. At the time of the study, the school had many students whose family lived on welfare, many headed by single parents, and higher numbers of child protection cases than average for the city. This is also the case today (Statistics Norway 2014).

The student intake, according to the principal, had changed over the years. He positioned the core of current students as the ancestors of four and five generations of industrial workers, and maintained that,

These old working class families, they lived, as we all know (sic!) after having read Oscar Braathen (famous Norwegian author of working-class lives), with mother and father and eight children in a one-room apartment. They do that today also, but nowadays these families have a dark skin. The immigrants have taken over.

He broadened the picture to include recent gentrification:

Many of the apartments along the river have been restored and are inhabited by very, what can I say, resourceful people. These people, who have many resources and normally would have lived on another side of the city, have chosen to live here and send their children to my school. Hence I have three groups of pupils who are rather different from one another, and this makes it exciting to work here.

At the time of the research as well as today, around 50% of the student population is of immigrant origin, with altogether 29 languages represented in the school. The two questions mentioned earlier, about the processes of inclusion and exclusion, and the significance of social class in school practices, are addressed under two sub-headings: (1) School organization and teacher practice and (2) Student response, subjectivity and agency. It should be said that the categories used are not discrete, rather they overlap in many instances. As already stated, analysis is limited to qualitative data from one school, *City Park*, which allows for in-depth investigation of the interactive making of social and classed hierarchies in and through urban education.

37.4 School Organization and Teacher Practice in an Urban Classroom

37.4.1 *The Social Relations of Classroom Practices*

The research revealed that nearly all teaching activity at *City Park* was teacher and textbook directed with students having little to say about content and working methods. The most prevalent pedagogic approach was ‘good old fashioned teaching’, as it was referred to by the vice principal. This meant whole class teaching with presentation of a common theme by the teacher, use of a blackboard alternating with individual, desk work assignments, and, occasionally, group work during which teachers gave individual help or tried to motivate unwilling students. Alternatively, teaching was based on ‘dialogue’ in terms of a teacher-led conversation on a particular theme. In neither case did the students have much say about content and working methods. These ‘basic’ pedagogical forms have considerable stability across time and levels of schooling, despite national reforms (Klette 2003; Markussen and Seland 2013). Observation of the classrooms showed that both whole class teaching and teacher-led dialogue invariably resulted in marginalisation of some students. Closer investigation showed that those most likely to be marginalised and ignored were working-class students, across gender and minority status.

For example, Tim, a working class boy was among those who did not engage in school work. He said that what made him dislike school so much was the requirement to ‘sit’ all day. ‘One just has to sit there and write and think [...]. We sit here for so long, see, [...] nothing can be more boring than going to school [...]. You sit there all the time. I believe everybody in school finds it boring. Maybe not first graders, though’. Tim articulates the physical strain of the traditional academic classroom.

Annette, a high-achieving middle-class girl, gave the following account of differentiating practices during lessons.

Anette: In some subjects it is like this, it is the bright pupils, those who make it, they get the chance to get to know more. But it (the teaching) is quite difficult. So those who don’t understand everything from the start, they never get it explained sufficiently. So it seems anyway. They are quite slow, they don’t get good marks and so on.

Interviewer: Do you think it is because some stand out during lessons?

Anette: When the teacher puts questions to the students, then it is, like, the bright ones, those who know it, who answer all the time, you see.

Interviewer: What happens then?

Anette: Then, those who do not understand, they, if they ask... I don’t know, it seems like they don’t get the explanation that works. It is something they do not understand, because it goes too fast. So if one cannot follow from the start, then one understands little of what is going on.

Many lessons seemed to follow this educational exchange pattern, in which the teacher attends to the ‘bright’ students and, in effect, takes little notice of those who are ‘quite slow’ and ‘do not understand’. The teachers, often not aware that they were treating their students in this way, expressed satisfaction with a particular

lesson by emphasising the participation of interested and active students. They did not realise it seems, that many students did not participate fully and some, not at all. Depending on the teachers, students either sat listening, or were engaged in other quiet activities or small-talk with classmates. They sometimes wandered about or caused disruption.

37.4.2 *Assessment Practices*

Schools' certifying power is part of the formal requirement of the state, but this is only to a limited extent recognized by the teachers.⁹ Through the formal assessment practices of school, the tension between the individual and the institution becomes apparent. Thus students displayed differential dispositions towards the testing process, making it a definitive statement about the sort of learner they were. Although students' responses varied, most shared a sense of an event which revealed something intrinsic about them as individuals. Success and failure are made public and visible to all through certain formal assessment procedures, such as the awarding of marks, the standardization of tests and exams, and the use of other technologies that are intended to inform the teacher, the students and their families of 'where they each stand' (Arnesen 2002; Asp-Onsjö and Holm 2014).

Tests are a reminder and re-occurring confirmation of success for some; yet for others, they mean all-encompassing failure, visible suffering, and fear and anxiety. For example, in a ninth-grade mathematics lessons, the teacher was going through a test which had been set a few days before. The results of the test and the corrected test-sheet were handed out to each student with a short comment. 'Good work, Andy.' 'You could have done better', 'Excellent'. Some sheets however were handed out without comment, as in the case of Robert. He put away the test-sheet without looking at it, and sat through the rest of the lesson motionless and staring in front of him. At the end of the lesson, he made a move of despair and intensity, whispering: 'This maths is destroying my life!' The teacher looked at Robert briefly and gave no response to the outburst before proceeding with his instructions. Such are the daily dramas of assessments and grading. The natural science teacher talked about Nafissa, a working-class girl from a minority background, one of his favorites for her positive attitude and smiling face, and her response to the result of an assignment. As usual she received a low mark, primarily due to her poor Norwegian language skills. She had burst into tears and, according to the teacher, 'cried and cried and cried, I felt so very sorry for her, but what could I do?' Similar to other students of immigrant background, particularly newcomers or students with a mother tongue other than Norwegian, Nafissa had extra tuition in Norwegian (Norwegian II) which amounted to a few lessons a week. She was also entitled to bilingual subject tuition,

⁹Only the principal of the *West End School* (the most affluent) raised the issue. She reflected on the contradiction between setting marks in compulsory education and guidance of individual students in their learning.

but due to limited funding by the municipality, this was available to only a few. Students in Nafissa's class did not receive bilingual subject tuition in science. The lack of resources made many teachers feel inadequate to help their minority language students within the regular time for tuition, and to make a fair judgement of their academic progress. Some subject teachers implied that they had given up on some students.¹⁰

37.4.3 *Differential Attention*

Students said that they often witnessed differential treatment of students by teachers. Positive involvement with some students, signaled the importance of these students. Those who fell within the teacher's field of vision were perceived as more important than those who remained outside or 'completely on the periphery' (Arnesen 2002, p. 234, 2011). Several students were *in* class but were symbolically excluded. Helen, for instance, a white working-class girl, had attended a special school for a period, and returned just before the research period. Despite being a formal member of the class, she was perceived by the teachers as an 'outsider'. As her form teacher said, 'she is a nobody' in the class. Other teachers spoke of her only as someone easily overlooked. She was a student to be pitied, and, according to my observations, when attending the ordinary class, was only spoken to by the remedial teacher (Arnesen 2003). Not only the most disadvantaged were marginalized; also, the quieter 'low achieving' girls, for instance, Sabina 'who is failing because she is so far behind the others'. She also went unnoticed during lessons. In another class, there were three boys from immigrant backgrounds who sat quietly by the classroom wall, and uttered not a word during several natural science lessons. On questioning their teacher, I was told that he tended to forget them because they were almost invisible. As in Nafissa's case, all three had poor Norwegian language skills, which meant that they were unable to follow the teacher, who avoided addressing explicitly the language problems of such students. In various situations, thus, language problems could be seen as a marginalizing dimension both with regard to teaching and in other formal and informal interactions between students and between students and teachers, particularly for the quiet students.¹¹

¹⁰ All students in Norway are entitled to 'quality' education and instruction adapted to their abilities and needs (NMER 1998). Special education (*spesialundervisning*) is the formal term used in the education act (§5) for provision for those students who do not benefit from regular tuition. This provision should be available to all students, including minority students who need it, after particular formal (diagnostic) procedures. Adapted language tuition is the formal term in the education act (§ 2–8), specially designed for minority lingual students with limited Norwegian language skills. Adapted language tuition encompasses Special Norwegian tuition, Bilingual subject tuition and Mother tongue tuition. The extent to which and how all of these provisions are implemented varies considerably between municipalities and schools (NDET 2014).

¹¹ In her longitudinal study of one class over 10 years, Nielsen (2009) concluded that the most important marginalizing mechanism in school, was not bullying, but discrete invisibility of 'quiet' minority students.

Not seeing or 'ignoring' was a strategy observed in numerous lessons. The teachers would start off by urging students to get involved in the lesson. However, when this strategy failed, they had the choice of whether or not to intervene. In most lessons, a middle-class boy, Simon, sat drawing, and occasionally talking to friends. He did not engage much in written assignments, but was frequently active in discussion. The teacher did not push him, because he said he was sure that Simon would make it in the end, as he came from a solid family. The teacher said that he had talked to the father and they had agreed on letting Simon decide for himself. However, in most cases, the teachers tended to leave alone those students for whom they had low expectations, in order to 'get through' the lesson. In lessons where the teacher had authority and students' respect, most students would try to follow the instructions and take part, but even there, some lost the thread, or did not understand, and became passive. This happened frequently, as was the case for several low performing, working-class girls, who attended to their work silently and dutifully, but who rarely succeeded in attracting the teacher's attention when they needed help. Generally, the teachers tended to exaggerate the time and attention given in class to 'low performing' students. More often *inside* the classroom teachers gave priority, possibly without being aware of it, to the bright and hard-working students with respect to time and attention when they failed to adapt their teaching approach to the actual diversity, and different interests and needs of the students. This was particularly evident in larger classes. The school and teachers were sensitive to the diversity and multicultural context of their school in a general way, but all were not able to change their pedagogical practices accordingly. In order to compensate for this, the same teachers would make time and put effort into building good relations, looking after and following up the low performing students and some of those with special needs, *outside* the regular lessons.

Students were sensitive to *unfairness* in the distribution of teachers' attention in the classroom. Some teachers were accused of being more partial than others. Preferential treatment for some and not for others was evident in the interactions in the classroom. Harald, for instance, argued that his form teacher and the social science teacher were both biased, because they focused continually on the same, 'good' students, a point also suggested in Annette's interview cited above. Huan, a working-class minority student who often came into conflict with his teachers, made a comment to the same effect regarding a history class. He said that his history teacher would ignore some students, including himself, by sending them to work in group rooms where they were allowed to do whatever they pleased. She would then, according to Huan, concentrate her attention on the bright ones and those who were willing to put effort in their work. Only they, he said, received proper teaching. Certainly the picture is more complex and nuanced than Huan suggested, and this example should not be generalized to other teachers' practices in the school. This study did not include parents. However, according to the principal, the parents in general did not interfere much with the school and had few complaints, although he expected that this might change with the influx of more middle-class families.

37.4.4 *Practices of Inclusion and Exclusion*

Teachers would, in different ways, act to include socially the students and to motivate them to do the work in hand. A form teacher at *Central Park* attempted to develop initiatives aimed at changing negative patterns of class behaviour, particularly teasing and bullying. He occasionally set aside time for joking and relaxed social situations in which the students could talk together and 'have a laugh'. A class trip was organized for the students at the beginning of ninth grade, to visit a cottage in the woods surrounding Oslo – partly to improve the social relations of the class. This was a social event attended by nearly all the students, and it was reported by teachers and students alike to have made a difference in the quality of communications between the different class groups. Teasing and bullying seemed to decline, but still there was much noise and disorder. The form teacher actively tried to resolve the conflicts between students and welcome students that were defined as 'special'. The teacher said that belonging to the regular class was generally best for them, and that this should be persevered with, before remedial out-of-class or other segregated provision were chosen. The teachers emphasized the importance of social aspects of inclusion, but this did not seem in any fundamental way to affect the standardized practices that were introduced.

In Norway, students whose first language is not Norwegian or Sami, and who have poor Norwegian skills are entitled to 'Special Norwegian tuition' (here called Norwegian II) for minority lingual students. Norwegian I (regular course) and Norwegian II were organized in parallel sessions. In most classes in this school only those students of immigrant background with poor Norwegian skills would attend the Norwegian II class. Students in the observed class, however, were divided not according to language skills but along ethnic lines, with the effect that the Norwegian I class which retained status as *the class*, now exclusively was inhabited by the white, majority students. All the immigrant background students, irrespective of Norwegian skills (some were fluent in Norwegian), were required to attend the Norwegian II class, which comprised students of immigrant background drawn from different classes. The nature of the division was felt by some to be unfair. For example, some minority girls perceived the ethnic separation as discriminatory and exclusionary, and the language course as something second rate, while others were happier because they were in a quieter classroom.

Inclusive practices were seen as ideal, but the actual practices of dealing with differences, were based on traditional categorical thinking and segregated solutions, as was the case in most other schools too (Cameron et al. 2012). Special education or out-of-class remedial provision was fraught with problems, either due to insufficient resources, lack of qualified personnel, or problems of coordinating teaching inside and outside the 'regular' classroom. Most students with 'special needs' were provided with specialist teaching for only a few sessions each week. Out-of-class remedial teaching was organized in small groups with students mainly working in isolation from the mainstream, the outcome of which was that they had a more fragmented school experience and poorer teaching quality.

Central Park School had established alternatives to special education; projects which targeted students with a practical orientation and who “*need to get away a little from their school desk during the week and do other things than work with pure theory*” (school policy document).¹² There were three out-of-class, out-of-school alternatives: the Boat project, the Wood project, and the Learning for Life project or Girl project. These were said to be particularly adapted to students who ‘needed a more practical training’ more relevant to ‘ordinary life’. This provision and the accompanied discourses implied on the one hand that regular class work was theoretical and less relevant to ordinary life – and on the other, downplayed the fact that the school could not cope with these students. The following text was included in a brochure for ‘parents and all those who have their work in school’.

Both the school law and the national curriculum state that all students have a right to instruction, according to their aptitudes. Despite this, our common comprehensive school, which builds on ideas of equality and social justice, is not capable of giving the educational provision that the students are entitled to. To meet the special needs of students with a more practical orientation, Central Park School has decided to develop projects with a pronounced emphasis on practical work. Hence, we try to build on the strongest abilities of the individual student, rather than focus on students’ problems and shortcomings. (...) We want to provide students with new tasks not associated with defeat/failure, which offer the chance of mastery in accordance with personal satisfaction. This requires activities that give status and prestige to students, simultaneous to being relevant to ‘ordinary life’.

Students participating in these projects were characterized by the teachers as students who did not ‘fit’ within the ‘normal school’. The Boat and Wood projects were in fact designed for boys who displayed disruptive behaviour ‘without being too disturbed’, according to the counsellor. The third project was called the ‘girl project’ or, officially, ‘learning for life’ (in practice oriented towards domesticity), designed especially for girls of immigrant background, who, according to the Vice Principal, do ‘not function well’ in the normal school setting. Behind these crude categories, and from the interview and the observation data, it was evident that the students selected were working-class and who, at the point of transfer to a project, had experienced a long process of disengagement with the school. The transfer however meant full segregation for a period of time, with little coordination between project and studying the compulsory curriculum. This, for some, meant that they were at risk of not receiving formal certification at the end of their schooling, thus increasing the risk of their further exclusion (Frønes and Strømme 2010).

School staff claimed to be very accepting and tolerant of students with such problems. It was argued that deviant or troublesome students from a disadvantaged background were not a big problem: teachers and other students made allowances when ‘Fred would be an hour late for school, because everyone knew that [...] his

¹² A former Minister of Education, Kristin Clement (2001–2005), used much the same rhetoric in the preface to the Report to the Storting 30 (2003–2004) entitled *Culture for Learning*, i.e. ‘We shall all work towards the ideal to provide all students irrespective of their backgrounds and needs, access to adapted and differentiated teaching. All students are equal (*likeverdige*), but no-one is the same. Both ‘those tired of theory’ and ‘those with a thirst for theory’ should be met with respect’ (NMER 2003, author’s translation).

mother was drinking'. Relationships between the teachers and those who were defined as having problems were underpinned by 'principles of compassion' towards disadvantaged students rather than *belief in their capacity to learn* (van Zanten 2007 p. 440). However, there was less compassion for 'foreign minority lingual' boys with major behavioral problems, who were held responsible for the discontent of some teachers.

The categories used to define students with 'special needs', i.e. as 'sick', 'fall outside', 'do not fit into the normal school', 'do not thrive with academic subjects', 'have better practical talents', had connotations of social class bias, reaffirming middle-class students as the norm for school conduct and behaviour (Arnesen 2003; Arnesen et al. 2007). Although ostensibly benefiting from a regime of compassion, socially-disadvantaged students were most likely to receive segregated provision, and pathologised for coming from 'messy homes' and low achievement.

Alternatives outside of the 'ordinary' school were targeted at certain groups as described in the school brochure, which conveyed subtle messages about what was the norm, i.e. forms of knowledge, values, language and life styles which confirmed and supported the dominant culture, power and interests of their representatives (Bourdieu 1991). When students with 'practical talent' unable to accommodate the 'theoretical school', were excluded, the message was sent that theoretical/academic knowledge and the ways in which it is disseminated count most and have privileged status. And extending the argument, those students placed outside or excluded, were thus defined as not having a *self-evident right* to belong to the 'ordinary' school.¹³

Through pedagogy, organization of alternatives, and categorization of students, a picture emerges not only of social hierarchies between the students, but also examples of how the appropriation of academic knowledge marginalizes other kinds of knowledge, particularly those defined as manual or practical. Willis (1977) argues that the mental/manual distinction presents a 'fertile field for the construction of naturalized division in human capacities' (p. 147), which reveals how regular pedagogy transforms into forms of compensatory pedagogy that reaffirm classed and raced social difference (Möller 2013). Thus, the teachers do not simply deliver the curriculum in nice and orderly learning environments, but are part of the political and institutional context fraught with dilemmas about objectives, levels and distribution of resources, complex interpersonal and group relationships, balance between community and individual 'needs', power struggles for control and dominance, mere survival and so on.

Research has revealed the shortcomings of special education practices (e.g. Nordahl and Hausstätter 2009). Most special education research has, however,

¹³ It is interesting to observe that minority students resisted being moved to special education or other alternative provisions away from their ordinary school class. They did not want to stand out, and insisted on following the regular class, even if they were not given any special support. They insisted on being 'normal'. The case study gives examples of different situations where students faced low expectations. Some students would invest in trying to get on, irrespective of the teachers' expectation -with the help of other students, and teachers who were supportive of their efforts to make academic progress. Others were more resigned, became invisible in the classroom, and/or showed open frustration and anger.

ignored the key institutional function of special education (and other alternatives outside school) in an unequal, stratified, and racialized education system (McCall and Skrtic 2009). Poor working-class are overrepresented disproportionately in the take up of special education (Pihl 2010). Behaviour problems and conflicts with school are the most frequent selection criteria for entry into special education, which may account for the fact that about two-thirds of those selected, are boys.

Minority students are also disproportionately represented. Pihl (2010) carried out an archive study of selection criteria for special needs education of linguistic and cultural minorities in Oslo, over a period of 15 years. The study showed that the standardized tools used were inappropriate for assessing minority pupils, with the result that the children were over-represented in special education, and, to an increasing extent, became segregated from their usual classes.

37.4.5 Practices of Categorization and Assumptions of Difference

There were multiple examples where gender, minority status, achievement level intersected with social class. Noise can be one particular differentiating aspect of school life in which this intersection came to light. Noise in school seemed in general to be associated with boys. Behavior in terms of physical restlessness was also associated with boys, despite the fact that most boys were neither noisy nor restless. The Norwegian-language teacher attributed noise not just to boys, but to boys from a particular immigrant culture.

Liu is temperamental, and I think it has something to do with his cultural background. I do not know where in China he is from, but some of them are sort of quick-tempered, and restless. But he is willing to listen.

The gendered and cultural assumptions also seemed to have an implicit social class aspect; when teachers talked in depth about the noisy boys, they were making an implicit distinction between different categories of boys: the 'noisy' boys were said by the teachers to have no interest in 'theory', and were misfits in the 'normal' school with no 'inner' control. It turns out that the teachers equated the 'noisy' boys with working-class boys who dislike school. This did not change their definition of 'natural' gender differences. Typical boys' behaviour was associated by the teachers with 'noisy' working-class kids' (Willis 1977), and typical girls' behaviour, with the quietest and most well-adapted girls, as described below by the school counsellor. Staff-room talk involved conversations about the students, particularly those who presented problems. The counsellor gave an overview of different student types, from the main point of view of gender, but implicitly involving class and minority status:

There are few left of the Norwegian normal-rabbles, boys who are noisy and academically weak, although they still exist. The new is that we have more students who we perceive as being sick. The problem is depressed, boundless boys who are a mixture of violence and suicide, [and] who do not get sufficient help.

She maintained that:

The girls have not changed much, because you had the quiet reticent girls who were sitting in a corner. You had them before and you have them now. You had the resourceful bright girls. You had the dutiful girls, you had the probing girls, who often ended up going in the wrong direction. You had them before and you have them today. You can say, those we have now who we did not have before, are the lingual-minority girls, but they do not really pose any problems for the school.

The on-going categorization of students also occurred, both in formal settings for a diagnosis, a label, mainly authorized by experts, in order perhaps to obtain special education resources, and in more informal conversations in the staffroom, both underpinned particular versions of the students. These versions were based on assumptions, hearsay and knowledge often in a fragmented form about the students' lives and behaviour inside and outside school (Arnesen 2003). This student categorization, however, had consequences for the students' school life and outcome of their schooling. The urban context of the students seemed to seep into school practices, through this fragmented knowledge about their home circumstances (messy, solid, resourceful) and assumption about what students do outside school.

37.5 Student Response, Subjectivity and Agency

The students were important both as experiencing and embodied school subjects, but also as witnesses to what is taking place. They made meaning of and judgments about what they experienced, and were sensitive to injustice and unfairness of teachers. Here I address four aspects of student response, subjectivities and agency in relation to teacher practices.

37.5.1 Adapting and Opposing to Circumstances

Most students seemed to take school for granted, adapt well to the circumstances in which they found themselves and tried to make the best of it, particularly as they were well aware of the significance of education and the importance of the outcome of schooling in terms of grades which determines the range of options available to them later on. Even Tim acknowledged that 'you have to go to school'. Hence, several students talked about the necessity of increasing their efforts and intentions to the effect of doing more work as they got closer to the transition to upper secondary school. Mary, a white working-class girl, spoke about how she had not done much in the year, something she believed the teacher knew, despite the fact that he had not spoken to her about it. In fact, in the classroom context, she did not represent a problem for the teacher, and as a rule, she did not get much attention from the teacher.

Observations showed that most students were involved in everyday school activities, and tried to get on with their school work, irrespective of the quality of teaching or level of disorder in their classes. Some were ambitious and hardworking, and were able to create their own way of working, concentrating on doing the work set, despite their low grades. I interpret this behavior, not so much as a case of conformity to the school, but rather a display of rational agency, personal ambition and desire to succeed.

37.5.2 *Response to Formal Ranking*

The grades they achieved clearly influenced the students, who knew their position in the hierarchy. It similarly informed their classmates. Tom, for instance, grouped his classmates by distinguishing between ‘those who don’t give a damn about school work, those who are really smart, those who are OK and trying to improve their grades and such, and those people who used to be good and are going down, I don’t know’. Svein, who was considered to be a ‘slow’ student, found most lessons boring, and ‘a bit difficult, actually. Have problems with maths and such, grades and such. I get poor grades all the time...’.

Students reacted in different ways to getting poor marks. Some were ambitious, and worked hard to achieve their best. Some did less, unwilling to invest with respect to work. Some had given up, for example Svein who knew he would never achieve higher scores, whatever he did. Some made it clear that they would not let the school’s judgement invade their life. Martin, for example:

No, I do not always get good grades. I mostly don’t give a damn, actually. I do not care what the others say about me, or what you may think. As long as I am just being myself, I manage fine.

Martin revealed elsewhere in the interview that he actually did care about getting good marks, and hoped to improve. However, he seemed quite relaxed about it. The teacher described him as from a solid working-class family. Martin spoke about playing the horn in the school brass band. He was seen by the teacher as a ‘great guy’. Overall, he seemed to have a well-founded working-class identity, which made him less vulnerable to the school and other people’s opinion. The ability to disconnect oneself as a person from the judgement of the school, determined the extent of the influence of school assessment exerted on the individual. Marginalization processes in schools are assumed to work through the level of the importance given to schooling and education, how strongly students identify with the school and how they see themselves through the eyes of the school.

Most students tried actively to mitigate their association with failure and having feelings of not being good enough, by adopting strategies aimed at preserving their self-respect. In interviews they revealed identity work that protected them against the definitions and norms of the school. For instance, some explained that they had

low grades because they did not like either the subject or the teacher. This strategy was particularly effective if ‘clever’ students shared their perception, for example, ‘no-one likes the social science class’, as Tim put it.

37.5.3 Agency and Response to Classroom Practices

Teachers had power through the formal technologies of assessment, frequently used as carrot and stick. Or they dealt with behavioral problems by sending troublemakers to a group room, as occasionally in the social science lesson. However, students also exercised power by ‘setting the agenda’ e.g. through disruption, and hence influenced and controlled the behaviour of the others, not least the teachers. Students were occasionally also able to influence the teaching in other ways, e.g. through democratic means of negotiations.¹⁴

The teachers explained the noise and disorder in the class by referring to (1) attributes of the pupil, e.g. hyperactive, spoilt, ill; (2) poor control of (other) teachers who were either too soft or too strict; (3) minority students, particularly boys, with inadequate language skills, ‘their mother tongue is not Norwegian and hence they are frustrated at not being able to understand the lessons’; and (4) problematic relations at home and beyond the school’s remit.

The students invariably had other explanations; boring instruction associated with lack of variation, irrelevance of content, and lack of adequate support from teachers. They particularly pointed out that the teaching was often too difficult for some pupils to follow, ‘and so they cause an uproar’. Some students openly admitted that the most boring lessons were subjects where they were likely to fail or get poor marks.¹⁵

37.5.4 Relationships, Conflicts and Community

The students talked in their interviews about their relations with the teachers, about those who were good and bad. They identified teachers who seemed to care, show respect and have good relationships and working practices. They provided narratives of episodes in which teachers were prejudiced, as demonstrated earlier in this chapter. They described further incidents where teachers were seen as oppressive

¹⁴Democratic negotiation was marginal at the Central City school, but a central feature at West End school.

¹⁵In 2000 there was hearing or debate about school conditions with 12–15 year-old students from Oslo. It generated a strongly worded, unambiguous critique of traditional classroom teaching which they felt dominated most classrooms. The hearing was followed up by the book *Tre års kjedsomhet? Om å være elev i ungdomsskolen* [Three years of boredom? Being a student in lower secondary school] (Grepperud 2000).

towards some students, for instance, belittling them and using sarcasm. In the case of a student seen as a nuisance by the teacher, the student headed towards the back of the room and responded to the teacher telling him to sit down, by saying that he just wanted to fetch a book. The teacher commented 'I didn't even think that you could read!'

Relationships between students were marked by the school's urban context, with large classes and a diverse composition of students. There was much evidence, however, of students emphasizing the collective in the form of an imaginary community. They employed a range of strategies to maintain a sense of social community despite conflicts, teasing and bullying, which was more marked they said, than in the previous year when they entered the school. Most students, across differences of gender, class and ethnicity, tended to talk in collective terms.

Students were actively involved in social activities which I interpreted as 'incorporation work', with respect to helping classmates, often across social class. I observed on several occasions students spontaneously helping each other. Pauline, for instance, regularly sat next to Helen. Tor received help from classmates during lessons. Such student initiatives seemed positive in terms of promoting inclusion and enhancing the participation of everyone in the activities of the class, academic and socially. The teachers, however, did not always applaud such initiatives, especially from the brighter students, even though they found them 'touching' to observe. As the civics teacher said, she had to intervene because Pauline spent too much time helping Helen which was likely to affect her own work negatively; so she told Pauline to make sure to look after herself.

School life is a special kind of cultural and social practice in which tensions of student inclusion and exclusion is embedded. All the students recognized the school as a place where learning takes place, but some, more often working-class students, experienced much disappointment in their ending their school career without a full certificate and with experiences of neglect and disrespect. As Eivind said of his new beginning at upper secondary school, It is 'lovely to be more respected in a way, that people don't look down on you, for example and such. They look at us as human beings, it seems', compared to his experiences at compulsory school (Arnesen et al. 2013).

37.6 Conclusion

In this final section I turn to an initial question: What is the significance of social class in the school processes of inclusion and exclusion? Thinking dynamically as well as multi-dimensionally about social class, represents great challenges both empirically and theoretically. First, class, gender, minority status and disability are *structures of power in different ways*, which are systematic rather than random. However, although systematic, each school and classroom is unique in the way that power is exercised, contested and organized. Secondly, social class and other

dimensions of difference, such as gender, ethnicity and disability are historically developed within distinctive professional discourses, and organized as specialized research fields, with their respective university courses, research methodologies and journals. Hence, the intersection of areas of specialization is challenging. Consequently, rather than focus on dimensions of difference, I have tried to foreground urban mechanisms and processes of inclusion and exclusion which illuminate multiple dimensions of inequality which impact on social class. The particular significance of social class in education is according to Giroux (1983) connected to questions of what is valued through the curriculum, and what counts as high or low status knowledge (intellectual or manual). The increased academization of education, and the simultaneous reduction in the status of practical and esthetic subjects over the last two decades, is a case in point. Thirdly, social class has become a significant marker in the organization of school and students; who is the 'natural' member of the regular class, who must negotiate, and who is transferred to segregated provision. The disproportionality in special education and projects of disengaged working-class students, particularly working-class boys (both ethnic Norwegians and minorities), leads to their pathologisation when they come in conflict with the school.

Policies of inclusion are embedded in a field of tension between competing values and interests (Arnesen and Lundahl 2006). As education increasingly becomes key to the 'good life', schooling is simultaneously an object of desire and a cause of suffering, particularly for those who do not succeed. Inclusionary policies and practices need to transcend simple change solutions by taking a critical look at current tendencies across the educational landscape. These suggest firstly, that education increasingly privileges academic knowledge and gives more weight to students' cognitive abilities, distributing reward and punishment through 'objective' merits regardless of the students' background, experiences and interests. Secondly, children's and young people's upbringing and life are increasingly subjected to institutionalised scrutiny and surveillance, in which social class issues and inequalities are transformed into discourses of individual failure and pathology.

Teachers are confronted with increased demands to deal with student diversity and a variety of problems arising from the urban context. They have heavy workloads and, in many cases, limited means of realising the aims of the 'inclusive school'. We should ask, following Silver and Miller (2003), whether demanding *full inclusion* is likely to show that hierarchical practices in school and disadvantage in terms of poverty, social exclusion and other forms of domination are integral to the functioning of society, rather than accidental or unintended consequences easily addressed with alternative programs or financial adjustment here and there. This question needs increased attention in a time of global capitalism and rapid political and social changes, even in such 'well-functioning' welfare societies as Norway. There is a need for more comprehensive and critical analyses that is able to demonstrate the interactive dynamics between political, institutional, relational, and ethical dimensions of classroom practices in urban contexts. Such analyses should include, as in the present study, making visible classroom processes and the

experience of different groups of students and teachers, but taking it further to show the limitations and blind spots of equality and inclusion policies which privilege some students and disadvantage others. Furthermore, I suggest that it is necessary to address agency that may foreground the students' desires and ambitions, hence raising ethical questions about what living a (school) life under different conditions might or should entail. These are complementary themes that may open up new ways of discussing how social justice, inclusion and equality can be enacted, within and outside schooling.

Chapter 38

Educating ‘Euro-citizens’: A Study of a Vocational Uppers Secondary Programme in Health Care and Social Services in a Finnish (Sub)Urban Setting

Sirpa Lappalainen

38.1 Introduction

Nordic countries, such as Finland, have long been regarded as paradigmatic welfare states, where citizens receive support in order to secure their well-being as well as benefit from the common good (Bloch et al. 2003; Esping-Andersen 1996). However, the Nordic welfare state model has been eroded by the spread of neoliberalism, which emphasizes economic reasoning and market orientation (Gordon et al. 2003; Telhaug et al. 2006). This erosion of the welfare state has impacted on the idea of citizenship. In the Finnish context, turning points included an exceptionally deep economic depression at the beginning of the 1990s and membership of the European Union in 1995. The economic depression worked to legitimate changes in politics and policies – neo-liberal reasoning was added to the political agenda through a rhetoric of necessity in a difficult economic climate (Kantola 2002). The concept of the ‘active citizenship’ was mobilized (Harinen 2000). Individuals were required to take responsibility for their own success and also for the wellbeing of their inner circle. One of the paradoxes was that on one hand individuals were pushed to take risks; on the other failure was potentially more disastrous from individuals’ point of view because the welfare state did not provide the same backup as previously.

The state was no longer understood as responsible for protecting individuals from the uncertainties of the market, but rather, for helping people to participate successfully in the market through education, flexible employment and tax incentives (Turner 2001 p. 194). This meant that although equity remained a goal, the focus was more on equal access than equal outcomes, and inclusion was more extensively based on individual positioning in the market and patterns of

S. Lappalainen (✉)

e-mail: sirpa.lappalainen@helsinki.fi

consumption. Moreover, again partly due to its weak economy, Finland was exceptionally conformist to the Europeanisation of educational policy (Lundahl 2007; Ollikainen 2000), this shift in reasoning much in evidence in curriculum documents. This shift was exceptionally marked in curriculum documents of Vocational Education and Training (VET) (Lappalainen and Lahelma 2015). From the millennium onwards, vocational curriculum documentation has contained discourses referring to a new kind of ideal subjectivity; the internationally flexible, labour-market citizen, who on the one hand is capable and willing to cross national borders for employment and on the other, as a consumer and worker, also pays attention to national interests (Isopahkala-Bourét et al. 2014). However, for example, students participating in the research tended to be quite sceptical about their prospects in the transnational labour market, seeing their future mainly tied into the local context (Lappalainen 2014). The national curriculum can be understood as a programme, which the nation state, through political debate, has established to prepare young people for future citizenship (Erekson 2012; Gordon et al. 2000; Yates and Grumer 2011). At the same time, defining desirable features of citizens works as a tool for social selection and control (Hargreaves 1994). However, as Ball et al. (2012, p. 3) argue educational policy statements are not implemented but enacted; i.e. 'translated from text to action' in relation to a particular historical context. Thus, although, statements presented in curriculum oblige educators to adopt certain pedagogical practices, they can be put into effect in a revised form and thus be contested.

In this chapter, I explore how the ideal subjectivity of labour-market citizen introduced in curriculum is (re)formed in the everyday life of a vocational upper-secondary college of Health Care and Social Services (HS). I have chosen to focus on HS because it is a sector where changes to the welfare state have been most pronounced (e.g. Filander 2003). Moreover, educational and vocational guidance (EVG) as well as employment authorities tend to propose HS for particular groups of people. For example, girls (Kurki 2008) and women (e.g. Antikainen 2010; Chang 2014) with immigrant background are thus actively guided towards HS regardless of their previous educational history. Also for young people with low grades in school, HS is often seen as a 'realistic' educational track (e.g. Lappalainen et al. 2013). Previous analyses of curriculum documentation suggest that the ideal subjectivity, based with neo-liberal reasoning, is the labour market citizen: students are expected to internalise the ethos of entrepreneurship and lifelong learning, and become capable of change, for instance as already noted, in crossing national borders to follow the needs of the labour market (Isopahkala-Bourét et al. 2014; Lappalainen 2014). Although, this neo-liberal reasoning has begun to impact on the objectives of existing educational policy, analysis of pedagogical practices in the female-dominated upper-secondary college of HS complicates the picture by revealing how neo-liberal reasoning can be problematised and the social democratic basis of the programme actively and subtly maintained.

38.2 Theoretical Background

This chapter draws on two research projects,¹ which focused on an analysis of the construction of citizenship and difference in upper-secondary vocational education and training (VET), a field where young people are prepared for labour-market citizenship. The concept of citizenship is historically constructed, and thus the economic, political and social climate shapes the ways it is understood (Harinen 2000; Skeggs 2004). Following Ruth Lister (2003) and Nira Yuval-Davis (1997), citizenship here is regarded as multilayered and contextualized, drawing on meanings from lived experience and the social, historical and political context. Historically, as a means to train rational, disciplined and obedient workers, vocational education had a special relevance in Finnish nation building and citizenship (e.g. Kettunen 2010 p. 220). The concept of labour-market citizenship in the research projects refers to the transformation from representation of ideal citizenship in relation to the nation state, to relating instead to the transnational labour market, for example, involving multinational companies.

Theoretically *feminist post-structuralism* frames the subject as constantly in a process of becoming; constructing itself by drawing on available discourses and cultural practices, while at the same time, forced into subjectivity by the same discourses and practices (Davies 2004; St. Pierre 2000). *Materialism* refers to understanding such subjectification in a social, economic and historical context (Jackson 2001 p. 284). This approach to understanding subject formation influences how class is conceptualized. Although the students' backgrounds can be described as working class or lower-middle class in terms of their parents' educational and professional backgrounds, class is not reduced merely to socio-economic status. Class is understood as a social position, which is changing and blurred in interaction with other categories, such as gender, age and ethnicity. Together these elements can be seen to strengthen social hierarchies, but they may also operate in contradictory ways (Anthias 2005 p. 36; Tolonen 2012 p. 127).

The above theoretical perspectives were intertwined with the adoption of a *contextualised ethnographic perspective*, meaning that fieldwork interpretations are understood against the background of current educational policy (Lahelma et al. 2014a). This theoretical framework acknowledges both the existence of educational structures and governing techniques of vocational practice and politics, and how people located in the educational field exhibit their agency (Adkins and Skeggs 2004). This is exemplified by analysis of subject formation in relation to 'Social, Business and Labour Market' and what it provides for (sub)urban youth subject, and also how it relates to the erosion of the Nordic welfare state.

¹The research projects were funded by the Academy of Finland and were entitled: Citizenship, Agency and Difference in Upper Secondary Education – With Special Focus on Vocational Institutions (project number 1131548, led by Elina Lahelma) and Learning to become practical nurses: Ethnography on Vocational Education of Health care and Social services (project number 1133632, led by Sirpa Lappalainen).

38.3 'Urban' in the Finnish Context

It is important to keep in mind context when using the concept 'urban'. This is a study of vocational education in a Finnish suburban setting. Finland is a relatively sparsely populated Nordic country with few metropolitan areas. 'Urban' in the Finnish context is usually associated with former working-class areas, now populated by the so-called 'creative class'; that is, people working in the fields of art and design, information technology and academia – with music festivals, vintage shop, yoga studios, pop up cafes and so on. Like other Nordic countries, it is the suburban districts, which have the reputation as the main source of social problems, e.g. unemployment, poverty and substance abuse (Öhrn 2012). These are, however, areas where unemployment rates and proportion of population with an immigrant background are higher than average, and education and income levels are lower than average. The current tendency in Finland is to centralize public services such as health care, social services, education and culture into larger units, with, for example, small local libraries and health care centres under threat. Thus availability of local services varies, and at its minimum, comprises just a small shopping mall with grocery, hair salon and pub or pizzeria.

The welfare state still has some influence despite the erosion of public services, and Finland is not the worst in terms of regional segregation. Due to economic development, welfare policy in the capital Helsinki, for example, regional socio-economic differences were decreasing until the 1990s (Vaattovaara et al. 2011). Moreover, unlike suburban districts, for example Rosengård in Sweden or Clichy-sois-Bois in France, Finnish suburban areas were not subjected to violent forms of collective resistance. However, trends in recent decades are worrying. Structural changes in economy and migration have reversed patterns of socio-economic difference between the areas (Kortteinen et al. 2006) and school achievement levels (Kuusela 2006, 2010) and thus Finland is now closer, socio-economically, to more segregated countries (Bernelius 2013). At the policy level, segregation in metropolitan areas is considered a social risk that needs to be avoided (e.g. Bernelius 2013). Still, this has not stopped governments from pursuing New Right policies, which deepen the gap between advantaged and less advantaged groups and strengthen obstacles preventing upward mobility. The revision of Basic Education Act 1998 (628/1998, 6§; 28§) was a turning point in terms of regional educational segregation of education. Before the revision of the act, schools had particular catchment areas, which in practice meant that pupils went to the local school. After 1998, schools still had to take pupils living in their catchment areas. However, pupils had right to apply to attend a school outside their neighbourhood. In fact, this increased level of choice favoured more privileged groups with greater economic, cultural and social resources (Kosunen 2014). A more recent example of New Right policy is a government's bill to restrict children's right to early childhood (pre-school) education. NGOs focusing on children's right and wellbeing, as well as education trade unions and critical researchers came out against the reform, which is considered a serious reversal for educational equality.

38.4 Research Context

This chapter draws on 3 years of ethnographic fieldwork (Autumn 2007 to Spring 2010) in one vocational upper secondary college specializing in courses in Health Care and Social Services (HS). Upper-secondary vocational education comprises, in general, 3 years of study in a specific vocational sector. This gives, in principle, eligibility for entry into higher education, both polytechnics and universities. However, the most preferred institution is the more vocationally oriented polytechnic rather than university. After getting their school leaving certificate, students become qualified practical nurses.² They work at basic level within nursing, care, education and rehabilitation, in the health care and social services sector. The sector has problems in recruiting; therefore the knowledge and skills provided at upper-secondary college will enable young people to take up relatively stable forms of employment. However, the work at basic level within HS is poorly paid. It might guarantee reasonable living standards but does not allow for middle class forms of consumption.³ Moreover, although VET, in recent years has actively been promoted by educational stakeholders, still the more academically oriented route of general upper secondary education has surprisingly well retained its symbolic value.

Student choice between different upper-secondary study pathways can be said to be classed, ethnicised and gendered. Young people from working-class and/or ethnic minority backgrounds more often end up on less culturally-valued vocational routes than white middle-class youth, who form the majority in more academic forms of study (Rinne 2012).⁴ Gender segregation inside VET is also evident. According to recent figures (Official Statistics of Finland 2013), the field of HS is 85% female, whereas for Technology and Transport, the percentage is 18.

The college where the research was carried out was one of the biggest in Finland with approximately 1900 students and 190 teaching staff. Most students interviewed in their first year at college lived in the suburbs, where incomes and employment levels are lower and proportion of migrants higher than average, as already noted. For female students living in the suburbs, this college seemed to be the most obvious choice. The few 'high achievers' at the college were of much curiosity to the teachers, who wondered why they, given their wider choice of other more academic courses, had chosen the vocational route of HS.

In the first 2 years of fieldwork, I followed a group of 24 students (22 female and 2 male), who had started their studies in Autumn, 2007. Most students decided on vocational education as soon as they completed compulsory schooling. Most were

²Practical nurse is a protected occupational title licensed by the National Supervisory Authority of Welfare and Health.

³In 2014, the average wage in the public sector was 3094 euros (Official Statistics of Finland 2015), whereas according to the Finnish Union of Practical Nurses, the average wage of a qualified practical nurse was 2076 euros (Super 2015).

⁴The Finnish upper- secondary education system is strictly divided into general (gymnasium) and vocational institutions. The former offers an academic, all-round programme of studies that prepares students for the matriculation examination.

born in 1990 or 1991, so that their childhood was spent during a marked economic downturn of the 1990s in Finland. Moreover, their first steps into the labour market were blighted by the continuing difficult economic climate.

The last year of fieldwork was spent following three groups of students at the end of their college studies. Student ages varied in the groups; the youngest students were just 18 years old, while the oldest were over 30. At the beginning of the academic year, group size varied between 18 and 24.⁵ Two were single-sex female groups, whereas the third had slightly more females than males. All students interviewed had completed their compulsory schooling in Finland although three had come to Finland when very young and two had transnational family arrangements.

Here, the main focus is on the course 'Social, Business and Labour Market (Subjects)' (SBLS), one of nine core subjects.⁶ The course was divided in two parts. The first part was taught in the second year of a basic studies programme and the second, took place in the students' final year. Course teachers were well qualified with university degrees in the social sciences. The objectives of the course were as follows, that the student: (1) contributes to the management of general affairs at college and in on-the-job training placements; (2) assesses his/her abilities as an active citizenship and consumer; (3) knows how to use social services provided; (4) draws up a personal financial plan; (5) assesses the significance of entrepreneurship to the Finnish national economy; and (6) is able to search for information on workplaces in the health care and social and health care sector as well as on the European Union and its citizens (Finnish National Board of Education 2010, 244). Here, SBLS is regarded as an arena where expectations regarding future labour-market citizenship are produced, reproduced and challenged.

38.5 Data and Methodology

The analysis presented in the chapter draws on field notes generated by the SBLS course (12 days) plus interviews with two teachers who taught the course, lasting each approximately 80 min. The ethnographic fieldwork (Heyl 2001; Lahelma 2002) shaped how interviews were conducted and what questions were asked. The teacher interviews started with a request for a description of their work history, with further questions relating to their job description (e.g. what kind of courses he/she is teaching, what he/she is emphasizing in teaching), student group, differences between students, and educational 'philosophy' as well as the content of the subject that they were teaching.

The process of analysis had three phases. The first phase was an overall reading of the materials generated by the whole research project, highlighting areas, where

⁵Due to suspensions and dropouts, the group's size tended to decrease during the year.

⁶The nine core subjects are Swedish, second national language, foreign language, mathematics, physics and chemistry, business and labour-market subjects, physical education, health education, arts and culture.

questions of citizenship were actualized. This research phase showed that SBLS was an educational space that was ambivalent towards the requirement for neo-liberal reasoning. For example, the curriculum and the content of the course are explicit in promoting a particular kind of subjectivity; of flexible and mobile workers with an internalised ethos of entrepreneurship. This however was challengeable during the lessons. While the content of the curriculum was acknowledged in teaching, the way issues were introduced seemed dissonant with the 'ethos' of the curriculum texts. The second analytic phase focused on field-notes of pedagogic encounters between teachers and students on SBLS course in more detail (see Youdell 2011 p. 85), especially how society was constructed in these encounters: i.e. what was said and what were the consequences. The third phase involved reading the field notes and teacher interviews side-by-side, to explore how teachers make sense about their own teaching. This analytic phase revealed how teachers struggled with and negotiated the content of curriculum.

38.6 Business and Labour Market Subjects: An Arena for Problematising Neo Liberal Reasoning?

38.6.1 The People's State?

The following snapshot comes from beginning of the first lesson of the SBLS course. The teacher describes the content of the course, and introduces concepts of family, community and society.

Kimmo (a teacher, male) delivered the outline of the course saying that the course is one of the core subjects and it is common course for all vocational students [...]. He said that we are not going to use any textbook, which means lot of notes. In the printed outline of the course, the core content was listed under the following topics: acting as a member of society and EU citizen; impact on households and companies of Finland's and the EU's economy; acting as a member of a work community; acting according to labour-market procedures. He mentioned the rules of working life, noting that 'quite a lot of you have experience on working life already'. He started to talk about the concept of society, illustrating his talk by drawing nested circles on the blackboard with the smallest representing individual, the next size up representing the family, and the next representing community and the largest, the EU. He explained that often the starting point is a family; 'individuals form a family. A family is a place for reproduction where our batteries are recharged so that we are able to act in society'. The concept of community was explained as follows. 'Community is often formed by individuals, who have a common goal more or less.' The football team was given as an example on a community. He continued by referring to the history of Finnish nation state, describing how artists and intellectuals built a joint mental image of Finland. 'We were injected with a common sense of belonging in between the huge Russia and Sweden. He then brought the EU into the discussion, and how we were incorporated into the big joint family of the EU. (Fieldnotes: SBLS, Autumn 2008.)

In analyzing this example, questions arose about the ways society is described and made sense of (Davies 2004). The above 'synopsis' of the lecture shows society

as starting from the individual through to the family, community (e.g. football team) and nation state, ending up with the EU. Individual and family are described in abstract gender-neutral ways; categories of male and female are not reproduced. Moreover, the family could be any kind of family; hetero-sexual nuclear family, 'rainbow' multiethnic family or extended family. Community is illustrated by the football team which is curious in such a female-dominated context. Football has not the same relevance in Finland as, for example, UK or Germany, where the local football team is both a binding and potentially dividing force related to social class and regional as well as gender identity formation (Dunning 2000; Gibbons 2014; Harris 2001). Traditionally Finnish 'teacher-hood' or professional self-concept is characterized by conformism towards governmental ideology and adoption of a neutral, non-political stance (Räisänen 2011, 442). Although religious community, political party or fan club might have been better illustrations of community, football, from the (male) teacher's point of view, was a neutral way to exemplify the idea of community.

As the lecture continues, the teacher makes visible how the Finnish nation state can be seen as a formation of elites, where the common sense of belonging is based on the geo-political location between two more powerful countries. Benedict Anderson (1983/2006), in his analysis of the spread of nationalism, provides the concept of 'imagined community', as not something concrete but rather, an image of affinity that members hold in their minds (Anderson 1983/2006). In his lecture, the teacher reveals the process of imagining the Finnish nation state. When introducing the EU, he has no similar story. However, when talking about EU he used the metaphor of family to communicate collective aims, at the same time as still keeping an analytical distance in describing how national and transnational collectives are created through political action.

In the interviews, I asked teachers to reflect on what were the most important course themes or issues. Kimmo said that one of his aims is to cover themes in the curriculum. However, his main concern is to transmit an understanding of how society works and awaken student interest in social issues. He expressed a commitment to the view that this should be carried out in a neutral manner. 'At least I tried to avoid expressing my own values, though still for sure they (values) sometimes pop up'.

Kimmo's view of the social/civil awareness of his students was relatively pessimistic. He argued that many of them have no idea of basic concepts such as state or municipality. He especially mentioned the EU as a challenging theme to which he generally gives less attention. It has been argued that European education policy has not managed to dissociate citizenship from the nation state, so that people's sense of belonging is still based on the idea of national community (Philippou et al. 2009). Teaching on SBLs was generally based on existing 'stories' about the nation while it was more difficult to create collective narratives for 'euro citizenship' even though it is a formal aim of the course.

The lecture described above continued with the next part focusing on society:

Kimmo introduced a picture of three intertwined wheels, which illustrated the social, political and economic systems. It was explained that society is made up of three systems: social, voluntary coalitions of people, such as hobby clubs, residents' associations, sport clubs;

political, how social life is organized by means of administration and legislation (State and municipalities). [...]; and economic, the pursuit of profit, companies.

Kimmo: The political system tries to constrain the economic system so that people are not exploited.

Kimmo asks whether any one system dominates the others

Helmi (female student): Money dominates too much.

Pilvi (female student): Agree, money dominates far too much, nothing can't be done without money.

Kimmo: How might it be possible to reduce that domination? I do indeed agree with you.

Laura: I think it's entangled with social; there are people who can't afford the [medical] treatment that they need.

Kimmo turned the discussion to children's leisure activities and how parents are required to give money for activities.

Kimmo: You mean that the political system isn't working properly? The allocation of resources is politics. (Field-notes: SBLs, Autumn 2008.)

It has been argued that neo-liberal reasoning indicates a move away from a rights-based model of citizenship to citizenship based on consumer-orientation, entrepreneurship and the economy; with the state entrusted through education to produce particular forms of subjectivity appropriate for the presumed needs of the economy (Peters 2011 p. 174; Komulainen 2006 p. 215). Our previous analyses (Isopahkala-Bouret et al. 2014; Lappalainen et al. 2010) indicated how neo-liberal rationality and emphasis of market forces, is expressed in vocational curriculum documents. However, Kimmo's teaching as above indicates that neo-liberal reasoning can be problematized by both teachers and students. The teacher (Kimmo) argues that 'the political system tries to constrain the economic system so that people are not exploited'; hence the relationship between political and economic is seen by him as contentious; and the present economic system is potentially exploitative and needs to be regulated by the political system. Kimmo makes the point that the political system should not be for economy but for the people. Students point out that material resources set limits for individual agency. Kimmo supports this interpretation by citing an example of how the need to make money affects the leisure time of families and also by asking what could be done to reduce the domination of economics. This view of the relationship between economy and politics, co-constructed by teacher and students, offers a challenge to the demand for neo-liberal rationality and echoes the tradition of the social democratic welfare era when the role of the state was seen as to protect people from the uncertainties of capitalism.

38.6.2 Uncomfortable Entrepreneurship

As already noted, Finland has been pro-active in developing education for entrepreneurship. Vocational education has a place in the education system from primary school to higher education (Komulainen et al. 2009 p. 631). The title of the course, 'Business and Labour Market Subjects', reflects the inclusion of industry and commerce in school and university curricula (Ahonen 2003). One objective of SBLs is

therefore to understand the ‘significance of entrepreneurship to the national Finnish economy’ (Finnish National Board of Education 2010 p. 244). Katri Komulainen et al. (2009, p. 632) have introduced the concept of ‘the enterprising self’ referring to the moral regulation inherent in neoliberalism. It operates through various institutions, promoting an entrepreneur-like subjectivity, including ability and willingness to take risks, independence, and self-reliance as a desirable form of the selfhood (ibid). Curriculum texts are seen here as cultural practices, where the ideal subjectivity of the ‘enterprising self’ is defined (see Isopahkala-Bourét et al. 2014; Koski 2009). However, the following example shows ambivalence in how entrepreneurship is handled. This is taken from a lesson which took place in the students’ final year at the college:

We moved on to the next theme, which was entrepreneurship. The way the theme was introduced made me feel that the teacher’s view might be quite ambivalent. [...] Asko (male teacher): We have this weird theme; entrepreneurship. It’s a big issue – we have an entrepreneurship boom here. [...] Is it possible to become an entrepreneur straight out of school?

Laura (the student): Why not?

Asko: Would you?

Laura: Well, no...

Asko: If we talk about ‘care entrepreneurship’, if you are not interested at all, that’s fine, you can keep your own distance.

Asko stated that it is good to be critical. One student commented on entrepreneurship as too complicated. Asko wrote on the blackboard “Finnish attitudes” and explained. Previously there was a time when entrepreneurs were hated as capitalist predators; nowadays it’s the other way around.⁷ [...].

Asko: How much do entrepreneurs work?

Ninni (student female): 24/7.

Asko: A bit overkill [...] He continued to explain that Finnish thinking is wary of the huge risks of entrepreneurship, ‘a myth of bankruptcy and then comes divorce, alcohol and drugs – truth or legend?’

Minja (student female): Overkill.

[...]

Asko: It is thought that as wage earners we stay safe but it doesn’t work out like that, the wage earner is not safe in this country either. (Fieldnotes: Business and Labour Market Subjects, Spring 2010.)

Most interesting about the example given above is how, when introducing entrepreneurship as ‘weird’, Asko does not assume that it is a legitimate topic for the course but rather, something, which is difficult to incorporate. The theme of entrepreneurship is addressed by drawing on the conventional cultural narrative of risk and failure. Exposed to colourful expressions like ‘capitalist predators’ and descriptions of personal catastrophe such as bankruptcy, divorce and drug-taking, students are facilitated in understanding the change in political climate – where entrepreneurship changes from something that is socially suspect to something highly desirable. It is hard to see in Asko’s story about social change, an advocacy of entrepreneurship; rather he puts an analytical distance between himself and officially promoted views on entrepreneurship, making visible the political nature

⁷This particular teacher tended to use colourful expressions and juxtapositions.

of the phenomenon. Asko thus promotes critical thinking among his students rather than proactive commitment to entrepreneurship.

Of further note is that while the teacher makes it clear that entrepreneurship is supposed to be discussed in the course, sceptical views are openly encouraged (see Koski 2009). At the end of the lesson described above students were given an assignment, of which the last of three options was on entrepreneurship – students were asked to develop a business plan. When handing out the assignment the teacher commented, 'This third one is for those with an entrepreneurial mindset – you have to think about yourselves as entrepreneurs; if you hate it, this is not your choice'. I interviewed the teacher after the course was over. He had taught social sciences and business since the 1980s in polytechnics and in vocational education, having previously worked in public administration and welfare of drug-users. I raised the manner in which entrepreneurship was introduced in the course discussion:

SL: When I followed your lessons I started to wonder, you said something like 'you can keep your opinion', I mean I started to wonder whether entrepreneurship education has met opposition, or whether you meant to communicate a critical stance, I mean, it just made me curious.

Asko: Well yes, (small laugh), I have taught so much, it might have come up somehow automatically, well definitely, I am a bit critical, I mean we have lot of kind of like fanaticism and kind of like flimflam in terms of entrepreneurship in our society. These entrepreneurship educators, they think too enthusiastically that it is a solution to everything and it should be implemented in early childhood education, even for toddlers. I find it a stupid and childish idea, especially in the care sector. Nurses have to become skilled professionals, in the first place. After that, it makes sense that some of them might end up as entrepreneurs. And I think also that it might be liberating, I mean I know that quite a lot of nurses are critical as well, and students also. It might be liberating to know that you can think what you like, that you are allowed to listen and discuss and form your own opinion and you are not supposed to be extremely positive. I have gained the impression of the implementation of the idea of positive thinking in entrepreneurship education. I don't think in that way, it is OK to be critical or have a negative view. But, well I haven't thought about that before (Teacher interview).

Both Kimmo and Asko took a somewhat critical stance towards entrepreneurship education. However in the extract above, Asko used epithets of 'fanaticism' and 'flimflam' in his criticism of entrepreneurship education, words conventionally used to articulate a disapproving stance toward religious worldviews. He also actively distanced himself from entrepreneurship educators, whose confidence in the potential value of entrepreneurship education, he ridiculed. The concept of the 'enterprising self' contains the interweaving of various moral attributes defining the good life (Rose 1992). Initiative, independence, assertiveness, risk-taking, self-responsibility are all regarded as characteristics crucial in entrepreneurship (Keskitalo et al. 2010 p. 15). According to Koski (2009) the advent of the idea of the 'enterprising self' in educational policymaking throughout the European Union symbolises the presence of new technologies of moral regulation. Drawing on Deleuze-Quattarian theorization Deborah Youdell (2011, p. 14) suggests that education should be understood as a complex assemblage of various heterogeneous objects, which create unity through the way they work together. Youdell (2011, p. 15) argues that politics is manifested

and pursued at all levels of education from political election manifesto pledges to everyday life inside educational institutions. In the pedagogical encounter described above, the teacher negotiates with the curriculum, seeking ways to fulfill the expectations of him as stated in curriculum, without surrendering his intellectual integrity.

It has been noted that SBLS is a space in which there is an expectation to cultivate the entrepreneurial mindset of students. However, the teachers interviewed do not consider entrepreneurship as a concept describing selfhood but rather as a relation between individual and labour market. Their vision of the future of their students is as wage earners not entrepreneurs. Moreover, as our earlier analysis shows (Lahelma et al. 2014b) HS teachers prefer to see themselves as professionals, providing the qualifications needed in the workplace. This might explain their ambivalence in terms of entrepreneurship education. In the context of HS vocational studies, this ambivalence creates a space where educational aims which draw on neo-liberal governance can be criticised (see e.g. Besley and Peters 2007).

38.7 Conclusion

In this chapter I have focused on pedagogic encounters between teachers and students in the context of SBLS, a subject in the upper-secondary vocational field of Health Care and Social Services, which, in the Finnish urban context, is a popular option for young women from working-class and ethnic-minority backgrounds. Traditionally Finnish teachers do not problematize governmental educational ideology (e.g. Räisänen 2011); that is considered to be the task of sociologists. Therefore, the way that SBLS was taught was surprising. Although teachers were careful to cover all aspects of the curriculum, their teaching certainly did not conform to the existing political climate which emphasises neo-liberal reasoning and the labour market. Social democratic welfare values were acknowledged in the criticism of the idea of the enterprising self.

Although the national curriculum is intended to govern education, still as Deborah Youdell (2011, p. 85) argues, the ways educators think about and engage with educational systems, structures and processes influence in pedagogy – even though, as Kimmo stated in the interview – they actively try to avoid conveying their personal views. SBLS was mainly taught by the teachers with a background in the social or political sciences. I want to suggest that it was this academic background that enabled them to distance themselves from government ideology and made it hard for them to ‘buy into’ the rationale, in which people’s successes as well as failures are individualized and where the main aim is to produce obedient citizens with enterprising mindsets (see Koski 2009).

Due to the Europeanisation of Finnish VET, neo-liberal reasoning frames the curriculum and more explicitly, the objectives of SBLS. However, teachers and students displayed the power, at least to some extent, to disrupt the discourse of neo-liberalism. SBLS lessons constituted an arena where disruption was possible,

and where there was a space for critical thinking. Historical tendencies were used critically to scrutinise marketization as well as entrepreneurship. What might this mean for young people growing up in suburban settings, who intend to work in the care sector which provides relative security of employment, although poorly paid? In fact it cuts both ways. On the one hand, the critique of neoliberal policies can be understood as a counter politics (Youdell 2011 p. 15–16), which takes the form of everyday struggle or resistance, provokes awareness of forms of governance, and, at best, awakens a sense of political agency among young people. On the other hand, when preparing students simply as wage earners, the risk is that their future vision is simply to become skillful and caring workers at the lowest levels of the public sector. Their vocational education and training thus becomes merely the reproduction of a discourse of 'lack of alternative', which according to Skeggs (1997, p. 161) is a central feature of being working class. Fulfilling individual aspirations is a luxury primarily available to white, middle class high achieving youth. Moreover, the female-dominated field of HS is poorly paid compared with other male-dominated vocational sectors. There is an equity problem where belonging is based on individuals' market and consumption positioning. Thus the challenge in educating these young people from the city and the suburbs in particular is how to problematize and disrupt prevailing discourses of neoliberalism without destroying their hopes and ambitions for the future.

Chapter 39

‘We Are Not Interested in Knowledge for Its Own Sake. Knowledge Should Be Put into Motion...’ Young Adults, Social Mobilization and Learning in Poor, Multi-ethnic Suburbs in Sweden’s Metropolitan Districts

Ove Sernhede

39.1 Aims and Method

In recent times we have seen hopeful signals from many multi-ethnic high-rise suburbs in the metropolitan districts of Sweden. Young people have formed organizations with explicitly articulated objectives to help themselves, and others in similar situations, to acquire knowledge and apply the knowledge in constructive dialogue rather than engage with authorities through Molotov cocktails and police confrontation. Drawing inspiration from hip-hop culture, the tradition of adult education that was once crucial for the Swedish labor movement, and global narratives, a new social movement is seeking a voice in local and national policy-making. A broader public became aware of these developments in the aftermath of widespread riots by youths in Stockholm in 2013, when representatives of the organizations offered articulate explanations for the violence in marginalized suburbs (without condoning it) on various media platforms.

This chapter initially outlines the socio-economic background that engendered this new form of suburban mobilization. It focuses mainly on an organization called *The Panthers for the Restoration of the Suburb* in Gothenburg (hereafter the Panthers). However, two other influential organizations are also considered: *The Megaphone* in Stockholm, and *The Voice and Face of the Street* in Malmö. A key theoretical aim is to acquire contextualized understanding of the organizations’

The title relates to a quote from Sandor, a 26-year old informant with a Bolivian background and member of *The Panthers for the Restoration of the Suburb*.

A **young adult** is, according to Erik H Erikson (1993), anyone who is 20–30 years old, a category mainly used in professions related to healthcare and social work.

knowledge-seeking and mobilizing activities, as well as the purposeful learning processes embedded in their everyday practices. A subsequent practical aim is to apply any understanding gained to consider lessons that compulsory schools run by the municipality could potentially learn from the joyful and purposeful learning the organizations espouse in their daily activities.

The chapter is largely based on information gathered in an ongoing research project, financed by the Swedish Research Council (VR), entitled *The Suburb and the Renaissance for Adult Education: Adult Youths' Self-controlled Communities of Practices, for Learning and Social Mobilization in Poor Neighbourhoods in Stockholm, Gothenburg and Malmö*. The collected data are ethnographic, mainly gathered through participant observations and interviews (Beach 1995; Willis 1977, 2004) together with 'netnographic' examination of ways that members of the Panthers interact and communicate through social media.¹ In accordance with the aims of the project (and this chapter) informants are selected through procedures that Morgan (1998) calls 'purposive sampling', i.e. from contacts made in the ethnographic fieldwork. All the individual interviews are semi-structured and carried out in the neighbourhoods where the organizations are rooted and active.

39.2 The Structure of the Chapter and Some Theoretical Considerations

Young people's knowledge-seeking practices and engagement in civil society activities are complex and multi-faceted, especially in areas marked by segregation and multidimensional poverty. Therefore, limiting research to a single theoretical perspective would, at best, severely restrict the insights that could be obtained. Thus the first part of the chapter provides background information about this new social movement, identifying and considering the key shared elements of the focal organizations' socio-economic and cultural contexts. During the last three decades Sweden has been transformed into a society with very similar patterns of inequality to those of many other European countries. To understand these societal traits and how the development of Swedish society has affected people in different social and economic positions knowledge of contemporary national and international research on segregation, exclusion and new patterns of poverty is highly valuable (Bourdieu et al. 1999; Salonen 2013; Wacquant 2008). Post-colonial theory (Appadurai 1997; Hall 1996) is also crucial in this respect as well as knowledge of urban studies theories on space, social order and identity related to theories of marginalization and citizenship (Bunar and Sernhede 2013; Dikec 2007; Harvey 1989, 2009).

The second part of the chapter presents the three organizations mentioned, the tensions that fostered their creation, the main issues they address and their articu-

¹Netnography is the branch of [ethnography](#) that analyses the behaviour of individuals and groups on the Internet. Netnography uses online marketing research techniques to provide useful insights. The term "netnography" was coined by Robert Kozinets (1998).

lated objectives. The third part focuses more closely on the Panthers, analysing (*inter alia*) the organization's knowledge-promoting and other (intimately associated) social mobilization activities. For this purpose there is a need for theories on civil society from political science (Putnam 2000; Rothstein 2003) and sociological theories on social movements (Castells 1983, 2010). Knowledge of insights gained from studies on the democracy-strengthening potential of adult education is also important (Du Bois 1998; Gustavsson 1995). This part of the chapter also analyses in more detail forms of learning that are embedded in the everyday practises of organizations like the Panthers, thus there is a need for theoretical understanding of learning processes (Fornäs et al. 1995; Lave and Wenger 1991).

39.3 Background and Social Preconditions

In the summer of 2013 a series of intense youth uprisings in several Stockholm suburbs took much of the world by surprise. For a week Swedish youth hit the headlines in global media. Sweden had not seen unrest on such scale since the hunger riots that raged in Swedish cities during the First World War. However, for anyone aware of the impact on Swedish societal life of the rapid neo-liberalization that began in the late 1980s, angry responses in the urban margins to alienation, unemployment, austerity and modern poverty were neither surprising nor new.² The uprising started in Husby, a poor high-rise neighbourhood in the north-west of Stockholm, after a resident was killed by a policeman. The police statement about the event was not consistent with what actually happened. Everybody knew this since some inhabitants had video recordings of the incident. The police have long had a bad reputation in the area and many local inhabitants said they perceived the statement of the police as an officially sanctioned offensive act, in line with harassments they experienced more or less daily. During the course of 5 or 6 days tensions grew and one evening violent confrontations between large groups of youth and the police erupted.³

²In English a suburb has various definitions. A common one is a distinct residential area (usually, but not always, populated by middle class people) within commuting distance of a city centre. In contemporary Sweden suburb essentially refers to physically and socially segregated, poverty-stricken, immigrant-rich, high-rise fringes of major cities, similar to high-rise 'sink estates' in the UK and 'housing projects' in the USA. The Metropolitan Committee (Storstadskommittén) established by the Swedish Parliament in the 1990s to study metropolitan neighbourhoods delivered several reports on living conditions in these areas that were generally characterized as socially vulnerable.

³This sequence of events has parallels to the Cynthia Jarrett case in Tottenham (London), 1985, the Rodney King case in Los Angeles, 1992, the Paris riots in 2005, and the widespread riots in London 2011. On all of these occasions police actions prompted victims' relatives and neighbors to demand explanations and independent investigations. The inability of the police to provide credible explanations was a major source of festering irritations that eventually triggered riots.

The scale of attention these events received in the media throughout this week of turmoil also contributed to their spread to a number of smaller municipalities around Sweden. International media perceived the events as particularly disturbing and shocking because they conflicted with deeply engrained stereotyped images of Sweden.

In contrast, the Swedish public has become increasingly familiar with reports of cars being set alight and police charges against young people in the suburbs of metropolitan areas. Rosengård in Malmö and Tensta in Stockholm were sites of similar tumultuous scenes during the winter of 2008, followed by Gottsunda in Uppsala and both Biskopsgården and Angered in Gothenburg during the summer of 2009. Clearly the poor immigrant-dominated suburbs in the metropolitan areas have become arenas where social tensions that are deeply embedded in Swedish society are sharply displayed. Although Sweden was never one of the main colonial powers in Europe, there are still many parallels to the situation in countries like the UK, France and The Netherlands. Post-colonial conditions characterized by a polarization between “us” and “them” have during the last decades divided the Swedish society. Racism and otherization of groups with non-western, ethnic background is also prominent in many ways in contemporary Sweden (Appadurai 1997, Hall 1996, Sernhede 2002).

39.3.1 From “Welfare” to “Workfare”

A report published in 2013 by the Central Bureau of Statistics of the European Union, EUROSTAT, shows that nearly 120 million of the EU’s 505 million citizens are living in relative poverty. According to a recent report published in 2015 by Oxfam, “A Europe for the Many, Not for the Few” the figures are even higher. The frequency and intensity of the explosive disturbances around Europe during the past decade must be understood against a background where large groups of emerging generations are stuck in positions of permanent marginality. Many youngsters have lost (or never had) footholds in society and are living in extremely precarious conditions. The high rate of unemployment is not conditioned by business cycles but entirely by structural factors.

The French sociologist Loïc Wacquant (2009) has claimed that society has abandoned “welfare” for “workfare”, which is tantamount to substituting “regulation of the poor” for “punishing the poor”.⁴ Wacquant argues that the state has assumed a Janus face. While the upper, privileged layers of society have acquired increasingly freer means to realize desires and aspirations those worst off are exposed to increasingly harsh conditions and pressures. Levels of allowances have decreased, employment policies are stressing ‘personal responsibilities’ rather than rights and in the

⁴Other scholars, among others Bauman (1998), Bourdieu et al. (1999), Crouch (2005), Harvey (2005), Therborn (2013) and Atkinson (2015), have reached similar conclusions from different points of departure.

deprived districts of metropolitan areas social policy has been replaced by steadily heavier police actions.

The events in the suburbs of Stockholm, Gothenburg and Malmö must be seen as reactions to the increasingly inequitable patterns of urban development in Sweden. During the past two decades prosperity and wealth (in terms of disposable income) have grown substantially in certain parts of the cities, but remained static or even declined in other parts (Andersson et al. 2009; Lundqvist 2014). The increasing gaps in every relevant parameter – standard of living, habitation, health and wealth – are truly shocking. Indeed, socio-economic gaps and differences in income have been widening more in relative terms in Sweden than in any other OECD country (OECD 2013).

The Swedish government's own investigations have shown that more than 40 % of young people between 20 and 25 years old living in deprived and (hence) exposed districts of metropolitan areas are neither studying nor working (Regeringskansliet 2012). More than half of the children in these districts are growing up in families defined as living below the poverty line. More than half of those who are leaving 9-year compulsory schooling also lack sufficient qualifications to proceed to the next educational level. However, the major triggers of the explosive events are not relative deprivation, lack of health, poor education, or crowded living conditions. Instead, the main factors appear to be social stratification, its clear manifestation in spatial segregation, and an unwelcome consequence of today's neoliberal urban development: the city-branding that makes certain parts of towns more attractive than others (Harvey 1989; Sassen 2001).

Some parts of cities become trendy, fashionable and affluent in this process, but others can become victims of what Wacquant describes as "territorial stigma", the "badlands" of contemporary urban landscapes (Wacquant 2008). Those hardest hit by the processes of advanced and structurally permanent marginalization are forced to live in these areas. Equally important to the sheer segregation this imposes are the social and psychological consequences of the new hierarchies of living quarters. Segregation is spawning a "place-ism", as people's residential addresses are increasingly important components of their identity (Dikeç 2007; Harvey 2009; Sernhede 2002). Those living at stigmatized addresses are frequently perceived by others, and themselves, as "losers". Many see themselves as being locked into their own suburb, lacking education, any kind of desirable future and hope. The consequent frustrations are exacerbated by experiences of discrimination, second-class citizenship, police harassment and feelings of wrath and grief induced by seeing the lack of respect with which their parents are treated by Swedish society.

The youths' uprisings should not be regarded as a social movement in a conventional sense (Castells 1983), because the rebellious groups of youths involved were not organized collectives with an explicit program intent on changing society. Nevertheless, they expressed, with varying degrees of coherence, demands for social justice. In this sense there is a clear parallel with what the French cultural geographer Mustafa Dikeç (2007) discusses in the most exhaustive analysis of the events in the autumn of 2005 in France. The rebellion spread from Paris to 300 urban areas and was quashed only after the introduction of a state of emergency and

the drafting of 25,000 extra policemen. This nation-wide uprising is described by Dikeç as an inarticulate social movement of justice.⁵

39.4 Youth and Social Mobilization in the Metropolitan Districts of Sweden

As mentioned earlier a more organized movement is also growing, of young people who do not see petrol bombs and battles with the police as solutions to their problems. Instead, they are interested in developing alternative strategies for achieving social justice in the metropolitan districts of Sweden, which are more consistent with key aspects of what is generally considered a social movement. A distinctive feature of this movement is the realization that burning cars and throwing stones at the police may create media headlines, but soon becomes counterproductive, causing suburban districts to be even more stigmatized and tightly controlled by the police. Those involved also recognize starkly different requirements (long-term social and political investments) to enable inhabitants in these districts to improve their position. With self-evident authority, young articulate voices spoke during the riots from within the eye of the storm, and a different more nuanced picture of the suburbs than the current stereotype has become perceptible. Cars being set on fire and stone-throwing cannot be defended, but the background of these events must be illuminated in order to elucidate them.

In *Stockholm* part of this new movement is called **The Megaphone**. It encompasses various agencies, but lecture activities run by a group called *Harakat* are essential to the Megaphone project as a whole. *Harakat*, which is defined as a “*forum for important social issues and dialogue*”, has for some years invited speakers from all over the country, mainly from universities, but also politicians and celebrities. Globalization, segregation, right-wing populism, and racism are some of the themes that have been discussed in recent years. *Harakat* is not just about learning and knowledge in a traditional academic sense, it is an Arabic word that also includes motion, use of knowledge to create action or motion and (hence) in this context, social mobilization. The Megaphone, driven by a group of young adults from Husby and other suburbs, is committed to increasing residents’ participation in local development and is also involved in cultural activities and various forms of educational work. “*We see society’s shortcomings and want to be part of the solution*”. The Megaphone sees “*the exchange of knowledge, insight and inspiration*” as the basis for “*commitment and change*”. In addition to seminars and lectures, they organize events like “*Everybody is Creative*”, a festival inviting all residents to participate in creations of “*colour and shape*” on the streets and squares of Husby. Under the motto *From Tahir to Husby*, The Megaphone has also actively engaged in advocacy and organized demonstrations against social cutbacks in deprived neighbourhoods

⁵The discussion on definition of a social movement is too extensive to cover in this chapter, see Touraine (1981), Melucci (1996), Castells (1983, 2010) and della Porta and Tarrow (2005).

of North East Stockholm. The Megaphone has applied to the Swedish Board for Adult Education for authorisation to start a college for adult education – a Folk High School (Folkhögskola) – focusing on urban studies to extend *Harakat* efforts to acquire knowledge about and practically address segregation and inequality. Its website, www.megafonen.com, states that “*the improvement and exchange of knowledge, insight and inspiration [will be the basis for political change]*”. The Megaphone has also actively sought to influence opinions, and opinion-makers.’

In *Malmö* the organization called **The Movement for the Voice and the Face of the Street** has emerged from hip-hop culture and is deeply rooted in highrise suburban areas where most of the population have immigrant backgrounds. The organization arranges seminars, conferences and workshops on diverse aspects of numerous (largely humanities) subjects, ranging for instance from youth culture in *Malmö* through national issues and the political situation in third world countries, to the history of colonialism and global environmental issues. It has its own radio station, arranges concerts and has developed a pedagogy of its own, linked to writing rap lyrics. The more experienced members are prominent in the media, in diverse capacities and formats, for instance participating in talk shows, interviews, and lectures all over Sweden. The organization has also established what it calls the Street Academy, offering courses designed to help under 20-year-olds “give vent to their creativity” by writing, recording songs and producing films. The Movement for the Voice and the Face of the Street is now relatively well established and supported by the local housing company owned by *Malmö* Municipality. In their own words on their website, www.rgra.se, they define themselves as follows: “*We believe in creative learning and personal development by allowing participants to discover and develop their talents. When the individual is at the centre of a creative process his or her confidence can be strengthened. The Movement for the Voice and the Face of the Street is about providing tools, the individual must find his or her personal motivation, energy and strength. We design our activities in line with participants’ commitment and ideas and create opportunities for participants to express these ideas in the way they prefer or want to explore. The goal is to create awareness among the young people we have contact with, through practical action to create opportunities so that they, in turn, can change the context through the way they reflect and critically observe artificial facts.*”

In *Gothenburg* a group of unemployed adult youth with diverse immigrant backgrounds started **The Panthers for the Restoration of the Suburb**, in *Biskopsgården* – hereafter *Bishop’s Yard* – in the winter of 2011 (www.pantrarna.wordpress.com). The organization is strongly influenced by the way the Black Panther Party (formed in California in the USA in 1967), gave black people pride in being black. Similarly, the Swedish Panthers wanted to endow the immigrant youths in the poor suburbs with pride and strength. The Panthers of *Gothenburg* was founded during a process in which some young adults mobilized large numbers of both young and old people to oppose social cuts in general, particularly the closure of a youth club and cuts in school staff. There were also fierce demands for the local authorities to provide a meeting place for young unemployed adults, who simply had nowhere to meet except for the streets. Deficiencies in this mobilization and

articulation of demands led the activists to see the need for an organization, so they formed Panthers for the Restoration of the Suburb. The confrontation with the local politicians was quite intense and strongly covered in media. Finally the Panthers succeeded, as they obtained promises from politicians to help in the creation of a meeting place for young people in the area. This gained the organization a lot of credibility among young people all over the city of Gothenburg. The Panthers had contacts with the Megaphone and adopted their idea of Harakat. In the last 3 years they have arranged a series of Harakat seminars of their own in Gothenburg. The organization has also sharply criticized the policing of their residential areas and made some spectacular gains in relation to the stereotypical portraits of their suburbs in local media. The Gothenburg Panthers' routines include organizing workshops, engaging in camp activities, arranging football tournaments, attending political meetings, mobilizing young people in the area to demand better schools, and associated activities such as arranging study groups for pupils who need help with their homework.

The realization that raised voices and constructive actions may make a difference triggered similar activities by young people in all the suburbs of metropolitan Gothenburg. A common denominator of the three major movements – the Megaphone, Voice and Face of the Street, and the Panthers – is that their points of departure are taken from narratives with significant historical and global references. The Panthers explicitly find inspiration in the more militant parts of the black civil rights movement in North America, The Movement for the Voice and the Face of the Street has been strongly influenced by self-organization activities of the poor in Brazil's *favelas* and the Arab Spring has strongly influenced The Megaphone from the start.

39.5 A Deeper Look into the Panthers for the Restoration of the Suburb

A key trigger of the Panthers' emergence was the global financial crisis of 2008–2009,⁶ particularly its rapid impact on Swedish industries. Factories in Gothenburg greatly reduced their work forces during 2009 and many uneducated young people from the immigrant-rich suburbs lost their jobs. Mullan X, a 25-year-old male interviewee with a Kurdish background and one of the Panthers' founders, describes the background to the organization's birth as follows:

You know what happened when so many of us with darker skin from the neighborhood here in Bishop's Yard received notices from Volvo ... and there was a lot of us you know ... we got the feeling that we were worthless, we were second-class citizens and antagonisms

⁶Three researchers are engaged in the research project *The Suburb and the Renaissance for Adult Education*: Dr René Leon-Rosales, Associate Professor Johan Södermalm, and Professor Ove Sernhede who are respectively based in and responsible for collecting data collection Stockholm, Malmö and Gothenburg.

between people escalated, it became worse and worse, and then people started shooting at each other with guns. The situation we have today, with fights between different groups or gangs grew out of the desperation caused by the crisis. I was kicked out from the factory because I did not have a high school diploma, so I started at the Folk High School.

Mullan X is not the only one who began to take courses at the Folk High School in Bishop's Yard. Many with the same background started a new educational career as a result of job losses in the manufacturing or construction industry. Few young men and women from Bishop's Yard had previously considered the Folk High School as an option, although it had been in the area for many years and was widely known to have strong social commitment.

39.5.1 A Revival of Adult Education (Folkbildning)

In the above quotation, Mullan X tells us that social tensions with deep historical roots played key roles in the Panthers' formation. Such tensions were also major parts of the Folk High School of Bishop's Yard's curriculum. Resonant themes covered by the school included (*inter alia*) the history of the Swedish workers' movement, creation of the welfare state, history of immigration into Sweden, post-colonialism, neoliberalism, and racism in Sweden. This school is part of Gothenburg Folk High School and today is mainly financed through funding from the State, but the whole idea of Folk High Schools emerged more than 150 years ago as a way of providing education for the peasantry. In the late nineteenth century they became crucial elements of the workers' movement as providers of an important form of adult education. Then the trade unions and workers parties financed the Folk High School system. At that time it provided the only route for the working classes to obtain knowledge and education on premises they collectively owned. It also formed a cornerstone of *Folkbildning*, a form of adult public education, together with various associations that organized study circles, sporting activities or clubs in factories and neighbourhoods. The explicit aim then was to mobilize people through knowledge and learning. The goals of the Folk High School in Bishop's Yard today are even more oriented towards addressing social issues, with a mission to involve individuals in self-reinforcing, empowering processes (thereby strengthening democracy and addressing inequities). The Folk High School was a strong social force in the heyday of the workers' movement, and it is still important in poor Swedish metropolitan districts (Rubenson 1995).

The Folk High School of Gothenburg presents itself on its website as follows:

- Gothenburg Folk High School should through education challenge and provide tools for social change and create participation for a democratic and inclusive society.
- By pursuing sustainable and qualitative activities we want to be a leading organization in public education.

Mullan X and others in similar circumstances have declared that they can identify with the whole idea and tradition of the Folk High School. He continues in the interview quoted above:

The way they taught at the Folk High School was different from what I was used to at school. The teachers were interested in me and I became interested in school. I had heard about Martin Luther King before. I was interested in politics so I had wide knowledge of Latin America and Che Guevara, and so on ... then at the Folk High School I started reading about Martin Luther King and I read about Malcolm X. Then I wondered what came after Malcolm X when he was assassinated, what happened? King was also killed, that's when I learned about the Black Panther Party (BPP). What I saw was people of color with confidence, aware of where they wanted to achieve, and they were interested in questions of power. This I liked. Every organization needs a trigger to create an identity.

The organization grew very quickly during the first year and in 2012 the Panthers arranged the first ever Mayday celebration in Bishop's Yard. Bobby Seal, the founding father of the Black Panther Party in the US, was invited and gave a speech. A thousand people participated in this whole-day event, which also included several hip-hop concerts, poetry readings etc. In the next Mayday celebration the Panthers were supported by international speakers like Emory Douglas, the former Minister of Culture for the Black Panther Party, and radical internationally acclaimed hip-hop acts like *Dead Prez*, who also participated in seminars and workshops with local rappers. The events were bigger than the Labour movement's traditional Mayday demonstrations in the centre of the City. Through these activities, the Panthers showed that it had become a mature organization that had no problems collaborating with ABF, the cultural branch of the labour movement, or the University of Gothenburg. In 2014 the Panthers arranged a whole day and night festival called *Speak Your Mind* on Mayday, for the first time outside Bishop's Yard. The festival was held in Angered, the biggest poor high-rise suburban area in Gothenburg with 50,000 inhabitants. More than 5,000 people from all over Gothenburg attended the event, listened to the music and talks, had a sandwich and coffee in the park, checked out the art exhibition, played with children, bought books and joined in discussions etc.

The Panthers have also received recognition for interventions in media debates and serious seminars, such as a series they arranged entitled *Harakat*, which have been widely popular and attended by many people outside the organization. Sandor, a 26-year-old male with parents born in Bolivia, explains that the Panthers have adopted *Harakat* from the Megaphone and gives his perspective on knowledge and learning:

Harakat is not just lectures, the actual *Harakat* is getting knowledge and using it, *Harakat* means motion and knowledge should be put into motion, we are not interested in knowledge for its own sake. *Harakat* is a process. A lecture may be good but a lecture is not [by itself] *Harakat*. This is our philosophy when it comes to seeking knowledge, so to speak. *Harakat* is more like: 'Give me this knowledge because I need it, I intend to go out and change the way things are...'

A major theme of discussion within the Panthers has been how to realize their educational ambitions. Alkani, a 19-year-old female Panther born in Iran, also sees a connection to local religious everyday life:

The Panthers need to get together with the college thing, but that is a long way ... so we started getting smaller and we made Harakat, you know various lectures. For that's what people want. People like to go to lectures, we have this tradition in our neighborhoods, you know ... on Friday we listen to lectures in the mosque and stuff. There are many who go. One may not believe that there are so many young people who go to the mosque to listen to lectures, but there really are. Every time I went to lectures in the mosque there were perhaps 20 young people there, sitting in one of those small local mosques and listening to someone talking about different stuff, so we are used to like having seminars and stuff...

The Panthers have many ideas, but now they are planning to establish a Folk High School focusing on the creative arts, together with the Association for the Promotion of Art, which has an established presence in the Swedish folkbildning system. In the near future they also intend to start vocational training courses in professions with recognized manpower shortages. They run creative training courses in fields such as journalism, creative writing, and filmmaking. Indeed, young people of the suburbs with immigrant backgrounds seem to be showing more drive and interest than anyone else in preserving and developing the heritage of the social movements that founded and cemented the democratic ethos of Swedish society in the late nineteenth and early twentieth centuries. Furthermore, here too hip-hop culture has enabled dissemination and realization of key ideas. In Sweden youths in a rap-group or B-boy crew can easily form a study circle, which (as a modern form of traditional social movement-based educational organization) entitles them to subsidies from the State. During the past 20 years these educational organizations have functioned as a kind of alternative school system for young people in the focal neighbourhoods. Here they have learned about their own history and, hence, acquired understanding of their own position in Swedish society. Moreover, they have learnt how to organize themselves and develop strategies to counter discrimination and denials of citizenship.

39.5.2 *The Local and the Global*

The Panthers of Gothenburg regard themselves as participants in global battlefronts for justice and democracy. As Alkani, the 19-year old female Panther activist born in Iran mentioned above, said in an interview:

It feels like it all fits together, we are a part of the world as well ... it really is the whole world it is all about ... there is a global upper class and ... yes, but there are struggles all over the world as well. And that is precisely the problem, there is an upper class here in this country and in the world. And it is (laughs) an obstacle to our freedom ... it's wrong that a small minority has access to more than 50 percent, or whatever it is, of all our resources on the whole earth... and the only way to resolve it is to allocate the resources. But it doesn't seem like they want to do that ... still we'll have to do it ...

It is not difficult to understand how this perspective has come to be incorporated in the Panthers' understanding of the world order. It is part of a range of ideas that are related to and inter-woven with the continuous inter-cultural dialogues in a

neighbourhood like Bishop's Yard. An interesting dynamic aspect is the extreme ethnic heterogeneity in Swedish suburbs, and accompanying hybridization processes. The people who live in the "Million Programme" areas have roots and connections spanning the entire globe.⁷ These neighbourhoods often contain no more than 7–8,000 people, but their residents often speak more than 100 languages. No ethnic group dominates over any other group. In Gothenburg, a city with more than 500,000 inhabitants, there are dozens of such neighbourhoods.

Mullan X gives the following perspective on the Panthers' relation to current post-colonial conditions:

The Black Panther Party said that they were a result of colonialism, black people were in the United States because of slavery and colonialism, and I could identify with that. We are in Sweden not because we are slaves but because there has been interference in our home countries, the involvement of the US and other powers that led to my parents being forced to flee, so we are also a result of colonialism and imperialism. I live in Sweden, I was born here but I'm not Swedish, and I'm not Turkish - black people in the United States are not seen as full citizens of the USA, and they are not Africans either – we Kurds are children of the same colonial oppression and we are in exile in France, Germany, England and so on without being Europeans. Our parents were grateful that they were given shelter here, but we young people are no longer so grateful, we do not want to be second-class citizens and that is why we are part of the same movement as BPP and that's why we say that we want change, 'By any means necessary'.

Many commentators assume that there is little solidarity and community in multi-ethnic areas in the European metropolises, in contrast to traditional working class areas. However, in major Swedish cities (at least) they appear to be generating new forms of collective identities and strategies for dignified living rooted in their specific contexts. This applies primarily to young people who continually meet and interact in their everyday lives: in the streets, schools, youth clubs, etc. They develop communities and friendships that do not recognize many of the ethnic boundaries enclosing their parents. Several studies have shown how hip-hop culture in these areas provides a basis for multi-ethnic meetings that can also be described as ethnic alliances. In all the areas where these new forms of social mobilization are emerging we may also identify a history of strong local hip-hop environments that have often come to represent specific suburbs (Sernhede 2005, 2011). However, as already mentioned, there is also an equally important domestic historical dimension that may surprise those who lack familiarity with the attitudes, commitments and activities of youths in the suburbs constructed in the "Million Programme". Following the traditional ethos embedded in late nineteenth century Swedish social movements (revivalist and temperance, as well as the workers' adult education movements), the Panthers demand the recognition and rehabilitation of marginalized groups who have been forced out into the urban periphery by the coercive transformation process of recent decades.

⁷The Million Program was an ambitious politically motivated housing program realized in 1965–1975. It was intended to rehouse less well-off residents of dated buildings. It represented the biggest political venture of both the Social Democratic Party and the Swedish Welfare State. Today these dwellings in the urban periphery house the poor, immigrant part of the Swedish population.

The Panthers could be considered a community of practice, in the sense that they provide a communicative environment where language is a mediating resource for learning and meaning construction (Lave and Wenger 1991; Nielsen and Kvale 2000; Wenger 1998). All learning is both an individual and a collective process. Communities of practice are characterized by social activities, through which skills, knowledge and values are acquired. The participants in a community of practice develop patterns of meaning as well as identity. Research has shown that many young people living in disadvantaged suburbs have a habitus and access to cultural capital that are of limited relevance to their ability to succeed in school (Bourdieu 1986; Bunar 2001, 2010; Runfors 2003; Sernhede 2011). As schools in these areas often neglect young people's potentials for learning, it is important to explore what and how young people learn in contexts that they constitute themselves.

39.5.3 *Learning Processes in the Panthers' Everyday Praxis*

The experience of being regarded as a second-class citizen because you live in the wrong neighborhood, have the wrong skin color, speak Swedish with the wrong accent, or have the wrong last name has led to the emergence of various counter-strategies. In this respect, the Panthers could be seen as a manifestation of a collective compensatory, and identity-creating process (Fornäs et al. 1995).

The Panthers actively reflect on the surrounding world as well as on their representation of themselves as a group. The commitment, earnestness and intensity shown by the Panthers are seldom found in the compulsory schools situated in Bishop's Yard or other high-rise suburbs. The behavior patterns manifested in the group's relations with the surrounding world, the members' interactions with each other, and their attitudes to work within the organization, are major constituents of the organization's identity. The Panthers' strategically oriented ambitions can be seen in how the group represents itself (on posters, and through their style of dressing, speech and behavior in public, etc.), and in the communication patterns and self-understanding that develops within the group. However, there are also aspects of the group's activities that are less reflective and thus may be considered less conscious sides of this community of practice. From this perspective, we can see how the Panthers as a community of practice is engaged in strategic as well as non-reflective processes.

A political organization such as the Panthers and a school are obviously strikingly different arenas for learning. Notably, the learning that occurs in a group such as the Panthers involves competences that have not largely been acquired through formal training or courses, but through sheer necessity to respond to the external social environment. Immediately apparent is the groups' acquisition of several *practical skills* and *administrative capabilities*. Members of the Panthers may learn (for example) to manage study circles, handle the group's finances, arrange and conduct meetings, or advertise various activities. In addition, and most importantly, they develop *cognitive knowledge*. This is crucial because in order to have and artic-

ulate coherent visions for changing a society one must clearly know a great deal about how the local society functions, historical matters, current laws, the governance and economics of the municipality etc. The Harakat seminars, with invited speakers from academia, the political parties, and officials from various agencies in the city, are all related to such issues. However, the importance of national and global socio-economic histories and current trends is also recognized, as well as local events, and many Harakat seminars have focused on key issues in the post-colonial world. These are crucial elements of the Panthers' understanding of their position in Swedish society. For this reason, amongst others, they read and discuss texts such as the Brazilian theologian Paulo Freire's *Pedagogy of the Oppressed* and the French-speaking West Indian philosopher and psychiatrist Franz Fanon's *Black Skin, White Masks*. Selima comments:

When we read *Pedagogy of the Oppressed* we understood the crucial importance of our own experience and history. That discussion helped us to understand our own struggle in a historical perspective and relate what we do here in Sweden today to what our parents did in the countries where they were born...

The acquisition of such practical, administrative and cognitive abilities exemplifies a kind of learning that is also prominent in the schools. But this learning occurs in an activist collective for the purpose of satisfying subjectively experienced needs to change conditions the members think are unfair.

39.5.4 Gender Issues

Back in the 1960s the Black Panther Party was accused of being an organization with strong macho ideals (Bloom and Martin Jr 2013; Wallace 1978). The women in the organization played an inconspicuous role in the political agenda that the Black Panthers created (with some exceptions, notably Angela Davis, even if she was not a member *per se*). Similarly, in recent decades there has been strong criticism of the male-domination in hip-hop culture, which is slated for being a misogynist, sexist, homophobic and (heterosexual) male-glorifying culture. The debate on life patterns in urban immigrant-rich suburbs has also focused on gender issues and many social commentators have argued that there is widespread oppression of women in these districts.

The young adults in the Panthers are well aware of this discussion about the living conditions in their own suburbs. It is true that the organization was started by young males, and that few females were initially involved. However, this has changed. Mullan X:

When we started, we had only one girl and 14 guys, and now it is becoming quite the opposite. I can't explain it, in fact I don't know if there is an explanation, but I can say why there were more guys at first. It's because the ones who came up with the idea knew more guys. But you know there have been problems in our neighborhood to create a place for boys and girls to meet, so it has been very gender segregated. But in the Panthers it's fifty-fifty right now, there is maybe a slight advantage for girls and it's good ... we live in Sweden, we're conscious in a different way about gender, but when we formed our organization it was

mostly guys. You know hip-hop when it started in Sweden it was only guys, but in a very short time it has changed, the girls have taken over. It's the same with the Megaphone, the girls have taken over and the same with the Panthers, and the girls are making their way to the top of hip-hop in Sweden too ... I think it's very invigorating for them that they're building their Feminism as Creoles, there's an extra strength and that has set up a women's movement in the Panthers called Hayat.

The mentioned feminist organization within the Panthers called Hayat was initiated by Alkani, she tells how it happened:

It started when we had a dinner for girls arranged by the Panthers, it was during Ramadan ... there were maybe ... 45 girls and we were in the Kurdish PKK head office in the main square. Then we discussed things, and thought that we should do something to strengthen the girls. So we decided to create our own organization within the other organization, we thought that this might help the Panthers, to organize the girls. In the beginning there were not many, we started a boxing club for girls too.

Interviewer: What does Hayat mean?

A: Hayat means life in Arabic. That was what we talked about, what we do with our lives and we do it for our lives: this is no hobby.

During the past 2 years, more and more young women have joined the Panthers, due to strategic efforts to raise the profile of females in the organization. Whenever the Panthers are invited to participate in a conference, seminar, demonstration or protest meeting they must be represented by both a male and a female. The organization's new chairperson is Selima, a 24-year-old woman of Palestinian origin who has already been quoted. She has meant a lot to many of the girls and young women who have joined the organization. Like many of the other members I have interviewed, she strongly relates to hip-hop and strongly insists that females are represented as well as men on all levels in the organization:

I've always felt the oppressive structures. They've been there during my childhood. But it's been more a feeling that I don't fit in here ... Society isn't for people like me, so I have to adapt myself. But I can't ... I can never be like an ordinary Swede. The feeling has always been there ... then I started thinking 'But why is it like this?'. I feel that this is my country ... but why am I not allowed to make myself feel that way?! Then I understood that I have to do something about this. I was inspired by hip-hop ... you know the entire movement in the United States ... it was so inspiring, the movement began through culture, music and lyrics, people began to express how they felt ... all the injustice and so on and I also felt that. And then came the Panthers and put what I felt into words. The Panthers gave me the theoretical concepts and explained my feelings. We also talked about our gender roles ... what it meant to be a boy and what it meant to be a girl ... the Panthers really encourage me and every girl to take part in the work, and now I think that the girls do most of the talk and much of the work.

39.5.5 The Panthers' Knowledge-Promoting Practices: A Summary Analysis

By organizing *Harakat* seminars and events like *Speak Your Mind* the Panthers of Gothenburg engage in concrete educational and democratization processes that are key elements of *folkbildning* (Rubenson 1995). Scandinavian *folkbildning* has close

connections to democratic processes, and can be linked to the concept of empowerment. From a global perspective, the African American intellectual Du Bois (1903/1999) had similar thoughts about self-education and its connection to the German tradition of 'Bildung'. He was convinced that people could be empowered, attain self-esteem and gain full citizenship through holistic education. The Panthers from Bishop's Yard in Gothenburg explicitly refer to Du Bois and his thoughts on "double consciousness" as an inspiration. Folkbildning may also be considered a particular learning tradition within a specific social context and with a specific purpose. Hence, it can be seen as a movement to provide politically charged education for the general population. Folkbildning is also strongly connected to the process of self-education and regarded within a Scandinavian context as crucial, not only for civil society but also for every human being's liberation, regardless of tradition, class, and place in society (Gustavsson 1995).

Just as the labor movement once created its own cultural and educational organizations in order to instill sufficient courage via knowledge to demand universal suffrage and access to social rights, young people of the suburbs today engage in mobilization via seminars, study circles, lectures, homework assistance, and cultural arrangements. In addition their own cultural articulation and expressions will enable acquisition of the knowledge required to attain self-confidence and authority. Where the regular school has failed alternative structures are about to be created. These may well provide second chances for all those who lack education and hence hope for the future.

Previous research on processes related to civil society has largely neglected the roles of young adults, and the social implications of learning processes (formal and informal) outside the school system. Ethnographic research on youth from poor neighbourhoods has mainly focused on groups or collectives that have access to channels for developing their own musical cultures and multi-ethnic communities (Sernhede 2002; Sernhede and Söderman 2010).

The Panthers consciously raise social, pedagogical, and political issues in efforts to improve local civil society. Research on civil society has highlighted the importance of trust for a socially coherent society and the development of social movements (Putnam 2000; Rothstein 2003). Other studies have (similarly) noted the need for credibility and reliability for a civil society that functions well, and sustainable social mobilization (Blackmar 2006; Ostrom 1990). Sociologists have also noted the necessity of symbolic systems capable of disseminating messages to the world inside and outside the group, symbolic production that also strengthens the group's identity (Castells 1983, 2010). The Panthers are clearly well aware of all these requirements, although they have not read the academic research on these matters. Urban studies research has pointed out the importance of "urban commons" as foundations for the emergence of vibrant institutions in our contemporary, globalized civil society (Harvey 2012). The Panthers' activities can be seen as efforts to develop a form of such "commons" – spaces where trust, common norms, reliability and forms for symbolic communication can be developed. Similarly, the Panthers seems to be aware of points raised in academic discussions regarding gender power order, the construction of gender and associated issues, although they have never been involved in such discussions, at least formally (Connell 1995; Gilroy 2000).

39.6 Discussion and Tentative Conclusions

The emergence of the Panthers has raised issues that generally receive relatively little attention in compulsory schools, but are highly resonant with their marginalized immigrant pupils. "Why did we immigrants, of all people, end up in these poor areas"? How should the increasing class divisions be understood; "we are stuck at the bottom because we are dumb, or because the die are loaded against us"? "Does society have to consist of winners and losers"? The young people in the Panthers search for answers to these questions. If the compulsory schools of the municipalities in marginalized suburban areas want to develop opportunities for dealing with their situation, they must open up to the world of their pupils. Thus, suburban schools must learn to respect the political and cultural expressions developed by the youth in these neighborhoods. In recent times it is also possible to see, probably as a result of the work by the Panthers, a growing interest in what is happening in the local community, especially from young teachers who aim to keep up with contemporary social issues and trends in the youth culture.

By refusing to listen and attend to the insights and criticism developed in organizations such as the Panthers or hip-hop collectives, we may miss essential perspectives in discussions on social issues and developments, and ways to address social problems. If Swedish society had been open to the invitations to dialogue embedded in the political messages of suburban youths' cultural expressions we may have been spared the riots in Stockholm in 2013. The autonomous activities of organizations like the Megaphone, the Voice and the Face of the Street, and the Panthers can be seen as attempts to obtain, provide and disseminate various forms of learning in the contemporary urban context. However, the ultimate objective can be summarized as breaking the stigmatization that threatens to trap the youths in the poor suburbs perpetually in ghettos, where they have very limited contact with the surrounding society and even more limited prospects. Thus, an important aspect of efforts to break segregation patterns in Swedish society must be to create arenas in which young people from the suburbs, particularly, can be seen, heard, and interact with youngsters from other areas.

In this context, political, social and cultural expressions provide ideal starting points for building bridges and fostering encounters between different social, ethnic and religious groups. In this way, young people can play important roles in improving civil society. Even though many politicians talk about the necessity of integration and making visible immigrant youth from these neighborhoods, not much seems to be happening.

Various agencies, like the Panthers, The Megaphone, The Voice and the Face of the Street and other grass-root organizations are now trying to build such bridges in many metropolitan suburbs in Sweden. However, active participation is also required from schools that embrace the creation of truly democratic living conditions for all citizens as self-evident objectives of education and learning. The pupils could perceive such schools as their own, providing answers to their questions, and both speaking openly about and problematizing discrimination, 'othering', stigmatization and poverty gaps.

Such schools' staff and pupils would perceive themselves as being deeply involved in efforts to promote genuine, inclusive citizenship for the entire population. The staff and pupils must be prepared to meet and learn from the world around them, and their schools could then play important roles in building a globally connected and vibrant civil society. Such schools would also have much to learn from organizations like the Panthers for the Restoration of the Suburb.

Chapter 40

Young People and Local Power Geometries in Helsinki. The Intertwining of Social Class, Gender and Ethnicity in Public Spaces

Tarja Tolonen

40.1 Introduction

Young people and their relation to and identification with public, semi-public and private places have been researched for a number of years in many parts of the world, including Finland. Youth groups or cultures are often identified by their place, and spaces are markers of identities, for example suburban youth (Lähteenmaa 1991), the boys of 'Koskela', a suburb of Helsinki (Louhivuori 1988), street corner society (Whyte 1943), club culture (Thornton 1995), girls' horse stable culture (Tolonen 1992) and girls' bedroom culture (McRobbie and Garber 1986).

In the light of youth research, the questions of social identity, belonging, marginalization, citizenship and urban education often have spatial dimensions. Here, young people's relationships to urban space and school space are inspected in view of gendered, classed and ethnic informal practices. And, vice versa, I claim that the social orders of everyday life are formed and reformed within practices of using the space. These informal spatial practices are also reflected in formal legal rights and the current political atmosphere.

In this chapter the pluralistic cultural and social practices of young people are traced within the context of urban spaces. Special attention is given to physical and social spaces, such as schools and shopping centres, to show how the social and spatial are intertwined. How the rights, abilities and will to use the space and act as 'active citizens' in it are central to young people's belonging, is also examined (see also Gordon 2007, p. 447). In addition, the changing power geometries of local places (Massey 1994) are traced.

Young people's resources and possibilities to use urban public space as active citizens vary. The chances of acquiring the potential respected membership of a

T. Tolonen (✉)
University of Helsinki, Helsinki, Finland
e-mail: tarja.tolonen@helsinki.fi

community are strongly framed and intertwined with gender, class and ethnicity (Skeggs 2004). I will show how the use of public space has varying and contested meanings in the minds of a group of young people who have taken part in the present empirical study conducted in eastern Helsinki youth clubs, schools and urban spaces in 2008 and 2009.

According to Elisabet Öhrn and Gaby Weiner, urban education refers to interrelationships between poverty, immigration, and poor schooling often in inner city areas (Öhrn and Weiner 2007) where the quality of the neighbourhood is central: 'When accounting for patterns of pupil behavior and achievement in schools, the location of neighborhood remains connected to social and cultural behavior' (Öhrn and Weiner 2007, p. 400). In the Finnish context, and more specifically, that of the City of Helsinki, researching urban education is a rather different matter. Instead of being deprived, inner city schools in Helsinki are more like elite schools, often specialized in certain subjects like languages, math, music or sport. However, the questions of poverty and social inequality as well as class, cultural patterns, being an immigrant and educational equality are valid and applicable in suburban areas surrounding the city centre of Helsinki. In this chapter I present a suburban area in eastern Helsinki, not particularly poor or problematized, but which if compared with other areas of Helsinki does feature some social, cultural and economic differences, as shown by a range of social indicators. It is a district of small semi-detached private homes, and rental housing owned by the City of Helsinki. According to the publication 'Helsinki by Districts 2011' (City of Helsinki Urban Facts), the proportion of people with university-level education in the area (in 2010) was approximately 30% (the national average is 38%). The unemployment rate was approximately 11%, with the average being 8% in Helsinki proper. Roughly 15% of the inhabitants have a first language and nationality other than Finnish; in the area's western parts it is 6%. In eastern parts the proportion of 7–15-year-olds is approximately 10%, and in some western parts 6%. (See http://www.hel.fi/hel2/tietokeskus/julkaisut/pdf/11_03_30_Tilasto_hki_alueittain_2011_Tikkanen.pdf, see also Helsingin tila ja kehitys 2013)

Here, I continue to trace what Tuula Gordon (2007), p. 447 stated, that cities can be studied 'as political spaces where rights and duties of citizenship can be enacted.' In urban spaces, moreover, pluralistic practices that intertwine with social class, ethnicity and gender, are traced. My starting point is similar to Gordon's: namely 'that local areas contain formations of political spaces where processes related to belonging, inclusion and exclusion are played out and contested.' Furthermore, I will reflect on certain *informal* cultural practices of young people in the context of a specific district in eastern Helsinki. Before doing so, however, I explain some *formal contexts* by giving examples of Finnish education and youth work legislation, and will also make reference to the current political discussion and atmosphere.

40.2 Official Finland and Equal Rights

Finland is a country where equal rights have been valued and promoted, as reflected in a large body of legislation. For example, the Basic Education Act states that ‘The purpose of education referred to in this Act is to support pupils’ growth into humanity and into ethically responsible membership of society and to provide them with knowledge and skills needed in life.’ And: ‘Education shall promote civilization and equality in society and pupils’ prerequisites for participating in education and otherwise developing themselves during their lives.’ (Basic Education Act 628/1998.)

In addition to promoting civilization and equality, Finland officially supports the pupil in becoming a *responsible member* of society, referring to the Protestant ethic of earning one’s right to be a citizen through bearing responsibilities. In addition, the Youth Act, which concerns youth policy and applies to persons under 29 years of age, goes even further by aiming to promote *active citizenship* and empowerment, based on values such as equality, multiculturalism and internationalism.

1. The purpose of this Act is to support young people’s growth and independence, to promote young people’s active citizenship and empowerment and to improve young people’s growth and living conditions.
2. The implementation of the purpose is based on communality, solidarity, equity and equality, multiculturalism and internationalism, healthy life styles, and respect of life and the environment.

Youth Act (72/2006) (webpages of the Ministry of Education and Culture, unofficial translation)

However, at the political level these themes of citizenship and multiculturalism are contested. The themes of ethnicity, multiculturalism and racism arose in political consciousness with the success of the ‘ultra-nationalistic’ True Finns party in parliamentary elections in the spring of 2011, and again in 2015. In 2011 the True Finns won over 19% of the popular vote and in 2015 formed part of the coalition government. In addition, journalists, politicians and researchers have been harassed for being too ‘immigrant friendly’, and on many public webpages the amount of hate speech has increased. Some MPs have also made openly racist comments. On the other hand, strong opposition, including a spontaneous movement called ‘We have a dream’, has arisen in social media and on the streets of many cities. Some of this socio-political context was already evident in the school and street atmosphere while collecting the data for this research, and is important to understand it as a background to the present chapter.

Questions of gender equality have also been at stake in the agendas of Finnish state policy. According to the Act on Equality 8.8.1986/609, passed in 1986, women and men are to be treated equally:

The objectives of this Act are to prevent discrimination based on gender, to promote equality between women and men, and thus to improve the status of women, particularly in working life.

Therefore in the eyes of the law women are equal to men, and this is to be promoted by national and municipal organs, employers and educational institutions. The discrimination and harassment of women are also forbidden by law, and compensation is to be expected if it occurs. In addition, a quite liberal law on same-sex marriage was passed by the Finnish Parliament on 28.11.2014, again with lively political discussion both for and against it.

Legislation concerning education, youth work and gender equality reflect the values of the parliament and thus of the whole nation. That is, equal rights, active citizenship and nondiscrimination are mentioned in many laws, and are practiced by public administration and also many NGOs and development projects. It is, however, interesting how these (also contested) equal rights, memberships, citizenships and responsive memberships of society are played out in the everyday lives of young people in Helsinki, where the present research project's data has mainly been collected. Later, I will turn to particular cases of experienced urban space, citizenship and equality, as well as rights and belonging.

40.3 The Practices of Spaces, and Different Shades of the Power Geometry

I claim that the political, social and physical spaces, as well as formal and informal ones, are closely related with each other. In my understanding, both place and space are deeply relational, and intertwine with the social and 'mental' (see Massey 1994). Doreen Massey sees the spatial as socially constituted and the social as spatially constituted. Both space and place are seen as 'natural objectives' but dependent on social relations. Places can be seen as networks of social relations, and Massey uses the term *power geometry* to emphasize how groups and individuals are differently positioned in these networks, and in relation to each other. Here, I focus on local youth groups and their ways of forming a style (for example in relation to school, popular culture, gender and ethnicity). Different individuals as well as groups recognize each other as distinct from other groups and their ways of being in the public sphere (see later examples). These processes of group formation, styles and distinctions take place in local institutions such as school and youth centres, as well as the local public sphere. These different processes form power geometries and balances. Massey also claims that the identities of places are constructed through the specificity of their interaction with other places rather than by their counter-position to them (see Massey 1994, p. 121). These different formations of groups and styles are made through subtle distinctions – at times they are counter-positions and contested – but the main point is that they are formed in relation to each other, as power geometries.

One's relation to space is therefore also social – and one can have a feeling of belonging or of being dominated, or one of being marginalized in relation to a particular space. Fangen (2010) has distinguished several aspects of marginalization:

educational and labour market exclusion, as well as e.g. spatial, relational and socio-political exclusion, in relation to family, friends, civic society and leisure activities. Elsewhere I have discussed educational transitions and exclusion, along with leisure activities and friendships (see Tolonen 2013). Here, I concentrate on the relationship between spatial and social aspects, and how these resonate within society as a question of belonging or as one of urban citizenship, meaning educational practices in different urban spaces (see Gordon 2007; Öhrn and Weiner 2007). Here the different institutions and spaces used by the young in the area form local political and social power geometries which are related to each other. Examples are presented later in the chapter.

My claim here is that local social gendered, classed and ethnic orders are performed in local schools, streets, youth clubs and shopping centres. Even though both gender and ethnicity studies have histories of their own, gender and ethnicity are defined here as symbolically, culturally and hierarchically marked. They are seen as everyday action that is repeatedly performed according to the local gendered, classed and ethnic orders of everyday life. For example, in the everyday life of the school young people form a local, gendered order through different competing performances of masculinities and femininities (in relation to sport, fashion, popular culture and political opinions). These local gender orders are repeated, contested and ever-changing, and are made and remade through performances in everyday life. In addition, different nations, localities and schools value different kinds of masculinities and femininities, and in this way support the formation of gendered youth cultures in the school (See Tolonen 2001, for more on gender see Anthias 2005; Butler 1999; Jokinen 2004; Skeggs 2004). In the field of ethnicity studies and studies of racism, it has been shown that racism is an ideological construction which creates 'others'. It is also structured in the sense that racial and ethnic domination has a history, laws and practices, and yet it is process since racism is re-created and re-confirmed in everyday practices (see Essed 2002, 185; and also Hall 1990; Rastas 2005, 2009.) So here I combine such everyday orders made through gender and ethnicity, and assume that they are local, but formed historically through the relationships between domination, social division and social class (Skeggs 2004). In addition formations of these everyday orders are framed by the current national political agendas as well as formal laws and regulations of equal rights.

The examples presented in the next sections are drawn from empirical data consisting of 39 interviews with young people aged 13–17 years, of whom 23 were boys and 16 were girls. In all, 33 interviews were conducted in the Helsinki area. Other interviews were carried out in the small north-eastern Finnish city of Kajaani, known for its paper industry but also high rate of youth employment. Here, however, it is the Helsinki data that is referred to, and more specifically, data collected in eastern Helsinki to describe the power geometries (Massey 1994) of a particular suburban area from various points of views.

In addition to the interviews of students and some parents, the data include ethnographic observations, photos, pictures drawn by students, as well as discussions with teachers, youth workers and police. The data were collected mainly in youth clubs and a school in Helsinki in 2008–2009 as part of the research project 'Young

people's leisure time' funded by the Youth Research Network, and the University of Helsinki's 'Material formation of the family' project. The names of all the informants in this study have been changed to preserve the anonymity of the interviewees.

40.4 School Space and Youth Clubs: Divisions and Encounters

My analysis is inspired by Gordon et al. (2000), p. 53), who distinguish three layers of the school: the official, informal and physical. The official school is stipulated in the documents of the school and the state. The informal school means socio-cultural practices and interaction other than instruction between students and between students and staff. When focusing on the physical school, the above researchers examined the possibilities and limitations offered by school buildings and spaces (see also Souto 2011; Tolonen 2001).

The school is an important site of becoming a formal and active citizen (see Gordon 2007). It is a space for education and career, and also social control and policy. At the formal level of the school, one can gain respect through the positive assessment of school work. Here, it is the informal and physical school that will be primarily referred to when analysing the everyday social orders created by young people. The informal school is a level dominated by peers, and where another kind of value of the self is formed (Souto 2011; Tolonen 2001). In accordance with Carol Gaskell (2008), I see that the school acts as a space where respect and reputations can be fought over and negotiated. Further, the school is an ideal space for negotiating social status, reputation and 'social and active citizenship' since there the dynamics of negotiations can be witnessed and redistributed by school peers and also brought to the street (see also Manninen et al. 2011; Nayak and Kehily 2008; Tolonen 1998, 2001).

At this informal level, different styles and social positions can be distinguished. One of the styles relates to official school, that is, of being a successful student (with good grades and motivation) (see also Willis 1977). One of the social positions relates to informal youth cultural styles (sports, computers, popular culture), and in addition, another relates to ethnicity. Young people read these styles and social positions in sensitive and innovative ways, and situate themselves socially in relation to both formal school (grades) and informal school (youth cultural styles, ethnicity) (see Souto 2011; Tolonen 2001).

As one interviewee, Tia, a 15-year-old girl from a Finnish working-class background said about her classmates, and herself:

Researcher: What sort of youth cultural styles can you point out in your school?

Tia: There are different styles of rockers, the ordinary ones, then the heavy ones, then Lizzies, and then there are all sorts of different groups of people (...) To be honest, no one in our class really likes people from abroad/immigrants. Except I don't discriminate against them.

Despite her classmates' attitudes, Tia distanced herself from this power geometry and prejudiced thoughts and actions – not out loud, but by avoiding these boys at school. Another student of the same school situated himself in the social setting through youth cultural styles and school success, but also in relation to his immigrant background:

Arif: There are heavy rockers, there are those who don't study, and who do; there are ordinary Finns, and then foreigners (=immigrants), and I am mostly with the immigrants. Then there are the racists ones, and those who do sports, the ones who play with computers and talk about them (...) I am among the foreigners, and those who study.

I visited this school for some months, interviewing the young people about their leisure time, and writing down my observations. I mainly saw peaceful events but at times I also witnessed racist bullying among the boys. Some of these young people appeared to be skinheads: along with their racist opinions, they wore pilot jackets, jeans and army boots. They used mental tactics to control their classmates and their public opinions, and some attempted to control the school space in physical ways, such as standing like a guard in front of the class, and staring at certain students. I never saw them touching anyone, apparently because I was present, and they also had an active and firm classroom teacher who did not tolerate such behaviour. But it did affect the social atmosphere. Occasionally other boys in their class took part of the teasing, like the 'hockey player' in the next example.

Research Diary 4th of May 2009: I went to school this morning before 11 and hung around in the corridor where ninth graders congregate(...) Some students I knew were present, and one ninth grade boy (a hockey player) teased a Somali boy. The Somali boy walked upstairs and this bigger boy tried to prevent him, clearly wanted to give a performance about teasing this smaller and darker boy. He mentioned something about the boy's big brother. A teacher came and stopped this unfair wrestling. The bigger boy had a hesitant smile on his face, but I did not see the smaller one smiling. This was not a game between friends.

I could see these 'Finnish boys' (in skinhead outfits) upstairs, and downstairs there were more immigrant children and their friends. This social line was not always kept, and different groups of young people seemed to gather in different places. –

I learned that the spaces and social orders of everyday life seemed to go together in this school. While carrying out the interviews I also learned that the students with racist attitudes did not like certain places in the suburb. Further, there seemed to be a strong social and physical division of space in the school – a certain power geometry or 'balance' was evident at the time. The informal school was divided physically and socially into 'upstairs' and 'downstairs' (cf. Souto 2011). von Brömssen and Risenfors (2014) have written about spatial distinction as expressed at the 'immigrant corner' of one Swedish school. As in this Swedish research, the students with an immigrant background in my study used their corner downstairs as a strong place for identity work. It was socially loud, with the students concentrating on having fun there during the school day, similar to the findings of von Brömssen and Risenfors (2014). Further, the students in this space presented themselves as proud multicultural persons. There seemed to be more boys at the corner than girls, but 'everyone' was welcomed if they were friends of the people there. I did not observe as strong a social hierarchy among the immigrant background students in this school

as did von Brömssen and Risenfors (2014), where even the seating order was set. To the contrary, this school had a changing ‘everyday social order’, based, however, on ethnicity and gender.

In brief, the everyday social order was continuously made and remade within the power geometry of the school space and social space. However, it was not neutral, free, similar or equal for everyone. One’s position in this order was tied to divisions established by gender, ethnicity and class. The school was in a mixed suburb in terms of social class and ethnicity, and also the number of boys and girls was similar. Working-class boys in particular seemed to be more street-wise and not so interested in education and official school than, for example, middle-class girls and a number of ethnic minority youth. Some of the school’s social and spatial power geometries were constructed through cultural style, ethnicity and gender: the young people actively read each other’s styles and ways of publicly acting in the school and on the street (see also Gaskell 2008), drew up the social categories, and decided who belonged to which group and in which position. Even the youth-culture options were not open to all; for example there were no ‘heavy rockers’ among the young people with an immigrant background, who identified rather with American Hiphop or R&B music (see Tolonen 2013).

As well as the school, I visited several youth clubs in the area, and observed different communal histories and power geometries in them. Unlike the school, entering the youth clubs was clearly voluntary: young people could choose where and with whom to spend their leisure time.

Researcher: I have been to the school and have a feeling that there is segregation between immigrant young people and others. What do you think about this? And there are also some conflicts at school.

Youth worker: Well, one can see in our youth club that the immigrant youth are one big group, like based on boys from African countries and then some others like Russians or boys from Kosovo will join them. But here they get along. On the other hand, some more quiet Finns are not familiar with their noisy ways and don’t hang around with them.

Researcher: Any differences between the youth clubs nearby?

Youth worker: Well this used to be a strongly Finnish club. Then we had one youth worker who started to ask young people with different backgrounds to join in, and it was deeply contested if the immigrant young people could join. There were fights over it outside.

But honestly, I think we need to have multicultural clubs. The immigrants have come and have stayed.

At this time the situation at the local youth club was peaceful, but it had not always been. Also, other youth clubs in the Helsinki suburbs have been in a state of change, being contested due to the everyday local gendered and ethnic orders (see also Honkasalo 2011; Perho 2010). Local groups may dominate some clubs, and this may be the case especially in suburban settings. Usually the youth clubs situated near the city centre attract young people from the suburbs who wish to take part in some special activity (computer club, theatre, music) (Cf. Kivijärvi 2015, 2010, 2013), some of them dominated by girls. The local youth clubs have frequently been used by those who have been keen to stay and spend time in their own neighborhoods, having an attitude of neighbourhood nationalism. Working-class and

immigrant boys often dominated the local youth clubs, but at times working-class and a group of girls with various immigrant backgrounds also found their way there (see also Kivijärvi 2015; Tolonen 2010, 2013).

Such articulations of the power geometry (Massey 1994) of the school and youth centres were not born in a vacuum. As mentioned earlier, from the perspective of social class, this neighbourhood's educational average was slightly lower than in other parts of Helsinki. However, there were families with academic, as well as working-class and immigrant backgrounds. The educational background and work status of the families actually varied very much. Thus, at school one could find young people with various backgrounds, but those I met at the youth club were mainly boys from a working-class background.

In the schools and youth centres I visited in eastern Helsinki, 20–40% of the young people could be identified as having an immigrant background, and at least 12 of my 33 interviewees in Helsinki had immigrant backgrounds as well, with either one or both parents having moved from another country to Finland. In this particular suburban area the question of dealing with multiculturalism and being an immigrant was important, and was often dealt with by young people in different, often gender-specific ways. Not just segregation, but also togetherness was evident. The young people said they formed spontaneous football teams of 'foreigners' or 'refugees' against 'Finns', even though they may have had an immigrant background but were not necessarily refugees – these terms were used as (ironic) identifications and ways of showing belongingness while playing with and against each other, and can be interpreted as *neighborhood nationalism* (Back 1996; Gordon 2007; Kivijärvi 2015; Haikkola 2011), meaning here a feeling of togetherness among the working-class and ethnic minorities. Girls, too, told of participating in the games, even though these urban articulations of neighbourhood nationalism through football were dominated by boys.

40.5 The Shopping Centre as Contested Urban Space: A Wild Youth Club or Relaxing Leisure Site?

The local shopping centre was rather well equipped, with many culture and sports services and local shops along with a large food store. Local services, as well as a metro station and bus stops were situated near the centre, meaning that it was a central and focal connecting point for almost all the inhabitants of the area, not just young people. Further, a kind of 'field struggle' over this urban space seemed to be going on between the different actors.

The local shopping centre presented a very different place from the perspective of adults. Once at a meeting in one of the local schools, teachers, youth workers, police and some parents debated the leisure practices of young people in the area. I talked with two local police officers, and they apparently saw the shopping centre as a potential crime scene: they told me that many different kind of drugs were on

their way in, and alcohol use was decreasing. Young people would sell anything they could get hold of, even medicine from their parents; at times they sold harder drugs. The police felt they were unable to control this unless someone committed a crime, then they could do a drug test. Sometimes they also got calls from the shopping centre concerning shoplifting or some nuisance, mainly bad behaviour. Especially during the winter, young people spent a good deal of time in the shopping centre. The police officers estimated approximately 30 'regulars' daily, school hours included. According to them, the youths ran around, behaved badly, walked into people and pushed. They also congregated in the nearby park, which according to the adults caused problems. The police were frustrated by their behaviour. The police also told me that other young people avoided the shopping centre, as they were afraid of the youth gangs there. In addition, one youth worker commented on the private security guards who kept order there in addition to the police: they were young themselves, and the young people knew how to provoke them.

The local authorities seemed to have a joint mission – to solve the youth problem in public urban space and correct the power geometry dominated by some young people. Evidently the young people in question acted as active citizens in public space, but did this in a wrong and not very responsible way, resulting in being perceived by other citizens as a threat. This united the different authorities (see Pyry 2015; Tani 2011). The youth workers also had co-operated with the police and social workers, which they felt was positive and useful, with new young people finding their way to the youth clubs which offered support and supervision. They claimed that young people caused trouble at the shopping centre, and called it 'a wild youth club'.

What about the young people themselves? How did the local youth see the very same place? What would different young people say about this place, and what kind of social practices and power geometries were to be found there as a public space?

I interviewed Oskari, a 15-year-old boy from a working-class background, who had quite poor school motivation and success, and he expressed a high level of interest in hanging around at the shopping centre with friends:

Oskari: Well we hang around here and there, sit down and do something.

Researcher: With whom?

Oskari: Depends who turns up there. (...) Well we see each other there (in a certain place) and meet, so we don't have to call each other. You just go there. We then go somewhere else, or just stay there. (...) There is this place close to stairs, behind them. That is where we sit.

Researcher: You sit and talk then (...) Have you ever been in trouble? Like with the guards? I interviewed some youth workers, and they say some of you do get into trouble.

Oskari: Yeah. With the guards. Sometimes the guards come over and then some of us start to argue with them, if we are bored. It is fun to irritate them, we get something to do, and some fun also (...) With all the authorities, it's fun to be mouthy with the police.

Researcher: Well how often do you hang around there?

Oskari: Almost every day.

The shopping centre seemed to offer him a pleasurable place with a large community of his own, where everyone can be friends, and one can spend time without the demands of school success or goal-oriented hobbies. For him, it was simply a

pleasure to be in a city space as a ‘flexible citizen’ (cf. Gordon 2007; Ong 1999; Pyyry 2015), to emphasize social togetherness. Oskari did not see himself and his friends as active in petty crime, as a nuisance to others (asserted by the police) or as wild youth (asserted by the youth worker). However, he did agree that they provoked the guards or other authorities – if they were bored (cf. Hebdige 1985; MacDonald and Shildrick 2007; Whyte 1943).

Oskari was an example of working-class boy who spent his time mostly in local urban space with other working-class and immigrant friends, but he also moved around the city. Similarly, some of the girls in the study spent their time in other Helsinki shopping centres, not here in the local one. Nelli, in the next example, was a working-class girl who did not particularly like school and was intent on vocational training. She, too, avoided the local shopping centre. In her leisure time she more often sought relaxation with friends than action. She said she liked to play outdoor games and spent much of her free time at the local youth club. She did not like the young people at the local shopping centre: she felt their way of behaving in this public space was not her style, since they acted tough and immature, and not responsibly.

Researcher: So you don’t spend time in the shopping centre?

Nelli: No, I really don’t (...) Those who hang around there, they pretend to be drunk or something, they like to present themselves as tough (...) I don’t like to spend my time with them. They are so childish.

Nelli’s friend Milla was also from a working-class background, and liked to spend her time at the youth club in a more private girls’ group with immigrant background girls, rather than with many people in a public space. Being in this group, she said, made her feel welcome instead of like an outsider.

Milla: I mainly have friends who are from another country (than Finland), then I don’t feel like an outsider since I am a foreigner (born in Eastern Europe). I have some Finnish friends but only a few. My friends are mostly foreigners.

She expressed feelings of ‘neighbourhood nationalism’ (Back 1996; Gordon 2007), meaning that she belonged to this neighborhood, but, mainly to her multicultural group (Honkasalo 2011; Kivijärvi 2015), which she found supportive. These girls distanced themselves from the bigger youth crowd at the shopping centre whose behaviour they disliked. However, some, like Lea, would also spend time there just to sit in a cafe.

Lea: Oh yes, there is (trouble) nowadays. In the newspaper there was a story that there has been trouble with young people, but they are some strangers, I don’t know them at all. Sometimes my friends are there also.

Jani was a 15-year-old lower-middle-class boy; his parents had a secondary education and worked in the service sector. Concerning his leisure practices, he claimed he had some hobbies elsewhere, including making films and music himself. Jani liked his class as well as going to school, and did not like hanging around at any of the shopping centres, even though he shopped there at times.

Researcher: How often do you go to the (local) shopping centre? And what do you do there, what is nice about it?

Jani: I think some of the shops there are nice. If I go there I do some shopping (...) a few times a week.

Researcher: You don't hang around in there?

Jani: No I don't.

Researcher: Why? Some young people do.

Jani: Well I think it is quite stupid, that they spend their time there in the shopping centre. They always, like, throw stuff around, or something like that.

Jani was clearly distancing himself from the young people in the shopping centre. He thought it was stupid, and not a very sensible or respectable way to spend one's leisure time (Skeggs 2004).

Using a shopping centre as a place to hang around in was contested in many ways – while some did so daily, others, young people as well as authorities, had strong opinions that loitering in the street or in a shopping centre was a sign of 'doing nothing' or a way of getting in trouble with the law (see also MacDonald and Shildrick 2007; Massey 1998; Robinson 2009; Tani 2011). The opinions of the police, youth workers and various young people were all different articulations of the power geometry (Massey 1994) within this particular shopping centre, and exemplify 'a field struggle' over the proper use of a public urban space along with the articulation of the right kind of active citizenship.

A continuum of power geometries between the school and the street was also evident. As in many other studies, here it was more likely that working-class boys with a negative attitude to official school were the ones who felt more at home in the public, less-controlled space of the shopping centre. This hanging around in city space gave them the possibility to feel that they belonged to their neighbourhood (see MacDonald and Shildrick 2007; Shildrick 2006) and to express 'neighbourhood nationalism' (Back 1996; Gordon 2007; Kivijärvi 2015), at times together with some of the working-class girls and immigrant boys and girls. Middle-class boys and girls tended to have some kind of hobby (sports or cultural), and many, along with immigrant girls, saw it as not particularly respectable or sensible to hang around in this shopping centre (see discussion on respectability in Skeggs 2004; also see Hollingworth and Williams 2009; Isotalo 2015; Peltola 2015). An everyday social order, as well as a contested power geometry (Massey 1994) seemed to be evident in relation to these places among the local youth. This order had its classed, gendered and ethnic measures.

40.6 Urban Spaces, and Ethnic and Gendered Risks

All the young people participating in this study used the city space in multiple ways. At times, they stayed more at the local shopping centre during their leisure time, at other times they would prefer to ride the metro and buses, staying in different stations. Other shopping centres were also popular, as well as some petrol stations with coffee bars, hamburger restaurants, sports fields and open parks. Many of the interviewees of all ages (12–17) moved freely in the city space, both girls and boys.

They travelled daily from local premises and streets to sport clubs, to reach their hobbies, or to the city centre. For some, this moving about was an important basis of their identity; for others, staying in the local surroundings was important in terms of neighbourhood nationalism (Back 1996; Gordon 2007; Kivijärvi 2015).

Moving about and facing risks were experienced in many ways, and these risks also had gendered and ethnic power geometry (Massey 1994) measures. Most of the girls in the study claimed they were not afraid to move around in Helsinki by themselves or with their friends, although they preferred the latter. However the girls claimed they became very angry at times. Some had experienced sexual harassment, either verbal or physical, often in connection with public transportation. They felt that their right to be mobile urban citizens was violated when their free movement around city was interrupted by strangers.

Researcher: Have you ever been afraid in the metro station here?

Tia: Well every week, I said to my boyfriend, I don't want to go alone anymore – always some men, and sometimes women, come and talk to me at the metro. Sometimes they are just lonely, that's ok. But there are these guys who come – and I always try to go where other women are sitting – since these men come and sit too close to me and start talking to me. I don't like it. Sometimes they are drunk. At times some of them speak English, and I can't speak English that well.

However, as well as irritating or anger-provoking experiences in the city space, sometimes the girls were actually frightened, as in the following case of Riina, a 17-year-old working-class girl.

Riina: I am into Thai boxing (...) I wanted to start doing a self-defence hobby. My mum asked me why not something like dancing, but I said I would soon be 18 and starting to going out. Who would defend me then, dancing wouldn't help me. (...) Once I came home late from my boyfriend's, and near our house there are these bushes, I was just crossing the road and two boys came after me. There was a crowd of boys coming from the football field and two started to follow me. They ran after me and grabbed me, and I was quite scared. I got away, but later I felt kind of traumatized, I mean I don't necessary want to walk alone in the dark, I am scared.

The power geometry and gendered order was changing in everyday life – but even though women have full rights as urban citizens to move about, this was at times jeopardized by threatening situations. Hille Koskela has written about gendered spaces and the gender-related production of urban space and fear. She claims that gender is one of the most crucial factors regarding fear of violence and geographic mobility in urban areas (Koskela 1999, p. 111). In addition, Koskela claims that women who have been exposed to violence in the street are more afraid afterwards (Koskela 1999, p. 116).

Experiencing the urban space as safe is therefore strongly gendered, and the girls in the present study felt they were open to certain risks, ranging from unpleasant or annoying, to truly frightening (see also Aaltonen 2006). As well, it was evident that the existing power geometry between genders was at times potentially threatening to girls.

However, moving about in public urban space was not without risks for boys either, with both Finnish or immigrant backgrounds and looks. Next, I show some examples of risks experienced by immigrant boys, since they often circulated

through urban space. For some of them, mobility seemed to be a crucial basis of their identity, in addition to having a space of their own, the ‘immigrant corner’ at school (see also von Brömssen and Risenfors 2014).

Many immigrant boys told me in the interviews that they had several hundred friends, whom they met both virtually and face-to-face while on the move. Katrine Fangen (2010) has named these large networks ‘communities of difference’ (see also Vestel 2004), in which young people with immigrant backgrounds can support each other with respect to racist and prejudiced attitudes and experiences in school and outside of it. The ritual of moving about and occasionally meeting in a sense reinforced these large networks, as well as the power geometry (Massey 1994) and balance of ethnic relations in public spaces. It reinforced their right to walk or otherwise move in the city space, like the young women above, as active urban citizens. But also like the young women, the young men, too, could be exposed to risks and there were occasions in which the power geometry was challenged.

A 16-year-old boy with a Mediterranean background, Ollie, said he moved quite a bit both socially and spatially. He belonged to a socially and ethnically mixed eastern Helsinki group at the local youth club as well as many other groups and networks involved in his favorite sports. He also knew people who had contested official city space in search of excitement: these young people painted graffiti in places controlled by guards. As well as excitement and having fun, marking the place with illegal graffiti had its risks.

Ollie: I always liked the graffiti paintings (...) Well I have lots of friends who do them as well (...) Once I saw my friend (...) all beaten up by the guards, they had caught him in the woods.

Young men who painted graffiti took risks, and if caught, had to deal with the consequences. Here, adult members of society, the guards, tried to prevent an illegal marking of space from taking place, but by questionable means.

The power of the group and of networks, as well as the power geometries between groups of young men, is shown to be at stake in the next example. Mahad, a 16-year-old boy, told me that the use of the N-word is very humiliating for him, and often prompts him to fight. I continued the discussion he had brought up:

Researcher: Well who uses the N-word anyway?

Mahad: Those skinheads do. At school. In seventh grade. Not anymore. And if they don't shut up you ask more people (...) that has happened. A gang fight. In the centre, at the shore. I was there also. We walked by, they just challenged us. The heavy metal guys. All the immigrants together fought against the skins and heavy rockers. (...) But I don't think they say this (N-word) now, since there are so many of us, a big bunch of people.

Researcher: So there is a sense of safeness when there is such a big group. But would you dare go there (a certain square) in the evening by yourself?

Mahad: Oh yes (...) But once someone beat me up there. A big man, a kind of skinhead, someone 50 years old or so. He just came from a bar, near this food shop.

Researcher: Terrible. I am truly sorry. Does it affect where you go now, and what you do?

Mahad: No, no. I was a coward then, I didn't dare to do anything. But since I got beaten up I've become a tough guy (...) I won't let anyone touch me, to beat me up.

The contested moments of power geometries presented here are the fights between immigrant background boys and skinheads and heavy rockers, as well as a

violent adult man in the nearby square. Similarly to Gaskell's (2008) study, the power geometry of the streets and the school was interconnected in the above example. For some boys, learning only the school subjects as well as rules and duties as citizens was not enough (see Gordon 2007): becoming streetwise and learning how to negotiate in terms of respect and the use of violence were also relevant (Gaskell 2008; Manninen et al. 2011), and a way to survive.

Anoop Nayak writes about racist name-calling in the classroom. He claims that even though young, black people can also call white students names such as white duck or ice cream, these names do not refer to slavery, imperialism, apartheid and discrimination (see Nayak 2003, p. 149–151), and thus do not trigger feelings of humiliation and a devaluing of oneself as a citizen. Calling immigrants and other students with darker skin derogatory names is also common in Finnish schools, streets and other public spaces (cf. Hautaniemi 2004; Souto 2011), not to mention physical encounters or even assaults: all leave an unpleasant feeling of not belonging due to the colour of one's skin. In order to move about in public spaces freely as an urban citizen, it was safer to have the support of large networks (Fangen 2010) – this was clearly experienced by boys from immigrant backgrounds.

Even though a majority of the young people felt it was safe for them to move about in public city space, some had experienced risky and unpleasant situations, leaving deep marks on them, and these experiences were intertwined with gender and ethnicity. Both girls and boys had encountered frightening situations. The above-mentioned boy felt he had become 'tough' after being attacked. The girl in the example no longer wanted to move around alone. Experiencing these risks confirmed that actually open free urban space was not the same for all: one needed to learn that there are risks, and that the risks and ways of dealing with them were not only gendered and ethnic but also classed, as the lives of middle-class youth appeared to be more centred on their hobbies than working-class youth, which affected their use of public city space.

40.7 Conclusion: Urban Space as Open City Space: Can Anyone Go Anywhere and Feel They Belong?

Defining the use of urban space, as well as the relationships between youth groups and between youth and adults, is hardly ever seen as neutral. I agree with Öhrn and Weiner (2007) that school and neighbourhood are interconnected: as well as social and cultural behaviour, school achievement can also be influenced by a school's surrounding neighbourhood.

In this chapter I have given several illustrations of the use of different spaces and power geometries within one urban neighbourhood in eastern Helsinki. School was found to be a space with many layers, and the young people presented different positions in relation to school success, local youth styles and gender, as well as ethnicity, all of which were displayed by strong spatial practices and mainly

dominated by boys (see also von Brömssen and Risenfors 2014). The spatial divisions of school by ethnicity were not so strongly evident within the local youth clubs that the young people visited voluntarily in their leisure time. However, in the past, rivalry based on the use and ‘ownership’ of one particular club had arisen between boys from different ethnic groups (see also Kivijärvi 2013). On the other hand, the dominance of boys over girls in the public space of the school and youth clubs was not explicitly questioned, and contested moments in the gender relations were not widely reported in the data even though girls criticized the boys’ speech and actions, and mimicked them in an ironic way. Furthermore, girls spent less time in the shopping centre than did boys. In addition, girls’ behaviour in this public space was not seen as problematic as that of some mainly working-class boys, who found their social lives to be richer and more relaxed outside the school and youth clubs run by adults. The shopping centre was more a basis of their identity than school (see also MacDonald and Shildrick 2007; Massey 1998; Willis 1977).

In the streets and on public transportation both boys and girls felt vulnerable at times. Despite feeling safe in urban spaces in Helsinki, some conflicts and actual attacks were also reported by the girls and boys. When experiencing an actual attack by a stranger, both girls and boys reacted strongly. It seemed to challenge their right to belong in the public space and to act as active urban citizens. Being subjected to an attack did not only change their feelings about the urban space in negative ways, but also their behaviour towards others. Boys formed large networks to avoid (racist) attacks and remain safe (Fangen 2010); girls did not report having large safety networks but rather smaller and trustworthy girls’ groups.

Varying and changing gendered, ethnic and classed orders as well as different power geometries among different social groups therefore occurred in the urban space examined. Other’s views concerning the urban space were particularly negative if youth practices in the public sphere attracted (unwanted) attention or were worrisome (see also Tani 2011), or if the youths’ actions were not interpreted as respectable, that they had not learned to act as proper urban citizens (see also Gordon 2007). Every city, region and nation is alarmed if their young people appear on the streets too often, are too loud or behave in an anti-social manner (Cf. Hjelm et al. 2014). The practices of the young people here varied from hanging out and meeting friends to possible petty crime. Not just streets and shopping centres, but also youth clubs and the school space were presented here as contested, and in addition, as self-made and remade within local power geometries (Massey 1994) by different youth groups in relation to others, including the authorities.

In urban spaces, informal relations meet formal demands, regulations, laws and the political atmosphere in sensitive social ways. The building of respectable and active citizenship takes place in informal social relations, and these processes are contested through power geometries and balances formed in different urban spaces such as schools, youth clubs, shopping centres and the street. The everyday social orders of who is who, and who is respected and valued, are constructed in these different urban sites.

This valuing and revaluing of young people takes place in urban spaces: young people learn where and how they are welcomed and what is possible for them, as

well as what is expected of them in order to act as members of a local and national society. Young people also learn that they cannot claim a natural-born right to citizenship, as in the eyes of law (see Gordon 2007); rather, in order to achieve full, appropriate, active and responsible citizenship (Acts of education and youth work) they need to learn their classed, gendered and ethnic intersectional places in the everyday social orders fashioned through local power geometries. The urban spaces seem to teach each person where and how to belong. There are formal laws which assume that everyone is treated equally, yet here are informal local power geometries which contest public values.

But what kind of practices might be generated to dissolve the current inequalities based on social class, gender and ethnicity in urban education? The answer may lay in city planning with the aim of preventing segregation of the everyday spheres of young city people in levels, for instance, housing, education and youth policy. In educational and youth policy we can promote equality by eliminating the segregation processes inside and between schools or youth clubs: we need to take the teaching of social tolerance even more seriously in the schools. In addition the quality of public discussion including high-standard journalism needs to be improved and control of anonymous hate speech on social media restricted. The creation of space for equal policy is important. Policing urban spaces requires listening to different groups of people in the local areas, and strengthening young people's skills to take part in public discussions and spaces in a civilized manner.

Part VII
North America

Chapter 41

Urban Education in North America: Section Editor's Introduction

Paula Groves Price

In 2008, the world, particularly North America and the United States, rejoiced the historic election of President Barack Obama. With the democratic election of the first African American president in the continent, citizens across the USA believed that change was on the horizon. The feelings of hope and optimism were strongest in large urban cities, where the economic downturn from the George W. Bush administration left unemployment at record highs, particularly in communities of color. Urban communities were hopeful that the policies and practices of a president of color, a president who spent some of his early career as a community organizer in urban environments, would support the revitalization of urban cities and people.

What emerged over the past 9 years since the publication of the first *International Handbook of Urban Education*, is a stark realization that when it comes to urban education in North America, the more things change, the more they stay the same. While some of the Obama administration's policies have made significant improvements in lives of citizens across the USA—access to affordable health care and economic stimulus policies to curb unemployment and create jobs—urban education has made little progress. Urban communities and schools are still struggling with inequality of access and opportunity, and the centrality of race in the struggle has never been more pronounced. While Canada is often recognized for success in more equitable outcomes in urban schools, as compared with other areas of the world, it also is not immune to inequality and stratification along race and economic status.

North America, because of its wealth, power, and influence, is often looked upon as a leader in urban education and school reform. In discourse and policy, emphasis is placed on raising student achievement in schools and improving teaching and learning, particularly for students from historically marginalized backgrounds who

live in poverty. While the policy and school-based approaches differ somewhat in Canada and the United States, the ideological, political, and economic impacts of globalization and neoliberalism across North America remain at the core of the inequality that is experienced in urban cities.

This introduction is organized into three major parts to provide context for some of the major themes that have emerged in the field of Urban Education in North America over the last decade. These themes are also evident in various forms in the chapters included in this section of the *Handbook*. I begin with a central question that may seem absurd at first glance—what is urban education? Embedded in this question is a larger discussion of shifting definitions and conceptualizations of “urban” that is often racialized, and connected to notions of place and space. Next, I continue with a discussion of neoliberalism in urban education, as it is not just a theory, but a set of policies and practices that have had real effects on the lives of urban communities and schools in North America. Without a doubt, neoliberal ideologies and policies have guided many actions in urban education that have had devastating effects on communities of color. Finally, I end the introduction with a preview of the six chapters included in this section and their connections to the larger discussions of (re)conceptualizing “urban,” neoliberalism, and their implications for greater equity in North America.

41.1 What Is Urban Education?

In 2012, H. Richard Milner wrote an editorial in *Urban Education* questioning exactly what is meant when a school is called “urban.” From his experiences in the United States, he encountered numerous superintendents, researchers, and policy-makers that all made reference to urban education and urban schools, but seemed to have no shared definition of urban or urban education. How could schools located in rural and suburban areas, geographically a far distance from any city, still be classified as an urban school? Irby (2015) agreed, noting that in the field of urban education, it is used to describe “anything and everything” related to the education of children in poverty, regardless of where they live. Increasingly, people across North America classify schools as “urban” because of the characteristics of the people in the school, not the geographic location. In other words, schools with a significant population of students of color and/or students in poverty are referred to as urban schools regardless of location. Milner (2012a) argued that in order for the field to develop and evolve, shared definitions are required to differentiate among the social contexts of schools and communities. He developed a typology of three categorizations that he surmised would help researchers and practitioners communicate with a shared language the various contexts in urban education. He suggests the term “urban intensive” should be used to describe schools in large metropolitan cities with a high population density and scarcity of resources; “urban emergent” describes schools located in large to mid sized cities, but not with the density of the urban intensive; and “urban characteristic” describes schools that are not necessarily

located in cities, but experience some of the challenges associated with urban contexts such as increases in English language learners.

While these classifications might indeed provide helpful language and frameworks for making sense of different social contexts of urban education, the lack of connection to the significance of space and place is a limitation of a descriptive typology (Irby 2015). For many urban education researchers, the location and significance of the city is one of the most defining aspects of urban education, as it is the production of place and space that mediates the production of inequality in global capitalism. Removing the specificity of the city in the tethering of urban education as ecological or socio-spatial systems, however, plays into the general public's lexicon of urban associated with particular people and communities.

The works of Buendia (2011) and Daniel (2010) call for urban education researchers to (re)conceptualize or (re)imagine the urban-suburban binary, as those binaries feed representations of people in racialized and classed terms. Of particular significance here is the dialectical relationship between blackness and whiteness as oppositional subjectivities in the imaginary connected with the terms urban and suburban. In the same way that whiteness in North America has no meaning if not connected to the significance of blackness, the meaning of urban and suburban are engaged in a symbiotic relationship. According to Daniel (2010), who speaks from a Canadian perspective, "the imagery that is attached to urban schools (i.e. schools located within the areas marked as the inner city rings) continues to be mired in deficit constructs and the pathologizing of students, parents, and communities" (p. 824). This imagery of urban is steeped in ideologies of blackness and whiteness, and is rooted and reproduced by American media representations. According to Daniel (2010), the representation of "urban" as poverty, dilapidated schools and buildings, and minoritized bodies is not the reality of urban spaces in Canada. In her analysis of Ontario, urban and suburban realities, particularly as it relates to space, have become enmeshed, as low income housing projects are often located in suburban settlements to create mixed-income neighborhoods. The government housing that exists in the cities, she asserts, at first glance is indistinguishable from surrounding buildings, but is largely inhabited by new immigrants. However, similar to the United States, gentrification projects have continually displaced low income and racial and ethnic minorities from their spaces in the city to facilitate the needs of high-income earners seeking the urbane experience. Relocation policies for the poor to suburban developments, therefore, supports the Canadian myth of inclusion while also masking some of the inequality that is often associated with the image of "urban." To reinterpret the meanings of urban and suburban, however, "requires a rethinking of location, subjectivity, and practice. It requires the engagement of leaders at the communal, educational, and political levels who are willing and able to challenge these constructions to facilitate a reimagining" (Daniel 2010, p. 825). From a critical race theory perspective, because racism is endemic and normalized in much of North America and the world, this reimagining proves to be very difficult, particularly in the context of globalization and neoliberalism (Zamudio et al. 2011).

The centrality of race is increasingly the major factor in the inequality that persists across the primary areas of difficulty and resource scarcity in urban North

America. Alexander et al. (2014) conducted a 25-year longitudinal study in Baltimore, MD, USA, following 800 children in 20 Baltimore public schools, from the time they entered first grade until they were into their 30s. In what Milner (2012a) would classify as an “urban emergent” city, half of the families were low-income, with most parents not attaining a high school diploma, and 40% of the low-income families were white. This longitudinal study was unique because most urban studies synonymously position “urban” with communities of color, even though white urban poor is not uncommon. The results of this study provide further evidence that institutional and structural race-based discrimination and privilege impact all spheres of life:

...it was clear that African- Americans face greater barriers to employment. ...Racial inequality also is embedded in hidden ways in other spheres of life, including discrimination in housing and banking practices that have kept white and Black Baltimore substantially separate and cut off working class African-Americans from potentially valuable social contacts. ...The race-based privilege that benefits working-class whites over working-class African-Americans has its origins in the discriminatory practices that excluded African-Americans from the skilled trades during Baltimore’s booming World War II and post-war industrial economy. (Alexander and Olson 2014, p. 1)

In other words, this study revealed the myriad ways that race in the “outside of school environments” disproportionately affect families and children of color in urban cities (Milner 2012b). There are similar findings in Canada, however, because of relocation policies, the racialized segregation and density issues are not as pronounced as in the United States (Hulchanski 2007). Looking at some of the major issues within urban schools, however, reveals that in both Canada and the United States, the needs of students of color, particularly Black children, are not adequately served. Race and poverty, therefore, remain the central challenges facing urban cities and schools, contributing to the North American conceptualization of “urban” as Black and poor. Daniel (2010) notes that the dropout rate of Black students in Ontario, which is above 40%, has been cause for alarm and has prompted Canadian urban educators to critique the structures of inequality in the system and the superficial ways multiculturalism and inclusion are approached in Canadian schools. Culturally responsive Alternative Schools, similar to some charter schools in the USA, have now been developed in Ontario. The high failure rates of Black students, First Nations students, and immigrant students in Toronto is also prompting more choice schools, and similar to the USA, market ideologies are driving reforms aimed at addressing increasing inequality in schools.

41.2 Neoliberalism and Urban Education

One of the central features of urban education in North America is that it is often the site of school reform efforts that influence the policies and practices of schools throughout the continent. Corporate models, school choice, accountability policies, and charter school policies are all “experiments” in reform that have emerged from

the United States that have influenced educational reform around the world. In the decade since the publication of the first edition of the *International Handbook of Urban Education*, the discourses and policies grounded in neoliberal ideologies have heightened and dominated all reform efforts in the United States. Canada has also seen a rise in neoliberal ideologies of choice and market ideologies. Lipman (2011) describes neoliberalism as “an ensemble of economic and social policies, forms of governance, and discourses and ideologies that promote individual self-interest, unrestricted flows of capital, deep reductions in the cost of labor, and sharp retrenchment of the sphere” (p. 6). Central to neoliberalism is the privatization of social goods under the premise that competitive markets are more effective and efficient.

In the United States, with the rise of Arne Duncan as the Secretary of Education in the Obama Administration (2009–2016), neoliberal ideologies and policies have dominated nearly all aspects of education, particularly in urban cities. As the former CEO of Chicago Public Schools (2001–2009), his urban educational policies quickly became the national model for attempts to improve schooling across the country. The result proved devastating for many predominantly African American schools and communities, where “failing schools” in cities like Chicago and Detroit were closed and/or subjected to takeovers by mayors, states, or corporations. These corporate “turn-around” models also focused on expanding education markets in urban schools, encouraging teacher incentive pay based on student test scores (Lipman 2011).

Duncan’s \$4 billion signature policy, *Race to the Top*, required states to compete for federal allocation dollars by submitting proposals for reforms that included expanding charter and choice schools, greatly undermining the power of teacher unions. The intense focus on charters, choice, competition, and teacher unions was the focus of the critically acclaimed and controversial documentary *Waiting for Superman* (2010) by director Davis Guggenheim. Following multiple families searching for quality schools amidst urban decay, the film positions charter schools as one of the solutions to improving urban education. Because of the limited resources and number of seats available in these schools, gaining access to a quality education in urban America was represented as literally winning the lottery. Critiqued for its lack of teacher voice, presentation of teacher unions as the major inhibiting force in school reform, and questionable data regarding the overall performance of charter schools as compared to traditional public schools, *Waiting for Superman* ignited a public spotlight on urban education and the need for more school reform.

Without a doubt, there are some charter schools in the USA that are excelling and better meeting the needs of historically marginalized students. The rapid increase in charter schools, however, supported by federal, state, and local governments, at the expense of community public schools is putting the future of public education at risk. Privately operated but publicly funded charter schools are also shifting the values and identity of education, as corporate models treat school administrators as managers tasked to reach production targets, and teachers sometimes resort to unethical tactics to meet test score benchmarks for incentive pay or punitive

consequences. Perhaps the greatest example of the threat to public education by neoliberalism is in New Orleans, LA, USA. In the 10 years following the devastating hurricane Katrina in 2005, the state of Louisiana opted to place the rebuilding of education on the open market. Partnering with education reform corporations, the New Orleans Recovery School District (RSD) is the first all-charter district in the nation. While the boards of each school, which sets the hiring practices, dress code, and operating rules are non-profit, the schools can be run by a management corporation which can be for-profit. The results have been many corporate run schools across New Orleans that have shifted to “no excuses” models, focusing on strict discipline, testing, and routinized structure (Kimmitt 2015).

Disproportionately used in the poor and largely Black communities, residents and researchers note that the school to prison pipeline is more overt than ever, as the schools look and feel like jail, and students are suspended, expelled and placed into the juvenile justice system at alarming rates. In the 2012–2013 school year, three of the Collegiate Academies, which operate under corporate control and the “no excuses” model in New Orleans, had the largest out of school suspension rates for minor infractions, at 58%, 61% and 69% (Kimmitt 2015). While empirical research on the impacts of these models on student achievement success has yet to be determined, it is clear that urban schools in the United States are at a moral crossroads in recognizing the costs of such reform efforts, particularly the impacts of “selling” mostly Black schools in urban communities to the highest bidder.

Black public community schools, which also employed teachers and administrators from the community, are closing and replaced at alarming rates with corporate charter schools that operate for a profit. This trend in urban education has gained great momentum—16 schools in the city of Detroit have been closed and placed under emergency management; 20 of the 27 schools in Memphis are charters and under a new management system—and more are likely to follow as neoliberal discourses and practices are pushed at all levels of government.

Urban communities, however, are resisting some of these reforms and are mobilizing against corporate takeovers, filing civil rights lawsuits, and coming together out of concern for the loss of community control over schools. At the heart of these resistance movements is the threat to democracy and the racialized implications of replacing public goods in the hands of private interests. As neoliberals have attempted to redefine democracy in terms of choice in the marketplace while replacing notions of government responsibility for the collective well-being of citizens with notions of competitive individualism and personal accountability, the “neoliberal project” is shifting our understandings of the meaning of education from social good to private investment (Lipman 2011).

The call now is for urban educators across the world, but particularly in North America, to actively engage in activist scholarship that links critical research with the current social movements that are mobilizing across cities. The authors in this section of the *Handbook* are examples of scholar-activists who are working in solidarity with urban communities to improve urban education and the conditions surrounding urban children and communities. While certainly a continent as expansive as North America cannot be easily encapsulated in only six chapters, the authors in

this section take us back to some of the critical themes that were briefly introduced in this editor's introduction. Questions of the significance of place and the defining, and redefining of urban; the centrality of race and inequality in schools and communities, social activism and community mobilization, and the impacts of neoliberal ideologies and practices in urban cities and schools are all addressed in this section.

The section begins with a critical discussion of *why race still matters in urban education*. Evans, Cardenas, & Dixson utilize Critical Race Theory to show how neoliberalism, particularly colorblind ideologies, have ushered the destruction of public education. The authors connect the macro issues that many communities of color face in urban cities—wealth and income inequality, housing, access to health care, and the prison industrial complex—to the ways in which children of color are perceived, treated, and educated in urban schools. Their analysis showcases the ways neoliberal ideologies and policies not only support negative stereotypes about urban children, but also work to legitimize the school to prison pipeline in America.

Parekh & Gaztambide-Fernández discuss structural inequality and segregation in Toronto despite progressive integration strategies. The chapter draws on data from the Toronto District School Board (TDSB), Canada's largest and most diverse public education system, to show how different forms of segregation, particularly race-based and class-based, continue to manifest despite policy efforts to counter such inequalities. While Canada is often praised for its public education system in promoting equitable opportunities for diverse students, the authors also show the ways that choice programs, special education, and streaming practices promote inequality and segregation. The chapter investigates the current demographic trends as well as the barriers urban school systems encounter in effecting sustainable change.

John Lupinacci showcases some of the resistance activism enacted by educators in Detroit, MI, USA specifically around environmental justice in urban communities. As a scholar-activist, Lupinacci shares the power of grassroots and community organizing to push back against neoliberal agendas to gentrify and privatize. Here, the significance of place, space, and city is highlighted in light of larger social justice issues related to sustainability and food sovereignty. The chapter is a unique case study that illustrates the ways grassroots activism and education can successfully respond to neoliberal attacks on education and urban life.

Continuing with the theme of community activism, Clemons, Price, & Clemons discuss Hip Hop Based Education as a means for student and community engagement and activism. Highlighting the voices of Black urban students and parents in a mid-sized southern city, their work points out the importance of culture, identity, and culturally responsive methodologies for urban children to develop a sense of self and pride in community. In their study, Hip Hop is not positioned as just an urban musical culture, but also as a means to facilitate critical thinking skills to mobilize youth for community activism. Grounded in the Children's Defense Fund Freedom Schools movement, the chapter discusses how a civil rights based curriculum and Hip Hop Based curriculum can work together to empower urban children and families.

In the chapter *Latina urban education: At the crossroads of intersectional violence*, Mariscal, Velasquez, Agüero, and Urrieta push urban educators to critically think about the ways urban education reproduces oppressive, racist, heteronormative, and patriarchal ideologies. Approaching their analysis from an intersectional framework, the authors discuss urban Latina schooling through a mind-body-spirit lens. Aiming to disrupt the binaries often found in the literature on urban education, the chapter proposes that intersectionality is the framework with the capacity to support the social justice pedagogies of resistance that are needed to decolonize urban education.

The section ends with Hollis and Goings and their discussion of a culturally responsive model designed to improve urban schooling and achievement. Approaching urban education from the perspectives of the fields of psychology and prevention science, the comprehensive CARE framework is designed to address the academic, social, and emotional needs of students and teachers to improve urban education. This model, which connects culturally relevant pedagogy, attachment to school, emotional health, and high expectations from and for teachers and students, is a holistic approach to educating the whole child. This approach is counter to the ‘no excuses’ and disciplinary focused models found in many urban schools, and is presented as an approach to increase student achievement and reduce the school to prison pipeline.

Collectively, the articles in this section of the *Handbook* provide theoretically rich critiques coupled with examples of community resistance and pedagogies of hope. The articles also represent a mixture of emerging and established scholars in the field of urban education, as many of these co-authored pieces are in collaboration with doctoral students. In content and methodology, they are testimony that urban education in North America has moved in the scholar-activist tradition, as it is one of our only weapons to fight against neoliberal agendas that threaten our dignity and existence.

Chapter 42

Why Race Still Matters in Urban Education: Critical Race Theory and Urban Education

M. Alex Evans, Nancy Cardenas, and Adrienne D. Dixon

Imagine a first grade student, Brooklyn, on the Wednesday morning after the 2008 election results were announced. She stands proudly in a classroom among her peers with her right hand confidently placed over her heart reciting the pledge of allegiance. She smiles cheerfully shouting, “with liberty and justice for all!” Still filled with the high-spirited energy of her parents and grandparents whose tears of joy flowed freely as they witnessed the first African-American win the election to become the 44th President of the United States of America. Unable to grasp the full context of their emotional outpour, their collective elation had a profound impact on her because for the first time in her life she believed that even for her anything was truly possible.

Darell, her older brother, sits quietly in his ninth grade homeroom class reflecting on President-Elect Barack Obama’s acceptance speech, “if there is anyone out there that still doubts that America is place where all things are possible, who still questions the power of our democracy, tonight is your answer.” Though he could grasp the historical significance of this event that Brooklyn could not, even he bought into the notion that things would change for the better allowing everyone to be afforded equal opportunities in America.

“Doesn’t a black in the Oval Office put the lie to both black inferiority and white racism? Doesn’t it imply a ‘post-racial’ America?” (Steele 2008) After the election black conservative Shelby Steele used this momentous occasion to suggest that the U.S. had realized the erasure of the stigma of America’s racist past. Steele asked, “Does his victory mean that America is now officially beyond racism? Does it finally complete the work of the civil rights movement so that racism is at last dismissible as an explanation of black difficulty?” (Steele 2008) While it isn’t difficult

M.A. Evans (✉) • N. Cardenas • A.D. Dixon

to understand how our hypothetical characters Brooklyn and Darell might buy into narratives suggesting a new anti-racist America, first we simply answer each question posed by Steele, no. America is not post-racial (Dixson 2015).

In order to provide evidence we fast-forward 8 years to 2016, President Obama's last year in office. With Donald Trump's ascension as the leading Republican Presidential candidate even young students like Brooklyn and Darell are able to experience the sharp departure from previous messages of progress to more conservative racialized discourse in efforts to "make America great again." Largely because of Trump's popularity as a television icon, much of the news coverage surrounding the 2016 presidential election focuses on his rhetoric that closely mirrors historic methods of oppression, which is a stark contrast from President Obama's themes of change.

Though their diverging political views are due in large part to political party affiliation, this chapter argues that conservative colorblind and post-racial values are a direct response of retrenchment to President Obama's tenure in office. On the surface of arguably the World's largest political stage, all of our society witnesses the open condemnation and removal of Black Lives Matters members as well as silent Muslim protestors from presidential rallies, proposals of pseudo-concentration camps based on religion, and building walls to keep "Mexicans" out of America. However, we believe that this blatant protection of oppressive status quos serves as a microcosm of American society as a whole, which has shattered its own public education systems with post-racial policies that disproportionately cost communities of color.

With looming racially charged issues at the forefront of the 2016 national consciousness such as police brutality, mass incarceration, the Flint water crisis, immigration reform, the armed occupation of federal buildings by "patriotic militiamen," and steady increase of anti-Muslim and anti-Black patriot groups, "race relations" are again at a pivotal point in America's history. We reflect on America's retrogression since the last Presidential candidate took office, not as a comprehensive examination of post-racial versus markedly racial political campaigning, but as a reference point for theoretical framing for the effects of colorblind policies on public education a manner in which young students like Brooklyn and Darell might also appreciate.

This chapter directly addresses the question of *Why Race Still Matters in Urban Education* as it stresses the necessity for theorizing and analyzing educational inequity as a by-product of race and racializing processes (Dixson 2014). We argue that similar colorblind and post-racial philosophies have ushered in a wave of unprecedented destruction of public education that harms not only children of color, but also teachers and communities of color with pronounced racially disproportionate outcomes (Dixson et al. 2015). First, this chapter will examine post-racial and colorblind ideologies as it places the resulting colorblind policies of public education within the American historical context. Then the chapter will outline the racially disproportionate outcomes that currently occur within communities of color such as wealth and income disparities, upward mobility, housing, the prison industrial complex, and health care. Next, we will consider issues facing students of color, as

discriminatory stereotypes serve to legitimize the effects the school-to-prison pipeline. Lastly, we will address the challenges such as the diversity gap, retention rates, and teacher reform in which teachers of color across the nation face daily.

42.1 Post-Racialism and Colorblindness in America

Our analysis of the post-racial rhetoric immediately following the election of President Barack Obama does not focus merely on the legitimacy of post-racial discourse. Rather, we argue that post-racial rhetoric has historically served as the precursor for acts of retrenchment through the implementation of colorblind ideologies, which have historic roots fostering white racial domination (Crenshaw 1988). With the decision in *Brown v. Board of Education* the U.S. Supreme Court overturned the “separate but equal” doctrine established in the infamous *Plessy v. Ferguson* decision. However, as *Brown II* held that schools should be integrated “with all deliberate speed,” lasting precedents for colorblind decision-making precedent were set, stall or do nothing at all. By placing the burden of enforcement of racial injustice remedies on state and local government, the federal government effectively washed its hands of resolving racial segregation in schools. Disturbingly a number of districts failed to desegregate for decades, and even today public schools are more segregated now that they were over four decades ago (Rothstein 2013).

Subscription to post-racialism legitimizes the implementation of racist practices as colorblind ideologies, disregards the multifaceted socially and historically constructed firsthand experiences of persons of color. Though post-racial ideologies purport to provide universal, neutral, and objective methods of decision-making, they inherently benefit the dominant class as it forces minoritized individuals to divorce themselves from their differing realities from that of the dominant class. Colorblindness on the other hand, typically subscribes to the notion that race-conscious decision-making is synonymous with racism, forcing people of color to seek redress devoid of any attempts to address their experiences of racial inequality. Much like it is impossible for a woman speaking with a group of men to detach herself from her experiences as a woman, it is also impossible for persons of color to rid themselves of their own highly individualized lived experiences.

Generally the conservative viewpoint understands racism as acts of discrimination, involving malicious intent, which are inflicted primarily by individuals upon others based on the color of one’s skin. However, we argue that racism is “culturally sanctioned beliefs which, regardless of the intentions involved, defend the advantages Whites have because of the subordinated positions of racial minorities” (Wellman 1977). By employing this definition we are able to dispute the element of individual acts as we argue that racism is a product of cultural collectiveness.

In *Racism Without Racists*, Eduardo Bonilla-Silva coined the term colorblind racism, which explains how those who subscribe to the dominant racial ideology, rationalize people of color’s present-day status as the direct results of market

dynamics, phenomena that naturally occur, and culturally assigned limitations. Bonilla-Silva (2006) states that colorblind racism became the dominant racial ideology as a systematic device for keeping racial minorities in positions of subservience. Colorblind racism manifests itself covertly as opposed to the more commonly referenced “Jim Crow” form of explicit racism. Still, colorblind racism is indistinguishable from Jim Crow racism as they are forms of both exerting and controlling political and social power.

In housing, minoritized persons and whites are often directed into certain neighborhoods, or especially in the cases of minoritized persons directed away from affluent neighborhoods. Economically, advertisements for job openings are highly racialized in ways that effectively benefit whites. Lastly in politics, various policy practices such as racial gerrymandering serve to disenfranchise entire communities of color. Colorblind racism simply operates as a totalizing racial discourse that obfuscates the general resentment towards minoritized persons, that justifies the criticism of their morality, values, and work ethic (Bonilla-Silva 2006).

In *A Critique of Our Constitution is Color-Blind*, Neil Gotanda’s examination of colorblind interpretation of constitutionalism is particularly helpful, for a critical analysis of public education as it pertains to the public-private distinction. This distinction splits the private sphere of individuality, under the guise of contractual freedom, from the public sphere of governmental regulation. Further it differentiates actors as private citizens exercising their rights and public officials exercising state power. In other words, while a state may not tell an individual person who their associates must be, the individual acting on their own volition can be as selective or discriminatory as he/she desires.

According to Gotanda, while racial consideration amounting to discrimination is, in most instances, constitutionally permissible by the private actors, such discrimination is only constitutionally prohibited during the course of state action. For example, *Bob Jones University v. United States*, held that parochial schools could not obtain tax-exempt status if they enforce a sincere belief that the Bible forbids interracial dating and marriage. However, within the same case the Court left open the door for a private right to discrimination as it emphasized that the opinion only applied to religious schools, not with churches or other purely religious institutions (Gotanda 1991). This is particularly relevant to the privatization of public school education systems through venture philanthropy, which has created new markets worth billions of dollars (Scott 2009). Kumashiro (2012) claims that venture philanthropists spend millions targeting the largest urban school districts, as they experiment with various models in which they eventually seek to expand nationally. This not only allows for investors to take a more hands-on approach with evaluation and decision-making, but it also lowers the public oversight for assessment of instances of racial injustices thereby permitting colorblind investments irrespective of racial disparities.

The argument against post-racial politics provides a seemingly paradoxical view of post-racialism when considering both President Obama’s statements and his administrations’ policies. During his remarks on the remembrance of Martin Luther King, Jr., President Obama addressed post-racial statements likened to those

suggested by Steele when he stated, “there were some who suggested that somehow we had entered into a post-racial America, all those problems would be solved. That didn’t work so well” (Obama 2010). Ian Haney-Lopez outlines in *Dog Whistle Politics* how few of President Obama’s public statements acknowledge racial realities while a number reinforce the post-racial paradigm.

To illustrate this point further, following the racial statements made by his former pastor, Reverend Jeremiah Wright, then Presidential candidate Obama arguably saved his candidacy by delivering a “race” speech in Philadelphia (Obama 2008). In this speech President Obama referred to the racial discrimination of the past as the cause for today’s racial inequality, rather than providing a more direct analysis of contemporary racism. Haney Lopez (2014) argues that while privately President Obama is well informed on the structural depths of contemporary racism, a large degree of his political success can be attributed to his centrist abilities to appeal to bipartisan constituencies with such post-racial performances. President Obama’s mastery of post-racial performances echoing both liberal and conservative racial politics can be summed up with the *Denver Post*’s reaction to his famous Philadelphia speech: “Obama’s eloquent address revived, for Democrats, [Martin Luther] King’s dream of a colorblind America. No racial quotas; no Jim Crow laws. Just Americas.” (Sugrue 2010).

Consequently, as a society we are firmly wedged between progress and repression where enigmatic conditions force our first Black President to subscribe to post-racial politics in order to navigate through America’s perpetually racist state of white domination. Next, we will argue in greater detail the necessity for critically examining policy through race-conscious analysis as we survey the disparate effects of various educational reform policies that employ colorblind ideologies.

42.2 Effects on Public Education

As we recognize that public education in the American context has suffered from racial disparities from its inception, we offer a comprehensive analysis as to why the election of President Obama did not signal the beginning of a post racial era in the United States. Communities, students, and teachers of color are all faced with wide ranging racial disparities within America’s public education system. Not only are these disparities symptoms of American society at-large, but they are also emblematic of the vestiges of Jim Crow, slavery, and centuries of America’s racist past. In order to improve our public schools, specifically our urban schools, we must examine the deep societal scars of racism as we may find that they are in fact still fresh wounds. As we seek to address issues regarding wealth, employment, constructed criminality, mobility, access, and discrimination through policy, we highlight the manners in which purported post racial and colorblind policies injure people of color in urban settings on every level.

42.3 Communities of Color

42.3.1 *Wealth*

While the nation continues to become more ethnically and racially diverse, wealth inequality remains as disparities widen between racial and ethnic groups. Wealth is the accumulation of assets people own (e.g. homes, pension savings, and bank accounts, business ownership, etc.) minus all debts (Oliver and Shapiro 1995; Shapiro et al. 2013). Wealth can be gained through work and saving, but it can also be inherited. More importantly, wealth can greatly impact ones access to life opportunities. When combined with other resources such as income, it can secure a desired social status and standard of living that includes access to valuable resources (e.g. a high quality education, healthcare, training, career options, high status social connections) that can be passed down to one's children and future generations (Oliver and Shapiro 1995). Wealth is also particularly important due the financial security it provides people during a job loss or an unexpected crisis.

Wealth inequality not only harms economic growth within families but also within communities and in our nation. Such examples of its significant impact was observed in the Great Recession of 2007–2009, where many, but mainly communities of color, were affected by high and long term unemployment and the fall of the housing and financial market (Oliver and Shapiro 1995; Shapiro et al. 2013). Despite economic improvements, not all households have equally benefitted and as a result the racial wealth gap continues to widen.

Since the 1980s wealth inequality has continued to widen between groups of color and whites. For example, in 2013, the wealth of white households was 13 times greater than the median wealth of black households, and 10 times greater than that of Hispanics (Kochhar and Fry 2014). Whites earned a substantial increase in median wealth when compared to 2010 where they had eight times the wealth of black households and nine times the wealth of Hispanic households. As the economy began to recover from 2010 to 2013, whites were the only group that saw an increase in their net worth. As white's median net worth increased from 138,600 to 141,900, blacks and Hispanics experienced a drop in median wealth (Kochhar and Fry 2014). Blacks had a 33.7% drop in median wealth from \$16,600 in 2010 to \$11,000 in 2013 and Hispanics had a 14.3% decrease from \$16,000 to 13,700 (Kochhar and Fry 2014).

Such great wealth disparities illustrate the inequality in wealth but do not explain why many blacks and Hispanics haven't seen much improvement in their relative economic status. Policy makers, researchers, and economists have and continue to overlook racial disparities by focusing only on income, occupational attainment, and education which underestimate the magnitude of the problem. This steers attention away from the historical and current factors that have and continue to perpetuate racial wealth inequality in our country (Oliver and Shapiro 1995). Nevertheless, excluding a large subset of the population from accessing avenues toward wealth

not only poses an issue for political stability but also for the nation's economic stability (Shin 2015).

Given that blacks and Hispanics are disproportionately lower income, their wealth building is greatly affected by national and statewide policies aimed at assisting low income and groups of color (Shin 2015). Instead, federal policies have been reinforcing the wealth gap by enacting wealth-building policies that benefit the wealthy. Current research has found that institutional and policy dynamics in relation to homeownership, income and employment, increased earnings, college education, and family financial support and inheritance are key influential factors of the racial wealth gap (Oliver and Shapiro 1995; Shin 2015). However, homeownership was the largest factor influencing the loss of wealth for communities of color.

For most U.S. families, homes are the largest investments and the main way to store wealth. Yet, inequalities in homeownership fall along racial and ethnic lines. When compared to 45 % of blacks and 47 % of Latinos, 73 % of whites own a home (Shin 2015). There are also significant differences in the median worth of homes between ethnicity and race. For example, the homes of whites are worth approximately \$85,800 compared to \$50,000 for blacks and \$48,000 for Latino homeowners (Shin 2015). Furthermore, blacks and Latinos are more likely to have homes in highly segregated neighborhoods with lower equity values, high poverty rates, lower home values, and a declining infrastructure (Shin 2015). These inequalities stem from the effects of segregation, redlining, and continuing discrimination on mortgage lending practices (Oliver and Shapiro 1995). Moreover, other factors such as labor markets and income can help increase wealth.

42.3.2 Labor Markets and Income

Labor markets can provide economic security through earned income, health coverage, paid leave and workplace retirement, pensions and other forms of savings to American families (Shin 2015). Nonetheless, inequality in the labor market accounts for 20 % of the increase in the racial wealth gap within the last 25 years, as well as about 9 % in unemployment rates (Shin 2015). The drastic racial disparities in employment are outcomes of racial discrimination, geographic barriers, social capital, and structural and institutionalized racism. Acts of discrimination have made it very difficult for groups of color but more specifically for blacks to save and build assets (Oliver and Shapiro 1995).

When examining the income gap, white families made about \$50,400, while blacks made \$32,038, and Hispanics earned \$36,840 (Shin 2015). In addition, blacks and Hispanics earn a lower return on their income when compared to whites. For instance, a white family will typically receive a return of \$19.51 for each dollar earned, while Hispanics will see \$3.63 and black only \$4.80 in return (Shin 2015). Consequently, the lower the income the lower the return for each dollar, which not only affects their ability to save but to turn additional money into wealth. In addition to discrimination and disparities in income between race and ethnicity, communities

of color face a higher risk of short and long term unemployment (Shapiro et al. 2013).

Although unemployment can and has greatly affected wealth accumulation for many American families, communities of color have increasingly faced the burden of being unemployed. Not only are blacks and Latinos more likely to experience unemployment but they are also more likely to stay unemployed for extended periods of time (Shapiro et al. 2013). At the end of 2014, the national unemployment rates were 4.5 % for whites, 6.7 % for Hispanics, and 11 % for blacks (Wilson 2015). In addition, long term employment among black employees was 37 % which was the highest when compared to 29.8 % of Hispanics and 31 % for whites (Wilson 2015). Disparities in income and in employment can greatly reduce the chances of upward social mobility for communities of color.

42.3.3 Upward Mobility

Following the 2008 recession, the threat of economic security is no longer an issue of the poor. In 2010, 32 % of Americans reported not having sufficient funds to withstand unemployment or an emergency (Rapport and Wheary 2013). Economic insecurity now affects those outside the brackets of poverty and include individuals and families from the middle class. From all U.S. households, the middle class was the group mostly impacted by the recession. They not only experienced a job loss of 60 % but also lost 28 % of their wealth. In a Pew survey in 2012, 85 % of middle class adults reported struggling to maintain their standard of living now than a decade ago (Rapport and Wheary 2013). Similar to the working poor, the middle class also face similar issues with upward social mobility but face a higher risk of falling into poverty (Rapport and Wheary 2013). For the working poor and those living in poverty the opportunity to move up and out of their current economic status is not only inhibited but is often cut off. Stagnant social mobility, labor discrimination, and rise of low wage jobs with not benefits are significantly affecting upward mobility for both groups (Rapport and Wheary 2013).

In our current U.S. economic state, “the majority of Americans born into poverty will remain at or near the poverty level throughout their adulthood (Rapport and Wheary 2013, p. 2).” However, communities of color, but more specifically, blacks living in poverty are less likely to experience upward mobility when compared to whites. According to a report by Reeves and Rodrigues (2015), upward mobility for blacks living in the bottom of the income distribution is less likely when compared to whites. More specifically, 51 % of blacks born into the lowest fifth of the income distribution continue to live in their current status at the age of 40 when compared to 23 % of whites (Reeves and Rodrigues 2015). Research also shows that black children born to middle-income parents are more likely to experience downward mobility when compared to whites. While 31 % of black children are experiencing higher incomes than their parents, 45 % of middle income black children face

dropping to the bottom of the income distribution within one generation when compared to 16 % of white middle income children (PEW Charitable Trusts 2007).

When looking at social mobility across the 50 states, 9 southern states including Louisiana, Oklahoma, South Carolina, Alabama, Florida, Kentucky, Mississippi, North Carolina and Texas have the worst upward mobility and higher downward mobility compared to the rest of the nation (Pew Center on the States 2012). Children who were born and raised in the bottom fifth had a 4 % chance of rising to the top fifth in these locations (Leonhardt 2013). Thus, regions with larger black populations had lower upward mobility and higher downward mobility rates (Leonhardt 2013). Interestingly enough, groups living in many of these southern states not only face issues with social mobility but with access to health care.

42.3.4 Health Care

As a result of advancements in technology, medicine, and greater access to health care, more Americans today are generally living healthier lives when compared to previous years. Despite these advancements disparities in health care access in the U.S. have continued to be an ongoing issue. In particular, groups of color face significant disparities in obtaining health coverage and as a result experience poor health access and higher health costs (Henry J. Kaiser Family Foundation 2013). With groups of color expected to account for more than half of the population by 2050, it is crucial to address the current disparities in healthcare that affect a disproportionate amount of groups of color (Henry J. Kaiser Family Foundation 2013).

In 2010 the Affordable Care Act (ACA) was enacted to help reduce the number of uninsured by expanding affordable Medicaid coverage for millions of low income Americans (Henry J. Kaiser Family Foundation 2013). Given that low income and groups of color make up a large percentage of the uninsured, the ACA coverage expansion can particularly benefit them and improve disparities. With its new provisions, Medicaid expanded coverage for adults by extending eligibility to 138 % of adults living in the federal poverty level (Henry J. Kaiser Family Foundation 2013). However, the Supreme Court ruling on the ACA made implementation of the Medicaid expansion a state choice. As a result many low income and communities of color continue to remain uninsured due to their states decision to not to expand Medicaid (Henry J. Kaiser Family Foundation 2013).

Currently, only 32 states have expanded Medicaid to its residents. The remaining states, which mainly consist of Southern states, have 3.1 million poor adults who continue to be uninsured and fall into the coverage gap (Henry J. Kaiser Family Foundation 2016). From this group, 1.7 million individuals are from groups of color and live in poverty (Artiga et al. 2015). In the absence of Medicaid expansion, many cannot afford to purchase Marketplace coverage which begins at 100 % federal poverty level. Among the uninsured, people of color are 20 % more likely to fall under this category and into the coverage gap when compared to 11 % of whites (Artiga et al. 2015). When compared to 16 % of blacks, 27 % of Hispanics are at risk for

being uninsured (Artiga et al. 2015). As a result of residing in the southern states that have not expanded Medicaid, 24 % of black adults fall into the coverage gap, while 11 % of uninsured whites and 7 % of Hispanics fall into the coverage gap. Overall, the states with the largest share of uninsured adults that fall into the coverage gap are Texas, Florida, and Georgia (Artiga et al. 2015). For example, out of 0.9 million uninsured black 19 % reside in Georgia, 16 % in Texas, 14 % in Florida, 11 % in Louisiana and 39 % in other states. For Hispanics, 52 % of the 0.7 million uninsured poor adults reside in Texas, 27 % in Florida, and 22 % in other states (Artiga et al. 2015). Therefore, the lack of expansion of Medicaid largely affects people of color due to the fact that they lack access to Medicaid and are low income. Expanding health coverage can help promote increased access to care and can address the health disparities that many people of color face (Artiga et al. 2015).

42.3.5 War on Drugs/Prison Industrial Complex

Since President Nixon's declaration of "War on Drugs" during the early 1970s, billions of dollars have been spent to decrease drug use and drug related crimes in the U.S. (Sirin 2011). Nevertheless, after 46 years of struggling to combat the issues related to drug use and crime, the war on drugs has resulted in increased racial injustices and disparities that largely target and criminalize minorities and immigrants (Sirin 2011). Policy leaders have enacted and enforced highly punitive policies that have led to an increased number of imprisoned minorities and temporary and permanent disenfranchisement for communities of color (Sirin 2011).

One particular outcome of the war on drugs was the rise in the prison population over the past years. From 1980 to 2008, the number of people incarcerated for a drug offense increased from 40,000 to 500,000. Amongst this group, African Americans and Latinos made up 66 % of the population. Out of 1.5 million drug arrests in 2013, 80 % constituted for possession (Drug Policy Alliance 2015). In federal prisons, more than 50 % of people are imprisoned for drug law violations. Blacks' comprise 30 % of those arrested for drug charges and 40 % of those imprisoned in state or federal prisons (Drug Policy Alliance 2015). Similar to blacks, Latinos make up 20 % in state prison for drug violations and 37 % of people incarcerated in federal prisons. By 2013, Latinos constituted 47 % of all cases in federal courts for drug charges. Thus, 57 % of people imprisoned in state prisons and 77 % of people imprisoned in federal prisons are either Black or Latino (Drug Policy Alliance 2015).

With the recent dramatic increase of heroin use and abuse among whites, many have questioned the response of policy leaders against the current heroin epidemic (Seelye 2015). More specifically, it is clear that the drug related policies are associates to race due to compassion that political leaders are showing for white drug users. When compared to the black heroin epidemic during the 1960, where blacks faced zero tolerance criminal charges and little to no medical help, current heroin addicts are not being viewed as criminals but as having a disease that needs to be

addressed with a more compassionate approach through the use of treatment (Seelye 2015).

Nevertheless, President Obama has begun to address some of the racial disparities on drugs and incarceration rates. On August 3, 2010, President Obama overturned the Anti-Drug Abuse Acts of 1986 and 1988 by adopting the Fair Sentencing Act, which changes the cocaine sentencing between crack and cocaine (Sirin 2011). In addition this act eliminates the “simple possession mandatory minimum, limits the excessive penalties served by people convicted of low-level crack cocaine offenses, and increases penalties for high-level traffickers (Sirin 2011, p. 91).” However, more effective policy changes are needed to help reduce the criminalization of drug possession which mainly affect groups of color.

42.4 Children of Color

Defiant, disorderly lazy, disrespectful, dangerous, criminal, immoral, ignorant, and unintelligent; children of color are often branded with these negative stereotypes prior to beginning kindergarten (Crenshaw 1988). While typically viewed as individualized points of view, the practice of utilizing discriminatory stereotypes to justify the mistreatment and disparate educational outcomes of persons of color has a pointed historical legacy of racism (Simson 2014). This racist propagation has roots not only in the history of the United States, but also in the apartheid, the holocaust, as well as colonization throughout all of the African diaspora.

Historically, these bigoted and racialized stereotypes have received heavy substantiation through scientific racism, and have been utilized to justify the domination and embezzling of persons of color for centuries (Simson 2014). In modern times identical sentiments are evident in education policy as they are hidden beneath the veil of post-racial rhetoric with terms such as “urban,” “inner city,” “at-risk,” and “troubled” youth, which operate to signify race without the outright mentioning of race itself.

While education enhances the life chances of disadvantaged classes and provides an avenue for upward mobility (Ewert et al. 2014), for many students of color their sole opportunity for advancement in society is congested with a plethora of racial disparities. In America students of color and low-income students tend to have lower educational attainment than white and more affluent students. One clear example is that young white men in America are more likely to graduate from high school than nearly any other advanced nation, while Blacks are much less likely to graduate or go to college (Ewert et al. 2014). In addition to limited educational attainment (Kena et al. 2014), black students face a number of racial disparities including but not limited to disparities in standardized test scores, low representation in gifted education (Ford 2013), and being over-represented in special education classes (Ahram et al. 2011), as well as remedial courses. While each of these respective racial inequalities harm the educational advancement of students of color, the push out phenomenon that removes students from their classrooms for minor

behavioral issues arguably exacerbates all other disparities as it creates hostile learning environments, as well as takes students outside of the schoolhouse walls.

The “school-to-prison pipeline” is a term that signifies the harsh practices and policies that funnels schoolchildren, particular children of color, from schools directly into the juvenile and criminal justice systems. The racial disparities within the pipeline are due in large part to the social construction of who and what constitutes criminality, which is directly attributable to an exceedingly racialized past. With America’s prevalence of mass incarceration and the prison industrial complex these racial troupes of “dangerous” persons of color as constant threats in need of neutralization play themselves out in a plethora of ways in American society. Weissman (2014) exhibits how punitive school discipline conditions children of color, most notably from poor communities, for what is prearranged to become their own place within the extensive carceral state. Therefore the school-to-prison pipeline is a direct result of punitive policies, which serve as manufacturers of racialized social engineering.

Zero tolerance policies were originally a reaction to widespread anxieties over increased violence, gang activity, and drug-related problems (Losen and Skiba 2010). As a result of the Gun-Free Schools Act of 1994, zero tolerance policies led to a number of punitive policies that conditioned federal funding on mandatory 1-year expulsions for students who committed specific firearm offenses (Simson 2014). Although zero tolerance policies were intended to preserve safe school environments by removing students who commit egregious acts of misconduct, they have increasingly been used to remove students for trivial misbehaviors. Under this punitive regime, students of color, especially Black students are disproportionately discipline and suffer the most consequences (Simson 2014). The utilization of these policies often reflect the community in which they serve as zero tolerance policy typically aligns with the view that “inner-city”, and “urban” schools are morally inferior institutions in need of strict discipline procedures (McNeal and Dunbar 2010).

“Minority overrepresentation in school punishment is by no means a new finding in school discipline research. Investigations of a variety of school punishments over the past 25 years have consistently found evidence of socioeconomic and racial disproportionality in the administration of school discipline” (Skiba et al. 2002, p. 318). Although suspension rates since have increased for all students across demographic lines since 1970, children of color have seen drastic increases. Black students’ suspension rates saw a 12.5% increase from 1970 to 2009–2010; and during the same period the rate only increased by 1.1% for white students. This displays a glaring racial disparity, as there is an increase of more than 11 times higher for Black students than for white students. It seems probable that racial stereotyping, whether deliberate or unconscious, has contributed to the inequalities and can shed light upon at least some part of current racial disproportionality in school discipline (Simson 2014). UCLA’s Civil Rights Project estimated that over two million students were suspended or expelled from schools during the 2009–2010 school year (Losen and Martinez 2013). This represents the fact that one out of every nine

secondary school students was suspended at least one time during that school year, with a much higher probability of children of color being suspended.

In a 2010 report, "*Suspended Education: Urban Middle Schools in Crisis*," overwhelming racial and gender disparities were shown at the middle school level as much greater rates of disparities appeared than when collective K-12 data were examined. Almost 30 % of Black boys were suspended in comparison to only 10 % of white boys. Similarly, nearly 20 % of Black girls were suspended, compared to just 4 % of white girls (Losen and Martinez 2013). Further evaluation of data for 18 of the United States' largest school districts revealed that in 15 districts, at least 30 % of all Black boys enrolled were suspended at least once. Throughout these districts, hundreds of schools had remarkably high suspension rates of 50 % or more for Black boys (Losen and Martinez 2013).

Like Black students, Latino students are also overrepresented within the school-to-prison pipeline as 70 % of all students arrested or referred to law enforcement nationally are Black and Latino (American Civil Liberties Union 2012). While Black students are three and a half times more likely to be suspended than their white peers (American Civil Liberties Union 2012), Latino students are also targeted with the use of zero tolerance policies, as they are three times more likely to be suspended, expelled, and referred to court than their white counterparts who commit identical violations (National Council of La Raza 2007). The Children's Defense Fund found that in 2011, for every 7 s one Latino public school student was suspended. For every 27 s one Latino high school student dropped out, and for every 58 s one Latino public school student was corporally punished (Children's Defense Fund 2011). In 2006, although Latino boys only accounted for 10 % of the country's student population they totaled 14 % of all suspended students, while in contrast white boys accounted for 29 % of the national student population but were only 28 % of all suspended students (Children's Defense Fund 2011).

The Civil Rights Project's study displays that 2624 secondary schools in 323 districts across the nation suspended at least 25 % of their student body (Losen and Martinez 2013). The study goes on to show that 519 of these schools had suspension rates of at least 50 % of their respective student bodies. Schools are labeled as hotspot secondary schools if they suspend more than 25 % of any subgroup. Chicago had the greatest amount of high-suspension hotspot schools out of urban districts across the nation with 82 hotspot schools (Losen and Martinez 2013).

Throughout the nation high suspension rates in both middle and high schools have seen dramatic increases for Black students over time. One out of four Black secondary school children, and nearly one in three Black middle school males, were suspended at least once in 2009–2010 (Losen and Martinez 2013). According to Losen, Black girls in secondary schools were the most marginalized group, as they were suspended at more than 18 %, which was a much higher rate than that of any other racial or ethnic group. Crenshaw further highlights the effects on Black girls in *Black Girls Matter: Pushed Out, Overpoliced, and Underprotected*, as she notes that in New York City public schools in 2011–2012, 90 % of all girls expelled were Black. Some researchers assert that out-of-school suspensions and expulsions are

closely correlated with consequent participation in juvenile and criminal justice systems (Noguera 2003; Toldson 2011).

Taking into consideration students' academic development, the widespread abuse of suspensions and expulsions has significant costs (US Department of Education/Department of Justice 2014). When children of color are pushed out of schools, they are often times unsupervised and are unable benefit from instruction by teachers, healthy interactions with their peers, and mature mentorship that are offered within their schools. In regards to suspended students, schools fail to aid student in the cultivation of the skills and approaches to avoid future difficulties. "Suspended students are less likely to graduate on time and more likely to be suspended again, repeat a grade, drop out of school, and become involved in the juvenile justice system" (US Department of Education/Department of Justice 2014). Frequent suspensions of children of color has an immediate and ongoing consequence on those students who choose to apply for college or try to get a job due to the criminal charges that are often times filed against them for trivial misbehavior in the classroom.

The American Pediatrics Association indicated that schools with higher rates of expulsion and out-of-school suspension are not safer for students or faculty (Losen and Martinez 2013). The Civil Rights Project research demystifies the notion that removing the "disruptive" kids out of class will benefit the "good" kids so that they can learn, because there are many feasible options that do not result in hectic school atmospheres. Harsh punitive practices do more harm than good, and retaining out-of-school suspension as a last measure can lead to better achievement outcomes and enhanced graduation rates (Losen and Martinez 2013).

When a 14-year-old student of color was suspended from his high school in Texas for his invention—a digital clock within a pencil box, that he brought to school to impress his teachers, President Obama addressed the issue that had gone viral by the time of his comments. Much like his responses to highly racialized public incidents, President Obama responded with colorblind rhetoric as he stated, "Cool clock, Ahmed. Want to bring it to the White House? We should inspire more kids like you to like science. It's what makes America great" (Berghel 2015). Although his public comments clearly reflect his strategically colorblind political rhetoric approach, in January 2014 the Obama Administration announced new federal guidelines, *Guiding Principles*, which would lead to a number of White House initiatives designed to assist in the dismantling the school-to-prison pipeline. These federal guidelines were aimed at reducing the use of zero-tolerance policies, suspensions, expulsions, and recommended for school districts to use alternative measures instead of arresting students for slight disciplinary infractions (US Department of Education/Department of Justice 2014). The data gathered by the U.S. Department of Education's Office for Civil Rights demonstrates the stark discriminatory racial disparities that exist in school discipline for children of color. Former U.S. Attorney General Eric Holder concurred as he indicated that African-American students were disciplined more severely and more frequently because of their race (US Department of Education/Department of Justice 2014). Throughout the 2011–2012 academic year, Black children totaled only 18% of preschool children in the U.S., but

accounted for 42 % of students suspended one time and 48 % of students suspended one than one times from preschools (U.S. Department of Education/Department of Justice 2014).

42.5 Teachers of Color

U.S. school demographics are rapidly changing in terms of students' race, ethnicity, and language. Nationally, students of color make up more than 45 % of the K-12 public school population and will continue to increase, making minority students the majority in the public school system (Boser 2011). Despite this increase, teachers of color continue to be drastically underrepresented in the public school teaching force (Boser 2011; Partee 2014). Between 2003 and 2013, the percentage of teachers of color within the public education system has remained stagnant with only a small increase from 17 % to 18 % (Murray and Jenkins-Scott 2014). Today, teachers of color represent 14 % of the teacher workforce with 7.6 % Latino and 6.6 % black teachers, while white teachers represent 82.3 % of the total teacher population (Bristol 2015). When looking at state level data, similar trends are observed but with the diversity gap largely increasing in some states more than others.

42.5.1 Diversity Gap

According to Boser (2014), there are 35 states with gaps of 20 percentage points or more between the diversity of the teacher and student populations. The top 10 states with the largest gaps include, California with a 44 % gap; Nevada, 42 %; Maryland, 40 %; Arizona, 37 %; Delaware, 35 %; Texas, 32 %; Alaska, 34 %; Illinois, 32 %; Georgia, 32 %; Colorado, 31 %. For example, in California, 73 % of students are of color but the percent of teachers of color range at 29 %. Similarly, Maryland has a large diversity gap between teachers and students of color with a minority student population of 55 % and a non-white teacher population of 17 %. When examining teachers' racial and ethnic backgrounds, Hispanic teachers have a wider teacher-student diversity gap. Hispanic teachers in the state of Nevada account for 9 % of the teacher population while Hispanic students make up 9 % of the population. In some school districts the diversity gap is strikingly wider than that of the state. For instance, in the Chelsea public school district in Massachusetts, there is a 76 % gap between Hispanic teachers and students while in the Randolph district there is a 52 % gap between African American students and teachers. In Santa Ana, California, there is a 67 % gap between Hispanic students and teachers, with 93 % of Hispanic students and only 26 % of Hispanic teachers. In Boston, where minority students account for 75 % of the public school population, African American teachers represent 21 % of the workforce while Hispanic teachers make up 10 % (BPS 2014).

42.5.2 Benefits of Minority Teachers in the Classroom

This issue poses a major concern for our public schools and for our students of color. Educators and policy leaders must ensure that all students, especially students of color, have access to both high quality educational opportunities and to a diverse teaching force that is reflective and responsive to their racial, ethnic, and linguistic cultures and learning needs (Dilworth and Coleman 2014). Research has shown that minority teachers can positively influence the achievement and retention rates of students of color by serving as positive role models, providing more favorable views of their academics, teaching with a greater level of social and racial consciousness, appearing more committed and drawn to teaching in difficult to staff urban schools, and are more apt to persist in those settings (Achinstein et al. 2010; Boser 2011; Dilworth and Coleman 2014; Murray and Jenkins-Scott 2014; Partee and Center for American 2014). In response to the minority teacher employment issue, policy leaders as well as organizations have adopted different practices in order to increase the presence of minority teachers across schools but more specifically for high poverty and high minority schools.

42.5.3 Recruitment of Teachers of Color

Over the past 40 years, organizations including the Education Commission of the States, The American Association of College of Teacher Education, and the National Educational Association have promoted and executed various initiatives in order to recruit minorities into the teaching workforce (Ingersoll and May 2011). In addition, during the 1980s numerous foundations such as the Ford Foundation, the Dewitt Wallace-Reader's Digest Fund and others have greatly invested in recruiting and preparing teachers of color. Efforts to recruit teachers of color have included an establishment of teacher programs in high schools, bridge programs between community colleges and 4-year institutions, career ladders for current paraprofessionals in the education field, and alternative certification programs (Ingersoll and May 2011). To date, over 36 states have and continue to implement policies to recruit and prepare teachers of color (Ingersoll and May 2011). While these efforts have brought positive gains, teacher retention has been an ongoing issue.

42.5.4 Retention Among Teachers of Color

Since the late 1980s, there has been an increase in teacher turnover rates among teachers of color (Ingersoll and May 2011). From the late 1980s to 2009, the annual teacher turnover rate for minority teachers increased from 15.1 % to 19.3 %. White teachers only experienced a 1.2 % increase in turnover rates from 14.4 % to 15.6 %

within the same period. More specifically, at the beginning of the 2003–2004 school year, 47,600 minority teachers entered the work field but by the following school year a total of 56,000 minority teachers left the field (Ingersoll and May 2011). While there are various reasons for teachers of color leaving the profession, some of the most stated reasons for leaving the teaching workforce was organizational conditions which have mainly resulted from NCLB and mandated high stakes testing. For other teachers of color, such as those in New Orleans, leaving the profession was a result of the charter school movement that took over the city's public schools (Cook and Dixson 2012; Dixson et al. 2014).

42.5.5 NCLB, High Stakes Testing, and Organizational Conditions

With the adoption of NCLB and mandated high stakes testing, teacher accountability requirements have greatly influenced minority teachers' retention rates. In addition, these federal and statewide practices have further affected organizational conditions for teachers of color. Teachers who are employed in high need schools and communities face more obstacles in meeting student performance requirements and thus are more vulnerable to transfer or leave the profession when goals are not met (Achinstein and Ogawa 2012). Since teachers of color are more likely to work in disadvantaged schools their tenure and retention may be less secure.

In a 2007 survey, 200 New York teachers of color reported that as a result of the NCLB requirements, teachers were forced to adopt prescribed instructional programs that narrowed curriculum and limited their autonomy (Achinstein and Ogawa 2012). They also felt that the new form of teacher accountability which included high stakes testing, hindered their personal and professional identities and diminished opportunities to connect with their students. These mandated accountability policies caused job dissatisfaction and resistance among non-white teachers.

Similar trends were observed in an ethnographic study conducted by Achinstein and Ogawa (2012). Findings illustrated non-white teachers' frustration towards the high emphasis on raising test scores among minority students. Having to heavily focus on preparing students of color for high stakes testing led many of the Los Angeles minority teachers to consider leaving the field because it conflicted with their commitment to support and respond to their student's needs. These new approaches prevented teachers from engaging students in multicultural curriculum and critical pedagogy. Teachers also mentioned being closely monitored by administrator who randomly checked in on them during class to ensure they were teaching the district-mandated practices. This created a sense of fear for many teachers that further prevented them from teaching outside of the mandated curriculum. Overall, teachers did not feel supported by administrators to teach students what they thought would be more educationally and culturally relevant. Teachers also felt that they

were not given the opportunities to take part in many of the day to day decisions that affect their students and their own performance.

42.5.6 Charter School Movement and Teacher Reform: A New Orleans Story

With over, 6000 schools across 42 states and the District of Columbia, charter schools have been the fastest growing school option across the U.S. Over the past decade, student enrollment rates have increased by 70 %, with over 2.7 million students currently enrolled in public charter schools (CREDO 2013). This is 5 % more than the total population enrolled in public schools. With its mission of narrowing the achievement gap across race, gender, and ethnicity, and social class, charter schools have continued to attract the attention of policy leaders, educators and families (Zimmer and Buddin 2007). While charter schools are mainly supported by political leaders and private organizations, they have faced criticism by many educators and community leaders who have documented through research that charter schools are generally no better than public schools and instead are often worse (Zimmer and Buddin 2007), causing devastation to low income and communities of color. In the case of New Orleans, the takeover and growth of charter schools negatively affected the public school system as well as the stability of the city itself.

After Hurricane Katrina hit in 2005, New Orleans public school system experienced drastic changes that included a new school board governance and new army of white teachers (Dixson et al. 2015). Along with this new change came the takeover of the Orleans Parish School District by the all-charter Recovery School District, which converted over 70 % of the public schools into charter schools (Barret and Harris 2015). However, one of the many losses that New Orleans public schools faced was that of its teachers and administrators who were mainly African American and part of the community (Barret and Harris 2015; Cook and Dixson 2012; Dixson et al. 2015).

Prior to Hurricane Katrina, the New Orleans teacher profession included a higher percentage of black teachers when compared to other urban school districts. While blacks account for 17 % of all teachers in urban cities, 72 % of New Orleans teachers are black (Barret and Harris 2015; Cook and Dixson 2012). However, from 2004 to 2014 the percentage of black teachers dropped from 72 % to 49 %. What greatly influenced the decrease of black teachers in New Orleans was the mass dismissal of over 7500 teachers, administrators, and paraprofessional (Barret and Harris 2015; Cook and Dixson 2012; Dixson et al. 2015). Education reform organizations worked to replace the mostly veteran African American teaching workforce with white young teachers from programs such as Teach for America, New Leaders for New Schools, and the New Teacher Project (Dixson et al. 2015). As the rate of African American teachers rapidly declined, white teachers in New Orleans increased from about 22 % to 48 % during the same period (Barret and Harris 2015).

The mass dismissal of black teachers after Katrina continues to be a topic of concern due to the high number of black teachers and administrators that were replaced by whites who had no historical roots in the community. From 2003 to 2004, about 60 % of teachers were from the local community, while 19 % were from out of the state, and 20 % from Louisiana (Barret and Harris 2015). During 2007–2014, percentage of teachers from New Orleans dropped from 55 % to approximately 33 %, while percentages for out of state teachers increased from 21 % to 38 %.

After Katrina, percentages of teacher with 5 or less years of experience had increased from 33 % to 54 % (Barret and Harris 2015). More importantly, during the same time, the percentage of veteran teachers with more than 20 years had dropped. Thus, teachers with less experience were being hired at higher rates while teachers with more experience were not. In addition, the percentage of certified teachers dropped from 79 % to 56 % during the 2003–2014 period, causing more concern on the quality of teachers being placed in schools to teach low income students of color (Barret and Harris 2015). While New Orleans was one of the major cities to be negatively impacted by the charter movement, other cities across the nation are largely observing similar trends in their high poverty and high minority communities.

42.6 Conclusion

It is clear that in today's political climate America is fraught with a vast array of racial disparities. By reflecting over the last decade's practices and policies we are about to realize that America's perception of racial progress is at best contradiction from the evidence stated above. Without a doubt there has been extraordinary levels of progress from the most controversial moments of the civil rights movement. However, now we must critically ask one another exactly which direction are we headed in today? Many suggested that by simply electing President Barack Obama, America has officially ushered in the post-racial era. Our analysis proves that not only was this notion false, but we have also proven that in this short amount of time America has demonstrated a continual regression of racial disparities. These color-blind practices and policies in public education greatly effect young students like Brooklyn and Darell, their families, as well as the teachers charged with educating them. As long as racial disparities continue to plague the American education system, and as long as policies directly harm people of color much greater than whites, race still matters in urban education thereby evidencing the necessity for theorizing and analyzing educational inequity as a by-product of racism and the racializing processes.

Chapter 43

The More Things Change: Durable Inequalities and New Forms of Segregation in Canadian Public Schools

Gillian Parekh and Rubén Gaztambide-Fernández

43.1 Introduction

Canadian public education was established in the mid-nineteenth century with the intention of enforcing Victorian values, promoting industry, and securing the integration of new immigrants into the growing settler nation (Tomkins 2008). Public schools provide opportunities across diverse economic, cultural, and social groups, and today Canada is widely recognized for its apparent success at creating equitable outcomes for its diverse students (OECD 2015). Canadian public school systems are complex, providing instruction in primary and secondary grades as well as continuing education. In addition, and particularly within urban school districts, Canadian schools have historically offered an expansive range of programs through which students can access specialized academic or enhanced technical development. While such specialized programs were intended to provide a wide range of choices and cater to student interests, they have also been an important mechanism for the production of social and economic inequities (Smaller 2014). Despite large-scale efforts to address these dynamics, over the last two decades such “programs of choice” have become further entrenched while also obscuring their role in the production of inequality, usually through the rhetoric of choice and market logics (Parekh et al. 2011). In this chapter, we examine the extent to which programs of choice structures function as an extension of historical streaming and who do these program pathways most affect?

Although these patterns of inequality are evident throughout the Canadian public school system, they manifest in unique and particularly vivid ways within the context of large urban regions. Canada’s largest urban centre, Toronto, is also home to

e-mail: Gillian.parekh@utoronto.ca

Canada's largest public education system, the Toronto District School Board (TDSB). Reflecting the diversity found in many North American gateway cities, the TDSB boasts a significant student population with just under a quarter of a million regular day students and 160,000 continuing education students (TDSB 2014a). As we hope to show in this chapter, the tremendous cultural and socio-economic diversity that characterizes this large population of students makes Toronto an important location for the examination of patterns of segregation and inequality in public schools. Moreover, because of its commitment to a robust and expansive approach to data collection and research, the TDSB also provides a detailed and extensive view of the patterns of inequality that are produced as an outcome of varied programs of choice. As such, Toronto is a unique space for education inquiry, policy development, and implementation.

In fact, over the last several years, reports coming out of the TDSB have raised the alarm over the extent of disproportionate over- and under-representation of ethno-racial, economic, gender, and (dis)ability identities within the board's specialized programs (Brown and Parekh 2010, 2013; Sinay 2010). Analyses of student demographics suggest that all specialized programs, whether they are considered more or less socially desirable, tend to lead to homogenous groupings of students. Despite myriad board improvement and school effectiveness strategies and interventions to address systemic inequity, students within specialized arts, gifted, and French immersion programs are disproportionately White and have more access to social and economic resources, while students within special education and trades/skills focused programs continue to be disproportionately racialized and poor (Parekh 2013a).

Despite deliberate attempts to work against the deleterious effects of streaming policies that sustained unequal access in the past, new programmatic policies collide with old patterns to recreate persistent inequality. However, we argue that neo-liberal discourses and notions of choice have the effect of occluding these patterns and making it appear as if they are a natural outcome rather than a manifestation of what Charles Tilly called "durable inequality" (Tilly 1999). This chapter investigates current demographic trends and examines how new social, cultural, and economic barriers shape the implementation of new programs in urban school systems. Seeking sustainable change, we deconstruct the societal forces and conditions that enable these inequities to persist.

43.2 The City of Toronto and Its School Board

While the population is about a tenth that of the United States, Canada is home to several major North American cities with booming metropolitan areas, such as Vancouver, Montreal, and Toronto. The City of Toronto, for example, has a population of roughly 2.6 million, similar to that of Chicago's 2.8 million (UNdata 2015), and the Greater Toronto Area is estimated to have a population of roughly over six million (Statistics Canada 2015). In addition, Toronto boasts an international

reputation for being one of the most multicultural and diverse cities in the world. There are over 140 different dialects and languages spoken across the city and, as of 2006, 50% of all residents were born outside of Canada (City of Toronto 2016).

In 2015, the Economist Intelligence Unit ranked Toronto as “the most liveable city in the world” based upon indicators of safety, food security, liveability, cost of living, business environment, and democracy (City of Toronto 2015). Furthermore, Toronto has been ranked “the best economy in the world for young people” by the CITI foundation, results based largely on entrepreneurial success, cost of living, and gender equity (CITI 2015). Despite these accolades, Toronto has scored high on not-so-flattering indicators as well. In 2015, for instance, a study by the United Way ranked Toronto as Canada’s top city for income inequality (United Way 2015). Due to its size, diverse population, and socio-economic advantages and challenges, Toronto provides an interesting context for research on equity in education.

43.2.1 The Toronto District School Board

The Toronto District School Board (TDSB) is Canada’s largest public school district and one of the largest in North America (TDSB 2015a). With its close to 600 schools, the TDSB is accountable for the education of just under a quarter of a million regular day students and approximately 160,000 continuing education students. Similar to many school districts across North America, the TDSB offers public education to students from Junior Kindergarten (enrolment eligibility for the year a child turns 4) to Grade 12. Elementary schools generally include Kindergarten to Grade 8 and secondary schools generally include Grades 9–12.¹ Its student population reflects the unique diversity and multiculturalism of its host city, as illustrated by data drawn from the Student and Parent Census described later in this chapter (TDSB 2015a). Gender split across the student population is relatively stable at 48% female and 52% male (Yau et al. 2013). Over half of the student population speak another a language other than English and two thirds of students are from families where both parents were born outside of Canada (TDSB 2015a; Yau et al. 2013).

The most prominent racial categories in the district are students who self-identify most commonly as White (29%), South Asian (24%), East Asian (15%) and Black (12%). The remaining 20% include students who self-identify across groups such as Latin American, Middle Eastern, Mixed, Southeast Asian, and Aboriginal. Pulling from the 2011 Parent Census information on students enrolled in grades kindergarten to grade 6, 28% of families reported having an annual household income of less than \$30,000 while 26% reported an annual household income of over \$100,000 (Yau et al. 2013). However, the stratification of income is not equitably distributed across racial groups. For example, while 59% of students (Grades K-6) who identified as White come from families with an annual household income

¹ However, there are various iterations of schools across the TDSB spanning many different grades.

Fig. 43.1 Family income (JK-Grade 6) by ethno-racial group

of over \$100,000, this was only true of 4% of students (Grades K-6) identified as Black. Conversely, while only 9% of White students live in families where the annual household income is below \$30,000, the same is true for 27% of East Asian students, 39% of South Asian Students, 48% of Black students and 56% of Middle Eastern students (Yau et al. 2013) (See Fig. 43.1, also reproduced from Yau et al. 2013).

43.3 TDSB School Demographics and Inequality

The historic amalgamation of the six municipalities that today constitute the City of Toronto led to the 1998 merger of six municipal school districts into what is today the Toronto District School Board (Robson et al. 2015). Prior to this, the Toronto Board of Education developed and implemented the Every Student Survey, or ESS (Wright 1970). Between 1970 and 1995, the ESS was cyclically distributed and collected basic demographic information from its student population, which was then examined against select programming information and achievement indicators. After amalgamation, the TDSB re-crafted the extensive survey, now known as the TDSB's Student and Parent Census, and administered its first iteration in 2006 (TDSB 2014b). Due to the size of the TDSB and the comprehensive nature of the surveys, the TDSB Student and Parent Census is now considered the largest youth survey in the country (TDSB 2014b).

The TDSB's Student and Parent Census collects parental and student demographic as well as experiential information. Parents complete surveys designed for Kindergarten to Grade 6, while students in grade 7–8, as well as students in grade 9–12, respond to the survey themselves. Students in Grade 9–12 are asked to

complete the most expansive version of the census and are randomly assigned either Form A, which has a focus on demographics, in-school experiences and self-perception, or Form B, which focuses on demographics, out-of-school experiences, and academic aspirations. While there is some overlap between both Form A and Form B, the goal is to collect a broad range of information without burdening students with cumbersome questionnaires.

The TDSB Census is also unique in that, while the data collected are kept confidential, the results are not anonymous. Students are asked to provide their student identification number so that demographic and experiential data can be merged with students' program and academic achievement information. Other aspects of student life are also captured through various tools and merged into the TDSB's database. Information such as suspension, attendance, and post-secondary confirmations are also linked to student identification and can be included in analyses around achievement and other socio-demographic trends. The ability to connect across these data provides a robust and thorough picture of students' experiences and other schooling outcomes that is without comparison across Canadian school districts.

While concerns exist around the collection and analyses of demographic data, including apprehensions around privacy and the potential for the stigmatization of particular groups, results and trend analyses offer the opportunity to deepen the investigation into areas of inequity resulting from the structure of the school system (see also Gormley et al. 2012). In addition, demographic, experiential and academic analyses have the potential to promote targeted interventions. Despite its unique size, demographic make-up, and representation of socio-economic diversity, the structure of the TDSB is replicated in other school districts across the province and Canada. With its complexity of collected variables spanning achievement, program and student demographic data, as well as its geographic location within one of Canada's premiere gateway cities, the TDSB provides an ideal location for an analysis of structural equity.

43.3.1 Perceptions of Ability and Program Demographics

One of the key features of specialty programs and programs of choice is that enrolment is often connected to perceptions of student ability. For example, school counsellors, teachers or parents may recommend that students take Advanced Placement courses or the entrance exam for the International Baccalaureate Program based upon students' assumed capacity. Students believed to be creative performers may be recommended to audition for a speciality arts program. Whereas students who are perceived to be struggling academically and require a more 'hands-on' approach to learning may be recommended to consider pursuing a trade or skills based program, perhaps even support from special education. However, perceptions of ability can be subjective as is what constitutes academic success. Demographic trends exploring who is often considered 'able' and who is perceived to be 'less able' continue to be largely reflective of historical patterns of inequality along lines of

gender, racial and class divisions (see Clandfield et al. 2014; Smaller 2014; Erevelles 2000; Gould 1996). Educators, guidance counsellors, and school-based psychologists, for instance, often employ report card grades as ‘data’ to inform their recommendations about what level of programming students should receive (TDSB 2015b). However, what remains hidden within students’ grades, assessments, and report card data are the gendered, racialized and classed perceptions of student ability that shape perceptions of academic potential (Reid and Knight 2006).

The patterns of differentiation that yield groupings that are starkly homogenous in comparison to the school population are also reproduced in more subtle and as such more pernicious ways. Notions of what it means to be “gifted” and “talented” are heavily influenced by dominant ideas about how such characteristics are enacted and the criteria by which they are determined. In their work on how notions of “talent” are mobilized within specialized arts programs, for example, Gaztambide-Fernández et al. (2013) show how these ideas are linked to racial and classed perceptions of what it means to be talented. They argue that who is deemed to be talented and therefore worthy of specialized arts education is heavily influenced by race, class, and gendered perceptions that produce inequality of access and outcomes.

While some groups benefit from established practices for determining talent, potential, or skills, many other students’ life courses are burdened by barriers. When students’ observed differences, learning styles, and diverse approaches to their schoolwork are perceived as extreme, schools involve a separate medicalized system, the special education system, to further justify decisions to reduce curricular expectations and segregate students into classes with stripped curriculum and limited post-secondary opportunities.

Despite the resilient system of sorting and organizing students into homogenous groups based upon perceptions of ability, the research continues to expose the drawbacks of ability-grouping. Supporting the findings in this analysis, Houtveen and Van de Grift (2001) demonstrate how placement in lower-ability groupings further disadvantages students. They claim that creating and placing students in lower-ability groups: imposes low expectations on students; reflects demographic divisions along lines of class and race; is rarely a temporary placement but instead sets a trajectory of placement within lower ability groups; and creates spaces in which students often receive less instruction.

With an abundance of evidence demonstrating the pedagogical and social justice arguments for eliminating lower-ability groupings, promoting heterogeneous program opportunities, and ensuring equitable access to desirable programs, the TDSB and the Ministry of Education have attempted to move towards more inclusionary models of education. In 2009, the Ministry of Education released a planning document entitled “Ontario’s Equity and Inclusive Education Strategy: Realizing the Promise of Diversity.” This document was intended to promote inclusive strategies

and reduce system-wide experiences of myriad forms of discrimination. However, the document ignored systemic issues embedded within the education system and instead focused on teachers and classroom strategies. While important pedagogically, the provincial inclusion strategy did not address the structural barriers embedded within the education system.

43.4 Streaming and the Structuring of Inequality

Scholars have identified the relationship between social privilege, perceived ability, and greater academic opportunity (Curtis et al. 1992; Clandfield et al. 2014; Parekh et al. 2011; Parekh 2014).² The reproduction of social privilege and replication of marginalization of social and cultural groups has been linked to educational mechanisms such as streaming or academic tracking, the Ministry of Education in Ontario insists that streaming does not exist (Brown and Sinay 2008). However, when we explore the trajectories of students based upon the majority of courses taken across the various secondary levels, patterns of streaming emerge.

Within the TDSB, secondary school students can enrol in classes within various programs of study (Brown 2008a). Across the secondary school panel, the TDSB offers seven possible course levels in which students can participate. Students in Grades 9–10, for instance, can enrol in courses at the Academic, Applied, and Locally Developed levels of study, with Academic level courses being the most rigorous. Similarly, for Grades 11–12, students can enrol in courses at the levels of university preparedness (University), mixed university and college preparedness (Mixed), community college preparedness (College), courses open to all students (Open) and workplace preparedness (Workplace). Of all Grade 11-12 course options, courses preparing students for a pathway to university are considered the most academically challenging (Brown 2008a). Course data from 2011 to 2012 shows that almost two thirds of secondary students enrol in the Academic program of study, roughly a quarter enter the Applied program of study and just under 5% take the majority of their courses at the Locally Developed level (Parekh 2013b).

The link between academic streaming and post-secondary access is clear. Even though decisions around academic pathways are determined in grade 8 (and, arguably, before), students entering the Academic program of study in grade 9 have a much greater chance of confirming an offer to university after graduation (55.2%)

²The following sections include select system, program, variable descriptions and data drawn from Parekh (2014). *Social Citizenship and Disability: Identity, belonging, and the structural organization of education*. PhD Thesis, York University, Toronto.

as compared to students entering the Applied program of study at 4.2%. Less than 5% of students taking the majority of their courses at the Locally Developed level access any form of post-secondary education (university or community college) (Parekh 2014). Interestingly, for students embarking along the applied- community college pathway, whose destination is intended to be community college, 79.3% of students do not apply to any post-secondary institutions once they are eligible (Parekh 2014).

The pervasiveness of the academic streaming process is well-defined in terms of the relationship between secondary program of study and post-secondary access. Demographic patterns also exist. Girls are slightly over-represented in the Academic program of study, while males are notably over-represented in the Applied and Locally Developed program of study. Racial disparities are also apparent, with White, East Asian and South Asian students being slightly over-represented in the academic program of study. Black students are notably under-represented in the Academic program of study but substantially over-represented in the Applied and Locally Developed programs of study. Students identified as having a disability or special education need are also under-represented in the Academic program of study and over-represented in the Applied and Locally Developed programs of study. In addition, income has a significant relationship to program of study with wealthier students over-represented in the Academic program of study and students living in lower income households over-represented in the Applied and Locally Developed programs of study (Parekh 2014). In many ways, these patterns are not surprising, as they mirror the findings from a well-established body of research that shows how students are sorted through tracking or streaming practices (Curtis et al. 1992; Oakes 1985; 1990; Smaller 2014). While it is crucial to show how these patterns continue to operate despite attempts to de-stream the system, what we want to show here is how the same patterns are once again reproduced through programs that, at least in principle, should effectively counter demographic segregation. In short, while the system seems to aim to de-stream, new forms of streaming are now operating and yielding the same negative results.

43.5 Data Sources and Analyses

To explore the extent of how programs of choice function as an extension of traditional streaming, we employed data from the TDSB and explored a number of Chi Square analyses to uncover the relationships between program enrolment and student demographics. Data for the following analysis is drawn from two sources within the TDSB. The analyses correlating Grade 12 (year 4) students graduation and post-secondary confirmation draws data only for students who were in Grade 12 for the first time ($n=15,975$) in 2011–12. However, when correlating to responses from the 2011 student census, depending on the question, the number of completed

responses can vary. For all other analyses within this quantitative analysis, all students in the secondary panel (2011–2012) were included, which resulted in an N of 90,838 students.

43.5.1 Program Descriptions

This chapter includes a review of six programs that fall into the category of “Programs of Choice” and which are offered within public secondary schools across the TDSB. Each program has its own unique vision and purpose. Many programs reviewed in this chapter are considered to be elite and competitive programs and are perceived by the public as having high status, particularly by groups that, themselves, have high status. Programs such as the International Baccalaureate (IB) program, French Immersion, Elite Athletics and Specialty Arts programs all offer students enriched learning opportunities and often direct access to university. Many elite programs require students pass an admissions and/or audition process to gain entrance. By contrast, programs such as the Specialist High Skills Major (SHSM) and Ontario Youth Apprenticeship (OYAP), which do not require selective admissions process, are considered as specialized skills development for students who are on the pathways to community college or employment within the trades. Below, we review each of the programs and then explore their relationship to achievement, student demographics and school experiences.

43.5.1.1 The International Baccalaureate Program

The IB program is internationally renowned for its academic rigour (Tarc and Beatty 2012). With recognized accreditation in over 125 countries, the program provides students with first-year university courses while they are still in high school and it is highly valued by post-secondary institutions around the world. Geared towards Grades 11 and 12, the IB diploma program was offered at six TDSB secondary schools over the 2011–12 school year. Students prepare for the highly competitive IB diploma by enrolling in a preparatory program in Grade 9. Exams are sent to a central office and marked externally (TDSB 2013a). For this analysis, students identified as participants in the IB program were students taking the IB preparatory program in Grade 9 and 10 as well as the diploma program for Grades 11–12. It is important to note that most Ontario school districts offering IB require students’ families to pay a substantive fee to access the program. Despite pressure to follow suit, as recently as 2013 the TDSB voted to keep access to the IB program free to students (Edmiston 2013).

43.5.1.2 French Immersion

The French Immersion program offers students who do not speak French as their first language the opportunity to learn French through immersion at school. Both early immersion and middle immersion programs offer 100 % of course material in French, with the exception of some specialized courses such as physical education. Secondary immersion requires students to obtain ten credits in French in order to graduate with a Certificate of Bilingual Studies in French Immersion (TDSB 2013b).

In the TDSB, early immersion begins in Senior Kindergarten and is offered at 56 schools across the district (TDSB 2013b). Middle immersion programs, which begin in grade 4, are offered at three locations, while secondary Immersion programs are offered at ten schools in the Greater Toronto Area. The TDSB also offers a Grade 7 continuation program, which allows students to take 50 % of their academic courses in French. The TDSB offers this program within 22 schools (TDSB 2013b). Given Canada's official bilingualism, French Immersion programming, which provides students with a firm conversational and academic foundation in a second language, can be considered one of the most marketable programs offered within the TDSB, broadening future academic and economic opportunities for participating students (Curtis et al. 1992; Parekh et al. 2011). Students included in this analysis for French Immersion were students who were enrolled in French Immersion programming at the secondary level.

43.5.1.3 Academic Program for Gifted Athletes (Elite Athletes Program)

The APGA or Elite Athletes program provides flexible secondary timetabling and support for students who are competing in athletics at provincial, national, or international levels (Northview Heights Secondary School 2013). Students must have a B average in order to be eligible for entrance into the program in addition to recognized competitive athletic standings (TDSB 2013c). Only four schools in the TDSB host the elite athlete program, of which three were included in this analysis. Students identified as participating in the program were included based on their course codes.³

43.5.1.4 Specialist High School Major Program

Specialist High Skills Major (SHSM) is a program approved by the Ontario MOE. Each program has five components which include 6–12 (generally Grade 11–12 level) required credits within a particular post-secondary pathway. The program includes a co-op opportunity as well. The program makes use of the Ontario Skills Passport as well as “Reach Ahead” opportunities to document achievement

³Course codes are assigned to every course offered within public education institutions across Ontario and denote the program and level of course offered.

and provide students with post-secondary experiences (TDSB 2013d). Areas of specialization include art and culture; aviation and aerospace; business; construction; energy; environment; health and wellness; horticulture and landscaping; hospitality and tourism; information and communication technology; justice, community safety, and emergency services; manufacturing; non-profit; sports; and transportation (TDSB 2013d).

43.5.1.5 Ontario Youth Apprenticeship Program (OYAP)

OYAP provides students with the chance to pursue apprenticeship and workplace opportunities following high school. “The Ontario Youth Apprenticeship Program (OYAP) is a School to Work program that opens the door for students to explore and work in apprenticeship occupations starting in Grade 11 or Grade 12 through the Cooperative Education program. Students have an opportunity to become registered apprentices and work towards becoming certified journeypersons in a skilled trade while completing their secondary school diplomas” (OYAP 2013, para. 1).

43.5.1.6 Specialized Arts Schools

While all other programs reviewed in this chapter, refer to programs offered as options within larger schools, we felt it was important to include the specialized arts schools as part of this analysis due to their reputation for prestigious programming (Gaztambide-Fernández and Howard 2010). Admission is based upon a competitive application and audition process. The current TDSB website dedicated to specialized arts programming states that “these programs are for students who wish to pursue visual arts and performing arts at a professional level. This program consists of intensive programs within select schools as well as specialized schools focused solely on the arts” (TDSB 2013e, p. 24). Only two specialized arts schools were included in this analysis as they were the only two in which *all* students participated in the specialty arts curriculum as opposed to an in-school arts program.

All charts and tables include a variable known as ‘Total across TDSB secondary schools’. This category of analysis demonstrates the overall results from the secondary level in the TDSB were included as a baseline.

43.5.2 Outcome Variables

43.5.2.1 Program of Study

The Program of Study (POS) is determined based on the majority of courses students take over grade 9–10 or the first 2 years of secondary school. The levels of program of study are Academic, Applied, and Locally Developed. The “Undefined”

classification only includes a small proportion of students, namely those who have entered the TDSB after grade 10 or who largely take non-credit or special education courses.

Courses at the Academic level are expected to provide the greatest academic rigour and lecture-style structure. Applied courses are intended to provide hands-on instruction and, while covering the same curriculum as in the Academic program, have lowered course expectations in assessment and production of work. Locally Developed courses are intended to teach life skills and basic curriculum. In addition, Locally Developed courses prepare students for potential entrance into the workplace directly from high school and do not prepare students for post-secondary education.

There is a large variance of participation within levels of POS across school-wide structures. Overall, 65.7% of students in Grades 9–10 take the majority of their courses in the academic POS, while 25.4% take the majority of their courses in the applied POS. Less than 10% of the student population take the majority of their courses in the Locally Developed POS (4.1%) or have an undefined POS (4.8%). However, across programs of choice, the proportion of students taking the majority of their courses in the Academic or Applied program of study varies dramatically. For example, 99.2% of students in the IB program take the majority of their courses at the academic level as compared to only 40.4% of students participating in the OYAP program. While 5.9% of students in the Specialty Arts Schools take the majority of their courses at the Applied level, this is true for 38.1% of students taking SHSM programs (see Figs. 43.2 and 43.3).

43.5.2.2 Post-secondary Confirmation

The TDSB collects post-secondary information from Ontario universities and community colleges, including whether students have applied to any post-secondary institution (inside or outside Ontario) and whether they have confirmed an offer of

Fig. 43.2 Program of study across programs of choice, 2011–2012

Fig. 43.3 Post-secondary confirmations across programs of choice, 2011–2012

acceptance to an Ontario college (generally a 2-year post-secondary program) or university (comparably, a 4-year post-secondary program). Students are eligible to submit an application to a post-secondary institution while they are in grade 12 as long as they are on course to graduate at the end of the school year. Overall, 39.5% of students at the secondary level in the TDSB will confirm an offer of admission to an Ontario university while 6.4% will confirm an offer of admission to an Ontario college. Students who applied to a post-secondary education (PSE) institution but who either accepted an offer outside of Ontario or were not successful made up 11.4% of the secondary student population. However, 42.7% of secondary students did not apply to either college or university. Not surprisingly, students in the IB program had the highest rate of university confirmations (83%), followed by students enrolled in the French Immersion program (62.5%), both programs far exceeding the TDSB average. Interestingly, all four elite programs had lower confirmations to college than the TDSB average.

While unable to confirm offers of acceptance to institutions outside of Ontario, all four elite programs (French Immersion, Specialty Arts, IB, and Elite Athlete) had higher than average application rates with no confirmation, suggesting greater access to institutions outside of Ontario and perhaps Canada. While 17% of students in the OYAP program confirmed an offer of admission to community college, students enrolled in the SHSM program, a program also highly related to the Applied-College pathway, had an exceedingly low community college confirmation rate of just 2.2%. Most notable in Fig. 43.4 is the variation across programs for students who did not apply to any post-secondary institution. While the TDSB average for students who did not apply is 42.7%, this was true for only 3.9% of students in the IB program and 16.4% for students enrolled in French Immersion. However, for students enrolled in community college bound programs, the rate of students not applying to university or college was 71.2% for students in OYAP and a staggering 81.3% for students in the SHSM program.

To summarize, exploring the results for both academic level of program of study and post-secondary confirmations demonstrate a close relationship between each program of choice, academic pathway and post-secondary access. There is a clear division between program outcomes for students enrolled in the IB, French Immersion, Specialty Arts, and Elite Athlete programs as compared to students

Fig. 43.4 Gender across programs of choice, 2011–2012

enrolled in the Specialist High Skills Major and Youth Apprenticeship Programs. While we cannot determine causality across these relationships, the findings do suggest that further exploration is required to better understand the stratified program outcomes.

43.6 Demographics and Program Enrolment

Having determined the clear relationships between program enrolment, academic level and post-secondary outcomes, it is important to further understand who is most affected by these program pathways. Employing the same data set and Chi Square analyses, program enrolment was explored through the context of gender, race, disability, income, neighbourhood resources and students’ experience of belonging in school.

43.6.1 Gender

Gender proportions varied across school-wide structures. In the TDSB’s secondary panel there is an uneven gender divide, with roughly 5% more male than female students, resulting in proportions of 47.1% female and 52.9% male (Fig. 43.4). Female students are notably over-represented in elite, academic and arts focused programs. For example, female students make up two thirds of the student population at specialty arts schools. Conversely, male students are slightly over-represented within the elite athlete and OYAP program, and make up almost two thirds of students in the SHSM programs.

43.6.2 Race

In the Student and Parent Census, racial identity is determined based upon students' own self-identification. Students have multiple ethno-racial options including an option to write their response. The four largest racial categories across the TDSB secondary panel in 2011–12 were White (28.3%), South Asian (21%), East Asian (17.9%), and Black (12.6%) (Table 43.1). A racial analysis of programs of choice reveals interesting trends. Of the more elite programs, students who self-identified as White were greatly over-represented within Specialty Arts, Elite Athletics, and French Immersion but were notably under-represented within the IB program. While White students were over-represented in the OYAP, they were under-represented within the SHSM programs. Students who self-identified as South Asian were largely under-represented across all programs with the exception of a close representation within SHSM programs, but were almost doubly represented within the IB program. Revealing a similar pattern, students who self-identified as East Asian were under-represented across all programs with the exception of the IB program. However, the overall proportion of students who self-identified as Black were close to the same within French Immersion programs. In contrast, Black students were under-represented within Specialty Arts, IB, and the Elite Athletics and over-represented within the college-workplace bound programs such as SHSM and OYAP.

Table 43.1 Racial representation across programs of choice, 2011–2012

Programs	Aboriginal	Black	East Asian	Latin American	Middle Eastern	Mixed	South Asian	South east Asian	White
Specialty arts	0.5%	3.2%	4.3%	2.3%	0.7%	12.6%	1.5%	1.4%	73.4%
IB	0%	5.9%	23%	0.5%	4.1%	4.3%	40.8%	4.8%	16.5%
French	0.1%	11.1%	8.4%	1.9%	3.8%	12.2%	4.9%	2.2%	55.4%
Elite Athlete	0%	7.4%	1.1%	0.4%	1.5%	12.6%	3%	1.1%	73%
SHSM	0.1%	21.3%	9.1%	4.8%	6.5%	10.3%	21.6%	5.3%	20.9%
OYAP	0.7%	16.7%	8.6%	2.7%	4.8%	7.7%	18%	5.2%	35.6%
Total across TDSB secondary	0.3%	12.6%	17.9%	2.2%	5.8%	6.9%	21%	4.9%	28.3%

43.6.3 *Students Identified with Disabilities and/or Special Education Needs*

Data on students identified with disabilities and/or special education needs (SEN) is based upon special education information. This is a contentious variable as the difference between how students are institutionally defined through special education is highly incongruent with the way students self-identify as disabled (see reported figures, Yau and O'Reilly 2007 as compared to Brown 2008b). Therefore, for the purpose of this analysis, the category of students identified with disabilities or SEN are students who have been both formally identified through an Identification, Placement, and Review Committee (IPRC process) as well as students who have been given an Individual Education Plan (IEP) without a formal identification. Both the student demographic profile and academic trajectories of students identified as gifted and students identified as having a disability or SEN are notably disparate (Brown and Parekh 2010). Therefore, we have excluded students identified as gifted even though they are traditionally included as students with special education needs.

The following analysis looks at the proportion of students across programs of choice who had been identified as having a disability (excluding those identified as gifted). Across the TDSB's secondary panel, 15.1% of students had been identified as disabled; however, this proportion fluctuated across programs of choice (Figs. 43.5 and 43.6). Students with SEN were notably under-represented within IB, French Immersion, and the Elite Athletics programs, were slightly over-represented within Specialty Arts Schools. Students with SEN were greatly over-represented within the SHSM program and almost doubly represented within the OYAP program.

43.6.4 *Income*

By employing students' postal code information, the TDSB linked students to their neighbourhood income. After neighbourhood incomes were tabulated, collective incomes were distributed across ten income deciles consisting of roughly 10% of

Fig. 43.5 Disability/SEN across programs of choice, 2011–2012

Fig. 43.6 Income across Programs of Choice, 2011–2012

the student population. Exploring the correlation between income and programs of choice reveals interesting trends. Students enrolled in the more elite programs, such as Speciality Arts, Elite Athletics, and French Immersion, were much more likely to come from higher income households (7th–10th income deciles) as compared to students enrolled in the SHSM program, who were much more likely to be from lower income families (1st–5th income deciles). Students enrolled in the OYAP program were much more likely to be from middle income families (4th–8th income deciles); whereas students in the IB program were largely over-represented within the middle income deciles, only slightly higher than OYAP (5th–9th income deciles).

43.6.5 Learning Opportunity Index

The LOI is a school-level scale based upon six socio-economic factors measuring external challenges at the neighborhood level. Factors included in this index are median income, families whose before-tax income falls below the Low Income Measure, families who are currently using social assistance, adults with minimal education, adults with post-secondary (university) degrees, and families headed by a lone parent. Each school across the TDSB is ranked according to this index, lowest ranking indicating greatest challenge (TDSB 2011). The range of external challenge across the TDSB secondary panel had a mean of 0.45 but ranged from 0.001 to 0.956. The closer the mean is to 1.0, the higher the degree of external challenge.

While the LOI for the schools associated to students attending the Specialty Arts program, followed closely by French Immersion, experienced little observable challenge, quite the opposite is true for the SHSM Program. An interesting finding here is that while the IB program is considered a more elite program it is had the second highest level of neighbourhood challenge (see Fig. 43.7).

Fig. 43.7 Mean LOI across programs of choice, 2011–2012

Fig. 43.8 Students’ experiences of belonging and exclusion across programs of choice, 2011–2012

43.6.6 Belonging

The scale of belonging was developed using experiential questions from the TDSB’s Grade 9–12 Student Census (form A). The scale of belonging drew on questions that focused on students’ experience of safety, acceptance, inclusion, and shared power at school and within their classrooms. There is a clear relationship between students’ experience of belonging and the perceived social value or elite status of programs (Fig. 43.8). While students attending Specialty Arts schools were most likely to report experiences of belonging, the more elite programs scored higher than the TDSB average. Conversely, students enrolled in community college and apprenticeship focused programs were more likely to report the experience of exclusion as compared to elite programs as well as compared to the TDSB average.

43.7 Discussion and Implications

Aside from the more ambivalent trends concerning the IB program, which deserve special attention, in this chapter we can point to clear relationships between elite and non-elite programs across achievement, student demographic and experiential data. Drawing upon conceptions of ability and talent to justify access, elite programs such as Specialty Arts, Elite Athletics, and French Immersion provide access to suspiciously homogenous groups of students who are already privileged by other material and social circumstances. Conversely, community college and apprenticeship-focused programs such as the SHSM and OYAP similarly serve groups of students that are starkly homogenous in terms of gender and class even as they are racially diverse. To us, this is a clear indication that Programs of Choice are a more diffuse extension of the traditional system of academic streaming, leading different groups of students towards disparate post-secondary outcomes.

These patterns of inequality are not new even though they are enacted through new schemes. As far back as 1970, Wright evidenced how Toronto students of privilege were accessing greater academic opportunities over their less-privileged peers. In 1992, Curtis, Livingstone, and Smaller demonstrated similar trends and revealed how certain student groups are systematically denied access to more marketable education opportunities, resulting in a reduction of post-secondary access and an increase in more precarious forms of employment and income. Students living in under-resourced neighbourhoods are, both historically and currently, denied equitable access to marketable programs, such as second-language immersion and advanced-placement opportunities and are more likely to be bottom streamed in vocational programming (Deosaran and Wright 1976; Martell 2009; Parekh et al. 2011; Wright 1970). King et al. (2009) reported that under half of students who took community college-preparation courses and under a sixth of students taking work-place preparation (including apprenticeship programs) went to college. By contrast, close to three quarters of students who took university preparation courses went on to university (King et al. 2009).

Key to understanding the patterns highlighted in this chapter is the growing research showing that graduation from high school alone does little to impact students' life course in terms of health and economic security (see Fonseca and Zheng 2011; Kearney et al. 2015). As most students eventually graduate from the TDSB, with or without support, we intentionally omitted an analysis of graduation outcomes. While it is certainly commendable that the Ministry of Education and the Toronto District School Board have given tremendous attention to improving graduation rates for all students, which currently stands at 84% (TDSB 2014c), the focus on graduation alone ignores the structural patterns that have a more significant effect on students' lifelong outcomes. As the bar shifts towards higher education, post-secondary access is now considered a key protective factor against precarious employment and income insecurity (Kirby 2009). It is therefore critical to better understand how structural barriers play a role not only in whether students graduate, but in streaming or guiding particular groups of students towards post-secondary

destinations and high-value careers and others towards low-wage employment (Clandfield et al. 2014).

Insisting solely on providing different pathways toward graduation is to ignore how such pathways also enforce broader patterns of inequality. The patterns of inequality that emerge when we look closely at who takes advantage of specific programs of choice demonstrate that despite the efforts, schooling continues to function as the de facto organizational mechanism for reproducing social inequalities (Duncan-Andrade and Morrell 2008). What is more pernicious is that such programs obscure the role of schooling in producing inequality by shifting the focus to students' choices as the cause of their experiences of failure and/or success. Yet, economic and social stratification are not the inevitable outcome of student choices; they are produced through a systematic channeling of resources and the structuring of pathways that yield particular outcomes.

The case of Toronto is an important illustration, given its reputation as a progressive city with a school board that has taken issues of inequality seriously and has attempted to address how formal structures like streaming produce inequality. The case of the TDSB shows that programming policies that ostensibly give students more options to make decisions about their future end up reproducing the same patterns of inequality that are evident in other urban school districts. As educators committed to equity and social justice, our task is not only to reveal such patterns, but to insist on system-wide strategies for addressing inequality that do not shift the onus to students and their families and that recognize how social and cultural context shapes choices as well as outcomes.

Chapter 44

Resistance Wisdom and Grassroots Urban Education: Lessons from Detroit

John Lupinacci

We need to leave behind the concept of education as a passport to more money and higher status in the future and replace it with a concept of education as an ongoing process that enlists the tremendous energies and creativity of schoolchildren in rebuilding and respiriting our communities and our cities now, in the present. (Boggs 2002, para. 8)

In the context of recognizing and reconnecting with our commons, and common sense, in efforts to better support *all* students, I find Detroit—like so many other urban communities around the world for which modern economics has failed—to be rich with hope and promise despite the clearly visible economic abandonment and worldwide notoriety for violence and crime. While there is plenty of research that exist to tell stories that further pathologize poverty and criminalize youth, this work resists such a fetish and turns attention to the resilience and political organizing of educators as cultural workers recognizing that schools ought to focus learning around a fundamental student need—the need and right to nourishing and culturally appropriate food and clean water to drink and air to breathe.

It is no secret, as a part of the rust belt, that the city of Detroit offers a now infamous landscape of abandonment, unemployment, and with that a significant amount of crime. Despite the constant depiction of Detroit as a place of abandonment and industrial failure, it is a place of great wealth in terms of resilience and determination. In fact, in response to the many struggles Detroiters face—many of which are akin to folks all over the planet in situations not all that different, their resilience and determination is encouragement to reconsidering the limiting ways our communities often get defined by economics, labor, and production and to recognize how such economic systems of exploitation can distract us from recognizing and valuing the abundance of life sustaining relationship in our neighborhoods and in our neighbors.

J. Lupinacci (✉)

The cultural assumptions that dominate perceptions of Detroit, as city in poverty, tell us that Detroit is a failure—an epic site of ruins ripe for tourism and exploitation. Such assumptions are sadly also applied to how students living in poverty are perceived by schools as in need of being saved. The dominant cultural assumption pervasive in addressing the “hard times” in Detroit is that markets will save the city, that jobs above anything will bring back the economy. Furthermore in regards to students, education is at best often understood as the pathway for youth to either leave the city or to be trained to work in a low-wage economy with little or no social safety nets. At its worst, educational structures in modern society view students as human capital in an industry or an enterprise in which education is privatized and outsourced to companies. Such, assumptions and perceptions play into sorting students into systemic poverty, military service, and/or seeking economic opportunity through informal economies that are illegal and thus tracking youth into prisons.

If as urban activist-educators we rethink how we frame success towards recognizing and valuing the cultural commons, the day-to-day non-monetized traditions and practices that support life, we might look at how amazing it is that despite the political and economic enclosures contributing to poverty in Detroit life still exist. In Detroit, a city that many consider “a canary in the coal mine” for what happens when industry collapses and abandons the local, it is important that we learn from the ways that the city is alive and growing. What is brought to the forefront of our attention when we recognize the value in alternatives to the exploitation of free market capitalism are the efforts of local people as they respond to local conditions with an interest in valuing equity in both human and the more-than-human world. When rethinking the role of education, we can learn a lot from the diversity of local efforts around the globe that support neighborhood subsistence and find strength through intergenerational learning as such efforts are often inextricable from the wealth of wisdom that resides locally. A wisdom that gets passed on as people share experiences together to teach and learn local traditions that support local subsistence.

Confronted by the systemic violence of Eurocentrism—or white, male, wealthy supremacy—a group of activists and educators set out to interrogate systems of such supremacy at work in their neighborhoods and confronted the need for establishing food security—or their rights to have access to healthy food. The following chapter briefly introduces environmental justice and eco-racism in relationship to education and then addresses how when faced with such a challenge the radical activist-educators in urban communities asked: How is it that such exploitation and systemic violence is rationalized, justified, and/or ignored and what could be done to resist such violence and engage youth in building healthy and autonomous communities? While often responses to address conditions faced by students, teachers, and families in urban educational settings include the intersections of race, class, and gender, examinations of urban education are rarely connected with the high levels of environmental racism experienced by urban communities. The story that follows in this chapter is a story about what happens when educators and activists in an urban community have had enough and take action to resist the poisoning and imprisonment of their community. As a result, an embedded story within this story

of resistance, is a story of how schools—more specifically culturally-relevant urban education—can play a significant role in organizing food sovereignty as a key step toward, and facet of, autonomy and self-reliance through access to healthy and culturally appropriate food that is produced by ecologically sustainable means as part of a local economy—in Detroit, Michigan.

44.1 Environmental Justice and Eco-racism

Environmental justice work highlights how destructive environmental practices occur disproportionately in marginalized communities. For example, emissions of dangerous gases and industrial toxic disposal sites are often located near, or in, poor communities. Environmental justice work typically recognizes the intersectional impacts and causes of destructive environmental practices as interrelated and inextricable from social justice issues. With approximately 700 million people on the planet living in extreme poverty (United Nations 2014) and strong support that poverty—primarily through high levels of stress hormones, malnutrition, and exposure to environmental toxins—impairs development for young children (Cookson 2008; Krugman 2008), it seems as if more schools, communities, and educational researchers should explicitly address these inequities and explore alternatives to supporting healthy development for all children (Weaver-Hightower 2011). Meanwhile, for all species on the planet, “global emissions of carbon dioxide (CO₂) have increased by almost 50% since 1990” (United Nations 2014, p. 40) and scientists report that the increase is caused by human impacts on the environment; changes in climate are causally connected with floods, droughts, famine, and war.

One example in North America that illustrates the connections between childhood poverty, carbon dioxide emissions, and climate change effecting both urban and rural communities is the fact that in 2012 the United States produced an estimated 280 billion gallons of fracking wastewater, which has been shown to contain cancer-causing and radioactive materials that contaminated drinking water sources (Ridlington and Rumpler 2013). For example, in California, fracking—through wastewater with known and unknown impacts—primarily affects low-income communities (Srebotnjak and Rotkin-Ellman 2015), and children and older people are always the most vulnerable members of any such community. The current political climate has recently seen an increased focus on addressing the use of extreme violence against People of Color. The Black Lives Matter (#Blacklivesmatter) movement has recently brought to the forefront many of these intersectional issues marginalized communities are faced with in their day-to-day lives. Breaking stories from Flint, MI in late 2015 and early 2016 reported how—in efforts to save money—financially appointed unelected officials decided to reconnect Flint residents with water drawn from the local polluted river. This decision exposed residents to water that far exceeded legal limits of lead and other toxic and corrosive pollutants. Flint is an urban community abandoned by the automotive industry and is primarily a community comprised of Black and Brown lives (Blow 2016; Eligon 2016; Ganim

and Tran 2016). While activists were able to break this story from Flint, countless other communities around the world endure similar injustices as their water, land, homes, and cultures become so-called collateral damage of progress and growth. The questions remain: “Who/What benefits?” And, “Who/What suffers unjustly?” Furthermore: “How is it decisions are being made with such short-sightedness and cruelty toward specific communities?”

A major aspect of the violence done onto marginalized communities that often goes unacknowledged by privileged—often white—communities, is the disproportionate location of poor families, and Black and Brown families, in proximity to toxic environmental conditions. Alarming levels of toxicity in soil, air, and water—often the result of the disposal of hazardous waste—are all problems that marginalized families must struggle with at much higher than acceptable levels of exposure. While environmental justice activists have worked hard for decades to expose the public health threats of pollutants in all communities, especially as these hazards reflect racist policies and laws, future generations are inheriting these challenges to equity and equality. Another example of environmental racism, sometimes referred to by activists and scholars as eco-racism, is how incinerators and other hazardous waste facilities are much more likely to be built in neighborhoods where poor People of Color and Indigenous communities live. In Los Angeles county, “hazardous waste, treatment, and storage facilities were found to be disproportionately located in areas where African American and Latinos live” (Boer et al. 1997). Robert Bullard (2002), a leading researcher examining environmental racism in North America writes, environmental degradation is much more likely to be experienced by peoples who have also been systematically excluded and exploited economically.

In Detroit, Michigan, the largest trash incinerator in the world burns 4,000 tons of garbage every day, a process that is converted into energy in the form of electricity. The incinerator costs Detroit residents over 1.1 billion dollars and ravages the local neighborhoods with toxic pollution linked to high asthma rates and other illnesses. Pollutants resulting from burning trash are linked to cancer, respiratory ailments, skin diseases, and birth defects in disproportionate levels for working class communities and People of Color. Today, Detroit has higher rates of respiratory illness than the rest of the State of Michigan. Children living near the incinerator are hospitalized three times more often than the state average for asthma and those growing up near toxic sites have been shown by neuroscientists to have severe learning disabilities, and shorter life expectancies. Furthermore, death rates for asthma among children in Detroit is twice the state average (Wasilevich et al. 2008).

Other dangerous toxins include high quantities of lead—a highly toxic metal—found in housing, soil, and water sources in poor communities. Despite lead’s toxic characteristics, it was used for centuries in paint, gasoline, batteries, ceramics, and many other products creating major public health problems. According to the Center for Disease Control (CDC) approximately 250,000 children between the ages of 1 and 5 years have over the CDC-recommended safe level of 10 µg of lead per deciliter of blood (www.cdc.gov/nceh/lead). Medical research demonstrates that exposure to lead has serious neurological and probable behavioral effects on children. According to the American Academy of Pediatrics (2005), the most definitive

effects of the toxicity of lead poisoning are cognitive impairments; however there is convincing evidence that other aspects of brain or nerve function, especially behavior, may also be impacted. The same organization reports that students with elevated levels of lead are not only less attentive and hyperactive, but also show low rates of graduation from high school, evidence of reading disabilities, and increased aggression (American Academy of Pediatrics 2005). These economic, legal, and environmental differences create marked differences in quality of life for people living in poverty and systemically contribute to the marginalization and subjugation of People of Color.

44.1.1 Youth Engagement, Urban Education, and Environmental Justice

Just think of how much safer, healthier and livelier our communities would become almost overnight if as a natural and normal part of the curriculum from K-12, school children were taking responsibility for maintaining neighborhood streets, planting community gardens, recycling waste, creating healthier school lunches, organizing neighborhood festivals. This is the fastest way to motivate all our children to learn and at the same time turn our communities into lively neighborhoods where crime is going down because hope is going up. (Boggs 2002, para. 9)

Challenges of the 21st century require that future generations of decision-makers are skilled at problem solving that recognizes the interrelationship between social and environmental justice. Many radical environmental educators, activists, and scholars take the position that educational opportunities for youth activism is a critical, and arguably necessary, experience toward addressing environmental degradation and increased social suffering. Youth activism, in education, can be broadly understood as youth democratically involved in the decision-making process on matters that will impact their communities—both locally and globally. In short, such activism in schools and communities involves diverse intergenerational, and in some cases interspecies, voices and perspectives in decisions being made by all those directly impacted by the decision. While justice work, whatever the issues, tends to be centered around adult participation, youth activism offers the opportunity for adults to pass on important experience from elders to future leaders in the community while intentionally being fully inclusive of youth as part of the social structures of decision-making. Sadly, current educational settings ridden with high stakes testing, increased standardized curriculum, and zero-tolerance policies in schools place constraints on opportunities for educators to structure youth activism into local curriculum.

One example of urban youth activism is the Toxic Soil Busters (TSB) youth-run worker co-operative in Worcester, Massachusetts. TSB consist of a collective of all youth that offer soil testing, lead-safe landscaping, multi-media public outreach, video production, and training. (<http://www.worcesterroots.org/projects-and-programs/toxic-soil-busters-co-op/>). TSB employs urban youth to test soil and then

work to remediate through the redesign of lead poisoned landscapes. Furthermore, they work on a global level to share their stories through videography that details the youth activism toward environmental justice.

In Oakland, California a hip-hop youth organization called Grind for the Green (G4G) aims to responsibly, through cultural relevancy, mobilize Youth of Color into the environmental movement. G4G works through social media networks and grassroots organizing to organize and host musical events. With their sights on addressing the short fall of the environmental justice movement to reach urban youth in culturally relevant ways, they work to connect environmental literacy with real-world life experiences. G4G follows five principles for mobilizing a youth activist group: “reconnection to the earth, eco-literacy, leadership development, new media, and cultural relevancy” (Florez and Gokaldas 2010, p. 22). G4G not only created and hosted the first ever solar powered hip-hop concert but also that event mobilized youth and their families together with hip-hop fans and artists with environmental activist groups organizing with(in) the community to take action against environmental racism in the Bay Area (Arnold 2009). In addition to organizing hip-hop events as a platform for engaging over 1,500 inner city youth, through events produced by youth, G4G has employed 25 youth with green jobs.

While the examples could continue, we turn our attention to Detroit and the organization of youth as central to environmental justice and systemic racism and classism in Detroit for Families of Color and especially for young women and children. Stand Up Speak Out! (SUSO), an outreach of the East Michigan Environmental Action Council (EMEAC), engages youth and families in Detroit to advocate for environmental justice for Southeast Michigan. Working collaboratively with schools and other environmental organizations in Detroit, SUSO works with urban youth toward influencing policy changes for a Zero-waste Detroit, shutting the city’s massive incinerator, and campaigns like an anti-idling policy for commercial vehicles. In connection with EMEAC, the Young Educators Alliance (YEA) seeks to provide a “pipeline for community activism” through fostering the development of young activists learning “to identify injustices, place them in a historical context, and propose alternatives that involve community input, community organizing, and/or advocacy” (EMEAC 2015, para. 4).

44.2 Food Deserts to Food Sovereignty: Lessons from Detroit

For many folks living in industrialized nation-states like the US, it is likely that they have access to, or even knowledge of, culturally relevant affordable food ingredients and traditions. If they are not low-income or living in a predominantly low-income neighborhood then geographically and economically it is likely that they have access to healthy food choices several times a day. However, if someone happens to live in many of the urban and rural communities in the United States—it is likely they live in what is referred to as a food desert: a locale with limited access to fresh, healthy food. This does not mean that folks living in food deserts do not have

access to any food—it describes conditions under which community members have little or no access to nourishing food and educational settings that promote food traditions that support both physical and cultural health. This growing condition in many of the nation’s cities is a phenomenon referred to as a food desert. Food deserts are geographic locations with mostly fast food, dollar stores, gas stations, liquor stores, etc. These types of food establishments as part of a larger unjust food distribution system are primarily interested in profit and have little if any interest or knowledge in local health. In a food desert, processed pre-packaged food—often laden with preservatives and processed sugars—are directly contributing to the failing health of many of the nation’s vulnerable populations. According to a study conducted in Detroit, Michigan more than half a million Detroit residents live in areas defined as food deserts (MG Research & Consulting 2007). People in Detroit suffer from a lack of access to healthy, fresh food. This post-industrial phenomenon has created populations of people statistically more likely to suffer or die early deaths from diet related disease than people who have access to healthy food. Malik Yakini, referring to the study, explains:

Researcher Mari Gallegher came to Detroit...and characterized much of Detroit as a food desert. An area, according to her definition, where Detroiters have to travel twice as far to get to a major grocer as they do to what she called a fringe food location or what we in Detroit call a party store—a store that sells alcohol, cigarettes, tobacco, potato chips, candy, and other things that can only nominally be considered to be food. (Yakini 2011)

Yakini—a leader, activist, and educator in the Detroit Black Community Food Security Network (DBCFSN)—goes on to explain:

Rather than just complain or lament about our condition, our organization practices self-determination. We think it is important that people themselves stand up and find solutions to our problems. One of the solutions to the lack of access to fresh affordable healthy produce in the city of Detroit is urban agriculture. (Yakini 2011)

While the damage caused by food deserts in Detroit is certainly a blow to the local community, there is a movement of resistance to this reality. Local groups are responding to the lack of access to healthy food in Detroit by producing their own food and educating youth on local food production. Such efforts to establish food sovereignty in Detroit have made significant gains through arguing food security as a fundamental human right.

At the dawn of the 21st century, food may very well be a determining factor for human survival as a species. As food traditions rapidly monoculturalize, an associated loss of the health and healing wisdom of the elders in our communities occurs. While discourses of food security inform dominant discussions on food justice, hunger, and health, what is likely a stronger and more sustainable discourse for addressing food justice is the concept of sovereignty.

In 2007, over 500 representatives of diverse grassroots organizations met in the village of Nyéléni in Sélingué, Mali in response to the growing experiences of local “capacities to produce healthy, good and abundant food...being threatened and undermined by neo-liberalism and global capitalism” (Nyéléni 2007 p. 1). Recognizing collective wisdom and self-determination of the world’s women and

indigenous cultures, these *campesinos/las* identified food sovereignty as having the “power to preserve, recover and build on our food producing knowledge and capacity” (Nyéléni 2007, p. 1). The participants produced *The Declaration of Nyéléni* (2007) named in honor of a legendary Malian woman who fed her people—define food sovereignty as “the right of peoples to healthy and culturally appropriate food produced through ecologically sound and sustainable methods, and their right to define their own food and agriculture systems” (p. 1).

Building from the valuable information and language that food security research and policy has to offer, the remainder of this chapter explores how a very intentional group of local activists organize and subvert oppressive social, economic, and political systems to transform neighborhoods in Detroit, Michigan from food deserts dependent on imported unhealthy, cheap food to sovereign food systems with access to culturally appropriate, nutritious, and affordable food. For the activist farmers in Detroit, in solidarity with *campesinos/las* around the world, the question became: How do we learn to prepare and grow culturally appropriate and healthy food for ourselves?

According to the Centers for Disease Control and Prevention (CDC) “Good nutrition can help lower risk for many chronic diseases, including heart disease, stroke, some cancers, diabetes, and osteoporosis” (CDC 2009, p. 7). Further the CDC (2009) reports: “Health disparities in chronic disease incidence and mortality are widespread among members of racial and ethnic minority populations” (p. 1). Research linking nutrition to physical and mental health has found that malnourishment among adults and children is especially prevalent within vulnerable populations (CDC 2009; Seligman et al. 2011). So while not only do food choices have both short and long term health implications but they are also found to be inextricably linked with systems of racism, classism, and sexism. Food keeps us alive and also connects to our diverse cultures and bioregions in ways that truly support diversity on the planet. However, for many marginalized communities there is an increased incidence of food insecurity (Coleman-Jensen et al. 2012; FAO, WFP, & IFAD, 2012).

44.2.1 Resistance Wisdom: Food Is a Human Right

The drafting of the *Universal Declaration of Human Rights* (UDHR) in 1948, clearly outlined the importance of access to food for all people, recognizing food as a basic human right:

Everyone has the right to a standard of living adequate for the health and well-being of himself or his family, including food, clothing, housing and medical care and necessary social services, and the right to security in the event of unemployment, sickness, disability, widowhood, old age or other lack of livelihood in circumstances beyond his control. (UDHR Article 25, para. 1)

This is reinforced and then further detailed in 1966 by Article 11 of the *International Covenant on Economic, Social and Cultural Rights* (ICESCR):

The States Parties to the present Covenant recognize the right of everyone to an adequate standard of living for himself and his family, including adequate food, clothing and housing, and to the continuous improvement of living conditions. (para. 1)

The human right to adequate food falls under a broader human rights framework that insures an adequate standard of living. Access to food and nutrition is often considered an economic right and thus nested in rights to wages, health, and a clean environment. The United States of America is one of seven that have signed but not yet ratified the ICESCR. Meanwhile, there are currently 162 countries are state parties legally bound to the ICESCR. The Detroit Black Community Food Security Network (DBCFSN) addresses these issues through a political discourse that advocates for a food-secure city. Before looking closely at the DBCFSN, it is important to understand the larger international context within which food security has come to be a human rights issue.

A fair standard of living is considered to be dependent on the security of individuals, or groups of individuals, as a fulfillment of civil liberties and freedom. A consistent trend in the world, especially in so-called developing countries, shows that those denied civil liberties suffer disproportionately from social injustice and severe deprivations (FAO et al. 2012). Included in this suffering are food security, hunger-related disease, malnutrition, and preventable childhood mortality.

Unfortunately the ICESCR and the UDHR alone fail to specifically address and meet the needs of the human rights of children. Where there are hungry people there are also hungry children. In 1989 this need was addressed by the Convention on the Rights of the Child (CRC). The CRC, in Article 24, states:

Children have the right to good quality health care—the best health care possible—to safe drinking water, nutritious food, a clean and safe environment, and information to help them stay healthy. Rich countries should help poorer countries achieve this.

The CRC is one of the most widely accepted international agreements in the human rights framework with 193 state parties ratifying. However, the United States have not yet ratified the CRC.

In contrast to any progressive roles of social states working to adhere to the UDHR, ICESCR, and the CRC, even international adherence to policy that protects food and nutrition rights remains more of a hope than an achievement. Attention to hunger concerns, as one of the many human rights violations that impact low-income and marginalized populations, is one reason to argue for a human rights approach to food security. However, in the United States a systematic dismantling of any social safety net has increased human rights violations and transformed a war against poverty to a war against poor people and thus poor children.

44.2.2 Hunger and Food Security in the United States

It is disgraceful that in the United States, one of the world's most wealthy countries, hunger and malnutrition plague the daily lives of people. The most profound aspect of this human rights violation is that it is primarily an act of violence against children. According to the U.S. Department of Agriculture (USDA) in 2012 there were 33.1 million adults living in food insecure households and 15.9 million children—or approximately 22 % of all children in the United States (Coleman-Jensen et al. 2013). In addition to the 49 million living in food insecure homes, 7 million households were considered to have one or more persons suffering from hunger due to not being able to afford food despite food welfare programs. The number of people denied access to food in the United States has grown from 13.5 % of households were food insecure in 1998 and in 2012 that number grew to 15.9 % (Coleman-Jensen et al. 2013). As a result of a growing financial hardship and a national recession, the number of people living hungry with little or no access to food is increasing. Simply put, access to healthy food is an undeniable and crucial issue in the United States.

In the United States of America, food insecurity refers to being in a position in which persons are unable to obtain sufficient food for themselves or their household. It most commonly occurs that people in this position skip meals or cut back on the quality or quantity of food. In many developing countries around the world famine, and thus hunger, is apparent and visible. However, in the United States hunger has taken root in a form that hides the lack of nutrition in food items behind abundant access to inexpensive yet unhealthy food. While starvation only rarely occurs in the United States, children and adults frequently go hungry and a consistent mild form of malnutrition occurs doing long-term damage (Krugman 2008). Despite the presence of government aid programs in the form of welfare food assistance, hunger and malnutrition most often occur as a result of low financial resources.

In the United States issues of social welfare, like food security, do not go entirely unaddressed. However, with ongoing cutbacks on welfare programing, assistance to support the healthy development of heath food secure households is inadequate and increasingly problematic. The difficulty of access to welfare and/or limits placed on receiving welfare most severely impact children living in poverty. Welfare reform in the United States, under the unfortunate title of the Personal Responsibility and Work Opportunity Reconciliation Act (PRWORA), ties welfare entitlements such as food, childcare, and housing assistance to strict and inflexible work requirements, and has systematical contributed to an increase in the number of children living in food insecure households.

One of the most vital supports for families living in conditions of poverty is food welfare assistance, or in what in the United States is called the Supplemental Nutrition Assistance Program (SNAP). Food welfare assistance enables poor families to receive government aid that they can use to purchase food. In the United States, it has become increasingly difficult to apply for and receive such food

assistance. Decades of policy reform that has deregulated social responsibility for both federal and state governments has made life increasingly threatened food security in the United States. In Detroit, Michigan, only 8% of the recorded use of food welfare assistance was documented to be as used at food retailers that provide healthy fresh food options (MG Research & Consulting 2007). Despite claims from the United States Department of Agriculture (USDA) that the food assistance program serves as a first line of defense against hunger, food as a major profit industry has been anything but respectful of human rights, often leaving large communities of people dependent on convenience stores and gas stations for food.

For most of the United States, regardless of social class, food must be purchased. Wealthy food corporations have invested in powerful lobbying tactics that have allowed for little or no government regulation on price or quality of healthy food items. For a growing number of families, grocery stores have moved away from low-income areas thus making healthy food practically inaccessible to marginalized communities. This results in a unique situation by which malnutrition looks different than ever before—in that children are receiving food to eat but all too often it is not nourishing and healthy food. A lack of adequate government supported social welfare infringes on the human right to access nutritious food. Further, the move to relocate food providers out of financial and physical reach from poor families exposes the racism and classism embedded in food policy in the United States.

44.3 Resistance to Food Insecurity: The Black Community Food Security Network

The Detroit Black Community Food Security Network (DBCFSN) is a food sovereignty group that has taken issue with the level of food insecurity in Detroit. They describe the condition of living in a food desert as an act of aggression on racial and class minorities. The DBCFSN is a coalition of local activists who work together to counter the injustices of food insecurity by advocating and acting for strong food secure systems in Detroit. A food desert, in the United States, is a visible phenomenon that exposes the intense levels of economic and racial inequality that exist beyond a deteriorating welfare system and encompass overall food insecurity. The damage caused by food deserts in Detroit has been a crushing blow delivered to many of the city's residents. However, there is a movement to resist the systemic violence inherent in food insecurity. Local groups of activists and farmers are responding to the lack of healthy food in Detroit by producing their own food. Urban farms and local gardens are being established, revived, and maintained throughout the city. A major part of the movement towards strong food security, the food sovereignty movement has been a major influence and a growing source of inspiration.

The DBCFSN was founded in 2006 with the intent to empower members of the community to develop active roles in establishing local food security. Seeing food security as a crucial element in childhood health, well being, and development, the

network grew out of a local emphasis on food as a human right often denied to the black community under the political structures of white supremacy. The DBCFSN is an African-centered learning community of food activists and producers that work within the local community to respond to food insecurity in Detroit by addressing food insecurity as part of the systemic violence of Eurocentrism. While the Network works on many fronts their primary efforts can be summarized as working to: (1) Educate and promote sustainable, equitable, and culturally appropriate urban agricultural practices, (2) Develop and enforce a local food security policy, and (3) Invest in the refocusing education for Detroit's youth toward knowledge of food sovereignty and their right to live happily and healthily in their local communities.

Important to understanding the purpose of the DBCFSN is the group's organic growth in response to the communities directly impacted by food insecurity. The DBCFSN recognizes racial inequality, economic injustice, and environmental degradation as violence justified by policy and practices deeply influenced by political structures and cultural assumptions shaping the politics of Detroit. In the case of the DBCFSN, efforts to improve food security is an issue of justice related to food and thus the group advocates that historically marginalized and oppressed populations establish and protect local leadership. While DBCFSN primarily focuses on the city's African American population, they recognize that improved policy that addresses food insecurity improves and stabilizes local food systems and thus is a benefit to all local residents.

The DBCFSN describes food security as a "condition which exists when all of the members of a community have access, in close proximity, to adequate amounts of nutritious, culturally appropriate food at all times, from sources that are environmentally sound and just" (<http://detroitblackfoodsecurity.org>). The DBCFSN further defines a food secure city as a "city in which all of its citizens are hunger-free, healthy and benefit from the food systems that impact their lives" (<http://detroit-blackfoodsecurity.org>). The DBCFSN, most effectively, has worked to create a discourse in local politics that responds to food insecurity in a way that recognizes the multiple layers in which the local community suffers unjustly and demands an opportunity for local organizations to work toward the human right to healthy food. In other words, the DBCFSN works through a food sovereignty framework to influence food security policy.

44.3.1 Urban Agriculture and Alternative Food Systems

In 2006, the DBCFSN instituted an urban garden program in some of the local schools. This action involved the short-term use of a quarter of an acre plot on the Detroit's east side. Here, they planted and harvested vegetables and herbs and farmed on a community work schedule that involved students, teachers, and parents from the community as well as local urban farmers. However, they were forced to move after 1 year of successful farming when city land was sold to a developer. They continued their mission on another half-acre of land on the city's Westside,

called the “D-town farm”. The D-town farm was a garden site at which the DBCFSN prepared gardening beds, an irrigation system, local farming leaders, and sold produce locally in the neighborhood and at the city’s farmer’s market. One year later, the Network acquired another 2-acre plot of land from the city—a former tree nursery located in a large city park. They negotiated usage of the land for a fixed fee of one dollar a year for 10 years. The D-town farm became an agricultural project that had grown in scale, ameliorating the local impacts of food insecurity. By 2009, the DBCFSN had expanded the number of local markets to which they provided fresh produce and began talks with the Detroit Public Schools in efforts to become a direct source of local healthy food for children (M. Yakini, personal communication, March 26, 2009).

In a short span of time they have become a primary source of food for local neighborhood people through actions that involved the local citizens directly in the food production process. Their effort to farm in Detroit is a political action taken to restore human dignity and make up for a lack of attention to the basic human right of access to healthy food. A strong aspect of the DBCFSN is its recognition of food insecurity as a problem that runs deeper than simply a lack of fresh and healthy food in the city. The lack of access to transportation, an ineffective and almost non-existent system of public transportation, a record high rate of unemployment, and unsafe neighborhood conditions are all contributing factors impacting Detroit citizens’ right to access food. The DBCFSN initiates work that feeds people and engages them in sustained farming and learning culturally relevant food practices that will continue to provide sustenance toward a healthier Detroit. Additionally the DBCFSN recognizes the importance of ensuring that their food sovereignty efforts are supported at the level of local government.

44.3.2 Developing a Detroit Food Security Policy (DFSP)

In 2006, the DBCFSN went before the Neighborhood and Community Service Standing Committee of the Detroit City Council. Here, the DBCFSN highlighted the lack of a comprehensive food security policy, and advised the committee of the importance such a policy. Afterwards, the DBCFSN was appointed by the City of Detroit to draft this policy. Over the following year the DBCFSN researched and wrote a food security policy for the City of Detroit. The DBCFSN recognized this as an opportunity and sought to form a committee specifically dedicated to this massive undertaking. The Public Policy Committee, a division of the DBCFSN, involved the community and several public meetings from which they solicited feedback from several local and international experts and was able to make several recommendations in their presentation to the City Council. The Detroit City Council put the policy to a vote for approval and the Detroit Food Security Policy (DFSP) unanimously passed. Detroit officially adopted DFSP in March of 2008. With official policy in place, the DBCFSN’s battle for food security was granted a voice in the local governmental.

Not only did the success of local government's acknowledgment of food insecurity assist the Network's political agenda, but it also carved out a place at the decision-making table for other local organizations. In a relatively short amount of time, the DBCFSN engaged local citizens, policy makers, and community organizations in collaborating to ensure a food-secure city. The result was a turning point as public officials decreasingly sought outside expert assistance on the issue of hunger in Detroit, and could turn to local organizations for input and assistance. The DBCFSN served as a political catalyst for a political alliance between over 30 of the city's most active organizations concerned with long-term social justice and sustainability of Detroit. This is truly a unique and powerful alliance as many of these organizations, despite their shared interests, are often forced into competing with each other for limited resources and funding. Yet, they find themselves unified by the food sovereignty movement stewarded by the DBCFSN. Under the umbrella of a shared goal of food security they collectively have a stronger voice. The political agenda and policy initiatives of the DBCFSN, set forth by the adoption of the DFSP, has created an opportunity for Detroit to reclaim food security.

44.3.3 Educating and Empowering Detroit's Youngest Citizens

The DFSP reflects much of the vision of the DBCFSN, but most important to the movement, from its inception, is a focus on education. This policy emphasizes the importance of education in playing a role in establishing food security. It also recognizes that providing healthy food is only one step toward food security. A simultaneous, necessary task remains that education supports the development of healthy food conscious citizens who know and are free to make healthy choices in regards to food. The types of education called for in the DFSP directly address the cultural habits of Eurocentrism for all members of the local community and hinge heavily on quality public of education—a healthy, equal, and culturally responsive education free at the point of access for all children. Simply put, the DFSP helps to provide policy that creates the opportunity for a serious conversation about how educational reform might better support children learning in all neighborhoods in the city. For any community that does not know how to access, grow, and prepare healthy food, food security is merely an idea rather than a reality. Without education, the agricultural efforts of the DBCFSN are reduced to short-term aid for the hungry and are not likely to be sustained. Recognizing this, the Network, advocates for citizens to engage in learning important connections between food and health issues in the community. They advocate and practice a strong belief that citizens should have access to affordable, healthy food as well as to an education that exposes the false marketing of the global food corporations that profit at the expense of poor communities.

The DBCFSN has implemented school reform that has reached public schools, public and private charter schools, churches, community organizations, shelters, hospitals and many before- and after-school programs in Detroit. In all cases a focal

point of such local reform is the consideration of the impact that education has on the dietary habits and health of the local community. The Network recognizes the potential impact that can be made by educational reform that purposefully aims to foster and develop learning opportunities for members of the community about not only their rights to a happy, healthy life but how they can actively work to provide such a life for themselves and future generations. The DBCFSN also recognizes that schools and public sites of learning ought to be places that offer healthful food. Interest in healthy school food is on the rise nationally, as advocated by First Lady Michelle Obama in her “Let’s Move” campaign to end childhood obesity (<http://www.letsmove.gov/>) and such initiatives like Healthy, Hunger-Free Kids Act of 2010 by US Congress to fund childhood nutrition and free healthy lunch programs, the DBCFSN and the DFSP provides a solid model for how to work with schools and organizations to provide educational reform that both teaches the community to be leaders in establishing local food security, as well as becoming the suppliers of the local healthy food.

A fundamental position of radical educators supportive of food sovereignty curriculum in our communities is that if education can play a role in identifying and examining root causes of social suffering and environmental degradation, then we have a collective responsibility to recognizing the limitations to how many of our leaders frame justice work.

Such limits can be understood by looking at how a food security discourse differs from that of food sovereignty. While food security helps to participate in a common language that exists in policy and educational reform, food sovereignty is inclusive of a larger commitment to self-determination and autonomy from a dependency on historically oppressive governing states.

Given such critical distinctions and goals, educators play a role in supporting food sovereignty and teaching toward communities that actively subvert the oppressive food regimes found in a growing number of communities in the United States and around the world. With so much of this work resting on food wisdom being shared and passed on from generation to generation, as recognized by the DCBFSN, education plays an integral role in the movement.

Recognizing the suffering and complex historical, socio-political context influencing life for Detroiters, it is impossible to separate the need for educational reform from the need to establish food sovereignty in Detroit. There are many recommendations that can be made for education that supports food sovereignty from the work that DBCFSN has done over a very short amount of time. Pulling from the Detroit Food Security Policy (DFSP), schools should encourage young people toward an economic future in local agricultural practices that contribute to a direct reduction of dependency on outsiders, who have systematically failed the local community. The work of the DBCFSN, in partnership with schools, has shown that curriculum that exposes the politics of food while offering a solution that simultaneously addresses local hunger, empowers students and strengthens community.

In an age of failure by government to honor human rights, schools working in support of food sovereignty can certainly fill any gaps created and maintained by a cruel system designed to starve and poison the bodies and minds of children. The

DBCFSN recommends that school reform eliminate foods and drinks with high sugar content, artificial preservatives, and artificial dyes from meals and from vending machines. These poisonous so-called *foods* should be replaced with quality locally produced sustenance that supports the right of children to healthy food. If we were to take seriously food sovereignty in our communities then every school should have a school garden that can provide for healthy lunches that also served as an experiential site for learning how to cultivate healthy, culturally appropriate food as a fundamental part of the curriculum.

In all cases school reform needs to commit to feeding children healthy food. Based on research examples and policy standards set forth by the DBCFSN, schools should require that meal programs provide fresh local foods that come from local farmers. This both responds to an economic recession for farmers, as well as creates opportunities for young people to become producers of local healthy food.

44.4 Conclusion

Nationally, food has been and continues to be a battleground in schools, as attention to childhood nutrition has increased through school lunch and nutrition reform programs funded by the Healthy, Hunger-Free Kids Act. However, federal budget cuts have continued to further reduce SNAP for families in need of food assistance. In connection with the 2013 documentary *A Place at the Table*, TakePart's food editor Willy Blackmore (2013) reports:

While the money is going to other anti-hunger programs, the across the board reduction will affect the ability of 22 million children to get enough food at home. In 2014, the average benefit per person per meal will be a measly \$1.40. (para. 9)

In other words, what is occurring here is one important line of defense against food insecurity is removed, or severely limited, in efforts to fund another—and nothing more is actually accomplished. This is why a food security discourse is limiting as it often relies on government to provide for communities. However, a food sovereignty discourse acknowledges the systematic failures of centralized governments to provide for all people and shifts attention toward investing in living, local systems that recognize and value people taking action and responsibility to provide for one another in their communities.

In the case of the DBCFSN we can learn how a food sovereignty movement can benefit from engaging in political work framed in a food security discourse to begin to shift that discourse to one more centered on food sovereignty. So, while schools across the nation have perpetuated several bad food practices ranging from candy sales to the serving of horrifying meals consisting of processed foods—almost always laden with excessive amounts of processed sugar—that have little or no long term nutritional value, the Network works to establish the right for all children in Detroit to attend schools that plant, tend, and harvest food as part of the school's curriculum. The schools that they have partnered with have become a neighborhood

food source wherein the community, especially the children, folks convene to learn to eat and prepare locally cultivated culturally appropriate, healthy, and affordable food.

While this chapter is not intended to provide a generalized example, it is intended to share how an organization rooted in food sovereignty works through a human rights framework and food security discourse to create space to initiate, develop, and sustain food sovereignty work in Detroit. Food sovereignty movements provide the opportunity for leaders in the community—whether they be teachers, researchers, activists, pastors, or parents—to shift the current access to food and respond to the systemic political and economic rationalization for not feeding our communities. In other words, the DBCFSN help to share the stories of groups organizing and taking direct actions toward reclaiming our collective right of any peoples to have a valued voice in the decisions being made that will impact our communities now and for generations to come. The message is simple, food is essential to the cultural and biological strength of any community and to systematically deny that right ought to be met with strong resistance. Grace Lee Boggs (2002) in a speech given in Detroit at An Educational Summit on the Urban Crisis, describing learning programs outside of the limitations of schools, explained:

[B]y enlisting the energies and creativity of schoolchildren in addressing the urban crisis, they provide children and young people with opportunities to take ownership of problems or issues affecting their school and their town. Thereby they give meaning to the lives of our children in the present while preparing them to become active citizens in a democratic society. At the same time they foster the culture of hope and change in the community which is something we all need, whether we live in the inner city or the suburbs. (para. 12)

Similar to the kind of educational programming Boggs calls for more of when referring to the now 40 year old program she founded called Detroit Summer, the overall strategy of the DBCFSN is to act locally by directly teaching about and addressing issues such as failing welfare assistance, economic abandonment, and the combined health and health care of primarily poor families of color as unjust and unacceptable. The DBCFSN, as a leader in a local food revolution serves as a catalyst for a social movement that *feeds* Detroit. The DBCFSN are a strong model for how to use policy and a human rights framework to reinforce actions they are already taking in order to both insure and grow food security.

The work of DBCFSN could also be seen as utopian; however, time and time again local democratic movements that demand human dignity seem to be a successful model for communities around the world. Claims of idealism have become a marketing tool for global capitalism used by market fundamentalists whose sole food agendas rests on profit. The United States of America is a nation state by which food has been deregulated to the point at which obesity is a leading cause of preventable death and the reports from the Center for Disease Control warn that this current generation of children has a shorter life expectancy than their parents (Belluck 2005). Efforts to maintain high profit margins for corporations have isolated people into survival situations, by which they are forced to purchase unhealthy food or starve—both which lead to early death. Unfortunately for the multi-national food industry, people in places like Detroit are resisting. They resist

through a right to food. Food knowledge and the ability to grow nutritious food locally in abundance is a powerful weapon in a battle to end hunger and local poverty. Fortunately for the children of Detroit the DBCFSN recognizes food insecurity as a dangerous threat and has taken action in solidarity with food sovereignty movements around the world to locally blaze a path for future generations of Detroit as a socially just, sustainable, and healthy community for all.

Chapter 45

“Hold Up, Wait a Minute, Let Me Put Some Freedom In It”: Hip-Hop Based Education and the Freedom School Experience

Kristal Moore Clemons, Paula Groves Price, and Kawachi A. Clemons

45.1 Introduction

For over 60 years, America’s system of public schooling has undergone a number of “experiments” to reform the nature and process of schooling (Chicago, Houston, New York, Los Angeles, New Orleans, Newark). The types of reforms and the ideologies guiding the different reforms have varied, but all are, at their core, based on liberal ideologies of democracy and universality (Groves 2002). Some reforms have been based on the need to address equal opportunities to a quality education (desegregation efforts); some focused on diversifying curriculum and experiences for students in classrooms (multicultural education movement); and others have been rooted in responses to global capitalism (excellence movement). And while the results of these different reforms are varied and debatable, they all rest on an assumption that there is a “one best system” for schooling in a diverse pluralistic society (Tyack 1974; Groves 2002).

When we look at the experiences and outcomes of the schooling experiences of African Americans, it is clear that under these attempts at this universal system, African American children have been significantly shortchanged. African American children are disproportionately placed in special education, tracked into lower level

courses and ability groups by teachers, expelled, suspended, and forced out of schools (Linton 2015; Murrell 2002; Oakes 1985). If anything, the experience of African Americans in schools provides strong evidence that there is no ‘one best system,’ or at best, such a system has not been designed and implemented in ways that systematically support the success of all students.

According to Comer and Haynes (1991), American education has failed to address the needs of Black children largely because the structure of public education and the philosophies that guide its development neglect salient features of Black culture and life. In other words, most schools are not culturally responsive to African American children and they do not acknowledge the epistemologies and cultural experiences that African American students bring to the classroom.

This chapter urges readers to critically consider the use of Hip Hop culture as an educational tool and framework for the educational success of urban African American youth. The data presented in this chapter is from the Durham Freedom School, located in Durham, North Carolina. This 5-week summer program was a part of a network of summer programs sponsored by the Children’s Defense Fund (CDF). The CDF is a private non-profit organization that provides programming in high needs areas to “build strong, literate, and empowered children prepared to make a difference in themselves, their families, communities, nation, and world” (<http://www.childrensdefense.org/programs/freedomschools/>).

The CDF Freedom Schools grew out of the work of the 1964 Mississippi Freedom Summer Project where over 40 freedom schools were created serving over 2000 young children and adults. This movement was rebirthed in the early 1990s under the auspices of the Black Student Leadership Network (BSLN), a national organization that operated from 1991 to 1996. The BSLN was created to train a group of young activists in movement building and social change. They also wanted to strengthen the intergenerational leadership between activists from the 1950 and 1960s and the post civil rights generation. Utilizing data collected from the 2007 and 2008 Durham Freedom School this paper will: (1) discuss HHBE as a culturally responsive framework to engage urban youth in their education and community; (2) discuss HHBE as a critical thinking and social activism vehicle for youth to mobilize and find voice; and (3) present the voices of urban youth and parents engaged in a Hip Hop Based Education Freedom School.

Over 50 years after the 1964 Mississippi Freedom Schools, there is still a need for libratory education, particularly for children of color in economically disenfranchised communities. In many ways, the conditions of predominantly African American communities have worsened, as schools deteriorate and the juvenile justice system and prison industrial complex disproportionately incarcerate Black and Brown bodies in what the Children’s Defense Fund calls the “cradle to prison pipeline” (<http://www.childrensdefense.org/library/data/cradle-prison-pipeline-report-2007-full-highres.html>).

For African American children and families living under this system of the “new Jim Crow,” American society has sent a clear message that Black lives do not matter (Alexander 2010). This is the reality Grammy Award winning Hip Hop artist Kendrick Lamar is articulating in his song “Alright” from his 2015 album *To Pimp*

a Butterfly. Lamar describes his psychological and emotional burdens, the racial inequities as it pertains to police brutality against black bodies, and the struggles characterized by the recent Black Lives Matter movement. Similar to slave songs and the Negro spirituals of the Civil Rights Movement, “Alright” is a song of testimony whose significance is also bound in the socio-political context and the expressive needs of the Hip Hop generation. Lamar’s underlying message, like the voices outlined in this chapter, is driven by a specific pain and struggle that ultimately manifests into a mantra of hope and optimism.

45.2 Hip Hop Based Education

Scholars and artists describe Hip Hop as a form of musical, cultural, and social creativity. According to Dyson (2004), Hip Hop expresses the desire of young Black people to reclaim their history, reactivate forms of Black radicalism and contest the powers of despair and economic depression that presently besiege the Black community. Hip Hop Based Education (HHBE) is theoretically grounded in the traditions of critical theory and the field of culturally relevant pedagogy has largely informed its classroom application (Hill 2009). According to Marc Lamont Hill (2009), HHBE is a comprehensive phrase that includes the use of the four elements of Hip Hop (rap/MCing, the DJ/turntablism, break dancing, graffiti) to inform pedagogy in both formal and informal school spaces. He states, “Hip hop pedagogy reflects an alternate, more expansive vision of pedagogy that reconsiders the relationships among students, teachers, texts, schools, and the broader social world” (Hill 2009, p. 120). Scholars of culturally relevant pedagogy have demonstrated through their research and community endeavors the importance of appealing to the worldviews, values, cultural orientations and experiences in order to impact greater educational outcomes (e.g. Lee 1995; Gay 2000; Ladson-Billings 1995, 1998). For the purposes of this essay, we are situating HHBE as an extension of culturally responsive pedagogy. While culturally relevant and culturally responsive pedagogy are often used interchangeably, we believe that HHBE is not only culturally *relevant*, in terms of curriculum and approach, but it is also *responsive* to the needs and conditions of the community and the students. Because of our data and analysis of Hip Hop as a vehicle for greater social action and civic engagement for youth, we are using the term culturally responsive.

Love (2015) reminds us of the lack of attention that has been given to HHBE methods in education programs for elementary and early childhood students. She writes, “HHBE has resulted in many positive education outcomes, ranging from teaching academic skills to teaching critical reflection at secondary levels. Given what HHBE have accomplished, it is troubling that there is an absence of attention to these methods in programs for elementary and early childhood educators” (p. 107). Dimitriadis (2015) agrees and argues for educators to utilize approaches that take seriously how young people respond to Hip Hop texts. This call for student-centered pedagogy, where students of color are valued and understood as both learners and

creators of knowledge, is a powerful epistemological shift in how society traditionally understands the roles of teachers and students (Delgado-Bernal 2002).

As educators, our lot is to make connections between sources of knowledge from both inside and outside of the traditional classroom. Hip Hop pedagogy provides opportunities to make such connections with students. Hip Hop culture is a product of the post civil rights movement that embodies rap music, graffiti, art, breakdancing, spoken word, performance art, and personal expression through clothing, hairstyles and diction. Hip Hop is the culture of urban marginalized youth. It is a combination of the thoughts, words, and behaviors/actions of those who dwell in urban settings and have traditionally been marginalized from socioeconomic and educational attainment (Emdin 2010). Rap music and Hip Hop culture has allowed many Black youths to develop and express a deeper critical consciousness (Dyson 2004). Through Hip Hop, a voice has been established that cries out against injustice, celebrates cultural traditions, and re-affirms a Black aesthetic that has been systematically subordinated through colonization, slavery, and pressure towards assimilation. Critics of Hip Hop and its discourse often present it in a dichotomy of art versus reality where the perspective of Hip Hop's reality is not seen as art. Shusterman (2005) notes, "this dogmatic dichotomy suggests that art is somehow only fiction and deceit rather than a powerful reality that can purvey the truth and represent the real in ways just as powerful as scientific and philosophical discourse" (p. 55). Clemons (2014a) furthers this notion of musical art and listening by stating this artistic familiarity or lack of familiarity in the case of Hip Hop "is a result of a constructed objectivity presents a musical hegemony that places rap music on the margins of what is considered as acceptable forms of artistic representation" (p. 52). Through the use of a Hip Hop pedagogy, educators can encourage students to use Hip Hop culture to tell stories of hope, perseverance, and remain committed to social justice.

45.3 The Freedom Schools Movement

The 1964 Mississippi Freedom Summer Project was an effort by nonviolent, civil rights activists to integrate Mississippi's segregated political and educational system. Clemons (2014b) reminds us,

The summer of 1964 marked an important time in American history. With little money and few supplies, the Freedom Schools set out to empower African Americans in Mississippi to become active citizens and change agents in their respective communities. In 1964, there were at least forty-one Freedom School sites located in churches, run down taverns, back porches, and under trees in various counties in Mississippi. (p. 141)

Over 3000 students attended the Mississippi Freedom Schools. Originally aimed at school-aged children, the freedom schools also served many adults. The curriculum focused on the philosophy of the Civil Rights Movement, reading, writing, arithmetic, and African American history. Freedom Schools' pedagogical vision began with

the Student Nonviolent Coordinating Committee (SNCC). SNCC wanted to “simultaneously change the hearts of southern Whites, to enlighten America about conditions in the South, and to discover true morality in themselves” (Perlstein 1990, p. 298).

The Freedom Schools of 1964 were part of serious efforts to combat voter suppression and encourage the youth to engage in the movement for civil rights. The members of SNCC knew they needed teacher to confront the segregated public educational school system in Mississippi. The Freedom Schools of 1964 wanted to supplement what children were not getting in their traditional public schools and mobilize voter registration. The Freedom Schools movement was reborn in 1992 under the leadership of Marian Wright Edelman and the CDF’s Black Community Crusade for Children. The contemporary Freedom Schools were created in an effort to strengthen the intergenerational leadership between activists from the 1950s and 1960s and the post-civil rights generation. Presently there are over 150 CDF Freedom Schools’ sites in 96 cities and 29 states across the country (<http://www.childrensdefense.org/programs/freedomschools/>). CDF Freedom Schools are typically comprised of a 5 or 6-week summer enrichment program. CDF Freedom Schools call their students “scholars” to push them in a direction of educational excellence and civic engagement. The ratio between scholars and servant leaders is typically ten students to one teacher. The staff is usually a diverse of group of neighborhood stakeholders and college-aged students that serve as the teachers or Servant Leader Interns (SLIs). The staff must participate in an extensive national training at Alex Haley’s Farm in Clinton and the University of Tennessee Knoxville in Knoxville Tennessee. The facilitators are called Ella Baker Trainers (EBTs) and they work with the SLIs to teach them how to properly institute the integrated reading curriculum (IRC). The national training is also a time for the SLIs to meet other SLIs from across the nation and recognize that they are indeed part of a movement where every student who is participating will be reading the same book, singing the same songs and participating in the same social action in their respective city. Individual grade levels do not separate the CDF Freedom Schools; instead they are separated into four levels. Level I is comprised of kindergarten to second grade, Level II is comprised of third through fifth grade, Level III is comprised of sixth through eighth grade, and Level IV is comprised of ninth through eleventh grade.

45.4 The Durham Freedom School

The CDF Freedom Schools program focuses on the theme “I Can and Must Make a Difference” in my self, family, community, country, world and with hope, education and action. The students who participate in the program are intentionally called “scholars” to empower them to adopt an academic identity that allows them to become their own educational advocates. Scholars are separated into four levels/grades. Level I (K–2), Level II (3–5), Level III (6–8), and Level IV (9–12). The SLIs

use a curriculum designed by the CDF that is equipped with lesson plans, discussion questions, and an outside resource list. In addition to student participation, parents were required to attend at least two parent meetings during the duration of the program. The parent meetings consisted of information about the local and national social action agenda from the CDF and more local information on pertinent issues within the community.

A typical day at CDF Freedom Schools begins with Harambee! a Kiswahili term for “let’s pull together”—a 30-min activity to celebrate and affirm the value of each participant and prepare for work and learning ahead. After Harambee! the integrated reading curriculum (IRC) begins and lasts for 2 h and 45 min. In that time, scholars engage in cooperative group activities, conflict resolution discussions, Drop Everything and Read (D.E.A.R.) time, critical thinking, social action, and group reading. The IRC in CDF Freedom Schools utilizes many award winning children’s and young adult books that are grounded in Civil Rights and Black history and written by African American, Caribbean and Latino authors. For many students, the IRC is their first experience with a multicultural literacy curriculum that is culturally responsive in both content and pedagogy. Consistent with Gardner’s theory of multiple intelligences, scholars have opportunities to report back their comprehension through poetry, song, diagramming, and role-playing (Gardner 1993, 2006; Seiler 2008). Following the IRC, every CDF Freedom school transitions into an afternoon curriculum that is site specific and tailored to the expertise and strengths of the local staff.

The Durham Freedom School (DFS) was a Hip Hop Inspired Freedom School that was connected to the host university’s Hip Hop Initiative’s pre-collegiate program (Clemons and Clemons 2013). The 5-week summer program served children in grades 3–9 in the local community for scholars to experience culturally relevant reading, community action, and a supportive and culturally stimulating learning environment. During the summers of 2007 and 2008, 63 and 57 scholars were enrolled, respectively.

The afternoon curriculum unique to the Durham Freedom School was entitled Hip Hop based. Designed to promote the development of leadership skills, critical thinking, and literacy through engagement in Hip Hop, the afternoon curriculum provided scholars opportunities to write, perform, organize performance venues, and critically analyze Hip Hop history, music, and culture.

One of the initial inspirations for the Durham Freedom School’s Hip Hop based educational approach was sparked from the Hip Hop Arts and Leadership (HHAL) work Mary Stone Hanley and her graduate students developed. Hanley et al. (2005) note, “Hip Hop, an art form that involves music, literary skills, and performance skills, presents a means of cognitive, affective, and psychomotor learning, imagination, qualitative problem-solving, sensory awareness, concentration and focus, literacy, and cultural knowledge—qualities intrinsic to the arts” (p. 4). Grounded in the four elements of Hip Hop, scholars in the DFS learned the art of DJing and the technological and production side of the industry; the art of Mcing and the use of

literary devices used to effectively manipulate language; the art of graffiti and visual art; and the art of break-dancing and the use of dance and creative movement in drama (Forman and Neal 2004). In the afternoons, scholars also worked with Hip Hop artists, co-creating songs, poetry, and performances. Scholars also participated in a Hip Hop club, where they could focus more closely on areas that matched their individual interests. Afternoon clubs included music production, visual arts/fashion design, Hip Hop theater, Hip Hop history, Hip Hop health and wellness, and Hip Hop dance. In each of these clubs, students used Hip Hop to engage in discussions of critical social issues facing the community.

In addition to implementing the CDF’s integrated reading curriculum and an afternoon Hip Hop based curriculum, the DFS also included field experiences and a finale to showcase student artwork and performances for the community.

What follows are the voices of students and parents involved in the Hip Hop Based Durham Freedom School. It is important, however, that we briefly mention our positionality and involvement in the Durham Freedom School and the data collection process, as we believe that identity is a core component of culturally responsive education and research. We are all self-proclaimed members of the Hip Hop generation, growing up in Black urban contexts where Hip Hop music and culture were central to our upbringing and ways of life. As African American scholars and educators, we believe that “Black Minds Matter” and our collective mission as scholar-activists is to improve the education and opportunities for students of color, particularly those in urban environments.

Kristal and Kawachi founded the Durham Freedom School, recognizing a critical need in the community. Paula, who previously lived in the Durham community, and was therefore familiar with the community context, served as an external evaluator. Kawachi served as director of the Hip Hop Initiative at North Carolina Central University. He worked to situate the Durham Freedom School under the University’s pre-collegiate program, R.A.P. (readiness and academic preparedness) and served as the Durham Freedom School’s sponsoring organization. Kristal’s previous experiences as a Servant Leader Intern with the Children’s Defense Fund Freedom Schools in Chicago helped her transition into project director of the Durham Freedom School.

As a part of the external evaluation, Paula conducted focus group interviews with all 55 scholars enrolled in the Durham Freedom School in the Summer of 2008, as well as focus group and individual interviews with all staff members. Kawachi, who also served as the executive director of the Durham Freedom School, conducted the parent focus group interview following one of the parent meetings. The parent group interview included five mothers, one grandmother, and two fathers. All data was transcribed and coded, and using the constant comparison method, organized into themes (Glazer and Strauss 1967). This chapter centers on the scholars and the parents in the DFS because the voices of urban kids and parents are often silenced in public discussions of urban education.

45.5 “You betta Recognize”: Youth and Parents Speak Out

Freedom is as freedom does
 how it is and what it was
 There was a joke, they used to tease,
 but now we have it and can't believe.
 Why we have it, why it's true
 how you know freedom belongs to you?
 It's in your heart, it's in your soul
 people come the more it grows.
 Ain't it nice to just be free?
 it only takes money, power, respect to have freedom.
 So thank the people that are older than me
 because they did it for us to be free.
 -Level III Scholar, age 12, *Durham Freedom School*

During the final week of the Durham Freedom School, scholars were interviewed to reflect on their learning over the summer as well as their experiences in the camp and the public school during the school year. Parents were interviewed regarding the experiences of their children in the Durham Freedom School and any changes that they have noticed in their children as a result of their participation in the summer program. The major themes that emerged from the data are presented in relation to two songs that were co-created by the scholars, servant leader interns and Hip Hop artists: “Freedom School is the Place to Be (Remix)” and “I am Hip Hop.” These two songs, in lyrical content and expression, exemplify the sentiments and voices heard from both the “old school” (parents) and the “new school” (scholars). These two songs also showcase the critical thinking skills, talents, and social activism of urban youth engaged in Hip Hop based education. Under the theme “Freedom School is the Place to Be (Remix), we discuss Freedom School and Hip Hop as culturally responsive education. The “I am Hip Hop” theme further explores Hip Hop based education as a means for self-expression and critical social activism.

45.6 “Freedom School is the Place to Be (Remix)”: Hip Hop Is Culturally Responsive

Freedom School is the place to be
 Where we read a lot of books about our history
 Freedom School is the place to be
 So everybody come and have fun with me
 Verse 1
 Everybody come and have fun
 I am Hip Hop that's fo sho
 But hey, you should already know
 Because especially the way my lyrics flow
 Smooth
 People think Hip Hop is all about calling girls _____
 But I say no

Now I'm in the game and all that's definitely go'in change

My lyrics got so much range

They can make a difference and even break change

Chorus:

Freedom School is the Place to Be (x4)

Everybody come and have fun

Verse 2

We can make a difference

You can make a difference

Hey, we all can make a difference

And I can make a difference so we all can make a difference

Bridge:

Tell me what you feel like doing y'all

I feel like hanging with my tribe

Hold up, wait a minute

Let me put some freedom in it

Freedom in it (x 4)

Freedom School is the place to be (x4)

Everybody come and have fun.

(DFS All-stars Level II & III Scholars 2008, track 1)

One of the major ideas expressed by the scholars at the DFS, was that their experience was very different from their experience in public school during the academic year. Freedom School was the “place to be” because it was fun, engaging, culturally responsive, and empowering. One 12 year old scholar remarked:

[At the DFS] we get to do something fun for once. At my school we can't never do nothing unless we have permission slips. I think that Durham Freedom School's better than school cuz we learned a lot of things. We learned about freedom and Hip Hop and all kinds of stuff.

Here, this male scholar comments that not only does he have the opportunity to engage in fun activities while learning, at the DFS he also learns about freedom while experiencing greater freedom. His comments that at his school they can't “never do nothing unless we have permission slips” exemplifies his frustration at the lack of freedom students possess to do non-traditional activities or engage in field experiences. At the DFS, in addition to their activities across the University campus and in the community, scholars visited the planetarium and a science museum in neighboring communities on two separate occasions.

Freedom School was also “the place to be” because it was a culturally responsive educational environment where scholars “read a lot of books about our history.” Both scholars and parents remarked that a great strength of DFS was the opportunity to learn more about Black history, particularly through literacy. One 12 year old scholar said:

I've been learning about Hip Hop, pretty much. Learning new stuff and reading books and learning about Black history... I learned about Emmett Till and the murder of him. I learned about Martin Luther King, and I learned about Malcolm X, and W.E.B. DuBois. I've learned about clothing, where all the graffiti came from, like, the four elements of Hip Hop.

This scholar explicitly connects his knowledge of Hip Hop to the legacy of Black history and the CDF integrated reading curriculum. Many DFS students also spoke

about how learning Black history and the elements of Hip Hop made them rethink their feelings about school and schooling. Another scholar stated:

I love writing. Cuz I like writing poems, cuz I'm the master at poems. And reading? Reading, it changed me a lot because the books was so exciting and they weren't really boring and they caught my eye. Like, literally.

For this 12 year old boy, the CDF integrated reading curriculum that offered many books written by and about African Americans changed his feelings about reading. The books literally "caught his eye" because he could see himself in the curriculum and connect with the stories. His love for writing and writing poems was supported in both the morning CDF reading curriculum and the afternoon Hip Hop curriculum. This shift in attitudes towards academic subjects is consistent with the literature in culturally responsive pedagogy and multicultural education. This furthers the notion that teachers and educational researchers can "see students take both responsibility for and deep interest in their education" (Ladson-Billings 2014 pp. 76–77). Ladson-Billings (2014) reminds us that this is the secret behind culturally relevant pedagogy: the ability to link principles of learning with deep understanding of (an appreciation for) culture.

Parents also noted that the culturally responsive curriculum and pedagogy at the DFS made significant impacts on their children. One mother discussed an increase in motivation and engagement in her son:

I have a teenager who used to come the last couple years. And when I brought him here he was very apprehensive about being in the program. His self-esteem was a little low, but he had really engaged himself in the program and they engaged him and it, and worked on his reading skills. He reads today, which I was kinda, you know, happy about. He just changed his outlook about school and being able to apply himself. He was motivated during the summer. I mean he wanted to come every day, and it just helped him express himself more. English grades improved....turning that switch on, something that was done here, and I think, also there is interest in a new career path. We've been hearing for the past 13 years I want to be a policeman, well now we wanna be a graphic designer.

This mother attributes the change in her son's "outlook about school" and ability to apply himself to the DFS experience. Because Servant Leaders (teachers) made efforts to engage him and also assist him in improving his reading and literacy skills with culturally responsive curriculum, this scholar became motivated, and that motivation extended into the school year with improved grades and interest in a new career path.

Another mother echoed these sentiments in relation to her daughter's motivation and potential career path. She says:

Yeah I've got a student who is interested in graphic art as well. She always wanted to color and draw and stuff like that, but recently [we] went on a train trip to Charlotte and she was checking out the graffiti on the train cars and thinking "Oh, I think I could do that!" She ended up doing something like that in camp. She applies the things she learned in camp to a lot of different areas in her life and she is really excited about the Harambee. She kept teaching me Harambee, and she's trying. I don't know what it is, but she's trying. The way you format things actually did seem to open her up more, and I liked that.

This mother appreciated the DFS because for her daughter, the curriculum and pedagogy seemed to “open her up more” to applying her knowledge gained to “a lot of different areas in her life.” The culturally responsive educational experience excited her daughter so much that she has been teaching her family central features of the Freedom School experience, such as Harambee, in an effort to replicate it at home. This idea of Freedom School opening up children to more learning and also increased communication and sharing at home was also shared by another mother:

Well I know with my son, he was able to communicate more. Me and him always talk and a lot of times I don't know what he's talking about. Sometime you know, with all the words in the Hip Hop slang, I always wished that I could relate some of his teachings in high school to be able to help him learn more. But Freedom School, it helped him to be able to read more, he wanted to read more, he wanted to, and he would come home and [say] “We had discussions in Freedom School.” He was just like, he knew who did this one thing... you know and it really opened up a lot of communication between us.

This mother attributes the Freedom School experience to improved reading skills and an increased desire and motivation to read and share his learning with his mother. The previous examples also exemplify the power of engagement in a Hip Hop based curriculum. Hip Hop connects with the scholars and has also exposed them to potential career paths that they previously never considered. Learning the different elements of Hip Hop has opened students to considering their passions and possibly involving themselves in a multi-billion dollar industry. HHBE in the DFS context has helped scholars learn, retain and understand the culture around them. One father noted,

I think since like Hip Hop culture has become pop culture, that's what a lot of these children out here relate to and understand. The methods of teaching that you guys use incorporate Hip Hop culture and it makes it more relatable to the kids because, as the lady was saying this morning, a lot of people want to be so formal and structured and rigid, and well a lot of these children are more free flowing because that's just how Hip Hop is. You know? And, I think they retain better, they retain things better that they understand. You know? And the reason why, Hip Hop is so influential to them is because it's real, you know. I think that that's what you guys bring forth.

An important thing to note with the above father's comments is the recognition of Hip Hop Based education as curriculum content and pedagogy. He refers to the incorporation of Hip Hop culture and content as a means to relate to the children, but perhaps more importantly, he discusses the “methods of teaching” utilized in the DFS as being more aligned culturally with the children because they are “more free flowing” because that is the style of Hip Hop. Unlike the rigidity of the public school system, this parent acknowledges that the instruction matches with the Hip Hop identity espoused by most of the children.

When describing the difference between curriculum at DFS and what is learned during the school year in public school, another 12 year old male scholar responded:

At school, really, they learn about math, and language arts, and science, and all that stuff. But in Freedom School we talk about Black history, and music, and plus it's more fun here than at school cuz at school they want you do work behind what you talking about. And here we don't pretty much do work, we just read.

Here we see a shift in consciousness and understanding about school. This DFS scholar does not look as learning Black history or reading as “work” rather he sees it as a source of edification and appreciates seeing his reflection in the curriculum. The use of Hip Hop combined with the CDFs civil rights educational approach functions as Love (2015) describes as “a tool for reflecting on the past to make connections with the present, centered on African traditions” (p. 111). Hip Hop at its core is a space of communal learning, which influences children’s social, emotional, educational, physical, and creative skills from birth (Love 2015).

Another 12 year old male scholar reflected on his social and emotional growth as a result of his participation in the DFS:

I think it’s helping me a lot! Cuz I’m learning more about my culture! And I can go to my school and teach everyone else.

Again, this scholar recognized that engaging in culturally responsive curriculum is helping him grow, and he is excited to teach everyone else his new knowledge of Black history and Hip Hop. Parents overwhelmingly expressed satisfaction regarding the curriculum at DFS and the academic achievements of their children. Many parents realized the DFS experience put their child at an educational advantage by introducing them to texts prior to the commencement of their traditional school year. One mother recounted a conversation she had with her child about Lorraine Hansberry’s *A Raisin in the Sun*:

I told my daughter, “Raisin in the Sun” is on primetime television. My daughter responded, “Oh! I read that in Freedom School.” So I said, when did you read “Raisin in the Sun?” Because I didn’t have the book at home, and that was really impressive. The reading list that you guys have, it’s really helping the kids get ahead.

Another mom shared a similar sentiment when she was going over the school reading list for her daughter’s grade level at the beginning of the academic year. She stated,

You know when they start 7th grade they have a reading list and she started going over it she said “Oh! I read that!” in Freedom School. I said: “Well, go Freedom School!”

The DFS parents were satisfied with the exposure their children had to a more diverse library of multicultural texts. They also noted this type of curriculum fostered a greater sense of community amongst their peers. A mother of a level II scholar discussed the impact DFS’s curriculum and environment had on her shy son.

I think another piece that added was the, just being in the community sense at Freedom School, gave ‘em some, like a really good feeling of belonging and then go out and perhaps open up to other kids. My son is shy, as I’ve said before, but it did give him a means to have a place to come to every, on a daily basis, where everybody was close and interact together and you know, open up more, you know.

Fostering a sense of community and belonging in Freedom Schools is just as important as the academic curriculum. The ritual of beginning the day with Harambee, a pulling together of the group in community, offers multiple opportunities for scholars to affirm one another via songs and recognitions for small and large accomplishments. Similarly, the overarching national theme of making a difference in self and

community reiterates the importance of scholars working together to improve the community.

The notion of community building and safe and supportive environment extended beyond the classroom. A mother of a level II scholar discussed how the DFS curriculum and creative products provided support in a time where she and her daughter were grieving the loss of a loved one:

Well, my [name] missed the last week of Freedom School because my grandmother died unexpectedly. And [when] she got back and got the tape, the video, a few weeks later, and then she heard the poem about, you know the boy who lost his family, she said, “sounds like he’s talking to me” you know, she could relate to that.

The poem she is referring to is entitled “It’s Ok” written by two level III male scholars. They wrote this poem after they completed their morning lesson based on the CDF integrated reading curriculum book *Getting Away with Murder: The True Story of the Emmett Till Case*. They later turned this poem into a rap song during their afternoon music production course. The lyrics are shared below.

Verse 1—I feel sorry for those who lost another momma, daddy, cousin, aunt or brother
uncle nephew, niece or sister

I feel your pain and I know you miss ‘em

Let me tell you something that happened to me

My gramps got cancer, died and left me

I know what you going through and I know it hurts but appreciate what you got and for what
it’s worth

Cause you never know what you got until it’s gone

Then you really gonna feel like God did you wrong

But that’s one of the reasons why I wrote this song to tell y’all that life must go on

Chorus: It’s okay y’all (it’s okay) let your tears fall (let ‘em fall)

Things will get brighter

You will see

Your life will get easy, much more easy (easy)

When it seems like your sadness never will cease

After your struggle there will be peace

Verse 2—Yo, I remember when my aunt died, didn’t know what do when my mom cried

Still keep a shovel in my hand like a drill

Thinking it’s a dream, didn’t know it was for real

Homie in jail

Still missing with the bills

Then we went bankrupt couldn’t pay the bills

Stepmom left had me feeling real sad

Hitting up the way got me feeling real mad

Grandad died didn’t think he would have passed

So I had the blues like I’m playing in a brass

But I stayed strong made it through the hard times

And if I said I didn’t cry, I’m probably lying

Chorus: It’s okay y’all (it’s okay) let your tears fall (let ‘em fall)

Things will get brighter

You will see

Your life will get easy, much more easy (easy)

When it seems like your sadness never will cease

After your struggle there will be peace
(Lemmons et al. 2008 track 6)

Perry et al. (2004) suggest that African American students are academically more receptive and successful when cooperation, harmony, socialization, and community guide their learning environments. Love (2015) furthers this notion by stating, “these learning components are indicative of a Hip Hop community of practice that is racially and ethnically diverse, intergenerational, and rich with learning opportunities for young children to observe, listen, and participate in activities that foster learning and creativity” (p. 125). The level III scholars observed the message about the grief, violence and brutality of losing a loved one in the case of Emmett Till, listened to the stories of their peers, and participated in a creative writing activity that eventually proved to be cathartic for a fellow scholar enduring a similar feeling of grief. Similar to Kendrick Lamar’s “Alright,” the song written by Lemmons et al. (2008) showcases intergenerational grief and sorrow while also offering hope and affirmation. Countering the hegemonic masculinity commonly found in popular rap songs, these two male scholars profess “it’s okay y’all (it’s okay) let your tears fall (let ‘em fall)” because “when it seems like your sadness never will cease, after your struggle there will be peace.”

45.7 “I am Hip Hop”: Hip Hop as Identity Expression and Social Activism

The DFS curriculum also engaged scholars in a social action project for the duration of the summer program. Students participated in a silent march, with picket signs about the Children’s Defense Fund national agenda related children’s health care. The DFS staff engaged with the scholars about the issues surrounding children and health insurance. Scholars completed written reflections on how they felt about health care and how it felt to go the doctor. As a group, students read about the Deamonte Driver story, a 12-year-old Maryland boy whose dental problems went untreated until he succumbed to a severe brain infection and died. The Children’s Defense Fund sent this information to each Freedom Schools site in an effort to mobilize the community to support the nation’s uninsured children. Many scholars shared that they did not realize that health insurance was an issue that concerned them and many children in the world. DFS scholars combined their understanding of the elements of Hip Hop with the mandatory CDF social action project. The blend of social action and HHBE forced scholars to think about the world around them in new and critical ways. One mother of a level II male scholar shared,

Yeah I heard that one. That one really got through, in terms of health education. It was the most powerful health education message that we’ve ever heard, but this was the one that made sense to him. He talked about that one extensively.

A 12-year-old male scholar reflected on his learning at the DFS and shared:

Um, well I learned about Hip Hop and the history about Hip Hop and how it got started. And I learned how to do a whole bunch of art. And uh I learned how to rap. Ok, I learned art, health, and healthI learned about how 9.4 of million children do not have health insurance...and I learned how to make beats. Um, what else did I learn? Yeah, history, theater and Hip Hop.

In addition to providing information about the number of uninsured children in America, the DFS also provided free health screenings. Each scholar that wanted to participate had access to a licensed medical professional authorized to provide physicals for children as a part of our food and nutrition program. While conducting the health screenings, the staff was alerted about a 9-year-old scholar with high blood pressure. The doctor was able to talk to the scholar’s parent about blood pressure and provide tips on how to address the issue. The doctor also spoke to each scholar about their vision, dietary habits, and physical activity, connecting health care and social justice.

The DFS intentionally integrated the CDF’s “I can and must make a difference in myself, my family, my community, my country, and my world” mantra alongside the social action project and the history of Hip Hop. One 12 year old male scholar described the types of differences he could make in his community:

Well I can help my community by like, doing community service even though [I] didn’t get in trouble for anything. Umm, trying to help kids, like young kids, kids that’s younger than me, tell ‘em not to be in gangs, and influence them not to pick up a gun and shoot people.

Here we see a shift in this scholar’s idea of community service away from a punitive action that one does because they “got in trouble” to a model that is about mentoring younger children to make positive choices. This scholar recognizes that in his community, young kids need older children to be a positive influence, and he sees himself serving in that role. This idea of making a difference in the community was common in many of the individual and collective Hip Hop songs written by the scholars at the DFS.

Clemons and Clemons (2013) reflect on the song “I am Hip Hop” in their piece entitled *What the music said: Hip Hop as a transformative educational tool*. The song was a collaboration between two Level III scholars—one male, one female—and their servant leader intern. They wrote this song in response to the question, “What is Hip Hop?” The group performed their song, “I Am Hip Hop” (Garcia et al. 2008, track 8) live at the end of the summer finale.

Verse 1 — Servant Leader Intern
 Freedom School what
 Everybody what
 Can I kick it?
 Yes you can
 Well a’ight Hip Hop lets take a stand
 I can and must make a difference in my
 Self
 Family and
 Community

Country and
 World
 That's right y'all together we stand and
 divided we fall
 I am hip hop, I am on "the
 yes, yes, y'all and don't stop"
 Don't stop we do it,
 Hip Hop is ours so we got to make improvements
 It's a whole lot going on now,
 It's a whole lot of biting styles,
 And that ai'nt cool, cuz we don't style bite in
 the Freedom School
 Naw, we too original
 Make a difference we can make a change this instant
 It's all on us now, we gotta hold this down
 We go'in "touch it, read it, learn it, teach it",
 then tell your friends all about it
 So they can come next year with you so we
 can grow as a crew and stay true
 Stay you
 Cuz I'm a stay me
 H-I-P H-O-P
 _____ spit rhymes so dopely

Chorus:

I am Hip Hop I can make a difference (repeat 4xs)

Verse 2—Level III Scholar, Male

I am Hip Hop you should know
 Wearing fresh out shoes and baggy clothes
 Making a change with a positive rap
 putting hip hop all over the map
 Cuz all these rappers talk about girls
 but this rapper is changing the world
 Hip Hop we ain't doing it right all we talk
 about is getting drunk all night
 Everybody come to Freedom School with me
 _____ on the check sound saying rhymes dopely

Verse 3—Level III Scholar, Female

Freedom School is the place to be
 Come on y'all come party with me
 Hip Hop, I will always be
 Making a change in my community
 It's recognition time
 You will see
 Spreading my wings come fly with me
 I'm Hip Hop and so are you
 I made a difference, you made one too
 You made one too
 You made one too

Chorus:

I am Hip Hop I can make a difference (repeat 4xs)

(Clemons & Clemons pp. 66–68).

This is another example of how students engaged in the process of writing lyrics, producing beats, and organizing live performances can create meaningful work. The scholars used Hip Hop as their lens to remix the CDF’s “I Can and Must Make a Difference” theme. Their translation of this concept into rap songs and poetry expanded the overall mission of the CDF. This extension of HHBE articulated a pedagogy of passion where the scholars and servant leader interns could dive into their artistic repertoire and tell their own stories. Central to this legitimizing experience is the claiming of a Hip Hop identity for both the scholars and Servant Leader Interns (teachers). The lyrical content of the co-created song demonstrates the multi-generational power of Hip Hop as a culture. The Servant Leader Intern’s “Hip Hop is ours so we got to make improvements,” to the “I am Hip Hop you should know” and “Hip Hop I will always be” of the scholars, reflects an identity connection with Hip Hop.

In addition to claiming a Hip Hop identity, many scholars also discussed Hip Hop as way to express identity. One 12 year old female scholar said:

Hip Hop is great to express yourself in different ways. Like you can rap... either you can rap it, you can dance it out, or you can just sing it in the way about your life and what the differences are between your life and what’s Hip Hop... I think they should have it in regular school too because if we learn about it here and we learn about it in there, then we’ll know more and like... cuz it does have something to do with the things that we learn in regular school, like history.

A 12-year-old male scholar sitting next to her cosigned on her reflection:

Basically what she said is, how you express yourself. And singing and dancing. You know, or some kind of art. And like, how you, well, it’s really hard to express yourself. Well it’s a way to express yourself without violence. Well basically Hip Hop is history. And we bring Hip Hop back to life.

An 11-year-old scholar agreed that Hip Hop should be offered in school:

It would help some people if they do have more Hip Hop in um, school, and might help them want to learn, want to learn about it. And, they might want to start even, well learning about, learning how to participate in school.

Another scholar reflected on Hip Hop in his public school:

But the closest we ever get to Hip Hop is literature, and poems and stuff. That’s the closest we ever get. I think we should talk about Hip Hop in school because, maybe arts might not, arts might get canceled again, and we won’t have nothing else to do. And we should, like, represent Hip Hop in a good way, not in a bad way, talk mess about it

Here, these scholars build a case for why Hip Hop should also be incorporated into the curriculum of public schools. They connect various elements of Hip Hop to self expression (and multiple means of expression and engagement) with the content areas of history and English. They also recognize that the benefits of Hip Hop in terms of self expression and connection with the arts are also easily disposable and cut.

Just as the scholars identified themselves as Hip Hop, the parents self identified as products of the Hip Hop generation. Hip Hop history, and its connection to the country’s social, political, and economic landscape, served as a bridge between scholars and parents. Parents were able to talk about the music of their youth with

their children, as the scholars learned about “old school” Hip Hop in their courses. One 12 year old female scholar remarked:

I learned how to express myself in Hip Hop and stuff. We learned about different things, different people I haven’t even heard about or heard their music before. Like DJ Kool Herc.

Perhaps more significant, however, than the bridge between the old school and new school, is the impact of HHBE on the sense of self and identity in the scholars. A mother reflects:

My son is kind of shy and to himself. By the end of the program I think he was more outgoing, and he seemed more confident. And he seems to have more...he just felt better about himself. Not that he had low self esteem, but he was kind of the quiet one and he kept back, he held back. And he interacted more, you know, he made various friends. And it made him feel like he was significant in society, you know. And the people he was schooled with, he was just, he was a minority in his elementary school. And here he felt like “wow,” look at the all of African American males. You know I am powerful and I am somebody. I think that brought him out a lot, increased his confidence.

For this mother, the DFS, a culturally responsive schooling environment, provided her son the space to feel “significant in society” and feel that he is “powerful” and “somebody.” This testimony reflects the common critique that many Black families have of public schools. Too often the messages that Black males in particular receive in school are that they are not significant, and they do not matter. Being in the presence of African American male scholars and teachers at the DFS increased his confidence and affirmed his existence as a scholar who could contribute to making his community a better place.

A father agreed, stating:

Kind of piggybacking off of what she said...I think this program is so great because it teaches these children about their selves. You know it teaches about African /African American culture, you know. Um and it builds value in that person, self pride, self worth. So when these kids go out here in the world, and they’re presented with other culture’s values, they question those values. You know, a lot of times our kids go out here with low self esteem and low knowledge of self and they just want to be a part of something. You guys teaching them more about themselves, it raises their esteem level to the point to where they know how to say “no”, you know to a lot of things that a lot of their parents, aunts and uncles and grandparents, were unable to say “no” to. You understand what I’m saying?

With these two parent testimonies, we also see a connection to what some Hip Hop artists and scholars call the fifth element of Hip Hop, a strong “knowledge of self” as a result of being exposed to the DFS curriculum. The parent and scholar voices in this section build upon what Hill and Petchauer (2013) conceptualized as the need for deeper aesthetic, epistemological, and theoretical engagement with Hip Hop as a holistic cultural movement that moves beyond “teachers and educational entrepreneurs who use live and recorded rhymes to promote the rote memorizations of facts or adherence to dress code policies” (p. 3). The parents’ reflections represent the acknowledgement that the Hip Hop based education is more than just teaching mathematics lessons with catchy rhymes. The power of Hip Hop based education is in the cultural, social, and political connections scholars make with their teachers, each other, the community, and their own identity.

45.8 Conclusion

The fusion of HHBE with the culturally responsive CDF integrated reading curriculum created a sense of belonging to the educational process for all summer participants. A major theme that emerged from the scholar-parent focus group was the presence of a true communal atmosphere within the DFS. In many of the scholars' narratives, they indicated a lack of inclusion in the curriculum in traditional school. They expressed how their personal viewpoints were not always valued which in turn produced a diminished desire and drive to excel. Through culturally responsive curriculum and pedagogy, scholars and parents were able to find voice, and work in an educational space that affirmed their identity. This reflective and powerful element of voice (narrative) builds on what linguists and communication scholars describe as *nommo*. This African idea of *nommo* (the power of the word) generates the energy needed to deal with life's twists and turns; sustains our spirits in the face of insurmountable odds and transforms psychological suffering into external denunciations (Keys 2008). This sentiment echoes what Hip Hop pioneer Afrikka Bambaataa suggests is the true essence and power of Hip Hop, “its capacity to empower young people to want to change their lives” (Watkins 2005, p. 22).

The songs the DFS scholars created articulate what Burnim and Maultsby (2006) call a sense of musical agency. Musical agency, as Burnim and Maultsby posit, seeks “to broaden our understanding of modes of resistance African Americans have utilized from the antebellum period to the present” (p. 5). The importance of allowing the young scholars to write, present, and reflect on their own terms brings on a characteristic where “regardless of where or when it is performed (the) music speaks to and for each generation—especially the generation that creates it (Taylor 1986, p. 22). The Durham Freedom School reminds us of the power of artistic representation, especially from the youth, because it is their voice.

Ladson-Billings (2014), in her reflection of her “[r]evolving pedagogical stance,” reminds us that many teachers express strong beliefs in the academic efficacy of their students, yet they rarely push students to consider critical perspectives on policies and practices that may have a direct impact on their lives and communities (p. 78). Reflecting on her experiences observing teachers in the field she writes, “There was no discussion on issues such as school choice, school closing, rising incarceration rates, gun laws, or even everyday school climate questions like whether students should wear uniforms (which typically sparks spirited debate)” (p. 78). Hip Hop, according to Ladson-Billings, can offer “important opportunities for changing the way we think, learn, perceive, and perform in the world” (p. 78).

The DFS's commitment to building upon the CDF's mission of “I can and must make a difference in my self, family, community, country, and world via the medium of Hip Hop addresses Ladson-Billings' critique and pushes policies and practices that may ultimately impact the scholars' lives. When the DFS actualized its commitment to HHBE by connecting the CDF's civil rights based educational approach

with the elements of Hip Hop culture, it furthered what Jocelyn Wilson (2007) described as “Hip Hop community of practice” She writes,

Focusing inquiry and situating it based on what hip-hop participants “do”—that is, how they practice hip-hop in their day-to-day lives, and how what they do creates meaning and identity. How youth and youth influencers utilize the hip hop community of practice to define, curate, and use artifacts, language styles, kinship norms, schooling methods, epistemologies of authenticity, and aesthetic practices to remix generational narratives about ideology, identity, race, class, and gender (p. 68).

The DFS, with its commitment to fully integrate Hip Hop culture into the curriculum and pedagogy, provided a community space of practice where scholars, teachers, and parents could engage and affirm identity while actively uplifting the community.

Chapter 46

Latina Urban Education: At the Crossroads of Intersectional Violence

Kathy Mariscal, Yesenia Velásquez, Arturo Agüero, and Luis Urrieta

46.1 Introduction

As a Chicana from south central Los Angeles, as a daughter of Mexican immigrants, a queer Mestizo ni de aquí ni de allá, and an indígena scholar, we do not merely read about education as it happens to Chicanas/Latinas. We are telling and retelling how schooling and education has impacted us as Chicanas, Latinas, a Mestizo, and an indígena. Schooling and education are not the same phenomenon just as education and educación are false cognates of the other (see Urrieta and Villanes 2013; Bernal et al. 2006; Valenzuela 1999). We come from a tradition of educación that speaks to loving, healing and critical pedagogies that honor the voice of our sisters, mothers, tías, abuelas, partners, daughters, and activists who pave the way for us to continue this legacy (Delgado Bernal et al. 2006). Educación has impacted how we have come to understand family, friends, communities, aspirations, and understandings of the world (Urrieta 2010; Valenzuela 1999). We have acquired language and tools that have helped name and understand the manifestations of oppression. Our schools are known to “fail” and to have children who are failed by a system, so why are we here?

Schooling is both a colonial project and a site, both an event and a system we partake in consciously and unconsciously (Tuck and Yang 2012). Oppressive systems of education, schooling, and research act as apparatuses to disseminate dominant ideologies and reinforce the hierarchical configurations of society that sustain racism, sexism, eurocentrism, classism, colonialism, heteronormative patriarchy, and many other “isms” of oppression. Urban education continues to reproduce everyday experiences in schools that need to be explored with Latinas at the center of analysis; thus, moving from the dominant dichotomous thinking that plagues

K. Mariscal (✉) • Y. Velásquez • A. Agüero • L. Urrieta
University of Texas at Austin, Austin, TX, USA
e-mail: katmariscal@gmail.com

urban education systems and places at its margin those it sees as the Other, to one of intersectionality. By shifting away from viewing the Latina from a dichotomy of public/private and theory/practice (Cruz 2001), an intersectional framework provides us with multidimensional analysis to honor the perspective of Latinas as agents in and around their educational experiences. Centering the Latina, re/imagines possibility and simultaneously disrupts the Western-, hetero-, and male-centric educational rubrics and ways of knowing to amplify *nuestras voces*, *nuestras realidades*, y *nuestras humanidades*.

Our use of the term *Latina* attempts to include the many lives and voices of *nosotras* in the United States. Latinas come from diverse nationalities, racial/ethnic backgrounds, linguistic spectrums, educational backgrounds, and many positions; their multidimensional positionality are intersectional and impact Latinxs' social experiences of oppression and discrimination (Pacheco 2014). We acknowledge that our intersectional approach may not account for all U.S. urban youths. Our focus on urban Latina youths is less of an investigation of the polarized opposites of mainstream/whitestream schools: "non-white," "non-male," and more as an affirmation of *being*: Latinx, woman.

Our collective stories as Latinxs¹ guide us throughout this chapter; we have experienced and witnessed the powers of education from multiple identity sites. Our educational experiences and standpoints differ, and yet we can share similarities as gendered, raced, sexualized individuals (Cammarota 2011; Hurtado and Gurin 2004). We purposefully center our analysis within and across those three identity markers, while simultaneously acknowledging the variously complex and fluid intersections of our co-constructed identities. We have choice in the intersections we choose, we have privilege in writing and speaking; however, this paper is about honoring voice.

In this chapter we begin with addressing the (mis)education of Latinas, while outlining the urban crisis in education. Then, we discuss how history, ideology, and process of urban schooling become inscribed on the Latina body. Finally, by centering the body, we bring to light a proposal of intersectionality as a social justice project in education rooted in: resistance, transformative pedagogies that disrupt binaries, and towards a revolution in thought, practice, and theory.

46.2 Intersectionality: Mind-Body-Spirit

Taking together the work of Chicana/Latina feminist thought we analyze the experiences of Latina urban youth with a lens of hope, love, and transformation (Anzaldúa 1987, 1997; Delgado Bernal 2002; Delgado Bernal et al. 2006). We center an intersectional framework rooted in mind-body-spirit (Calderón

¹We deliberately use the terms *Latinx/Latinxs* over more ubiquitous terms like *Latina/o* and *Latin@* to include gender identities and expressions beyond the limiting confines of feminine/masculine binaries. *Latinx* demarcates a calculated and intersectional race-gender category that affirms genderqueer, non-binary, agender, and fluid identities that standardized Spanish grammar forecloses.

et al. 2012; hooks 1986, 1989, 2003, 2014). bell hooks proposes mind-body-spirit through a liberatory education lens that challenges the compartmentalization of our bodies through oppressive schooling (hooks 2014). Pedagogical practices whether classrooms, homes, and communities should promote critical consciousness, so that thought is transformed to recognize oppression but also move towards liberation of the mind-body-spirit (Freire 1970; Akom 2009; Ladson-Billings and Henry 1990). Through “practicing freedom” we humanize the mind-body-spirit where we acknowledge the interconnectedness of our thought, feelings, being, becoming, and knowing (Freire 1976).

There are so many crisis-based “theories” targeting the issues and failures of urban schools, but none make sense if they are not willing to go beyond the boundaries of how we understand *being* in western thought (Yosso 2005). Western thought is hetero-patriarchal violence that produces and supports disconnection, individualism, and competition. Intersectionality, vis-a-vis mind-body-spirit is: human connection, writing, thinking, activism, pedagogy, methodology. Mind-body-spirit is the intersectional lens we need to speak to the experience of Latinas in urban schools (Calderón et al. 2012). The body produces the experience of education, therefore schooling mechanisms must be examined apropos the body. Such that “we must ask how the Brown [Latina] body is regulated and governed in schools and other institutions? How does a regime of a given society become inscribed onto the bodies of our youth?” (Cruz 2001, p. 664). Because the classroom and society are largely situated within a regime of whiteness and eurocentrism, the Latina body is displaced by what she is not: white, male.

46.2.1 Critical Literature Review

46.2.1.1 (Mis)education

Our analysis brings to light violent portrayals of Latinas in educational research that propagate discrimination and marginality in order to invite others to disinvest from “crisis” frameworks.

The literature of urban schools has failed to disrupt the crisis narrative by dehistoricizing and depoliticizing the relationship between schools and student bodies further entrenching colonial ideologies of singles-stories (Adichie 2009; Brown and Donnor 2011). “Schools” and “schooling” are, after all, moribund artifacts of colonial histories stubbornly informed by the power relations of the past (read: racist, sexist, etc.). Our response is to analyze the social-historical-political reality impacting Latina experiences in urban education, while developing and using lenses and theories rooted in decoloniality. Decolonizing these spaces and projects allow us to honor and value the mind-body-spirit that has been fragmented by the violence of *his-tory* (hooks 2014). Chicana/Latina feminist thought names Latinas: Nosotras. Only from this vantage point can Latina subjectivity be made visible and her resistance to these systems and structures reconciled. Problematizing the “crisis” discourses

etched onto the Latina body reframes and recontextualizes our understanding of urban education.

The gendered-raced-sexualized scheme impacts the (mis)education of Latinas; derisively, it is their identities that are perceived as the source of the “crisis” in education itself. In other words, the Latina achievement gap is not attributed to the failures of the urban education system, but rather as a direct consequence of Latinas’ embodied identities (León et al. 2011). We must challenge the crisis-centered educational research (Gándara and Contreras 2009) that (mis)identifies Latinxs bodies as “at-risk” or “high-risk.” Antonia Darder (2012) speaks to this when she writes, “rather than speaking about ‘high-risk’ students, it seems that it would be more accurate to speak of ‘high-risk’ institutions – that is, institutions that adversely impact the academic opportunities and possibilities of bicultural students” (p. 4). Such a (re)calibration of language and discourse would facilitate the mobilization of energies and resources to fix the violence of the system itself, rather than attempt to refigure and remold her performativity. Simply put, “at-risk student” discourses disingenuously obscure the richness of Latinas’ world-making and robs them of their agency, whereas “high-risk institutions” rhetoric exposes the student’s active relationship to the poorly prepared institutions.

46.3 Ideology, Schooling, and Heteronormative Patriarchy

There is a culture that is shaped by “values, rules, and ideology” (for example: sitting still, zero tolerance, and meritocracy) that reform policies sustain and promote (Hanushek 1997). Segregating Latina students and allowing them to passively sit in the classroom, silent and disengaged, values their presence only for filling seats. Schools cut cost by packing classrooms to the brim and maintaining order by socializing the Latina body to be invisible; consequently, (mis)educating her (Yair 2000). Learning is not the priority. Reform policies work under the premise of capitalism where schools are businesses with a bottom line (Anyon 1995, 1997, 2014).

[*Sit with me.*]

The (mis)education of Latinas is historically interconnected and linked to white male supremacy (Lapayese 2013), where white heterosexual males embody the morals, values, and ideals of the dominant norm (Mills 2000). Through official, unofficial, and hidden curriculums, the male body and the white body are made to be synonymous with intellect, rationality, and legitimacy (Chacon 2006), whereas women’s bodies and the bodies of people of color are constructed as lacking, deficient, and in a perpetual state of crisis. In this system, the history of maleness and whiteness are both undergirded by a hetero-patriarchal ideological architecture, which become the foundation for our education system (Urrieta and Villanes 2013; Urrieta 2010). Precisely because of the deficient breadth of a white male hetero-patriarchal supremacy, we consciously position the Latina body as a site for generating knowledge(s) and agency.

School improvement discourses for example, specifically current reform initiatives calling for all-male academies (Pratt-Clarke 2010), rely on the notion that in order to “save” males of color, they must silence and make invisible the experience of women of color to “defeminize” schools, to remove [sexual] “distractions,” etc. These discourses inherently inculcate Latinas as adversaries for Latino achievements in a way that implies Latina resilience and achievements are the effects of (mis)invested resources – resources for men. Suggesting Latinas benefit unfairly at the cost of Latinos illogically situates Latinas as both a cause and a catalyst of Latinx underperformance. The subtext of this line of thinking beckons Latinas to think of themselves as only Latino, to put aside their womanhood, to sacrifice their seat, to let males lead, and/or to go first. This focus on crisis is overwhelmingly focused on males (Latinos) and not the entirety of Latinxs (see Soto 2011; Fernández 2002). And we don’t necessarily disagree, men of color do face particular circumstances, but, while we agree that research on males of color is vital because it sheds light on the intersectional issues of race-gender identities (Delgado Bernal 2002; Howard and Navarro 2016; Noguera 2003; Zarate and Gallimore 2005), we bemoan scholarship that shies away from a stronger critique of white male supremacy, and of heteronormative patriarchy (see Sáenz and Ponjuan 2011; Saenz and Ponjuan 2009; Sáenz et al. 2015; Noguera 2012). This genre of neoliberal Latino “crisis” scholarship forgets to consider how at its core, it demands Latinos only be seen by their most privileged markers: straight, cisgender, men. Again, while the male of color education “crisis” scholarship *does* highlight educational inequities there is a lack of intersectional critique that undermines other ways of being Latinx. Cammarota (2004), for example, analyses Latina and Latino student experiences in urban settings using a race-gender ethnographic approach that complexifies resistance and choice using an intersectional framework rather than a single-axis, binary approach.

46.4 Disrupting Binaries

Latinas are expected, if not demanded, to provide the labors of love [which often is work], to provide for others the essentials of care in life, to metaphorically feed the heart, and to literally nurse the body of others (Sy and Romero 2008). At face value, or rather from the male gaze, absolute self-sacrifice appears to be the paragon of generosity, but from the margins, selflessness is a trap designed to redirect physical, emotional, and psychic energies to invest in the male body (Harris-Perry 2011).

The binaries operate in schools by reducing Latina bodies to objects (e.g. distracting objects, sexual objects, passive objects). Recognizing Latinas as subjects requires first an acknowledgement that, although there is no singular Latinx educational experience, privileging race and overlooking gender and sexuality defaults these experiences as effectively hetero-male. Binaries, after all, are blinders designed to overlook oppressive and intersectional forces that are experienced differently by different bodies (read: Latinas). Schools in particular employ a myriad

of binaries including but not limited to academic achievement (Malagon and Alvarez 2010), citizenship (López and López 2009; Suárez-Orozco et al. 2010), and class (Bettie 2014) to sort and sift out students through the educational pipeline. An intersectional approach disrupts simplistic understanding of schooling experiences by breaking the single-axis approach and exposing other variously overlapping axes that form the context of schooling (Crenshaw 1989, 1991).

The “problem” with gender, for example, is not that it is socially constructed, but rather that it is socially constrained (Flores and Garcia 2009; Butler 1990/2008). Masculinity and femininity are not uniform categories of being but rather multiplicitous, and highly contextual public performances (Kumashiro 1999; Muñoz 1999; Pascoe 2007). In urban schools, women are taught that they are opposite to men, and that only opposites attract (Garcia 2009; Ingraham 1994). This construction of an “opposite sex” operationalizes a common sense discourse about identity, place, and politics. Common sense discourses, however, are not neutral (Gramsci 1971): if there is to be an “opposite sex”, then a “preferred sex” stands as its obverse. When schools subscribe to binaries they maintain hierarchies based on power dynamics that polarize differences that disproportionately undermine the lives of Latinas (Knights and Kerfoot 2004). The violence of the gender binary as a disciplining political technology is teleologically rooted in reproducing patriarchy, masculinity, and misogyny.

Similarly, sexuality remains a missing axis of intersectional analysis. Bettie (2014) accurately argues that sexuality, usually analyzed within the raced-gendered-sexualized triad, has not obtained the same level of examination as race and gender. Understanding how Latinas’ sexuality is regulated in educational practices not only provides a lens for mapping intersectional enactments of social agency, but also serves as an avenue for (re)claiming/(re)writing the available imposed social scripts (Denner and Guzmán 2006). Currently, the Latina body is subjected to a binarist framework of extremes that imagines them as either sexually repressed, virgin-like beings, or hypersexual, hyperfertile, exotic personages (Lapayese 2013; Flores 2013; Garcia 2009, 2012; López and Chesney-Lind 2014). With contempt, we submit that both expressions of the this virgin-whore dichotomy are framed within a heteronormative blueprint that not only erases a queer subjectivity, but also ossifies a tradition of measuring the worth of a woman by her sexual availability to men. Urban schools then, are subject to critique when they reify these constructs by organizing school architecture, curriculum, policies, guidelines, and reform recommendations around policing Latina sexualities (Hyams 2000). Such a figuring of the Latina body in schools, in need of constant supervision, is steeped in an ideology that seeks to perpetuate the Latina subjugation and conserve the purity of the white race hegemony (Flores 2013). Undoing and unlearning these paradigms requires a queering of Latina bodies by refusing to be objects moved around by the education pipeline; subjectivity is found, according to Rodriguez (2003), in naming ourselves and negotiating our own discursive spaces in order to move towards armed social justice practices.

46.5 Pedagogies

To see her, the Latina, is to venture deeper into the borderlands from whence the contours of white supremacy and patriarchy can be seen overlapping in complicity (Anzaldúa 1987/2012; Elenes 2011). However, within the current urban educational context, it is her body that is constructed as unsuitable for education and in need of regulating.

Pedagogies are ideologically charged operations of teaching and learning (Camarrota and Romero 2006). We advocate those pedagogies that ignite critical consciousness that can lead to transformative practices of being and knowing (Sleeter 1995). Lapayese's (2013), "Morena pedagogy: Latina educators and Latina youth in urban schools," provides a feminist epistemology-based intersectional framework. In morena pedagogy, Latina students are encouraged to view the dynamic notion of selves, communities, and cultures as situated within resistance and agency. Through this framework,

Latina students would be allowed to think, write and speak against the grain – to be attentive to elite appropriations of their voices and struggles, and to assess how consciousness may be reconstituted to promote a more socially just world order (p. 495).

In reconstituting consciousness to promote a more socially just world, the singular, one-dimensional, and homogenous view of identity must be transformed into an intersectional reality. Urban education curriculum and instruction should connect the politics of the body to the mind-body-spirit so that they nourish not hinder their subjectivities (Garcia 2009, 2012). By linking the real physical body to our meta-physical sense of self, Latinas are allowed to exist in and beyond the borderlands. Developing our own stories, theories, and practices is a generative process (Solórzano and Delgado Bernal 2001; Delgado Bernal 2001; Brayboy 2005) that makes social justice possible in urban schools where text and subtext are in the domain of whiteness and maleness. Latinas should be encouraged to enact their educación by dialoguing the tensions of liberation and power of urban schooling (Freire and Macedo 2013). This sociopolitical action requires viewing the body as a space for knowledge production (Delgado Bernal et al. 2006).

46.5.1 Revolutionizing Action

The urgency to transform urban education is *now*, thus we call for a revolution in thought, practice, and in the way we honor voice. Revolution in thought follows Chicana Feminist Epistemology rooted in cultural intuition, disruption of binaries, and a queering of bodies (Calderón et al. 2012). Knowledge production should not follow a top-down hierarchical framework that privileges the disembodied archives of only white men. Experiential, generational, and interpersonal knowledges should be seeded – from the bottom up. Revolution in practice mirrors pedagogy of love (Darder 2012), a practice of healing, transformation and liberation for finding

ourselves. Education practices should value and respect both students and teachers as full autonomous beings as opposed to seeing learners through developmental, deficit-based frameworks. Similarly, teachers are also learners; the dialectic transforms both. Revolution in voice does not imply *giving* voice to others. In the same way that we do not empower others – they empower themselves – revolution in voice implies *honoring* nuestras voces. Voice takes many shapes: words, feelings, emotions, [purposeful] silences, memories; all manifestations of voice are worthy of occupying discursive spaces. These revolutions build on an existing knowledge base of Latinas’ ways of knowing (Delgado Bernal et al. 2006).

We must recontextualize the purpose of schooling to create a culture of inclusivity and wholeness that acknowledges all the ways Latinas survive, resist, and navigate schooling and education. Building from the work of Chicana and Latina feminists, we bridge theory and activism to engage in urban education as an act and an avenue for liberation. Social justice manifests itself in different ways in the classroom: ethnic studies, culturally relevant pedagogy, challenging banking notions of learning/teacher, vulnerability, centering student voices, and through actively learning and (un)learning.

Honoring Latina student voices in urban education is the practice of recognizing education (that is, the project of schooling urban youth) does not exist without students. Often, the only people considered “actors” and active in effecting change are teachers, administrators, and policymakers (Palmer and Martínez 2013). This chapter centers the Latina as the agent and subject of her own schooling experience, despite deficit-oriented discourses about Latinxs and education. We are in need of new practices rooted in transformation through the voice of Latinas. We ask: How can we re/imagine urban education reform to foster transformative practices? How can we decolonize teaching/learning in the urban context? How can urban schools eradicate western-, hetero-, and male-centric ideologies? How can we ensure culturally relevant pedagogy and critical pedagogy is relevant to Latinas?

46.6 Conclusion

Intersectional pedagogies are social justice practices because they center/name/account for the experiences of urban Latina youth. Moving towards educación – and not (mis)education – is activism in praxis (Freire 1970, 1998). Every teaching moment should reflect a pedagogy of care and of love. Decolonial work is undoing, redoing, and doing all at the same time (Figueroa 2015) because it rests on “an act of confrontation with a dominant system of thought” (hooks 1992, p. 1). We must be intersectional in the work we do for policy, health care, violence, mass-incarceration, sovereignty, sexuality, and any system where oppression exists.

Anzaldúa (2002) reminds us that:

You examine the description handed to you of the world, picking holes in the paradigms currently constructing reality. You doubt that traditional western science is the best knowl-

edge system, the only true, impartial arbiter of reality... You turn the established narrative on its head, seeing through, resisting, and subverting its assumptions... you must provide new narratives embodying alternative potentials (p. 561–562).

Anzaldúa's words epitomize Arvin et al.'s reminder (2013) that decentering Eurocentric frameworks, requires constant action of decolonization in order for us for us to abolish systems of power beyond white supremacy (Gillborn 2005; Leonardo 2002; Nolen 2015).

Social justice work is rooted in community. As scholars, practitioners, educators, we engage in the borderlands through spaces/ideologies/ways of knowing that have lived in the margins. As Latinxs, we must tell and retell our stories so that they are known, and heard in spaces in and beyond academia. Latina knowledge, experience, and ways of knowing are rooted in resilience that require the love of self.

Of Latinx.
Of Latina.

Chapter 47

Keeping the Dream Through the CARE Model: Examining Strategies to Bridge the Gaps in Education Among Urban Youth

Tiffany Hollis and Ramon B. Goings

Despite more than 30 years of reform efforts and policy changes, urban education systems have failed to close various gaps (e.g., academic, discipline) among low-income students of color. As a result, ensuring the academic success for students of color in urban school districts in the United States has been the subject of numerous policies, reports, books, and articles. Despite the numerous efforts to bridge the gaps that exist among low-income youth of color and their counterparts, there is much room for improvement. The persistent underachievement of students, especially those in urban schools, has placed a large number of students at risk of school failure (Milner and Lomotey 2015). For many youth who reside in urban areas, school failure translates into disengagement from the schooling process. Students who are disengaged or who do not have access to some of the materials and resources that are needed for them to be successful often do not perform well academically.

Students from low-income backgrounds are at a disadvantage before they even enter a classroom as a result of the differing economic, cultural, social, and academic experiences that they have encountered. In addition, many students arrive at school with different experiences in terms of access to educational materials and resources at home and school. Environmental factors such as joblessness, teenage pregnancy, crime, single-headed families, and welfare dependency may pose a challenge to children who grown up in certain underserved communities. All of these factors tend to exacerbate the problems that are present in urban schools today. In many instances, the aforementioned issues fall under the auspice of educational (in)

equity in public school systems, particularly in those that are considered urban or have higher concentrations of ethnic groups and low-income students. As a result, these factors contribute to the education of students of color. Educational equity in terms of discipline is a pressing issue that has been examined in detail historically and in the present. As a result, fostering resilience and helping youth to learn to be successful and overcome despite their circumstances, will be integral in shifting the tides of how urban youth are and will be educated, how they are viewed, and the levels of success that they will experience. Moreover, while helping students succeed is integral, a more pressing need is for educators to evaluate policies, procedures, and practices that have caused these educational inequities.

Fostering protective processes in schools and communities requires a major shift in belief systems among adults in the education community. In the new vision of schooling, it is important to view students' experiences, prior cultural knowledge, and language as strengths—not deficits. Believing and expecting that each student has knowledge and experience to contribute to the teaching and learning process is not enough. Opportunities must be created for students to demonstrate what they know and can do in schools and communities. Consequently, youth who have been labeled as “at-risk” in terms of societal definitions can use the protective factors in their lives to transform into “at-opportunity” and become productive citizens who contribute to society.

Despite the increased attention in urban schools highlighting the educational disparities including academic achievement, opportunity, and discipline gaps for students of color, school districts are taking proactive steps to improve. For instance, Miami-Dade County Public Schools (FL) evaluated their suspension data and consequently eliminated out-of-school suspensions. The school system instead has created success centers where students can still receive access to teachers and support staff (e.g., social workers, psychologists, etc.). However, because reforms like the removal of suspensions in Miami-Dade County Public Schools are not systemic throughout the United States, student outcomes such as graduation rates in many urban school districts are not reflective of an improvement. In the scholarly literature, researchers have pointed to a plethora of academic and environmental reasons for the achievement gap and have proposed solutions to improve outcomes for students of color. However, not often discussed is the development of a comprehensive framework that addresses the academic, social, and emotional needs of students and teachers to reduce the aforementioned gaps.

To address this need, the chapter authors propose the use of a CARE model to address the gaps impacting students of color in urban school districts. The CARE model explores the role that (C) culturally relevant pedagogy, (A) attachment to school, (R) regulating emotions (mental health), and (E) expectations of teachers, play in narrowing or closing the gaps. This chapter contributes to the literature by exploring solutions to closing these gaps by utilizing various research-based strategies to engage, educate, and empower students who are frequently underserved, and often profoundly “left behind,” by the educational system. The purpose of this book chapter is to shed light on the gaps that exists among students from low-income backgrounds and their peers who come from middle-class and affluent homes by examining the various factors that contribute to those gaps.

First, we provide a background of the development of education in the United States with a focus on demonstrating the beginnings of educational inequities. Second, we highlight the persistence of achievement, discipline, and opportunity gaps. Third, we introduce the CARE model as a guide for educators to close the aforementioned gaps. We then conclude with recommendations for policy, pedagogy, and practice.

47.1 Background

From the beginning of history, American public education has been perceived by many to be that cure for the social ills produced by inequality of opportunity and poverty can be reduced, thereby becoming the “great equalizer” (Gonzalez 2001). Gonzalez (2001) adds that “Education is the great equalizer in a democratic society, and if people are not given access to a quality education, then what we are doing is creating an underclass of people who will challenge our very way of life.” He further declares that the “civil rights question of our nation today is that of access to a quality education” (Gonzalez 2001, p. 2). Horace Mann envisioned a school that would be available and equal for all, part of the birthright of every American child, to be for the rich and the poor alike. Mann found “social harmony” to be his primary goal of the school (Cremin 1957, p. 8). As a result, education is seen by many as a way to achieve economic and social mobility.

Through the history of the United States, people of color have risked and given their lives in an effort to provide a better life for their families and to pursue new opportunities, as well as provide their children with access to a free and high-quality education. What is missing from discourse regarding access to education is the acknowledgement of racially segregated groups who were denied equal access to schooling for centuries (Tyack 2004). Although it can be argued that education’s key purpose is to provide an equitable education for all students, there are numerous factors that prevent education from being “the great equalizer.” Schools serving low-income students receive fewer resources, face greater difficulties attracting qualified teachers, face many more challenges in addressing student’s needs, and receive less support from parents. This inequality is widely recognized. However, the inequities facing children before they enter school are less publicized (Lee and Burkam 2002).

Education has been seen as more of a “dream deferred” or a dream denied by Black citizens since 1896 when the Supreme Court ruled in the historic case *Plessy v. Ferguson* that “separate but equal” facilities for people of color were deemed as constitutional and legal. The Plessy decision and subsequent Jim Crow era contributed to societal and educational inequities for non-White citizens generally, and African Americans specifically. It was not until the landmark Supreme Court case *Brown v. the Board of Education* (1954), which ruled that “separate, but equal” was in fact, unconstitutional. This law overturned the 1896 *Plessy v. Ferguson* decision, and was considered as a progressive step towards racial equality and educational

opportunity. Yet, as James (2015) argued, “as the playing field appeared to level, the rules of the game changed” (p. 162). In other words, while the *Brown v. Board of Education* decision ended segregation, it was met with much resistance, particularly in southern states where school integration was not widely enforced. For instance, some states closed their public schools as a stalling tactic instead of integrating Black and White students (Douglas 1995).

Over a century ago, W.E.B. DuBois discussed the social conditions of African Americans in *The Philadelphia Negro* (Du Bois 1899). In 1903, he found that the damages of racism and unequal opportunities irreversibly damaged the plight of African Americans in the twentieth century. He coined this term “the color line,” which indicates the damages of racism and discrimination to African Americans post-emancipation (DuBois 1903). However, even within twenty first century contexts, the *color line* is still an eminent problem that disrupts social, economic, and educational opportunities for African Americans today. Within education, race and skin color are still contributing factors to student mistreatment, school inequity, and community underdevelopment. Although race is a socially constructed category that has been assigned based on skin color, physical characteristics, common descent and ethnic background (Yetman 1985), there can be no doubt that race has played and continues to play a significant role in social stratification and inequality. This is certainly evident in the U.S. education system. The discrepancy between the academic performance between white and African Americans leads to a discussion of the gaps that exist and persist; therefore, contributing to the disparities that are currently present. Although DuBois asserted his beliefs about the color line over a century ago, the *color line* still exists in the twenty first century.

47.1.1 The Twenty First Century Color Line

Population data reveals that 31.5% of African Americans currently living in the United States are under the age of 19 years old, while 22.5% of this age group is White (U.S. Department of Commerce 2013). These statistics suggest that a larger percentage of African Americans are assumed to be economically dependent and without primary income. Population data also demonstrates median age disparities between Black and White citizens. According to Wilson (2012), higher median ages are associated with higher income categories and professional occupations. Employment data suggests greater economic strain for younger communities with greater percentages of economic dependents (Wilson 2012).

Aside from age disparities, unemployment also strains urban communities. National unemployment for African Americans is approximately 11.5% compared to 5.4% unemployment for Whites (U.S. Department of Labor 2013). It is important to consider that unemployment data only reflects adults *actively* seeking employment, and does not account for those incarcerated, homeless, and displaced. Meaning, while the unemployment rates for African Americans are high, the actual unemployment numbers are much higher. These unemployment statistics represent

a smaller percentage of wage-earning adults in African American communities. Given the large percentage of African American dependents, unemployment has a major impact on the ability of parents to provide for their children.

Wage earning and educational attainment presents another aspect of the *color line* between Black and Whites. According to the U.S. Department of Commerce (2013), the average monthly income differential by educational attainment between Black and Whites reveals a shortfall of \$527, \$1,001, and \$1,005 for those with a high school diploma, Bachelor's degree, and Master's degree, respectively. Further, the percentage differential in educational attainment between Blacks and Whites is 2.7%, -8.2%, and -3.8% for those with a high school diploma, Bachelor's degree, and Master's degree, respectively (U.S. Department of Commerce 2013). These data suggest that, on average, Blacks are a smaller percentage of the workforce, earn less income at every educational level, represent a larger percentage low education credentials, yet bear a greater percentage of dependent populations (U.S. Department of Commerce 2013).

Segregated housing trends, by race and income, also adds to the *color line*. The Pew Research Center found that 42% of Blacks lived in a census tract that was majority Black, or segregated. Moreover, the average Black person lived in a census tract that was at least 45% Black and the average White person lived in a census tract that was at least 77% White (National Low Income Housing Coalition 2012). The National Low Income Housing Coalition Report (2012) also suggests that housing segregation has increased from 1980 to 2010 in nine of ten major metropolitan cities, as measured by the Residential Income Segregation Index (RISI). Thus, the urban setting, based on the factors of population distribution, median age, unemployment, income and educational attainment, and housing, can be framed as an environment of social and economic isolation and inequity. These factors, along with structural inequalities that exist in the education system leads to the gaps that exist and persist; therefore, contributing to the disparities that are currently present.

47.2 Examining the Achievement, Discipline, and Opportunity Gaps

47.2.1 The Achievement Gap

The existence of the “achievement gap” between African American students and White students and its possible causes and remedies has gained considerable attention in both the public mind and in academia (Jencks and Phillips 1998). For the last several decades, academics and practitioners have sought to understand the achievement gap in racial terms (Ogbu 2003). The achievement gap in the United States often refers to the differences between White, middle class students and their non-White peers. Although it may seem as though the achievement gap may be a Black

and White issue, it is more accurate to refer to multiple gaps. Roughly defined, an achievement gap is the disparity between the academic performances of different groups of students. Several such gaps have been found to be associated with groups of individuals from certain economic, racial, and ethnic lines. For instance, there is an achievement gap between students from low-income families and their more affluent peers. This gap is also noted as a disparity between minority students, especially African American, Hispanic, and Native American students, and their White and Asian American counterparts (National Task Force on Minority High Achievement 1999). With the advent of federal legislation such as No Child Left Behind coupled with the demands of accountability and public unrest, there seems to be another “sleeping giant” in the midst of this struggling educational system. As Haycock (2001) explained, “To increase the achievement levels of minority and low-income students, we need to focus on what really matters: high standards, a challenging curriculum, and good teachers” (p. 1).

Unfortunately, inquiries into disparities in achievement often neglect to consider patterns in disciplinary referrals. Thus, insufficient discussions have taken place with regard to discipline, despite the fact that discipline sanctions have been disproportionately distributed across racial and ethnic groups with a significant overrepresentation of African Americans (Skiba et al. 2002). While many factors have been explored as contributors to the discipline gap, teacher beliefs and practices, biases, and cultural misunderstandings as it relates to discipline has received little attention.

47.2.2 *The Discipline Gap*

The discourse on the achievement gap, does not often focus on the role that the discipline gap and how minority students are subjected to a disproportionate rate of school disciplinary sanctions, which range from being removed from the classroom and being sent to the office, to facing suspension or even expulsion (Krezmien et al. 2006; Wallace et al. 2008; Butler et. al 2012). Consequently, disciplinary sanctions are imposed in an effort to maintain order and safety by removing students who break school rules and who are disruptive to the learning environment. These students are used to set an example to other students in order to deter other students from committing future rule infractions. However, schools tend to rely heavily on exclusion from the classroom as the primary discipline strategy (Arcia 2006), and this practice often has a disproportionate impact on students of color. Exclusionary school discipline practices include the referral of disruptive students out of the classroom and their subsequent suspension and expulsion from school (Losen and Gillespie 2012; Lewis et. al 2012).

From a social justice perspective, one of the main problems with exclusionary school discipline consequences is their disproportional negative impact on Black students, particularly males (Skiba et al. 2000; Smith and Harper 2015; Losen and Skiba 2010; Losen 2015;). The disproportionality of African American students, particularly males, in exclusionary school discipline is termed the *discipline gap*

(Monroe 2005, 2006). The discipline gap, or tendency for African American students to be sanctioned more frequently and severely than their peers, is present in almost every school system throughout the United States (Losen and Gillespie 2012; Losen and Martinez 2013). As a result of being out of class, too many Black students get caught in the school failure, dropout, and juvenile justice cycle, or school-to-prison pipeline (Casella 2003; Osher et al. 2010; Wald and Losen 2003; Losen 2015). As a result, the use of school exclusion as a discipline practice may contribute to the well-documented racial gaps in academic achievement, which, in turn contributes to the achievement gap.

Some researchers argue that teachers lack proper training and preparation to manage behaviors that may be culturally different from their own (Cartledge and Kourea 2008; Klinger et al. 2005). For instance, Eyler et al. (1983) reported that many teachers with socially heterogeneous populations are faced with students whose behavior they do not understand, and they are subsequently feel ill-equipped to respond to or cope with the behavior. Classroom disruptions can be properly managed if behavior interventions that are culturally responsive are implemented correctly (Cartledge and Kourea 2008; Klinger et al. 2005). Consequently, these interventions are seen as promising in terms of serving as preventative measures, given that a majority of teachers in the workforce are White, middle class, and monolingual females (Ladson-Billings 2001). Although implementation of culturally responsive practices must be systemic and happen at federal, state, district, and school levels (Abrams and Gibbs 2000; Klinger et al. 2005), administrators and teachers need to serve as agents of change and advocates of social justice access, equity, and inclusion of all students.

Even though the demographics of the students in schools are becoming more diverse, the majority of teachers are still White (Toldson et al. 2013; Ladson-Billings 2001; Hancock 2011). As a result, these changes have resulted in a cultural disconnect between students and teachers as many educators often do not know how to respond to the behavior needs of students from diverse backgrounds. While cultural differences among students can occasionally create challenges in the classroom, they should be viewed as opportunities to create positive, trusting relationships. This has resulted in a cultural disconnect between students and teachers. In an effort to create a stronger connection between teachers and students, it is recommended to include professional development that emphasizes cultural awareness (Toldson et al. 2013). Consequently, teachers can implement culturally responsive methods of classroom management, such as establishing a rapport with students and creating an optimal learning environment (i.e., warm, supportive, and caring), exploring the concept of cultural synchronization, and developing a greater sensitivity to culture by reflecting on their own instructional practices, interactions, and personal reactions to students and behaviors, as means of closing the discipline gap.

Definitions and expectations of appropriate behavior are culturally influenced, and conflicts are likely to occur when teachers and students come from different cultural backgrounds (Weinstein et al. 2003; 2004). Misreading behaviors or communication patterns of culturally and linguistically diverse students (i.e., White, Black, Latino, Asian, Native American) can lead teachers who are unprepared to

meet the educational needs of these students to see them as having a disability and request a referral to special education (Voltz et al. 2003). The combination of interpreting behaviors through singular cultural lens and instructional quality contributes to disproportionality in special education and discipline (Klinger et al. 2005). Therefore, implementing culturally relevant classroom management strategies, encouraging cultural synchronization, and fostering teacher-student interactions and relationships become important tools in the arsenal of reducing and preventing disproportionality in discipline. Problem behaviors among students are often a function of a misalignment of what is expected according to mainstream Eurocentric cultural norms and what diverse students bring to their school environments. Classroom expectations and behavioral norms are based on cultural constructs and as the classrooms become more diverse, students and teachers with backgrounds that are culturally diverse, may experience conflicts in schools.

47.2.3 The Opportunity Gap

The National Opportunity to Learn Campaign (2011) defines the opportunity gap as the disparity in access to quality schools and the resources needed for academic success, such as early childhood education, highly prepared and effective teachers, college preparatory curricula, and equitable instructional resources. Consequently, disadvantaged students are often in classrooms with the most inexperienced teachers, in school settings with the worst working conditions and the least support for educators (Wilkins et al. 2006). The teacher turnover and poor results that follow are hardly surprising, and no evaluation tool or alternative certifications will change this dysfunctional dynamic. In communities across the United States, children lack the crucial resources and opportunities—inside and outside of schools—that are necessary for them to reach their potential in terms of attaining a career, attending college, or achieving citizenship. These children often learn in inadequately funded schools with beginning teachers who have low expectations for them to succeed, participate in classes that do not challenge them, and have little or no access to other supports in their lives such as access to housing, health, and other resources that are often out of the school's control. While the achievement gap has dominated policy discussions over the past two decades, relatively little attention has been paid to a gap that is certainly becoming more and more evident in schools and in society in general—the opportunity gap.

Although opportunity and achievement are connected in more ways than can be imagined, they are very different issues with different concerns. Classes in schools serving mostly African American and Latino students are twice as likely to be taught by inexperienced teachers (with 3 years of experience or less) as classes at schools where there is a majority of White students (Wilkins et al. 2006). Classes in high poverty schools are also more likely to have inexperienced teachers. The percentage of inexperienced teachers in low poverty schools is 11 % whereas in high poverty schools it is 20 % (Mayer et al. 2000). Looking at teacher qualifications, the least

prepared teacher recruits are disproportionately found in under-resourced, hard-to-staff schools serving predominantly low-income and minority students in central cities and poor rural areas. Thus, students who most need highly skilled teachers are least likely to have them, further magnifying inequalities (Darling-Hammond 2010). Reframing the problem in terms of opportunity gaps focuses attention on examining the lack of access to the very resources that contribute to the success of more privileged students. This focus clarifies what actions need to be taken to guarantee that all students do indeed have opportunities to receive a high quality education. As many examples across the nation show, when given the opportunity, students from any cultural or ethnic background and any socioeconomic level can excel (Kitchen et al. 2007).

47.3 CARE Model

In order to address the various gaps previously discussed educators will need to approach these issues from various perspectives. We propose the use of the CARE model as one such solution to address the gaps impacting students of color in urban school districts. Consequently, the CARE model explores the role that (C) culturally relevant pedagogy, (A) attachment to school, (R) regulating emotions (mental health), and (E) expectations of teachers, play in narrowing or closing the gaps. We contend that a multi-faceted approach is essential to meet the needs of youth who are frequently underserved, and often profoundly “left behind,” by the educational system. The CARE model will close the gaps that exist among students from low-income backgrounds and their peers who come from middle-class and affluent homes by examining the various factors that contribute to those gaps.

47.3.1 Culturally Relevant Pedagogy

Ladson-Billings (2009) explained that most teachers have concerns about working with diverse student populations and need to examine their beliefs, expand their knowledge, and develop abilities related to students from diverse backgrounds. As a pedagogical tool, Ladson-Billings and other scholars have called for teachers to employ culturally responsive teaching (CRT) which is defined as “a pedagogy that empowers students intellectually, socially, emotionally, and politically by using cultural referents to impart knowledge, skills, and attitudes” (Ladson-Billings 2009, p. 20). Research studies suggest that teachers have deficit views about their racial and linguistically different minority students. Moreover, teachers also treat these students different from non-minority students and have lower expectations for them (Patton 2002). The reality is that demographic differences between teachers and their students are increasing in America’s classrooms. Thus, it is important for

teachers to become more culturally competent and responsive with their students. For instance, in order for teachers to engage in culturally relevant teaching, they must not only comprehend, but also embrace the roles that racial, ethnic, and socio-economic differences play in schools and classrooms (Ryan 2006).

Ladson-Billings (1994) identifies three components of CRT: (a) the teachers' perceptions of themselves and others, (b) the manner in which classroom social interactions are structured, and (c) teachers' perception of knowledge. Specifically, addressing the needs of African American students, she states that the primary aim of CRT is to assist in the development of a identity that allows African American students to choose academic excellence yet still identify with Africana and African American culture. As this description implies, culturally relevant teachers must be observant and alert to the classroom behaviors and communications, verbal and nonverbal, of students. There is no "one-size-fits all" approach to CRT. Every student must be studied individually and stereotypes about a particular group discarded. Culturally relevant teaching occurs only when teachers are sensitive to cultural differences and when culture is naturally integrated into the curriculum, into instructional and assessment practices, and into classroom management. Therefore, CRT is based on the idea that culture is central to student learning. In fact, the application of CRT relies heavily on whether or not the teacher can understand how a student's cultural complexities impact how they experience the world (Milner 2011). While CRT is critical to success of African American students, this pedagogical approach does not occur in isolation. Consequently, it is important that scholars and practitioners also address how the academic environment impacts the interactions between teachers and their students.

47.3.2 Academic Environment (Positive School Climate)

School, along with home and neighborhood, are the primary environments that impact child development. Schools with a positive climate, where children feel welcome and look forward to attending, families like to visit and volunteer, and staff like to work, are environments that promote learning and healthy growth (Haynes et al. 1997). Haynes et al.'s (1997) defines school climate as, "the quality and consistency of interpersonal interactions within the school community that influence children's cognitive, social, and psychological development" (p. 322). The climate of a school is especially important to the developmental and academic outcomes of vulnerable and at-risk students, such as homeless students and highly mobile students because it could mean the difference between achieving academic success or experiencing failure and eventually dropping out. Why do some children succeed and do well, despite the obstacles that they have had to overcome, while others fail and end up dropping out of school? Many would attribute the ability to overcome the odds and be successful to resilience and being able to regulate one's emotions, which will be discussed more in depth in the next paragraph.

47.3.3 *Regulation of Emotions (Mental Health)*

Another prerequisite for achieving classroom competency is the ability to self-regulate attention, emotions, and behavior (Masten and Coatsworth 1998). Such “executive functioning” in the brain may well be effected by child maltreatment (Child Welfare Information Gateway [CWIG] 2015). Executive functioning contributes to academic and career success and supports the ability for social interactions. Structural and chemical damage to areas of the brain that control executive functioning may result in the learning difficulties, lesser academic achievement, diminished IQ, and declining attentiveness or focus. Not surprisingly, traumatic experiences have the power to undermine the development of linguistic and communicative skills, hinder the formation of a coherent sense of self, and compromise the ability to attend to classroom tasks and instructions, organize and remember new information, and grasp cause-and-effect relationships—all of which are necessary to process information effectively (Shonk and Cicchetti 2001). Trauma can interfere with the capacity for relationship formation and for creative play, the latter being an important way for children to learn coping skills. Additionally, children who have experienced trauma may face one or more of the following: difficulties with sustained attention (Beers and De Bellis 2002; Streeck Fischer and van der Kolk 2000), slow processing speed due to increased arousal (Perry 2001), difficulty with verbal problem-solving tasks and expressing emotions (Coster and Cicchetti 1993), deficits in executive functioning tasks (i.e., goal setting, planning, etc.; Beers and De Bellis 2002), trouble sequentially organizing material which may result in reading, writing, and verbal communication problems (Craig 1992, as cited in Cole et al. 2005), and difficulty accepting others’ perspectives (Burack et al. 2006). Unfortunately, these traumatic experiences adversely impact communities of color generally, and African American communities specifically (Walker 2015).

Related to recurring fear, a traumatized child may experience hyperarousal, an unconscious response to a perceived threat triggered by chronic exposure to traumatic stress (Bloom 2013). As with fear, the brain creates permanent memories of traumatic events. These memories leave the child hyper sensitive to imminent danger as perceived in such nonverbal clues as eye contact, swift movement or a touch on the arm or tap on the shoulder (CWIG 2015). Hyperarousal causes a child to be on the alert for threats and to potentially misinterpret nonverbal cues as threatening even in safe spaces such as school classrooms. Instead of paying attention to learning, the child may be focused on determining whether a situation poses danger. The lack of focus on learning causes the child to fall behind academically and to be labeled with a learning disability. This misdiagnosis overlooks that fact that the child’s traumatized brain had developed in a way the keeps them on alert and unable to calm down and give attention to learning (Bloom 2013; CWIG 2015; National Scientific Council on the Developing Child 2010; Trosche 2014).

Shields and Cicchetti (1998) explain that deficits in the capacity to regulate emotion are a cause for serious concern because “the ability to modulate behavior, attention, and emotion underlie children’s adaptive functioning in a number of key

domains, including self-development, academic achievement, and interpersonal relationships.” (p. 391). Potential difficulties include poor impulse control, aggression against the self and/or others, trouble interpreting emotional signals, chronic uncertainty about the reliability of other people, and lack of a predictable sense of self. Shields and Cicchetti (1998) suggest that hypervigilance, or a constant alertness for danger, may play a key role in undermining the development of emotional self-regulation. They postulate that the hypervigilant child cannot shift away from distressing cues in the service of maintaining emotional regulation. Research now shows that trauma can undermine children’s ability to learn, form relationships, and function appropriately in the classroom (Shonk and Cicchetti 2001). Schools, which are significant communities for children, and teachers—the primary role models in these communities—must be given the supports they need to address trauma’s impact on learning. Otherwise, many children will be unable to achieve their academic potential. Students mentioned being more confident when they have positive role models whom they could trust and who showed them that they cared about them and had high expectations for them. Consequently, relationship with a caring and supportive adult, such as a teacher, can also have a positive effect on student’s success and academic performance.

47.3.4 Caring Relationships and Teacher Expectations

There is often a saying among teachers that “Students don’t care what you know until they know that you care.” Thus, there is a need for schools to have teachers who truly believe their students have the ability to succeed. This is even more critical for those students who have been disenfranchised to the degree that they may not even believe in their own academic ability. Furthermore, Werner and Smith (1992) reminded us of the role that teachers play in creating caring learning environments are critical to fostering resilience. Werner and Smith (1992) found that students mentioned positive role models and individuals whom they could trust and demonstrated deep care. Students tend to excel and do well when they believe that they can be successful. Research shows that the presence of just one caring adult in the life of a child can make a difference between success and failure in school (Gay 2000). Wilson and Corbett (2001) and Delpit (1995) noted that today’s classroom environments should be places in which expectations are clearly stated and inappropriate behaviors are dealt with immediately. Attempting to meet the needs of students requires that teachers and service providers develop an awareness of and explicitly respond to students’ ethnic, cultural, social, emotional, and cognitive characteristics (Brown 2004). Delpit (1995) indicated that many children expect many more direct verbal commands that perhaps teachers may expect to give or provide. If students interpret commands as questions, teachers and administrators may perceive them as uncooperative and insubordinate without understanding their failure to comprehend what is expected and why they choose not to comply (Delpit 1995).

Gaining student's cooperation in today's classrooms involves establishing a classroom atmosphere in which teachers are aware of, and address, students' cultural, linguistic, social, and emotional, and cognitive needs (Brown 2004). The physical features, emotional tone, and quality of interactions among students and between students and teachers have a tremendous impact on how or whether learning occurs. Classroom climates that are "cold," hostile, uninviting, and negative are not conducive to the learning environment for any students, and students with behavioral concerns tend to perform better in emotionally warm, caring, and supportive classroom climates (Howard 2006). As Howard discovered, students preferred "teachers who displayed caring bonds and attitudes towards them, and teachers who establish community-and family-type classroom environments" (p. 131).

Teacher effectiveness has a central role in fostering academic success. Students need master teachers who set high expectations, spend more time actually teaching because of good classroom management skills, encourage questions, promote life-long learning, create an engaging learning environment, and have a good rapport with both parents and students. In essence, the current school system is an alien school system where the curriculum does not motivate the children to want to learn because the coursework does not relate to them or to their experience and may be seen as irrelevant and insignificant. In addition to having a caring relationship with students, teachers and staff can also create a positive school climate.

47.4 Recommendations

Given that the US teacher workforce does not reflect the diversity of students, we provide this model as a guide for educators to use to ensure they are reaching their students of color. Furthermore, we provide three recommendations for education stakeholders concerned with not only addressing educational gaps, but also eliminating them:

1. *Development of Ongoing Culturally Responsive Teaching Professional Development*

Throughout our discussion in this chapter we have focused on the importance of having teachers who understand the culture and values of their students of color. Thus, it is paramount that school districts provide ongoing professional development for teachers on culturally responsive teaching. However, while providing professional development is critical, this professional development must be designed based on recommendations of students, teachers, and community members who represent the various cultures in the school district. Moreover, school district officials should look to teachers in the district who exhibit culturally responsive practices to help lead the professional development sessions as they can provide other teachers with skills that are directly applicable in the classroom setting.

Moreover, it cannot be assumed that all students from the same racial group (i.e. Black or Hispanic) share the same cultural values, thus this professional development must take into account the diversity in culture among students. Additionally, teachers (of all races/ethnicities) should be given the opportunity to first explore their cultural values and ways in which they see the world. This self-understanding is essential as it may be difficult to understand the cultures of others if teachers are not cognizant of how their ideologies, life experiences, and beliefs influence their teaching practices.

Through our personal encounters with teachers engaging in professional development, they often acknowledge that professional development is given in a “one-shot” approach where after one professional development session teachers should be able to implement everything from that session. As school systems develop their cultural responsive teaching we recommend that these sessions are ongoing, where teachers have the ability to learn the information and strategies, have ample time to implement them in their classrooms, and then receive feedback and consultation on how to improve their practices.

2. *Development of Mental Health Support and Training for Teachers and Students*

As described in our CARE framework, students who have had traumatic experiences are less likely to perform academically (Walker 2015). Therefore, there is a need for school districts to be responsive to the experiences (both in and out of school) that their students bring to the classroom. Even among adults, the discussion of mental health, especially in communities in color is a taboo topic. However, in order to support students who need mental health supports, we must be more vigilant in discussing these issues in communities of color. As a result, we recommend that concerned educators, mental health practitioners, and researchers collaborate to provide mental health training to teachers, students, and the community. Schools can serve as the epicenter for the community where all stakeholders have safe spaces with competent mental health professionals to talk through their problems.

We recommend including students in the training because in many instances students are more likely to be open with a peer than an adult. As a result, students should have some background information to know when it is appropriate to talk with an adult about their problems. As educators, this training is important to develop culturally sensitive methods to discuss traumatic experiences with students and be able to refer them to the proper mental health practitioner. Addressing budgetary matters which often cut mental health services in schools (e.g., school counselors and psychologists) will be necessary to ensure students of color have access to training and competent adults who can help them deal with issues that may impact their academic achievement.

3. *Revisions of Discipline Practices that Impact Students of Color*

In their (2015) report on the school suspension of Black students in 13 southern states Smith and Harper found that in more than 100 school districts Black students suspensions account for rates five times their representation in the student population. Moreover, the researchers found that in 84 school districts Black students accounted for 100% of all school suspensions in those districts.

We outline these data to show there is a glaring problem in the ways in which students of color are disciplined in school and we contend that these practices must come to a halt.

In order to change these statistics, we recommend that all school districts evaluate their suspension data and develop strategic workgroups comprised of district and school administrators, teachers, students, and community members that have a mission to understand *why* students of color are being suspended and then develop strategies to lower suspension rates. As we discussed previously, when students are suspended from school and do not have access to the curriculum, they are placed at a disadvantage that will ultimately impact their ability to succeed academically. Thus, strategies to lower suspensions should include in-school options for students and the availability of academic tutors and counselors.

47.5 Conclusion

While pundits from various viewpoints may disagree on how students should be taught and the policies that govern education, all can come to a consensus that *education is an equalizer*. In order to support students of color there is the need to galvanize all stakeholders who care about these students. Moreover, conversations must be framed from an anti-deficit perspective. Stakeholders must truly believe that the future success of the United States rests on our ability to ensure all students have the access to an equitable education that prepares them for success and not prison. We present in this chapter one framework that can be useful in guiding the work of educators, researchers, and policy makers who seek to develop programs, policies, and practices to support students of color. Our hope is that scholars, teachers, administrators, and society at large see the opportunity to support students of color and ensure their success.

Part VIII
Oceania

Chapter 48

Urban Education in Oceania:

Section Editor's Introduction

James G. Ladwig

Arguably, to understand Urban Education in Oceania, it is important to keep the history, demography and geography of the region in the forefront. That is, while it is possible to make some clear connections between the experiences of education in some Urban centres in the region and those in (mostly) Northern parts of the planet, those connections really misrepresent the region more widely. 'Urban' experiences, as they are known in the North, are the exception in Oceania. Understanding the broader context helps frame the issue of Urban education more clearly.

In geological terms, Oceania is comprised of more than 10,000 islands scattered across the South Pacific Ocean, with three nations occupying the largest of those islands: Australia, New Zealand and Papua New Guinea. (Earliest definitions of the term 'Oceania' were intended to include the Malay Archipelago – what now includes Malaysia, Singapore, Indonesia, Brunei, and Timor-Leste – but these are typically considered part of Southeast Asia in contemporary parlance and in the World Cup.) The largest of these islands is the continent (and country) of Australia followed in area by the island of Papua and the two main islands of New Zealand.

The more obvious reason to say that Urban Education is more the exception than rule in Oceania becomes evident when considering the population spread across the land mass of these islands. Most evidently, there are actually very few large cities in the region. Only two are larger than four million residents: Sydney and Melbourne – both in Australia. There are also only three more cities with populations greater than one million people: Perth, Adelaide, Auckland (NZ). In total, these cities comprise slightly more than one third of the overall population of Oceania of an estimated 36 million people. It is therefore clear that the majority of schooling (which does formally exist across the entire region) takes place in small (and smaller) regional centres across what is essentially the Southern half of the largest ocean on the planet.

J.G. Ladwig (✉)

School of Education, University of Newcastle, Newcastle 2308, Australia

e-mail: James.Ladwig@newcastle.edu.au

The question these raw facts bring to mind is, what can the experience of a couple of cities on the far side of the planet offer an international handbook of Urban Education? Here the history of the region, and its relatively recent transition into 'Modernity' provides a crucial key. That is, while it is possible to identify similarities in the economic and social conditions faced by some students in Sydney and Melbourne as proto-typically 'Urban,' it is actually the interface between the clearly imposed modern school system and the many and varied Indigenous populations of the region which makes the link between schooling and 'the Urban' very clear, wherever your planetary location.

Within this broader framing, Australia has individually developed its own history of understanding 'Urban' education in a global view (Connell 1980). Subsequently educational and sociological literature has focused on themes similar to those found in the metropolises of the world. From Jim Walker's well know study of male youth culture and its tenuous relationship with schooling, (Walker 1988), to Parlo Singh's undergoing interest in how marginalised youth (often from other parts of Oceania) live within the margins of Australia's urban contexts (Singh 2005), the Australian education research literature on Urban education has largely mirrored that found elsewhere – with adjustments for its specific local contexts and people. Never the less, the applicability of broader frameworks for social justice and education have clearly found a secure footing in the largest of Oceania's cities, (see, e.g. Blackmore (2007)).

Consequently, to extend beyond what's readily available, in this section, Michael Singh (below) provides a pan-regional insight into the major historical forces that have moulded the development of Oceania education. There Singh notes that the forces of Empire and the colonial are the very foundations of *all* the larger established educational systems of the region, and points to the crucial shift that occurred post-WWII. After WWII, with the previous colonial regimes slowly receding from the region, Singh notes, the seeds of contemporary modern schooling were sewn across the islands. Where colonial powers withdrew, modern nations have been established with substantial 'aide' inputs from several industrial powers: mostly notable (but not exclusively) the US, the UK and France. In these contexts, you see the same technologies used by previous colonialists and missionaries converted into the basic structures of mass schooling systems. Not surprisingly, these structures have never been a simple 'fit' for the Indigenous peoples of the region and the manner in which schooling is (still) imposed helps define the experience of these people sheds clear light on the historical foundations of the 'Urban.'

To put this historical framework into sharp relief, it is also important to keep in mind how the development of the global economy developed throughout this history. Here, the historical role of former colonies as 'primary producers' for their respective Empires has clearly played a significant role in the development of schooling. As Griffiths (below) argues, the development of schooling was one of instruments which propelled economic development in the region – with mass education embraced as a means of collective development at the turn of the twentieth century (in Australia and New Zealand), and later in the quick post-WWII transition into 'developing' independent nations placing more direct economic interests in

schooling. With these two histories in mind (Singh's post-colonial view, and Griffiths world economic view) we see reason for why it is now possible to find local school reforms drawing on the same 'radical' pedagogical frameworks often promoted within Urban America – in contexts that look nothing like the inner cities of the world.

Within the metropolises of Oceania, while the region continues to grow in population, each of the major Urban settings are now going through yet another transition, as they grapple with population growth pressures and the demands that places on infrastructure, and the highly predictable concomitant tensions that come with contemporary global cities. Here, Emma Rowe has been tracking the political strategies and tactics related to schooling among the urban middle classes in one Urban centre. Below she points out early how the now global policy rhetoric of choice has been taken up in defence of public schooling, but that defence is not entirely about making schooling universally public. Rather, the 'choosers', as Rowe calls them, are employing similar parental strategies of educational aspiration we have seen across the industrialised world, with all the paradoxical unions of social inclusion and social exclusion (Popkewitz and Lindblad 2000). The strength of the choice rhetoric, Rowe demonstrates, does raise the question of whether or not mass universal education will in fact, continue to expand throughout the region.

And finally, from the edge of one of Australia's urban cities, where small regional towns are becoming the very edges of the urban centres, Jay Phillips and Allan Luke present a detailed grounded analysis of the ways in which 'deficit' explanations are used at the interface of schooling and Australia's Indigenous populations. International readers will quickly recognise the basic structure of deficit reasoning, as it has been central to many analyses of how disadvantaged populations are governed by schools in the urban centres of the world. Two important dynamics made clear in Phillips and Luke's analysis are especially important from an international perspective: (1) this work carefully documents the ubiquity of deficit reasoning – across all 'stakeholders' perspectives, and (2) the dominance of very clear binary moral judgements that structure the experience of Indigenous students within that deficit reasoning. The theoretical implications of this last analysis carry far beyond the specific location from which it comes. When read in conjunction with the other chapters in this section, it is clear to see that the 'micro' connections between local distinctions and political struggles on the one hand, and the broader global historical 'macro' dynamics of capital and colonialism on the other, are part and parcel of how the urban is lived in Oceania.

Chapter 49

Urban Education Across the Post-colonial, Post-Cold War South Pacific: Changes in the Trans-national Order of Theorising

Michael Singh

49.1 Introduction

There is more to urban education across the South Pacific than its geography might first admit. The homes of South Pacific Ocean peoples are immense; all made possible by their capabilities for long ocean voyages using the stars and currents to navigate. They themselves represent a vast constellation of hospitable and generous peoples spanning Polynesia and Melanesia. Moreover, the South Pacific has long been part of the urban education of Europeans and North Americans. For the purposes of this chapter urban education is defined as the production and circulation of knowledge for metropolitan populations via an interconnected set of intellectual projects that proceed in unpredictable directions from various geographical points. The spatial distribution of the intellectual resources constituting urban education extends beyond the boundaries of Euro-American post/colonial spheres of influence. This definition opens up possibilities for activating and mobilising theoretic-linguistic knowledge produced through non-Western intellectual cultures. No doubt, this definition challenges the ways in which the South Pacific Ocean peoples are unequally installed in the post-Cold War geo-political ordering of knowledge of urban education.

Here the concept ‘theoretic-linguistic’ captures the idea that all theories are expressed in one language or another and, moreover, that the conceptual divergence expressed in diverse languages can bring forward possibilities for innovative theorising (Singh 2013). This is not a matter of construing an unbridgeable division between theoretic-linguistic knowledge in South Pacific languages and theories in English. Instead, it acknowledges that there are divergences in the devices, strategies and moves used to assemble knowledge in different places (Delsing 2001). Because conceptual categories are bound to the language in which they emerge,

researchers' linguistic repertoire provides scope for theoretical innovation. This chapter explores four interrelated ways of thinking through urban education within-and-without the South Pacific. The idea of urban education in the South Pacific depends on one's imagination, one's connections with the nations within and beyond the region, and one's role in the forces at work here-and-there. These three concepts invite consideration of a fourth way of thinking through urban education, namely using South Pacific intellectual resources being employed to theorise urban education within and outside the region in the past, present and future. This chapter introduces concepts from South Pacific Ocean researchers to theorise urban education as a challenge to the privileging of extant theory (Refiti 2013; Thaman 2003; Tuinamua 2007; Vaka'uta 2009). Here then, South Pacific Ocean peoples and their ideas are constitutive of urban education, rather than merely a **source** of data to be analysed by theories imported elsewhere.

Producing and disseminating contrasting accounts of urban education is integral to the task of demystifying the idea – and the ideology – of urban education. This chapter draws upon on a range of 'South Pacific Euro-American' literature, albeit situating it **historically** and theoretically within a new framework which contributes to reworking conversations about the globalisation of urban education. In addition to South Pacific theorising (Refiti 2013; Thaman 2003, 2009; Vaka'uta 2009), three related strategies are used for generating a contrasting account of urban education within-and-without the South Pacific in this chapter.

Specifically, Burawoy, Blum, George, Gille and Thayer's (2000) notions of local/global connections, imaginations and forces are used to frame the ensuing analysis. It is argued that the local/global connections, imaginations and forces of urban education find concrete expressions in the dynamics of particular localities throughout the South Pacific where resistance and accommodation are evoked (Jourdan & Salaün, 2013). Local/global connections are taken to mean a thickening of the sphere of urban education. On the one hand, this thickening of local/global connections in urban education is shaped by the post-colonial and post-cold war interrelationships among nation-states (Lotherington 1998; Vltchek 2013). On the other hand, these local/global connections are also solidifying via public efforts to build outward connections via urban education. These are due in no small part to the marked decline citizens now have in determining the policy agenda of their nation-states as their governments' disinvest in their citizens (McCormick 2014). Urban education along with tax justice, labour markets and natural resources, are increasingly marked by a grid of transnational governing forces. Local/global imagination refers to the reactions against the disconnected nation-state through demands to reinvigorate local cultures within transnational frameworks. Burawoy, Blum, George, Gille and Thayer (2000: 34) define local/global forces as "the supranational forces that operate above the nation." These include the world market and its constituent institutions such as the World Bank, the International Monetary Fund, the Organisation for Economic Cooperation and Development, the United Nations, and the fracturing European Union. They all operate on the back of nation states which are pressed to respond to these **transnational demands from above, rather than those claims coming from their citizens below.**

49.1.1 *South Pacific Theorising about Urban Education*

All too often the South Pacific Ocean peoples are absent from accounts of urban education. Ironically, this erasure of the place of urban education from within-and-without the South Pacific is affected through the forces of colonialism emanating from London and Paris. Over the last five centuries South Pacific Ocean peoples have shaped colonial encounters across the region. Flexner's (2014) analysis of multiple sources of evidence – from landscapes, sites, and artefacts along with written documents as well as oral traditions – reveals complementarities and contradictions that destabilise orthodox historical narratives of colonialism. This research poses challenges for interpreting the local/global tensions in urban education across the South Pacific today. In Hirst's (1974) terms, the urban education institutionalised throughout the South Pacific passed on knowledge that was independent of the intellectual **cultures of the peoples** colonised by London and Paris. Tuinamua (2007) argues that the urban education system introduced by these Anglo-French colonists via pedagogies of rote learning served to impose on South Pacific values urban superstitions concerning the validity of mechanistic thinking, passivity, shame, self-gratification and consumerism (also see Lingam 2004, 2007). Colonialism worked to wipe out South Pacific languages and intellectual resources by not recognizing them as sources of knowledge production because they and the people who created them were considered to be inferior to their English or French masters (Delsing 2001).

However, the socio-political, economic and cultural changes borne of post-colonialism are slowly changing aspects of this curriculum orientation South Pacific urban education (Lotherington 1998; Mangubhai 2002). Significantly, this is occurring through the generation of South Pacific theoretic-linguistic tools for analysing the region's urban education anew (Tuhiwai-Smith 1999). It is recognised that 'techno-rational, personalistic and emancipatory knowledge' and 'Christian religious knowledge' (Tuinamua 2007: 112, 116) along with 'western knowledge' (Fairbairn-Dunlop 2014; Thaman 2009) are used to analyse South Pacific urban education. The argument that the production of South Pacific theoretic-linguistic knowledge warrants a place in the debates of urban education is gaining leverage (Fairbairn-Dunlop 2014). The question that is now being posed is why not use 'Pacific knowledge and knowledge construction processes' or 'Māori knowledge' (Fairbairn-Dunlop 2014; Thaman 2009) or 'Indigenous knowledge' and 'non-Western knowledge' (Thaman 1993) to theorise urban education within-and-without the South Pacific? For these researchers, seeing **the South Pacific Ocean** people as creators of new theoretic-linguistic knowledge is necessary for interrupting the inherited colonial system of urban education.

How might this absence of the South Pacific Ocean peoples in the construction of urban education be broken? Some argue that their 'voices' (Dirlik 1997: 130, 138) warrant a place in thickening the local/global sphere of influence in debating matters of urban education. However, Thaman (2003) sees the South Pacific Ocean peoples' quest for intellectual liberation coming from deepening and extending

their own capabilities for theorising, and not the idea of ‘voice’ (also see Chilisa 2012). Other researchers have established that there is little relationship between students’ expression of their ‘voice’ and their learning (Stapleton 2002; Helms-Park and Stapleton 2003; Stapleton and Helms-Park 2008; Young 2000, 2009). On the contrary, students are misled into assuming that their ‘voice’ takes precedence in assessments of their work over key elements of argumentation using concepts, propositions, evidence and reasoning (Fulford 2009; Moore and Muller 1999). Moreover, the case for students’ voice neglects differences in experiential knowledge among students from diverse backgrounds (Arnot and Reay 2007; Fielding 2007). This ignores the structural controls affected through the privileging of English-only monolingual literacy theory and Anglophone or Francophone theories.

Taumoeofolau (2011) argues for an interdisciplinary project to shed the yoke of the Anglo-French colonial urban education through centring South Pacific languages and conceptual **knowledge. This is preferable to celebrating voice.** Producing theoretic-linguistic knowledge is central to Thaman’s (2003) work to interrupt the hegemony of **Euro-American intellectual power** over the peoples of the South Pacific, and the ideological dominance of the colonial past over their future. As is usual, ever-advancing information, communication and surveillance technologies promise interactive pedagogies that are supposed to redress power imbalances by fast-tracking processes for decolonising South Pacific education (Wesley-Smith 2003). The privileging of Euro-American theoretical knowledge in South Pacific schooling is an expression of its urbanisation but impacts negatively on efforts to reclaim (Gnecchi-Ruscone 2012; Rainey 1999), and revalue South Pacific theoretic-linguistic knowledge. The aim is to counteract its negative impact.

Thaman’s (2003) struggle is directed against the links between Euro-American theorists and South Pacific data generators that bind them unevenly and unequally in this division of intellectual labour. This creates what Alatas (2006) calls academic dependency. Thaman’s (2003) efforts focus on redressing the colonial erasure of the South Pacific Ocean researchers’ capabilities for theorising, and revivifying the intellectual resources their languages provide them for doing so – their concepts, metaphors and images. Thaman (2009) formulates strategies that move beyond ‘academic dependency’ by using South Pacific as well as and other theoretic-linguistic knowledge as a basis for analysing urban education. For instance, the Tongan concept of kakala, or garland of fragrant flowers is used by Thaman (2009) with teacher education students to define research. This process is configured as comprising *toli* (materials selection), *tui* (making of a kakala) and *luva* (presentation of a kakala as a sign of respect and love). The Tongan concept of kakala has equivalents in Fiji (*salusalu*), Hawaii (*lei*) and Cook Islands (*hei*). Here, academic dependency is challenged by South Pacific concepts that foreground interdependence, reciprocity and circulation (Delsing 2001).

The divergences among South Pacific languages are used to undertake theorising in co-existence with the tensions posed by the global press to use extant theories

available in English (Singh, 2013). The academic dependency created by English language theories has its basis in British colonialism. In 1874, 96 years of British rule began in Fiji; the Cook Islands became a British protectorate in 1888, while the British Solomon Islands Protectorate was proclaimed in 1893, and Tonga became a British protected state in 1900. Hawaii was colonized by the British in 1843, having been colonised by the Spanish previously, and then subsequently colonised by the USA in 1889 along with Guam (1898) and the Philippines (1898).

South Pacific Ocean researchers are asking, how are the capabilities for theorising to be developed throughout the region (Vaka'uta 2009)? How **might** South Pacific theoretic-linguistic knowledge be constructed and incorporated teaching/learning throughout the region at all levels of education (Thaman 1993, 2009)? In other words, they are asking how can South Pacific theoretic-linguistic knowledge be generated and used in new ways, so that it may be revalued. Moreover, they value the interfacing of South Pacific and other theoretic-linguistic knowledge through exchanges for the learning and excitement this engenders. Thus, the integration of South Pacific theoretic-linguistic **knowledge** into urban education is meant to generate a solid foundation for reinforcing and building researchers' capabilities for theorising across South Pacific communities and beyond. It is not an end in itself, or merely a means for gaining respect. The process of interfacing South Pacific theoretic-linguistic knowledge with other knowledge scaffolds South Pacific researchers' experiences in, and opportunities for theorising and demystifying theory.

South Pacific modes of theorising urban education are an important source of critique and means for conceptualising *alter-natives* to global uniformity. Such theorising contributes to the work of creating common reference points (Vaka'uta 2009). Challenging the idea of endless development through urban education as an end-goal in **itself** is an important focus for South Pacific theorising. Vaka'uta (2009) explores an *alter-native* way of reading based on the concept of tālanga, importantly, from the perspective of a tu'a (commoner). The concept tālanga is defined as a way of being, a way of speaking, and as a way of reading (also see Elley & Mangubhai 1979). Its key elements serve as analytical lenses for a mode of interpretation that aims to be critical and liberating at once. Vaka'uta's (2009) theorising of South Pacific urban education gives new meanings to human welfare, socio-political affairs and people's relations with natural rhythms of the earth's climate.

South Pacific theorising by Refiti's (2013) uses Samoan concepts to analyse the struggle between efforts to extend the space of intellectual freedom (*manu*), and efforts to capture and control such possibilities (*tapu*). Parenthetically, Samoa was partitioned between and colonized by Germany and the USA in 1899. Refiti (2013, p. 30) reasons that because 'buggery' and 'bricklaying' can be framed as Parisian conceptual tools without question by monolingual English-speakers, then similar theoretical work can be **undertaken by using** Samoan concepts analytically. Methodologically, this entails (a) activating Samoan concepts on the proviso that they are creative rather than merely descriptive, and (b) stitching together Samoan concepts and those from other languages, knowing full well that the edges have not been trimmed and the seams remain exposed.

Thus, South Pacific theorising is significant because it challenges urban education to speak past the dichotomy of 'local Indigenous wisdom' and the provincial Euro-American theoretical claims on universal truths. As Chakrabarty (2007) argues Euro-American theories are both indispensable and inadequate in helping South Pacific researchers to theorise urban education throughout the region. Here the concept of provincializing sees South Pacific researchers taking a critical stance to imaginings of Euro-American urban education as an idealized prototype for South Pacific Ocean peoples. Treating Euro-American theories as provincial rather than universal, South Pacific researchers have taken on the paradoxical and uncertain task of renewing theorising from and for the South Pacific while exploring Euro-American theories through the lens of South Pacific theorising.

South Pacific theorists such as Thaman's (2009) are not particularly interested in the horrors of colonialism given that these accounts can also be used to belittle their ancestors and position themselves today as victims. Such accounts better serve the interests of the metropolitan descendants of Euro-American colonialists who are keen on self-flagellation. In terms of Thaman's (2009) concept of *kakala*, urban education in the South Pacific comprises *toli* (intellectual materials selected mostly from London or Paris), *tui* (forming urbanised South Pacific Ocean's peoples) and *luva* (the presentation of graduates of such education as a sign of the metropolis' respect and love). The key point here is that multilingual researchers have the capabilities for innovative theorising through exploring the divergences that arise from doing so in two or more languages.

However, the use of South Pacific theorising is not without problems. A key issue is whether such theorising about the local/global dimension to the problems of urban education of relevance to South Pacific Ocean's peoples will be heard beyond their homes (Spivak 2010). This does not license either the reinvention of a Euro-American intellectual hegemony or having to be resigned to fragmented ethnicities (Jullien 2014). The dual concerns of Refiti (2013), Vaka'uta (2009) and Thaman (2009) are to foreground the work in South Pacific researchers in generating *alter-native* conceptual reference points and contributing to a common intellectual project for analysing and debating urban education. Where this is not done, both Indigenous and non-indigenous researchers can be complicit in perpetuating the intellectual hegemony of Euro-American theories framing urban education. Paradoxically, global approaches to framing and legitimising broad participation in education policy debates also support the dominating status and development agendas of state's providing regional aid (McCormick 2014).

South Pacific theorising about urban education is a necessary step in working through divergences in postmonolingual, intercultural education (Jullien 2014). Thus, Vaka'uta (2009) offers Tongan language concepts as a vehicle for altering existing theoretic-linguistic knowledge and modes of critique about urban education. The aim is to **generate alter-native** theoretical resources **to** those that tend to serve the interests of colonizers rather than the colonized. For Vaka'uta (2009) such South Pacific Ocean theorising contributes to the ongoing work by Indigenous scholars to shift beyond the restrictive powers of Euro-American theories into a

more open intellectual mode. Nevertheless, the struggles over theorising and theory in urban education throughout the South Pacific are complex and contradictory.

Importantly, this theoretical research by Refiti's (2013), Thaman (2003, 2009) and Vaka'uta (2009) stands in marked contrast to so-called southern theory. As Lundström (2009: 86) argues that "after decades of postcolonial feminist critique of male dominance and internal racial hierarchies within the 'southern' (and northern) contexts ... southern theory does not alter the notion that the canon of social theory is a gendered story. ... From the north to the south, men surely embody the term general theory ...". Moreover, Reed (2014: 168) contends that southern theory actually reproduces the claim that the "metropole produces explanatory theories, while the periphery produces philosophy and interesting intellectual history." Further, the intellectual relations between South Pacific Oceans' peoples and Euro-Americans in terms of theorising are neither singular nor schematically pure, due to the historical combining of these geospatial modes of theoretical knowledge production (Gramsci 1971). Historically, the resources of divergent intellectual cultures have been brought together to surpass southern and northern – eastern and western – theorising, (Alatas 2006; Chakrabarty 2007; Reed 2014; Wichmann 1999). Paradoxically, sometimes intellectual conflicts have been accentuated with scorn directed against South Pacific theorising as much as a tenacious and passionate aversion to Euro-American theorising. For instance, South Pacific Oceans' researchers are contributing to theorising as result of their material and cultural subjugation as much as their anti-colonial and anti-neoliberal struggles (Tuhiwai-Smith 1999). However, South Pacific school and university education remains **dependent upon and subservient to** Euro-American theories (Muller 2009).

49.1.2 *Educational Connections with the Metropole*

To understand 'urban education,' it is necessary to appreciate the changing historical context of colonialization across the world's oceans and the role of the empires emanating out of London and Paris. The metropolitan powers of London and Paris extended the frontiers of urban education to the South Pacific from the eighteenth century onwards. Thus, the South Pacific is *intimately connected* to urban education in the Euro-American metropolis. The idea of South Pacific Euro-American connectedness speaks to the mutually constituting shaping of one by the other. In other words, this is not a matter of the separatism implied by notions of centre/periphery, or north/south, or 'home/field' (e.g. Gunson 1969). For instance, Tuinamua (2007) reports that many South Pacific nation-states work with variants of the urban education introduced by colonial powers. The urban education imported into South Pacific villages through the colonising efforts of missionaries and imperialists from London and Paris gave expression to nineteenth century modes of urban manufacturing (e.g. Gunson 1969). Of course, European exploration of the South Pacific goes back to the voyages of the Dutch explorer, Abel Tasman in 1642. **The Dutch were** the dominating maritime trader of the time (Palmer and others 2014). The French

connection with the South Seas dates back at least as far as the voyage of Binot Paulmier de Gonneville (1503–1505) (West-Sooby 2013). However, it was not until the eighteenth century that the South Pacific impacted on the collective French imagination, diving exploration and colonial expansion throughout the region. It did likewise at the same time for another newly emerging maritime power, Britain.

The educational transformations effected throughout the South Pacific were linked to the long-term colonial projects of London and Paris. The British and French made concerted efforts to use urban education to establish a permanent presence for themselves – economically, politically, socially and territorially, throughout the South Pacific. There is much to South Pacific education that is the product of colonial projects hatched in London and Paris. Colonialism deprived the very spiritual peoples of the South Pacific of much, promising them ordered lives along with material and religious benefits in return. **Christian theology was deployed to re-engineer the people's humanity by re-forming their minds and politics** (Tomlinson and McDougall 2012). Colonialism and missions were inseparable. Connected as a form of religious-political activity, missionary ventures smothered local religious cultures under the globally homogenising forces of European religious expansionism and standardisation, while serving to establish and strengthen colonial systems and governance structures (Delsing 2001; Gunson 1969). However, resistance to these combined projects, forced missionaries to review, rework and redefine theology and faith in terms that were relevant and contextually agreeable to **the South Pacific Ocean peoples and their life concerns** (Uriam 1999; Harvey 2014).

Colonial projects emanating from London and Paris reconfigured the spatial and socio-cultural orientations of the urban education of the South Pacific Ocean **peoples**. Their urban education itself represented a permanent alteration of human activities in the South Pacific. Christian mission education played a central role in these endeavours. Christian politics throughout the South Pacific engages in competitive power struggles between denominations to govern society and partake in policy debates about language use, music, citizenship ideals and shaping nation-states (Tomlinson and McDougall 2012). The South Pacific Ocean **peoples'** inherited uses of their communal land and seas were redirected via urban education to compel their uses in manufacturing and to demand that they use their energies in new urban industries. London and Paris sponsored urban education throughout their South Pacific colonies to help establish new property relations and moral assumptions to govern the South Pacific Ocean peoples. This also made possible the redistribution of their lands and seas. Christian mission education played a central role in both. To do so, changes were effected in the notion of what constituted the ownership of the land and seas, and the spirituality the South Pacific Ocean peoples invested in both. In this way urban education played its role in making it possible to dispossess these people of their lands and seas through its privatisation and their conversion to Christianity.

Urban education played a small but nonetheless significant part in making contemporary forms of globalisation possible, including the field of transnational education. For instance, Ladwig (2008) argues that the transnational power structures of urban education are integral to current local/global struggles, including those

associated with inhumanity and racism. Likewise, Lange (2012) argues that around the globe education does as much, if not more to promote rather than to combat ethnic violence. Education does so through shaping identities that promote inter-communal animosity, assertive expectations, incentives to eliminate competitors and capabilities to mobilise social movements (Hviding and Rio 2011).

Today the urban education provided in the cities of Nouméa and Papeete are internal to France, with French Polynesia (1842) and New Caledonia (1853) being part of the French Republic. However, Euro-American urban education is not an unqualified blessing. The South Pacific serves as an object of desire for those who would escape the ravages of savage urbanisation. As the roots of Euro-American faith in urbanisation are undermined by their own industrial *coal-onisation* of the world, imaginings of the South Pacific peoples come to the fore. Disenchantment with Euro-American urban education feeds the enchantment with the prospects of an education in/by the nature and cultures of the South Pacific. Euro-American colonialism has brought several centuries of industrially-driven ecological and socio-cultural destruction to the South Pacific. However, the South Pacific still provides an urban education for those in the cities of the world about what might constitute a good life. Urban education in the form of eco-tourism, staffed by South Pacific Ocean waiters and chambermaids, connects Euro-America's urban bourgeoisie with paradise, offering an education into what constitutes happiness and the good life. Gauguin's Tahitian legacy lives on in the luxury Paul Gauguin Cruise company, which sails the South Pacific islands year-round.

Anthropological studies of the South Pacific contributed to the education of Euro-American urbanites in the 1920s, capturing the international attention of urban readers at the same time demonstrating just how limited their education was. For instance, Bronislaw Malinowski's years in the South Pacific reveal strong parallels between British imperial adventure fiction and social anthropology (Delsing 2001; Thompson 1995), especially his take-for-granted sense of unquestioned European superiority (Jahoda 2007). Likewise, Margaret Mead's research in South Pacific Oceanic societies contributed to the sexual education of North Americans while also being constrained by North **American ideologies**, including biologically deterministic views of human behaviour (Foerstel 1988; Grinager 1980).

In the early 1940s, Keesing (1941) sought to re-educate North American urban elites from Honolulu to Boston, through counter-constructions that challenged the destructive and disorganising power and associated ignorance of colonialism and its white supremacist concepts associated with the South Pacific. As part of the militarisation of anthropology during World War II, Keesing (1945) tested the urbane racialised politics of the United States by bringing into question European colonial enterprises in the South Pacific. European claims to expert knowledge of the region were contested. Because few really knew little about the region, Keesing questioned claims that he himself and his colleagues' had specialist knowledge of the South Pacific.

As part of white colonialism in the South Pacific, US anthropologists contributed to urban education for the anti-Japanese war. Their urban education program emphasised the need for an anti-racist disposition in creating trusting interpersonal relations with **the** South Pacific Ocean peoples. They challenged the legitimacy of

‘nice white colonialism’ and its inherently exploitative interests irrespective of whether it emanated from Europe, North America, Japan or Australia (Brawley and Dixon 2014). Racism in its Darwinist and biological scientific forms and the abuses to which it gave rise by governments was rejected. Instead, they helped shape the United States’ colonial policy so as to make its imperial acquisitions and Americanisation of the South Pacific Ocean’s people possible. South Pacific urban education was directed at having people use their ‘freedom’ and ‘independence’ in ways expected of them by Americans (Brawley and Dixon 2014). However, the peoples of the South Pacific Ocean did not simply have aspirations for a fair go. In contrast, they begin with the presupposition that they are already equally as intelligent as those Euro-American who mistook themselves to be superior. As the following section indicates the South Pacific Ocean people’s work of verifying their presupposition of intellectual equality confronted an urban educated imagination that was otherwise fixated on inequalities of all kinds.

49.1.3 Educating the Imagination of Urbanites

Vaka’uta’s (2009) concept of *tālanga* offers a way of being, a way of speaking **and** a way of reading urban education from the perspective of a *tu’a*; that is **the South Pacific Ocean** peoples. **Such ways of being, speaking and reading are** done without posing a simple reaction to, or against the structural changes in South Pacific states. From this perspective, the South Pacific inhabits a conspicuous place in educating the imagination of urbanites throughout the Pacific Rim and beyond. The South Pacific enlarged the Euro-American imagination. The encounters with **the** South Pacific educated the Euro-American imagination in new views of affluence, with visions of inexhaustible stores of food and fish, music and dance, sun and fragrances. Much of this imagination was produced and captured by the world’s favourite centre for urban education. Hollywood caught Euro-American images and imaginings of a peaceful paradise where one’s sexuality could be explored. In educating the imagination of urbanites the South Pacific offered people marked by imaginings of savagery along with an idyllic Eden. In films of the eighteenth-century story of Captain Bligh and the mutinous men of the HMS *Bounty* the latter won over South Pacific people. However, the uncouth mutineers led by Fletcher Christian, bring death and destruction to the South Pacific.

The South Pacific also plays the part of utopia in the world’s urban education. *Couples Retreat* (Billingsley 2009) was set in Bora Bora (French Polynesia) and teaches viewers about unconventional therapies for dealing with issues in marital relationships. The South Pacific provides an urban education in mental and sexual health, giving sustenance to a belief in the innocence of the primordial. In *The Blue Lagoon* (Kleiser 1980), Nanuya Levu (Fiji) provides a site where Euro-American promiscuity finds an excuse to live, given the disappointments of urbanisation elsewhere. The South Pacific has been imagined as a sustainable physical and cultural

paradise despite the destruction wrought by urbanisation throughout Europe, North America and Asia, and its associated local/global climate change and neoliberal economic recession (Crossley & Sprague 2014; Ford 2012).

South Pacific women have an especially significant part in the urban education of Euro-Americans. Paul Gauguin's colourful manipulation of the Parisian imagination through images of South Pacific women, their oceans and lands impacted on France's conventional artistic thinking and decadent practices. At a time Tahiti was experiencing a plague of Parisian missionaries which Gauguin struggled against. Gauguin died fronting a prison sentence for crimes against French colonial authorities, including the offence of encouraging Tahitian children not to go to school. This Parisian born Spanish/Peruvian artist invented modern European/South Pacific art. Educational institutions of various kinds, including Christian missions were integral to the projection of urbanisation and associated global ideologies into local communities throughout the South Pacific (Tomlinson and McDougall 2012). These institutions worked to penetrate South Pacific people and to reshape their religious beliefs. While these institutions used their power to force European ideologies into the South Pacific Ocean's peoples, conflicts arose out of these colonial projects. Disciplined behaviour was imposed on these supposedly unruly South Pacific Ocean's peoples, who in some instances demonstrated their hatred of these evangelical enterprises (Laracy 1976, 1999).

Paul Gauguin, a syphilitic paedophile and ex-stockbroker, is perhaps the South Pacific's most fecund urban educator (Gedo 1994; Mather 2007; Morowitz 1998; Taouma 2004; Wettlaufer 2007). This savage man's use of intense colours was inspired by Japanese prints (Wichmann 1999). The paintings that came out of his *La Maison du Jouis* ("The House of Orgasm") rendered as innocent his nude Tahitian models who were also his sex slaves. Even so Gauguin's paintings of Tahitian women are imbued with the enigmatic urban themes of maternity, desire, death and fear. Celebrated in bold colours, these Tahitian women feature in paintings such as *La Orana Maria* (1891), *The Seed of the Areoi* (1892), *Where Do We Come From? What Are We? Where Are We Going?* (1897), and *Two Tahitian Women* (1899). Paintings of Tahitian women are now at the centre of the world's urban education, their paintings hanging in museums and galleries in New York, Boston, Washington, Paris, St. Petersburg and Moscow (Duran 2009; Vercoe 2013). No original Gauguin paintings remain in French Polynesia.

The South Pacific Ocean peoples provide Euro-Americans a means of time travel. These urban imaginings set the South Pacific apart in time rather than being seen as contemporaneous (Fabian 1983). Periods beyond their own history could be obtained through cruising or sailing the South Pacific **Ocean** to explore an idyllic past, prior to urbanisation. The educated imagination engendered by the South Pacific fosters the illusion of travelling among people who offer the prospects of leaving the savage urban Euro-American ahead in history. Euro-American imaginings of the primeval South Pacific serves as a counterweight to brutal realities of urban regress. If Euro-American sustainability is even a possibility it is partly imagined through the lives of the South Pacific (Crossley and Sprague 2014). Moreover,

the preoccupation with the past reproduces the idea of the South Pacific as a timeless Ocean of wonderlands. However, the South Pacific peoples of today are a very different people from their pre-colonial forebears. As Dirlik (1997: 140) explains, “they are products of a modern historical experience [and] partake of the social, ideological and cultural diversities of the present, and, **consequently** hold diverse views of the present, the past and the future.” **Just as Chief** Plenty Coups did for the Crow Nation in North America (Lear 2009), the point is not to recover a past that is gone but to assert new visions for the South Pacific’s future.

In sum, the South Pacific altered the urban education of Europeans and North Americans. The South Pacific provides an escape from urban capitalism, as much as a frontier for capitalist development (McCormack and Barclay 2013). These contradictory imaginings derived from the South Pacific are constituents of urban education. The South Pacific educates the urban imaginations of Europe and North America. Dirlik (1997: 130) argues for the latter to liberate themselves from the hegemony of these imaginings with the help of **the** South Pacific researchers’ theorising themselves and their place in the world of urban education. The disenchantment with the consequences of the expropriation of intellectual and material resources from the Ocean drives South Pacific researchers’ quest for developing their capabilities for theorising.

49.1.4 Forces of Global Economic Reorganization and Education

Colonialism, a vast, contradictory and contested concept, has not disappeared entirely from the South Pacific. Today the South Pacific provides a site for the changing global economic order (McCormack and Barclay 2013). At various locations across the South Pacific, are arrayed the economic forces of the United States and China, and thus the political and military forces of these super-powers. The Samoan concepts *manu* and *tapu* are useful for analysing contemporary struggles for freedom and control across the South Pacific (Refiti 2013). The struggles by the South Pacific Ocean peoples to extend the space of freedom now face efforts by new interests in the region to capture and control much of what it has (Vltchek 2013; Wesley-Smith 2003).

Beijing’s involvement in the South Pacific includes the use of aid, diplomacy, economic investment and strategic alliances to become a regional power and create a new regional order. Together these changes in post-Cold War forces are shifting the connections and imagination that have shaped the urban education of the South Pacific. With regard to aid, Zhang (2007: 376) observes that many South Pacific countries “are impoverished and among the least developed in the world. Internally divided and weakly governed, they are heavily aid-dependent. It makes them extremely vulnerable to external players.” China’s aid includes building a parliamentary complex in Vanuatu (colonised by the French and British in 1906), the foreign ministry headquarters in PNG, a multi-story government office in Samoa,

and a sports stadium in Fiji. Zhang (2007: 368) observes that this aid makes a political statement rather than facilitating economic development, and has been criticised as such. For Zhang (2007: 376) such “relatively small investment in these countries can have a major impact and influence in the region [resulting] in major long term payoffs for countries such as China.”

The primary goal of Beijing’s foreign policy is “to foster a regional and global order conducive to China’s continued economic growth and development ... which it has calculatingly cultivated to its own advantage” (Zhang 2007: 371–372). For Zhang (2007: 369) “the Pacific is one of the most fiercely fought battlegrounds between [Beijing] and [Taipei] for international recognition.” Zhang (2007: 368) acknowledges the price to be paid by South Pacific countries for China’s development opportunities includes a range of “destabilising factors such as China and Taiwan’s competition for international recognition and the vulnerability of the Pacific island states to the manipulation of ‘cheque book diplomacy’ and its impact on corruption and governance.” Beijing has more diplomats in the South Pacific than do other countries. Typically, the first official overseas visit by a South Pacific government leader is to Beijing, and not to Canberra, Washington or Wellington (Yang 2009). Beijing’s ‘assertive’, or even ‘aggressive’ broadening of its interests in the South Pacific is similar to its approach in Africa, Latin America and Southeast Asia. However, the concerns about Beijing’s presence in the South Pacific are due to “the opaque nature of its political system, secretive nature of its foreign policy-making process and general lack of information” (Zhang 2007: 372). Zhang (2007: 377) argues that Beijing’s ‘dollar diplomacy’ in the South Pacific has “helped entrench endemic corruption in the region and poses serious threats to efforts aimed at enhancing good governance and accountability ... the Chinese ask no questions about internal corruption, governance and accountability.”

In terms of economics, Beijing’s involvement in the South Pacific also includes bilateral trade, investment, tourism, and the training of government officials and technical staff. Beijing’s economic interests in the South Pacific focus on the search for timber, minerals including gold and copper, fisheries and hydrocarbons. Beijing is involved in organisations such as the Pacific Islands Forum and the South Pacific Tourism Organisation. It has also created the China-Pacific Island Countries Economic Development and Cooperation Forum, and the China Pacific Island Countries Economic Development and Cooperation Guiding Framework. Beijing’s state and private companies have invested billions of dollars in hotels, plantations, garment factories, fishing and logging operations in the South Pacific (Yang 2009).

Beijing “has become a significant power to be reckoned with in the [South] Pacific” (Zhang 2007: 375; see also Lanteigne 2012). Yang (2009: 4) notes that for Beijing “the supply of energy and natural resources has become an increasingly important security issue.” There are a range of issues at stake in this shift of power towards Beijing. These include efforts to secure international diplomatic recognition by Beijing, rather than Taipei; challenges to Euro-American alliances in the region which pose concerns about international security, and the growing power of the Chinese diaspora in the region which Beijing sees as its responsibility to protect them. Yang (2009: 4) reports that “Chinese nationals and immigrants are doing

much damage to China's image [because they are] corrupting local officials and politicians." Beijing's claim to be responsible for protecting the growing Chinese communities throughout the South Pacific region creates worries that it might become "increasingly involved in the internal affairs of Pacific island states because of the growing Chinese communities in the region" (Yang 2009: 1).

Further, Zhang (2007: 371) raises the prospect that Beijing's presence in the South Pacific might also be "undermining the relationships of the Pacific island countries with dominant powers in the region and ... challenging the US leadership in the Asia Pacific." Yang (2009: 3) echoes these claims with the observation that Beijing's deepening involvement in the South Pacific is "part of a longer-term political and strategic investment aimed at challenging the leadership of the United States in the greater Asia Pacific region." In addition, Yang indicates that Beijing has a well-planned long-term strategy for the South Pacific that entails improving airports, bridges and highways, as well as increasing tourism and migration from China. Beijing is acutely aware of being "an undemocratically elected government with a controlled society in a globalised world" (Yang 2009: 2). However, as Yang (2009: 2) reports that Beijing's leaders "see no major military clashes between China and other great powers before 2020." They deemed the first two decades of the twenty-first century an important period of strategic opportunities for China's economic development. Yang (2009: 6) suggests that "China's deepening involvement in the South Pacific is a calculated strategic move for its military security." The South Pacific is the frontier for post-Cold War capitalist development, albeit now with Chinese characteristics. The success of post-Maoist China with capitalist development has brought the nations of the South Pacific to the forefront in a new generation of urban education that marries Canberra, Washington, Wellington and Beijing.

49.1.5 Worrying About South Pacific Urban Education

The ongoing efforts by Refiti (2013), Thaman (2003, 2009), Tuinamuaana (2007) and Vaka'uta (2009) to renew the capabilities for producing South Pacific theoretic-linguistic resources have instructive parallels in the work of Chinese scholars (Davies 2007: 219). It is in the interface among the South Pacific, Euro-American and now Chinese theoretic-linguistic resources that these scholars are constructing new dimensions to South Pacific theorising. Both the South Pacific struggles to extend the spaces of freedom (*manu*) for urban education and to counter efforts directed at capturing and controlling such possibilities (*tapu*) are important for a new generation of urban education throughout the region.

Beijing occupies an increasingly central role in constituting urban education in the South Pacific through its aid, diplomatic, diasporic and economic presence. Integrating Beijing's "learning dialectic" (Keith 2009) into the South Pacific's "productive conversations" (p. 241) about urban education is, of course, an indicator of historical shifts in geopolitical power throughout the region. Of relevance here, is Beijing's pedagogy of assessing and analysing the relevance of, and selectively

learning all the comparative strong points from other countries, while ignoring weaknesses and failures, through deliberative understanding of domestic and foreign realities. This means rejecting both the parasitic copy-cat and the overly self-confident isolationist approaches to urban education. Thus, learning from China by learning the Chinese language might be framed as a further development in urban education which benefits the South Pacific Ocean people. Of particular importance, is Beijing's educational approach to using foreign ideas which promotes "self-reliance and national independence rather than abject and uncritical subservience to the national experience of others" (Keith 2009: 30). Thus, learning Chinese to study what China is doing in the South Pacific is important for furthering the self-reliance and independence of the South Pacific Oceans' people. Such an urban education has a place in informing whether they become subservient to get to other nations.

Davies (2007) account of Chinese scholars' efforts to import foreign ideas, albeit on the grounds that can be made serviceable with respect to domestic interests invites self-reflexive theorising about future directions for urban education in the South Pacific and the region's fringe-dwellers. Her arguments offer possibilities for appropriating South Pacific, Euro-American and Chinese ideas, while taking a questioning stance regarding each, in order to enhance the value and valuing of South Pacific theorising about what urban education might mean now. This entails establishing a relationship between theory and critical inquiry through their contested and open-ended interpretations, so as to debate what might be the indiscriminate or inappropriate uses of concepts drawn from various languages. The disagreements among South Pacific intellectuals about which concepts, metaphors and images from which languages might be enlisted for the purpose of theorising urban education, its planning and methods, add value to these debates. The necessitates intellectual rigour in theorising using ideas from South Pacific, Euro-American and Chinese languages – so as to choose those likely to serve less colonial interests as home and abroad.

49.2 Conclusion

It is reasonable to say that urban education is constituted, in part through what the colonists and the colonised did in the South Pacific as much as what they did in London, Paris and Washington. Urban education and the South Pacific bear an intriguing multidimensional relationship, with one constituting the other. The South Pacific has provided knowledge and materials to expand and enrich Euro-American urban education. Much of what is known about the South Pacific is the work of outsiders – colonialists, missionaries, movie-makers, explorers, capitalists – from Britain, France and the US. When students in London, Paris and Washington are being taught about the South Pacific it is likely to be the knowledge generated by these outsiders that they are studying. Moreover, the South Pacific Ocean peoples have been marshalled into urban education round the world. In this midst of this there is scope for reordering what constitutes urban education through the contributions of South Pacific

theorising. To deny the South Pacific Ocean peoples a presence in constituting and understanding urban education is to deny the intellectual and material resources of these people as being constituents of the European metropolis' knowledge.

Given the post-Cold War socio-historical changes in the trans-national order bearing down on the region, three important propositions emerge from this study of urban education across the post-colonial South Pacific. First, local/global connections are inherent in theorising urban education in the South Pacific. These century-old educational connections continue to be formed between the South Pacific Ocean people and their friends, relatives and corporate employers in Europe and North America. Local/global connections are now sustained between the South Pacific Ocean people working and studying in the metropole and those they leave behind. The electronic flows of money; emails sharing ideas; people's short visits for births, deaths, marriages; family migration chains, and the travels of tourists are integral to South Pacific researchers' theorisation of urban education. These extensive, multi-urban local/global connections provide openings that otherwise might be closed by the forces of provincial theoretical determination (Chakrabarty, 2007). The growing presence of Beijing in the South Pacific is expanding the geographical boundaries of theoretic-linguistic connections beyond the urban centres of Europe and North America. The Chinese presence creates new opportunities for theorising changing urban education in the South Pacific.

Integral to theorising the relationship between urban education and the South Pacific is the creation of a local/global imagination among the Euro-American colonisers and the colonised of a utopian paradise. South Pacific Ocean's peoples fed upon, adapted to, or fought back against the local/global connections these imaginings that were created by Hollywood. The imagination of the urban film industry continues to project its South Pacific imaginary into the global market for cultural commodities.

The local/global forces propelling urban education across the South Pacific are increasingly framed in terms of Beijing's economic interests. These particular economic forces are subject to negotiation among elites within the South Pacific, avoiding local people themselves, but presenting a focus for concern if not resistance to Washington, Canberra and Wellington whose power in the region is degrading. Beijing's economic interests are propelling South Pacific Ocean's peoples to pursue socially contingent processes of capital accumulation and consumerism in the search for new markets for raw materials. From any of the many sites of urban education across the South Pacific connections by air and water fan out in multiple directions, albeit thinning any substance this might give to imagination linking any two sites.

Paris, London, Beijing and Washington feed local/global forces that draw upon, and make themselves felt through the South Pacific. The local/global connection and imagination of the peoples of the South Pacific Ocean exist within these forces. Here, however, it is possible to find a margin of autonomy, sufficient in some instances to ignite change. For instance, Yang (2009: 4) suggests "the South Pacific nation's strong Christian traditions encourage firm anti-Communism." In comparison, the United States, Australia and New Zealand are highly regarded by the South

Pacific peoples, having important aid, disaster relief, sporting, peacekeeping and immigration ties.

Overall, the multiple languages of the South Pacific provide a rich array of concepts, metaphors and images for theorising urban education. However, the possibilities for South Pacific theorising exist in tension with, and are deeply inflected by colonialism and the trans-national re-ordering of the post-Cold War South Pacific. Constituted through these tensions South Pacific theorising seeks to explain urban education arising from governmental claims, the logic of of South Pacific peoples, discrimination against equality, opportunity and languages education (Jourdan and Salaün 2013). As in past, the South Pacific is a really useful site for investigating urban education. This now entails exploring the links urban education has to the critiques of incongruous and disputed concepts such as capitalism and Eurocentrism (McCormack and Barclay 2013). Examining the place of the post-colonial, post-Cold War South Pacific in the changing the trans-national order is indispensable for re-theorising what urban education might now mean. Changing trans-national connections, imaginings and forces are meditating and modifying ways of theorising urban education. South Pacific theorising is part of the wealth of possible alternatives for a rich array of counter- and parallel theorising about urban education. These possibilities continue to exist despite the global dominance of extant theory in English. Working from this starting point, two questions might inspire further investigation. First, how can multilingual researchers in urban education around the world grasp the intercultural divergences their linguistic repertoire provides for theorising? Second, how might extant theories in urban education be provincialized so so to bring to the fore the intellectual value of their contextual embeddedness?

Chapter 50

Urban Education, Work, and Social Mobility in Oceania: World-Systems Patterns, and Limits, for Peripheral Zones

Tom G. Griffiths

50.1 Education, Development, and Social Mobility

A direct relationship between education and projects for national development is so well established in policy that it is difficult to imagine otherwise. Ongoing efforts by the World Bank to present its work, and its loans for education in particular, under the banner of poverty reduction, are illustrative of this dominant discourse (Klees et al. 2012). Similarly, the Millennium Development Goal X.X to achieve Universal Primary Schooling by 2015, while unlikely to be realized (UNESCO 2015), reflects in part the development promise attached to expanded education. Scholars examining the expansion of mass schooling from the ‘world culture theory’ perspective highlight that the claimed or intended link between education and national economic development is a part of the “world polity’s myth of progress” (Ramirez and Boli 1987, p. 155). The argument here is that an identifiable world culture, centred on ideas about the nation-state and extending to ideas about its institutions and how they contribute to state formation, disseminates the view that “formal education is necessary and beneficial for economic growth, technical innovation, citizen loyalty, and democratic institutions, among other things” (Meyer et al. 1997, 149).

A world culture theory perspective locates causation for the expansion of mass schooling, and indeed for other identified areas of educational policy convergence, within a world culture of schooling. Alternative theories arguing for economic (and political economy) causation are dismissed, their rejection based primarily on their supposed inability to account for the simultaneous expansion of schooling across

e-mail: tom.griffiths@newcastle.edu.au

diverse polities, in divergent stages of capitalist economic development (see for example Ramirez 2003). Debate about this question is part of a broader critique of world culture theory within comparative and international education. I will return to this debate below, but want to highlight here the shared, cultural attributes of formal education centred human capital formation for national economic growth, and political formation as citizens of the nation-state (see Griffiths and Arnove 2015, part of a special issue of *Globalisation, Societies and Education*).¹

Understanding human capital theory and its influence on formal education policy and practice, particularly in current times, rests in the post-World War II projects of reconstruction and development. In the context of the cold-war struggle for political and ideological influence, and the dismantling of empires producing newly independent states across the developing world, ideas of universal stages of progress and economic development were embodied in modernization theory. As is well established, Rostow's (1959) articulation of prescriptive and universal stages of economic growth were a significant part of this theorizing, arguing that their achievement was primarily a matter of policy makers making the appropriate "strategic decisions" that would create the conditions for growth, take-up, etc. Investments in education to form the human capital seen as a pre-requisite for a nation-states economic take-off, in Rostow's terms, were just the sort of strategic decision referred to, firmly casting responsibility then for economic growth, progress and modernization onto local political actors, policy makers and populations.

The dependency theory critique of this sort of universal theory of national modernization and development questioned its foundations. Frank's (1966) essay is a classic articulation of the critique, arguing that "the expansion of the capitalist system over the past centuries effectively and entirely penetrated even the apparently most isolated sectors of the underdeveloped world. Therefore, the economic, political, social, and cultural institutions and relations we now observe there are the products of the historical development of the capitalist system no less than are the seemingly more modern or capitalist features of the national metropolises of these under-developed countries" (p. 19). Recent work by Higginbottom (2013) has documented the scope of the net transfer of surplus value from Latin America to core states of Europe and the United States, occurring in large part through direct foreign investment in the region. He concluded that "the basic tenet of the dependency thesis still holds", and that "despite the claimed benefits of neoliberal globalization, Latin America remains not so much a developing continent as one that is being actively underdeveloped by the world capitalist system" (p. 17).

Work like that of Higginbottom illustrates how the capitalist world-economy continues to create and reinforce unequal levels of development within and between states, such that the ongoing growth and development of already 'developed' core

¹The special issue of *Globalisation, Societies and Education* was volume 13, issue 1, edited by Iveta Silova and Jeremy Rappleye (2015): Beyond the world culture debate in comparative education: critiques, alternatives, and a noisy conversation (available here: <http://www.tandfonline.com/toc/cgse20/13/1#.VaSCbmATH8s>).

states and areas of the world-economy is based on transfers of surplus to them, and so requires the ‘underdevelopment’ of peripheral areas. In basic terms, the critique of modernization theory under a capitalist world-system continues in the sense that the social and economic development of peripheral areas is simply not viable without a change in the structure of the over-arching system. The same critique applies to human capital theory where it is tied to promises of national growth and development within the world-economy via the lifting of the national populations level of educational attainment and credentials. Valley and Spreen (2012) report the rise of human capital theory in the 1960s, fading in response to Marxist and Dependency theory critiques in the 1970s and 1980s, only to return in the 1990s. Just as the dominant idea of national development being possible for all has continued throughout this period, pending the application of the ‘correct’ policies, so too has the human capital formation conception of national education prevailed.

The strength of the still dominant ideas of social mobility through education is evident in policy discourse and practice across the world, whether through programs and loans of international agencies to developing countries, or policy in developed areas. Critical scholars like Klees (2008) have reviewed a series of policies prescriptions based in neoliberal capitalist thinking, setting out the case against their utility in terms of improving access and equity in education, and in turn their capacity to generate universal development. But the idea of measuring a rate of return on investments in education, both for individual economic benefits and broader national economic (and social) benefits, prevails as a part of mainstream educational policy, discourse and thinking. In wealthy countries like Australia, an emphasis on individual economic benefits has justified an end to fully publicly funded university education in the late twentieth century, and at the time of writing an unprecedented attempt to de-regulate university fees and reduce public funding to around 50% by increasing students’ deferred fees, and so shifting costs from the State onto individual students (Croucher 2014).

The ongoing appeal of human capital theory for projects of national development is evident across the world, reinforced by international institutions, despite the inevitable difficulties in determining causation in any correlation between expanded levels of education amongst the national population and labour force, and measures of economic growth and development. Critiques of modernization theory drew attention to structural causes of development, and under-development, independent (to some degree) of educational levels. The potentials for investments in education to under-write, or constitute a pre-condition for, growth and development within the existing world-economy, presumably remain tantalizing for national policy makers and for populations. Working from a broader definition of development to include conceptions of social and cultural development (see for example Nussbaum 2012), characterized by some in terms of forming social capital, we might similarly believe in and look to the potentials for mass education to impact on such developments to the benefit of national society.

50.2 A World-Systems Perspective

From a world-systems perspective, efforts to achieve development, and in the cases of many part of the world to embark on some sort of attempt to ‘catch-up’ to the levels of development, and consumption, in the ‘developed’ world, must be seen in terms of the operation and trajectory of the capitalist world-system. Building on the dependency theory critique, Immanuel Wallerstein has maintained the position that any upward mobility by an area or state within the world-economy is only possible via a redistribution of available surplus across areas, and so via the decline of other areas or states in ways that preserve the structural inequality of the whole system (see for example Wallerstein 2005). Part of the argument here is that as the capitalist world-economy expanded and developed, different patterns and forms of wage labor were instituted in the core, semi-peripheral and peripheral zones of the world-economy. The core areas of the world-economy were able to accumulate sufficient surplus, via global commodity chains, and with the support of strong state structures often applying mercantilist policies, to achieve active or passive support for the system and contain political discontent that might lead to class-based unrest, or revolution. Higher rates of fully proletarianised labor with sufficiently high wages and working conditions for a sufficient sector of the workforce, frequently negotiated via institutionalized labor unions, facilitated this stability.

The crucial point here is that the normal operation of the single capitalist world-economy, incorporating ostensibly independent and sovereign states, delivers a disproportionate extraction of surplus value from the peripheral and semi peripheral zones, via a wide range of labor arrangements, through global commodity chains, and through the processes of unequal exchange, to core areas. In effect, the relatively high wages, working conditions, and material standards of living within core zones is dependent on, and subsidized by, this transfer of surplus. It is a requirement of the stability of the world-system. These systemic conditions have direct implications for development projects, and the very goal of achieving development within the world-economy. The apparent limited capacity of national governments to effectively regulate, let alone control, the operation of the world-economy within their national borders, and the ongoing relocation of capital and production to lower-wage areas pressuring governments to provide further concessions to attract and maintain capital investments, further illustrate the problematic nature of any universal development project.

A major characteristic of the capitalist world-system’s operation has been the relocation of capital and production processes to semi-peripheral and peripheral regions, in “the search for low-cost labour forces” (Wallerstein 1983, p. 39), and other favourable conditions, to maintain, restore, or increase profits. The argument here is that as profit rates in particular industries have fallen due to a combination of factors that are inherent to capitalist economics, markedly during periods of global downturn/depression, relocating production to reduce wage costs and lift profits has followed (Wallerstein 1983, 1994). One of the pressures on profits, over time, is the fully proletarianised labour force in the core areas, such that relocating production

to semi-peripheral and peripheral zones has involved “incorporating new workforces destined to be semi-proletarianised” (Wallerstein 1983, p. 39). The historical trajectory of the textile industry is a classic example. It moved over time from being a prestigious and high-value added industry located in the core of the world-economy, dominated by the Dutch in the mid-seventeenth century, shifting to France and England in rural areas with cheaper labour costs compared to its location in Dutch towns, and then English mercantilist policies saw it emerge as the primary site of this high-status industry into the eighteenth century (see Wallerstein 1980, 1989). Subsequent pressures on profits drove the industry to lower labour costs, resulting in either low-wage ‘sweat shop’ modes of production located within core zones, and/or the relocation of production to semi-peripheral and peripheral zones, where it remains primarily located, in countries of Latin America and Oceania, such as Bangladesh, Honduras, Pakistan and China. The once high-prestige industry located in the core and hegemonic powers, is now a high-volume, low-wage industry in the periphery.

The broader world-systems argument is that strategies like this on the part of capital to maintain profits, and the endless accumulation of capital as a defining feature of capitalism, are approaching absolute limits that point to a systemic transition toward an alternative world-system (Wallerstein 2013; Wallerstein et al. 2013). The relocation of production is illustrative, being geographically bound. Moreover, the contradictory effect of this sort of relocation is to promote increased levels of proletarianisation within the semi-peripheral and peripheral zones, accompanied by pressure from labor to increase wages, which in turn impact on profits (for a thorough account of the case of China see Li 2008). This process of proletarianisation via relocated production contributes to the growing rates of urbanization across the world, and with it growing pressures for and rates of mass, urban education, coupled with the promise of development and social mobility through education (Griffiths 2013b).

50.3 Oceania and the World-System

The complex linguistic, social and cultural, and historical diversity of countries and their populations across Oceania make it almost meaningless to attempt to discuss the Oceania region in any way that seeks to identify distinguishing features of the region. Historical experiences of colonial rule under different European powers, and subsequent processes of de-colonisation and national independence, might be obvious characteristics upon which some sense of a shared regional history could be built, but these experiences are radically different. Consider just the experience of Indonesia for example: a former Dutch colony covering an expanse of thousands of islands, with a large multicultural and multilingual population; occupied by the Japanese in World War II; a post-World War military struggle for independence from the Dutch; Independence and Cold-War interference and support for an internal coup; compared with for example the colonial experience of Australia moving from

British colonies to a Commonwealth Federation of states in 1901, with a small population of mostly white European ‘settlers’ (coupled with an Aboriginal population that was still subject to policies of effective genocide), and relatively rich in natural resources, land mass, and preferential trade relations with the former colonial power.

The United Nations includes 25 countries (or dependent territories) in the “macro geographical region” of Oceania, including: Australia, New Zealand, Norfolk Island, Fiji, New Caledonia, Papua New Guinea, Solomon Islands, Vanuatu, Guam, Kiribati, Marshall Islands, Federated States of Micronesia, Nauru, Northern Mariana Islands, Palau, American Samoa, Cook Islands, French Polynesia, Niue, Pitcairn, Samoa, Tokelau, Tonga, Tuvalu, Wallis and Futuna Islands (United Nations Statistics Division 2015). This grouping includes wealthy countries like Australia and New Zealand; formally declared “Least Developed Countries” (e.g. Tuvalu), and multiple “Small island developing states” (e.g. Papua New Guinea, Fiji, Tonga, Vanuatu).

Historical data shows a clear secular tendency towards increased rates of urbanisation across the world. A United Nations (2015) report notes that “Global urbanization is expected to continue, so that by 2050, the world will be one-third rural (34%) and two-thirds urban (66%), roughly the reverse of the global rural-urban population distribution of the mid-twentieth century” (p. 7).

The report highlights differential levels of urbanisation across regions, within the overall trend over time, such that broad areas of Africa and Asia are reported as still having less than half the population living in designated urban areas (40% and 47.5% respectively), compared with Oceania (70.8%) and Europe (73.4%) (United Nations 2015, p. 10). Here again these regional figures for Oceania contain a wide range, such that “the median level of urbanization in Oceania more than doubled from 23% in 1950 to 56% in 2014, but the range of levels across countries in the region remains wide”, with countries like Papua New Guinea having a reported 13% of its population living in urban areas in 2014, compared to 89% in Australia (p. 48).

Looking at participation rates in mass schooling, we see similar patterns across primary, secondary and tertiary education, that are consistent with broader measures of the countries’ human development index (HDI) rankings (see for example United Nations 2013). Australia’s reported HDI in 2012 was 0.938, compared with Tonga at 0.710, or PNG at 0.466 (pp. 148–151). We could continue this exercise to illustrate the diverse levels of ‘development’ using established measures and indicators across the countries and territories formally grouped in the Oceania region. A world-systems perspective insists that both the broad secular tendencies, and the particular manifestations of these within nation-states, be approached and understood in terms of the operation of the capitalist world-economy.

World-systems analysis sees the growth in urbanisation is part of the conventional account of the Industrial Revolution, and associated processes of modernisation, involving: technological advances in agriculture producing less labour intensive production, and promoting large-scale farming squeezing out small, semi-feudal type production; and the associated movements of populations from rural areas to the cities. This process has been uneven, however, with particular characteristics across different zones of the world-economy. The urbanisation and industrialisation processes can account for some parts of the world-economy, including some coun-

tries within the Oceania region, achieving high rates of urbanised, and fully-proletarianised labour (e.g. Australia and New Zealand), while in other countries semi-proletarianised households persist, effectively subsidising production, and profits / capital accumulation, of industry by facilitating lower-wages that those required by fully proletarianised labour (e.g. Papua New Guinea or Tonga). As indicated, these processes are at the heart of one of the key tensions of the capitalist world-economy, as the incremental move toward higher rates of fully-proletarianised labour in low-wage peripheral and semi-peripheral areas, by necessity involves increased wages to fully meet the needs of households, which in turn contributes to future relocations of production.

50.4 Oceania, Urban Education and the World-System

I have emphasized above the process of increased urbanization, linked to the historical spread and development of the capitalist world-economy. In a general sense this is about the movement of populations, over time, from rural areas and agricultural work, to cities and urban areas in search of non-agricultural work; coupled with developments in the global division of labour across ostensibly independent nation-states within the world-economy. The growth of urban populations, involving semi-proletarian households and longer-term moves towards fully-proletarianised labour, clearly underpins the phenomenon of ‘urban education’ that this volume is concerned with. From its United States origins, the concept of urban education has been associated with the study of schooling in areas catering for poor, working-class, low socio-economic status, disadvantaged students. The multiple literatures associated with this phenomenon are extensive, ranging from the study of systemic, curricular and pedagogical forms and practices and their impacts on identified equity of disadvantaged groups. Underpinning much of the research in these areas is the idea, stemming back to Bowles and Gintis’ (1976) work, that formal schooling reproduces social inequalities present within capitalist societies. As is well known, extensive and ongoing debate ensued with respect to how and for who schools played this reproductive role, contributing to the creation and evaluation of a wide range of interventions, reforms and practices aimed at reducing (if not overcoming entirely) inequitable experiences of social groups within formal systems of schooling.

The broad field of critical pedagogy, or critical education, has been a major contributor to analyses of the roles of formal schooling in (re) creating, maintaining, strengthening, and legitimizing, social inequalities, and imagining alternatives (see for example Darder et al. 2008, 2015). From a world-systems perspective, any question of education’s potential contribution to improved social mobility of students, including those in identified equity or disadvantaged groups, in urban schools, must consider what is possible for the nation-state in question and the share of global surplus value it receives within the capitalist world-economy. This sort of analysis will almost inevitably point to the limited capacity of education systems in many, if

not most, parts of the world to deliver on their promises of upward social mobility through education, and of meritocratic systems providing this opportunity. This is seen even in core areas of the world-economy, with growing rates of unemployment for those with and without educational credentials, and seemingly irresolvable pressures on the State in these countries, and countries everywhere, to reduce public spending while managing pressure from populations, and from capital, to increase spending on social services, and on infrastructure to subsidise business activity and profits respectively (Wallerstein 2013). In Randall Collins' (2013) characterisation, "The mass inflationary school system tells its students that it is providing a pathway to elite jobs, but spills most of them into an economy where menial work is all that is available unless one had outcompeted 80% of one's school peers. Now wonder they are alienated" (p. 53). In peripheral areas, the promises continue to lose credibility in the face of relentless poverty, unemployment and conflict. As Fagotto (2014) reported in the case of Nepalese youth leaving home to work (and to tragically die) in Qatar, "Remaining in Nepal is not an option. 'In this country it doesn't matter how much you study, you will never get a job' he says" (p. 10).

For Wallerstein, the collapse of historical socialism, and the broader decline of the 'Old Left' as a vehicle for delivering social mobility and improved wellbeing, is symptomatic of a deeper, world-systemic failure of these sorts of promises – the promises of liberalism as a cultural framework for the world-system. The argument here is that while the Old Left, anti-systemic and national liberation movements once offered an alternative pathway to national development (Wallerstein 2005), and in the case of so-called 'under-developed' states the promise to 'catch-up' to levels enjoyed in 'developed' countries, their failure to deliver these promises amounts to a loss of this sort of systemic safety valve, "the collapse on constraints on the dangerous classes" (Wallerstein 2005, p. 1273).

What role can urban schools play under such conditions? Continuing to work towards, to advocate for and advance the meritocratic promise, equitably distributing the allocation of educational credentials and the associated socio-economic rewards, would clearly be a positive step, and a move towards more socially just education systems. However, while achieving such an outcome continues to evade education systems to varying degrees, under existing conditions its achievement would amount to an equitable, unequal distribution of socio-economic rewards (see for example Griffiths 2009, 2013b). In peripheral zones of the world-economy, like some areas of the Oceania region, this sort of reform agenda is insufficient to both offer meaningful hope, and to deliver desired levels of health, security, meaningful employment and consumption. The argument here is to look more ambitiously beyond equity, towards alternative, more equal and more just, ways of distributing available socio-economic resources between and within nation-states.

Of course statements like this risk being immediately dismissed as (utopian) slogans, unrealistic ambitions insufficiently elaborated. At the time of writing Greece, for example, had achieved majority support for its rejection of mandated austerity from the European Union's Central European Bank, but struggled to elaborate an alternative within the constraints of the EU and its policy frameworks. The

so-called 'Grexit' (Greek exist from the EU) was put forward by some groupings, but was opposed by the majority of the anti-austerity Syriza government. These struggles highlight the difficulties of detailing alternative systems from within the structures, the cultural framework, the hegemonic discourses, of the capitalist world-system, in operation for over 500 years. Identifying inequalities, injustices, in all of their manifestations, is the relatively easier task, but the ongoing documentation of these highlights the need to at least adopt of two-pronged strategy of seeking to ameliorate these and minimise harm in the short-term, alongside efforts to influence systemic and structural change in ways that can remove the need for amelioration (Wallerstein 2011).

Urban education will continue to confront socio-economic disadvantage, inequality, and inequity, to varying degrees. And the potential for formal schooling to provide a pathway out will continue to depend on local initiatives, policy frameworks, teacher training, education funding, etcetera. But these conditions and possibilities, within Oceania and elsewhere, are constrained by the operation of the capitalist world-economy, and it's defining unequal distribution of surplus value and endless accumulation of capital, which have built and reinforced the structures of inequality between core, semi-peripheral and peripheral nation-states. World-systems analysis insists that we acknowledge and seek to understand this macro framework, its historical and current operation, and the constraints it places on attempts to deliver the long-standing promises of national development, and improved individual social and economic wellbeing.

In other work I have begun the task of trying to imagine how mass education could contribute to the longer-term project of influencing the transition of the current capitalist world-system towards a more just, equal, peaceful and democratic alternative (Griffiths 2013a). The intent there draws on Freirean and critical education ideas, to consider how education might contribute to broader social movements, by forming students with the required knowledge, skills and dispositions to participate in such movements, for systemic change. Some 20 years ago Wallerstein (1995) wrote:

You may think that the program I have outlined for judicious social and political action over the next twenty-five to fifty years is far too vague. But it is as concrete as one can be in the midst of a whirlpool. I have said essentially two things about life in a whirlpool. First, know to which shore you want to swim. And second, make sure that your immediate efforts seem to be moving in that direction. If you want greater precision than that, you will not find it, and you will drown while you are looking for it (p. 271).

While arguments like this, as a guide for action, are frustratingly short on detail, world events in the intervening 20 years also continue to demonstrate the capacity for movements of people to act on the world under historically specific and diverse conditions, moving or at least looking toward the shore of a more just, more equal, more democratic and more peaceful world. Politically engaged educators within Oceania can maintain such a perspective in their daily work, organise and advocate for such a perspective with colleagues, and incorporate this into our curricular and pedagogical interactions with our students.

Chapter 51

Middle-Class School Choice in the Urban: Educational Campaigning for a Public School

Emma E. Rowe

51.1 Introduction

Educational campaigning has received relatively little attention in the academic literature. This chapter draws on an ethnographic study of long-term and organised urban campaigns that are collectively lobbying the Victorian State Government in Australia, for a new public high school to be constructed in their neighbourhood (Rowe 2014, 2015, 2016).¹ I draw on these campaigns—not to ascertain a simplistic response as to whether they require a school or not—but rather to make important contributions for theorising middle-class school choice within the urban space.

It is important to note that in this chapter I draw on research to represent a distinctly Australian perspective, and yet this perspective is couched within an urban lens. Australia is a geographical landscape that is well known for its vast distances, its rurality and remoteness, and this impacts on schooling in myriad ways (Collins et al. 2000; Gale et al. 2015). In Australia, whether a school is rural or remote is a key indicator of school-level disadvantage, an indicator that is measured and presented via a numerical ‘score’ for school choosers (see, www.myschool.edu.au). Residents living in Australian rural areas retain far fewer options when it comes to ‘local’ secondary schools (Angus 2013; Doherty et al. 2013). Indeed, overarching government policy maintains that a local school—or one that is reasonably accessible from your place of residence—is a school located within 80 km from your home (ACARA 2014). This is relevant for thinking through the arguments that I present in this chapter.

¹This chapter is based on a larger ethnographic study, see Rowe (2016).

The campaigners in this study contend that the available public schools in their surrounding locale are simply “too far away”, at a distance of over 5 km (equivalent to 3 miles). This points to how, in the context of the urban, distance becomes heightened and concentrated. Urban space and urban schooling is highly conflicted, contested and disputed. As opposed to vast rural and remote spaces, distances within the urban are magnified by school zones and intake boundaries, marked out and territorialized via the politics of school choice.

Within the Australian urban, the inner-city has experienced dramatic social shifts and large-scale retreats to the neighbourhoods, often characterised as ‘white flight’ as parents flee from inner-city schooling (Campbell et al. 2009; Gulson 2011). This retreat is reinforced by contentious policies surrounding inner-city schooling. In the State of Victoria, mass-closures of public high schools occurred in the 1990s under a conservative government, with many of these schools located in the inner-city. Hundreds of public schools were closed within inner-city neighbourhoods and thousands of teachers dismissed, as the government proclaimed a so-called ‘education revolution’. The mass closures and the context of privatization is particularly relevant for this study, as each parental campaign is located in a neighbourhood which experienced a public school closure. Policy-makers claimed that inner-city schools were under-utilised (Spaull 1999), however, after waves of gentrification and reversal ‘white flight’, evidently there is a renewed interest in inner-city schooling. These urban movements are reiterated in research from the United States (Posey-Maddox 2014) and the United Kingdom (Reay et al. 2013), as urban inner-city public schools regain renewed interest from middle-class parents.

This is a significant context for thinking through the arguments that I present in this chapter. In this chapter, I make three key arguments: first, educational campaigning is a contemporary middle-class school choice strategy; second, the urban city space is generative of these educational campaigns, and how these choosers engage with school choice. Each of the campaigns is located within 10 km of the urban city centre, in a recently gentrified neighbourhood. Third, in order to explore these campaigns, it is necessary to rethink critical questions surrounding the spatial, such as gentrification, and the conceptualisation of the ‘local’ and the ‘community’ school.

Principally, I argue that educational campaigning is a contemporary middle-class school choice strategy. This has not been argued for previously in educational research. These campaigns present notable and interesting interventions in how we think about urban school choice and educational campaigns. Educational campaigning for public schools is routinely positioned in the literature as a tool of social justice, empowerment or resistance (Buras 2012; Lipman 2011; Mirza and Reay 2000; Warren and Mapp 2011). Thinking about these campaigns via a lens of choice is important for the extension of school choice and social movement scholarship, critical policy making and the critique of funding differentiations between schooling sectors.

51.2 The Middle-Class and School Choice

There is a wide breadth of research regarding middle-class school choice strategies. Collective campaigning differs to the choice strategies that have been previously argued for in scholarly works and denotes a contemporary middle-class strategy, one that has significant ramifications for government policy.

In thinking about the middle-class and choice, there is a danger in imagining the middle-class as a homogenous group. Due to the ever-increasing income differences between high and low earners, but also the rapid changes to the work-force, there are growing disparities and distinctions between the middle-classes (Campbell et al. 2009; Reay et al. 2011). In Reay et al.'s (2011) study, they refer to these differences as horizontal, vertical, geographical and political. There is a blurring of distinct categories, if measured primarily via employment or income levels. However, a key commonality of the middle-classes is their relationship to education which the authors argue “has become a central mechanism of white middle-class identity formation” (p. 19). This argument is also reflected in Campbell et al. (2009) who contends that the urban middle-class in Australia is increasingly defined by their “connection to schooling ... and the distinctive ways in which middle-class parents manage children and their schooling” (p. 18).

It is well demonstrated in the research that middle-class choosers are highly strategic and long-term planners (Ball 2003; Campbell et al. 2009). Middle-class parents rely on ‘hot knowledge’ and word-of-mouth to determine reputable schools (Ball and Vincent 1998; Reay et al. 2011; Rowe and Windle 2012). White, middle-class parents may work strategically together to acquire a ‘collective mass’ enrolment within an ill-regarded comprehensive school, in order to ‘turn it around’ and ensure success for their children (Posey-Maddox 2014; Posey-Maddox et al. 2014).

Choice practices are inherently spatial in that a school-of-choice is the means to construct spaces of distinction and also, social and cultural distance from working-class schools (Reay 2007; Reay and Lucey 2004). There are geographical “circuits of schooling” (Ball et al. 1995, p. 52) and middle-class parents navigate the educational market in a strategic way, similarly to how they navigate the housing market. Gentrification is a derivative of these movements (Butler and Robson 2003; Rowe 2015).

Research based in the United Kingdom and the United States has demonstrated strong relationships between spatial arrangements and schooling (e.g. Ball et al. 1995; Ball and Vincent 2007; Butler and Hamnett 2007; Gulosino and Lubienski 2011; Lubienski and Dougherty 2009; Lubienski et al. 2009; Reay 2007; Taylor 2001). In order to obtain a perceived higher quality of state funded education, studies show that parents are willing to pay more for houses enabling access to state-funded school-of-choice (Lubienski et al. 2013; Reay et al. 2011; Reay and Lucey 2004) and further, parents are willing to geographically relocate (Butler and Robson 2003; Robson and Butler 2001).

However, the point of difference in this study is that rather than relocate for a desirable school, the parents are collectively pushing for and pressuring the government for a brand-new local public high school. This contains implications for educational policy and funding in the context of ongoing privatization.

51.2.1 *Collective Strategies for a Public School*

The Australian public school is also known as a state school, government school, or an ordinary comprehensive school. It receives the majority of its funding from the State and Federal (central) Australian Government,² and is generally regarded as ‘free’ education, in comparison to a private school. Whilst the campaigners frame their requests as for a ‘public school’, their primary appeal is for a local school in their community. The school must be located within 2 km from their home (equivalent to 1.24 miles) and be accessible on foot or bike.

In the act of lobbying for a public high school, these campaigners represent a divergent choice. In a highly differentiated and privatised school system, like the one in Australia, those parents who *can* choose are increasingly choosing to send their children to the private school. The private system is made up of two separate sectors—the Independent and the Catholic sector. Consumer demand for the public school has significantly declined over the last 10 years, as demonstrated by the Australian Bureau of Statistics:³

The number of students in private schools has increased by more than the number of students in public schools ... since 2000 the number of students in private schools has increased by 21 % compared with an only 1 % increase in students attending government schools. (ABS 2011)

This “consistent increase” is firmly substantiated in the Gonski Report (2011), with the Independent sector recording the largest proportional increase (14 %), in comparison to both the Catholic (6 %) and public school (2 %). Despite this evidential decline, the Australian public school currently educates the majority of the population (66 % of the population) (Gonski et al. 2011). Considering that the public school educates the majority of the Australian population, it is critical to consider how parents are engaging with, and choosing the public school.

An important distinction that can be made in regards to private/public is the composition of the student cohort. Australian public schools educate the majority of students within the lowest quarter of socio-educational advantage. Compared to the Independent sector, which educates 13 %, the public school educates 36 % of the bottom quarter. This is described by Gonski et al. (2011) as follows:

²The Australian public school receives a total of 95 % of its total funding from both forms of government (the state and the Federal Government, which is the central form of government).

³I substantiate these statistics further in my book (see Rowe 2016), drawing on raw ABS data to quantify sector-based school choices, since 1980.

Of all students in the lowest quarter [including the lower and middle two tiers] of socio-educational advantage, almost 80 per cent attended government schools ... Government schools provide for a high proportion of Indigenous students and students with disability. In 2010, 85 per cent of all Indigenous students attended government schools ... Seventy-eight percent of students with a funded disability attended government schools... 83 per cent of students enrolled in schools in remote and very remote areas attend government schools. (p. 10)

Even though public schools are mired in disadvantage when considering the overall scale, urban public schools are highly differentiated on the basis of their locality (Lamb 2007). Urban public schools characterised by disadvantage are routinely located in high-poverty neighbourhoods and Teese (2000) refers to these as “sink schools” or “residualised schools” (p. 189).

In Australia, government policy theoretically enforces accessibility of public schools, allegedly free and open access. Parents retain automatic access to the school measured as closest to their residential address. This is referred to as the ‘school zone’ or ‘catchment area’. Parents are able to enrol in any government school of their choosing—even if it is outside of their ‘zone’—provided the institution has sufficient places. However, for certain public schools, demand far exceeds places available. These are “high-demand” public schools. For these schools, your residential address operates as the principal mechanism of exclusion and inclusion. In the contemporary market-place, in the context of under-funding, under-supply and privatization, the savvy consumer-citizen utilizes residential address to acquire enrolment in the high-demand public school, fundamentally driving segregation across the urban public schooling sector.

51.2.2 *The Study*

In this study, data was generated via participant observation, face-to-face interviews, campaigner material (such as their support letters and website data) and newspaper reports. The study also generated statistical and visual data, in the form of maps, photographs and statistics (see, Rowe 2016).

The participants in this study are white, Australian-born and first English speakers; the majority are university educated and employed in professional, or upper managerial employment positions; the majority own a home, in a neighbourhood that records higher income levels, in comparison to the State median. The majority identify as progressive, politically left and atheistic. For those participants who identify with a traditional religion, they also identify as non-practicing.

I provide a map to show the location of each parental-based campaign⁴ and the proximity of surrounding schools (see Fig. 51.1):

⁴All names of schools, neighbourhoods, campaigns and participants are pseudonyms, in the interests of ethical research. These maps were originally published in Rowe (2016).

Fig. 51.1 A map of the campaigns

Collective campaigning is part of these choosers tool kit, despite the extensive time commitment that it requires. Collective campaigning necessitates a long list of sizeable, organised and sustained activities. The campaigners are committed to their cause, with a sustained effort spanning over 10 years. Each campaign alleges they have a database of over 1,500 members however, my observation documented a range of 10–25 members, per meeting. The campaigners meet once a month as a collective, and have been doing so for over 12 years. They also meet monthly with bureaucrats from the Department of Education.

Fig. 51.2 “This village needs a high school”, the Smith High Campaign

The campaigns are politically active and attract political attention, such as formal meetings with the State Minister of Education or the opposition Minister. Each campaign maintains a social media presence, in the form of a professionally-designed website and a Facebook page; they independently conduct research, such as surveys or questionnaires, and publish and compile these results for public viewing. For example, the Smith High Campaign produced a 36-page survey that included 267 responses to 4 questions. This was published and made available to the public on their website (Smith High Campaign 2013). The Lawson High Campaign produced a 44-page research document in support of their goals and made this available for download on their website (Lawson High Working Group 2009).

Each campaign elicits donations from individuals and businesses, including banks, real estate agents and property developers. The Smith High Campaign has featured on television and frequently on radio. There are over 40 support letters available on their website, written by individual campaigners, local businesses, political representatives and so on. The campaigner's commitment to the cause is considerably evident, over a long-term period. Indeed, the main spokesperson for the Smith High Campaign said to the mass-media, 'it is full time job' (Topsfield 2012).

In calling for a new urban school and utilizing defined measurements, the space itself takes on a proliferation of identities, from an inner-city neighbourhood to a community, a learning community or a community hub, and conceptualized here by the Smith campaigners as a 'village' (see Fig. 51.2).

The neighbourhood may merely represent a locality within a larger city environment, and in the global sense, these are miniscule spaces, but this points to the paradox of urban space in hyperglobalist terrain. Urban spaces are reduced and magnified in equal measure, in the demand for public resources. They are reduced to the more romanticized sense of space (community and village) and yet they are magnified in

the sense that certain surrounding neighbourhoods represent intractable distances for certain school choosers (Rowe 2016). This resonates with Robertson's (1995) original thesis regarding 'glocalization'. As globalization grows, the modern consumer increasingly requires the differentiation of consumption goods. This can be readily translated to the increasing differentiation of public schools in the market-place for the discerning consumer, such as the variety of specialized charter schools, Independent public schools, or partnership schools. Beck (2002) extends upon 'glocalization' as a critical lens for thinking about globalization:

The first is that globalization is about globalization. This isn't true. Globalization is about localization as well. You cannot even think about globalization without referring to specific locations and places. One of the important consequences of the globalization thesis is the recovering of the concept of place. (p. 23)

As globalized neoliberal policies promote choice, competition and privatization, the government-funded and local urban school takes on renewed significance, particularly for savvy school choosers, or the 'consumer-citizen' (Peters 2004). This is elucidated by the participants long-term and dedicated pursuit for their school-of-choice, despite the proximity of surrounding schools, but also the 'back-up' option that many participants discuss, in case the campaign is not successful. Their 'back-up' option reveals an additional breadth of strategies. If they do not receive a school in their immediate locale, interview participants discuss the possibility of relocating for a desirable public high school; are willing to lie about their residential address; or, pay the fees for a private school. Interview participants also discuss expensive and multiple waiting lists for prestigious schools, as soon as the children are born; musical instruments and second languages, to acquire access into elite schools; entry examinations and private tuition (Rowe and Windle 2012).

However, their primary strategy is to lobby and pressure the government for a brand new school within 2 km of their residence. In making their claims, the campaigners rely on an argument of distance and geography. There are multiple schools in their surrounding neighbourhoods, but campaigners claim they are 'too far away' or that certain schools are over-subscribed. But these are arguably smokescreens for preferences (see, Fig. 51.1). Indeed, schooling within the urban space provokes a sense of false commonality but also conflict, the constant clash between homogeneity and heterogeneity (Robertson 1995). Massey (2005) writes,

...the very fact that cities (like all places) are home to the weavings together, mutual indifferences and outright antagonisms of such a myriad of trajectories, and that this itself has a spatial form which will further mould those differentiations and relations, means that, within cities, the nature of that question—of our living together—will be very differentially articulated. *The challenge of the negotiation of place is shockingly unequal.* (p. 169, my emphasis)

It is in the inner-city public schooling market that the politics of urban space is highlighted and wrought out, as affluent and savvy consumers aggressively pursue desirable public schools, within a compacted and under-funded market. It is in this

space that class lines are clearly and tangibly drawn, demonstrated and underlined by school zones and intake boundaries (Leonardo and Hunter 2007). The schools surrounding the campaigners are ‘known’ through a lens of race, poverty and social class. Indeed, it is not simply the stratification between “good” and “bad” schools—it reaches beyond that to the urban space in which the school is positioned, and how this space is characterised by school choosers.

51.2.3 *The Collective Identity: Gentrification and Community*

Gentrification is an en-masse movement of middle-class residents into a specific neighbourhood, during a particular period of time. Not only do the new residents reconstruct a type of collective identity, but so too does the gentrified locale. This is suggested in Glass’s (1964) description of gentrification. The incomers reclassify the social character of the district, to set it apart from what it *was*. *The school market is adept at conjuring this particular sense of collective identity—an homogenous social imaginary—played out as an idealistic ‘community’ school.*

The new inhabitants share similar sociological characteristics and this speaks to a form of collective identity—one that is underpinned by class and race. I argue that celebration of the ‘local’ and the ‘community’ garner traction via gentrification, and this produces a type of collective identity. Bourdieu (1999) provides a starting point, in speaking to the ‘local’:

The ability to dominate space, notably by appropriating (materially or symbolically) the rare goods (public or private) distributed there, depends on the capital possessed. Capital makes it possible to keep undesirable persons and things at a distance at the same time that it brings closer desirable persons and things (made desirable, among other things, by their richness in capital), thereby minimizing the necessary expense (notably in time) in appropriating them. Proximity in physical space allows the proximity in social space to deliver all its effects ... (p. 127)

For the urban newcomer, or the ‘gentry’, the local becomes valuable but only in so far that it enables better consumption of capital, and reinforces social and cultural distance from the *other*. It is through this lens that the notion of community (or perhaps, the celebration of community) gains traction. Research suggests that the celebration of community emerges after processes of gentrification (Howe 2009; O’Hanlon and Sharpe 2009; Zukin 1987). For the newly migrated residents, the neighbourhood *develops* distinctiveness, character and social identity (Bridge 2001; Cole 1985; Winters 1979). The school is a fundamental space in which to extend upon these perceived differences and augment distinction. This is an act of class power and the ‘reclassification’ of taste, as Bridge (2001) writes:

Those with social power have a monopoly over ways of seeing and classifying objects according to their criteria of good taste. The ability to create new systems of discernment is

class power. Gentrification can be seen as one such reclassification (away from the working-class city and the desirability of the middle-class neighbourhoods) in which inner urban living became once again invested with ideas of status, style and cosmopolitanism. (p. 92)

Occupying land is an act of distinction (Bourdieu 1984), in that the occupiers seek to distinguish themselves from their working class history, through aesthetic choices and consumption. Urban spaces are associated with particular social identities or groups—and this is frequently conveyed via slang, such as ‘trailer trash’ or ‘chav’, ‘hipster’ or ‘snob’, ‘bogan’—and this social identity is connected to dominant consumption points or the way in which a person dresses themselves, how they speak, or the car they drive. These are all related to class.

Research also connects gentrification with an increase in political activity and left-leaning politics (O’Hanlon and Sharpe 2009) and formation of collective action (Auyero 2003; Foweraker 1995; Paley 2001). Foweraker (1995) describes collective action as representing “a search for solidarity values, primary relations and community” (p. 12). Arguably, there is a strong interaction occurring here between gentrification, celebrations of community and collective action. Collective action is motivated by thematic conceptualisations of community and emerges after an active process of localised gentrification. ‘The local’ and ‘community’ public high school serves as a symbolic representation of shared values and identity.

51.3 Conclusion

This chooser in this study demonstrates certain choice behaviour. They are early choosers, long-term planners and child-matchers. They are highly strategic. These findings are not new and have been well-demonstrated in previous research (e.g. Ball 2003; Campbell et al. 2009; Reay et al. 2011). However, collective campaigning differs to the choice strategies that have been previously argued for in scholarly works and denotes a contemporary middle-class strategy, one that has significant ramifications for government policy. Collective campaigning is part of these choosers tool kit, despite the extensive time commitment that it requires. As part of their collective campaign, the lobbyists engage with collective and individual political tactics, including swinging voting; meeting with the Department of Education; and engaging with politicians and other core decision-makers to change, rather than exit the system.

A collective campaign for a public high school is a choice strategy that occurs within the context of the urban, and the urban is generative for thinking through how educational policies play out in absolute space. The relationship between geographical location and disadvantage is evident (Collins et al. 2000; Gale et al. 2015; Gonski et al. 2011), and there are far fewer schooling options in the Australian rural and remote in comparison to the urban (Doherty et al. 2013). Within the urban, matters of space are amplified and intensified. Whilst school choosers rely on arguments of proximity and axioms of choice, the local community school is fundamentally involved in the formation of *distance*. The distance comprises far

more than physical distance, rather it concerns “material and cultural distance” (Reay 2007, p. 1192). The school constructs modes of inclusion and exclusion within an absolute space.

It is the neoliberal policy environment that set up these tensions and it must be emphasised that the valuing and agitation for a local community school is not a mechanism of social exclusion in itself. Unregulated competition and choice contributes to increased segregation and division between schools, but also, between geographical locales.

Peters (2004) contends that the most significant problems faced by the British government in 2020 would be the pressures placed on public services. As the citizen is increasingly positioned as a consumer within neoliberal constructs, the citizen will be motivated to express their dissatisfaction via lobby groups and collective protest. Power will be distributed to collective protests as they express political views, through frameworks of consumer choice.

Due to the exaggerated differences between schools (e.g. difference in funding levels), certain public schools are considerably more attractive, than others. The difference in desirability is, in fact, so considerable that parents are willing to engage in longitudinal campaigning commitments, which necessitate their time and money. The social composition of the school is a fundamental facet of this equation, and segregation is clearly playing out across the urban public school sector. Schools that contain an increased concentration of higher socio-economic status students are significantly more preferable for the participants in this study, who are willing and able to collectively draw on political, cultural and social resources to influence the policy landscape.

Chapter 52

Two Worlds Apart: Indigenous Community Perspectives and Non-Indigenous Teacher Perspectives on Australian Schools

Jay Phillips and Allan Luke

52.1 Introduction

We write this piece from Australia where we reside, respectively on the traditional lands of the Tubbagah People of the Wiradjuri Nation (in New South Wales) and those of the Turrbal People (in Queensland). This chapter is itself the artefact of Indigenous/non-Indigenous research collaboration. Jay Phillips is a Wakka Wakka Gooreng Gooreng woman and educator from southeast Queensland who is now the Head of the School of Indigenous Australian Studies at Charles Sturt University, New South Wales. Allan Luke is Chinese-American by birth, an Australian/Canadian citizen and has worked in Australian educational research, teacher education and policy for three decades, with collaborations with Indigenous students, educators, and scholars. Here we report on a cornerstone study from a major, Australian government funded evaluation project that we worked on as part of an Indigenous/non-Indigenous, multinational and multidisciplinary research team (Luke et al. 2011, 2013). We approach this task from a shared interest in critical Indigenous studies of teacher education and school reform.

There are well-trodden paths we could follow to introduce international readers of this *Handbook* to the education of Australia's Indigenous peoples: Aborigines and Torres Strait Islanders. We could start from a genocidal history of invasion, incarceration, residential schooling, forced labor, political and economic marginalisation. We could review current analyses of the effects of this history on traditional lands, Indigenous health, cultural and linguistic sustainability, economic and

political participation, and education – noting the performance ‘gaps’ in schools on all conventional measures (Department of Education, Employment and Workplace Relations 2012). We could begin from scholarship on Indigenous epistemologies and Aboriginal knowledge (e.g., Nakata 2007; Martin 2008), Indigenous re-appropriation of critical theory (Moreton-Robinson 2008), and powerful pan-Indigenous models of decolonisation (e.g., Smith 2012). Indeed, an overview of significant reform agendas proposed by leading Aboriginal educators (e.g., Sarra 2012; Yungaporta 2007; Pearson 2009) might provide grounds for our study. These are all vantage points for looking at the vexed relationship between Australian Indigenous children, students and youth, their Elders, parents and families and communities – on the one hand – and mainstream, predominantly White, Australian schooling in a period of test-driven accountability – on the other. Further, on the basis of the reception to presentations of this work to Canadian, American and Chinese educators – we surmise that there would be points of comparison in the histories of Indigenous peoples elsewhere.

Our evaluation studies of Indigenous school reform lead us to a different starting point: listening to, hearing and engaging with the commentaries, voices, narratives and analyses of Indigenous community as they discuss and recount their experiences and current encounters with Australian state schools. Here we undertake a contrastive documentation of the views of Indigenous community members, Elders, parents, education workers, and young people and, indeed, of the views of their non-Indigenous teachers and school principals. This is a dramatic picture of two distinctive cultural lifeworlds, communities and worldviews in contact, of two very different ‘constructions’ by participants of a shared, mutual experience: everyday interaction in the social field of the Australian school. Taken together, our Indigenous and non-Indigenous participants repeatedly confirmed and corroborated a key theme: that Indigenous peoples continue to be viewed and ‘treated’ through the lens and language of cultural, intellectual and moral ‘deficit’.

52.2 Background

One of the great mythologies of Indigenous education and educational research is that there is a singular, homogeneous entity of the ‘Indigenous Community’. This is a convenient fiction that enables stereotyping and misrepresentation of elements of Indigenous lifeworlds and the misrecognition of complex power relations and generational histories within communities. It also can lead to reforms at the system and school level where a single Indigenous ‘voice’ is elicited, taken as a reification of a singular ‘Aboriginal’ community, nation, view or standpoint, as Indigenous teachers, educator and community workers here report. This chapter documents the diverse and complex views of Aboriginal and Torres Strait Islander community members on schooling, teachers and principals in several metropolitan, regional and suburban communities.

Our study examined the following topics:

- Indigenous community Elders' and parents' views on the schools' engagement with local communities;
- Schools' variable impacts on the community;
- Indigenous students' educational experiences and relationships with the school, its operations and messages;
- Indigenous students' aspirations, outcomes and pathways through and from the schools; and,
- Indigenous teachers' and education workers experiences and relationships inside the school, and with community engagement initiatives.

It is derived from a 4 year longitudinal, empirical Australian study of Indigenous school reform (Luke et al. 2011, 2013). This larger, umbrella study describes the operations and effects of a national network of 127 schools working under anti-racist and inclusive education agenda established by Aboriginal educator Chris Sarra (2012). A comparison group of 74 schools was also studied. The combined corpus of systemic achievement and attendance data, survey, interview, and focus group data, and observational field work is the largest empirical study of Indigenous schooling in Australia to date. The community-based research reported here was undertaken as the epistemological, cultural and sociological starting point for the larger study. Our intent is to take Indigenous community voices and perspectives as the starting point, vantage point and perhaps, vanishing point for school reform.

In 2012, data were collected from four Indigenous communities in metropolitan, provincial and regional/rural New South Wales and Queensland. Interviews and focus groups were conducted with 85 participants: 54 students, 18 parents, Indigenous Education Workers (IEWs) or volunteers, 10 community members and 3 Elders. The metropolitan community is located close to a major capital city. It is also a regional hub for funding and services for Indigenous health, welfare agencies, and legal and community support services. There is one large middle/secondary school with 6% Indigenous students, and four (4) affiliated elementary schools enrolling between 5% and 8% Indigenous students. The provincial and regional/rural areas have two larger schools (8% Indigenous; 39% Indigenous), six affiliated elementary schools in total with between 4% and 12% Indigenous students, and one additional comparison school. *The majority of all Australian students of Aboriginal and Torres Strait Islander cultural backgrounds are enrolled as minorities in urban and suburban schools* (Department of Education, Employment and Workplace Relations 2012).

In accordance with established cultural protocols for conducting research with Indigenous communities (Australian Institute of Aboriginal and Torres Strait Islander Studies 2012; cf. Kovach 2009), all data was collected by Indigenous researchers familiar with and known in the communities in question. Interviews and focus groups were conducted with local parents, community workers, including those working in cross-sectoral agencies (e.g., social services, Indigenous non-government organisations), Indigenous Education Workers (hereafter, IEWs), and students. To augment these data sets, we also undertook a parallel analysis of qualitative and quantitative data collected for the larger study. This comprised an

additional 76 interviews collected from IEWs, teachers, counsellors and Elders, parents and students, and survey responses from 10 Indigenous principals, 34 Indigenous teachers, and 13 IEWs, teacher aides and ancillary support staff. This second set of interviews was *not* conducted exclusively by Indigenous researchers. We use them to triangulate and exemplify key themes and issues. While this is not a representative sample of Australian schools, then, the composite data sets are the most extensive corpus of interview and survey data from Aboriginal and Torres Strait Islander peoples about education to date. All interview data were transcribed and reviewed using both NVivo and conventional open-ended, axial coding methods. In this way, recurring themes and propositional claims were identified.

52.3 Teachers Talk

To set the scene for community views – we begin with a reanalysis of key findings from the 2010 survey of 233 non-Indigenous teachers of Indigenous students undertaken as part of the larger study (Luke et al. 2011). On one key item, teachers were asked about the advice they would offer new teachers about the Indigenous students in their schools. The NVivo analysis of the teacher short answer data from 233 respondents was characterised by frequent statements of self-doubt, and lack of knowledge about the local cultural and historical context of their schools. A process of axial coding was undertaken with a series of analytic cycles. The codes (see Fig. 52.2) represent the dominant views of respondents – qualitative comments from an individual respondent could contain multiple references. Figure 52.1 shows the ‘coverage’ for each code as a percentage of the entire dataset (i.e., all qualitative teacher comments).

Following Bishop and Berryman’s (2006) prototypical work with New Zealand teachers working with Maori students, we classify those attributions of educational performance to home/community/student/culture as deficit explanations. As shown in Fig. 52.1, when teachers were asked ‘what would you advise new teachers to your school?’ in relation to working with Indigenous students, 45.9% of the suggested advice was characterised by a focus on the remediation or fixing of students, community, culture or home. We use the term ‘deficit discourse’ to refer to those teacher comments that implicate student, home, community or cultural ‘lack’, specifically where teachers cite these ‘issues’ and ‘problems’ as the most important influences on Indigenous students’ learning. For example:

- “lack of support for learning at home”
- “psychological issues from home”
- “poor food choices”
- “family background, peers”
- “motivation to perform”
- “community issues that come in with the students”
- “low self-esteem”

Fig. 52.1 Teachers comments coded by theme: what would you advise new teachers?

- “they [Indigenous students] blame everything that happens to them on that person being racist. They are not prepared to accept that they are responsible for their behaviour”
- “culture, home life, how students’ families and community value education, and self-esteem.”

Teachers placed markedly less importance on institutional factors as significant determinants of Indigenous student achievement and success, e.g., *curriculum and pedagogy* (7.7%), *identification of systemic barriers/programs* (16%), *community governance* (12.1%), *professional development* (6.1%) and *setting goals using measurable outcomes* (6.5%). Here teachers focused on factors intrinsic to schooling, which can be directly influenced by the actions of principals and teachers:

- “connectivity and relevance [of learning] to their lives”
- “[teachers] understanding [Indigenous students’] needs and backgrounds”
- “[schools] having an open and strong policy on racism, and embedded respect for Indigenous peoples from teachers and in programming”
- “develop curriculum tasks which are flexible enough to accommodate a variety of cultural perspectives”

Figure 52.2 presents exemplary descriptions of each code.

One teacher described how reflecting on their teaching practices impacted on the engagement of Indigenous students in his classes:

Instead of saying they’re just naughty boys, I sort of took a step back and thought well hang on what am I trying to teach them? I critically evaluated what I was doing. I think some people have a bit of difficulty doing that and I was able to just think, ‘okay I can see why

<i>Code (node) Name</i>	<i>Code description</i>
Deficit discourses	Comments refer to home, student, community or cultural 'lack', citing these as a key influence on Indigenous students learning. (771 references; 45.9% coverage).
Systemic Factors	Comments include reference to systemic programs at a range of levels from school level (e.g., bullying programs) to systemic programs (e.g., PLPs). (278 references; 16.0% coverage).
Community Governance	Comments include reference to Indigenous organisations (e.g., IECBs) and individuals (e.g., local Elders) and school staff and facilities (e.g., the use of Indigenous spaces in schools). (248 references; 12.1% coverage).
Pedagogy and Curriculum	Comments in which reference is made to embedding Indigenous perspectives, local traditional knowledges, or other pedagogical/curriculum choices). (162 references; 7.7% coverage).
Universalising the Child	Comments in which Indigenous students are universalised, such as the use colour blind discourses, e.g., "success is the same for all students, Aboriginal or non-Aboriginal". (100 references; 7.3% coverage).
Measurable Outcomes	Comments include reference to measurable outcomes such as retention at school, attendance, meeting mainstream normative achievement benchmarks (e.g., NAPLAN), student articulation in university or work). (127 references; 6.5% coverage).
Professional Development	Comments include reference to professional development in a range of areas from courses to expose teachers to local Indigenous communities and knowledges to broader Indigenous studies of colonisation and history). (34 references; 6.32% coverage).

Fig. 5.2.2 Code descriptions on teacher responses

they'd be getting a little bit restless and maybe disengaged with what I'm doing'. So I took on a new approach and ... it was amazing just to see how changing the way I delivered something, the content, how as soon as that engagement picked up the behaviour just went – it was sort of like a see-saw effect. The engagement was up; the behaviours were down. I mean they still had their days but... – *Primary Teacher, 2012*

Several in this same cohort of teachers also suggested that new teachers must know the local history and culture, including “tribal names” of local Indigenous groups (Aborigines and Torres Strait Islanders do not use a nomenclature of “tribes”). When asked to identify the Traditional Owners of the land on which their schools are situated, 445 teacher respondents (46% of sample) were able to correctly identify the Traditional Owners (Luke et al. 2013, pp. 121–149). This knowledge is important for establishing a climate of recognition in schools and using this as a pathway to address issues of reform. When teachers were asked to name the traditional language of the area, only 266 (27%) provided an accurate response (pp. 263–265).

While a majority were not able to name either local Indigenous peoples or languages, teachers consistently cited the importance of new teachers engaging with the local community. Our analytic point is this version of engagement tends to be defined as an interpersonal strategy, i.e., ‘getting to know’ students’ families, rather than as a systemic or professional intervention to either know historic place, land and peoples, cultures and practices in ways that assist in policy, curriculum and program planning and development. This teacher’s view and approach was common:

As with most ‘problem’ students, educating families is where to begin. For Indigenous students, this goes one step further in needing to educate the community as well. Parents and community need education in understanding what school is about, realising that the

experiences they had and the attitudes of the past are [not] what is happening in schools today. Furthermore, Indigenous communities need to break down their ‘crabs in the bucket’ mentalities if their children are to succeed. – *Teacher, 2010*

In this way, community engagement is seen by many teachers as a means to resolve the issues and problems that they infer stem from the aforementioned deficits in students and families. Community engagement was typically defined as a means to change, reframe and modify that out-of-school context, rather than as a *means* for substantive planning and consultation, and local Indigenous community involvement in decision-making in relation to school practices and policies. Deficit discourse, therefore, tends to reframe ‘engagement’ as a task of fixing and repairing – rather than knowing – a cultural/racial Other.

In direct contrast, IEWs, Indigenous teachers, Elders, parents and students offered ideas and strategies that were part of a more complex definition of community engagement. For them, community engagement was grounded by strong, local connections between Indigenous peoples, and ‘cultural days’, for example, were a way for schools to support this. In one focus group discussion IEWs and parents discussed how funding for these programs rarely “came from the school”, suggesting that “if other people are going to put funding in and do things with the Murri kids, then they [the schools] will allow it to happen” (Ami 2012).

Parental involvement in schools was seen as desired, but affected by the lack of decision-making power that parents held:

When we first tried to get our parent forum going we had 20 people in at least one meeting. But because parents had no say in our school – they stopped turning up. But at that [first] meeting, everything we said, everything we suggested, every idea, or just an inkling of an idea was shot down, and the principal told us too that it would be her choice. And it fell apart. – *Parent*

We’ll see in the forms that they put out [that] the principal should be doing this, and this – getting with Indigenous staff ... community involvement, you know, with your Elders – they should be incorporated with decision-making, with our children. That doesn’t happen at our school. They don’t call any of our Elders to come in and have a round table – ‘well what do you think we should be doing for our Indigenous kids? What would you like to see happen?’ – That never happens in our school ... when we put stuff forward it gets thrown out the window. And an individual [at the school] will say to me, ‘we will do an Indigenous activity once a term and *you* can do it.’ – *IEW/Parent*

This extends as well to Indigenous staff working within the school. One Aboriginal teacher at an urban school further reflects on how their school engages Indigenous people in the management of Aboriginal programs.

Non-Indigenous school managers ... manage Aboriginal education ... and I don’t think Aboriginal education can be managed and administered; it’s an emotional and cultural thing. There is absolutely no cultural overlay to anything in this school. There are a few programs that run every now and then. When they do, we [teacher and Aboriginal support staff in the school] don’t know about it. We hear about it second hand... I was told in no uncertain terms that [Aboriginal education] remains in the deputy’s [Deputy Principal’s] portfolio. – *Aboriginal Teacher, 2012*

In this teacher's view, this type of management approach is reflected in many other schools. This top-heavy leadership approach is, in his estimation, "a real boys' club". There is a mismatch between what is promoted by the school and the lack of delegation to, and involvement by, Indigenous school staff in everyday decision-making and planning: "this idea of community engagement is not even happening at the school level. I don't know how they will engage the community when they aren't even engaging their existing [Aboriginal] staff" (Gerald 2012).

In a major Australian policy statement, the Indigenous Community Governance Project (ICGP) defines community as:

A network of people and organisations linked together by a web of personal relationships, cultural and political connections and identities, networks of support, traditions and institutions, shared socioeconomic conditions, or common understandings and interests ... [they] are more than just residential locations or interpersonal networks ... they (are) enduring social patterns, institutional voices, roles, functions, collective identities and structures (Hunt and Smith 2006, p. 5).

By this model, substantive and authentic engagement with community remains challenging for many schools led by non-Indigenous leaders. It would entail a shift in epistemic and practical focus to one that begins from and prioritises *relationality* – the connectedness of people to kin, place and land, spirit, generation, culture and embodied knowledge (Martin 2008).

52.4 Community Talk

Deficit discourses persist in Indigenous education in Australia and have been powerful drivers of education policy since the 1960s (Whatman and Duncan 2012). These discourses go largely unchallenged in the mainstream, non-Indigenous media and public political discourse in Australia (Luke 1996). Judging from the accounts we have placed on the table here, they continue to have a strong influence on the perception of the predominantly White, non-Indigenous educational workforce. For several decades, strategies in Indigenous education have focussed primarily on 'fixing' some social, educational, attitudinal or economic element of Indigenous families or communities as assessed by outsiders. Ultimately, the main concern of these strategies was to prepare Indigenous students for a conventionally-defined, assimilationist model of 'success' in Western schools (Herbert 2011), with several leading Indigenous public intellectuals working at building a bipartisan consensus on the imperative to "close the gap" on national standardised test scores and school completion measures (e.g., Pearson 2009; cf. Department of Education, Employment and Workplace Relations 2012; Ladwig and Luke 2013).

In the current study, Aboriginal and Torres Strait Islander participants identified a number of historical and systemic issues that operate independently of Indigenous students/families but which have direct impact on the participation, retention and educational success of Indigenous students. Many argued that the presumed

collective ‘lack’ of Indigenous capacity cannot be held to account for the overall pattern of inertia and tokenism in the reform of systemic factors at the school level.

Teachers’ accounts reinforce a general theme where socioeconomic disadvantage is highlighted as *more* significant than cultural background, in some cases disregarding the relevance of cultural/linguistic difference altogether. Accordingly, a de-culturalised approach is tied very closely to a reframing of the student as universal, individuated entity – rather than one whose habitus, dispositions, practices and knowledges might indeed be different from an unmarked White norm.

- “Treating all students as equal and **not labelling them as ‘Indigenous’**. In my experience, Indigenous students just want to be treated the same as everyone”
- “**Treat all students as individuals** – both Indigenous and non-Indigenous”
- “I have never seen or heard of any specific goals being set for any of my Indigenous students”
- “Success is the same for all students –Aboriginal or non-Aboriginal”
- “The goals should be the same as for any student – **to become a fully functioning mainstream member of society**, society’s norms must be adhered to”
- “**Very individualised** as all Indigenous students are different, just like all non-Indigenous students”

At the same time, the reform-focused schools we studied promote their acknowledgement of Indigenous cultures through symbolism and visible artefacts (e.g., murals, NAIDOC day, Indigenous music and dance at school assemblies). Following models of recognitive social justice (Fraser 1997), the assumption here is that symbolic recognition will assist in resolving the issues associated with socioeconomic disadvantage, which in turn will lead to an empowerment of Indigenous knowledges and cultures in school for Indigenous students and educators alike.

Among many of the teachers, there is a prevailing view of Indigenous peoples as objects lacking the capacity for agency, aspiration or involvement:

Too often indigenous (sic) students do not even expect themselves to achieve good results. Where Indigenous students are often underachieving, I do wonder whether there is almost ‘negative peer pressure’ which says, “we don’t care and we don’t do well, if their friends are not doing well”... – *Teacher, Teacher Survey, 2010*

Many teachers further expressed concern about the plight of Indigenous families and communities citing influences such as, “poor attitude stemming from history”, “lack of self-esteem”, and “inadequate family and peer support”. These are reported as external barriers to school success, as socioeconomic and cultural deficiencies that require intervention.

Although these are constructed as barriers to learning, there is a suggestion that this intervention is beyond the scope of the school. That is, there are consistent claims by many teachers and school leaders that the major impediments to Indigenous students’ learning are that Indigenous students/families, “*don’t value education*”; and until students “*improve their behaviour*” and families become “*interested in their children’s schooling*”, the problems students experience in the classroom will not easily be resolved.

In contrast, Indigenous students and staff spoke at length about the long-standing focus by teachers and schools on managing the behaviour of Indigenous students, and on rewarding what schools defined as “*good behaviour*”. It was stressed in two of the focus groups that “*overworked IEWs*” were often called on to undertake this behaviour management. This has implications in terms of expertise, professional and cultural responsibilities, and fair remuneration. An Aboriginal teacher aide with 17 years’ experience in the one school, remarked:

Too often indigenous (sic) students do not even expect themselves to achieve good results. Where Indigenous students are often underachieving, I do wonder whether there is almost ‘negative peer pressure’ which says, “we don’t care and we don’t do well, if their friends are not doing well”... – *Teacher, Teacher Survey 2010*

This view was corroborated in interviews with several other IEWs, many of whom felt that they became the default adjudicator of all behavioural problems.

Deficit discourses, then, are part of an unmarked status quo in Indigenous education. In some cases, deficit discourses manifest as paternalism, in others, as victim blaming. This is illustrated by the following teacher responses to the question: In your experience, what are the problems that Indigenous students face at your school? We use the voices of Indigenous informants to answer back to each teacher’s concern.

Problem 1: Everyone is different, so we should all be treated the same

- “We are a fairly multicultural school, where all the students are quite well accepted. I can see that many tend to *create their own problems*, by not wanting to co-operate with their teachers, calling the ‘you’re picking on me because I’m black’ card and behaving accordingly” (**Non-Aboriginal teacher**, Teacher Survey, 2010).
- “At grade 12 next year do you know what we will be studying? The Protection Era ... they don’t tell the truth on that – they have things about the British protecting and ... helping the Indigenous people. But they sent them off to stations and stuff. They don’t have that in [the lessons]... we’re getting educated on crap” (**Aboriginal student**, 2012).
- “Teachers, they don’t even notice [it] and they wonder why everyone would walk out of class because of people being racist ... they go ‘oh, that’s wrong to say’, but then they’ll let them go” (**Aboriginal student**, 2012).

Problem 2: ‘Special treatment’ makes ‘them’ feel different

- “Too much attention on programs that make them, 1. Feel different, and 2. Make them appear different...” (**Non-Aboriginal teacher**, Teacher Survey, 2010).
- “I reckon that there’s a lot of people that accuse us of having more benefits than others ... There’s a lot of [non-Indigenous] kids that come [to the Aboriginal support centre] for help as well. You go up to the library and you get no help up there. Because our Aunties are here to help us too and all other

big kids that have done all the work coming up too” (**Aboriginal student**, 2012).

- “That’s an issue where the white mothers and fathers would go into the meetings at night and they’d be saying their piece – ‘Why do the Indigenous people or Aboriginal people get free this and that and we have to pay’ ... My response to that is always for every service there is for an Indigenous person there is an equal one out there for the white people and they can find it” (**Aboriginal parent**, 2012).

There are further implications that flow on from how non-Indigenous teachers ‘recognise’ and ‘name’ Indigenous students, communities and families. Issues that were raised in focus groups included the following:

- Schools appear to select Aboriginal consultants/informants on the basis of their willingness to align with the school perspective that was, in many instances, a deficit perspective.
- Health issues need to be considered. Schools tend to mis-recognise student health problems as behavioural issues.
- There is a lack of recognition of Aboriginal and Torres Strait Islander students’ achievements. Students raised this as a factor influencing student engagement and attendance.

One of the Elders, with a close and long-standing relationship in her metropolitan community region, is regularly called upon as community representative for school committees. She reflects on the changes that she has seen in her 32 years of involvement in education. In her view, the main difference is that now there is:

... respect [from the school], they make sure every Indigenous kid come and see the right thing together. Not just one, not this couple that they know can do things; the whole lot. And some of them, when that time happening they don’t even turn up. That’s why they fail, it’s their fault [Indigenous students]. I found that those don’t turn up on the right day, well, ‘what’s the good of you’. And [you] can’t blame teacher or head master or anybody – you blame yourself ... those big people come out, like footballer [and] after that 3 days they don’t even turn up for sport or swimming carnival or camp. Then the mother come and whinge, ‘why my child didn’t go to the camp?’ Well you just ask yourself ‘why didn’t you have the money and pay for them to go?’ – *Aboriginal Elder, 2012*

The observation here is that Indigenous students turn up to ‘special days’ designed to encourage school and academic engagement using sports, but that such programs do not necessarily result in sustained attendance. This Elder is frustrated that parents and students do not live up to their responsibilities. On the other hand, the Aboriginal director of a local Indigenous community agency explained how attendance at the local high school was higher on days when they ran the Indigenous games programs in schools. He highlighted this as a positive thing but also indicated that it was the school’s responsibility to build on this.

These ‘special days’ – NAIDOC celebrations, camps – are viewed as an important baseline for getting to know the local community. But the key question is whether they then lead to sustained engagement between communities and schools,

students and teachers. As an IEW in a remote school puts it, these days serve as a way to build “connection between the children” and school staff. This particular worker builds these connections outside of school hours. She suggests that “there should be more of that in the school; teachers taking the children out and doing bush walks and camp-overs and stuff, because the teachers will get a connection with the children if they do that sort of thing. It’s more one-on-one sort of stuff.”

An Indigenous student at the same school stated that becoming “part of the family” or “making friends with students” is not the goal. She would like teachers to use these positive relationships inside the classroom to assist students with their academic success. She says:

I’d have to say that – I don’t really like teachers that try to be your friend. But I do like teachers that are friendly and will have a chat with you every now and then. In class they help you with your work whenever you need it and they don’t tell you straight away that it’s wrong, [or] ‘that’s not the right way, don’t do this’. They tend to explain it to you more and suggest better ways of looking at something rather than saying that whatever you’re doing is wrong. – *Student from a Very Remote Community, 2011*

In the focus groups, many Indigenous high school students stated that they found it difficult to understand their teachers. The IEWs were viewed as having important roles in addressing this problem, as de facto cultural mediators. Further, the students viewed out-of-school activities and connections as a further way of addressing the question of relationships.

For urban schools, the community issues are different. For many, there is no distinct local community, but rather a network of government and non-government organisations, agencies and small community working parties that develop for specific purposes (e.g., Murri Court, Education focus groups, Health organisations). There is also greater seasonal and cyclical movement of Aboriginal and Torres Strait Islander people and families within and across regions in metropolitan and provincial areas. Community members reported that much of this transience is guided by whether there are extended family members in the area. One commented that this should be seen as an advantage, rather than a disadvantage in setting up regional approaches to education providers. In fact, most schools still treat seasonal or cyclical movement as an aberration from the unmarked norm of single child/nuclear family/continuous enrolment and attendance.

In Merribridge, a metropolitan community, such education support networks already exist with locally-connected regional groups that comprise local community members and workers. In another local metropolitan school, an Indigenous-led community educational dialogue forum brings together IEWs, Indigenous teachers and Elders for regular exchanges and discussions about school and community issues. This organisation already has a track record of intervention. Indigenous stakeholders identified a complex array of strategic interventions that respond to what they view as systemic, pedagogical, governance, professional development, and attitudinal issues. These suggested interventions are underpinned by overarching themes of cultural acknowledgement, respect for local and contextual Indigenous knowledge, and building relationships at multiple levels. In the next sections these issues will be discussed.

52.5 Community Engagement

A major theme that arose in discussions with students in interviews was the importance of the support of their family, mothers in particular, for students' continuity and completion of schooling. When reflecting on the support she received in the classroom when she was at school – and its limitations – *Nicola* says she relies on "... mainly just myself and my mum". This identification of 'family support' as an important influence on Indigenous students' valuing and completing school resonates with those expressed by non-Indigenous teachers. In this instance, however, students refer to their family as *strength* – as enabling their perseverance in the face of negative experiences at school.

Given this strength, Indigenous informants reinforced the need for schools to develop alternative ways of communicating and engaging with community. Specifically, they called for the acknowledgement of the diverse circumstances of parents – "a lot of whom work these days" (Ami 2012) – and the local community networks outside the school. As this parent suggests, it can be complicated:

So I've missed the run and I was hoping, that the teachers don't think that I don't care about my child because I haven't come up to a parent teacher interview ... it just makes me sick in the stomach that they think I haven't made the effort to get there ... I don't want the school thinking that I don't care because I do care. I don't want to waste their time ... If I had concerns then I probably would go ... but I guess the thing is, your child knows that you are there to support them and that's all that really matters at the moment. – *Edie, Parent, 2012*

This reliance on members of the community coming *to* the school can also be an inhibiting factor. Engagement can be seen as a process by which the schools connect with the community. The benefits of school staff – in this case an Aboriginal worker with connections to the local community – taking advantage of connections outside the school is demonstrated in the following account. In this case, a local playgroup was established after the idea was formulated, planned and executed after a group of local Aboriginal women of varying ages and backgrounds met to discuss ways to improve the community. IEW *Erika* (Wellham State School 2012) was "amazed at the insight that these women had about not only their own lives, but the lives of other people in the community and what [they thought] would change the problems they perceived". This group of women ran the playgroup until its management was taken over by the local municipal Council, who introduced formal credentialing and standardisation of services. At this stage the community felt like it "wasn't theirs anymore" and their participation in the program stopped. At present, the women involved in this first iteration are undertaking training to develop the skills and qualifications to run the playgroup.

Regular "cultural days" and school-based programs for Aboriginal and Torres Strait Islander students were viewed as important. Participants discussed the value of these programs at length. In the past, these cultural days often were undertaken off-site, in school hours, and were co-ordinated by Indigenous staff. They were able to take advantage of community networks to bring in speakers and facilitate peer

support for Indigenous students across schools in the region. In one metropolitan area with a high population of Indigenous people (local and transient), there has been no sustained commitment to these valuable activities as school support, as government funding ebbed and flowed. These activities were reported as valuable for maintaining connections, sustaining cultural support at a community level, and revitalising students' commitment to education in the process. As one Elder put it, "our kids don't have to talk to white; they need to talk to their own colour" (Uncle Wilton 2012).

There is a history of consultation and Indigenous community effort in attempting to develop and implement programs in many of the schools studied. One IEW described a process that she sees as necessary to making schools and teachers accountable, which she considered to be at the heart of effective governance.

Following a visit to her school by a "bigwig from an Indigenous education department", she describes the situation:

He comes into our school and says, 'ok ... you've got X amount of dollars, what have you done to service the children at this school? ... He said, 'I don't want to talk to your teachers or any admin. I want to talk to every child. Give me a list of all your Aboriginal and Torres Strait kids right ... and he actually got the kids down and said, 'right, what support do you get? Does anyone help you?' And he just took notes... but if you haven't got anybody out there to say 'hey what are you doing? They can do whatever they want. – *Indigenous Education Worker, Metropolitan School, 2012*

This resonates with the views of the director of a local community agency, who makes links between consultation and establishing an environment for high expectations, as against the prevailing deficit models. Similarly, he suggests that the starting point rests with asking what individuals want.

We say to them, 'What do you expect from us?' And we allow them at the beginning – the students when they come in, and the workers when they come in – that first day when I talk to them, I ask them what their expectations are of us as an organisation and what they would expect us to do, so that it becomes a conversation around expectations... – *Director, Indigenous Community Agency, 2012*

Across the focus groups, then, many informants expressed the need to hold schools and school leaders accountable for decisions, practices and outcomes.

52.6 Indigenous Student Support Centres

The establishment of an Aboriginal and Torres Strait Islander support centre in the Summerfort High Hub School provided a space for Indigenous students to complete their work in a safe and supportive environment. This was an increasingly common practice in Indigenous reform agendas (e.g., Davis 2016). In this particular school, students and Indigenous staff say that this environment is not mirrored across other spaces in the school. In the classroom, students ask for assistance and/or seek acknowledgement but suggest that this is rarely forthcoming.

It was reported that some non-Indigenous students and staff in the school see this support centre as a “flop house”. In one example, the school’s groundsman oversaw the use of the room by Indigenous students, regularly questioning their right to this space. While non-Indigenous students often use the room, especially if they are connected to Aboriginal and Torres Strait Islander students, those that aren’t familiar with the space comment that Indigenous students “*do nothing*” when they go down to this centre. Students report that they repeatedly resist these accusations, but indicate that this does little to change this view of this support centre.

In another school, an Indigenous teacher describes the tenuous position, which the Aboriginal student support centre occupies:

A certain deputy said that this room is being mishandled and mismanaged. A room like this has to be informal by nature. This is not a room that can be managed ... this is a welcoming space. It’s not a room it’s a space, it’s a withdrawal space. The kids have nowhere else to go, they need somewhere. You know the dancers have got their studio, the musicians have got their studio, everybody has got their space. But we always have to be defending. I had to fight for 5 years to get this space. Five years. No one wanted to give us this space. It’s really difficult for Alison [an IEW] because she is in here. – *Indigenous Teacher, Secondary School, 2012*

Unlike many community-based First Nations schools in Canada, few Australian state and non-state schools have formal structures of local school boards or elected local officials that might provide Indigenous community members with a formal, official platform to participate in school governance. Hence, community participants emphasised that in the past, and now, schools tended to provide opportunities for consultation in order to “tick a box”, as one speaker stated. Additionally, schools tend to organise ad hoc committees/consultation around occasional events. But often there was a perception that community consultation was strategically timed to confirm or ‘rubber stamp’ school policies and actions, in effect silencing Indigenous voices in the process. Many of the informants stated that they believed that the community engagement was token, rather than part of a genuine or substantive participation in decision-making and governance.

The Indigenous parents interviewed stated repeatedly that Indigenous communities did indeed value education. Several described efficient community networks in some regions that can be mobilised or be further developed. Participants highlighted how important it is for schools to be respectful of these cultural connections in their own planning. One parent, who is also a long-serving IEW, suggested that while central for community, schools either downplay these connections or see them as inconsequential to the work of the school: “I think at our school, if you have a cultural thing outside of school hours then the principal would be happy with that ‘cause it doesn’t interrupt her timetable ... but she doesn’t see the importance of it”.

Conversely, one of the Elders suggested that reliance on these connections may be counterproductive as, in her experience, it’s the “same two ones all the time” that attend meetings at the school, “and you feel, ‘why are not the parents here?’” (Aunty Rona 2012). While there is a perception that schools are undertaking community engagement, IEWs see that community people whose philosophies align more readily with those of the school are generally chosen over those deemed to be unsuitable:

“I was never invited to [one important committee meeting], or told when it was on – this is going back a few years now – and I can only say the reason why was because I’ve got a big mouth” (Lily 2012).

Another IEW summed it up in the following way: “see they don’t like Aboriginal people who speak up ... the average Aboriginal is ‘yes sir, no sir, 3 bags full sir’. It’s the old saying, ‘be seen and not heard’ ... then they put their arm around you and make you feel really good as long as you allow them to” (Edie 2012). In one focus group there was agreement that many meetings and consultations were examples of “signing off” for reporting purposes, rather than mechanisms for active and involvement by community in actual decision-making.

At the school level, one of the key issues facing Indigenous parents and students is criticism from non-Indigenous parents and others for what are perceived as being unearned, discriminatory privilege. One parent commented: “There’s probably a lot of white families out there that get quite jealous when they suppose that all the kids were getting free swimming lessons and they didn’t have to pay for anything really ... You’d see them, the mothers, when you’re waiting for your son or daughter and they come and they say, ‘well you didn’t have to pay for your trip ‘cause yours is free’”.

This view of ‘Black privilege’ is expressed by several of the non-Indigenous teachers:

... they did lunch vouchers at the canteen for Aboriginal kids. Now that was a divisive system because there are a lot of other kids who were worse off and didn’t have lunch and didn’t have morning tea and their diet was dreadful. But the Aboriginal kids, some of which, didn’t need the money. So that sort of thing – because it was divisive. But I think if you do things like when you go on an excursion or something, that you take a group of kids, of all kids. That then makes it an inclusive process.

...Aboriginal children suddenly got a lot of funding for all this extra help and yet we had children in the class that really were desperate as well, non-Aboriginal children, that we ... it was like they were really missing out. – *Primary School Teacher, Metropolitan School, 2012*

As mentioned, cultural support programs, and similar community initiatives, were dependent on external funding: “The funding didn’t come from the school, the funding came from outside the school ... if other people are going to put in funding and do things with the Murri kids, then they’ll allow it to happen ... there’s no continuity” (Lily 2012).

The ways in which schools are funded and how these funds are managed have an impact on planning for sustainable, long-term reform. Prior to 2005, schools were allocated funding (above their base per student capitation rate) for Indigenous initiatives through the Aboriginal Student Support and Parent Awareness (ASSPA) program. Funding guidelines were changed in mid-2005. At this point, instead of receiving targeted money directly through ASSPA, schools had to make funding submissions through a two-stage application process via the Parent and Student Participation Initiative (PSPI). This continues to be a labour intensive process, with no guarantee of success. As reported by the Australian Education Union (2005), there was a significant drop in Indigenous parental participation as a consequence.

Of the 561 schools that responded to the AEU Indigenous Education Funding Survey, 78 % reported that they had an established Aboriginal Student Support and Parent Awareness committee. After the introduction of the PSPI funding rules, only 9 % had received approvals to fund initiatives for similar Indigenous engagement programs within the school (AEU 2005, p. 20). In this context, Indigenous informants called for sustained involvement of Indigenous staff and community in key activities in terms of decision-making in relation to how “Aboriginal funding” is allocated and spent. As stakeholders, Indigenous people expressed that “we should feel like we can demand things from schools” (Edie 2012).

Schools must use funds allocated for Indigenous programs for Aboriginal and Torres Strait Islander initiatives recommended by Indigenous stakeholders: simply, “we should have a say”. IEWs and Indigenous educators spoke candidly on the reliance on non-recurrent grants funding for Indigenous education initiatives, referring to this as “soft money”. The result was a lack of long-range strategic commitment, difficulties in planning and few ongoing, permanent positions for key workers. Participants in metropolitan, provincial and rural regions stated that this had influenced the level of parental engagement and participation in the school: “we used to have a lot of parent participation in the school [but] then the funding ran out”.

52.7 Student Leadership Programs

Workers and students noted a tendency of school leadership programs for Indigenous students to be specifically targeted at individual students, rather than being used to engage and develop the whole range of Indigenous students.

I found at the school there never seems to be somebody ... targeting Aboriginal kids – not just one kid. But why not target them [‘kids that muck up’], then try and get them involved in the school so that they can go to the leadership programme. Don’t target these kids that you know are going to make it because of their family background. – *Parent, Metropolitan Community, 2012*

This parent suggests that leadership programs may be used to acknowledge and develop the leadership qualities of students who may not conform to what the school recognises as a ‘model’ Indigenous student. The shift implied here is from a view of student leadership programs as a means to reward behaviour and performance – as normatively defined by the mainstream school – to a view that sees them as a developmental pathway for engaging a diversity of students.

There were examples of other kinds of leadership in the accounts provided by secondary school students. For example, a Year 10 student described an incident between a teacher and a Year 8 student, where the older student eventually intervened on behalf of the younger boy. A teacher entered the Aboriginal support centre in search of the IEW to work with a young male student, who needed assistance with a task. As *Gloria* explains:

Aunty Lucie goes, 'you have a long way to go, Max. Come on, you can do it ... the teacher's like, 'concentrate! Stop playing with the board' ... really nagging and I was doing maths work on the board, just having fun. 'Come on come on you've got a long way to go'. And then the teacher turns around and goes, "that's if he'll even make it [to senior] ... Max became upset and he just turned round the corner and when he heard me call his name his whole body language was, like, relief that he heard me say his name and he turned and when he looked at me his body language was down just from what she said.

So I just gentle hugged him and said to the teacher, 'don't you dare say that to an Indigenous man, cause there's hardly any Indigenous men here at this school ... because he will take that to heart he will not want to come back to school' ... And when she walked off, Max gave me one more hug ... he was still crying but he felt really good that I stepped over. And [the teacher] said, 'I won't say it again... thank you for telling me'. – *Gloria, Indigenous Student, 2012*

This student's account of the incident speaks to a different kind of Indigenous leadership in the school, one that was recognised by other Indigenous students:

See once when Gloria came up to me she said, "you know what this teacher said to Max?" Max's my brother, I look after him and comes up to me and goes this teacher said this to Max, "you are not going to make it to grade 11" ... I said, "black boy where is that teacher I'm going to knock her off now". Then I said, "no, I'll go look for Max first", and he was happy to see me and I'm like, "no I can't take this no more, I'm going to, like, drop out" and I'm just going to go to another school. But then I look around and I see all my little kids coming up and they're saying, 'hi Charlotte, how nice to see you'. And I go all my little grade eighters come to me, and I'm like, I can't leave cause they are there looking up at me. I can't leave them all there 'cause if I leave what will they do? They look up to all of us. You have to stay at school and just put up with it and just try their best. You stop; they stop. What are they going to do? So they won't have, like, no great big support there. – *Charlotte, Indigenous Student, 2012*

Many of the issues reported here are drawn together in this student's narrative. It is about fundamental cultural misunderstanding, where deficit thinking and explanation becomes a default mode in teacher/student interactions, even in the dedicated Indigenous space. But this is also about Indigenous students' cultural relations, ethics and duty of care that are misrecognised and invisible in institutions that remain detached from Indigenous communities, knowledges and standpoints.

52.8 Indigenous School Staff

While many Indigenous education workers were critical and sceptical about the ways their work had been defined, they also believed that schools could make more strategic use of Aboriginal and Torres Strait Islander teachers and support staff. A common view was that many IEWs were given reactive roles (e.g., for behaviour management, or ameliorating difficult parent/community relations) rather than proactive roles (e.g., leading professional development, advising on curriculum development, and teaching Indigenous studies). One IEW referred to the reactive role in terms of "keeping the racial peace".

This is highlighted in this reflection of a long-standing teacher aide: “I have teachers coming to me and even though I’m in Prep, they’ll say ‘Oh, can you go and talk to this one and that one? I’ll say, ‘why?’ and they’ll say, ‘oh, their behaviour or they’re not working’, and I’ll go ‘righto’, so I go and do it.”

She goes on to explain how difficult it is to follow-through with tasks in a strategic way because she and other IEWs have minimal control over their daily timetable.

Participants in several sites report inadequate supervision and guidance of Indigenous staff as part of the whole school planning. In several schools with a history of substantive community engagement, Indigenous staff reported that they were respected and consulted.

Having [*Principal, Wellham State School*] here – I think she is the most wonderful person because of her leadership and her insight of not only the system in which she works and is highly skilled and knowledgeable in, but she has transitioned her thinking over to other ways of thinking. When you’ve got a leader who in that hierarchical sense can empower people around her, it’s not from the top down. It’s from the bottom up. She does it both ways. She had a middle ground of learning... She values the people around her, what they contribute ... she gives people the time and space to develop [their ideas], to grow”. – *Indigenous Education Worker, 2012*

In another school, the IEW mentions how the principal of her school “seems to know a little bit about each family, which helps” (*Rosa, Greenpoint State High, 2012*). In addition to this positive effect of school leaders engaging with Aboriginal families, *Rosa* also suggests how parental engagement is increased in this school because of its Aboriginal Council. This council is called upon to make decisions about “sports uniforms” for example, and the development of support programs such as “parent room”; the Council will be responsible for applying for PSPI grants for this initiative.

At Iron Oak High, Aboriginal worker, *May*, comments that it is important for parents to look at their home circumstances too. In describing the situation with an Indigenous student who would regularly get into fights with non-Indigenous students at their school she draws connections between how a student’s home life can mitigate against the strategies the school employs.

When you know this boy’s background and how he has been treated at home, I just think that the parents need to blame themselves ... not blame the school. Every kid isn’t like that either. Some kids just – some of them do have a hard time at home and they come here looking for an answer. But when they come here [IEW office] we like to tell them to go to class, you know. All they wanted was somebody to listen to them. But then they go back to the home environment. – *May, IEW, Iron Oak High School, 2011*

This worker was impressed with the way their school handled this situation – although it was the parents who had chosen to move the student to another school, a school at which he is now doing well. She indicates that while there are still students who get “angry in class”, they are usually calmed down once the “principal or others in the school talk to them” (May 2011).

In other cases, engagement is sporadic and informal. One community member stated that her view was that “Indigenous staff are expected to find their own way and are also directed to do jobs outside of their position description”. Elsewhere, the

lack of interaction between teachers and IEWs in planning processes was reported as a barrier. Many of the IEWs interviewed called for more formal mechanisms for teachers and IEWs to collaboratively plan and work together: “Effective professional relationships between teachers and IEWs are essential. Teachers can do an effective job with support staff. You don’t really need Aboriginal teachers to make a school Aboriginal-friendly” (IEW, Provincial Primary School, 2011).

Many support staff have to hold a “play-it-by-ear attitude” (*Gerald*, Lakeview High, 2011). According to many, where there is participation in planning and regular communication between teachers and IEWs, this is an important factor in prevention of detrimental issues that ultimately impact on the student rather than the school. In instances, this entails IEWs planning programs that specifically support the work of Indigenous students in classrooms. The general consensus is that improved communication with school leaders in relation to action plans would assist IEWs to be more strategic in the planning and execution of their workloads.

52.9 Community Engagement Versus Governance

As noted at the beginning of this chapter, Indigenous informants consistently stated that ideas around Indigenous “deficit” were fundamental to the thinking of many non-Indigenous educators. In one example, a community member with almost 15 years of experience as an IEW described the assumption by schools that “Aboriginal people haven’t really got expectations of their kids, [that] they don’t see the need for their kids to succeed in schools”. In her experience, this was simply “totally untrue”. School staff often draw conclusions about deficient Indigenous aspiration when they observe that parents don’t turn up for meetings or events organised by the school such as NAIDOC day. One community member commented that: “if they don’t turn up for something ... that the school is providing for them it [is taken to mean] that they don’t value education [and] they don’t care”.

Participants outlined how the relationship between the school and the family/student can impact on parental involvement. The assumption is that parents are available to attend parent/teacher interviews. The reality is that many Aboriginal and Torres Strait Islander parents are unable to be heavily involved “because they work – it is hard for parents, you know, unless they can [attend] ... schools can make the phone call, you know, home to the parents (Ami 2012)”.

Several informants commented that parents and IEWs were not informed about meetings, or when invited, had no prior information about the purpose of meetings. In one school, specific “outspoken” individuals were not invited to a forum and this disqualified them from membership on a school committee. In another instance, a school reportedly exaggerated community input at particular events. Community members were invited to an end-of-year “lunch”, asked questions about issues; and this was subsequently written up as “community consultation” (*Lily*, IEW, 2012). From one Aboriginal principal’s perspective, selection of consultants can be ad hoc, and puts pressure on the few individuals to be all things, to all people:

And what was a very common message from community was that we are sick of schools setting us up to come along and we have to do their stuff ... parents are feeling used. They come in. And spot a black face, and say, 'oh, we've got an Aboriginal parent, can you be the chair of this? Can you organise that project?' [the parents say] 'I don't know what to do. I've come in to show my support. I want to be part of the school. I don't have the skills and ability to do what they want me to do' – *Reese, Aboriginal Principal, 2012*

In sum, community members reported that community engagement consisted of school-directed and controlled consultation, with little opportunity for substantive community input into school governance and decision-making. In the overall evaluation study, there were infrequent reports of substantive community engagement, and Indigenous staff and parental involvement in school and teacher decision-making in relation to curriculum, whole-school planning or collaborative planning between teachers and IEWs. *However in the three cases of schools that were making demonstrable progress by conventional measures – this substantive community engagement was crucially linked to the teaching and learning that was occurring in classrooms* (Luke et al. 2012, pp. 400–406).

For one IEW, communicating with the local community to assist with a teacher's management of the classroom is straightforward: "We tell them [parents] exactly what's happening in the class, because you can't really tell them how to [parent] their children, but you just tell them this is what's happening in the classroom. Are you aware of what's happening? Do you need any help to change this sort of behaviour and stuff like that" (*Neil, IEW, Pinemead High*).

Authentic community governance is defined by the Indigenous Community Governance Project (ICGP) as "the evolving processes, relationships, institutions and structures by which a group of people, community or society organise themselves collectively to achieve the things that matter to them" (Hunt and Smith 2006, p. 9). A core feature of views expressed by Indigenous informants was that the maintenance of cultural connections inside schools enables Indigenous students and staff to exercise agency. They report on everyday cultural agency: how they manage daily barriers, build and maintain relationships with school staff and peers, act on opportunities within the school setting and develop shared understandings about potential effective practice through formal and informal community networks. This agency was practiced in peer-to-peer mentoring and support in emotional and academic situations.

The relationship between schools and community, teachers and students, school leaders, teachers and education workers was reported as a significant component of establishing mechanisms for effective community engagement. Interpersonal connections between non-Indigenous teachers and families/communities were seen as fundamental to shifting systems: "there's four teachers in my son's life who have made a difference ... and they're the ones who I have a personal relationship with" (*Erika 2012*). Here an issue arising in the classroom where a teacher perceived a threat: "I'm going to get my Dad to come up and beat you" – can be put into a more realistic context if the teacher 'knows' the family. Following this incident in the school between a teacher and her son, Erika describes what she initiated as a consequence:

How do you get the school to understand us? I knew what I was up against. I'm Aboriginal, I'm female. My son has learning difficulties ... How do I overcome these things... So I put together a presentation ... about who we are and what we're like, what our son is like, what works for us as a family, what strategies the school can use, tips for teachers – did the whole lot. Asked [the deputy principal], 'could I do this [as a professional development session]?' He gave me that time and he put it out to his staff. He's fantastic ... I had about 18–20 teachers in the room that were interested... I put this presentation on. I never got a phone call [about my son] for three weeks. – *Erika, IEW/Parent, 2012*

In this example, a discussion ensued between the parents and the school because of the mother's personal and professional connection with the principal. This led to her presenting a session to teachers on how to deal with her child. Because she was an IEW at the school, this session became a general professional development opportunity for relating to Indigenous students and families.

A local community organisation, Redhaven Inc. is described in the following case study. Its principles of operation offer insight into the differences between surface level engagement and 'signing off' to more in-depth governance where stakeholders are empowered within decision-making processes. One of Redhaven's successful interventions with school leavers, and program development to assist "transitioning young kids into further study, employment and adulthood" is **Challenge Day**.

Redhaven works with IEWs and high school students to design and plan the *Challenge Day*. This includes designing activities for the early childhood school children, consulting with Traditional Owners on local knowledge, working with Redhaven to build and prepare any resources required. Secondary students become mentors for younger children, Elders and workers at Redhaven become mentors for them, and students develop a range of skills in research, project writing, organisation, dealing with local council for permissions:

We have the mentors in the school, and then they come here one day a week, and they design, implement, do their site visit, do up site maps. They've got to tick all the boxes ... get our insurances in place. Then on the day – they run the day. We sit back, supervising of course, and those High School kids they run the whole day, and it's just fantastic ... what we notice is that the Primary School kids respond to the High School kids better than they respond to us (*Deon, Redhaven Inc, CEO, 2012*)

Community Case: Redhaven Inc., Community Agency

Redhaven assists and supports the diverse Aboriginal and Torres Strait community of Fieldbeach. This organisation actively promotes self-determination and advocates for positive economic, social, and educational change throughout the community.

Redhaven does this through:

- Collective, communal approaches where all individuals are valued and boundaries are clearly marked;
- A diverse and representative leadership team that consists of Elders, managers and team leaders;

(continued)

- Establishing a sense of ownership and control over outcomes to all workers;
- Creating connectedness – this is valued as the foundation for the organisation’s operation and the development of programs;
- They move beyond ‘naming’ the problem/s, and emphasise solution-oriented, incremental approaches that value the skills, knowledge and cultural protocols of local communities;

When asked if schools could operate in a similar way to Redhaven, one of the Indigenous workers, Frida said:

Yeah, definitely. Cause not only does it give them direction, and things like that, but it also gives them responsibility about things.

Redhaven works directly with Affiliate schools in the area, and has direct links through community with Merribridge. They provide paid services to secondary and primary schools as part of their operations – working particularly closely with IEWs at these schools; one of whom works across all schools in the area. When asked about school transitions and community engagement, the manager expressed the view that “the local high school and principal are really good – it’s not through lack of want, or even desire. I’m just not sure they know how to go about it” (Deon 2012).

When Aboriginal and Torres Strait Islander community and students are valued for their strengths the possibilities for engagement are broadened. In the examples discussed in this section, we see how this is positioned as beneficial to relationships, to the development of relevant support mechanisms, and the provision of more complex learning opportunities.

52.10 On Curriculum and Pedagogy

Aboriginal and Torres Strait Islander students provided numerous narrative illustrations of the conditions and interactions they experienced in classrooms. Students and Indigenous workers report student alienation and disenfranchisement on at least two levels: (1) inconsistent and arbitrary support for Indigenous students in the classroom across subject areas and grade:

When they don’t help with the things I need help on, and they, like, tell you to ask them – that’s what I do. When they don’t help, I just sit there, and I get real angry and I study myself, right, because I want to achieve something. If they’re not going to help me, then they should not be in the class. That’s what I think. I don’t listen to them, because they are not teaching me anything

“You know that quote, ‘forgive and forget’? That’s what they do to people that are cultural [Indigenous]. But when it comes to us it’s remember and then accuse and yell, and then give you a reason to get out of class so they don’t have to put up with you, or see you again. *Verna, Secondary Student, 2012.*”

And (2) inappropriate and alienating pedagogies of teachers when dealing with/teaching curriculum content dealing with Indigenous issues:

Once you got those [non-Indigenous] kids there, and they’re watching the movie, thinking in their heads – ‘go on. They did that. They’re, like, our people, and we can do that to [Indigenous people]... We can treat them like that because we’re higher than them. *Charlotte, Secondary Student, 2012.*”

The larger systemic issue of non-Indigenous teachers’ difficulties in naming, engaging with and talking about Aboriginality is well documented (Luke et al. 2012). Students and community voices are clear that the introduction of explicitly Indigenous curriculum content raises the stakes for teachers around their professional knowledge, capacity, and pedagogical approaches. In the view of students, there are risks of misrepresentation, misrecognition and backlash.

In terms of pedagogy and curriculum, there are two broad issues here. First, there are longstanding calls for culturally relevant teaching and support for Indigenous students reflected across the comments of IEWs and Indigenous community members. The second issue, foregrounded in debates over the Australian National Curriculum, relates to the teaching of Indigenous content and issues in the curriculum to all students. This issue of cultural-relevance is defined as the acknowledgment of the varying social and cultural capital of Indigenous students and the adjustment of teaching approaches to improve overall achievement and participation, conventionally defined, while setting the conditions for cultural and linguistic growth and sustainability (Yungaporta 2009). The latter has led to a vigorous national debate over the teaching of Indigenous studies within critical frameworks in ways that engage with Indigenous knowledge and disrupt longstanding cultural and historical misrepresentation and misunderstanding (Downey and Hart 2012; Rigney 2011; Phillips 2011).

Reflecting on his experiences through school in the 1970s, community worker *Claude* recalls how he experienced Aboriginal studies:

I was listening to the teacher tell the whole class [about Indigenous peoples]... and you’re one of two blackfellas in the class. And you sorta feel shame ... all the kids will come and say, “Oh, all a youse natives do this!” You know it gets ya thinkin’. And as ya grow older, you sorta resent a lotta things too ... Why am I in school? Why am I learning? – *Claude, Indigenous Community Member, 2012*

In one focus group interview, students from a metropolitan school describe similar reactions to being one of a few Indigenous students in an Indigenous studies class in 2012. They report on what they see as a need to manage and resist small and large statements of ignorance, which is particularly marked in Indigenous studies classes: “when I go into the class, I hear all this stuff being said around me, I just put my hands on my head and try to focus on the teacher”. The point here is that the ‘embedding’ of Indigenous knowledges in the curriculum has the effect no matter

what its intentions and the quality of the pedagogy, of making Indigenous students the objects of school knowledge and curriculum. *A key collateral effect can be the repositioning of the Indigenous student – “all youse natives” – in the classroom as an unintended and indirect ‘object’ of study.*

Indigenous and non-Indigenous staff and students can therefore see effective Indigenous studies very differently as shown in the following two cases.

Classroom Narrative I Embedding Indigenous Studies: Mismatched Perspectives

This incident regarding mismatched views of effective Indigenous studies was reported by Lily in 2012.

Yeah ok then so they were both here see, Iris [the support worker] went to the toilet and this other one [the teacher] was telling me how good they were [for] embedding Indigenous perspectives at the school, at Summerfort High School, as I worked at that school... and I said ‘that’s good’, and she says, ‘oh Lily... they are really doing it well now! [Then] Iris came back in ...she said ‘oh Lily, you should see what I saw the other day’. She said ‘one poor ... student came into my room – **she left her class because they were showing an old Indigenous film and they had put it on speed** [played on fast-forward]. These [Aboriginal] women there, with nothing on, walking around and running ... and everyone was sitting there laughing’.

This Aboriginal girl felt so embarrassed, she didn’t know what to do. **She shouldn’t have felt embarrassed, that teacher should have been ...** I looked at this other woman ... and I said ... **see Aboriginal and white people think differently.** Which is true they do – ‘cause one was white and one was black, and one thought they were embedding it very well and the black person had it right, you know she was there, she had an idea of what it was – she knew what was really happening.

In this same school, one of the IEWs had taken the initiative after observing an Indigenous studies lesson as she worked one-on-one with an Aboriginal student. She was unimpressed with the way the content was being portrayed and took the initiative to suggest that she deliver a guest class.

...Last year, I did teaching there, in Year 8, and that teacher who was supposed to present that [lesson] did nothing. That’s why I went on board ... I spoke about the early days, well I used the DVD of the early years, and we talked about reconciliation, assimilation, stolen generation, all of that and the most important thing was to all the kids in the classroom – is the respect. Respect for yourself, your culture.

In this case, the IEW, Indigenous staff and community were not involved in planning the lesson or teaching.

While Indigenous students and IEWs express appreciation that attempts are being made to embed Indigenous content into their curriculum, they indicate that the potential value of Indigenous studies may not be realised due to inappropriate and “racist” approaches. *Aside from these reported instances of outright derision and attack, the introduction of Indigenous content into the curriculum without well-trained and prepared teachers has the effect, however intentional, of turning*

Classroom Narrative II Student Reactions to Embedding Indigenous Perspectives

Student observations corroborate the alternate view of IEWs that selection of Indigenous studies content is not sufficient on its own to have value in the classroom. Teachers must also develop appropriate pedagogies to ensure that these lessons do not contribute to reinforcing the status quo.

In this vignette, one student describes her reactions to inappropriate teaching of Indigenous studies.

Charlotte: Back in the day when me and my sister were in grade 8 we learnt about the Stolen Generation. Like that was good and everything ... **then later on down the term it started to get really racist ... They would put us down.**

Interviewer: How did the teacher handle that situation?

Charlotte: Just sat there and didn't do anything. She just stood there and that will get us more angry and we get up and walk out of the class; just couldn't take it and we'd get into trouble for it ... (oh, I'm going to cry now remembering it)... **Like the teachers, they don't even notice and they wonder why, like, everyone would walk out of class because of, like, people being racist and everything** but yet they don't realise that and they won't do nothing about it. **They'll go, 'oh that's wrong to say', but then they'll let them go.**

At another school studying Stolen Generations, former student Nicola said that:

[When we were studying] Stolen Generations, all ya had to do was, like, write a letter. Like a big page of what it was. That's all ya had to do. We weren't really studying it ...

Indigenous students into objects of study, debate and contention in their own classrooms.

This chapter began with recognition that deficit discourses play a central role in teachers' views of Indigenous education, learners and communities. As the students' and IEWs' comments above indicate, the introduction of 'embedded' Indigenous content into the curriculum – a current policy imperative – places new pressures and responsibilities on teachers to work in extremely sensitive, knowledgeable and critical ways. When operating from deficit assumptions and vocabulary, the results are already leading to confused or unanticipated and incoherent classroom experiences. In focus group interviews on curriculum and pedagogy, several informants called for more accountability to the community: “teachers should be held accountable for what and how they teach” (*Aunty Lucie*, IEW, 2012).

What these classroom accounts suggest is that the experience pivots on the cultural experience, engagement, sensitivity and knowledge of the teacher. The

embedding of Indigenous content can generate conflict and contestation. This can be an opportunity for further learning and critical debate, or it can generate conditions for the continued alienation of Indigenous student and staff.

52.11 Teacher Knowledge and Attitude

Teacher knowledge is a significant factor in educational success. In a recent paper, Luke et al. (2012) report on survey findings about the extent and depth of teacher knowledge about and engagement with Indigenous communities and cultures. That work documents a predominantly White workforce that – despite stated commitments to social justice and equity for Indigenous peoples – has rare and limited engagement with Indigenous peoples outside of school, with negligible contact through sports, community events, media or everyday exchange. Approximately half of the teaching workforce sampled had had a conversation with an Indigenous person outside of school business in the previous 6 months; and only 13.7% of teachers had visited an Indigenous household.

The view of the Indigenous workers and focus group participants is that many teachers have limited knowledge about who the Aboriginal and Torres Strait Islander students are in the school, much less knowledge about what might constitute ‘Indigenous Identity’ and culture. When there is a willingness to develop effective relationships with students, opportunities for teachers to enhance their knowledge can arise. Alternatively, teachers’ limited knowledge can be detrimental to teaching, and also for dealing with Indigenous students in respectful ways. These two possibilities are demonstrated in the following recollection from an IEW from Summerfort High:

Thomas [past Indigenous student] found a teacher at the school that really enjoyed Indigenous studies ... This teacher took Thomas under her wing, and that whole family, their culture is embedded in them, and they feel so proud of it ... this young boy, he’s in class and they’re doing Indigenous studies. This teacher came and said to me, ‘Oh, you should see the look on his face’, she says, ‘As soon as I start talking I know I’ve got to be careful. I said to him that we’re doing history, we’re doing Captain Cook now – but we’re going to talk about [these] issues... You have to tell him, ‘we’re learning this now and then we’re talking about the issues around that. She was a good teacher.

And there was another teacher... I thought she was good. When I say good, I thought she knew about Aboriginal history and Aboriginal people. When I walked into [the staff room], she said to me, ‘Aboriginal people get so much; kids get so much’. That attitude is very prevalent ... and that’s why some teachers have this dead set against Indigenous kids because they believe that. – *Indigenous Education Worker, 2012*

There was a strong view of Indigenous participants that what was generally referred to as “cultural awareness training” should be compulsory for all school staff. However, “cultural awareness” was positioned as moving beyond programs that essentialise Indigenous students and cultures, toward professionalising teachers. That is, such professional development was reported to have an impact (or have benefit) for the core business of teachers’ work: curriculum, pedagogy and everyday relationships with Indigenous students: “...I think that cross cultural awareness

should be put back in schools so **teachers** are learning as well as the principals (Eddie 2012); or more simply, “they don’t correct [themselves] ‘cause the White people have no knowledge of us” (Aunty Lucie 2012). Students and IEWs raised three core concerns about teachers:

1. The need for teachers to “get off their backs” (Gloria 2012) on discipline: “It’s like one little thing we do wrong in class and they hold that against us the whole time. I’ve done my work, turn around, have a laugh, the teacher tells me to be quiet and do my work when everyone around the classroom is chucking themselves around” (Charlotte 2012); A lot of our Indigenous boys, they’re getting nailed for everything. Every single thing, they get nailed for. I’ve seen it happening for generations (*Aunty Lucie*, IEW).
2. The need for more attention on academic priorities: “high expectations aren’t just always the high goals to play football in AFL or something like that. It could be just the little ones that you set for yourself to achieve an A in a maths test or something like that” (Sophie 2012).
3. The need for a view of respect as a “two way street”: “And I reckon it’s pretty disrespectful [not acknowledging Indigenous cultures] considering that, because they are [white] Australian, like, they have their own background too and they think that we should respect what they want and I reckon they should do the same to other cultures, otherwise it’s not fair” (*Verna*, Secondary Student at a Metropolitan School).

There was a general view amongst students that they did not have the voice or position to make demands of the school or of teachers: “I do all the work the teacher tells me to do but they still don’t realise that ... they think I don’t ask for help and I beg them for help and they won’t help me” (Thelma 2012).

In a focus group discussion, students expressed frustration with how “tough” some of the teachers are on them. At times, students chose to use the word ‘tough’, while at other times they used the word ‘racist’. We asked the students, “What would you consider to be racist? How do you tell the difference between a teacher that’s just tough, and a teacher that’s racist?”

Here it was quite apparent that such issues are not straightforward, and the question generated this exchange about different students’ views of one teacher:

- Thelma:* That racist woman ... Ooh!!
- Charlotte:* No. She’s actually cool
- Thelma:* Nah, she’s ... every time I walk past she’s like [ooh]
- Charlotte:* Nah, you don’t ...
- Thelma:* I’m scared out, too, like for her eyes ... ooh she scared me!
- Charlotte:* She’s actually not [racist]. She’s good [*Thelma trying to debate*]. Oi! She’s our people, don’t you know?! She’s our people. She from Papua New Guinea and she used to be there now, in Sabai...she’s actually a very nice teacher, it’s just that she hates it when people, like, treat her bad, swear at her and give her flack and give her body language about it. ‘Cause if I was a teacher and someone swore at me, I could be hurt – wouldn’t you? ... You don’t just give them disrespect ... for an example, one day you rock up and you start swearing at her and like, ‘oh yeah?’, and the next day you have her again she’ll drop that and then she will just move on ... Instead of just ... going up there every day, looking at her, like, ‘what the hell do you want?’ and start swearing at her...

When talking about another “moody, bad-tempered” teacher, Thelma shared how:

every time I had the wrong shoes, I look around and I’d be the only one getting in trouble. Five or six other people got wrong shoes on and I’m thinking, ‘What’s going on here, like? ... Sometimes he’s all right and the next minute, boom!’

At this point, both girls agree. Thelma says to Charlotte,

“**So that’s tough, not racist**”. Gloria suggests that it may become “racist [if] when you go to that class and then he does it to you again but even more”. – *Indigenous Students from a Metropolitan Hub School, 2012*

For the students, racism was evidenced through repeated sequences and patterns of events, with recurrent behaviours and reprimands from teachers/staff across a range of contexts (e.g., parade, classroom, or playground). As shown in the exchange above, students appeared to develop a shared, but contestable ‘mapping’ of their everyday treatment by staff.

52.12 Student Attendance/Participation

The overall environment of the school impacts on student attendance and engagement. Attendance is measured in numerical terms, and described independently of engagement. There has been a longstanding history of schools looking to Indigenous students, parents and communities to understand issues of non-attendance or perceived lack of engagement in class (Ladwig and Luke 2013). For example these teachers reported that:

Andrew: Even with them not being at school, it might be something that’s not just instigated by the child not wanting to come. Sometimes it’s the parent not wanting to let the child go to school because they’re either alone or – I’ve had students that didn’t want to come to school because it was their birthday and their mum and dad said they could stay home or mum wanted a job to do around the house and they needed the child to be around. Little things and some of it...

Noelene: Or mum said I didn’t have to come to school today.

Andrew: Yeah and it’s like undermining the school.

For schools and teachers, the focus remains largely on the impact of non-attendance on curriculum and assessment. The responsibility for attendance rests with parents.

Another teacher says:

That makes it hard in terms of planning a curriculum for them that they can access. Particularly if you’re doing longer term tasks, they miss out on lots of stuff. We work very hard on getting the children here on time, because we have had a lot of lateness issues, attendance issues. We do have a proportion of children who don’t get fed at home. – *Non-Indigenous teacher, Northmarsh State School, 2012*

While schools look to students to understand these issues, students and families explain non-attendance largely as a result of schooling experiences. For example,

this community worker describes her brother's experiences of feeling negative judgements by both white teachers and peers when coupled with issues he had identifying as Aboriginal: "A lot of kids are ashamed. Like my older brother. He was really ashamed of who he was and he never told anybody ... he would never go to an Indigenous teacher or anything like that ... he wouldn't go to anything [and] he would just, like, fail his subject ... He ended up leaving school and he got an apprenticeship with my uncle" (Nicola 2012).

Sometimes, students felt a lack of interest and support from teachers and schools. This was particularly problematic after students had been away from school for any length of time. The academic issues that Thelma experienced were compounded by what she perceived as a lack of interest from her teachers in reviewing work she had missed. In this instance, *Thelma* was absent due to illness – she reflects on what happened when she returned to school:

My English teacher she [didn't] do anything ... she just expects me to do something about it ... when I rock up and I tell her I've been away, she goes, 'Okay ... well you have to catch up and stuff'. Like she knows about my – she knows I've been away, and I'm like 'what am I supposed to catch up on?'

However, this student was able to articulate a way that this teacher could improve support for her in these circumstances: "If I could stay back a bit late after class, like in lunch or something, just to, like, get some notes off them to see what I have to do". When asked how she handled the lack of support in this instance, she reflected that she just "did it in class". In her next statement she makes direct links between absence and how easy it is to fall behind without the appropriate support for this: "going back to school just gets even harder and the teachers just expect me to already know it and I'm, like, thinking, 'I don't know anything!' I just don't have a clue what to do".

Not only did many students not feel supported academically, but many reported that teachers did not acknowledge the reasons for absences. In this case, *Gloria* was mourning the death of an Auntie, and had taken time off school: "Everything's been happening this last week ... [The teachers] aren't recognising that we hurt ... They **are** recognising that we're away from school a lot". Interestingly, in another school, a teacher talked about an Indigenous student who was missing school in order to attend a family funeral:

She was doing fairly well, at the beginning of the year. Her first exam was pretty good, but her second exam once she stopped coming, she just didn't know the stuff. And that worries me a bit, because now, she's away for a funeral. She is missing more time. And of course, she's done the right thing. She sought an extension just the other day. She came and saw me and sought an extension of her own volition, she's done all the forms, she's done all the right things. But, she is now gone an open-ended-it's an open-ended thing-for when she's coming back. So I'm just going to have to work with her when she gets back. Try and get her back on track again. – *Teacher, Iron Oak State High School, 2012*

For many teachers, the reasons for the non-attendance of students remain unknown – an issue to be resolved by parents, students and Aboriginal staff in schools:

There are issues with truancy here, with Indigenous students ... One of them, I didn't see for the first month or so of school. And she had been avoiding coming to class. I don't know why. The other girl was attending, and was doing quite well and then stopped attending. And then her attendance was sporadic. The two of them, well ... there has been an interven-

tion, working with the Community Education Counsellor. She has really been working with them... and a teacher aide, who works with Indigenous students. – *Teacher, Iron Oak State High School, 2012*

In this case, the responsibility for understanding and “fixing” student disengagement in this class falls to the IEW. Although the teacher reports that the issue has been “resolved”, this teacher also reports that he “doesn’t know why” the students had not been attending. This is a recurring theme across schools, for example this teacher said that:

Absenteeism is a bit of a challenge but we’re – if they’re away more than two days, we let the principal know and she’s ringing to find out why they’re away and when they’ll be back. Our IEW is really good too because she’ll chase kids up and she’ll let you know if they’re at a funeral or if they’re just having the day off. – *Teacher, 2012*

Parents report that strong relationships between the school and students were vital in building student engagement and encouraging attendance. Claude had this to say:

Claude: Like me and my son – her older brother – always try and drum it in to her, y’know. My baby daughter, she... She says she wants to be a policeman and all that.. be a police officer. Well....You gotta finish high school ... before you can even become a policeman ...

Interviewer: So what would she say about her experience in high school?

Claude: Well she...she’s enjoying it at the moment. ‘Cause when she was up north there, she didn’t even worry about going to school at all, last year. Second term of last year, she come here, and she’s been going pretty good at the moment. So yeah, cause we went up there before school started [they] produced [IEW] there, and she met the new headmaster and all that, so yeah, she’s enjoying it there. I try and ask her if she needs any help, to go and see the Principal or whoever, if she needs help, or whatever she needs help with.

An Indigenous Education Worker running an after school program reported that having genuine connections with Indigenous students was vital: “Every Murri in the area knows George [an Aboriginal worker]. One of the Dads went to him and said, ‘I’ve never seen it before. This little one was arguing with his Mum saying, ‘I need the letter. I have to go to school. I have to go to school.’ ‘Why? Why?’ ‘It’s traditional games day. It’s traditional games day.’ And that was the whole purpose.... that was the whole purpose. Ohhh, I’ve never seen anything like it...” (*Deon, Redhaven, 2012*)

When asked to explain some of the reasons why they or other Indigenous students may not attend school, the response of one student was:

Charlotte: I reckon with most of them it just gets too hard for them and most feel like they don’t get much support from the teachers and cause they might not get the work, and they probably need to start off a bit slower to actually get the first bit of it, because they’re probably put in, just put in straight like ... The other week I was put like straight into doing my science experiment thingy and every time I get a science one it’s so big. I’m not even joking. Too many questions like, it does my head in. But first ‘you got to do this lesson’ thinking so many questions already due this lesson, and like nobody could do it, and like that just shows like what if they are doing that to the younger kids? Putting like, just ones that have come from Primary school, like they’re not going to want to stay in if it’s going to be this hard and they know it ‘cause they’re just not going to be able to do it.

- Interviewer:* It sounds like work just keeps getting piled on top without enough time to get the first thing done before you start the next thing.
- Thelma:* Happens to me but then if it happens to them they are just going to get into a bad habit of wanting to stay home cause they don't want to go to school too. *Teacher Aide, Metropolitan Hub School, 2012*

This student's comments focus on the incremental and developmental levels of difficulty of secondary school work. As she points out, the primary to secondary school transition is a key juncture and the support needs of Indigenous students become even more focal. This point is also taken up by a group of Indigenous parents from a provincial school:

- Maggie:* See this is the thing that I was saying about going from primary to secondary, is if they know they can't keep up with the rest of them, they'll pretend to be doing their best but still failing.
- Bridgette:* A lot just throw their bundle in, they won't try.
- Maggie:* Yeah and gradually as they go along, they get to a point where they think well what's the use? They'd rather drop out of school than continue.
- Bridgette:* I had a daughter working up the high school here but there was a lot of children up there that really did need a lot more help, a lot more education. She said they were lacking and really struggling.
- Maggie:* I think if they're going around the whole school, like I said, it makes them feel more comfortable that they don't feel targeted, oh you're the dummy sort of thing, you need help. That's been a big problem. It has been a big problem for our kids. *Parents, Provincial School, 2011*

The factors impacting on student attendance and engagement are complex. Where there is a lack of community engagement or very limited approaches for consultation with parents, the school and teachers' views prevail and focus on the 'student-as-problem', rather than 'system-as-problem'. The views and reflections in this section suggest that there are fundamentally different understandings of the same phenomenon: Indigenous students and parents questioning the level of school support; non-Indigenous teachers questioning why 'absence' is such an issue for Indigenous students.

52.13 Definitions of Success

Since the earliest days of policy development in Indigenous education the central issue has been instigating structural processes that enable community engagement and involvement in decision-making. Theoretically, there has been evolution from 'consultation' toward developing a system of intra-agency (school) governance; allowing the local Indigenous community to have input into the development, delivery and evaluation of work that is done by the school. In practice, and our interviewees have explained, that actual governance is often superficial and token. Further, according to many Indigenous educators and community members, this has not led to any quantum shifts in redefining or opening up definitions of 'what counts' as success.

Aboriginal principal, Dean, from a small, remote school (98 % Indigenous students) sees success in these terms:

Success is having our kids turn up for school. Success is having those kids enjoying being at school. Success is having them engaged when they're here. Success is them being happy, being safe. I could probably go on and on and on about that one because it's not always... it's not always just about what we [*achieve academically*]. It's not always about that. It's about relationships that the staff have with the kids, and the kids have with the staff. It's the fact that these kids want to be here. It's the fact that they're happy when they're here. It's the fact that they – remember I talked about that no shame? If we ask them to do something, they're happy to do it; they're happy to perform or they're happy to speak to; or they're happy to read out to... give everything a go. It's success.

... We might try something – we give things a decent go. We don't just next week go, oh geez, that didn't work last week so let's get rid of that one. We give things a decent go and, yeah, like I said, if they don't work, what's the point in keeping them? If those strategies don't work for these kids, we'll try something different.

... It might not show it on paper. It might not show that they're scoring whatever in NAPLAN, that they're in this band instead of that band or that sort of thing. We want our kids to achieve high but if they don't, we're not going to be beating ourselves up over it.

Many of the Indigenous informants noted a range of factors that contribute to establishing the conditions for Indigenous students to achieve 'successful outcomes'. But the point that this principal makes is that Indigenous communities have different criteria for what counts as 'success' beyond and in addition to test scores and other conventional measures.

An Aboriginal student from a very remote high school whose goal is to do Nursing or Law (or both), describes how high expectations and goal setting for Indigenous students is focussed at her school:

I'd probably have to say it's more a sporting kind of association. They really encourage kids to do their sports and they also encourage kids to be proud of who they are in a way. In a way they try to be strict but there's some kids that don't even really listen or anything like that which is a bit disappointing. But yeah the school's more of a sporting kind of school with some class work as well. – *Student, Very Remote School, 2011*

She sees that sport is an avenue for developing non-academic skills that influence your application in the academic context. She is seen as a 'role-model/mentor' in the school and a peer tutor for other Indigenous students who come to her if they have not understood what they have learned in class. She reiterates what students from Merribridge have suggested, that collaborative support and mentoring is a way to pay-forward for a collective gain. There is a distinction suggested here between 'mentoring' – actively working with others; and 'role-modelling' – showing your 'success' to encourage others along the same path. The true measure of the value of that role modelling for the whole student body is reliant on the systems that the school sets up to 'share' the valuable lessons between the school groups. Just as 'leadership' has been expressed as something which does not need to reside at the top of the pyramid (e.g., in the principal), so too should this idea of role models encourage the natural connections and diverse levels of leadership demonstrated by students. Sometimes role modelling is needed for things that the school may not see,

or value, because it doesn't fit the scope of how they define 'success' or 'successful school behaviours'.

I don't think our curriculum has catered for [*when teachers 'fail' Indigenous kids who do attend regularly*] and that's why we've challenged the curriculum and there's a lot of things to do with our line structures, with kids coming in from remote who might turn up a couple of weeks late, arrive here and then all of a sudden gets put on. This is the only class that's available in this life for you, where they may not have any links or relationships, we're allowing them to take back home. – *Aboriginal Teacher, Provincial School, 2011*

Indigenous parents and education workers make the case for an expanded range of criteria for 'success' in schools for Indigenous students that include, but that also go beyond conventional measures (i.e., quality relationships, active participation and engagement, cultural knowledge).

52.14 Reconciling Education

Deficit discourse is defined as a language of 'lack' – of absence of knowledge, practice and resource (e.g., lack of resources in the home, lack of discipline, domestic problems, poverty, health issues, substance abuse and criminality, negative attitudes toward schooling, cultural 'loss'). There is broad concurrence between community views and teachers' comments about Indigenous education. Despite decades of reform *and* intervention, and an official policy veneer that aims for social justice and reconciliation – many Australian educators continue to work and practice from a baseline of deficit assumptions about Indigenous cultures and peoples. These views extend not only to Indigenous students, their families and parents, but impact on the everyday experience of their Indigenous professional colleagues in schools.

Our aim was to create a relational space for dialogue within and around research on Indigenous schooling, where Indigenous voices and knowledges are not subordinated, hidden or taken-for-granted. Our other move here is to contrast these views with the selected data on teachers' and school leaders' views taken from the larger evaluation study. As far as was practically possible, we wanted to circumvent the longstanding filters of relying upon non-Indigenous researchers or officially designated Indigenous speakers and representatives. Although the scope and sample of the community voices and of the Indigenous education voices presented in this chapter cannot be seen as 'representative' in either scientific or cultural terms – what is clear is that the views of community members, parents and Indigenous peoples working within schools express very different cultural perspectives, experiences and knowledges than those of non-Indigenous educators who have legal carriage of the education of Indigenous youth.

These limitations and strengths of the present work noted – the voices and perspectives included here are diverse and, as noted at the onset, there is no singular Indigenous perspective or 'Community' perspective on any issue. We deliberately sampled a broad range of generational, gendered and local views – urban, suburban and regional. Several major themes emerged:

- *Indigenous communities, parents and students are of the view that they are defined and treated in terms of deficits or lacks, rather than cultural strengths, knowledges and community practices.* This is evident not just in the treatment and experiences of students, but also in the interpretation and position of parents and caregivers, community members and, in instances, Indigenous teachers, education workers and aides. In the deficit model, teachers, principals and schools effectively avoid real accountability to communities.
- *Indigenous community members, parents, educators and students share the view that non-Indigenous teachers and school staff need to improve their active knowledge of and engagement with Indigenous communities, culture, and knowledge.* The need for stronger professional development and training programs on cultural awareness was a recurrent theme.
- *Cultural recognition, community-based activities, cultural activities and designated spaces for Indigenous students are important for symbolic and practical purposes in setting a base for improved mutual relationships, understanding and Indigenous school participation.* There was agreement on this point, but with the crucial caveat that such symbolic activities needed to lead to substantive engagement with community.
- *Many current school efforts at ‘consultation’ and ‘engagement’ are viewed as token efforts without any real commitment to Indigenous governance or decision-making.* This included both efforts to engage community and the use of Indigenous school staff and teachers. Many interviewees felt that they were condescended to and ‘used’ by school authorities for purposes of “sign off” and surface level engagement.
- *Many Aboriginal staff in schools state that they are positioned in reactive and service roles, rather than substantive advisory, leadership or consultative roles.* There are notable exceptions to this, but the general sense was that these positions did not have the requisite professional status and respect, clarity of responsibilities or recurrent funding.
- *Students interviewed raised the issues of the need for mutual respect, better relationships and timely assistance from teachers in classrooms.* Many students stated that they felt that teachers unnecessarily and unjustly singled out Indigenous students for poor behaviour and performance.
- *Students and Indigenous education workers described the problems and issues raised by non-Indigenous teachers’ attempts to teach Indigenous content as part of the curriculum.* Some teachers’ attempts to include and ‘embed’ Indigenous knowledge led to misrepresentation and misunderstanding, and the negative positioning of Indigenous students in classrooms. This is a crucial challenge for current national efforts to require the teaching of Indigenous studies across the curriculum.
- *While they recognise the need for improved test score performance and academic achievement, Indigenous community members and educators reiterated the need for expanded criteria and benchmarks of ‘success’, including improved relationships, engagement, health and cultural knowledge.*

There is a broad message here. The larger study (Luke et al. 2013) establishes both interpretive and empirical grounds that Indigenous people involved in education are the objects of deficit discourses, talk and assumptions. These, they report,

permeate their interactions and relations with non-Indigenous school staff and educators who, despite the best of intentions and, in many cases, stated commitment to ‘social justice’, anti-racism and ‘equity’ fall into deficit talk and thinking as ‘default’ teaching positions (cf. Cazden 1991). Indeed, in the major evaluation study one of our key findings was that past key thresholds of % of Indigenous students in their classes – teachers tended to move towards a ‘default’ of basic skills pedagogy (15 %) and vocational curriculum (11.5 %) (Luke et al. 2013, p. 213).

Taken together, their comments call for substantive, informed and sustained engagement between schools and communities characterised by mutual respect, with the aim for shared decision-making and collaborative governance at all levels of the educational enterprise. Without exception, the Indigenous speakers’ view is that, at present, this is not occurring.

But there are also two further major process issues that arise from this study. First, the study itself undermines the myth that Indigenous parents, community members, IEWs and, indeed, students somehow lack the capacity to engage in substantive, informed dialogue about educational issues, school practices and operations, and teaching and learning. These are articulate and powerful voices.

Second, there are two very different standpoints on what is occurring in schools and in communities. While many of the issues and perspectives noted above would not be foreign to non-Indigenous school leaders and teachers – Indigenous standpoints on education are different in perspective, experience, belief and aspiration than those of non-Indigenous school leaders and teachers. Reading through our transcripts and comparing them to the views of principals and teachers – we are struck again and again by the simple fact that there are two radically different, yet intersecting, lifeworlds that meet in the school. Without the human capacity to listen and hear, respect and engage with patience and humility – Australian schools will continue to make halting and sporadic progress in the education of Indigenous peoples.

Acknowledgement We thank James Ladwig and George Noblett for their editorial support. This research was supported by funding from the Commonwealth Government, Department of Employment, Education and Workplace Relations, Canberra, Australia for the evaluation of the Stronger Smarter Learning Communities project, 2009–2013. The authors would like to thank the Indigenous communities, Elders, parents, students, education workers, teachers and principals who generously participated in this study. Our colleague John Lester provided wisdom and guidance throughout; Nerida Spina provided timely editorial assistance. We acknowledge the ideas and support of our colleagues on the research team: Courtney Cazden, Rhonda Coopes, Valentina Klenowski, James Ladwig, John Lester, Shelley MacDonald, Nerida Spina and Annette Woods.

Chapter 53

Urban Education in the United Kingdom: Section Editor's Introduction

Kalwant Bhopal

There has been a great deal of research which has explored the concept of the 'urban' in relation to educational achievement and attendance (Johnson 1999) with an emphasis on a 'crisis' in urban education (Whitty 1986) as well as attempts to 'fix' failing schools (Hill 1998). More recently urban education has been analysed in relation to educational policy making in the UK (Lupton 2005), in which changes in educational policy-making have affected the educational experiences of students, resulting in greater inequalities and a further marginalisation of disadvantaged communities (Crozier; Whitty, this section).

This section of the collection specifically explores urban education in the UK. Recent data suggests that 81.5 % of the population in the UK live in urban areas (Census 2011) in which the wealth gap between the rich and the poor differs significantly (Wilkinson and Pickett 2009). In a culture of austerity, current government policy to address the economic deficit such as the 'cap' on benefits and the 'bed-room tax' have significantly marginalised the most disadvantaged groups (Taylor-Gooby and Stoker 2011). Changes in educational policy have also resulted in cuts to education budgets (such as the scrapping of the Ethnic Minority Achievement Grant (EMAG) and Traveller Education Services (TES) (NASUWT 2012). Similarly, such austerity cuts have disproportionately affected disadvantaged and marginalised communities in which inequalities continue to persist at all levels of educational achievement. Recent research suggests that students who are eligible for free school meals were less likely to achieve five or more A*–C grades in their General Certificate of Secondary Education (GCSE) than the student average. In 2012/13, 64.8 % of pupils not eligible for free school meals obtained at least five A*–C grades. However, this percentage drops dramatically to just 38.1 % amongst pupils who are eligible for free school meals indicating that poverty can have a

significant effect on educational achievement (Demos 2014). Such inequalities continue when examining access to higher education. Whilst there has been an increase in the numbers of students applying for and attending university (Adams 2014) there is evidence to suggest that Black and minority ethnic students are less likely than their White peers to be accepted at Russell Group¹ universities (Boliver 2014). Just 36% of Black and minority ethnic applicants to all Russell group universities were offered places compared to 55% of white applicants between 2010 and 2012. Against this backdrop, this section of the collection explores urban education in the UK. It challenges inequalities in urban education with each of the chapters addressing the most recent, up to date innovative research in the field of urban education. The collection of chapters captures different understandings and discourses of urban education in diverse social, economic and political contexts: which includes perspectives from England, Scotland and Ireland. The themes focus particularly on aspects of inequalities in relation to understanding urban education in relation to 'race', class, wealth, space, migration and marginalisation. The UK has seen significant changes in educational policy making, which have contributed to greater educational inequalities. The chapters in this section emphasise the importance of challenging such inequalities and the need for progressing a social justice agenda.

Gary McCulloch in 'Histories of Urban Education in the United Kingdom' provides a comprehensive review of the literature on the history of urban education in the UK by outlining the strengths and weaknesses of the field of urban education. The chapter outlines the origins and development of the history of urban education and explores how educational provision is linked to urban society, focussing on the historical characteristics of educational reform in different urban contexts. McCulloch specifically uses London as a case study example to do this. The chapter explores how the history of urban education has developed by focussing on aspects of inequality such as class (especially the working class), the significance of social geography in understanding the urban and changes in urban education which have emphasised new themes of inequality such as ethnicity in relation to literacy. McCulloch concludes that there is no distinct genre or urban educational history in Britain but the work, 'demonstrably provides key insights into a substantial and always prominent feature of urban life and services' (p).

The Chap. 55 by Meg Maguire on 'Wealth Inequalities and 'Hidden Injuries' in the Global City: Educational policy in London' explores how the effects of educational policies on school 'choice' linked to setting and streaming in schools in London are based on aspects of polarisation. Maguire argues that children are categorised and segregated based on the 'hidden injuries' of class and racial inequalities. She suggests that polarisation tactics are often used in schools in which the 'divided city' is translated into the 'divided classroom'. Maguire argues, 'In cultural terms, cities have always been places of 'lived complexities' because in demographics and geographical (spatial) terms, metropolitan cities include the most and least

¹The Russell Group consists of 24 prestigious universities. These universities are research led and consistently score highly in league tables. They include the universities of Oxford, Cambridge and the London School of Economics.

privileged and powerfully demonstrate the stark polarisation between access to and exclusion from cultural/social patterns of consumption' (p). These divisions have had significant impacts on educational choice and access. Maguire argues that in the neo-liberal global city, educational choice is affected by geographical location and space in which middle class parents are able to select schools with predominantly middle class intakes, which are often located in middle class housing enclaves: hence, placing their children and themselves in advantageous locations and positions. Consequently, Maguire suggests that '...it seems unremarkable to talk of divided schools in divided cities. In educational terms, the issue is not about diversity in the city but is more about the avoidance of diversity, the marginalisation of the 'other' and the reinforcement of widening gaps of inequalities, the reproduction of insiders and outsiders' (p). Maguire demonstrates how the system of banding and setting in schools is related to aspects of class, ethnicity/race and gender. 'Thus it is reasonable to assume that in London schools (as elsewhere) the fact of classifying students by 'ability' – which correlates highly with aspects of their social identities – may mean that 'ability' is masking other forms of older patterns of exclusion and oppression' (p). Maguire argues that on the one hand whilst London remains a global city, it continues to be affected by neo-liberal policies of austerity, which advantage some and disadvantage others.

David James, in his Chap. 56 'Knowing Your Place? The Urban as an Educational Resource', explores how 'the urban' functions as an educational resource in English schooling. He draws on empirical studies to discuss how two opposing understandings of the urban as an educational resource affect implications for learning and achievement. James suggests that the use of the urban as a resource does not necessarily address the question of equality. The first project that James draws upon is based upon an independent evaluation of area based curriculum initiatives, which includes aims to increase student engagement through area based curriculum projects in schools. The second project is based upon a sample of white middle class families who turned their backs on 'mainstream choosing' by choosing schools for their children with average or low performing achievement. A major finding of the study suggested a clear commitment from the families to comprehensive schooling and the welfare state. James discusses the two projects to demonstrate how contrasting examples of 'the urban' can be used as positive resources based on locality, curriculum and pedagogy. James suggests that '...as well as being a dynamic and constitutive context, 'the urban' functions powerfully as an educative resource, but in doing so always begs the difficult and uncomfortable question, 'in whose interests? To whose benefit and to whose disadvantage?' (p).

In 'Race Matters: Urban Education, globalisation and the 21st Century' Gill Crozier explores the importance of race and urban education by focussing on urban geographies, space and place, the role of parents, racism and White Supremacy. She does so by drawing on theories of Critical Race/Feminism, Whiteness and Intersectionality. Crozier discusses how policy frameworks around race and education have changed considerably which has affected the context of urban education. Crozier suggests that, 'It is not only since the inception of neo-liberal education policies that schools in urban centres have been differentiated and segregated.

School allocation, prior to the 'school choice' policy was largely based on locality and catchment area. The classed and raced differentiated urban spaces (Savage et al. 2005) translated into classed and raced differentiated schools' (p). Crozier outlines the racism, marginalisation and exclusion that continues to exist for those from Black, Asian and minority ethnic communities as outlined in their educational experiences. Whilst such structural inequalities continue to exist, in recent times these have become far more complex in a changing society. 'An additional challenge to urban education and the wider community is the danger of polarisations – hierarchies of oppression which lead, amongst other things to racial antagonisms' (p). Consequently, race can no longer be ignored when addressing inequalities in education, particularly in relation to the socio-economic and political context of urban education. However Crozier also recognises that racial differences cannot be understood without a recognition of the role of social class and indeed, white hegemony. '...class oppression is central to structural inequalities and white hegemony as part of that. White hegemony and social class are inextricably linked. Therefore whilst at times foregrounding race it is essential to challenge these central oppressions simultaneously and collectively' (p).

Geoff Whitty and Jake Anders in their Chap. 58, 'Closing the Achievement Gap in English Cities and Towns in the 21st Century' explore the gaps between socio-economic groups through cognitive measures and the achievement of academic qualifications. Whitty and Anders argue that the academic attainment gap in schools emphasises that student performance during the compulsory schooling age has significant implications for success in access to higher education and the labour market. Furthermore, there are significant differences in these experiences for different groups based on social class and ethnic backgrounds. This chapter explores how the gap can be narrowed in the compulsory schooling phase at ages 5–16 and examines interventions can be useful in tackling the relationship between social background and educational achievement. Different strategies, which have been used to close the attainment gap are discussed, these include: National Strategies, Academies, Extended Schools, Reading Recovery, Teach First and The London Challenge, as well as recent Coalition government policies (2010–2015). The authors' argue that whilst many different strategies have been introduced, 'There are already signs that the slight narrowing of the attainment gap identified under New Labour has stalled or even been reversed, at least at secondary level' (DfE 2014; Ofsted 2014) (p. 28). However, even where attainment gaps have narrowed the gaps are largest for 'elite measures' in which the disadvantaged continue to remain on the margins. The authors suggest that society has to be clear about the expectation of schools in achieving equality for all. They note that 'This does not mean that schools cannot make a difference, or that they do not have a particularly important role in helping to narrow the attainment gap and thereby enhancing the life chances of disadvantaged children. It does mean that they cannot do it alone' (p).

Dympna Devine's Chap. 59 'Migrant Children in Urban Schools in Ireland: being valued differently?' focuses on exploring how children are valued in schools and the effect this has on wider inequalities between different groups of children. Devine explores the tensions and dilemmas associated with valuing migrant children

in schools in Ireland, '...a group who are increasingly visible in global policy discourse in education and who epitomise dilemmas around reputation and risk, value and being valued in an increasingly competitively structured education market' (p). The chapter explores how changes in the population of Ireland in the 'Celtic' tiger boom which resulted in the attraction of highly skilled immigrants working in different industries such as IT and pharmaceutical industries, resulted in significant numbers of immigrant children attending schools in Ireland. Whilst net migration declined, the numbers of immigrant children in schools continued to increase as many immigrant families decided to remain in Ireland despite the economic recession. Devine suggests that, '...as education systems become simultaneously directed toward neo-liberal performance based goals, this influences what is valued and I argue how children may become differently valued and positioned within the more competitive market driven discourse' (p). Devine considers two key issues which suggest recognition and value; access to schools/school choice and policies of immigrant support in schools. She suggests that there are dilemmas about being valued differently for migrant children and these take place in their relationships with their peers and teachers: 'Tensions related to reputation, resilience, risk and potential reward emerge in migrant children's own experiences of teaching and learning' (p). Furthermore, identifying the needs of migrant children has to move beyond the use of classificatory 'labels'. Devine suggests that, 'Being differently valued can imply both recognition and misrecognition. Identifying the additional needs of migrant children can lead to positive visibility in the classroom *provided* it moves beyond a classificatory 'label' and becomes a mechanism for realising each child's rights to both quality and equality in their learning process' (p).

Ross Deuchar, Johanne Miller and Lisa Borchardt provide a Scottish perspective on urban education by focussing on the nature and impact of detached street work and how it can be used as a form of urban education in deprived, marginalised communities. The chapter uses data from a longitudinal qualitative research study, which examined how street work programmes in Glasgow generate social capital amongst disadvantaged young people, youth workers and other community members. The authors provide a contextual background to policy shifts in relation to young people as well as different perspectives on youth work. The rich, detailed qualitative data is used to explore specific themes: building trust, reciprocity and confidence; addressing territorial violence, anti-social behaviour, alcohol and drug-misuse; and generating responsibility, empowerment and social inclusion. The authors argue that detached youth work is a positive means of engaging with marginalised young people and can be used as a form of empowerment within the urban educational context. Furthermore, youth services such as Youth Matters are able to provide positive support for young people, particularly in relation to education, employment, training and voluntary services. However, some young people may continue to be dependent upon such services: 'This type of work needs to continue in these communities alongside a wider focus on supporting young people to build wider relationships with other professionals as well as local adult residents. In order to truly empower young people, agencies like Youth Matters need to encourage

them to take ownership over their own lives and to believe that they can achieve things without the support and mentorship of youth workers' (p).

Each of the chapters presented in this section provide a critical discourse on neo-liberal approaches to urban education in the UK. They do so by focussing on the importance of addressing inequalities in access and achievement in education. If we are to move towards a socially just society in which education is a route rather than a barrier to success and social mobility, then we must continue to question how this can be achieved, particularly in relation to the 'urban'. UK government policy making must address the structural inequalities that continue to exist particularly in addressing the changing demographics of schools in the urban context, as well as the recognition that greater support is vital for those who remain on the margins.

Chapter 54

Histories of Urban Education in the United Kingdom

Gary McCulloch

54.1 Urban History and Urban Education

‘Urban history’ and ‘urban education’ have to a certain extent developed as areas of study rather separately from each other, and yet the history of urban education emerged to contribute to both types of literature, led particularly by key figures such as W.E. Marsden of the University of Liverpool and David Reeder at the University of Leicester. Calls for a closer connection between historical study and contemporary policy in urban education have asserted the importance of historical understanding for the formulation of urban educational policy, and often the need for historians of urban education to relate their work to contemporary concerns. Commentators have often noted the inchoate and piecemeal nature of the development of the history of urban education in the UK.

On the one hand, the study of urban history as a sub-discipline developed strongly in the British context from the 1960s. Writing on British urban history was influenced by H.J. Dyos and the Centre for Urban History at the University of Leicester (Cannadine 1982). Dyos was the first professor of urban history in Britain, from 1971 until his death in 1978, and founded the Centre for Urban History and also the *Urban History Yearbook*, published from 1974. His own work examined the dynamics of the Victorian city as it developed during the nineteenth century (see e.g. Dyos and Wolff 1973), a topic that was taken up and developed further by other writers including Derek Fraser (1976, 1979) and R.J. Morris (1986; Morris and Rodger 1993). By the turn of the century, what had begun as something of a cottage industry was thriving to the extent that a three-volume Cambridge urban history of Britain could be produced. This was arranged in chronological order, with the first volume mapping out urban developments from 600 AD to 1540, the second from 1540 to

G. McCulloch (✉)

UCL Institute of Education London, 20 Bedford Way, London WC1H 0AL, UK

e-mail: g.mcculloch@ucl.ac.uk

1840, and the third from 1840 to 1950 (Clark 2000–2001). Another major enterprise was the long-running book series ‘Historical urban studies’ published by Ashgate, under the editorship of Jean-Luc Pinot and Richard Rodger (e.g. Colls and Rodger 2004). This included detailed monographs and edited collections in diverse areas of urban history in Britain, such as *The City and the Senses* (Cowan and Steward 2007), *City Status in the British Isles* (Beckett 2005) and *Culture and Class in English Public Museums* (Hill 2005), among a burgeoning set of comparative and international works.

On the other hand, in the 1970s and 1980s there was generally a lack of historical perspective in discussions about the character and development of urban education in the UK. The edition of the *World Year Book of Education* published in 1970, for instance, was devoted to the theme of education in cities (Lauwerys and Scanlon 1970). This included for example chapters on planning schools for new communities in England and Wales (Smith 1970), the established city of Nottingham (Newson and Lowinger 1970), and the new town of Milton Keynes (Harding 1970). However, none of these developed a clear historical dimension to the issues raised; they preferred instead to concentrate on future plans for development. Over the following two decades, major problems were identified that were highly relevant to the development of urban education in Britain. Increasing attention was given to vocational and technical education, especially as a result of increasing youth unemployment and economic difficulties in urban districts. The problems of individual schools in urban areas such as William Tyndale School in 1975 also focused concern on the lack of accountability of schools to parents and their local communities, and the apparent failings of local education authorities (LEAs) (see e.g. Simon 1991). Yet there was little historical awareness about the urban tensions that underlay these new developments. In 1976, when the Labour prime minister James Callaghan launched the self-styled ‘Great Debate’ on education, the historian David Reeder complained that current concerns about urban schooling failed to take account of longer-term historical factors such as Victorian school buildings and out of date planning. Indeed, he averred, historians were virtually excluded from the contemporary analysis of urban education (Reeder 1977a, p. 2).

This situation differed markedly from the USA, for example, where the field of urban education became established in the 1960s, with the launch of journals such as *Urban Education* (1965) and *Education and Urban Society* (1968). Writing on the history of urban education became prominent in the wake of urban-based protests about racial discrimination and social inequality, and the comparativist Edward King was able to publish a historical review on urbanisation and education in Britain that emphasised such issues in a special issue of the *International Review of Education* on the effects of urbanisation on education in 1967 (King 1967). In 1969, the radical historian Michael Katz edited a special issue of the American journal *History of Education Quarterly* on the theme of urban education. This included substantial work by leading historians of education on education and race, the Northern ghettos, urban school reform, the urban child, and the city as teacher (*History of Education Quarterly* 1969). Katz himself derived several common issues from this collection. In particular, he noted the importance of relating historical study to the

contemporary problems of urban schools and schooling. According to Katz, 'hard-nosed historical assessment of the comparative impact of schooling and environment as educative forces and of the outcomes of school reform bears directly upon an understanding of the origins and scope of the urban school culture today' (Katz 1969, 326). Katz concluded that such historical work 'links up with, and contributes to, the larger critical contemporary reappraisal of American life and institutions', which he regarded as being of fundamental significance (Katz 1969, p. 328). At the same time, he also emphasised the need for further historical research, which would in turn provide 'detailed, empirical knowledge about schools and their clientele, knowledge which we do not yet have in anything like sufficient quantity' (Katz 1969, p. 326). This clarion call was soon followed by a number of historical studies into the characteristics and outcomes of urban education in American cities (e.g. Kaestle 1973; Tyack 1974; Goodenow and Ravitch 1983). Such treatments were rather more focused and comprehensive than was the case in Britain.

It was not until the second half of the 1970s that serious efforts began to be made to introduce a consciously urban history of education in the context of the UK. For this, it was David Reeder who was principally responsible. Reeder was based at the University of Leicester and was a member of its Centre for Urban History. His mentor was H.J. Dyos, although he was also much influenced by the work of the historian of education Brian Simon, also based at Leicester (Marsden and Grosvenor 2007). He was also involved in the work of the History of Education Society, established in 1967 and now organising annual conferences as well as a regular journal. Reeder organised the 1976 History of Education Society conference on the theme of urban education in the nineteenth century, taking his cue from Dyos in focusing especially on the Victorian city (Reeder 1977b). The collection of articles that resulted from this included papers by Derek Fraser on education and urban politics (Fraser 1977), W.B. Stephens on illiteracy and schooling in provincial towns (Stephens 1977), W.E. Marsden on education and social geography (Marsden 1977), Reeder himself on city children (Reeder 1977a, b, c), Dennis Smith on social conflict and urban education (Smith 1977), and Sol Cohen on the history of urban education in the United States (Cohen 1977). Cohen's contribution helped to consolidate the close relationship that was developing between the British and American protagonists in this area, just as the involvement of the sociologist Smith and the geographer Marsden suggested scope for interdisciplinary collaborations. The collection marked, as Reeder justly claimed, the first attempt in Britain 'to initiate a discussion on urban education as a focus of historical study' (Reeder 1977a, p. 10). As Marsden and Grosvenor have noted in assessing Reeder's importance in promoting the history of urban education, 'His "foot in both camps" involvement in education and in history was no doubt of help to him in bringing to bear the skills of the Leicester departments in the quest to update the history of education, and at the same time to highlight the importance of the educational dimension for urban historians.' (Marsden and Grosvenor 2007, p. 305).

Another key figure in the early development of a specific literature in the history of urban education in the UK was W.E. Marsden of the University of Liverpool. While Reeder built on his associations with urban history and Victorian studies,

Marsden was trained in historical geography. He utilised this to document the historical and social geography of education in the UK. A number of sociologists in the postwar period such as John Barron Mays in Liverpool and M.P. Carter in Sheffield had shown the implications of deprived urban conditions for urban working class children and youth (Mays 1962/1968; Carter 1962). Mays demonstrated that examination success in the 'Crown Street schools of Liverpool was lower than in the city as a whole and far less than in the more prosperous residential suburbs (Mays 1962/1968, p. 185). Marsden identified differences in resources and opportunities both between and within towns and cities (Marsden 1977, p. 50). For example, he noted that a growth in residential segregation from the late nineteenth century, splintering towns and cities into distinctive social areas, became a significant influence on attitudes towards education as well as on other related aspects such as religion. According to Marsden, both for elementary schools and for secondary schools, the development of a hierarchy of social respectability and selectiveness was largely accounted for through their location in the different social areas of towns and cities. Thus, there was a close correlation between the location of private schools and the social geography of the town, while secondary schools often responded to incipient or expected social decline through the expedient of following their clientele to the suburbs. School fees were adjusted to social areas, and the actual buildings that were provided tended to match the perceived status of the locality (Marsden 1983, p. 99). Such a framework of analysis facilitated an interdisciplinary approach to the ways in which urban forms and relationships of schooling could be investigated in greater depth (Marsden 1987).

Some other developments at this time served to further reinforce the significance of the historical dimension for urban educators. By the early 1980s, as the Conservative prime minister Margaret Thatcher began to give increasing attention to educational issues, the sociologist Gerald Grace could elaborate on the importance of recovering a sense of the historical dimension. Grace led a popular Masters course in urban education at King's College London, which he had established in 1976, focusing particularly on inner-city problems for teachers and school leaders in what was then the Inner London Education Authority (ILEA) (Grace 2007, p. 959; see also Grace 1978). He was alert to the historical and political aspects of this area of study in the development of this course. As Grace observed in an influential edited collection, *Education and the City*, urban school systems 'arose in particular historical conditions and as the outcome of a complex of forces'. The outcomes of particular forces, he suggested, varied over time and in relation to the dynamics of the society involved. Therefore, Grace insisted, a serious study of urban education was obliged to engage with such issues, even if the principal concern of such study might be with the problems of contemporary urban schooling. Grace concluded that students of urban education should 'locate their contemporary discussions in a framework which is sensitive to issues of continuity and change', and also that the recovery of a historical dimension was a precondition of the development of what he called 'critical scholarship' in the field (Grace 1984a, pp. 35–37). One section of this collection dealt in greater depth with the historical location of urban education, with a contribution on the history of urban education in America,

another on university settlements and the city, and a third on the urban, the domestic, and education for girls (Grace 1984b, Part II).

The consolidation of a literature in the history of urban education in the UK was highlighted in different ways in two international collections, both published in 1992, although these works also indicated limitations in its role, both in terms of its relevance to current issues in urban education and for its contribution to an understanding of historical issues. The first of these, the *World Year Book of Education* of 1992 which focused on urban education, offered a number of reflections on historical approaches in a way that its predecessor of 1970 had not attempted (Coulby et al. 1992). It suggested that in the UK, and even more in the USA, much of the work produced by urban educationists took a historical approach, and also pointed out the existence of a large number of studies of this type on individual schools and (Coulby 1992). On the other hand, it commented that historical perspectives often tended to be remote from the 'struggles of the present' (Coulby and Jones 1992, p. 5). For this reason, it argued, they needed to be combined with approaches that emphasised social, political and economic contextualisation, and the role of discontinuities as well as continuities in the development of urban education. These observations indicated the potential linkages between historical, sociological and international approaches to urban education, although they appeared to locate history as a junior partner and to dismiss a specifically national focus as unduly parochial.

The second collection published in 1992, edited by Marsden from the UK together with an American colleague, Ronald Goodenow, was a specifically historical work, part of a book series on 'Themes in international urban history' published by Cambridge University Press and Editions de la Maison des Sciences de l'Homme in association with the Centre for Urban History at the University of Leicester (Goodenow and Marsden 1992). It included substantial papers by William Marsden, on social stratification and nineteenth-century English urban education (Marsden 1992), and Christine Heward, on the social effects of compulsory schooling in nineteenth-century Birmingham (Heward 1992). Nevertheless, David Reeder, in his contribution to the collection reviewing trends in Britain, continued to lament that there remained 'no distinct genre of urban educational history' in the UK (Reeder 1992, p. 13). At the same time, he was optimistic that 'a more sophisticated and analytical approach to the history of schooling in the city (and to an associated range of social and cultural activities) has been contributing to a greater awareness of the relations between education and the city' (Reeder 1992, p. 13). With the emergence of this kind of approach, there appeared to be sound prospects for historians of urban education to make a fuller contribution both to urban history as a whole and to an understanding of (see also McCulloch 2007).

54.2 Educational Provision in an Urban Society

The history of urban education has contributed to the historical study of urban society in Britain in the past two decades in particular in a number of ways. First, it has emphasised the role and characteristics of the provision of education in urban

centres, especially for the working class. Second, it has demonstrated the significance of the social geography and ecology of the city, building on Marsden's earlier work. Third, it has begun to pursue fresh themes such as ethnicity in urban contexts, the experience of urban education, and the nature of literacy.

Urban growth over the past two centuries has undoubtedly been of an unprecedented scale. In 1801 there were no towns in Britain, apart from London, with over 100,000 inhabitants. By 1831, there were seven of these (Manchester, Glasgow, Liverpool, Edinburgh, Birmingham, Leeds and Bristol). By 1901, nearly 40 towns had reached this level, and by 1911, out of a total population of 45 million, 40% lived in towns of over 100,000 people (over 50% in England and Wales). During this period of massive urban growth, moreover, London retained its already well established pre-eminence in terms of size. Seven million people lived in London in 1911, while 14 provincial cities had over a quarter of a million (Harris 1993, p. 42; see also Daunton 2001).

Each of these burgeoning towns and cities had specific characteristics of their own in terms of industrial, social and cultural developments. All demanded increasing levels of social services, including education. The provision of social services was strongly marked by differences of social class, amplified and deepened by the pressures of urban society. Social class has indeed been a key theme in the history of urban education, as for the history of education in Britain in more general terms. Social class conflict has been highly significant in determining the nature of the education system as it has developed over the past two centuries, with the growth of large industrial towns and cities a potent factor in this (see for example McCulloch 1998). Recent literature on the history of urban education has highlighted this in greater depth while also revising key features, often drawing on the findings of detailed sociological studies, and tending to emphasise the nature and problems of the urban working class (Grosvenor and Hall 2012).

Jonathan Rose's work, for example, has questioned the idea promoted in earlier studies such as that of Stephen Humphries (1981) that urban working class children resented or resisted their schooling experiences. Rose has demonstrated that a large proportion of working class children enjoyed their compulsory schooling (Rose 1993), and indeed that working class people drew on a range of learning experiences inside and outside school to enhance their position in society and their cultural improvement (Rose 2001). Other work has demonstrated the variety of levels of literacy in different urban locales. Although towns had established themselves as centres of education and literacy as early as the twelfth century AD (Barrow 2000), in the nineteenth century they were highly diverse in their literacy levels between one part of the country and another, as well as between different types of urban communities (Vincent 2000; Colclough and Vincent 2009).

The social differences that were evident in urban areas also encouraged attempts to 'civilise' working-class children and youth in a wide range of educational arenas. Kevin Brehony portrayed the advocates and organisers of the Children's Happy Evenings Association, the Children's Recreation School, Evening Play Centres, Vacation Schools, the Guild of Play and other play initiatives current in the late nineteenth and early twentieth centuries, in terms of play as 'an antidote to a dis-

ease, the aetiology of which was held to be the city and the conditions of urban life in the areas labelled as slums' (Brehony 2003, p. 89). Rebecca Bates has analysed the connections between the vulnerable position of working-class children in late Victorian England and the enforcement of juvenile emigration in large numbers to support the British Empire in different parts of the world (Bates 2009). The nature of city childhoods has also been discussed in more detail in work by Ian Grosvenor who has documented how data on city children, both in the mass and as individuals was recoded and maintained by LEAs such as Birmingham (Grosvenor 2007, 2009).

In the last few decades also, historians of urban education have begun to give increasing attention to urban middle class schooling. Simon Gunn's work highlighted the urban characteristics and identity of the English middle class (Gunn 2004, 2005). Richard Trainor suggested that a socially, occupationally and geographically diverse urban middle class developed in the nineteenth century, with significant implications for the character of education. The upper middle class sent their sons to preparatory schools and public schools, while the children of the lower middle classes went to day schools (Trainor 2001, p. 697). McCulloch has examined the local differences of Victorian grammar schools (McCulloch 2011a; see also Gunn 2004). The relationship between working class and middle class groups in specific urban areas has also begun to be examined, initially for the most recent period (Smith and Higley 2012; Hamnett 2003; Reay 2007; Butler et al. 2013).

The relationships between urban educational provision and the dimensions of ethnicity and gender have also begun to be mapped out in detail. Immigration especially from Commonwealth countries has been a significant factor in population trends in many urban communities in Britain since World War II, with the precise nature and implications of these trends varying considerably, and leading in many cases to instances of interracial conflict. Ian Grosvenor's work, for example, has shown how the issue of racism has impacted on education in the case of Birmingham in the 1960s (Grosvenor 1997, especially chapters 3 and 4). Lorna Chessum also examined the development of racialised conflict centring on education in the context of the African-Caribbean community of Leicester in the same period (Chessum 1997). The experiences of immigrants and ethnic minorities in these different urban contexts have been explored in depth by Kevin Myers (2009, 2011, 2015). Again, there is evidence of growing recognition of the connections between the variables of class and ethnicity in relation to recent developments in urban contexts, specifically London (Hamnett 2011; Hamnett et al 2007; Raveaud and Zanten 2007).

Other historians have continued to build on earlier work on the character of gender-based inequalities as they have arisen in the urban environment, and have begun to analyse in greater depth the educational experiences of girls and women in towns and cities. For example, Joyce Goodman has examined the removal of children living in the brothels of Manchester, highlighting the social danger that was deemed to be represented in sexually active girls (Goodman 2003). Stephanie Spencer has pursued aspects of the experiences of young girls and women living and working in the city in the late 1950s, with the city itself constructed as a 'rite of passage' for girls on the brink of adulthood, a 'physical space which facilitated

independent living, studying and employment opportunities', but also 'an imagined educative space in which to form an adult female identity' (Spencer 2003, p. 133).

Discussions of urban educational reform also stimulated a significant body of historical literature. The position of local education authorities (LEAs) was under a great deal of scrutiny from the 1980s onwards, with a much reduced role as a result. The LEAs based in major urban centres often had the resources to take a lead in developing particular approaches, whether in concert with or against the grain of national educational policies. In the period after World War Two until the 1960s, a number of urban county boroughs took the lead in championing educational reforms, including the development of comprehensive secondary schools intended for all abilities and aptitudes. From the 1960s until the 1980s, the ILEA was highly prominent for its independent position in promoting urban educational reform from its position in London. After the Education Reform Act of 1988 and the abolition of the ILEA, the powers and authority of the LEAs became significantly diminished.

A special issue of the *Oxford Review of Education* on the centenary of the establishment of the LEAs in 2002 provided a sustained overview of the changes in their position over that time and of their significance as sources of urban educational reform (Lowe 2002). This included a contribution by McCulloch on the range of approaches taken by LEAs to the organisation of secondary education under the 1944 Education Act, such as the tripartite stance of grammar, technical and modern schools that was enthusiastically taken up by Sheffield LEA (McCulloch 2002). A paper by David Crook documented the role of LEAs in comprehensivisation in England and Wales from the 1940s to the 1970s, including the urban vision of the London School Plan in the 1940s (Crook 2002). John Davis reviewed the role of the ILEA in the William Tyndale Junior School affair that came to national prominence in the 1970s (Davis 2002). Ian Grosvenor discussed the involvement of Birmingham LEA in compiling the records of school pupils in the area (Grosvenor 2002). A paper by Tim Brighouse recalled his own career in LEAs from the ILEA to Oxfordshire and then Birmingham (Brighouse 2002). Gareth Elwyn Jones also contributed a significant piece on the roles taken by LEAs in Wales over the past century, in particular in Cardiff and Swansea in differing from the policies prescribed by the Ministry of Education (Jones 2002).

London provided the prime example of how urban educational reform could be generated in a distinct and often contradictory fashion in relation to the approach taken by the national State, from the days of the London School Board in the late nineteenth century to the London County Council (LCC) and then the ILEA. The case of the London School Board (1870–1904) is a fascinating example of the issues involved in governing and reforming the educational provision of a major city. It was, as Jane Martin has observed, a 'flagship institution' that helped to set the educational standards for other school boards to follow (Martin 2001, p. 167). It was a democratic institution in a number of respects, and provided significant opportunities for example for women teachers and activists such as Mary Bridges Adams to become involved in its work (Martin 2004, 2010). Jane Read's research has shown the scope for infant schools in London to promote progressive pedagogy, and also for special education facilities to be developed (Read 2004, Read 2006). Here it was

that London, incomparably the largest urban community in the UK, struggled to come to terms with the diverse needs of its unruly, changing and still growing population.

The distinctive educational stance of London over the 60 years of the LCC's existence has also attracted continuing attention. The close relationship between education and feminist and labour movements in the capital city in the twentieth century has been examined by Martin (2007, 2008). The LCC was active in supporting new approaches to the curriculum, for example in citizenship teaching (Keating 2011), as well as in helping to encourage teacher professional development through courses and conferences (Robinson 2011) and evacuating schoolchildren at the start of the Second World War (Gaertner 2010). The ILEA was established in 1965 to take over the educational responsibilities of the LCC, which was replaced by the Greater London Council (GLC). This new authority soon emulated and even surpassed the independent reputation cultivated by its predecessors. It became widely regarded as a key national and even international centre of educational expertise and authority in its own right. Moreover, it also enabled a wide range of local activists from different backgrounds to take part in urban educational reform, both in setting the agenda for social and political change and in putting it into practice at a grass roots level. It also made powerful and influential enemies, in particular national policy makers who often resented the independence and powers that the ILEA flaunted, so to speak, in their own back yard. When problems such as the William Tyndale affair arose, the ILEA was exposed to damaging and undermining criticism (David 2002). It struggled to survive after the election of Margaret Thatcher's Conservative government in 1979, and was eventually abolished along with the GLC itself (Mortimore 2008; Stewart 2015). The former leader of the ILEA, Sir Peter Newsam, has produced a full account of his career in this role (Newsam 2014). Nonetheless, both the LCC and the ILEA have received less attention from scholars interested in the history of urban education than might be expected. Over the last 30 years, and increasingly in the early years of the twenty-first century, urban educational reform has been absorbed and assimilated into national state policy more than it has set out to provide a distinctive and contradictory approach, although London Challenge has emerged as a fresh initiative to provide a coherent and independent educational strategy for the capital city (CfBT Education Trust 2014).

Much of this work on the history of urban education in Britain has been produced in a fairly dispersed and uncoordinated way within the space offered by associations such as the History of Education Society and ISCHE. It reflected the increased interest that was shown during this period in theoretical and methodological issues in the history of education, often demonstrating clear connections with social scientific ideas and methods (McCulloch 2011b). There were also some initiatives to organise research in this area more systematically through conferences on a related theme leading to special issues of a specialist journal. The first of these conferences was held in Birmingham in July 2001 as the annual meeting of the International Standing Conference for the History of Education (ISCHE), on the theme of 'Urbanisation and education: the city as a light and beacon?' This raised the key issue that 'although educational change and progress have so often taken place in

urban sites, the latter have also been seen by some as places of moral contagion and intellectual heresy and certainly not the best places to educate the young' (Grosvenor and Watts 2003a, p. 1). On this organising principle, a number of sub-themes were emphasised, with the city of Birmingham itself highlighted as a key example of both urban progress and urban danger. Papers by Brehony (2003), Goodman (2003) and Spencer (2003) were selected for the special issue of the journal *Paedagogica Historica* that followed (Grosvenor and Watts 2003b).

The second venture of this type was the annual conference of the UK History of Education Society held in Sheffield in November 2009, which led to the publication of a special issue of the journal *History of Education*. This was an interdisciplinary initiative in that it was organised in collaboration with the University of Sheffield School of Architecture, and also involved a number of geographers of education. The overall framework of the conference was of 'space, place and materialities', which gave particular scope to the role of urban history (Burke et al. 2010). The papers selected included one by Andrew Saint on the history of education in Battersea, London, since 1750, developing his earlier work on school architecture (Saint 2010; see also Saint 1987). Another paper, by Medway and Kingwell, also highlighted the urban context of London, this time with a specific focus on English teaching in a new comprehensive school, Walworth School, between 1946 and 1963 (Medway and Kingwell 2010; see also Medway et al. 2014).

Such organised interventions, influential though they were, tended to be the exception rather than the rule, and most work produced on the history of urban education over this period was the result of individuals working on different projects in separate contexts. Overall, it constituted a steady stream of research, broadly by historians of education, that consolidated detailed understandings of urban educational history.

54.3 Conclusions

This chapter has reviewed the contribution made by histories of urban education in the United Kingdom, from their early beginnings in the 1970s, and has sketched the outlines of some of its most significant and characteristic work. This has tended overall to emphasise the historical dynamics of the relationships between education and urban society, and the longer-term nature of urban educational provision and reform. It has established close connections with international trends in the history of urban education, and especially with its leading practitioners in the USA. This research has not been wholly coherent or systematic, being conducted mainly by individual scholars working on their own specialist interests. It has fallen mainly to the history of education research community to maintain a flow of fresh research, although this has tended to be published in specialised history of education journals with a relatively narrow readership. Arguably it remains true, as Marsden argued in 1992, that there is no distinct genre of urban educational history in Britain, if this

means that there is little infrastructure that maintains it as a separate sub-discipline.

Nonetheless, this area of work should not be disregarded, either by urban historians in general or by educators who are seeking to address the fresh issues facing urban education in the twenty-first century. As a dimension of urban history, it demonstrably provides key insights into a substantial and always prominent feature of urban life and services. As a contribution to urban education, as Jack Dougherty has concluded in a survey of American urban, suburban and educational history, ‘Better histories of cities, suburbs, and schooling also have the potential to contribute to broader public policy discussion on this controversial and complex topic.’ (Daugherty 2008, pp. 256–57). It provides an unmatched means of locating our contemporary arguments in a framework that is sensitive to issues of continuity and change.

Chapter 55

Wealth, Inequalities and ‘Hidden Injuries’ in the Global City: Educational Policy in London

Meg Maguire

55.1 Starting with the (Global) City

Cities are diverse: they are localities, and specific context, both economic and cultural, always matters when we are dealing with things which have a local character. However, cities are embedded within a global system and changes in that system matter for the character of the specific places. (Byrne 2001, p. 23)

One of the reasons for concentrating on London is that it is a major city. Indeed, according to Hales et al. (2014), London is second only to New York in the international index of global cities. London is already the largest city in Europe and the sixth richest place on earth. Its population is currently 8.6 million and is forecast to rise to 11 million by 2050. By 2038, it is estimated that 50 % of the population of London will be of Black, Asian and Minority Ethnic (BAME) heritage (GLA 2013). In this rapidly expanding and increasingly diverse setting, there is already great competition and pressure on various forms of social consumption; that is, housing, employment, schooling, and good health provision – the base components of a decent life. However London is a global city – and this means that it is at the centre of international service provision, trade, production, and innovation on an unparalleled scale. For these reasons, London is a highly desirable and attractive place in which to live, and in which to invest! Since the late twentieth century, London has witnessed unprecedented movements of international capital into the city. While London is a global financial centre, it is also a location where the secondary circuits of capitalism are in play as seen in the consumption patterns of housing and property. The accumulation of land and property by global companies, the investment in

London property by wealthy conglomerates and the super wealthy is changing the face of the city and is displacing lower paid service workers and their families.

The fact that the London residential property market is still riding high, despite the poor performance of the UK economy, owes much to the continuing interest of wealthy overseas buyers who now dominate the top end of the market (*according to Knight Frank [a well-known estate agent/realtor]* they account for 51% of the prime London market for sales £1 m plus). Indeed the demand is so great that, notwithstanding the vast size of London, there is reported to be a significant shortage of stock.

(Fisher 2013, np my inclusion italicised).

All these developments make London a unique setting in the UK –more like New York than Manchester- with more in common with Tokyo than Cardiff.

But while London attracts the super wealthy and inward investment, it is also a beacon for many others – a place of freedom from forms of cultural and social oppression as well as a place of opportunity and work. As with other global cities, London is simultaneously a material and structural ‘place’ and a city of promise and excitement – a ‘symbolic project’ (Zukin 2003, p. 146). Pile (2005, p. 6) positions the city and urban life as a set of ‘wishes and desires, anxieties and fears’ as well as a place of disruption, consumption, inequality and opportunity. London attracts a wide range of consumers, entrepreneurs, investors, artists, workers, refugees, asylum seekers– all those looking for a better and richer life in an international, cosmopolitan and ‘super-diverse’ city (Vertovec 2007) where there is the promise of better employment and enhanced educational opportunities for themselves and their children.

There is some contestation in the literature as to whether cities like London, New York, Tokyo and Hong Kong are best seen as world cities or global cities. In this chapter I take the perspective argued by Saskia Sassen that world cities exist but that they may not necessarily be global – she cites the case of Miami. World cities like Istanbul and New Delhi are celebrated historic centres of culture and attract international tourism but cities like New York and London are global in their economic and fiscal reach and in their power. Drawing on Sassen (2005), the point of using the concept of the city as global is to foreground and centre the role being played by globalisation in material and structural terms.

Global cities around the world are the terrain where a multiplicity of globalization processes assume concrete, localized forms. These localized forms are, in good part, what globalization is about. Recovering place means recovering the multiplicity of presences in this landscape. The large city of today has emerged as a strategic site for a whole range of new types of operations – political, economic, “cultural”, subjective. It is one of the nexi where the formation of new claims, by both the powerful and the disadvantaged, materializes and assumes concrete forms. (Sassen 2005, p.40)

In a globalising world, national influence is being weakened or reduced due to the conditions of the global market place. The outcomes of these changes are seen in the moves to privatise the public sphere of social-welfare provision, in the deregulation of the corporate sector, the reduction (and avoidance) of corporate taxation made ‘feasible’ by cuts in public spending, the hollowing out of the state, and the

insatiable move to strengthen the conditions for neo-liberal expansion (Klein 2014). The outcomes are also seen in global cities which have more in common with one another than other cities in their national jurisdictions, for increasingly, global cities are becoming free-standing and autonomous.

55.2 London: A Divided City

What is taking place in all global cities, and in London in particular, is a massive escalation in the growth of the wealth gap and the ensuing social polarisation that characterises contemporary forms of globalisation. The highest income group has grown exponentially and incomes at the top and bottom have pulled apart dramatically (Wilkinson and Pickett 2009; Dorling 2014). This division is reflected in housing occupation trends and long term patterns of gentrification in London (Hamnett 2003). It is worth exploring this gentrification trend as it has had implications for the availability of housing for lower paid service and public sector workers as well as in shaping the competition for places in local schools in London (Hamnett 2003).

In the third quarter of the twentieth century, fuelled by the baby-boomers who had larger disposable incomes than their parents' generation, London became an arena of conspicuous consumption. The baby boomers expected to become property-owners at an earlier age than their parents and they also expected to have access to a cosmopolitan urban lifestyle. Young professionals and others now looked for 'improving neighbourhoods' in London and bought up cheaper housing in traditional working class areas (Butler and Robson 2003a, b).

The new middle class fractions that moved into these older working class areas, appropriated the social space for their own cultural 'divertissement' as well as colonising local schools. Improvements in local services, for example in health provision and increased personal services such as organic food stores and yoga classes, coupled with the renovation of local buildings have tended to benefit one section of the population and indirectly enhance the 'value' of the property in these gentrifying enclaves (Butler and Robson 2003). For example, the reputations and 'value' of housing and schools in Notting Hill Gate, in the west of London, were very different in the late 1950s and early 1960s than they are today. Notting Hill Gate was an old, run-down part of London where large Victorian houses were divided up into small flats or made into bed and breakfast hotels to home new arrivals to the country (Maguire et al. 2006). The local schools were regarded as challenging to teach in, and it was difficult to recruit and retain teachers in this part of London. In many parts of Notting Hill today (as illustrated by the film of the same name) there have been massive changes; a totally revisioned and refurbished location of private accommodation, out-priced except for all but the super-wealthy. In the contemporary city, there are communities of people with shared consumption preferences who have displaced the indigenous and poorer groups. This pattern has been exacerbated by more recent moves into London property by the international business sector and the super wealthy investing their capital in housing which is often left

empty – a solid investment in turbulent economic times. Different social classes now inhabit physically parallel but equally separate worlds.

In cultural terms, cities have always been places of ‘lived complexities’ because, in demographic and geographical (spatial) terms, metropolitan cities include the most and least privileged and powerfully demonstrate the stark polarisation between access to and exclusion from cultural/social patterns of consumption. London contains internationally celebrated theatres, opera houses, major art galleries and wide-ranging leisure and cultural provision while the homeless sleep in the doorways and shelters of the city centre. Simultaneously, ‘the city’ has continued to stand as a metaphor for disruption and corruption, at least in relation to the urban working classes. For these reasons, as well as for reasons related to housing systems and access to other social goods such as education, as we shall see, it is appropriate to talk of ‘divided cities’.

As an aside, although this chapter concentrates on London, the impact of globalisation for rural communities, available housing stock and access to life chances has been no less dramatic. The movement of middle class families into desirable suburban and rural settings; second-home rural ownership; the decline of work in non-urbanised settings; all these changes have combined to produce high levels of economic and social disadvantage for the rural working classes, whose experiences would also be included in the condensate of ‘urban’. Some time ago, Gerald Grace (1978) recognised that there are similarities between urban and rural settings; poverty and disadvantage are not just evident in cities. However the crucial point he makes is that, ‘Metropolitan cities provide the arenas for the making visible of fundamental contradictions within the wider society and of the ideological and political conflicts associated with such contradictions’ (Grace 1978, p. 3). In consequence, patterns of social polarisation mark and shape the divided global city. As Lipman (2011, p.4) argued in relation to Chicago, a point that applies equally to London:

cities of this type require concentrations of high-paid professionals and managers and legions of low-paid service workers... high stakes accountability and a system of stratified educational opportunities support(ed) gentrification, dispossession of working-class communities of color, and the production of a stratified labor force.

55.3 Wealth, Inequality and Austerity

Some time ago, Pahl (1968) highlighted a distinction between ‘proximity’ and ‘access’ in urban settings that still helps to explain the pattern of resource distribution. He argued that some people lived in less advantaged places – in areas where industries emitted harmful gases, for instance, or where there was a shortage of ‘good’ schools. The people living in these areas, were in proximity to reduced life changes and to increased risks. Other people were better placed to access social goods because of where they lived, or because of their capacity to travel or relocate to gain advantages – transcending space. Place and space are crucial in any struggle over consumption. Where you live can dictate which hospital you are treated in,

what dentist is available, what school you can attend. Overall, patterns of housing allocation, the availability (or not) of work, transport connections, the accessibility of public-welfare resources for example, make some places more or less attractive, and thus, inhibit or attract occupancy and raise or lower the desirability of any area.

For the last two decades, London has been recast and reconstructed by neo-liberal policies which have in turn had powerful outcomes in terms of proximity and access issues. Atkinson (2006 p. 176) has written of the 'micro-geographies of segregation' where 'the creation of apparent wider neighbourhood diversity may conceal the hyper-segregation of rich and poor'. Increasingly under the Coalition Conservative Government (2010–2015) and in the current Conservative administration (2015–2020) ambitious plans have been laid out to make significant public spending cuts through reducing state welfare benefits (O'Hara 2014). Work has been offered as the panacea to poverty – even if it is zero-hours employment. Welfare benefits have been capped. Housing costs have been raised in line with so-called market prices (Gibb 2015). Rents are 'almost twice as high in London than the national average, with nearly half of private tenants in London falling under the national poverty line' (Marom and Carmon 2015, pp. 3–4). In 2013, the Greater London Authority, the pan-London governmental agency, highlighted an erosion in an older commitment to provide social housing based on need: rather, they argued that 'those who contribute through hard work to London's success should expect a reasonable housing offer in return' (GLA 2013, p. 22).

Fuelled largely by the culture of austerity (for some but not for others), the government passed various laws designed to eliminate the economic deficit by introducing changes that Hills (2014) has characterised as being much harder on those with low incomes (see also Taylor-Gooby and Stoker 2011). Bhattacharyya (2015) argues that the project of austerity is intended to diminish expectations of what can be afforded by the welfare state through extending exclusion and normalising precarity. One move has been to 'cap' the amount of benefits that poorer people receive – a move that has led families to turn to food banks in order to survive. Perhaps the most heinous of these laws has been the so-called 'bedroom tax' where those in social housing with a 'spare' bedroom have been asked to pay more rent or move out of their homes. This was extremely harsh for those with disabilities who needed an extra room for their equipment or for their carer to be able to stay overnight. An outcome of the combination of these welfare reforms was that low income families who could not now afford the increased rent, were threatened with having to move – at the cost of their jobs, their social networks and their children's schooling (Slater 2014). This was viewed by many commentators as a form of social and ethnic cleansing (Gentleman 2012).

Camden Council is planning the largest single displacement of poor people from London in the wake of the coalition government's controversial welfare reforms, singling out more than 700 families to be moved up to 200 miles away. Camden council said that it would shortly be contacting 761 households, comprising 2816 adults and children, because the coalition's benefit cap, will mean that they will be unable to afford their current accommodation or any other home in the south-east.

The Labour-controlled council warns that the majority of these families have three children and, once the cap is imposed this summer, will need to find on average an additional £90 a week for rent to remain in their homes. The local authority says it has been forced to look as far afield as Bradford, Birmingham and Leicester, and warns that 900 schoolchildren – more than one child for each class as an average across the borough's schools – face having their education disrupted by the move. (Campbell 2013, np)

The 'bedroom tax' has largely been viewed as a failed policy (Gibb 2015). It was not possible to decant and move families from the global city to cheaper housing enclaves because of a lack of smaller properties as well as because of the public opprobrium that this policy met. Nevertheless it signifies a drop in commitment towards social housing for those on lower incomes, especially in London, where all property attracts a financial premium. The impact of all these related changes in housing costs, and a massive shortage in housing stock of all sorts (social and private) except for those making inward investments at the very top of the price scale is part of a complex and under-explored shift in population profile in London.

The ingress into London of both new middle class and ethnically diverse populations is being mirrored by the simultaneous egress of white lower middle- and working-class 'natives' into the suburbs and beyond. This latter, a central but poorly understood and neglected characteristic of the recent demographic history of London, is far too substantial a phenomenon to be dismissed as a mere artefact of gentrification processes themselves. The voluntary movement out of the central city of a significant proportion of its formerly core population has complex dynamics of its own, to which neither the 'gentrification/displacement' couplet nor the simplifying truisms of 'white flight' can do sociological justice. (Butler and Robson 2003a, p.7)

The significance of all these transformations for the global city (and for education policy) need more exploration than is possible here, but the point is that London is a volatile locale that is open to complex shifts including localised forms of globalisation that are evidenced in population changes (Sassen 2005). And while, I have concentrated on issues such as housing, low income and reduced access to social consumption as these aspects contextualise what it is like for those who struggle to live in a global city, these factors also contextualise the capacity, or not, to access 'good' education.

55.4 Education in London: Choice and Access Problems

English education is characterised by 'policy overload', constant change, and the regular insertion of new forms of governance and provision. Due to the current policy 'crisis' generated by the alleged need to raise attainment in schools, there have been repeated changes to the curriculum, in assessment modes and in performance management in schools. These shifts have been accompanied by wider structural changes in the types of schools available and their relative capacity for more/less autonomy in relation to the central state. English education is characterised by its allegiance to the market form and neo-liberalism as the best ways to solve

intractable problems; 'enterprise can succeed where the state has failed' (Ball 2013, p. 226). In consequence, there have been various attempts to insert forms of privatisation into state maintained schools – for example, by allowing business groups and third sector providers to run new types and chains of schools (Olmedo 2013) or by contracting out in-school services such as catering and cleaning (Ball et al. 2010). For over three decades English schools have been subjected to continual reforms and innovations in the search for increased efficiency and effectiveness as measured by the results published in national and international tests and by regular in-school inspections. School results are published annually so that parents can see which schools are doing well and which schools are doing less well. This information arguably drives the parental market of school choice. In all this reforming, education has, somewhat inevitably, become increasingly commodified.

Education (like health and like housing) is a class of goods for which there is an unassailable demand. Like all marketable goods, education is packaged into different 'brands'; thus, there are different types of schools with different costs and charges. This is because, in neo-liberal times, education is positioned (largely) in terms of its direct exchange value in the labour market. It is a commodity to be accessed or purchased in order to bring off individual advantage in an increasingly globalised labour market. As the exchange value of some education forms is high and enduring (think of an Oxbridge Degree or perhaps attending Eton), and is constructed in a hierarchical manner, a subsidiary market surrounds school provision in order to assist and accelerate the acquisition of this valuable commodity (see Koyama 2010, for a discussion of New York's supplemental educational services). In England, and especially in London, there is an enormous array of private provision of pre-schooling, additional classes, tutorial support and coaching that swiftly changes to meet any new education reforms; what Ball calls an edu-business (Ball 2009). 'Those who can afford it send their children, from pre-school upwards, to an array of learning activities; those who cannot, watch other children move ahead' (Mortimore 2013, p. 1). It is not surprising then that in England, as Mortimore (2013, p. 1) puts it, 'the struggle for an education dominates life in our society to an ever increasing extent'.

Parents are caught up in a circuit of pressure to ensure their children get into a 'good' school and parents are responsible for 'choosing' well. Schools publish a great deal of information about themselves on the web and because their continuity depends on them attracting enough new students each year who go on to do well in the national tests, they are pressured to perform well and to be able to produce a good account of themselves in terms of performance. In a setting of high stakes testing and high levels of individual school accountability and league tables, it might sometimes seem as if schools are being coerced to 'perform' for their own survival as much as for the children they are schooling. From a parent's perspective, it may sometimes seem that unless they are able to help with reading, spelling and mathematics at home, that they are 'failing' their children and are 'bad' parents. However the reality is that in this pressure cooker education market, some parents are better placed than others to bring off some advantages for their own children. As Vincent (2001 p. 360) has repeatedly noted, there are patterns of advantage and disadvan-

tage in parent's opportunities and awareness and she argues that 'Working-class parents, often lacking the sense of entitlement to act, and often the same degree of knowledge of the education system' face more problems in navigating the educational system (Vincent 2001, p. 360). More prosaically, even if working-class parents have knowledge of the system and the will to act, they will not necessarily have the surplus forms of capital that are needed to access and fund extra-curricular classes or private tuition at test time. As Gillies (2005 p. 842) found:

Parents with access to middle-class resources (such as money, high status social contacts and legitimated cultural knowledge) drew on these capitals to consolidate their power and advantage, and invested heavily in their children's education as a method of transferring this privilege.

In a setting where 'a shift towards what might be called a neoliberal model of education, in organisation and in practice is clearly discernable' (Ball 2013, p. 5) the notion that parents can 'choose' the school that they want for their children is a central motif in educational discourse. In London, the secondary schools market is complex and can be difficult to manoeuvre (there is an equally complex and hierarchical market in primary schooling and in University provision). The pressure is intensified when choosing a secondary school because of high stakes testing and subsequent admission to University/transition to the labour market. Greater London is divided into 33 boroughs of which 12 are in inner London. These 33 boroughs contain a wide range of different types of schools which have different admissions policies. Some schools are academically selective or partially selective. Others select on different criteria such as distance from the school, or whether a sibling attends the school. Some schools are faith schools with different admissions policies. Parents can apply across London and are asked to list their six preferred schools. Any application to fee-paying schools is outside this Pan London scheme.

However, the notion of parental 'choice' is illusionary because the parents and family have to 'match' the admissions criteria of the school they are 'choosing' for their child. This is the case across England, as a teacher reported recently in an anonymous blog:

In much of the country, there aren't a huge number (of schools) within a convenient distance of our homes, and when the various religious schools for whom your child is an inadmissible heretic are stripped out, there may be only one candidate left anyway. Even in urban areas, where there are more schools to choose from, that choice is not all it seems. Nearly all schools use proximity in their admissions policy, so whether you get the school you want rather depends on how many other people with children of the same age live between you and its front gates.

<http://www.theguardian.com/education/2014/sep/23/choosing-secondary-school-teachers-guide-for-parents>.

In London 'choice' is complex and competition for places in the more popular schools is acute. 'Choosing' is complicated by space/locale and where a family lives. London is so vast that it is not often possible to cross the city to access a 'good' school because the transport costs are high and the traffic is intense in the

mornings and evenings even if driving were viable. It is complicated by the type of provision in some parts of London; there may be many faith schools in one borough and less community secular schools. Areas where schools are recognisably 'good' will have seen housing costs rise exponentially in the immediate vicinity— a factor that will limit access to these popular schools to those who can afford to live in the locale (and will contribute to a further rise in house prices). Areas where there is easy access to centres of professional employment such as the law district, the business district, contribute towards the production of urban enclaves where aspirations are high and consumption patterns are very similar:

Employment and housing are strategically central to middle-class activity and patterns of consumption and leisure are understood, particularly in the context of metropolitan heterogeneity, as representing symbolic strategies of distinction and the drawing of formal boundaries around conceptions of group identity. (Butler and Robson 2003, a. p. 26)

Here I would add 'education' to these central factors of middle-class patterns of consumption.

In a market economy where (some) parents 'choose' their children's school, the evidence is that middle class families, by and large, select schools with predominantly middle-class intakes, frequently in middle-class housing enclaves (Butler and Robson 2003a). Buying a house in the catchment area of a 'desirable' school can shore up individual privilege and ensure educational advantage. The evidence is that middle class children predominantly attend schools with a large middle-class intake that attract teachers who stay longer, that access better resourcing and recruit more pro-school students. These schools may be somewhat less heterogeneous (in terms of race/ethnic) diversity); they certainly are in terms of socio-economic status (West et al. 2009). In cases like this, it seems unremarkable to talk of divided schools in divided cities. In educational terms, the issue is not about diversity in the city but is more about the avoidance of diversity, the marginalisation of the 'other' and the reinforcement of widening gaps of inequalities; the reproduction of insiders and outsiders. Thus, class, housing zones and middle-class cultural capital can and are deployed to bring off educational advantage. Critics of these sorts of claims may argue that London schools are far more sophisticated in the tactics and strategies that they deploy in order to raise the achievement of all of their students. They may also argue that because of spatial patterns, where public/private housing can sometimes sit street by street, that London schools are far more democratic in their intake and student profile. They may argue that the new middle-classes, those 'gentrifiers' who have chosen to stay in the city, hold more enlightened social attitudes.

One study that has looked more closely at white middle-class cosmopolitan choosing has sought to move beyond any simplistic notion of middle-classness as a 'go-getting', high-flying, winners take all' approach to the social world of the city (Reay et al. 2011, p. 7). Reay et al. (2011) conducted a study into what they termed 'against the grain school choice in neoliberal times'; a study conducted in three urban areas, including London (see Crozier's chapter in this Handbook). The study focused on urban families who, somewhat counter-intuitively, chose to send their

children to their local state comprehensive schools. Reay et al. found that the parents in their study were fully aware of the reams of information that were available to them about their local schools but that they were ‘dismissive of league tables of examination results’ (p. 70) In a period when ‘class and ethnic segregation and polarisation are growing’ (p. 7), this study found that some middle class white parents were making school choices that were mediated by their commitments and values to ‘to act ethically’ (p. 71) and support their local schools as well as respecting the benefits and gains of diversity – social mix benefits that some of them recognised as not being present in their own schooling. However, a tension in this values-choosing was evident in the specific gains made by their children because of selecting these schools. As the researchers found, ‘the ordinary school provided the right context for the young people to stand out or show their ‘specialness’ or ‘extraness’” (Reay et al. 2011, p. 74). Their choice brought off access to additional resources for their children in their schools and they gained ‘specific social, cultural and ideological returns from the school as a microcosm of a politically, socially and ethnically diverse society’ (p. 80). The parents did choose schools that were local but they were also aware that the schools they selected were ‘good enough’ and not schools that were seen as ‘failing’. At the end of this study, the team discussed their conflicts in exploring the values, beliefs and educational choice-making of a group that they recognised as trying to make ‘an effort to reach out across social differences when many are not’ (p. 167) but they also shore up the point that, inevitably, the middle-classes are best placed to bring off advantage, wherever they are placed. In this case, not only is this advantage at the expense of less privileged children, it is also based on middle class children accessing (some) social and cultural knowledge that will be an advantage to them later on in their cosmopolitan futures in the global city.

Across London there is intense pressure to access certain schools. One change is that since the international downturn in the economy, more middle class families are rejecting private schooling as being too costly and are turning to the ‘good’ state schools in larger numbers. The growth of ‘super state schools’ that are currently being selected by leading national politicians who are pressured to show their avoidance of privilege (and who are all based in London regardless of the constituencies that they represent) is a signal of this development (Herrmann 2014). Another change is that the population growth is putting immense pressure on state welfare provision (housing, health and education) and there is an increase in parental anxiety in this period of austerity about accessing ‘good’ schools for their children. According to Coughlan (2015), ‘the pressure on places is most apparent in London, where applicant numbers are up 4% on last year, which in turn were up 5% on the previous year’ (<http://www.bbc.co.uk/news/education-31698086>). In 2014/2015 almost one third of London parents did not get their first choice of secondary school – a highly visible conflict over scarce resources and a central contradiction in the global city (Grace 1978).

55.5 Inside Schools- the 'hidden injuries'

So far, I have tried to sketch in the ways in which housing occupancy, social class and education are inextricably interwoven in the neo-liberal global city. I have also argued that the commodification of education and the individualisation of school choice in a hyper-active form provide a contextualising backdrop to education provision in London. Now I consider some of the key in-school practices that sort and stratify students and lead to some of the 'hidden injuries' of contemporary schooling in the global city (and elsewhere) (Boaler 2005). I then unpack some of the current debates related to educational disadvantage, 'under-achievement' and attainment in London schools (Burgess 2014).

Classifying practices that sort and select students either for 'special treatment' because they have 'learning difficulties' or because they are 'high ability' or some such rhetoric of inclusion/exclusion have a long history in the English education context. Brian Simon, writing of the 1930s in England, told of how schools utilised mechanisms to select those with academic capacity, 'to pick them out early, help them along, differentiate their teaching from that of the "rest" in preparation for the move into a differentiated sphere of schooling' and at the same time designating those not chosen as 'socially inferior children' (Simon 1974, p. 226). Jackson and Marsden's study of 88 working class children demonstrated powerfully 'how savagely and sadly a school system can become a tenacious self-fulfilling prophecy, cutting talent down in the search for the chosen few' (Jackson and Marsden 1965, p. 248). While the crudest forms of some of these classifying practices may not be as much in evidence, there are more subtle ploys in place such as selecting the 'most able' students to study Latin (a mark of distinction in the English school setting), or differentiating the resource allocation offered to different 'types' of students.

Gillborn and Youdell (2000) conducted a study into the grouping practices being deployed in one London school. Using the concept of 'educational triage', they argued that schools were caught up between notions of equity and pressures to ensure that higher proportions of students were achieving a grade C and above at the key national examination point for 16 year olds. They found that the school developed differentiating practices involving educational 'rationing':

strategies [that] often focus on pupils seen as heading towards grade D passes, where an improvement of a single grade could potentially figure significantly in the school's final results. In effect, the schools seek to convert likely grade Ds into grade Cs. (Gillborn and Youdell 2000, p. 133)

It might be argued that rationing education in this way and concentrating on a cohort of students whose success will contribute enormously to the school's reputation is a 'good thing' for the school and for those students who otherwise may have 'failed'. Gillborn and Youdell argue that this sort of 'rationing' is socially unjust and their study also shows how setting and other forms of selective grouping works to reduce opportunities for working class and Black students. Gillborn (2001 p. 2) talks of the 'losses endured by pupils in the lower groups who face teachers with

low expectations and work solely with peers who feel labelled as second-rate and destined for failure’.

Policy is a compromise between the past, present and future as ‘new principles and innovations are merged and conflated with older rationales and previous practices’ (Ball 2013, p. 63). Policies that classify and sort can have lasting consequences for those individuals caught up in a tension between these sorts of equity and performance demands (Whitty 2008). For example, two studies of young people in the post-compulsory education and training market in London (Maguire 2009) demonstrated that some young people at the end of compulsory secondary schooling had internalized a view of themselves as ‘lacking’ in some ways. Having experienced less success at doing school and being less able to construct themselves as ‘good learners’ meant that these young people experienced formal schooling as a time and place that spoke to their shortcomings, rather than anything more positive.

Well, sitting in lessons every day and listening to teachers telling you what to do, that isn’t really enjoyable is it? And finding the work hard isn’t enjoyable either is it? And teachers that don’t help you, don’t make it enjoyable do it? So, I don’t get much out of this school, do I? (Debra – student with ‘learning difficulties’ cited in Maguire 2009, p. 32)

In a recent study based in four secondary schools (two in inner London, one in outer London and one in a small town in the suburbs) that explored how policies were being enacted, not unexpectedly, all the schools were concentrating on raising student attainment (Ball et al. 2012). Teachers were sometimes uncomfortable with having to ‘measure and compare’ their students ‘and attempt(ing) to find a balance between the interests of the students and the interests of the school’ (p. 72). However, as a consequence of the pressure to perform, students were ‘objectified as talented, borderline, underachieving, irredeemable etc.’ Students were being ‘branded’ as ‘bad’ or ‘good’ learners in relation to their perceived capacity to attain, a judgment that had outcomes in terms of the resources and support that was given to different categories of students; Gillborn and Youdell’s ‘rationing’. Students in the four schools were ‘set’ into ‘ability groups’ in different subjects and so they got clear messages about their capacity for success. While streaming or tracking is unusual in English schools, setting is common, particularly in high stakes subjects such as English, mathematics and science. As Travers (2014) found, the impact of this sort of ‘treatment’ can be a ‘hidden injury’ to the person concerned:

I think a lot of the time you got sorted into a lower set or something and it was like ‘oh that’s me done, I’m never going to be smart enough kind of situation’... they see it as people giving up on them more than anything. (John, working class white student, cited in Travers 2014, n.p.)

The question that needs to be addressed is the extent to which banding or setting correlates with factors of class, ethnicity/race and gender. The evidence consistently demonstrates that the so-called ‘lower sets’ have a disproportionate number of boys, students of specific minority ethnic backgrounds, working class students and those identified as having some form of ‘learning difficulty’ (Kutnick et al. 2005). Thus, it is reasonable to assume that in London schools (as elsewhere) the fact of classifying

students by ‘ability’ and then rationing schooling – which correlates highly with aspects of their social identities- may mean that ‘ability’ is masking other forms of older patterns of exclusion and oppression.

55.6 The London Challenge: Making a Difference in the Global City?

Over time, policy attempts have been made to ameliorate or change the educational outcomes of poverty and deprivation. There is not enough space in this chapter to do justice to the complex policy history of interventions into the ‘problems’ of urban education in general and London schools in particular (but see Brighouse 2007; Barker 2008). Pratt-Adams Maguire and Burn (2010, p. 83) argue that ‘the form education policy interventions has taken has often been shaped by ideologies of differentiation, separation and segregation’ where the poor and working class have been positioned as the ‘problem’ and this approach has generally influenced urban education reform. There have been various attempts at different times at forms of redistribution such as putting more money into city schools, providing free breakfasts and dinners for school children and, more recently in the UK, the pupil premium – additional money allocated to schools on the basis of their numbers of children in receipt of free school meals; the government’s proxy for poverty.

More recently urban school policy has been shaped by an older urban education discourse –focusing on the differences between similar schools and arguing that ‘poverty is no excuse’ – an approach that was originally highlighted by Cicerelli in the US (1972). The argument goes that if some schools with similar intakes and difficulties are doing well – as measured by standardised tests – then similar schools doing less-well must be doing something wrong. This idea has been highly influential- not least perhaps because it has displaced a wider political analysis of poverty and a lack of social justice policies of redistribution. It is an approach that displaces issues of difference within marginalised groups and maintains a ‘color blind’ approach (Gallagher 2003). This type of approach characterises much of the mainstream schools improvement discourse in England (Raffo 2009). The ‘problem’ of urban education then becomes located in the ‘achievement gap’ between working class children and middle class children and schools are charged with transforming this situation through undertaking ‘gap-narrowing’ work (Kendell et al. 2008). In the early twenty-first century, the main focus has been with individualised in-school changes in management and leadership, more intensive tracking of student progression, and focussed preparation and coaching for tests. In many ways, drawing on a book title of the same name, it could be argued that the real problem is one of: ‘So much reform and so little change’ (Payne 2008).

One reform has been heralded as breaking with past policy failures and making a real difference. The London Challenge (DfES 2003) was set up to improve London secondary schools that collectively had often been demonised as some of the

poorest (academically) in the country. It was set up in 2003 and ran until 2011 – and it is worth noting that it is very rare that any policies are funded and supported for this amount of time. The Challenge brought teachers together from different London schools to share good practice and work together across schools, to improve their pedagogy. It had two well received programmes of support; the Improving Teacher Programme and the Outstanding Teacher Programme which were highly rated by teachers (Baars et al. 2014). It placed ‘particular emphasis on the development of leadership capacity at school level’ (Baars et al. 2014, p. 71).

At its peak, the London Challenge programme had a budget of £40million a year, funding ‘in-kind’ packages of support for underperforming schools, jointly brokered by an expert adviser and officials in the Department for Education. It also invested heavily in school leadership, including development programmes and consultant heads to support leaders of struggling schools, and worked with key boroughs to ensure robust local planning and support for school improvement. During the period of the London Challenge, secondary school performance in London saw a dramatic improvement, and local authorities in inner London went from the worst performing to the best performing nationally. (Kidson and Norris 2014, p. 2)

In their report, *Lessons from London Schools*, Baars et al. (2014) highlight the ‘remarkable’ progress in educational improvement. They argue that in addition to the London Challenge other factors such as local education authority (school board) support as well as changes in school types (they cite academy schools) and new forms of teacher education have produced this dramatic improvement. They claim that this improvement is not based on variables such as gentrification ‘displacing’ poorer children, or on factors of ethnicity or indeed on some of the additional opportunities present in London. ‘The data and research evidence does not support any of these explanations as being sufficient to explain the improvement in quality’ (Baars et al. 2014, p. 9). They claim that London has been successful because of the way in which teachers worked together to solve their own problems, because of systems leadership and school-to-school support. They argue that these gains have come about because education policy interventions have been sustained over time.

One of the ‘tricky’ issues involved in making claims about improvement and success is how is this to be measured? While some research talks about percentage increases in student attainment, or in terms of points gained, Wyness (2011) prefers to assess London’s improvements in terms of a more easily understood measure – the benchmark of 5 GCSEs (the national tests taken at age 16).

50 per cent of pupils in London achieve five plus GCSEs including English and maths, while 48 per cent of pupils outside London achieve this. For the rather more ambitious target of the English baccalaureate, only 16 per cent of pupils in London manage this. However, again the rest of the country fares no better – with 14 per cent of pupils outside London achieving the English baccalaureate. (Wyness 2011, p. 11)

Obviously ‘the remarkable improvement journey of London’s schools since the turn of the century’, if indeed this is the case, is a key case study for ‘urban school reform’ (Baars et al. 2014, p. 6). But Burgess (2014, p. 15) argues that while the London effect is real, ‘pupil progress is the best measure of what schools add to their pupils and this is 9.77% of a standard deviation higher in London’, the reasons

for this gain, which is also evident in Birmingham, has more to do with the diversity of London’s school students and their parents than the actions of policy-makers and reformers.

The basis for the London performance is the ethnic composition of its school population. There is a straightforward effect: the lowest progress group, White British pupils, make up 36% of pupils in London and 84% in the rest of England. London simply has a higher fraction of high-scoring pupils. This is not by chance of course: a key part of the London effect is its attraction to migrants and those aspiring to a better life... the children of immigrants typically have a high aspirations and place greater hopes in the education system. (Burgess 2014, pp. 15–16)

Burgess does recognise that these London children typically live in poorer neighbourhoods and face various forms of exclusion and racism but he claims that the children of recent arrivals have high aspirations and expectations and that this makes the difference to their in-school attainment –although it may be argued that this is an individualising and divisive approach to take. Recent research has suggested that test improvements in London schools are more complex and that there are a raft of reasons (Blanded et al. 2015). However, most importantly, higher levels of achievement in school may not translate directly into better life-chances or greater labour-market opportunities and that is the real challenge.

It is undeniable that supporting good teachers and promoting effective pedagogy, selecting and retaining good teachers and leaders will lead to in-school improvements (Wyness 2011). If these improvements then lead to real gains for (some previously excluded) students that in turn transfer into additional life-chances, then they are to be welcomed. However, there is a need to turn back to the complexities of the wider socio-economic and political context. As Thrupp and Lupton (2006) have complained, there is often more focus on transforming children than transforming the social context that surrounds schooling. ‘The problem is still seen as residing in the urban working classes, or their schools, and not in the problems that unjust structural relations present for these communities’ (Pratt-Adams et al. 2010, p. 94).

55.7 Wealth, Inequalities and ‘Hidden Injuries’ in the Global City: Repairing or Displacing the Damage?

In 1997, Mortimore and Whitty asked a question that is still pertinent today in any discussion of (London’s) education. ‘Can school improvement overcome the effects of disadvantage?’ Tactics like limiting the curriculum in urban schools to focus on the basic core subjects, sorting and selecting out some children for additional resources and coaching (Gillborn and Youdell’s ‘educational triage and rationing), micro-managing children’s attainment (not learning) through data-tracking and target setting will enable a few more children from ‘disadvantaged’ backgrounds to cross those first hurdles at school. Mortimore and Whitty (1997) claim that what sometimes happens is the already advantaged make even more gains so that the

opportunity gap is maintained while the parameters change a bit. The question has to be, what then are the costs to those left even further behind in this individualistic, academic steeple chase? As Anyon (2014) argues, what is needed are radical changes to the systemic practices that sustain patterns of exclusion rather than merely tinkering at the edges.

In these times of austerity and massive wealth disparities, the global city is sustained by and reproduces those structural conditions that perpetuate poverty and child poverty – low wages, an increasingly casualised workforce, a lack of a living wage, benefit cuts and poor housing – producing a central core of highly privileged and wealthy individuals and a precariat round the edges (Ridge 2013). All this results in a divided city that illuminates the ‘fundamental contradictions’ of the wider society (Grace 1978 p. 3). London children and their families have made gains in their educational attainment but Burgess (2014, p. 16) believes that ‘the basis for that success lies more with pupils and parents than it does with policy makers’. He adds that, ‘a key part of the London effect is its attraction to migrants and those aspiring to a better life’ (p. 16). While research indicates that London schools are doing better than they used to do, nevertheless the tactics being deployed that stratify and segregate may replicate the ‘divided city’ in its ‘divided classrooms’ and shore up the distinctions between those with more/less access to social goods. Perhaps it is simply that everybody’s boat has been lifted to some degree, but other boats are lifted significantly higher, as Mortimore and Whitty argued some time ago. Perhaps what we are witnessing is a localized form of one impact of globalisation- the movements of people.

As a global city, London enjoys unparalleled advantages in its capacity to attract imaginative, creative and resilient new populations. While it would be a politics of despair to sideline the fact that London’s children are doing better in school, it is important not to allow this ‘success’ to displace the need for broader structural analyses and changes. In these neo-liberal times, where austerity is set to continue, the dominant discourse alleges that what matters is individually located and that people should be rewarded for what they personally achieve. In this way any structural effects that shape outcomes are displaced and erased. As Baumann (2000, p. 34) makes clear, in these neo-liberal times ‘individualization is a fate, not a choice’. In the global city, the policy problem resides in positioning education as an individual good, and a commodity to be exchanged for individual advantage, status and economic prosperity while failing to recognise the debilitating structural effects of policies of austerity. For these reasons, education policy on its own will not address the fundamental causes of the social problems that attach to the global city:

Teachers, principals, and urban students are not the culprits – as reform policies that target high stakes testing, educator quality, and the control of youth assume. Rather, an unjust economy and the policies through which it is maintained create barriers to educational success that no teacher or principal practice, no standardized test, and no “zero tolerance” policy can surmount for long... macroeconomic mandates continually trump urban educational policy and school reform. (Anyon 2014, p. 5)

Chapter 56

Knowing Your Place? The Urban as an Educational Resource

David James

56.1 Introduction

There is a long-standing and well-established association between ‘urban schools’ and ‘the urban working class’, and in this context ‘urban’ also carries strong connotations of deficit, especially in certain areas of policy (see Archer et al. 2010; Maguire et al. 2006; RSA 2010). Yet in some industrialised countries, most people live and work in urban settings, and institutionalised education is largely an urban matter. In England and Wales, the Office for National Statistics’ analysis of the 2011 Census suggests that 81.5% of the population live in urban areas, that population increase is greater in urban than in rural areas, and that urban areas have a younger age profile (Office for National Statistics 2013). This is important because as Dyson pointed out some time ago, whilst there is overlap between the terms ‘urban’ and ‘disadvantage’, it also matters that the urban setting is characterised by concentration, which has its own dynamic effects (Dyson 2003). So as well as being an important context, the urban also has a more *constitutive* sense. How and why does ‘the urban’ – real, imagined or both – feature in schooling, in the curriculum, in teacher/student activity, in learning and achievement? What part do distinctively urban elements play in the learning culture, and what are the consequences? This chapter outlines two contrasting examples of deliberate action that harnesses features of the urban in educational processes. The first has a socially progressive intent, attempting to work through institutions. The second is what we might term ‘individually progressive’, in that it is largely about individuals securing the elements of an individual educational project. The chapter ends with some brief observations about how the two examples connect to tell us something about the role of

‘the urban’ as a resource in educational endeavour and how it can be most helpfully understood.

56.2 A Partnership- and Area-Based Curriculum in Peterborough, England

In the 2011–2012 academic year, the Royal Society of Arts, Manufactures and Commerce (RSA)¹ commissioned an independent evaluation (James 2012) of an important phase in their Area Based Curriculum initiatives. This provided resources and expertise to bring together five schools (three Primary [age range typically 5–11], two Secondary [age range typically 11–16]) and several organisations from the public and private sectors, in Peterborough, England. The project’s objectives included ambitions to increase student engagement through area-based curriculum projects in each school, to increase the quality, number and diversity of relationships that students had with individuals and organisations in Peterborough, to enhance school partnerships with others in the community, and to develop a model that could be ‘scaled up’.

These objectives rested upon a clearly articulated set of concerns about an increasing disconnection between children and the places where they live, seen to have been exacerbated by the National Curriculum, National Strategies and other policies driven by powerful ‘standards’ and ‘economic competitiveness’ agendas (RSA 2010). Such forces were changing the very concept of the school. In much policy, it was argued:

Schools are imagined as isolated institutions floating in a neutral space and as such, it is supposed, can be straight-forwardly compared through data on measurable indicators. Thinking about schools as dynamic, embedded, situated, human institutions makes comparability far more difficult and hence challenges dominant education discourses (RSA 2010, p. 8)

The project also sprang from a critique of large and well-known area-based policy interventions such as Educational Priority Areas,² Education Action Zones,³

¹The RSA (Royal Society for the encouragement of Arts, Manufactures and Commerce) was founded in 1754, and has a mission to ‘enrich society through ideas and action’ and to mobilise creative capacities towards ‘a twenty-first century enlightenment’. See <https://www.thersa.org/about-us/>

²Educational Priority Areas were proposed in the Plowden Report (1967) and involved extra resources being directed to schools in areas with a high proportion of disadvantaged pupils. The initiative faltered by the end of the 1970s (see Smith 1987).

³Education Action Zones (EAZs) were launched in 1998 as ‘the standard bearers in a new crusade uniting business, schools, local education authorities and parents to modernise education in areas of social deprivation’ (Department for Education and Employment 1997; See also Reid and Brain 2003).

Extended Schools,⁴ and City Challenge,⁵ which it was felt were associated with deficit views of certain communities and geographical areas, and which fostered narrow, individualised accounts of how families passed on educational failure (RSA 2010). The RSA expressed serious concerns about the effects of all this on the well-being of children, on how and what they learn, and on what they can achieve in educational settings.

The RSA diagnosis sketched out above connects with long-standing concepts of education for citizenship (see for example Kerr 1999), but also had resonance with perceptions ‘on the ground’, at least amongst teachers and representatives of the organisations with whom they formed partnerships. One teacher, whose background included working in a large engineering company, spoke for many others when he described the scale of recent social and economic change in Peterborough: The decline of major industry had ‘torn the heart out of the City and affected thousands of lives’; in addition to the loss of jobs, there had been marked changes in the social fabric. For example, the ‘eight or nine working men’s social clubs, which were hugely important, providing sport like football and cricket’ were now gone. Coupled with a rapidly-changing ethnic composition and a relatively large number of recently-arrived families, he suggested that these shifts made it more difficult for all children to have or feel a strong connection with their city. To most of the adults interviewed, the project seemed to offer a small opportunity to do something about this problem.

Whilst there is not the space here to do justice to the full breadth and complexity of the project, we can use elements of the evaluation to look at what activities it fostered, and consider how these worked, and the extent to which they entailed a reconceptualization of the local, urban setting. Most of the data for the evaluation was gathered during four substantial visits to Peterborough in the 2011–2012 academic year. It included: observational data (e.g. derived from ‘walking the city’, and 7 visits to schools and 3 to partner organisations); 34 interviews (with teachers, representatives of partner organisations, young people, and RSA co-ordinator); perusal of young people’s work in all 5 schools and of school-level curriculum and other documents. It also included participation in a RSA ‘Expert Seminar’ and some quantitative data collected by RSA against a pre-project baseline. Evaluation access was assisted by a RSA-employed senior researcher who coordinated the wider project activity. The design and conduct of the evaluation was approved by the Cardiff University School of Social Sciences Research Ethics Committee (for further details, see James 2012).

⁴Extended Schools in England are based on a similar idea to the ‘full service schools’ in the United States. The Department for Education and Skills began to actively promote the concept in 2002. In practice it usually means promoting the use of school facilities by the community and the building of better school/community links. There is a strong emphasis on areas of social disadvantage.

⁵City Challenge was launched in April 2008 by the Department for Children Schools and Families. It was designed to improve educational outcomes and ‘to crack the associated cycle of disadvantage and underachievement’ in the West Midlands, Greater Manchester and London (see Hutchings et al. 2012).

56.2.1 Project Activity

In one example, staff at Dogsthorpe Junior School⁶ had for some time been concerned to make ‘place’ a more prominent feature of the curriculum, partly in response to increases in the proportion of its pupils who were recent arrivals from Eastern Europe. The project enabled the key teacher in this school to build up a close working relationship with *Railworld*, an educational charity and heritage/leisure organisation focused on the history of railways and on sustainable transport. *Railworld* was keen to raise its profile and develop its facilities so that they would be more attractive to younger visitors. The partnership gave rise to a number of activities. In one, the school and the organisation jointly set up an event at the Town Hall, attended by the Mayor and the local authority Head of Tourism amongst others, in which some 80 children acted as ‘tourism consultants’ for the city. In another, children visited *Railworld*, and in addition to the sort of learning activities that are common in school visits, they were asked to provide detailed feedback on such matters as layout, signage, and the design of exhibits. This information was used to shape the development of the site, and the same children were invited back for a ‘fiesta’ event to see the results. The teacher reported that for some children, the activities had provided a new ‘sense of place’ and, for the first time, a real connection to something in the city other than their school. She was also pleased that she and her colleagues had been able to make *Railworld* a core feature of some of their work in the mainstream curriculum, for learning in literacy, reading, design and technology, maths and science.

In another example, a partnership between West Town Primary School⁷ and Peterborough Cathedral included pupils responding to a request from the Cathedral’s education office for help with the preparation of a large bid for resources to improve the Cathedral’s educational facilities. At the same time, their visits to the Cathedral formed the basis for projects with considerable depth and reach across the curriculum: pupils used items and events as diverse as the tomb of Katherine of Aragon and a relatively recent fire at the Cathedral (in 2001), the latter forming the basis for an imaginative writing competition. Children also contributed to displays of drawings, painting and model-making inspired by the Cathedral, discussed principles in building construction and maintenance with two visitors from the construction industry, and considered plans for the renovation of a former hospital building near the school.

These deliberate attempts to make explicit use of elements of the locality, and many others like them, were closely intertwined with other pedagogic goals. In both the examples mentioned above, serious attention was also paid to giving children new opportunities for ‘voice’. Indeed, in the West Town example, the RSA project

⁶Now Dogsthorpe Academy, part of the Greenwood Dale Foundation Trust group of Academies. See <http://dogsthorpeacademy.org/> (Accessed March 2015).

⁷Now West Town Primary Academy, part of the Cambridge Meridian Academies Trust. See <http://www.westtownprimary.org/> (Accessed March 2015).

was preceded by work with Creative Partnerships⁸ in which the school used the approach of Dorothy Heathcote to guide teaching and learning: Heathcote's concept of *mantle of the expert* was used to frame group-based activities designed to provide a rich educational experience characterised by her 'Three Rs' of rigour, realisation and responsibility.⁹ Many of the activities at both these schools were as much about democratic citizenry as they were about sustainable transport, the Cathedral or Peterborough itself. It is worth noting too that in all three primary schools involved in the project, the energetic pursuit of a partnership-driven area-based curriculum was seen as compatible with mainstream curriculum goals and with the maximisation of learning opportunities and pupil achievement. Work under the initiative was felt by teachers to be clearly enhancing the quality and coherence of the education on offer, and to be contributing positively to school's account of itself to Ofsted (the Office for Standards in Education, Children's Services and Skills),¹⁰ to parents and to other stakeholders.

There was a striking contrast between the three primary schools and the two secondary schools involved in terms of what activities were initiated in the name of the project. Thomas Deacon Academy,¹¹ a very large secondary school of around 2200 students, was divided into six 'Colleges' each of which functioned as the 'home' for students and the place for their tutor group time, amongst other things. The school's participation in the project saw each College review its community links, then seek to form a partnership with one or more organisations or individuals beyond the school in order to develop a new curriculum unit that would run through the summer term. The partners selected included a radio station, an artist, a museum, a relationship counselling service, an engineering company, a charity, sports organisations and a Trust concerned with mental health. In the event, there was a great deal of variation

⁸ 'Creative Partnerships was the UK's flagship creative learning programme running throughout England from 2002 until 30 September 2011 when funding was withdrawn by Arts Council England... (it) brought creative workers such as artists, architects and scientists into schools to work with teachers to inspire young people and help them learn... From 2002 to 2011, Creative Partnerships worked intensively with over 2700 schools across England, 90,000 teachers and over 1 million young people'. See <http://www.creative-partnerships.com/>. For a good analysis of examples of activity see Jones and Thomson, 2008.

⁹ Dorothy Heathcote was an educationalist and drama teacher who became particularly well known for her concept of *mantle of the expert*. This 'asks children to approach problems and challenges as if they are experts... in 1981, for the BBC programme *Teacher*, the producer Roger Burgess filmed Heathcote giving a classic demonstration of "mantle of the expert". She aims to release the latent knowledge in a class of 9-year-olds by asking them to run a fictitious shoe factory... The children had digested Heathcote's Three Rs – rigour, realisation and responsibility' *Guardian* Obituary, 17th November 2011. Reproduced with the kind permission of Guardian News & Media Ltd as the copyright owner.

¹⁰ Ofsted is the Office for Standards in Education, Children's Services and Office for Skills, a non-ministerial department of Government. It inspects and regulates services that care for children and young people, and services providing education and skills for learners of all ages. See <https://www.gov.uk/government/organisations/ofsted/about> (Accessed March 2015).

¹¹ See <http://www.thomasdeaconacademy.co.uk/page/default.asp?title=Home&pid=1> (Accessed March 2015).

in the activities in terms of volume, density and how much ‘traction’ each one appeared to gain. From the outset, there was a tension between the ambitions of the project and what could be achieved in the 3 h of a student’s timetable that the school felt able to dedicate to it. Several proposed activities appeared to ‘run out of steam’ before using the whole of the 3 h, which itself further diminished their apparent importance to the school. Where activities had filled the whole of this time, many students described them as productive and enjoyable, and there was clear recognition that new connections were being made with the city (and, it was often claimed by students, such connections were entirely absent across the rest of the curriculum). A good example would be the use of ‘migration boxes’ from the museum that contained sets of personal belongings of people who had migrated at various times. This session was part of a set of three that connected humanities subjects to the local area and community. Yet whilst students valued these highly, the staff concerned had reservations. As one said, whilst the activities had been worthwhile, ‘...they did not lead to a measurable increase in knowledge of the local area or community whilst at the same time running the risk of “dumbing down”, giving students a superficial view of history, geography and psychology’ (James 2012, p. 15).

The other secondary school participating in the project, Ken Stimpson Community School,¹² appeared to have a large number of pre-existing links with a range of organisations, in part owing to its 6 years of Business and Enterprise College Status. There were close links with engineering firms, churches, faith groups, a cluster of sheltered housing, and a multinational corporation. Involvement in the project had seen the addition of a new relationship with the Peterborough Environment City Trust, but in more general terms, according to the Deputy Head, the RSA project had ‘...been a catalyst that has further promoted our desire to get right into our local community and (it had) underlined our wish to do even more of that’ (see James 2012, p. 16). Nevertheless, only one new example of a collaborative curriculum design came to light during the evaluation, and this involved partnering with a local college rather than with a non-educational organisation. Most of the activity that appeared in some way attributable to the initiative took the form of two ‘collapsed curriculum’ days in which some 180 Year 8 students participated. The first of these looked at refugees, involving both the Red Cross and the testimony of a refugee, and it included competitive group-work in which the winning group were invited to present their impressions on local radio; the second had teams of students working with local adult volunteers to compete in a ‘fashion through the ages’ event. On this second occasion, the winning team saw their designed garment made up. The key teacher spoke of the difficulties of having collapsed curriculum days, given the pressures on subject-teaching colleagues to increase and maximise GCSE attainments. She thought that such days were unlikely to increase beyond 2 per year for this reason. In this school, the area-based curriculum initiative found some affinity with a concept of ‘enterprise’, though it must be noted that in practice, this latter term appeared to mainly refer to students working in teams on tasks with a competitive element.

¹² See <http://www.kscs.org.uk/> (Accessed March 2015).

56.2.2 Improving the Learning Culture?

There were several prominent themes in the analysis presented by the evaluation of the RSA Area-Based Curriculum project in Peterborough. One of these is about whether or not new activities and learning opportunities were enabled. There were marked differences between the primary and secondary schools in this regard. In the primary schools, the initiative was embraced as a fresh approach to collaborative curriculum design and implementation as teachers worked with partners to explore new starting-points around which learning activities could be generated. The evidence showed clearly that the learning experiences of several hundred children were enhanced as a result. Children were, in effect, ‘repositioned’ by the initiative, because their relationships to the locality and a number of organisations within it were fundamentally revised, often from a minimal starting-point. Equally strong was evidence of a powerful boost to professional identity for the teachers themselves. The evaluation suggests that in the primary setting, some key elements of the learning culture (including the nature of accountability, the meaning of professionalism, the lower profile of discrete academic subjects and the responsibility of teachers to operate across subject boundaries) made it possible for teachers to innovate and to take risks. Importantly, these risks were not seen as being in opposition to securing measured improvements in standards, given the prevailing conceptions of this term. Rather, they were seen as strategies for improving the processes that underpin successful teaching and learning. Indeed, in one school the initiative was regarded as part of an institutional strategy following a disappointing Ofsted inspection, and was collectively perceived as offering a means to build new strengths that both Ofsted and the local authority would recognise and welcome.

Though not without merit, the initiative had little success in the secondary schools. Key elements of the learning culture here include the clear lines of separation between subjects, but even more importantly between subject learning and the more skills-focused and pastoral aspects of secondary schooling. Such distinctions have long been strongly interpreted and regarded as differences in status – of types of knowledge, qualifications and even of teachers (see for example Follett 1989; Power 1995). The evaluation of the initiative in the two secondary schools suggests that Watkins’ recent meta-analysis is correct: a climate in which certain General Certificate of Secondary Education (GCSE) examination results are so crucial to the contemporary secondary school is also one in which a ‘performance orientation’ now overshadows a ‘learning orientation’, despite the fundamental dependence of the former on the latter (Watkins 2010). Hence, even in secondary schools that were keen to participate, the only small foothold available for an initiative like the RSA Area-Based Curriculum is in the time and space normally allocated to the pastoral and to skills-focused activity. Even here – the evaluation found – the activities often became further diminished. It is as if, institutionally speaking, secondary schools can only take up initiatives in a wholehearted manner if they contribute directly, immediately and obviously to the headline measures by which the school will be judged. A similar finding emerged in recent research on work-related learning in the

secondary curriculum in Bristol, in which it was found that subject-oriented materials and processes based on the world of work, designed by experienced teachers to improve the learning and attainments of young people of *all* abilities in GCSE mathematics including the ‘high-fliers’, were in practice relegated to being used as a ‘remedial’ measure for a few students on a C/D GCSE borderline. This group’s outcomes would make most difference to the standing of schools in the league tables (James, Bathmaker and Waller, 2010). In sum, whilst the two secondary schools involved represented different kinds of response to the RSA initiative in Peterborough, in neither one could it be said that the initiative had an impact of the sort set out in its objectives.

56.2.3 Affinities with Other Educational Values

A second theme coming through strongly in the analysis was around the importance of teachers’ educational values and what might be termed ‘pre-existing educational mandates’ in some of the organisations forming partnerships. This was something that previous RSA-based reflection had identified (e.g. Thomas 2011, p. 5). A specific example would be the Cathedral’s energetic educational programme and its need to be able to demonstrate that it had consulted children as part of its major bid for resources to improve its educational facilities. But in more general terms, both individually and collectively, teachers and other key players who were centrally involved found the initiative to be compatible with values they already held about teaching, learning and the purposes of schools. Examples across the initiative include: a strong pre-existing drive to use the local area more explicitly across a school; an established way of working with a strong child-centred, problem-solving approach (Heathcote’s ‘mantle of the expert’ mentioned earlier); a ‘social enterprise’ interpretation of the expectations associated with the Business and Enterprise secondary school specialism.

56.2.4 Teacher Professionalism

Like other observers, the RSA had pointed out that a generally declared greater autonomy for teachers to own the curriculum came at the same time as many teachers had been, in effect, ‘deskilled’ by the National Curriculum and National Strategies. A third theme in the analysis pertains to this dilemma and what the initiative might provide in response. Thomas pointed out that the White Paper *The Importance of Teaching* (Department for Education 2010) had promoted more training in classrooms and more focus on ‘core teaching skills’ whilst saying nothing about how teachers could learn to deal with what should be taught and why. This, it was argued, was similar to contradictions in government views of teachers and teaching, and ‘...any genuine recognition that teachers could be curators or

creators, rather than merely organisers, of knowledge, is missing from government analysis for what makes a quality teacher. Hence, support for teachers to develop into professionals creating and mediating knowledge is likely to be absent, despite the rhetoric of curriculum freedom' (Thomas 2012, p. 10). In England at least, new forms of support will be needed if teachers are to develop curriculum with confidence, and all the more so if they are innovating and experimenting for the first time. The RSA initiative provided a supportive structure (and leadership, which the evaluation found to be bold, energetic and consistent), offering a model that could be used in this way. In a very telling phrase, one group of teachers described how the initiative had given them the confidence to 'tear up the script'. There are strong parallels here with the findings of the evaluation of the Teacher Training Agency's *School Based Research Consortium Initiative* where being involved in supported reflection in a research project appeared to energise teachers and provide them with an enhanced sense of professional autonomy (see Simons et al. 2003).

Finally, it was instructive to think about the initiative in terms of its conceptual basis, and to look at it alongside other recent accounts of the problems in the schools sector and their accompanying recommendations for change. As we have seen, the initiative did rest on a particular diagnosis of problems and weaknesses in current policy and practice, and it was designed to offer some sort of remedy, at least by way of providing an example. However, at the same time it was driven by widely-held definitions of those problems and weaknesses rather than by a compelling alternative vision for education, such as Fielding and Moss's (2011) notion of radical education and the common school, or Coffield and Williamson's (2011) 'communities of discovery'. Both these views of how educational arrangements might be revised are powerful because they are utopian in the best sense (Levitas 2003), offering the sense of purpose and direction that is otherwise lost or missing. They do this using real-world examples as well as theory-based reasoning. The evaluation suggested that for all its many strengths and achievements, in working within a dominant and dominating (yet under-articulated) set of purposes in secondary schools, the RSA initiative was in effect institutionally sidelined and therefore very limited in its potential reach in that sector.

56.3 White Middle Class 'against the grain' School Choice

The orchestrated harnessing of elements of the urban in the RSA initiative, outlined above, sits in contrast (and perhaps, opposition) to the way in which 'the urban' surfaced in another research project. In the UK Economic and Social Research Council (ESRC)-funded project *Identities, Educational Choice and White Urban Middle Classes*¹³ (ESRC reference RES-148-25-0023) there were a number of dif-

¹³ Part of the ESRC-funded Programme *Identities and Social Action*. The project was directed by Diane Reay, Gill Crozier and David James. The team also included Phoebe Beedell, Fiona Jamieson, Katya Williams and Sumi Hollingworth.

ferent facets of the urban context that came into sharp relief. The project studied a sample of white middle-class families turning their backs on ‘mainstream choosing’, instead making choices of secondary school that might be termed ‘going against the grain’. The schools they chose were averagely- or low-performing schools when other, more conventionally justified choices could have been made. ‘Mainstream choosing’ is part of a broader neoliberal context in which choice, markets and individualism have increasingly overshadowed the fragile discourse of welfare (Ball 2003). This made the specific group of particular interest, not least because it seemed that they may be strong supporters of comprehensive secondary education and may have been guided in their choices by welfarist values that stood outside or beyond the now-dominant ideology. We studied 125 families in London, ‘Riverton’ and ‘Norton’, mainly via interviews with 181 parents and 68 young people (for further details of the design and method, see Reay et al. 2011, 2013).

Again, there is only space here for a brief glimpse of the findings and analysis of the study. A major and early finding was that in only very few of the families were there clear commitments to either comprehensive schooling or to the welfare state, and most of the choices of secondary school were driven by a broad and complex mix of motives and orientations. The history of schooling in the family played a large part, and in order to grasp this we found it helpful to distinguish between first, second and third generation white middle class people.¹⁴ In some instances, the choice of school was a reaction to the social narrowness of a parent’s own schooling, in terms of its social class or ethnic composition or its ethos and/or disciplinary regime. In others, the choice reflected a deliberate re-creation of the parents’ own trajectory, where for example at least one parent’s background included upward social mobility attributed to schooling. There were however many other considerations in addition to family history: One of the most crucial of these was how the parents saw and understood matters like the quality of an educational process and the extent to which one could compare schools.

56.3.1 A Clearly Defined Educational Project

Across most of the parents there was a great deal of scepticism in regard to the information that in policy terms is assumed to underpin the enabling of rational choice in a market, and we heard frequent criticism of conventional assumptions around examination results and their use in league tables and in Ofsted reports. In general this group of parents appeared to have a view of schooling and its outcomes informed by sociological insights. For example, they were aware of long-standing

¹⁴For example, a ‘first generation’ middle-class parent would be one whose own parents were working-class; a third generation middle-class parent would be one whose own parents and grandparents were middle-class.

correlations between social class and academic attainment, and thought that league table position might tell one more about the social composition of a school than about the quality of education on offer.

This point is vital in understanding their ‘break’ with ‘mainstream choosing’, especially when put alongside another major theme, namely the conception of the educational project as something greater than schooling (even while schooling was acknowledged as its main ingredient). It was common for these parents to have a clearly-articulated sense of the goals and purposes of the educational process *for their own children*, that it should (for example) equip them to live and work comfortably alongside people from different social and ethnic backgrounds. A fairly typical expression of this view came from the parent who told us that her son’s exposure to the diversity of backgrounds in the local comprehensive school would ‘make him a better doctor’, or another parent who felt a similar experience made his daughter a ‘fully paid up citizen of the twenty-first century’ in a way that his own narrower, more conventionally privileged schooling could not have done. These signals of the educational project are perhaps also a reminder of the poverty of the market conception of ‘choice’ running through much education policy of recent years, in which ‘choice’ is constructed as a preference amongst a series of plausible options of the sort presumed to face people in everyday retail consumption. We found that a decision to attend a particular school was not the expression of a mere preference of one option over another, but something much deeper. Rather, it was an expression of *commitment* (see Sayer 2005 for a helpful discussion of this preference/commitment distinction).

56.3.2 *Ethnic Diversity as a Resource*

There were many examples of parents promoting friendships across ethnic groups and celebrating the ethnic diversity of the chosen schools, and it was clear that such experience was considered an important facet of the educational project, as well as a source of capital for young people in a context of globalisation and multicultural living. There is here a deliberate use of the urban context (specifically, ethnic diversity) in order to generate particular kinds of disposition. We have described and discussed these aspects of the analysis at some length elsewhere (see for example James et al. 2010; Reay et al. 2007, 2011, 2013) and found some strong parallels with other work on public sector urban professionals for whom urban schools nurture a cosmopolitan view (e.g. Van Zanten 2003) and on the ‘cultural omnivore’ in certain forms of middle class self-formation which encompasses and celebrates a wide variety of cultural forms (e.g. Bennett et al. 2009).

Connected to this valuing of the ethnic ‘other’ as an educational resource was a frequent denigration of both the black and the white working-class ‘other’, which at first appeared paradoxical. There were several examples of parents voicing what

Bourdieu termed ‘white racism’ (Bourdieu 1998) in which lower social classes are thought of as morally inferior, and terms like ‘white trash’, ‘chav’ and ‘charver’ were sometimes used to describe whole groups of people and their children – sometimes groups of children in the chosen school, and sometimes those in other schools that had been avoided. The contrast (sometimes implied, sometimes explicit) was with those ethnic minority families that seem to display a strong work ethic. Our analysis suggested both anxieties in respect of excessive whiteness (cf. Skeggs 2004) and also deliberate processes of differentiating the white middle class self through what we might term ‘adding colour’ to it by association with ethnic diversity. There is a striking resonance here with the work of Skey on different strains of national belonging and the middle class identification with a cosmopolitan cultural diversity (nurtured, for example, through ‘travel’, but constructed in opposition to mere tourism – see Skey 2011).

56.3.3 *A High-Risk Investment?*

This brings us to two final examples of where the analysis of the project would take us. Firstly, the fears and anxieties mentioned above were directly linked to high levels of monitoring of schools and teachers across the sample, and a level of vigilance we termed ‘parental managerialism’. In part, this may be understood against the backdrop of both the popularly imagined and the researched reality of the types of secondary schools their children were attending. As many studies have shown, some urban schools appear to be very good at individualising social differences in economic, social and cultural resources, at recognising only certain forms of ability and at producing personal failure (see for example Archer et al. 2010; Gewirtz 2001). A consideration of this backdrop led us to suggest that white middle-class against-the-grain secondary choosing could often be understood via the metaphor of a *high-risk investment*. In other words, there were conscious and deliberate actions by parents to serve the ends of a clearly-defined educational project, but the means available were anxiety-producing and felt to carry relatively high risks. Nevertheless, the potential gains were also high, compared to the ‘safe’ alternative (of a secondary school with less diversity and high examination pass-rates). As a response to this anxiety and risk, and again in keeping with the financial investment metaphor, parents tended to monitor the process very closely indeed, through roles on governing bodies, visiting the school, friendships with teachers and other contacts. Several spoke of the option of ‘pulling out’ if things did not work out as hoped. However, things did usually work out as hoped:

Across all three locales the young people were generally doing well at school. Most were performing well compared to their age equivalent peers, with some performing significantly above average. The choice of school their parents made did not seem to have had any negative impact on academic development and in fact the children seemed to have benefited from being in inner city comprehensives. In terms of measurable academic success, of the 117 young people who had reached at least 16, all except three boys and one girl did well

in GCSEs...Of the 71 who were over 18, eight went on to Oxbridge after A levels (six from London) and the others went to a range of pre- and post-1992 universities' (Reay et al. 2011, p. 128).

Finally, it is important to note that the anxieties and vigilance we saw were often balanced by a confident perception of the young person's intrinsic high ability, or 'brightness'. Our interviews contained over 250 references to this, none of which had been directly solicited. Collectively, these families held a strong view that their children were special or especially bright and that this would (other things being equal) become reflected in academic credentials. This may be understood as a form of Bourdieusian *misrecognition* (James 2015) as it 'explains away' the social advantages that produce the outcomes, masking the strong mutual affinity between a school's absolute compulsion to maximise its headline results, the persistent monitoring by parents, and the propensity of middle-class children to do relatively well in conventional academic terms, even in these averagely and below-averagely-performing schools. The 'Gifted and Talented' scheme¹⁵ was an important element, and in addition some of the schools attended by young people in our sample had gone to great lengths to persuade them to stay.

56.4 The Urban as an Educative Resource

The two projects reported here, then, give rise to contrasting examples of 'the urban' itself functioning as an educative resource. In the first, there is a city-level attempt to form new partnerships to use the urban locality (and even recent industrial decline) as a tool to drive a large part of the curriculum, not only giving young people a new vehicle for the learning of maths, English, Art and so forth but also the opportunity to change their relationship to the locality and even to engage in meaningful decision-making within it. In the second there is a deliberate family-level use of the urban context to provide a school setting that is itself part of a wider educational project, the fruition of which will be seen in a young person who achieves well in conventional terms but who can also be worldly, street-wise, resilient, comfortable with – and able to relate to – a wide range of other people from a diversity of backgrounds. These more obvious differences between the two examples are important, but it is worth giving at least some brief attention to how they may also be connected.

¹⁵Described at the time of the study on the UK Government Department for Children, Schools and Families 'Standards' website thus: 'Gifted and talented children are those who have one or more abilities developed to a level significantly ahead of their year group (or with the potential to develop these abilities). In England the term "gifted" refers to those pupils who are capable of excelling in academic subjects such as English or History. "Talented" refers to those pupils who may excel in areas requiring visio-spatial skills or practical abilities, such as in games and PE, drama, or art'. The Guidance Note *Identifying Gifted and Talented Learners – getting started* was revised in 2008 and is now available at <https://www.education.gov.uk/publications/eOrderingDownload/Getting%20StartedWR.pdf> (accessed March, 2015).

An important connection is that in both cases, intentions and individual actions are heavily refracted by powerful structural features, and have a range of consequences that go well beyond initial goals. Whilst the current level of curriculum specification and current accountability regimes for primary education (that is, some of the main elements of the learning culture) offered a 'space' in which the Area Based Curriculum project could work, the equivalent learning culture in the secondary school setting provided little opportunity for it to gain purchase. Indeed, it could be argued that what emerged here was *a demonstration of the irrelevance of the local urban setting for the most revered forms of educational activity*. This point about the learning culture and its affordances as a field is vital, because in educational settings we have become accustomed to look to personal, interpersonal and technical-organisational factors (such as vision, leadership, new 'species' of school or forms of organisation) to provide recipes that might yield improvement. Linked to this, and as several theorists have noted, the UK (and arguably, specifically England) continues to suffer from a lack of a shared purpose around educational endeavour. This lack of a shared articulated educational purpose may suit some interests quite well, but the main point here is that it continually prevents any real progress with regard to achieving greater equity. A lack of explicit educational purpose opens the door to a range of shifting assumptions, and

...implicit assumptions about educational purpose, quality and equity do not engage systematically or analytically with detailed arguments about what an equitable education system might look like (Raffo 2014, p. 3).

In respect of the second project reported here, individual choices of school that could be characterised as less than optimal (in the terms of the assumptions of policy and practices of 'mainstream choosing') nevertheless yielded a range of specific advantages. The parents concerned were geographically mobile, with almost 70% having recently moved to the areas in which they now lived, which were often the 'gentrifying' areas of an urban landscape (see for example Butler 2003). They were also highly educated and qualified: as a group they had over four times the UK average incidence of private secondary education and a high proportion had been to selective state secondary schools. Some 83% were qualified to degree level, and over a quarter also held postgraduate qualifications. Together with aspects of family educational history, these characteristics produced capitals and dispositions that would play out differently depending on the field in which they are enmeshed.

The parents' high level of involvement in the schools was often explained in a conventional way. Certain backgrounds, professional skills and connections were felt – by the schools and the parents themselves – to offer valuable support to the school (and by implication to *all* the students within it). Formal involvements included many Governor roles¹⁶ across the sample, but there were also many informal contacts as well. At the same time, our data showed us that it would naïve to regard these contacts as entirely separate from parental monitoring and management

¹⁶For general information about school governors in England, see <http://www.nga.org.uk/Home.aspx> (Accessed March 2015).

of the specific young person's education, so in a sense the parental 'input' to the school may come at a price. Like the American work of Brantlinger (2003) our evidence and analysis suggested that given their backgrounds and dispositions, the families studied would find it difficult to avoid reaping advantages that are hard-wired into the urban school and its systems. This was particularly evident in the form of the extra resources made available to those students designated as 'gifted and talented'. Yet these parents were not setting out to generate further inequalities and were (on the whole) attempting to act ethically in an unethical context. Indeed, many of them saw their choice of an ordinary local school as a strategy for *avoiding* conventional educational privilege and the sorts of differentiation and distinction that come with it.

Yet despite their 'sociological' appreciation of their relative advantage and their confidence that their own children were particularly 'bright', it is important to note the anxiety and uncertainty that characterised the actions and experiences of most of the families. In addition, the structural advantages we clearly see across the sample cannot be equated with some kind of on-going continued structural certainty. As we noted in the preface to the paperback edition of the main book to arise from the project, contemporary economic and social changes put increasing strain on middle class people like those in the study:

...for many of this group, the near-certainties of middle-class life have gone, as welfare cuts bite, job security is non-existent and credential inflation – particularly for graduates – takes hold and is felt more keenly by more people. More of the middle-classes find themselves on uncertain ground, positioned between an extremely rich powerful elite and a growing number of struggling poor. For people like those in our study, this economic and social in-between-ness is lived out, practically and psychologically, in a struggle with a contradiction between wanting the best educationally for their own children, yet at the same time desiring a fair education system for all children. Such tensions generate anxiety, insecurity and ambivalence (Reay et al. 2013, vii).

56.5 Conclusion: The Urban as Urbane or Mundane?

It is clearly possible for the urban to be a positive educational resource in the sense that the locality can be a rich source of expertise, curricula focus, pedagogic design, inspiration, and so forth. Yet for this to work to the advantage of many requires curriculum and accountability structures that permit 'the urban' to be treated as 'the urbane' (Raffo 2014). This seemed to be possible in the three Peterborough primary schools but somewhat out of reach in the secondary schools. It is now many years since secondary schools in England could easily adapt parts of their high-stakes public examinations to be geared to the local through officially-recognised teacher-defined components (the so-called 'Mode 3' General Certificate in Education) and it is important to note that there were perennial concerns around this even in its heyday (see for example Whitty 1985). In England, recent years have seen powerful encouragements to schools to focus on a narrowing band of academic achievements in the name of 'raising standards' and in the hope that doing so may lead to greater

economic competitiveness and even greater equity. There has been some loss of vocational qualifications and also skills-focused qualifications as a result, with the latter having *worsened* some student's chances of access to 'powerful knowledge' via recognised mainstream qualifications (see Harrison et al. 2015). It would be difficult to design a system more effective in preventing a positive use of the local urban area in the secondary curriculum: here, the urban appears not so much urbane, as mundane. Meanwhile, as we have seen in the second study discussed above, the urban setting offers, for some, the means to develop certain counter-intuitive forms of capital as well. Even as the school harnesses new local parental expertise, this is far from a simple gain for all students in the school and it can be bound up in processes that maintain and even amplify certain relative advantages and disadvantages. Thus, as well as being a dynamic and constitutive context, 'the urban' functions powerfully as an educative resource, but in doing so it always begs the difficult and uncomfortable questions 'In whose interests? To whose benefit and to whose disadvantage?'

Chapter 57

Race Matters: Urban Education, Globalisation and the Twenty-First Century

Gill Crozier

The educational landscape in Britain in the early twenty-first century is constantly changing. It shifts according to changes of government, economic instability and global pressures. The key concerns around race and anti/racism of the 2000s have waned into the policy background. The focus now is once again on sameness – on assimilation, an emphasis on the so-called and nebulous ‘British values’ (DfE 2011) and ‘community cohesion’ (Cantle 2001), although now more in the guise of ‘counter terrorism’ (Home Office 2015). The targeted initiatives to address Black and Minority Ethnic¹ underachievement have been cut, and the blame for poor educational performance is laid at the feet of parents, the children themselves, teachers or ‘failing’ schools. Thus the emphasis is on individual responsibility: not structures or, specifically in relation to this chapter, structural racism. Britain, as elsewhere, is also caught up in the global competition for a top place in the educational stakes as defined by the Organisation for Economic Cooperation and Development’s (OECD) Programme for International Student Assessment (PISA) (see for example Lingard and Sellar 2013). Initiatives are thus driven by school effectiveness rather than addressing inequalities. Over nearly 30 years we have seen the development and entrenchment of a marketised Education system which has led to an atomised system of schooling, individualisation with the individual being held accountable for her or his own underachievement (see for example Field 2010; Machin and McNally

¹The term Black and Minority Ethnic has taken on a common currency in Britain and is used in policy documents, as well as academic publications; most organisations tend to use it in their publications and reports also. It is not unproblematic and in particular can imply essentialism of Black and Minority Ethnic people which is erroneous. However, I am using the term as a signifier or racial and ethnic diversity which in the British context relates to Black African, Black Caribbean, Black Other, Pakistani, Bangladeshi, Chinese, Asian Other and Black and Minority Ethnic and White, mixed heritage people.

G. Crozier (✉)

University of Roehampton, Roehampton Lane, London SW15 5 PJ, UK
e-mail: g.crozier@roehampton.ac.uk

2006). All of this has consequences for urban education and 'race' issues. The term 'urban education' is taken here to refer to schools and education provision located within town or city centres or conurbations that have substantial populations which are richly diverse socially and in most cases ethnically. In contemporary Britain the schools comprise different types including Local Authority maintained and Academies; faith schools and Free schools. This atomised and fragmented education system also contributes to the challenges facing urban schools, for whilst they offer enriching experiences and are potentially excellent centres for learning and preparation for cosmopolitan citizenship, they are often ill resourced to exploit fully this potential.

Against a backdrop of economic cuts are the changing demographics and diversity of needs and desires. Britain is not only a multicultural and multiracial society but now represents superdiversity according to some (see for example Vertovec 2006, 2007). Additionally in Britain we have seen a rise in poverty, a fragmentation of communities still reeling from the devastation of traditional industries in the 1980s and 1990s and with that the far Right's exploitation of discontent to whip up racial hatred. Following some progress in the development of 'race' awareness and anti-racist policies under New Labour (1997–2010), the Equalities and Human Rights Commission Report (EHRC 2010) 'How Fair is Britain?' demonstrated that Britain is still not that fair at all. For example the enduring under achievement of certain minority ethnic groups namely Black Caribbean, African Caribbean, Somalis, Bangladeshi and Pakistani heritage and Gypsy, Roma, Traveller children, prevails (DCSF 2008, 2009; Equalities and Human Rights Commission (EHRC) 2010; Department for Education (DfE) 2013).

More recently the Office of National Statistics (ONS) survey (NatCen 2014) of British Social Attitudes revealed that 60% of the population felt confident to declare that they were racist. This sense that it is acceptable to hold such views can also be demonstrated by events such as the Chelsea football supporters' display of racism in the Paris Metro when they refused to allow a black man to board the metro train and chanted that they 'are racists' and 'happy with that' (Taylor and Quinn 2015).

The significance of these individual attitudes is twofold: on the one hand they indicate the changing ethos of the society of what is acceptable and give voice to a narrow retrogressive position of acceptable racism; and on the other this apparent shift in attitudes causes politicians, especially in an election year (2015), to capitulate and try to match equally racist policies around immigration controls. As Tomlinson (2008) argued the obsession with immigration controls reinforces these negative and racist sentiments implying and reinforcing the erroneous view that migrants are to blame for unemployment, housing shortages, pressures on the health service and school failure. This is the context of urban education in Britain in the early twenty-first century.

Underpinning this scenario however, theoretical understanding of racism/s has developed and in the twenty-first century a clearer recognition of Whiteness and its implications for racist oppression has developed (Garner 2007) in relation to an understanding of intersectional identities (Bhopal and Preston 2012; Crenshaw 2003) and the importance of on the one hand foregrounding race, but on the other

the importance of challenging hierarchies of oppression and therefore eschewing damaging polarisations such as between BME groups and between BME and the White working-class.

These are some of the central issues that will be explored in relation to published key research and ideas in a discussion and exploration of inequalities and ideas for progressing social justice. In the rest of the chapter I will focus on the following themes to explore the concerns around urban education and race in Britain today: race matters; the education context in contemporary Britain and implications for racialised education experiences (including a discussion of super diversity); race and education: the state of play; urban geographies: space and place; the role of parents; racisms and White supremacy. In my analysis I will draw on the theoretical resources of Critical Race Theory and theories of Whiteness. I aim to address the salience of gender and social class in relation to race in the struggle for equality and social justice in education. This aspect of the analysis is informed by understandings of intersectionalities (Bhopal and Preston 2012; Crenshaw 2003).

57.1 Race Matters

To begin the discussion of race and urban education I want to outline the rationale of why race continues to matter and in the context of this chapter what I mean by race. Firstly the term race: amongst sociologists and education scholars it is clearly understood that race is a social construction without biological bases. For this reason it is frequently written within inverted commas signifying its problematic nature. Since I believe these problematics are fairly well understood I have decided not to use inverted commas around the term, in this chapter.. The social constructions of race are signified by colour and perceived physiological indicators. These perceptions and constructions translate into racist behaviours and practices overt and covert, explicit and implicit in terms of a racially underpinned and imbued society. Some, such as Modood (2005), argue that racism is also cultural. This is contested by others (e.g. Gillborn 2008) but if we accept this idea of cultural racism, I suggest that it does not follow that culture (also a contested term) is a definition of race. Culture is a fluid concept. Representations of culture might take the form of: language, religion, food, forms of dress, but whilst these might be aspects of culture, none of these is absolute or fixed or indeed can be attributed to a specific person just because they 'seem' to be of a certain ethnic group. Attributions of 'culture' essentialise: Black and Minority Ethnic people in particular, are often described by cultural traits or ascribed a particular manifestation of culture, as though that is their absolute identity. Black and Minority Ethnic people then come to be fixed by some often fairly arbitrary putative, cultural signifier; a signifier that is also an artefact of the dominant group.

The term culture is also used extremely loosely in the sense for example, of talking about people of 'different cultures', when they often mean of different colour or ethnic or national heritage. 'Different culture' is used, I suggest, as a shorthand for

identifying some perception of ‘difference’, often difference of skin colour or physiology, but it is often meaningless, since it is based on a subjective perception.

Without going in to the complex analysis of socio-linguistics which is beyond the scope of the chapter, in this chapter the term *race* is used to denote the experience of racism as defined by Macpherson (1999); it is used here to explore the impact of the perceptions of race on the education and opportunities of young people and the implications for their life chances of structural racism/s (see also Warmington 2009). Also following Solomos et al. (1982) and Gilroy (1992), race is taken as being not ‘a fixed unitary principle’ but one that changes over time in response to political and economic structures and conditions and social relations (Solomos et al. 1982). Race, it is argued, along with other structural inequalities, is embedded in the fabric of society and unless challenged and overturned is and will be continuously, reproduced: in spite of the contemporary focus on ‘super diversity’ and multiculturalism, although the latter is less popular now, this is why the focus on race remains important and relevant.

57.2 The Educational Landscape of Race in Twenty-First Century Britain and the Urban Context

The policy frameworks around Race and Education have changed markedly over the decades from the 1950s to 1960s, two significant periods of post-colonial migration but even more rapidly since 2010 and the loss of power by New Labour. New Labour largely because of the Macpherson Report (1999) arising from the murder of the teenager Stephen Lawrence, introduced the Race Relations Amendment Act (2000) which gave recognition, for the first time in Britain, of institutional racism and required all public institutions and organisations to develop policies on challenging and monitoring racism (see Tomlinson 2008; Crozier 2012 for further details of the historical developments of race policies and education). Since then we have seen the focus on race and racism disappear from the political and education agenda. The UK Coalition Government (2010–2015) made severe economic cuts and changes which have reversed the advances in the fight against racism. For example, the Race Relations Amendment Act (2000) which, whilst still on the statute books, has been superseded by the less specific and more nebulous Equalities Act (2010) and subsequently the requirement for public institutions and organisations (including schools and universities) to record racial harassment, write and implement policies on challenging and ensuring against racial discrimination, have been abandoned. In 2011 the Ethnic Minority Achievement Grant (EMAG), a specific grant targeted at supporting minority ethnic groups in schools with English as an Additional language (EAL) provision, and other support measures, was abandoned as a specifically allocated grant; also in 2011 the Education Act removed the

requirement for Ofsted² to inspect how schools were complying with the ‘community cohesion duty’ and so on (NASUWT 2014).

Multiculturalism, often regarded by social scientists as the soft option to challenging racism head on, has been denounced by international politicians including the UK Prime Minister Cameron (Wright and Taylor 2011) and the German Chancellor Merkel (Weaver 2010) as, amongst other things, fuelling disharmony and community divisions and putatively contributing to the radicalisation of Muslim youth. We have also seen the rise of the far Right English Defence League and the anti-Europe and anti-immigration United Kingdom Independent Party (UKIP). Both these factions blame migrants for the loss of jobs for British nationals, housing shortages and diminishing public resources, constructing migrants as the feckless and the troublesome Other (Tomlinson 2008). Such sentiments thrive in the climate of austerity with low and depressed wages, an increase in poverty levels amongst families, signified by food banks in one of the world’s richest countries, and one of the worst housing crises since post World War 2 Britain (Islam 2013), without a clear and serious political explanation or locating the blame on financial corruption, mismanagement and ineptitude (Gamble 2009; Harvey 2010).

Over the past decade in urban centres there have been a series of dramatic and significant events, which disrupt and potentially destabilise communities. These include wide ranging events, for example the bombing in London the discovery of other explosive devices in a London park, a parked car (July 2005), the brutal murder in a London street during the day time of an off duty soldier (2013); these events appear to have been carried out by extremists, erroneously in the name of Islam; all of these events have given rise to speculation about the radicalisation of Muslims and concomitantly have fuelled the development of Islamophobia (Stone 2004). In addition there has been civil unrest including demonstrations and occupations expressing discontent with austerity measures, housing shortages and corruption of the banking sector. A national riot took place throughout England (2011) in 66 locations, provoked initially by the police shooting of a Black man in Tottenham, London (Bridges 2012). These are signifiers of major discontent and also a conflicted society; they also suggest something about the failure of urban education to address and meet the needs of the society’s young people. This fluid, diverse and as suggested, in some ways unstable context, is ripe for polarisations and racialised antagonisms.

Britain in 2015, together with much of Western Europe, is more culturally and ethnically diverse than ever. There are many different nationalities represented in British urban centres with for example an estimated 300 national languages spoken in London as an indicator of this (Vertovec 2007). The population includes second and third generation people who came from countries once colonised by Britain and more recently refugees and asylum seekers together with Europeans arising from

²The Office for Standards in Education Children’s Services and Skills is a non-governmental ministerial department (often denoted as a quango) that inspects and regulates services for children and young people, and services that provide education and skills for all ages. See <https://www.gov.uk/organisations/ofsted>. Ofsted reports directly to Parliament.

membership of the European Union and the open border policy. In the last decade with the accession of Eastern European countries former Soviet Block countries, significant migration from Poland, the Czech Republic, Bulgaria, Romania has ensued. According to Steven Vertovec (2007) this diversity is more complex than has been acknowledged. He argues that there is now complex diversity not only in terms of languages, religion, other aspects of culture but also in terms of education, migration status, social class, occupation, length of establishment in Britain and so on—and this is not just between ethnic groups but also these differences are within ethnic groups. Moreover, he argues that government policies on multiculturalism have focused on the traditional, historic post-colonial groups from the Caribbean and South and East Asia. This he suggests, is too limiting since the newer, smaller, and as he says, less organised groups, are those ‘groups that have transformed the social landscape of Britain’ (Vertovec 2007) and that this needs to be acknowledged and addressed. Statistically, he continues, ethnic diversity is now also spreading across the rest of Britain and beyond London and key cities. Whilst this may be the case to some extent, it remains variable and we have little evidence to assess Vertovec’s assertions. The infusion of cultural diversity in terms of languages spoken, and types of food available in shops are the most noticeable changes; other changes regarding values and ways of being are difficult to research and in any case will take longer to assess. The term diversity itself has been much criticised as vague and nebulous and often leading to obfuscation of the central and significant issue of racism and racial discrimination (Ahmed 2007). Whilst ‘super diversity’ may be an important concept to facilitate understanding the complexity of contemporary society, it is not yet clear what the implications are with regard to the pressing issues of urban education and race matters.

However, the issue of migration which has given rise to the concept of ‘super diversity’, is important to the concerns of this chapter in terms of the conditions of urban education and any tensions or enhancements the complex dynamics of migration and demographic changes might lead to. The accession of six more European countries in 2004 from former the Soviet Block including white and Roma migrants complicates the analysis of discrimination, prejudice and disadvantage given the antagonisms levelled against these people, and the significant educational underachievement of Roma children together with Gypsies and Travellers (Bhopal and Myers 2008). Nevertheless, our increasing understanding of White privilege (Gillborn 2008) is useful in helping us make sense of this, which I will discuss below.

Driven by the PISA assessments and league tables (Lingard and Sellar 2013), as well as the operationalization of the British ‘school choice policy’, schools are pre-occupied with performance and the Ofsted inspection regimes rather than equality issues. Arguably they are interconnected; certainly examination success links with the league table position but the point here is who and what are prioritised? And how are these school successes achieved? We have seen in studies such as Gillborn and Youdell’s (2000) that in order to ensure student success at the Year 10 General

Certificate of Secondary Education³ GCSE assessment point, the practice of educational triage was operated in their study schools. In this way children on a significant grade boundary (Gillborn and Youdell termed this the A*-C economy) were given extra support whilst the needs of others were eschewed. Their research showed that it was Black African-Caribbean students who received the least support.

According to Lingard and Sellar (2013) international league table position in terms of the PISA results is increasingly important, not least because of the financial rewards available to highly regarded knowledge economies, a role which Britain wants to occupy. League table position for individual schools takes on further importance at a national level too, since it is on this basis that parents make their choice of school and subsequently schools might survive or fail accordingly. For these reasons successive governments have introduced various initiatives to raise achievement. The focus though has been on the individual child and the parents – and increasingly on the parents whose own education is spotlighted as a cause for their child's under achievement (Field 2010) rather than on structural inequalities. Leonardo and Tran (2013) argue for example that neo-liberal policies are constructed as providing all solutions for the individual. Thus if the individual fails, then it is her or his own fault that they have not adequately utilised what is available to them. Leonardo and Tran go on to say that neo-liberal individualised and competitive frameworks serve to mask issues of race and racial inequalities.

High performing schools are essential to the marketization of the education project both nationally and internationally. At a national level parents' school choice is a key driver and in turn parental choice drives schools' policies and practice in order to achieve and or maintain the attractive league table position. Clearly not all schools achieve this nor could they. For some urban schools such ambitions are hardly attainable and in some cases head teachers and the school governors prefer not to play this particular game. In terms of urban education what we see is a pattern of differentiation based on class and race amongst school type and school success.

57.3 Geographies of Urban Education: Spaces of Exclusion

It is not only since the inception of neo-liberal education policies that schools in urban centres have been differentiated and segregated. School allocation, prior to the 'school choice' policy was largely based on locality and catchment area. The classed and raced differentiated urban spaces (Savage et al. 2005) translated into classed and raced differentiated schools. These 'geographies of schooling' were exacerbated and further embedded by the 'school choice' policy which as we know from an abundance of research (for example Ball 2003; Butler and Robson 2003; Gewirtz et al. 1995) middle class (and mainly white) parents who have the requisite social and cultural capitals are more likely to exert that choice effectively. In London

³GCSE examinations take place in Year 11 (students age 15–16 years). These examinations' results inform a students' future direction in terms of further study or work.

with the largest Black and Minority Ethnic population in Britain of 40% (2011 Census), whilst rich and poor live side by side, school differentiation along class and race lines is often quite stark (Butler and Robson 2003). Reay et al. (2011) in their study of white middle class families in London and two other areas in England, found in all of the three urban centres that there were some urban schools where there were no white middle class families and in London they found schools with almost 100% Black and Ethnic Minority populations. Although there are exceptions, such as in Reay et al.'s (2011) study which focused on those White middle-class parents who chose to send their children to urban comprehensive schools, Butler and Robson (2003) and Ball (2003) showed that White middle-class families engaged with the essence of the education market and played the system to ensure that their children did not have to go to such schools: schools, which Diane Reay (2007) in her analysis of the urban comprehensive has termed 'unruly spaces'. She argues that White and Black working-class children and 'their' urban schools are constructed in the White middle-class imaginary as 'the Other'; both the children and the schools are frequently demonised as out of control and undesirable and the schools are constructed as places that will inevitably fail their children.

The impact of this demonisation and segregating behaviour is broadly two fold. On the one hand it has a material impact where in a highly competitive field of school choice and where money follows the child, a school whose reputation has been destroyed will be in a difficult situation in terms of recruiting pupils. Moreover, schools that under recruit will not receive sufficient money and thus resources will be inadequate. More concerning is the segregation of children on any grounds but racial and classed segregation evokes frightening historical analogies and creates an elitist ethos. This in turn feeds into, and reinforces, White middle-class privilege and supremacy; the latter of these concepts will be discussed more fully below. Secondly, the emotional and psychic impact of this segregation together with the derogation of their school, cannot be underestimated. Diane Reay (2007) analyses this effect through the voices and experiences of young secondary aged children. The children in her study who attended urban schools reproduced the notion of 'good and bad' schools (Lucey and Reay 2002) most frequently describing their own school in negative, denigrating terms which as Reay (2007) argues had damaging implications for the ways the children assessed themselves and their communities.

Differentials between schools with some schools offering different and more advantaging experiences, has been exacerbated with the introduction of Academies and Free Schools; not that these new types of school are necessarily for the better but also their introduction make the system more difficult to navigate for some. However, the clearest examples of differentiated opportunities that are raced and classed are in fact in universities where reputations are more widely publicised in terms of Oxbridge and the Russell Group 'high status' universities (Boliver 2013). None of these universities have significant numbers of BME students even though BME students are reportedly "over represented in the university sector" (Kerr 2010). Those universities that might be referred to as 'urban universities' such as the post 1992 modern universities which are less well resourced and receive less

research funding, have been the most successful at recruiting and supporting BME students. This is important because these universities have been criticised, often unfairly, for, the quality of the experience they provide including teaching and the value of their degrees (Chapman 2010); also large employers (offering high salaries) tend to target Oxbridge and certain Russell Group University graduates (High Fliers Report 2015) in order to recruit new employees, thus disadvantaging graduates from other universities.

57.4 Race and Education: The Current State of Play

The New Labour Government (1997–2010) claimed that by the end of their term of office in 2010 Britain was a more tolerant and fairer society than it was when they first came in to office. Ministers went so far as to say that race was no longer a central issue of concern and now the focus had to be on social class. New Labour had invested substantially in race and education policies and initiatives and had targeted Black and Minority Ethnic groups in order to raise educational attainment. However, the Equalities and Human Rights Commission (EHRC) (2010) report ‘How Fair is Britain?’ clearly revealed that it was still not very fair at all and 5 years on, if anything, the situation is much worse.

In particular Black Caribbean, certain Black African groups, and Pakistani and Bangladeshi heritage children together with Gypsy, Roma and Traveller children are still significantly under achieving compared to their White counterparts; this is both at school and higher education level (Department for Children Schools and Families (DCSF) 2008, 2009; EHRC 2010; Department for Education (DfE) 2012; Stevenson 2012) Social class is an important factor as is gender but research has shown that race is the overriding factor (see for example Strand 2011). The endurance of schools’ failure of BME students is a deep seated and embedded systemic issue. However, Strand (2012) has shown that whilst Black underachievement continues to prevail the picture is more complex with some Black African groups achieving well. Cassen and Kingdon (2007) also identify a complex and variable picture of underachievement for Black and Minority Ethnic groups. At the other end of the scale certain Indian heritage groups and British Chinese children achieve highly, in spite of experiencing personal racial harassment (Mau 2014; Archer and Francis 2007). Social class is a particular factor in these differences but such factors are rarely absolute or singular. The construction of the ‘model minority’, (Leonardo 2009) whilst at a psychic level may have negative effects, in terms of academic achievement, would seem to ensure high teacher expectations and also position those young people in a positive academic space in order to succeed.

Others have written about the importance of focusing on success rather than interminably on failure or underachievement (e.g. Rhamie 2007). The construction of Black children and boys in particular for example, as failures, tends to lead to lower expectations as discussed below and a fixing of this underachievement as part of

their persona or worse, so called 'ability'. The focus is too often on the child rather than on the failure of the schools to recognise their own failure of these children.

Teachers, schools, policy makers and so on are implicated in a complex web infused with hegemonic – White – values. Teachers play a highly significant role; they are at the interface between society and the children. Obviously they are not individually or even collectively solely responsible for this but their role is very important and all teachers and educational professionals have to take some responsibility for school failure and discriminations and the perpetuation of inequalities. Rist (2000), Strand (2012), and Basit (1997), for example, have shown that White teachers tend to have lower expectations of BME children which impacts on their achievement levels, and Rist (2000) and Mechtenberg (2009) more recently, have discussed the impact of this in relation to the self-fulfilling prophecy. Given the differences in achievement amongst minority ethnic groups, as indicated above, it suggests a hierarchy of expectations, when all other things are equal (see for example Strand 2012 regarding his findings on social class and the pattern of Black Caribbean children's under achievement across a representation of all types of school). Archer et al. (2010) go on to say teachers make differentiations between ethnic groups based on their perceptions perhaps informed by stereotypes, prejudices and so on. Burgess and Greaves (2009) provide quantitative evidence from a longitudinal study employing large-scale observational data. They demonstrate that teachers categorise children and create exemplars to make conscious or unconscious judgements about future students from the same group, based on prior information of others from those ethnic groups. Drawing on Chang and Demyan (2007) they also state that these exemplars or stereotypes differ across ethnic groups. In their conclusions they argue that on average Black Caribbean and Black African pupils are under assessed relative to White, Indian and Chinese and mixed Asian pupils who are over assessed. They note that there are important differences across subjects within ethnic groups and differences between schools across groups and subjects. Given teachers use of previously held views of minority ethnic groups and their behaviour and performance, they go on to say: "The dependence of a pupil's assessment of performance of others of her ethnic group locally means that school composition matters." (p. 23).

This evidence identifies the salience and implications of negative constructions of BME children and young people that abound. Black Caribbean boys are frequently singled out as being troublesome, unruly, difficult and disinterested (Sewell 1997; Mac an Ghaill 1988; Noguera 2013). However, the White view of Black people, mainly males, is also that they are fascinating, strange and entertaining (Said 2003). Black girls on the other hand according to Rollock (2011) are often rendered invisible by the contrast and fear of their Black male counterparts. In addition the discourse of girls' academic success together with a stereotype of girls as less threatening mitigates the potential negative effect of their Black identity on White teachers' perceptions. Whilst this may have a positive effect in terms of exclusion rates, their academic success which appears to be positive, is apparently measured against that of Black males who we know are underachieving. When measured against their White female peers they are seen to be underachieving also. Rollock argues that the

Black girls' position is invidious since they have become invisible and their academic aspirations are undermined and neglected. Others such as Morris (2007) writing in the USA, have found that Black girls are frequently described by teachers as "coarse and overly assertive" (p. 491). Teachers aimed to temper this behaviour and mould the girls into a more passive (White) model of femininity. Morris argues how this threatened the Black girls' success. Controlling Black people whether it is males through a positioning as entertaining or exotic, or assimilating Black females into a stereotype of White girls' behaviour, are devices to ensure that Black people are less threatening and can be kept in their place (see also Puwar 2004). Passivity is also a common construct of South Asian girls; in their case it is often used as an excuse or reason for their underperformance in schools, blaming them or their parents for 'low aspirations' (Shain 2003). By contrast South Asian boys, similar to Black African and Caribbean boys, are seen as threatening and 'prone to' forming gangs in school (Shain 2011; Alexander 2000). They are seen as tribal and said to draw on their community and extended family if they need to resolve peer group issues (Crozier 2004).

Following this, it is perhaps unsurprising to find that BME children and in particular Black Caribbean children, are placed in lower sets in both primary and secondary schools (Strand 2012; Gillborn and Youdell 2000). Repeated research (e.g. Ireson et al. 2001; Hallam et al. 2008; Wells and Serna 1997) has shown the disadvantages and damage of streaming and setting. It has the effect of undermining self-confidence and engendering negative learner identities (Hallam et al. 2008) and leads to students giving up hope (Archer et al. 2010). It also reinforces labelling and stereotyping of Black children as deficient (Rist 2000). In fact streaming and setting perpetuates differential achievement outcomes since as Collins et al. (2000) have argued, children in the lower sets do not receive the same education, curriculum content or indeed learning opportunities as those privileged, largely White, students in the higher groupings: "they receive a form of schooling that steers them towards the backgrounds they come from" (p. 135).

School failure leads to disillusioned and demotivated students, often resulting in disaffected behaviour with the consequence of school exclusions. It is therefore hardly surprising that just like the significant underachievement of Black Caribbean children there is correspondingly a disproportionate number of Black Caribbean children excluded from school, with boys in both instances being in the majority (Parsons 2009). Underachievement and exclusion give rise to a domino effect which can account for the disproportionate number of Black young men out of work and also in prison. In the current period of economic crisis the first to suffer in terms of unemployment, and loss of other resources, are young, working-class and low credentialed young people (Blanchflower 2011); also just under half of Black men 16–24 years of age, 47.4%, compared with 20.8% Whites, in Britain in 2011 were reported as being unemployed (Ball et al. 2012).

Whilst Cassen and Kingdon (2007) for example, have suggested that young BME people do not identify racism as a reason for their underachievement, there is other evidence that shows they are acutely aware of the impeding effects racism in society can have on their future opportunities and job prospects. Archer et al. (2010)

for instance report that Black urban school students in their research were disheartened by future prospects holding a view that Black people are only destined for menial jobs. By contrast to Cassen and Kingdon (2007) and Archer et al. (2010) also demonstrate that Black students' concerns about racism were not limited to the world outside of school but their Black respondents also expressed hurt from the racist abuse they experienced from their peers. Such hurt has a number of implications and effects. The hidden psychic costs of racist abuse should not be underestimated but is in fact frequently ignored. The US psychologist Margaret Beale-Spencer has written of the stressor effects of racist abuse and the impact on the self-concept. Beale-Spencer and Harpalani (2001) focus on the structural and contextual analysis of school as a stressful experience that impacts negatively upon young black people's psychosocial well-being. They argue that young people throughout their schooling encounter experiences which contribute to the development of identity and influence their choice of coping strategies. They go on to say that 'the presence and engagement with structural racism poses severe risks for the learning of adaptive coping strategies and positive outcomes with regard to individual and community level health and well-being' (Beale-Spencer and Harpalani 2001).

Throughout the parents' accounts, in my own study, (Crozier 2005a, b) a pattern of racist school experiences for most of the children are identified as emotionally challenging and negative, which it would seem in Beale-Spencer and Harpalani's terms, could result in the undermining of their mental health and well-being. The impact and consequences of the experiences of racism were serious concerns for the parents. They spoke about the need to support the morale of their children and they feared their personality being changed as a result of these pressures. As one mother, Sara (African Caribbean mother, business studies degree) "I'm a mother with an African male child and I know there's an onslaught on our male children, so I'm very conscious about his spirit not being broken." (Crozier 2005b).

In another study of South Asian families (Crozier 2004) South Asian secondary school students reported on the deep anxieties they held during morning and afternoon recess and lunch breaks and even between lessons when they had to change classrooms. Some reported hanging back to avoid being physically hit and resulting in being late for lessons which in turn had the consequence of school punishment. Many of the young people said that they would only go on school trips if their Asian friends went although often their friends were in different sets – another negative consequence of such segregation. The students' stance resulted not in understanding or sympathy from the school, nor positive action, but rather gave rise to teachers' criticisms of the South Asian students' separating themselves off (Crozier and Davies 2008). A further consequence was that the children often missed-out on enriching educational experiences. Disturbingly these experiences did not end at school but in some later work with university students Crozier and Reay (2008) reported that South Asian students in their study recounted similar experiences of fear and seeking solidarity with other Asian students (see also Bhopal 2010). Although this action was understandable, at times it had the effect of restricting or cutting them off from accessing important aspects of their university experience and

put constraints on opportunities to acquire the requisite cultural and social capital to progress successfully through their studies.

57.5 The Role of Parents

School students particularly those who are marginalised from the mainstream or who might be described as vulnerable to discrimination and racist harassment, have limited voice or agency. Their recourse is often to walk away as in truancing or hitting out, as in so called disruptive behaviour. It is in relation to such challenging experiences that parents might be the sole advocate for the child. In the study referred to above (Crozier 2005a, b) the Black parents played this role. They sought to intervene on their child's behalf as well as providing substantial support, and in the case of the child who was on a long term suspension from school, provided alternative educational opportunities. Another parent whose child had also been suspended, had to give up her job in order to be at home with him.

Parents are regarded increasingly as important by schools and policy makers, although their role in relation to schools moves backwards and forwards along a continuum: of support for teachers, as consumers, as stakeholders, calling teachers to account and more recently, providing 'school ready', 'exam prepared' children; children with the requisite cultural capital that ensure success and good league table results for schools (Crozier *in press*). Schools are less keen on assertive, interventionist parents who might question or challenge them and often see this as a threat to their professionalism (Vincent 1996). The BME parents in my study (Crozier 2005a) frequently tried to speak up for their children or request advice on how to support their children, or for more homework. They reported that often they were either fobbed off or not taken seriously. The parents, mainly mothers, including a teacher, social worker, and business woman, described the downward spiral of educational achievement of their children. In spite of frequent visits to the school about homework and setting and exclusions, they reported being ignored and quite ineffective in being able to support their children. This experience with the school contrasts with the experiences of White middle-class parents (Ball 2003).

Studies of White middle-class families and schools have shown the privileged position these families hold in relation to the schools and the benefits their children derive from this (Ball 2003; Ball and Vincent 2007; Reay et al. 2011). Reay et al. (2011) for example, report the high frequency the White middle-class parents intervened if they were unhappy with the school's practice or behaviour such as if their child was placed in a lower set or failed to get on to the Gifted and Talented Scheme. Their successful interventions contrast markedly with the Black middle-class parents reported in Vincent et al.'s (2012) study of Black middle-class parents. Vincent et al. (2012) (see also Rollock et al. 2011) report that their respondents faced a subtle but pervasive form of racism signifying misrepresentation and misrecognition. Some parents felt that the message from the school indicated that their child, as a Black child, was only capable of a certain level of achievement. Parents felt

they also were stereotyped in negative ways, such as some fathers who felt they were seen as a threat, and some mothers were thought to be victims of aggressive partners, neither of which was so. This is a further example where social class is fairly irrelevant in the face of structural racism.

57.6 Racisms and White Supremacy: Underpinning Urban Education

The reasons for BME underachievement are varied and complex and institutional and structural racism is central to this. There is a substantial amount of research that demonstrates the prevalence of racist practices in education (for example: Archer 2003; Gillborn and Youdell 2000; Gillborn 1990, 1995; Mac an Ghail 1988; Mirza 1992; Shain 2003, 2011). Likewise the discussion of the various manifestations of institutional, structural as well as personal racism throughout this chapter provides evidence of this. As stated earlier manifestations of racism shift according to the socio-economic and political context nationally but are also influenced by global factors (Sivanandan 2002), such as the impact or perceived impact of migration and the blame erroneously placed on this for unemployment, housing shortages etc.. As already discussed this has given rise to the development of racisms in terms of forms of discrimination and structural inequalities based on colour and also perceptions of certain cultures. Modood (2005) controversially argues that whilst there is often a connection between colour racism and culture the two facets of racism need not always be present. He makes his argument on the basis of many contemporary developments but the rise of Islamophobia and the media hype of Islam as an international threat is central to this. As already argued, culture is itself a contested term and within race discourses leads into the diffuse and tangential territory of ‘diversity’ and ‘difference’, referred to and critiqued earlier. However, cultural racism does link in with reference to ‘superdiversity’ (Vertovec 2006) and as Sivanandan (2002) has said, racism never stands still and “the racism that faces us today is not the racism we faced 40 or 50 years ago” (p. 1). Sivanandan recognises the racism that is perpetrated against refugees and asylum seekers and he also includes Roma, Sintis and “poor whites from Eastern Europe”. Sivanandan argues that the experiences of these White groups is based on “fear of strangers” and thus xenophobic but is also racist in the way “it operates”. Others, as well as Sivanandan, have argued against the dualist black-white distinction of colour racism in that it ignores Irish racism according to Mac an Ghail (1999) and the White working-class according to Cole (2009). Gillborn (2008) on the other hand challenges this view taking a Critical Race Theory (CRT) stance of foregrounding racism based on colour discrimination. The importance of CRT together with an engagement with White hegemony is in focusing directly on discriminatory practices and Othering, and away from diversionary cultural exoticism (Crozier 2012). These debates are important and complex and I do not intend to ignore the issue of social class or indeed Irish racism, but I

also assert that recognition of White supremacy is essential to understanding racial oppression and in order to go beyond anti-racist consciousness raising or tweaking policy and practice, in the fight against it.

White supremacy is not, as Gillborn (2008) has said, about the narrow racism of right wing, fascist ideologies. It is more powerful and extensive than that, it is a view “that is normalized and taken for granted.” (p. 35). In other words it is hegemonic. It is central to our lives and is wholly pervasive; it is often taken for granted and its dominance rarely questioned or its existence even recognised. Garner (2007) problematises it as a concept and recognises how it can be used in counterproductive ways. But he also shows how it is an important concept to further our understanding of how racism operates and can be challenged. He argues that Whiteness is a racial identity but one that only exists “in so far as other racialised identities, such as Black, Asian etcetera exist” (p. 2). Whiteness, he says, is a system of power, privilege and cultural capital (Garner 2007). Leonardo (2002) identifies it as a discourse, and Gillborn (2005) goes further by suggesting that: “Critical scholarship on whiteness is not an assault on white people per se: it is an assault on the socially constructed and constantly reinforced power of white identifications and interests (see Ladson-Billings and Tate 1995)” (pp. 58–60). Challenges by White people to White hegemony do take place but are limited. Of course not all people are ‘equally White’ (Leonardo 2002). That is to say they do not have equal power, privilege and influence but arguably all White people have equal interest in safe-guarding their relative White privilege and with that relative advantage (Marx 2006).

Utilizing the concept or discourse of Whiteness to make sense of the educational experiences and evidence of oppression discussed in this chapter I suggest, helps to explain why some anti-racist initiatives have failed to make any impact on BME children’s underachievement for example. It contributes to understanding the insidiousness of the symbolic violence rendered on BME children in school, inhibiting their acquisition of those resources to help them progress through the system of attainment and learning and marginalising their voice. Of course White dominance does not just operate in urban schools but it impacts significantly in these spaces where there are already tensions and pressures, as I have discussed throughout this chapter. White dominance impacts on and perpetrates all facets of the education system: policies, resourcing, curriculum, teacher training and so on. In understanding the ways that Whiteness operates and impacts, we can begin to develop ways of undermining and dismantling its hold but this understanding and a commitment to dismantling White hegemony and thus decentering is central.

57.7 Conclusion

In this chapter I have described the socio-economic and political context of urban education. I have discussed the ways this influences and impacts on the educational experience and opportunities of young BME people. The discrimination and failure of schools to improve the life chances of these young people is disgracefully

enduring. In the chapter I have tried to show that whilst some of the structural inequalities have remained fairly constant the context has become more complex. The changing demographics of schools add to the intricacies of the needs and expectations that schools and their teachers have to respond to. The fairly constant policy changes that schools experience with fewer resources and English as an Additional Language support is one such, contributes to the challenge. Moreover, the changes to teacher education has meant that there is now less preparation of new teachers and less opportunity for in-service development to engage effectively with racial diversity and learn how to effectively address racism in the classroom (Davies 2015).

The policy of school choice has contributed to White flight from some urban schools creating an unhealthy imbalance in the school experience of what should be an integrated and enriching racial diversity. The creation of Free Schools has also contributed, albeit unintentionally, to segregated racial and religious communities. The multiplicity of different types of schools including various types of Academies, as well as Free Schools and Local Authority maintained, has atomized the system and made the possibility of developing and implementing unifying anti-racist policies extremely difficult if not untenable. However, prior to the current Coalition Government (2010–2015) in London the Equality Challenge initiative which targeted BME children's under achievement relatively successfully and improved the urban educational experience across the city, demonstrates some progressive possibilities. According to Baars et al. (2014) the successful initiatives included improved resources such as financial, more teachers and improved school building quality. In addition the improvement of London schools also depended upon effective leadership; a more professional working culture and collective sense of possibility and professional development. Likewise, the calls to localism (e.g. Sahlberg 2011) might be a way forward to bring influence on a small scale but with a potentially cascading effect. Also generating parental participative and democratic involvement on an equal basis is another (Hong et al. 2009).

An additional challenge to urban education and the wider community is the danger of polarisations – hierarchies of oppression which lead, amongst other things, to racial antagonisms. Whilst I have focused on race in this chapter and I would argue that foregrounding race is important strategically, the significance of social class must not be underestimated. As I have discussed in relation to BME achievement and parental participation in schools, race is shown to 'trump' social class. However, class oppression is central to structural inequalities and White hegemony as part of that. White hegemony and social class are inextricably linked. Therefore whilst at times foregrounding race it is essential to challenge these central oppressions simultaneously and collectively.

Education cannot be held responsible for societal manifestations of discontent such as the riots of 2013 and the putative rise of radicalisation amongst young Muslim people. The much quoted sentiment expressed by Bernstein (1971) that education cannot compensate for society holds true. But education, academics and education professionals in general, have a central part to play to support and help to guide people and give sound preparation for children's and young people's future lives.

Chapter 58

‘Closing the Achievement Gap’ in English Cities and Towns in the Twenty-First Century

Geoff Whitty and Jake Anders

58.1 Introduction

A key focus in English education policy in recent years has been on overcoming persistent ‘social class’ differences in educational achievement, even though the issue is often discussed in terms of ‘poverty’, ‘disadvantage’, ‘deprivation’ or ‘social exclusion’ and differences are usually identified using measures of socio-economic status (SES) or eligibility for free school meals (FSM) (Whitty 2001). For many years in the last century there were major concerns about the underachievement of girls. That gender gap has been largely reversed, although not in the hard sciences or at the very highest levels in some other subjects (Ringrose 2013). Minority ethnic achievement has also been a concern, although there are significant differences in the performance of different minority groups (Gillborn and Mirza 2000).

The policy response to these issues has frequently been targeted at schools (or groups of schools) in urban areas, given the generally higher levels of disadvantage in these locations. Although it can be argued that all schools in England are urban in one sense or another (see Campbell and Whitty 2007), urban education in the UK usually refers to specific spatial locations where a particular combination of economic, social, cultural and demographic conditions poses significant challenges for the education system. While these have traditionally been identified as the inner city areas of large conurbations, including London, there has recently been a growing

emphasis on the rather different set of challenging conditions that has emerged in smaller isolated towns, especially those in coastal areas.

The urban focus of recent policies in England has sometimes been explicit (as in the case of area-based interventions) but more often implicit (as in the case of national strategies for school improvement). In this chapter we explore a number of such policies, the particular challenges in urban education they sought to address, and their successes and failures. Our emphasis here is on narrowing attainment gaps between socio-economic groups as identified through cognitive measures and the achievement of academic qualifications. This is not intended to suggest that the only purpose of schooling is to achieve such qualifications or that those who fail to do so are deficient, either absolutely or relatively, in other important respects. Indeed, during the period under consideration here there was, for example, considerable emphasis on the role of education in fostering 'well-being'.

One difficulty in establishing the impact of other aspects of education though is that data in these areas are limited and highly contentious. Furthermore, in the present political climate in England, many of those advocating the importance of these wider aspects of education find themselves justifying them in terms of their impact on attainment (see, for example, Harrison et al. 2015). Although this might seem to be ceding too much in the argument over the purposes of education, there is a great deal of evidence that life chances in English society are closely linked to school attainment in a myriad of ways and that personal fulfilment and social justice could both be enhanced by narrowing or closing longstanding academic achievement and participation gaps (Schuller et al. 2004). As Kerr and West (2010) put it, 'despite the dangers of narrowing our view of what education is about', a focus on attainment is justifiable because 'attainment undeniably has important consequences for life chances' (p. 16).

One specific reason why it is important to address the academic attainment gap in schools is that student performance during the compulsory phase of education has significant implications for access to higher education and the labour market. There has been a considerable and, at least until recently, persistent gap in England in the rates of participation in higher education between different social groups and in their opportunities for access to employment in science and technology and the professions (Kelly and Cook 2007). There has also been a strong tendency for students at the most competitive universities (usually concentrating on the self-selected Russell Group of research-intensive institutions) to be drawn from more affluent families (Boliver 2011).

Although there may still be some financial and aspirational barriers to widening participation and ensuring fair access in higher education, it is clear that one of the major impediments to students proceeding to higher education is low prior attainment (Whitty et al. 2015). Recent research has found that, while there is a considerable gap in higher education participation between those from different backgrounds, this gap is actually very small once prior attainment has been fully taken into account (Anders 2012; Vignoles and Crawford 2010). Prior attainment and choices made in terms of future study at ages 14 and 16 can then have huge consequences for future employment prospects. Low attainment and inappropriate subject choices

can be particularly restrictive on opportunities for entry into the professions (Milburn 2009) and STEM (Science, Technology, Engineering and Mathematics) related employment (Coyne and Goodfellow 2008).

The remainder of this chapter will concentrate on attempts to narrow the gap in the compulsory phase of schooling (ages 5–16), as well as identifying the sorts of interventions in those years that the evidence suggests might have some potential to break the enduring link between social background and educational achievement. It is important to note, however, that parallel policies have been pursued in relation to pre-school (NESS 2010) and post-compulsory education (Harris 2010).

58.2 New Labour's Attempt to Narrow the Attainment Gap in English Schools, 1997–2010

We begin by highlighting the socio-economic gradient in attainment throughout the English schooling system. Using data from attainment in 2005 (DfES 2006), while there is always a gap between FSM and non-FSM eligible students in terms of relative performance, this does not grow inexorably through the different stages of schooling up to age 14. In each of these stages, the performance of children eligible for FSM is around 85–90 % that of the rest of the cohort, but this widens somewhat at Key Stage 4 where FSM-eligible young people achieve roughly three quarters the average point score of the rest of the cohort (DfES 2006).

Survey data analysed by Goodman et al. (2009) present a slightly different picture when using more detailed measures of SES, rather than simply FSM eligibility. These authors find a widening gap in attainment through children's educational careers up until Key Stage 3 (age 14), but that it narrows somewhat for Key Stage 4 results. The difference between these two analyses is accounted for by the fact that FSM eligibility splits the population into a deprived group and the rest, whereas this analysis generally compares a broader (compared to FSM) lower group with a smaller (compared to non-FSM) higher group. Nevertheless, taken together these studies do point to a widening of the socio-economic gap during English children's educational careers.

During its 13 years in office the New Labour government, first elected in 1997 under the leadership of Tony Blair, increasingly made it a key part of its educational policy to narrow the attainment gap between children from different socio-economic backgrounds (Lupton and Obolenskaya 2013). Given this goal it is perhaps surprising that data on the trends for this gap are somewhat patchy. While there are figures on the gap at particular points in time, they often use different measures of attainment and/or different comparator groups, making the assessment of trends quite difficult. It is also the case that, in the initial period of New Labour government, apart from the Excellence in Cities (EICs) and Education Action Zones (EAZs) programmes, the major emphasis was on driving up standards overall.

EiCs and EAZs were both area-based, but ultimately short-lived, programmes, specifically targeting the issues of disadvantage in urban contexts. EAZs were

established in 1998, following a competitive bidding process by partnerships of schools, local authorities, business and community groups. EAZs received £750,000 on top of £250,000, which had to be sourced from private sponsorship in order to be eligible, with which to establish an “Action Forum”. This acted as a kind of super-governing-body with limited powers over member schools and responsible for drawing up an action plan to be approved by the Secretary of State for Education to raise educational standards in the zone. After disappointing results, funding for new EAZs was dropped after 3 years with all EAZs coming to a stop at the end of their 5 year contracts (Brain and Reid 2003; Power et al. 2004).

EiCs were also an area-based intervention, (initially) focused on local authority areas but, unlike EAZs, they were designated rather than competitive. Starting in September 1999, funding was provided in order to provide some additional programmes (such as Learning Mentors and Learning Support Units), as well as facilitate partnership working and sharing of best practice (through Specialist and Beacon schools) between schools in these shared contexts. An evaluation found a positive, but very modest, impact on attainment at age 14 in both English and mathematics, but rather more marked improvements in attendance (Machin et al. 2004, 2007).

It was the failure of this type of policy to have a significant impact on social differences in attainment that led to specific policies after 2001 to address the attainment gap, with a major thrust in this direction after 2005 (Lupton and Obolenskaya 2013). Although there were increases in average levels of attainment in the first period of New Labour government, some have argued that even these increases were at least partly achieved through grade inflation (Tymms 2004).

Figure 58.1 shows trends in the attainment gap up until 2003 and suggests a slight narrowing of the gap between students from non-manual and manual families.

The Office for National Statistics (ONS 2006) provides data on changes in the attainment gap from 2002 to 2005. These figures show a reduction in the attainment gap between pupils eligible for FSM and those not in terms of those obtaining no GCSEs (or equivalents) and the proportion obtaining 5 or more A*-C GCSEs (or equivalents). These figures show a stronger trend towards narrowing when IDACI (an area-based indicator of deprivation) is used instead of FSM eligibility. This is because this measure compares the most deprived with the least deprived, rather than the most deprived with the rest, and there seems to be evidence of generalised catching up between the bottom three deprivation quartiles and the top. In the FSM measures this catching up by pupils in the middle reduced the relative gains of the bottom compared to the top.

Cook (2011) too presents evidence of a further reduction in the attainment gap between 2006 and 2010. He uses performance relative to the mean in sciences, modern languages, maths, English, history and geography, generally regarded as the core subjects. In this case the size of the reduction looks to be relatively modest and concentrated among those in the bottom fifth of households ranked by deprivation (Fig. 58.2).

The analysis shows a steady weakening of the overall correlation between the two factors in the years between 2006 and 2010. Interestingly, this is the case

Fig. 58.1 Percentage of cohort achieving 5+ A*-C GCSEs by parents' social class: 1988–2003 (%). Note: Discontinuity exists between 1997 and 1999 because of a change in the classification of social class from SEG to NSSEC. Manual and non-manual categories have been constructed by grouping more detailed breakdown of social class groups. The 'other' group has been excluded from the analysis (Source: DfES (2006) analysis of Youth Cohort Study cohorts 4–12, sweep 1)

Fig. 58.2 The relationship between household deprivation and relative performance in GCSE point score in core subjects. Notes: Vertical axis shows standard deviation from mean GCSE point score performance in the core subjects of sciences, modern languages, maths, English, history and geography. Percentiles of household deprivation derived using Income Deprivation Affecting Children Index (IDACI) (Source: Cook (2011) analysis of National Pupil Database)

Fig. 58.3 “Gaps in educational performance have narrowed only very slightly despite significant investment” (Source: HM Government (2010b, p. 20) drawing on data from various official sources)

particularly for KS4 attainment overall, where performance on some vocational courses is included. It could be argued that this lends some support to the charge that part of the decline in the socio-economic attainment gap is due to lower-performing students being diverted to alternative courses (de Waal 2008). However, as the core measure still shows a decline not all of the reduction in the gap can be dismissed as illusory, even if one accepts the argument that the alternative courses are somehow less rigorous or marketable.

Although by most measures there was thus a small reduction in the attainment gap under the New Labour government of 1997–2010, it must be regarded as a disappointing achievement when compared with the aspirations of successive Prime Ministers and Secretaries of State for Education. Not surprisingly, the Coalition government that took over in 2010 tended to dismiss even the limited narrowing of the gap that was achieved under New Labour, regarding it as a poor return on the significant amount of public resources invested. This picture is summarised and restated in the Coalition government’s Social Mobility Strategy (HM Government 2010b), and presented graphically in Fig. 58.3 with a politically loaded heading.

58.3 What May Have Contributed to the Narrowing of the Gap?

There were considerable numbers of educational initiatives during the period of New Labour government, reflecting a variety of different understandings about how best to close the gap. They ranged from area-based interventions like Education Action Zones, Excellence in Cities (both of which were described above) and the London Challenge, through national-level changes such as the creation of a network of specialist schools, the foundation of academy schools outside the local authority system, and the National Strategies for Literacy and Numeracy. It also included remodelling the school workforce including the use of more teaching assistants, improving school leadership training, enhancing teacher quality, and the 'personalisation' of education through individually targeted interventions such as Reading Recovery. In addition, there was Every Child Matters, a multi-agency policy that addressed a wider 'children's agenda'. We discuss the success of these policies in the remainder of this section.

The vast numbers of education policies introduced by New Labour led to charges of 'initiative-itis', while the tendency to alter them even before they had been properly evaluated has meant that it is virtually impossible to determine across the system as whole which policies were effective in narrowing the gap. This despite the fact that the government espoused an 'evidence-based' approach to policy and often employed the rhetoric of 'what works' (see Ofsted 2010b; Whitty 2012).

For some policies, such as Education Action Zones, Excellence in Cities and the employment of teaching assistants, the evidence is equivocal or suggests only a very modest positive impact – or even a negative one (Power et al. 2004; Machin et al. 2004, 2007; Blatchford et al. 2012). We therefore focus in the rest of this chapter on the analysis of some of the policies for which there does seem to be some credible evidence that they did have a positive impact on narrowing the attainment gap.

58.3.1 *The National Strategies*

The National Strategies for Literacy (from September 1998) and Numeracy (from September 1999) were a key early policy enacted by Labour in an attempt to raise baseline achievement and thereby, it was anticipated, help to reduce the gap. An evaluation of a major plank of the National Strategy for Literacy, namely the 'Literacy Hour', was conducted by Machin and McNally at the London School of Economics. This identified a significant impact of the Literacy Hour in its piloted form as part of the earlier National Literacy Programme (NLP). It found that 'reading and English Key Stage 2 levels rose by more in NLP schools between 1996 and 1998' than in the comparator schools which had not yet introduced the policy (Machin and McNally 2004, p. 27).

A more critical view has been taken by a series of reports by Tymms and colleagues (Tymms 2004; Tymms et al. 2005; Tymms and Merrell 2007). These question the extent to which standards have truly increased by using secondary data on pupil performance that are argued to be more comparable over time. While it does seem likely that some of the increase in apparent performance has been due to grade inflation it should not detract from quasi-experimental evidence, such as that used by Machin and McNally, since there is no particular reason to think inflation would affect the pilot schools more than comparator schools.

However, the results found by Machin and McNally relate to very early impacts of the intervention. It seems plausible that part of these effects are simply due to the increased focus generated by the introduction of these strategies. Indeed the evaluation of the National Literacy and Numeracy Strategies commissioned by the DfES suggests ‘... the initial gains in the 1999 national tests were likely due largely to higher motivation on the part of teachers and others at the local level’ (Earl et al. 2001, p. 5). This would also explain the tailing off in improvements observed in general performance over the period.

More generally Earl et al. (2001) were positive about the impact the Strategies were having in terms of implementation, suggesting they brought about large shifts in priorities within almost all schools in the country. They describe the Strategies as ‘successful’ at more than one point in their report. However, in a critique similar to that later developed by Tymms, Goldstein (2002) suggests the report relied too much on test performance at KS2 to justify extrapolating from successful implementation to success in raising standards.

Machin and McNally (2004) also noted particularly strong effects at lower levels of attainment (but still positive effects for those already achieving above the target level), and an increased impact for boys (who were otherwise lagging) compared to girls. The results on differential impacts at varying levels of ability fit well with the suggestion by Jerrim (2012) of a reduction in the attainment gap at the bottom of the ability distribution and suggests that the Strategies may have been more effective in this respect than their critics claim.

Evaluation of the National Strategies is a difficult task for several reasons. Elements such as the Literacy and Numeracy strategies were rolled out rapidly and comprehensively, quickly becoming a pervasive part of the education system. The Strategies also had many elements reaching across EYFS, primary, secondary, behaviour and attendance, and school improvement programmes. Many evaluations only point to overall improvements in attainment over the period (DfE 2011), implicitly treating almost all New Labour education policies as part of the National Strategies. They also tend to provide only descriptive evidence, and we have no indication of what would have happened in the presence of different or unchanged policies. Indeed the national schools inspectorate (known as Ofsted) has pointed to the failure to evaluate which elements of the National Strategies were successful as a serious shortcoming, partly stemming from the sheer number of initiatives introduced in a relatively short period of time. Its report does however praise the impact the National Strategies have had on increased debate around pedagogy, suggesting

almost all schools feel they have led to an improvement in teaching and learning and the use of assessment (Ofsted 2010b, p. 5).

Specific evaluation of the Narrowing the Gaps element of the National Strategies was carried out by York Consulting (Starks 2011). This focussed on support and resources for both children eligible for FSM and Gypsy, Roma, Traveller (GRT) children. It describes finding evidence of increased use of the practices their literature review suggests are effective in improving pupil attendance, motivation, confidence and attainment. These included capacity building by local authorities to support schools in achieving goals, improved engagement with parents and intelligent tracking of pupil attainment. For the reasons referred to above, there is little specific quantitative evidence of how this feeds through into outcomes beyond the national trends in attainment gaps identified earlier. The limited case study evidence on the reduction of gaps is not particularly encouraging, with only three out of the eight case study schools reducing the attainment gap. However, it is not clear how representative these case studies were and the conclusion appears to relate to a rather limited time frame, although it is not entirely clear exactly what this is. The report suggests that the Strategies were anyway not fully implemented by the end of the period and it argues that with continued support we may see further positive results.

Ultimately, the National Strategies seem to have had a limited impact on the attainment gap, while their overall impact plateaued in later years. By then, and well before it lost the 2010 election, the New Labour government had decided that such large-scale national initiatives were no longer appropriate. Its Children's Plan envisaged much greater local and professional autonomy in driving improvement in the future (DCSF 2007). This was consistent with a wider trend towards handing more responsibility to schools and federations of schools, including autonomous academies and chains of such academies (Curtis 2009).

58.3.2 *Academies*

Originally called 'city academies', academies were based on an expectation that giving greater autonomy to schools with dynamic leadership teams and private sponsorship would improve their performance. Some of these academies were new schools in disadvantaged areas, while others were existing schools deemed to be failing under local authority supervision. Almost all of those founded by New Labour were in disadvantaged, urban contexts.

An official evaluation conducted by PricewaterhouseCoopers on behalf of the DfES (PWC 2008) notes an increased level of performance in these schools relative to the national average. However, this methodology has been criticised (Machin and Vernoit 2011) on two main counts. Firstly, new academies during the period of evaluation had a significantly more disadvantaged intake relative to the national average. Secondly, changes in the socio-economic status of the intake frequently

accompanied the opening of an academy, and these have the potential to further undermine the validity of the comparison.

An evaluation by the National Audit Office (NAO) used a more select group of comparator schools, based on their intake and performance relative to the academies prior to conversion. This found increases in performance, but the analysis suggests this was largely driven by the ‘substantial improvements by the less disadvantaged pupils’ (NAO 2007, p. 27). While improvements are of course to be welcomed, this does not seem particularly promising for reducing attainment gaps between students from higher socio-economic backgrounds unless there are substantial peer effects. On the other hand, as Maden (2002) once put it, successful schools tend to have ‘a “critical mass” of more engaged, broadly “pro-school” children to start with’ (p. 336), so a longer term perspective may be helpful here.

In their own study, Machin and Vernoit (2011) went further to try and overcome the potential for selection bias in the choice of comparator schools. They used maintained schools that went on to become academies after their data collection period. Their analysis yielded preliminary results suggesting that in the academies an extra 3 percentage points of pupils achieved top grades (5 A*-C) at GCSE (or equivalents). However, they only identified this effect in academies that had been open for more than 2 years at the time of their evaluation. Interestingly, their results suggested that despite the same increase in the socio-economic status of the school’s intake noted above (and the consequent reduction for neighbouring schools) there were also increases in performance in those neighbouring schools, perhaps due to increased competition. This finding runs counter to the claims made by most critics of academies, who regard their success as coming at the expense of other local schools.

Further work by Machin and colleagues delved into the ways in which academies achieved improvements in their own outcomes. Their findings are not encouraging for proponents of the policy as a way of closing gaps in performance: they suggest that in general those academies that converted between 2002 and 2007 improved their results by ‘further raising the attainments of students in the top half of the ability distribution, and in particular pupils in the top 20% tail’ and not by improving the results of those in the bottom tail. In addition, they found no evidence of improvements among the academies converting in 2008 and 2009 (Machin and Silva 2013). Perhaps this suggests that conversion to academies is only a useful policy in certain circumstances. Unfortunately, the incoming Coalition government cancelled an evaluation of academies commissioned by the previous government, which might have shed further light on these issues.

Although some of the academies founded under New Labour proved successful in improving the attainment of disadvantaged students, not all academies have performed so well in this and indeed other respects. As Curtis et al. (2008) argued, ‘Academies are in danger of being regarded by politicians as a panacea for a broad range of education problems’. They pointed out that, given the variable performance of academies to date, ‘conversion to an Academy may not always be the best route to improvement’ and that care needed to be taken ‘to ensure they are the “best fit” solution to the problem at hand’ (p. 10). A recent House of Commons Select

Committee report raised doubts about the evidence for academisation driving improvement, although it was more positive about the impact of the early New Labour academies than those created under the subsequent Coalition government (House of Commons 2015).

58.3.3 *Extended Schools*

Extended schools and full service extended schools (similar to full service schools or 'wrap-around schooling' in the USA) were introduced to provide an extended day and/or additional social services on school sites. These were seen as particularly important in areas of multiple deprivation where families needed to access a wide range of support services. The evaluation of New Labour's pilot programme of full service extended schools found that the number of students reaching the national benchmark at age 16 (five good GCSEs) in such schools rose faster than the national average and that it brought particularly positive outcomes for poorer families by providing stability and improving their children's engagement in learning. Encouragingly in terms of the concerns of this paper, the final report indicated that the achievement gap between advantaged and disadvantaged students, based on FSM eligibility, had narrowed in these schools (Cummings et al. 2007, p. 126). However, as this was less of a flagship policy, there is limited evidence about it compared to that available on the National Strategies or the academies programme.

58.3.4 *Reading Recovery*

Support for Reading Recovery was an example of a policy targeted directly at individuals rather than schools or areas and was part of a broader personalisation agenda that developed in the later years of the New Labour administration. Reading Recovery originated in New Zealand but was introduced in England by the Institute of Education and given some government funding and it eventually became a key component of the national Every Child a Reader programme. It provides one on one support to children falling behind in their reading in the first few years of school. While there are often more such children in urban schools, it also supported individuals in more advantaged contexts. A Reading Recovery evaluation (NatCen 2011) saw statistically significant improvements in reading ability and reading related attitudes and behaviours for children receiving help from the programme. It is worth noting, however, that this is a purely descriptive analysis; no comparator group can be identified since it is only in schools where Reading Recovery is being implemented that eligible pupils are identified. As such, we cannot say what progress these children would have made in the absence of Reading Recovery. It could be the case that some would have caught up by themselves or through pre-existing

support mechanism, or alternatively that they would have fallen further behind. The same evaluation also used a quasi-experimental method to estimate a wider impact of Every Child a Reader. This found an encouraging impact on school level reading and writing attainment of between 2 and 6 percentage points in the later years of the intervention.

58.3.5 *Teach First*

There has been an increasing recognition that ‘that getting the right people to become teachers is critical to high performance’ (Barber and Mourshed 2007, p. 16). Teach First, like Teach for America, was an initiative to recruit highly qualified graduates into teaching in particularly disadvantaged schools. It began work in London in 2002 and, until relatively recently, all Teach First recruits spent their 2 years on the programme in school in disadvantaged, urban contexts. An evaluation by Muijs et al. (2010) provides indicative results that schools with Teach First teachers achieve higher attainment for their students than comparable schools (as matched by type of school, gender intake, performance levels, student intake characteristics, location and school size). As with any quasi-experimental method we cannot be sure the results are causal, since the matching will not be able to ensure the schools are truly comparable; indeed, since schools choose if they wish to partner with Teach First there seems considerable scope for those with more proactive leadership or more capacity to benefit from Teach First teachers to be driving these results. The evaluation attempts to assess this possibility by also comparing Ofsted evaluations of Teach First and comparator schools, finding little significant difference. It also finds some evidence of a mild, but significant, correlation between the number of Teach First teachers in a school and its student outcomes, a pattern we would expect where such teachers are making a real difference to the pupils’ attainment. While this does not give us specific evidence on closing the attainment gap, since all Teach First schools have disadvantaged intakes, it seems plausible that this initiative can help to reduce between school attainment gaps.

58.3.6 *London Challenge*

The transformation of schooling in London under New Labour is worthy of particular attention. Wyness (2011) notes that, while the demographic character of London would lead one to expect that educational outcomes in London would be inferior to those in the rest of the country, London students actually perform better than those from the rest of the country at most ages and levels of attainment. Performing similarly well to the rest of the country at KS1, London students ‘pull away from their non-London counterparts at Key Stage 2, with the gap remaining constant, or increasing at Key Stage 4’ (Wyness 2011, p. 47). In this section we explore why this

is the case, considering the role of both direct policy interventions and other influences.

One of the possible explanations Wyness offers for this is the London Challenge, a policy introduced in 2003 at a time when there was something of a 'moral panic' about the performance of London's schools. Its overall brief was ambitious and extensive (DfES 2005). While it included some market-based elements, others seemed to respond to the potentially negative effects of such policies. It was consistent with the New Labour emphasis on standards, and recognised the importance of concerted collective efforts to raise achievement among those schools and children that had been languishing under existing policies. The first Commissioner for London Schools, Tim Brighouse, describes London as trying to be the first place to show that schools could contribute to 'cracking the cycle of disadvantage' (Brighouse 2007, p. 79).

London Challenge was initially a 5 year partnership between central government, schools and boroughs to raise standards in London's secondary school system. Provision included transforming some failing schools into academies, pan-London resources and programmes available to all schools, individualized support for the most disadvantaged students and intensive work with 5 of the 33 London boroughs and more particularly with 'Keys to Success' schools within them. These schools were those in London facing the biggest challenges and in greatest need of additional support. Each school received bespoke solutions through diagnostic work and on-going support (Brighouse 2007). Provision was extended in 2006 to include work with primary schools and in relation to students' progression to further and higher education. Additional continuing professional development for teachers was provided through the Chartered London Teacher scheme and for head teachers through the London Leadership Strategy.

The Conservative Secretary of State for Education from 2010 to 2014, Michael Gove, claimed that the three most important elements were sponsored academies, the use of outstanding schools to mentor others and a focus on improving the quality of teaching – especially through Teach First, the English equivalent of Teach for America (Gove 2012). While this emphasis is perhaps not surprising given the centrality of these particular policies to his own party's preferred reforms, which are discussed at the end of this paper, there is certainly some support for the claim that each of these particular policies had a positive impact on schools in their own right (Machin and Veroit 2011; Earley and Weindling 2006; Muijs et al. 2010). However, we are not aware of any research that shows that they were necessarily the most important elements in the success of the London Challenge or in narrowing the attainment gap in London. In reality, New Labour's London Challenge programme whose success Gove was praising was a multi-faceted and system-wide policy, and it included some elements that seem to be out of step with the present government's approach. It involved a range of interventions at the level of 'the London teacher, the London leader, the London school and the London student' (Brighouse 2007, p. 80ff).

This means that unfortunately, as with national policies, it is actually quite difficult to identify which, if any, of the particular parts of the intervention did make a

difference. Nevertheless, many commentators have suggested that the overall approach of London Challenge does seem to have had an impact. They point to national performance data that show that between 2003 and 2006, the national rate of improvement in the number of students achieving 5 or more GCSE passes with grades A*-C at age 16 was 6.7%, whereas in London it was 8.4% and in the 'Keys to Success' schools in London it was 12.9% (DfES 2007a).

Towards the end of its existence, the London Challenge was extended to other English cities as the City Challenge (DfES 2007b). Hutchings et al. (2012) suggest that these programmes had impacts on reducing the number of underperforming schools and increasing the performance of those eligible for FSM faster than the national average. However, only in London (and in Greater Manchester in the primary phase) was there a closing of the attainment gap over the period 2008–2011.

Even in London, it was initially suggested that the improvement in the overall performance of London schools noted above derived largely from an increase in attainment among the more advantaged students in the schools that were receiving the most intensive interventions. However, subsequently it was found that not only were the 'Keys to Success' schools improving at a faster rate than the norm, the attainment gap for disadvantaged children in London was itself narrowing faster than elsewhere and narrowing fastest in these particular schools. Using FSM entitlement as a proxy for economic disadvantage, data provided to us by the DfES showed that attainment at age 16 for this group of pupils within 'Keys to Success' schools rose by a larger amount than for the non-FSM pupils (13.1 points compared to 12.3 points for the latter between 2003 and 2006). Michael Gove too drew attention to this particular success for poorer children in London when he noted that while in England more generally '35 per cent of children on free school meals achieve five good GCSEs with English and Maths ... in inner-London 52 per cent meet [this benchmark]' (Gove 2012). He also noted that this is not far off the national average for pupils regardless of their background.

A report by Ofsted on the impact of London Challenge described continuing positive impacts beyond the initial period. It noted that the primary schools that joined the London Challenge 'are improving faster than those in the rest of England', partly attributing this to schools continuing to participate in development programmes for teachers after the support given as part of London Challenge had ended (Ofsted 2010a). The report was positive about the possibilities for maintaining the gains from London Challenge due to changes it has engendered in practices (such as increased use of performance data to track progress) and ethos (such as motivating staff to share good practice with other schools). It could be that such collaboration may have countered the more negative effects of school choice mechanisms, so it will be important to monitor what happens in London now that the initiative as a whole has finally come to an end but market-oriented policies remain in place. On this issue, Hutchings et al. (2012) found some encouraging evidence that schools that were part of the initial London Challenge scheme, but no longer funded as Keys to Success schools after 2008, continued to improve at a faster rate than the national average despite the extra support ending.

However, it is possible that there were also other factors at work in London that contributed to progress in London under New Labour (Wyness 2011; Allen 2012). Indeed, various reports in 2014 on the improvement in the educational performance of London, and the role of the London Challenge in that improvement, came to significantly different conclusions. These varied from lauding the London Challenge (Baars et al. 2014), explaining the success by earlier educational interventions (Greaves et al. 2014) and attributing it to the changing ethnic mix of the capital, noting that between 2004 and 2013, the share of London's population that is White British fell by 10%, while higher performing groups such as Mixed, Other White, and Black African became a larger share of London's population (Burgess 2014, Figure 6). The controversy continues to this day (McAleavy and Elwick 2015; Blanden et al. 2015), but this issue requires resolution before we can assume that policies associated with the London Challenge are replicable (even with contextual adjustments) in other parts of the country, as has been suggested by Ofsted (2013) and Centre Forum (Claeys et al. 2014).

After all, it can plausibly be argued (rather as Diane Ravitch (2010) argues in the case of New York school district 2) that even the limited progress made under New Labour, particularly in London, was more to do with their tenure of office coinciding with a period of sustained economic boom and demographic changes than with any of these education policies – so that perhaps the economy is the driver and Bernstein (1970) was right that education cannot compensate for society. If this is the case it will be much more of a challenge to bring about similar improvements in the post-industrial cities of the North of England or the run-down coastal towns that have recently become the focus of education policy.

58.4 Policies Under the Conservative-Liberal Democrat Coalition, 2010–2015

The Coalition government that was elected to replace New Labour in May 2010 made an ambitious commitment to 'closing' the achievement gap as part of a wider commitment to increasing social mobility, which it claimed had stalled under New Labour (HM Government 2010a). The general thrust of its policies was to continue and accelerate the emphasis on seeking improvement through school autonomy, competition and choice that was pioneered by Margaret Thatcher's Conservative government but continued by New Labour under Tony Blair (Whitty 1989, 2008).

While the academies policy of the Blair government discussed above sought to use academy status mainly to prioritise the replacement or improvement of failing schools in disadvantaged areas, the Conservative-led Coalition potentially extended this status to virtually all schools. Schools highly rated by Ofsted, a disproportionate number of which are in more affluent areas, can now be granted academy status automatically if they so desire. Meanwhile, parents, teachers and others have been encouraged to open publicly funded 'free schools', which like academies are outside

local authority jurisdiction. It remains an open question whether such policies help to ‘close’ the gap or, as some critics have suggested, effectively ‘open’ it up again, and attempts to assess the evidence have so far come to no firm conclusions about the impact of these policies (House of Commons 2015; McNally 2015). Around 60% of English secondary schools and nearly 10% of primary schools now have academy or free school status and increasingly many of them are being linked in academy ‘chains’, whose performance, like that of stand-alone academies, is variable particularly in respect of closing the gap (Hutchings et al. 2014).

Recognising that there is a complex relationship between attainment, autonomy, collaboration and accountability, the House of Commons Education Committee has argued that ‘current evidence does not allow us to draw conclusions on whether academies in themselves are a positive force for change’ and ‘agree[d] with Ofsted that it is too early to draw conclusions on the quality of education provided by free schools or their broader system impact’ (House of Commons 2015). Nevertheless, a study by the think tank, Policy Exchange, has since argued that, contrary to some of the criticisms levelled at free schools, their presence has improved, rather than diminished, the results of poorly performing neighbouring schools (Porter and Simons 2015). However, the methodology of the report has come in for criticism given its lack of statistical significance testing and potential issues of improvements being driven by regression towards the mean (Green 2015). Nevertheless, it is certainly a finding that would merit more rigorous investigation.

As mentioned earlier, a major thrust of policy under the Coalition government was to identify and address achievement gaps outside the large conurbations. Some of these underperforming areas have been in apparently affluent counties such as Surrey in the south of England but media attention has often become focused on small northern cities, small towns in the east of England and coastal towns around the country (Ofsted 2013). It has certainly been important to highlight previously neglected underperformance in such areas and remind ourselves that the achievement gap is (and has always been in practice) much more than a ‘urban’ problem in the conventional sense. Not only are there more disadvantaged children outside ‘failing’ schools in the big cities but they are often ‘unseen’ for a variety of reasons that require careful study. However, the Coalition’s main policy solutions were largely familiar, namely academisation and a series of local and regional challenges (Ovenden-Hope and Passy 2013; Claeys et al. 2014). It will be important that any future such initiatives are aligned to particular local demographics and economic conditions rather than mimicking the apparent success of London Challenge (and to a lesser extent the other City Challenges) of the New Labour era, and give due consideration to the sorts of issues raised in the discussion of London Challenge earlier in this chapter.

There is also considerable controversy about whether the Coalition government’s curriculum policies will eventually help to close the attainment gap. There was for example a commendable emphasis on early literacy but an undue commitment to ‘synthetic phonics’ as the only way to teach reading, despite evidence that, while it can indeed be an effective strategy with disadvantaged children, it is not a panacea and that a more mixed approach is desirable (Wyse and Parker 2012).

Another policy introduced by Michael Gove, when Secretary of State for Education in the Coalition Government, was the 'English Baccalaureate', an award to students but also effectively a new performance measure for secondary schools based on the percentage of students achieving high grades in specified subjects, i.e. English, mathematics, two sciences, history or geography and a foreign language. This seems, initially at least, to have affected socially disadvantaged students adversely as they are more likely to have been exposed to alternative curricula than more advantaged students on a university entrance track (DfE 2014).

A linked policy was to reduce the number of 'equivalent' qualifications that are permitted to be used in school performance tables as alternatives to the GCSE qualifications at age 16. This is having an impact on the number of vocational qualifications taught in schools and has placed a further emphasis on a return to conventional academic qualifications. Ironically, in view of the Coalition government's enthusiastic embrace of the academies programme, some of the New Labour academies that moved sharply up the performance tables in recent years did so partly by introducing these alternative qualifications (de Waal 2009).

The Coalition government's response to concerns about its traditionalist curriculum policy was that social justice requires equal access to high status knowledge and that there is little point in students succeeding on courses that are deemed to have little value by universities, employers and the wider society. However, while there may well be a good argument for ensuring that all students should have the opportunity to gain access to 'powerful knowledge' (Young 2010), if indeed that is what is the traditional curriculum provides, governments will need to give more attention than hitherto to reforming the pedagogy through which school subjects are taught (Whitty 2010). Exley & Ball (2011) have argued that some current approaches involve a return to the nineteenth century and we need to remember that very few disadvantaged children and families benefited from the forms of schooling that predominated in those days.

Some of the neo-conservative policies advocated by the Conservatives were moderated by the social justice agenda of the Liberal Democrat party whose votes gave the Coalition its majority in parliament. Among policies that were strongly influenced by Liberal Democrat thinking was a commitment to address the attainment gap through a 'pupil premium' paid on top of the normal grant for every school age student in receipt of free school meals in state schools. This was consistent with the earlier trend of linking resources to individuals in need regardless of the neighbourhood in which they were receiving their schooling. Unfortunately, welcome as this payment was, the level of it was significantly below that envisaged by the Liberal Democrats prior to the election and it replaced some other targeted benefits that were paid under New Labour. Most seriously, the fact that it was introduced at a time of major expenditure cuts in other areas meant that some schools barely noticed its impact. Nevertheless, it was subsequently significantly increased and extended and, although the money is not ring-fenced or mandated for particular purposes, monitoring of its use by Ofsted may be helping to ensure that it is actually used to benefit the education of the disadvantaged. Early surveys were not particularly encouraging in this respect, and suggested that too little of the money allocated

through the pupil premium for disadvantaged children was being spent on activities that are known to boost attainment (Sutton Trust 2012; Ofsted 2012). However, more recent surveys have been somewhat more positive about its role in narrowing the gap (Ofsted 2014a).

An initiative that may have helped in this respect was the creation by the Coalition Government of an Education Endowment Foundation, a grant-making charity dedicated to raising the attainment of disadvantaged pupils in English primary and secondary schools by finding out 'what works' in challenging educational disadvantage. One of the ways in which it does this is by providing independent and accessible information through a Learning and Teaching Toolkit (EEF 2012), which provides guidance to schools on how best to use the pupil premium to improve attainment by summarising relevant educational research from the United Kingdom and elsewhere. It identified effective feedback, meta-cognition and peer tutoring as three strategies that have been shown to have high or very high impact at low cost, on the basis of strong evidence. In the case of peer tutoring it suggested that children from disadvantaged backgrounds derived particularly large benefits from this strategy. It also identified the high impact of early years interventions, but noted the high costs involved.

But all this may be of marginal significance. There are already signs that the slight narrowing of the attainment gap identified earlier under New Labour has stalled or even been reversed, at least at secondary school level (DfE 2014; Ofsted 2014b). While this may reflect the wider effects of economic austerity as much as specific education policies brought in by the Coalition Government (Clifton and Cook 2012), the downgrading of vocational and alternative courses in accountability measures does seem to have had a significant impact (Adams 2015).

A further issue is that the gap on what are being termed as 'elite measures' (i.e. those recording the highest levels of attainment) has remained stubbornly wide, as illustrated in Fig. 58.4 below.

This shows that, even where the attainment gap in schools has narrowed overall, it is largest for the elite measures, Levels 5 and 6 at KS2, 5A*-C at KS4 and AAB at A-level (even after drop-out). Given the crucial importance of these and other elite measures for social sorting, via entry to the upper reaches of higher education and the professions, the challenge remains considerable. This will hardly be surprising to those familiar with theories of social and cultural reproduction (Bowles and Gintis 1976; Bourdieu and Passeron 1977).

If further progress is to be made, what is needed, at the very least, is an acceptance of the conclusion of Kerr and West (2010) that 'efforts to improve schools must be accompanied by efforts to support disadvantaged families' (p. 41). This was also the thrust of reports by Labour MPs, Field (2010) and Allen (2011). Furthermore, as argued under a previous government, 'society needs to be clearer about what schools can and cannot be expected to do' (Mortimore and Whitty 1997, p. 12). This does not mean that schools cannot make a difference, or that they do not have a particularly important role in helping to narrow the attainment gap and thereby enhancing the life chances of disadvantaged children. It does mean that they cannot do it alone. The analysis of the impact of English education policy since 1997

Fig. 58.4 FSM gaps for ‘elite measures’ across the key stages, 2012 (Source: DfE personal communication, 2013)

offered here also provides support for the warning made by Ravitch (2010) in relation to parallel policies in the USA ‘that, in education, there are no shortcuts, no utopias, and no silver bullets’ (p. 3). Unfortunately, there is little evidence that English politicians of any political persuasion have yet learnt those lessons.

Chapter 59

Migrant Children in Urban Schools in Ireland

Dympna Devine

59.1 Introduction

Education policy and practice has a profound impact on the power and positioning of children in the wider society (Devine 2002). Global policymakers such as the Organisation of Economic Development and Co-operation (OECD) are having a profound impact on shaping who and what matters in education and how children's learning, being and 'doing' is being directed in particular ways (Devine and Luttrell 2013). Neo-liberal market oriented policies, given further momentum in the economic crisis, construct childhood and what is 'good' in childhood in terms of what is required of children in human capital terms. What is defined as 'good' is however value laden. What is at stake is not only how schooling and education is being defined, but how childhood is being constructed through the dominant message systems (Bernstein 1975) in schools. In this context, 'value' is attributed to those children who shape themselves according to the neo-liberal ideal, contributing to the talent pool through their performance in schools. This 'governing by numbers' (Grek 2009) raises key questions for educators in terms of who and what to value in their pedagogy and for children in terms how they negotiate and position themselves in an increasingly value laden synoptic environment. Such questions are bound with the framing of children's identities, including citizenship (Devine 2002), how practices at the level of schooling shapes children's experience of whom they are, as well as what they will become. It raises questions around how children as a group are valued, what is valued in children's learning and if children are valued differently depending on how they 'perform' in school (Devine and McGillicuddy 2016). In this chapter I argue that it is how children are differently valued in schools that set the context within which wider inequalities between different groups of children emerge. This is a complex process, influencing present well-being as well as future

life-chances. I explore the tensions and dilemmas in the ‘valuing’ of children in urban schools in Ireland with respect to migrant children – a group who are increasingly visible in global policy discourse in education and who epitomize dilemmas around reputation and risk, value and being valued in an increasingly competitively structured education market. However as Pink and Noblit (2007) remind us, the experience of urbanization and urban education varies across cultural and social contexts, and with it the experience of these market dynamics and how they are played out at local and national levels.

59.2 Local Dynamics: The Irish Context

Ireland is an interesting case both in terms of patterns of economic, social and urban development as well as the structuring of the education system. Over a period of 30 years it evolved from being a predominantly rural based economy and society to now being positioned as among the most open economies in the world, heavily reliant on foreign direct investment for economic growth and development. It has in that time strategically sought to position itself at the high end of the global market economy with a significant presence of leading IT/digital companies and companies involved in the pharmaceutical/health care sectors. Urbanisation has accompanied this change, with almost 40% of the population of 4.6 million located in the city of Dublin and its surrounding environs, a proportion set to increase substantively over the next 20 years (Central Statistics Office 2013).

This wider shift has been accompanied by changed patterns of migration. Ireland was traditionally a country of emigration with repeat circulations of a mainly Irish diaspora in patterns of immigration/emigration depending on economic cycles of expansion and contraction. More recently it was identified by the OECD (2010: 25) as having the most abrupt and intensive migration pattern among OECD countries in the past two decades, with the number of immigrants doubling in the period from 1998 to 2007 from 7.8% to 15.7% of the population during what became known as the ‘Celtic’ tiger boom. Earlier phases of this intensive immigration were characterized by the attraction of highly skilled immigrants working in the IT/digital, pharmaceutical and health related sectors. However the pattern shifted from 2006 to a greater intake of less skilled immigrants to service the booming construction and services sectors. While immigrants came from over 180 countries, substantive numbers came from Eastern Europe after 2004 (especially Poland), Asia (India and the Philippines) and to a lesser extent Nigeria (CSO 2013). During the financial crisis, one of the countries globally to be most severely affected (Nolan et al. 2014), net migration declined. Yet the numbers of children of immigrant families in schools continued to increase suggesting a choice by immigrant families to remain in Ireland in spite of the deep recession (CSO 2013). In addition, national level studies of parental background and education confirm higher than average levels of education to degree and post-graduate levels, especially among mothers (primary care givers) in immigrant groups (McGinnity et al. 2015), including those from Eastern Europe,

Africa and Asia.¹ Nonetheless, data also suggests that of the migrant child population many have experienced separation from their parents during the transition process and a substantive proportion (18%) live in lone parent families (Dept of Children and Youth Affairs 2012). With the adoption of neo-liberal policies of economic reform, and severe cut backs to the provision of public services during the recessionary period, the burden of the economic crisis in Ireland has been most strongly experienced by children and young people (UNICEF 2014) with rates of consistent child poverty increasing from 8% to 11% during the crisis years. Migrants, coupled with children in lone families are among those adversely affected, all the more so because they tend to be clustered in disadvantaged communities in the largest urban centres.

The context in Ireland then is one marked by rapid and intensive social and economic change, from boom to bust (and currently considerable growth again), with significant demographic change in the proportion of children of immigrant background in the school sectors. While children of immigrant background now comprise approximately 12% of the primary school population, and 10% of the secondary school population, greater clustering of immigrants is evident in secondary schools in urban centres and in primary and secondary schools more generally in disadvantaged areas. Within Irish society, the ethnic 'norm' is white, sedentary and Catholic. This is reflected in a mostly state funded denominational school system, with over 90% of primary schools under Catholic patronage, and just over 2% classified as multi-denominational (Darmody et al. 2012). As we will see, this raises key issues around recognition and power, including access to schools. Given that only 52% of the migrant population defines themselves as Catholic (CSO 2013), significant issues can arise in the capacity of migrant families to access a school in the local community (Devine 2011).

The analysis and data drawn on in the remainder of the chapter derives from a number of mainly qualitative and ethnographic studies of migrant children and young people in urban schools in Ireland over the past 15 years, and more extensively reported elsewhere.² Ethical protocols in conducting research with immigrant children and their parents were followed and secured through university ethics committee.³ Names used throughout are pseudonyms.

¹ This is especially significant for the performance of immigrant students (OECD 2012) as is the level of clustering of immigrants of low SES together in disadvantaged schools.

² These included intensive case study analysis of policies and practices across 12 urban schools (6 primary and 6 second level) in the earlier phases of immigration, that included interviews with teachers and 345 students (See Devine 2005; Devine and Kelly 2006; Devine et al. 2008), in addition to research in later years on the experiences of immigrant parents in 6 urban schools (Devine 2011), and further research exploring teaching practices through interviews and observations of 78 teachers and their classes in 12 urban schools (Devine et al. 2013).

³ This followed best practice in relation to research with vulnerable groups and specifically with children and young people (Alderson and Morrow 2004).

59.3 Migrant Children and Education: The Impact of Global Policy

I want to take as my starting point two significant global policy platforms in relation to the structuring of modern childhoods and consider these in terms of tensions over the broader value and valuing of migrant children. The first is the influence of the OECD. Globally its impact is felt through the Programme for International Student Assessment (PISA), which ranks countries in a series of league tables based on student performances in the areas of literacy, mathematics and science. The OECD draws very specific linkages between these indicators of children's performance and the maximization of economic growth through their human capital. In other words the *value* of children is increasingly being constructed in terms of the *added value* they bring through their productivity in schools (Devine and Luttrell 2013). The power of such league tables signals a new form of governing by numbers (Grek et al. 2009) which has direct consequences for shaping debates not only over pedagogy but over children's very identities – practices of subjectification par excellence (Devine 2002; Foucault 1979). Rose (2001) refers to the 'governing of the soul' in modern societies, the liberal 'subject' free to choose, and pursue 'excellence' as a matter of personal 'character' and individual agency. We can equally apply such concepts to children in schools – the 'good' child as liberal 'subject' and 'productive' citizen, maximizing personal achievement and development, and the pursuit of happiness through their productivity in school. As centres of disciplinary power, schools then require children to 'work' upon themselves in particular ways (Devine 2002). But this is not played out in the same way for all children and is significantly influenced by the resources they can mobilise (Devine 2009), and which may be differently valued in schools.

The intersection between the global policy space on valuing children as human capital and how this influences practice at national, and indeed local levels, is especially evident in the case of migrant children. With the advent of advanced market capitalism, competition states (Ball 2009) seek to harness the best talent among citizens, but also boost the supply of labour through targeted immigration that contributes to the 'talent' pool. Given the central role of education to processes of 'human capital' development, states compete not only on the attraction of 'high end' immigrants, but simultaneously on positioning themselves competitively with other states in terms of education outcomes. These latter become a signifier of present as well as future economic and social capacities – all important in the sustained attraction of inward high end international /multi-national investment. In countries such as Ireland, a perceived 'drop' in educational capital interpreted through 'PISA' performance scores becomes a potential 'threat' to its reputation as a fertile ground for high end skilled (English speaking) adult labour.

This is where the discourse of migration as contributor to national prosperity becomes a double edge sword however. Tensions arise between the value of migrants as economic labour in the present and threats to long-term economic and social stability if migrants, and especially the children of immigrants, do not integrate into

the broader social and cultural fabric of the society. These issues are to the fore currently in the ‘refugee crisis’ in Europe, as border controls are implemented in the EU, and the racialization of Muslims especially and xenophobic sentiment increases. Alba and Foner (2015) in their overview of policies across Europe and the USA define ‘integration’ thus:

“Integration,” as we understand it, refers to the processes that increase the opportunities of immigrants and their descendants to obtain the valued “stuff” of a society, as well as social acceptance, through participation in major institutions such as the educational and political system and the labor and housing markets. Full integration implies parity of life chances with members of the native majority group and being recognized as a legitimate part of the national community. (Alba and Foner 2015: 5)

Integration here is explicitly equated with value – obtaining the ‘valued stuff’ of a society. But it is also connected with being recognized within that society, as a legitimate member of the community. As we will see what counts as ‘legitimate’ and of value, what is recognized, is key to the wider valuing of those who are ‘othered’.

Concerns over the lack of immigrant integration have given rise to a substantive focus in European policy in this area in recent years, with education targeted as a key mechanism through which integration is to be realized. The European Directive on the education of children of migrant ‘workers’ (EU Directive 77/46/CEE) is one example as is the evolution of policy through the work of the OECD, International Monetary Fund (IMF); the European Union (EU); United Nations Education Social and Cultural Organisation (UNESCO) and the World Bank. One issue that consistently emerges is the relative underperformance of immigrant groups in education into the second and third generations, as well as the clustering of immigrant children and their families in disadvantaged schools and communities (OECD 2010, 2012, 2013).

These embedded patterns suggest tensions with respect to the positioning of immigrants and their children in settlement societies that centre around the *valuing* of migrant children as persons in the present and their *added value* (or not) to the society as a whole through their future ‘becoming’ as adults. Within neo-liberal discourse, migrant children are ‘valued’ as potentially productive, performing, flexible, mobile workers of the future adult labour force, especially in ‘ageing’ societies (Zeicher et al. 2007). They add value to the settlement society *provided* that they accommodate to the norms within that society, interpreted through their levels of comparative achievement relative to native children (OECD 2010). While patterns of integration of migrant children and their families may differ (Alba and Foner 2015; Stepick and Stepick 2010) policy discourses increasingly refer to the ‘enrichment’ value of migrant children, adding to the national talent pool, enhancing the possibility for cultural and economic exchange and flexibility through their very diversity (Bryan 2010; Reay et al. 2010). Simultaneously however migrant children are positioned as a potential threat to the very social cohesion that is required to enhance economic growth and development. They become potential liabilities and ‘risk’ when their performance lowers that of the country nationally in comparative PISA scores, or through patterns of disengagement and dissonant acculturation

(Stipeck 2010) that are perceived as a threat to the social order. We see then a mirroring of the valuing of adult migrants (in productive terms through their contribution to the labour market) with that of their children – through their relative productivity in schools. Within this economically instrumentalist discourse, sustained investment in the education of migrant children is advocated, not as a ‘good’ in and of itself, but almost as a firewall against the negative social and economic impact of the lack of immigrant integration (Devine 2011).

But ‘regimes of truth’ and policy is more complex than this. Power operates in multiple, contradictory and diverse ways and includes the power to resist, re-subjectify and re/form (Youdell 2006). Parallel with this human capital and social investment policy discourse on children and childhood more generally (Kjorholt and Qvortrup 2012), there is an increasing emphasis being placed on children’s rights, voice and participation through the United Nations Convention on the Rights of the Child (UNCRC). This latter provides guidelines not only for a ‘good’ childhood but also what is ‘good’ in childhood (James and James 2008). As such it signals very specific discourses around what is valued in childhood as well as how children should be valued. General principles define children’s rights of non-discrimination and having a say in matters that directly affect them (Articles 2, 3 and 12). Within education the convention asserts children’s rights not only to education (Article 28) but to their holistic development and overall well-being (Article 29). Put simply it defines children’s *rights to education* as well as to equality and quality *in their experience of education*. Globally this has led to an increasing focus on children’s well-being, voice and participation that becomes directly translated into policies and practice at national level (Ben Arieh and Froenes 2011; Lundy 2013). While the concept of well-being is itself open to critique (Morrow and Mayall 2009); nonetheless summary indicators such as those provided by UNICEF (2009) attempt to frame the analysis on the valuing of children within a broader framework of inclusion, participation and citizenship. The lens has also focused on migrant children, with a special report on children in immigrant families conducted by UNICEF in 2009. More recently indicators of immigrant integration have also been published (OECD 2012) as well as detailed analyses of policies and practices in schools to improve the quality of immigrant children’s educational experience (OECD 2010). Such research provides clear indicators of the negative impact of clustering of migrant children in disadvantaged urban communities. It confirms that poor student performance, particularly among immigrant students is most strongly related to the proportion of students in the school whose mothers have low levels of education. The links between such clustering and wider processes of integration and settlement into the host society are clear.

However, as education systems become simultaneously directed toward neo-liberal performance based goals, this influences what is valued and I argue how children may become differently valued and positioned within the more competitive market driven discourse. This is especially the case for children at the margins of society, including those of immigrant background. This is not a simple process however and requires a nuanced understanding of the dialectical interplay between structure and agency in shaping actions and reactions in social contexts (Giddens 1984), including in schools (Devine 2002).

59.4 Practices of Recognition in Urban Schools

Pedagogy is fundamentally about transformation, but it is the nature of that transformation (as production or reproduction), who defines what shape it will take and how it is experienced in *practice* that frames children's identities and educational experience. Bourdieu captures these tensions when he speaks of social spaces, such as schools, as fields of struggle, caught between forces of transformation and preservation depending on access to power and resources:

A field is a structured social space, a field of forces, a force field...Constant permanent relationships of inequality operate inside this space, which at the same time, becomes a space in which the various actors struggle for the *transformation or preservation* of the field. (Bourdieu 1998: 40–41)

Recognition is central to these dynamics of transformation and preservation, endlessly 'affirmed and reaffirmed' through everyday social inter-change between social actors with mutual dispositions in a given field. Of course the capacity to recognise and be recognised is itself subject to the distribution of power with significant differences across social groupings both in the volume of capital (economic, social and cultural) agents hold and the relative weighting of different types of capital in each field. The dynamic and active 'playing' within each 'field' is also undercut by strong emotional and psychosocial processes (Reay 2005; Zembylas 2011) as individuals re/act within them.

Conceptualising school space as social, interactive and agentic allows for a more nuanced analysis of the processes of both production and reproduction that give rise to different learning trajectories for migrant children in schools. These tensions can be framed in terms of tensions in 'productive' practice. It is a tension between the harnessing of migrant children's potential as flexible, mobile productive adult *becomings* (added value) and the full recognition of their *present* lived experiences (valuing) rooted in negotiating their identities (and that of their family) in the settlement society (McGovern and Devine 2015). These are both informed by and contribute to dynamics of recognition/misrecognition at both global and local levels.

It could be argued that the two strands do not need to operate in opposition – that valuing migrant children, securing their 'well-being', brings 'added value' in terms of productivity, integration and social cohesion. The tension arises however because it is policy makers who may frame these possibilities in reverse. Well-being arises *from* productivity and performance, achieved through individual effort and 'character' rather than through social investment and a sustained infrastructure of state support. Within the neo-liberal paradigm, value is placed on those who produce and perform, with an implicit devaluing of those who do not succeed because of assumed deficits in their character/motivation and/or individual capacities. Practically it involves a retraction in support for those who are in need and an increasing reliance on a discourse of personal responsibility and self-actualization. Inter-generationally it emphasizes the value of children as future adult assets, while implicitly valuing children differently on the basis of their affiliation to dominant cultural and classed norms (white/majority ethnic and middle class).

We see this thrust in global policy in the increasing focus on processes of acculturation of immigrant families as explanatory factors in social mobility (OECD 2012). Rights then are placed alongside responsibilities; ‘failure’ at school is ascribed to lack of ‘good’ parenting (Crozier et al. 2010), while wider structural inequalities are downplayed and ignored. While these are tensions that equally apply to other groups of children, the synoptic gaze on migrant children is particularly intense precisely because as a group they are positioned in global discourses as valuable (potential diverse and flexible adult labour supply) and in need of valuing as persons with rights to provision, protection and participation.

59.5 Evolving Patterns with Migrant Children in Urban Schools

From a national policy perspective two key issues signal some of these dynamics of recognition and value: access to schools/school choice; and policy of immigrant supports in schools. I want to consider these with respect to evolving patterns and practices with migrant children in urban schools in Ireland.

59.5.1 *The Impact of National Policy*

The policy context in Ireland has shifted over the past two decades, from one of total absence in the early phases of immigration, to a rapid trajectory of policy and legal developments that signaled shifting and contradictory discourses on immigration and migrant children in practice. This is most explicit in constitutional change to citizenship rights in 2004 where this was now to be determined by blood lineage by the children of existing citizens and/or length of stay of immigrant parents in Ireland prior to the birth of the child.⁴ While the evolving policy discourse presented immigration in terms of the added value it brought to Irish society, tolerance towards immigration itself was equated with ‘having a particular type of immigration’ (National Economic and Social Council 2006: 160), especially those who would induce minimal social and cultural change (Kitching 2014).

The earlier policy inertia and subsequent impetus toward preservation rather than transformation (Bourdieu 1998) in the policy field crystallized in ‘problems’ of school access and choice for immigrant families in the state funded denominational (mainly Catholic) education system. It came to the fore in one urban centre (Balbriggan) on the outskirts of Dublin city in September 2007 (at the peak of the

⁴The impetus for this change was to curtail the inward flow of ‘illegal immigrants and asylum seekers – a group of immigrants who did not ‘fit’ with the attraction of immigrants with high educational capital. In practice it created a dichotomy between children born in Ireland – those who were automatically entitled to citizenship and those who were not.

'Celtic Tiger' economic boom) when a large grouping of immigrant children could not access a school in their heavily populated rapidly growing area. The intersection of poor urban planning, an insufficient number of school places and a system that upheld the rights of School 'patrons' to prioritize the enrolment of Catholic children in Catholic schools, resulted in 80 children, mostly black African, being unable to find a local school place at the start of the school year. This required the establishment of 'emergency' schools to cater for these children, as well as to bus some to schools of their faith outside their local area. It provided a clear example of racialised policies in practice, if not intent, that signaled the indifference to difference that characterized much state social policy in earlier decades. It also provided a telling example of how *practices* are key to signifying dynamics of power, and of the interwoven capillary nature of this power across key institutions which govern, classify and shape in line with deeply embedded and 'taken-for-granted' norms. While the events in Balbriggan spurred State authorities to action because of the clustered numbers involved, what happened in Balbriggan merely crystallized the difficulties that were being faced individually by other immigrant parents in accessing local schools, which were all Catholic, in other densely populated urban areas (Devine 2011). Media headlines at the time reflect the range of discourses and counter discourses that came into play. Church authorities were critical of the State's lack of provision of a sufficient diversity of school types, 'Archbishop says state to blame for school crisis' (Irish Times September 4th 2007), while the State sought to distance itself from any racialised intent: 'Hanafin [minister for education at the time] proposes inclusive school model' (Irish times, Sept 7th 2007). The minister's response was revealing not only in terms of the deracialised discourse which was evident in her remark that 'It might be a skin-colour issue, but it's not necessarily a race issue' (Irish times Sept 8th 2007) but also her attempts to isolate the events to a single community, rather than as a signifier of broader dynamics of power and inequalities in Irish society. The construction of the 'problem' of access to schools as a local/individual rather than a national/societal matter (derived from 'people' making choices to 'gravitate to areas'), devoid of political responsibility (it is not desirable) was further reiterated by the Minister's response to questioning in the Dáil [national parliament] when she stated:

While it is not desirable that a school would only have children from an ethnic background, the position is reflective of the area and the new communities, which have been established in Balbriggan. A similar situation arose in areas to which Irish people emigrated because people gravitate to areas where members of their own communities live. (Dail Eireann, Oct 2nd 2007)

What is interesting from this excerpt is how it also brings to the fore overlapping discourses related to school choice, integration (and what this might mean in a multi-ethnic Ireland), segregation and exclusion. It also called upon prior experiences of Irish emigration to signal understanding/similarity to/embracing of the immigrant community and the difficulties 'they' are encountering. The simultaneous construction of the children of immigrants as 'other' by defining them as being from an 'ethnic' background highlights the normalcy of white Irish ethnicity, which

does not need to be named or defined. It also indicates the ‘polite’ discourse (Kitching 2010) which governs rhetoric in the field, delimiting the racialised dynamics at play given that all of these children from an ‘ethnic’ background were black.

This ‘crisis’ brought to the fore patterns being identified in research that confirmed not only the guilt facing primary school principals especially in ‘turning’ children away, but conversely the highly selective practices that were being engaged in by some schools in ‘screening’ out immigrant applicants and students with additional needs (Darmody et al. 2012; Devine 2011) especially in (middle class urban) areas where there was intense competition for school places.

A forum on school patronage (Coolahan 2012), established in response to the ‘crisis’ recommended the devolution of primary schools from Catholic patronage in areas of high diversity and the creation of a wider range of schools to cater for all faith types. Yet it drew substantively on a discourse of parental choice rather than inclusion and social justice in its primary deliberations (Devine 2011; Kitching 2014). It is a prime example of the State positioning itself as ‘neutral mediator’ between different interest groups and a more modern neo-liberal fashioning of ‘Irishness’ in line with consumer capitalism (Inglis 2008) through appeals to the discourse of ‘parental choice’.

The issue has again come to national prominence in school census data (2014) which highlighted that four out of every five children of immigrant background were concentrated in 23% of the State’s primary schools. The publication of the Schools Admission Bill (2015) which seeks to regulate discriminatory practices in relation to enrolments and access by minority groups (including Travellers⁵ and children with additional support needs) also gave rise to media debate. Newspaper headlines signal the outcome of ethnic segregation and clustering in certain areas ‘Concern school divestment causing ethnic segregation’ (Irish Times, Feb 25th 2015); ‘Census figures raise concerns of ethnic segregation in schools’ (Irish Times Feb 24th 2015).

This wider policy context also contributed to practices on the ground – for schools in terms of dilemmas around the management of ‘reputation’ and ethnic segregation, and for immigrant parents as they sought the ‘best’ school for their child. The shortage of school places in certain areas, coupled with the transitory nature of immigrant experience, ensured that for parents newly arrived into a local community securing a place in a local school could be difficult. School choice then was predicated on belonging to the majority faith (Catholicism), as well as being an established member of the local community, which of course many immigrants, by their nature, are not:

My experience started when I wanted to get the first one into school. There was this barrier there, as they said if you are not Catholic, you cannot go to a Catholic school... I am a Christian – an Anglican. So they sent me to [Siverwood primary]... Catholic schools is basically Catholic. Some Africans feel there is no alternative there because I know some

⁵Travellers are an indigenous minority ethnic group in Ireland and are equivalent to what are often referred to as ‘gypsies’ elsewhere. While their lack of recognition and status is similar to that of gypsies and Roma in other countries, they are a distinct group in the Irish context.

friends who go to Pentecostal churches and they don't want to go to Catholic schools. My daughter is in a Catholic school because then there was no alternative. (Mr Adeyemi, Silverwood primary)

The psychosocial impact is reflected in this Nigerian parent's later description of the delicate 'balancing act' he and his family weave in terms of visibility and invisibility in the local community, including overt involvement in school activities:

Because you don't feel like you are welcome [...] so that would be why we would prefer to be in the shell and just be between your own community... That might be part of the reason that we are not involved in the school activities. (Mr Adeyemi, Silverwood primary)

59.5.2 Performance and Achievement of Migrant Children in Urban Schools

A second shift that intersects the global with the local, relates to the performance of immigrant children in the education system and supports put in place to enable their learning and development. Analysis of first generation immigrant children's performance in PISA 2006 in Ireland suggested provisional indications (given the numbers were relatively small at that time) of comparatively positive scores relative to native-born children (OECD 2006). This dovetailed with State discourse that Ireland was following a similar trajectory as Australia and Canada, as a 'good' country for migrant children (or a country with 'good' migrant children?). Subsequent analysis of PISA (OECD 2009) however recorded a significant decline in Ireland's overall ranking, representing reputational 'risk' to the positioning of 'Ireland Inc.' as a high end human capital intensive economy just at the period of the wider financial crisis, with its devastating consequences for the society as a whole. So seriously was the drop in performance taken that a national literacy and numeracy strategy was instigated (DES 2011) with the first real emergence of strategic targeting of improving performance across schools nationally. While the reasons for this decline are complex (Cosgrove et al. 2010), PISA patterns (OECD 2012) and national level studies at primary level (Shiel et al. 2014) in relation to the achievement of immigrant children confirm their under-performance (especially in literacy) relative to 'all other children'. This applies especially to those immigrants whose first language is not English and to those who are more likely to be in disadvantaged schools. Given the higher than average educational profile of immigrant parents in Ireland noted earlier, these patterns suggest systemic/school level factors are also at play in patterns of under-performance, reinforced through clustering in urban communities of socio-economic disadvantage.⁶ From a policy perspective however – the sphere of re/action is one that normalizes the relative under-performance of migrant children as an inevitability:

⁶The impact of ses of the school has been found to have an especially strong impact on immigrant performance especially if they are concentrated in schools attended by students who face similar socio-economic disadvantage (OECD 2012).

the outcomes of the OECD PISA 2009 tests demonstrated clearly *that like migrant students in other countries* [emphasis added], migrant students in Ireland perform less well in literacy and numeracy than their native peers (Dept. of Education and Skills 2011, p. 65).

This ‘fixing of failure’ (Reay 2005) is predicated on the construction of migrant children and their families in deficit terms. In the Intercultural Education Strategy (DES 2010) for example, this fixing of ‘deficits’ is individualized to deficient acculturating practices of parents (lack of English and poor knowledge of the system) in addition to poor practices in individual schools. Simultaneously however both this Intercultural strategy, and the strategy on literacy and numeracy (DES 2011) acknowledges the importance of recognition and sensitivity to mother tongue learning, citing the pioneering work of Cummins (2001) and the ‘enrichment’ brought to schools through exposure to a variety of languages (DES 2011, p. 65–67). These are positive signifiers of valuing and recognising migrant children in the present of their lives. However in spite of the emerging patterns on immigrant underperformance, language support services for immigrant children and young people was among the first services to be cut back in schools during the economic crisis. This created considerable tensions in the ‘field’ for teachers and school leaders as they sought to work with a diminishing pool of resources in high need contexts. It also raised key questions over their valuing as a group in the system as a whole.⁷ Migrant children are more likely to be positioned as ‘risk’ and/or ‘threat’ during a period of heightened economic recession and decline. This tension is best exemplified by Ms Macken – a teacher with a consistent record of solid work with immigrant communities in her school when she highlights the challenge of recognizing and valuing each child, when resources are scarce. However uncomfortably, a dichotomy may be established, between ‘them’ and ‘us’ as choices are made over who gets the additional time and support:

Its’ not about creating difference between *our Irish child* and *our international child* but it is very much about losing out when they all need extra support (Ms Macken, Oakleaf primary)

Furthermore these ‘choices’ are also inter-connected with wider community dynamics as teachers and school principals manage perceptions and the ‘reputation’ of their school within the local community (Devine 2013). For schools, pedagogic tensions arise between catering to the needs of children of immigrant background in a holistic, authentic manner within a wider cultural, social and economic frame where reputation, risk and added value (through higher school scores) have to be managed within an increasingly market driven environment. The threat for example of ‘white flight’ or being identified as an ‘immigrant’ school becomes a minefield for school leaders to navigate – as school selections based on faith, race, class and colour merge in a system centred on parental ‘choice’. As Ms Hannigan, a principal

⁷ Given the political tensions at the time over the nature of cut backs in education – it is also worth noting the relative invisibility of immigrant parents as a constituency within the system as a whole (Devine 2011), making cut-backs in this area less contentious and more politically viable than in others across the system.

of a multi-denominational primary school in one large urban centre stated (Devine 2013):

One parent wanted his child moved to another local [Catholic] school ...he probably looked in the yard one day and thought 'oh my god' when he saw all the immigrant kids there... are we going to be the black school with the white school?⁸...it is very tricky (Ms Hannigan, Principal Beechwood Primary)

The 'trickiness' of managing reputational risk locally, mirrors the dynamics that take place globally across competition states within the widening neo-liberal climate. Value for money reviews of school successes and practice (DES 2011), coupled with a narrowing of the gaze on individual schools through school comparisons in performance, heighten the stakes for those who seek to remain truly inclusive in their culture and ethos (Devine 2013). While the stakes rise for all children as 'productive' citizens in such a climate, they rise especially for those who struggle to be seen and heard. For children of immigrant background, they are differently valued in that they face the additional burden of proving their right to belong (McGovern and Devine 2015). It is their achievement in school that signals their 'normalisation' – the burden of proof that they are just like 'all other children'.

It is clear that contrasting and contradictory discourses are at play with respect to migrant children in terms of both national policy and expectations relating to achievement'. On the one hand there is a holistic perspective on migrant children (e.g., valuing culture and mother tongue, aspirations toward quality teaching including high expectations for migrant children's learning). On the other there is a discourse that involves a more conditional directive approach to their education (language acquisition and achievement in literacy and numeracy) that does not involve 'radical' change within the wider field of education (DES 2010, p. 7). If considered from a rights based perspective of the UNCRC, these rights appear to be conditional, placed alongside responsibility, as if the latter is exercised as a matter of 'free' choice, independent of the myriad influences that mediate children and their parents capacities and resources to fully participate. Yet this is the essence of constructing the productive migrant child that is implicitly equated with their right to belong. It is an additional burden of responsibility as migrant children are caught at the intersection of local and global agendas (Arnot and Swartz 2012) that is well reflected in the conflation of rights, responsibilities and civilness articulated in the Intercultural Education Strategy produced by the Department of Education and Skills:

If a single concept has emerged from other countries' experiences, it is that integration is about both rights and responsibilities. Clarifying civic responsibilities, for example, has been a major component in international intercultural dialogue events (DES 2010, p. 48)

⁸Simplistic dichotomies of parental choice should not be assumed however. There is evidence of children from African countries seeking to attend the local Catholic school (Devine 2011) – perhaps in recognition of its 'normality' hence prestige, but also because a more formalised structure, that is familiar to them in their home countries, is evident through the wearing of school uniforms.

With the onset of the economic crisis and the contraction of the welfare state, such as occurred in Ireland, the tension between recognition and mis/recognition of migrant children becomes more pronounced. Framed in the neo-liberal discourse of self responsibility, the space of being valued rests on the immigrant family and their children making the effort to ‘integrate’, some with more success than others (McGovern and Devine 2015). It is this wider policy context – both globally and nationally which sets the conditions for how migrant children experience their schooling.

59.6 Migrant Children’s Experiences in Urban Schools

Tensions over recognition are central to pedagogic practice: who to recognize (who is visible?); what to recognize (how much of ‘the other’ to incorporate as ‘our own’) and if this recognition is viewed as core to the pedagogical relationship or peripheral (an additive extra) to the work of teachers in schools. My own initial research with teachers identified consistently positive views that directly related to the *added value* migrant children brought to the classroom environment (Devine 2011):

I guess that the first generation migrants have the manners and the gratitude ...so my experience has been phenomenally positive. (Ms O’Mahony, Redford community college)

Classed and ethnic categories mediated the ‘added value’ of the children however and teachers, signaling a lack of awareness of dynamics of inequality (Devine and McGillicuddy 2016), tended to be most positive about those children who were like themselves:

Very quickly we discovered that the children coming in were by and large I’d say ...a very ambitious set of people and very middle class, very positive (Mr Martin, Riverside primary)

As the boom subsided and immigrant patterns consolidated, it was clear there were differences in how teachers viewed different ethnic groups as well as their progress in the classroom, confirming patterns identified elsewhere (Archer and Francis 2007; Gillborn 2010). When teachers were asked how ‘well’ the children were doing, views also were more circumspect. A migrant child ‘doing well’ implied that they were behaving well and ‘no trouble’. It was their demeanor and disposition, rather than academic progress per se, that was foregrounded in their valuing. Subsequent in-depth analysis of the pedagogical practices of 78 teachers across 12 primary and secondary schools (Devine et al. 2013) through recorded observations of classroom lessons, identified significant differences in practice that was influenced by the number of immigrant children who were present in the classroom. In this respect the greater the number of immigrant children present, the less likely were children to be actively involved in the lesson. In addition, indicators of high expectations – such as time on task, as well as higher order questioning was less likely in classrooms with a higher proportion of immigrant children present.

These latter are key indicators of recognition: being ‘seen’, ‘heard’ and valued in the classroom. Teachers in the study questioned their levels of efficacy and capacity to work with this ‘difference’, suggesting real needs in professional development, both for teachers and school leaders in this area:

You are constantly trying to make sure you are including everyone and keeping everyone happy and trying to get that balance, *when you are brought up in a certain culture yourself and you are stepping out of that yourself [emphasis added]*. (Ms King, Hollybrook primary)

A considerable difficulty for teachers in their work with migrant children was the often ad hoc nature of language support provision and a lack of co-ordination and development of sustained systems and practice. This ensured that they drew upon their practical knowledge and understanding, rather than an informed perspective of what is best practice in the field.

It kind of makes me feel quite helpless because he [migrant child] is not getting any work done; I kind of feel that I am failing him and the system is failing him. (Ms Tuohy, Hollybrook primary)

We had no TEFL department and one of the teachers kind of set up, really off her own back ...it wasn't always taken as seriously as it should have been (Ms Fahy, Primrose Dale)

Our observations confirmed that it was children of immigrant background who were significantly less engaged to the end of lessons, and less likely to be actively participating in lessons observed. Ms Fahy's comment highlights how the lacunae in policy at school level (mirrored by a retractive policy at state level, especially with the onset of the economic crisis) positioned these students as not ‘always taken seriously’, especially in a context of intensifying demands. The clustering of these students in disadvantaged schools gives an additional cause for concern, given the noted tendency for teachers in such schools to have lower expectations for learning. These patterns were influenced by the number of immigrant children present as well as by class size, contextual factors related to the wider field of educational policy as well as housing and urban planning. Where migrant children were in a relative minority numerically, their ‘invisibility’ pedagogically was more pronounced, compounded by the noted tendency, as newly arrived immigrants, to be acquiescent and quiet in the class (Devine 2011).

As we see with Ms Dunne below, in an already strained context, she queries the value of whom she is to spend time with, legitimated in the context of deficit constructs of this particular child of immigrant background (as well as an example of self fulfilling prophecies in action):

There is one student who's English is atrocious and my main problem is dealing with her as she doesn't communicate...then her attendance is atrocious. It wasn't worth the investment of my time when the others needed as much help as I could give them (Ms Dunne, teacher, Oakvale Secondary)

Yet there is a dialectic at work here that is not reducible to finite patterns. The challenge of ‘stepping out’ of oneself pedagogically mirrored the emotional investment of self that was also evident in teachers' engagement with migrant children at an inter-personal level. Words like ‘worrying about’, ‘reaching out’,

'joy' and soft spot' also permeated teacher narratives, alongside concerns over the practical challenges of catering for the needs of all children in the classroom:

I had a student who came into this country with no English and he asked me "can I please come to your higher level class even though my English isn't great" ... He ended up getting a C 1 in Higher Level English ... I get such joy from that. (Mr O'Brien, Blue bell Grove, Disadvantaged Secondary)

Of course migrant children are not a homogenous 'whole' and come to their education with widely varying ethnic, social and migratory (including pre-migratory) experiences (Fernandez-Kelly 2008). Their positioning is mediated not only by access to resources by the family (including wider kinship networks) but also by the 'unsettling' which occurs in negotiating new experiences of identity making. For immigrant parents there is a desire to maintain their cultural heritage and identity while simultaneously acknowledging Irish ways of being and doing. This is reflected in the comments of Mrs Gahatak, an Indian mother and Mr Adeyemi, a Nigerian father:

It is a rule that we speak *our own* language and again at bedtime my daughter or son wants a story we would have a turn in saying stories in Hindi...but I haven't taught them the writing. When we go to India they will learn this (Mrs Ghatak, Beechwood primary)

Each time he (child) said my teachers said to bring 'Nigerian' music, 'Nigerian food' – that is good. He said to me that he wants to write a report on 'African food'. Tell your teacher I don't know 'African food', do you mean 'Nigerian food'? To recognize what they feel that they still belong (Mr Adeyemi, Silverwood primary)

For children, their deeper (required) knowing/learning of the settlement culture presents both risks as well as opportunities. How they negotiate this with parents is a key factor shaping their and their family's successful integration in to the settlement society. In this sense the children play a very active 'bridging' role through their own settlement 'work', mediating the culture and values, as well as social networks, of the society and school community in which they are now embedded. In the example above, Mr Adeyemi impresses on his son the distinctiveness of Nigerian identity and his approval and preference that this would be recognized in school. In the public space of the school however, migrant children must navigate this 'distinctiveness', and in interviews, detailed below, expressed some ambiguity about the extent to which their heritage would be rendered visible in the classroom. As in other studies (Orellana 2010) the children in our studies also engaged in language brokering between home and school. But their relative fluency in English potentially undermined traditional parental authority when it was the children who translated notes home from school, or who knew best how to help younger siblings with homework, or mediate communication from the school (Devine 2009; McGovern and Devine 2015). 'Being valued' derived from the long term benefits to the family through successful integration (and the potential of academic success) in a context where the children were often also required to maintain traditional values tied to their ethnic heritage (language, customs, religion, respectful demeanor).

As noted, this negotiation of belonging brought challenges for the children in terms of what was valued and recognised in their relations with peers. Reay (2005)

and Zembylas (2011) refer to the feelings of shame and fear which can permeate the negotiation of insider/outsider status in school – spatial and experiential patterns of closeness and distance (Hargreaves 2001, p. 1061; Devine 2007) which were evident in my own work with migrant children in Irish schools. Cultural and ethnic identity was important in forging bonds within same ethnic groups but was of little value outside of it, creating spheres of inclusion/exclusion especially in free play spaces intersecting with gender and classed dynamics. In addition to their formal school work, the children did a great deal of emotional work in order to cope with their positioning in school. This was especially the case for visibly different children, black children of African background, who sought other strategies (doing well in school; being good at football) to minimize their ‘outsider’ status. Evident was the resilience of children, querying their positioning as ‘other’ and their capacities to undercut the very discourses which frame them as less valued:

Everybody has a right... I don't know why they call black people coloured. White people, when they get sick, they get blue and pink. When they die they get pale, and when they feel sick they get purple. Black people don't do that. I don't know why they are calling us coloured, they are the ones who turn all different colours (Martha, Second generation Libyan; Oakleaf primary)

This negotiation of recognition also cut across the children's engagement with the formal learning spaces in school. While valuing the opportunities schooling provided, success in school was a double-edged sword that had to be traversed with caution, as the children managed their ‘outsider/insider’ status. Here we see the conflation of social class and ethnic identity, given that many of these middle class children were attending working class schools. What is telling in the excerpts below is how the children themselves negotiated the pace of their learning and their identities as learners (as fast or slow) in order to ‘blend in’ and minimize their difference. While intersections of class and gender are clearly evident, the children here defined their migrant status – ‘being from a different country’ as the significant influence:

Tariq: I used to do maths really fast but now I do it sort of slow... like not the first to finish cos some children they say you are trying to show off *just because you are from a different country*. [Emphasis added]

Other children, agree: ‘just because we are trying to do our best’ (Oakleaf primary)

Negotiating visibility in relations with teachers was also something which had to be carefully managed. What emerged most strongly were migrant children's feelings of *gratitude* when they were recognized and valued in schools. Gratitude can of course itself be a signifier of lower status, of their ‘outsider’ status as migrants. Sarah's comment below about being asked during the interview about her experience of school highlights this double minority status which interconnects with the riskiness of being mis/recognized in order to ‘blend’ in:

you are the first lady who comes to speak to us about this...it is good...nobody asks us
(Sarah, Oakleaf primary)

Gratitude is itself embedded in dynamics of power and can signal feeling less than valued in and of oneself, yet it was consistently evoked by migrant children of all ages that I spoke with. In this sense it suggested a feeling of vulnerability and

lack of locus of control. It inter-connects with the children's working at 'being good' and being respectful in their demeanor in schools, conscious of securing their family's acceptance and 'good' reputation within the wider school community. As we saw in the observational research on teacher practices noted earlier (Devine et al. 2013), this 'acquiescence' however could be at the cost of their visibility, and ultimately opportunities for learning in the classroom. In general immigrant children were reluctant to be overtly critical of their experiences, especially in terms of getting sufficient teacher attention, although this also was dependent on family status and associated levels of confidence in negotiating the schooling experience (McGovern and Devine 2015). It was also influenced by age, with older students in the later stages of second level schooling most critical of teachers having lower expectations and not providing them with the support they needed:

The teaching is like looking, they should put more improvement about the student.
(Roseanne, Ghana, Ashleaf community college)

This sense of vulnerability – of knowing one's self as 'other' was also reflected in the children's attitudes toward the nature of recognition of their ethnic identities in school. Where recognition involved authentic incorporation of cultural knowledge into classroom learning, for all children, they were positive. Ambivalence was expressed however when cultural recognition was practiced as an additive extra for celebration and display. In one of the field trips, to Oakleaf primary, the embodied impact of authentic recognition is reflected in the children's assertion that 'it makes you feel comfortable'. In the excerpt below this is exemplified when a missionary Catholic nun came to visit the school and spoke effortlessly in Arabic to some of the children I was interviewing:

Interviewer: So what's that like when someone comes in and speaks like that? [in your mother tongue]

Sarah: Cool! [Laughs] and she is Irish!.. *it makes you feel very comfortable* (Group interview, Oakleaf primary).

Sarah's comment re-iterates Cummins' (2001) assertions related to the benefits which accrue when mother tongue recognition occurs in tandem with learning the language of the settlement country. It raises important questions about how migrant children are positioned pedagogically and the impact on their sense of self, and by implication their learner identities (Devine and McGillicuddy 2016).

59.7 Conclusion

The positioning of migrant children in urban education, must be considered in terms of the impact of globalisation in a wider context of neo-liberal reform. The creation of mobile flexible and high skilled labour markets, a key focus of the OECD, becomes paramount with respect to migrant children and their education, viewed as an under tapped pool for future market needs, through their present performance and achievement in mainly urban schools. Simultaneously international discourse,

through the UNCRC and UNICEF articulates rights based approaches that signal the need to recognize and value the holistic development of all children, including those of immigrant background, with due attention to culture and identities. Yet alongside the positive attribution of potential in these global policy platforms, there is the contradictory discourse of deficit that positions and shapes migrant children as continuously in need of intervention and reform. Coupled with the retraction in the welfare state within neo-liberal policy, and the associated emphasis on individual responsibility and 'character' in shaping life chances, migrant children struggle in a dialectical loop of mis/recognition that becomes embedded in dynamics of exclusion and school failure. While there are significant differences across migrant groups as well as across different countries (Alba and Foner 2015; Crul and Schneider 2010), success is dependent on having the personal economic cultural and social resources that enable some migrant children succeed. These dynamics are especially evident in urban schools, caught at the intersection of tensions in how migrant children are to be accommodated, valued and understood.

In taking the exemplar of Ireland, a high skills global economy characterized by intense patterns of economic and social development, the analysis highlighted the complex weaving of global and local dynamics in shaping responses to immigration in urban schools. Issues of access to local schools that prioritize majority faith (Catholic) provision, in addition to cut backs to migrant language supports during the economic recession were shown to operate alongside a changing national discourse on performance and reputational risk in an increasingly market oriented education system. For school principals and teachers in urban schools – where migrant children are most likely to be clustered, dilemmas abounded around who and what to prioritize in a diminishing pool of resources and high need contexts. Yet for migrant children themselves, their resilience, determination and ambition was also to the fore. Their contribution to the wider settlement processes of their families, through their patterns of engagement and interaction in schools highlighted their competencies in negotiating new and hybrid identities, often in very challenging contexts. As social spaces, urban schools are a key backdrop in the construction of migrant childhoods and identities. In the Irish context this is overlain with particular dynamics of economic and social development, as well as historical patterns of state/church control in education and emigration/immigration. Patterns of migrant clustering and the consolidation of inequalities into the second generation are beginning to emerge, reinforced through a deep economic recession. This not only undermines these children's rights and well-being in the present, but sets the seeds for wider inequalities and injustices into their future lives as adults.

Chapter 60

‘I Trust Them More Than I Trust Myself’: Detached Streetwork, Young People and the Building of Social Capital in Scottish Urban Communities

Ross Deuchar, Johanne Miller, and Lisa Borchardt

60.1 Introduction

Youth work in Scotland and the wider UK has its roots in the charitable and philanthropic practices of nineteenth century community-based organisations (Davies 1999; Tett 2010; Coburn and Wallace 2011). It has been argued that contemporary practice in youth work is about ‘giving ownership to young people, getting their views about what they feel about life and helping them with the problems they encounter’ (Deuchar 2013: 155; see also Davies 1999; Wood and Hine 2009; Sercombe 2010; Coburn and Wallace 2011). In this chapter, we explore the types of issues and problems often encountered by young people in disadvantaged communities, and the ways in which streetwork and youth work – as a form of urban education – can help to build the social capital needed to enable them to tackle these issues head-on and gain the resilience needed to navigate their way around the obstacles and challenges they come across.

First, we provide an analysis of the social and political developments that have arguably led to disadvantaged young people experiencing a greater sense of social exclusion. Second, we examine the principles underpinning youth work, and the particular potential for streetwork and youth work to re-engage marginalised young people. The current political focus on growing and developing youth work practice in Scotland will be outlined, and the particular challenges associated with poverty, social exclusion and youth offending in Glasgow (Scotland's largest city) discussed. Third, we outline the methods we employed to conduct a 4-year longitudinal study of the progressive impact of one youth work service in Glasgow, with a particular focus on examining the extent to and ways in which the service was able to foster social capital in socially deprived neighbourhoods. A critical exploration of social capital is provided, and the key themes that emerged from our data outlined. Fourth and finally, we assimilate our insights with the key theories underpinning social capital. In so doing, we draw some important implications about the potential impact of youth and streetwork in and beyond the west of Scotland context as well as recommendations for the future.

60.2 Young People, Marginalisation and Social Exclusion

Young people, and in particular teenagers, are often perceived as a threat when situated in urban contexts (Valentine 1996; Holligan and Deuchar 2011). To understand the reasons for this, we must look back to a moment in British history that changed public perceptions about children and young people. A watershed moment in the history of youth justice in Britain was the tragic death of Jamie Bulger in 1993 (Muncie 2009). The death of Bulger at the hands of two 10-year-old boys caused uproar in British society, and ultimately changed the public's perception of children and young people. No longer were they viewed as innocents but as beings capable of great evil:

As anguish vied with outrage, calls for retribution and revenge at least matched those for compassion and understanding and a demand for the increasingly secular policing of children was championed in the context of a tardy response by the church. (James and Jenks 1996: 315)

Following this tragic death, a moral panic ensued and public outrage caused politicians to reconceptualise how youth were viewed within the justice system. The system became embedded within a punitive ideology and policies began to emerge that concentrated on surveillance and control of children and young people (Muncie 2009). The Conservative Prime Minister at the time, John Major, was cited as stating that 'we should understand a little less and condemn a little more' (Hayden and Scraton 2000: 431).

During the New Labour years, there was an increasing tendency to draw upon apparatus to control and contain working class communities in order to manage the ills associated with poverty through a series of initiatives aimed at being tough on

crime (Muncie 2006). Legislation towards children and young people such as dispersal orders, curfews, electronic monitoring (EM), civil injunctions, parenting orders, Anti-Social Behaviour Orders (ASBOs) and gang injunctions all punished those who committed crime but did little to help alleviate the causes of it; indeed, in some cases they exacerbated problems, causing young people to re-offend (Cullen and Gendreau 2000; Agnew 2006; Deuchar 2011b). For example, Deuchar's (2011b) study into the impact of police-monitored home detention curfews on young men in Scotland illustrates that many experienced anger as a result of their loss of liberty; combined with the erratic nature of police monitoring visits, this led to frequent instances of breaching – thus illustrating the way in which punishment used in isolation can function as a social strain conducive to reoffending (Agnew 2006). The Scottish youth justice system was formally based upon a welfare-based ethos, whereby the Kilbrandon Report of 1964 established that all interventions for young offenders should be directed at meeting their needs rather than responding to their deeds – leading on directly to the establishment of the Children's Hearing System in 1971 (Muncie 2009). However, as the increased use of ASBOs, curfews and EM illustrates, from the 1990s onwards it became increasingly underpinned by a more 'complex set of penal rationales' (McAara 2006: 142). The release of the Anti-Social Behaviour (Scotland) Act 2004 created new powers and incentives to assist local authorities in dealing with a range of youth behavior, and included the extension of ASBOs and EM to 12–15 year olds (Deuchar 2010).

From 2007 onwards, the devolved Scottish National Party (SNP) Government in Scotland initiated a more balanced approach towards dealing with anti-social behaviour, encompassing a focus on prevention, intervention and rehabilitation in addition to enforcement (Nellis et al. 2010). Further, following their election to Westminster in 2010 the Coalition government embraced a 'rehabilitation revolution', which included the abolition of the ASBO (Jamieson 2012: 458). However, although the approach to the creation of community safety adopted in Scotland over the past 8 years has been consistent with past Scottish traditions predicated on a positivistic welfare model as well as the principles underpinning human rights legislation (Cavadino and Dignan 2007), it is also true to say that, in practice, some of the strident punitiveness of the New Labour legacy has remained on both sides of the border (Nellis et al. 2010; Deuchar 2010).

For instance, at the time of writing, police use of stop and search policies in Scotland are under much scrutiny due to its effect on children and young people (Murray 2014). Stop and search policy has the aim of reducing offending, but a side effect emerging from it is that children and young people are pushed further away from the rest of society as they try to avoid the apparatus of the state. Many young people feel that they are targeted by the police and demonised by the rest of society, as a result of how they look and the areas they stay in, causing feelings of distrust, oppression and resentment (Deuchar 2013; Jackson and Smith 2013; Deuchar et al. 2015; Miller et al. 2015). Indeed, many move themselves to the margins in order to avoid CCTV, police patrols (in particular stop and searches) and negative public perceptions (Matthews et al. 1999; Woolley et al. 1999; Percy-Smith and Matthews

2001; Jackson and Smith 2013; Miller et al. 2015). In practice, this results in some young people spending more time in liminal and potentially risky spaces, as they move their locations from visible public spaces into darker and more hidden back streets and alleyways (Matthews 2003; Deuchar 2009).

Accordingly, it is reasonable to argue that those who occupy the streets of socially deprived urban communities are also the most victimised groups within society (Matthews et al. 1999). Many young people who grow up in disadvantaged areas only know their local area as they have little opportunity for trips or holidays away from the locale of the neighbourhood (Deuchar 2009). Indeed, their local environment is their main experience of public life and space and their movement throughout this space defines the boundaries of their world (Ward 1978) and sets expectations upon their role within this world.

Being able to inhabit public spaces is an important element of young people's socialisation process, and as Valentine (1996) highlights public spaces are retreating but they are sorely needed. Lieberg (1995) discusses how teenagers have no obvious place of their own, the only place they have to go is public spaces and this is where they are the most visible for the apparatus of the state and for conflict with other young people. Yet this carving out of place and space is imbued with creating a separate identity; young people require a space of their own without supervision and more and more of these places and spaces are contested by adults (Valentine 1996), resulting in social exclusion (Woolley et al. 1999).

Additionally, one of the key risks of social exclusion is getting lost in the transition from education to the labour market (Bynner and Parsons 2002; Finlay et al. 2010; Miller et al. 2015). It is widely acknowledged that transitions from education to labour are no longer linear (Raffo and Reeves 2000; MacDonald 2011) and young people exist in a world of economic and social uncertainty that has been compounded by the current economic crisis. Those who are excluded from school have a higher risk of offending (McAra and McVie 2010) and those who leave school with little to no qualifications typically end up in the revolving door of low pay/no pay insecure jobs (Shildrick et al. 2010) and have worse health and well being than the rest of society (Parekh et al. 2010). Young people growing up in deprived urbanised areas face more and more complex problems within an uncertain age, and the cost of social exclusion at a young age can adversely affect them for the rest of their lives. In particular, evidence has illustrated that minority ethnic young people living against the backdrop of social deprivation and poverty are exposed to a double layer of social exclusion, stereotyping 'othering' (Deuchar and Bhopal 2012; Myers 2016). In a wider sense, it has been found that the last 30 years have seen an increase in 'xenophobia, ethnic tension, racism and even ethnic violence' in most West European societies, with negative sentiments towards migrants being 'more pronounced' in economically vulnerable populations (Semyonov et al. 2006; Deuchar 2011a: 673). Accordingly, ensuring that disadvantaged youth are re-engaged in urban street contexts is essential.

60.3 Detached Youthwork and Streetwork as a Re-engagement Tool

Youth work has increasingly been regarded as holding strong potential to reach detached, excluded or marginalised youth (Jarret et al. 2005; Deuchar 2009; Coburn 2011). This is not a new phenomenon, since youth work has a long and varied history within Scotland and Britain (Smith 1996, 2005). The focus of its work with children and young people has evolved throughout its history, and it has been a site and provider of informal education, leisure activities, advocating, moral education, a strategy for reducing offending and a means of re-engaging the disengaged (Crimmens et al. 2004). It has undergone many structural changes throughout its long history, originally concentrating on the moral education of children and young people. However, as society changed with the social construction of the adolescent and the introduction of consumerism, the Abermarle Report (Ministry of Education 1960) directed it towards being a universal service for young people by providing leisure pursuits. This period is referred to by Wylie (2010) as the golden era of youth work, when the practice was held in high regard and was supported by government funding and through policy. Yet, in more recent years it has lost such regard and frustratingly to the profession it has become immersed in more formal structures in society such as education, criminal justice and the prison service (Wylie 2010; Bradford and Cullen 2014).

Youth work is often used in order to reach those who are deemed marginalised, socially excluded or hard to reach – in line with policy and practice over the last 30 years focused on the aim of creating better relationships and outcomes for young people (Coburn and Wallace 2011). Detached youth work, in particular, is an effective method of engaging young people on the margins as it maintains the importance of young people's space and goes to where they are comfortable to begin creating relationships:

Detached youth work endeavours to provide a *broad-based 'social education'*, normally at the *behest of*, and largely *in a form determined by*, young people on their own territory. (Crimmens et al. 2004: 8, emphasis added by authors)

This quote is important as it encapsulates three of the main principles underpinning the ethos of detached youth work: (1) the voluntary principle, (2) delivering support on young people's own terms and in their own social contexts, and (3) creating trusting relationships (Davies and Merton 2009). These are not all the principles of youth work (see Batsleer and Davies 2010 for a full account of youth work) – but they are essential in creating relationships that work with young people who are marginalised, disengaged or hard to reach as they put the concerns of the young person to the fore.

One of the areas with the longest history of this type of work is North America, where the practice of street work has been used since the 1920s to reach young people involved in gangs (Klein 1971). Britain's detached youth work has been a more recent addition, coming to the fore following the publication of the Abermarle

Report (Ministry of Education 1960) and its successes are one of the reasons it is seen to be the panacea to youth's problems. Yet the linking to more formal institutions is regarded as a threat to professional youth workers as they feel not only have they lost their secured place but with austerity cuts these links are changing the structure and focus of youth work – making its future uncertain (Bradford and Cullen 2014).

In 2014, the Scottish Government released a national strategy to ensure that 'Scotland is *the* place for children to grow up in' (Scottish Government 2014: 2). The Government committed £17.8 million over 2 years to support youth work within Scotland, and the National Youth Work Strategy 2014–2019 sets out the key ambitions of the Scottish Government in this area over the next 5 years; namely to:

- Ensure Scotland is the best place to be young and grow up in;
- Put young people at the heart of government policy;
- Recognise the value of youth work;
- Build the workforce capacity;
- Measure the impact of youth work (Scottish Government 2014: 2)

This is an ambitious set of aims, particularly when the problems that were discussed at the beginning of the chapter are taken into consideration. Glasgow (Scotland's largest city) was an industrial city that never recovered from the deindustrialisation process that emerged within the eighties, resulting in many of the geographical areas that were linked to industry such as shipbuilding and production becoming steeped in deprivation. At the time of carrying out the research reported in this chapter between 2011 and 2014 there were 55,012 young people between the ages of 10 and 18 living within Glasgow (Glasgow City Council 2010). Of that group 17,000 lived in severe poverty (Save the Children 2008), 3707 were estimated to be in the NEET (not in education, employment or training) category (Scottish Government 2011), over 4000 were thought to be gang members (VRU 2011; Deuchar 2013), and over 700 were in prison, on remand or on curfews (Scottish Prison Service 2011). These types of groups are normally deemed hard to reach as they do not typically engage with more formal or traditional structures within society. These are the groups that detached street work is required to engage and with the problem as entrenched as it is within Glasgow, the challenges that face youth workers are vast.

A youth project in Glasgow set out to try and address the problems that young people experience as outlined above by working together with young people to increase levels of social capital, and as part of a focused funding bid the organisation incorporated a 3 year longitudinal research-based evaluation of the project. We will now discuss this evaluation indicating how youth work acted as a site for social capital building in urban contexts as a result of the relationships that were built with youth workers (Miller et al. 2015; Coburn 2011).

60.4 Background to the Initiative and Research

In 2010, a local youth work service in Glasgow – which for the purposes of this chapter we give the pseudonym *Youth Matters* – implemented a stepping up programme which would see the service expand over the next 4 years across four local communities in the city. This subsequently resulted in the setting up of detached streetwork and youth work projects, youth clubs and early intervention programmes in primary and secondary schools within these local neighbourhoods. In each of the communities, youth workers first engaged with disadvantaged young people out on the streets and invited them to participate in a range of projects, including diversionary sports initiatives (including football, boxing and athletics), issues-based workshops (focused on addressing the causes of, and looking at alternatives to, alcohol and drug dependency, street and gang violence and anger and aggression issues), residential weekends focused on participating in a range of recreational and outdoor sporting initiatives) and opportunities for voluntary befriending schemes with local adult residents as well as a range of other local community service initiatives. Youth workers also gave support to young people with locating jobs, completing applications and preparing for interviews and gaining employability skills.

Each of the communities had a long history of suffering from poverty, deprivation and issues related to anti-social behaviour, territorial violence and alcohol/drug misuse, and *Youth Matters* targeted these areas in an attempt to re-engage young, disadvantaged people and divert their attention away from some of the more negative influences within their communities. With streetwork central to the service's focus, the youth work programmes were designed to engage local young people and aspired to address some of the issues of anti-social behaviour and youth disengagement.

In mid-2011, we began a 3-year qualitative study exploring the progressive impact of the initiative on young people across the four local communities with a particular focus on examining the extent to, and ways in which, the service was able to foster social capital. Bourdieu (1986) defined social capital as a resource 'made up of social obligations and "connections" which are convertible, in certain conditions, into economic capital' (Bourdieu 1986: 404). Field (2003), among others, has argued that Bourdieu's views on social capital are individualistic: as social connections are being seen as a means of cultivating personal superiority and economic gain, the focus is on the individual rather than on the important interplay between fostering benefit for the individual and the community. Putnam (2000) challenges the individualistic approach by putting forward a community-generated theory of social capital which fosters personal and communal outcomes, generating both public and private returns.

Putnam believes that social capital is a collective asset with a common good. He concentrates upon the interaction of capital between the individual and the community, acknowledges the important and complex relationships that occur between these structures in the creation of capital, and addresses both the cultural and structural importance at play. He posits that there are three levels of social capital:

bridging, bonding and linking. *Bonding* social capital tends to reinforce exclusive identities, maintain homogeneity, mobilise solidarity and is characterised by dense, multifunctional ties, localised trust and unity (Putnam 2000; Western et al. 2005). *Bridging* social capital tends to be characterised by weak ties and thin levels of trust, but broadens identities and brings together people across diverse social divisions. The third dimension, *linking* social capital, is simply a particular type of bridging which enables people to forge alliances with authoritative organisations and individuals in positions of power (Woolcock 2001; Western et al. 2005; Terrion and Hogrebe 2007).

The overall aim of our research was to detect the factors which play a role in creating an environment of social cohesion and trust in which young people, local residents and people associated with public services interact with each other, and where the three levels of social capital outlined by Putnam (2000) can begin to emerge. Across the 3 years, 43 semi-structured interviews with 84 participating young people (mostly aged 14–18) and 7 additional interviews with staff members involved in the programme were conducted. The focus of the research was to explore and examine the progressive impact of the initiative across 4 years. Accordingly, we aspired to track and interview as many of the participating young people on more than one occasion as was practically possible and so many of the young people were interviewed on several occasions. However, it was not always possible to follow up on all young people due to minimal drop out combined with some young people moving on to positive destinations (such as full-time education or employment) which made it more difficult to re-engage with them. Transcribing of the interviews was followed by a two-stage data analysis process. First, we engaged in a conventional content analysis phase where we immersed ourselves in the data and conceptual themes and sub-themes were identified. Thereafter, a directed content analysis phase was conducted where emerging overarching themes were interpreted in light of the existing literature on social capital (Hsieh and Shannon 2005).

In the sections that follow, the key themes that emerged from the data will be outlined, drawing on key quotations that represent the participants' views as well as insights from existing literature. Pseudonyms are used for all of the participating young people and staff members. In presenting these themes, we provide an insight into the way in which the service was having an impact over the 3 years. In the concluding discussion, we assimilate our insights with those emerging from the key theories on social capital, draw some wider implications for wider social and cultural contexts and make recommendations for the future.

60.5 Themes and Insights Emerging from the Interviews

60.5.1 Theme 1: Building Trust, Reciprocity and Confidence

According to the Scottish Index of Social Deprivation (SIMD), just under a quarter of Glasgow's communities are among the most deprived 5% of datazones across Scotland (Scottish Government 2012). In its focused attempts to address the root causes of social disaffection and youth crime, each of the local communities *Youth Matters* selected for the street and youth work interventions was characterised by high indicators of poverty and multiple deprivation. In all of the communities, young people who participated in the youth work programmes were mostly between the ages of 12–18 and were predominantly from white ethnic backgrounds – reflecting the fact that only 15% of Glasgow's population is currently derived from ethnic minority groups. The youth workers who delivered the interventions at *Youth Matters* (consisting of six males and one female) were also all from white ethnic backgrounds and were either full-time or sessional (part-time) workers; although all had some level of Youth Work and/or Community Learning and Development qualifications, not all had completed a full degree prior to taking up their professional posts. In addition, while some had many years of experience in the field, others had only been working in a youth work context for a few years – but all shared a strong commitment towards building a sense of social justice and inclusion among young people from disadvantaged backgrounds.

In each of the local communities where the research took place, youth workers highlighted how the support being offered to young people had to be consistent and that this took time. Being visible on the streets within an area for a lengthy period of time enabled the workers, regardless of their age, gender or relevant experience, to build relationships with young people where worries were listened to and their aspirations given room to grow:

We might not agree with what they say. But you've got to let them have a voice, you know. And I think that's important. And that's what we do, you know. You don't shout them down just because they've got an opinion. And I just feel a lot of young people have got opinions but a lot of people don't want to listen to their opinions. Irrespective of whether you think they're right or wrong. You still, they still have got an opinion. And you really should be sitting there and listening to their opinion. (*Jimmy, Youth Worker*)

Ensuring the young people had spaces where they felt they were listened to and given support from an adult was essential in creating a relationship that was built on trust. The issue of trust was something that was raised in a number of interviews with young people, as this participant illustrates:

You don't get many people you can trust. Well for me I don't trust many people 'cause I lost a lot of trust. You know what I mean. I used to trust everybody, tell them all my business. And it would all come backfiring on me. But it was only a few people that I can trust. [*Youth Matters worker*] is one of them. (*Stewart*)

Across the four areas, the young people talked about the wide-ranging activities that the *Youth Matters* staff had pointed them towards, including opportunities for

playing pool and football, going on residential trips, engaging in issues-based and practical workshops. During the final set of interviews in 2014, young people in several of the local areas highlighted the recent opportunities they had been given to participate in boxing programmes as a result of personal interests they had in the sport. Initially workers in one area were reluctant to take a group out of their local community due to the need to take public transport and walking a distance while out of their own area as the young people had previously taken part in territorial violence. But after sharing their doubts and listening to the young people, the youth workers established trust and successfully took the young people outwith their area.

Around three quarters of the young people who were interviewed felt that *Youth Matters* enabled them to get off of the local streets, out of their houses and – on occasions – away from their housing schemes:

They take me places, and get me off the streets (*Jack*)

It gets you out of the house from like just sitting there playing your console and all that. (*James*)

It gets us oot the scheme [housing estate]. (*Ben*)

The issue of trust and rapport with the workers was a consistent theme that emerged within discussions with young people:

(We trust) workers like at *Youth Matters* generally because they, they're friendly, they're friendly faces ... they just kind of, they want to talk to you, they want to be friendly. (*Stacey and Beverley*)

We found that the vast majority of young people continued to engage with the service, with a small minority of 'drop outs'. Where young people did begin to disengage, youth workers were quick to follow them up and re-establish contact wherever possible. Where we found that young people were unavailable to participate in follow-up interviews, it was often because they had moved into positive destinations (full-time education or employment) as opposed to any form of disengagement or 'drop out', and in such cases we did attempt to track these young people and mostly were able to engage them in follow-on interviews. During later interviews, after the programme had been implemented for almost 2 years, we found that trust in the youth workers had deepened among those who continued to engage with the service (and those who had moved on to positive destinations but continued to have intermittent contact with the youth workers). Indeed, the young people valued the opportunity to confide in them about personal, sensitive issues:

They never tell anybody else ... they help you oot in a lot of things ... if we need anything then they're still there ... if you have a problem or anything, you have to go and talk to them or find oot. (*Mark and Sharon*)

Like, if you've got a problem we can just go and tell them. (*James*)

I trust them more than I trust myself! I probably get along wi' [worker] more than I dae wi' my own mates. (*Chris*)

By 2014, many of the young people talked about the way in which they felt that the workers were always there for them. They described wide-ranging examples of the support that the youth workers had given them with personal and family problems and with accessing opportunities for education and training initiatives and

even housing accommodation. One young man in one of the areas described the local workers as 'warm and kind and loving', This relationship was reciprocal, with youth workers often going above and beyond their professional roles to show young people they cared about them:

... me and Paul we've actually kind of like ... got bags of clothes from the house from ourselves, for our kids and what have you and pretended that we were going to go to the charity shop, the Cash for Clothes shop and it was shut, and 'och, oh shit I don't believe it, oh no, I've got that bag there, any use to anyone?' Then they might need this or whatever, not want to say maybe use new clothes or maybe use, could do with the help or whatever. And there's times you take them places and they're wearing what you gave them right because you know they've not got anything else, it's an absolute shame. I don't know who else would go the extra mile for them. (*Adam, youth worker*)

These types of examples were consistent across all the areas and illustrated the level of caring and understanding that workers showed towards young people that made them feel valued and enabled reciprocal relationships to grow. In two of the local communities, the regular youth workers changed during the course of our research due to staffing issues. In one case the worker had been moved to work in a different area, which caused some of the young people to feel that they would struggle to trust a new worker due to the rapport built with the first worker. However, after going back to interview the same young people several months later, the situation had changed; it was very evident that the young people in both communities trusted the newer youth workers completely, with some talking about the way in which they had really helped to 'improve relations in the community'. In fact, one young man explained that he now valued the new workers *more* than the original staff. The relationships among young people and youth workers also broke down gender barriers; for example the level of trust in the male youth workers allowed several young women to feel that they could confide in them about confidential, personal issues:

They're personally helped me through so much ... we're lassies (girls) and see if we were away on residential (weekends) n'that and see if we started our periods, we would have the confidence to go and say something to Jimmy and that's a guy! (*Stacey*)

I went to them because during like my past I had quite a rough time ... I was kind of, went into the act of being in a depression, and I've told them about it. And they spoke it through with me ... they talk to you, they let you get everything out and they tell you, that, they promise it'll be OK. (*Rose*)

Like if you've got worries, you can tell them ... but like the conversation stays been yoos two. (*Paula*)

Sometimes in areas where trust levels were very low, it took workers up to 2 years before they had trusting relationships with the young people. In two of the areas, the regular youth workers changed during the course of our research due to staffing issues. In one case the worker had been moved to work in a different area, which caused some of the young people to feel that they would struggle to trust a new worker due to the rapport built with the first worker. However, after going back to interview the same young people 5 months later, the situation had changed. They still spoke about the first worker and still requested to get her back but over time

most of the interviewees had begun to build up trust with the new workers. Indeed, by the time we conducted our final set of interviews in 2014, it was very evident that the young people in this community trusted the newer youth workers completely, with some talking about the way in which they had really helped to ‘improve relations in the community’. In spite of these trusting relationships, three young men we interviewed indicated that some of the younger people in their local housing scheme might not trust new youth workers coming in to the area again in the future, because they might be afraid they will talk to the police:

People just think, when they’re no’ too sure about them, grasses or whatever. (*Brian, Jim and Phil*)

What was apparent in early interviews was that many of the young people struggled to build trust with other adults, particularly the police. By 2014, it appeared that many of the young people’s attitudes towards the police were still very hostile, because of their experiences of being stopped, searched and dispersed out on the streets. However, as a result of conversations they had had with youth workers or experiences they had gained during residential trips, there were early signs to suggest that some young people were beginning to differentiate between police officers who were negative in their approach towards them and those who were not. In two of the areas, young people recognised that officers were simply trying to do their jobs correctly and could be normal, decent people:

(Some are) just decent people ... some of them are just nice. (*Fergus*)

We never used to like the polis ... but then there was a guy that came on ... a residential wi’ us for a weekend ... and then after that, that’s when we started to think, ‘well, they’re decent people – they’re just normal living people ... you wouldnae even have thought he was a copper unless he told us that. And that just goes to show that, without the uniform, they’re just normal people. (*Stacey*)

In wider terms, across the 3 years of the initiative a recurring theme among the young people in all areas was their lack of trust in other adults. Some young people explained that they were reluctant to trust people when they met them at first, in case they were the police or were drug addicts or dealers. However, by 2014 some of the young people indicated that they had gained an increased sense of trust in local adults as a result of their engagement with *Youth Matters*. This was particularly apparent in one of the areas where youth workers had encouraged the young people to become involved in organising a Burns’ Supper for local residents, and where reciprocity began to emerge between younger and older generations as a result of a local voluntary befriending scheme that young people became involved in:

We worked wi’ older people when we done the Burns’ Supper ... we’d get like a table each and we’d serve them. And they’d just chat away to you and stuff. (*Paula*)

I did the ‘Rabbie Burns’ thing. The old woman ... she was like, ‘some old people just think that you are all toerags [hooligans], you cannae dae anything wi’ your life and everything.’ She’s like, ‘we don’t think that ... we think that your generation is better than our generation.’ (*Kerry*)

Like the befriending n’all, like you can help old people ... like I don’t know, before we were wee bastards ... but then we learned how to respect adults and give an adult respect, they’ll respect you back. (*Stacey and Beverley*)

Thus, it seems that *Youth Matters* was able to instil a sense of social support and trust among young people, but in situations where key points of contact changed it took a long period of time for some young people to adjust. Levels of trust differed in each area and analysis of both the workers and the young people's interviews indicated that the level of trust the young people had with workers, residents, organisations and police officers correlated with the length of time spent in an area. However, the evidence arising from the two areas that were affected by staffing changes suggests that the support offered by *Youth Matters* staff – new and old – generated reciprocity, confidence and trust in time due to their approachability and commitment to build positive relationships. The youth workers were clearly encouraging young people to trust other adults outside of *Youth Matters*, particularly in one of the areas where youngsters took on leading roles in local community events.

Our insights suggest that, towards the end of the funded period, *Youth Matters* was beginning to find an increased role in supporting young people to deal more effectively with the police, and in some respects was enabling the building of social capital between young people and local police officers as a means of preventing the circularity of 'othering' that can occur between these groups (Gormally and Deuchar 2012). Accordingly, our research suggests that, by building reciprocity and trust between young people and youth workers, and confidence among young people, the *Youth Matters* service was able to contribute to the development of:

- *Bonding* social capital, through building localised unity among young people and between young people and workers.
- *Bridging* social capital, through broadening young people's identities via volunteering, helping them to achieve confidence and success beyond their localised networks and bringing them into contact with groups and individuals from different age generations.
- Initial signs of *linking* social capital, through enabling some young people to respond with less hostility towards police officers.

Thus, the service was instrumental in building communal forms of social capital which raised self-esteem and self-belief among disadvantaged groups of young people.

60.5.2 Theme 2: Addressing Territorial Violence, Anti-social Behaviour, Alcohol and Drug-Misuse

In early interviews, all participants were asked what they thought of their local areas and what they would like to change. A number of issues were discussed but, interestingly, many of the young people had become accustomed to territorial violence occurring in their neighbourhoods. In early and middle-stage interviews, many also discussed alcohol and drug use and anti-social behaviour as things that blighted their communities:

The schemes split. Like, there's people you'll know fae the schee that you'll like and talk to ... and there's other people in the scheme that you won't het on wi' cause you won't talk to them (*Brian*)

This isnae the nicest of areas ... fae the gang violence and all that, and drugs and alcohol. (*Tony*)

During later interviews, there were differences of opinion about the extent to which territorial issues had dissipated, and – where they had – the role that *Youth Matters* had played in this. For instance, in some areas the young people felt that territorial gang conflict had been seriously reduced and felt that *Youth Matters* had assisted with this:

Before this, everyone was fighting and arguing, doing bad stuff... [that's changed] a lot. (*Jack*)

Now we get on with each other much better. (*Scott*)

Like, when we go on trips ... we dae talk to other people, like – aye – we get on. (*Katie*)

[The trips] take their mind off actually goin' oot and fightin'. (*Ross*)

'Cause they just show that the person's no' as bad as they think they are. And they can get along wi' each other ... and there's like no need for fighting. And like it's, if you've got a problem wi' the other person it's, you can talk it out. (*Benny and Jody*)

These young people clearly felt that the physical activities and recreational trips organised by *Youth Matters*, combined with the personalised mentoring and team-building skills of the workers, had helped to break down territorial barriers. During the final sets of interviews conducted between 2013 and 2014, although there was the recognition that the problems associated with territoriality were still around, young people across all of the targeted communities spoke highly about the workshops they had engaged in as part of the service. The workshops were from a range of youth work resources, included input from reformed offenders and taught them about the risks associated with violence, alcohol and drugs.

Youth workers discussed how they had to be adaptable to the area and the situations they were in, utilising existing resources and creating something new from them to be able to address the issues that came up at that time. They also heavily relied on inter-agency working when they felt that a specific area required a more specialised focus. For example, it was thought that the gang workshops that they were delivering were not hard hitting enough for the groups they were working with so the workers contacted *Medics Against Violence*, a particularly hard hitting agency that addresses the impact of violence in the west of Scotland. Being able to be flexible with the workshops that were required was reported from all areas as being of great importance. At different times, with different people, different methods were required to address the issues that came up:

We've just been working on street work, actual street work. Group work on the streets. We've got flash cards, got all these different things. So we've been trying to tackle the sexual health stuff but alcohol's still...but there's a lot of work to do still. (*Jennifer, youth worker*)

And it's, and we needed a hard hitting thing. You know, it's saying, 'look this is the real world. This is what happens when you carry a knife. When you're drinking alcohol, this is what happens. You might have the knife, and you might not intending to use the knife but

you mix the both of them it's going to happen. This is what happens'. And they show you the consequences of what happens. (*Jimmy, youth worker*)

The young people were particularly positive about the outdoor recreational activities they were taken on with *Youth Matters*, and often felt that these and other recreational activities helped to break down territorial barriers and divert their attention away from fighting. To be brought out of their housing schemes and mix with other schemes and local areas was something that almost all interviewees reflected positively on. During the final interviews in 2014, several young people highlighted the way in which they had developed more positive relationships with those from other local areas:

We had a residential, and we shared a bus wi' people like from (area 1) and people from (area 2) and (area 3). (*Sharon*)

Jimmy has got (scheme 1) and (scheme 2) to play fitba' together ... and if they play fitba', do you know what I mean, they'll end up getting' a relationship, so they've telt our pals that they're alright ... so it definitely has stopped the fightin'. (*Beverley and Stacey*)

Alcohol and drug misuse within the local communities was a common theme to emerge in early interviews. Two and 3 years later, the young people in some of the local areas disclosed that they still drank alcohol most weekends and – in one of the local areas – admitted to smoking cannabis regularly. However, in several of the communities where *Youth Matters* was deployed youngsters clearly felt that workers had helped to address alcohol and drug intake and enabled them to reflect more deeply about consequences:

When anybody was drinking or smoking (the workers) would always say ... they've been telling them to stop it because it can harm them (*Jack*)

I'm a responsible drinker ... but it was good to know from the alcohol side of it in the workshops, and what to look out for n'that. (*Chris*)

Indeed, one youth worker referred to a young man who participated in the service and – as a result – moved from drug intake and crime to a positive destination in sport:

One young ... boy was in heavy, heavy involved in drugs and alcohol. And I just said, 'look I'm going to start a wee boxing thing up here. Would any of you be interested?' And probably about ten of them say, 'aye I'll go down, I'm quite interested'. And cause of territorial stuff I had to take them out of the area. I had to take them to (area name). That's across the other side of the water. And I got this young boy involved in the boxing side of it. And... he's potentially now, he's going to be a professional boxer. (*Jimmy, Youth Worker*)

We had a boxing programme and it went right through the winter months last year ... we have got a wee boy who will probably be a champion next year probably, who we got him out a drug gang. And he is now just starting, he will probably turn 'pro' this year ... now he is just an athlete. He was on drugs, he was smoking all sorts, he was hitting teachers, he had a reputation and he was out of school at fourteen. Then Jimmy got him into the boxing. (*Janice, youth worker*)

Previous research has illustrated that youth work can be a powerful means of engaging young people, directing their attention away from gang violence and building and deepening socialisation networks (Deuchar 2009, 2013). Our insights indicate that the *Youth Matters* programme was a powerful impetus for change in

young people's lives in this respect; by widening young people's networks beyond their immediate, localised peer groups through organising recreational activities and excursions, the youth workers enabled some youngsters to move away from their focus on territorial behaviour. By establishing organised workshops and facilitating open discussions focused on the dangers and risks of alcohol and drug misuse and anti-social behaviour, the initiative also enabled young people to reflect on their own behaviour in this respect. Coburn and Wallace (2011) highlight that a 'health belief model of health behaviours' suggests that young people are more likely to take preventative action when they believe that there is a risk to themselves. By adopting a programme of workshops underpinned by this approach, youth workers at *Youth Matters* were able to support young people in taking greater responsibility in minimising the risks associated with drugs, alcohol and crime.

We can summarise that – by helping to address territorial violence, anti-social behaviour and problematic patterns of alcohol and drug-misuse – the *Youth Matters* service was able to further contribute to the development of:

- *Bridging* social capital, through widening their socialisation networks during recreational excursions: young people were regularly introduced to networks that spanned across traditional social boundaries.
- *Bonding* social capital, through building communal opportunities for self-reflection and instilling a sense of solidarity among young people via open discussions that raised awareness about risks and dangers associated with alcohol and drug dependency. In some cases, this led on to increased recreational and even professional engagement in sport.

However, due to the deeply ingrained culture of territorial violence in some local areas in Glasgow and the continuing acceptance of excessive alcohol intake and cannabis smoking as a form of recreation among young people, the service recognised that it had further work to do in continuing to build social capital as a means of further confronting these issues and minimising health and wellbeing risks:

So we've just been working on street work, actual street work. Group work on the streets. We've got flash cards, got all these different things, but alcohol's still...but there's a lot of work to do still. (*Jennifer, Youth Worker*)

And it's, and we needed a hard hitting thing. You know, it's saying, 'look this is the real world. This is what happens when you carry a knife. When you're drinking alcohol, this is what happens. You might have the knife, and you might not intending to use the knife but you mix the both of them it's going to happen. This is what happens'. And they show you the consequences of what happens. And we've got that on [a] Tuesday night [workshop]. (*Jimmy, Youth Worker*)

60.5.3 *Theme 3: Generating Responsibility, Empowerment and Social Inclusion*

During interviews with young people across the four target areas, several referred to the way in which youth workers within the project had provided them with the support that they needed to apply for jobs, perform well in interviews and – in some cases – to actually gain employment. This was particularly evident during the later interviews we conducted, where young people were able to look back and reflect upon the way in which workers had supported them in this way:

They're helped me wi' my job search ... how to make my CV better and what to say and help me wi' my interviews and that when I do go for it. (*Katie*)

I was trying to find work to dae and they were givin' me like forms for apprenticeships and stuff like that ... and I've just started at the Apollo Players Theatre, doing backstage work ... [the worker] sent emails out for me and I ended up gettin' it. (*Sharon*)

They help you wi', like, they take you and tell you what to put on your CV. And, like tell you – 'cause obviously they've got experience and all that, so they know what they can ask you and that. So they can dae mock interviews and that wi' you. (*Katie*)

During our final set of interviews in 2014, several other young people described the way in which they had managed to gain employment or entry back into education as a result of the support offered to them via *Youth Matters*:

Me and Gary went for (an apprenticeship) and Gary got a job ... through it. (*Paul*)

I wouldnae have got into my first year (at college) ... Jimmy was the one that gave me my reference. And then my second year he helped me dae my 20 hours volunteering. If I didnae dae my 20 hours volunteering I would have never got into my second year. And if I didnae get the reference I wouldnae have got into my first. (*Beverley*)

They helped one of my pals to get a job ... in scaffolding. (*Tony*)

In addition to gaining employability skills which in some cases led onto job and training opportunities, many of the young people talked about the way in which the youth workers increased their sense of personal confidence and their ability to communicate with wider groups of individuals. For example, one young man in one of the areas described the way in which he had been given the opportunity to lead a workshop on gang violence with pupils in the local secondary school, which had given him a great deal of confidence. Other young people also talked about being introduced to opportunities to do peer mentoring; one young person explained that this gave her the confidence 'to go into a room and meet people', while another felt that it had given her the motivation to 'help other people just like (*Youth Matters*) helped us'. Several young people talked about the way in which the new opportunities they had been given through *Youth Matters* had helped them to 'calm down' and, during one of our final interviews in one of the four areas, the young people talked at length about the way in which the *Youth Matters* staff had helped them to widen their ambitions and aspirations in life and to really believe in themselves:

They're an inspiration to everyone ... like, they know what to say and what to do. They encourage young people to do better with themselves, like to achieve more and reach high for what they believe in. (*Rose*)

However, youth workers indicated that the potential to support young people back into work is likely to get harder, as the availability of jobs in the west of Scotland becomes slimmer and the need for previous experience and more complex skills becomes more prominent:

The thing is, the problems here are getting bigger. No' because it's just because of the unemployment side of it, but we've got young people who are going to find it very difficult to get jobs. (*Jimmy, youth worker*)

Our insights suggested that the youth work principles underpinning the *Youth Matters* initiative were pivotal in generating communal social capital between workers and the young people in the four targeted areas of Glasgow, and that this in turn improved the young people's opportunities for acquiring personal social capital and self-efficacy that could be traded for economic capital via employment (Bourdieu 1986; Bandura 1995). The methods of engagement used by the youth workers built trust, respect, co-operation and reciprocity. The workers clearly looked for a 'glimmer of potential' and set up opportunities that enabled young people to recognise their own skill set and to feel safe enough to reach out and test their abilities (Sercombe 2010: 131).

Opportunity-giving was the most common theme that emerged from analysis of how the workers built trust co-operation and reciprocity. Opportunities that were provided were varied and included social gatherings that incorporated residents, family members and young people from other areas. Activities such as boxing, flying, swimming, residential excursions, camping etc. all increased the amounts of available leisure activities and were activities that the young people may not have accessed without the service. Opportunities such as training/college courses, help with home/course work, C.V.'s, applications, accessing specialist services for dyslexia and finding and applying for jobs were the most common ones that were listed by workers and young people.

The participating young people were thus given a sense of responsibility and self-belief, which helped them to move back from the margins of their communities. In some cases, they gained opportunities for both voluntary work and paid employment (Putnam 1993). But, even although there were clear indications that a sizeable number of the young people engaging with the *Youth Matters* programme were beginning to find routes back into education training and employment by the end of the 3 year evaluation period, the staff indicated that the problems associated with accessibility of jobs and the continued need for developing flexible and complex skills may make this process harder in the future.

Overall, then, our research suggests that, by generating responsibility, empowerment and a sense of inclusion among young people, the *Youth Matters* service was able to further contribute to the development of:

- *Bridging* social capital, through broadening young people's identities via volunteering and employment opportunities, helping them to achieve confidence and success beyond their localised networks and bringing them into contact with groups and individuals that spanned across traditional social boundaries.

The building of opportunities for responsibility and empowerment generated additional layers of communal social capital that raised personal esteem and self-belief, while also generating individualistic forms of capital where self-efficacy emerged that could be traded for economic capital via employment. Evidence from the longitudinal element of the study suggested that young people increasingly began to reap the benefits of this towards the end of *Youth Matters'* 3-year funding period, where more groups of youngsters were beginning to find their way back into positive destinations.

60.6 Concluding Discussion

In this chapter, we have argued that detached youth work has increasingly been seen and recognised as a particularly effective way of engaging marginalised young people through its focus on engaging with young people in their own social spaces and on their own terms and its fundamental orientation around the building of trustful relationships (Crimmens et al. 2004; Davies and Merton 2009). In this way, it represents an important means of empowerment within socially disadvantaged urban street contexts, where contemporary literature suggests that many young people feel demonised, are often subjected to excessive surveillance and control and experience feelings of distrust, oppression and resentment (Valentine 1996; Muncie 2009; Deuchar 2013; Jackson and Smith 2013; Deuchar et al. 2015; Miller et al. 2015).

Cognisant of these issues, in Scotland the Scottish Government (2014: 8) has acknowledged that its ambition of ensuring that young people 'achieve the best possible outcomes for themselves and society' is dependent on building youth empowerment. In socially deprived urban communities, enabling young people to exercise genuine power is particularly important given the sense of social exclusion and disadvantage they routinely experience. The Scottish Government argues that effective engagement with disadvantaged youth can offer 'developmental opportunities as well as the ability to lead, take responsibility, make decisions and make a real and lasting contribution – both economically and socially – to Scotland's present and future' (*ibid*: 8). In this chapter, we have drawn upon the evidence from a longitudinal research-based evaluation of one particular detached youth work programme that focused on some of the most socially deprived and disadvantaged communities in Glasgow, in an attempt to examine the extent to which the service was able to foster social capital and – in so doing – build a greater sense of youth empowerment.

Our insights illustrate that the *Youth Matters* service led to an increase in *bonding* social capital within the communities where it was deployed, characterised by dense, multifunctional ties, localised trust and unity (Putnam 2000; Western et al. 2005). Although the transitions that emerged as a result of staff changes in some of the local communities led to uncertainty and unease to begin with, the young people ultimately adapted and enthusiastically accepted newer staff due to the hard work and dedication of each successive team of youth workers who worked tirelessly to

earn young people's trust through positive relationship-building (Coburn 2011). In generating closer social bonds, many of the young people developed increased levels of confidence and self-efficacy that enabled them to enhance their opportunities for gaining employment (Bandura 1995). By encouraging young people to recognise their own skills and potential and develop an increased ability to write CVs and prepare for interviews, social capital was converted into cultural and economic capital (Robson 2009).

Our evidence suggests that the *Youth Matters* service was increasingly able to support young people to find positive destinations in education, training, employment and in voluntary services by the end of the 3-year funded period, as well as reconsidering their use of and dependency on alcohol and drugs to some extent. Although not discussed in the chapter, an unexpected outcome of the project was that the service helped young people deal with family problems and youth workers played a large role in advocating for young people. For example, some youth workers supported young people during periods of bereavement and also provided positive references for them to accompany college and job applications or – in a minority of cases – as evidence for bail reports if they became involved in the criminal justice system.

The emerging insights also suggest that the *Youth Matters* project enabled some of the young people to move away from territorial violence as a result of the *bridging* social capital that was generated by youth workers, as well as the implementation of local issues-based workshops. By organising recreational trips that brought young people from different housing schemes together, the youth workers were able to broaden identities to some extent and bring together people across some diverse social divisions (Putnam 2000). However, our data also suggests that aggression and violence could still be normalized by some young people within the focus communities and that historical territorial rivalries were still in evidence – as the quotations from young people such as Brian and Tony in earlier sections illustrate. The *Youth Matters* service was clearly able to achieve some very impressive results in terms of steering young people away from violence; however, it has to be recognized that the problems associated with territorial gang violence are by no means resolved in some of the communities in Glasgow (for a fuller discussion, see Deuchar 2013).

The groups of young people that *Youth Matters* worked with could not have been reached with traditional youth work alone, but the mix of street work and traditional youth work meant that the service was reaching the majority of young people in the communities. Street work was repeatedly mentioned by the youth workers as the first step in reaching those deemed to be 'disengaged youth' and once a trusting relationship was built they were then able to move the young people towards more issues-based work where they could then start addressing issues such as violence, drugs and alcohol etc. This was then accompanied by providing activities and signposting young people towards other agencies so having a mix of traditional and street youth work was essential in *Youth Matters*' success with young people.

Insights from the final sets of interviews also indicated early signs that the service had slowly enabled some young people to become more tolerant towards the work of the police and to manage the pressures that the police sometimes created in

their lives more effectively. The implementation of local befriending schemes and community service initiatives had also encouraged the breaking down of barriers between young people and local adult residents, and built youngsters' confidence in their use of communication skills (Deuchar et al. 2015). Accordingly, we would argue that services like *Youth Matters* can and do enable disadvantaged young people in urban contexts to lead, take responsibility, make decisions and make a real and lasting contribution to society (Scottish Government 2014).

In spite of the many positive insights to emerge from our research, we believe that organisations like *Youth Matters* need to be aware of the risks associated with young people's dependency upon their services. Across the four neighbourhoods where we worked, the final sets of interviews in 2013 and 2014 indicated that many of the young people had started to become dependent on *Youth Matters* and the support offered by the youth workers. When asked what they think might happen if the *Youth Matters* project was to come to an end, they indicated that they might drift back into old patterns of behaviour and that the local communities and young people would really suffer from the lack of support.

Serbombe (2010) has argued that, alongside the virtue of empowerment often lies the vice of dependency. Although it is undoubtedly recognised that 'the process of youth work [is]...contingent on the quality of relationship between a young person and a youth worker' (Harland and Morgan 2006: 10), the young people in Glasgow's socially deprived communities would benefit from a facilitated process of becoming less dependent on youth workers for gaining a sense of trust, confidence and support. Indeed in a general sense we believe that, in providing an empowering form of urban education on society's margins, youth workers also need to ensure that young people build positive relationships with other professionals and adults in both their local and more distant communities, and to facilitate agency (Sercombe 2010). For example, Sercombe (2010: 133) argues the need for spreading the professional load and facilitating young people to build a relationship with other workers, referring young people on to other services and helping young people to build a 'normal' support base: a mix of 'friends, family fellow student or co-workers and professional support'. In our later interviews, signs were beginning to emerge that this was happening in some of the areas where *Youth Matters* workers were arranging more distant trips to rural parts of Scotland. This type of work needs to continue in these communities alongside a focus on supporting young people to build wider relationships with other professionals as well as local adult residents, as per Sercombe's suggestions (above). In order to truly empower young people, agencies like *Youth Matters* need to encourage them to take ownership over their own lives and to believe that they can achieve things without the support and mentorship of youth workers.

In addition, we believe that youth work agencies in socially deprived communities like the ones we worked in need to place an added emphasis on generating stronger forms of *linking* social capital, which will enable them to forge stronger alliances with authoritative agencies such as the police (Woolcock 2001; Western et al. 2005; Terrion and Hoglebe 2007). One way of doing this is to adopt an assets-based approach and engage young people in the organisation of local com-

munity ‘listening events’. Bringing local people, agencies and authoritative organisations together in ‘irrational’ ways can facilitate a focus on co-production of ideas, open and deliberative dialogue and the building of localised positive action focused on collective resources and strengths, rather than on needs and problems (Ritzer 1996: 197; Deuchar et al. 2015). As our wider, collective body of work has illustrated (Deuchar et al. 2015; Miller et al. 2015), local integration initiatives of this kind can enable localised fear and anxiety about young people’s behaviour to begin to dissipate and enhanced feelings of safety and wellbeing begin to emerge. They can also ensure that power and who does, or is perceived to, hold power within communities is discussed, challenged and most importantly shared.

While we need to be cautious about generalising our insights from Glasgow to wider social and cultural contexts, we believe that our research insights illustrate the potential for youth work services to adopt a role in facilitating agency, empowerment and power-sharing process in socially disadvantaged urban contexts. Despite being complex, relational and situational (Gormally and Coburn 2014), this type of practice can have a positive impact for all involved. By enabling this type of interaction and localized agency, services like *Youth Matters* and others like it that exist in Scotland, the UK and the wider world have the potential to have a wider influence on reducing anti-social behaviour, alcohol and drug misuse and increasing the number of young people engaged in positive lifestyles. In so doing, they can play a wider role in the building of safe, inclusive and flourishing communities.

Part X
Western Europe

Chapter 61

Urban Education in Western Europe: Section Editor's Introduction

Francesca Gobbo

In their introduction to the first edition of the *International Handbook of Urban Education*, the General Editors George W. Noblit and William T. Pink (2007) questioned whether “urban education” could exclusively be understood as the research and intervention realm that urban centers have engendered, owing to the many problems (poverty, crime, overpopulation, despair) afflicting them, and pointed out the need to take into consideration “th mirror image” of towns and cities that is instead communicated by the word “urbane”, specifying how the polarity urban-urbane provided researchers with alternative paths for exploring and debating the meanings and scope of “urban education”. About 10 years later, the authors anthologized in the new Western Europe section contribute with their research and interpretations to further problematize such meanings and scope of “urban education” – even when it is not acknowledged as part of the Western European educational vocabulary (as Lorenz Lassnigg points out) – and attest their engagement with problematic school issues and the pursuit of social justice and civic participation in different social and national contexts. Interestingly, the latter do not merely represent the wider frames in which those issues and aims are set, defined, and negotiated, but are in turn affected, and more or less deeply changed, by the recognition of the problems and the search for solutions, as Jens Adams and Alik Mazukatow indicate with reference to a “post-migrant” Berlin, or by Francesca Gobbo, with regard to the institution of the nursery school as a “public service” and its opening to men educators. In fact, notwithstanding the complexity and specificity of each urban context documented by the chapters, I believe that at least a *fil rouge* can be traced connecting the contributions across their diversities, namely *change*.

F. Gobbo (✉)

Former Professor at the University of Turin, Turin, Italy

e-mail: francesca.gobbo@unito.it

Change seems to be especially relevant, as it also translates as *agency* with reference to individuals and communities, and resonates at the level of *identity*: with regard to nation states, change results from the acknowledgement of their multicultural social fabric to which immigrants have contributed either as the “new citizens” in “post-migrant” Berlin (though citizenship legislation does not guarantee that they be symbolically included in discourses of national community), or as indispensable, but ignored, “warrantors” for the stability of the ageing Austrian population. However, the perception of demographic and cultural transformations is also heightened by the awareness of minority groups such as the Roma in Catalonia (studied by Bálint-Ábel Bereményi and Silvia Carrasco) or the Trentino Sinti in the North East of Italy (reported by Federica Setti of the Italian wom.an.ed collective) that they have long since been part of the cultural identity of their countries, albeit their likewise long social exclusion and/or marginalization. The case of Roma, and Sinti, is particularly interesting because of its European relevance that has produced important initiatives such as the Decade of Roma Inclusion and more recently the *EU Framework for National Roma Integration Strategies*, and adds a transnational and transcultural dimension to the subjects’ national and ethnic identity. Changes that have to do with a process of identity complexification can be traced in practically every chapter: thus, for instance, from Setti’s investigation we come to know how the Trentino Sinti teenagers’ involvement with the imaginary characters of television series, and/or their participation in the web social networks make them elaborate an unforeseen, multifaceted identity; Paola Giorgis’ contribution alerts readers of how the learning a “non-mother tongue” provides both immigrant and non immigrant youth with the opportunity to achieve a critical view on themselves and others, to structure new affiliations and understand the symbolic connection between languages and social environments; the voices of immigrant students – in Rebecca Sansoé’s paragraph –, who attend a vocational education course in Turin (Italy), underline how through it they have attained a new perspective on themselves as persons able to be, at the same time, prospective workers (notwithstanding the economic crisis) and thoughtful, caring sons for their families; Isabella Pescarmona points out, in her report, how the impact of an educational innovation on the schools’ everyday pedagogy and expectations prods teachers to critically reconsider and reconstruct their professional identity; Elisa Sartore underlines that since history, and particularly the history of Italy, has always been characterized by cultural, linguistic, religious and ethnic diversities, the issues of identity and diversity can be critically approached only through the historical lens, and she does so by collecting life stories of Somali-Italians; finally, the agency of Turkish immigrants in Berlin, reported by Adams and Mazukatow, is successfully testified by their founding of a private school to counter discrimination too often experienced by their children in public institutions, the establishment of a cultural/ethnic association that aims to achieve higher visibility and social recognition for the immigrant community, and by the private school’s students’ investment in their future who subscribe to goals of achievement, performance, meritocracy and self-responsibility that can apparently co-exist with the school’s “ethnicization” process.

This last observation allows me to take into consideration the issues of identity and change from a different angle – that of identity theory -, and to point out that the interpretation of urban and ethnic identities as multifaceted and complex co-constructions is in these chapters the result of a learning process construed as either entailing “multiculturalism as the normal human experience” (Goodenough 1976), or as a path of additive enculturation. In both cases, the so called cultural roots of the subjects intersect, or intertwine (rather than being silenced or effaced by majority's actions and policies) with new cultural and relational experiences. Though situations of discrimination and segregation are not eliminated, minority or immigrant subjects seem to have decided that they can no longer be expected, or required, to give up what they learned from the family's or community's teachings. Yet the persistence of segregation and exclusion cannot be ignored, and it is explored by two interesting contributions, respectively by Clément Rivière and Sonja Kosunen, and by Sofia Marques da Silva and Pedro Abrantes. In the one comparing two culturally and ethnically mixed neighborhoods – in Paris and in Milan – Rivière and Kosunen explore the urban dimension by focusing on the processes of children's urban socialization that are promoted, or on the contrary not encouraged, by the families' social background and aspirations. Thus, while the authors underline the different choice made by the Milan families, they also point out the role of the so called school markets as related to, and reinforcing, the French families' concerns for their children's social mobility that indirectly produce a newer form of segregation: in fact, as their children attend a school outside the area of residence, the lines of social differentiation and inequality are redesigned, since low status families can only afford to enroll their children in the local schools. The contribution by Sofia Marques da Silva and Pedro Abrantes sets the theme of “urban education” against the background of the current global crisis and provides readers with a provocative interpretation of how the lack of social change and the persistence of inequalities engender young people's disinvestment in and disaffection for education: in reviving Erving Goffman's theory of “cooling the mark out” the two Portuguese researchers convincingly highlight, and explain, youth's contradictory beliefs toward schooling as well as their (unexpected, by the older generations) availability to downsize their hopes and prospects, and thus indirectly legitimate the neo-liberal political narratives and the current economic austerity measures.

In devoting the next pages to retracing the different chapters in greater details, I aim both to answer the readers' expectation for a more analytical presentation of the authors' research and interpretation efforts, and to suggest – as Noblit and Pink did for the first edition of the *International Handbook of Urban Education* – that this second one be also read and understood “as a tool for opening up conversations about the current status and possible futures of urban education” (Noblit and Pink 2007, p. xxxv).

The chapter about Spain, that opens the Western Europe section, is an interesting example of how Urban Education in Europe often translates into engaged research on minorities' education, namely the educational and social “problems” of stigmatized Roma families and their children, and/or of immigrant communities inhabiting democratic, albeit economically and socio-culturally stratified European societies.

Bálint-Ábel Bereményi and Silvia Carrasco, in their “Bittersweet Success. The Impact of Academic Achievement among the Spanish Roma after a Decade of Roma Inclusion”, deal with the “Roma problem” by choosing to investigate the short-period results and the wider effects of initiatives and policies the “problem” elicited at the national and European levels¹ to tackle cultural and institutional stumbling blocks to school continuity and further educational pursuits, as well as social and economic inclusion of the members of this culturally non homogeneous minority, whose Spanish citizenship was granted only in 1978. These ample research and intervention concerns characterize most of the studies carried out among Roma people in Spain (and in many other European nation states, cfr. Gobbo 2015): in this case, the authors extend the line of research initiated by Abajo and Carrasco (2004) and focus on the conditions that promote academic success among young Roma in Catalonia, and on the impact that their successful trajectories have on themselves, their families and the Roma communities. Rooted in the belief that schooling is a “key element” for achieving social justice and equality of opportunities, the researchers’ investigation innovates both in terms of the issues investigated (*school continuity* instead of disengagement and dropping out, for instance), and of theories with which to interpret the success and inclusion of Roma rather than their failure or exclusion. The latter have not disappear – the authors acknowledge – because, while funds for Roma projects have increased (at least at the European level), they can still perpetuate a form of social separation, if not segregation, precisely because the investments target only Roma pupils and students. For their research purposes, Bereményi and Carrasco singled out a number of subjects respectively belonging to the pre-Decade generation and to the Decade generation, whose recollections – as interpreted by the authors – point out that the Decade generation has a more linear school trajectory and a positive participation in academic peer groups, from whom they can, for example, learn how to “navigate” the relatively unfamiliar school world and culture. If feelings of social isolation, loneliness, mistrust, together with the lack of institutional knowledge, persist also among the Roma youth of the Decade generation, they are not as sharp and marginalizing as they have been for the previous generation. In fact, the younger Roma recognize how there are teachers they can rely on, and who are engaged in making changes so as to realize the students’ right to education. In both groups, parents, and older siblings, provide emotional support, and urge the younger ones to bear the social and educational frustrations in order to attain the indispensable cultural and academic capital, and even realize the unachieved ambitions of some adults. Bereményi and Carrasco stress how the organization of panEuropean Roma networks has furthered the

For an earlier investigation and debate on the issue of Spanish Roma education by the same authors, see Bereményi and Carrasco 2015.

construction of a transnational Roma identity and, especially among those of the Decade generation, an engagement in forming themselves as European Roma persons, notwithstanding the few models available, and valorizing their transcultural identities through national and international networks and/or NGOs. In fact – as the two researchers notice – the good command of English and of the Internet that many of them have, contribute to the elaboration of a multifaceted identity where forms of continuity with Roma culture and values, and maintenance of strong emotional ties with the community and the family (cfr. Setti 2015), co-exist together with pro-academic attitudes and a deeper awareness of local and global injustice. According to the researchers' interpretation, both generations have thus been able to achieve "accommodation without assimilation" to the non Roma cultural contexts: the *process of additive acculturation* they undergo does not demand a sharp discontinuity with most of their cultural traditions, though it can often be difficult, or even painful, especially in the case of Roma women eager to pursue further schooling and at the same time gain emancipation from cultural rules such as early marriage (cfr. Gobbo 2004, for an Italian example). The positive expectations of trustworthy teachers towards them as Roma students, the provision of social and academic capital by peer groups who function as bridging agents, and the support of parents and siblings allow Bereményi and Carrasco to posit a theoretical interpretation that valorizes multiples forms of capital – aspirational, navigational, social, cultural, linguistic, familial, resistant and identity capital – as the factors thanks to which personal academic projects can be envisaged and enacted, and a European Roma identity attained and nourished, notwithstanding that the "Roma problem" is still under notice of default, and the cultural discourse often pushes into the background, or even silences, the needed political solutions.

In the chapter that follows, authors Clément Rivière and Sonja Kosunen deal with the themes of "School Choice, School Markets and Children's Urban Socialization" through a comparative approach that takes them to two socially mixed area of Paris (France) and Milan (Italy), namely Paris-Villeite and Monza-Padova respectively. They explore the urban dimension from the point of view children's school experiences and careers in relation to processes of urban socialization that shape their perception and familiarity with the urban spaces, and are promoted, or limited, by families' aspirations and children's social background. Through in depth interviews of parents in the two areas, Rivière and Kosunen aim to learn how children acquire mobility skills, what such ability means from the points of view of social relations within the neighborhood of residence and of academic prospects, and how relevant are the parents's concerns and expectations with regard to their children's autonomy when they leave primary school to enroll in lower secondary education. The findings highlight the different orientations of families in Paris-Villeite and Milan/Monza-Padova on school choice and educational investment, on the one hand, and, on the other, the children's differential learning about their own social identity and that of other social groups, as well as the construction of new ties and networks for the young ones who daily leave home and use public transportation to attend a school in another neighborhood. In fact, children's mobility appears strongly related to the choice of secondary school, and though parents want to make

sure that their sons and daughters will be able to use public transportation on their's own before letting them do so, the appreciation schools outside the place of residence enjoy among middle and upper class French families is crucial in promoting children's urban autonomy. While it is true that both French and Italian parents give additional similar reasons for such autonomy (the irregular school timetable of secondary schools, the peer group's pressure on children that would make adult supervision embarrassing, lesser parental involvement in school matters than in primary education, the reassuring company of school mates in busses and metro), the journey to a school in a different neighborhood shapes the urban and social experience of French students in characteristic ways: the parents' economic, social and cultural resources favor mobility (unlike what happens for lower class students who tend to enroll in the local schools), but at the same time promote school segregation and reinforce social inequalities. Rivière and Kosunen connect the latter to the role of school markets, and to the greater relevance they have in the French context, as among French middle and upper class parents school success is perceived as what will determine children's future social prospects and foster their upward mobility (or at least protect them from sliding downward). And while they see quality of education – which is presumed to be better guaranteed by a school outside the neighborhood of residence – as a “life investment”, the schools themselves compete for attracting students and thus redraw the lines of social differentiation and inequality through the experience of urban socialization. The two researchers point out that, on the contrary, the Milan school market is less hierarchical: in fact, for Northern Italian families school choice means enrolling children in a private (i.e., Catholic) school, rather than in a public one, and both options are available in the neighborhood. Thus, in the Monza-Padova area, the production and reproduction of social differentiation is less relevant, since – in the authors' interpretation – schooling is also strongly related to family life, and benefits from the help and supervision of grandparents, so that leaving the neighborhood is not encouraged and therefore the peers' pressure for children's autonomy is exercised, and felt, to a lesser degree. Rivière and Kosunen close their research by once more underlining the role of school markets “in shaping in a specific way the social differentiation of urban socialization”, but suggesting that the interaction between families, the State and the market in different mixed areas is worth asking further questions given that, in Paris, an “elitist state” with its production of sharp spatial and social hierarchies, threatens local schools and engenders school segregation, while, in Milan a “delegating state” makes local schools still relevant for the organization of daily life, and maintains weaker “the spatial dimension of parental educational strategies”.

In their chapter titled “Trans-/Locally Situated: Informal Educational Processes and the Emergence of a New Urban Civil Society in ‘Post-Migrant’ Berlin”, Jens Adam and Alik Mazukatow present and discuss an interesting and ambitious educational initiative, founded and supported by the descendants of Turkish immigrants to Germany, that aims to improve the school performance and future prospects of their children of Turkish origin (though pupils and students from different backgrounds can also enroll). The chapter is divided in five sections: the first one reports the ethnographic exploration (which is expanded in the third section) of the school

“as an urban site”, where informal educational processes, and involvement with the socio-political dimension of Berlin, take place besides the teaching/learning of the official curricula. In the second section the authors explore the transformation of Berlin urban civil society and argue that it has been re-shaped by the presence of the immigrants, and of their descendants. In the fourth section the authors cast a closer look at the informal educational processes engendered by the intersection between the school and the city, as well as at the various “strategies of social positioning” and the effects that interventions into urban education produce for the socio-political fabric of a “post-migrant city”. Finally Adams and Mazukatow discuss the formative power of migration for the social life of Germany, by pointing out how dominant concepts of “education” and “urban civil society” can be challenged by a civic engagement that at the same time is characterized by transnational affiliations and by a solid local grounding and orientation intending to answer unsatisfactory educational policies.

In presenting the school – that is interpreted as productive of “locality” –, the authors underline how the transnational religious movement founded by Fethullah Gülen, with his attention and care for education, inspired the establishment of the private Gymnasium. The goals were to counter the discriminatory experience of public schooling by children of immigrants, who in Germany as in other European countries are overrepresented in vocational education, and offer equality of opportunity to students who are third or fourth generation Turkish immigrants. The Gymnasium provides an educational alternative to segregated schooling (as the authors notice, local families living in Berlin mixed neighborhoods can choose to enroll their children in schools outside the place of residence) and also offers Turkish language as a regular school subject to students who, after the change of citizenship legislation in 2000, are representatives of the “new Germans”. Nevertheless, the latter tend to remain excluded at the symbolic and discursive level from a national community that has at last come to perceive itself as a “country of immigration”. Borrowing from Stefan Lanz’s scholarly contributions, Adams and Mazukatow see in the concept of *dispositif* an effective interpretive key allowing them to understand the changes in self-perception of Berlin inhabitants: from the national-homogeneous city to the multicultural-differential metropolis to the cosmopolitan-diverse metropolis where diversity is highly valued and the contemporary neoliberal turns of the market stress self-responsibility, that is also fostered in the Gymnasium together with the importance, for the students, of investing in their future. During the ethnographic observations and in depth interviews of teachers, students, parents, Mazukatow witnessed the efforts the school made for conveying – even through the decoration of the building’s interior walls – the importance of achievement and performance. Students subscribe to it, confiding that a good education, enrolment in a prestigious university, meritocracy and self-responsibility can lead to a future satisfactory working position almost by default, and to a social recognition that will repay them of the (direct or indirect) experience of discrimination. For the “social actor” that the school founding association embodies, the most important goals are the improvement of one’s social position and the capacity to transform the urban context, namely to create “urban sites” where formal and

informal educational processes and new modes of interaction with the urban context are enacted. A few more points deserve to be mentioned, namely the co-existence of “strategies of social positioning” with a process of “ethnicization” of the school, the perception of differences as “normal”, and the conversion of a socially constructed minority into a “majority” that, through the association, organizes social events and establishes contacts with the relevant social actors (policymakers, civil society, for instance) so as to realize the associates’ aspiration for recognition and higher visibility within the urban context. According to Adams and Mazukatow, such high educational and social investment can promote and support the demands for social justice, for more and better opportunities for immigrants, for acknowledging the role of multilingualism and diversity both in the national context and in Berlin, as a “post-migrant city”, where “migration” becomes a “perspective on changing societal realities”, and basic notions such as “belonging”, “nation”, “citizenship” cannot be but problematized, especially since the ideals of achievement that structure the self image of the school and of its pupils correspond to the neoliberal concept of the entrepreneurial self.

The chapter by Lorenz Lassnigg on “Urban Education in Austria – ‘Repression’ of the Topic and a ‘Reversed’ Political Agenda” opens with the acknowledgement that “the concept of urban education is not familiar in the Austrian and the wider German speaking discourse either”, and that “not even an expression in the German/Austrian language exists for this concept”. Yet, as the author delves into the complex historical and geo-political and educational mapping of Austria to trace the reasons of such silence, we learn that issues usually connected with Urban Education are in fact present, but misrecognized or, as Lassnigg puts it, “repressed”, owing to the Austrian school policies that have supported the rural regions and overlooked the urbanization processes taking place in the areas around the three more important cities – among which only Vienna has a metropolitan dimension – as well as the reality and effects of immigration. The author’s overall interpretation of the Austrian urban-rural polarity, of the lack of a common perspective in political discourses, and of a common strategy towards effective solutions – all effectively veiling the problems of urban education – results from his keen examination of different, interrelated dimensions, namely

- The distribution and aggregation of population along the urban/rural continuum and the concurrent disregard for the shape and development of urbanization;
- The political conflict historically waged over the Austrian educational structure that allows to understand the urban/rural division from a wider and complex perspective;
- The consequences of the “political (in)capacities” (as the author writes) to tackle the urban education issues; and, finally,
- The impact of immigration on urban education that now suffers from the ensuing political polarization.

The complex federal structure – warns Lassnigg – and the long history of political struggles along urban/rural and left/right lines have hampered the solutions of problems such as the high enrolment of disadvantaged youth in urban common

schools (that can nevertheless provide a route to upward mobility through upper secondary vocational colleges enabling students to access higher education), or the considerable number of academic schools in urban rather than in rural areas, with the resulting inequality of opportunities for those inhabiting the latter. Furthermore, the great agglomerations around the three urban centers appear as hidden from the attention and concerns of citizens who can thus ignore both the social class duality in urban environments and the greater social and educational contradictions obtaining within the urban/rural polarity (for instance, transportation privileging the agglomeration centers, less diverse school provision in rural areas, social and educational focalization on urban youth that entails marginalization of the rural one from political discourses). Somewhat ironically Lassnigg points out that “the rural regions are ‘privileged’ by the distribution of primary school, whereas they are ‘rationed’ in the academic track”, even though the rural schools receive “relatively more resources than urban ones”: thus, if the “reversed political agenda of support of the rural regions” misrecognizes the relevance of urban education issues, a parallel misrecognition of the uneven allocation of economic and educational resources, or of the distribution of upper level schools, and individuals’ opportunities, takes place among the regional and central authorities. As for the issue of immigration, the Austrian author observes how much time has been inefficiently used for the education of an increasingly diverse school population who often ends being enrolled in special schools, or in schools with special needs programs, and whose failure rate is considerable. The reluctance to recognize that, in Austria, immigrants are indispensable for the stability of an ageing population, and the oscillation between a strong assimilationist approach and a multicultural one have hindered the acknowledgement of immigration as a “political object” and, with regard to the schooling of immigrants’ children, the need to identify and implement appropriate language policies for such linguistically diverse school population. Thus, Lassnigg’s concluding reflections on immigration cannot but stress how the factors causing the “repression” of urban education problems (“the hidden agglomeration process, the historical legacies concerning federalism, the political polarization around the lower secondary schools, and the complex and contradictory governance structures”) have also been able to hold off political and practical action towards the immigrants and their children.

The chapter authored by the Italian wom.an.ed collective, and titled “Identity and Diversity: the Educational Challenge in Urban contexts”, focuses on the relevance of, and interplay between identity and diversity in a number of Italian urban and educational contexts that each wom.an.ed member studied through an extensive ethnographic approach. Furthermore, the collective chooses to emphasize the concept of diversity rather than of difference(s), in the firm belief that the former entails a horizontal, non hierarchical plan where the opposition us/them can dissolve (as long as the balance of power allows it) in a multiplicity of memberships related to contexts and individuals’ interactions. Not unlike other European nation states, Italy too has acknowledged that the researchers’ attention to such themes is the consequence of the immigration flows that started to arrive in the mid-1980s and that promoted an unprecedented – though not always effective – engagement of

educators with anthropological concepts (such as culture, ethnicity, processes of cultural transmission and learning, among others), on the one hand, and, on the other, with the discourse and practice of intercultural education, and of social justice. Furthermore, Roma and Sinti groups that have lived for generation in Italy, and hold Italian citizenship, are now approached by educators as culturally and ethnically *diverse* people, rather than as marginal or outcasts (though of course the unjust ways in which too many of them are treated, and the prejudices they suffer from, are denounced), whose specific cultural identity needs to be known and taken into account to realize the children's right to education. The various authors intertwine their methodological and theoretical competence with their engagement in education, particularly in the field of intercultural education, since even when the contribution is not about immigrants, or minority youth and adults, as in the case of Isabella Pescarmona, the schools investigated in Bologna and its province have already become multicultural and it is precisely this initial situation that prods teachers and the researcher to introduce, and test, the cooperative learning approach, known as Complex Instruction, that is aimed to provide equity and inclusion in heterogeneous classrooms. Here, however, Pescarmona focuses on the critical learning and on the identity dilemmas that an educational innovation arises among teachers: as the latter are engaged in creating the conditions for pupils' group working at multi-dimensional tasks and in delegating responsibility of results to them, they have to grapple with the culture(s) of the school taken until then for granted, with a complex educational "architecture" that rests on rigid classroom timetables and unquestioned respect of colleagues' loads and teaching goals, as well as with the children's reluctance, or sheer difficulty to trudge a new way of doing school work and assuming authority. Thus the goal of providing the diverse pupils with equality of opportunities implies for the teachers not only learning to practice a new pedagogic approach, but also, and especially, to critically reconsider their professional identity, the meaning, and manners, of teaching, as well as the social barriers and the (prejudicial) expectations they entail. As teachers start to question themselves *as teachers and engaged persons*, their perception of the classroom and of their role changes (though not always smoothly) and fosters a more problematic and multifaceted individual and professional awareness.

The paragraph written by Rebecca Sansoé deals with the increasing enrolment of immigrant youth in vocational education. Her ethnographic research was carried out in two courses held in Turin and established by the Piedmont Region, and the conclusion she draws from a 2 year participant observation, and in depth interviews to students, teachers and trainers, underlines the crucial relevance of attending to the students' voice (or emic view, in the anthropological vocabulary) in order to understand their decision to continue studying or, on the contrary, to drop out and choose "to do business". In fact, the choice of those who stayed in school and elected both teachers and trainers as their reference points is highlighted – as Sansoé points out – by the step in the opposite direction taken by those peers who soon leave. For the first ones, the educational experience implies not only the acquisition of knowledge and competences, but also a new perspective on themselves, and a willingness to meet both the challenge of the learning process and that of a job, just

as the economic crisis heavily hits Turin and its local small manufacturing firms. As the disruptive global processes impact on industrial production and the economy, the young immigrants' professional capacity and skills on which they capitalize for constructing better prospects (and securing a legal immigrant status and the residency permit) is not only at risk, but their availability to personal and cultural changes is also deeply affected. Thus – points out Sansoé – researchers themselves will be challenged to investigate the influence of global events on these subjects' disposition to transformation and future commitments.

The chapter's section by Paola Giorgis concerns multilingualism in its constitutive relation with identity: the researcher underlines how languages shape and orient people's identities and their (urban, in this case) experiences, on the one hand, and, on the other, how everyone is “the sum of her/his languages ... [which is in turn] the product and the producer” of people's everyday lives. Giorgis' research is carried out in foreign language classrooms where, through the study of a “non-mother” tongue, youth – both of Italian and non-Italian origin – can explore the assumed “natural” connection between languages and the socio-cultural environments, and realize how such connection is a symbolic and historical construction that further benefits from the encounters with, and contributions from other languages. Though she is conscious of young people's “linguistic consumerism” and of how they often subscribe to an uncritical reproduction of marketed cultural and social habits, Giorgis argues for the relevance of such learning process: the appropriation of a foreign language and the practice of cross-linguistic interactions allow youth to cast a different view on themselves and on others, establish new affiliations and elaborate diverse identities, according to the context, the actors, the communication goals. She further invites readers to notice that in so doing, those students – perhaps unwittingly but positively – question the monolingualism and monoculturalism of the school, highlighting instead the intercultural potential of languages, and confirm that “diversity” should be inflected in the plural.

Giorgis' bold interpretation of Italian and non-Italian students' linguistic practices and of the issue of diversity provides a meaningful introduction to Federica Setti's fieldwork findings and reflections on the Sinti minority of Trento, in the NorthEast of Italy. Her ethnographic research was first carried out in a Sinti family – a choice that allowed her to come in contact with the family's teenage daughters – and then in a lower secondary school where the social relations with Gage (as Sinti call the Italian majority) and immigrant peers are more positive than in other Italian school contexts, owing to the awareness of adult and young Sinti that they are effectively part of both the past and present of the Trento area (regardless of the injustice and prejudices they had, and have still to face), as their fluency in the local dialect testifies. As Setti observed and learned, such trans-ethnic dimension of their identity continues to be intertwined with Sinti cultural rules and meanings that are respected and upheld also by the younger generation, notwithstanding its lively involvement with American television series and pop music stars, as well as its virtual “hanging around” the social networks. She interprets the process of Sinti identity construction and faceting through the theories of Ward H. Goodenough (1976) and Harry F. Wolcott (1991) that posit how enculturation is from the

beginning a multi/intercultural learning experience, and that indirectly engender – as Setti remarks – the successive notion of cultural intersectionality as well as the review of the cultural discontinuity paradigm, at the basis of early anthropology of education research. Thus this researcher points out how Sinti youth are, at the same time, enculturated by their families, by the peer groups, and by the culture of the schools, but she also stresses how the latter too often tends to consistently ignore this minority’s cultural and linguistic complexity, or to scale it down through procedures of labelling and categorizing (frequently supported by media reports and ad hoc political claims) that can only produce a short-sighted and essentialistic multiculturalism.

Elisa Sartore, with her final notes on the relationship between “our” Italian history and the history of others, concludes the chapter written by the wom.an.ed collective. She opens those notes by asking how to deal with “the construction of differences and identities from a historical perspective”, and answers by remarking how “it is a historically blind assumption defining diversity – romanticised or problematised – as external and alien to us”, because, as she points out, in the history of Italy those who are (or appear) different from us have always been with us, leaving lasting traces in the urban environment, in the language, in our cultural ways. History is for Sartore the crucial tool thanks to which to approach critically – even ironically – the issues of national identity and diversity, and to understand how they have in time been addressed and constructed – or, more often, mis-constructed. Through her research she aimed not only to re-establish a *just* perspective on the national narratives, but also, and most urgently, to question how certain interpretations and theories (as well as policies) were/are elaborated, disseminated, taken for granted and naturalized in a “dominant” discourse. She set out to collect a number of life narratives from Somali-Italians, a “forgotten minority [that] can be considered as a living legacy of Italian colonialism and postcolonialism”, whose human and cultural alienating experiences, that the narrators had to undergo during their childhood and youth, she analyzed, highlighting their personal strength and capacity to develop a definition of themselves that is at the same time “a statement of belonging” and “a complex representation of (...) their otherness as a multiplicity of identities”. As Sartore underlines, the collected Somali-Italians’ narratives compel “us” to understand the Italian national identity “as a composite one”, and they further invite to complement such understanding by recalling, and once more valorizing, the educational perspective and action of Brazilian educator Paulo Freire, from whom to learn how a transformative educational path can only be attained through dialogical spirit and practice.

Sofia Marques da Silva and Pedro Abrantes, in their chapter titled “Growing up in Europe’s Backyard: Researching on Education and Youth in Portuguese Poor Suburban Settings”, present and discuss a number of researches that were carried out against the background of the current global crisis and that deal with issues (problematic schools in problematic areas, students from families with stories of unemployment, exclusion and even poverty) typically found under the rubric of Urban Education, and that in Europe characterize instead suburban areas, or the urban peripheries. The latter (that in the case of Portugal regard the cities of Lisbon

and Oporto) have both undergone considerable changes as they are now mostly inhabited by immigrants from Africa (many of whom from the country's former colonies) whose children have a high school failure rate or, if older, are overrepresented in vocational education courses, and by those Portuguese citizens who either emigrated from the countryside or moved away from the urban centers, owing to the rising costs of living there. Thus, in the presentation of the research findings, da Silva and Abrantes argue that, notwithstanding the country's investments to promote equality of opportunities, the results are meager, and they will hardly improve soon, given the effects of European austerity regulations, the prevailing neoliberal orientation in Portuguese politics and policies, and the gloomy prospects for the national economy. Then, in underlining the consequences such situation engenders at the social and educational levels, they point out how, on the one hand, a majority of young people seem to express a form of detachment relatively to the hope of making their life conditions and work opportunities (now increasingly temporary or "on call") better, and how, on the other, their decreasing expectations about the future not unexpectedly affect their perception and evaluation of the educational experience and relevance. It is therefore interesting – and even provocative – that da Silva and Abrantes propose to interpret the young people's disaffected disposition through Erving Goffman's theory of "cooling the mark out" that the American sociologist posited to explain the lack "of adverse reactions, which may lead to the collapse of a certain social order". They further notice how, in contemporary Portugal, the acceptance of the situation, by those who are most disadvantaged by it and now no longer exclusively belong to low income families, is characterized by a series of apparently contradictory attitudes – "a growing distrust in authorities and institutions"; subscription to a perspective that stresses individual availability and initiative, speed and flexibility; the idea that young people "have to adapt in their own identity" and downsize their possibilities – that unintentionally justify both the *status quo* with its unbalance of power, as well as their feelings of insecurity and vulnerability instigated, and then legitimated, by current political narratives and actual economic measures.

The final chapter by Francesca Gobbo is about "Bringing up the Babies: Men Educators in the Municipal Nursery Schools of an Italian Town", and translates the concerns and engagements characterizing the field of Urban Education in terms of "participation", a democratic value and a political goal that, with particular regard to the care and education of babies and toddlers, in 1971 prodded the Italian Parliament to vote a law that instituted municipal nursery schools which would, at the same time, provide women with work opportunities, and men with the possibility to bring gender diversity into a "feminized" environment. The author had initially aimed to explore gender diversity at the level of nursery schools (and specifically the municipal ones of Hilltown), but, as often happens with ethnographic explorations, a different theme emerged from the narratives she was listening to, namely the men educators' engagement with their professional role and identity, and their construction in relation to the trajectories of each of them. The latter are approached by first presenting the socio-political context that promoted the nursery school as a public service, at a time of considerable cultural changes in

Italy, and the educational debate and research projects that have since accompanied and enlivened both this institution, its educational practice as well as the (not many) reflective contributions on gender and early childhood education and care by Italian and European experts. Then the men educators' narratives are introduced, and both the common and diverse aspects that characterize the narrators' life and professional career experiences are considered and interpreted. Gobbo highlights the relevance that personal concerns and interests played in each man's construction of his professional identity, the "situated" learning process that most of them underwent, the stress they placed on their *educational role* rather than on gender, even though none of them denied the tensions and conflicts that a man's presence introduces in the nursery schools. In her conclusions the author points out how those educators take pain to underline men's differences, rather than commonalities, and thus to eschew expectations of gender homogeneity (as in fact happened during the early years of feminist militancy), how their "apprenticeship" – as Gobbo dubs the learning "by doing" or "in the field" they evoke – opens up a new area of research on identity and work practice, and how their educational engagement with children so deeply touch their memories and selves that they interpret it as a further, and crucial, learning experience. From the point of view of an intercultural educator as the author of the chapter is, the latter awareness is not only highly meaningful but it can also be an invitation to approach Urban Education from a different point of view, namely by considering how children, in this case, and learners, in general, *contribute* to educators' personal and professional realization.

Chapter 62

Bittersweet Success. The Impact of Academic Achievement Among the Spanish Roma After a Decade of Roma Inclusion

Bálint Ábel Bereményi and Sílvia Carrasco

62.1 Introduction

The Roma in Spain, called *Gitano* or *Caló*, represent the most numerous¹ and most stigmatised ethnic minority that historically has been discriminated against (Laparra 2011; FRA and UNDP 2012). Despite the often stereotyped view, the Spanish Roma,² just like other European Roma groups, represent a highly heterogeneous community in terms of identity, cultural norms, socioeconomic conditions and even language. Unlike other widely studied stigmatized groups, such as those from non-EU international migration, the Spanish Roma may become more or less visible according to their performed phenotype (including clothing style, jewellery, hair-styles, speech). In the past two decades European agencies, institutions, expert bodies and an emerging trans-national Roma civil society have created a new political subject: the “European Roma”, through policies that have developed from a generalist, human-rights protection approach to a targeted, ethnically based one, especially through international political commitments such as the *Decade of Roma*

Authors in alphabetical order. The co-authors share equal responsibility for the ideas expressed in this chapter.

¹Estimations vary. Recently Council of Europe (2010) published 750,000. Others (Laparra 2011) estimate a population between 500,000 and 1,000,000.

²In this article we apply the term “Spanish Roma” to refer to the *Gitano* or *Caló* population, instead of using these latter *emic* concepts, in order to link our contribution to the academic literature of the emergent field of “Roma education”. We will clearly highlight when we allude to other ethnic-cultural groups described by their environment as Gipsy, Sinti, Roma, Cigány, Țigan, etc. collectively identified under the umbrella terms of Roma/Gypsy/Travellers.

Inclusion (2005–2015) and the EU Framework for National Integration Strategy up to 2020 (2011) (Kovats 2002; Kóczé and Rövid 2012). Spain has also had a long tradition of drawing up Roma development plans since the mid-1980s. Currently, the Spanish National Roma Integration Strategy (NRIS) offers impressive educational target figures despite the fact that from 2010 onwards all educational investments – both generic and targeted – have decreased (Laparra et al. 2013, p. 12). Regional Roma plans (e.g. in Catalonia) also need to be mentioned as they are the principal frameworks of social and educational interventions targeting the Roma population in particular Autonomous Communities in Spain. There is a general agreement among experts that schooling is a key element or *strategic area* towards the elimination of the social inequalities experienced by the European Roma population. This idea stems from numerous reports and statistics that highlight the Roma's disadvantaged situation throughout the European countries (FRA and UNDP 2012). Indeed, over the past 35 years, educational and social policy reforms have significantly contributed to improving the social inclusion of the Roma population in Spain. Nevertheless, the gap in school achievement between mainstream Spaniards and the Roma population has hardly reduced (Laparra 2011; FRA and UNDP 2012). Consecutive educational reforms have often been frustrated by under-financing (Carrasco 2004, p. 10). Despite their inclusive and intercultural character, an increasing number of measures have tended to focus on specific populations, such as the Roma or immigrant children in a segregated way (Carrasco 2004) using different terms and professional roles (intercultural mediators, school promoters, professionals in social inclusion, etc.) to work with problematic populations (Carrasco and Bereményi 2013). In the last two decades an increasing volume of educational programmes and projects has emerged, explicitly targeting Roma children and youth, in response to rising European funding opportunities. However, up to now few systematic evaluations of these programmes are available (for an exception, see Bereményi and Mírka 2012), which increases the relevance of any small scale research that gives an insight into them.

Research on Roma schooling has evolved a heated and highly politicized debate among experts, politicians, decision makers, practitioners and the general public, fundamentally in negative terms, highlighting phenomena such as school segregation, underachievement and dropping out. An approach that makes high achievement visible became more than necessary, bearing in mind the risk that providing a biased image of a stigmatized minority may justify the lack of adequate services addressed to them. Recent studies on successful school trajectories among Roma youth (Abajo and Carrasco 2004; Gamella 2011; Bereményi and Carrasco 2015; Brüggemann 2014; Kende 2007; Mendi 1999; Óhidy 2013; Fehér 2015; Feischmidt 2008; Durst et al. 2014; Kriston and Varga 2011; Máté 2015; Székelyi et al. 2005) are revealing a greater capacity to explain the complexity of Roma youth's educational, social and cultural experiences today than previous common approaches. Activists and many school professionals define the positive consequences of school success in terms of empowerment, emancipation and widened opportunities as a

linear process, often failing to reflect on its more complex social and cultural effects. Our analysis aims to refine this view addressing both positive and negative effects at an individual, family and community level from a social capital perspective that draws on recent works on minority, working class groups and may shed new light upon previous and new data collected on academically successful Roma youth. In order to do so, we defined two main research questions that will take us through the analysis. Firstly, we inquired into how social capital is operating in the family and ethnic community, in peer relations and with regards to institutional agents. Secondly, we aimed to identify what sociocultural changes are triggered by academic success.

62.2 From Failure to Success: Shifting Perspectives on Minority Students' Academic Trajectories and the Research on Roma Youth

62.2.1 Minority School Success, Education Research and Social Capital Frameworks

In the last third of the twentieth century most of the research about minorities and education was dominated by different and more often complementary than contradictory paradigms that attempted to *explain failure*, by focusing on students, schools and communities that were overrepresented in underachievement. Certain groups appeared to be permanently challenging the widespread belief that education was unmistakably the key to better job opportunities and the right investment for moving out of poverty, as well as the nation-states' policy expectations of the production of human capital. John U. Ogbu's ethnographic and theoretical work on African-Americans and schooling complicated the pervasive culturalist explanation of the educational situation of certain minority groups by establishing the distinction between what he called 'immigrant' or 'voluntary' minorities and 'caste-like' or 'involuntary' ones and their relations to schooling, shifting the focus to specifically subaltern structural positions of ethicized minority conditions and experiences. The main concern of the cultural ecological framework was to explain differences in minority students' performance and to produce evidence to show how this performance could significantly vary in different contexts (Gibson and Ogbu 1991), identifying societal factors and community forces that could account for those variations. Ogbu's highly "influential and controversial" framework (Foley 2004) triggered the development, not only of major relevant works from similar positions (Fordham and Ogbu 1986; Fordham 1996), but also considerable criticism that tended to focus on variations within the same minority groups in order to identify patterns and conditions that favoured their academic success (Horvat and Lewis 2003).

In parallel, drawing on other outstanding theoretical works produced in the sociology and the anthropology of education,³ an important number of scholars⁴ contributed to the understanding of how different processes of reproduction and resistance were taking place and what kind of impacts they had on the school experiences of immigrant and non-immigrant minority students from highly stigmatised groups. Moving away from underlying deficit perspectives that had often impregnated previous analysis and focusing on processes of subtractive schooling and institutional racism, as well as on the assets and agency of marginalized groups, social capital theories, critical race theory and intersectional analysis addressed their specific as well as common social and education experiences. Especially relevant in the development of this new approach is Stanton-Salazar's pre-eminent scholarship (1997, 2001, 2004) on a social capital framework for understanding how minority working class children and youth and their *support networks*, located in the USA, manufacture both 'hope' and 'despair,' going beyond the conventional interests in isolated elements such as performance, and acting as resources for potential transformation. Stanton-Salazar also recalls the importance of *protective agents* (Cochran et al. 1990; Coleman 1988; Garbarino et al. 1992) as resources related to healthy human development within families, communities and schools and social services that can be highly instrumental for the promotion of some individuals but also may apply selective logics that determine who shall "make it" and who shall not, among them. For students from highly marginalized groups, the "provision of regular, personalized, and soundly based *evaluative feedback, advice, and guidance* that incorporate the thoughtful provision of institutional" (1997, p. 11) becomes essential.

Another essential contribution is Carter's analysis of differences in school attachment and engagement among African-American and Latino youth. Carter (2003, 2005, 2006) challenged and complicated the explanatory power of the "acting white" hypothesis⁵ by focusing on the minority students' capacity to handle and combine what she defines as dominant and non-dominant forms of cultural capital. She notes that academically successful African-American students have *broken the boundaries of this insideloutside world dichotomy*. These "cultural navigators" or *cultural straddlers* understand the functions of both dominant and non-dominant cultural capital and value and embrace skills for participating in multiple cultural environments, including their mainstream society, their school environments, and

³The unprecedented transformation of sociological and anthropological theories of education until today, with the works of Bourdieu and Passeron (1970) in France and Paul Willis (1977) in the UK, has been by far well acknowledged and synthesized.

⁴In the last decades of the twentieth century, emblematic contributions by Fordham (1985); Gibson (1988); Valdés (1997) or Valenzuela (1999) in the US or Gillborn and Safia Mirza (2000) in UK have to be mentioned, although they initially focused on originally immigrant students.

⁵Signithia Fordham and John Ogbu (1986) in their widely cited work sustain that one major reason for academic underachievement among Black youth in the USA is a general cultural devaluation of educational attainment among African Americans, which bases on an oppositional cultural identity.

their respective ethno-racial communities –a conclusion that reinforces Stanton-Salazar’s analysis.

However, other scholars are not so optimistic and emphasize the “burden of academic success” for working class minority youth. Inspired by Fordham and Ogbu, and also concerned with the attribution of “acting white”, Hurst (2007) explores the process of estrangement in attending a 4-year college as it is experienced and managed by working class youth of different (White, Latino and Native American) origins and presents the students’ feelings and reactions in an apparently insurmountable situation of *divided loyalties*. At the other extreme, other authors (Gibson et al. 2004; Conchas 2006), report the disadvantaged students’ attribution of their successful trajectories to their families’ support, values, motivation and upbringing, as well as to schools’ strategies of engaging and promoting minority students who were already performing better and thus creating *school connections* as crucial sources of social capital.

Several studies of academic trajectories of working class minority students of highly stigmatised immigrant backgrounds in different European countries (Pàmies et al. 2013; Shah et al. 2010; Behtoui and Neergaard 2015) have also shown the high value of immigrant parents’ social networks such as religious and cultural associations as vital resources to foster success, as they neutralize the negative effects of discrimination by providing emotional support, positive self-images and friends, and essential information and advice related to educational options. Crul et al. (2012) highlights, among other factors, the importance of positive teacher-student interactions, the support of peers in similar situations as well as the access to alternative routes to further education stages in the education system.

Finally, other dimensions of social capital have been identified as part of the cultural wealth of minority communities’ capacity from the perspective of critical race theories that account for academic success, such as the different forms of capital defined by Yosso (2005) –aspirational, navigational, social, linguistic, familial and resistant capital – that overlap and play significant roles, for example, in creating *cultures of possibility* between different generations within the family. At an individual level, this would be consistent with Côte’s notion of *identity capital* (Côté 1996) such as more complex ways of negotiation, making sense and fitting into multiple, intimidating or unexplored worlds.

62.2.2 Research on Roma Students’ Successful Academic Trajectories in Spain

It was not until the turn of the century that some European researchers turned to some of these theoretical contributions to address the educational situation of Roma children and youth. In the case of the Roma in Spain, it started by re-conceptualizing them as an involuntary minority according to Ogbu’s framework, but also adopting a completely unusual approach to the education of Roma youth, up to that point, by

focusing on achievement and agency rather than on failure and marginalization. It is important to recall that the Roma in Spain only became full citizens of the country with adoption of the 1978 democratic constitution which gave them the same rights and entitlements that advanced the social and political status of all nationals, although exclusion and prejudice remained quite unchanged. At the turn of the century, the vast majority of the Spanish Roma had only recently left behind a pervasive experience of generally precarious, well-intended charitable schooling initiatives, especially those who lived in highly excluded settings. Roma children were also affected by an extensive dropping out of school in poorly equipped public schools where compensatory interventions for limited expectations were the norm. In parallel to massive numbers of international immigrant arrivals since the mid-1990s, a progressive comprehensive school reform was put forward that extended compulsory education until the age of 16. This had devastating consequences for the Roma students who had been increasingly completing the previous compulsory basic education that finished by the age of 14, and the path to academic promotion through post-compulsory options suddenly receded as primary school students now had to change schools and attend secondary schools at the age of 12, a step that many Roma students never took and quite a few still do not take nowadays. Most of the Roma students still appeared to be more disengaged from schools and dropped out earlier than children from immigrant and mainstream backgrounds. However, in spite of all these direct and indirect barriers to trajectories of academic success, practitioners and researchers were aware that some of them, in a variety of situations and settings, were making it.

Abajo and Carrasco's groundbreaking research (2004) was carried out in five regions in Spain that differed in several key elements such as being predominantly urban or rural, with different average income rates and proportion of Roma inhabitants, as well as diverse regional policies in education and social affairs. By reconstructing the social, academic and personal experiences and trajectories of Spanish Roma women and men, the project explored the relative weight of different factors involved in *generating conditions for achievement and school continuity* in diverse social situations, but also the *personal and social implications of achievement and school continuity* for girls/women and boys/men within the cultural strategies of reproduction of their families and communities and the possibilities for additive acculturation processes in contrast to ethnic encapsulation and cultural assimilation. These authors revealed that those successful Spanish Roma youth mostly believed in both effort and luck, because they were confident in their ability. They had had no – or only limited – experiences of segregation, either between schools or within the school, into ability groups and all mentioned having been exposed to high demands and expectations from teachers, regardless of the type of school they had attended. Those individuals who had experienced the most difficult situations in their trajectories highlighted the importance of the personal involvement of certain school personnel in crucial episodes, as well as the critical role of support grants to remain in education apart from free tuition fees, as a key factor in obtaining their families' permission. As for the influence of community forces and the perception of the opportunity structure on their school performance, it appeared to be much higher on men than on women, but equally important on the parents of Roma youth

and young adults, regardless of gender. Finally, gender and ethnic identity re-elaborations were found to be much more important than social class (or socioeconomic position) for achievement and continuity. In sum, although current knowledge would have expected that sustained positive social conditions – commonly identified as integrated positions of families in socioeconomic and educational domains – and strong encouragement would promote greater possibilities of achievement and educational continuity, they could be accomplished in a wide variety of social and personal situations, including extreme poverty, disabled conditions or the lack of a supportive intra-ethnic peer group, provided that certain experiences took place in the individuals' trajectories. More relevant conditions for achievement would appear to be, therefore, those related to teachers' explicit expectations and their early communication of attributed ability to the parents and the students themselves, the participation in an academically-oriented peer group (intra- or inter-ethnic), and the resulting emergence of academic aspirations among parents and students.

The project's findings on the *impact* of achievement and continuity on identity construction and social relations were quite different in weight and content for men and for women. While young women saw academic continuity in relation to a notion of general emancipation of both Roma men and women, young men did not. For Roma boys and young men, achievement and continuity in education implied postponing marriage and having to cope with some accusations of unfaithfulness to expected family duties relevant for the ethnic community. For Roma girls and young women, however, achievement and continuity in education implied several other challenges. They had to learn how to make better use of fewer opportunities than those their male relatives enjoyed but also show good results as a proof of real interest in education while, at the same time behaving in the expected traditional way and coping with responsibilities both at home, outside home and at school. In addition to this, young Roma women had to struggle to postpone marriage or had to face the difficulties of intra-group marriage. Facing these decisions and constraints, some of them were increasingly part of a trend that considered symbolically undesirable alternatives such as marrying out of the ethnic group or ultimately giving up on marriage. In sum, the impact of achievement and continuity obliged young women to make considerable efforts to build a positive Roma identity with no available models while being often accused by community members of threatening or losing ethnic traits and ties, as a considerable body of literature has repeatedly stated in similar situations among subaltern ethnic minorities.

One of the main contributions of Abajo and Carrasco was that they proved how relevant available public resources could be to making academic success and education continuity a real possibility if perspectives of research and intervention changed, especially underlying the sustained commitment to specific allocated resources for low income and excluded social sectors in which they are overrepresented. In 2004, Spanish Roma youth, therefore, seemed to be standing at the crossroads of multiple unexplored paths related to education, gender relations and cultural change that could be simultaneously and successfully followed, provided that certain changes took place in public policies to allow for community participation and development in additive ways.

By the time this study was published, there was a growing interest in success stories among European Roma groups as these stigmatized minority groups were gradually becoming a hot topic in the European policy agendas.

62.2.3 Recent Research on Roma Students' School Success

Research on successful academic trajectories of Roma students and its impact, is scarce, though. Instead of representing a subsample of wider projects, knowledge is mostly based on a purposefully sampled population that is chosen in order to find out what conditions may lead to success and, less frequently, what consequences it may have on young Roma. Qualitative research in this field, in the past 15 years (Mendi 1999; Abajo and Carrasco 2004; Kende 2005a, b; 2007; Óhidy 2013; Fehér 2015; Gamella 2011; Máté 2015; Kende and Neményi 2006; Ceglédi 2012; Kriston and Varga 2011; Durst et al. 2014; Székelyi et al. 2005; Feischmidt 2008) identified individual characteristics and personality traits – with a strong emphasis on resiliency – as well as outstanding interpersonal skills among the successful Roma informants, that facilitate the development of strong adaptive and solution-oriented coping strategies. Overemphasising individual traits, without studying the wider societal and economic environment would be misleading. Thus most of these studies highlight as important supporting factors the family's social and economic background, the experience of an integrated and non-discriminative living environment, a non-segregated schooling experience, emotional support received from family and sustaining good relations with significant individuals, especially teachers and Roma or non-Roma peers, as well as the presence of institutional support structures. A further, often overseen factor, namely, the evolution of certain demographic variables (drastic drop in mortality rate, and more recently, in birth rate in the Roma populations), is also mentioned by anthropologists and social psychologists (Gamella 2011; Székelyi et al. 2005). While all these can be seen as paramount supporting factors, many of them were missing or were present only on a temporary basis in the informants' life trajectory, which suggests, following Abajo and Carrasco (2004), that academic achievement and continuity can be developed in any sociocultural or economic conditions, though with different probabilities. Nevertheless, most of these authors go further, analysing the individual, social and cultural impacts of social mobility through schooling. Mendi (1999) puts the main emphasis on mid-term fatigue (and the corresponding psychosomatic vulnerability) that these Roma students are exposed to due to the repeated adaptation efforts in their school environments. Several studies explore ongoing struggles related to different adopted complex identity strategies (levels and forms of acculturation, class and gender identities); while others (Durst et al. 2014; Abajo and Carrasco 2004) inquire into dilemmas with respect to labour-market integration, life-work balance, couple-choice practices and alternative family models. Authors highlight major gender and social class differences not only in terms of success factors, but also of their individual and social impact. Mendi (1999), Abajo and Carrasco (2004), Durst et al.

(2014) and Máté (2015) explicitly warn us of the often invisible costs of social mobility that may undermine the widely predicated direct connection between continued educational trajectories and the promised positive effects in terms of social mobility.

Further on, our findings aim to contribute an interpretation highlighting how social capital is created and operates in family, ethnic community, in peer relations and also with regards to institutional agents. At the same time we will also reflect on what sociocultural changes are triggered by school success.

62.3 Methods

Our study followed a purposive sampling approach that is commonly applied in the case of hard-to-find populations (Bernard 2011, p. 191), with low social visibility, which applies to Roma youth with academically successful trajectories. To be included in our sample we have searched for *Spanish Roma youth with successful academic trajectories* in Catalonia. Both ‘success’ and ‘Roma youth’ have been defined by objective and subjective criteria. We regarded academic success as ‘school continuity beyond compulsory education stages’ and have complemented this definition with the subjective perception of every young Roma person included in the sample about his/her achievement, not necessarily defined by high grades but as ‘satisfactory performance that enables them to follow further education stages’ in the Spanish education system. As a result of this relative flexibility, our sample has been composed of a fairly diverse population in terms of socioeconomic conditions, family structure and (inter)ethnic composition, families’ and peers’ cultural and social capital, among other aspects. Self-ascription to the Roma (Gitano) ethnic group has been accepted for the inclusion of individuals into the sample, bearing in mind their context-dependent multiple cultural, ethnic, social or ideological identifications (Tremlett and McGarry 2013; Messing 2014).

Our strategy for reaching the target population entailed the mediation of institutional gatekeepers: NGOs in charge of the distribution of scholarships, a Roma NGO with a mentoring project and other Roma and pro-Roma NGOs. Nevertheless, the most important sampling method was chain-referral (Biernacki and Waldorf 1981). All those youth found through institutional agents had some sort of relationship with Roma or pro-Roma NGOs, at least those towards the end of their compulsory schooling. In contrast, many of those identified through chain-referral had only occasional contact with those NGOs, and none of them were employed or contracted by them. It is clear though, that this research could not reach those *invisible* high-achieving Roma that would not disclose their ethnic identity, that live away from recognised Roma communities, or simply live in geographical zones (rural areas, far from capital cities, with poor communication and transport, etc.), that researchers and pro-Roma NGOs rarely reach.

To carry out our analysis, we included cases selected from two sets of samples. The first one corresponds to the ‘pre-Decade generation’ and the data were collected

in 2002–2003 consisting of a set of 25 individuals from whom we selected the 9 richest and most suitable ones for the current analysis. The reconstruction of their experiences and trajectories was widely backed up by ethnographic fieldwork both among Roma communities and in school settings and was part of the first approach this team developed as part of the larger Spanish project coordinated by Abajo and Carrasco. The second set of the sample is composed of 12 individuals and corresponds to the ‘Decade generation’, from which we have selected 7 for the current analysis, having among the richest materials of the diverse types of trajectories collected. They were interviewed in 2014/2015 with the same thorough instruments previously designed and applied in the earlier data collection and in areas with which the research team is familiar after several projects. The interview guide included several sections designed to reconstruct objective data on academic trajectories and encourage reflective narratives from the interviewees upon their own experiences.

In both cases, in-depth interviews were conducted that lasted 70–140 min. Most of the interviewees were met twice in order to allow for further elaboration of some important aspects in their life-paths. In order to guarantee enough diversity within the sets and also some differences due to the time gap, we have strategically picked 16 life-trajectories: 11 women and 5 men; 10 from the age-group of 18–30 and 6 from that of 31–50. Both sets of informants, on average, were in their early 30s at the time of the interviews. Currently, all the interviewees live in urban areas in Catalonia, all but one live close to the city of Barcelona and all but two were also born in Catalonia. Seven out of 16 were born in segregated and stigmatized urban enclaves, four in integrated neighbourhoods with a significant number of Roma population, and five of them in integrated neighbourhoods with no other Roma population. A 12 year gap before and after the Decade’s initiatives⁶ has been designed and implemented, which yields an interesting opportunity for comparison, and we will also attempt to understand both changes and continuities of experiences and trajectories in a swiftly changing economic, social and policy environment.

62.4 Findings

In the following section, we present some relevant findings of our empirical data on academically successful Roma youth. Firstly, we present the two samples, or generations, that we are analysing. Secondly, we focus on the family conditions of our informants. Thirdly, we mention the most important aspects with respect to the school climate and the institutional agents. Fourthly, we highlight the potential of the programmes targeted at the Roma. Finally, we centre on some of the

⁶Again: we do not refer to the initiative of the Decade of Roma Inclusion in the strict sense, but rather to a wide range of policies, programmes and projects that have recently emerged targeting the improvement of the Roma populations throughout Europe.

relationships between school success and sociocultural change, at the individual, family and community levels.

62.4.1 Who Are the Successful Roma Youth?

At the beginning of the twentieth century, commitment of European governmental and international bodies to the inclusion of the European Roma began to intensify, and it finally materialised in a formal commitment called the Decade of Roma Inclusion 2005–2015 (hereafter referred to as ‘Decade’). Spain did not join the Decade until 2009, but it initiated programmes, debates and interventions in the spirit of the emerging European Roma debate. Our analysis includes academically successful Roma youth who completed their compulsory schooling before the ‘Decade’ (‘Pre-Decade generation’), and those whose schooling coincided with the design and implementation of the new Roma-targeted initiatives (‘Decade generation’). Our definition of ‘academically successful Roma youth’ for the Pre-Decade generation was broader and looser, and included young Roma individuals having completed education beyond the compulsory school stages – due to the fact that those youngsters regarded themselves as such, and so did their local communities. In contrast, in the Decade generation, we already had a wider available pool of young Roma university students to select from, due to the changing situation that we further detail later. It has to be noted, therefore, that quite interestingly, and perhaps also inevitably, the construction of a sample by identifying individuals to be included in our specific study has itself produced the first kind of findings. In effect, a narrower and more conventional definition of who the academically successful young Roma are has led us to individuals who share much more conventional trajectories and identities of school achievement and continuity with their non-Roma peers. However, the questions remain as to the relative weight of the different factors that have triggered and materialized their aspirations and engagement.

While in the pre-Decade generation more than half (five out of nine) of our interviewees were born in integrated working-class neighbourhoods, in the Decade generation they are mostly (four out of seven) from segregated, poor, stigmatized districts, brought up in precarious socioeconomic conditions. The latter fact may have to do with improved educational opportunities available to poor Roma children growing up in segregated, poorly served neighbourhoods. It should be emphasised that in the pre-Decade generation we found a higher proportion of interrupted academic pathways, namely those who were forced by circumstances to abandon studies on a temporary or permanent basis. Recently, there have been more young Roma people with a lineal, uninterrupted school trajectory. All the interviewees maintain some relationship with Roma or pro-Roma NGOs, some of them (7 out of 16) have been employed by these, but only one enjoyed targeted support from a Roma foundation during his compulsory education. While in the pre-Decade generation we recognised a supportive role of the Roma NGOs in terms of employment and post-compulsory studies, in the Decade generation a modified influence can be

identified: NGOs get young Roma people connected with pan-European Roma networks providing them, not only with positive elements for forming a European Roma identity, but also with related knowledge, skills and experience. Four out of the seven more recent informants have travelled abroad as part of some Roma related programme, having a good command of English. Finally, it is important to highlight that significant gender inequalities in most of the above-mentioned dimensions have not faded away in the Decade generation, though some new related phenomena have appeared, that will be treated further on. In Table 62.1, we summarize the most relevant data corresponding to our interviewees.

62.4.2 *They Wanted Us to Have the Opportunity That They Didn't Have*

Most of our interviewees are second or third generation rural-to-urban migrants of the 1950s and 1960s. At the time of the interviews (2003, 2015), the informants' families lived in three types of urban context: segregated working class, integrated working class or integrated middle class districts. The analysed cases offer a great diversity in terms of family size, model and ethnic composition, roles and status, and also in gender relations. For example, a shrinking family size is observable in our sample, as opposed to earlier ethnographic studies, as emphasized by Gamella (2011). Interviewees' parents mostly became engaged in unskilled temporary jobs. Construction and the service sector (bars, restaurants, cleaning) are the most recurrent job profiles among the parents of our informants, combined with more marginal jobs, such as itinerant trade or scrap metal collection. Relatively few of them worked in the flea-market on a regular basis or other ethnicised niches, and most of the mothers became involved in mainstream jobs. Parents had sporadic school experience, though in some cases, they attended alternative learning courses as adults. Their own frustrated academic aspiration appears as a recurring central element in the interviews, projected on their children in positive terms. Pilar, similarly to the others, recalls her father in this way:

He had to leave his studies because he needed to help at home. So he always transmitted to me the fact that he could not finish his studies... he wanted me to, well, do what I did. He urged me a lot. [Pilar]

In most of the cases, parents provided care and assistance acting as supportive agents, but having limited information of the school system. Informants' elder siblings and close relatives are also often mentioned as key figures not only as motivating factors but also as the ones who transmit knowledge about the school culture and provide access to networks. However, in several trajectories this was not the case, as an academic orientation is not necessarily shared by those relatives.

My older brother has always been very different from me, very, very different... He was always on the street, well, still he is. He went into school and straight away he left with two

Table 62.1 Main data on the Roma youth selected for this analysis

Sample	Roma youth	Age now	Neighbourhood type	Highest educ achieved	Family ethnic composition	Social Economic Status	High school ownership	School trajectory	Significant institutional agents
Decade generation (2015)	Noelia	28	Integrated, working-class	University	Mixed	Comfortable	Public	Lineal	High-school teacher; Father's colleague
	Eli	32	Integrated, working-class	University	Mixed	Precarious	Public	Interrupted, short-term	Intragenerational support; Trade unionist; Fellow members of a social movement
	Gabriel	30	Segregated, poor	University	Roma only	Precarious	'concertada'	Lineal	Employer where mother works as domestic cleaner; High-school teacher
	José Eugenio	26	Segregated, poor	University	Mixed	Intermediate	'concertada'	Lineal	Primary/High-school teachers; Non-Roma peers
	Sara	24	Segregated, poor	University	Roma only	Precarious	'concertada'	Lineal	Intragenerational support; Employer where mother works as domestic cleaner; Primary and High-school teachers; School peers
	Ainara	40	Integrated, working-class	Upper Vocational	Mixed	Precarious	Public	Interrupted, long-term	Roma peers connect her to Roma university access course
	Víctor	29	Segregated, poor	Mid-level Vocational	Roma only	Intermediate	Public	Lineal	Roma NGO mentors

Table 62.1 (continued)

Sample	Roma youth	Age now	Neighbourhood type	Highest educ achieved	Family ethnic composition	Social Economic Status	High school ownership	School trajectory	Significant institutional agents
Pre-Decade Generation (2002, 2003)	Pilar	37	Segregated, poor	University	Mixed	Intermediate	Public	Lineal	Fathers' politically active colleagues and friends; father's contact person at university
	Mariluz	36	Segregated, poor	Upper Vocational	Roma only	Precarious	Public	Interrupted, short-term	High-school teachers; middle-class mentors at a working place
	Juana	46	Integrated, middle class	Mid-level Vocational	Mixed	Intermediate	Public	Interrupted, dropped out	High-school teacher; entrepreneur father's need for administrative work
	Diego	55	Integrated, rural	University	Roma only	Intermediate	Public	Lineal	Father's friend: teacher in a progressive high-school; Civic servant father
	Óscar	42	Segregated, poor	University	Mixed	Intermediate	Public	Lineal	Father's colleagues (father voluntary worker in non-formal education)
	Charo	37	Segregated, poor	Mid-level Vocational	Mixed	Precarious	Public	Interrupted, long-term	Local pro-Roma organisation
	Rosario	54	Integrated, rural	University	Roma only	Comfortable	Public	Lineal	Intragenerational support (all older siblings achieve high education levels)
	José	48	Integrated, middle class	Mid-level Vocational	Roma only	Comfortable	Public	Interrupted, dropped out	Schooling in Switzerland, in a more liberal atmosphere: supportive teachers
	Natalia	38	Integrated, working-class	University	Mixed	Intermediate	Public	Lineal	Father: politically implicated Roma activist, with good academic and labour market contacts

or three friends to hang around and they spent the whole day on the beach or... well, he would just go into the classroom and he would do nothing. [Victor]

62.4.3 *What I Knew in Eight Grade Was the Same as Someone Who Was in the Fifth or Sixth Grade in a Normal School*

Most of our interviewees began and finished their compulsory school trajectory in public schools. Those coming from comfortable socioeconomic conditions (3) pursued their education in the public system, but all of these lived in integrated neighbourhoods where Roma, immigrant or vulnerable students were not present in any significant numbers. In those families of intermediate socioeconomic conditions (7) school election strategy varied: all of them went to public primary schools, but none remained in stigmatized public schools in the second part of their compulsory education or in post-compulsory stages. Some chose public secondary schools or publicly financed private schools (hereafter: ‘concertada schools’), but predominantly away from their home districts, in the search of better quality and more integrated peer-relations. Among the youth growing up in precarious conditions (6) all but two attended public schools in their own district. Two siblings attended ‘concertada’ schools with a significant monthly fee. The younger sister sums this strategy in the following way:

After all, what I think is that those who value education will go out of the neighbourhood.
[Sara]

Sara’s older brother, Gabriel, changed school five times in the search of “better quality”, until he got admitted to university. Gabriel’s case is that of a pioneer with exceptionally high school mobility, pursuing high academic aspirations coupled with sustained family support with scarce school-related knowledge. In the pre-Decade generation we could not find any Roma who had attended ‘concertada’ schools, while we did in the Decade generation. This picture shows that parents living in segregated neighbourhoods holding high academic aspiration will choose ‘concertada’ schools for their children. As a contrast, Charo from the pre-Decade generation could not count on strong family support and she began primary school in a highly segregated public school. In her interpretation, initial low quality schooling limited her further opportunities both in terms of academic preparation and of labour market aspirations and orientation. Years later, she passed the university admission test, but in the end she could not combine her studies with productive and reproductive roles, so she had to settle for short-term vocational courses.

Like Charo, many other informants mentioned that loneliness was one of the strongest feelings they had owing to being in school together with mistrusting non-Roma peers, and having limited institutional knowledge and skills. This experience however can generate a strongly critical understanding of the society and one’s place in it.

And so, if you are a Roma, and on top of that you are poor, and you live in a marginalised neighbourhood, the very society will shut you out... When I went to school and I said I was from Fountain Hill and I was a Roma... well, nobody would talk to me. [Charo]

Family members, especially parents, were active in preparing their children for these forms of frustration that, they believe, belong to the minority condition. Ainara owes to her mother the development of a strategic capacity of being reserved about entering into any relationship with school peers.

My mother kept telling me: 'You keep silence. Once they know you, then you can tell them you are a Roma [Ainara]

Beyond challenging experiences with non-Roma peers, all informants report having close affectionate relationships with school-oriented non-Roma fellow students, which meant having an opportunity to obtain academic and cultural capital, as well as to receive emotional and moral support. Time spent with non-Roma peers is often described as a continuous intellectual challenge, a process of identification with their values and practices.

I stuck together with a bunch of girls who studied a lot. And I wanted to be like them. Yeah, they wanted to become teachers, or wanted to become whatever, or... Perhaps all those things just passed on to me. I wanted to, I wanted to become something. [Mariluz]

Those were the happiest years of my life, because I felt so good. There, we could have contact with people of special sensibility. And we were only 15 and we were already involved in group debates [Diego]

The explicit or implicit will to befriend the “clever pupils” or the school-oriented ones is sometimes induced through parents’ messages as an unquestioned strategy of acculturation. The importance of school relationships with non-Roma peers is accentuated by the fact that most of our informants never had access to extracurricular activities or membership of formal organisations.

In primary school, many interviewees established caring relationships with the teachers, while the secondary school often meant the loss of this protective, familial environment, and instead they felt a lack of guidance and even fear from more distant teacher-student relationships. Some informants though, reported close relationships with significant high-school teachers who had good teaching skills, strong personal commitment, trust and high academic expectations.

Actually, I did have some teachers who helped me a lot in elementary school. Well, they are the ones who really know you... they did back me up a lot... because perhaps... actually, it's the only support I ever received. Motivating me, like, "you're really worth it, don't stop, keep on going"... Yeah, because I would never hear it from my parents. [Eli]

Ironically, José Eugenio and Gabriel mentioned that teachers’ low expectations and guidance towards low-prestige tracks triggered defiance, decisiveness and resistance, desire to show one’s capacity to achieve, despite negative prognoses.

at the end of secondary school I was given an aptitude test with the Psychologist, and he looks at it, [...] And this person tells my parents and me and my tutor, that I have no chance whatsoever of getting into university, that I should immediately forget about it... That I should forget about university, that I should put the Baccalaureate out of my head, and that vocational training might suit me, but not without difficulties. [José Eugenio]

This latter case, only observed in the Decade generation among those attending ‘concertada’ school, points to students’ academic resilience (Borman and Rachuba 2001). Professional services such as career guidance, that favour middle-class students, may also activate frustrations in ambitious working-class minority students if they operate in a culturally insensitive way. In the observed cases, however, unconditional family support could counter-balance the destructive effects of the career guidance. We can see at this point that eventual school success can be produced in different pedagogic and school models, but initial caring and trustful relationships with at least one institutional agent is a crosscutting aspect, although it is often missing in secondary school.

Interviews also reveal other non-school-related institutional agents that played some role in Roma youth’s academic promotion, as the following examples show (see the full list in Table 62.1). A Roma NGO’s mentor helped Víctor choose the most adequate vocational training. A trade-unionist got Eli involved in an ongoing social movement and indirectly motivated her to return to formal university studies. An old acquaintance of Pilar’s father provided her with a range of information about how the university and scholarship system functions. Mariluz, working in a school canteen, got in touch with a teacher, who connected her with a Roma NGO that immediately enrolled her in a professional training course and offered her a job opportunity. As a domestic cleaner, Gabriel and Sara’s mother gained access to information on the best ‘concertada’ schools of the district, directly from her middle class employer. Natalia’s father, a Roma activist, had a good relationship with university anthropologists who could assist Natalia in choosing the most adequate university course for her. All these *weak* social ties could occasionally function as institutional agents, i.e. agents connecting one with institutional resources and opportunities, sometimes with life-altering effect.

The influence of these institutional agents is especially strong where parents’ own cultural and social capital makes it impossible for them to foster the children’s academic career. In Table 62.1, we can observe that all our informants were given a hand by someone either at an early or more advanced point of their school process: a supporting element or even structures that helped develop and strengthen one’s academic resilience and engagement.

62.4.4 Targeted Roma Programmes

We also turned our attention to policies, plans and programmes explicitly targeted at the Roma population that might have had a direct influence on school success and the academic continuity of the Roma youth. Some of our interviewees highlight the impact of some promising programmes while others demonstrate their limited scope and coverage. These promotion programmes have mostly emerged in the past 15 years, so we expected that they would appear in the Decade generation. Indeed, their impact on those interviewees who could benefit from them was considerable.

A personalised mentoring project run by a Roma NGO and partly financed by governmental funds, aims at promoting successful academic trajectories in agreement with families, schools and the promising students. Only one of our interviewees enjoyed its benefits during and beyond the compulsory school years. Víctor got in touch with the project through her school tutor in a highly segregated secondary school.

When I finished the second year of secondary school, when I began to think about the future... then there was the XYZ Foundation, those were the ones who helped you. Yes, yes... the only ones who I've received support from was the foundation... [During the vocational training] they helped me even more, because they wanted a Roma to achieve... [Victor]

Another measure, a preparation course for the university admission test, targeting Roma students over 25 years of age, has been run for five consecutive years through the Catalan Comprehensive Roma Plan,⁷ which is financed through public funds. It is one of the few ethnically targeted measures that foster access or return to post-compulsory formal education. Interviews suggest that rather than its academic content, it is the relaxed and trustful atmosphere, caring relationships, mutual attention, and the continuous presence of Roma role-models and peers that create its added value compared to ordinary preparation programmes.

I had this, this insecurity within me, of being incapable... Well, it is true that, through the Comprehensive Plan... what I could find there was a lot of support, on the teachers' part. "You can make it!" And also we used to go there together... this motivated me a lot, because we went there together... and then we chatted... Besides, with folks who also liked it a lot, liked to learn and know about history... We always had sort of interesting conversations... about what we studied there. [Eli]

Three informants who participated in the course previously had fairly good academic trajectories and strong school-related motivations, while one had experience of truancy and disengagement from the school system, which shows the mixed profile of participants. Two of those who passed the exam could not take up university studies due to their family commitments. Certainly, reengagement with tertiary studies is challenging under the contrary pressure of academic aspirations and unfavourable conditions.

Other targeted programmes are significantly missing from our interviewees' accounts. The flagship project of the Catalan Comprehensive Roma Plan called Roma School Promotion Programme (SPP) aims to promote Roma students achieving school success and a life-long learning trajectory (Generalitat de Catalunya 2009). Nevertheless, in practice, SPP allocates most of its energy to the reduction of truancy and dropping out, concentrating more on the Roma students who are perceived by schools to be problematic – and hence assigned to the Roma school promoter⁸ – than on the average or high-achieving ones (Bereményi and Mirga 2012).

⁷“Comprehensive Plan for the Romani People in Catalonia” or “Pla Integral del Poble Gitano a Catalunya” in Catalan.

⁸The “school promoter” is a Roma person who acts both as a tutor and an intercultural or community mediator keeping strong relationship with school teachers, families and Roma children both in primary and secondary school.

Our empirical data show that while this and other similar targeted programmes may have a decisive role in certain educational stages and life situations, they are not systematically available to all Roma students, as resources are often designed in terms of the desired outcome (school attendance, better school grades) rather than of a life process. Also, they are unevenly distributed in terms of location, age, school type and educational needs. Access to them tends to depend on the catchment area of the NGOs that execute them. In this sense, paradoxically, living in segregated neighbourhoods and attending highly segregated public schools may be favourable aspects for gaining access to targeted resources. For instance, Mariluz, in her school years had access to mainstream extracurricular activities thanks to her father's willingness to enrol her in English courses and IT classes. However, during the process of gaining access to university and afterwards, she could not find supporting organisations or programmes that could meet her needs.

This and other cases highlight the contradictions related to the allocation strategies of certain targeted services, which may remain unavailable to successful Roma students. Also it makes clear that targeted support programmes may foster individual careers, but do not tend to challenge systemic inequalities, and unjust institutional operation.

62.4.5 School Success and Sociocultural Changes

The highest dropout rate among the Roma occurs in secondary school, with the Roma girls dropping out well before the end of compulsory schooling age. The main motivations behind truancy and eventual dropping out differ by gender. Girls refer more often to "family reasons", that is, their reproductive roles, such as taking care of younger siblings or getting married at an early age; while boys prefer to leave studies to get engaged with their productive role. Family pressure is twice as strong on the girls, as on the boys (FSG and CEET 2013). Our interviewees speak about gendered expectations expressed at family and ethnic community level, manifested in a range of ways: from simple pressure to prohibition, differentiated praise and punishment for good/bad marks; uneven distribution of household tasks or different degrees of support given at post-compulsory stages. Experiences in this sense have not significantly changed between the two generations. Abajo and Carrasco (2004) identified varied family profiles with respect to the (lack of) gendered support provided to their children. Our recently collected data also suggest that girls choose post-compulsory education in worse conditions than boys. For example, Noelia chose a vocational training because her parents did not allow her to travel to a distant university campus where the desired academic course took place. Later on she was forbidden to take a degree in Tourism, as her parents did not like the idea of her travelling away from home. It was only her third attempt, choosing Law Studies at a nearby university campus that was approved by her father. Dropping out or early school leaving under gendered community-pressure may also explain why postponed studies are taken on out of one's own decision more often among women

than among men (FSG and CEET 2013, p. 68). But beyond community forces and family decisions, what is extremely relevant is how young women and men construct their life project, develop strategies to manage difficulties and forge a complex identity that we will reflect on further on in this chapter.

Length of school studies significantly vary in both studied generations, from a post-compulsory vocational course finished at the age of 18, to Master's studies finished at 32, or postponed university studies currently pursued at the age of 40. Nevertheless, we could identify some common factors shared in all trajectories. On an individual level we can observe a wide range of effects of school continuity. A higher level of *acculturation* among these young people is manifested in a critical re-examination, challenge or even redefinition of some shared traditional values of the ethnic culture, with a special emphasis on gender relations.

What I am now, is because I achieved it by breaking the mould, or being like that. Until 18, I couldn't achieve it. [Charo]

Charo did not get married at an expected age, and she got involved in mainstream forms of free-time activities: attending cinema, discotheques and pubs or smoking in public spaces. Beyond mould-breaking individual attitudes, a further important aspect was revealed in the Decade interviews, but not observed in the pre-Decade generation. Through the active discourse production by European institutions, agencies and the third sector organisations, emancipation of the Roma people became wedded to feminist discourses. It can be observed both in online platforms, in public discourses and policy documents. While Roma women already reflected a more emancipation-committed and group-oriented narrative in the pre-Decade generation, now what we can observe – in the younger generation – is men's critical acknowledgment of gender inequality and clear statements challenging women's subordination in their own families, which undoubtedly reflects a more individualistic position.

An increased *autonomy* of decision making also emerges as a process of individualisation within the family in both academic/work and social strategies: i.e. decisions on what to study and what job to take on are less negotiated with family members, as his/her expertise in the changing labour market niches is gradually acknowledged by the family. Also, a certain *flexibility* and *plurality* of the *expected social roles* can be achieved through continued studies, such as the possibility of a delayed marriage or even staying single, without negative social consequences. This latter corresponds to a process of negotiation and conflict-resolution, a gradual social and economic investment in schooling and the adjustment of the assigned social roles to that of the reference framework of the mainstream society. Of course, significant differences can be observed in this process among older and younger siblings or among different family structures that may change throughout the years. The acculturation process is recognised by interviewees to be painful. The disposition to culturally adjust oneself to his/her non-Roma environment may cause suffering because of cultural distancing, questioning one's own loyalty to his/her ethnic environment. Besides, a "bicultural network orientation" (Stanton-Salazar 1997) is an attempt to gain access to different sociocultural universes, in order that one can

maintain networks of protective agents while at the same time crossing borders to reach institutional agents necessary for social mobility.

The personal cost that it means to you... Because it is not only that everybody questions what you are doing or what you are not doing, because in the long run you can always say "well, you know", it affects you, doesn't it? But being so different from your group... it is very hard, you know [Mariluz]

It may even cause a feeling of *inbetweenness* with respect to one's own cultural origin, or solitude within one's own family and ethnic community, especially in late adolescence, when strongly committed friendships are forged.

Of course, when you chat with your cousins... just like with Roma friends, I didn't think about it. But I've always seen that my concerns or the conversations that I wanted to have about school things and things like that... and they didn't have the same concerns... and I didn't feel comfortable with myself [Sara]

Growing up within this negotiated dichotomy becomes part of the identity construction process, which in certain moments may cause confusion or a conflicting self-image. Eli describes it as finding yourself "out of place" or in an "in-between place".

For the Paya [non-Roma] I was the Roma girl, and for the Roma I was the Paya and so I didn't have... I couldn't put myself in any place, and I was always out of place. [Eli]

In the Decade generation a new element appears, due to the connectedness of several informants to events organised by international Roma organisations: a feeling of belonging to a transnational ethnic group.

I consider myself a lucky person that I could get in touch with... with these people [at a European Roma youth meeting in Budapest], and I could learn from them... or to have had access to another vision, well, another concept of the Roma culture" [Eli]

The ritualization of this common belonging as a regular practice (e.g. celebration of the international Roma day, or Facebook posting of daily news on different Roma communities in Europe, etc.) and the identification with an emancipatory discourse on rights, recognition and dignity (reproduced in social media platforms on a regular basis) contribute to the shaping of one's identity as a *contemporary* Roma woman or man with advanced studies; even if these elements still need to be negotiated with their families and local communities.

These dynamics, perceived on an individual level, have direct and indirect influence on family and community. The generalised acceptance of the continued studies and its consequences actively contribute to a process of relative acculturation. This process allows families to combine more open social practices with the use of the culturally relevant symbolic elements and practices of ethnic belonging. Another phenomenon that probably stems from a profound economic crisis is that families tend to assess in positive terms the access to new labour market opportunities through continued studies. However, messages received by Roma students are often contradictory (practices being inconsistent with discourses), which may lead to confusion. As we can also observe in Noelia's case, her family appreciated particular university studies (Law) and in particular places (campus, close to their home),

but other more liberal options were refused by them (Tourism studies, at a far-away university campus). Roma and pro-Roma associations seem to play an active role in the creation of higher labour market aspirations linked to continued studies. Pro-school rhetoric belongs to their positive image-building strategies and potential role-models are actively promoted by them in public events. Ironically they are also active in creating a particular third-sector labour market for successful Roma youth that is mainly sustained through the growing amount of available European funds targeted at Roma-related intervention projects. This phenomenon could be observed in both periods of data collection, but Roma youth taking up professional roles in NGOs have undoubtedly increased in the past decade.

Another far-reaching aspect of the effects of school continuity is interethnic marriage. We have seen that 9 out of 16 successful youth of both generations are descendants of ethnic intermarriage, and 13 of 16 are currently in a mixed relationship (formal marriage or not). Actually, in the younger generation there is only one endogamous marriage – that of Víctor – who had achieved the shortest post-compulsory studies in our sample and has worked in unrelated manual jobs ever since. It is necessary to speak about this phenomenon in terms of both the cause and consequence of school success, depending on the particular social context. Spanish Roma have historically always contracted interethnic marriages (San Román 1994) in spite of proclaimed norms, but when it comes to social sectors with strong aspirations of social mobility through schooling, ethnic intermarriage can be a predictor of school success (Abajo and Carrasco 2004, p. 182). This does not mean that the Roma ethnic belonging or cultural content has any negative effect on studies, quite the contrary. Augmenting levels of social opportunity will increase one's aspirations and will provide further instruments. Experiences of positive intercultural relations, will definitely contribute to those instruments. In other words, following the idea of *accommodation without assimilation* (Gibson 1988) minority youth tend to adopt pro-academic attitudes and other elements of the mainstream culture in order to carry out an accommodation to the basic expectations of the majority society, and at the same time avoiding discontinuities with community and family culture, especially when it may become a valuable social and cultural capital through increased national and international networks.

My mother's siblings didn't change at all in two generations. My mother did. She is the only one who has really changed things. She changed that my sister and I, well, we are not with Roma partners, we have studied and we have further aspirations in life, you know. Without losing our origin! [Gabriel]

Undoubtedly, we must recognise the construction of complex *transcultural identities* (Davidson 1996), based on dichotomies, with aspirations to modify their social role and status both in their ethnic community and in the mainstream society. Nevertheless, the trend for successful Roma youth to contract interethnic marriages may serve as a discrediting factor that may question them as role models for younger generations from a conservative, traditionalist perspective. Notwithstanding this, in practice it shows that relevance as an academic role model will depend on the strength of the actual relationships maintained with the ethnic community, rather than on purity in terms of traditional cultural norms.

62.5 Discussion and Conclusions

This chapter focuses on the academically successful Spanish Roma youth and their complex situation both within their families and ethnic communities, as well as in the wider social environment. Our empirical analysis is based on two data sets taken with a distance in time of a decade, which enabled us to gain an insight into some continuities and emerging new phenomena as far as conditions, dynamics, processes and impact are concerned. Our objective was firstly to understand how social capital is operating in the family ethnic community, in peer relations and with regards to institutional agents. Secondly, we aimed at identifying what sociocultural changes are triggered by school success. Throughout the research we aimed at conceptualising high achievement among Roma youth overcoming limited definitions anchored in the explanatory framework of failure and the compensatory intervention approach.

From a social capital perspective, the parents' and wider family's most active role must be defined as supportive or protective agents. In a context where little school-related experience and knowledge is held by older generations, psychological support, provision of a trusting atmosphere, and the transmission of coping strategies are the most important functions of the wider family. It may create a powerful source of *resistant capital* (Yosso 2005) for the Roma youth with successful trajectories, inasmuch as it may teach them how to prevent and manage different forms of frustration stemming from the mainstream vs. minority power relation (discrimination, racism, classism, low expectations, etc.), in the sense of coping strategies, rather than Ogbu's (1998) "oppositional identity". Beyond that, parents' earlier but frustrated academic aspirations and their later efforts in non-formal or informal education to achieve literacy may also act as strong references to the youth, creating a sort of *aspirational capital* (Yosso 2005). Also, some family members who earlier did "something different" (interethnic marriage or inter-class friendships, divorce, mainstream jobs or outstanding contract terms, international migration, etc.) can become long-lasting *change agents* whose influence is emphasized and appreciated by successful Roma youth. Siblings and close cousins may offer an extremely influential *intra-generational support* that can provide and facilitate access not only to institutional support agents, but also to resource-rich networks and knowledge. All the above mentioned functions and roles that family members can provide seem to have been sustained throughout the past decade. So we could not identify any major differences between the pre-Decade and the Decade generations, in this regard.

As far as relations with non-Roma peers are concerned, they are far too often mentioned as the source of discriminatory, subordinating dynamics in school. Nevertheless, they also appear in school relations as *bridging agents* that provide orientation and aspiration not only with respect to academic projection and information about how to "decode the system" but also with a meaningful, affective content. It is often non-Roma peers who transmit positive feelings about intellectual activities, not just as a necessary obligation to achieve qualifications. Affective relationships among Roma and non-Roma peers have proved to become a strong source of

emotional and moral support: in some of our cases these relationships were essential, for the development of self-esteem and academic resilience, in order to face difficulties. A related phenomenon is that Roma parents with academic aspirations often push their children towards those non-Roma peers that they perceive as academically oriented and “well-educated”: a clear strategy to provide their children with cultural capital elements unavailable at home. A new finding is that Roma peers are also mentioned as active agents in one’s intellectual and academic development, but only in those trajectories where experience sharing among Roma students constituted a purposeful objective of an intervention programme. This phenomenon had already been observed in the pre-Décade generation, but its dimensions have clearly broadened by now. Not only its dimensions but also its impacts must be recognised, as detailed further on. These systematic or one-off encounters with academically oriented Roma peers give room for the reformulation of the idea of what being Roma can be, beyond locally inherited definitions, which is closely related to what Côté (1996) delineated with the concept of *identity capital*. As opposed to the pre-Décade generation, which begun a process of self-identification in positive terms closely linked to local (Spanish, Catalan) school-related intellectual knowledge, the Décade generation has gone beyond these terms, engaging in an exchange with other non-Spanish Roma, and non-Roma minority (gender, immigrant, religious, etc.) and mainstream (youth) groups, thus engaging in the production of new types of social capital based on their global generational experience. Those programmes with a European perspective have been launched and intensified in the past decade and they provide new means of self-identification, both as Spanish and European Roma youth.

We have also learnt new aspects with respect to the institutional agents. Following Stanton-Salazar (2004) we mean by *institutional agents* those individuals or groups who have the capacity to connect one with institutional resources and opportunity structures, even if they don’t belong to those institutional structures. They may be school related experts (teachers, career advisors, mentors) through sustained support, but they may also be non-school-related resource-rich individuals such as acquaintances’ acquaintances with a one-time support.

Teachers or school mentors who maintain an affective, trusting and academically inspiring relationship with Roma students were often mentioned in the interviews. These mentors or tutors are reported to transmit high and realistic academic expectations towards Roma children, communicating it also to the parents. In secondary school, intellectually inspiring teachers can become role-models, and a source of system-related knowledge, although caring relationships are equally referred to as a relevant form of capital among youth (Valenzuela 1998). Beyond individual teachers’ effort, few but significant examples (Mariluz’s Roma-only school as well as José Eugenio’s elite high-school, to recall just two extreme examples) of school models promoting resilience among minority students (Borman and Rachuba 2001) must also be highlighted. Non-school related agents are also present in each and every successful Roma child’s trajectory. This fact highlights the importance of *weak ties* (Granovetter 1973) that may give a significant push to Roma children and youth through one-off advice or by opening up their more resource-rich networks to

allow contact with influential individuals. We identified a wide range of non-school-based institutional agents in Roma youth's life-stories that may trigger life-altering changes, especially where families lack sufficient resources and where schools do not provide children with academic career orientation in an explicit and effective way: examples vary from a trade union activist to a domestic cleaner mother's middle class employer, from an NGO mentor to a father's politically active colleagues. Both pre-Decade and Decade generation Roma youth in our study share the features identified by Crul and colleagues (2012) that create the conditions for educational success, especially the students' capacity to negotiate (directly or indirectly) institutional resources and opportunities. This negotiating capacity of the Roma students who were committed to their own extended academic trajectories was already identified in the pre-Decade generation, but in relation to their own families' acceptance or agreement. Beyond family, school and institutional agents – directly and indirectly related to them – our results suggest that targeted Roma programmes may also create conditions for Roma youth to foster their academic success. In the past decade the availability and relevance of these ethnically targeted programmes have grown due to the increasing amount of European funds available for this purpose and its emerging political relevance. We found that participation in those programmes may become important at different levels and in various ways. It may provide sustained emotional, psychological support and it helps develop healthy and realistic academic aspirations. Also, taking part in it may sensitize school agents through mediation. Furthermore, an often mentioned benefit of those programmes is that they may connect academically oriented Roma youth with similar Roma peers, which provides a relaxed, familiar, comfortable context for catching up with school requirements. But also we found that all these programmes focus far too much on (preventing) dropping out, low achievement and school conflicts while offering less to the average or high achieving Roma youth, especially if they attended integrated schools. Also, these support structures proved not to focus on trajectories but on outcomes, meaning that their main objective is to form a desired student type, rather than to sustain resource-rich support provision throughout the whole academic trajectory. Although these structures have an enormous potential, in our cases they were found to be less efficient in making help available to Roma youth in relatively favourable conditions, situated out of their catchment areas. From a comparative perspective, in some empowering programmes launched in the past decade, young Roma people can find new profiles of institutional agency: mentors, young Roma leaders embedded in resource-rich European networks, political activists, or volunteering university students. These new structures and programmes hold a strong potential to link Roma children and youth to a wide variety of networks, previously not available to them. Additionally, wide-spread access to Internet, especially social networking (facebook, Whatsapp, etc.), has intensified all the above mentioned potential as well as favoured individuals' capacity to invest in alternative, non-locally forged Roma identity formation, i.e. the increase of one's *identity capital* (Côté 1996). Another important finding related to the supporting programmes highlights the increasing role of the Roma and pro-Roma NGOs, not only

as implementers of the above mentioned projects, but also as creators of a widening labour market niche for the highly trained Roma youth.

Finally, the second main question in this research was related to the sociocultural changes triggered by school success: additive acculturation, agency, ethnic belonging and gender differences. Acculturation process is often reported by our interviewees as a painful transition through cultural distancing from one's ethnic group towards a bicultural network orientation, through feelings of *inbetweenness*. Far from underrating the acculturation struggle, we have found that in a context of an emerging pan-European Roma identity – that has been promoted in terms of empowerment and emancipation through active social participation – the Roma/non-Roma dichotomy has been gradually substituted by a more complex intersectional understanding of what it means to be a Roma young person. Accordingly, group variation is due to an intersectional reality of socialization that is conditioned by gender, social class, race (meaning here phenotypical appearance) and ethnicity, among other significant factors of inequality. Our findings show, too, that the Decade generation is, to a certain point, leaving behind bitter dilemmas grounded on a dichotomy of loyalties when engaging in uncommon social and cultural paths regarded as non-traditional in their communities of origin.

Academically successful Roma youth must also be recognized as active change-agents within their families and ethnic communities; as cultural brokers, who may exercise their influence in taking on a wide variety of roles: such as *role models* for a younger generation; as active political or public participants; as professional experts (intercultural mediator, school promoter, health mediators, Roma NGO professionals, Roma researcher, among others), to mention but some.

As we previously saw, a positive sense of Roma ethnic belonging has gradually become a more plural, and a more complex experience than before, especially through the European embeddedness of the process as well as its exposure to academic expert debates. The Internet and social networks have made it possible to connect minority experience to a wider emancipatory discourse often created by academic activists, but actively absorbed and sometimes critically contested by Roma youth activists. Roma activism discourses (and often the objectives of those European programmes) have gradually become permeated with intersectional approaches and awareness-raising by including critical feminist analysis. As a result, the successful Roma youth of the Decade generation seem to show more awareness of the structures of inequality in a global sense, than were those of the pre-Decade generation. Beyond exposure to different discourses, men and women from each generation also produced different interpretations of their lived experiences. Therefore, the key issues related to the academic success of the Roma youth can only be fully understood within an intersectional framework (Collins 1999).

The past decade explicitly devoted to the inclusion of the Roma has not fulfilled high expectations, for it has not triggered a systematic change in resolving a series of conditions conceptualised as “the Roma problem”. Nevertheless it has clearly made a difference in the way academically successful Roma youth think about themselves and their future socioeconomic possibilities, even though the question remains as to how the current access of this Decade generation of Roma youth to the

ordinary labour market will have improved at a time of higher labour market competition, a situation that may render the aspirations and efforts of these young Roma students unfortunately bittersweet.

Chapter 63

Trans-/Locally Situated: Informal Educational Processes and the Emergence of a New Urban Civil Society in “Post-Migrant” Berlin

Jens Adam and Alik Mazukatow

“Our children shall not work as cleaners in their future” one manager of the private grammar school “Friedrichsdorf Gymnasium”¹ summarizes the objective of the pedagogical work at this institution. Located in a north-western district of Berlin, the school represents the most ambitious project of an educational initiative, which was founded by Turkish migrants to Germany or rather by their descendants. In the 1990s this initiative started to establish tutorial centres in the city, which have ever since been offering additional classes in the afternoon for pupils to improve their school performance. Later on, elementary schools, day-care-centres, a secondary school and finally the grammar school – which leads its pupils to the German university-entrance diploma “Abitur” – were established. Even though all these institutions are open for everyone, who is willing and able to pay the fees, and even though the instruction follows accurately the officially adopted curricula of the authorities of Berlin, the schools are mostly attended by students with a Turkish background.

63.1 Line of Argument

This private school, the very specific composition of its pupils, the initiative’s relations with the city as well as its position within the urban educational settings constitute the starting point of our examination. For this article, we take the Friedrichsdorf

¹ In order to secure a certain level of anonymity for their research partners the authors use a pseudonym to designate the school focused in this article.

Gymnasium as an urban site and an ethnographic case study to combine two interconnected analytical perspectives: firstly, we will illustrate the practice and significance of *informal educational processes* taking place in this school beside the official curricula as well as characterizing the school's supporting association's activities to navigate through the socio-political fabric of the city. Building on these observations, we will secondly explore the current *transformation of the urban civil society* in a city, which is incrementally reshaped by the permanent presence, the increasingly differentiated contributions and growing claims of "migrants"² and their descendants. In other words, in this article we would like to scrutinize the shifting relations between "urban education", "migration", and the "socio-political fabric" of Berlin taking the civic engagement of one specific educational initiative as analytical and empirical starting point.

For this purpose, we will begin in the *second section* with an introduction of the school as a clearly locally situated, but transnationally connected urban site. We will argue that discriminatory effects of the public schooling system and the – often critical, sometimes supportive – media coverage have to be taken into account. As contexts of how locality is produced at Friedrichsdorf Gymnasium and as determining factors for the civic positioning of the school's founding educational initiative those aspects play a crucial role in constituting our field.

In the *third section* we will display the broader picture: We will examine the most significant shifts concerning public debates about and political approaches toward the continuous presence of "migrants" in Germany as a whole, and especially in Berlin, that took place over the last decades. In a following step we will introduce two important contributions of contemporary German "critical migration studies", which we consider as useful to illuminate our empirical case: on the one hand an analytical focus on the emergence of new urban sites and spatial practices brought into being by "migrants"; on the other hand the conceptualization of Germany as a "post-migrant society", in which everyone, and not only migrants or their descendants, is affected by the effects of migration.

In the *fourth section* we will take a closer ethnographic look on the respective school as such a new urban site and especially on different informal learning processes taking place in this social setting. Hereby we will focus mostly on two aspects: firstly, the visual dominance and practical relevance of "ideals of achieving" in the daily life and the institutional self-image of the school; secondly, the moments and constellations of an internal "everyday-ethnicization", which we will relate interpretively to the aforementioned discriminatory effects of the public educational system.

In the *fifth section* we will discuss informal educational processes emerging at the intersections between "school" and city": mostly we will analyze several "strategies of civic positioning" developed and applied by the school's supporting

²We put "migrants" in quotation marks to point out that we consider this term as a socially constructed category, which is still widely used in public discourse, for instance, to denote children and grandchildren of migrants, even though they were born in Germany and thus have not migrated personally.

association to become visible in, and to navigate through, urban contexts. Most notably we will distinguish between strategies to project futures, strategies to produce urban sites and strategies to create “webs of overlapping commonalities” (Schiffauer 2009). Hereby we hope to illustrate some of the spatial and political effects of that kind of interventions into urban education for the socio-political fabric of a “post-migrant city”.

In the concluding section we will connect our empirical observations to current debates about the formative power of migration on the very fundamentals of social life in Germany. We will discuss how dominant concepts of “education” and an “urban civil society” can be challenged by a civic engagement that on the one hand is clearly inspired by transnational references and affiliations, but on the other hand has a clearly local grounding and orientation – not least in trying to fix some of the deficiencies of official education policies.

63.2 A Locality and Its Contexts: Media Reactions, Transnational Affiliations, Discriminatory Effects, and the Promise of Socio-economic Advancement

63.2.1 *The Production of Locality*

To begin our argument we would like to introduce the Friedrichsdorf Gymnasium as an urban site. To study everyday life and get the picture of how the school is constructed as a social place Arjun Appadurai’s perspective on localities has proven helpful. Appadurai distinguishes between locality “as primarily relational and contextual rather than as scalar or spatial” in contrast to neighbourhoods which „refer to actually existing social forms“ (Appadurai 1995, p. 204). Hence, locality refers to the social production of place in relation to a specific contexts, production which generates and requires contexts at the same time (see *ibid.*). Asking about what processes of social construction lay behind a locality, helps us to understand the informal educational processes taking place here.

As we will point out later the same contexts producing locality at Friedrichsdorf Gymnasium also delimit and form possibilities to act within the city for the school’s supporting association: as an urban actor, this association is constantly developing navigational capacity to cope with structural conditions and obstacles while adapting their aspirations towards modifying them. But now we will turn to the relevant contexts which we consider to be the location of the school premises, the transnational affiliations of the school and its’ supporters, the discriminatory effects of the public schooling system, and the media reaction to this founding.

63.2.2 The Friedrichsdorf Gymnasium as an Urban Site

Friedrichsdorf Gymnasium is located in one of Berlin's most western districts. Away from the residential areas next to a garage of the local bus company there is the extensive area harbouring the Gymnasium and the adjacent "Friedrichsdorf Middle School". In what used to be once premises of the British Army and later of the German custom office today 210 pupils are striving for the highest degree German school system offers. One red brick building with most classrooms facing a canteen, a gym, and a recently built house with state of the art classrooms for the science courses are the centre of school life.

The school has a lot to offer including extra coaching classes in the afternoon and educational recreational activities such as guitar lessons and creative writing for the school journal. Pupils, teachers or parents refer to the better or more convenient learning conditions to explain why they chose this school: it provides decisively smaller classes with only 12–20 pupils and more intensive, almost personal pedagogical supervision than public institutions; it has a good reputation concerning discipline among pupils and offers, not least, Turkish as a regular school subject. In spite of attempts to change this composition nearly all of the pupils are of "Turkish origin" or "German-Turks" as many would coin it. As third or fourth generation in Germany neither the media or most of the Germans who consider themselves ethnically German nor the pupils themselves are ready to call themselves outright Germans without hyphen or addition. One reason often put forward by critical media reports to explain this specific composition are the school's affiliations to a transnationally active religious movement. But an ethnographic perspective can illustrate that such religious references remain rather discreetly in the background during day-to-day life and don't seem to be the main component to explain the school's attractiveness among the city's vibrant German-Turkish community.

63.2.3 Between Religious Affiliations and the Promise of Socio-economic Advancement: The Local Grounding of a Transnational Educational Initiative

Looking at the school's supporting initiative, however, *religious affiliations and the transnational connections* are striking: The founders, which have established a supporting association as organizational framework for their activities, indicate the Turkish, but US-based Imam Fethullah Gülen as a most significant source of inspiration. Besides his recent conflict with former Turkish prime minister and today's president Recep Tayyip Erdogan and his political followers, Fethullah Gülen³ has gained a broader attention for his specific version of a at once conservative and

³ <http://www.theguardian.com/world/2016/jan/07/turkish-prosecutors-life-sentence-cleric-coup-plot-fethullah-gulen> (last access: 5th of February 2016).

moderate Islam, which seeks avowedly to reconcile “religion” with “modernity” and has committed itself to inter-faith-dialogue (Ebaugh 2010; Hendrick 2015). His catchy plea “build schools, not mosques” was taken up by followers all over the world – today more than 1,000 schools in a high variety of countries are attributed to belong to the transnational network of the “Gülen movement”, each of them having their specific local groundings, connections and meanings.

But these religious affiliations are just one aspect to explain the local emergence of this transnationally inspired educational initiative and the composition of its pupils: most significantly the school promises to supply the basis for successful professional careers and offers hereby an appealing alternative to a public educational system, which is regularly blamed by parents and researchers alike for its *discriminatory effects* towards certain social groups or migrant communities. Pundits most often point to the traditionally three-tiered school system in Germany, which selects children as early as in the age of 10 – allegedly according to meritocratic criteria-that has however proven to be a key factor in reproducing social structures and inequalities (Gomolla and Radtke 2002; Wellgraf 2012). Put simply, children of academics attend disproportionately often the prestigious “Gymnasiums” that qualify their graduates directly to study at universities, whereby working class children are clearly underrepresented in these institutions. Similarly the latter constitute the majority of pupils visiting the “Hauptschulen”, which were originally aimed at preparing young people to take up so-called lower qualified jobs in industry or agriculture. As an effect of labour migration to Germany since the 1950s an ethnic component was added to this selective system: the descendants of these migrants, which came as industrial workers or refugees to Germany succeed decisively less often to be accepted as pupils of a Gymnasium than their contemporaries without such a “migration background”. By implication they are significantly overrepresented in the remaining school forms, where they are often confronted already as pupils with the little options the labour market has to offer to graduates of these institutions in a meanwhile largely deindustrialised city like Berlin (Wellgraf 2012).

Despite such empirical findings and despite different educational reform projects it turned out to be socio-politically difficult to change this selective system fundamentally. Attitudes and practices of the established academic middle classes to preserve these three-tiered structures are often put forward as part of an explanation: In 2010, for instance, the electorate of Hamburg rejected in a referendum the proposal to extend elementary schools to the age of 12 and to postpone consequently the moment of division of the pupils to the three different types of school by 2 years – a result which was mostly due to the high mobilization of the mentioned stratum. And in Berlin a rather informal behaviour has been frequently discussed in local media, politics and academic articles alike: many middle-class families living in the multi-ethnic, diverse inner-city neighbourhoods make every effort to enrol their children in schools outside their own districts as they consider the high percentage of migrants as “harmful” for the education of their children (Karakayali and zur Nieden 2014; Partridge 2012).

Representatives of the supporting association, teachers or pupils of the Friedrichsdorf Gymnasium refer regularly to their own experiences with a discriminatory educational system to explain the existence of the school in the first

place or their individual choice to go there. From this perspective the foundation appears as an act of civic self-empowerment of a presumably disadvantaged group to counterbalance some of the deficiencies of public schooling in Berlin. Accordingly one employee of the supporting association mentions the “ordinary people’s ambition for advancement” as the elementary driving force of such educational initiatives.

Media reports oscillate between presenting the school as an ambitious educational initiative and questioning the local legitimacy of such transnationally affiliated projects. Especially the association’s connections to the transnational Gülen network lead regularly to critical articles in the German press: Some journalists even called out for the domestic intelligence agency to investigate (*Der Tagesspiegel* 21.10.2004) because – as goes the argument – it was not clear whether islamists have taken Berlin Senate by surprise. In this article the author suggests that due to the school’s supporting association’s close connections to the – allegedly undemocratic – ideas and beliefs of Fethullah Gülen, the founding of the school should be under scrutiny. The underlying assumption is that an organization founding a school and being close to a Muslim Imam would adopt his thoughts completely and aim to transfer them unbowed to their school. No translation processes into a specific local context or negotiation processes with local educational authorities are taken into consideration.

The influential periodical *Der Spiegel* insinuates about Gülen being head of a virtual criminal network by publishing an article about his movement under the title “The Godfather” (*Der Spiegel* 32/2012). In contrast to the allusion of being the leading character of a mafia-like web Gülen knew how to present himself as a Ghandi, or so the article says. It insists on two sides of the movement: one being worldly and open and one being secretive. It states that Friedrichsdorf Gymnasium’s good reputation is one of the successes of the movement, although one does not know exactly what business lurks on the shadowy side of Gülen. It strikes again that the Gülen movement, the school and its supporting association are seen as representing one identical set of thoughts and beliefs. The local legitimacy of such educational initiatives is questioned not only by the assumption of illegal practices, but by the constant references to a faraway power centre, which attempts to realize its nontransparent objectives in a parallel world. It has to be mentioned that supportive articles can be found as well in German media. For instance weekly newspaper *Die Zeit* states that “Allah’s eager strivers” (*Die Zeit* 08/2010) can realize their ambitious objectives in these schools. The transnational affiliations are mentioned, but the description of a locally grounded educational initiative in which Gülen’s ideas do not play a big role in everyday life, constitutes the leitmotif of this article. It consequently allows a difference between Gülen’s doctrine, the activities of the local organizations of a transnational movement and the schools founded by those organizations.

A completely different picture is suggested by newspaper *Zaman Avrupa*. Part of the extensive media network affiliated to the Gülen movement the European branch of Turkey’s most popular newspaper publishes a German edition in Turkish language with extensive coverage of Friedrichsdorf Gymnasium. For instance, the school is

discussed in relation to the 50th anniversary of the binational agreements between Turkey and West Germany to send workers to support West Germany's by then boosting economy. The positive development of the school is stressed and being assessed as a success of the Turkish community in Germany. Fethullah Gülen is not mentioned once (*Zaman Avrupa* 16.06.2011).

As a way of introduction we presented the local situation and specific character of the Friedrichsdorf Gymnasium, its transnational religious affiliations, discriminatory effects in the public schooling system and some exemplary media reports. We consider these aspects as relevant aspects for the relational and processual production of the school as an urban locality and conditions for different informal educational processes. Before we have a closer ethnographic look into daily school life in section III, we will turn to the broader frame of the founding of such a school and discuss some of the most important changes in the perception and handling of "migration" in Germany and Berlin.

63.3 Shifting Grounds: "Migration" as an Object of Public Debate and Critical Research

63.3.1 *Discursive Paths: Germany's Reluctant (Self-) Perceptions as a "Country of Immigration"*

It took quite a while until German society in its majority was willing to perceive Germany as a "country of immigration" (Mannitz and Schneider 2014). At least until the late 1980s public and political discussions were dominated by positions picturing labour migration as a provisional phenomenon responding to temporal economic needs. Against the backdrop of the historically established and widely naturalized self-image of the German nation as a homogenous ethno-cultural community, with precisely definable boundaries of belonging, migrants were predominantly classified as "external" or "strangers"; their continuous presence in Germany was often estimated as potentially "problematic".

Only when it became obvious that the so-called "guest workers" stayed for decades, had and raised their children in Germany, founded businesses here and left diverse traces in urban life, these established patterns of perception were set slowly in motion. Voices that pictured immigration as enriching for the country gained in importance. Questions concerning the permanence or the scale of immigration as well as the legal, societal or cultural status of migrants became matters of political contestation and heated public debate in the 1980s and 1990s. As a most relevant consequence the nationality law could be substantially modified in 2000 – still against the strong opposition of the political right. By these reforms, the traditionally dominant "jus sanguinis" as the defining factor of a German citizen was supplemented by elements of the "jus solis". Thus, since these changes children born in Germany having non-German parents with a permanent residence status could

receive German citizenship automatically and were not any longer legally categorized as “strangers”; simultaneously the hitherto protracted process of naturalization was shortened and simplified. As an effect the idea that you can become a German – and consequently that you don’t need to be born as one – has spread over the years. In other words, the construct of the nation as a “pure community of descent” has been slowly but steadily undermined from its margins.

That is not to say that the older positions and perspectives – concerning the elementary “problematization” of migration, the exclusive emphasis on demographic or economic needs to legitimate it or the evocation of an ethnically defined nation as “normal” or desirable state of affairs – have disappeared from public debate. Complaints about an allegedly missing “willingness to integrate”, to “arrive mentally”, or to learn the German language are still regularly invoked as motives in media and political discourse just as an expressed concern about the formation of so-called “parallel societies” (*Parallelgesellschaften*) of migrant communities putatively lacking sufficient connections and overlaps with the German “majority society” (*Mehrheitsgesellschaft*). Simultaneously the “new Germans” are continuously confronted with discursive or symbolic exclusions from the national community, with racializing representations and institutional discrimination in schools or public authorities. In a nutshell, in the year 2015 debates about migration turn out to take place in a dynamic field of contestation, in which different patterns of perception and political rationalities operate in parallel. But undoubtedly relevant shifts in societal patterns of perception and the legal framework can be recorded on a national level, which put the foundation of a private school by representatives of the Turkish community in Berlin in another context than some decades ago.

63.3.2 *An Urban Society Remodelled: Changing Discourses and Political Regulations Focussing Migration to/in Berlin*

Concerning the city of Berlin itself even more significant changes took place. In the following passage we will draw mostly on the work of Stefan Lanz to shed light on remarkable shifts of the dominant discursive formations and logics of governances focussing “migration to/in the city” over the twentieth century (Lanz 2007, 2011, 2013) – insights we consider as essential to understand the position of pupils with “a migrant background” in the city’s schools as well as of an educational initiative of Berlin Turks in the urban civil society.

Following Michel Foucault (1994), Lanz uses the concept of *dispositif* as his analytical frame to illustrate the successive emergence of three different structuring patterns to perceive and handle the influx of people and the presence of “otherness” in the city. The term *dispositif* denotes a “resolutely heterogeneous ensemble of discourses, institutions, architectural arrangements, policy decisions, laws, administrative measures, scientific statements, moral and philosophic propositions”

(Foucault quoted in Rabinow 2003, p. 51), which are assembled to deal with demographic, economic or political developments noticed at a given time as “problematic”. Thus *dispositif* can be understood as “a device of population control and economic management composed of otherwise scattered elements (...) that coalesce in particular historical conjunctures” (Feldman 2012, p. 15). As Lanz shows, sustainable shifts or the emergence of a new *dispositif* can normally be traced back to moments of crises in which the previous, hitherto established one comes under pressure due to fundamental economic or political changes (Lanz 2011).

According to this analysis the first *dispositif of the national-homogeneous city* came into being as a consequence of the foundation of the German empire in 1871 and – generally speaking⁴ – structured public representation, political attitudes and administrative measures towards migration in Berlin until the crisis of urban governance technics of post-war welfare state in the late 1970s. It was built on the widely naturalized urban imaginary of a culturally, ethnically and nationally homogeneous population and categorized “difference” almost exclusively as “external others”. The hierarchical (racial) division of migrants into “worthy” and “unwelcomed” groups, the sole dominance of the interests of the receiving economy, the establishment of restrictive regulation measures and the articulation of worries about an upcoming societal disintegration were key elements of patterns of action and perception guided by this first *dispositif*.

Mostly due to political and economical shifts taking place since the late 1970s as well as to altered perceptions concerning the permanence and the composition of immigrant groups this first apparatus came under growing pressure. Especially since 1981/1982 – when changes towards conservative governments had taken place on the national and on the urban level alike – it was gradually overlaid by the *dispositif of a multicultural-differential metropolis*. City authorities and the urban public began to perceive cultural diversity as “enriching” and a potential for the economic development of the city. An essentialist notion of culture – as it has been common in Germany since the nineteenth century – was expanded towards migrant communities, which were henceforth conceptualized as internally homogeneous and culturally delimitable. Simultaneously forms of migrant self-organisation were increasingly supported as constructive civic engagement towards social integration in a city, which was economically fundamentally transformed by deindustrialization and growing unemployment. Another urban imaginary came into being: Berliners

⁴Due to the specific object of study and the analytical focus of this article we will not deepen at this point the examination of the manifold breaks, which characterize German history and which include war, dictatorship and genocide. For the purpose of this article we just want to record briefly the point of origin to emphasize the changes that took place since the 1970s concerning the ways how migration to/in Berlin were perceived and dealt with by urban politics and society. Nevertheless we would like to record that we follow Stefan Lanz and others in their assessment that institutional racism, bureaucratic acts of exclusion and the perception of “migrants” as racialized others were kept intact through different political systems – even though the national socialist dictatorship (1933–1945) radicalized these, like many others, features doubtlessly. Beside the mentioned contributions of Stefan Lanz the study of historian Ulrich Herbert (2001) on the history of policies on foreigners could be consulted to deepen these questions of continuity and break.

started to perceive their city as a lively metropolis, composed of different culturally defined and internally integrated communities under the umbrella of a still hegemonic and rather essentialist concept of German mainstream culture.

Roughly at the turn of the millennium a second shift to the *dispositif of the cosmopolitan-diverse metropolis* took place and can be attributed again to political and economic changes: on the one hand the already mentioned reform of the national citizenship law contributed to an altered self-perception of the German society and made the inclusion of “difference” more likely – especially as the newly elected left-wing city government was willing to campaign actively for naturalization. On the other hand new types of hybrid diversity and more flexible forms of temporary mobility became more and more visible in daily urban life. The previous leitmotiv of the city as a mosaic of delimitable, rather stable and co-existing communities proved difficult to sustain. Simultaneously – despite ongoing high unemployment and weak public finances – a modified media representation of the city as an exciting, creative, liberal and internationally connected metropolis emerged and suggested new potentials for economic dynamism in the upcoming “creative industry”. For the purpose of this article two consequences of this third *dispositif* are central: firstly, city governance was progressively guided by the new self-image of a metropolis composed of “super-diversity” (Vertovec 2007; Meissner and Vertovec 2015), which replaced gradually the hitherto concept of a bipolar opposition between an ethno-cultural majority of the “Germans” and the immigrated “others”. Secondly, neoliberal turns in social and labour market policies on national and urban level found expression in an ever stronger emphasis on self-responsibility with regard to secure one’s livelihood. Migrant communities, which are demonstrably discriminated on the labour market, have been increasingly confronted with the request to fulfil better their economic potential and to invest in their own future. “Empowerment” and “education” have become key metaphors of the new urban discourses and city policies dealing with the consequences of migration and an increasingly diverse population, which progressively breaks with the idea of an ethno-cultural majority.

Even though an impressive line of development becomes apparent, Stefan Lanz points out that the two older *dispositifs* have not completely disappeared. Especially in moments of crisis or when drastic events – like terrorist attacks – dominate the contemporary global information flow elements of the two actually overcome patterns of action and perception can reemerge in city politics or media reports – in other words: the representation of “migrants” as “problematic”, “threatening” and racialized “others”, references to bipolar patterns of perception that divide between a “German majority” and “ethnicized minorities” or the questioning of the judicial and political status of migrants remain options in the public discourse. Notwithstanding the city government’s enhanced acceptance and promotion of “diversity” or its increasing claim and support of “self-empowerment” and “education” define more favourable conditions for the civic project of a private grammar school founded by an educational initiative of migrants.

63.3.3 A “Post-Migrant Society”?: Analytical Perspectives of “Critical Migration Studies” in Germany

As a reaction to the longer established and still regularly reactivated forms of representing migrants as “problematic”, “strangers” and “temporary” a “critical migration studies” has emerged inside the Social Science and anthropological disciplines to propose new analytical perspectives on migration in/to Germany (Hess et al. 2009; Labor Migration 2014; Hess and Näser 2015; Römhild 2015). For the purpose of this article we consider two of these positions as particularly relevant:

A first line of research has aimed to present counter-images to these established modes of representations by focusing on the so far hardly perceived everyday life in cities, where the presence and the handling of “diversity” had already become a self-evident daily routine. Several researchers analyze the “*transnational spaces*” that have been emerging especially in these urban neighbourhoods in which migrant communities often outnumber citizens with a “German” origin. Regina Römhild, for instance, speaks about the formation of different “sites of opportunity”, which are co-produced by interacting young city dwellers in such different urban locations like fast food restaurants, shopping malls, in multi-ethnic school classes or youth centers (Römhild 2015). At these places chances open up to develop transnational connections, biographies and self-conceptions beyond the “integration demand” and the still powerful ethnicizing categories of German state policies and mainstream society. According to Römhild informal educational processes take place in these spaces as the interacting adolescents learn to navigate through a “super-diverse” (Vertovec 2007) urban space and simultaneously to tackle the contradictory expectations of the mainstream society in a very practical sense. Erol Yildiz’ term “*transtopia*” points in the same direction (Yildiz 2013). He denotes hereby urban “intermediary spaces”, created and used by migrants, where global interconnections merge and consolidate into new, locally grounded contexts of everyday life (Yildiz 2015). Yildiz highlights most of all the spatial practices and strategies of positioning, appropriation and transformation that take place in these contexts and that – according to his analysis – entail an innovative potential to develop critical attitudes towards dominant discourses or to bring into life new urban “self-evidences”.

A second line of research – partly inspired by postcolonial studies – proposes to conceptualize Germany as a “*post-migrant society*”, in which everyone, and not only migrants or their descendants, is affected by the effects of migration. This approach emphasizes the potentials of “mobilities” to transform radically the established institutions and fundamentals of German society. Consequently the proponents of this line of research demand that social scientists should not any longer consider “migration” as their empirical object, but as a perspective on changing societal realities – in other words: instead of producing further refined ethnographic studies about life strategies of a respective mobile group or ethnic community research should take migration as a starting point to develop new

analytical perspectives on transformations of basic societal ideas like “belonging”, the “nation” or “citizenship” (Bojadžijev and Römhild 2014; Römhild 2015).

In this article we will connect to both these lines of research: on the one hand we will use the terms “transtopia” and “site of opportunity” to shed light on the new urban space that has emerged with the foundation of the Friedrichsdorf Gymnasium. We will analyze some aspects of everyday life in the school as well as civic strategies of the supporting association to position in the city. Subsequently we will discuss to which extent new and critical positions towards dominant discourses on migration are developed in this context. On the other hand we will examine which transformations of “education” and “civil society” – as two further societal key concepts – become visible when we take the formation of this school not as a limited object of study but as a point of departure for an analytical perspective on the shaping of a “cosmopolitan-diverse city”.

63.4 Informal Learning Processes: How Friedrichsdorf Gymnasium Becomes a Social Place

This part of the article sheds light on daily life and school routine. It will explore whether the school is a place where diversity and transnational connections are seen as something normal. Although being an institution intended to convey knowledge based on formalist ideas of contents of education we will argue that Friedrichsdorf Gymnasium is also, as a result of the specific mechanisms of place-making, a place where informal learning processes take place.

To explore how Friedrichstadt Gymnasium is being produced as a locality is being produced I (Alik Mazukatow) used a variety of ethnographic research methods. Between September and November 2012 I did participant observation of classes, intermissions, and extra curricular activities of the senior year’s courses. I went on an excursion with them, played badminton in physical education, tried to get to know them while eating in the canteen and not lose sight of the teachers when spending my intermissions in the staff room or attending staff meetings. In addition to participant observation I conducted narrative interviews with teachers and students, many of them structured, transcribed, and encoded. Others however could be seen as just casual talks with the curious ethnographer. However, even those kind of situations can be treated as interviews with which one can analyze an institution, the individual’s embodied experience and the workings of the institution to produce those experiences (DeVault and McCoy 2006).

When analysing the ideals of achievement, not only the statements pupils and teachers but the school decoration caught my interest for which we used visual content analysis. We consider ethnography the research method to make sense of such a corpus of diverse materials thereby linking different levels of interpretation (Binder 2004).

63.4.1 Ideals of Achievement: Performance and Effort Equals Success

In this part of the article we will describe how ideals of performance and effort are established.⁵ They can be read as a reaction to a reproachful public by playing the „ethnic card“ and provoking a correspondent strategy: stressing that the school is a place of achievement, success, and accomplishment and creating ideals of performance and achievement. Nevertheless ethnic as well as organizational factors of the school as an institution cannot be dismissed when talking about how locality is produced at Friedrichsdorf Gymnasium.

In their comparative study of the education system of four European countries Schiffauer et al. drew attention to how resources are used. According to them the arrangements and designs symbolize and reflect certain assumptions about the role of school in society (Baumann and Sunier 2002, p. 23). Resources and interior design according to this view are not randomly chosen but part of the means to achieve pedagogical goals. While rejecting the study's underlying assumption of national types of educational organization, we still think that the use of resources reflects an attempt of schools to define their task and place in broader society, reflecting expectations of the particular context the school is situated in.

Our first example will be a big poster hanging in the floors of Friedrichsdorf Gymnasium. On black background it shows a single glowing light bulb which is centred, the cap facing the lower part of the poster. Above the glass bulb the writing says “Our greatest weakness lies in giving up”. Under the cap it continues “The most certain way to succeed is always to try just one more time”. In smaller writing the author of the quote is added: The inventor of the light bulbs, Thomas Edison. Since it is attached on the floor of the classrooms for the foreign language classes, the poster is in English. It tells the observer not to give up, dismissing this possibility as a universal weakness of humankind. Who else could be addressed by the “our”? To try once more is “always” the most fail-proof way to success. Success is therefore mostly a series of failures with a strong-willed individual not ready to give up, sort of a trail-and-error. Considering that the quote is supposedly Thomas Edison's, it reflects a common opinion how inventors like him work: a bright idea put to work by countless malfunctioning prototypes. And speaking of bright ideas, the light bulb is not put in a socket with no contact to an electric circuit whatsoever. Therefore, the glowing of the bulb does not refer to electricity. The poster plays with dark and light metaphor where, dating back to enlightenment, light means brain power, ideas, and autonomy of the rational individual.

Pictures like the light bulb in Friedrichsdorf Gymnasium create evidences while concealing the means of production of that evidence. By doing that, they produce an aura of authenticity and naturalise their message. The evidence may be embedded in an evidence-dispositif (Schade and Wenk 2011). The insight of Barthes who

⁵All names of people are altered. The chosen paragraphs from my research notes are slightly altered to fit in here and had to be translated for this article.

states that the imposition of meaning does not constitute a fundamental difference between pictures and writing (see Barthes 1993, 110) will be important for the next example. As writing it still will be analyzed like the picture of the light bulb looking for evidences.

Let us turn to six colourful round boards on the walls of the school each with a diameter of approximately 30 cm, linked by arithmetic operators all neatly arranged in a row. The whole installation says:

Paying attention in class + listening to the teachers and class mates + doing homework + not distracting class mates + showing polite behaviour and respect towards the other = Success in school and in life

The first four addends are expectations concerning the proper behaviour in school. 'Proper' behaviour in this case is calibrated towards the institutional framework to ensure smooth proceedings reminding us that school creates a massive disciplinary effect upon pupils which has to be maintained. The fifth addend seems a bit different. What counts as respect and politeness is not a direct consequence of the organisational proceedings of the institution. It gives way to the expectations regarding the attitude of the pupils. Furthermore, the request is not to be polite but show politeness, therefore addressing a performative aspect the ideals of achievement.

Graphical arrangement in a row points to the logic of the installation that all of the addends lead straight to sum, namely success in school and life. The evidence of the installation is based on mathematical means of expression which gives it an air of a recipe: just add a bit of homework and polite behaviour and you will be successful in school and life. Notice the vocabulary used, which is very specific to the institution and its proceedings. One could argue that most of the student's life is school, but would a successful school career lead to success in life in general? The installation gives us a very narrow sense of success in life but at the same time very specific instructions how to get there. The nature of an equation being, of course, that depending on how much you add to one part the other side of the equality sign must change equally – a mathematical precision when it comes to earn success depending on the efforts that were taken.

One could argue that school decoration could be perceived benevolently or resentful, depending on the individual. So I was curious when I did my interviews what pupils might think of the ideals of achievement and performance.

Alik: Why is it worth it to effect performance here?

Yeter: Yeah, future. You need now a good performance to have a good NC and later a good university place. And later a good job. (NC: Threshold to be able to enrol in certain subjects at the university of one's choice, depending on your grades, A.M.)

Performing at school is for Yeter only one piece of a whole chain. According to her, a good performance leads to good grades which enable one to enter the university and study the more prestigious subjects. This translates to a good job later. Neither in this passage nor during the whole interview Yeter expressed any doubts about the for her natural order where a good education leads to a successful job. What's being said by her seems to rest on a narratives of linear succession of effort and success.

Another example is the statement of Ibrahim when thinking about whether he should do his studies in Switzerland. For him doing so would yield many advantages

as I heard, if you really study in Switzerland, this is recognized world-wide. If you have a certificate from Switzerland as a student, you can gain access everywhere. You'll be among the first ones being hired. (...) when people see my certificate they should say: Ok, wow, this guy has achieved something.

A certificate in one's hands is proof for Ibrahim of his achievements. It could guarantee job offers in the whole world. As physical proof of the efforts he made it seems like this document allows him to earn recognition world-wide. By that Ibrahim mentions a critical aspect of achievement: recognition. One could say that within the different ways to a successful life he sees a Swiss certificate as undeniable proof of success and guarantee for admission. The fact that Yeter and Ibrahim believe in the meritocratic idea behind the institution is probably one way for them to achieve a position and socio-economic status they want for their lives. If not being dismissed as naïve, their belief in the meritocratic ideal could be seen as proof of how refined their career plans are as successful, future academics with good careers based on international education.

Within the realms of an institution, monitoring their members' ideals of success and achievement clearly has a performative side to them. Notice that within the context of small numbers of pupils in one class students and staff know each other very well. As mode of working, teachers are asked to demand group work which happened very often during my observations. Those groups of three or four would usually work on a topic and present their findings afterwards. The combination of small classes and frequent work in small groups in different constellations makes sure that every pupil establishes at least a working basis with everybody else – sanctioned by the teachers and the workings of the institution by grading the outcomes of the working process. This time my field notes will be the basis for our interpretation:

In biology class of Ms. Kramer there is team work. I joined the group for chromosome mutations. Ozan, Ibrahim, Şafak, Dilek, and me are sitting around a single table. (...) Ozan takes the leadership. He suggests the course of action for the presentation and it is also him who gathers the pencils of all the other pupils to explain the complicated mutations. The pencils depicting the dna-sequences. (...) When Ibrahim tries to add something to the discussion he couldn't get a word in edgeways. Ibrahim says later to his friend Şafak: "Ozan gets on my nerves!". Subsequently both talk about tomorrow's excursion while Ozan and Dilek prepare the presentation. (...) Ibrahim and Şafak know that I will join them on the excursion and ask me about it while Ozan dictates to Dilek what she should write on the worksheet of the group. Ms. Kramer joins the group: "That means those two did the work sheet, that means you the other two will present?". It seems she realized the uneven distribution of tasks within the group. Ozan says "All of us worked on that". Ms. Kramer: "I saw mainly two people working here". Ozan: "Yes but the work sheet was only 15 minutes, the 30 minutes before that all of us gathered the information. We also have a witness." and pointing at me. I say: "I will be on the watch to take sides here. All of you worked well". Ms. Kramer (skeptically): "Really? Well...". (Fieldnotes 27.09.2012)

Wondering how institutional orders get adopted Helga Kelle investigated how a predetermined setting gets translated into lived social practice laying emphasis on

collective practices of producing a symbolic territory, discursive practices to produce a public within groups and the organisational order of the institution along age influence processes of identification and appropriation (Kelle 1997). In our example it was very clear that Ozan was the leader. Neither the pupils, nor the teacher nor the ethnographer had any doubt about that. To ensure his role Ozan almost hushed Ibrahim up by being so taken by the discussion and his own thoughts on the topic, not noticing his friend and his wish to contribute. Still Ozan is defending his group mates with all the credibility one of the smartest and most diligent pupils of his year owns. The whole group is under scrutiny of Ms. Kramer who eventually would have to grade all of them. Although not all members of the group contributed equally only half an hour of group building processes were needed to see the teacher as an outsider who questions the cohesion of the group. Being called as a witness the ethnographer does not want to take sides to enable further research with all groups and participants. In the eye of the dynamics of the situation however his poor attempt not to take sides was bound to fail. Even more interesting is that he was called as an independent observer but was made choosing sides within the institutional setting. Not being a formal member of the setting still does not save the participant observer from being subjected to the institutional classifications and how people act them out. What's more: he was literally forced to do part of the teacher's work namely to evaluate the student's performances.

63.4.2 Achievement as a Strategy Against Discrimination

From what we discussed so far one of the conclusions could be that the promise of meritocracy is all in all intact. In other parts of the educational system however these beliefs have vanished for good. In the lowest rank of schools, the Hauptschule, ethnographer Stefan Wellgraf found that structural disadvantages of the labour market get transformed into a negative self-perception of pupils (Wellgraf 2012). No matter how hard pupils work the chance of finding subsequent job training are close to zero but instead of debating the structural shortcomings of the educational system school and authorities called to the pupils to reinforce their individual efforts. It is in this setting where the myth of meritocracy and the institution as such loses its credibility and the fragility of the underlying ideology is exposed (Wellgraf 2014). Whereas our previous analysis indicates a more or less unconditional belief in efforts, accomplishments, and success we will diversify these assertions in the paragraphs that follow.

At second glance, the desire for prestigious certificates which have to be recognized by future employers and the recognition of one's efforts in order to get them might be a strategy against discrimination and racism, as Ibrahim puts it.

I think that a German businessman, a German employer somehow takes his own compatriot rather than a foreigner or a migrant. And that's why our achievement is so important, to do something. That's why, as a migrant, you should put your best effort into it, because it's really like that: In Germany you are not first choice.

The passage of the interview reveals a system difference that results in discrimination and unequal opportunities. On the one hand, there is the German employer who would choose “unquestioned Germans”⁶ over immigrants or foreigners. Achievement is one way to overcome the unjust classification. It would be one way to gain access in the field of competition in which otherwise he would not even be admitted because of ethnic prejudice. Parts of the strong narrative of achievement and success at Friedrichsdorf Gymnasium therefore could be read as a reaction to discriminatory forces from people who are aware that dominant society frequently makes them second choice. Accomplishment seems therefore a sphere stronger than ethnic prejudice: high class qualifications exceed the blemish of having a history of migration in the family.

Unfortunately it is not entirely the case that accomplishment is stronger than ethnic prejudice, as the headmistress Ms. Baumann points out:

Especially kids (...) who come here after 10th grade. They have experienced some time at other grammar schools and don't feel noticed with their achievements. Instead happenstance is being insinuated. Or 'you cheated anyway!' We had a girl here who put it very nicely: "My English teacher never appreciated that I was studying hard at home. He always said: 'Even a blind squirrel finds a nut once in a while'."

As I already discussed earlier, recognition is a key part of success and accomplishment. The discrimination Ms. Baumann describes rests upon teachers who from their institutional position of power do not recognize the effort being made. The equation we analyzed above comes to mind where the efforts put into are translating into success with mathematical precision. Discrimination disables this equation because not every effort being made equals a success in school and in life. The success of Friedrichsdorf Gymnasium in building a school from scratch may be attributed precisely to the promise that pupils will find a niche in German education system where effort will get recognized without taking ethnical factors, at least not to pupil's disadvantage, into account.

63.4.3 The Workings of Ethnicization Within School Life

As we saw in the last section, stigmatization from outside directed to being Turkish and the offering to achieve success with other pupils who in parts could not get their achievements be recognized because they are Turkish is part of everyday life for our informants. All that happening within an institution which lets pupils form groups and sanctions behaviour, the sanctioning being adapted to the needs of the institutional framework. No wonder that the pupils conceived themselves as a group, but not just any group but an ethnic distinct one. As a man with supposedly non-German look and a non-German name I frequently get asked whether I was “originally” from Germany. At Friedrichsdorf Gymnasium where among students practically

⁶Referring to Germans who by their position in hegemonic discourse are ethnically unmarked.

everyone was linked with Turkish culture by family ties, this was not different. People were quite curious to ask for my familial origins

A girl asks me for my name: „Ali? Alex? (as if in German or Turkish?). Also someone else asks about my nationality. I refused to answer right then and suggested the break because I did not want to disturb class. (Fieldnotes 17.09.2012)

One of the group asks me: “May I ask you something? Are You Turkish? Because, you resemble a Turk a bit”. (Fieldnotes 19.09.2012)

My reaction to those kind of questions is irritation because of the simplicity of ethnic categorization but I do not elaborate much about my own ethnic background. Sticking to that principle I want to – rather than live out my narcissistic side – point to the many possibilities of taking positionings into account to analyze the field. Ethnic categorizations have a huge effect on group building processes at Friedrichsdorf Gymnasium. As a tool of interpretation we suggest Herbert Kalthoff’s perspective on his own research in boarding schools. He starts his considerations by observing modes of engrossing and rejecting the ethnographer’s person in his field. While doing participant observation scientists get to know the (probably) unknown life world which subsequently they aim to represent in a scientific study. The way scientists get represented by their field should not go unnoticed (Kalthoff 1997). The modes, ways, negotiations how the field represents the fieldworker as a stranger yields useful interpretations about how people see their field and themselves. As pointed out above one common way of representing me as a stranger in the field (at least in the beginning of my research) was to ask whether I was familiar, hence Turkish. Collecting the ways of how the ethnographer is represented as stranger in his field we would like to point how ethnic factors influence group building processes at Friedrichsdorf Gymnasium.

At a time when I was already known to some staff and students, curiosity and questions about the ethnographer get transformed into a way of making assumptions about his personal background and integrating him into the institutional order:

When I was entering the classroom to have a look at the Turkish class of Mister Uzun I have been warned by a student: “But this is Turkish!”. Nevertheless, I sit down. Hatice tells me some time later: “I am not sure whether you will understand something here”. I answer: “I am sure that I will understand a little bit”. (Fieldnotes 19.09.2012)

When entering the classroom, concerns were expressed about whether or not I should do participant observation there. As frequently as I told my informants that I was not Turkish I added that I was learning the language at the time. The information that got stuck though was that I was not Turkish, therefore would not understand them. Hatice’s warning reveals a pattern of controlling spaces according to belonging. To her, Turkish class was an exclusive space for and with Turks. Her reaction shows clearly how language and belonging patterns space in Friedrichsdorf Gymnasium. Her remark may also be read as warning about the exclusive effect this space of equals could have on me as a stranger. My non-status within the organisation therefore provoked her warning but it was not the main factor ordering her perception. The non-Turkish ethnic outsider would be welcome but face exclusion based on language. And indeed, my Turkish was bad enough to be excluded by bilinguals any time. Nehir shows how it was done:

Nehir tells me in English class with Mister Nakamura that she said something in Turkish about me during her presentation in Politics class the other day. "I hope you did not understand that, back then I did not really know you". The English documentary will be watched one more time to answer more detailed questions. That is why Nehir was asked to switch out the light again. Mister Nakamura: "Nehir switches out the light". Nehir: "Always me! Her şey bize yaptırıyor!" (Fieldnotes 02.11.2012)

Nehir never told me what she said about me but the growing trust towards the ethnographer was very moving. In the same situation she told me about her excluding me from what is said about me she demonstrates how to exclude the teacher by protesting in Turkish, therefore letting the other pupils know but keeping the teacher in the dark. Her Turkish phrase translates to: "He is letting us do everything!". The choice of language makes clear who is meant by "us". The exclamation opens a forum for the Turkish-speaking students to complain without the teacher understanding. In our opinion this is a perfect example how institutional factors as the unequal distribution of power between teachers and students and ethnical factors as the heightened awareness of space and belonging come together in everyday life of which we will give one more example.

The headmistress Ms. Baumann talks about different expectations pupils might have from Turkish teachers. In a school with an unusually heterogeneous staff when it comes to nationality and origin (Germans with and without Turkish or other cultural backgrounds, foreigners from Turkey and elsewhere) I wanted to know whether ethnic belonging influences classes:

Ms. Baumann: But I think that also showing a bit more empathy is expected from Turkish colleagues. And we have different ones, when you look at the colleague who is germanized that much that he thinks in German as well. He is virtually stuck in the wrong body. With him pupils will find a lack of understanding more often than with the colleague who struggles with German language and switches sometimes to Turkish while explaining something in group work. I think there are differences among the Turkish colleagues.

Ms. Baumann claims that students would not prove very masterful in the adaption of their expectations. On the basis of (suspected) common belonging students direct expectations differently. Turkish teachers are expected to be more understanding and empathetic than others. Partly, those expectations seem to get disappointed. Ms. Baumann's quote indicates a continuum of types of Turkish teachers with least German influence which are most empathetic on the one side. On the other side there are Turkish colleagues who are so germanized that they disappoint the high expectations of the pupils. They are stuck in the wrong body because their behaviour (German) does not match their appearance (Turkish).

63.4.4 The Friedrichsdorf Gymnasium as a "transtopia"?

The findings of how locality is produced in Friedrichsdorf Gymnasium showed two salient results. Firstly, the dominance of meritocratic ideals of achievement and success that concerns school rules and official guidelines as well as attitudes and narratives of the pupils was shown. Secondly, discourses about ethnic discrimination

and processes of ethnicization, reinforced by institutional order, were found. Is Friedrichsdorf Gymnasium therefore a “site of opportunity” where educational processes of how to cope with the diversity of the “post-migrant city” and how to react to the impositions of mainstream society are set in motion (Römhild 2011)? Might it be a “transtopia” where marginalized knowledge and people get the centre of attention, by creating a different urban normality questioning norms and therefore having subversive effects (Yildiz 2015)? Both concepts point to spaces with everyday transnational references. They highlight an emerging creativity of “post-migrants” to react critically to the integration imperatives of the mainstream society. Römhild and Yıldiz demonstrate that the newly created, post-migrant normality entails a more situational and playful handling of ethnic belonging. Sites of opportunity and transtopias therefore mark spatial concepts which carry the potential to subvert hegemonic power relations.

As we saw above, Friedrichsdorf Gymnasium is indeed a space where transnational affiliations are commonplace. In contrast especially to (some) public schools achievement does not get derogated by ethnical factors. When putting up school decoration describing the ideal behaviour for successful attendance at grammar schools the seemingly universal language of mathematics beats the ethnically connoted expectations to be more empathetic in every day cooperation and routine. Having family ties to Turkey or some other country creates a space where pupils orient their perception towards belonging, create situational forums to express their protest, but at the next moment they return to their work groups and defend them as if they were as meaningful to them as ethnical links. When imagining the future, an excellent international diploma as a proof of one’s own efforts and hard work seems as a way out of discrimination in the job market.

We argue that what students at Friedrichsdorf Gymnasium learn, besides the curricula, is a twofold strategy which is neither subversive nor on the creative side. Firstly, students learn how to integrate ethnicity in their ways of perception and to make it a resource [...]. The school is created as a social place made by migrants and attended by their offsprings where ethnic affiliations are an important component of every day life, starting from Turkish cuisine in the canteen to teachers who are very aware of Muslim holidays and willing to schedule the big exam some other time and reaching as far as Turkish language classes as official part of the curricula. Secondly, they learn that emphasizing their effort, achievement and success is a widely recognized strategy that might trump the marginalizing effect ethnicity still has in dominant German society. The irrefutable proof of diplomas or other successes might work as gate opener in a society where being Turkish still might preclude equal opportunities to participate.

Applying ethnicization when needed, might point us back towards Lanz’ “dispositif of a multicultural-differential metropolis” where cultural diversity was recognized as an enriching value in itself. “Participation” rested on the essentialized notion of different and hierarchized cultures which forces people to self-identify accordingly if they want to take part in the socio-political fields of the city. Although a shift of dominant dispositifs could be recorded, tendencies towards ethnicization might be remnants of the older migratory regimes. The strategy to emphasize

achievements might point towards the newer “dispositif of the cosmopolitan-diverse metropolis” where cultural diversity within the metropolis is seen as a given and “self-empowerment” becomes more and more a requirement to get public recognition. In the super-diverse city with its allegedly mobile and flexible inhabitants participation is not any longer regulated through static concepts of belonging or “identity by birth” alone. In accordance with neoliberal concepts of self-activating citizens “achievement”, “effort” and “success” become relevant criteria to define one’s position in the socio-political fabric of the city. From this perspective, Friedrichsdorf Gymnasium does not constitute a very subversive place. But it seems to admit informal educational processes, which impart how to navigate through a multilayered, partly contradictory migratory regime. Combining strategies of achievement with strategies of self-ethnicization could be considered as perfectly suited to prepare students to fit into current requirements instead of creating critical counterpositions to mainstream society as Erol Yildiz’ notion *transtopia* would suggest. Simultaneously to activate ethnic categories in school life might be a sign that the path of participation through achievement is still fragile – or to put it differently: the older dispositifs still take their effects.

63.5 Boundary Points: Strategies of Civic Positioning and Policies of Belonging in the Intersections Between School and City

In this section we will discuss another dimension of the informal learning processes taking place in the urban sites, which open up as a consequence of the engagement of this educational initiative. We will now turn to “strategies of civic positioning”,⁷ which come into being as effects of the supporting association’s activities in the intersections between “school” and “city” – the attempts to advance its projects and simultaneously to become visible or to “gain ground” in the urban context constitute relevant starting points for our analysis. Two aspects of these strategies will hereby

⁷Fundamentally we follow hereby a praxeological understanding of “strategy” as formulated for instance by Pierre Bourdieu (Bourdieu and Lamaison 1985) to which we would add an even stronger focus on the physical circumstances of urban space. Consequently in using this word we don’t think about rather isolated individuals or small groups conceiving beforehand consistent instructions on how to act in a following process of a fully projectable implementation – even though such moments of deliberate conceptualization can be important settings to evoke forms of positioning, which might turn out to be successful in a given context. Instead we consider strategies as clearly relational capacities, which emerge as effects of daily practice and interaction in specific “social plays”. They are not restricted to “knowing the rules” of a game in a rather mechanical way, but are constantly evolved, exercised, tested and adapted in the relational thicket of everyday life shaped by power structures, discourses, material circumstances etc. in a given social field – or to put it differently: the (social and physical) conditions of urban space are constitutive factors to bring these relational capacities into life. To which extent a given actor disposes of agency in these settings would be an empirical and analytical question.

come to the fore: on the one hand, their *spatial orientation* as they lead regularly to different forms of shaping, modifying or acquiring urban sites; on the other hand, their *navigational quality* as they are aimed at finding one's feet in the complex social and political fabric of the city – or to put it differently: we will interpret these strategies not primarily as bounded efforts to establish successfully private educational institutions, but rather as relational attempts to obtain social positions, to participate in or to get access to political and social configurations in contemporary Berlin – aspirations, which find their expression especially in temporary or lasting interventions in urban space.

63.5.1 *Projecting Futures or the “Capacity to Aspire”*

During one of our field visits the supporting association's chairman shows me (Jens Adam) around the compound where the Friedrichsdorf Gymnasium is located. Once a military property – first used by the German imperial army and during the division of Berlin by the British Armed Forces – the area is shaped by buildings from different epochs erected for distinct purposes. We pass by several repair shops, a disused hotel in the style of a 1970s tower block, workshops run by a Christian charity organization to offer employment for mentally handicapped people and several red brick buildings constructed in the late nineteenth century. A modern and functional supermarket was established recently at one end of the area. While we are touring the chairman points to one of the brick buildings framed by old tall trees and explains that it was once used as the officers' mess. “Here we could house a university, at least in principle”, he says and shows afterwards to the empty hotel behind us: “Here most certainly not.” Although a university as such has hitherto not been planned yet, I understand his gesture as an indication of further aspirations, of a certain vision about a desirable development of the association's activities as well as of the social place the chairman wants to create for these educational initiatives and its pupils. My interlocutor hands me over a glossy brochure titled “Bildungscampus”, which illustrates such advanced ideas. It presents the projected transformation of the multifarious compound into a coherent, gradually evolved campus: Three already existing institutions – the Gymnasium, a middle school and a day-care centre – shall be extended and supplemented by a vocationally oriented upper secondary school (Fachoberschule) and a boarding house for pupils not living in Berlin. Furthermore the brochure refers to the already mentioned workshops for the handicapped, which shall be integrated into a “unique” project, “which enables new synergy effects and pedagogical forms of teaching and learning” (TÜDESB e.V. no date).

“There are these singular occasions, which you get once in your lifetime. Either you grab them or they will pass by”, remarks the chairman to explain the outlined plan to me. In this case, the exceptional occasion was the fact that the federal government's agency, which owned the compound, opened a bidding process to sell its property. The supporting association noticed the chance to consolidate its hitherto

investment and engagement into the area, took part and won the procedure against several rivals. In the course of this process it had to evolve a longer-term concept, which conveyed coherence and solidity, not only to convince a bank to allow a credit but furthermore to persuade local politicians and authorities, present and prospective tenants to cooperate. Thus, for this project the association had to integrate existing institutions, to conceive mutually advantageous models for collaboration as well as to define reasonable usages for the empty buildings on the compound. However, during our conversation it becomes apparent that the “Bildungscampus” was not made from one piece. It was not the association’s outlined objective from the beginning of its activities, but it came into being in the course of a step by step relational process, which took up sudden occasions and was furthermore shaped by the conditions of the local space, the necessity to demonstrate solid finances and the concerns of tenants, neighbours and politicians. The association’s openly uttered conviction that “education” is the “absolute precondition for equal opportunities, for societal participation and successful integration” (TÜDESB e.V. no date) can be understood as a kind of inner compass to navigate through this process, which brought together on a very practical level longer-term moral concepts with concrete experiences in building up educational initiatives and spatial options.

In his works about the urban poor in Mumbai cultural anthropologist Arjun Appadurai proposes to examine “*the capacity to aspire*” to gain a better understanding of what can be done to improve the living conditions and social position of slum dwellers in the Global South (Appadurai 2004). For the purpose of our argument we would like to refer to four of Appadurai’s observations: firstly, he states that “aspirations are never simply individual”, but “are always formed in interaction and in the thick of social life.” (ibid., p. 67) Secondly, aspirations should be analyzed as links between rather abstract concepts and beliefs about the world with “more densely local ideas” about forms of living and even more “specific wants and choices” (ibid., p. 68). Thirdly, he emphasizes that “the relatively rich and powerful invariably have a more developed capacity to aspire”, which is thus “not evenly distributed in any society” (ibid., p. 68). And finally, he expects the capacity to aspire of poorer and marginalized groups to grow when they start to engage in concrete fields of practice, in longer-term initiatives and alliances and in strategical interventions into urban political processes.

Even though the political framework and social position of our Berlin case might differ quite substantially from these of the examined Mumbai initiatives we consider Appadurai’s insights as inspiring, to interpret the discussed activities of the supporting association. Its engagement for the “Bildungscampus” most certainly opens up a multi-layered field of interactions, in which elementary beliefs in the strength of “education”, a vision about a prospectively improved social position of one’s own community, a willingness to intervene actively into a public school system perceived as discriminatory and the desire to transform a concrete urban compound flow together. In the course of this practical, incremental and interactive process the capacity to aspire inside a hitherto marginalized community can grow and should enable its proponents not only to “engage their own futures” (ibid., p. 63), but to participate critically and constructively in social and political processes that shape contemporary Berlin.

63.5.2 “Place-Making” or the Production of Urban Sites

It became already apparent that the association’s activities create urban sites, which enable formal as well as informal educational processes and furthermore lead to new modes of encounter or interaction within the urban context. In this section we would like to analyze such forms of explicit “place-making” as a second strategy of civic positioning, which can evoke rather *continuous* as well as *temporary* urban sites. In both cases these activities have at least two dimensions: on the one hand, they can be understood as part of the “identity work” taking place in the intersections between educational initiatives and the city; on the other hand, they can be interpreted as elements of the association’s policy of visibility.

When we talk about “identity” or “identity work” we don’t assume a somehow substantial state of being, which could be emphasized to establish an elementary difference between a given migrant community and the German mainstream. Following a meanwhile dominant stance in social research we consider “identities” as always relational, processual and socially constructed in practical encounters and political fields (Hall 1990, 1991, 1992; Baumann 1996). Along these lines social anthropologist Synnøve Bendixsen defines “identity” in her study about a Muslim youth organization in Berlin “as the mechanism through which we locate ourselves in relation to the social world” (Bendixsen 2005, p. 89; see also Bendixsen 2013). In addition, she rightly underlines that socially constructed and influential labels like “ethnicity, class, occupation, age, or sex” have to be taken into account to analyze forms of positioning of marginalized or even stigmatized migrant communities in Berlin – especially as these categories have a share in enabling or impeding senses of belonging as well as in reducing these groups’ capacity to escape to the anonymity of the city. Bendixsen goes on to examine different tactics and strategies to “create spaces of belonging”, which fulfil simultaneously *identitarian, educational and emancipatory functions* for the youth organization’s members – spaces that are clearly not meant to construct an isolated “parallel society”, but to “become a part of Berlin and, simultaneously, contribute to shape a vibrant city” (2005, p. 92; 96). We would like to connect to these observations by analyzing now the school’s supporting association’s modes and attempts of “place-making” as reactions to ascribed positions and likewise as strategies to participate or to become visible in the urban context.

As mentioned before these attempts can lead to continuous or to temporary urban sites. The founding of a school belongs obviously to the first category. Consequently we could already expose some of the Friedrichsdorf Gymnasium’s identitarian, educational and emancipatory functions – just to recall a few: in this school certain cultural or religious differences from the standardized forms of self-perception of the German mainstream are perceived as “normal”; members of a socially constructed “minority” come into a context, in which they experience themselves situationally as “majority”; and pupils who are used to being discriminated against in the public school system, take part in formal and informal learning processes that should enable them to participate more successfully in economic and social fields

later on in their lives. During our fieldwork we could take notice that such long-term projects are complemented by the supporting association's regular endeavours to organize visible events in the city. We will now highlight these forms of temporary place-making as another mode of positioning in the urban field. By way of introduction, we draw on our fieldnotes of two such events:

In October 2012 the school's supporting association cooperates with "Academia" – according to the self-description "a network of successful graduates with a migration background" – to organize a "teacher's day" in a five-star hotel located in the posh Kurfürstendamm area in the western city centre. The hosts have rented one of the hotel's ballrooms equipped with big round tables and serve their guests a multi-course dinner. At the beginning representatives of the two associations as well as the headmaster of the Gymnasium deliver speeches, in which they stress the significance of the teaching profession.

Several times the source and cause for this meeting is mentioned: The UN designated one day in October to appreciate explicitly the performance and the achievements of teachers. Consequently the supporting association has invited first of all teachers and childcare workers of its own institutions as a sign of esteem. But in addition the hosts took the opportunity to address teachers and headmasters of public schools as well as representatives of the city's education authority. Obviously the event was meant to connect the association's initiatives better and – as one of our table-mates expresses – to arouse the interest of public schools' teachers to consider these private schools as a potential working place. In individual conversations with us several teachers of the Friedrichsdorf Gymnasium take notice with a slight disappointment how scarcely anybody of this second group has shown up. Some of the tables remain vacant. (fieldnotes October 2012)

In May 2013 teachers of the Friedrichsdorf Gymnasium organize a "pupils' congress" under the title "you can win with your ideas!". In preparation of this event the organizers had distributed leaflets and posters to schools all over Germany, which proposed to pupils to work in small groups on one of two predefined issues: "school in 25 years" or "social justice in Germany". The results should be presented on a poster to be sent to Berlin. The authors of the better projects were invited to take part in the pupils' congress, during which a jury would choose the best results – thus "education", "achievement" and "competition" are again leitmotifs of this format.

The venue, in which the "pupils' congress" takes place, is remarkable. Through the offices of the social democratic parliamentary group the organizers got the permission to use premises of the House of Representatives of Berlin. Consequently for one day the pupils take parts of the parliamentary building in their possession: in the corridors one can find their posters on the walls and in one of the parliamentary groups' meeting rooms the discussions take place. The setting and format enable a simulation and practice of democratic processes and manners: The pupils are split into two thematic groups as the two predefined issues are discussed one after the other. The first group takes a seat along the u-shaped tables and starts with the election of a president, a moderator, a timekeeper, a minute taker and a press officer. After that the pupils are invited to present the key argument of their respective project to the plenum. They learn how to use the table microphones and the sound system. Points of views are formulated, discussed and voted on. The president and the moderator perceive requests to speak, give the floor, summarize, and interrupt when it gets too long. Results of the discussion are registered and a press release formulated, which is delivered later on to a social democratic member of the city parliament. The pupils take control of this space physically as well as symbolically; they fill it with their presence, their discussions and positions and collect experiences with each other. In this temporary urban site pupils with and without "migration background", from private and public schools, from Hanover and Bavaria, from Berlin inner city districts as well as from small towns in the hinterlands meet. (fieldnotes May 2013)

Further examples could be added. On all these occasions we could observe at least three similarities illustrating “place-making” as a second strategy of civic positioning: Firstly, all of these events were organized at prestigious sites. Reading the often critical reports in the German media about the “non-transparency” or the “desire for isolation”, which allegedly characterize the activities of organisations belonging to the “Gülen movement”, one could expect such events to take place in rather hidden and secluded places in one of Berlin’s migrant neighbourhoods. The opposite is true; the chosen places are centrally located, open for a (solvent) public, frequented by the established academic middle classes and dispose of a high reputation. It seems rather obvious to link these modes of production of temporary sites with the supporting association’s aspirations after societal recognition and higher visibility in the urban field. It looks like the organizers would hope that the prestige of the hosting institutions could “symbolically consecrate” these events and its participants – as Pierre Bourdieu once formulated concerning another context (1999, p. 129). Secondly – and closely connected to our first observation – these forms of place-making endeavour to create opportunities to interact, to participate and to improve hereby the supporting association’s access to more established educational actors, to local politicians, dignitaries as well as to an urban civil society. And thirdly the centrality of “education” or “advancement through education” as key metaphors to be mobilized in the course of such events stands out. Thus, the potentials of these concepts to bring about new relations, to open fields of encounter or to re-position social actors in the urban field come to light. Simultaneously these temporary urban sites create possibilities for a gradual semantic shift: for instance by connecting “education” with claims for justice and better advancement opportunities for migrant communities, with questions about democracy or about the role of multilingualism and cultural difference in a national context. Based on these observations the possible emancipatory functions of these temporary and continuous sites become clear: a group of migrants – or their still socially stigmatised descendants – creates actively urban settings for education, for living and development and expresses hereby not to content oneself with the social and political positions they have been often allocated to in the course of powerful societal processes and discourses over the last decades.

63.5.3 “Networking” or Creating “Webs of Overlapping Commonalities”

The third strategy is closely connected to the aforementioned ones and may even seem self-evident, but it is – from our perspective – still particularly relevant to understand the current transformations of the urban political field and civil society: In the context of its project the supporting association builds up temporary or stable links with a wide range of actors, consolidates close or loose alliances and

develops hereby a “web of overlapping commonalities” (Schiffauer 2009, p. 174). Again, we would like to illustrate this third strategy by drawing on our ethnographic observations:

- The supporting association organizes the Berlin part of the nationwide “German-Turkish Cultural Olympics”, which takes place in the renowned educational and cultural institution “Urania” in the Western city centre. During this event the moderator calls high-ranking persons on stage to announce the winners, to award prizes and to address the audience: one Member of the House of Representatives of Berlin, the ambassador of the German Foreign Office in charge of “intercultural dialogue”, the consul general of Turkey in Berlin, and the chairman of an association called “Turkish Community in Berlin”. (fieldnotes February 2013)
- During a launching event of a new book about the “educational initiatives of the Gülen movement”, taking place in Berlin’s House of Representatives, Rabbi Walter Gomolka gives the main talk. He indicates certain similarities between Jewish life in Germany before the national socialist dictatorship and the present initiatives discussed in the book: in both cases the protagonists aim(ed) at finding a contemporary reading of religion as well as for an equal participation in societal processes. He points out his knowledge of the “patchy” or “stuttering history of Germany”, which put an end to these Jewish debates and attempts, as main reason, why he takes the floor on this event – “even if you are regularly blamed for being naïve.” (fieldnotes April 2014)
- In the course of the different educational projects the supporting association approaches the local Members of the German Federal Parliament of different parties, the mayors of the district as well as of Berlin and representatives of the education authority. These persons come to visit the schools or the “Bildungscampus” and strike up working alliances with the projects’ initiators.

Two aspects of these forms of networking should be registered: Firstly, in the context of these invitations, contacts and interactions the supporting association’s members interweave themselves incrementally with civil society processes and shape hereby again their position in the urban social field – not least because the schools’ initiators are confronted with assessments and expectations of their counterparts. Thus we could observe during the “pupils’ congress” how a politician formulated his ideas about this cooperation: he asked about “transferable results” of these private schools, which could be applied for public schools; according to him the supporting association should start now “to give something back” as the public educational system needed urgently such impulses. (fieldnotes May 2013) This is not to say that the school’s initiators will take up each of such suggestions made by temporary or stable cooperation partners – but undoubtedly they have to take them into consideration not to put these indispensable relations and their hard-earned position in the social fabric of the city at risk. Secondly, these modes of networking illustrate the current emergence of new political formations (Adam and Vonderau 2014) in a post-migrant urban society. Cultural anthropologist Werner Schiffauer

speaks about the “possibility to build partial or temporary coalitions” as the rationale for a pragmatic vision of civic policies that incorporate rather established, upcoming or so far excluded actors into “a sustainable web of societal solidarity and cohesion”. As an example, during a public discussion he suggested that *the Islamic community could form a coalition with the Catholic Church to impede gay marriage while collaborating with the Green Party to enforce dual citizenship. The Social Democrats could be interesting partners with regard to social legislation and with the Christian Democrats they might share ideas concerning family policy* (Schiffauer 2009, p. 174, our translation and paraphrase). Thus, he develops the vision of political strategies that combine punctual alliances with capacities to avoid possible escalations of conflicts about contentious matters – as one might need the respective counterpart in further coalitions. Along these lines we interpret the supporting association’s various forms of networking not only as attempts to promote their own projects but as contributions to build “webs of overlapping commonalities”, which could underpin a post-migrant civic society.

63.6 Conclusion: Emerging Forms of Civil Society in a “Post-Migrant City”

In this article we aimed at developing a perspective on rather informal educational processes emerging in and around a private school in Berlin. Thus we didn’t concentrate on the official curriculum and its implementation during class. Instead we explored different navigational capacities emerging on the one hand beside the proper educational programme in the school and on the other hand at the intersections between “school” and “city”.

In the first field of analysis we examined different dimensions of “ideals of achievement”, which structure not only the self-concepts of the school and its pupils, but affect as well the shape of the school building. These ideals seem to correspond pretty well with neoliberal ideals of the “entrepreneurial self” (Bröckling 2016; Lanz 2009) and – surprisingly enough – seem to cover the discriminatory effects, which are regularly mentioned to explain the founding and the attractiveness of the school. In addition, we traced constellations of “self-ethnicization” appearing in everyday school life and evoking “otherness” in relation to the German mainstream. In these constellations practical references to a common origin, a specific cultural knowledge or a mutual position in the socio-political context are made. Recalling Stefan Lanz’ observations about consecutive “dispositifs” assembling “migration” and the “city” these results could appear inconsistent: the trust in advancement through education and achievement suits quite well with the currently operating “dispositif of the cosmopolitan-diverse metropolis”; the tendency to ethnicized positions seems rather to correspond with the older “dispositif of a multicultural-differential metropolis”. We would like to argue that our empirical

observations point to a parallelism, overlapping and entanglements of different patterns to perceive and handle diversity in the city. As a young Berliner “with a migration background” you might be regularly addressed as a “prospective contributor” to a new urban dynamism and expression of a super-diverse city; nonetheless you will constantly be confronted with discriminatory effects emerging inside public institutions or daily social constellations differentiating between “ethno-cultural groups”. From our perspective, the school can be understood as one urban site, where young city dwellers experience to navigate through the contradictory demands of the socio-political context and its migration regimes. Interestingly enough this site seems not to open opportunities to develop subversive perspectives on the public regimes of migration and diversity, which Erol Yildiz accredits to his concept of “transtopia”; the navigational capacities of the pupils seem to evolve rather between two affirmative positions.

In the second field of analysis we explored different strategies of civic positioning, which come into being as part of the school’s supporting association’s attempts to advance its educational initiatives. We emphasized two dimensions of these strategies: on the one hand their direction to create and shape – temporary or continuous – urban sites; on the other hand their navigational qualities as they are aimed at finding one’s way through the complex socio-political fabric of the city. From our perspective these “relational capacities” constitute the essence of the informal educational processes taking place at the intersections between “school” and “city”. Representatives of a still marginalized community develop successively networks and connections, they appropriate and shape urban sites and seek hereby to position themselves visibly in the urban context. Claims to entangle transnational references to a religious movement with clearly local sites, communities and educational conditions constitute a striking feature of these strategies. These claims and their transformation into concrete educational projects bring along potentials to modify the key concepts structuring urban life. In the course of this article we referred to the media coverage of the educational initiatives to point out that exactly these transnational connections are difficult to accept for parts of the German public. Even though some of the critical reports might be motivated by the indeed remarkable overlaps of economic, religious and political activities that characterize the transnational “Gülen-movement”, one can still recognize established modes of perceptions in these articles questioning the local legitimacy of such transnationally connected educational projects. Ideals of a “national-heterogeneous community”, to which “migrants” have to adapt, shine through. From our perspective, the claims of the supporting association to situate these transnational references locally and to become hereby distinctively visible in the socio-political fabric point to the incremental transformation of an urban civil society, which could correspond better with the still recently emerged “dispositif of the cosmopolitan-diverse metropolis” – an urban civil society, which simultaneously demands and admits civic engagement of its diverse members and which is built on the constant development of “webs of overlapping commonalities”. These emerging forms could prove to be the basis for

a concept of civil society, which considers “diversity” as its connecting factor. As could be shown layers of older “dispositifs” still draw the public institutions, everyday constellations and media reports in Berlin. The development of a “post-migrant city” appears to be a contested process that activates different modes of perception and political instruments – a development, which will most certainly evoke new fields and requirements for informal educational processes.

Chapter 64

Identity and Diversity: The Educational Challenge in Urban Contexts

Paola Giorgis, Isabella Pescarmona, Rebecca Sansoé, Elisa Sartore, and Federica Setti

64.1 Introduction

From qualitative research studies carried out in the field of Anthropology of Education, the collective wom.an.ed – women’s studies in anthropology and education – here presents a contribution aimed at providing a reflection on the construction and deconstruction of the category of “difference” and “identity” within urban educational contexts. The common methodological element in our studies is the

The collective wom.an.ed is composed by Paola Giorgis, Giorgia Peano, Isabella Pescarmona, Rebecca Sansoé, Elisa Sartore and Federica Setti. The contribution here presented was written by: Isabella Pescarmona, paragraphs from 1.1 to 1.4; Rebecca Sansoé, paragraph 2; Paola Giorgis, paragraphs from 3.1 to 3.4; Federica Setti, paragraphs from 4.1 to 4.4; Elisa Sartore, paragraphs from 5.1 to 5.3. *wom.an.ed (women’s studies in anthropology and education)* is a collective created by a group of teachers, researchers and practitioners with many years of professional experience in the field of education and training. wom.an.ed’s aim is to develop and promote the anthropological approach in schools, social services, vocational education and training (VET), health care institutions and private social groups, such as charities, NGO, etc. wom.an.ed carries out projects both from a theoretical point of view (research, training and dissemination) and from a practical point of view, conducting field studies and research action on the territory, providing the management of social and cultural services, as well as the development of intercultural mediation.

ethnographic approach that allows us to turn a critical eye on the processes of construction of such categories within different institutional and historical contexts investigated as cultural spaces.

In the theoretical-etymological debate on “diversity” and “difference”, Abdallah-Preteille says that the category of “difference” should be distinguished from that of “diversity”. Terms often used interchangeably, “difference” and “diversity” instead refer to dissimilar concepts: “difference” is defined on the basis of an expressed or implied deviation from a rule, usually set by a dominant group that has the power to define the Other, and to measure her/his distance from the norm as a deficit. By contrast, the concept of “diversity” is placed on a horizontal, non-hierarchical plan that dissolves the opposition us/them in a landscape of multiple and diversified memberships and configurations which depend on the context, the opportunities and the interactions (Abdallah-Preteille 2005, p. 11–21). In accepting this theoretical-etymological distinction, our studies investigate the dialectical relationship between the construction of “difference” as constitutive of the institution, and that of “diversity”, arising from emic visions, and designed as an opportunity for the deconstruction of the category of “difference”.

The construction of “difference” also impacts with that of “identity”, and with its possible or potential declinations – possible, as defined by dynamics of power which often frame, if not hinder, the full development of individual potential. “Identity” is multicultural by definition. It is characterised by different gender, sexual orientation, race, ethnicity, religion, language, social class, and bodily difference. In different contexts, different cultures are expected to be differently operative: according to Goodenough (1976) “everyone develops varying degrees of multi-cultural competence in at least some micro-culture” (*id.*, p. 4). Yet, the possibility of developing different competences to participate to different contexts follow patterns which, explicitly or implicitly, (re)produce dynamics of power and privileges (*id.*). Indeed, in the history of relationships between minorities and majorities the asymmetry of power is a fundamental thematic tie also to understand the perspectives of the first: considering that the institutions “belong to the majorities” and it does often not exist a representation of the cultures, languages and experiences of the minority members within the institutions, it does not yet exist a warranty for the respect of social justice within the institutions.

As for the bound between difference and identity, it is important to consider that

on one side, the positive acknowledgement of cultural diversity (no people, no group or subgroup lacks of a distinctive vision of the nature and supernatural, of the social and affective relationships [...] neither in the most extreme and degraded conditions) leads to the

e-mail: federica.setti@womaned.org

recognition of a common humanity. On the other side, we cannot believe that we can write about communication, comprehension, exchange and about cultural relationships without considering the dimension of power. Indeed, not only cultural differences exist, but also differentials of power between one culture and the other and, clearly, between the subjects that belong to one or the other culture. (Gobbo 2000, p. 15–16)

In singular ethnographic contexts then emerge, in more or less visible way, as the “discourse on difference” manifests itself as a narrative of the Other that reveals unequal status of power. Education is at the front line to challenge the (re)production of “difference” to favour the development of identities and to recognize the value of diversity. In particular, we consider Urban Education as a meaningful conceptual site where diversity displays in daily experiences, practices and interactions in multicultural contexts: diversity between and within groups challenges reification and pre-assumptions on cultures, and it engages the discourse of the complexity of identity, thus avoiding to stereotype both the “cultural” and the “multicultural”. Therefore, as Rockwell (2010) recommends, we follow an approach that entails the “capacity of positioning” (2010, p. 40) – as ethnographers – “to unveil and denounce, not the knowledge and the secrets ‘of those who stay lower’ in the hierarchy of power, but the secrets ‘of those who stay higher’ that we can perceive from the bottom” (*id.*). We can do this trying to “tell and write about ‘what is known but not told’ from those who have the power”, without “losing the capacity of moral indignation” (*id.*).

We thus address the challenges advanced by Urban Education not as educational issues connected to minorities or immigrants, but rather as educational opportunities which assume the daily complexity, in particular that concerning the complexity of identity, as a recurring feature. Our research studies, conducted in several school and extra-school urban contexts in Italy, show how diversity is, paradoxically, the common trait of the subjects involved in the educational relation, emerging as a situated, negotiated and co-constructed process. Our educational approach values diversity as a way to enhance learning, as well as to develop an awareness on how self and others are perceived and represented.

The contribution here presented focuses on two main areas of research. The first regards the teaching/learning relation, presenting data from a study which considers the educational strategy of Complex Instruction as a way to re-apprehend the classroom as a cultural space, and from another research which examines the socio-cultural impacts on students’ expectations in vocational education. The second, presented in two case studies, observes how linguistic interactions between adolescents challenge a priori assumptions of cultural belongings, and create cross-cultural affiliations. A final reflection considers the theme of diversity from a historical perspective, showing how it is a relative and protean notion.

The aim of our research is then to investigate how diversities display in the urban context, suggesting how a much needed and critical understanding can be offered by a transformative intercultural education, able to question and impair power relations. Please note that though as *wom.an.ed* we consider our research studies as whole project, the sections of the contribution are presented with the pronoun “I” to explicit and vindicate the ethnographic principle of situated subjectivity and of the researcher’s responsibility.

64.2 Teaching and Learning in Multicultural Contexts

Educational and training contexts are cultural spaces, where implicit set of rules of behaviour, norms of interaction and mutual expectations give meaning to school life and shape individuals' choices and actions. This "culture of the school" (Hargreaves and Woods 1984; Florio-Ruane 1996; Gobbo 2000) is neither natural, nor neutral. This culture hides a system of power and privileges that may influence the participation in social and learning interaction and the access to resources (see Goodenough 1976). Although it is usually taken for granted, this may shape the way of acquiring knowledge and developing skills, which are required to be able to participate successfully in school, social and work contexts. It plays a role in the perception of self and of goals that seem appropriate and desirable to the people who learn and work in educational contexts, and maybe would improve their conditions.

The question is to what extent teachers and students are in a position to give (and obtain) access to situations that really provide them with the opportunity of teaching and learning in a more equal way. Indeed, teachers and students are both under the pressure of the same culture, but they are also individuals that try to overcome the same cultural barriers in order to reach their educational goals in our multicultural urban contexts. As Goodenough says, individual people are to be considered "as learners of culture in the context of social interaction, as they pursue their various interests and try to deal with their various problems of living-problem" that involve the necessity of choosing among conflicting goals, competing wants" (*ib.*, p. 4).

For these reasons, it could be interesting analysing, firstly, how teachers test themselves with an educational innovation in order to change some cultural school norms and give more equal opportunity of learning for all; secondly, how students who dropped out from formal education succeeded in a vocational educational course, and change their previous aspirations.

Therefore, our studies suggest that Urban Education should investigate how individuals move and take decisions in educational contexts and how the culture and organization of these contexts facilitate or hinder their access to learning resources, and may impact on their identity by changing their personal motivations, beliefs and norms of acting.

64.3 Identity Challenges in Innovating Education in Urban Contexts

Urban Education studies are often related to schools in metropolitan communities, which are characterized by an increasing number of students representing many ethnic minorities, multiple languages, and frequently a low socio-economic level. The educational debate focuses mainly on how to help teachers to meet the needs of students in urban classrooms. Thus, many teacher-training courses are designed to develop the knowledge, the skills, and the attitudes necessary to teach in multicultural contexts. Most interventions regard the students' school achievement and competence that teachers require, rarely dealing with the way in which teachers think

about the new ideas and strategies and implement these in their classrooms. Urban Education requires also considering how teachers change their usual beliefs and practice and how they develop their professional identity in order to give equal learning opportunities for all students.

A worthwhile way to examine this issue is analysing how Complex Instruction, a cooperative learning method for heterogeneous classrooms, has been learnt and implemented by a group of primary school teachers, in some schools in Bologna and its province, in Italy. Complex Instruction (CI) has been seen by these teachers as an occasion to innovate and make more inclusive their way of teaching, regardless of the students' cultural and social backgrounds. Indeed, CI is not only a set of tools for improving classroom relations and creating a welcoming space where to learn. It explicitly aims at creating an 'equitable classroom' by exploiting different cultural, linguistic and cognitive abilities of students as resources for learning, and by calling into question usual teachers' and students' expectations and habitual classroom tasks, since these can contribute to establish classroom stratification – and thus student academic and social exclusion (Cohen and Lotan 1997, 2004, 2014). I adopted an ethnographic methodology to understand how this group of teachers (after attending a cooperative learning course) created new CI teaching units and experimented these in their classrooms.¹ I employed different data collection techniques (such as interviews and participant observation, informal conversations and group discussions) during both teacher meetings and CI lessons to examine the reasons, feelings and choices of the teachers involved in this process of educational change (Pescarmona 2012). Research findings do not give an evaluation of a CI strict implementation, but rather a qualitative interpretation of the process, which sheds light on the uneven but rich way of dealing with the new educational method.

64.4 Challenging Teacher Professional Identity

Learning and implementing an educational innovation was more problematic than what may have been initially expected. These teachers were highly motivated to make students understand that there are different ways to learn, and often stated they were "fascinated" by the Cohen's sociological theory. However, they coped with CI in a complex way. Rather than simply transferring the new ideas and cooperative rules into practice, teachers discussed critical educational issues, such as how pupils learn, what and how to assess the work, how to teach. The most recurring questions² concerned creating multiple ability tasks able to stimulate

¹This contribution is a reflection on some findings from my PhD research thesis in Ethnography of Education, which was developed from 2007 to 2010 at the Doctorate School in Human Sciences, University of Turin, Italy (Pescarmona 2012).

²I called these recurring questions 'educational dilemmas'. The main ones were: (1) the tension between teacher-centred habits versus pupil-centred style; (2) the negotiation between a broader notion of intelligence versus the priority given to the language and mathematical skills (Pescarmona 2010); (3) the evaluation of product versus process; (4) the recognition of equal rights for each pupil to give his/her intellectual contribution versus the promotion of social competences for living and working together respectfully (see Pescarmona 2010).

high-order thinking, delegating authority to student groups in solving a multidimensional tasks, or evaluating them according to a broader notion of intelligence (see Gardner 1983). For instance, teachers recognized the importance of designing multiple ability group work, but argued the priority of developing linguistic skills at school and complained about the pressure caused by having to follow a vast syllabus. They also pointed out the difficulty in the relationship with colleagues in creating multidimensional tasks within a rigid school timetable. They believed that their role was aimed at promoting students' ability to make their own decisions and choices, but often reported they had to act as mediators both of students' interactions and learning activities. They constantly put into a dialectical relation the new method to their professional experience as well as to their personal value choices and goals (Pescarmona 2010, 2011a; Gobbo 2007).

The process of educational innovation entailed a great effort of negotiation and self-involvement. Sometimes this created stress and frustrations, and led teachers to implement only those CI aspects that could be more easily inserted into their habitual teaching experiences and school context. However, at the same time, this process stimulated teachers to reflect on their usual way of teaching in a more critical way and made them aware of learning and social barriers that some beliefs and habits may reinforce³ (Pescarmona 2010, 2011a, 2014b). Dealing with a new method constantly challenged what-is-taken-for-granted and called into question the pre-existent "culture of the school" (Florio-Ruane 1996; Gobbo 2000). It showed the classroom as a non-neutral space, but as a social system where some expectations and norms may create social hierarchy and inequality. Thus, these teachers tried to find new strategies⁴ to cope with usual constraints. They were encouraged to make non-routine decisions and reach new and unforeseen solutions. For example, they interpreted the syllabus in a more open and interdisciplinary way connecting pop music and illustrations with pieces of information, and re-organized the school timetable in order to devote more time to working with students and to collaborating with colleagues. Furthermore, they acknowledged that experimenting with CI gave them the occasion to rekindle and re-interpret educational goals that they strongly believed in, such as equal opportunities for all (Pescarmona 2010, 2011a, 2015). This process of innovation gave teachers back the power to change and the capacity for choice in a more equal perspective.

64.5 Reflexivity and Imagination

This process of educational innovation was accompanied by teachers' social and cultural self-questioning. It led teachers to critically reflect on their role in class. They started thinking to acquire a fruitful method to face their heterogeneous classes, but during the process they realized that they were the true subjects of change. Experimenting with CI made them "strangers" to their usual way of

³I referred to it as "fluctuation of agency" (Pescarmona 2011a).

⁴I referred to them as "coping strategies" (see Woods and Hargreaves 1984; Jeffrey 2006).

teaching and considering the educational relationship with their students (Pescarmona 2014b). Thus, they felt they had the power to think and act in a different way, by using their imagination (i.e. the capability of seeing themselves in roles, relations and contexts unexpected and different from the usual ones. See Appiah 1996). They became aware that their role was not pigeonholed in a predefined “script”, but this could be changed.

Indeed, teachers professional identity was not frozen in the previous teacher training. It was not monolithic, but multifaceted and dynamic. Teachers were active participants in the process of change and could move from the previous school cultural norms to new ones.⁵ In this sense, they developed a multicultural professional identity. Releasing themselves from a predefined identity, these teachers were able to recognize the same multiple identity to their students by developing multiple expectations and breaking the traditional classroom rules and hierarchy. Thus, they could provide students with an alternative way of learning and being evaluated, in order to realize equal opportunities for all. This insight is at the core of educational innovation.

Therefore, Urban Education is challenged also by taking into account the complex process of transforming professional identity of teachers and staff who work daily at school, and to what extent they can change the culture of the school in a more equitable way.

64.6 Changing the Perspective of Learning

In Italy, as in Europe, the concentration of foreign students in vocational education and training (VET) raises a growing concern. In effect, the choice of vocational education is interpreted as a sign of assimilation into the urban underclass, leading to poverty and downward mobility (Portes and Zhou 1993; Rumbaut 1997). An anthropological approach overturns the terms of the educational discourse considering this choice from the students’ point of view. This perspective challenges the vocational training as an a priori segregating choice: the ethnographic research brings out an emic successful concept defined in relation to the subjects and their strategies (Gobbo 2000).

In the ethnographic research with a group of young immigrants enrolled in vocational education and training, the learner’s point of view is central in the analysis (Sansoé 2012a, 2014). The classroom and the relationship between teacher and students are, in fact, only some of the situations where the subjects experience the learning process, as it takes many forms and meanings that go beyond the institutional settings. In this case study, the researcher and the ethnographic narrative follow the young students’ growth in VET along 2 years and in their further choices. The different paths of the students show the complexity of the elements that enable and guide the learning processes.

The learning process is closely related to the definition of the learner’s identity. Gradually, the students define their paths according to dynamics which are in mutual

⁵This opportunity to change was also experienced by their students learning to work together and give a creative contribution to the task (Pescarmona 2011b, 2014a).

relation or opposition. The young immigrant learners orient their motivation in two symmetrical ways: some seek and find their system of reference in the figure of teachers and in the resources offered by VET, while others turn their attention outside. Students who would emerge as the excellence of the course – as Mohammed, Malik, Omar and Yankuba – are, in fact, shaped by the relation with the students who have chosen the other way – as Ahmed, Walid and Kamal.

Some students continue investing in the vocational education and then choose to carry on with their studies. The willingness to learn new cultural contents always involves a change of perspective on themselves and on others, on one's skills and ability (Sansoé 2012b). In this situation the willingness to change perspective distinguishes these students. Other students, on the contrary, turn away from the resources and the professional possibilities offered by the training courses. In this specific urban context dropping out of vocational education leads slipping into the alternate route of 'earning a lot of money by doing business'. Therefore, the willingness to learn is directed to different cultural contexts, school and work, on the one hand, and street and 'business', on the other. The greater or lesser willingness to learn the cultural contents of vocational education reflects the choice of belonging to a community rather than to the other.

The ethnographic narrative also shows the disruptive impacts of economic change on the choices and paths of this group of young immigrants. In effect, the crisis of the local industry (in Turin, a city in the northwest of Italy) makes the outcome of the training course uncertain. Students become aware that the school is not able to guarantee access to employment. The socioeconomic transformations impact on their projects, and draw a narrow space for imagining their future: this case study highlights how this context leads young immigrants to a short-term planning (Gobbo and Sansoé 2011).

The learners acquire new cultural contents, beliefs and behaviours that generate a change in their perspective: when a subject learns, the representation of himself and his role changes. However, the willingness to learn is closely linked to the perception of the obstacles, on the one hand, and the possibilities that society offers to them on the other. The future challenge is thus to investigate how the context affects the subjects' choices, and frames their openness to the transformation that the acquisition of new cultural contents implies.

64.7 Linguistic and Cultural Diversities as Metaphors of the Urban Experience

*Each language modifies the other, crossbreeds with it,
fertilizes it. Each language makes the other relative.
Like everybody, I am the sum of my languages –
the language of my family and childhood, and education
and friendship, and love, and the larger, changing world* (Eva Hoffman)

Languages shape the urban experience in many ways. They speak to us when we walk by through the dialogues in the streets, the ads on the buses, the shop-signs, the food in the markets, or the song we can hear coming from a window, in what is known as the "linguistic landscape" (Barni and Extra 2008, p. 25–28).

Photo 64.1 Hand-written sign in Porta Palazzo market, Turin, Italy (Photo by the Author)

Photo 64.2 Hand-written sign hung on a traffic lamp, Turin, Italy (Photo by the Author)

The first photo shows a hand-written sign in “Porta Palazzo”, the largest European open-air market which exhibits daily in Turin (see Sansoé, Part One, Chap. 3). The sign, which warns: “Do not touch”, is written in the three languages of the ethno-linguistic communities which live in the area⁶: Arabic, Chinese and Romanian. An older sign written in Italian, “Non toccare la merce” is only partially visible behind

⁶Another large community in Turin is the Peruvian one, but they live in a different area of the city, the San Paolo district, and they gather around another large open-air market, the “Corso Racconigi” market.

it, possibly owing to the fact that the majority of customers are non-Italian speakers. The other photograph shows a hand-written bilingual Italian-Chinese sign which was hung on the lights at a street crossing. It expresses birthday wishes, and there is a decorating balloon tied to it. The four hanzis reiterate the message written in Italian, “Buon Compleanno” (“Happy Birthday”), as they mean “life/birth”, “day”, “cheerful” and “wishes” in Contemporary Standard Chinese.⁷ What is interesting here is that the message was presumably written by an Italian person addressing either to a Chinese person, (i.e. a girl, as the balloons is pink, maybe to impress her), or to an Italian one – that being the case, the foreign language is here used as a secret code to convey a private message in a public space.

These are just a couple of examples of how languages speak to us and shape the metropolitan geography we live in. Yet, if urban landscapes are filled with languages, languages are not a simple background of the urban experience. Rather, they constitute it, as they orientate and wave the different nets of interactions we live through, and by: each of us is indeed the sum of her/his languages – of the family, education, friendship, love, and the larger changing world – and that sum is both the product and the producer of our own lives. Linguistic diversity then characterizes personal and collective experiences, but it also raises several questions. I will address two of them, examining briefly the connection of language and identity in the urban context, and devoting more attention to the educational challenge that linguistic diversity advances.

64.8 Language and Identity in the Urban Context: Monolingual Belonging and Multiple Affiliations

In October 2014 *The Guardian* online edited a chart of London’s second languages (=other than English) mapped by tube stops. The “Tube Tongues” map shows how linguistic territories are both well defined and mixing. Oliver O’ Brian, the researcher in geovisualization and web mapping at the University College of London (UCL) who made the study, gives this example: “a journey on the Bakerloo [line] passes through areas with large proportions of Gujarati, Portuguese, French and Tagalog languages speakers, as well as the varied Chinese languages spoken in Chinatown” (<http://www.theguardian.com/news/datablog/2014/oct/30/-sp-londons-tube-languages-visualised>). Travelling on the underground means travelling through several languages, and the urban linguistic geography shows that cross-linguistic encounters coexist with monolingual enclaves.

One of my former students, a girl from Morocco, speaks four languages: Arabic and French as mother tongues, Italian as the language she had to learn when she and her family migrated to Turin, and English, the language she learnt at school. One

⁷I wish to thank Ai Murayama, Marco Losurdo and Olek Borrelli for translating the messages from Chinese, and for offering suggestions for the interpretation. The first message says: “Do not touch and do not touse”, while in the second one, since the hanzis seem imitated, it is possible that the message was written by an Italian person.

day, she told me she was learning a fifth tongue, a specific dialect from a village in Puglia, to communicate with her boyfriend's parents.⁸ They had migrated to the North of Italy in the 1970s, during one of the last waves of what is known as the "internal immigration". They had never learnt Italian: all through the years, they had tried to reduce as much as possible public contacts, offices and affairs; in case, the linguistic mediators had always been, as often happens, their children. Their younger son still translated their communications from Italian to dialect, and vice versa, both in formal (i.e. at the doctor's) and in informal conversations (i.e. with his girlfriend). Paradoxical as it may sound, such a highly defended linguistic territory does not weaken, but rather reinforces the phenomenon of linguistic diversity which characterizes the urban experience. There is no mixing there, but precisely its absence tells us about the perception, or even the fear, of a much too 'contaminated' world outside, where language mixing means language loss, and language loss means the loss of the personal and cultural identity.

This example highlights the most fundamental characteristic of language, that is its connection with individual and collective identities. Languages are primary components of identity belongings, as well as synergetic elements of affiliations and representations which shape and are shaped by new contacts:

Migration is certainly a social phenomenon in which language acts as a catalyst, shaping forms of identity and providing a focal point for the reformulation of identities. In this sense, the linguistic issue assumes a central position because it encompasses the issues surrounding learning the language of the host communities in order to survive and integrate socially and professionally; and because contact with new languages and cultures brings to the fore the individual cultural and linguistic identity of all the communities within a given area. (Barni in Barni and Extra 2008, p. 217)

The process of linguistic cross-breeding has always existed, due to the promiscuous nature of languages. What strikes now is its scale, brought forth by global migrations, and its wide spread, in particular in two environments, the urban contexts and the trans-territorial communications (i.e. the Internet). These multiple and multiplied contacts have denaturalized the essentialist link 'one person=one language=one nation' which has shaped language ideologies since the emergence of the Nation-States, showing that

The traditional idea of 'a language', then, is an ideological artefact with very considerable power – operating as a major ingredient in the apparatus of modern governmentality – it is played out in a wide variety of domains (education, immigration, high and popular culture, etc.) (...). (Blommaert and Rampton 2012, p. 10–11)

Instead,

⁸When I asked her how she felt about the situation, she smiled putting into evidence the paradox that she, a foreigner according to the Italian law, could speak fluent Italian, while her boyfriend's parents, formally Italian, could hardly speak a word of it. The episode invites us to avoid overgeneralization when speaking of 'minority' and 'majority' (the old couple, formally 'majority', are marginalized, in an evident condition of 'minority'), as well as when speaking of 'native' and 'foreigner' (indeed, who is the 'foreigner' in this situation? aren't there different levels and nuances of 'foreignness' and 'otherness'? then, who has the power to define the Other as such? and on which grounds?).

a much more differentiated account of the organization of communicative practices emerges, centring on genres, activities and relationships that are enacted in ways that are often missed by both official and common sense accounts. (*id.*, p. 11)

Research should then address the multiple ways

in which people take on different linguistic forms as they align or disaffiliate with different groups at different moments and stages. It has to investigate how they (try to) opt in and out of these groups, how they perform or play with linguistic signs of group belonging, and how they develop particular trajectories of group identification throughout their lives. (*id.*, p. 12)

In such conditions, where languages constantly and dynamically meet and cross-breed, and people reshape their identities according to the linguistic repertoires and resources they wish to (or can) access or adopt to signal their adherence to specific groups, what is the place, and the task, of language education, and in particular of foreign language education?

64.9 Foreign Language Education. An Intercultural Perspective

Foreign language education is the prime promoter of the foreign perspective (Claire Kramersch)

Foreign language classrooms are the ideal sites for the deconstruction of all what is the taken-for-granted of individual and collective identities, and of monocultural and nationalist frameworks. By breaking the ‘natural’ link word-world, foreign language education unveils how far it is cultural and situated, opening a new linguistic and symbolic territory: from the perspective of the new language, students-explorers can observe critically how Sameness and Otherness are constructed through linguistic practices, thus dismissing a priori assumptions about languages and cultures. Decentering one’s own perspective of the self and the other,

Learning foreign languages is (or, more exactly, should be) the place par excellence for learning alterity. While legitimately, but exclusively, focusing on the linguistic dimension of learning, we have gradually eluded the deeply humanist dimension of that learning. The primacy of the functional dimension of language to the detriment of its ontological value has generated an education primarily defined as instrumental, a technicalization of language and communication.⁹ (Abdallah-Preteuille 2008, p. 56)

The acquisition of a foreign language should then move away from the mere acquisition of instrumental-linguistic-cultural notions to become *intercultural*, as a chance to reflect on one’s own culture, to understand its own diversity and internal complexity, as well as to discover Otherness. By making the familiar foreign, Foreign Language Education induces an “experiencing [of] the boundary [and] discovering that each of these cultures is much less monolithic than was originally

⁹All translations are by the author of this contribution.

perceived (...) [as well as understanding] boundary not as an actual event but, rather, as a state of mind, as a positioning of the learner at the intersection of multiple social roles and individual choices” (Kramsch 1993, p. 234), and thus engaging her/him “in the dialectic of meaning production” (*ib.*, p. 239). A foreign language learner can thus take possession of a “third place”, according to Claire Kramsch’s poignant definition, a territory from which s/he can create new meanings: linguistic and symbolic, multiple and dynamic, with varying degrees of plurality and creativity, such a space in-between can offer “the opportunity for personal meanings, pleasures and power” (*ib.*, p. 238). New understandings can arise from the contrast between the meanings related to one’s own native language and culture and those of the new language, bringing out the symbolic and mediated nature of language, and thus favouring the problematization of meanings (and representations) that are often taken-for-granted.

Foreign language learners, teachers and researchers are then in the perfect place to observe how languages can (re)produce, or challenge, cultural meanings and discourses. The potential change brought along by foreign language education seen as the occasion of an intercultural reflection can be a field for future exploration in the educational context to observe how it can be declined within the school context and what educational opportunities it can offer: which roles are enacted, or voices silenced, through linguistic interactions; what is connected to each language in terms of values, projections, and representations of possible identities; what are the perspectives for individual and collective transformation that the use of different languages can offer. Rather than teaching languages, renewed linguistic pedagogies could teach *about* languages, eliciting students to see and meet the others’ diversity, as well as their own, stimulating their curiosity, and making them explorers of the worlds of languages.

64.10 Language Practices: Reshaping Individual and Collective Identities

In the years 2010–2012, I conducted a qualitative research study among native and non-native Italian adolescent students, aimed at investigating what happens when a non-mother tongue separates the speaker from her or his own cultural belonging and identity/ies in L1 (mother-tongue), and how this divorce impacts on the perceptions and representations of the self and the others. The language in question was English as a Foreign Language: for its prevalence as a foreign language studied in Italian schools,¹⁰ and, most of all, for its being a language *equally* foreign for both Italian

¹⁰One hundred percent at ISCED level 2 (Lower Secondary Education), and 96 % at ISCED level 3 (Upper Secondary Education, including Vocational Education). Data from *Key Data on Teaching Languages at School in Europe 2012*, EACEA P9, Eurydice and Policy Support, Brussels, pp. 75–81.

and non-Italian students. The hypothesis of the research was that the experience of a foreign language can reframe individual and collective identities from a personal and relational point of view, and that this can impact on and remodel the different roles and footings that one can assume, perform, or access, in the context of the classroom. I was particularly interested in finding out the *intercultural potential* of a language equally foreign for both Italian and non-Italian students, as is the case of English in the Italian context.

What emerged was that both in the school and in the extra-school contexts Italian and non-Italian adolescent students appropriate different languages bottom-up, and widely practice cross-linguistic interactions to create new affiliations.¹¹ Gender and ethnolinguistic descent did not emerge as to influence these linguistic practices, which rather run on several paths traced by transcultural youth products, such as: hip hop music; online blogs, games and communications; TV series; participation in the social networks; the Internet. A critical linguistic perspective could consider these linguistic practices, whether live or on the web, as ‘linguistic consumerism’, the shopping for different items from the shelves of the super-market of languages to adhere to a series of youth transnational sub-cultures: in this view, these practices are far from being critical and emancipatory, as they are rather reproducing models of transgression which are promoted by the market itself. Yet, what is relevant is not the intention, and not even the awareness or the aim of these linguistic practices, but rather their *process*: that is, what happens when two or more people communicate using different languages, how their mutual perception and representation changes through this experience, and how such a change can create not only new affiliations, but, principally, new *perspectives* on self and the others. Adolescents jump on/off languages according to different lines and patterns, where the representation of personal and collective identities, and the creation of in-groups and out-groups, are practices which depend on the context, the aim of the communication, and the people the adolescent wishes to include or exclude. The patterns and the lines of the interactions also perform different functions: young people code-switch to a *different language* to establish a *mutual recognition* within the territory of a *common interest* (music, cartoons, TV series, online blogs or games, etc.), to create a special *affective link* with someone or *to protect* their intimacy (for example to share secrets with their boy/girlfriend or best friend), as well as *to mimic/appropriate/subvert* hierarchies (for example, as a counter-act of power on adults and teachers).

In her theoretical-etymological considerations on “difference” and “diversity”, Abdallah-Preteille advances that the notion of “difference” refers to a hierarchical construct, a fixed category set by a dominant group who has the power to define the Other and label “difference” as a deviation from a norm, whereas “diversity” is a dynamic and non-hierarchical concept, as it indicates multiple and diversified memberships defined by the context, the opportunities and the interactions (Abdallah-Preteille 2005, p. 11–21). “Diversity” should then be spelt in the plural as “diversities”: within this paradigm, bottom-up appropriation of English(es) and

¹¹ I discussed the findings in previous publications (Giorgis 2013a, b).

practices of cross-linguistic interactions allow adolescents and young people to spell out their difference through the appropriation of different kinds of diversities performed through linguistic practices.

Yet, by so doing, adolescents intersect the institutional cultures of the school: the cross-culturality which young people enact, not solely but mainly through language mixing and code-switching, contrasts with the general monoculturalism (and monolingualism) of the institution. Since multiplicity is a key dimension in particular for minorities, as it allows them both to move towards new affiliations and to continue to adhere to their origins, the monoculturalism of the institutions notably impacts on cultural and linguistic minorities, such as those of Sinti and Roma.

64.11 The Trentino “Gypsy” Population: Sinti and Roma’s Family Networks

My ethnographic study (Setti 2014, 2015a, b) was carried out among the Sinti, who represent the larger “Gypsy” population in Trentino, a region in the North-east of Italy. They comprise a network of Roma families from Istria and Croatia living in northern Italy. They were already nomadic in this territory by the seventeenth century and have been settled in Trent since the nineteenth century (Piasere 2004). Non-Sinti people are called Gagi or Gage by the Sinti. The orthodox social term used for the Sinti is “Zingari” (Gypsies) and/or “Nomadi” (Nomads). Some 375 Sinti live in the Trentino Province, mostly in the capital, and are divided into different family networks: the Eftavagaria (meaning the “seven carts”), the Estraxaria (from Austria), the Gackane (from Germany), the Lombardi (from Lombardy) and finally the Istrian Roma (from Istria and Croatia). The latter arrived in the same period as the others, were put in the same campsite, and considered “Gypsy” alongside all the other families. There have been frequent mixed marriages among different Sinti families and between Sinti and Istrian Roma, as well as between Sinti men and Gage women who have learnt Sinto. This language is a variant of Romani and not everyone speaks the older language ‘Sinto stretto’ or ‘true Sinto’. About 40 % of Sinto terms derive from German (Gomes 1998; Piasere 2004; Tauber 2006). The Roma, who have lived with the Sinti for a long time, speak both Romani and Sinto. The autochthonous Sinti and Roma, though having Italian citizenship, are an extremely small percentage of the Italian population. Therefore, media-fuelled fears about the “Nomad emergency” do not reflect a real issue and rather show the discrepancy between qualitative and quantitative data in the representations set out by the popular media (see Setti 2015b).

64.12 Peer Groups

The ethnographic research carried out shows how peer groups are fundamental for the processes of cultural transmission and acquisition among young people. Furthermore, the shared peer groups are key contexts for outlining the trails of “cultural continuity” between the cultures of the young people’s family networks and the cultures present within the institutions, such as the school. Goodenough (1981) defines “micro-cultures” all the sub-cultures to which the subjects participate beyond the “macro-cultures” in which they are competent, such as those of the Sinti family network and of the Gage. Therefore, it is important to reflect on what it means to be Sinti and be Gage, and how do the cultural and social constructions elaborated along the being-Sinti-being-Gage continuum shape young people’s identities in the context of urban education.

Piasere defines the elaboration of such a continuum in the following way:

Gypsies on one side and Gage on the other side are two mutual constructions of otherness. In most cases they are constructed in a way that emphasizes a strong opposition between the two groups. [...] The Romani and Gagikani dimensions are at the two ends of a continuum, in which everyone places opposite borders, wherever it is useful for them. (Piasere 2004, p. 29–30)

Sinti teenagers play with these constructions. Positioning along this theoretical continuum assumes new forms with each generation, as relayed to me by a young married Sinti man. He said: ‘we are Sinti and we are Gage, but surely we are more Sinti than Gage!’. He refers to the fact that they do things that the Gage usually do, such as living in houses, attending school regularly, inviting Gage friends (which included me) to parties, and speaking in ‘Gagio’ (Italian). However, they always do such things *romanes* style, in a ‘Sinti way’, as the locution ‘for sure we are more Sinti than Gage!’ testifies. It seems that positioning along the continuum between Sinti and Gage is then strongly related to the experience of school. Going to school is a ‘Gage thing’, as Sinti teenagers say. This is related to the epistemology of the school, elaborated by the “minority” within the context of the “majority society” (Ogbu 2003). However, Roma and Sinti teenagers’ points of view are usually not considered in the documents that regulate the school’s organization and their pathways in it. I have observed how peer group cultures are important in shaping the daily school experience of Sinti teenagers. Peer groups also have a strong influence on their younger relatives. Sinti teenagers and young adults use their imagination and representational skills creatively in the elaboration of their identities and in the relationship with non-Sinti. Furthermore, my ethnographic study shows how the teenagers’ use of the Internet shapes their self-definition. They participate increasingly with extended peer groups of immigrant teenagers from different ethnic and national backgrounds, such as Kosovo Roma, Moroccan, Albanese, South American as well as Italian. They meet them in middle and vocational schools but also in non-educational contexts such as shopping centres, clubs and in the streets of a multicul-

tural city quarter. In their free time, they often like to use Facebook. Through this social network, they share new codes among peer groups, which also include meaningful media characters, such as those of High School Musical and celebrities such as 50 Cent, Elvis Presley and Al Pacino. Notably, their favourite characters, who they often try to emulate, come from different ethnic and national backgrounds (see Setti 2015a).

64.13 Propriospects¹²

“Every individual acquires competences in myriads of micro-cultures and in their subcultural variants” (Wolcott 2004, p. 222). Every person develops a different *propriospect* through which she/he interprets the surrounding world. Every young Sinti girl/boy, as each of their parents, relatives and teachers has then a unique and unrepeatable *propriospect* related to what she/he learns and to the interpretations on what surrounds him/her. Furthermore, everyone re-elaborates differently cultural experience and reproduces macro- and micro-cultures in ways that are always different from everyone else, at least in some aspects. Goodenough stresses that, in the same way in which everyone is competent in more than one language – considering also dialects – similarly she/he is competent in more cultures and codes.

Thus, through what I observed and reported in my field diary, I found a coherent interpretation of the young Sinti’s experience and developing of their identities in terms of Goodenough’s notion of *propriospect* (Goodenough 1981, p. 98; see also Wolcott 2004). This conceptual tool (Fig. 64.1) clearly shows us how young Sinti were enculturated simultaneously by their own families, by the different cultures of the school and by the different peer groups. Goodenough explained his use of the term in the following way:

Out of his own experience each individual develops his private, subjective view of the world and of its contents – his personal outlook. It embraces both his cognitive and his affective orderings of his experience. [...] Included in a person’s *propriospect* and, indeed, largely dominating its content are the various standards for perceiving, evaluating, believing, and doing that he attributes to other persons as a result of his experience of their actions and admonitions. [...] A person may not only attribute different systems of standards to different sets of others, he may also be competent in more than one of them – be competent, that is, in more than one culture. (Goodenough 1981, p. 98–99)

For example, Giama, a 14 year-old Sinti girl, was competent in the macro-culture of her Sinti family network and in the Sinti language, as well as in the macro-culture

¹²This term was coined by Goodenough from Latin, according to the etymology of “*proprio*” which means “related specifically to the self” and “*spectus*” which means “view, perspective” (Goodenough 1981, p. 98). The author highlights how the equivalent term in Greek would have been “*idiorama*”, but he preferred to avoid this terminological alternative, because in English the suffix “-orama” was already widely used for other neologisms.

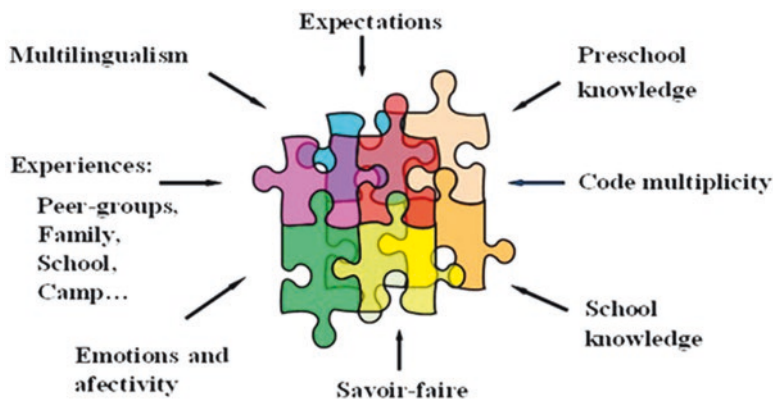

Fig. 64.1 Conceptual map of the meaning of *propriospect*

of the Gage society “reproduced” (Bourdieu and Passeron 1970) in the school. Furthermore, she was competent in the micro-cultures of her different peer groups, namely her Gage classmate girls at school, her Sinti cousins’ peer group and also a ‘media’ peer group of fiction and film’ characters, shared with real and virtual friends through social networks.

Looking at Roma and Sinti’s own *propriospects* shows how the categorization and denomination of these people and their children inside the urban institutions – such as the schools – as (before) “Gypsy” and (then) “Nomads” reproduce a stigma (Goffman 1963) created by the “majority society” and not their emic points of view, how they describe themselves and who they are. On the one hand, Italian regional and school legislation claims to be aimed at safeguarding a monolithic notion of “Nomadic” and “Gypsy” culture or a set of features thought of as Roma and Sinti culture. But, on the other hand, Sinti and Roma students and their families may receive equal rights to education and social inclusion only if they accept assimilation or when they hide their Roma and Sinti origin to avoid negative naming or labelling (see Setti 2015a). In this way, a subtle but pervasive policy of control is reproduced in national and local governments.

64.14 New Concepts for the Urban Education’s Field of Studies

From the ethnographic research¹³ – carried out according to the literature and the studies of Anthropology and Education – new concepts and interpretative keys arise, that are useful also for Urban Education. First of all, the concept of “rooted-

¹³As I was doing a part of my fieldwork in the school, I had the opportunity to meet provincial officials responsible for the new guidelines about the inclusion and integration of foreign and

ness” should replace the paradigm of marginality referred to those who are too often interpreted as weak and passive subjects in the urban areas, such as members of minorities, migrants, refugees, etc. Secondly – but not less important – the concept of “cultural intersections” (Gobbo 2004) could substitute the paradigm of “cultural discontinuity”¹⁴ (especially) between the cultures of minority families’ networks and those of the urban institutions managed by those seen as the “true natives”.

With regards to the first point, the supposed “monoculturalism” of minorities’ members is often intended and interpreted by the representatives of institutions, social workers, teachers, etc. as ‘far away’ and ‘very different’ from ‘the culture’ of the majority society. On the contrary, my research indicates how Sinti have a history deeply involved and rooted within the local territory, and how they are not only competent in their linguistic variant of the Romani language – and in Italian – but also competent in the local dialect spoken in Trent, beyond being competent in other languages (i.e. some teenagers used to speak and write daily in a quite good English). Therefore, one of the most meaningful results of my ethnography suggests that urban institutions, such as the school, would benefit from the awareness that youths – as well as adults – are multicultural and competent in more than one language and culture. Indeed, their family network has been sharing diverse socio-economic, geographical and political features with the members of the majority’s society, at least in the last century of history, as well as the same territory. However, the educational and social-care projects addressed to urban minorities such as Sinti and Roma, have often been built around the paradigm of their supposed social marginality, with regards to the majority society. This approach has contributed to the exclusion of the minorities’ students from teaching activities within schools, because the educational projects have considered them as permanently “Nomads”, ‘just arrived’ from ‘far away’ and with special educational needs (Setti 2015b). On the contrary, from the ethnographic research comes to light the rootedness of the Sinti at a historical, geographical, social, cultural, religious, linguistic and residential level. Although their history has been characterized by diverse forms and levels of interregional and international mobility and circulation, since a century they have been rooted in the Trentino region and since the 1960s they have been staying in a sedentary way. They are ‘anchored’ in the local territory also through linguistic exchanges, characterized by daily code-switching: from Sinto-romanes, to Italian, to dialect (Setti 2014). During my fieldwork at my Sinti host Janeira, for example, I

Roma students. I drew upon my ethnographic experience in a Sinti family network and in a middle school of Trent to challenge the idea of an essentialized and monolithic notion of culture and to highlight the processes of transformation in different cultures to which the students belong. Following feedback that I gave this group, the document was changed and these recommendations were reflected in a much-improved second draft (Provincia Autonoma di Trento, 2012, *Inserimento e Integrazione degli Studenti Stranieri. Linee Guida per le Istituzioni Scolastiche e Formative della Provincia di Trento* [Inclusion and Integration of Foreign Students. Guide Lines for Schools of the Province of Trento]). This might be considered an example of the importance of ‘engaged anthropology’ in the contexts where fieldwork is carried out, as Herzfeld has remarked (see Herzfeld 2012).

¹⁴To deepen into the paradigm of “cultural discontinuity” see Gobbo 2000.

often heard her son Raino speaking in dialect with friends or colleagues. Therefore once I asked him: ‘you know the dialect very well, don’t you?’ and he answered me: “of course, I am ‘Trentin’¹⁵!”. My interlocutors’ affirmation of ‘being ‘Trentini’” was constant on a daily base. During the afternoons that we spent together, Janeira, her sisters, her mother, and her sisters-in-law often used to tell sayings in dialect, some of which were new for me and referred to their memories and experience lived in Trentino during their childhood, adolescence and adulthood, tracing the transformations which had characterized the same territory from those times to the present, telling how the Gage themselves have changed and how the local peasants were in the past. In the same way, by speaking with the old Sinti, I could get a wide, complex and detailed perspective of Trentino’s history, geography and of its important political events. Sinti people with whom I used to live during fieldwork – both young and less young – never defined themselves only as Sinti, but always also as ‘Trentini’, highlighting the dialects and traditions, which distinguished them from the other Roma family networks living in the adjacent regions.

With regards to the second concept, the theoretical approaches that show to be the most appropriate for the orientation of the future urban educational and social-care projects – addressed to minority members – detach themselves from the paradigm of cultural discontinuity. On the contrary, they consider the diverse forms of the geographical, historical and linguistic presence of the minority members in the respective territories of residence. My ethnographic research shows that the paradigm of cultural discontinuity cannot anymore be considered exhaustive to interpret the educative processes, to which the youths of minorities participate. On the contrary, the elements of what can be described as “cultural continuity” (Setti, *in press*) – between macro- and micro-cultures shared within family networks, school and peer groups – arise from my study. For instance, writing certainly represents a form of ‘continuity’ because it is considered to be fundamental by Sinti parents, by teachers, as well as broadly by youths, who daily delight writing when at home, at the “Nomads” camp and at school. Similarly, I noticed what can be described as cultural continuity with regards to the use of computers and Internet technologies (videos, multimedia devices, etc.) by Sinti youths, because they were accustomed to use them already in their own families, before than at school. There are also some school subjects which potentially are an important means of connection between the cultures to which Sinti students participate, inside and outside of school. Most of the Sinti students were interested in the teaching of religion, a central feature with regards to their own family network, crossed by diverse families who decide to convert themselves to the Pentecostal evangelism of the Evangelic Gypsy Mission (MEZ). For this reason, the young Sinti were interested in deepening their knowledge about the Holy Scriptures. Furthermore, the young Sinti were particularly interested to foreign languages and science. Sinti girls were constantly inquiring about topics related to the human body, to the feminine reproductive apparatus and connected themes. Indeed, they would have not talked about these topics with their

¹⁵The word ‘Trentin’ is in the local dialect and means ‘a person who come from and raises in Trento’.

mothers, for reasons of respect and decency, but they shared them within their peer groups of young friends and relatives, representing an occasion of cultural continuity.

Therefore, today it is not correct anymore to interpret education and school processes of minorities' members – such as Sinti and Roma youths – by using the paradigm of cultural discontinuity, because they are competent in the non-Sinti macro-culture and in many micro-cultures, also shared with some Gage peers, even before attending school. The youths rather try to intersect (Gobbo 2004) their own worlds with those of the non-Sinti, an aspect that the school institution does not seem to catch, yet.

The concept of cultural intersections not only permits to show the cultural spaces that are created in the relationships between Sinti and Gage and the new 'cultural creations' shared in mixed peer groups, but also the difficulties and sufferings that those processes can hide. Indeed "to become a multiculturally competent person, is a process that has not to be underestimated and that it is not always easy" (Gobbo 2004, p. 638), considering how, at times, it can unbalance "the equilibrium between different and sometimes opposite cultural heritages" (*ibid*). Considering the life history of a young Roma cultural mediator, Gobbo observes that the Latin root of the term "secare", from which derives the word 'intersection', reminds how often the turning points in the lives of people can be described and comprised through the metaphor of a – more or less sharp – cut that individuals make at a symbolic and affective level in the transition from one culture to the other. However, these "cuts" are not made once and forever, and they can be "resewn" again, as the young Sinti teach us, crossing daily from one cultural code to the other, using different languages and dialects in a competent way.

64.15 Finding Our History in the Stories of the Other

How can we discuss not only the worthiness, but also the urgency of considering the construction of differences and identities from a historical perspective? It is a historically blind assumption defining diversity – romanticised or problematised – as external and alien to us. It hides the lack of a systematic reflection on the historical dimension of the encounter between diverse groups of people. Italy, like Europe, was not overwhelmed by the encounter with the Other in the last two decades. Italian history tells us about Visigoths, Ostrogoth, Longobards, then Saracens, Normans, Hungarians, followed by France, Spain, and the German Empire. If we look back at our history, we realise that the question of the *different-from-us* has always been present. Every society, every dominant group has always sought to provide political and social responses to questions, challenges and problems that arose when they came into contact with the Other: Exclusion, Segregation, Assimilation, Integration are not unknown models in Italian history. During every period of time – now as then, societies have made attempts to categorise and define

the Us and the Other. During every period of time we can draw dominant narratives on the others.

We come from and we built our sense of identity and belonging on our own narratives. As anthropologists what is more important is to understand how narratives play a part in our description of us and of others, how they influenced our way to see (and divide) the world. When anthropological and educational research refers to history, it is not to fill out an inventory of ideas and facts (such a list would in any case be inevitably partial), nor to describe the truthful narrative of history. Thus, we go back to history to put our knowledge into critical perspective. Italian historian of education Remo Fornaca says that

in the study of any educational or anthropological questions, we need to give space and vitality to the study of history, and the memory of the past has to have a purposeful and critical character, and not merely be descriptive. It can lend colour to a current story, a problem, a concept or an event. We go back to history to get a new understanding, a view – partial but equally compelling – around a question. (Fornaca 1999, p. 8)

We go back to history to understand “how” the question of the *different-from-us* has been addressed, if a representation of the Other was set up, and what effects it has had on others and on us. Furthermore we go back to history in order to be able to detect legacies of that history in our current reality. Looking at history as an opportunity to get a critical and proactive understanding of some current questions describes what I called *historical consciousness* (Sartore 2014a). If we consider the following points concerning *historical consciousness*: a ceaseless interrogation of meanings; the consciousness of the underlying unity which must link past, present and future; an open-ended question about the roots of our knowledge, we can see them echoed in an educational approach that wants to be a theoretical and practical stance against intellectual, cultural and historical reductionism. Not being familiar with some historical moments in which an Us-Other relationship has been established not only restricts the ability to argue about our own national history, but also limits the possibility to discover where our beliefs are founded. In regards to national history, for example, examining the approach to the *different-from-us* could tell us whom we have defined as “other”, which characteristics we have attributed to them, and which social, political or ideological assumptions have justified our actions. In regards to our academic discipline, a careful analysis of the many forms of the Us-Other encounter would play a crucial role for a better and consistent articulation of the discourse on diversity, as it calls into question interpretations, categories (such as identity, diversity, sense of belonging), theoretical constructs, and conceptual frameworks (what belongs to the sphere of us and what belongs to the others’ sphere). What results is a critical review of our knowledge, because putting our knowledge to the test of history reveals its cultural debts. Italian anthropologist Roberto Beneduce writes that speaking about the other “inevitably means talking about us, our own knowledge and history, and how many things we are used to considering natural or implicit” (Beneduce 1998, p. 13). Nothing is natural. Everything is *culturally situated*.

With these assumptions, a strong historical consciousness and a serious historical research will allow us, on the one hand, to order historical and cultural facts in a wider and more meaningful parabola and, on the other hand, to make theoretical and epistemological reflections, breaks, shifts and openings. Historical consciousness and critical thinking seem linked in a generative spiral, oriented toward the development of our knowledge on diversity.

64.16 Dominant Narratives and Life Stories: Fragments of a Historically Sensitive Ethnography

Thinking about the construction of differences and national identities in terms of narratives or discourses implies a dense interpretive tour that aims to understand reasons, functions and effects that characterize a particular approach to address the issue of the *different-from-us*. A discourse, in its multifaceted nature between the subject and the object, between the linguistic and the cultural, between the social and the political, is able to (a) hold together and put in relation identity and otherness, (b) take into account the specific cultural, social and historical context, and (c) bring to the surface processes of construction of difference. Analysing texts (such as legislation, press, news, didactic material, etc.) in their double-layered form of specificity, both political and cultural/historical means emphasizing the context in which a *natural* system of meaning reveals its *arbitrary* essence. At a deeper level, the discourse can be defined as a symbolic act intent on explaining and justifying beliefs, ideas and actions. Without going into the details of Foucault's theory (even if my recourse to the concept of "discourse" manifests a theoretical debt to it), we can assume that a dominant "discourse" is a place – historically determined – in which a connection between power and knowledge takes place. It is a set of statements, signs, symbols and practices, which, in different ways, organizes a system of values, and draws the fine line between identity and otherness. What is important is understanding that through the interpretation of the approach to the difference in terms of "dominant discourse on the other" we have easier access to the sphere of us rather than to a real knowledge of the object of the discourse. More precisely, we can understand: the position that "us" assumes in relation to the otherness; the set of characteristic attributes to the Other; the anthropological premises that justify the rules of inclusion or exclusion from the dominant identity and establish the hierarchies among the differences. Categorisations, descriptive terms, styles, and recurring imagery contribute to forming and modelling different and plural representations of "us" and "other".

The need to hold together the dominant narratives with the minor and subjective ones in order to penetrate more deeply into the reality is not a new anthropological notion. As suggested by Morwenna Griffiths (1995), the subject is not a simple reflection of the social or of the cultural, on the contrary, every subject endorses them, filtering, reinventing, translating and sometimes rejecting dominant models.

Griffiths goes beyond the belief that considers individual stories a pale reflection of the facts, and asserts the idea that these stories are, instead, the real face of knowledge about the world. These stories situate history in a human, historical, relational, and dialogical context, revealing the systematic incompleteness of totalitarian positions. Therefore, listening to the others is a way to enrich our knowledge of history, assuming as a prerequisite that each person is accorded his *agency*, his ability to conceptualise interpretations and actions. Thus the collection of the life stories of those who are traditionally considered “minor characters” becomes a worthwhile opportunity to examine not only the interpretations of the others about themselves, but also to listen to new historical narratives on national identities, diversity and belonging.

My ethnographic research among the Somali-Italians (Sartore 2014a) finds in these assumptions its epistemological and theoretical setting. The often forgotten Somali-Italian minority can be considered as a living legacy of Italian colonialism and postcolonialism. This is made up of Italian citizens who mostly share a similar background: they were born in Somalia in the decade from 1950 to 1960 of mixed parentage (usually an Italian father and a Somali mother); they spent their infancy and first years of school in Catholic missions in Somalia, and arrived in Italy beginning the late-1960s. What is remarkable about Somali-Italians is that they inform us about a fairly unknown historical period. If the Italian colonial past does not give us a new story but a story that Western modernity is not used to telling about itself (Chambers 1994), the life stories of the Somali-Italians bring to the surface the often left in the shadows postcolonial Italian parenthesis.¹⁶

In these life stories, the relationship between Italy and Somalia is defined, first of all, as a long time relationship that seamlessly spans the dimensions of past, present, and future. As V describes it,

In order to understand the identity of Somali-Italians you need to understand that it's a history embracing several time periods: the colonial period, post-colonial, Italy in the 70s and the present in which we are living. None can be ignored. Our history, the story of the Somali-Italian minority starts during colonialism.

The colonial period, the decade of Italian Administration, life in Italy and the possible return to Somalia simply mark the segments of a *continuum*. The colonial past, about which the storytellers do not have direct experience, emerges as the origin of their minority group story. The decade of Italian Administration is situated in perfect continuity with Italian colonialism (1885–1941). The Italian Administration is described as a short-sighted, disorganised and rough power that substantially enacts the racist colonial legislation and reinforces the racist attitude.

¹⁶The Italian presence in Somalia during the decade 1950–1960 is of interest to only a handful of Italian researchers. In 1950, after the colonial era ended, Italy returned to Somalia with a UN mandate that established the Italian Trusteeship Administration of Somalia. Italy's new mission was to guide Somalia (the former colony!) to independence over a 10-year period. The agreement required the new administration to develop the colony's political institutions, expand the educational system, improve the economic infrastructure, and to give the indigenous people freedom of the press and the right to dissent.

What does it mean to be a Somali-Italian? It must seem an insignificant question to most people [...]. It is not. There are many categories in which we have been immersed: half-caste, half-breed, contaminated, different, shameful, sinful. All generated by colonialism and its racist narrative on the others. (G)

The life stories describe the Italian approach to the young Somali-Italians as a systematic organisation of identities and otherness aimed to hide or remove what was in the middle, between Italians and Somalis. Somali-Italians children were separated from their Somali mothers and the Somali social environment. They grew up in Catholic missions where they were compulsorily baptised and assigned of new names. They were educated in Italian schools. School and society were ambiguous and alienating sources of knowledge. On the one hand, Italian language, literature, history and geography represented the only cultural reference points and created a strong attachment to the Italian community. On the other, life outside the mission made clear the reality of a not-belonging (either to the Italian or to the Somali community).

It's difficult to spend your whole life in the middle with no chance of joining a group. There is always going to be someone to remind you that you aren't this... or that you are that. (G)

We speak Italian, speak it very well, while on the other hand we don't speak the language of our other self. I was whiter than the people around me in my day-to-day life, so I was automatically an outsider but, at the same time and especially in Italy, I was darker and once again was out of place. (L)

I grew up in Mogadishu, Somalia, in the 50s. My dad was white from Italy, and my mom was black from Somalia. Even the idea of us as a family was challenging to most people. But nature had its wicked way, and brown babies were born. But from about the age of five, I was aware that I didn't fit. I was the black kid with Muslim origins in the Catholic school run by nuns. I was an anomaly, and my self was rooting around for definition and trying to plug in. Because the self likes to fit, to belong. And it is important. It has an extremely important function. Without it, we literally can't interface with others. But my skin color wasn't right. My hair wasn't right. My history wasn't right. My self became defined by otherness, which meant that, in that social world, I didn't really exist. And I was "other" before being anything else – even before being a girl. I was a noticeable nobody. (A)

However, the process of enculturation does not preclude the development of a self-definition. The need to define oneself appears in every life story as a statement of belonging, but also a complex representation of the self that embraces history, memories, languages, cultures, physical and emotional places. The life stories are the place in which storytellers describe their personal feeling of being "different Italians" (R), and explain their otherness as a multiplicity of identities. There is someone who draws for himself a new concept of "Italian"; who defines himself as a "bicultural and cosmopolitan" person; who claims for herself a historical and collective Somali-Italian identity ((A) says "I am, we are Somali-Italians, that is a specific historical identity"); who, not finding any possible synthesis, presents herself as "an Italian with Somali origins, born in Somalia... but also 'meticcias'" (L).

We can discover that within those we usually consider *different-from-us* there are "different Italians", perfect native informants, capable of presenting the experience of the outsider with the language of the insider, and vice versa. They choose to

address their complex origin, identity, and language emphasizing issues of resistance and in-betweenness, testifying to and embracing the poetics of relations, multiplicity, ambivalence, and subversion of a dominant narrative. New forms of belonging can emerge with force from the life stories raising new questions about the usual understanding in regard to identity and otherness. Diversity between and within groups challenges reification and pre-assumptions, and it engages the discourse of the complexity of identity. New self-definitions force us to re-chart concepts of identity and otherness, moving from a geographically based criterion to melt definitions: where otherness can also find a place within us. The so-called “hyphenated identity” (Ponzanesi 2004) is not a simple duality, is not a link created by the migration to a new country. Making sense of past colonial legacies is important when this process is linked to the recent debate on Italian identity. The Somali-Italians bring to the surface the paradoxes that are implicit in the common notion of what a foreigner or a citizen should be. They force us to rethink the national identity as a composite one – before and beyond any monolithic national identity.

Minor stories, or stories of minorities, write new paragraphs on our national narratives on “us”. They also reveal the special relationship that a country builds with its past, what fits and what remains excluded in the construction of a national history.

64.17 From Difference to Diversities: A Dialogical and Transformative Path

A Brazilian educator and philosopher, a leading advocate of the critical pedagogy movement, Paulo Freire is best known for his influential work, *Pedagogy of the Oppressed* (1968), which may be best read as an extension of, or reply to, Frantz Fanon’s *The Wretched of the Earth* (1961). Freire began to embrace a non-orthodox form of what could be considered adult education speaking about the development of a critical consciousness, a process by which men and women would deal critically with reality and discover how to participate in the transformation of their world. I see in Freire’s process of consciousness an inspiration, a sort of direction for our disciplines. Using an ethnographic approach to diversity as a reflexive and critical movement allows us to understand limits and possible openings of what we already know or we think we know. The recognition of the social, cultural, and political context in which we are immersed is just the first step. “Consciousness” implies a critical movement, a process of transformation of a reality, a belief (Freire 1971). The goal is to gain a critical and dialogical consciousness able to unveil, demythologise or de-naturalise beliefs taken-for-granted. As Freire would have said: freedom from any form of oppression.

The contributions here presented draw a landscape in which ethnographic research allows access to a critical and transformative knowledge for our disciplines. It enriches our vocabulary on identity, and recognises and intensifies our engagement in the universe of diversity. It is not only the irruption of the Other that

represents one of the greatest invitations to review our knowledge. It is the discovery of how we act in relation to that Other that can put in motion reflective processes that enrich that knowledge.

In her TED Talk the writer Chimamanda Ngozi Adichie explains what she calls “the danger of the single story”.

Start the story with the arrows of the Native Americans, and not with the arrival of the British, and you have an entirely different story. Start the story with the failure of the African state, and not with the colonial creation of the African state, and you have an entirely different story.

The single story creates stereotypical narratives, and the problem with stereotypical narratives is not that they are untrue, but that they are incomplete. The consequence of the single story is that it makes one story become the only story. One knowledge becomes the only knowledge. Freire (1971) wrote that the dialogue between narratives is the fundamental condition for the real humanization of knowledge. Any ‘non dialogical’ knowledge leads to different forms of construction of the otherness. And when knowledge becomes ‘anti-dialogical’ it legitimates the reification, the conquest and the domination of the Other. Stories matter. Many stories matter. Stories have been used to dispossess and to malign, but stories can also be used to humanize and to write a dialogical history. Stories can break the dignity of a people, but stories can also repair that broken dignity. Stories demystify. Some stories are a counter-history. Some stories are simply an attempt to bring out the heterogeneity where we usually see homogeneity (Sartore 2014b).

The ethnographic research here presented is guided by and proposes an educational approach that raises objections to the categories we use to describe the world. In other words, we can define this transformative process as an exercise of decentralization, through which we move out from our cultural, historical and scientific beliefs and the first result (or maybe one of the first) is to broaden the understanding of the general concept of culture, identity and difference (Gobbo 2008).

Chapter 65

Bringing Up the Babies: Men Educators in the Municipal Nursery Schools of an Italian Town

Francesca Gobbo

To Aylan and to all the children who lost their life while trying to have a life.

65.1 Introduction

When, some years ago, I was invited to write a chapter for the first edition of the *International Handbook of Urban Education* (Gobbo 2007), I introduced my ethnographic research among the Veneto (Italy) travelling attractionists with the insightful reflections of one of them. Her words about her occupational group's relation to local towns led me to balance the denotative meaning of "urban" (that which pertains to the spatial layout of a town or city, from the Latin *urbs*, cfr. Onions 1966; Devoto 1968) with the connotatives "urbane" and "urbanity" (*idem*), that well interpreted how those people constructed their occupational identity and developed interactions with their sedentary co-citizens (Gobbo 2007), though such social know-how of theirs hardly produced any effective intervention on their children's right to education (Gobbo 2015, 2017, forthcoming). My decision did not question that urban education, as a field of study, is characterized by concern for and engagement with social problems, since research among immigrants and minorities such as the Roma that I encouraged and supported (Gobbo 2012), had confirmed how urban schools often exclude on the basis of a "public policy" and/or of a culture that "make it difficult for students to use education to alter their life chances" (Noblit and 2007: xi), or even complete their schooling, as in the case of the attractionists. On the contrary, in studying attractionist families and the schooling vicissitudes of

F. Gobbo (✉)

e-mail: francesca.gobbo@unito.it

their children I aimed to connect the concern for social justice and inclusion that in the last 25 years has particularly regarded school careers and prospects of immigrants' children and youth (Gobbo 2000; Galloni and Ricucci 2010; Gobbo and Ricucci 2010; Gobbo et al. 2009). With their cyclically interrupted school attendance and the lack of ad hoc educational provisions, the limited learning of mobile pupils and students could certainly be defined as one of the "multiple forms of urban education" (Noblit and Pink 2007, p. xix), though I have always problematized it as a meaningful case of/for intercultural education. Furthermore, the fieldwork findings allowed me to supplement the "localizing endeavor placing education into a specific geographic context" by underlining the *participation* – albeit largely unrecognized – of mobile families to the urban culture and the "mirror image" of cities (Noblit and Pink 2007, p. xv) that resulted from non formal learning processes they had by necessity undergone. In being both a central democratic value and an important socio-political goal pursued by democratic societies, I suggest that *participation* underlines a different, yet strictly intertwined, element of the urban dimension, namely that of *civitas*: "the condition, the collectivity of city/town dwellers" (Onions 1966; Devoto 1968).¹

From this point of view, my research focus on the institution of the nursery school, and particularly on the men educators² of Hilltown³ nursery schools, aims, on the one hand, to highlight *civillcivic* value and meaning of an institution a child accesses because he/she is considered not only as a member of a family, but "as a citizen belonging to a society, entitled to rights that neither descend from his/her parents nor from their position in the labour market. Access to certain services should be considered one of those 'rights', and among such services there is one that

¹In this sense, urban education deals with what (poverty, prejudice, racism, social exclusion, among others) prevents people from being full members of a collectivity and what (active initiatives, ad hoc policies and project, etc.) will instead reinstate their membership by recognizing and realizing their rights. Since *civitas* cannot but evoke its connection with civilization, I hasten to declare my awareness of how civilizations have too often been built on violence on, and subjugation of people.

²In Italian departments of education, those who will be responsible for educational and care work that is not carried out in classrooms and does not imply formal teaching are defined as educators (for a critical and well documented approach to this educational figure within Continental Europe and the Anglophone world's relative unfamiliarity with it, see Cameron and Moss 2011). I need to add that the Italian literature on nursery school I consulted has two ways of presenting nursery school educators: because in Italian language nouns can (with some exceptions) be differentiated by gender, any time an author writes of "educators" in general terms (for instance, when presenting an educational perspective or theory), the masculine is used (*l'educatore, gli educatori*) according to the understanding that the choice of the masculine does not refer to actual men, but is rather characterized by a neutral or abstract undertone. It is in fact rare to read *l'educatrice* when the discourse does not concern a specific case or context (the exception I found is Catarsi 2008). On the contrary, when an author writes about a certain nursery school (or a number of them) and what takes place there in terms of educational practices, problems, initiatives, debates, we read of *l'educatrice, le educatrici*, because the linguistic (unavoidable) choice respects the fact that in those cases most educators are women.

³Hilltown is a fictional name that I chose to protect the privacy of those working in its educational institutions.

I would define as ‘institution for early childhood’” (Moss 2004, p. 8).⁴ On the other hand, it explores an aspect relevant to the concept and enactment of democratic participation, namely men’s potential for the care and education of very young children and the different ways and occasions it was realized by the (not surprisingly) limited number of men in Hilltown nursery schools.⁵

An in-service training seminar on cultural diversities and intercultural education, that had been organized by Hilltown educational services, provided me with the serendipitous opportunity to explore and hopefully understand the lived experience of gender diversity in those contexts, by learning from each man’s narrative how he had chosen (or had come across the possibility) to work with babies and toddlers, and how each of them had constructed a recognizable personal and professional identity in interaction with their social life and choices, and the specific working environment, whose socio-political and cultural specificities must firstly be concisely introduced.

65.2 The Nursery School as “Public Service”

It was 1971 when, 3 years after legislating on the *scuola materna* (now *scuola dell’infanzia*, childhood school), the Italian Parliament voted a law that, while reformulating the aims of, and the responsibilities for early childhood education, underlined how the path towards a future meaningful civic participation requires the recognition of families’ and children’s rights, as well as the rights of those in charge of childcare (cfr. Mantovani, 1976). Law 1044/1971⁶ thus intersected a new concern for families and children with the political relevance that the social and gendered dimension had gained after 1968⁷: with regard to this aspect, it acknowledged the

⁴Peter Moss’ stance is in accord with international law that considers a child as an autonomous individual person. However, doing ethnographic research in Padua (Italy) nursery schools, I could appreciate how the rights of children were seen by educators and policymakers (not to speak of cooks, since I was specifically focusing on meal time) in balance with the rights of parents to educate their sons and daughters according to the family philosophical or religious beliefs. With regard to the latter, see Council of Europe (2014), *Signposts – policy and practice for teaching about religions and non religious world views in intercultural education*, Council of Europe, Strasbourg, with particular regard to ch. 8, pp. 77–86. See also the *Convention on the Rights of the Child* <http://www.ohchr.org>. The Italian Constitution distinguishes between “juridical capacity” (*capacità giuridica*) and “acting capacity” (*capacità di agire*): the latter refers to those who, like minors, are not able to exercise their rights and require others – such as parents for the children – who do so in their name. Cfr. Ambrosini 2004.

⁵The personal and professional trajectories of nursery school men educators will be illustrated and interpreted through the narratives I collected from them between 2014 and 2015, and from the informal observations of the nursery schools where they work.

⁶See http://www.edscuola.it/archivio/norme/leggi/11044_71.html.

⁷I am old enough to remember when, in 1970, in the United States, a new front was opened up by the women’s movement, after the students’ and minorities’ movements of the end of the 1960s had succeeded in their demand that ethnic diversity be recognized and valorized, as well as that

right of women to a job and career opportunities, on the one hand, and, on the other, that of men to challenge the prejudice that assigned, if not assimilated, childcare to mother's care, by choosing to work as nursery school educators.⁸

Law 1044/1971 stated that municipal nursery schools would be established *with the support of the State* and that "assistance to children up to 3 years of age within the framework of family politics is a social service of public interest".⁹ In other words, those nursery schools would provide "temporary" custody and care of children "so as to ensure an adequate assistance to families and *facilitate women's access to work within a framework of an overall system of social security*".¹⁰ To achieve those goals, between 1972 and 1976 the State was to assign "special funds" to the Italian Regions,¹¹ that in turn would transfer such contributions to municipalities and their local governments in order for them to build new nursery schools or restore existing childcare institutions.¹²

American society be acknowledged as multicultural. Not unlike the minority citizens, women electrified the social and political debate by demanding recognition of gender cultural specificity and arguing vigorously against what they defined as the outdated goal of female emancipation. Such cultural and political stance did not take long to cross the Atlantic ocean and come to Europe and to Italy.

⁸Ragazzini (2011, p. 86, my emphasis) indicts the "social conditioning" of professional roles and identities as "the main barrier" to "the *emancipation* of men in contexts where women have a dominant role", where the word "emancipation" produces an unexpected second-wave feminist effect (cfr. Van Laere et al. 2014; emphasis mine) that is partially counterbalanced by the consideration that immediately follows, namely "the same is also valid for the *integration* of women in contexts where men have always occupied position of prestige" (*idem*, emphasis mine).

⁹The emphasis is mine.

¹⁰The emphasis is mine.

¹¹The law further stated that Regions had to

- "establish the general criteria for construction, management and supervision of the nursery schools", through their own legislative acts, and see that nursery schools would
- "respond to the needs of families concerning [nursery schools'] location and functioning",
- "be managed with the participation of families and representatives of recognized local social organizations",
- "have enough qualified personnel, able to guarantee health and socio-educational assistance to children", and finally
- "implement technical, construction and organizational requirements for attaining the harmonious development of the children".

¹²For a long time, the Italian State had delegated childhood care and assistance to philanthropists who understandably gave help to the poorest children. The first public intervention – O.N.M.I., the acronym of the *Opera Nazionale Maternità e Infanzia* (National Charity for Maternity and Childhood) – took place in 1925 (3 years after Mussolini took power) and aimed to promote and support both families and the birth rate according to the then prevailing "mystique of motherhood". To this purpose, the Fascist ideology depicted women's destiny as delimited by the boundaries of the home. Needy and deserted mothers benefitted from the services of O.N.M.I. nursery schools, but child care was also organized in factories with more than 50 women as employees. The O.N.M.I. nursery schools had the task of providing children with assistance and health care more than with educational activities (Catarsi 2008). In 1971, most of the non-religious child care institutions still belonged to O.N.M.I..

The educational and social relevance of that legislative step was certainly related to the improved economic condition of Italian families (the consequence of the so called post-war “Italian miracle”), the transformation of the family structure from patriarchal to nuclear,¹³ and the increasing job opportunities for women,¹⁴ all of which fueled the demand for a different approach to childhood care and education that the women’s movement strongly supported (Catarsi 2008; Catarsi and Fortunati 2004).

Though the limits of law 1044/1971 with regard to the *educational* commitment of the institution “nursery school” were soon pointed out (see for instance Frabboni 1985; Bondioli and Mantovani 1987), it was (and still is) considered innovative because “it recognizes the value of motherhood and therefore the right of *all mothers – whether they worked or not* – to benefit from nursery schools. It further establishes that the State has the duty to intervene and organize social service of public interest” (Catarsi 2008, p. 8, my emphasis). In fact, State intervention means that municipalities are held responsible for the establishment, organization and management of nursery schools so that, from the beginning, the *local* social contexts as well as the *locally* enacted educational approaches took on a primary relevance. From a perspective that valorizes the social dimension, parent’s and political forces’ participation and involvement in the life of nursery and childhood schools – the so called “social management”¹⁵ – are interpreted as an effective and positive contribution to the wider process of decentralization and democratization of the State. Nevertheless, the emphasis on “democratic control”, but especially the still prevailing concerns for “assistance” and “custody” of children over education, made researchers and educators aware that the “educational potential” of the nursery school could be “jeopardized” (Catarsi 2004a, p. 25), and prodded them to firmly engage in transforming those traditional concerns in an educational discourse and practice that had *children*, with their unforeseen¹⁶ psychological and social potentials, at the center of

¹³At the beginning of the 1970s, there was the last massive migration from Southern Italy and countryside areas to the regions of the so called “industrial triangle” (the Northern regions of Piedmont, Lombardy, Liguria). People moved seeking better life conditions or in consequence of the 1968 earthquake that had ravaged vast areas of Sicily. The rise of urban population in the Northern cities and towns inevitably entailed greater needs for, and demand of social services.

¹⁴The 1970s, as Catarsi (2004a) points out, had been a decade of great social changes, when the Italian parliament legislated on divorce (1970), protection of motherhood and paid maternity leave (1971), family rights and spouses’ equality (1975), work equality and women’s access to jobs up to that time reserved for men (1977), abortion (1978). Three years earlier, as I mentioned, childhood schools for children between 3 and 6 years of age had been instituted by the Italian Parliament with law 444/1968.

¹⁵On this point see Zaninelli 2010; Catarsi 2004b, among others.

¹⁶The effort of Italian researchers and educators to combine forms of educational planning with the unpredictability of children’s potentials and uncertainty of pedagogical practices seem to anticipate the debate on the education and care “divide” (Van Laere et al. 2012), where a holistic viewpoint is argued and supported against the drive for “schoolification” of early childhood education and care (ECEC). In referring other researchers’ critical stance, these three authors stress how “working and dialoguing with children, families and local communities from diverse backgrounds are uncertain, value-bound practices which go beyond applying prescribed teaching methods”, and

both academic investigation and of nursery school personnel's pedagogy¹⁷ (cfr. Mantovani and Musatti 1983; Bondioli and Mantovani 1987; Mantovani and Calidoni 2008; Mantovani et al. 2003, among others). If, with time, it became clear that the nursery school as "public service" had been instituted "without an educational tradition to refer to, and heavily conditioned by ideological prejudices both by those opposing it and by those supporting it", as well as by the "current inability to make knowledge and practice dialectically interact" (Bondioli and Mantovani 1987 p. 7), such critical remarks were convincingly mitigated by the acknowledgement that since 1971 "a culture of early childhood has grown" (ibidem), and that a "strong connection ... between childhood education services and the elaboration and dissemination of a thoughtful perspective on children's competencies and potentials" had been successfully promoted, as it was later underlined (Fortunati 2004, p. 47). Furthermore, the recognition that the personnel's *educational* formation was urgently required in order to provide educators with effective professional competence and identity, found a first, effective answer in the *localized* character of the nursery school: the latter gave educators the opportunity to take, and test, educational initiatives, learn about projects carried out in nursery schools other than their own, and share and compare participatory experiences and pedagogy. Such institutional condition might produce what was defined as "empirical eclecticism" – favored by the diffusion of a neo-liberal orientation in economy, politics and society (Frabboni 1985)¹⁸ -, but it also engendered the *Gruppo nazionale di lavoro e studio sugli asili nido* (National group for work and research in nursery schools) that in 1980 was founded by Loris Malaguzzi in Reggio Emilia. Thanks to his leadership and to the many creative educators who disseminated their educational work and goals through the journal *Bambini* (Children), and at the *Gruppo's* annual meetings, both became important opportunities to present and exchange experiences and research findings, and to further elaborate a specific educational perspective for early childhood institutions whose educational quality has become nationally and internationally known.

As it was pointed out (Bondioli and Mantovani 1987), the fact that nursery schools began to be viewed as places where care interacts with education prodded researchers and educators to start new investigation paths and learn about children's everyday life and development, envisage trajectories of professional competence, and critically reflect on the quality of education and service offered. Furthermore, the recognition that, in being cared for, babies and toddlers experience learning and communicative processes – provided by educators and by an appropriately orga-

propose a normative conceptualization based "on a *broad and integrated understanding of care, well-being, learning and pedagogy which values reciprocal relationship and an element of not-knowing*" (Van Laere et al. 2012, p. 528; emphasis in the original).

¹⁷ Here and in other passages I use the term pedagogy according to its English use and meaning. In Italian the word would be education, as pedagogy (*pedagogia*) indicates the theoretical elaboration of the educational action.

¹⁸ For further documentation and critical reflections on different questions, problems, solutions concerning the contemporary institution of the nursery school see Zaninelli (2010) and (Catarsi 2004b).

nized environment – suggests a fruitful reinterpretation of their role and goals: she/he is seen as a “mediator” who ensures that children have “time and room to explore and learn” (Catarsi 2008, p. 21), is aware of how learning and caring are “deeply intertwined with one another” (idem, p. 25) and gives so young children the indispensable emotional, cultural and learning continuity they need through an educational planning that respects – indeed is responsible for the realization of – the positively “unpredictable”¹⁹ potentials of children (cfr. Mantovani and Musatti 1983; Bondioli and Mantovani 1987; Mantovani and Calidoni 2008; Catarsi and Fortunati 2004; Mantovani et al. 2003, among others). Furthermore – argued those in favor of planning – the latter would highlight the educational responsibilities of educators alongside caring, and establish parents as interlocutors and collaborators with whom to discuss expectations and goals, and make choices.

65.3 Gender and Professionalism in Childhood Care and Education

The relationship between nursery schools and the children’s families is not only central to the institution’s approaches and practices, but it also differently underlines the relevance of local contexts and cultures: the “relational pedagogy” enacted by nursery school educators promotes the “combined engagement between children and their carers” as well as the “mutual exchange between the different contexts in which children grow up” (Fortunati 2004, p. 55). As Catarsi notices, nursery school educators “gradually understood how parents’ participation could improve [the educators’] relationship with children” (2008, p. 17), and although mothers remain the privileged interlocutors of nursery school personnel – especially during the process of babies’ integration in the nursery school²⁰ – various occasions have regularly been promoted to also involve fathers in care work, as well as to invite both parents (and women educators as well, see Gallerani et al. 2014) to critically consider the assumption that women are the “natural” providers of care and assistance, and whose competencies are supported by their gender.

In *Bambini*, gender and men working as childhood educators are treated in a limited way and, perhaps not surprisingly, mostly by European researchers (Moss 2004; Peeters 2005; Ndjapou 2009),²¹ while the other authoritative journal – *Infanzia* (Childhood) – has published a number of articles especially on the theme of gender

¹⁹ See footnote 16.

²⁰ Depending on the municipal regulations, babies as young as 3 months can be “integrated” (*inseriti*) in a nursery school and during what is informally called “time for integration” (*periodo di inserimento*) the mother is at the side of her son or daughter until he/she feels at home and trusts the educator. In Hilltown such process is defined as “setting-in” (informally, *periodo di ambientamento*).

²¹ With regard to this issue, see Peeters (2007), Vandenbroeck and Peeters (2008), Van Laere et al. (2012, 2014), and Peeters et al. (2015).

education. In 2010, Malavasi recognized that “the theme of the male figure in childhood services is a question that has interrogated us for years both with regard to the specificity, the meaning and the opportunities such presence has in education, and because – until today, at least – the issue of the blue quotas²² remains of absolutely minimal relevance, in terms of numbers, if it is compared with what takes place in other European countries” (2010, p. 11). Furthermore, the author had also to acknowledge the lack of a serious, in depth debate about the role of men in childhood education, as well as the failure of the services to produce a “pluralistic” educational perspective. In an effort to understand the reasons for such lack of attention, Malavasi asked five men educators²³ why they chose to work in nursery schools. As was perhaps expected, each man gave different explanations for his “choice” that had in fact been more the consequence of an unplanned opportunity than of a reflective decision. And even when the latter had been spurred by an interest for teaching or social work, this would not have necessarily been in the field of childhood education. However, all the educators testified how such option had proved to be a satisfactory one, since it afforded the opportunity to find one’s own way to relate to children and the institution of the nursery school, or to enact one’s “professional creativity” (*posso metterci del mio*, I can contribute with something of my own), or to affirm one’s own professional identity, and to construct specific competencies. In conclusion – Malavasi recognizes – “there is a long way to go”, because the assumed “naturalness” of women’s care “paralyzed” interventions about men’s role and function in the nursery school,²⁴ and therefore it is most urgent “to deconstruct stereotypes and pre-established imagery as a strategy to modify how [both women and men educators] realize a professional style and participation to educational processes” (idem, p. 12). The deconstruction of the myths of the man as the “breadwinner” and of the woman as the “natural carer”²⁵ is also dealt with by another article, whose subtitle – “a missing professional figure” – underlines the limited attraction that nursery school care work has for men (Ragazzini 2011), and the role stereotyped expectations have in deterring their potential “to complete and enrich the care work done by women in so many years” (idem, p. 88),²⁶ as well as to valorize fathers’ presence and involvement in the nursery school. In exploring why fathers

²²The expression “blue quotas” obviously refers to men through the color (blue) traditionally assigned to baby boys. Baby girls have traditionally been assigned the color pink, therefore in Italy we speak of “pink quotas” when new, or more openings for women in social, economic and political positions are debated and demanded.

²³They work in nursery schools coordinated and managed by the cooperative association Malavasi is a member of.

²⁴Burgess (2012) also shares Malavasi’s concern and interpretation.

²⁵According to Catarsi (2008), the limited attention to the nursery school educators’ formation and specific competencies could depend on the fact that for a long time they have been likened – if not assimilated – to the mother’s figure.

²⁶A critical reflection about the increase of men in German educational services questions whether a greater involvement of men in those contexts might not paradoxically result in bringing back the issue of gender “to the so called ‘natural differences’ and impose a more stereotyped behavior of men and women, boy and girls?” (Rohrmann 2012, p. 11).

and men educators are still marginalized, and why gender stereotypes still prevail,²⁷ the answers Ragazzini received from women and men educators are interesting, though they seem to confirm a still essentialized view of gender.²⁸ Thus, for example, a woman educator worried that “the absence of a male model might produce a form of [figurative] flattening, of homogenization of the educational style that is increasingly closer to the maternal role” (idem, p. 92), while a man educator concluded how “we [women and men] balance each other, we men are better at stimulating and promoting [children’s] playing activities, but this does not mean that we must do only that”, and another underlined how children like men educators because they can “perceive the richness of diversity; they enjoy the possibility of dealing with someone who breaks the female homogenisation in the services” (ibidem). As for men in care work, they “have yet to prove they can do it better than women”, a point confirmed by a man colleague who remembered how, at the beginning, “the time for a baby’s change was simply taboo. I could not do it! My strong personality and self-assurance [eventually] broke the spell; the third day I explicitly asked ‘Would you at last let me clean the baby!?’” (idem, p. 93). Not unlike women accessing men’s careers, in the nursery school (the few) men educators must show that they are up to the task, and that they succeeded in constructing a work identity that rests on a solid professionalism (ibidem).

At the European level the debate on early childhood care and education started in the 1980s, thus testifying of an early Europeanization of the issue and concern for social justice. Peeters (2007) retraces the history of men’s involvement in early childhood education since the mid-1980s, when “the European Union started the first Gender Equality programme in order to give women equal opportunities on the labour market. Inside the EU Gender Equality Program, the European Commission set up a Network on Childcare and other measures to reconcile Employment and Family Responsibilities in 1986” (idem, p. 1). If those early provisions were meant to answer women’s right to work and childcare (just as law 1044/1971 had aimed to do for Italian women and families), soon the relevance of male figures in childcare was taken in due consideration, and in 1993 the Council of Ministers of the European Community issued recommendations for increased participation of men in childcare. At the beginning, the goal of promoting participation of men as carers addressed fathers, but Peeters reminds his readers how it was soon realized that the

²⁷ Interestingly, articles on gender education acknowledge the changes obtaining in society and the family with regard to gender roles and responsibilities, but at the same time they underline how current ideas of masculinity and femininity too often follow traditional or stereotyped categorizations, on the one hand, and on the other they point out the prevailing belief, in the family and in school, that education should be “neutral”. Thus, “gender education is mainly carried out through forms of unthinking practice” (Trufarelli 2013, p. 341) and gender “neutrality” acts as a “veil” that hides the persisting gender hierarchy (idem). See also Ghighi 2009a, b; Rossi 2009. A comprehensive presentation of the topic is in Gamberi, Di Maio, Selmi, *Educare al genere*, Carocci, Roma, 2003.

²⁸ It seems to me that Malavasi’s argument also succumbs to essentialization when she stresses the need for “many more male teachers as ‘ambassadors’ of a further, new, possible, educational model” (2010, p. 13).

recommendations would have little effect unless in nursery schools and kindergartens men were employed as childcare workers so that they could be role models for the children, while childcare centers, in turn, “could play an important role as places where a new culture of childcare could be created: a culture in which there is a place for men” (idem, p. 2), that could benefit children’s development and gender socialization.²⁹

Since in the early 1990s only few men worked in the childcare sector, at the European level the decision was taken to “drastically” increase their number: ad hoc campaigns were launched, projects funded, and researchers argued that childcare quality was related to the presence of men educators in childhood institutions. However if the total number of men in childcare increased (especially in Denmark and in the Nordic countries, underlines Peeters³⁰), proportionally their number did not rise and the target (20 % of childcare workforce for 2006) was not reached. The repeatedly asked question was, and is, why so few men get involved in childcare and education, while women continue to be overrepresented. A first answer focused on pay and working conditions, as well as on perceptions of status and masculinity in childcare, though a higher level of professionalism and salaries did not seem to attract more men to childcare. A second answer emphasized how the latter is consistently interpreted, and presented, as “women’s work” that tends to reproduce itself, making the maternal model hardly meaningful to men and their male identity. An educational perspective founded on “gender identity” would favor seeing childcare centers as based on multiple identity of the carers, whereby “each separate identity must continually be called into question and be made visible through dialogue and debate” (idem, p. 4). As men behave differently than women, their presence and educational manners question the traditional culture of care in childcare centers where the risk is (especially when there is only one man educator) that he be seen “as representing ‘men’ as a category” and expected “simultaneously to represent and challenge traditional masculinity” (idem, p. 5). Thus, in Peeters’ view, childcare – as a “gender segregated profession” – needs effective policy actions, mostly in the area of training, qualification and pay, as well as greater attention to career education and guidance, to avoid that care be a second-chance work choice, as researchers often observe.

The issue of “gender segregation” in caring professions – believed to be linked to low status profession – is critically examined with regard to the investment in professionalism by European policymakers and institutions, in order to understand why it has not succeeded in attracting more men to childcare and education (Vandenbroeck and Peeters 2008). Such lack of success not only deprives fathers and children of role models other than the maternal one, but cannot answer the growing demand in the caring professions “if recruitment is limited to women only” (idem, p. 704). The two authors suggest that the “bourgeois, patriarchal model of the family” historically favored the recruitment of lower class women for the care of children, whose role was modeled after the stereotype of the “ideal mother”. The

²⁹On this point, see Rubio’s presentation of the special issue of *Bambini in Europa*, 2012.

³⁰For an update on the Nordic countries, and Norway in particular, see Askland 2012.

latter persisted not only thanks to the popularity of post World War II “attachment psychology”, but also, and paradoxically, to “the feminist movement of the 1970s [that] intensified the image of child care as a female issue” (idem, p. 705). When the mother represents the ideal, the result cannot but be gender segregation, reproduction of the female workforce, and prevention of men in joining the caring profession. Quoting relevant research, Vandebroek and Peeters point out how there are fewer men “seeking” to work as carers than “finders” and “settlers”, namely those who come to work in a traditional female job after having tried other sectors. And while the authors report the number of different initiatives, projects and policies aimed to promote a greater participation of men to childcare through the realization of “a gender-neutral concept of professionalism”, they also underline the need for more research on how “the gendered culture of the profession is transmitted through overt and covert curricula and how this may affect [the students]” (idem, p. 707). The authors’ own study of textbooks in childcare and of secondary school and adult education students report how boys and men asserted their different approach to children from that of the women colleagues, on the one hand, and, on the other, complained about the gender-specific content of curricula, the gender stereotypes and the “sexist hidden curriculum” conveyed by textbooks, all contributing “to the general feeling that care is a female work” (idem, p. 710). On their part, men pointed out how, at work, they were treated differently, and were “assigned different and stereotypical tasks ... such as outdoor play, construction play and creative activities” (ibidem). Vandebroek and Peeters conclude that notwithstanding the public emphasis and investment on professionalism, men continue to keep themselves at distance from care work and that – with specific regard to the Flanders – “there is an urgent need to revisit the curriculum and introduce variations, including music and sports” as well as to screen and revise the current textbooks, where “an overt and covert hegemonic femininity of the profession” persists (idem, p. 713). Citing the successful initiatives carried out in other European nation states, the authors stress how “persistent, long-term strategies are needed” (idem, p. 713) that should aim not only at men and boys in caring work, but also at “women in the care workforce, teachers in early childhood education, school advisory offices and labour offices” (ibidem). Thus, when childhood care and education is dealt with from the perspective of gender, the latter questions not only the stereotyped views of professional practice, but especially a narrow notion of education whereby early schoolification is supported at the expense of care. On their part, those researchers who are in favor of a holistic approach to childhood care and education underline how the pursuit of “learning [of babies and toddlers] requires a caring attitude”, as they argue that care “goes beyond a physical dimension and encompasses an emotional, societal and political dimension. In this context, *it [care] is seen as an important element of both democratic practice and citizenship*” (Van Laere et al. 2012, pp. 537, 536; emphasis mine). In my view, this educational *and* political stance leads these researchers to articulate the discourses on gender and care in terms of “gender inequalities” and “gender equality”, and to aim at challenging the “gender order” in childhood care and education (cfr. Van Laere et al. 2014), on the one hand, and, on the other, at developing “a gender-conscious understanding of professionalism that goes beyond

traditional gendered notions” (Peeters et al. 2015, p. 9) as well as the awareness that “care, referring to love, tactility and bodily emissions, takes us back to forgotten issues of *children who are being and becoming citizens*” (idem, p. 8; emphasis mine).

65.4 Hilltown Nursery Schools’ Men Educators and Their Narratives³¹

As a researcher in intercultural education and particularly interested in how encounters with diversity contribute to the construction of identities, between 2014 and 2015 I decided to ask the men educators in Hilltown nursery schools to narrate how they achieved that position, how they lived such working and cultural experience, and how it connected with their personal prior and present life choices and their identity construction. The methodology was that of the narrative language: as in previous occasions, I chose to explore and interpret the stories through the “narrative language” (Scheffler 1991), namely by addressing “the activities and feelings of people” and gaining “access to the way those people understand themselves” (idem: 121), by listening to them as they speak in their own voice (cfr. Gobbo 2004, 2010, 2014). Therefore I asked Riccardo, Edoardo, Francesco, Renato, Matteo and Paolo³² if they could step into the role of narrators and tell me about their choices and experiences in “the form of a story told in the first person” that is “not only narrated in a chronological sequence but also – and particularly – ... is structured by the narrator’s intention”. Such methodological choice is qualified by the recognition that “it is the narrator’s view of things that governs the story’s development, the narrator’s beliefs, desires, obstacles, and lacks that frame its dramatic movement, and the narrator’s vocabulary that shapes the episodes recounted and defines the current problem to be faced” (Scheffler: 121–122). For the purpose of this presentation, only the narratives’ passages concerning diversities, specificities and commonalities in these men’s professional careers and life experience will be pointed out, though I hasten to say that my decision does not aim to draw a homogeneous picture of this group of Italian men educators, as their stories will clearly indicate.³³

How did these men narrate their decision to become nursery school educators? Riccardo (64 at the time of the narrative, and retired since 2012) had *chosen* to successfully participate in the municipal competition for nursery school educators that had been held – as he recollected – in 1979. He described himself as a young man seriously involved in the non violence movement and an admirer of Gandhi and

³¹ I am deeply grateful to the educators for their generous availability and I wish to thank them for the time they devoted to narrate their life and work experiences to me.

³² Their names are fictional to protect their privacy.

³³ As will be learned from the men’s narratives, the specificity of those educators’ personal and professional trajectories cannot be exclusively attributed to their gender, since I am sure that similarly rich and vivid narratives could be collected from women educators.

Martin Luther King, among others. He had refused to do the military service and chosen instead to join the civil service, confiding that he could thus contribute to a new model of cultural and political development (“*it was the time – he recollected – when we wanted to change the world*”). Earlier on he had worked with deaf mute children and youth, for whose education and care he had attained a degree. Paolo (35 year old and the youngest of the group) had also long since decided to work in a nursery school, but he had to begin as a substitute educator and only later he achieved a tenured position. Edoardo (57 year old when I collected his narrative) in 1998 had entered two different municipal competitions: one for a position in the town social services (for the handicapped, psychiatric patients, etc.) and the other in the public nursery schools. He has been successful in both, but the office for early childhood education had summoned him first. Though happy for the call, he had been hesitant because his prior working experience had been in other kinds of social services: “*I knew nothing about babies and toddlers, but for the nursery school competition I figured I could use what I had learned in working with people cared by the social services*”. Francesco (49 year old at the time of the narrative) started to work in a nursery school because his girlfriend of the time had applied in his name for a position as “substitute educator”; later he suggested to Renato (46 year old last year) – his roommate – to do the same, and thus the latter soon started to work as a substitute educator in various nursery schools. Matteo (40 year old when I met him) had worked in a nursery school run by a local cooperative (upon the suggestion of his girlfriend). Later he participated in a municipal competition, and though unsuccessful, he subsequently received a phone call from the office for childhood education and was summoned to start working in one of the municipal nursery schools.

Among these Italian men, those who “*had given a try*” (as Matteo said) to work as nursery school educators underlined how their professional learning had largely taken place “in the field”, or “by doing it”, namely by either watching how the more experienced women educators went about with the children, or by asking directly how to care for the children’s needs. This aspect has interesting *intercultural* implications, since for instance Riccardo and Francesco had established a dialogue with the older women assistants who until then were expected to assist children (according to the culture of *Opera Nazionale Maternità e Infanzia*, see footnote 12) rather than promote occasions for creative educational initiatives. Such dialogue was not always smooth, as Riccardo remembers: the older colleagues had imposed their “*institutional order*” to the nursery school and the children, and thus “*the toys were on the shelves, the children were given just a toy once a day. So what did I do? I took all the toys from the shelves and placed them on the floor. The other educator became very agitated since my initiative meant that later on all those toys had to be picked up and put back again on the shelves!*”. Riccardo did not stop there: he encouraged the older children to climb on the garden slide and slide down, while he would stand at the side ready to grab anyone who might fall off. Then, together with a younger woman educator, he gave way to “*the so called dirtying activities, that children are very fond of, because just give a child some soil, water, sand and you make him/her happy!*”. On the contrary, Francesco (who upon being summoned had

wondered “*what are nursery schools?*” and had had his training “*in the field*”) recognized he had learned “*very very much*” from the older women assistants since “*they knew a lot about children, what and how to clean a child, how to recognize if he/she was ill*”.

The differences in educational knowledge and practice seem to be characterized more by intergenerational and training diversity than by gender; at the beginning, the narrators did not mention it as an issue, though it soon appeared in all their narratives. First of all, regardless of the different circumstances that brought each of these men to become a nursery school educator, they all evoked the surprise their arrival raised: Riccardo remembered being perceived as “*the outsider, the man*” and as the one who would relate to children in a different way (as in fact happened), and he also added that at the beginning of every school year parents would seldom spontaneously entrust their children to him, unlike what happened to his women colleagues. He had interpreted such caution “*as if in order to trust me – [the man] educator – parents needed time to verify the relation I had established with their child*”. On his part, Edoardo recalled how parents had instead accepted his presence and how some of them had even appreciated that “*at last there are [educational] positions for men in nursery schools*”. According to him, a man educator reassures mothers because they do not perceive him as a rival or a competitor for the child’s affection. Francesco underlined how he raised “*curiosity*” (“*look, how strange, a man, a male!*”) and positive expectations such as “*at last a man! At last a young man!*”. Renato, a tall man who at the time of the narrative was (and I am sure he still is) sporting a pair of remarkable moustache, impressive sideburns and earring, did not elaborate on the impact his different outlook must have made on the nursery school world, but specified how “*I realize that mothers feel more confirmed in their role by me than by the other women educators who can be very critical of them*”. As for Matteo, he recollected how “*at the beginning, the fact that I was a man produced a few waves and surprise*”. However he made me notice that men in nursery schools are *not* few, but they are *not* noticed by researchers, probably because they occupy the position of “operators” (those who keep the classrooms and the nursery schools clean and in order). He wondered why there are so many of the latter, and so few men educators. Paolo too had been “*a good surprise for everyone there [at the nursery school]. ... The parents like that I work in this nursery school. And when we meet there is always someone who says ‘good, there is a man here!’ And one can see that the children like a man educator, so maybe we also need a male figure in the nursery schools*”.

Yet, in their narratives, all these men, *as educators*, seemed to assign little relevance to gender as a socio-political construct. Instead they all stressed professionalism, on the one hand, and, on the other, how working with babies and toddlers had made them aware of their physical and emotional differences. Thus Riccardo remembered that “*when I took one of them in my arms I realized how the way I did was different from that of a woman. When a woman holds a child in her arms, he/she feels ... enveloped in the softness of her breast. Instead when a man holds a child in his arms and hugs her/him, the child feels the pectoral muscle, sees a beard (as in my case), the smell of smoke if one smokes (I don’t – he hastened to specify) ... in*

other words, from the point of view of the body, of physicality, it is an experience of diversity that the child cannot but feel, cannot but go through”, and that is at the same time undergone by the man. In Edoardo’s view, “men are stronger than women and so even if they have reached middle age they can still sit on the floor with the children, or hold one in their arms”. Francesco, who had been a sports instructor, pointed out how “I always tried to find my own way, to pay lot of attention to my body language”. Later, the issue of the male body once more returned in Francesco’s narrative, when he spoke of the way he cares for the children and how he learned which were the best things to do: “I owe it a lot to the sports coaches I met at training courses. I learned a lot about the human body, and I realized that I always have to be aware of my strength, my voice, my body when I am in contact with a child. I pay absolute attention to how I get hold of a child, to her/his joints especially if she/he is a disabled child I have learned all this thanks to my sports experience and to the everyday practice in nursery schools. Children are minds but they are also bodies, and their body will tell you everything. [I wish to repeat how] my colleague and I pay a lot of attention to the language of the body, to what you researchers call metacommunication”. For Renato it was educationally important to learn “to be at their level, to play with them and relate to them at their level. ... If I stand here and the child is over there, he will see me in another dimension, but if I sit on the floor with him, if we look into each other’s eyes ... [then it is different!]”. Matteo, clad in his Latin American grab and looking ready to join a street demonstration, wondered: “I am not sure that gender is so important Are we men more physical? But so are some women colleagues. And then men are also different from each other”.

As for professionalism, everyone underlined that, regardless of the curiosity and enthusiasm a man-in-the-nursery school raises, they were there to do educational work: unquestionably, for Riccardo, “those working in nursery schools must be educators with specific roles and functions, rather than ‘playing mother’ to those children”, a view shared by Renato who pointed out how “children need to be independent, I am not their mother but their educator”. He further acknowledged that “at this early age the most important relation is with the mother”, consequently “an educator can be close to a child, but not more than that. I provide them with continuity and thus they trust me”. Matteo, who had been raised by a single mother and said he “always lived in the midst of women”, wondered if “maybe I chose this work to be a fatherly figure for the children”, but firmly concluded that “in the end, however, this is work, regardless of gender, and it is a demanding work as well”. Actually – he continued – “ours, mine, is a type of work where what counts is how an educator is, and what is his/her intellectual personal formation”, a point he made again by stressing that “men and women educators are professionals first of all. What is important is the educational approach. Let’s leave behind us any talk of gender differences and how they were solved”. In fact his narrative ended with him reaffirming that there are no differences between women and men: instead, “it is a matter of professionalism”. Paolo, in concluding his narrative, recognized the dynamic dimension of professionalism: “I have changed a lot, I am able to plan all there is to do, and if there is something that has to be done, I’ll do it”.

In their narratives, these educators offered their own *interpretation* of the professional role by highlighting the different multiple educational aims each of them pursues within the overall care and educational project of the public institution. Riccardo narrated himself as the professional person who “*accompanies*” the child along her/his development, and “*supports*” her/him when she/he must say good bye to her/his mother. He alleviated the pain of a child’s separation from mother by confirming “*morning after morning, week after week, month after month that mother will return*”. If very young children were a totally new experience to him at the beginning of his work (“*I felt like Gulliver in the land of Lilliput! All those tiny tables, tiny chairs, tiny beds!*”), he soon realized that not only the memories of his own childhood would come back to him when he saw a child cry at his/her mother’s leaving, but those memories helped him “*to put myself in the child’s shoes ... and reassure him/her that mother or father would come back in the afternoon*”. When his retirement was near, he wrote a few pages about his nursery school work experience, pointing out that whenever he had involved children in playing activities (such as painting, reading, masquerading, etc.) “*I had always listened to the emotions those activities elicited in my inner self*”; in caring for the children and their personal hygiene he had always made sure “*to be in eye contact with the baby, to ‘handle’ his/her body with respect and a delicate touch, to show attention and consideration for his/her physicality*”, an attitude he also maintained at lunch and break times, “*aware [as I was] that acceptance or refusal of food indicates the child’s will that has to be respected*”.³⁴ On his part, Edoardo stressed how “*our main goal is to make children – especially the three year olds – increasingly independent, for instance by involving them in the ‘educational lunch’, when they set and clean the tables, help themselves with the dishes, bring the water to the tables*”. In relation to his vision of the educators’ responsibility, he added that “*the main educational objectives are the same as when one works with adults: what is important is the relation one establishes with the persons, the effort to promote and support change*”. And “*with children [than with adults] there are more joyful moments and opportunities, there is real change, you see them grow!*”. Francesco pointed out that an educator “*must create a type of environment where the children can experience moving freely around, independently and safely*”. And then, in reminiscing his own childhood, he described the park near which his family lived, as “*the most beautiful place where a child can grow up, because my friends and I were always playing outside, in the open air, doing daring things ... I believe I learned to confront specific situations [in the nursery school] with a great peace of mind [owing to those past experiences]. ... Here one of our most important tasks is to prevent accidents from happening to the children, but when they do happen it’s better to keep cool so as not to alarm the child. An educator must remain clear headed ... [and my attitude] certainly owes a lot to my experience in sports*”. For Renato, who like others learned his role “*in the field*” and went on learning while working, “*to do a good job, an educator must feel empathy for the children, and be not too anxious*”. He held a very firm conviction: “*if an educator doesn’t like children, or is full of anxiety, better find*

³⁴On this particular point see also Gobbo, (2016).

another type of work ... [Because] if one stands aloof from the children, they will stay away from him, if one is too protective, he is not doing his job. ... When a child falls, what do you do? You try to understand what and how it happened, and make him understand why he fell. Often children cry more because of our worried reaction than because they are really hurt". Matteo pointed out that he introduced new ways of working with the toddlers, encouraging them to "experiment. They must be free to experiment with colors, for instance, what is important is the process, not just the product. I am not saying that rules are not necessary but freedom to experiment is very very important!". And Paolo emphasized how the educator's professional dimension implies "establishing a climate of trust from the very beginning. We are careful not to 'play mother' or 'father', because parents are one thing and educators another. Of course many of us are anxious about the well being of the children and we pay lots of attention that they don't hurt themselves".

One aspect related to caring for children's physical needs was brought up by Francesco whose narrative was the first one I collected, and became a question I asked all the others. As can be imagined, it had to do with how and what they felt while changing and cleaning babies and toddlers, in particular after poo. Francesco brought it up when, after having stressed how educators – be they women or men – must earn the children's trust, he pointed out to me how the latter is also achieved by the way one takes care of a child's body and needs: "I always tried to find my own way, to control my reaction to feces and bad smells. ... We educators [regardless of gender] are constantly focused on the child". Such focus had an unexpected consequence on him: "what happened as consequence of working in a nursery school was that my senses of taste and smell became increasingly finer. You might not believe it, but this is exactly what happened. They [the senses of taste and smell] are among my 'working tools', because I can detect if one of our children is not well from her/his smell, I even know it before the child makes you understand that she/he feels sick. It's thanks to the smell she/he has". He recognized that people feel embarrassed by unpleasant body odors, though – especially with babies – they are unvoidable events. On his part, Edoardo remembered that upon beginning his nursery school work he was helped by the fact that he had taken care of his baby son, and also that, "caring for the elderly is not very different than caring for babies". On the contrary, Renato admitted that "at the beginning it was difficult for me to touch a child, and it is not a matter of the educator's gender! It would be difficult for a woman educator as well. Then, whether you like it or not, you have to reckon with these tasks ... As for the smell, and cleaning a child, with time it becomes a natural thing to do, unless you must do it right after lunch. The child should not feel that I am keeping him/her, and his poo, at distance. I don't have to 'play mother' while I clean it, but I shouldn't either keep him/her at distance because of his/her bad smell. In fact one can even play at a 'what a stink!' game. Because we aim at the child's independence, we will urge him/her to sit on the potty. And after all, to change a child is not a particularly intimate moment, on the contrary it is more like a factory chain, I mean an educator changes between 10 and 20 diapers a day, our sense of smell familiarizes with certain odors. I have no taboos, I feel in synphony with the children also at the body level". When I asked him about his reaction to babies'

odors, Matteo laughed and specified that “*one has to move quickly when he detects the signal*” (as in fact I saw him doing). But he made me notice that besides unpleasant smells there are also the pleasant ones: some babies and toddlers are washed and “perfumed” more than others, and “*one recognizes children also from their nice smell. But in a nursery school smells are pervasive: both the unpleasant and the nice ones. Think of the good smell of food that is cooking! But we don’t talk much about it among colleagues. And then there is also the smell of tears, of fear ... when a child is afraid, or is not well, I recognize it not only from the facial expression but also from her/his different smell*”. Paolo did not dwell on this aspect in details, but instead underlined how “*cleaning and washing the children is indispensable, the children enjoy feeling clean and well cared for. I never had any problems nor the children had. I could say that we are all at ease*”. However he mentioned an educational project on the sense of smell he was quite proud of: “*children enjoyed smelling the different aromas we had placed in small glasses covered with a piece of paper where we had punched small holes. They were invited to smell, to look at, to touch what was inside the glasses*”.

In the end, how did these men elaborate their being men and educators, how did they connect their professional dimension with their prior different life experiences that none of them wished to play down or set aside, and to which they in fact gave due relevance in their narratives? Riccardo pointed out that though his main interest is (and was, when he was still a nursery school educator) in his private practice, unlike other colleagues who moved to primary or secondary schools as soon as a post was available, he instead “*had wanted to stay working in the nursery school*” of which he appreciated the fact that babies and toddlers “*if they like you, they like you. No mediation in the nursery school !*”. Edoardo, who had worked for 15 years with the elderly, the handicapped, the psychiatric patients, recognized that accepting to work as a nursery school educator “*was the right choice to make, I got along well and didn’t have any problem*” in switching to take care of children and in such different environments. The change took place smoothly: “*I was lucky, the first year I chose to work in a structure where parents took their children and stayed with them there for the afternoon. Because there were adults there, I felt their participation provided [me with] a sort of bridge between my previous working experience and the future one. I felt really at home and worked with the adults as well*”. Francesco,³⁵ notwithstanding his deep “*involvement*” in the humanities in which he graduated, soon came to realize that he liked working with little children, regardless of his initial ignorance about nursery schools, and though he “*could not always transfer the educational theories studied [for the competition] into the everyday nursery school practice, such ability came with time*”. In any case, he stressed he is proud of being an educator, which is “*a joy because of the children. Sure there have been problems, but there has been a considerable institutional evolution since the mid-1990s*”. He introduced to me his woman colleague with whom he shares the educational responsibility of a group of children and stressed that “*it is not a matter of being a man or a woman, it’s a matter of the experiences one underwent. My*

³⁵ Riccardo and Edoardo also hold university degrees. Renato is working on his thesis.

colleague and I see things in a very similar way precisely because we were both into sports. We speak the same language, and we pay a lot of attention that children move around safely, yet we don't prevent them from exploring new games, and let them play them. We teach them not to hurt themselves, we teach them how to play safely". In my view, the good relation Francesco established with his colleague seems to be based not only on sharing a past in sports, but also on his family education ("my mother brought me up in a 'modern' way regarding gender equality ... [because] she sympathized for the feminist movement, which I then critically reflected on") and his experience with militant feminism. As he recollected, the few men educators don't have any specific influence on the way childcare is carried out, because it is heavily "feminized". He added that, in his view, generation, more than gender, was important: he was referring to the 1970s/1980s feminist generation, that he saw as "very ideologized", "very anti-male", while the younger women have a different attitude, as they no longer stand separate and together. Instead, in that decade, a man was portrayed and perceived by feminists as "other than themselves", and he remembered to have heard how "we are made in a way and men in another". He stressed how he had supported the women's protest though in some cases he was asked to leave the demonstration because he was a man. He said that "many a times I feel discriminated against, because I am categorized as a man regardless of the kind of person/man I am". He also thought as questionable the somewhat prevailing maternalistic attitudes that can produce recommendations such as either "you're a man, leave it to us", or "you're the man, you take care of this, go ahead, they [the parents] will listen to you". And thus Francesco learned to be authoritative, though "I pay lots of attention not to be authoritarian. [Because] first of all it is a matter of authority!". Renato remembered how being a substitute educator was different from being in the tenured position he achieved in 2007: "a substitute is under less pressure from a bureaucratic point of view and from the parents, because everyone knows he won't stay long in this or that nursery school. And then, one has no time to develop a real synergy with the children, there is little educational continuity. Thus it was important for me to learn and remember the names of the children, I tried to learn them as quickly as possible in order to become a 'member' of the nursery school as quickly as possible. I must admit that I liked to go from one nursery school to the other, some of the substitutions were for a year and in so called 'frontier' nursery schools, those for the Roma for example. I remember those times with satisfaction because if one is able to go beyond the institutional dimension, then one can be friends with the Roma. That I liked what I was doing was appreciated by most parents, in fact some of them even asked me if I could babysit for their children at home!". He interpreted mothers' exclusive relation to their children as the consequence of the missing intergenerational transmission of "know how" about children (a condition he and his partner experienced), on the one hand, and on the other as the result of stereotypical beliefs (such as 'leave it to me, I'll take care of it, I'll do it'). Instead "this is educational work and it is right for men to participate in it". Renato's curriculum vitae is quite interesting: born in a region of the deep Italian South, in a family of limited economic means, he attended teachers high school, but had a personal revolutionary project nourished by the literary works of Stirner,

Sartre, and Camus. He first ran away from home at 16, then again at 18 when he settled in a Northern Italian town, ready to move again if he ever heard of an interesting suggestion. In those times he saw himself as an anarchist and/or an existentialist. He judged the 1980s, when he was growing up, as the “*meaningless decade of consumerism*”, though, in a way, he would have liked to share in that consumption, go with the flow, “*homogenize*” socially and maybe achieve some social mobility. However, he was deeply aware that those were questionable bourgeois aspirations and that he had to refuse them. In fact he had always worked: at the beginning in the building trade – building stands for concerts, fairs or other popular events. Then he worked in a call center, afterwards – having enrolled at the university for a degree in education – he worked as a waiter in restaurants and hotels. As he pointed out, “*I’ve always worked, I’ve always supported myself*”. As for Matteo, he had studied to become an accountant, but once he realized he did not like that kind of work he adapted to a considerable number of different jobs, because he had not yet found what he liked to do: a conscientious objector, he worked in summer camps, then with disabled persons for 2 years, and during winter time he helped disadvantaged children. Later he worked in a farm, and afterwards in a factory where caravans were constructed. All along he was active “in the movement”, as we say in Italy, and had been in Genova in 2001 for the G8 Summit. At one point he wondered what he wanted to do with his life, and because his girlfriend of that time was organizing a cooperative to manage a local nursery school, he was asked if he wanted to participate in it. Working as a postman at the time, he decided “*to give it a try*”. He took an educational course and then enrolled in a vocational school for community services’ managers. He worked at the nursery school as assistant-educator: all his colleagues had educational degrees and he said he learned a lot from watching how they took care of the children. At night he would drive to a nearby town to attend the vocational school. Since he found he liked his new position, he enrolled at the university, for a degree in education. His political militancy could still be felt when he talked about children: “*children are all the same, even though they are not treated all alike. For instance, there is the class A child and the class B one. You should see the cars parents drive their children to school with! While some parents don’t even have a small car. In any case this educational service provided by the municipality is quite expensive. Education should be free!*”. Paolo had started working as substitute educator in 2004, at the age of 25, precisely in the nursery school where I collected his narrative about 10 years later. In 2009 he became a tenured educator owing to the many years of work as substitute educator. He had studied at a vocational secondary school, where students are prepared to work in the social services, including nursery schools. Possibly, the fact that his mother is one of the few women nursery school “operators”, made some difference: from his point of view, this family/nursery school connection was important because he became familiar with that particular environment very early, and very early he came to like it.

As the life experiences and trajectories of these men are different, it was interesting to learn how they saw their own professional future and that of the nursery school: Riccardo, in his written reflections, had questioned the assumption that nursery schools are “for women only”; instead, believing that men have a relevant

role to play in early childhood education, he regretted that meager public funding now favors the new family-based nursery schools, once more centred on the mother figure and role. Educators like him had had a pedagogical training, even though he recognized that in the early years educators had to make the best out of their own intellectual resources and investment, since the municipal educational coordination started only in the 1990s.³⁶ It is thus understandable that he should stress (just like his former colleagues) that an educator should not act “*as a ‘mother’ to the child entrusted to him/her*”, because early childhood care and education are not a matter of gender “naturalness”, but of specific knowledge, practice and reflexivity. Edoardo – not unlike what the other men educators had remarked in their narratives – pointed out that nursery school work is stressful both physically and mentally because “*children require, and absorb, lots of energy and enthusiasm [from the educators] that however tend to decrease with age. ... [In other words] it is a mental condition, we are not as ‘fresh’ as we used to*”. He made me notice that the nursery school workforce has grown old: most of them are in their 50s, having started to work in their 20s. He further claimed that bureaucracy has grown larger and larger, and tends to monopolize the minds of educators: “*these are the things that make one older!*”. He was not against educational planning for the good of the children, but he felt that it is somewhat characterized by a “top down” approach that “*frames*” educators and “*conditions*” them too much. And while he agreed that the work of the educators – all of them – should be assessed by evaluating how they implement the planned educational activities, he worried that in the end these procedures would burn off much of the educators’ creativity and freedom. He admitted that bureaucracy annoys him and wondered if such reaction was more typical of men, since he noticed that in group work he is always more impatient than his women colleagues. Paradoxically, either because of his impatience or because he is the only man in the group, he usually ends up playing the role of the mediator! Because of his mother’s work, Paolo knew about the changes obtaining in nursery schools: he remembered how “*nursery schools were at the beginning a social issue that later on became educational. Enrollment grew precisely because of its educational quality, but now it is down, there are fewer educators, and fewer funds. We make every effort to maintain the quality level of before, notwithstanding the scarce resources, it is more demanding for us, but we still work in small groups as few as we are*”. As for Renato, he shared with me how “*I am very happy to come here every morning, to come to my children, but not because they are mine, but because I like them. I don’t share this educational top down approach by the Educational Coordination. Earlier on there was room for innovation, now every one must plan and do the same activities. No more unconventional educators like in the 1970s. And there are more and more externalizations, fewer or no more municipal nursery schools because they are too expensive, the private sector or the cooperatives are taking hold*”. It was a feeling Matteo agreed with: “*basically – he stressed – I feel happy, this work is almost a a sort of enjoyment, it is right for me. Unlike my previous jobs, even my health has gotten better. It is a work that makes me feel all right, I really like to be with children,*

³⁶ About the Educational Coordination Office, see Catarsi (2010).

it improves my good humour". Nevertheless, he was aware of the contradictions existing at the educational level: "each of us strive to affirm certain values, knowing very well that children are not alike. Children do not all live on same economic and social level, there are those who have more, and those who have nothing, and besides we educators do not yet know if every child will have the same opportunity than others". With regard to the work itself Matteo was convinced that "this is a job that questions yourself as a person, as you are, it is based on relation, and if one is sick helshe must make any effort to go on with the show. The way I act as an educator is to push into the background any feeling of uneasiness, I try to achieve and maintain the right distance, I try to infuse my work with myself, and at the same time I am careful that such infusion might not be too much".

65.5 Conclusions

In voicing his critical position towards giving "gender" a focal place in discourses of early childhood education and care, Matteo had pointed out that if men educators are "more physical" (i.e., ready to engage in outdoor play and projects,³⁷ and to encourage children to move around even when they are inside, etc.), so are many women colleagues, and that, in the end, "men are also different from each other". In fact the narratives I collected (and that are only partially presented here) precisely testify how personal histories and interests, as well as social concerns and engagement, make each of these educators different from his other men colleagues, though the commitment of every one to build a trustworthy and educationally positive relationship with children and "accompany" or "support" the latter's emotional and learning trajectories allows seeing all six as a collective, characterized by a shared process of constructing a professional identity not exclusively based on the gendered distinction. Such identity had not very firm foundations at the beginning, owing either to the lack of familiarity with the nursery school environment (as expressed in Riccardo's surprise for "those tiny tables, chairs, beds!", or Francesco's wondering about what kind of educational place nursery schools were), or to the limited formation in care work that was progressively built "in the field" or "by doing it [i.e., care work]", especially in the case of the four of them who had seized working in a nursery school, when such opportunity presented itself.³⁸ However, even those as Riccardo, Francesco and Edoardo, who had studied education or social work, had to consider how much of their training and/or experience was

³⁷ Some nursery schools have a small vegetable garden in their backyards that children are invited to tend, and in one of them (that will be the object of a different text) berry shrubs and hedges of aromatics were planted by the man educator so that children could develop their senses of smell and taste.

³⁸ The foursome seems to validate the European research findings, according to which most men who enter careers traditionally hegemonized by women and defined as gender-specific, such as childcare, have "retought careers" (Vandenbroeck and Peeters 2008).

immediately useful in caring for babies and toddlers. In a critical appraisal of nursery school educators' formation,³⁹ it is pointed out how the local administrations' decision to establish nursery schools had to reckon with "the lack of a psycho-educational culture concerned with children between 0 and 6 years of age, as well as of a national formative blueprint" (Cocever 2014, p. 175), that was initially answered by annual or semester courses at the local level, rather than at the university's. If this diagnosis recalls Frabboni's criticism (1985) that was crucial in promoting the notion and practice of educational planning, the process of *learning nursery school care work while caring for the babies* narrated by these educators can suggest a different interpretation, namely one that sees the co-construction of a professional identity and practice in terms of *situated learning* (cfr. Lave and Wenger 1991): in fact, these educators more or less explicitly describe themselves as apprentices to more experienced colleagues⁴⁰ whom from a metaphorical margin they observed providing to the needs of children, before they were in turn able to step in and take care of children's well being and emotions (and do so in one's own way, as Riccardo narrated), and testify of their own agency and unforeseen potentials.⁴¹ As they succeeded in being engaged with the children, their apprenticeship ramified to include *learning from the children's responses* to their caring and educational activities ("I provide them with continuity and they trust me"; "from the point of view of the body it is an experience of diversity that the child cannot but feel"; "if they like you, they like you") as well as *from their own feelings and memories*. Thus, a baby's pain and fear at seeing his/her mother leave made Riccardo remember his own childhood, while, in playing with, or cleaning one of them, he would "listen to the emotions ... in my inner self ... be in eye contact with him/her ... show attention for his/her physicality". Francesco highlights the relevance of his past experience in sports when taking care of the children's bodies and of his own body language, and revives the memory of how much he enjoyed playing with his friends in a park to explain that an educator must create the conditions for the children to move around "freely, independently and safely". The gratification Edoardo feels in witnessing the babies and toddlers grow and change is related, and compared, to his previous experience with the elderly, Matteo hypothesizes that in choosing to become a nursery school educator he might have aimed "to be a fatherly figure for the children" (having always been surrounded by women in his early years) and Paolo highlighted the connection between his work and his prior "familiarity" with nursery schools. As was seen, the body – that of the children as well as that of the men – came to the foreground in many points of the narratives as a constitutive, and touching, aspect

³⁹ Acknowledging the persisting feminization of care work and education, Cocever (2014) writes "educators" in the feminine (*educatrici*).

⁴⁰ The more experienced women colleagues had set the rules that had become almost "naturally" institutionalized. To go counter those rules – as Riccardo did – meant not so much affirming a gendered point of view but placing the children – their needs and potentials – at the center of caring and educational action.

⁴¹ Scheffler's elaboration on human potential could provide a fruitful, open-ended interpretation of the personal and professional realization these men attained in nursery school work (see Scheffler 1985).

of the educators' learning process: when, for instance, they underlined how they understand that, through their smell, children communicate pain or fear, or a family's special attention, or when they sit on the floor to read a story and interact on an equal basis and more freely with the toddlers. In their narratives, these men educators could not but recognize that their presence "*made waves*",⁴² that it was, and is, appreciated by most families⁴³ and, according to Edoardo and Renato, reassures mothers that they will not be their competitors. Yet, they all shied away from representing their work and professional identity in terms of a gendered perspective and repeatedly stressed their status as educators, and that "*what counts is how an educator is, and what his/her personal formation is. (...) [Because] this is a job that question yourself as a person*". In other words, the *diversity* they, as men, introduce to balance gender inequality is once more interpreted – an interpretation they all shared – as the persons' diversified experiences that nourish a professional identity, and is in turn nourished by the latter. The regret they all expressed about some loss of pedagogic creativity owing to a top down educational planning, and the difficulty in maintaining today the quality standards of Hilltown nursery schools (because of growing costs and scarce resources), suggest that the debate about (gender) equality must be complemented by the concern for the social diversity of children that translates in diversity (i.e., inequality) of opportunities and future participation because "*each of us strive to affirm certain values ... [but we know that] children do not all live on the same economic and social level, there are those who have more, and those who have nothing, and besides we educators do not yet know if every child will have the same opportunities than others*".

⁴²The surprise and the "waves" these men educators made in the nursery school environments evoke the unpredictable man educator who is the main character of director Marco Ferreri's movie *Chiedo asilo* (Seeking asylum) (1979). The word *asilo* in Italian indicates both the shelter and the nursery school, conveying the historical notion that the places where needy children were hosted had protection as their major goal. Ferreri obviously played with the double meaning of the word.

Chapter 66

School Choice, School Markets and Children's Urban Socialization

Clément Rivière and Sonja Kosunen

66.1 Introduction

Schools in cities are places for children's socialization. This chapter aims to extend and enrich the understanding of urban education by highlighting the relation between children's schooling experiences and their *urban socialization*, defined as the social process that shapes their representations and action in urban space. The interaction between the school and children's urban "careers" (Becker 1963) has indeed rarely been studied, despite of their porosity: the journey to school, for instance, is generally the first experience of children's autonomous mobility across European countries (Vercesi 2008). More broadly, the urban socialization is often an overlooked dimension in the study of "primary socialization", as defined by Peter Berger and Thomas Luckmann (1966). The purpose of this chapter is to shed light on the urban outcomes of the schooling experiences, such as the acquisition of mobility skills and other socializing effects, and have a closer look at the phenomenon in terms of social class. We specifically concentrate on the journey to school and the transition to lower secondary education, as that shift within the comprehensive education seems somehow to change the child's relationship with the surrounding neighbourhood and public transportation.

Recent studies concerning lower-class pupils (Méndez 2013) and students (Pasquali 2014) entering elite institutions located in well-off areas offer several avenues for research. First, the journeys to school give children information about their own social identity and the identity of other groups, through a better

consciousness of the social structure of the city. Second, social ties and networks develop (or do not develop) around these practices of mobility. Third, the child's self-esteem arises in relation to the ability to travel alone across the city. All these processes take place in relation to children's social backgrounds. Therefore, sociological research has highlighted the social differentiation of socialization processes, a result that invites to tackle inequalities and their production among children.

This chapter draws on in-depth interviews conducted with parents living in two socially mixed areas of Paris (France) and Milan (Italy), which allows to investigate the role played by political and socio-cultural contexts in shaping children's urban socialization. In particular, the role of school choice policies, which influence the journeys the children make to school and that have "important implications for children's development of local social capital" (Weller and Bruegel 2009), will be discussed.

After a short presentation of the methodology and the local contexts of this study, in the first empirical section of this article, we describe the school journeys and related experiences and the embedded processes of urban socialization. Second, we discuss the role of the families' school choices, and schools as producers of urban inequalities among children. The final section focuses on results concerning the school markets as structural contexts for urban socialization processes.

66.2 Methodology

The empirical material used in this chapter was gathered for a study focusing on parental supervision of children's mobility and outdoor play practices (Rivière 2014). Between March 2009 and April 2012, 78 in-depth interviews were conducted with 88 parents (51 mothers, 17 fathers and 10 couples) in the cities of Paris and Milan. Forty three interviews were conducted in Italian in Milan, and 35 in French in Paris, all of them transcribed in the original language and later on subjected to qualitative content analysis. The choice of conducting interviews with parents of at least one child aged from 8 to 14 (123 children, 171 overall – see Table 66.1) was based on the interest on studying more accurately the changes in parental supervision in relation to the children's entry to lower-secondary school.

The interest for studying this transition follows the tradition of previous urban studies in urban education (e.g. Weller and Bruegel 2009), which have highlighted the fact that this transition is a shift concerning children's mobility practices. In addition, the usual age for accessing lower-secondary school is the same in France and in Italy (11 years of age – see Table 66.2), and thereby the idea was to define a symmetrical setting: from 3 years before entering lower-secondary school (8 years old) to 3 years after (14 years old).

The structure of the semi-structured thematic interview was divided into three parts: the first one concerned the life in the neighbourhood and the residential trajec-

tory of the interviewee; second, the children's usage of public space (with their parents and without them); and the third the parents' perceptions of urban life and social control over their children in public space. The interviews lasted between 30 and 165 min, with an average length of 73 min. As highlighted in Table 66.3, interviewees were contacted by various means, such as local associations, but also directly in public spaces and via snowball-sampling.

Social class is considered an important factor constituting the educational practices of families and educational trajectories of their children (e.g. Lareau 2003; van Zanten 2009). It is defined here as a combination of the parents education level and position in the labour market. The relative proportion of families from lower social backgrounds is slightly higher in Milan (12 working class parents out of 51) than in Paris (7 out of 37), but middle-class parents constitute the majority in our material in both contexts (62 parents out of 88, about 70%) (Table 66.4).

As similar as possible areas have been selected in order to enforce the comparability of this study. More specifically, these neighbourhoods in the two cities share similar features concerning the social and cultural heterogeneity of their population, their morphology, their (north-eastern) location in the city and their historical trajectories.

The area investigated in Milan (Monza-Padova) counted 76,427 inhabitants in 2008. Around one quarter (23.7%) of them were immigrants (a share ten times higher than 20 years before), which reflects the long history of internal and later on international migration towards this first farming and then small-industry area. The neighbourhood is well connected by road and public transportation to the centre of Milan, and its population has progressively changed in relation to the de-industrialisation process, as highlighted by gentrification trends in some delimited sectors of the area.

The area investigated in Paris (Villette-Belleville, 125,393 inhabitants in 2008) is located in the 19th district of Paris, which is on the territory of the former independent municipalities of La Villette and Belleville. It has several features in common with Monza-Padova, in particular its initially rural and then industrial history. The 19th district is a socially and ethnically mixed area (15.7% of foreigners in 2008) with a lower quality provision of both public and private secondary education, if compared with more central districts of Paris.

66.3 Schooling Experience and Urban Experience

What could be constantly derived from the interviews was the fact that children's practices of mobility are significantly shaped by their school "career" (Becker 1963). In both cities, the primary school in particular appeared as a springboard

towards children's urban autonomy. They travelled more often to secondary schools without adult supervision. Simultaneously studies show that in several Western countries, also in France, access to secondary school is one of the two most dangerous periods for children in terms of fatal traffic accidents (Granié 2010).

The age of the first autonomous journey to (and/or from) school varies accordingly to a set of environmental characteristics. First, the possibility for the child to go to school without adult supervision, but along with other children, has a positive impact on the level of autonomy reached at identical steps of the school path. Those children can be neighbours, schoolmates or sons of parent's friends or acquaintances living in the neighbourhood. In such a perspective, around home the presence of other children who are attending the same school is a precious resource for autonomy.

When she entered primary school, we could not go and pick up her anymore, so I asked two sisters living in our building if they would accept to take my daughter with them every morning. This is the way she began going to school without us. And also at the end of the school day, as they were leaving at the same hour. Then, progressively, she did it by herself, in a natural way so to say. (Father, Employee in an employment agency, two daughters aged 25 and 12, Paris)

However, what parents take into account in their decision is mostly the levels of complexity and perceived danger associated to the journey. As outlined in previous research, living close by the school tends to encourage parents into letting their child travel the journey to school without adults (Lewis and Torres 2010). Beyond the mere physical distance, journeys perceived as more complex (e.g. including heavily trafficked streets to cross, narrow sidewalks and/or deserted spaces) make parents significantly more reluctant to concede autonomy to their children on their way to school, an increasingly frequent request as they grow up.

He has been asking me recently if he could go to school alone, or come back from school alone. It's not so close from here, around twenty minutes walking. He has a large street to cross... And then there is a crossroad with no traffic light, which is quite dangerous. It is true that I don't feel so relaxed when I imagine him walking alone over there. (...) I know that he has a good friend who goes alone to school, but he has only five minutes to walk, and that is not comparable. (Mother, Engineer in a public research centre, one son aged 9, Paris)

As discussed in previous research (see e.g. Vercesi 2008; Weller and Bruegel 2009; Lehman-Frisch et al. 2012a), the access to secondary education profoundly shapes the autonomization process of children's mobility practices. The first year of lower-secondary school (*sixième* in Paris, *prima media* in Milan – with children around 11 years old) means in most cases the start of autonomous journeys to school, as they are not accompanied anymore. The reasons for this change are multiple, as will be shown in the following analyses. The shift towards autonomous mobility within the city frequently occurs during the first days or weeks following the beginning of school year. Table 66.5 describes this phenomenon for the Parisian case: the share of children accompanied by their parents for the journey to school declines along the years and reaches zero when the children reach the age of 11,

Table 66.5 The journey to school (Paris)

Age	Children accompanied by an adult	By an older member of the brotherhood	Mixed forms of accompaniment	Alone or with schoolmates
8	5 (62.5%)	2 (25%)	1 (12.5%)	–
9	5 (50%)	–	4 (40%)	1 (10%)
10	4 (40%)	–	3 (30%)	3 (30%)
11	–	1 (14.3%)	1 (14.3%)	5 (71.4%)
12	–	–	–	9 (100%)
13	–	–	–	7 (100%)
14	–	–	–	6 (100%)

whereas the share of children making the journey alone or with school-mates quickly increases as they get older.

As a matter of fact, in Milan, a significant number of primary schools do not let pupils go home alone after school, which sheds another light on the role played by school as an institution in shaping the urban autonomy of children. In this case the school provides limitations.

My son goes and comes back to school with one of us, because the head of the school ask parents to do so. Until the last year of primary school. They say they have to be sure the children enter the school, they have to be given to teachers by parents themselves. (Mother, Educator, one son aged 8, Milan)

At primary school they don't let children go out alone. Someone they know has to come and pick them up. (Mother, Civil servant, one son aged 10, Milan)

In both cities, interviewees' discourses allow to analytically distinguish four explicative factors for the significant effect of access to secondary school on children's autonomy during the journey to school. First, lower-secondary school, with its irregular hours, make it more difficult for parents to accompany the child. Second, as for cultural, play and clothing practices (Pasquier 2005; Mardon 2010), also peer group pressure among children increases significantly, and is a strong disincentive in relation to be escorted to school by a parent. Third, the parents who are the most reluctant to let their children go alone observe that most pupils do the journey without adults, which further reassures them.¹ Last but not least, and in relation to the previous arguments, lower-secondary school does not serve adults' social relations as much as primary school does, that is to say that the parents are more involved in the activities of primary schools and thereby know the other parents better. Beyond the mere journey to school, this progressive gain of autonomy reverberates on daily mobility practices and outdoor play in the neighbourhood.

You don't walk anymore to school with your child. My daughter from the beginning told us... I mean, I did not really consider to accompany her anyway, but she told us: "I warn

¹The observed autonomy of other children can also be used by less autonomous children when they negotiate more freedom with their parents.

you, you will not go with me, not even for part of the journey, nothing, you let me go by myself". (...) During the last year at primary school, I was the one saying: "Now you could go alone to school", but she was not interested, she wanted us to go with us. But as soon as she entered lower-secondary school...

So, she associated lower-secondary school and going there by herself?

She did, yes. From the beginning. Even before, she talked about this during summer holidays: "You won't walk with me to lower-secondary school, no way". (Mother, Project officer, one daughter aged 11, Paris)

At the beginning I was accompanying my elder daughter, and then I saw that most of them go back alone from there. So that I felt more relaxed to let her go alone. (Mother, Housewife, two daughters aged 12 and 5, one son aged 9, Milan)

The last year of primary school was frequently considered as a training year for the practices of urban autonomy for the children, before they enrolled to lower-secondary school. This preparation does not only deal with exploring the new itinerary that the child will have to travel. Indeed, it can imply developing mobility skills such as taking public transportation alone (bus and/or underground) or facing new responsibilities such as holding home keys.

I have to say that during the summer between the end of primary school and the beginning of lower-secondary school, I tried to prepare him, to make him more ready by letting him close the door, sometimes I let him go alone to meet friends, so that he could be more used to these kind of things. So that now when he goes out alone I feel relaxed. (Mother, Housewife, one son aged 12, Milan)

During the last year of primary school, progressively... While going to school, I was walking behind him in order to make him get used walking alone. (...) I wanted him to be ready for his first year at lower-secondary school. (Mother, Primary school teacher, one son aged 11 and one daughter aged 5, Milan)

We train him to what he will have to face next year, because he will pass from primary to lower-secondary school and will have to go there alone, with the bus. (...) For instance, we have been trying to send him buy bread or similar easy things in the area. (Father, Sales representative, one son aged 10, Milan)

Attending lower-secondary level in school strongly shapes the representations of what the children can autonomously do in the city. As observed also for many other domains of children's lives (Chamboredon 1991), their position in the school path has consequences on the way they are perceived by adults. In short, the peer group's social pressure attached to attending the lower secondary school made the children willing to make their school journeys unaccompanied. Simultaneously the stage of schooling and the age of the children were considered by the parents in order to let them make the journey alone or with their friends. The changes in the everyday schooling from primary to lower secondary education seemed to shape what was considered desirable and what was embarrassing behaviour in terms of making the way to the school. This role played by the school as an institution in shaping children's urban socialization process gets all the more emphasised in the socially differentiated outcomes of school choices, which will be discussed in the following section.

66.4 School Choice and Urban Space: Changing Practices

School choices, in particular when children do not attend the local school, contribute to shaping the children's urban experience as the choice has several consequences on their practices of mobility, but also on their relationship with their own neighbourhood.

Schooling outside the neighbourhood fosters children's independent mobility, by confronting them with new experiences such as a regular use of public transportation. Sometimes the distance between home and school is long, due to the choice of a private school or a specific track, for example. As a consequence the pupils travel to school by bus, tram or subway, as described in the following two examples. Because of their choice of a specific track (courses both in French and German in the first case, intensive music education in the second one), these two children had to go to lower-secondary school quite far from home, and had to use the subway autonomously in order to reach the school.

At the beginning of the first year he was taking the bus together with a friend of his. Then he decided to take the subway, a journey with two changes but which is shorter in terms of time. Besides, he did not like the way so much, as he had to walk to reach the bus station, and it's very dark in wintertime. So that he begun to take the subway, and along his way he meets his schoolmates. He got used to the subway very quickly. (Mother, Part-time sales advisor, three sons aged 13, 11 and 7, Paris)

Before she used to go walking to school, as the journey was only five minutes long. Now she has to walk to the metro station, and has to change line. The journey in subway lasts around 15 minutes, she could not do that walking. So during the first days at her new lower-secondary school, she went together with her mother. And we found out that she has two schoolmates living in the neighbourhood, and now they often go together. In most cases they wait for each other and go to the station together. (Father, University teacher, one daughter aged 12, one son aged 8, Paris)

As highlighted by these two quotes, the children who are used to take the public transportation to go to school often meet other pupils along their way. Conversely, their access to local social networks tends to be significantly less extensive than in the case of children who go to the local school. Indeed, most of their schoolmates live in other neighbourhoods, and they have less possibilities to spend time with local kids. In such a perspective, school choices to other than the local school amplify the porosity between children's school experience and urban experience, as their social life is largely shaped by the networks they (and their parents) build at school (Weller and Bruegel 2009). This is a reason why an active decision in choosing the local school can be related to a fear of the child otherwise feeling socially isolated in the neighbourhood.

As her secondary school is not located in the neighbourhood, she has friends living... Not everywhere in Paris but further from here, so that to visit her she has to take the subway. She has to leave the neighbourhood. Social relations take her away from here. (Mother, Certified public accountant, two daughters aged 13 and 10, one son aged 7, Paris)

What I think is that if you go to a school outside your neighbourhood, and all the more if the school is far away, it is much more difficult to make friends and develop networks of friends. You cannot play with your mates after school for example. [...] I don't want her to live a life in which she feels isolated. I really don't. I think it's important to fully live the neighbourhood experience. (Mother, Project officer, one daughter aged 11, Paris)

The choice of another school than the local one has thus several urban outcomes for the children, as they get earlier used to an autonomous use of public transportation, and also as their social networks are embedded within their school experience. However, it is well-known that families school choices are shaped by their economic, cultural and social resources (see e.g. van Zanten 2009). This sheds a new light on the fact that middle-class and upper-middle class children, who more frequently go to school outside the neighbourhood in our sample, tend to take public transportation earlier than lower-class children. Especially, parents' efforts to progressively train their children to travel in bus or subway alone appear to be related with a desire to anticipate such constraints produced by schooling experience. School choices thus shape the urban socialization of middle-class children in a direct (when they go to school outside the neighbourhood) but also in an indirect way (as their parents anticipate this possibility in their training practices).

Anyway, within the five next years, he will have to... He is gonna do it [go to school in another neighbourhood]. So, without necessarily sending him alone in the subway, we try to teach him how to read a map, how to change between different lines, all kind of things that appear obvious when you are an adult, but are not so obvious for a child to whom they have not been explained. We try to raise his curiosity for this kind of things. (Father, Finance manager, two sons aged 10 and 3, Paris)

This year she will be dancing ballet, which I am not really keen on. However, the idea was to allow her to do what she wants, but also, as the journey to go there is quite long... It's not a test, but let say that if it's working there, it's gonna work also to go to lower-secondary school I don't know where. (Mother, Free-lance journalist, one daughter aged 9, one son aged 3, Paris)

Conversely, lower-class parents in our data rarely discussed future journeys to school as a reason for anticipating the transmission of mobility skills. School choices tend to contain lower-class children in their neighbourhood, whereas they favour the building of more diffuse social networks in the city for middle-class and upper-middle class children. This combination of a differentiated socialization to public transportation and of a differentiated construction of social networks certainly contributes to reproducing socially contrasted uses and representations of urban space. In particular, children's local social capital, defined as the resources deriving from access to social networks (Bourdieu 1980), mobility skills, ability and interest to navigate different kinds of neighbourhoods, appear to be partly shaped by the school choices families make. Upper-class and middle-class families have the means to conduct more sophisticated choices than their lower-class counterparts. This is related also to the practices of intentionally teaching the children how to behave and take their place in urban space, the instruction of how to use the public transportation being a concrete example of that. In other words, such choices contribute to producing a more or less "dominant" or "dominated" relationship with the

city, as these practices potentially have several outcomes on urban autonomy (e.g. being able to navigate an unknown area alone, to ask the way to strangers, to face unforeseen interactions...) and social networks. Such socializing and segregating effects should definitely be considered in terms of “transmission of differential advantages to children” (Lareau 2003), that is to say in terms of social inequalities. However, the comparison of the interviews collected in Paris and Milan highlight that school markets play a role in shaping these social contrasts.

66.5 School Markets and Children’s Urban Socialization

The choices of schools at different levels of education appear to shape more profoundly children’s urban socialization in the Parisian case (Villette-Belleville) than in the Milanese one (Monza-Padova).

As a matter of fact, school success tends to be a more important stake in the French context, where the transition to the next stage of education is tracked via performance measurements, and where it is eventually perceived as determining the social destiny of children (Oberti 2007). Whereas school degrees still protect from downward social mobility (Peugny 2009), school choice are conducted in a tense context in which youth is perceived as a “life investment” (Van de Velde 2008). As Agnès van Zanten (2009) states, school choices are not just any choices, but particularly important ones, as they include affective elements (such as choosing social networks for children via school) and have long-terms consequences on the child’s educational and even occupational career.

The modalities of school choice differ in Paris and Milan, as the school markets fundamentally differ on the basis of urban space. Parents’ strategies have frequently a spatial component in the Parisian case, where the allocation to public schools takes place by local school allocation policies within catchment areas. This is related to an unequal distribution of the educational offer in urban space (Oberti 2005), meaning, different provision of schools by amounts and quality across neighbourhoods, and with a legitimation of competition between schools over their pupils (first order competition, see Delvaux and van Zanten 2006) by recent policies (Oberti et al. 2012). As a consequence, the possibility of school choice often implies that there are differences across schools so that choosing has a rationale (Seppänen 2006), and sending the children to a school located outside the neighbourhood might seem attractive. The choices in Paris were conducted across neighbourhoods, as the school markets logic of action and unequal distribution of educational provision within and across areas emerged.

In Milan, however, school choices were more frequently about choosing between the local public school and the local private, catholic school located in the area. The local school market was less hierarchical by its symbolic structure and it was organised relatively more locally in order to serve better the every-day family life in Milan, more so than in Paris. In other words, school choices tended to produce less

social differentiation in terms of urban socialization in the Milanese case study than in Paris, where public schooling was sometimes considered as an eviction factor from the neighbourhood for middle-class children (in particular for the children whose parents considered school performance as a priority). Parisian parents were all the more conscious of symbolic hierarchies in school markets as prestigious public schools were quite easily reachable by public transportation, sharpening their perception of an unequal school offer.

Schools are a real problem. Probably in all kind of neighbourhoods, but some areas are advantaged, they have a really good public schooling offer, so to say an excellent public offer... Obviously, it is not difficult to send your children to the local school when it is among the best in the whole country. (Mother, Certified public accountant, two daughters aged 13 and 10, one son aged 7, Paris)

Discourses pointing out the necessity to go out of the neighbourhood to benefit from a quality education are a by-product of the high social and cultural diversity of the local population combined with the relative proximity of more prestigious public and private schools, sharpening parents' temptation to educate their children outside the neighbourhood. In fact, many upper-middle but also middle-class children ended up leaving the neighbourhood for more central and "better" schools, the timing of their flight varying accordingly to the profile of their parents (income, degree, profession, etc.). Such eviction of local space impacts the social mix at school, but also outside school as children's social networks are largely embedded with their everyday schooling. As a consequence, the provision of schools together with the school choices in the local school market could be considered as producing social segregation in Vilette-Belleville, illustrating at the local level the fact that school segregation in lower secondary schools is stronger than residential segregation at the metropolitan level (Oberti et al. 2012). At the same time, this hierarchized and tense market fosters the urban autonomy of the children who go to school outside their own neighbourhood, that is to say middle-class children.

Spatial and symbolic hierarchies of schools were much less central in the interviews conducted in Milan, where the schooling was strongly related to family care and was organised in a more locally-oriented way. Italy is a State whose welfare policies largely rely on families compared to other Western countries (Oberti 2009). Family members are thus of a great help in daily life organization, all the more as the amount of hours spent at school per day is shorter than in Paris. In particular, grand-parents play a "crucial" (Ghezzi 2012) role in children daily care in Milan: in interviews they are often described as indispensable resources for child-caring, restraining residential choices but also influencing the school choices.

A lot of people live in this neighbourhood because their own parents live here, so they stay living close by them.

Is it because they are helpful to take care of the children?

Yes. Definitely. I observed it myself very quickly because as soon as my son was born my mother helped me. She cannot drive so it was not possible for us to go too far because she was helping us, and we also could help her if necessary. The mother of my husband also lives in the area. (Mother, Primary school teacher, one son aged 11 and one daughter aged 5, Milan)

Mother: If the grand-parents were not living here...

They take care of your son from time to time?

Father: They go and pick him up after school every day, and accompany him to the swimming pool. (Father and Mother, Sales representative/Employee in a private company, one son aged 10, Milan)

Indeed, attending a school outside the neighbourhood would make it more difficult for the parents to benefit from the local familial help and would create additional costs in terms of time or money. Therefore the important role of the help received from the family members in Milan potentially slows down educational choosing strategies, which would lead to exiting the neighbourhood. This constraint combines with a lesser pressure on parents' shoulder than in Paris concerning school performance, as degrees have a relatively less decisive impact on social trajectories in the Italian context (Cousin 2009). As a consequence, parents' preferably choose a local Catholic school when they do not want their child to attend the local public school. The impact of such a choice on urban socialization is then obviously not the same than when the school chosen is far from home. In Milan the children of the neighbourhood seemed to use the local educational provision (both public and private) within the neighbourhood, whereas in Paris the experienced and applied school market extended to further areas also expanding the urban space of the children who were attending these schools.

The analysis of the interviews in the two contexts highlights the importance of the impact of the locality of the school markets on urban socialization. As a matter of fact, the local school appears as an institution (concerning its quality) evicting the local upper-middle-class children to further areas of the city in the Parisian case study, which contributes in producing and reproducing social segregation on the one-hand, socially contrasted urban socialization experiences on the other hand. The more family-oriented child-caring regime in the Italian context (Oberti 2000) highlights by contrast the more decisive role played by school in differentiating children's experiences in Paris.

66.6 Discussion

Considering school trajectories as "careers" allows to observe the role played by school as an institution in shaping children's ways of discovering the city, as the level reached in schooling appears to be more meaningful for urban socialization than biological age. More specifically, children acquire (or do not acquire) mobility skills along their school experience, build social networks inside and/or outside their neighbourhood, navigate different kind of urban environments according to the location of the schools. This chapter has touched upon the relations across families' school choices in Paris and Milan, the diversified and differently locally organized educational provision and their consequences both on school segregation as well as on the different capacities of children from different social backgrounds to use the public space and transportation efficiently.

The socializing effects of the school experience are thus not only related to the institution itself, its agents and users, but also to its location within urban space. Therefore, it is not enough to state that school is an agent in the urban socialization process. As a matter of fact, this agent produces socially contrasted outcomes for children in terms of urban skills acquisition (in particular regarding the autonomous use of public transportation), social mix, building of social networks and proximity/distance to the neighbourhood. It does not only produces school inequalities but also *spatial inequalities*, notably in relation with school choices, whose urban outcomes for children have rarely been taken into account by research. Most probably, it also produces social differentiation in the urban experience of parents, whose local social capital largely relies on their children's friendship ties (Weller and Bruegel 2009).

Whereas relatively few comparative research has been carried on children's mobility in urban space (see e.g. Lehman-Frisch et al. 2012b), the comparative perspective sheds light on the role played by school markets in shaping in a specific way the social differentiation of urban socialization. It appears in particular necessary to take into account local welfare configurations, i.e. the way families, the State and the market interact. In Paris, an "elitist state" organizes a very tense competition between schools and pupils, producing strong social and spatial hierarchies, which is a threat for local schools in socially mixed areas as it increases the likelihood of school segregation. In Milan, a "delegating state" relies more on families and the church as pillars of children's care, which makes the local schools -both public and private - the easiest way to cope with the organization of daily life. The spatial dimension of parental educational strategies appears to be weaker in Milan, whereas a very competitive and spatially hierarchized school market reinforces social differentiation in children's urban socialization in Paris.

Chapter 67

Urban Education in Austria: ‘Repression’ of the Topic and a ‘Reversed’ Political Agenda

Lorenz Lassnigg

67.1 Introduction

The concept of urban education is not familiar in the Austrian and the wider German speaking discourse either. This can be shown by literature search, which is hampered by the fact that not even an expression in the German/Austrian language exists for this concept.¹ We find two exceptional occasions when the concept was highlighted: at a 2000 conference in Vienna carrying this name (Achs 2001), and at the 2011 European Conference for Educational Research in Berlin (EERA 2011) with the same general conference topic. A recent OECD publication gives a specific position of Austria in the urbanisation trend, as the displayed indicators show a tendency of below average achievement in urban contexts, whereas in most countries these areas rather show overall advantages, often also related to polarised structures within the urban contexts (OECD 2014, p. 3).

Whereas urban education gained prominence in the 1960s and 1970s in the English speaking discourse, the urban-rural polarity is rather reversed in Austria.

¹Literature searches using the terms ‘urban education’ and ‘rural education’ in titles and all text were run in the EBSCOHOST Education Research Complete database, also using ‘Austria’ as additional term. The searches found primarily items from the US, with some predominance of urban over rural education since the 1960s (without a disappearance of the latter); specific Austrian contributions to the international discourse were not found. Searches in the German PEDOCS database found very few contributions that focus on regional aspects; wider reviews and analyses about education research mostly do not take the rural-urban dimension as a specific topic, if they consider it, the proportions are very low (e.g., among 800 key words over four periods between 2000–2009, 200 per period, only one incidence of ‘regional’ and ‘Bundesland’ was found by Dees 2014; among 8.600 educational research projects the topic ‘regional planning’ counted 0,2% in Weishaupt and Rittberger 2012).

The rural schools (*Landschule*) were a central topic of Austrian education policy in the 1950s (Göttlicher 2016); however, the concept of urban schools (*Stadtschule*) is mainly a historical term, used for the emergence of specific schools in the cities of earlier historical times up to the nineteenth century. Accordingly searching ‘urban education’ and ‘rural education’ in the ECER webpages² finds only references to some recent/current research projects dealing with rural schools. Two phenomena stand out with this polarity, first the discourse models the urban school as the (average) reference unit without naming it explicitly as such, and the rural as the exception which should be treated in some special ambiguous way (either supported or ‘normalised’); related to this, the broader issues of urbanisation are more or less neglected, and regional policies have focused towards the support of the non-urban regions. The second phenomenon demonstrates a kind of conceptual ‘repression’ in the old Freudian manner, as the main topics addressed in the international discourse about urban education related to disadvantage, stigmatisation, conflict, etc., are not tackled as serious and legitimate issues to be resolved, but rather marginalised and de-legitimised as incompetent malfunctions of Austrian schools and those responsible for them.

Whereas urban education is not emphasised as a deliberate topic, regional issues are heavily contested and politicised in Austria. Main messages by the policy makers and the researchers at the mentioned ‘Urban Education’-Conference 2000 clearly indicate this situation. Leaders from the Viennese board of education defend better urban opportunities by the more diverse and more complete supply against unsubstantiated and unjustified political critique based on rhetoric of a healthy and idyllic world in the countryside that in fact would restrict opportunities because of the missing education supply. They also point to fights about resources between the concentrated urban contexts and the strongly regionally dispersed and thus more expensive rural structures.

The researchers focus on the equity and efficiency issues related to the uneven regional opportunity structures and on the question of better/worse social background conditions in different regional aggregates. Austria has an early tracked school structure at the lower secondary level with a separation of a common (*Hauptschule*-HS) and a selective upper level academic school (*Allgemeinbildende Höhere Schule*-AHS) starting at age 10 after 4 years of primary school (*Volksschule*). The composition of this lower secondary structure in compulsory schooling, and related to this the role and composition of the schools of the two tracks, differ fundamentally between urban and rural contexts, and these structural differences are related to the density of the regional supply of school types. The academic schools are concentrated in urban regions and the common schools are more widely dispersed in rural regions, thus the academic participation is much higher in towns and cities. This unequal regional participation is reflected in a regionally different composition of common schools. The rural ones include a wider spectrum of students, whereas the urban common schools concentrate on disadvantaged youth, who were

²See for the general search: <http://www.eera-ecer.de/search/>; and for ECER Berlin about ‘urban education’ http://www.eera-ecer.de/ecer2011/?no_cache=1

selected out from further educational careers. The big political contest concerns the attitudes towards these differences, one camp around the more rurally oriented Christian-Democrats favouring a more selective academic school and a strengthening of the common track, whereas the other around the more urban Social Democrats criticise the restricted opportunities in rural regions and advocate a reform of the tracked structure towards a (more) comprehensive school. Empirically the distribution of opportunities is contested because of a lack of data and information.³ The opportunities related to the two tracks are to some degree less unequal than the structure suggests, because the common school also provides a route towards upward mobility mainly through a track of upper secondary vocational colleges (*Berufsbildende Höhere Schulen-BHS*) that provide credentials at the same level as the academic track (AHS), and effective access to higher education. The contributions of the researchers at the 'Urban Education' conference have pointed to the problems resulting from the tracked structure, and the polarised ideological convictions related to them, which hinder progression towards a solution of the problems in either direction. Empirical analyses indicate on the one hand that the distribution of abilities in the rural common school is much broader than that of the urban academic schools, with much overlap in the upper range; thus, if the academic school provides more elaborate opportunities for learning and progression, the more able students of rural common schools are denied part of their potential opportunities (Eder 2001, 2009). On the other hand, the meritocratic pull towards the academic track in the urban regions drives the common school towards a high degree of concentration of disadvantage that deprives the participants in this track from part of their potential opportunities because of the related aggregation effects (Schrodt 2014).

Overall, the rural-urban polarity appears flawed in some fundamental ways in the Austrian perceptions and discourses about educational challenges. On the one hand the discourse is focused on an aggregate perspective of the national formal structure of education, driven by the tracked vs. comprehensive polarity; on the other hand the various stakeholders involved in the actors constellations of education policy and practice are in different ways embedded in different kinds of national, regional and local communities, thus perceiving the educational structure from different angles. Because of the regionally biased structure, very different evaluations of the status-quo arise, implicitly addressing rather four categories of schools than the formal two ones academic and common, i.e. urban academic schools, rural common schools, rural academic schools, and urban common schools; more or less neglected is the complex area in between, in the regions around the bigger cities, which we might call a sub-urban one. The protagonists at the poles of the tracked-comprehensive polarity argue on a basis of different images of the school structure,

³The Austrian education statistics do not include data and information about the social background of students, thus it was the gradually increased participation in the International Assessments (TIMSS, PISA, PIRLS) that has provided this kind of information, and a more recently started big endeavor of the periodical recording of educational standards at grades 4 and 8 provides also punctual social background information.

somehow both neglecting the topics of urban education: the advocates of the tracked structure have the generalisation of the rural types of a selective academic school and a diverse common school in mind both of which were never common, as will be shown below, whereas the protagonists of the comprehensive structure rather argue from the perspective of the urban structure of diverse (common) academic schools and marginalised common schools, which do not reflect the challenges of the rural structure. A political focus on a change of the average formal system structure will not be appropriate to both sides of the rural-urban polarity. As a general consequence, there is no common ground in the political discourses, and a common strategy of finding solutions cannot be found, partly because of these different 'languages'.

This overall interpretation will be deconstructed in the chapter at some levels of analysis, in order to show the complexity of forces behind the polarised discourses, trying to tackle the tensions between ideologically founded perceptions and – also to some extent ideologically biased – 'realities' that create a kind of confusion. Institutionalism in a loose version is used as a theoretical and methodological lens of looking at the rural-urban polarity by assuming that the various institutional frameworks (political actors and structures, schools and their administration, administrative structures, etc.) involved in the double sense of organisational and normative structures are representing and at the same time influencing the meaning of the regional spaces, and are interrelated in complex ways (intersectionality). In this perspective the regional divisions are part of the actors and their practices in the various interrelated societal fields. The following interrelated dimensions are considered:

- First, the phenomenology of the urban/rural structures as an aggregating-distributing mechanism of the population and the societal environments including the distribution of educational institutions is analysed in greater detail. In the Austrian discourses the shape and development of urbanisation is more or less taken as a given that is not further questioned as a reality shaping phenomenon.
- Second, the historical legacies of the political conflict related to the educational structure are conceptually embedded into the also historically evolved broader political structures that reflect the regional divisions and the social actors attached to them (centralist-federalist state structure, agriculture-industry-services, political organisations, religious attachments to these elements, etc.). In this perspective the urban-rural division of schools cannot be conceived as a separate functional issue, but is part of a complex wider structure.
- Third the current issues in urban education are related to the political (in)capacities to cope with the problems (ideological, normative and structural constraints, distributional issues in financing, etc.). At this level the federalist governance structures are of concern, which include the rural-urban polarity because the capital of Vienna as the biggest urban entity is one of nine political and administrative units in the Austrian federalism, whereas the majority of other federalist units only include none or much smaller urban agglomerations.

- Since the late 1960s (im)migration has emerged as a specific topic concerning urban education, which was repressed as an explicit issue for a long time. However, the topic has increasingly received attention because of the emerging diversity among students, and different effects on rural and urban schools (demographic dynamic, language policy, cultures, etc.); since the 1990s these issues have also become politicised in a polarised way, thus hampering functional solutions.

The intersection of these dimensions turns the urban-rural polarity into such a complex phenomenon that is neither easy to understand nor to tackle in a reasonable and functional way. In the following these dimensions are discussed and analysed more deeply.

67.2 Urban/Rural Structures and the Educational Institutions

The discourse about urban education is strongly driven by images of big metropolitan agglomerations, in the diction of the OECD by the emergence of megacities. In the regional, economic, and innovation related fields that deal with 'competitiveness' on a global scale the urban regions have been distinguished as a separate level of discussion beyond the national level. The metropolitan or city regions are devised to compete among each other on a global scale, and in parallel also to cooperate with each other (e.g., the Eurocities project). In this sense, the bigger city agglomerations are to some degree conceptually disembedded from their national contexts (Florida 1999), and at the same time pushed into a new action structure that includes multiple comparisons among each other (e.g., various city rankings). A key discourse concerns innovation (e.g., regional innovation systems) and the contribution of higher education institutions (which have also become object of various global rankings).

The universities are deemed to have undergone waves of 'academic revolutions' (Etzkowitz 2004), the most recent one under the auspices of 'academic capitalism' (Rhoades and Slaughter 2004). Within the discourses of the knowledge economy and society, and more recently the 'knowledge triangle' of research, education and innovation the (urban) educational structures and institutions are tightly involved as a feeding device into higher education which in turn is expected to be globally competitive. Higher education institutions should at the same time also be more strongly embedded into the local environment by developing multiple interactions and relationships with the surrounding economy and society through the 'third mission'.

In relation to the national urban-rural dynamic in the frameworks of education, these discourses point towards a pooling of resources, and also towards regional concentration, thus changing the previous regional policy paradigm of more even distribution of resources among different aggregates towards the global competitiveness of the urban agglomerations. This change poses questions about conse-

quences for the urban-rural relationships at a national or regional level: does it promote the agglomeration tendencies, and the flow of resources towards them? How is higher education distributed among the agglomerations of different space and concentration? How are the rural regions affected by a (cyclical) dynamic of pull-effects from the agglomerations vs. investments into being a better feeder for them? Overall, in the polarity of the assets (strengths) and challenges (weaknesses) of urban education, this discourse increases the demand for improvement, and at least in short sight also might pose decisions about where to distribute (additional) resources with the highest effects. These questions seem more pressing for small countries, as the investment potential into big centres of research and innovation is substantially smaller simply because of the scale of the available resources.⁴

Looking at the regional structures in Austria, some observations can be made on a comparative⁵ and on a national level. Vienna as the Austrian capital city hosts the biggest share of the national population compared to the other main Western capitals; however, the overall urbanisation of Austria stagnates on a low level, whereas it is increasing in most other regions and countries. This signifies an overall comparatively small degree of urbanisation, and a big difference between the capital metropole of Vienna and the other Austrian agglomerations. The national data support this picture (see annex Tables 67.1 and 67.2). Figures 67.1 and 67.2 show the structure, based on a distinction between the administrative town/city regions, the (functional) agglomerations in which they are embedded, and the 'pure' rural regions, which are also functionally separate from urban environments. A striking point is that the administrative urban entities (enclosing 38% of the Austrian population) give an underestimating picture of urbanisation, as the greater urban regions which are functionally surrounding the towns and cities are adding further 28% living in de facto but not administrative urbanised regions (Fig. 67.2). The small towns being not linked to bigger agglomerations, which are to some degree an influential paradigm of living environment in the public discourses and perception enclose only a small proportion of the population (3% in the administrative town regions plus 5% in their immediate surroundings), whereas the hidden urban agglomerations around Vienna and the other bigger towns/cities (a kind of suburbia) enclose one fourth of the population (762 T around Vienna and 1.3 M around the other towns/cities within agglomerations); this kind of quasi-urban-metropolitan environments is treated as a mixture of towns and more rural environments in

⁴This point can be illustrated, if we look at the scale of the big global research universities in the US in relation to a 'normal' university in a small state (already times ago the budget of the University of California alone was similar to the whole Austrian higher education budget); looking at the global rankings, there are only few institutions in small countries that can fairly compete with the big US elite institutions (e.g. ETH Zurich), and Finland tries to step into this path with the development of the Aalto University (the success of which, however, cannot be reasonably predicted at this point).

⁵Comparisons of urbanisation are to some degree hampered by the fact that the demarcations of the cities from their greater environment might differ, consequently not the same units are compared if national definitions are the basis of the data (which is often the case; the European NUTS-Definition is a standardized one but restricted to EU member states).

Fig. 67.1 Stylised geography of urban regions in Austria (Source: author's own picture based on analysis of Austria Statistics data. Legend: *thick circles* with city/town names = big agglomerations; *thin circles* = smaller agglomerations; town names *outside circles* = small towns, linked to each other (by —) or stand alone)

Fig. 67.2 Population by urban and rural regions (Source: author's own figure based on own analysis of Austria Statistics data)

administrative-political practices as well as in the public perception. However, if the agglomerations are taken into account, the greater regions of Graz and Linz enclose 550 T resp. 650 T populations that are substantially more urbanised than the city areas alone (260 T resp. 200 T), and also change ranks, as the Linz-surroundings are much more densely populated than the Graz surroundings.

As these agglomerations are hidden from the attention, the social circumstances are not known, in particular, how the duality in urban environments between the more wealthy on the one side, and the more disadvantaged and problematic parts on the other are distributed in those hidden urbanised regions. In the discourse mostly the wealthy side is considered, as on average these regions are relatively richer in terms of regional GDP.

Two kinds of consequences for the educational structures follow from this hidden urbanisation process: First, the issue of 'economies of scale' differs between urbanised and non-urbanised regions, as the focus on financing is laid only within the communes, without considering the neighbouring ones, and also competing with neighbouring ones for status and resources; thus a degree of waste of resources might emerge; as the transport flows and structures within these regions are heavily biased towards the agglomeration centre, the opportunities of the middle class might be biased or violated to some degree because the school supply is overall less broad and diverse than in the cities. Second, because of the superficially more wealthy status, the 'dark sides' connected with urbanisation might be relatively even more marginalised in these areas than in the city regions, because the attention (and prejudice) is driven away from these problems, normally attached to urban youth. Because of the overall 'repression' of urban education the latter problems are quite unexplored by research.

The structure of the supply of schools is originally explored in Figs. 67.3 and 67.4, displaying the distribution of participation in different versions of regional typologies.

The hidden urbanisation by the regional agglomerations around the urban centres can be broken down by the population density. Thus the regional units that look rural by population density alone are located within the wider environment allowing a comparison of the less or lowly urbanised regions with the densely urbanised centres. Figure 67.3a shows how the school types are distributed across the regions, as compared to the rough distribution of the population.⁶ We see a clear divide between the mass compulsory schools on the one hand, which are even more widely

⁶The distribution of categories in the sum of all schools is always more similar to the compulsory schools because their overall number is much higher (all schools N=6.015, primary N=3.066; lower secondary mass schools N=1.104; lower secondary academic N=268; upper secondary academic N=345; total upper secondary N=1.710; because of an ongoing structural reform in lower secondary mass schools the number of schools must have been estimated; the academic school sites as organizational units mostly comprise lower and upper secondary levels, thus the number of physical academic school sites is similar to the number of upper secondary schools; the total number of upper secondary schools includes the academic and vocational schools, also the part-time compulsory schools related to apprenticeship and the institutionally separate schools for health occupations.

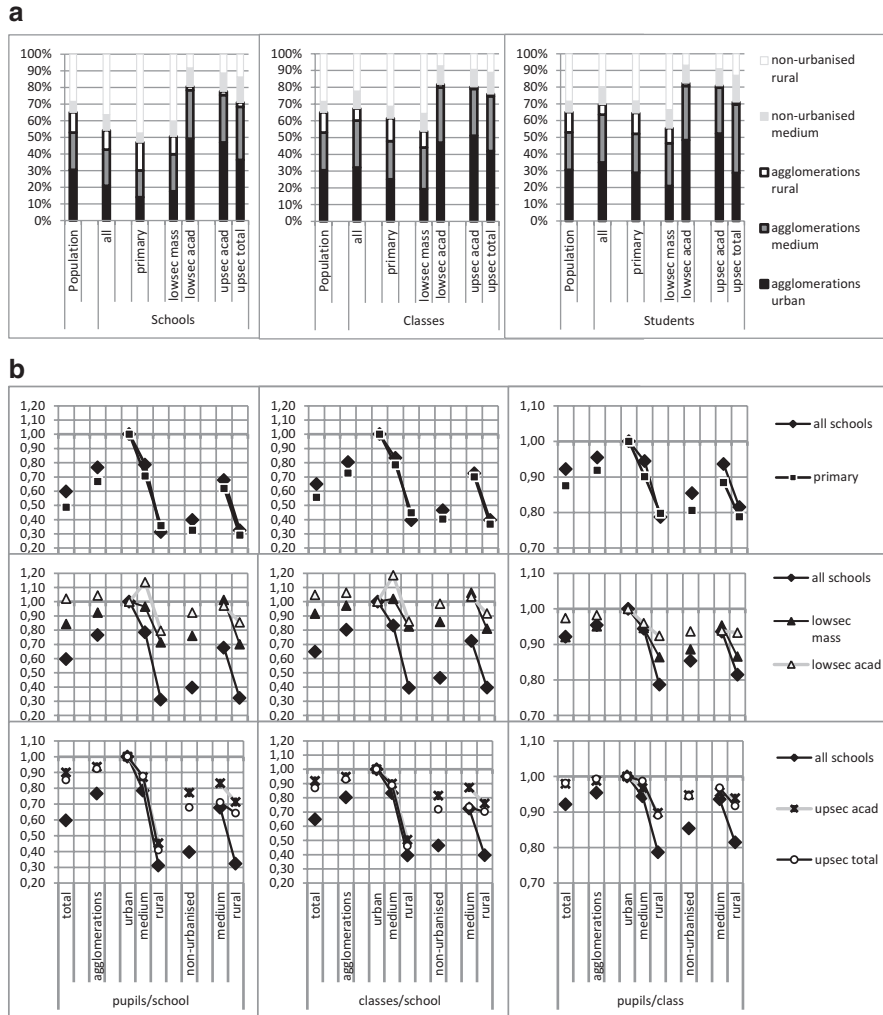

Fig. 67.3 Participation variables by regional type of agglomeration and population density. (a) Distribution of schools, classes and pupils by type of agglomeration and population density. (b) School size and pupils per class by type of agglomeration and population density (Source: authors own figure based on own analysis of Austria Statistics data)

distributed towards the rural regions than the population, and the selective academic and upper secondary school, which are strongly concentrated in the urban centres on the other hand. Eighty percent of the academic schools are situated within the urbanised parts of the agglomerations, whereas around half of the primary and mass lower secondary schools are distributed towards the non-urbanised regions where only one third of the population lives. In addition we find almost one fifth of primary schools (and 10% of mass lower secondary schools) in the less densely populated

areas within agglomerations. The academic school is also much more concentrated (half in the core urban centres) than the overall upper secondary schools that include also the large part of vocational education, the latter being more widely distributed outside the agglomerations and also towards the less urbanised regions within the agglomerations. In particular the primary schools also show a characteristic distinction of the three indicators used for the description: the schools are much more widely distributed than the classes within schools and the participation of pupils (the latter correspond grossly to the distribution of the population).

This means that the rural regions are 'privileged' by the distribution of the primary school, whereas they are 'rationed' in the academic track. Some structural consequences are displayed in Fig. 67.3b. Overall, schools are substantially smaller in rural regions than in urbanised ones, with a divide between compulsory schools and the academic track, and rural schools also receive relatively more resources than urban ones (grossly measured by the pupils per class ratio). The resource indicator is consistently more compressed in the agglomerations overall, and also shows stepwise relatively more resources in less densely populated regions both within agglomerations and outside the agglomerations. Thus bigger schools mean grossly less resources per pupil ('economies of scale'). However, if a higher degree of disadvantage and problem-loaded areas in the densely urbanised regions, as well as a more polarised structure of privileged and disadvantaged areas, is taken into account, these differences might substantially reflect rather a 'dis-economy of scale', as the most needy regions might receive relatively less resources than others. The existing conceptual and ideological disregard of the issues of urban education drives the attention away from these distributional divides, so that knowledge and even information is missing about the distribution problems within the highly urbanised regions.

The urban structures can be further differentiated by some striking distinctions (see the annex tables for detailed information), first between different types of urban environments (upper panel of Fig. 67.4), and second between different degrees of urbanisation within the agglomerations (cities, surrounding 'core agglomerations – *Kernzone*' with a high population and employment density, and 'extended agglomerations- *Außenzone*' with a high degree of commuting into the urban centres). The types of urban environments include the three large highly urbanised agglomerations of Vienna, Graz and Linz (where together more than 40% of the Austrian population live), and two types of less concentrated urban regions, those more densely embedded into some degree of an agglomerative environment (these include the smaller regional capitals of the Austrian *Länder*), and other more 'stand-alone' small towns without such an environment. Figure 67.4 compares the distribution of the population with the distribution of schools among these types of urbanisation, and shows a kind of polarised structure. Half of the population lives in bigger or smaller agglomerations, the other half in small towns or rural regions.⁷ The proportion of people living in stand-alone small towns is about double compared to those

⁷The rural regions also include different kinds of settlements, from small villages to very small towns that are not classified as urban regions ('*Stadregionen*') by Austria Statistics.

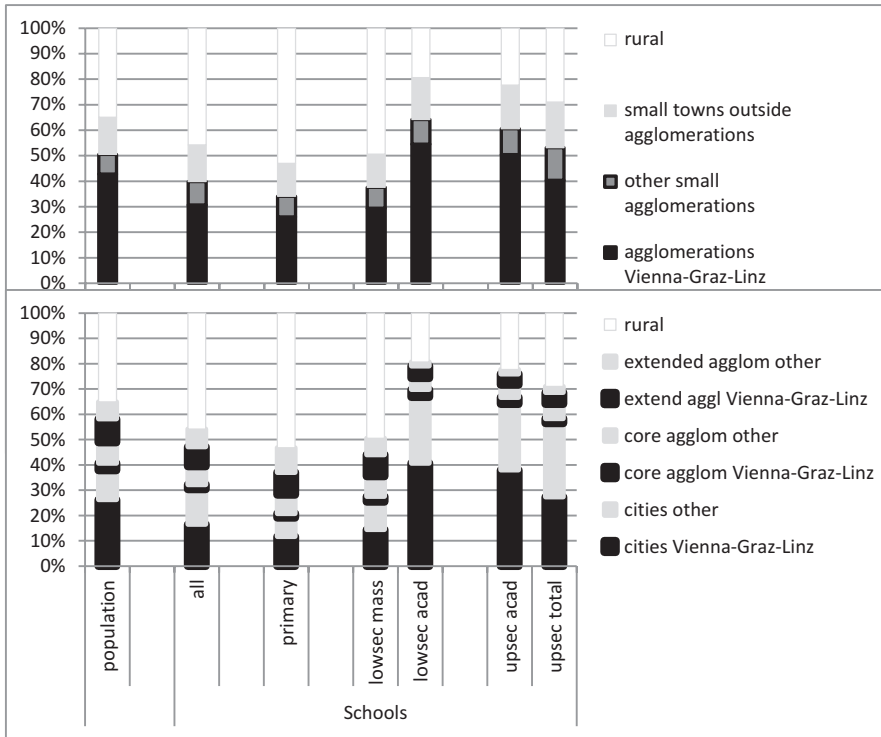

Fig. 67.4 Distribution-concentration of schools by regional typologies (Source: authors own figure based on own analysis of Austria Statistics data)

in small agglomerations, pointing to some discontinuities with urbanisation. This polarisation is reflected in the distribution of schools, with the majority of compulsory schools being situated in rural regions or small towns, and the majority of academic schools in the agglomerations (half of total in the three large ones of Vienna, Graz and Linz); the vocational schools are more evenly distributed according to the population.

The distinction of the degree of urbanisation in the different kinds of agglomerations shows the high concentration of academic and upper secondary schools to the different kinds of cities. Less than 40% of the population lives in cities, but more than half up to two thirds of these types of schools are situated in cities (with almost 40% of academic school in the cities of Vienna, Graz and Linz); the regions of hidden urbanisation host clearly a lower proportion of academic and upper secondary schools, but a similar proportion of primary and lower secondary mass schools, compared to their share of the population. The regional polarisation is particular striking at the lower secondary level, where half of the mass schools are situated in rural regions, and the highest proportion of academic schools is situated in cities alone.

The next two sections relate this uneven and polarised distribution of schools to the specific governance structure and to the historical political fights and conflicts about public education, which can explain to some degree the high focus on rural education and the neglect of the problems of urban education.

67.3 Historical Legacies of the Political Conflict Related to the Educational Structure

Within policy making in Austrian education the conflict about the segregated structure in the 10–14 cycle of lower secondary compulsory education is a kind of structuring ‘leitmotif’, that orders the discourses as well as the actors along the comprehensive-segregated division, and has its repercussions to many other key political issues, from early education to the organisation of access to higher education. This issue is politically structured in a certain way, as the decisions in Austrian parliament about issues of school structure require a qualified constitutional (two-third) majority. In the past this meant that the two ‘big’ political parties, Social democrats (SPÖ) and Christian-conservative democrats (*ÖVP-Österreichische Volkspartei*), must have found a compromise; in the meantime the party spectre has diversified towards four to five parties, however, the comprehensive-segregated division has remained intact with the green party joining the Social democrats, and the right-wing Freedom party joining the Christian-conservatives.

However, the polarisation does not only concern the blocked political decision structure, but is also tightly related to the overall constitution of the Austrian federal state. At this point the historical legacies must be taken into consideration in multiple ways. In a longer historical perspective, public education was linked to the liberal-republican vs. the catholic-absolutist division, with the basic structures of education being grounded first in the highly bureaucratic absolutist state (competing with the church, after the victory of the counter-reformation), second in the plans devised around and after the defeated 1848 revolution, and third in the short liberal period of the 1860s around the capitalist expansion, when Habsburg-Austria was a big player, and Vienna became one of the biggest metropolises of the world. However, after the crises of the 1870s the Liberals were sustainably defeated by the construction of (one of) the first modern right wing political mass parties that gradually united the catholic-conservative rural (peasant) masses and the urban petit bourgeoisie on a reactionary anti-industrial, anti-market, and above all, Anti-Semitic basis (Boyer 2010). This movement was started in Vienna, and increasingly had to compete with the parallel upcoming Socialist movement that successfully tried to organise the proletarian masses. In the beginning of the twentieth century, when Vienna was a world metropole, the political climate was strongly driven by the fights between these two parties.

When the Habsburg monarchy broke apart after World War 1 the main players of the small remaining German speaking part could not believe in the viability of this

unit and wanted to join Germany, which was forbidden by the peace treaties. Thus a new 'state, wanted by nobody' (Andics 1962) had to be constructed for 'the rest' of the big empire, and this process emerged in a dualist way, with two parallel histories and two competing camps among the political players, the 'centralists' and the 'federalists'⁸: one history is the foundation based on a constitution devised by Hans Kelsen in a predominantly centralist spirit and decided by the Austrian Parliament in 1920; another competing history is that the (pre-existing) regional units (*Länder*) have founded the new republic by their formal declaration to the parliament to join the new republic in 1918. A complex and contradictory federalist system was built in the new small state, which has had – different from Switzerland – a tradition of a unitary state since centuries, however, always accompanied by battles between the *Länder* interests and the centralist monarchy. Conflicts about the distribution of competences between the central and the regional levels were a core issue from the beginning, and education was always, and is still situated amidst these conflicts, with strong consequences for governance and policy making in education (the distribution of responsibilities for education have been left open in the Austrian constitution of 1920, until a very complex solution was amended in 1962 that has built a structure of mixed responsibilities between the central and the regional levels, and in fact blocked reform decisions by demanding a two-third majority in parliament).

The battleground between federalists and centralists was changed in a fundamental way by an institutional transformation of the urban metropole of Vienna from a city within the surrounding Lower Austria into one of the Austrian federal states in 1921. This preserved the conservative majority in agrarian Lower Austria, and gave the leading Social Democrats the opportunity to continue the reforms started by the central coalition government after its breakdown in 1920 – by this move they also received a big stake in favour of federalism, against their basic preference of the unitarian state, and consequently made the issues more complex. 'Red Vienna' became a laboratory of reforms in a conservative, crisis-driven environment, shaken by heavy political fights between the left and the right. One reform issue was the educational structure. The Social Democrats with Otto Glöckel as a leading figure proposed to develop a comprehensive school at the lower secondary level and had opened a reform department for systematic experimentation at the level of the education ministry and started trials at the school level.

This structure was shifted to the level of Vienna, when the political protagonists had to leave the central Austrian government, and the school reform became one of the main issues of contest between the main political movements. The Christian Party leading the central government was strongly related to the rural interests and defended the traditional segregated structure of education, whereas the Social Democrats were somehow 'insulated' in the exceptional environment of metropoli-

⁸As some other concepts the understanding of a 'federalist' is different in Austria (and more generally in German language) from the US and maybe the English understanding, denoting not the central level (of the federation), but rather the decentral lower level of the regional units, and the proponents of their interests and positioning.

tan Vienna, with all its social and economic problems and its (too) big size for the small country. In 1927 a compromise concerning the structure of the lower secondary level has been decided which, however, could not be implemented, because of the regime-shift to the Austro-fascist regime in 1934. The Social Democratic streaming-model (called *Hauptschule*) of a comprehensive school differentiated by a higher and a lower achievement track (A and B; track A should be equivalent to the academic school) was foreseen as one of three institutional tracks: a rural upper cycle of primary schools, the new model, and the academic school.

On the background of the political cleavages between the oppositional parties, and the central-federal divide the reform of urban education turned into the 'Viennese reform' and the problems of urban education turned into the problems of 'Viennese education'. During the German Nazi-regime the issues of the regional position of Vienna were aggravated by a big administrative extension of the metropolitan agglomeration around Vienna through the incorporation of about 100 surrounding communes into the city area – this shift was immediately reversed after the liberation in 1945, however, it took years to re-implement the previous structure, and one should not wonder that this issue has become a kind of taboo subsequently.

After World War 2 until the end of the 1950s a main topic of education policy was – besides the reconstruction of the institutional framework – the preservation of the traditional structure of rural education, the upper cycle of primary school (*Volksschul-Oberstufe*), which very often combined different grades in a class. This conservative strategy was embedded in a broader concept of preservation of the closed agrarian rural culture and environment against industrialisation, and tried to undermine the alternative strategy of implementing the two-track common school from 1927, which had been already established as the legal norm in 1945.

In the end of the 1950s full implementation of the tracked model of *Hauptschule* in parallel to the academic track was decided, and realised during the 1960s. The main change has been to spread this tracked type from the urban to the rural regions, and to abolish the upper cycle of the primary school. In parallel the academic school was also to some degree regionally extended to smaller towns. Subsequently the proposal of a full comprehensive school has always remained in place as a kind of more or less excluded 'discursive ghost', and time and again it also rose up to respectability on the political agenda (in the late 1960s and early 1970s, and again since the mid-2000s). The solution has always been to reform the mass track and to preserve the academic track, leading to the current structure shown in the previous section. In the 1980s the two-track streaming model has been changed to a three-level setting differentiation by achievement groups, and currently the achievement groups should be transformed to individualised differentiation within class, using team-teaching as a main device.

In the long term two overlapping developments can be observed, first the spread of the traditional urban structure towards the less urbanised regions by abolishing the traditional rural structure; secondly the traditional urban structure changed in parallel by the increase of participation in the academic track, which paradoxically marginalised the school type that was extended to the whole of the country. Because the attention was laid mainly on the rural regions, the urban structure served as a

norm, and the problems of urban education were more or less neglected; at the same time the influence of the social background variables on achievement and education careers was completely missing in education statistics.

Until the international large scale assessments the results of education were not observed regularly in a transparent way, and politics concentrated on the input dimension of (additional) financing, and in particular during the 1970s on providing additional teachers.

First the full participation in the 1995 TIMSS (*Third International Mathematics and Science Study*; see <https://www.bifie.at/node/106>), and later the PISA (*Programme for International Student Assessment*) results have identified quite severe achievement gaps and 'problem groups'. However, on the background of the polarised political discourse, these results were rather scandalised by attributions of blame to competing actors, instead of looking more deeply for pragmatic solutions.

Putting these arguments together, the overall pattern of the political discourse about the problems and solutions in education has driven the attention away from urban education. The focus has been laid on a more even distribution of facilities towards more rural regions taking a previous urban structure as a norm. The polarising topic of federalism-centralism, and a more expensive rural framework of education, reinforces the competition between these different regional aggregates, and because of the *Länder* as core players in the federalist structure the urban regions are on the one hand hidden behind the averages of the majority of the *Länder*, and are in the case of Vienna highlighted as an exceptional situation of a special metropolitan area (whereas in fact the agglomerations of Graz and Linz are also quite large but not perceived as such, and have no real advocates).

In the contested complex centralist-federalist structure the political discourses about education are mainly situated at the federal level, and follow a historical legacy of a one-size-fits-all approach of an 'average'-guided systems reform. In the logic of this discourse the urban status of Vienna, as a minority of one among nine federal units, appears as exceptional and 'problematic', measured not against the standards of urban education (which do not exist in the national discourse, because units of comparison are missing) but in a reversed manner against the more rural conditions. Consequently, the issues of urban education are not tackled as serious issues to be resolved, but '*repressed*' in the old Freudian manner behind an average overall structure; this means in particular, that the specific conditions in the urban regions are not even sufficiently visible.

67.4 Political (In)capacities to Cope with the Urban-Rural Polarity

As indicated in the previous section the regional structure is heavily politicised because of a complex federal structure in which Vienna is a contested federal unit because of its definite urban structure different from the other units, and – more

importantly – because of a long tradition of political struggles, in particular related to education. These struggles revive along rural-urban and political right-left lines, and are complicated by a regional border that divides the overall Vienna metropolitan region into the state of Vienna as the urban core and its surrounding areas that are part of the surrounding state of Lower Austria. Vienna has a long social democratic tradition, and has been the centre of a social democratic attempt towards school reforms after World War 1 which still somehow casts a cloud over the enduring struggles in education policy, with the segregated structure from age 10 vs. the ideal of a comprehensive school at least until age 14 at its core.

The previous analysis of the regional structures has shown different degrees of urbanisation in the primary and lower secondary levels of compulsory schools on the one hand and the academic and upper secondary level schools on the other. These two different categories are governed and financed in different ways by different authorities: the academic and upper secondary schools are under the formal responsibility and financing of the central government; and the compulsory schools are under a mixed structure of responsibilities, with the regional authorities implementing the (gross) central regulations. In the latter area the federal government has to finance the teachers, however, the regional authorities allocate the money and get it refunded within very loose rules (some average indications based on the number of pupils, and very few requirements concerning the invoice; only recently some monitoring information is also required). This governance structure would require a highly cooperative actors' constellation which, however, is not realised as argued in the previous section. On the contrary, the schools are a main object in the double polarised conflictual structure of power games between the central and the regional authorities (the centralist-federalist conflict) that in addition are led by different political affiliations, and of the related political preferences about the school structure (the comprehensive-segregation conflict). Two basic traits are of substantial influence in this structure: first, the Austrian federalism is mainly a distributional machine, as the *Länder* mainly spend money they receive via transfers from the central level (the central authorities have to transfer grossly half of their education budget to the *Länder*, without having control or even information about the specific use of this money); second, behind the mixed allocation of responsibilities lies a highly bureaucratic central administration, which cannot reach the level of schools because the authority structure is 'broken' by the federalist interventions. From several reasons can be predicted that this structure cannot work reasonably.

Two examples can illustrate the logic of this governance system. The evaluation of one of the biggest recent federal reform initiatives, the reform of the differentiation structure of the lower secondary school from achievement groups towards individualised instruction in heterogeneous classes through team teaching ('*Neue Mittelschule*') was fully implemented only in about one of five cases (Eder et al. 2015). Several analyses of the allocation of resources rather find indications of a maximization of resources by the *Länder* than of a reasonable allocation of them. The allocation of resources to the primary schools in the recent decades have led to a substantial increase of resources per pupil in the *Länder* with a demographic decline, whereas there was no increase in Vienna, the only region which would have

afforded more resources because it did not experience a decline (Lassnigg 2016; Bruneforth et al. *forthcoming*).

Interestingly, despite this apparent divergence between the demand for resources and the allocation of resources among the *Länder*, which is documented already since some time in different versions, and can be demonstrated by several observations (e.g., the *Austrian National Education Reports* from 2009 to 2012, Specht 2009a, b; Bruneforth and Lassnigg 2012; Herzog-Punzenberger 2012; Lassnigg 2015), virtually no requests for a redistribution of resources can be found in the public debate. This can be possibly explained by a lack of awareness and comparative information about the distribution of resources. The system drives each regional unit to look inwardly to the own resources, which are allocated periodically by a political process of financial transfers ('*Finanzausgleich*'). Another possible explanation could lie in an endemically unstable architecture of the negotiated transfers, and a kind of underlying agreement among the actors not to question the distribution, because otherwise the architecture could break down. Education is only one part of the complex overall framework of transfers, so even substantial drawbacks in this area could be compensated by advantages in other areas.

At the level of political competition the endemic repression of the disadvantages and problems of urban education and its marginalisation as a system and policy failure rather creates an inclination for politicians to present the achievements in their own domain positively, instead of pointing to the problems and demands, and demonstrating them thoroughly. The coincidence of the largest urban agglomeration being also a unit in the federalist system might thus be a factor in support of the neglect and repression of its problems. And, furthermore, if Vienna as the most pronounced metropolitan agglomeration is hiding its disadvantages, then the other smaller agglomerations will be inclined to do the same. As the agglomerations are part of the wider region, they hide automatically themselves, if they not specifically observed.

67.5 (Im)migration as a Specific Topic Concerning Urban Education

The 'reversed' political agenda means that the focus is laid more on the rural conditions, comprising a wide network of small schools, and an uneven distribution of the upper level schools between rural and urban regions. Consequently the opportunities of educational progression of individuals are also distributed in an uneven manner. Within this basic structure the Austrian education system has in particular not been very able to cope with the phenomenon of immigration that concerns rather the urban communities. As the migrants were for quite a long time considered as temporary so called 'guest workers', the phenomenon by itself also was more or less 'repressed' as an issue, so that no sufficient conditions for the education of the immigrant offspring were build up.

At the time of writing (March 2016), with the increase of the number of refugees, migration might have reached a new dimension, and the past experience might not provide a valid picture of how to cope productively with this issue. In Austria, as in many other Western countries, the declining and ageing 'native' population is setting demands for a substantial amount of immigration, in order to hold the population even stable. This has been demonstrated already for quite a long time. However, much time has been missed to develop the necessary practices to educate the increasingly diverse student population in a sufficiently productive manner. The dimension of the diversity has not been observed sufficiently because only a foreign nationality was used as an indicator, and the distinction of the generations of immigrants has not been made. Then the observation has been improved by taking the spoken language as an indicator at the national level and at the regional level of the Länder, increasingly realising that a substantial part of pupils in Vienna are speaking a foreign language. However, the proportions in agglomerations outside Vienna were not known for some time – so there was a stepwise acknowledgement of a basic demand for developing new practices.

Currently the proportion of pupils speaking foreign languages (mainly Turkish 7%, and former-Yugoslavian 7%, other 12%) at primary school is distributed across the Austrian Länder around an average of almost 30%, in a range between above 10% and almost 60%; in rural regions the proportion is around 10%, and in the densely populated regions it is on average 50% in a range between above 20% and almost 60%. Across school types the proportion ranges most between above 10% and below 30%, with a higher proportion particularly in business related medium level vocational schools (above 50%). The proportion of pupils speaking foreign languages is concentrated to 20% in classes with more than half of all children, and to around 50% in such classes among the immigrants only. The proportion of pupils that do not reach the standards is more than double compared to the native pupils, and higher at the 8th grade (standards not reached Math. 4th grade 24% : 9%; Math 8th grade 35% : 13%).

Since the 1980s the shift from the earlier paradigm of temporary labour migration towards permanent immigration has become an increasingly contested terrain at the political level. Whereas the longer term demographic gaps are to some degree accepted as an issue, there have been also periodical economic estimates that show in the short term negative impulses from immigration on the labour market towards increasing effects on unemployment. The trade unions have therefore taken a critical stance, which was reinforced first by conflicts with the employers' organisations about dumping in terms wages and labour conditions and second by the stepwise opening up of the labour market in the process of European integration after the accession to the European Union (EU) in 1995. In the European integration process the opening of the Eastern European countries after 1989 and their subsequent accession to the EU have been a source of fears about the impact on the labour market. A stepwise delayed liberalisation of the labour market was therefore negotiated with the EU in order to agree to the Eastern enlargement. During the violent break-

up of Yugoslavia many refugees have also been taken, as this region – together with Turkey – has always been the main origin of immigration to Austria.

Besides this basic critical background to immigration the strategies of how politics and society should cope with immigration has also been always a contested terrain, oscillating between a strong assimilation programme vs. multiculturalist stances of mutual adaptations between the immigrants' cultures and the native population. In school and education politics these conflicting programmes have materialised – and still do so – primarily in the field of language policies: how strongly should the immigrant children be forced to quickly learn German as the dominating language of instruction vs. how much room should the native language(s) of the immigrants, and related to this their cultures, have in school, and how much should they change in turn towards multiculturalism. Another main topic in education concerns the issue of how much immigrant children were transferred to special schools, which still exist to some degree despite an overall integrative strategy since the 1980s (overall, about 40 % of children with special needs are segregated in special schools, the slight majority is integrated in mainstream education). Children speaking non-native languages are still transferred to special schools or the special need programmes at a rate that is 50 % above the rate among German speaking children (5.5 % vs. 3.6 % on Austrian average, the overall proportion in special education programmes ranging between 3.7 % and 8.4 % in the different *Länder*). This transfer increases during the compulsory school careers from about 3 % in the beginning (grade 1) to around 7 % at grades 6–8 (vs. 2–4 % among the German speaking children). In the sector of apprenticeship which is an important part of vocational education, where the access to training and education is controlled by the training enterprises, a below average representation of migrant youth has been deliberately acknowledged by the social partners as a political issue to be tackled in 2011 (Beirat für Wirtschafts- und Sozialfragen 2011).

At the expert level much development work towards a cultural opening up has been brought forward, being reflected in the preparation of the Austrian National Education report 2012, where the issues related to immigration were an overall leading device, and should be tackled in each of the topical chapters. A specific chapter (Herzog-Punzenberger and Schnell 2012) reviewed and analysed the issues around multilingualism, trying to give a strong message towards an emphasis on the strengths of multilingualism, instead of seeing diverse languages and cultures mainly as 'a problem'.

According to Herzog-Punzenberger and Schnell (2012, 239–40) four types of measures were basically designed for supporting children with non-native languages since the early 1990s:

- Learning German as a second language
- Learning the primary non-German language
- Integrated instruction in mainstream classes by a status of 'extraordinary pupils (*außerordentliche SchülerInnen*)' until they have acquired sufficient competences for ordinary instruction
- Intercultural learning.

However, the provision of these measures had not any binding status, and was not very much monitored and followed up. It was not before 2008 that a department of diversity and language policies was created in the ministry of education, in order to develop more comprehensive policies for the support of diversity. In parallel a secretary of state for integration politics was established in the ministry of the interior that proposed a broader array of policies in an action plan for integration in 2012, using the analyses and recommendations of an OECD-country examination about migration and education (Nusche et al. 2009). Five types of measures were proposed:

- Support of language learning in German and the native language, starting in preschool education and followed up in school, and supported by the development of instruction material as well as mentoring and counseling activities
- Professionalization of the teaching, administrative, and supervising personnel in preschool and school education by several institutional entities and frameworks
- Support and competence development of the migrant parents
- Development and intensification of the dialogue with the communities of migrants
- Public relations in support of these kinds of policies.

Still the strategies and the degree of implementation of this programme remained questionable, and an almost complete lack of evaluation of measures and policies in this field was observed by the authors. In the political discourse some tensions emerged between the more diversity oriented approach in the education sphere and the more administrative and adaptation oriented approach in the ministry of the interior, which belonged to the different political camps.

Politics took mainly up the issue of German language learning in preschool education, by providing a free and compulsory year of Kindergarten before the start of the school careers. As the local and regional authorities are responsible for the preschool area, the central authorities cannot directly intervene in this field in the Austrian federalist framework. As Kindergarten is not free in Austria, an agreement between the central government and the Länder was negotiated that allocated money from the central budget for this purpose which had to be matched by money from the Länder, in order to provide the necessary places in Kindergarten. After a first step, the proposal was made to extend this programme to a second free and compulsory year of Kindergarten. However, here political conflicts emerged and the duty to enroll in Kindergarten for this second year was reduced to those who need additional learning. These policies meet several problems, as the preschool areas is a very diverse field in Austria because of the distributed responsibilities, with a high degree of variation in the institutional provisions (e.g., opening times, spatial accessibility in rural regions, budgeting and monitoring practices). The high priority of the measures needed quick reaction by the various stakeholders, and several difficulties have arisen, a main one being the challenge of quickly setting up the necessary infrastructure. In the Länder it was not always possible to use the resources

allocated on the one hand, and in the Vienna region 'cultural clashes' have emerged, as it is not clear to which degree providers with more or less fundamentalist orientations were supported by the quick extension of facilities. This issue came up recently on the background of the increase of a take-up of refugees.

Because of its size and the high visibility as a federal unit the attention on the migration issues is strongly oriented towards Vienna, whereas the other agglomerations with similar proportions of migrants are not so much visible. The political climate adds to this, as the right-wing freedom party that focuses its strategy towards the 'migration problem' is competing mainly with the Social Democrats for the electorate. Thus in terms of politics the Viennese government must find itself in a catch-22 position: if it provides politics offensively for solutions of problems in support of migrant communities it is under attack because of supporting 'them' instead of 'us', if – on the contrary – it leaves the politics in this area in the silent, it is attacked because of 'not doing anything' about the problems.

In sum, it must be said that it took a very long time until the slowly emerging issue of migration was considered as a 'political object' that needs to be deliberately tackled with some priority. At the point when it really came up on the agenda and the search for solutions intensified more seriously, its weight has become too heavy to let much room for experimentation and a wider search for solutions – the current (and maybe also future) wave of refugees to Europe has once more overtaken the already strained situation, creating a new situation at least in the short run. The factors contributing to the repression of the problems of urban education worked out in the previous sections, as they are the hidden agglomeration process, the historical legacies concerning federalism, the political polarization around the lower secondary schools, and the complex and contradictory governance structures, have contributed to these delays in the political and the practical sphere.

67.6 Concluding Remarks and Some Questions for Further Attention

The exploration of the Austrian case has shown a special constellation of urban education as a repressed phenomenon in the Freudian sense, combined with a reversed political agenda of support of the rural regions. Historical legacies of polarized political conflict positions about the contested shape of the federalist state, and about the structure of lower secondary education have contributed to the emergence of this constellation. A main factor is the contradictory interplay of the institutional structures of the state and the education system with the positioning of the political actors (parties and interest organisations). On the background of a divided regional structure with Vienna as a large metropolitan agglomeration and some other urbanized agglomerations on the one hand, and several small towns and a more rural countryside on the other, Vienna has an outstanding position of one of nine federal

states, giving the still leading Social Democrats a stake in the federalist structure that points against their basically centralist orientation. The problems of urban education are downplayed in this constellation, as the Viennese politicians must show success rather than problems, and the other more hidden agglomerations lose a vanguard that would openly and deliberately struggle for solutions. In fact many indications point to a tendency that in the federalist constellation of the distribution of resources Vienna does not get a share according to the needs, but rather a share according to a political *fait accompli* as a result of complex negotiations.

In the longer term an interesting process of structural change is observed since World War 2, as the original urban structure with the mass lower secondary school as the predominant institution was spread to the rural regions, whereas in parallel the structure within the urban agglomerations changed towards a predominance of the academic school and a marginalization of the mass track. The academic schools are heavily concentrated in the city areas, compromising the opportunities in less urbanized regions.

The disadvantages and problems of urban education which do not have strong advocates in the given structure seem to be matched with lower resources, and this constellation might arise out of a misunderstanding of 'economies of scale': the indicators show much larger schools in the urban agglomerations, and at the same time higher numbers of pupils per class. This holds for all types of schools, also for the mass lower secondary school, which is privileged by several better background factors in the rural regions, and marginalized in the urban agglomerations. This relationship between school size and resources per pupil might deserve more attention, looking at non-linearity. A well-known stylized fact is that larger schools provide better results; another more contested stylized fact is that resources are not clearly related to results. If we take into account the two, in fact different types of the mass lower secondary school conflated in one type in Austria, we see the potentially misleading results which might come out from superficial comparisons between such types – the academic school must also be heterogeneous, if the complementary type is. The urban-rural distinction might serve as an explanatory device in this sense.

A final question concerns the issues of the hidden agglomeration processes, displayed by the simple observations of the population dynamics. How much do their internal structures lead to the problems of more densely urbanized regions, or do they rather preserve the traits of the small towns they previously were? How much can the research about Suburbia illuminate these structures? At least for Austria this would be important issues for further reasoning and analysis. And a final question concerns the role of the institutional demarcations (e.g., the coincidence of state and city borders, and at the same time the intersection of cohesive agglomerations by administrative and institutional borders) in relation to the dynamic of urbanization.

Chapter 68

Growing Up in Europe's Backyard: Researching on Education and Youth in Portuguese Poor Suburban Settings

Sofia Marques da Silva and Pedro Abrantes

68.1 Young People in the Portuguese Suburban Outcasts: An Overview

Portugal was mostly a rural, illiterate and traditional country, until the 1960s. In just four decades, the population working in agriculture declined from more than 50 % to less than 5 % (Machado and Costa 2000). The upsurge of many jobs in the industry and services, near the coast, generated a huge exodus from the misery living conditions in the fields, complemented by the arrival of many immigrants, especially from African former colonies and more recently from Brazil and Eastern Europe as well. Nowadays, 40 % of the population lives in Lisbon and Porto metropolitan areas, and services became the main occupational sector (Instituto Nacional de Estatística 2011), although most of these jobs are temporary, low paid and not highly qualified, especially in the building sector (men) and in the cleaning and selling sectors (women) (Pinto and Queirós 2010). So, the transition to modernity and democracy was not in contradiction with the persistency of high levels of social inequality and severe poverty (Martins et al. 2009).

Lisbon and Porto city centres turn into cultural and economic nodes, attracting many international companies, events and tourists, towards a concept of “global city” (Sassen 1998), while their living population has actually decreased, due to the rise of housing prices. Meanwhile, their suburbs have flourished, from the 1970s on, with small villages now linked to the city centre through highways and railways,

P. Abrantes
Universidade Aberta and Instituto Universitario de Lisboa, Lisbon, Portugal

turning to be very crowded towns in few years, often with very low planning structures.

A recent research on the biographies of working class' members living in the Lisbon suburbs (Abrantes 2013) allows us to understand how hard (and unstable) working lives and this double exclusion process – from the countryside and from the city centre – was compensated by a sense of belonging based on a long-run investment on private property, specially an apartment and a car, as well as an expectation of paving the stage to improve the educational and living opportunities of their offspring. During their lifetime, many of these workers have worked in agriculture, industry and service (sometimes at the same time) have gone through periods of unemployment, and informal work (with no rights). Unpaid salaries, harmful activities and other labour abuses were very common. Their wage was often close to the minimum national wage (currently, around 540 euros), and considering the increase of the living cost, this value in real terms was not improved since its establishment, in the 1970s.

On the one hand, an alliance between banks, powerful building companies and local authorities enabled many citizens to afford to buy houses in the suburbs. Small apartments in tall and poor buildings were available even for those with low salaries, through long-term loans. On the other hand, reproducing traditional practices, networks and knowledge, many people built their own houses, from good houses with gardens up to very humble tents in slums. From the 1990s on, these ghettos were gradually replaced by social housing headquarters, solving some of the infra-structural problems, but not the social and economic ones (Arbacci and Malheiros 2010).

Besides, in a few years the suburbs of those two cities became also quite multicultural, especially in comparison with the rest of the country. The growing immigrant populations, especially from Africa, were concentrated in some areas of the Lisbon periphery. According to official data, around 52% of the foreigners living in Portugal inhabits the Lisbon metropolitan area (9% in the city centre, and the others in the suburbs), and this rate goes up to 80%, in the case of African citizens (Oliveira and Gomes 2014). According to the same report, 52% of the African foreigners lives in an overcrowded accommodation, in contrast with 16% of the Portuguese. Formerly nomad, the Gipsy communities were also pushed to these areas, where poor populations were segregated, living in precarious conditions and suffering pervasive stigmas. So, as noted by Wacquant (2008), in many cities across the world, the advance of capitalism has generated an urban polarization, leading to the rise of exclusion, violence and repression patterns, in some headquarters where deprived populations are concentrated. This was especially the case in the cities where the expansion was faster and occurred more recently.

For the young generation growing up in these districts, massive educational failure, as well as problems of employment and social integration, was acknowledged from the 1990s. As shown by José Machado Pais (2003), most young people in Portugal remained supported by their parents for many years, enjoying a “semi-dependence status” and the rise of consumption patterns, but also suffering a “defuturization”, both through the “utopization” (dreamed future) or the “atopization” (absence of future). If this was not the case of those with long and successful school-

ing pathways, mainly from privileged backgrounds (Guerreiro and Abrantes 2004), this was actually the case of many young people in the suburban areas. Mobility and social changes have weakened family structures and especially their ability to socialize young people. Traditional work socialization, embedded in family practices, particularly in agriculture, fishery and small business, is no longer available, while the formal path to employment, through long and successful educational careers, is not accomplished by most young people from the suburbs.

An ethnographic research in a youth centre located in a suburban area in the north of Portugal (Silva 2011) explored and discussed how structural inequalities were integrated in young people habitus and how they managed to organise their life pathways navigating those inequalities in a way that allowed them not to lose their face and dignity. Being some of them the third generation without any socialization for labour, as their parents and grand parents received the state minimum income, we encounter young people with fragile connection to what it means to have a job, a salary and, consequently, a weak connection to a school based on work values.

The economic crisis and the austerity policies, from 2010 on, make this situation worst, due to the erosion (and polarisation) of both employment opportunities and welfare structures. Actually, from 2001 to 2014, the unemployment rate has increased from 3 to 15 %, and it went up to 35 % among the young people (Carmo et al. 2014), while taxes and prices, including in basic services as transports, education and health, were dramatically increased. Besides, even among the employed youth, temporary jobs became the common situation. Although early school leaving rate has declined during the last decades, particularly due to the extension of compulsory education, the expansion of vocational training and the crisis of youth employment, it is still 27 % (32 % among the male population) for the whole country (Justino et al. 2014). Therefore, the conditions for the transition to adult life, especially through work, residential move and parenthood were blocked for many young people, and the cohort of those who are neither studying nor working has actually increased. According to Carmo and Nunes (2013: pp. 385), “among social agents who are partially lacking in resources, low economic resources and school attainment walk hand in hand with low social trust and low participation in social activities”. The progress expected for these generation and their life prospects have suddenly collapsed.

In face of this depressive scenario, many of these youngsters migrated during the last years, especially to Central Europe, but also to other regions of the world. Official statistics pointed out that around 100,000 citizens were leaving the country, each year, and most of them are young. Besides, as a recent project underlies (Lopes 2014), in contrast with the immigration observed in the 1960s, that was mostly composed by low qualified young men, the current wave has a similar dimension but it is mixed, in terms of gender and educational levels.

One shall wonder if the lack of opportunities affecting young people from the suburbs is actually different from that young people are suffering in other regions of the country, especially in rural areas or in poor neighbourhoods of the inner urban centres. However, while an aging population now characterizes the later ones, the suburbs concentrate a large sector of current youth, especially those from ethnic

minority backgrounds. Besides, some situations of violence disseminated by the media have reinforced the stigmas of young people from these areas, generating moral fears in the mainstream society and reducing their work and life chances.

A recent research on the schooling careers of the young people from African backgrounds in Portugal (Roldão 2015) has shown a huge concentration in the so called “exclusion pathways”, including year retentions and low grades, during the primary and low secondary education, in contrast with the Portuguese students. This is especially the case of the natives and descendants (second generation) from Cape Verde (the second biggest immigrant community after Brasil), Guinea-Bissau and São Tome e Príncipe. And although the social class background is the most significant factor for educational inequalities, school failure is considerably higher among students from African backgrounds, in comparison with Portuguese ones living in similar social conditions.

This study has also shown that students from African background are increasingly over-represented in vocational training paths, while the autochthonous population is mostly attending the general courses of upper secondary education. For instance, the proportion of African students in vocational paths is 22% in lower secondary and 78% in upper secondary, while these rates are 7% and 43% among the Portuguese students. Even among each of these paths there are inequalities: comparing with the average, African students are concentrated in devaluated study areas (Humanities in general courses, and technical courses within the vocational ones) and considerably excluded from sciences, technologies and arts. Besides, it was also observed a cluster of secondary schools, located in the Lisbon metropolitan area, where the schooling failure rates are much higher than the national average.

68.2 Field Work with Students in Suburban Schools

Qualitative studies on how young people in poor contexts experience the schooling process are a central topic in Portuguese Sociology of Education, from the 1980s. The work of Benavente et al. (1987) in a school of Lisbon inner centre or the project of Stoer and Araújo (2000) on the relation between education and work in a rural community of the North of the country are two main landmarks for the following generation of researchers in this field. Although there are some theoretical differences, both studies stress the pervasive tensions, gaps and misunderstandings between schools and poor communities.

In a context of political democratization, economic growth and massive implementation of public schools all over the country, during the 1970s and the 1980s, the high rates of academic failure and early school leaving were neglected by the media and the public debates. In contrast, the above mentioned studies have shown an enduring gap between school and local cultures, as well as an increasing mismatch concerning youth expectations, interests and practices. As noted by Stoer (1986), after a short revolutionary stage where there were many projects to democratize

schools, the new elites, supported by powerful international institutions (as the World Bank), imposed a bureaucratic, centralist and authoritative framework to rule schools, recovering many structures of the dictatorship and neglecting local cultures, as a leverage for modernization and integration in the capitalist world.

The above mentioned rise and concentration of poor and diverse populations in the suburbs generated an increasing interest of educational researchers, during the last 15 years. An ethnographic research in the Lisbon periphery has characterized a main disposition of "distant participation" in the local secondary school (Abrantes 2003). Rather than a systematic resistance and opposition to school culture, most young people were trying to seize the day, deeply immersed in their sociability networks, being involved in some school activities, but resisting to others. The relations between teachers and students were described as strong and emotionally charged, while the school failure and the misbehaviour in some classes was mainly interpreted as consequences of some teachers' or students' character (or inability), rather than a class (or cultural) struggle. Besides, this study underlies the diversity of students' relation with school, including those who were studying, but whose "real life" was outside school, as well as those who were supported by teachers, oriented by a sense of distinction based on their high grades and a project of social mobility through higher education.

At the same time, the ethnographic work of Maria José Casa-Nova (2004) with a Gipsy community has revealed the huge mismatch between school rules, requirements and expectations, on the one hand, and Gipsy institutions, practices and conceptions. The irregular participation, low involvement and early dropout of Gipsy students are interpreted by school agents as a consequence of irresponsibility, ignorance and lack of rules, while in the Gipsy community is conceived in terms of its commitment to one's own family and culture. This is especially the case for girls, since they are expected to marry and to be mothers when they are teenagers. Although a diversity of cases is also apparent, a main (tacit) agreement prevails between young people, families and teachers, leading Gipsy youth to an early school leaving which reinforces their long-term social exclusion (Casa-Nova 2004). A more recent research with Ukrainian migrant children (Tereshchenko and Araújo 2011) remarked situations of exclusion in Portuguese schools felt by these children, in spite of feeling emotionally safe and secure. Authors call the attention to the high rates of school drop out among Eastern European children living in Portugal.

Another field research, developed in a marginalized neighbourhood of the Lisbon suburbs mostly populated by African communities, has focused on the indiscipline of students who are considered by educational authorities and the media as "out of control" (Costa 2012). This study has shown that many behaviors labelled as bullying or misbehaviour in the classrooms are actually cultural expressions of the local groups, as well as ways in which students participate in school life, expressing their feelings, perspectives and frustrations, while developing a sense of distinction and belonging.

The author emphasises the misunderstanding between teachers' and students' notions of the classroom interaction. On the one hand, the work with teachers allows us to observe a diversity of conceptions and attitudes towards students' behaviour,

under a generalized notion of the loss of teachers' authority, not just in this school, but in society as a whole. For instance, behaviors as using a cap in class, chewing gum, standing up without permission, making a joke are understood by some teachers as unacceptable in class and students are punished, while others interpret the same behavior as natural or meaningless. On the other hand, the work with students does not confirm such notion of the lack of importance of teachers. According to this study, young people value the empathy and ability of some teachers, playing a key role on the way they think and they act, while they criticize the rigidity and inability of other teachers to reach their expectations: to have fun but also to learn; most of all, to belong and to be understood. For instance, to joke in class is seen as a valuable practice, when teachers and classes are boring or when students are failing in some subject, but the same behaviors are seen as a betrayal in classes with teachers they like. As noted by a 15-old boy, "there are some teachers (...) who help you (...) you think they are cool! So, you won't misbehave with him, he his cool with you, you will be cool with him" Anyway, most students think that indiscipline in classroom is a way to belong to a group and to gain status and power over peers. And a 17-years old boy in a vocational course pointed out, when questioned about why students are often unruly in his group, "they want to have a kind of attention from someone (...) usually, they want to gain respect from colleagues (...) so they fake as they were nervous".

The long-run ethnographic work of Alexandra Leandro (2013), carried out two secondary schools in the poor Southern suburbs of Lisbon, provides also a fruitful contribution to this topic. Many students are from Gipsy or African families, conceived by school authorities as "savages". Focusing a mediation office within one of the schools, her work has explored how the disciplinary concerns, linked with cultural diversity, social inequalities and moral fear, have reinforced the detachment of these schools from their local environments, as well as their daily social control mechanisms. The borders between community and school rules are continuously emphasized. Students daily move around the thin line between physical games, jokes and violence, trying to enlarge their autonomy towards school authorities. Leandro (2013) analyzes the context in which school rules are continuously negotiated and children are socialized, showing how emotional bonds, physical language and moral claims are central features.

One of the many episodes analysed by Leandro (2013) is the following: "I notice that school is oddly silent (...) When I am walking through the playground with a mediator, we notice there is an ambulance inside the school. A girl tells us that Paulo [a student from a vocational group] has broken the foot of one of his colleagues. Other students join us. A girl says: 'Paulo will be beaten'. The mediator tries to calm down her: 'we've talking about this yesterday'. But she is upset: 'Paulo deserved it a long time ago, he mistreats everybody, he abuses'. We found Paulo in the bar. The mediator sits in his table and talk to him for some minutes. Paulo convulsively cries with his head on his harms, over the table. The mediator is close to him, touching in his arm, trying to calm him. Another student arrives, noticing that Paulo's mother and older brother are in the school. Paulo finally stands up.

A recent fieldwork in suburban schools included in a public program against social exclusion, named *Territórios Educativos de Intervenção Prioritária*, has

shown how these schooling landscapes are changing (Abrantes et al. 2013; Abrantes and Quaresma 2013). These schools are often blocked in a circuit of social vulnerability, ethno-cultural diversity, low scores in national exams, high retention rates, negatives stereotypes (usually associating schools with violence) and high staff turnover. Many teachers are assigned to these schools regardless of their own preference or familiarity with such educational contexts and since they are not prepared to work with these specific populations, they quickly develop negative ideas about them and try to move to another school and area as fast as they can. The recent reinforcement of national standards and national exams, based on a standardized and ethnocentric conception of the curriculum, as well as the diffusion of schools' average scores in the national media have strengthened the pressure over (and the depression of) these schools, areas and agents.

Our research in three different suburban basic (primary and lower secondary) schools, covered by this public program, observed some key trends. On the one hand, there is a growing concern with students' achievements and behaviors. In spite of an original principle of supporting local projects, in order to contribute to community development, most resources are now used to hire teachers to reinforce learning activities in the core-subjects, oriented towards a reduction of undisciplined behaviours and an improvement of scores in national exams. Students are seldom heard with regard to these strategies and actually many of them are not motivated by this intensification of learning traditional activities and social control. On the other hand, there is a local conviction (shared by teachers, students and parents) that they won't succeed anyway in national exams. These are "not for them". Surveillance and assistance apparatus were considerably developed, but massive academic failure and pupils' misbehaviour are still conceived and dealt with as personal (and family-based) handicaps. Vocational training is increasingly seen as the only solution for students living in poor suburban areas and who are conceived by school authorities as "naturally" unable and uninterested in sciences or literature, but can be motivated to practical activities oriented towards a fast integration in the labour market.

Still, according to the same research, in some suburban schools this national program was also used to support the development of youth projects, clubs and activities, especially in areas as sports, media and arts. This is the case when principals, teachers and students, supported by some local and national partners, are aware of the importance of these projects on young people's life, as well as on the community development, and they fight together every year to re-fund these activities and to create some new ones.

68.3 Discussing the (Im)possibility of Education Interventions in Poor Contexts

The latest but also old forms of economic and financial crisis led to profound changes in the life course of different generations, becoming more unpredictable, unstable, and causing several social risks and vulnerabilities. This situation, increasing with the economic crisis, has affected predominantly young people, lately from different social economic backgrounds, schooled and familiar with new media and social networks (Estanque 2014), with regard to their expectations, aspirations and pathways toward autonomy and citizenship. In the past four decades and in the Portuguese context, young people have suffered paradoxical processes of raising their expectations and, subsequently, cooling out them latter. Since 1974 Revolution that ended 60 years of a dictatorship, Portugal has been investing in providing education for all addressing the cultural project of guarantying the democracy and the needed stability through school and education (Stoer and Araújo 2000). In this study, carried out in a secondary education school, the authors analyse the Portuguese semiperipheral economic situation discussed through the vital role of school and its simultaneous crisis. The investment of Portuguese families in their children education grew as they expected that school could contribute for more qualified and secure jobs, and social mobility (Silva 2010). A study conducted in Lisbon on youth and transitions to the labour market from Natalia Alves (2008), already pointed the paradox between families' and young people's trust in Higher Education diploma and the decrease of the diploma's guaranty. In the past 20 years the process of lowering expectations started and in the past decade affected most of young people. The concept of *Lost Generation*, mentioned in the *International Labour Organization* reported on global trends of youth unemployment (2012), and inspired the *media*, dominating public discourses and becoming worthy of interest among researchers (Ainley 2011; Allen 2002). Research conducted in Portuguese contexts with young people accounted for the increasing amount of uncertainty in predicting the future and in making transition to adulthood more precarious and less linear (Silva 2011; Alves et al. 2011; Carmo et al. 2014).

Different processes are organised, namely by school contexts, but also by families, local institutions, local programs, etc., in order to deconstruct and reconstruct young people (and families) perception of school experience up to the level in which each individual adopts a satisfactory perception of his or her place in the process. In a qualitative research with girls from a poor suburban region in the North of Portugal, Laura Fonseca (2009), discusses how choices are driven, cooling expectations in order to make those girls to consider those as "pragmatic pathways" (Fonseca 2009: 220). The author considers as a strategy to restore reproduction mechanisms that put in danger equality and social justice. These girls experience their own choices concerning school and future through the perception that they are making a pragmatic choice, perpetuating the social order. Efforts are done to minimize (social, collective, individual) impacts of a structural fragile relationship with school and education because of the existence of limited opportunities. In the end we are upon a

rethorical inclusive educational policy that blames the victim for being excluded and rearranges smooth ways of excluding. An example is the unconditional belief in vocational courses, which is a “way out” solution. An ethnographic study conducted in a youth centre (Silva 2011) accounted for several cases of young people leaving school to start working in precarious jobs or engaging in a vocational course with no future:

I would like to continue in school, though. I would have the 9th grade and could get a better job afterwards. I already apply for McDonald, but I don't know when they call me. I left there my resume. I know a bit of everything: sewing, hairdressing, and waitressing. A bit of everything... (Girl,16).

- Why did you leave school? It was for any special reason?
- Because it is faster. But I will give up this as well. I am going to try another one even faster: only 2 months. I have a teacher that thinks it is better. (Girl, 15)

In an article written in 1952, Erving Goffman, discusses the cooling out processes carried out on individuals. Accordingly to that perspective, the cooling out processes of expectations seek to avoid adverse reactions, which may lead to the collapse of a certain social order. We consider that this concept is still useful to analyse contemporary phenomena, such the one we are discussing in this place.

In fact the process of *cooling* (Goffman 1952), through which much of the educational intervention operates, becomes institutionalised and accepted, legitimated even, by those who are cooled. This work is done in such a way that the phenomena, as the decisions young people within already fragile educational pathways make, are understood as normal and expected. An 18 years old girl from Fonseca's (2009: 76) research clarify her decision in abandon school in 8th grade:

I made a decision. I am not going to spend my mother's money. I had a conversation with her and I told her that I don't want to continue in school. I want to work. I already have a job, in a dry cleaning store. (...) I imagine that my life from now on will be like this: work and then home. It will be home/workplace; workplace/home. But I want to have some fun as well....

The cooling out of expectations is accompanied by a growing distrust in authorities and institutions, challenging society in general and the educational contexts in particular. These contexts have also featured, through their practices and discourses, cooling out processes of different generations of youth, especially those more affected by poverty and exclusion.

Young people are integrating discourses on versatility and individual initiative: people fail, because they are not fast enough, flexible enough. From their discourses we can understand how young people from different social backgrounds are, sometimes uncritically, integrating the idea that they have to adapt in their own identity. They are in a way realigning their own aspirations and expectations, which can be interpreted as strategies of coping and resilience in order not to loose completely the sense of their self. The study from Carmo et al. (2014) with Portuguese workers aged between 18 and 34, refers to the difficulty of young adults to project themselves in the future under such precarious and unpredictable situations: “individuals are faced with the constant need to make life decisions based on an outlook of

change and instability” (Carmo et al. 2014: 342). One interviewee of this study mentions that “anyone who manages to make long-term plans is to be congratulated because nobody knows what’s around the corner” (in Carmo et al. 2014: 350).

However, if conventionally these discourses fall upon those traditional groups often excluded and with poor social, economic and cultural background, these past 4 years of economic stagnation and decline of opportunities changed the landscape of young people affected. The spectrum of excluded increased and affects poor and middle class families, more qualified.

68.4 Reconceptualizing the Outsiders

Life conditions of young people have suffered a process of degradation and several structural problems as unemployment, risk behaviors, early school leaving, drop out, have now other proportions and are located in large social contexts.

In Portugal (Carmo and Nunes 2013) and in western contexts in general (Standing 2011) socially more protected groups against social exclusion are also affected. According to Standing (2011), “to be precariatized is to be subject to pressures and experiences that lead to a precariat existence, of living in the present, without a secure identity or sense of development achieved through work and lifestyle” (2011: 16). The economic crisis, followed by austerity measures turned precariousness in an epidemic situation, affecting different generations, but mainly young people from different social, cultural and educational backgrounds and settings. In Portugal the beginning of 2014 the unemployment rate among young people (15–24) was 42,1% (in 2008 was 16,4%) and the unemployment rate in general was 17,7% (in 2008 was 7,6%). Carmo et al. (2014), in an article on youth and unemployment in Portugal, emphasize that “unemployment rate in Europe is becoming markedly asymmetrical between southern and northern countries” (Carmo et al. 2014: 342). This study was developed through semi-structured interviews with portuguese young people from 18 to 34 experiencing precarious, low skilled and low paid work.

Economic stagnation and the decline of opportunities for young people have impact on levels of social engagement. Low aspirations, lack of goals, or sense of powerless might be feelings that young people, especially from countries more affected by the economic crisis followed by austerity, become acquainted with. This situation, accompanied by a growing disbelief in authorities and institutions, followed by general resentments towards EU institutions (Dessi and Greco 2012) is challenging the society and, in particular, cultural and educational contexts as precariousness experiences will have impact on their values and aspirations (O’Reilly et al. 2015). School, for example, does not seem to be able to deal with changes, and unemployment and under unemployment will have short and long-term effects. O’Reilly and colleagues when analyzing youth unemployment among European Countries during the economic crisis considers, for example, that differentiated educational solutions, like vocational pathways, will have as a consequence socially differentiated itineraries (O’Reilly et al. 2015).

Precariousness is part of our lives and lately is becoming familiar within different social, cultural and generational groups, assuming different layers and shapes. Job expectations and possibilities are very low among young people and their families, especially, from middle class and also from low income families, who expected more from the school promises: “recent graduates, current students or even pre-students work for a while for little or no pay, doing petty office jobs” (Standing 2011: 16).

Part-time employment, temporary jobs, mini-jobs, internships, flexi-jobs can be translated into different ways towards low-income, exploitation or accepted exploitation. These types of “employability” attached to a “flexibility burden” and affecting mainly youth (O’Reilly et al. 2015: 3), are constructed within a “discourse of celebration”, as a privilege and an opportunity in a specific context of extreme poverty. In these post financial crash conditions that are affecting different layers of the society, people in general are becoming “more self-exploited, having to do extra work in order to retain a niche of some sort” (Standing 2011: 15).

The relationship with the future is void. As Berardi says: “the future becomes a threat when the collective imagination is incapable of seeing possible alternatives to trends leading to devastation, increased poverty and violence” (Berardi 2009: 122). Young people are in general defining the future in the present (Hewitt and Stokes 1975; Leccardi 2005; Silva 2008; Pais 2003). Young people are explaining precariousness, lack of jobs, etc. by interpreting the situation as a normal one, therefore, as stable and expected. Through an ethnographic study in a Youth Centre located in a disadvantaged suburban area in the north of Portugal it was found that most of young people explanations were often disempowering: to have a job no matter in what conditions to help the family, that sometimes does not value school; to work in precarious conditions to be able pay for their education and not to give up everything (Silva 2011).

Several social problems are foreseen in a time “marked by insecurity for a growing mass of people that press at the precariat borders” (Standing 2011: 36). The problem is that the “youth left behind”, the traditionally disadvantaged affected groups (O’Reilly et al. 2015), are increasingly trapped and their negotiating position is getting weaker. Unqualified, from poor neighborhoods, with a migrant background, under educated, they are more vulnerable to precariousness and poorness as they are already negatively positioned. As Laura Fonseca points out in her study with girls from a poor neighborhood and from the Roma community “this context of crisis is a facilitator of the emergence of the “expectations cooling” that lead to school dropout, abandon school careers” (Fonseca 2009: 222).

The justification for their exclusion is now produced from mainstreaming settings. Crisis works as an excuse to take measures, especially in education that becomes a privilege while school disaffection is considered a more profound legitimated reality besides being already part of their identity. Crisis allowed invoking the “state of exception” as Fonseca and Ferreira (2015) well explained when analyzing the Portuguese government discursive strategies between 2011 and 2014.

68.5 Final Remarks: Making Sense of the World from the Backyard

The process of *cooling the mark out* was mainly seen among groups of young people already known for living among structural and traditional inequalities, living in poor neighborhoods at risk of becoming Early School Leavers (Silva 2011). However, austerity driven public sector cuts measures and economic and financial crisis affected different groups of young people with a good relationship with school and with their life projections. These last types of youngsters are appropriating these different repertoires of relationships with school and the labor market, by integrating precariousness and fewer expectations into their own identity, through a “normalisation of an emotional sense of insecurity and permanent risk” (Fonseca and Ferreira 2015: 705).

Young people from well-known deprived areas have had developed different types of strategies to still have comfort zones (Silva 2011). Our experience in doing research in suburban areas allowed us to describe two trends among young people dealing with insecurity and precariousness. One trend can be described as organised by a sense of pride and naiveté, with moments of clarity, when referring to their jobs and school conditions. A girl (16 years old) from a Youth Centre says “I have a feeling that next year I will leave and will be to France. It is a feeling. I can’t explain” (Silva 2011: 284). Sometimes they embellish their real life situation and their condition of structural inequalities. A young man from the same place (20 years old) that had a precarious job in a container ship only for 1 month: “I was a month there. I went to Spain, La Curuña. Now I will stay here. I was in the open sea. I am a sailor!” (Silva 2011: 268). In other moments they have a clear perspective about their educational possibilities as a 9th grade girl that mention that “for working class if you have the 9th grade it is OK. It is enough to work. (...) It is enough to wash dishes in a kitchen, in a restaurant, so that’s fine, it is enough” (Fonseca 2009: 218).

What seems to be clear is that they try to show “how they develop their action in relation towards a dominant social order” (Silva 2011: 261). This trend is more visible in young people “traditionally” associated with poor social and cultural backgrounds, often situated at the margins of powerful knowledge (Young 2011). Another trend is organised under the sense of fear. This trend seems to be affecting young people from different social backgrounds, usually those who with greater or lesser sacrifice, invested in education. Apparently, the *carpe diem* principle grows with the sense of unpredictability that they are perfectly aware of.

Doing research with disadvantaged young people reveals different perspectives and their inside knowledge about their sense of ownership when they have little possibility to choose and decide their future (Silva 2012). We also became acquainted as well as with different struggles done by young people to feel empowered and to cope with their fragile situation (Charlesworth 2000) and how, in this process, they end up by blaming themselves as individuals or as a community. This was done in a context of massive reduction in public welfare and in public spending legitimized

by powerful political narratives, namely through a “state of exception” narrative (Fonseca and Ferreira 2015).

Lately, we have become familiar with young people's acceptance and sense of inevitability concerning their vulnerability. Sometimes this is made visible by their absence from public protests, although some social movements arose when austerity measures within the EU “rescue package” started and they saw no future for them in the country.

If the process of cooling the mark out was mainly part of groups of young people facing structural and traditional inequalities, austerity driven public-sector cuts measures and economic and financial crisis changed the nature of the strategies and explanations driven by the affected groups which were from more diverse social background. Nevertheless, the most affected population of young people is those that we are used to acknowledge as normally excluded. Those, loosing with the flexibility discourse, less likely to profit by European measures to improve the quality of young people transitions, might be at risk of being forgotten and falling deeper in a precariousness trajectory.
