# Foreword to Organizational Change Thinkers Book

I really appreciate the opportunity to write a forword for this most interesting book because it allows me to reminisce a bit about the history of organization development (OD) and its focus on the management of change. I remember well in the mid-1960s my efforts with Warren Bennis and Richard Beckhard to capture the essence of OD, not by writing an integrated text but by accepting the fact that the best we could do is produce a paperback series which allowed various of us to express our own views of what OD was at this point in its youth. The Addison-Wesley Series eventually grew to over 30 volumes and reflected the many strands of thinking and practice that evolved. In many ways, this current volume is another iteration of this enormous diversity in presenting a field that we think has some common assumptions and values yet continues to evolve new directions. What better way to track this evolution than by many of us writing about many others of us.

By presenting the contributions of so many different OD practitioners and theorists, the editors have exposed us to a deeper cultural truth about our approach to knowledge and practice. The rampant individualism and pragmatism that has been the hallmark of US culture shows up very well in the variety of styles of thinking, practicing, and writing about these organizational issues and organizational change. In a way, I lament this diversity because it reflects another issue that derives from individualism, namely, that we are not very concerned about interconnecting or coordinating our various theories and practices.

Rather, even as academics, we seem to play out the marketing dream of putting our ideas out there and seeing who will buy. We have very little taste for acknowledging and critiquing each other, we have very little impulse to construct the grand theory that pulls it all together, and we have no great desire to acknowledge all versions of our own model that may have already been presented in other writings. We built our own edifice with our small team of collaborators and put our energy into improving it rather than seeing how it might connect to others. We let the market decide and compete as best as we can, but have little energy for integrating the many theories and practices that are out there. This willingness to tolerate diversity of thought, even encourage it, is well reflected in reviews of research. It will be an interesting challenge to the readers of this handbook to find the common elements, the integrative strands that have emerged from over 75 years of work in this arena.

There may be another cultural reason for this diversity. I have recently "discovered" that the English language is much more context dependent than most of us have realized or acknowledged. Words like *organization*, *management*, *leadership*, *trust*, *openness*, *relationship*, and *change* are incredibly ambiguous until they are put into concrete examples that give us the context of whether we are talking about a particular organization in a particular industry in a particular culture, at a particular stage in its growth, and so on. This linguistic ambiguity makes it very difficult to compare models, theories, and practices primarily because the authors usually do not provide enough examples to pin down what exactly is the essence of what they are talking about.

When we do talk about each other's theories or practices, it has been my experiences that my concepts such as *process consultation*, *career anchors*, *culture*, and *change* are often not understood by both critics and supporters. I don't fault them for this, nor do I fault myself for being a poor communicator. Instead, I attribute this to the inherent ambiguity in the English language. It may be inherently impossible to construct a tight theory in a high context language, which is, of course, the reason why we invent new terms such as Theory X and Theory Y or create mathematical models.

Having said that, the model that is presented in this book is particularly interesting wherein our ideas are presented by our colleagues rather than by ourselves. That mode of presentation will provide interesting experiences for each of us who are represented in this book and will provide a level of feedback we are ordinarily not privy to. The readers will get the unusual opportunity to compare how they read a particular author and how the biographer writing in this book represents that same author.

The editors are to be commended for having found a way to go beyond presenting several of us in our traditional writing or speaking mode, and to give us a new voice through the many authors writing these chapters. That will provide readers an opportunity to see how their interpretation of what each of us said matches the written presentations in this book, and for those of us who are still present, yet another opportunity to see how our own perception of what we said matches with what our biographers have said.

I look forward to an exciting read and congratulate the editors for providing us with a whole new approach to understanding the many points of view toward organization development and the management of change. The reader will get a great view of the history of this field through reading about almost three generations of thinkers and practitioners in this field.

Edgar H. Schein

# Preface

## Introduction to the Handbook

We, the editors, have had the great pleasure of assembling this volume. It has turned out to be more of a "labor of love" than we expected; both more labor and more love. We have been inspired by the stories of the great thinkers profiled here. We have loved learning more about them than we ever knew, even in the case of some close colleagues. And, we have thoroughly enjoyed making new friends and reconnecting with friends whom we haven't been in touch with for far too long. The "more labor" part was also the painstaking care that the contributing authors took in researching the great thinkers they profiled. It is to these authors and to all the great thinkers who created the field of Organization Development that we owe the existence of this handbook.

For readers who might not be familiar with Organization Development, it is a field pioneered by the social scientists whose stories you can read in this handbook. These individuals were concerned about social justice, organizational effectiveness, improving teamwork, understanding the role of the change agent and the effects of different styles of leadership, and much more. The focus of the field is on change, and especially change that takes place in organizations. Even more to the point, the kind of change that has been at the heart of Organization Development is change that helps organizations fulfill their purpose while at the same time offering opportunities for greater dignity and meaning to the people who live within them or are touched by their existence.

Although the roots of the field took hold even earlier, the real blossoming of thought began following the Second World War. The war was an abomination to everything that was good or worthwhile about society and human kind. It raised questions for many about what was going wrong in the world and what could be done to prevent something like it from happening again.

Early studies by Kurt Lewin, who fled to the United States from Nazi Germany, investigated how attitudes were shaped by group opinion and the effects of democratic versus autocratic leadership. Coch and French explored the power of participation in decision-making related to overcoming resistance to change. Eric Trist and his colleagues at the Tavistock Institute for Human Relations in London worked with the British Coal Board to find ways to make coal production more efficient after the war and in so doing discovered that workers held valuable insights regarding the

work they did that engineers and managers had overlooked. Bion, also at Tavistock, had experimented with group therapy among traumatized soldiers during the war and from those experiences and others began to help us see previously invisible dynamics that affected the work of groups and teams. Lewin and Reginal Revans independently piloted what became known as "action research." This was work intended to bring about change that took place in a real setting as opposed to a laboratory to study what happened as a result of trying out a variety of different approaches. What made action research unique was the collaboration of the "subject" or client in conducting and interpreting the work. It was discovered, as was the case in British coal mines, that the people on the front lines of change have valuable perspectives that even scientists studying an organization would have missed. The resulting tradition of involving those affected by change in planning and executing it has remained a hallmark of OD ever since and continues to differentiate it from "expert change" in which consultants decide for others what is best for them, or "top-down" change in which leaders attempt to use their position power to force others to comply with their directives.

Kurt Lewin's concerns about racial justice also led to the "T-group" or sensitivity training phenomena, later formalized under the egis of the National Training Labs, or NTL as it became known. On the other side of the Atlantic, Bion and his colleagues invented the Group Relations Conference, which helped participants examine their relationship with authority and their interpersonal relations. Together, these powerful movements in human relations led to an age of "personal enlightenment" which became central to the field for a time. Ever since, there has been a debate about whether Organization Development belongs in a serious business environment, since some leaders seem to be of the belief that one should leave his or her emotions and identity at the door before starting work every morning.

It wasn't until the next generation of scholars that the name of the field "Organization Development" was coined, simultaneously by Dick Beckhard and Robert Blake and Jane Mouton in the 1960s. The 1960s also saw the establishment of the first doctoral programs in Organization Development, which was followed by a proliferation of institutions that offered masters degrees to people working full time.

The 1970s and early 1980s saw recessions that added to the excuse for cutting out anything "touchy-feely" and instead focus on downsizing, cost-cutting, total quality, reengineering, and Lean Six-Sigma – anything that focused squarely on the bottom line and was driven by objective data rather than feelings. None of these "advancements" fit the values and methods of organization development and for a time, there were real questions about the field's survival. However, advances in scholarship continued and the need to pay attention to people in organizations didn't simply disappear. In the 1980s and 1990s, in areas like employee engagement and innovation, there were clear needs to call on people to do things that they would only do if committed to the success of their organization. Gaining that commitment required more than a single-minded focus on the bottom line. What's more, work on high performance systems and organizational culture brought about significant gains in organizational performance that were hard to ignore. Accountants could cite the costs of change but investors appreciated the returns.

The 1980s and 1990s also brought exciting new change innovations to the forefront, based on glimmers of earlier thinking. Appreciative inquiry, large group interventions, and future search conferences gave Organization Development a new lease on life and thrust it squarely into the realm of dealing with societal as well as organizational issues. This "second age of enlightenment" has us all believing that anything was possible and that our dream of making the world a better place was finally coming true. Then, another recession and a new villain on the scene interrupted our progress once again. By the early 2000s, investment bankers and deal makers who cared only about short-term shareholder profit started breaking up organizations and selling the pieces to the highest bidder through mergers or acquisitions. Leaders who cared about their people, took a longer-term view, or sought a more socially responsible role for their organizations were swept aside by operators who had no choice but to focus on cutting costs at all costs. The 2007–2008 recession led to another round of budget slashing in many organizations, turning back the clock. Once again the field appeared to be in peril, and yet competition and change remained constants that simply couldn't be eliminated by pretending they weren't happening. By the 2010s, new forms of organizing were investigated – forms that would allow organizations to be efficient and innovative at the same time, local and global, and socially responsible while caring about the bottom line. Technology continued to present new challenges as well, and those who didn't understand its potential for disruption at first were run over by those who did.

The thinkers profiled here didn't just stand by and watch this happen. They took challenges as opportunities to rethink and reposition the field. They offered new methodologies for change, more connected to the strategic directions organizations are trying to move. They didn't forget human beings, but leveraged the growing interest in all things talent related to make change both a responsibility for able leaders and a development opportunity for others. They learned about the future and found ways to help clients see it and want to make it happen. They embraced diversity and globalism, knowing that these forces could be temporarily blunted but never overcome. Although many of the early thinkers are no longer with us, their ideas and ideals continue to live on in the youngest generation of our scholars.

So, for those who are not yet familiar with the field of Organization Development, this handbook will tell the story of its evolution, from its earliest beginnings to the current day. In the profiles here you will read about important ideas, theories, and practices that gained widespread attention as they shaped not just the field itself but our societies and even the world.

Those who are very familiar with the field will find herein much of value and we hope delight. Our experience as editors was that we individually were more familiar with the works of some of the great thinkers than others. To read the profiles of these assembled thinkers and their work was to take a high-speed tour of our shared history, filling in spots in the landscape that we had previously zoomed past, not noticing or interpreting clearly. Beyond that, the people we did know as scholars we got to know as people, through the eyes of their biographers who were often students or close friends. In this fuller and inclusive picture, we could more easily grasp where the great ideas in our field came from, which caused us to reflect on our own

motivations for doing the work we do. This handbook is like a personal journal; it's as if the intellectual giants kept private diaries that they decided to throw into one collective pot with the hope that others would read them and perhaps be inspired to add their own.

We wanted to know more about the influences in these thinker's lives, both educational and collegial. We asked for insights about their mentors or heroes, and what problems they wanted to solve. We sought insights into how the times in which they lived might have directed their thinking and extrapolated this to present times and even into the future. We wanted to know why they did the research they did and how they did it. We were curious about where they applied their ideas and with what effect. We wondered about collaboration with other colleagues and especially about how ideas took hold and led to branches of the field being defined by their committed followers.

As we read on, we saw the evolution of ideas as the progression of science added finer filigree to earlier rough sketches. We also saw continued breakthroughs, intellectual leaps that could not be predicted simply by drawing a straight line between the past and present. Stepping back even further, we saw parts of the canvas that were still blank, waiting to be filled in. Other parts of the canvas were painted over many times, without a satisfactory result (One more time, how can we get those in power to share it willingly and for the benefit of all? Why, with all we know, are we still not more successful in bringing about change? How is it that with all of our research, we still allow inept leaders to rise to power and then follow them to our own destruction?). The field of Organization Development is alive, despite several inquiries into its health by undertakers arriving a little too early on the scene. Gratefully, the handbook will be continuously updated thanks to the miracle of online publishing. If new thinkers emerge or there are new ideas to report, they will be added in the years to come.

With the amazing help of our colleagues who rose to the challenge, this handbook has delivered on our intentions.

1. The handbook presents inspiring and thought provoking profiles of prominent organizational change thinkers, highlighting significant advancements in how organizational change has been conceived, theorized, researched, and practiced.
2. Each profile chapter captures the professional background of a legendary thinker and presents his or her key insights, new thinking, and major legacies to the field of organizational change.
3. The handbook includes, in one manuscript, the concepts, theories, and models of the sages who invented, built, and advanced the research and practice of change in organizations.
4. The structure of this handbook creates "relationships" with the highlighted scholars that are not obtained by simply reading a collection of their work.
5. The theories presented in the handbook are brought to life within the context of the scholar's experiences, which in turn inspires progressive thoughts for the readers of this handbook, furthering organizational change research and practice of today.

While you may choose to read only a few of the profiles, we suspect that you will be drawn in to read additional profiles as were we. The field of Organization Development has always been concerned about people and driven by a sense of what is right and just. Gaining insight into the ways in which the values and purposes of these incredible thinkers shaped their work makes for interesting drama. One might expect a handbook about scholars to be a little on the dry side, hardly something to be read like a novel on a plane or when without a date on a Friday evening. That might be true in a field like Mathematics, but after this experience, we choose to withhold our judgment. There are real people behind the great ideas in our field, and their stories are both compelling and endearing.

## A Guide to the Structure of the Chapters

It won't take you long to notice that the vast majority of the profiles follow a similar structure. The first section briefly describes the influences that motivated the thinker to investigate change in organizations, for example, the theorist's scholarly mentors. The focus is on the professional, intellectual, educational, social, and real-world influences that stimulated the theorist's curiosities about change in organizations and acts as an introduction to the theorist's story.

The second section focuses on the thinker's key contributions. Four or five advancements that were central to the work of the thinker are reviewed in this section. These are theoretical, methodological, and practical contributions. This is not an exhaustive coverage, but a presentation and discussion of their most significant contributions to organizational change. Those innovations or ideas that have endured over time are emphasized.

The third section of each profile addresses new insights that the work of the thinker inspired in others. This section will underscore how the work of these scholars has spurred new developments in theory and research that have led us to view change in organizations in new and surprising ways.

The fourth section focuses on legacies and unfinished business. What are the major intellectual legacies of this thinker? Which later thinkers has he or she influenced? Which parts of the thinker's legacy are still being investigated or have yet to be fully investigated? Are there themes that have been criticized by later thinkers that have shed light on the problem that motivated the original thinker? What later thinkers have explored the issues of this thinker and carried them further?

Finally, the profile concludes with suggested further readings. This final section includes a short list of books and journal articles that enable readers to take their interests further.

## How to Use This Book

Actually, we can't wait to see how people use this book. As designed, the expectation is that most people will access the book online, a profile at a time. While print

copies of the book will be available on demand, the projected cost would make buying a hard-bound volume prohibitive for all but libraries and a few especially dedicated individuals. Therefore, it's probably not a candidate as a text for graduate study as an entire volume, but to assign chapters to students to read and discuss is entirely doable. We can't imagine a better use for this handbook than to introduce the next generation of scholars to the people and history that preceded them. We won't tell you how to teach the book; you'll have your own ideas about that. We can envision lots of opportunities ranging from individual research efforts to group projects, covering eras or themes or looking for overarching messages much as we found ourselves doing. When you come up with a great idea that works, please let us know.

For those beyond their educational years, reading selected chapters about friends or mentors can be enlightening. Perhaps, it will encourage you to drop a note to someone you haven't spoken to for a while, saying you read about them and were surprised at something you learned. They probably won't mind and you may gain a renewed friendship in return.

On a more serious note, if you're undertaking research and looking for some original references or trying to come up with an original idea of your own, the handbook could be a good place to start. Most of the profiles are well-referenced and the suggestions for further reading are worth pursuing. The stories of these great thinkers are inspiring and remind us that despite their stature, they were after all just people like us.

## Going Forward

This journey hasn't ended; it's just beginning. That applies to the field of Organization Development and to this handbook as well. You may know of someone not included here who should be. There are several chapters in progress that didn't make it in time for the first print edition. Profiles on people like Rensis Likert, Noel Tichy, and Amy Edmonson haven't been overlooked; they are just taking longer to get done. Still, it's entirely possible that we have missed someone you think needs to be written about; please let us know, and let us know who should write about them – maybe it's you.

Over time, we'll be excited to be introduced to the new great thinkers in Organization Development. They are probably already making presentations at the Academy of Management or other conferences around the world. Let us know if you spot one before we do. We haven't established firm criteria by which we include or exclude people; we tried but found the task impossible. There were some social scientists who write about organizations with a concern about change but not from an Organization Development perspective. There are organizational theorists who help us understand how organizations work, which is something we need to understand, but don't write about change. It's hard to draw hard lines between the ins and the outs.

One criticism we are well aware of is that the volume, in the current version, includes more men than women, more whites than minorities, and more Americans than people from the rest of the world. More women are now attending graduate programs in the field than men; we hope that as a result, the gender picture will become more balanced over time. If you know someone who should be profiled who will help accelerate the shift, let us know. To a lesser extent, the same thing is happening in terms of minorities and people outside the USA. The numbers of nontraditional great thinkers are growing and your editors are on the lookout for them. All that said, we don't think that the online volume should become more like Facebook, where anyone can join. If there is no distinction between great thinkers and noncontributors, the handbook wouldn't serve a purpose.

We trust that you will enjoy reading some of the profiles as much as we have. We also hope that your reading inspires you to make your own contribution to the future of the field. There's room for you to be included in the next volume or to have your existing profile updated. More importantly, with all the great thinking represented here, we haven't seemed to solve all the world's problems. We need to keep up the effort.

# Acknowledgments

After an intensive period of selecting the many great thinkers of organizational change, contracting with contributing authors to craft their profiles, and working with Michael Hermann and Audrey Wong-Hillmann, our tireless editors at Palgrave Macmillan, this acknowledgment puts the finishing touch on our *Handbook of Organizational Change Thinkers*. The experience of creating this handbook, for each of us, was absorbing, enlightening, and truly enjoyable. There are several people to thank.

First, we would like to thank the many contributing authors who took the time out of their busy schedules to write the profile chapters. The handbook represents a diverse group of authors from many parts of the world: United States, Canada, Europe, South America, Asia, and Australia, many of whom are great organizational change thinkers, scholars, and practitioners themselves. Their efforts to conduct research, organize content, and determine and present the backgrounds, contributions, insights, and legacies of their thinkers are much appreciated.

Second, it's important to acknowledge a person who was instrumental in the conceptualization of this handbook. David Schwandt, thank you for the many hours we spent together in the classrooms and hallways of the George Washington University exploring the concept and content of this handbook. Your knowledge of the field of organizational change appears in many indirect ways throughout this handbook. One memorable image is three classroom whiteboard walls filled with timelines, listings of great thinkers, key change movements, and various ways to organize the book, some chronological and others conceptual.

As we developed the handbook, we realized that organizing the thinkers into our original format of early, contemporary, and emerging proved problematic as it was difficult to place many of the thinkers into a specific period. With advice from our editors at Palgrave Macmillan, we decided that an alphabetical organization of the thinkers seemed the best fit for a handbook of this magnitude. We envision many subsequent publications that explore the patterns of thought across the profiles.

Finally, for those great thinkers of organizational change who are still with us, thank you for agreeing to be profiled in this handbook. Many of you spent several

hours interacting with our contributing authors to provide them with what they needed to craft your profile. We express our sincere gratitude.

# About the Editors

**David B. Szabla** College of Education and Human Development, Western Michigan University, Kalamazoo, MI, USA

David B. Szabla leads the M.A. in Organizational Change Leadership in the Department of Educational Leadership, Research, and Technology at Western Michigan University where he teaches courses in group dynamics, large-scale change, and organization design. His research and writing center on resistance to change and the relationships among the content, process, and context of organizational change. David is recognized by executive business leaders for strong diagnostic, intervention design and evaluation skills, as well as keen communication, creative problem-solving, and program management capabilities. He has been published in *Research in Organizational Change and Development*, *Human Resource Development Quarterly*, *Emergence: Complexity and Organization*, and *The International Journal of Knowledge, Culture, and Change Management*. He is a member of the Management Consulting and Organization Development and Change Divisions of the Academy of Management, the Society for Industrial and Organizational Psychology, and the International Leadership Association.

**William A. Pasmore** Teachers College, Columbia University, New York, NY, USA

William A. Pasmore, Ph.D., is a Professor of Practice at Teachers College, Columbia University, and Senior Vice President at the Center for Creative Leadership. As a thought leader in the field of organization development, he has published 28 books including *Leading Continuous Change*, *Designing Effective Organizations*, *Creating Strategic Change*, *Relationships That Enable Enterprise Change*, and *Sociotechnical Systems: A Sourcebook*. He served as editor of the *Journal of Applied Behavioral Science* and, along with Richard Woodman, was the founding coeditor of the annual series *Research in Organizational Change and Development*.

**Mary A. Barnes** George Washington University, Washington, DC, USA

Mary A. Barnes is a scholar-practitioner who leads the Workforce Transformation Division for a medium-sized Federal agency. She has over 20 years of experience managing people, programs, projects, operations, and more. Her interest and

expertise are in developing organizational and talent-related solutions, including facilitating business model and organizational restructuring, planning and implementing change, business process redesign, and developing new programs and learning initiatives. She is a trusted advisor to executive leadership, helping them identify and remove barriers that get in the way of optimal levels of organizational performance and individual engagement. She has been a speaker on various organizational topics at conferences for the Academy of Human Resource Development, Academy of Management, and the Society for Human Resource Management. Her educational background includes an MBA, an M.S. in Financial Management, and a graduate certificate in Project Management. She is currently a doctoral candidate at George Washington University, studying Human and Organizational Learning, with a research focus on Change Management.

**Asha N. Gipson**   Teachers College, Columbia University, New York, NY, USA

Asha N. Gipson is a doctoral student studying Social-Organizational Psychology at Teachers College, Columbia University. Her research explores intersectionality, leadership development, and group/team dynamics and effectiveness. In addition to her studies, she also teaches courses in leadership and group dynamics and industrial-organizational psychology. She currently serves on the executive committee of the New York Center, an affiliate of the A.K. Rice Institute and is a member of the OD Network of New York. Asha received her Bachelor of Arts in Psychology from Pomona College and a Master of Arts in Organizational Psychology from Teachers College, Columbia University.

# Billie Alban: The Inclusive Organizational Development Practitioner and Scholar

Gary Mangiofico

## Abstract

This work provides an overview of the contributions of Billie Alban, one of the foremost early thinkers and leaders in the field of OD and change. From her early childhood and throughout her life, Billie became the voice of advocacy for stakeholder inclusion. Starting with her young adult life, this chapter explores the influences early OD figures had on her development as a practitioner and then moves on to her own formidable contributions to the field which served to influence the development of generations of OD practitioners. Billie Alban's key works on the use of large scale change methods, her collaborators and her beliefs that we are always in community are discussed, as is the key legacy of her work and presence in the field of OD.

## Keywords

Large group interventions • Alban & Bunker • Organizational development • Inclusion • NTL • Women pioneers • System • Management • Emergent dynamics • Systematizing of large group methods • Moral imperative of giving voice

## Introduction

Billie's (nee Wetter) remarkable journey began in the early twentieth century. Born in 1925 and raised in New York City, she began a bold and gracious life, becoming one of the key voices and one of the first significant women in the formative years of the field of Organizational Development (OD). Bold in that she embarked on adventures unique and courageous for a woman of her time and gracious in that there is a history and pattern to her life that show great interest in and respect for the voices of others along the way. This pattern of would find its way into her life's work and her well-known writing on *Large Group Interventions* (1997, 2006) with partner Barbara Bunker. An advocate for the inclusion of all stakeholders in the pursuit of possibilities that may affect them, Alban's work has served both as guidance and as a testament for the "rightness" of the collective voice to be heard.

## Influences and Motivations: The Early Years and the Influence of Inclusiveness

Alban was raised at 24 Washington Square North in Greenwich Village with her parents and a brother, Pierce Trowbridge Wetter Jr., who would go on to be one of the founders of Datron Advanced Technologies. According to his obituary, "Pierce worked until he retired from his chief scientist role at the age of 84, and was beloved at his workplace; it was common for the employees to refer to him as 'Uncle Pierce.'" Her mother, Gladys (nee Mock), was both an artist and an activist. Known for her etching, graphic arts, and printmaking, Mock's work has received awards, including the Emily Lowe Memorial Award and Audubon Artists, and has been on exhibition in the Art Institute of Chicago; Corcoran Gallery in Washington, D.C.; Carnegie Institute and International, among other museums. Alban's father, Pierce Trowbridge Wetter, a trained engineer, was very involved in the politics of his day. An activist and preservationist, he served on the Greenwich Village Historical Society and fought against the rerouting of Washington Square. Wetter was a union organizer and one of the original members of the Wobbly Group. The "Wobblies" as they were more commonly known, were members of the Industrial Workers of the World (IWW) founded in 1905. The IWW's primary focus was on the democracy of the workplace and differed from other unions, in that its leadership was chosen from amongst its rank and file. They believed in uniting workers as one class of people in an effort to counteract the influence of the employing class, deriving their strategies from socialism and anarchist movements.

As a Quaker and pacifist, he was opposed to World War I and spent 5 years in jail for his conscientious opposition. Though eventually pardoned in 1933 by President Franklin D. Roosevelt, Wetter initially refused the pardon based on his belief in his moral stance. Alban recalled her father as being very supportive of her and having a profound influence on her moral development, a trait that would influence her work in OD. This early influence of self-management of the common worker derived from her father and his work with the IWW philosophy is clearly reflected in her belief in the right of others to have a say in that in which they are a stakeholder. About this she stated, "I focused on the participative process of engaging all stakeholders, and then searching for the common ground amongst them (August, 2016)." Alban believed that in an organization, everyone had a right to be heard. Warner Burke (2016) has said, "She [Alban] is a woman loaded with integrity. Her deep convictions are part of what makes her so attractive to others, who quickly feel they can trust and believe in her." A strong and committed moral compass of what is right would influence her life's work.

Coming from such a formidable family, Alban has told her story of being raised on Washington Square as the beginning of wanting to understand others' views. She remembers that when she was a child, her family lived on the north side of the square, which was considered a fairly wealthy and comfortable area, with the southeast side's being known as Little Italy. She was told not to go to the south side because of "the Italians," who would "knock her off her bike and take it from her." But curious, as is her nature, Alban went to the Little Italy neighborhood anyway, and of course nothing bad happened. In fact, she recalled that she once fell off her bike, and an Italian mother came to her aid, helping her up and taking care of her. That's when Alban said she had a moment of insight, realizing – even as a child – that people say negative things about others but that those characteristics aren't necessarily true, and that one should listen to others directly to learn their story firsthand.

Alban said that New York City was a "great place" for her to grow up, providing a rich background in which to break down stereotypes and learn about life from the different kids in the park and the diverse communities around her. Alban grew up an Episcopalian, but went to a Quaker school in NYC; that school still exists today. That early Quaker influence impressed upon her the need to try diplomacy first, although that does not mean that a person must just take a passive position to meet harsh situations; rather, he or she needs to break down pejorative terms to work effectively in such conditions. She would go on to attend a boarding school in Massachusetts at age 12. While there, Alban rallied her peers and challenged the administration because its members did not include or involve the students (their customers) in what was being done or decided for them. She attended Goddard College in Vermont, a university that was considered very progressive. There, she loved that the administration involved the students in discussion. After graduation, she went on to Yale and was one of the first women to receive a Master of Fine Arts Degree in theater. Feeling that she needed to know something about business to get involved in the world, she also obtained a minor in economics.

## Emerging Professional Life and Early Influences

While at Yale, Alban met her husband, Guillermo Alban, an Ecuadorean, and moved with him to Ecuador, where she would live for some 15 years. While there, she began her family, having two daughters, Margarita – now a civic leader – and Patricia Lynn, who is a physician. Becoming fluent in Spanish, Billie Alban also taught in the drama department at the University of Guayaquil while cofounding a local repertory group, which would eventually play a part in her community restoration work that included staging plays to educate local people about poverty, health, and other issues of subsistent living. This work was done in collaboration with the Peace Corps in Ecuador.

Not long after moving to Ecuador, Alban and her husband began a transportation petroleum business, the Transpetroleo Corporation. She started the business of bunkering ships – fueling ships offshore so they can continue their journey. Soon after beginning this work as vice president, she realized that she needed a license as a master's ticket to captain, because in so doing, she could travel go up and down the South American coast to grow the business. So she went forward, qualified, and obtained her license. It was during this time that Alban got her first taste of business organization and found it to her liking; it would eventually be part of what supported her entry into the world of OD.

Alban recalled (2014) that while she was in Ecuador, she worked in a community development project to assist the "surbannos" ("barrios that were outside the city limits and not entitled to any services … nothing available!" [p. 9]). The project began to sponsor workshops that taught various trades as a means of self-sufficiency to the members of the slum barrios. Alban, a lifelong Episcopalian, was also involved in the seeding and building of a new congregation in Guayaquil with a group of other expatriates from both America and Great Britain. This effort would eventually evolve into what is now La Catedral Cristo Rey in the Diocesis Litoral Del Ecuador.

It was during this work that she was referred to National Training Laboratory (NTL) in Bethel, Maine, for further development through a colleague in the Episcopal Church. While exploring NTL and – after taking a community development program that was a T-group – she learned of the Program for Specialists in Organization Development (SPOD). Alban has readily admitted that her first application was denied. Warner Burke, who was on faculty at NTL at the time, said that the reason Alban was turned down was because she came from theater training and seemed inadequately prepared for SPOD. However, upset and resourceful, Alban wrote a letter furthering her case, explaining her business experience with the family transportation petroleum company as well as her concerted community outreach efforts and practice. Upon receiving the letter and being somewhat astonished at Alban's boldness, Richard "Dick" Beckhard and Burke agreed to give Alban a chance. Burke felt that much of her work clearly showed she understood management and leading change but that what she lacked was the formal language and training. Impressed by her management experience in Ecuador, Beckhard and Burke admitted her to the program. According to Burke, that was clearly the right decision. Alban became one of the first women to train in OD and one of the first to practice OD. Of her, Burke (2016) said, "Billie is to OD what Mary Parker Follett was to

management." And while Alban is far too humble to assert such a claim, she has before said (2014), "I may not have been the mother of OD, but I was there almost from the beginning – probably the oldest sister (p. 11)."

In the late 1960s, there was an increasing discontent with the exclusion of women among the NTL faculty. By then, Alban had become faculty and a notable practitioner. Burke and Beckhard began using her in all kinds of capacities, feeling that she was such a natural. Alban brought in Bunker to do work with her; and at the same time, there was Edie Seashore, who was a pioneer in the field of organizational development, heavily focused on the areas of coaching and feedback. She and her husband Charlie were renowned for their work on the "use of self." Alban, Bunker, and Seashore were joined by Elsie Y. Cross, also a pioneer in organizational development (OD) and of diversity for business, as well as the author of "Managing Diversity – The Courage to Lead (2000)." These women were not only pioneers in the field of OD, they were among the first significant women who advocated in the early years for the inclusion of more competent women in NTL, confronting the attitudes of the men at NTL. They were supported by Burke, whom Billie credited with being responsible for making many of the changes that led to greater inclusion of women in the OD field. After approximately 3 years, they had a confrontation with the men, which began changing the all-men's club of NTL and OD.

Beckhard, one of the founding fathers of the field of OD, had significant influence on Alban's development as a practitioner. When Alban first went to NTL and participated in a T-group, she heard Beckhard talk about organizations and the importance of organization structure, purpose, process, strategies, needs, leadership, etc. Impressed by his orientation, she quickly realized how important the work of OD was. As they both were fond of saying, we are all born into organizations – our family being the first and that being the place in which we primarily learn about how to handle leadership, relate to the outside world, deal with conflict, handle competing needs, and make plans to move forward. These ideas were crucial influences that impacted both her view of and how she worked with business, community, and religious institutions.

Alban said that Beckhard put on a workshop to determine how to help students in other programs understand OD. At one point, everyone went to lunch, but she stayed back with a friend, and they began to think about it and developed a design for the workshop. When Beckhard arrived, he reviewed her work and loved it – and they began a very close friendship and collaboration. Beckhard asked her to take over a workshop, being sure to collect data via interviewing people, creating interventions and so forth. Alban ran the workshop, with a very positive outcome. Even more impressed, Beckhard then helped Alban's career by deferring to her when he wasn't available to do the work. That, Alban said, is how she got her real start in OD. Their similar backgrounds – both training in the theatre before turning to OD – gave both of them something in common, while at the same time, providing unique experiences from which to draw in the development of their work together.

Beckhard believed that the purpose of OD was to ask how to improve the organization/system and then finding ways to improve it. This view was foundational to the early work of OD and Alban's induction to the work. Beckhard placed a lot of emphasis on helping organizations look at their strategic plans and intent and

then ask how to improve it. This focus helped organizations to function more effectively and manage change through a more systematized understanding of the organization, its identity and its environment. Beckhard's belief that organizations function better when they involve their employees in looking at all dimensions – such as strategy, department relations, across functions, etc. – weighed heavily in Alban's mind as she progressed as a practitioner. Beckhard understood more of the practice side of OD and postured that the field evolves theory out of practice, thus the importance of actual practice. He heavily promoted the learn-by-doing model. Given his practice orientation, he understood organizations from an applied point of view, arguing that one had to know how to *do* OD, not just talk about it. These views of systematization, engagement of stakeholders, and applied practice are influences that Alban incorporated during the entirety of her work.

Another early and key influence on Alban was Marvin Weisbord, who was significantly influenced by Kurt Lewin (1890–1947) who is credited as the "founding father" of OD. One key insight coming out of Lewin's vast legacy of work was the behavioral formula of $B = f(P,E)$, where a person's behavior is a function of his or her person interacting with the environment. From this notion is the foundation for realization that a person cannot be separated from his or her environment. This would also serve to ground Weisbord's practice theory (1987) that it is crucial to get the entire system in the room to seek "effective change," primarily because Weisbord also felt that if a person cannot understand the whole system, he or she will be challenged to change it. Weisbord's work in creating Future Search with partner Sandra Janoff was partly shaped by the likes of Eric Trist, Fred Emery, Merrelyn Emery, and Ronald Lippitt, as well as the field of systems theory. Notably, we see the influence of Lewinian action research methods impacting both Weisbord and Alban's practices. Alban and Bunker (1997) said, "Weisbord's thinking struck a deep chord with many of us. The notion of getting the whole system in the room was congruent with our experiences p. 22)." Weisbord was considered by many to be great at engaging people in practice – activities that make a difference for the organization.

Future Search's emphasis on giving purpose to meaningful change was a significant movement toward organizations' managing change by looking to the future so that it does not just come upon an individual. This made sense for Alban's practice orientation because it focused organizations on identifying where they would like to be in the best of all worlds and then told them how to plan to get there. This would become a philosophy that she would use in her own life beyond her work in OD.

Alban (2014, 2016) fondly recalled her time collaborating with Weisbord and said that she believes she influenced him as well, encouraging him to add "reward systems" to his now-famous six-box model, which he subsequently did (Weisbord 1976). Whereas both Weisbord and Alban trained in the managerial world of business (both in family business, to be precise) only later to stumble upon the field of OD, they have both become representative of bringing all the voices possible into the room and then facilitating the improvements and changes made possible by listening to those voices. For Alban, this hearkens back to those early influences from her father all the way through her formative years as practitioner influenced by Beckhard, Burke, and Weisbord.

As mentioned earlier, Beckhard served as dean of the early OD program in which Alban received her initial training. But his mentee, Burke, a noted industrial and organizational psychologist, was both teacher and, subsequently, collaborator with Alban. While at NTL, Burke became the director of the program and said that Alban was a natural "She [Alban] was a natural at designing, setting up and conducting experiential trainings," he said. "I felt she was a star!" Subsequently, he began to use Alban in all sorts of capacities. Burke left NTL in 1974 and went to Columbia University, where he developed two programs in OD, one basic and one advanced. He enlisted Alban to work in both, along with Harvey Hornstein. During this time, Burke became more of a mentor to Alban. She said that she learned much from Burke's scholarship but that he primarily provided her with a keen understanding of organization theory and its relationship to change management:

> It was a time where there were two groups: organization psychologists who looked at the individual and performance within organizations and then those in this emerging field of focusing on organization change thinking or early organization development, which was more group oriented. They decided to merge, realizing they were all dealing with the whole system, and the social psychology aspect is what they had in common. Organizational dynamics as well as organization development required you to come to know the system and realize the impact when new issues emerge in the environment. Warner was so good at the theoretical base and academia. (Alban 2016)

They progressively worked together for many years. But Burke was also responsible for encouraging her to write, Alban recalled. "On a flight to a client in the U.K., Warner said something to me that made a difference in the future of my work. Warner told me it was not enough to be creative and experienced. You had to be published (2014, p. 10)." Soon after that, the opportunity to write with Bunker came about.

## Renowned Collaboration with Barbara Bunker: The OD Partners

Alban met Bunker, a social/organizational psychologist, in the mid-1960s at Bethel. Alban remembered that during a Bethel meeting, Bunker was summarizing something very well. Alban was fascinated and knew that she wanted to get to know her. Bunker had previously been a graduate student at Teachers College, Columbia University.

While Alban was at Bethel with Seashore and others, there was a lot of small-group research going on, which was the reason so many people were going to Bethel to attend the small-group lab. Alban learned along with others who were translating the work on group dynamics from this experience to large groups. She was deeply involved in designing experiential activities for training (consultation) that went well beyond the T-groups and small-group dynamics. By 1987, the HRM program at Columbia had been developed by Burke, and Alban and Bunker – along with others – taught this 3-week program in OD every year and would do so for the next 15 years.

During the time, Alban and Bunker worked together in the late 1970s and 1980s, there was a lot of organization redesign going on in this nascent OD field. They began to hear about the Interactive Strategic Planning work Kathie

Dannemiller was doing in companies. She brought in hundreds – even thousands – of people and practiced in large groups to conduct interventions based on her change formula of *Dissatisfaction x Vision x First Concrete Steps > Resistance to Change (DxVxF › R)*. This is Dannemiller's refinement of Gliecher's (1960s original formula for change of C = (ABD)›X, where A is the status quo dissatisfaction, B denotes a desired clear state, D being practical steps to achieve the desired state, and X is the cost of the change (a version of this formula has also been credited to Beckhard and Harris).

This occurred during a time in which the OD field was primarily influenced by individual and small-group dynamics operating with a ratio of 1 (facilitator) to 8 (participants) – work that was then extrapolated and generalized to larger systems. Alban and Bunker reportedly looked at each other and realized that there was an emergent and radical movement of larger group actions taking place. Dannemiller went on to coinvent an approach to working with large groups, known as Whole-Scale Change, which resonated with Alban's deeply held belief that the whole system needed to be present. But one first had to ask who the stakeholders were – meaning, who really has a stake in the system and how it performs? Alban believed that when real stakeholders become engaged, that is when real change becomes sustainable. Their exploration into this emergent large-group facilitation for change phenomenon would find its way into Alban's practice and their partnership. Forming OD Partners, they worked with such companies as British Airways, Cathay Pacific Airways, Corning, ExxonMobil, Intel, ITT, Eastman Kodak, British Airways, and NASA, among many other private and public agencies, including religious congregations that were facing the need to adapt to a rapidly changing world, sometimes working with groups of 800 or more.

Both Bunker and Alban recalled the pair of them working very well together. Alban was a key collaborator and extroverted, while Bunker was more introverted and a more conceptual theoretical partner. Bunker said in an interview that Alban "was an extraordinary practitioner. Ideas would constantly generate from her work. She is also a very reflective practitioner who intuits how to work with her client." Alban would have an intuitive idea and then vet it with Bunker, and they would wrestle with the issue, both knowing that Alban intuitively had her hand on something that needed to be addressed. Alban's critical and intuitive assessment would then be balanced with Bunker's careful conceptual and theoretical knowledge, and together they would come up with the solution to work on the issue. Bunker's knowledge allowed them to frame the solution effectively, but Alban would always be correct about the initial issue. Both agreed that this became a defining characteristic of their mutual admiration and working relationship.

## Key Contributions: The Chronicler of an Emerging Era

While many contributions can be attributed to Alban, there are three for which this groundbreaking OD practitioner's work will most be remembered in the field of OD. First and foremost is her work on large-group interventions, stemming from her

lifelong collaboration with Bunker. Her second and perhaps more epoch-making will be the influence she has had on generations of OD practitioners who learned from her what OD is about and how OD works. And, third, her lifelong passion for giving voice to the voiceless in organizations continues as one of the hallmarks of large scale, if not all OD practice.

Alban and Bunker will always be known as major players of the conceptualization, furthering development, and systematizing of large-group methods. They become the chroniclers of the emerging practices of large-scale interventions evolving in the field of OD. Around the time they were becoming increasingly aware of the growing use of large-scale techniques, Bunker was contacted by then-Editor Clayton Alderfer of the *Journal of Applied Behavioral Science* (JABS), inquiring if she would be editor to a special issue on small-group methods. Bunker, in consultation with Alban, counterproposed to do the issue on large-group methods, and the editor agreed, saying if the two could not come up with a sufficient number of publishable articles, they could backfill with articles on small-group methods. Bunker and Alban sent out the solicitations for submissions and ended up receiving more submissions on large-group methods than they could publish. That particular 1992 special edition of JABS sold a record-breaking 5000-plus copies and went into a second printing and an updated special edition on large-group interventions in 2005. This was the affirmation that Alban and Bunker were onto something, and they started their journey together to write two books on large-group interventions.

Publisher Jossey Bass approached them to write something about these large-group methods. So the pair went to the Organization Development Network (ODN) with a proposal on large-group interventions. They realized they would be talking about their colleagues' work during their presentations and invited those people, originators of the techniques being discussed, to be in the room when they presented, to provide feedback, and to augment the dialogues. This led to these originators' talking with each other and engaging each other, which led to further development of their respective techniques. For the next 5 years (1993–1998), they began to work with ODN to organize four conferences in Dallas. These Dallas conferences on large-group interventions were very successful efforts in detailing a description and teaching about each method. They organized by theme, including whole-group decision-making, work design, and redesign, and methods for creating future, which helped people think about how and when to use these various methods. One major benefit of the Dallas conferences was that they made it easier and possible for both scholars and practitioners to use these methods to work with systems and subsequently advance the field. Until then, while the field of OD was oriented to systems theory, OD practitioners actually worked with small groups within organizations to address systems issues. These conferences and new methods changed the nature of how to gather all of the stakeholders in the system and get the work done, reprising Weisbord's influence that if you don't get the whole system in the room, you won't get the system issues addressed.

The work and outcomes of these conferences set the layout for what was to become their first book together, *Large Group Interventions* (1997). This book was the first to provide a systematic overview of large-group techniques and has become

a foundational book for all OD practitioners working at the system level. During the nearly 20 years since it was first printed, it has continued to provide the substance and guidance to use techniques that achieve both organizational ownership and effectiveness whilst getting all of the voices possible in the room. From the early influences of Lewin and Beckhard to more contemporary inspirations, this book has served to capture and demonstrate how change can be led at the systems level with a requisite understanding of the environmental context.

Part of the message in this book goes beyond the moral idea of democratizing large scale change efforts, to offer some very practical insights on the "why" or benefits of applying these techniques. Alban and Bunker (1997) offer that:

> Two major problems with top-down change are the amount of resistance that it creates and the time it takes to put the change in place….Representative groups or steering committees that do not meaningfully engage stakeholders do not produce commitment. Marv Weisbord (1987) is fond of saying that people will support that which they help to create. When everyone is involved in the decision process, carrying it out happens faster and with less resistance. It may seem strange, but getting everyone involved, even if it takes more time to plan and conduct change, is more efficient than trying to implement change "quickly and efficiently" using a small planning group." Furthermore, "Another advantage of using large-scale organizational change methods is access to information. The people closest to the problem or issue being discussed often have critical information that enriches the change strategy….by involving a critical mass of people, also access a critical mass of information that enriches the strategy. And, "A final advantage is that the diversity that comprises the whole system often creates synergy that leads to more innovative change – a more creative solution – than a small group can possibly produce." (pp. xvi–xvii)

The pair's subsequent book, *The Handbook of Large Group Interventions* (2006), further "chronicled" the extensive work using large-group methods that was occurring in the field of OD. A succinct history is provided about the unfolding and adoption of these techniques during the 1990s, along with case studies to further illustrate how to use them. Additionally, the authors provided four "core characteristics" that these methods have in common:

1. The inclusion of stakeholders;…that the people invited to participate include those who have a stake in the issues being discussed, regardless of level or function, whether they are inside or outside of the organization.
2. Engagement of multiple perspectives through interactive activities;….Participants engage in a series of activities that explore organization or community context and help them think more broadly than their own perspective.
3. An opportunity for Influence;….these structures allow people to have voice—to be heard—and to influence the outcomes under discussion at the meeting, and
4. A structure for finding the common ground/ agreement that participants share:…A goal and the process structure of many of these methods focus attention on the areas of agreement—the common ground—that participants share. (Adapted from 2006, pp. 19–20)

Alban's work (along with Bunker) on large-group methods will no doubt long be acknowledged and remembered at a meta-level. I would also propose that there are innumerable micro-level interactions for which Alban has made extraordinary

contributions to the field of OD: namely, the countless people whom she has trained and influenced by her scholarship, practice, and very being. From her early days in the PSOD program at NTL in the late 1960s to her leadership role in the 1970s, Alban was the doorway to OD for so many who came into the field. She has taught for more than five decades in renowned OD programs at Columbia and Pepperdine and has been formative in the lives of people who became OD practitioners. Whole generations of practitioners practice today having been guided by the core characteristics of large-group interventions, not just as techniques, but as a philosophy that the collective impacted deserves the dignity of being involved in that which will affect their lives.

This last statement, leads me to another profound contribution that Alban has made and that is making the moral imperative of giving voice to the voiceless also a valued and good practice for organizations as well as the field of OD to engage in. Perhaps, not the first to voice this, Alban certainly became the champion of this mindset in the practice and execution of leading change.

> In our experience, employees want to be treated like adults. "If there are difficulties the organization is facing, tell us about them", they say. "Help us understand the challenges. Allow us to offer our ideas and contribute to the solution. (2009, p. 22)

Recognizing that those with a "stake" in the process also had valuable insights and ideas that could improve as well as accelerate the change process being considered, Alban also believed that engagement of folks also leads to greater commitment and once offered,

> When I think about commitment, I think mission, enthusiasm, even passion. I see energy, excitement, and spirit, a willingness to put up with frustration and wrestle with obstacles. (1987, p. 151)

Alban and Bunker believe that central to an organization's success is the employees having a "sense of ownership." However, Alban will tell you that she believes this for any organization, albeit a company, or a community, or even the assisted living association she currently resides in. After moving into her assisted living community a few years ago, she realized that there was no bill of rights for the residents, and despite their shared ownership, the management could make changes and render decisions that affected the residents' lives without even asking. She proudly conveys that at 90 years of age, she launched meetings among the residents, organized and lobbied, and through their collective efforts got the Massachusetts State Legislature to pass HB-5358: An Act Establishing a Bill of Rights for Residents of Continuing-Care Retirement Communities. The legislative bill that was passed in March of 2015 ensured condo owners in these settings had a bill of rights for themselves. In her efforts to support the legislation, she testified that existing legislation did not include rights for residents, who may have invested their life savings to live in such arrangements and therefore needed protection, just like there would be in nursing homes and assisted living facilities. Those who have a "stake" in the issue(s) should be brought in and made a part of the process of change and

offered the opportunity to have their voices heard. I can't help but believe, and Alban agrees, that this in part can be tied back to the legacy and teachings of her father. A contribution she has carried forward over a lifetime.

## New Insights: Collectively Creating the Future

Alban's whole-system scholarship and practice has been profound for this author, as it has been for so many others. It has provided a basis for the insight of examining all organizing as community. She has brought this insight in to the field of OD and corporations and extended the whole-system approach to religious institutions as well (2008). The context of dynamic interactions becomes critical to the understanding of whatever "whole system" we are exploring. Moving away from the autonomous actor perspective, this legacy of work and its influences – stemming from its Lewinian origins – help us to see that all meaning is cocreated; thus, the work of the OD practitioner is to assess by not only collecting data but also understanding the interdependent stories of those involved in context, including themselves. Alban (Mead and Alban 2008, p. 133) offers these few reminders for doing so:

- You can't do it alone; you need the energy, wisdom, and commitment of the whole community.
- Build community; help the members of the congregation [*organization*] connect to each other.
- Give the people the opportunity to have meaningful conversations with one another.
- It takes persistence. One meeting does not do it; you have to keep at it.
- After an event, work with others to maintain the culture that existed during the meeting and carry the change forward.

As OD continues to bring clarity to organizations about the effectiveness of dealing with large-scale change, we as practitioners must do so in ways that allow the voiceless to be heard and be members in the dialogue for improvement. Alban herself has never gone anywhere without looking at the possibilities for improvement. She has demonstrated this many times, from her life at boarding school, to her work in the barrios of Ecuador back in the 1950s, to her latest achievement with the continuing care residents' Bill of Rights. Knowing that these living systems are a part of our life forever, she has taught us to both to look for opportunities for improvement and find the how of what can be done to make it better for all involved through processes of inclusiveness.

Alban has shown that social equity and the aims of business are not mutually exclusive but rather intricately support each other. An organization can see broader trends in the external environment but, ultimately, for most effective implementation, must act locally in a way that is meaningful for those involved. Her whole-system work has revealed that meaningful interconnection among people is essential in the forming of the collective future, ergo the organization's future. Alban and her

colleagues, notably Bunker, have demonstrated that the use of large-group interventions doesn't just connect people but actually builds community – community being a place where one has an investment and a sense of ownership, thus commitment to its success.

Alban showed through her work and advocacy that an organization's future is created by those who care – further, that this work can be done in a manner that is affirmative in nature. Her quintessential questions looked for what is possible together and include but are not limited to:

What is going well?

What if it was enhanced would be a significant improvement?

What secrets, that if they were sorted out, would further your [*organization*] life experience?

However, Alban (and Bunker) realized that the fostering of these large-group interventions would require educating leadership of an organization about their merits and benefits. She advises the OD practitioner that educating leadership for buy-in is essential to the use of these more democratic methods of intervention. Consequently, both leadership and the OD practitioner must shift to an understanding that:

> Large group interventions begin as events, but, as you will see, they can become new ways of managing in complex times. They require of management a willingness to democratize the workplace; they are not techniques for getting people to go along. They are genuinely participatory. They hold great promise for dealing with the uncertainties of the world we now face. (Alban and Bunker 1997, p. 10)

However, when used, these approaches assist in finding common ground amongst stakeholders, support mutual influence, and ultimately lead to a greater likelihood of innovative thinking.

## Legacies and Unfinished Business: What Are the New Compelling Ideas in OD Practice

Much like the organizations she worked with, Alban et al. (2004) presents the field of OD with questions about the evolution of its [*OD*] future. First, theory must find a way to translate into practice, and practice must derive its legitimacy from sound theoretical premises. Clearly, the systematizing, articulation, and dissemination of both the discoveries in scholarship and practice must find their way to a common dialogue and integration. We can learn from Alban and many others of her time that we must also risk being bold as we do so. The work of OD must continue to evolve and improve or risk becoming staid and potentially irrelevant. New frontiers for understanding lay in the application of this work to new forms of organizing and the complexity in which organizations find themselves today. Much as the insights from Alban's work have supported moving beyond small-group work to systems level, there may be a call today to move beyond the systems theory paradigm to chaordic

phenomenon and the perpetual shifts found in rapidly changing dynamics that are characterizing organizational life for so many. While this is challenging, to say the least, we may realize enormous benefits for organizations from expanding our capacity to adapt and be flexible and responsive to complex processes (Mangiofico 2013).

Alban and Bunker not only chronicled the emergence of large-group methods but the importance of the implications of these methods as well. As organizations become more diversified, virtual, global, complicated, etc., these methods hold promise to continue to assist with performance yet may require transformation to achieve democratization and inclusiveness in these new forms of organizing. To avoid becoming staid, these methods will need to accommodate the dialogue necessary to cocreate meaning in an ever-changing and heterogeneous world. They ask themselves (2004), "Why are there not more new concepts that lead to innovations in practice emerging in the field today? (p. 404)." A question I would argue as relevant 13 years later as it was when it was originally posed.

Their scholarship bridged the divide between practice and theory that paved a new way for OD practitioners to support organizations in realizing greater possibilities. Both practitioners and academics must continue to look for ways to "connect" to further develop innovative ideas for research and theory as well as new methods for practice. What form and shape this collaboration takes is still being debated between the academy and many other OD-related organizations. However, as Alban and Bunker posit, there is always the need for "the exploration of shared or common ground that is often the first goals in bringing groups together (2004, p. 419)." Perhaps, one place to look is on the cutting edge of the field such as the conceptual exploration of the fields of complex and chaotic organizing or the creative practices being employed by the organizations that have inculcated OD in to their composition, as well as inventive practices being used by practitioners in atypical settings. How might research tell us more about these developments? What partnerships, if created, would further our understanding of what's possible? And what resources if brought together would have the synergy to shift the future of OD to new relevance? I imagine, there are innumerable opportunities out there today, just as there was when Alban and her colleagues began to look around and see what was emerging 25–30 years ago. Our challenge, and perhaps a key legacy of Alban and her contemporaries, is to follow the path paved of exploring and collaborating to find emergent common ground that could fundamentally shift the future of OD, just like they did.

A voice for inclusion in the pursuit of what is communally possible, Alban has been a testament for the collective voices to be heard. Her earliest work – before the work was even known as "OD" – was propelled by a deep belief in communities and community groups of people. She reflects the idea that all of us are always in communion in organizations. We are born into a family organization with its unique characteristics, leadership, relationships with its leadership, interdependencies, and the like and go onto our local neighborhoods, school, church, community institutions, work, and so forth throughout our lives. And, in each of these contexts, if invited into the discussion, we will talk about our ideas, feelings, beliefs, and dreams and create our future together.

# Chris Argyris: The Iconoclast

**2**

Lee Bolman

**Abstract**

In a career that spanned more than 50 years, Chris Argyris played a unique, pioneering role in the development of our understanding of individuals, organizations, learning, and change. As a teacher and consultant, he was provocative, challenging, polarizing, and memorable. Many prominent scholars and practitioners credit Argyris as one of their most influential mentors. His influence stemmed from his writing as well as his personal impact. He provided the first major statement of the argument that conventional management practices create a fundamental conflict between organizations and people that is harmful to both because they treat employees like children. He developed the first comprehensive theory of organizational intervention, emphasizing core values, action research, and the ways that intervention and research can be mutually supportive. He emphasized the importance of clear values to guide efforts at organizational improvement, underscoring the importance of valid information, free and informed choice, and internal commitment. His work with Donald Schön on theories for action documented the pervasiveness of gaps between what people do and what they think they're doing. Those gaps impede organizational learning and effectiveness but prevent individuals and groups from seeing their own causality and result in behavior that deepens the problems individuals wish they could solve. Those ideas also led into work on organizational learning which emphasized that self-awareness and willingness to talk about "hot" issues are necessary but rare in organizational life.

## Contents

## Introduction

Robert Putnam (1995, p. 37) opens his biography of Chris Argyris with a telling anecdote:

> Picture a meeting of the Harvard University Interfaculty Initiative on Mind, Brain, and Behavior. An eminent professor of neurobiology is giving a talk on the anatomy and physiology of the brain. Chris Argyris speaks up to say, "If I wanted to use this knowledge to help some human being be more competent, it seems to me it ain't going to help."

As Putnam comments, this is "vintage Chris" – and note, not "vintage Argyris" because throughout his career, Argyris was "Chris" to almost everyone who knew him, regardless of relative age or status. It was one expression of his preference for egalitarian relationships. Throwing an unexpected cat among the canaries was a signature Chris Argyris move; he thrived on conflict and controversy as vehicles for dialogue and learning. With a smile and a genial tone of voice, he would pose a question or offer a hypothesis that regularly caught people off guard and moved the conversation onto terrain where he had home field advantage. His interventions often flowed from two core ideas in his world view: (1) most people, including the best and brightest, are blind to their own interpersonal incompetence; and (2) science is good only to the degree that it helps make the world better.

Argyris was notorious as a courageous provocateur who was exquisitely attuned to other people's blindness and internal contradictions, and he zeroed in on opportunities to help others learn about them. He would open classes with students in counseling and education, for example, by telling them that much of their work was "incompetence covered up by love" (Kleiner 2008). Early in his tenure at Harvard, students at the Graduate School of Education criticized him in class for his joint appointment in the business school, and one student was applauded for his statement that "As long as they're businessmen, they're no damn good!" (Kleiner 2008). Chris listened and went on. At the next class, Argyris opened by calling on a black student, "I'd like to ask you about the concept of nigger. What's the meaning of the concept?" There was dead silence. The student asked, "Are you crazy, professor?" Argyris said he really wanted an answer. A spirited discussion ensued, and Argyris summarized it with the observation that the concept of nigger treats an individual as part of a stereotype that means, regardless of who you are, "If you're black, you're no damn good. Is that correct?" Students nodded assent. Then Argyris played audio from the previous class of the student saying businessmen were no damn good. He asked, "Ladies and gentlemen, what's the difference?"

Chris Argyris was both loved and hated, admired and feared by his students and colleagues. Few, however, would deny that he was memorable. Many spent years replaying in their minds his comments or confrontations and their debates with him. He was at his energizing, provocative best in person, and many saw him as an extraordinary teacher. Argyris was also a prolific scholar who produced seminal works throughout a career that spanned six decades.

## Influences and Motivations: An Immigrant Who Loved Combat

Chris Argyris and his twin brother, Tom, were born in New Jersey in 1923, the second and third sons of Greek immigrants (Argyris, 2017, personal communication). Chris and Tom were close throughout their lives, and that partnership helped them both deal with their mother – a dominating, larger-than-life figure whom the boys referred to as "the general." Their mother would sometimes punish a misbehaving child by making him stay outside overnight. On at least one occasion, Chris slept on the floor inside the front door while his brother slept on the other side of the door. Before attending school, Chris and his two brothers spent several years living with their grandparents in Athens. When he returned to the United States and entered school, he was a short skinny kid with limited English who was sometimes the target of ethnic slurs (Argyris 1992; Lundberg 1998). Those early struggles anchored self-examination and self-improvement as central passions in his life.

Chris was also the peacemaker in the family, as demonstrated in one of the great family legends. His brother Tom fell in love and married Bertie Frankenhouser, who came from a family of Orthodox Jewish holocaust survivors. Bertie's parents strongly opposed the marriage, and her father pronounced that his daughter was now dead to him. As fate would have it, on a subsequent trip to Holland,

Mr. Frankenhouser visited a favorite café and was stunned to see Chris sitting at a table. Mistaking Chris for Tom, Mr. Frankenhouser fainted. Chris correctly intuited that this was his new father-in-law and told him when he woke up that this was clearly God's work. Chris subsequently arranged for the two sets of parents to meet, and it turned out that the two immigrant families enjoyed one another very much.

At the outbreak of World War II, Argyris joined the US. Army Signal Corps, eventually rising to become a second lieutenant. He viewed his military experience as formative in many ways. Chris saw a wider world than his immigrant community in New Jersey and learned that he had capacities and talents beyond those that he had previously recognized. He was profoundly influenced by his experiences as both subordinate and leader in a large and complex organization. He also got a powerful lesson in self-awareness.

> I was the officer in charge of several large Signal Corps depots in Chicago. I had formal awards to show that I was a very effective leader in terms of technical performance and efficiency. After I was discharged, I visited the depots as a civilian. I then found out that the employees had serious doubts about my human skills. Consistent with my upbringing, my reaction was that I had better learn more about myself. (Argyris 1992)

After the war, Argyris began his undergraduate studies and majored in psychology at Clark University, which had a strong tradition in that field. Its first president, G. Stanley Hall, was the founder of the American Psychological Association, and Sigmund Freud introduced psychoanalysis to North America in a series of lectures at Clark in 1909. While at Clark, Argyris first met Kurt Lewin, whose dictum that "there is nothing so practical as a good theory" became a central theme in all of Argyris' work. He described Lewin's impact as "tremendous" and could have been talking about himself when he summarized his view of Lewin: "Lewin did three things: he was committed to understanding reality as his participants understood it, he used a combination of so-called 'normal' science with a narrative-integrative approach, and he tested his ideas by trying to change the things he was studying" (Woodell 2003).

After Clark, Argyris followed the environmental psychologist Roger Barker, with whom he had worked with at Clark, to the University of Kansas. At Kansas, Argyris earned a master's degree in psychology and economics before heading to Cornell to study for a Ph.D. under the ethnographic sociologist, William Foote Whyte.

Whyte shared Lewin's belief that behavior had to be understood as a function of both person and environment, as well as Lewin's interest in action research. In his classic study of Boston gangs, *Street Corner Society* (Whyte 1993), Whyte became a participant observer who sometimes intervened to help his subjects solve problems that they faced. In describing what he learned from Whyte, Argyris said, "He was part of the Chicago School of Sociology that also focused on observing reality. He would send us out as graduate students and tell us to 'observe something.' He really helped us build a strong commitment to connecting with observational data. But he was also interested in change. In the last 30 years I would say he did more than any other sociologist to promote social change, especially in the area of labor-management relations" (Woodell 2003).

Argyris completed his work at Cornell in 1951, receiving the first Ph.D. in organizational behavior ever awarded and began his career at the Yale Labor and Management Research Center, working with its director, E. Wight Bakke. During his first year, Chris was asked to do an assessment of the state of research on organizations, which gave him an opportunity to interview the leading scholars in the field. He was then invited to talk at a conference of those leading lights:

> I presented my findings in a conference chaired by Douglas McGregor. He began by asking me to say one or two things I wanted to highlight. Without hesitating, I told the group that my biggest learning was how little they knew about each other's work, how insulated they were, and how their behavior did not match their espoused theories about integration and progress. There was deafening silence when I finished. . . . Later, several big names advised me that what I observed was probably correct. They also added that it may have been a poor career strategy to discuss those ideas publicly. Such discussions, they advised, were best done discreetly. Those who know my work know that I have not followed that advice. (Argyris 1992, p. 50)

Argyris stayed at Yale for 20 years, eventually becoming the Beach Professor of Administrative Sciences. He led the creation of Yale's Ph.D. program in organizational behavior and served as chair of the department of administrative sciences, which subsequently evolved into Yale's School of Management.

In 1971, Argyris moved to Harvard University as James Bryant Conant Professor of Education and Organizational Behavior. It was there that he began a collaboration with the M.I.T. philosopher Donald Schön, which led to some of his most significant late career work. Even after moving to emeritus status at Harvard, Argyris remained active as a scholar and consultant. He published his last book, *Organizational Traps: Leadership, Culture and Organizational Design*, in 2010, 3 years before his death at age 90 in 2013. He was survived by his wife of 63 years, Renee, and their two children, Dianne and Phillip.

## Key Contributions: There Is Nothing So Practical as a Good Theory-Based Intervention

The bulk of Argyris' work appears in books rather than journal articles. He once explained that he preferred writing books because he knew he could write what he wanted and get it published. The titles that Argyris chose for some of his most significant books provide signposts to organize a discussion of his major contributions.

### Personality and Organization

*Personality and Organization*, published 6 years after he completed his Ph.D., was the work that first put Argyris on the scholarly map. The publication year, 1957, positions it as one of the earliest efforts to develop a theoretical framework for the emerging field

of organizational behavior. It appeared a year before March and Simon's *Organizations*, 3 years before Douglas McGregor's T*he Human Side of Enterprise* (1960), and 4 years before Rensis Likert's *New Patterns of Management* (1961). In his introduction, Argyris wrote that it was too early to develop a mature theory, but he hoped to produce "a few basic foundations for what may someday develop into a systematic framework for the field of organizational behavior."

The title captured the book's focus: Argyris wanted to work at the intersection of research and theory on personality, on the one hand, and organizations on the other. "Most of this book, therefore, focuses on the question of *why* people behave the way they do in organizations." His central theme was that there was a basic conflict between human personality and prevailing management practice. Argyris argued that people have basic "self-actualization trends" – akin to the efforts of a plant to reach its biological potential. From infancy into adulthood, people advance from dependence to independence, from a narrow to a broader range of skills and interests. They move from a short time perspective (interests quickly developed and forgotten, with little ability to anticipate the future) to a much longer-term horizon. The child's impulsivity and limited self-knowledge are replaced by a more mature level of self-awareness and self-control.

Argyris argued that organizations often treated workers like children rather than adults. This person-structure conflict was built into traditional principles of organizational design and management. The structural concept of task specialization defines jobs as narrowly as possible to improve efficiency. Bosses direct and control subordinates, thus encouraging passivity and dependence. The conflict worsens at lower levels of the hierarchy – narrower, more mechanized jobs, more directives, and tighter controls. As people mature, conflict intensifies. Argyris argued that employees try to stay sane by looking for ways to escape these frustrations. He identified several options:

- They withdraw – through chronic absenteeism or simply by quitting.
- They stay on the job but withdraw psychologically, becoming indifferent, passive, and apathetic.
- They resist by restricting output, deception, featherbedding, or sabotage.
- They try to climb the hierarchy to better jobs. Moving up works for some, but there are rarely enough "better" jobs to go around, and many workers lack the desire or skills to become managers.
- They form alliances (such as labor unions) to redress the power imbalance. Union movements grow out of workers' desire for a more equal footing with management. Argyris cautioned, however, that union "bosses" might run their operations much like factories, because they knew no other way to manage. In the long run, employees' sense of powerlessness would change little.
- They teach their children to believe that work is unrewarding and that hopes for advancement are slim.

Argyris offered no simple fixes for these issues. Research was still too primitive, he said, though he proposed that "reality-centered leadership," which included self-

awareness and an understanding of individual and group dynamics, would help. He devoted a chapter to the "development of effective executive behavior" and articulated a theme that was to figure throughout his career. He described a visit to an executive development center in Europe where he asked the faculty how they felt about helping participants develop greater awareness of themselves and their impact on others. They said it was very important. Then Argyris asked why it wasn't part of their teaching. He noted that in discussions of business cases, the faculty focused on case content but not on "the executives' *own behavior* which is not only before their eyes, but *caused* by their interactions with each other." (Argyris 1957, p. 223)

Argyris reprised his views on the person-organization relationship almost 15 years later in *Integrating the Individual and the Organization* (1964). He updated his argument about conflict between individual and organization before devoting attention to methods for improving alignment. He wrote that better alignment required reducing defensive activities and the energy consumed in maintaining those defenses, while increasing individuals' experience of psychological success and the energy available for work. His recommendations included job redesign, a contingency model of structure (different structures for different kinds of decisions), and more emphasis on values. He acknowledged that his suggestions were speculative and would require further research.

## Interpersonal Competence and Organizational Effectiveness

Argyris became active in the T-Group movement in the 1950s, and this interest is strongly reflected in *Interpersonal Competence and Organizational Effectiveness* (Argyris 1962), which chronicles an intervention with the top executive system of a "very large corporation located in the Midwest." (Although not identified by name, we know that company was a major division of IBM in an era when "Big Blue" was perhaps the most admired business in America). In this book, Argyris briefly returns to the theme of conflict between individual and organization but argues that the conflict can be leveraged for growth. He added that how to do this is different at the top and bottom of organizations. Because lower-level workers have little control over their conditions of work, changes in the socio-technical environment are needed. But at executive levels, where individuals have high control over their work environment, it is essential to intervene at the interpersonal level.

The problem among executives that needs to be addressed, according to Argyris, is that traditional organizational values too narrowly emphasize rationality, control, and avoiding emotions. Those values impair interpersonal effectiveness because they lead executives to suppress feelings and ignore interpersonal dynamics. An emphasis on rationality leads to an irrational neglect of human issues that are a major element in executives' work. The effort to suppress emotions causes execs to avoid seeing or discussing sensitive or threatening ideas or issues. As a result, they are less likely to experiment or to be open to new possibilities. In such a system, individuals will also tend to be unaware of their impact on others and ineffective in solving interpersonal problems.

Much of the book describes an intervention that began with a diagnostic phase that included individual interviews with each executive and observations of their meetings. Argyris then organized the data around a series of themes such as the difficulty of getting at the facts, the proper role of the leader, difficulty of being a dissenter, management by crisis, and mistrust. Argyris presented the results in a 6-h, off-site meeting. The central message was that the executives, without knowing it, were creating the very problems they hoped to avoid. By the conclusion of the feedback session, the executives agreed to participate in a laboratory education program – with a T-group as its central feature.

In the book, Argyris develops an extensive conceptual rationale for why T-groups make sense as an intervention. In the classic T-group opening, the leader (Argyris uses the term "educator" in this book) typically opens with a few words encouraging the participants to learn from the experience by focusing on the here and now and then goes quiet. Participants face the question, "Now what?" They soon learn that their usual behavior patterns do not work, and they are forced to invent new ones. In the process, they begin to provide one another feedback, which helps them break free of old norms and develop new patterns. Argyris was always passionate about the importance of "directly observable data" and provides extensive accounts of what the executives actually said to one another during the T-group. An example, focusing on how bosses and subordinates interact with one another, is below:

> #2: They [corporate headquarters] really ask for too much detail. We get frightened, so up goes the paper work to be protected.
> #8: This makes our system an advisory one. We go up to them to argue our case before a judge. And the worst thing we can do is not have all the details.
> #7: Good point. I think we have little confidence and trust in our decision-making process, come to think of it.
> #2: (To division president) It was a lack of trust in, frankly, you. I felt if you had your way, you would have wanted X fired, and I thought it through far enough to be convinced that this was wrong.
> Educator: What would have happened if you could talk about your fears? This could get to the point that he [the President] may not trust you in firing people.
> #2: That's a good point.
> President: Yes, in all honesty, #2, I do feel you're weaker in handling the people problems.
> #2: And I've felt this.
> President: And by the way, I get this from above. Not as much. I think they are trying to leave us alone. Every time some major problem hits, I get put on the spot. "What's going on there?" "Are you a weak manager?" "Do you have incompetent people?" (Argyris 1962, pp. 205–206)

After the laboratory, Argyris spent several weeks studying the executives and interviewing their colleagues and subordinates. He found that the laboratory had led to significant changes in the behavior of the laboratory participants that were visible to those around them – they were more patient and understanding, better listeners, and less controlling. But colleagues and subordinates also reported that the changes started to wear off after a few weeks, and they were not sure how much to trust the

new behaviors. In a 9-month follow-up, Argyris found that the T-group participants still felt it had made a significant difference. One executive, for example, described a situation in which he discovered a computing error that might have cost the division hundreds of thousands of dollars. Before the intervention, he might have tried to hide the bad news for as long as possible, but now he felt free to discuss the problem immediately with the president.

Argyris summarized the outcomes of this intervention by saying that there was much to learn but reason for optimism: "We are suggesting nothing less than that the basic values which emphasize the dignity and importance of the individual can be integrated with the fury and pressure of everyday administrative life to the benefit of the individual and the organization" (Argyris 1962, p. 285).

In the next several years, the bloom came off the rose for the use of T-groups as a vehicle for organizational change. Argyris was involved in a notorious effort to use T-groups as an intervention into the culture of the US State Department. Although the foreign service officers who participated in the laboratories found them encouraging, the bureaucracy fought back, and ultimately the program was canceled. More scholar than diplomat, Argyris wrote a report in which he argued that efforts to reform the State Department would invariably fail unless they found a way to alter a culture that discouraged forthrightness and risk-taking and encouraged those who played it safe and did "not make waves" (Argyris 1967). The state department's defensive, risk-averse response was consistent with his diagnosis, but that meant the intervention made little dent. Argyris and the field of organization development gradually concluded that successful change required more than T-groups.

### Intervention Theory and Method: A Behavioral Science View

Argyris presented a broader view of organizational change in *Intervention Theory and Method,* published in 1970, well after his T-group interventions in organizations like IBM and the US State Department. He argued that it was a mistake to try to separate research and intervention and that the best way to understand something was to try to change it. While acknowledging that there were risks in combining research with intervention, he insisted that traditional approaches to research were based on the same top-down, unilateral values as traditional, dysfunctional models of organization. He argued that research, intervention, and organizations should all be designed around the same three core values: valid information, free and informed choice, and internal commitment to choices. He used case examples to support the argument that those three values could provide guidance in all of the major phases of a behavioral science intervention, including choice of client, diagnosis, intervention strategies, and assessment of outcomes. The book filled a gap in the literature by offering a comprehensive theory of intervention and had a significant impact on the thinking of practitioners in the rapidly growing fields of planned change and organizational development.

## The Applicability of Organizational Sociology

Argyris returned to the question of research and the role of the social scientist in several later books. *The Applicability of Organizational Sociology* (Argyris 1972) was based on a paper Argyris presented at an invitational conference. In it, he vigorously criticized the work of several eminent sociologists who were in the room, including Peter Blau, Charles Perrow, and James D. Thompson. Of Blau, he wrote bluntly that his "work may be more properly viewed as a quality control check on civil service regulations than as a contribution to formal organization theory." (Argyris 1972, p. 18). He wrote of Thompson that his "variable human seems to be minimally variable and minimally human." He criticized all the sociological work for failing to deliver on its promise to study the organization as a whole, for neglecting individual and interpersonal elements in organizations, and for providing no insight into how organizations might be changed and improved. The discussion of his paper at the conference was spirited, to put it mildly, and Chris loved the energy in this kind of debate.

Argyris developed this argument further in *Inner Contradictions of Rigorous Research* (1980). He repeated his argument that because traditional research strategies rest on the same values as traditional approaches to management, they produce internal contradictions, interfere with collection of valid data, and reinforce the status quo rather than foster new and better organizational forms.

## Theory in Practice: Increasing Professional Effectiveness

After he moved to Harvard in 1971, Argyris began a collaboration with Donald Schön that was to last until Schön's death in 1997. Until they began to work together, Argyris' output had been almost entirely single-authored books and articles, but the books he wrote with Schön are among the most influential of his career. The two began working together on an initiative to train school leaders. They brought together Schön's ideas on reflective inquiry and reflection in practice with Argyris' emphasis on interpersonal processes and directly observable data. They developed a novel structure for written personal cases, asking individuals to describe a situation in which they were or had been involved. The description was to include a section in which the individuals indicated what they intended and hoped to accomplish. Then they were asked to provide a brief script for how the conversation might go, structured in two columns, as in this excerpt from a case written by a manager (M) about a conversation with a subordinate (S):

| My underlying thoughts and feelings | What was said |
| --- | --- |
|  | M: S, during the past year, your performance has not been acceptable. You seem to be carrying a chip on your shoulder. I've heard words like lethargy, uncommitted, and disinterested in describing your recent performance. Administrators cannot have those characteristics. Let's discuss your feelings about your performance |

*(continued)*

| My underlying thoughts and feelings | What was said |
|---|---|
| He's aware of his current level of under-achievement. Why does he want to know if everyone noticed? | S: I recognize that I have not been performing up to my capability. Before we discuss that further, I'd like to know how widespread the perception of my lack of motivation is |
| | M: I think everyone in the firm has noticed |
| This old chestnut should be behind us | S: I have not been treated fairly. I worked hard as a leader at Office A, and the record shows it. I have not received recognition for my accomplishments. Instead, I've been kicked in the teeth |
| | M: You know that I'm not familiar with the specifics of the problems at Office A. I don't see any point in reminiscing about something that happened several years ago. Nothing constructive will come of it. I want to talk about you today – matters pertinent to your present and future performance |
| That is a valid point, but what's he doing with all his time? | S: There's not much I can do here with the weak economy |

The right hand column shows what was said between the parties. The left hand column contains unexpressed thoughts, feelings, or reactions that the case writer had in the course of the conversation.

Argyris and Schön collected hundreds of similar cases and discovered a remarkably consistent pattern. The cases almost invariably showed notable gaps between intent and behavior. Those gaps were easily visible to others who read the case but largely invisible to the writer. The cases suggested that almost everyone seemed to be reading from the same generic script, programmed to follow the same basic values and strategies. From these data, Argyris and Schön inferred that human reasoning and behavior are determined by two different versions of a "theory for action." One is the espoused theory, which contains individuals' own account of their behavior. Ask an individual to describe, explain, or predict his or her behavior, and the response constitutes espoused theory. But the case evidence consistently showed gaps between espoused theory and actual behavior. Individuals typically see themselves as more rational, open, concerned for others, and democratic than others see them. Such blindness is persistent because people learn little from their experience. Argyris and Schön attributed this to a generic theory-in-use that could account for much of the behavior they observed across the cases that they collected. They labeled it Model I (see Table 1).

Lurking in Model I is an implicit assumption that social interaction is dangerous, and you have to protect yourself against the ongoing risk of blows to your self-esteem and self-image. Individuals accomplish that through unilateral control, self-protection, and protection of others. Argyris and Schön acknowledged that Model I often worked on accomplishing goals, but they also emphasized the costs to learning. Individuals using Model I test assumptions privately, making self-sealing more likely. Another consequence of Model I is "single-loop learning," which often takes

**Table 1** Model 1 theory-in-use

| Core values (governing variables) | Action strategies | Consequences for behavioral world | Consequences for learning |
|---|---|---|---|
| Define and achieve your goals | Design and manage the environment unilaterally | You will be seen as defensive, inconsistent, fearful, selfish | Self-sealing (so you won't know about negative consequences of your actions) |
| Maximize winning, minimize losing | Own and control whatever is relevant to your interests | You create defensiveness in interpersonal relationships | Single-loop learning (you don't question your core values and assumptions) |
| Minimize generating or expressing negative feelings | Unilaterally protect yourself (from criticism, discomfort, vulnerability, and so on) | You reinforce defensive norms (mistrust, risk avoidance, conformity, rivalry, and so on) | You test your assumptions and beliefs privately, not publicly |
| Be rational | Unilaterally protect others from being upset or hurt (censor bad news, hold private meetings, and so on) | Key issues become undiscussable | Unconscious collusion to protect yourself and others from learning |

the form of "do-better" learning – individuals look for ways to do better at whatever they're already doing. But, Argyris and Schön argued, Model I inhibits double-loop learning, which inquires into the assumptions and values that underlie the behavior. At the organizational level, Model I enables tactical but not strategic learning – organizations may find ways to improve activities within the current business model but will have difficulty seeing or addressing the need for more fundamental change. This phenomenon is illustrated in many cases in which new entrants outmaneuvered established organizations at times of discontinuous change in technology or markets.

Argyris and Schön proposed an alternative theory-in-use, Model II, as an antidote to the blindness, defensiveness, and ineffectiveness generated by Model I. Where Model I was rooted in a large body of evidence, Model II was a rooted in the authors' theory. The governing variables in Model II were the same as the core values that Argyris had proposed a few years earlier in *Intervention Theory and Method* (1970): valid information, free and informed choice, and internal commitment. Model II emphasizes mutual influence, public testing, and combining advocacy with inquiry.

## Organizational Learning: A Theory of Action Perspective

In their next book together, *Organizational Learning*, Argyris and Schön built an organizational superstructure atop their theory of action conceptual model. It can be summarized in the following propositions:

1. *Organizational learning involves the detection and correction of error.*

   Argyris and Schön offer case examples throughout the book in which individuals in an organization were aware of significant error, but the organization could not act on this information because it was never communicated to decision-makers in a way that they could hear, understand, and use.

2. *Single-loop learning enables an organization to continue current activities and achieve existing goals, while double-loop learning enables an organization to change its underlying norms, policies, and objectives.*
3. *Most organizations are good at single-loop learning but poor at double-loop learning because they have O-I learning systems.*

   Argyris and Schön's model of O-I learning systems depicts a world in which information that is vague, ambiguous, hard to access, or inconsistent gives rise to error. In an ideal world, a good dialectic would enable the organization to detect and correct error but that is difficult or impossible in a Model I behavioral world where error is threatening and people are programmed to protect themselves and avoid threat. So they cover up. They avoid discussing sensitive issues or sanitize the sensitive content, which makes communication more ambiguous and confusing. This creates a bind because people's covering up violates organizational espoused theories that "we are rational people who do what it takes to solve important problems." No one wants to admit to themselves or others that they covering up. So they camouflage the cover-up and then camouflage the camouflage.

4. *When organizations recognize their inability to detect and correct significant errors, they often call on outside consultants for help. Those consultants may provide excellent diagnoses of the problems, but their interventions often fail because the consultants themselves operate in a Model I behavioral world and thus reinforce the dynamics that produced the problems in the first place.*
5. *Interventions to change limited learning systems can only work if individuals learn to employ Model II theories-in-use and then work to create Model II organizational learning systems.*

   Argyris and Schön illustrate this proposition using a number of cases of chronic organizational dysfunction in the private, educational, or public policy sectors. They note that in all these cases, participants feel caught in a system that they know is ineffective but that they despair of fixing. Caught in double binds, they play organizational games in which they use unilateral action and manipulation to protect their own interests. Their actions reinforce the very dynamics they wish they could change, but they are unaware of their own causality in maintaining ineffectiveness.

   In their conclusion, the authors acknowledge that one of their fundamental propositions is yet untested: can an intervention that focuses on the behavioral dynamics succeed in creating the O-II system that they recommend. They admit that such a goal is very difficult to achieve. Systems are stuck at O-I because members lack the capacity

to engage in double-loop inquiry and learning. Developing that capacity is difficult and time-consuming. Why bother? Argyris and Schön suggest that organizations may not have a choice: their limited capacity to learn stifles adaptation, innovation, and creativity, all increasingly vital to success in the modern world.

## New Insights: Learning Is Fundamental but Hard

Three principles that I learned from Chris Argyris pervade everything I do as a scholar and teacher.

1. Blindness and incongruence are pervasive in human interaction and constitute a fundamental barrier to learning and effectiveness at both the individual and the organizational level.
   I learned this truth at a personal level at the same time that I was trying to grasp it conceptually. As a young doctoral student, I had in Chris Argyris a faculty advisor who was tireless in his willingness to challenge and confront me. No hint of incongruence or wisp of interpersonal blindness escaped his notice. Working with Chris was hard and sometimes painful. But I would not have wanted it any other way. He was offering what I knew I needed – an opportunity to learn about the parts of myself with which I was most blind or least comfortable.
2. The personal learning needed to increase authenticity and self-awareness requires uncommon courage, honesty, and skill.
   Learning about aspects of oneself or one's behavior is inherently uncomfortable, if not painful. Everyone knows this – that is why there is an almost universal unconscious conspiracy to keep each other in the dark. As Argyris puts it, "All over the world, there is a theory-in-use about how to handle people nicely. The theory goes something like this: If you think you have to say something that will be upsetting to another person, do it in such a way that they can't hold you responsible for upsetting them. So, you bypass the threat, you cover up that you're bypassing, and you cover up that you're covering up."
       If you violate this rule of handling people nicely, they may feel hurt or angry and blame you. They may attack, pull back, or break off the relationship. In groups and organizations, you may be viewed as lacking in social grace, disruptive, or unwelcome. Those around you are likely to mobilize to whip you into line and, if that fails, to seek to expel you from the group. Only high levels of courage and skill can overcome this wall of resistance.
3. As a scholar and teacher, my primary task is learning, not comfort.
   As scholars of organizations, our work is to help individuals and larger systems attain the insights, skills, and commitments they need to build relationships and systems that value truth and freedom as well as effectiveness. Sometimes, that work requires willingness to challenge and push boundaries. That does not mean we have license to be uncaring or unpleasant, but avoiding "sensitive" topics or messages that might be upsetting often means that we steer clear of the areas that have the potential to produce the greatest learning.

## Legacies and Unfinished Business: Integrating Practice and Research

### The Individual and the Organization

When Argyris published his classic book, *Personality and Organization,* he opened the door for research on person-organization fit, though it took more than three decades for scholars to do significant empirical work in the area (in part because there were so few scholars in the field when he first published). In their meta-analysis of research on person-organization fit, Verquer et al. (2003) traced the concepts back to Argyris, but the earliest of the 21 studies they surveyed was published in 1989. Kristoff-Brown and Billsberry (2013) note that person-organization fit is "one of the most widely-used psychological constructs in industrial and work psychology" (p. 1). They acknowledge that there is substantial debate among scholars about how to conceptualize and measure the concept but add that empirical work has found that "fit has been shown to influence employees' motivation, job satisfaction, organizational commitment, tenure and performance" (p. 1). Meta-analyses by Hoffman and Woehr (2006) and Kristof-Brown (2005) confirm that person-organization fit is related to variables such as performance, organizational citizenship behavior, turnover, and job satisfaction.

### Interpersonal Dynamics in Organizations

Social psychologists such as Bales (1970) had studied interpersonal behavior in small groups before Argyris published his 1962 book, *Interpersonal Competence and Organizational Effectiveness*, but their prior work was mostly descriptive and provided little guidance on how to improve interpersonal effectiveness. Consistent with his world view, Argyris offered a normative perspective on how interpersonal dynamics could impair organizational effectiveness and what could be done about it. In this and subsequent work, Argyris insisted on the importance of directly observable data on how organizational participants interacted with one another. His ideas subsequently fed into a number of other research strands, including work on groupthink (e.g., Janis 1972), group performance (e.g., Hackman and Morris 1975), interpersonal trust (e.g., Ferrin and Dirks 2002), and emotional intelligence (e.g., Salovey and Mayer 1990).

### Organizational Change and Intervention

By the time that Argyris published *Intervention Theory and Method* in 1970, there was a growing literature on organizational development (OD) and planned change (e.g., Beckhard 1969; Bennis 1969; Schein 1969) that tackled a range of techniques and challenges. Argyris' work, however, was distinctive in offering a comprehensive and systematic conceptual framework. Argyris extended these ideas in his subsequent work on change, leadership development, and organizational learning, and his ideas have had substantial impact on the field (Cummings and Worley 2014).

## Organizational Learning

Argyris and Schön's 1978 book, *Organizational Learning*, was the most cited and probably the most influential work in his long career. Argyris and Schön conceptualized organizational learning as detection and correction of error. They focused particularly on how managers' interactions with one another obstruct learning because they avoid undiscussable issues and tiptoe around organizational taboos. This often seems to work in the short run because it avoids conflict and discomfort but creates a double bind. Managers can't solve problems without dealing with issues they have tried to hide, but tackling them would expose the cover-up. Argyris and Schön's ideas deeply influenced the thinking of Peter Senge in his highly influential 1990 book, *Organizational Learning*, and are reflected in other perspectives such as Kogut and Zander's (1992) argument that "growth occurs by building on the social relationships that currently exist in a firm."

Argyris and Schön's discussion of organizational learning reflects a particular focus within a broader field. Huber (1991), in his review of the organizational learning literature, sees conceptual divergence and a paucity of cumulative research, in part because scholars conceptualize learning in a variety of ways and publish across many different journals and disciplines, making it harder for scholars to find one another. So, for example, where Argyris and Schön define organizational learning as detection and correction of error, Levitt and March (1988) argue for viewing it as "encoding inferences from history into routines that guide behavior" (p. 319). Crossan et al. (1999) equate it to overall renewal of the enterprise and argue that it encompasses "four processes – intuiting, interpreting, integrating, and institutionalizing – linking the individual, group, and organizational levels."

## Social Science Research and Action Science

Following the lead of Kurt Lewin and his doctoral advisor, William F. Whyte, Argyris was a proponent of action research (or action science) from the beginning of his career. He argued that in practice, most social science was internally inconsistent because its basic methods inhibited the collection of valid data and prevented researchers from being helpful to the groups and organizations they studied. In his view, social science research was typically hostile to the people who were being studied. His argument rested on the proposition that standard social science methods are built around the same values of unilateral control and unilateral protection that dominate standard managerial practice – values which make it difficult to detect or correct error and to deal with threatening or sensitive topics. As a result, social scientists create a behavioral world in their relationships with the subjects of their research in which their findings will reinforce the status quo and offer no help in solving pressing social problems. Argyris' work has had a significant influence on the field of action research (see, e.g., Friedman 2001; Greenwood and Levin 2006; Torbert 2004). His critique of mainstream social science has been ignored or rejected by many scholars but not all. Gergen (2012), for example, cites Argyris as showing

that social science research has led to knowledge that "encourages government manipulation of the public" and is "ultimately inimical to social well-being" (p. 123). Hoshmand. and Polkinghorne (2002) cite Argyris in developing their argument that "the knowledge base of the [psychological] profession should be derived with diverse methods and from multiple sources, including the knowledge of practice" (p. 55), because that would enable researchers to take account of "the contextual instability of [researchers'] theories and the embedded nature of their research findings" (p. 60).

## Conclusion

An iconoclast throughout his career who found much to critique in the world around him. Argyris developed a coherent, distinctive, and provocative set of ideas that continue to challenge educators, practitioners, and scholars. "As Argyris' own theory predicts, his work threatens the scientific and managerial status quo, and he has been criticized by scholars and managers alike" (Lundberg 1998). He challenges educators to deepen their reflection on their values, their practice, and the relationships they create with their students. He models ways of learning from conflict, and he encourages an appreciation for the value of self-reflection and willingness to discuss the undiscussable. He asks practitioners to risk moving out of the safe but stultifying world of conventional ideas about organizations and leadership, to embrace values of valid information and free, informed choice, and to enhance their ability to learn from their experience. He challenges scholars to take responsibility for making the world a better place rather than developing theory and knowledge that reinforce the status quo. Throughout his life, Argyris retained a passion for self-improvement, for learning more about himself, and for making organizations more effective and humane. He wanted to help create a world in which that passion was more widely shared.

# Achilles Armenakis: A Journey of Discovery – Seeing Change Through New Eyes

**3**

Dennis R. Self

**Abstract**

The Scottish poet, Robert Burns, once wrote that "the best laid schemes o' mice and men, gang aft agley" (as cited in Crawford and MacLachlan 2009, p. 48). The journey Achilles Armenakis has taken perhaps can be best described as a journey to understand why the best laid change schemes of men have "gang aft agley." This chapter describes his personal journey along with those of his colleagues to not only understand the problems that arise when organizational leaders try to implement change initiatives but also to offer a framework by which organizational symptoms impacting organizational performance may be recognized, causes of those symptoms discovered, and solutions to "fix the causes" may be proposed. Understanding the process of diagnosis and evaluation, while identifying diagnostic bias, initially drove much of his research. However, during his voyage of research and discovery, Armenakis focused on change readiness or readiness for change in an organization. Along with his colleagues, and those doctoral students he so much influenced as a teacher, he has sought to answer the critical question of how change impacts organizational members, or change recipients, and what motivates them to not only accept but embrace a change initiative. I was one of those students fortunate enough to have the opportunity of studying under him and

Dennis R. Self has retired.

being along on part of that voyage. A favorite quote of his over the years has been that of Marcel Proust (Proust, *Remembrance of things past*. New York: Vintage Books, 1981 edition): "The real voyage of discovery consists not in seeking new lands, but in seeing with new eyes." Somehow, this has always seemed appropriate.

## Contents

## Introduction

There is an old saying that the only constant is change, to which we might add that understanding it is, therefore, critical. Because it is an industry of change consultants has emerged over time to assist managers in understanding and dealing with the particular forms of change impacting their organizations. Correspondingly, theoretical and empirical research has emerged in academia to explain change in its various forms, the impact of those forms and outcomes. A seminal paper by Lewin (1947) shaped much of that work as researchers focused on the phases of implementing change (or unfreezing, moving, and refreezing as Lewin described it). One of those researchers was Achilles Armenakis, who applied the three phases or stages of

change, expanding on and redefining the three stages as readiness, adoption, and institutionalization. Armenakis focused on understanding organizational members' beliefs about change and how best to create readiness for change. As such, diagnosis of the organizational context, the situation itself, and the member's beliefs to enable change leaders to develop effective strategies of change has been a critical part of his research.

## Influences and Motivations: Collegial Mentoring

Achilles Armenakis enrolled in the management doctoral program at Mississippi State University in 1967. An early mentor of his was management professor Dr. Donald (Don) C. Mosley, Sr., an active consultant who became interested in the emerging field of organizational development (OD). In the courses he taught, Mosley exposed Armenakis to numerous research articles on OD, including research by Kurt Lewin (1946, 1947). At the end of Armenakis' coursework, Mosley included Armenakis in an action research project with a US government-funded project in Mississippi. Action research comprises four phases, namely, problem diagnosis, action planning, implementation, and evaluation (Lewin 1946). Using an OD approach, Armenakis assisted in the problem diagnosis phase of action research. Interviews were conducted with numerous employees of the organization, generating much rich qualitative data. At night in the motel rooms, Mosley provided guidance to Armenakis about conducting interviews. Subsequently, during this project Armenakis' role was to design a method for evaluating the changes to the organization. This practical challenge of communicating to the client organization the results of the change project introduced Armenakis to the difficulty in evaluating organizational change. Working with his dissertation director, Mosley, and in conjunction with his other committee members, Armenakis conducted an empirical investigation of the evaluation problems experienced by OD consultants, and then devised procedures from the scholarly research to resolve the empirically identified problems (Armenakis 1973).

The action research project with Mosley provided the foundation for Armenakis' career in organizational change since the project involved all phases of action research. After Armenakis completed his doctoral studies, he was employed at Auburn University, where he established his research program in organizational change. In 1977, Armenakis founded the Auburn (University) Technical Assistance Center (ATAC), partially funded with a grant from the Economic Development Administration. ATAC (which still is operating; see http://www.auburnworks.org) is an applied research and consultation center which was designed to assist businesses in improving organizational effectiveness. Released from all teaching assignments, Armenakis devoted full time to providing management and technical assistance to businesses throughout the southeast USA. Thus, he was able to apply his interest in organizational change. Many of the projects he directed while in ATAC included the action research phases. Thus, his experience in these projects stimulated him to publish articles in the scholarly and

practitioner journals described below. In 1985, he resumed his full-time professorial role as Lowder Professor of Management.

The organizational culture of Auburn University's Department of Management also influenced Armenakis' research interest. The collegial culture of the department and the norm of publishing in academic journals resulted in developing a network of close colleagues. In particular, Arthur G. Bedeian, Hubert S. Feild, Stanley G. Harris, Kevin W. Mossholder, and William H. Holley served as valued colleagues that shared research ideas and solutions to practical issues faced by academics and practitioners. Additionally, the Auburn University PhD program allowed Armenakis to work with many talented graduate students.

## Key Contributions: Action Research

Armenakis' key contributions to organizational change can be grouped into five topics, namely, advancing expertise in evaluation; importance of uniqueness in organizational diagnosis; change readiness; strategies for implementing organizational change: a model; and theory integration research.

## Advancing Expertise in Evaluation

Armenakis' work on evaluation began with his dissertation (Armenakis 1973). In this research, he surveyed practicing organizational development consultants and inquired about the problems they experienced in evaluating their consultation projects. From the problems identified, he developed solutions and guidelines found in the scholarly literature to resolve the problems (cf. Armenakis and Feild 1975; Armenakis et al. 1976; Armenakis and Smith 1978).

After publishing several articles in academic journals on evaluation problems and recommended solutions, as described above, he was influenced by the research on evaluating organizational change by Professor Robert (Bob) T. Golembiewski. In evaluating organizational change, researchers might rely on respondents' articulations of organizational conditions temporally, using a quantitative methodology, e.g., self-report questionnaires. However, embedded in these articulations are what Golembiewski et al. (1976) identified as alpha, beta, and gamma change. *Gamma change* was defined as the condition in which the respondents redefine the concepts. Thus, the domain assessed at time-1 is redefined at time-2. *Beta change* occurs when the continuum (e.g., Likert scales) on which concepts were measured were recalibrated. That is, a "three" at time-1 is recalibrated to be a "two" or "four" at time-2. *Alpha change* is the articulation of organizational conditions when gamma and beta changes are absent. Armenakis quickly realized the value of Golembiewski's change typology and began developing methodological procedures to isolate the three types of change. From his attraction to the change typology, he began a series of research articles to propose methodologies for isolating concept redefinition, i.e., gamma change, and,

scale recalibration, beta change (cf. Armenakis and Zmud 1979). His research and that of other researchers on the change typology was summarized in Armenakis (1988). The research described in that summary fits into two categories. One category, labeled design approaches, included modifications in the research design which incorporated the ideal scale (cf. Armenakis and Zmud 1979) or the retrospective procedure (Terborg et al. 1980) or some combination of both. The second category, labeled statistical approaches, analyzed the respondent articulations using covariance analysis (Schmitt 1982). More recent research by Schmitt and Kuljanin (2008) has reconfirmed the importance of using covariance analysis to evaluate temporal assessments of change recipient responses to quantitative scales in organizational change.

Armenakis and colleagues (Mossholder et al. 1995) experimented with content analysis of qualitative data in assessing emotional reactions of 245 top echelon managers to an organizational transformation in a global appliance manufacturer. Computer-aided textual analysis (CATA) can be considered as a method to ameliorate the change typology issues in evaluating change. Although the change typology issues were not investigated, this article demonstrated the convenience of CATA in reliably and validly content analyzing qualitative data for assessment purposes.

## The Importance of Uniqueness in Organizational Diagnosis

During the diagnostic phase of action research, the objective is to identify the problem symptoms and determine problem causes. When a systematic diagnosis is conducted, the diagnostician ideally focuses on the *uniqueness* of the organization. Thus, the likelihood of solving the wrong problem is minimized. Armenakis typically initiated his change projects, which included a diagnostic program including numerous interviews of a representative random selection of managers and non-managers. One example of how this approach was used in a grey-iron foundry business is explained in Armenakis et al. (1981). Each interview consisted of open-ended questions. After explaining the purpose of the interviews, assuring each interviewee of the confidentiality of the interview information, and the interviewee describing his/her job, the first question asked was for the interviewee to explain the strengths/successes of the organization. This allowed the interviewee to talk freely about the positive aspects of his/her job/organization. Next, the interviewee was asked to explain the weaknesses/struggles the interviewee experienced. With the proper rapport established, the interviewee would typically open up to his/her perceptions. The natural next question is concerned with what the interviewee visualized as what changes he/she felt were necessary. And, finally, what were the interviewee's expectations regarding the purpose of the action research process. Ideally, especially in larger organizations in which interviewing large numbers of employees becomes expensive and time consuming, a quantitative scale is administered. The quantitative scale can be tailored to the organization by developing items from comments made by the interviewees or from combining existing scales readily available from the published literature.

**Fig. 1** The diagnostic funnel (Adapted from Gregory et al. 2007)
## Minimizing Diagnostic Bias

The accuracy of the diagnosis will affect the success of the organizational change process. As explained in Armenakis et al. (1990), diagnosis is information processing. This work on diagnostic bias was built from the contributions of Kahneman (2011). Bias can result from selecting inappropriate diagnostic models and incorrectly evoking heuristics during the diagnostic process employed by diagnosticians, thus resulting in misdiagnoses. In an article which demonstrated how to reduce the likelihood of bias (Gregory et al. 2007), the diagnostic process was depicted in a funnel shape. The information acquired during the diagnostic phase from open-ended interview questions was typically organized into Likert's (1967) causal, intervening, and outcome variables (CIO) and is depicted as the mouth of the funnel. The spout of the funnel, achieved through analyzing the collected data, is depicted as being much narrower than the mouth and represents the unique diagnostic paradigm for the organization. Thus, this approach maximizes the likelihood that the uniqueness of the organization will be recognized, and any changes conceived will be appropriate to address the problem causes (Fig. 1).

## Using Computer-Aided Text Analysis

With the advent of computer-aided textual analysis (CATA), Helmuth et al. (2015) demonstrated how qualitative data collected during an organizational diagnosis could be quantitatively analyzed to maximize reliability and validity. CATA has never been described as a diagnostic method in organizational diagnosis by change researchers. First, qualitative data collected during the diagnosis of a call center operation were manually analyzed and grouped into Likert's (1967) causal, intervening, and outcome categories. Then, the data in these categories were transformed into Pondy's (1967) multistage organizational conflict model, which represented the unique diagnostic

paradigm. The next step of the diagnosis involved using DICTION (Hart and Carroll 2012) to assess the rhetoric used by call center employees in describing their interactions with call center clients. This analysis was then used to determine how call center clients could better cope with the conflict between clients and call center employees.

## The Value of Action Groups in Diagnosis

Action groups (Moates et al. 2005) have been demonstrated to be useful in verifying a diagnosis, another step in determining that the diagnosis accurately describes the unique issues which inhibit the organization's effectiveness. The composition of action groups should be representative of the management and operative employees in the organization. The groups can be fed back the results of the diagnosis and charged with the responsibility of determining the content representativeness of the diagnosis. The feedback would consist of the major issues identified during the diagnostic phase. Action groups would first have the opportunity to add any new issues they felt were not included and then determine the relative importance of all issues. With time and resources as limited constraints, decisions can be made regarding the order in which issues should be tackled.

## Change Readiness

One of his most significant contributions was emphasizing the importance of change readiness in organizational change. The basic strategy to Armenakis' organizational change efforts involved employee participation. Getting employees involved in the diagnostic phase is significant in building not only ownership but also readiness for the impending changes (Armenakis et al. 1993; Armenakis and Harris 2002). Employee behavior is a function of beliefs, attitudes, and intentions (Fishbein and Azjen 1975). Readiness, Lewin's (1947) unfreezing phase, is created by changing the beliefs central to creating readiness, namely, discrepancy (i.e., believing that change is needed), appropriateness (i.e., believing that a proposed change is appropriate), efficacy (i.e., believing that the change can be implemented), principal support (i.e., believing that there is formal and informal support for a change), and valence (i.e., believing that the change will produce some benefits for the change recipients). When change recipients are asked about strengths/successes and weaknesses/struggles during an organizational diagnosis, they begin articulating organizational issues that are pleasant, as well as unpleasant, to them. It is natural for them to begin exchanging their opinions with colleagues, especially opinion leaders, which builds momentum for the change. This momentum builds principal support which can also translate into a belief that "we can do this" (i.e., efficacy). The belief of valence begins when the change recipients realize they are being queried about changes that will improve their job/organization. But they must also believe that any changes will benefit them personally. The appropriateness belief can be influenced by them expressing what they think should be changed.

These five beliefs can also serve as diagnostic information when attempting to determine why a change intervention was not successful. This is explained below when the importance of monitoring the progress of a change effort is explained.

The readiness program (Armenakis et al. 1993; Armenakis and Harris 2002) is guided by a process model which capitalizes on social learning theory (Bandura 1986) and incorporates the relevant factors important in creating readiness (see Fig. 2). Central to the model is a change message incorporating the five beliefs described above. Three influence strategies, namely, persuasive communication, active participation, and external information, are used to transmit the change message. The information collected during diagnosis can usefully be incorporated in the change message which must be communicated by global and local change agents, including opinion leaders who serve as horizontal change agents. Some of the content of these persuasive communication media (e.g., live oral presentations, informal interpersonal communications, written communications, and recorded presentations) can be taken from the responses of the change recipients during the diagnostic phase. In addition to the persuasive communication strategy, the change message can be transmitted using an active participation strategy, which can be comprised of vicarious learning and enactive mastery tactics. Vicarious learning can be achieved by change recipients observing colleagues being actively involved in the change activities, as well as visiting other sites to observe other personnel executing job activities. Enactive mastery can be achieved by getting change recipients involved in analyzing current job duties for efficiency and effectiveness. In

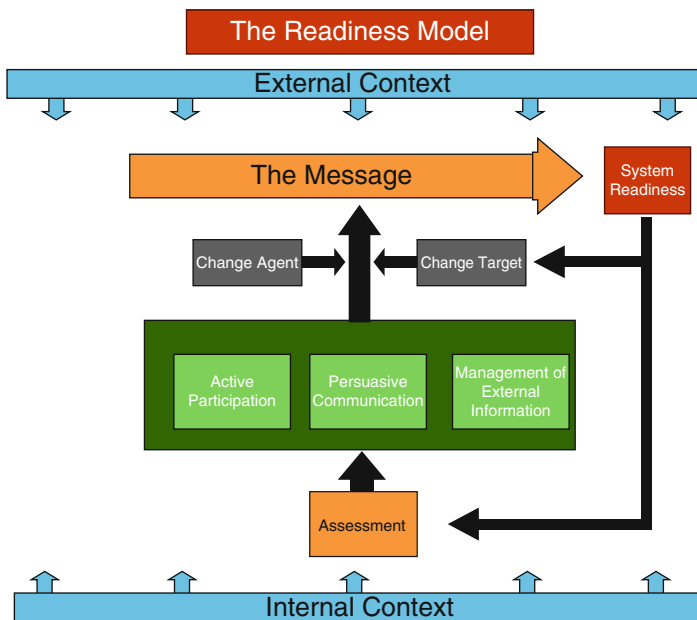

**Fig. 2** Readiness model (Adapted from Armenakis et al. 1993)

combination with the persuasive communication and active participation strategies, external information (e.g., news reports from respected media) can be incorporated in the change message to increase its credibility.

Also included in the model are change agent and change recipient attributes. In order for the change message to be believable, the change agents (i.e., global, local, and horizontal) must be perceived as credible. Moreover, the change agents must walk the talk. Knowing the composition of the change recipients is crucial. Being able to identify opinion leaders (i.e., horizontal change agents) is important in providing useful information about internal contextual conditions, as well as getting buy-in and building momentum for the change.

Monitoring of the readiness program can be helpful. Change agents should be alert to their assessments of each of the beliefs. Ideally, if one (or more) of the beliefs is assessed as being unfavorable, the readiness program should be analyzed, tweaked, and extended. Basically, if the change recipients are not considered *ready*, the change agents have not been effective. The assessment of the beliefs can be made using observation of, and interviews with, change recipients. Information provided by opinion leaders can be helpful in determining the pulse of the change recipients. If desired, quantitative scales (Armenakis et al. 2007; Holt et al. 2007), based on the readiness theory, have been specifically designed to conveniently assess the extent to which the beliefs represent change recipient readiness. For example, do change recipients believe that (a) change is needed; (b) the change is appropriate; (c) they can achieve the goals of the change: (d) the change agents (i.e., the global, local, and horizontal change agents) are walking the talk; and, (e) they will benefit from a change? If any of these beliefs are not widespread throughout the population of change recipients, resistance may be brewing. Actions need to be taken to improve the specific beliefs.

In a case study of monitoring an organizational change, Armenakis et al. (2007) described how they employed a qualitative methodology to assess a major organizational transformation implemented in 2001 in 1500 employees of a global information technology company. This is the same organization described in Armenakis and Harris (2002). In late 2001, the company was not achieving its stated objectives for the transformation, so the CEO requested assistance in determining why. The events of 2001 (i.e., the dot.com bust and the terrorist attacks of 9/11) rapidly changed the external environment. The researchers conducted interviews with the top management team. A content analysis of the interview information revealed the top management team believed the strategy for the transformed organization was no longer appropriate (given the external environmental events). Furthermore, the top management team did not believe they could effectively execute the original strategy. Thus, the two beliefs, i.e., appropriateness and efficacy, were insufficient. In other words, the TMT expressed they could not execute an inappropriate strategy. This was interpreted as a *warning* rather than resistance. After discussing this information, the TMT agreed that the strategy needed tweaking to better fit the changed external environment. Subsequently, the organization's performance improved. This IT transformation case demonstrated the value of the application of the beliefs in temporally assessing the effectiveness of organizational changes.

**Fig. 3** Implementation model (Adapted from Armenakis et al. 1999)

## Strategies for Implementing Organizational Change: A Model

To support his readiness model, Armenakis and his colleagues proposed an integrative model for planning and implementing change interventions. Armenakis et al. (1999) proposed a process model incorporating social learning theory (Bandura 1986) to guide the implementation of change efforts (Lewin's 1947, moving phase). This model is the companion to the readiness model and is intended to provide change agents with the necessary information to develop and execute an implementation program for organizational change (see Fig. 3). The seven implementation strategies (namely, active participation, persuasive communication, management of external and internal information, human resource management practices, rites and ceremonies, diffusion practices, and formalization activities) are explained as mechanisms for transmitting the five components of the change message. Essentially, the model can serve as a "toolkit" for implementing organizational change. The importance of the change agent and change recipient attributes is stressed as crucial in the success of any change effort. As with the readiness model, the change agents (i.e., global and local) must be perceived as credible. Furthermore, the knowledge about the change recipients, including who can be counted on to

serve as horizontal change agents, is critical. One subtle distinction about the implementation strategies is they serve to *reinforce* the five beliefs which comprise the change message. In other words, the organizational change should reinforce (a) the change was needed; (b) the change was appropriate; (c) the change recipients are effectively implementing the change, (d) the change agents are walking the talk; and (e) the change recipients are benefiting from the change. Some of the reinforcement is actually provided constantly by the change recipients performing their new duties. However, the change agents should also take opportunities to feedback the results of the organization's performance (e.g., costs, revenue, profit, etc.).

## Theory Integration Research

Armenakis also made a significant contribution to the field through integrating research on organization change. Armenakis and Bedeian (1999) viewed the literature on organizational change during the 1990s. In the article, they selected exemplary research which reflected contemporary thinking for the time period. The research was organized around four major themes, namely, content, context, process, and criterion issues. The purpose of this review was to emphasize the importance of each theme in the design and implementation of transformational change efforts. That is, in order for organizational change efforts to be successful, change agents should be attentive to the impact of each theme on the outcome of a change effort. Further research by Self et al. (2007) and Walker et al. (2007) explained the importance of each theme in organizational change efforts.

Oreg et al. (2011) conducted a 60-year review of the quantitative research which assessed change recipients' reactions to organizational change. The model developed from the review comprised antecedents, explicit reactions, and change consequences. The antecedents were grouped into pre-change antecedents (e.g., change recipient characteristics and internal context) and change antecedents (e.g., change process, perceived benefit/harm, and change content). Explicit reactions consisted of affective reactions (e.g., stress and pleasantness), cognitive reactions (e.g., change beliefs), and behavioral reactions (e.g., change recipient intentions). Change consequences included work-related consequences (e.g., job satisfaction) and personal consequences (e.g., health). From this analysis of the research, numerous theoretical issues and practical implications were discussed with suggestions for future research.

## New Insights: Toward Increasing Success in Change

Despite the best efforts of organizational managers and change management consultants, academic studies of change suggest that change initiatives are as likely to fail as they are to succeed (e.g., Ghosal and Bartlett 2000; Keller and Aiken 2008; Meany and Pung 2008). Armenakis et al. (1999) posited that these failures may occur because of management's failure to "shepherd the change effort through the entire process of change from diagnosis to institutionalization" (p. 98). Likewise,

Isabella (1990) posited that as a change progresses, different assumptions of what is happening may be called for, referring to them as "evolving interpretations" (p. 7). Labianca et al. (2000) stated that any resistance to change by organizational members could be "motivated...by the constraints of well-established, ingrained schemas" (p. 235.). It is therefore important to understand what is transpiring in the minds of organizational members as the change unfolds.

Lewin (1947) first proposed that change goes through three phases. The first is *unfreezing* when organizational members become open to change. The second phase is *moving*, when organizational members begin to adopt new behaviors necessary to implement the proposed change. The final phase is *freezing* (or *refreezing* as it is sometimes labeled) when the new change becomes standard procedure and practice. Thus, for Lewin, the critical first step to effectively and successfully implement a change initiative is that employees must be willing to let go of their current beliefs, attitudes, and behaviors. They must be open to the change. In Armenakis et al. (1993), and later in Armenakis et al. (1999), Armenakis and his colleagues took the Lewin model and expanded on it, referring specifically to the creation of *readiness* (for change) as necessary before the organization and its members could move on to the *adoption* of the change initiative which, if successful, would lead to *institutionalization* of the change initiative (making it permanent).

Armenakis and his colleagues drew upon Fishbein and Azjen (1975) to argue that the behavior of employees was a result of their beliefs, attitudes, and intentions. Thus, to create readiness for change in an organization, which Armenakis et al. (1993) defined as "the cognitive precursor to the behaviors of either resistance to, or support for, a change effort" (p. 681), organizational leaders must address those beliefs, attitudes, and intentions in their employees. This specific focus on employee reactions to change made Armenakis and his colleagues' work different from the prescriptive and top-down approaches of other change researchers (e.g., Anderson and Anderson 2001; Kanter et al. 1992; Kotter 1995). Indeed, Armenakis and his colleagues' approach seemed more in line with what Palmer et al. (2009) described as a contingency approach to change (e.g., Dunphy and Stace 1990; Balogun 2006).

The contingency approach recognizes that even in a top management team, different managers will hold different perspectives as to what exactly the ideal goals are to be achieved and what might be the best actions to take. Second, change issues are complex enough that "off-the-shelf" solutions are rarely appropriate. Finally, because of the nature of the change issue, the nature of the solution related to the change, and the overall context of the situation, there is no one best approach, thus different leadership approaches may be called for (Palmer et al. 2009). From this perspective the Armenakis model (1993, 1999) can be viewed as a change leadership model.

If leadership is defined as the ability of one individual to influence other individuals to achieve a common goal (Northouse 2012), then the Armenakis model is a leadership model. Faced with a change issue, the change leader must not only assess and understand the change issue, but consider the change issue from the perspective of the organization's members. Thus, a stakeholder analysis (Harrison and Shirom 1999) is a necessary tool in determining who will be impacted by the change, how

they have reacted in the past and, thus, may react to the change, various attributes, and the benefits and costs to them. The change leader, under the Armenakis et al. (1999) model, recognizes that change recipients may hold five beliefs or sentiments about any change: that the particular change may be necessary, that what will be done is an appropriate response, that each change recipient believes that both the individual and the organization are capable of implementing the change because the organization will provide the resources needed, that key people also believe in the change (those whom the individual change recipient relates most closely to, trusts, respects, etc.), and, finally, that the benefits may outweigh the costs to the change recipients. Recognizing this, the change leader can apply various strategies to shape the beliefs of the change recipients toward the change issue and initiative. Armenakis and colleagues (1999) provided for seven different strategies (e.g., active participation, persuasive communication, and formalization activities) available to the change leader.

What makes the Armenakis model contingent in nature is that it recognizes that the five beliefs held by the change recipients are not five, equal in influence weight beliefs. Based on each recipient's personality, experiences, attributes, and attitudes, different recipients may give different weights to the different beliefs. For example, employee A may hold greater confidence in his or her ability to deal with change than employee B. Employee C may have higher trust in the change leader than employee D. Different organizational members are not the same. There may be different attitudes toward change based on past experiences. Cynicism may be low or high. Morale may be low or high. Thus, the change leader must determine which combination of strategies may be best, given the circumstances, and how much weight to give to each. Initially, the change leader may rely heavily on managing internal and external information, combined with persuasive communication techniques to sell the change recipients on the need for change. To build (or rebuild) trust, getting change recipients to become actively involved in designing and implementing the change initiative may be appropriate (e.g., task forces, action teams, etc.). For those perhaps more cynical or skeptical about the change, the use of pilot programs and signaling out "small wins" (e.g., the diffusion practices strategy) may be needed. For long-term institutionalization of the change initiative, changes in policies and practices may be called for (the strategies of formalization activities and human resource management practices).

The strategies are not applied in stand-alone fashion, but in various combinations as deemed appropriate. Thus, through the combination of the strategies of active participation, management of internal information, diffusion practices, human resource management practices, and rites and ceremonies, a pilot program could be implemented, training provided to manage the program, information gained from the program circulated throughout the organization, and wins achieved from the success of the program publicly recognized in various ways. As time passes, different strategies may be employed in different ways and combinations, especially as the beliefs, and subsequently behaviors of the change recipients, are shaped. Thus, it can be seen that the Armenakis et al. model is a contingent leadership model.

Recently, the findings of the Gallup Poll on the state of employee engagement in the workplace was released (Woosley 2006). The findings showed that over half of all employees are disengaged from their workplaces. Over the past several decades, the workplace in many respects has not been friendly to employees. They have been downsized, their jobs outsourced or replaced by automation, salaries frozen, etc. As a result, over the past several decades, it has been made abundantly clear to employees that they are no different than the computer which sits on their desks, or the copy machine in the copy room, or the cubicle walls in which they sit – they are merely another expendable asset to be disposed of when no longer needed. Understandably, there is a lack of engagement, and a lack of trust in management. As Atkinson (2006) noted, trust is the foundation for all transactions and relational obligations. But if the relationships between manager and employee have become purely transactional, and any change perceived by the employee as having more costs than benefits, employees may express little enthusiasm for change (Dym 1999). Employees may be skeptical that management understands or even has the ability to deal with threats to the organization or opportunities that may arise (Gadiesh and Gilbert 2001). However, recognizing the beliefs that employees may hold, not only about specific change issues, but about the organization in general, the change leader can use the different strategies of Armenakis' (and colleagues) model to create an environment, which will lead to employee engagement in making a change initiative successful. The strategies (e.g., permitting opportunities for employees to be actively engaged in dealing with the change issue, sharing critical internal and external information, and recognizing employees who achieve small wins) can make the environment one that is supportive and based on mutual respect (cf. Atwater and Brett 2006; Bakker et al. 2007; Xu and Helena 2011). Thus, the Armenakis and colleagues' model can be viewed as a contingent-based leadership approach to implementing change in organizations, which can be used, regardless of which other prescriptive or process change management model is used, because it is not a change model as such – it is a leadership approach to guiding change.

## Legacies: Two Major Contributions

The contribution of Armenakis to the study of organizational change can be considered as twofold. First, while Pettigrew (1985) originally framed organizational change in terms of content, context, and process, through Armenakis' and his colleagues' research, a taxonomy of factors was developed that must be considered in understanding the nature of organizational change and should shape research on organizational change in terms of content, process, and context (Armenakis and Bedeian 1999; Holt et al. 2007; Self et al. 2007; Walker et al. 2007). This is important because when a change initiative (aimed at targets such as improving productivity or profitability) is introduced into an organization, it may impact employees in a number of ways, placing new burdens on work groups, changing the makeup of work groups, requiring the learning of new skills and relationships, creating new job and career opportunities, and eliminating old ones. At the same

time, the existing milieu impacts the change initiative. Current policies and procedures, organizational structure, and the organizational culture (or subcultures) and climate may impede the successful implementation of the change initiative. Therefore, a simultaneous assessment of variables must take place, due to the impact on organizational members.

However, as various researchers have noted (e.g., Choi and Behling 1997; Keller et al. 2010), a significant number of major change initiatives fail to achieve the desired goals of the change leaders in these organizations. This may be due to the failure of change leaders to comprehend the complexity of introducing a change initiative of significance into an organization, challenging the existing paradigms (Harrison and Shirom 1999). The Armenakis and Bedeian (1999) model provided a means to understanding this complexity.

The content factor addresses the "what" in organizational change. In 1993, both Macy and Izuma (1993) and Robertson et al. (1993) published meta-analyses of change literature as far back as 1961. They found that change content included human resource management issues, technological issues, structural issues, and social issues, among other issues. These issues related to management and organizational performance. Thus, if either management or organizational performance did not meet predetermined standards, then changes in the various content factors should result in improvement in management or organizational performance.

The process factor addresses the "how" in organizational change. That is, how will the particular change initiative be implemented? More specifically, the process factor embodies the specific methods the change leader or organization employs in implementing the change initiative. Depending on the nature of the initiative, seven possible strategies (Armenakis et al. 1999) may be employed: Active participation or getting organizational members involved in the implementation of the change, diffusion practices (using pilot studies, finding small "wins" and finding "champions" to disseminate the message), formalization activities (changing or creating policies that will ease and support implementation of the change initiative), managing internal and external information (information that explains the need for change, measures the status of the change implementation, etc.), persuasive communication (delivering the message of change by the change leader, change champions, and other supportive stakeholders), human resource management practices (selecting the right people, possessing the needed skills, knowledge, etc.) to both assist in the implementation of the change and to fit within the now changed organization; providing the training and development for current and future employees, measuring employee performance, especially as it relates to acceptance of the change, and effectiveness in operating in the changed environment; and finally, the rewards and benefits which would come from successful implementation of the change initiative and continued application of it, and use of the rites and ceremonies of the organization to help shape the desired culture post-change, as well as recognize those employees who embraced the change initiative as it was implemented and continue to do so. Typically, several of these strategies will be used in combination.

Contextual factors are the circumstances or the existing external and internal conditions that have been shown to influence organizational effectiveness. Multiple

facets comprise the overall context, including the external context and internal context. Contextual factors are the "why" part of change – they explain why the change is necessary. External contextual conditions will influence the performance of the organization and will be the driving force to implement content changes (strategic reorientation, organizational restructuring, and so forth) with hopes of improving an organization's performance. Internal contextual conditions are those organizational conditions which influence employees' beliefs, attitudes, intentions, and behaviors. An organizational change is implemented to achieve *fit* with the context.

Empirical support (e.g., Holt et al. 2007; Self et al. 2007; Walker et al. 2007) has been found for the Armenakis and Bedeian (1999) model. Self et al. (2007), for example, assessed the acceptance of a change initiative in a telecommunications company, as a result of variables related to the content, process, and context factors of the Armenakis and Bedeian (1999) model and found that these factors contributed to employee acceptance of the change initiative. Thus, the model posited by Armenakis and Bedeian (1999) remains a viable and comprehensive approach to developing successful change initiatives and methodologies, especially if a systematic and simultaneous assessment for the three factors is undertaken.

The second contribution of Armenakis to the study of organizational change is his and his colleagues' focus on the change recipient. Schein (1999) wrote that the failure to create readiness for change in organizations was a major contributor to the failure of change initiatives in these organizations. Kotter and Cohen (2002) further suggest that these failures are commonly related to human issues, not technical issues. While many organizational scholars tend to focus more on prescriptive and top-down-driven change (e.g., Anderson and Anderson 2001; Kotter 1995), Armenakis and his colleagues opted to focus on the change recipients within an organization. Thus, rather than a leader-centric approach, they chose to follow a more change recipient-centric approach to the study of change. As Armenakis and Harris (2009) noted, whatever the change may be, be it incremental or radical, ". . . what do change recipients consider when making their decision to embrace and support a change effort or reject and resist it? Since changes must ultimately be implemented by change recipients, understanding their motivations to support or resist organizational changes provides very practical insights into how to best lead change" (p. 128).

Armenakis and Harris (2009) noted that six interrelated themes emerged from their long study of organizational change: (a) the identification of certain *beliefs* that influence change recipients' motivations toward change; (b) the importance of change recipient participation in change initiatives; (c) the importance of proper diagnosis regarding the need to change; (d) proactively focusing on creating readiness for change, rather than reactively addressing resistance for change; (e) identifying those leadership strategies which could shape change recipient beliefs during the change process, and finally; (f) the importance of continuously assessing the reactions of the change recipients toward organizational change.

## Theme 1: The Change Beliefs

Armenakis and his colleagues (1993, 1999) identified five different change beliefs as those held by change recipients when faced with change: (a) discrepancy, or the belief that a change is needed; (b) appropriateness, or the belief that the proposed change initiative is the correct one to apply; (c) efficacy, or the belief that the change recipients and/or the organization have the capability to successfully implement the change (this can also include feelings that the organization will support the change recipients' efforts to make the change); (d) principal support, or the belief that formal, as well as informal leaders within the organization will actively support the change (formal leaders can range from the "C-Suite" leaders down to immediate supervisors, while informal leaders are the opinion leaders); and finally, (e) valence or the belief that there is some positive benefit (either short- or long-term) for the change recipient in the implementation of the change. By proactively seeking to understand the nature of these beliefs in change recipients, the change leader can shape the change message from the beginning, leading to a greater likelihood that readiness for change in the minds of the change recipients will be created.

## Theme 2: Change Recipient Participation

Getting change recipients involved even as early as the identification of the proposed change initiative, but certainly in the planning of the implementation, is an important step for the change leader. As Nutt (1986) demonstrated, involving organizational members in the process of change builds and reinforces ownership in the change initiative by the members. As Armenakis and Harris (2009) noted, getting the change recipients involved early on can help in identifying appropriate actions that must be taken to resolve the gaps between the desired and actual organizational circumstances. In many cases, frontline organizational members will have a deeper understanding of what will work, and what will not, in implementing change initiatives.

## Theme 3: Proper Diagnosis

Proper diagnosis of an organizational situation minimizes the risk of a misdiagnosis of ". . .identifying the wrong problem to solve and then deciding on a solution that is not appropriate" (Armenakis and Harris 2009, p. 131). It can also minimize the risk of management seizing on the latest management *fad* and using it not only to solve the wrong problem, but using it even though it may be the wrong solution. Failing to properly diagnose organizational situations can lead to implementing change initiatives that, rather than solving organizational problems, can lead to organizational failure.

## Theme 4: Creating Readiness for Change

Armenakis and his colleagues defined readiness as the cognitive precursor to the change recipients' behaviors regarding change (Armenakis et al. 1993). It reflects the change recipients' *beliefs* about the need for change in an organization and whether or not they *believe* the organization can change, has the right change initiative been planned, the right people supporting the change, whether or not the change recipients and organization have the capability of making the change, and, finally, if there is benefit in changing (Armenakis et al. 1999). The classic example of creating readiness involved Coch and French's (1948) classic study in a pajama manufacturing facility. A more recent example was provided by Kotter (2002) in which he described a situation wherein a senior manager loaded a conference table with one sample each of all the work gloves in use at each of the company's manufacturing plants. Each sample pair of gloves was labeled with the price a particular factory paid for the glove. It was quickly obvious that with each plant making its own purchases and negotiating its own prices, the procurement system was badly misaligned.

The readiness model provided by Armenakis and his colleagues (1993, 1999) is designed to provide the change leader or change management team with a model which will enable them to proactively create a plan whereby the beliefs of the change recipients can be shaped in the direction of change readiness. Armenakis and Harris (2009) believe that change leaders have the responsibility to "...sell the change recipients on the merits of an organizational change" (p. 132). Empirical support for this belief has been provided by Rafferty and Griffin (2006) through the reduction of change recipient uncertainty.

## Theme 5: Leadership Strategies

Being proactive in creating readiness means the development of a plan for doing so. Thus, the change leader is developing a plan to shape or change the beliefs, attitudes, and intentions held by the change recipients. It requires careful consideration of the nature of those beliefs, because the change leader is attempting to create the *meaning* of the intended change. As Pettigrew (1985) argued, "The Management of meaning refers to a process of symbol construction and value use designed to create legitimacy for one's own ideas, actions and demands, and to delegitimize the demands of one's opponents" (p. 442). In their discussion on *competing narratives,* Dawson and Buchanan (2005) noted that in change situations, there will be a number of different narratives "...each offering its own explanation of events and outcomes..." (p. 861). This is not, however, a past tense narrative. They argue that, "As a vehicle of sensemaking, narratives...of change are concerned with the way it is going to happen, and the way in which it is (or is not) happening, as well as the way it happened" (p. 861). As Weick (1995) noted, when faced with an event that changes what we do, how we do it, where we do it, etc., we strive to make sense of it and give it meaning. In a change situation, it is the responsibility of the change leader

to sensemake for the change recipients that will lead to the right beliefs, attitudes, and intentions yielding the desired organizational behaviors. Thus, the credibility (Kouzes and Posner 1993) of the change leader becomes paramount if the change leader is to succeed in changing those beliefs, attitudes, and intentions of the change recipients. If the change leader lacks credibility, it is unlikely that the change leader will be able to modify the beliefs, attitudes, and intentions of the change recipients.

## Theme 6: Continuous Assessment of the Reactions of the Change Recipients

Assessing the change recipients' readiness for change and tracking the adoption and institutionalization of the change can be grounded in the creation of the change message (Armenakis and Harris 2002). The development of the change message will suggest the strategies to be used to create readiness for the change initiative, leading to the adoption and institutionalization of the change initiative. Armenakis and Harris (2009) argue that the message components can be used to assess the status of the change initiative through quantitative or qualitative methods, or a combination thereof. By constantly analyzing change recipients' beliefs about the five components of the change message, it can be determined why a change implementation may be faltering. Working with a technology company, Armenakis and his colleagues (2007) were able to assess top management team beliefs and attitudes about a specific change as the change was being implemented.

## Unfinished Business: The Journey Continues

It is appropriate to quote Armenakis and Harris (2009) as to the unfinished business that lies ahead for them – and those colleagues who continue to actively seek deeper understanding of organizational change:

> Some of our primary stops along our journey to understand change motivation have been summarized. Yet we have not reached our destination and our journey continues along at least five avenues. Specifically, we are pursuing efforts to: (a) explore the relative significance of the five change beliefs (are some more central to change recipient buy in than others and in what contexts?); (b) examine the relationships between the five key beliefs and emotional reactions; (c) investigate the relationship between change recipient characteristics (regulatory focus) and reactions to organizational transformations; (d) address the relationship between internal contextual variables (relations with local change agents and co-workers) during organizational change; and (e) merge a consideration of ethics with change management (p. 137).

Quinn (2004) estimated that as much as 50% of all change efforts fail, often as a result of poor change leadership. The late philosopher, Eric Hoffer wrote, "Power is always charged with the impulse to eliminate human nature, the human variable" (p. 42). As long as there are people in organizations and organizations change, the

human element will be a factor in determining the success or failure of a particular change initiative. Armenakis and his colleagues recognized this early on, and their focus, just over two decades later, remains on those change recipients and their behaviors, beliefs, attitudes, and intentions.

## Conclusion

Because of the complexity of change, Achilles Armenakis and his colleagues recognized that, as Pettigrew noted in 1985, change must be studied in terms of content, context, and process. A failure by many organizational leaders to recognize that change and the efforts to manage it are shaped by the interaction of content, context, and process will lead to failure to gain desired outcomes. It also demonstrates the importance of a proper diagnosis and, thus, much of Armenakis' research supported the development of proper diagnoses of organizational situations as a first step. Additionally, Armenakis emphasized the importance of understanding the change through the eyes of change recipients. By taking their beliefs into account and applying strategies designed to reshape those beliefs, Armenakis and his colleagues' research showed that the likelihood of a successful change implantation should occur. Finally, as Saint Basil said, "A tree is known by its fruit; a man by his deeds." As one reads through the change literature, clearly Achilles Armenakis' life in academia has borne fruit that has shaped how many think about change, and the seeds of that fruit have been widely planted by others. These others are not only his many colleagues but also those doctoral students who studied under him and were guided by him. And these seeds which he planted will bear fruit for a long time to come.

# Frank J. Barrett: The Social Construction of Organizing

**4**

Michael Lewis

### Abstract

The landscape of the organizational change literature provides a rich and diverse terrain of ideas, theories, and models for both researchers and practitioners. When embarking on this journey, one would benefit from the contributions of the seminal thinkers in the organizational change field. In this chapter, readers are introduced to Frank J. Barrett, professor of management and global policy at the Naval Postgraduate School in Monetary, CA. Barrett's work provides an interesting and somewhat different approach to organizational change, which has been influenced by his early experiences in literature and jazz improvisation. Central to Barrett's contributions is the social construction of organizing and change. Barrett has argued that our understanding of change can be deepened through a social constructionist approach that places discourse and meaning-making as central to the process of change. In making this argument, Barrett challenges the dominant model of change as a rational process. Much of Barrett's contributions are also embedded in the idea that the shift from and industrial society to a postindustrial society has pressured organizations to find new ways to conceptualize and practice change. Barrett has used the metaphor of jazz improvisation as a way to engage in concepts, models, and practice of change. Readers will benefit from Barrett's work, not only for an alternative view of organizational change, but as a way to deepen their understanding and creative capacity for organizing and change.

## Contents

## Introduction

Sit down sometime for a conversation with Frank Barrett and you will gain a real appreciation for his love of big ideas and big questions. Read his contributions and you will gain an even greater appreciation for how his love of big ideas and big questions has driven him to challenge the dominant tenets of the organizational change field and argue for a social construction of organizing. As an example, in one of Barrett's earliest papers (Barrett and Srivastval, 1991), he took on the structural-functional orientation that has dominated the field by questioning the "giveness" and ahistorical nature of social structure given by proponents of this perspective. He challenges this by calling on scholars to pay more attention to the human and social construction of these structures over time. For Barrett, this meant paying attention to how discourse, language, and social interaction shape meaning and patterns of organizational reality. This argument has served as the basis for many of his contributions.

Many of Barrett's contributions are based in the social constructionist perspective that views organizational life as a socially constructed reality. In his many contributions and even in his doctoral seminars, one can see Barrett "wrestling" with the great Enlightenment philosophers such as Locke and Descartes and their claims for objective truth and universal order. To Barrett, meaning making is not an internal mental activity comprised of objective and distant observation, but rather a social activity comprised of dialogue and interaction. Barrett has taken this social constructionist orientation to study how organizations can achieve transformational change through discourse and social interaction.

Many of Barrett's other contributions in organizational change are situated in his argument that the shift from an industrial to postindustrial society has pressured organization to become more creative and innovative. Where the logic of the industrial society was efficiency through standardization, the logic of the postindustrial society has become innovation through collaboration. To meet this challenge, Barrett has

provided scholars and practitioners with new perspectives, ideas, and metaphors to conceptualize and understand organizational change at a deeper level.

These contributions and more are provided in this chapter in a way that seeks to inspire and motivate both scholars and practitioners of organizational change. Like other scholars, Barrett's career is emphasized through his interaction with his own social world and how he has constructed meaning from his interactions. Barrett's own career exemplifies his central argument that change is socially constructed through our interactions, dialogue, and even friendships.

Frank J. Barrett is a professor of management and global public policy at the Naval Postgraduate School in Monetary, CA, and serves on the doctoral faculty at Fielding Graduate University in Santa Barbara, CA. He has held the Boer & Croon Chair of Change Management at Tilburg University in the Netherlands and has served on faculties of Katholieke University of Leuven, Belgium, Penn State University's Behrend College, Case Western Reserve University, and Benedictine University. Barrett has also led seminars on change, specifically the transformative potential of appreciative inquiry. From 2008 to 2010, Barrett was a visiting scholar at the Harvard Business School and Harvard Program of Negotiations where he envisioned and began to write his latest book, "*Yes to the Mess: Surprising Leadership Lessons from Jazz*." This book uses jazz as a powerful metaphor for leading an organization in the postindustrial, knowledge-based society.

Barrett is not only an accomplished academic, but an accomplished practitioner. He has consulted with various organizations including Harvard University, Boeing, the US Navy, Ford Motor Manufacturing Division, General Electric, British Petroleum, The Cleveland Clinic, and The Medic Inn. His consulting involves working with organizations on vision planning, strategic planning, organizational restructuring, and organizational change. Barrett has been asked on numerous occasions to speak, lead workshops, and consult on his research, particularly in the areas on leadership, innovation, and improvisation. With his consulting, Barrett is an action researcher, writing and contributing to the body of knowledge on change and innovation.

Barrett has a BS and MA from the University of Notre Dame (Notre Dame) and a Ph.D. in Organizational Behavior from Case Western Reserve University. Barrett has served as an Associate Editor of *Human Relations* since 2006, a Senior Editor of *Organization Studies* since 2005, an Associate Editor of *Journal of Applied Behavioral Science* since 2004, and Associate Editor of *Journal of Action Research* since 2002. Barrett serves as an ad hoc reviewer for the *Academy of Management*, *Organizational Development and Change* division and also for several journals such as *Organization Science*, *Journal of Management Inquiry*, and *Academy of Management Review.*

## Influences and Motivations: Discovering the Power of Music and Discourse

Barrett grew up in Cleveland Ohio and very early in life was introduced to music. At age 6, he learned to play piano by mimicking his grandfather's play. Later in high school, Barrett joined a rock-and-roll band that later went on to become a backup

band for Eric Carmen, a well-known 1970s American singer and songwriter (Barrett had already left the band when they played with Eric Carmen). After graduating high school, Barrett enrolled at Notre Dame where he joined the glee club and learned how to read and compose music. Barrett would continue his interest with music beyond college and later became professional jazz pianist touring with the Tommy Dorsey Band. While seemingly unlikely, these experiences in music would significantly influence Barrett's research, particularly in the areas of collaboration, improvisation, creativity, and innovation.

Music was not Barrett's only influence. Narrative, dialogue, and metaphor all played significant roles in his path as a scholar. To provide some order to the details of Barrett's earliest influences, this section will focus on three pivotal periods in his life: (1) his undergraduate studies at Notre Dame, (2) his doctoral studies at Case Western Reserve University (Case Western), and (3) his career as a jazz pianist. We begin with Barrett's undergraduate experience.

## Undergraduate Experiences

As mentioned earlier, Barrett attended Notre Dame for both his undergraduate and graduate studies. He graduated with a BA in Government and International Relations in 1975 and then an MA in English in 1977. Notre Dame is a private catholic liberal arts school where theology and philosophy are a core part of its curriculum. While this might create angst among students, Barrett took to these courses and found a love for philosophy. His readings of the great philosophers, particularly Kierkegaard and Arendt, would later inform his social constructionist orientation, which shaped his research on organizational change. To provide some perspective on how these two philosophers influenced Barrett's contributions, it is important to have some context. Kierkegaard was a nineteenth century Danish philosopher who was considered the "father" of existentialism, an orientation that viewed the world as having no predetermined purpose or order and instead viewed purpose emerging through dialogue and interpretation. Essentially, an existentialist would argue that humans create their own meaning upon which purpose and order are constructed. Barrett wrote in several contributions how an organization's purpose, order, and structure are not predetermined, but instead, emerge through social interaction of organizational members.

Hannah Arendt's contributions, particularly her book "*The Human Condition,*" also had a significant influence on Barrett's contributions. In her book, Arendt argued that action is uniquely human and through human action new ideas are created and put into the world through public discourse. It is through this social interaction that Arendt saw change occurring. Barrett would later write about the power of human relations and action in creating change. Barrett would also demonstrate in his own work as a scholar the importance of public dialogue in shaping ideas. Arendt's work has made such an impact on Barrett that he makes a point to reread "*The Human Condition*" every year.

Continuing with Barrett's experience at Notre Dame, as a sophomore he had the opportunity to organize the college's Literary Festival. As part of his responsibilities, Barrett escorted writers, such as Arthur Miller and Tennessee Williams, to the festival, and through his interactions with these writers, Barrett became inspired by narrative and literature. This led him to spend an increasingly amount of time with the English department's faculty, which motivated Barrett to stay at Notre Dame and earn a Master's degree in Literature. Through this experience, Barrett discovered the power of language, narrative, and metaphor and used these in his contributions where he became known for his saying "*words create worlds*."

## Doctoral Studies at Case Western Reserve University

Barrett's early experiences at Notre Dame expanded during his doctoral studies. In August 1983, Barrett joined Case Western as a doctoral student in the organizational behavior department. While he came to Case Western already motivated by the power of narrative, metaphor, and discourse, it was Barrett's interaction with faculty and fellow students that shaped this interest and ability to use these ideas in his scholarly research. During his studies, Barrett's dissertation advisor, Suresh Srivastva, would invite him to come sit and observe meetings that he had with another doctoral student, David Cooperrider. Cooperrider was studying appreciative inquiry, and through these meetings, Barrett saw the power of questions in imagining positive possibilities for the future. Cooperrider's work in appreciative inquiry would greatly influence Barrett's own research. Both became good friends, working together to extend the practice of appreciative inquiry through the use of language and metaphor.

Also during his doctoral studies, Barrett encountered Ken Gergen's book, "*Toward Transformation in Social Knowledge*." In his book, Gergen argued for a generative social theory of knowledge creation. At that time, Barrett was exploring the power of generative metaphor in transformative change and found this book to be perhaps the most influential work he encountered during his doctoral studies. Barrett would later go on to write a paper with Ken Gergen and Sheila McNamee on transformative dialogue (Gergen et al. 2001).

After graduating from Case Western, Barrett went on to teach at the Naval Postgraduate School in Monterey, CA, as an Assistant Professor of Management (he was later promoted to Associate and then full Professor). Roger Evered was a professor of management at the Naval Postgraduate School, and Barrett's encounter with Evered, particularly through his seminal article written with Gerald Susman on action research (Susman and Evered 1978), influenced Barrett toward a social constructionist approach using action research. Barrett saw immense practicality in action research as a way for organizational members to bring about own positive change in their organizations.

All of these experiences and interaction led Barrett to formulate a central idea of an organization as a social construct. He would apply an appreciative approach as a way to focus on strengths and what "works" in an organization rather than what is

"broken." Through this, one can see ways of developing more collaborative and egalitarian organizations. This became a central path for Barrett's research and practice.

## A Career as a Jazz Musician

While Barrett had a successful career as a jazz pianist, it is his lifelong love for music and jazz that continues to influence and motivate his thinking and contributions in the field of organizational change. This is particularly true as it relates to his contributions in creativity and innovation.

As a scholar, Barrett became intrigued with the connection between jazz and organizational behavior. In his most recent book, *Yes to the mess: Surprising leadership lessons from jazz* (Barrett 2012), Barrett wrote about his first encounter with Karl Weick as a doctoral student. Barrett was introduced to Weick by his dissertation advisor as both a doctoral student and former jazz musician. Weick asked Barrett if he was writing his dissertation about jazz as an innovative organization and while at that time Barrett wondered what the two had in common, over time he made this connection and contributed significantly to jazz improvisation as a metaphor for an organization. In 1995, Barrett and Mary Jo Hatch organized and facilitated a session on jazz improvisation and organizational complexity at the national meeting of the Academy of Management. From this session, a special issue of *Organization Science* was published in 1998. Scholars, including Weick, Hatch, Meyer, Pasmore, and Barrett wrote about the connection between jazz improvisation and organization theory. Barrett's specific contribution was an article on jazz and the innovative organization (Barrett 1998a). This article became the foundation for his many of his other contributions concerning jazz improvisation as a metaphor for an organization. Barrett not only showed how the principles of jazz and jazz improvisation can be used to develop practices that increase collaboration, innovation, and creativity; he used jazz as a metaphor to reconceptualize the organization.

## Key Contributions: Challenging Rational Frameworks Through the Social Construction of Organizing

As indicated earlier, Barrett approached organizational change from a social constructionist orientation. Through his contributions, Barrett challenged the rational model of organizational change that viewed change as a planned process created through a series of sequential steps of identifying change targets, creating and implementing change strategies, and institutionalizing change. Barrett's argument has been that organizational change is not necessarily planned, but emerges through the activities and interaction of people. Ken Gergen once wrote that generative ideas emerge from joint thinking and significant conversation (Gergen 2009). This

resonated with Barrett and argued that the organization not as an objectified reality, but an invention of the human imagination that can change using that same imagination.

Barrett's challenge of the rational model can be traced back to his dissertation, where he conducted a longitudinal study to examine the social interaction of a management group evolving from a bureaucratic mind-set to a more egalitarian mind-set. Barrett used discourse analysis as a way to focus on the group's language and its influence on their cognitive framework. What Barrett observed was that language not only reflected reality; it actually created reality (Barrett 1990). Barrett took this discovery and began to study the social construct of ideas, particularly those perceived to have elements of universal meaning. Early in his career, Barrett conducted research on how masculinity is socially constructed within the US Navy. Using a methodology of life history through interviews with male naval officers, Barrett discovered that rather than some monolithic notion of masculinity, the masculinity was relationally constructed and actually differed across job specialties. Barrett's key insight was that the idea of masculinity emerged as much through organizational patterns and practices as it did through individual personalities and genetic predisposition (Barrett 1996). He concluded that masculinity is embedded within an arrangement of social practices, discourses, and ideologies. The US Navy, Barrett argued, was not only a gendered institution supported and maintained by its structure but also a gendering institution constructing identity through the daily action and discourse of its members (Barrett 1996). Generalizing this, one can argue that role identity within organizations does not necessarily come from formal and predetermined job titles and descriptions, but instead comes from the daily activity and interaction of organizational members. The "informal" role becomes just as important, if not more important, than the "formal" role.

With this idea of individual identity as socially constructed, it made sense for Barrett to extend his insight to organizations and organizational life. Barrett takes inspiration from the idea of an organization as a social construct to argue for human agency as a force for positive change.

While much of Barrett's contributions to organizational change are situated in the social construction of organizing, this section organizes his contributions through the following categories: (a) the use of discourse and language to understand change, (b) metaphor as an intervention for change, (c) the importance of appreciative learning cultures in organizational change, and (e) jazz as a metaphor for the organization.

## Discourse and Language: Using Discourse to Deepen Our Understanding of Change

Through discourse, meaning is given to our world, which in turn creates our reality. Knowledge is not something discovered, but instead created through social interactions. In his paper on knowledge creation as a dialogical accomplishment (Barrett 1999), Barrett challenged the rational view of knowledge creation as an individual

contribution and argued that knowledge creation is inherently social, constructed through human interaction and dialogue. The implication offered by Barrett is that social interaction is an immensely creative activity that shapes our world. While organizations use formal tools and processes to encourage and manage change, Barrett argues that through discourse, humans innovate and create novel possibilities for the future.

In a paper on the role of discourse in large-scale organizational change, Barrett and his colleagues challenged the basic assumption of organizational change as a planned activity done to people through a rational process and instead argued for a dynamic system that involved the construction of meaning through dialogue. Through dialogue, organizational members have the opportunity to construct a common experience and meaning that provides context for change (Barrett et al. 1995).

As an example of a dynamic system of change using discourse, Barrett points to GE's "Work Out" program as an example of change as a dynamic system constructed through dialogue and meaning making. GE's "Work Out" program began in 1988 and, as Barrett argued, essentially challenged the rational model of organizational change. While these "workout" sessions were typically viewed as a process for fast implementation of process improvements, they were also used to create dialogue among organizational members around the CEO's (Jack Welch) vision of the organization. These sessions allowed employees and managers to challenge the assumptions and beliefs embedded in Welch's vision and through discourse develop shared meanings, which led to changes in the organization's structures, activities, and practices. What Barrett suggested through this case is that assumptions and beliefs are formed, changed, and normalized through social interaction that occurs over time. Because of this, Barrett suggested that researchers take a historical and longitudinal perspective using case studies as a way to study how language and discourse within an organization change over time. For managers, Barrett suggested that change challenges the familiar language within an organization and that organizational members need a "safe place" to challenge and try out new language, much like GE employees were able to do through its "Work Out" program. When an organizational member questions change, managers should be careful not to construe this as resistance, but instead view it as a process for making sense of change.

## Metaphor: Understanding the Power of Metaphor in Creating Organizational Change

Metaphor is closely related to discourse, but Barrett's unique contribution in this area is his use of metaphor as the basis for OD interventions. While metaphor can help people organize and describe their world, Barrett saw its generative power to actually help people reshape and change their world.

Metaphor is not new in organizational theory. Morgan (1997) argued for metaphor as a way to better understand organizations and organizational life. He identified several metaphors used in organizational theory such as organizations as

machines and organizations as brains. The former is used to create an image of mechanistic processes through command and control management, while the latter is used to create an image of an organization as a learning system. Using metaphor can help people describe and understand an organization. Barrett's use of metaphor began with exploring how groups develop over time. He then later used metaphor in an OD intervention as a way to create organizational change.

In his study of metaphor in group development, Barrett argued that existing theories of group development have historically focused on predicting and explaining group behavior, but not on understanding how groups develop over time (Srivastva and Barrett 1988). Barrett examined how group developed by studying metaphor creation by a group that met consistently over a 14 week period. During this time, Barrett studied the group's language and discourse in order to identify metaphors created. He later was able to organize and see patterns in these metaphors that represented particular phases of their development. Early in the group's time together, Barrett documented the use of the metaphor identified as "group as a battle" created and used by members to describe their frustration, conflict, and even anger. Over time, Barrett identified the metaphor of "group is moving" and "group as order and peace" to reflect the changing social reality of the group as members became comfortable with each other. Later, Barrett identified the metaphor of "group as a deep container" to describe how members saw deep emotions emerging within the group. He then identified the metaphor "group as layers" used by members to describe the many layers members saw of their communication with each other. What Barrett discovered was that each of these metaphors represented a particular phase in the group's development and learning. By paying attention to group dialogue, Barrett argued, that we can better understand how groups change and develop over time.

Working with Cooperrider, Barrett later explored the use of metaphor in OD interventions as a way to change group cognition. In this case, Barrett worked with a management group of a hotel that he described as being "paralyzed by defensiveness, distrust, and dysfunctional conflict" (Barrett and Cooperrider 1990). Through the use of metaphor, Barrett intervened at the tacit level of awareness, helping the group to first change their cognitive framework and as a result, the perceptions each member held of each other. This cognitive change opened up the group's mind-set to new possibilities, thus allowing Barrett to facilitate transformative change of their organization. Through this work, Barrett argued the need for organizational members to first change their own cognitive frameworks before changing their organization.

For this particular intervention, Barrett chose as a metaphor another hotel that was clearly experiencing dramatically different and positive results. As predicted, group members first thought this hotel had little, if anything, in common with their organization and wondered its value in this intervention. Introducing and utilizing appreciative inquiry, Barrett turned group members into field researchers to discover and appreciate what worked well and what was valued within the hotel used as a metaphor. Over time, group members were able to create new meanings and appreciate what was positive in their own organization. This allowed for the group to see their own world anew and create a new vision and plans for this new positive future.

Barrett and Cooperrider wrote a paper on their experience with this generative metaphor intervention (Barrett and Cooperrider 1990). Their paper won "Best Paper of the Year" in 1988 at the National Academy of Management in the Organizational Development division and provided a model for practitioners to begin transforming their own mind-set toward an appreciative use of dialogue and metaphor as a force for transformational change. This process created a learning environment within the organization that fostered respect, hope, and excitement among organizational members. With this insight, Barrett went on to write about the idea of appreciative learning as a way to cultivate positive organizational change.

## Appreciative Learning: The Importance of Appreciative Learning Cultures in Organizational Change

As mentioned earlier, Barrett was influenced by Cooperrider's work in appreciative inquiry and was motivated to use an appreciative approach in contributing to Senge's conception of a learning organization (Barrett 1995). Barrett described this as an appreciative learning culture that shifted from focusing on solving problem to focusing on innovating the organization. The former teaches one to adapt to what exists; the latter teaches one to create something new.

In making his case for appreciative learning cultures, Barrett borrowed and extended Senge's work in generative learning (Senge 1990). In conceptualizing the learning organization, Senge makes a distinction between adaptive learning and generative learning. Where adaptive learning is focused on coping and adjusting to environmental demands, generative learning seeks to go beyond this to generate new possibilities and new ways of thinking about the world. While Barrett agrees with Senge's assertion that generative learning is central to developing an organization's capacity to grow and innovate, he extended this idea by suggesting that through an appreciative learning culture, managers are able to discover and value those features of the organization that are positive and strong. This then opens up possibilities for discourse that leads to generative learning. Barrett argued that through an appreciative learning culture, organizational members are able to expand from *what is* to *what might be* and to focus not on fixing what exists, but on creating what can exist (Barrett 1995).

In his paper on the appreciative learning culture (Barrett 1995), Barrett identified several competencies needed to support such a culture. The first is the capacity to appreciate positive possibilities by focusing on the strengths, successes, and the potential of organizational members. In nurturing this competency, organizations celebrate its members' achievements and strengths as a source of organizational vitality. The second competency is the capacity to challenge existing habits and conventional practices by experimenting with new practices that can stretch organizational members in new directions. This requires going beyond what is familiar as a way to challenge and redefine existing boundaries. The third competency is the capacity to allow members to see how their efforts make a difference. This is done through feedback, purpose, and progress. Finally, organizations need to develop the capacity to facilitate members' engagement in ongoing dialogue and exchange of

diverse perspectives. What Barrett described was a culture that values experimentation and systemic thinking. He borrowed from Argyis' (1991) concept of double-loop learning as a way to question basic assumptions and to see the world anew. For Barrett, an appreciative learning culture creates the environment for an organization to realize Senge's idea of generative learning.

Barrett's conceptualization of appreciative learning cultures led him to explore at a deeper level how organizational members work together and collaborate to create change. Barrett was able to do this by connecting learning and organizational change with his love for jazz and jazz improvisation.

## Jazz as Metaphor for the Organization: Creativity and Innovation Through Improvisation

In many respects, Barrett's argument for an appreciative learning culture and his challenge to the rational model of organizational change are situated in his observation that society has shifted away from the industrial age toward a postindustrial age. The industrial age, represented by the factory system, mass production, and formal and systematic methods of managing, suggests that organizations can be programmed. If the organization falls short of management's intention, it can be taken apart, diagnosed, fixed, and reprogrammed through a series of sequential steps that leads to organizational change.

This is dramatically different from Barrett's description of the postindustrial age, which embraces the idea of constant change through innovation. To meet the challenge of a fast-changing world fueled by innovation, Barrett identified a new metaphor of the organization as jazz improvisation. The metaphor of jazz improvisation serves as an effective counteract to the rational model suggesting that organizational change is not programmed, but instead emerges through the interaction of its members. By shifting the mind-set to an organization as jazz improvisation, Barrett shows that organizational change comes about through a manager's ability to facilitate creativity and innovation rather than an ability to command and control.

Jazz improvisation is the product of jazz bands, and Barrett argued that jazz bands are actual organizations comprised of diverse specialists designed to create, innovate, and change. The change created by jazz bands is not predetermined or prescribed through any rational plan, but through the spontaneous interaction and collaboration of diverse jazz musicians. Barrett argued that the characteristics of a jazz band can be applied to organizations as a way to understand change at a deeper level and to explore how to increase an organization's creative and innovative capacity (Barrett 2012).

As previously mentioned, when Barrett first encountered Karl Weick, he was asked if he was writing his dissertation on jazz and the innovative organization. While Barrett may have not initially seen the connection, he certainly did later in his career and has since made significant contributions. In describing jazz improvisation as a metaphor, Barrett drew a parallel between today's manager and a jazz player (Barrett 1998a). He described both as needing to make fast, irreversible decisions within a chaotic and turbulent environment. Managers, like jazz players, work

interdependently to interpret vague and often confusing information. To be successful in a fast-changing environment, both jazz players and managers must commit to the idea of innovation and change. Experimenting must be embraced as well as the inevitable mistakes that occur through experimentation. Both managers and jazz players operate and respond to their surroundings with no prescribed plan and with little certainty of outcome. Their path forward usually unfolds in front of them through their action and interaction (Barrett 1998).

Much of Barrett's contributions in this area connect back to the themes and arguments he has made throughout his career. He explained the jazz band as a social group that constructs new musical material through interaction. Jazz musicians, as Barrett tells it, learn the theory and rules that govern musical progress and then seek to create new meaning with other jazz musicians as they combine, recombine, and extend various forms and rules as a way to transform music in unexpected and novel ways (Barrett 1998). This is very much how Barrett saw organizational life in the twenty-first century postindustrial organization.

Barrett's most significant contribution to improvisation is his book, *Yes to the Mess: Surprising Leadership Lessons from Jazz* (Barrett 2012). True to his belief that narrative creates new worlds, Barrett used stories from his time as a jazz musician to develop insights into collaboration and innovation within organizations. Barrett described the improvising organization as an organization that values emergent strategy, creates fluid and minimal structures, provides opportunities for cross-functional conversations and interactions, embraces uncertainty and ambiguity, and develops a focus for appreciative inquiry. A central point made by Barrett was that unlike the rational model of planned change, organizational life is messy and requires creativity, on-the-spot decision-making, agility, and collaboration. Organizations need to learn to embrace uncertainty and imperfection that are inherent in improvisation (Barrett 2012).

*Yes to the Mess* provides an important contribution for practitioners. It not only provides an introduction to the improvising organization, it also provides managers and OD practitioners with ideas for developing the mind-sets, skills, and practices needed for improvisation within the organization. Barrett has used the tenets of his book and presentations in workshops as a way to help leaders focus on creating transformative change through learning, creativity, and innovation.

## Key Insights: Limitations of the Rational Model in the Postindustrial and Postmodern Society

Barrett's contributions are situated in his key insight that the rational model of organizational change can limit our understanding of organizational change at a deeper level. The rational model assumes that organizational members can be persuaded to change through logic and reason. It represents change as being created and managed through distinct and sequential steps that can be viewed as a programmed and planned process. Barrett has argued that the rational model of organizational change can "trap" an organization within the existing boundaries of its own cognitive framework. In making this argument, he goes on to argue that this

does little to inspire the imagination of new possibilities. In effect, Barrett is suggesting that through a rational model of change, managers actually become the keepers of the institutionalized structures and routines of the organization, guarding against any deviance from the status quo and limiting their capability to innovate.

Barrett has inspired researchers to understand and study organizations as a vibrant and ever-changing social entity that never truly reaches stasis. By paying attention to social dialogue, language, and metaphors, Barrett has argued that researchers can understand the social constructed reality of organizational life. Barrett has also inspired practitioners to view organizational change not as a way to solve problems, but as a way to help organizational members imagine new possibilities for its future. Barrett has argued that the organization is a manifestation of human imagination and that it is time to reimagine and construct a new concept of the organization (Cooperrider et al. 1995).

While Barrett has argued the limitation of the rational model of organizational change, he did not discount its contribution to the advancement of society, particularly in technology. But, Barrett has also observed that unprecedented advances in technology have led to a society that is increasingly turbulent and fast-moving. This is why Barrett has given so much emphasis on creativity and innovation.

Barrett has also provided the insight that to achieve transformative change, organizations must first change its existing cognitive framework. In doing this, Barrett used social cognition theory to explain that when faced with evidence that contradicts an individual's existing view of the world, he or she will actually "double down" on their existing behavior, making transformative change difficult (Barrett and Cooperrider 1990). To create transformative change, Barrett has demonstrated the need to replace existing cognitive framework with something new. In doing this, Barrett has contributed to our understanding of second-order cognitive change as described by Bartunek and Moch (1987). Through this insight, Barrett has worked toward moving scholars and practitioners from a focus on changing human behavior to a focus on changing human cognition. This insight forms his basis for helping organizations move beyond its limitations and boundaries of what exists to imagining what is possible.

In his research and practice, Barrett has pointed out the need for OD consultants to begin using narrative, discourse, and metaphor as a way to confront and replace old, outdated cognitive frameworks. He envisions appreciative methods as a focus and the metaphor of jazz improvisation as a way to conceive and unleash the capacity of human imagination to collaborate, innovate, and create. Through Barrett's contributions, scholars and practitioners are better equipped to understand and create positive change that taps into the transformative potential people and their ability to create, innovate, and learn.

## Legacies and Unfinished Business: The Social Construction of Organizing and Change

Barrett's ideas of the social construction of organizing and change stand out as central to his legacy. In contributing to this orientation, Barrett challenges the central tenets of the rational model of organizational change. His motivation has led him to

explore organizational change through the lens of discourse, metaphor, appreciative learning, and improvisation.

What is distinctive about Barrett's contributions is his foresight throughout his career. In his early contributions, before terms like disruptive innovation became lexicon in the organization theory literature, Barrett articulated disruption and its challenges. He has also argued that for organizations in the twenty-first century, creating new practices, routines, and even cultures will be the primary focus as a way to meet the challenges of a fast-changing environment. As we can see from his contributions, Barrett saw meaning making through discourse and collaboration as a means to meet this challenge.

Barrett has a distinctive ability to connect seemingly disparate worlds. He has connected jazz, narrative, and metaphor to organizational change and through this has provided scholars and practitioners with ideas and inspiration for research and practice. In his recent writings, Barrett shows how the principles of jazz and jazz improvisation can apply to organizations seeking to better collaborate and create positive change and innovation. As mentioned previously, Barrett is a social constructionist and believes in the power of human relations to act toward positive futures. We see this not only in his contributions but in his career as a scholar. Watch Barrett at any academic conference and you will see someone in constant interaction with colleagues. He views this activity not so much as career networking, but as a way to build on ideas. I was one of Barrett's doctoral students, and I witnessed many times his energy and enthusiasm for engaging with colleagues. Barrett has always encouraged his students to present at conferences, not as a way to build a CV, but as a way to engage the world with your ideas. Perhaps what motivates Barrett most is his core belief that ideas and theories make a difference. By engaging with others in our ideas, Barrett truly believes we can make positive difference in the world.

Even with all of his contributions, Barrett still sees unfinished business in his work. He is extending his work on social interaction and relations by exploring friendship and the power of human connections. His work on improvisation demonstrated that creativity and innovation come not from the lone genius, working alone in some laboratory, but through the positive dynamics of relationships. What still needs to be explored is the kind of relationships that lead to creativity and innovation and then how to keep these relationships alive and vibrant.

Barrett's work in cognitive change has led him to develop the idea he calls provocative competence, which is the ability to positively disrupt habits and routines of people as a way to build new perspectives. Provocative competence is an affirmative approach that seeks to first understand people's strengths and capabilities and then use this positive image to move people toward new situations. While this might lead to a level of vulnerability, it also provides the mechanism for forming new perspectives and thought processes. Barrett has described in detail how this competence is practiced in jazz, but more work is needed to understand how it can be practiced in organizations. What do these small disruptions look like in organizational life? Is it possible to create too much disruption and limit or prevent new patterns from forming? If so, how do we detect this and how can we prevent it? These are important questions and areas of research for both scholars and practitioners.

# Jean Bartunek and the Power of Working Across Boundaries: Dualities and the Missing Voice

**5**

John R. Austin

**Abstract**

Throughout her career, Jean Bartunek has purposely placed herself on boundaries and excitedly explored the tensions inherent in those boundaries. Theory and practice, insider and outsider, academic and practitioner, qualitative and quantitative – she's mined all these boundaries for insights that go well beyond the boundary in question. These studies challenge researchers, students, and managers to look beyond their own perspectives and embrace a form of dialectical inquiry to find the voices they may be ignoring or unconsciously undervaluing. Jean's work on second-order change, insider/outsider research methods, and academic-practitioner dynamics continues to contribute to our understanding of dialects, especially those that are initially hidden, and the paradoxes that are often attached to them.

Jean lives these boundaries in addition to studying them. In addition to being a full-time academic, she is also a Roman Catholic sister, a member of the Religious of the Sacred Heart. Both of these sides of her life are crucial to her identity and have been throughout her adult life.

A number of current areas of inquiry have benefited from Jean's work. These include context-sensitive sensemaking, missing voices in change theory and design, the lived experience of change, planned change and transformation, process and implementation theories, emotion in change, and idea translation across boundaries.

## Contents

## Introduction

Boundaries define a context, they define a construct, and they form the basis for identities. Once created, boundaries determine what is "in" and what is "out." Through her research, writing, and professional service, Jean Bartunek mines these boundaries for insight. Her work has often revealed the missing voices in our theories and in our understanding of organizational change. Dualities defined by a single boundary such as theory and practice, academic and practitioner, first- and second-order change, qualitative and qualitative research continue to define our understanding of relevance and credibility. Jean's writing challenges us to question those definitions and consider the implications.

This chapter has particular relevance for me, both personally and professionally. I am proud to have been Jean's first doctoral student and have maintained a friendship with her for many years. In addition, I've set a unique career path in which I've actively worked to "live at the boundary" between the academic and the practitioner, between theory and practice, and between long-term strategies and short-term tactics. Jean's work on dualities and tensions resonates with my experience as a professional "boundary spanner."

## Discovering the Power of OD and Connecting Research and Practice

Given Dr. Bartunek's interest in theory and practice throughout her professional life, it may come as little surprise that it was a combination of exposure to the practice of organization development (OD) as a participant and her training in research and

social psychology that set her on her career course. Jean recounts these early influences in an article included in the further reading section at the end of this chapter (Bartunek 2006).

Two early experiences with OD consultation showed Jean the significant power OD had to influence situations while also illustrating the potential negative consequences when not managed well. The first was a multipart OD intervention designed to improve participation in decision-making at a school where she taught in her first full-time position after becoming a sister. Unfortunately, the approach the consultants used for the OD intervention was inappropriate and led to serious problems. The intervention was cancelled in midyear. The second intervention was an OD workshop run with camp counselors at a camp for inner-city and suburban children in the Cleveland area. The workshop was immensely successful at creating a deep bond among the counselors. Jean notes that it was so successful the counselors occasionally forgot about their job of watching the campers (Bartunek 2006). Both these interventions had powerful and unanticipated effects on the participants. Jean recalls hoping that such approaches could have profound positive impacts if led by consultants that were more skilled.

In graduate school and particularly in her first full-time professorial job, Jean began to discover what forms of research were personally interesting to her. Her training had been in the use of laboratory research design, and it was a revelation that one could do research by engaging people in their normal context through surveys and interviews. In some cases, these projects also involved active OD interventions. She found this work much more interesting than laboratory studies in which researchers created artificial situations, though she still had questions regarding the rigor of the field studies and the lack of underlying theory.

Bartunek's passion for linking theory and practice, which has become a keystone of her career, can be traced back to Argyris and Schon's (1974) book *Theory in Practice*. Jean read this book in 1976, and it triggered a transformation in her thinking. She began to see how research in planned organizational change combined with her experiences of OD interventions could be seen through the combined lens of both theory and practice.

## The Influencers: Finding Her Way Out of the Lab

The story of Jean's development as a researcher would not be complete without mentioning two friends/mentors who played key roles in her work as a researcher and theorist: Chris Keys and Mike Moch. Chris helped establish Jean's early expertise in research and OD, while Mike introduced Jean to the value and techniques of field research.

Chris Keys joined the psychology department faculty of University of Illinois at Chicago in Jean's second year as a graduate student. He directed Jean's dissertation and became a close friend. Chris had been extensively involved in organization development consulting. With Chris, Jean became involved in several large-scale OD projects, and, through these, she was exposed to a range of OD exercises,

techniques, and assessments. He also encouraged Jean to participate in the graduate student development program of the National Training Labs, a series of 2-week and weekend t-group programs over a period of 2 years. Chris was instrumental in Jean's initial training as an OD professional and her launch as an active researcher, and Jean and Chris published several articles together.

Mike Moch joined the group at University of Illinois Urbana-Champaign the same time Jean did. He came from the Institute for Social Research at the University Michigan, where he received the contract to serve as an outside evaluator for two of the new quality of work life interventions. The first one was at the Tennessee Valley Authority. While Jean knew about organization development, Mike taught her about constructing scales and questionnaires and conducting interviews and field observation. Over a period of several years, he basically taught Jean how to do field research. Jean and Mike published a number of articles and a book together over the years. Their writing about third-order change (Bartunek and Moch 1987, 1994) and their observations on worker sensemaking around a quality of work life intervention (Moch and Bartunek 1990) have been particularly influential in subsequent transformational change theorizing.

## Key Contributions: Dualities and the Missing Voice

An examination of Dr. Bartunek's publications reveals a set of key contributions to our understanding of change and how we design organization development interventions. When taken as a whole, these contributions reveal a common theme of missing voices and dialectics with those missing voices.

Dualities abound in Jean's writing. Dualities have significant value as a driver of tensions and as a way to surface missing perspectives (Seo et al. 2004). Jean uses dualities to call attention to these alternate frames and to initiate a form of conceptual conversation between the frames (Bartunek 2004). The following are some examples of dualities in Jean's work: first-order/second-order change, insider/outsider, academic/practitioner, emotion/cognition, change planner/change recipient, quantitative/qualitative, and sensemaking/sense-giving. A focus on a duality, as distinguished from a plurality of more than two, draws attention to the unique balance between focus and frame challenging. A duality focuses attention on a single alternate perspective. This singular focus can have the effect of creating a tangible challenge to a dominant frame. By focusing attention in a singular alternate direction, the frame-challenging activity lends itself to a dialectic conversation. As an example, consider Jean's seminal research on second-order change. Rather than presenting the study as an open-ended critique of the various ways organizational change can be constrained by limited sensemaking, she defined an alternative type of change explicitly focused on frame-shifting. Once she defined this duality of first- and second-order change, Jean turned attention on the tensions and interactions between the two change types. The duality enables a sharp focus on the interaction. In a similar manner, Bartunek used the practitioner to sharpen focus on limitations of

academic mental models. Dr. Bartunek has successfully crafted a series of these dialectical conversations throughout her career. By doing so, she has helped us see the missing frames in the dominant logics driving our theorizing and practice.

## Sensemaking and Change: Second-Order Change

Bartunek's research on second-order change (Bartunek 1984, 1993; Bartunek and Moch 1987) has had a profound impact on the field of change. We can see its influence in many current theories of frame-shifting and sensemaking within the context of change. Second-order change refers to change in the underlying rules governing a social structure. This is distinguished from first-order change, which is change within a given social structure. Building from earlier discussions of interpretive schemes (Ranson et al. 1980), Jean examined the process through which interpretive schemes undergo second-order change, how that second-order change is related to restructuring, and how organizational leadership influences the change.

Bartunek sums up the dynamic between second-order change, leadership, and structure in this excerpt from her (1984) *Administrative Science Quarterly* paper:

> The outcome of the analysis is to suggest that second-order change in interpretive schemes occurs through a dialectical process in which old and new interpretive schemes interact, resulting in a synthesis. These changing interpretive schemes are both affected by and modify the organization's structure, but the relationship between interpretive schemes and structure is not direct. Rather, it is mediated by the actions organization members take in response to changing understanding or structure and the emotional reactions they have to these changes. An environmental impetus is probably necessary for change to begin, but the manner in which the environment affects the change depends on the organization's present interpretive schemes and structure. (Bartunek 1984, p. 356)

The study built upon a deep qualitative analysis of 10 years of documented decision-making within Jean's religious order in the USA as it struggled to redefine its mission. The richness and longtime horizon captured within the data offered an opportunity to truly dig deep into the dynamics of the change and not be caught up in short-term disputes. The result is a dialectical process description that has stood the test of time and still resonates with its theoretical clarity and relevance. This paper also highlighted how qualitative data can be used in a rigorous way to build new theory.

The qualitative shift in sensemaking inherent in second-order change has important implications, not just for the outcome of the change but also for the measurement of change. Quantitative measures designed to track the change may be built upon key assumptions that are no longer relevant in instances of second-order change. Understanding second-order shifts may require a more qualitative approach to data collection.

While much of the attention given to the 1984 article was on the connection between cognition and organizational change, it is interesting to observe that Jean

explicitly linked affect and cognition in this article as well. Emotional reactions by organization members play a central role in the model Jean developed. That the cognitive element of the model became this study's most enduring mark on the field may say more about the intellectual interests of management academics in the 1980s than it does about the study itself. The connection between emotion and cognition is an active area of inquiry at the moment and continues to be an area of interest for Dr. Bartunek (Seo et al. 2004). Sensemaking occurs as a combination of emotional and cognitive processing (Kahneman 2011), and organizational change cognitions and outcomes are often intimately linked with participant's emotional experiences with the initiative (Bartunek et al. 2006).

## Using Qualitative Research in Studies of Change

Unlike the other contributions described in this section, the use of qualitative research is not a distinct area of inquiry. Rather, this theme weaves throughout Jean's work. Occasionally qualitative research is the focus of a given article (Bartunek and Seo 2002; Bartunek 2012), but more often qualitative research is a supporting theme in a chapter or article.

   Jean's interest in qualitative methods can be traced back to her questions regarding the methodologies being used in social psychology experiments early in her career. As she readily admits, she found the work boring and repetitive. Increased focus on the context was just inherently more interesting to her. This interest in context naturally lent itself to more qualitative methods. Her 1984 article "Changing Interpretive Schemes and Organizational Restructuring" is often cited as a rare example of qualitative research published in a top-level management journal during that era.

   An interest in mixing rigor and relevance of change research design led to a wide range of collaborations throughout her career. Jean notes that this interest led her on many different adventures with various topics and has given her a sense of the breadth of the world of change research. This exploration is seen in the large number of papers in which she is second or third author alongside other collaborators.

## Insider/Outsider Research

Inquiry into dialectics and reconceptualizing roles is front and center in Jean's writing on insider/outsider research. Louis and Bartunek (1992) presented the benefits of insider/outsider collaboration on research teams and examined this topic even further in a monograph written as part of the Qualitative Research Methods Series (Bartunek and Louis 1996). Evered and Louis (1981) framed differences in how organizational insiders and outside researchers understood situations. Bartunek and Louis took this insight and began considering how the different

perspectives could simultaneously contribute to higher-quality research and better change outcomes. The insiders are not simply subjects of the research. They become cocreators who have a stake in the design of the project and have the opportunity to contribute their insights to the analysis. Organization members become partners, and the resultant outcomes will ideally have value not just for the broader research community but also for the organization itself.

The insider/outsider work has contributed to a wide array of research studies of organizational change since the mid-1990s. Illustrations are found in Bartunek et al. (1996), (1999), (2000), (2007), and Giorgi et al. (2014), among other places. Jean's insider/outsider work was also a precursor to her work with Sara Rynes on the academic-practitioner divide in the management field. One particularly interesting observation about Jean's examination of the insider/outsider dynamic is how she has redefined where the academic is situated in her writing. In early insider/outsider writing, the academic is the outsider who can offer new perspectives and rigorous techniques to help the organizational insider better manage the complexity of organizational change. In more recent writing, Jean presents the academic as the insider whose perspectives are constrained and would benefit from paying more attention to the outsider perspectives of the practicing managers.

## Practitioner/Academic Dynamics

The relationship between management academics and practicing managers emerges as a strong theme in Jean's work since 2001 when she coedited a special research forum in the Academy of Management Journal on knowledge transfer between academics and practitioners with Sara Rynes and Richard Daft (Rynes et al. 2001). Subsequent work has explored academic and practitioner research collaboration (Bartunek 2007), "implications for practice" sections in academic articles (Bartunek and Rynes 2010), knowledge sharing (Bartunek et al. 2003), idea translation (Austin and Bartunek 2003), and the paradoxes embedded in the practitioner/academic dynamic (Bartunek and Rynes 2014).

The success of this work, at least as measured by citation rates, can actually be seen as an intriguing example of using academic conventions to challenge prevailing mind-sets about the academic-practitioner divide. These articles all use the language and communication channels of conventional academic communication (journal articles, creating legitimacy through citation, empirical evidence, theory, etc.) to challenge management academics to rethink their understanding of, and relationship with, practicing managers. The articles themselves successfully create dialectic dynamics because they conform to norms of legitimacy for one side of the dualism (the target audience: management academics).

Jean views this work as having implications beyond just academic-practitioner interactions. The gap itself can be studied to gain insight into other professional divides categorized by similar tensions:

> Imagine, instead, an approach to this gap that does not try to resolve or bridge it, but treats it as fundamentally important in itself for scholarly research and theorizing. Such an approach does not take a side in conversations about whether effective academic-practitioner relationships are possible. Rather, it treats academic-practitioner tensions as significant phenomena whose exploration can suggest important knowledge that is pertinent not only to academics and practitioners, but also to other relationships that include tensions of some sort. (Bartunek and Rynes 2014, p. 1182)

## New Insights: Finding the Edge and Pushing

A number of current active areas of inquiry owe much to Jean's work. Context-sensitive sensemaking and inclusion of missing voices in theory building and change design are perhaps two that have been most powerfully influenced by Jean's work. Others include work on the lived experience of change, the relationship between planned change and transformation, implementation theory, role of emotion in organizational change, and idea translation across professional boundaries.

## Context-Sensitive Sensemaking

Second-order change research helped build recognition of the need to fuse cognitive approaches to change with qualitative research methods. Many second-order changes can only be understood, measured, and critically challenged via qualitative evaluation. We may take this observation for granted now, but it was a direct challenge to the prevailing interest in measurements of change in the 1970s and 1980s (cf., Bartunek and Franzak 1988). Bartunek's studies highlighted the assumption of some level of stasis built into many quantitative measures of change. Once a change grew beyond that level of stasis, quantitative measures of the change need to be critically examined. Qualitative and refined quantitative measures have great value in understanding a change, but standard approaches risked missing fundamental shifts characteristic within a second-order change.

## Missing Voices in Change Theory and Design

A central question that connects much of Dr. Bartunek's work is "Whose expertise is being ignored and why?" We see this in her work on insider/outsider research, in her work on the academic/practitioner divide, in her work on empowerment, and in her work on how recipients of change feel about the change. Each of these streams of research reflects an underlying dialogic questioning of who gets to tell the story and decide what knowledge is valid. We see a search for the underlying tension and potential paradox. The tension is the focal point. If there is no tension, nothing is

occurring. A good example of this can be seen in Bartunek and Ryne's work on the academic/practitioner divide (2014). They examine the use of the word "relevance" and the ongoing fights over what it means in academic discussions to raise the important point that the academic always tells the story. Relevance is important for the practicing manager as well, but academics rarely hear relevance discussed from the practitioner's perspective.

## The Lived Experience of Change

Jean's work on insider/outsider research as well as her active efforts to reach beyond the traditional academic perspective have contributed to efforts at legitimating the lived experience of change. Change participants are not viewed as merely data points or people to be influenced. They are potentially partners in the change. At a minimum, their perspectives are legitimate outcomes to consider when examining planned change (Balogun et al. 2015; Bartunek et al. 2006). While not always an explicit focus of her work, empathy for change participants is implicit in much of her work.

## Planned Change and Transformation

To what extent can planned change actually be transformative and, if it is, can it be controlled? This question is a challenge to the notion of planned change and how we measure it. The measurement challenge is true for both researchers and practitioners. Metrics is big business, and practitioners and academics alike often get seduced into focusing on what they can measure without looking for evidence of second-order change. Likewise, a review of current change management models could lead one to conclude that transformative change can be fully controlled with the right design. Schematic change, change that redefines fundamental cognitive frames, reminds us that the synthesis required for a new shared schema is messy and extremely difficult to predict beforehand.

## Process and Implementation Theories

In Austin and Bartunek (2003, 2012) review chapters, we considered how change process and change implementation theories differ and are connected. We examined current theory building and practice in the area of organizational change. We argued that previous reviews of change theory focused primarily on change process theory (how change happens) and often ignored change implementation theory (how one actively creates change). Academic change researchers often built process theories. Change practitioners often built implementation theories. Our review found four

dominant implementation motors in use both in 2003 and 2012. These implementation motors were participation, reflection, action research, and narrative. Contemporary OD interventions relied on one or more of these motors to drive successful implementation of change. A majority of implementation theories included some element of participation in combination with at least one of the other motors. We observed that the evolution of OD implementation has proceeded along a path characterized by increasing integration of the four implementation motors (Bartunek et al. 2008). Current practice is influenced by prior generations of OD practice, and newer implementation frameworks increasingly combine the four motors. For example, appreciative inquiry includes elements of participation, reflection, action research, and narrative motors. This work provides a valuable basis for future theorizing about change process and implementation, particularly as the field of planned change continues to struggle with connecting academic theorizing and practitioner application.

## The Role of Emotion in Organizational Change

Jean explored questions about conflict and emotion in change in her early research projects, and they have remained central elements throughout her career (Bartunek et al. 2006; Balogun et al. 2015; Giorgi et al. 2014). An attention to emotion is a natural offshoot of her focus on missing perspectives and the lived experience of change. Jean's recent work focuses on the perspective of the change recipient as well as the change leader. Change outcomes are not just driven by cognitive sensemaking. Emotional experiences anchor behaviors and color participant sensemaking. Emotions can also guide and explain resistance strategies, not just resistance toward a change initiative but resistance as a seed for emergent change initiatives.

## Idea Translation Across Professional Boundaries

As Jean reflected in a 2006 article, her career has always involved actively working across professional boundaries. Jean's many professional identities made idea translation a personal necessity. Her writing has helped others manage similar professional challenges. My personal efforts to work at the boundary of academic research and managerial practice are directly attributable to Jean's work and my collaboration with her. During the process of writing a review chapter with Jean in 2002, I came to recognize the importance of individuals who take on idea translation roles with the aim of bringing new ideas into different fields. Since that experience, I've chosen to craft a career as an idea translator rather than fully embrace an identity as an academic or practitioner. The questions Jean and I asked in our 2003 Handbook of Psychology chapter regarding how to overcome barriers between academic and change practitioners have continued to interest me. These questions prompted me to look for key idea translation moments facing change practitioners (Austin 2013) and work to train managers to see idea translation as a core component of their work as change leaders (Austin 2015a, b). Thanks to some of the questions raised by

Jean's work, this unique career choice could become one that is more common in the future. In my biased opinion, this would be a positive development for both practicing managers and academic researchers.

## Unfinished Business: Where Next?

Jean's current work digs deeper into questions of academic-practitioner dynamics that go beyond a binary understanding of professional identity or OD. For example, she is currently editing a book with Jane McKenzie (Professor of Management Knowledge and Learning at Henley Business School) that explores multiple modes of contemporary academic-practitioner partnerships around the world. It is tempting to focus on partnerships that fit into traditional roles and outcomes: academic as the outsider, practitioner as the industry expert, and articles/new management patterns as outcomes. However, modes of partnerships can evolve in a wide variety of directions. These partnerships are not just a means toward innovations. They can be innovations in themselves.

Her curiosity continues to be aimed at finding those things that may not be obvious or visible at first and which may be masked by the obvious, such as more in-depth exploration of the impacts recipients of change may have on change processes. Unearthing tensions and systematically exploring the paradoxes revealed by the tensions give her inquiry focus. One avenue for this inquiry regards considerations of relevance. Relevance, as a term, is used by academics and practitioners, and, interestingly, it is often used as justification for delegitimating the other's perspective or contribution; however, exploring relevant activities and practices (cf. Bartunek and Anthony 2016) can provide new possibilities for understanding the construct in more accessible ways.

The question that started Jean on her professional journey still resonates with her as well. How can we do OD or, more broadly, planned organizational change better? And how can OD contribute to academic scholarship? OD is still a powerful tool for positive change in organizations. It still can benefit from enhanced understandings of links between theory and practice, not to mention so many other dualities that reveal themselves to attentive observers. Jean continues to push the OD field to consider its progress and continue to improve. One way of doing this is through a deeper understanding of temporal dimensions of change, and Jean is now exploring that topic (Albert and Bartunek 2017; Bartunek and Woodman 2015).

Jean continues to find the tensions she engages and the possibilities of surfacing what is hidden to be consistent sources of renewal for her work. Confronting, naming, measuring, and debating theoretical implication of boundaries frame her work today as much as it did at the start of her career. Her efforts to push OD to contribute to academic scholarship has kept her collaborating with a wide array of academics and practitioners. This large and growing list of collaborators illustrate another of Dr. Bartunek's key contributions. She creates connections. As president of the Academy of Management she pressed the academy to strengthen ties between academics and practitioners. Her focus on rigor in research design and theory has

helped to break down boundaries between qualitative research and quantitative researchers. Her focus on insider/outsider research has helped trigger continuing conversations across academic-practitioner boundaries. In each case, Jean's writing exposed a tension and transformed that tension into an opportunity for constructive dialog across a boundary.

# Richard Beckhard: The Formulator of Organizational Change

**6**

Ronald Fry

**Abstract**

Richard Beckhard is recognized as one of the founders of the field of organization development and as a pioneer in the study and teaching of a systemic approach to planned change in complex organizations. As an educator, Beckhard was an adjunct professor at MIT's Sloan School of Management where he teamed with Douglas McGregor, Warren Bennis, and Edgar Schein in the early development of MIT's Department of Organization Studies. A practitioner at heart, he applied behavioral sciences to translate his international consulting experiences into many useful change management models and tools that still influence practice of change leadership today including the Formula for Change, Open Systems Planning, Responsibility Charting, Confrontation Meeting, and Task-Oriented Team Development. As an institution builder, he helped found the Organization Development Network, the International Organization Development Association, and the Family Firm Institute.

## Contents

## Introduction

Richard "Dick" Beckhard is widely known as one of the founders of the field of organization development (OD) and as a pioneer in the study and teaching of a systemic approach to planned change in complex organizations. He was an internationally sought out consultant to executives and organizations on topics ranging from leader succession to team and inter-group dynamics to planned, system-wide change. As a scholarly practitioner he translated this experience into many useful change management models and tools still in use today. As an institution builder, he helped found the Organization Development Network under the auspices of the National Training Laboratory, the International Organization Development Association, and the Family Firm Institute (and subsequently the *Family Business Review*). As an educator, Dick developed and taught system-wide organization change courses to masters and doctoral students, and Sloan Fellows, at MIT's Sloan School of Management where he also teamed with Douglas McGregor, Warren Bennis and Edgar Schein in the early development of MIT's Department of Organization Studies.

## Influences and Motivations: From Event Manager to International Change Facilitator

Beckhard was born in New York in 1918. His early professional passions were in the theatre. At Pomona College he supported himself through college by working as a stage manager. Eventually his talents took him to Broadway where he stage managed and radio-acted. Unable to be drafted for physical reasons, he helped found the Stagedoor Canteen for GIs in New York in 1943 and through an assignment with the Red Cross in New Guinea he helped direct entertainment shows for GIs in the South Pacific (Hampton 1997). It was at the Red Cross that a life-long pattern of doing and learning started as he took on new roles and positions including teaching drama and music, supervising the building of thatched huts in New Guinea, providing social

work services to GIs, and directing a field operation with a six million dollar budget. In his own words,

> My life pattern has consistently been one of doing something because it was there to be done and then trying to learn from the doing. For me, the only way of learning is by doing. . . .I never did anything because I was prepared for it. (Beckhard 1997, xii)

After World War II, Dick applied his extensive stage management and direction experience to become a "meeting management" consultant. He was approached by Ford in 1947 to help produce entertainment for a radical new car launch. That success led to others and his reputation as an expert in staging industrial shows led to several engagements including the Girl Scouts of America to stage general sessions at their triennial conference and a railroad "World's Fair" on the Chicago waterfront. In 1950, he was approached by Ron Lippitt and Lee Bradford, two of the founders of the National Training Laboratories (NTL), to apply his theatrical staging expertise and experience with role-playing to the staging of NTL's plenary "theory" sessions to make them more engaging. While doing this he participated in NTL's core program, the T-Group. That experience stimulated his seminal thinking on the relationships between group functioning and problems faced by managers in corporations (MIT Tech Talk 2000). Again in his words,

> Although I didn't' completely realize it at the time, I had undergone a profound experience. Those three weeks changed my life. The most profound effect of my first experience with NTL laboratory training was a dramatic increase in self-awareness. . . (Beckhard 1997, 19)

Later in his writings, a key assumption underlying Beckhard's thinking on organization change was that organizations functioned as systems of groups and understanding group dynamics was the key to facilitating improvement or change.

> As I thought about the presentations on theories about the effective group functioning [at NTL] and about the ways meetings were actually conducted, I realized there was little connection between the two. The knowledge and understandings that were being discovered were not being translated or applied to managers or leaders in organizations. A light flashed. Perhaps what was needed was "bridge" between the two worlds. . . (Beckhard 1997, 22)

This early experience at NTL also spawned a 35 year relationship wherein Dick became a staff member and served on the board.

In the late 1950s, Dick began collaborating with MIT Professor Douglas McGregor who founded the Organization Studies Department at MIT's Sloan School of Management. Here they initiated a project at General Mills designed to facilitate a system-wide process that included top team goal setting, leadership training for all management levels, performance improvement meetings between supervisors and workers, and work team identification and team building. In writing up the project as a case study, Doug and Dick needed a program title. Instead of Human Relations Training, Leadership Training, Management Development, or Organization Improvement, they chose "Organizational Development" to describe

the scope and focus of their work (Beckhard 1997). The experiences and ideas emerging from this work lead to one of the first training programs on "planned change" at NTL; "Program for Specialists in Organization Development (PSOD)." Participants would meet initially for a weeklong seminar with the instructors to learn the tools for planned or managed change. Each would then set off to apply their learnings on a change project. The cohort would reconvene quarterly to share experience, frame their lessons learned and plan for next steps. The components of this design, experiential learning along with peer feedback and meaning making, have become and remain staples of effective executive training today (Hampton 1997). The PSOD experience stimulated Dick to urge the founding of the Organization Development Network (ODN) in 1967 with its national publication, *The OD Practitioner*. By 2000, the ODN had grown to over 3,500 members and multiple international branches. The early success of PSOD also influenced some of the teaching staff to pioneer the first masters degree programs in organization development in 1975 at Case Western Reserve University and at Pepperdine University. By 2000 there would be over 45 graduate degree programs in OD throughout the world.

Douglas McGregor invited Beckhard to become one of the early faculty members of the new department of organizational studies at the Sloan School where he served as Senior Lecturer and then Adjunct Professor of Organization Behavior and Management from 1963 to 1984. In 1969 Dick, along with Edgar Schein and Warren Bennis, edited and launched the Addison-Wesley OD series. In their effort to understand the state of the practice of "organization development" at the time, Beckhard, Bennis and Schein chose to explore the definition of OD by having leading practitioners describe what they were doing. The original six books by Dick Beckhard, Edgar Schein, Warren Bennis, Robert Blake and Jane Mouton, Paul Lawrence and Jay Lorsch, and Richard Walton became and remain the foundational literature of the field of Organization Development (OD).

Dick's definition of OD, constructed from his observations of his and others' current practice, was provocative. He defined OD as, "an effort (1) planned, (2) organization-wide, and (3) managed from the top to (4) increase organizational effectiveness and health through (5) planned interventions in the organization's "processes" using behavioural science knowledge." (Beckhard 1969, 9). He distinguished OD from human relations training and management development efforts where the outcome were increased skills rather than organization change. He saw OD as interventions in the form of change programs whose goals were to create a new culture, new ways of working, changed management style, a reward system congruent with cultural values, and new allocation of tasks and roles to produce optimum use of human resources (Beckhard 1997).

From the 1960s through the 1980s Dick taught and developed OD Practitioners, change agents, institution builders, and future practical scholars (doctoral students) at MIT, Columbia Teachers College, Pepperdine University, Case Western Reserve University and the London Graduate School of Business. At the same time, he developed a global consulting practice with clients including Ansul Chemical

Company, Hotel Corporation of America, Raymond Company, Donut Corporation of America, J. Lyons, Ltd., Imperial Chemical Industries, and Proctor & Gamble.

> A common denominator in all of these contracts was having a [multi-year] relationship with the CEO. This allowed me to have input and influence at the [organization] center when needed. From my very first consulting assignment with Robert Hood at Ansul, I found myself working with both the leadership and with the organization as a whole. I learned on the job. Every client that hired me was concerned with changing something: the top team, the ways of work, external relations, communication patterns. My task was to help clients with their issues. In doing that, I quickly learned to use my learnings about process to "guide" the interaction. (Beckhard 1997, 64–65)

In his work in the field, Dick realized that his expertise went well beyond meetings improvement or staging large group events. He was being retained to work with, support, advise, challenge, provide theory, and to link to other experiences. It was his understanding of the management of process through relating interpersonally that was of value. He was primarily facilitating planned change in management style, relationships to the outside environment, operating policies and mechanisms, and the organization's culture (how people were treated, how teams functioned, how meetings were run, how decisions were made, what values should be driving the work, etc.). Consistent with his doing-learning modality, his reflections on his role and actions as a change agent and linking to behavioural science theory and concepts led to the creation of numerous models for interventions to facilitate planned, system-wide change which will be discussed in the next section.

Dick's first major client was Robert Hood at Ansul Chemical Company. Robert, like several to follow (e.g. George Raymond at Raymond Company and Roger Sonnabend, president of HCA) were second-generation heads of family businesses. As his interest in and experience with family dynamics and their impact on the business grew he also discovered that very little family business literature existed. He developed an innovative plan to partner with family business clients who, in return for his time, would provide their organizations as research sites. This led to the creation of the Family Firm Institute (with Elaine Hollander) in 1984, a nationwide organization to promote learning among practitioners from a variety of disciplines who work for and serve family companies. The Institute's activities include annual conferences and issuing of the *Family Business Review (FBR),* the only peer-reviewed journal that is focused entirely on family business theory and practice. (Hampton 1997). Dick served on the Institute's board and the FBR editorial board until his passing.

Dick retired from MIT and most of his formal teaching roles in 1984. He was honored with an unprecedented "MIT Richard Beckhard Day," built around a symposium with invited speakers who represented academic colleagues, clients and students. That evening at a dinner hosted by the Sloan School, Dean Abraham Siegel announced the formation of the Richard Beckhard Annual Prize for the best article in the OD or change management field to be published in the *Sloan Management Review.*

The final phase of Dick's career saw him based in his New York City apartment and spending full summers at his beloved family cabin on Lake Kesar in Maine. He continued editing the FBR and served on the advisory board of the Peter Drucker Foundation for Non-Profit Management where he co-edited its Future Series on Leadership. He found a new calling in coaching to change agents and consultants, and conducted annual master classes in OD for senior health managers in the UK's National Health Service under the auspices of the Public Management Foundation. He published his memoirs in 1997 under the title, "Agent of Change; My Life, My Practice." It was his ninth book to accompany 10 book chapters, and 26 periodical articles. Richard Beckhard passed away in December, 1999 at the age of 81.

## Key Contributions and Insights: Birthing the Field of Organization Development (OD)

Beckhard's pioneering work in 1969, *Organization Development: Strategies and Models,* helped to define and bound a nascent field of inquiry and practice. Based on his own stories of helping organizations to bring about planned change he developed role descriptions and skill sets for would be OD practitioners, a collection of issues or challenges that OD could address, and an initial typology of the skills and knowledge necessary for the development of OD practitioners. For the next 20 years, Dick collaborated with colleagues to author four more books and numerous articles and papers to convey the models and tools he derived from his work in helping large, complex systems to bring about effective change. The following represent some of the most used and cited of those contributions.

### A Systems Model for Managing Change in Organizations

His next volume for the newly established Addison-Wesley OD Series he co-edited was *Organizational Transitions*: *Managing Complex Change* with Rueben T Harris in 1977. In this work he laid out a new concept for understanding organization change; the transition state. He envisioned any large system change as moving from a *current state* through a *transition state* toward a *desired state*. It was this attention to the state-of-changing, or transition, that began to shape what we know today as the discipline of change management, leading change, or OD. Thus changing in a large, complex system involves:

> Setting goals and defining the future state, or organization conditions desired after the change.
>> Diagnosing the present condition in relation to those goals
>> Defining the *transition state*: activities and commitments required to reach the future state
>> Developing strategies and action plans for managing this transition
>> (Beckhard and Harris 1987, 30)

Underlying this deceptively simple list of managerial actions was what Dick had learned about systems thinking from his NTL experiences. He looked at organizations, groups and individuals as interconnected systems and applied *open systems theory* (introduced to him by James Clark, Charles Krone and Will McWhinney at UCLA) as a diagnostic tool for strategic planning and shaping future goals. He found it useful to managers at the beginning stages of defining goals and desired change state to:

1. Identify the present demand system; those domains that were making demands on the management (competitors, unions, media, employees, family, self?)
2. List current response pattern(s).
3. Look ahead 2 years to a future without change by you. If you didn't do things very differently, what would the demand system look like then?
4. Project your ideal or desired condition for the same time frame
5. Determine what behaviors would have to occur for you to reach the desired future condition
6. Perform a cost-benefit analysis of these activities and feed this into your strategic planning process (Beckhard 1997, 50).

To lead and coordinate the processes involved in the transition state, a *critical mass* was needed. Referred to today's literature as a "champion group" or "steering group" this is a sufficient number of key stakeholders that must be committed to the change goal and necessary transition steps. To this end, Dick introduced *Commitment Charting*. This tool identifies key players in the change context and initially identifies their commitment to the desired state by labelling them as "No Commitment," "Let it Happen," "Help it Happen," or "Make it Happen." For each person, you first identify the minimum commitment level you need from them and mark that cell with an O. Now assess their current level of commitment and put an X in that cell. If the O and x are in the same cell, you are all set! Where the O and x are not in the same cell for a given person, draw an arrow from the X to the O and that gives you and agenda to work on with that individual (Beckhard and Harris 1987). This tool has also been adapted to assess readiness for change as a precursor to action in the transition state.

Another widely used tool to help in managing the transition state is *Responsibility Charting*. Since people will be required to act in new ways during the transition, customary roles and responsibilities will be altered as well. Temporary work groups or teams with form and disband. This technique clarifies behaviour that is required to implement important change tasks, actions or decisions. The chart lists key actions, decisions or activities that will require collective input (e.g. developing a budget, allocating resources, deciding on use of capital or funds). Each stakeholder, team member, or key person is then allocated an "A" (approval or right to veto), an "S" (support or put resources toward), an "I" (inform – to be consulted before action), or an "X" (irrelevant to this action item). Then only one of the listed persons is given and R (responsible for seeing that it gets done). (Beckhard and Harris 1987) this helps reduce ambiguity, wasted energy and adverse emotional reactions between

individuals or groups whose interrelationships are bound to be affected by the changing, transitional state. Having adapted this numerous times in working with teams, I also see the benefit is foreshadowing to the team what kinds of decisions it will have to make, and when. If more than one person has an A for a particular action, then there will have to be consensus building. People wanting involvement become clearer as to the extent of that in a given action; both S and I provide ways to be involved, but not actually making the decision. Again when two or more receive A, it is critical to be clear about who has the additional R so there is not duplication, confusion or the ball gets dropped.

## Managing Resistance: A Formula for Change

Perhaps the most cited contribution of Dick Beckhard is referred to as the "formula for change." The common reporting of this idea is that Change happens when Dissatis-faction with the status quo, Shared Vision of a desired state and clarity of First steps combine to be greater that inherent Resistance to change: $D \times V \times F > R$.

Dick actually learned this concept from an Arthur D. Little consultant, David Gleicher, whom he met while engaged at Proctor & Gamble. The idea was more oriented to helping product development team leaders to keep a positive change momentum going in their teams. The original formulation was that in order for change momentum to be moving forward, the combined effect of degree of felt need to change, degree of shared future image, and clarity around very next steps had to be greater that the force of resistance in the situation: $C = (A \times B \times D) > R$.

C = Change
A = Level of dissatisfaction with the current state
B = Desirability of the proposed change or future state
D = Clarity of the next steps required to implement the change

Factors A, B and D must outweigh (as if a mathematical product, if any were to approach zero or be small, then the total product approaches zero) the perceived "costs" of changing for change to occur. Beckhard and Harris cite this as a resistance management tool in their book rather than a basic formula for change as it has been widely adapted. Nevertheless, this idea signifies Beckhard's support of Lewin's noted change process of unfreezing-adapting-refreezing. Dick viewed learning and change, or "inquiry" and change as he later phrased it as inseparable (Beckhard and Pritchard 1992).

## Factors That Affect Team Performance

Another lasting area of contribution from Beckhard's work and writing has to do with the dynamics that help teams to be effective in learning and performing.

In trying to bridge the gap he perceived between the knowledge and theory he was receiving from his NTL experiences and colleagues, and his observations of groups at work he derived what is commonly referred to as the *GRPI* model. This maintains that for any interdependent group to do its work, it must continuously manage: (1) clarity and agreement on its Goals, purpose or objectives; (2) clarity and agreement on the Roles members are to play; (3) clarity and agreement on the key Procedures the group will use to communicate and make decisions; and (4) how they will Interpersonally relate to one another during their work (Beckhard 1972). If group members are not clear or disagree with group goals, their roles in the group, the way key decisions are made, or with the relational norms that exist, then their energy and attention to their work is diverted to coping mechanisms or unconstructive emotional expressions. This notion of an agenda to manage in groups aligned with Dick's early observations that OD work was in service of changing how work is done for organization health and effectiveness, not for developing new knowledge or skills in individuals. Further he was challenging the tendency he observed in many OD practitioners to focus their attention on interpersonal dynamics, communication styles and norms *without* concern for the task to be accomplished.

This GRPI model has been since delineated into a hierarchal intervention model with an additional Systems factor based on extensive, multi-year OD project that Dick coordinated with primary healthcare teams through a grant from the then Office of Economic Opportunity (and now Robert Wood Johnson Foundation). The revised *SGRPI* model (Fry et al. 1977) has been published as a task-oriented team development manual (Rubin et al. 1978) and used widely in North America and Europe. The extension of Dick's core concept, based on interventions with multi-disciplinary health care teams was that lack of clarity or agreement at one level in the SGRPI hierarchy is most likely a symptom of, or will most likely be resolved by, working for clarity and agreement at the level above. Thus an apparent role conflict between two team members that seemingly cannot be resolved through some kind of role clarification or negotiation actually needs to be addressed at the level of team goals; do the two parties still agree on the overall reason for the team's existence? If that cannot be resolved, then it is a systems issue; someone outside the team who chartered it or designed it to do important work has to be brought in to help clarify the team goals. Again, the biggest implication of this model lies in the implication that apparent interpersonal conflicts (what we often refer to as personality clashes) are most likely to be symptoms of basic disagreement or lack of clarity about team goals, roles or procedures.

**It's All About the Work**
On several occasions, I co-facilitated with Dick an NTL Training Program on Large Systems Change. In this program (as well as other executive training settings) he would often conduct a short exercise where he would build a list

with the participants of "things that all organizations have." A typical list would look like this:

Structure
Communication
Reward system
Work
Decision-making Process
Strategy/Strategic Plan
Power and Authority
Supervision

Dick would then ask, "Which on the list is the most critical for what the organization does?"

Seldom, if ever, did anyone choose "work" which Dick felt was the correct answer. He was adamant! "This is the problem with us as consultants or change agents. Everyone in the organization understands that work is what matters most. You must make a critical choice. If you don't see work as the key, perhaps you should change your career and not be a change agent." (Field notes by Bob Toft from NTL program, Facilitating and Managing Complex systems Change, August 12–18, 1979).

## The Confrontation Meeting

Dick understood organizations as groups of groups and as his reputation spread as an expert in convening large or multiple group events, he began to experiment with rapid, whole system interventions that he deemed necessary particularly during the transition stage of a large change effort. In conditions of uncertainty, formation of new (often temporary) groups, and experimentation that characterize the transition phase of his change model, Dick saw that managers at the top tended to spend less and less time with their subordinates, communication decreased between top and middle levels and more employees were likely to express that they felt left out, less influential, even ignored. The organization potentially suffers from undue stress during the most important period of the overall change effort. Dick designed and perfected *The Confrontation Meeting* to provide a way for a large system to convene to take stock of their cohesion, alignment, and to deal with real conflicts that are getting the way of collaboration, all in 4–5 h.

A typical confrontation meeting agenda would be:

(A) Stage setting by top management: goals for the meeting, norms for participation, concern for real, honest communications including tough topics and conversations

(B) Information collecting: Small cross functional and multi-level groups of 7–8 form to discuss what are the current obstacles, demotivators, poor procedures or policies, unclear goals, that are getting in the way of doing good work? What different conditions would make life in the organization better?

(C) Information sharing: Group summaries are posted around the meeting space and duplicated for individual handouts after a break or lunch.

(D) Priority setting and Action planning: total group reconvenes to go through raw data on duplicated sheets and code each item with a category suggested by leadership. New, homogeneous groups form into their natural work units or functions with their functions or unit managers. Then they discuss problems or items that affect their area, decide on priorities and early action steps they are committed to taking, list issues or problems they want top management to give their priority attention to, and decide how to communicate the results of their session to the whole group.

(E) Organization Action planning: total group reconvenes and each functional unit reports its commitment and plans, and shares with top management group the items they believe the leadership should attend to. Top management reacts to this lest and makes new commitments for action where required. Each unit shares its plans for communicating the results of the confrontation meeting to all subordinates or co-workers not attending.

(F) and (G) Immediate follow-up by leadership group directly after the confrontation meeting ends to plan first follow-up actions and commit to progress review session within 4–6 weeks.

The outcomes from a confrontation meeting include an accurate reading of the organization's health, the opportunity for work units to set priorities for improvement, the opportunity for top management to make appropriate action decision based on valid information from the organization, an increased involvement in the organization's goals, a real commitment to action on the part of subgroups, and a basis for determining other mechanisms for communication between levels and groups, appropriate location of decisions, problem-solving within units as well as mechanisms for upward influence (Beckhard 1997).

If one were to look at the agenda topics for a *kaizen* session or General Electric's *Work Out* sessions, or any number of large group interventions in practice today, it is clear how Dick's insights and practice with the confrontation meeting foreshadowed these more current ways to facilitate rapid, large system problem solving session.

## New Insights: Ways of Doing and Being That Dick Has Modeled for Us

I was privileged to be both a student, colleague and friend of Dick's while earning my masters and doctorate at MIT's Sloan School of Management. As a student I marvelled at his ability to make me feel listened to, cared for, and yet quickly help

me simplify or prioritize my question, problem or dilemma for which I was seeking his counsel. He always scheduled student appointments for only 30 min each and yet I always left those encounters feeling like my mind had been expanded, I had seen something differently, and that I had been genuinely helped and valued by him. I have vivid memories of vying with my peers to get the opportunity to drive Dick on Friday afternoons to Logan Airport so he could get the shuttle back to New York. Those drives seemed like precious opportunities to get "backstage" with him to glean more insights and impressions about the nascent field of organization development and change.

In the field, Dick had a remarkable ability to listen to confused, overwhelmed, or simply frustrated leaders and managers who were stuck in inaction and help them reframe their situation in a way that opened space for them to act. For example, I witnessed an initial contracting, scouting and entry meeting he had with a potential client, Dr. Harold Wise, who was the director of an experimental primary health care center in the South Bronx, in New York. A satellite of a major community hospital the center supported eight multidisciplinary teams to deliver care to a defined neighbourhood in the most blighted and underserved area around the main hospital. Having been socially introduced by a mutual friend, Dr. Wise and Dick were meeting in person for the first time. Dr. Wise took about a half hour to describe a litany of issues, problems, or festering frustrations he was experiencing: senior management team not operating as a team, lost or damaged medical records, poor communications with the main hospital, safety of his employees in the local neighbourhood, lack of coordinated care coming out of the primary care teams, who was going to succeed him as director, a sense of failure in pioneering an experiment with amazing potential, etc. Dick listened intently and when Dr. Wise finally paused, Dick remarked, "I admire your passion for this place and what it can become. It sounds as if you have 5 or 6 issues on your plate that if dealt with effectively, could really improve your outlook on the future and help the Center achieve its mission. You have the top team which could be more cohesive and effective, you have succession planning to do once you are confident and trusting in your team, you have the interface with the main hospital to improve, you have operations issues that support the care teams and you have the care teams themselves that need attention. If I've got those right, then I'd suggest you pick any two to begin with – any two that you think would make the most positive difference if dealt with. You can't juggle all these at once." Dr. Wise acknowledged that Dick had heard him quite well and then paused. After a small silence he said that if the care teams were really functioning as he imagined they could and his top team was also more of a real team then his energy would be much more directed on constructive actions. That interaction became the launch of a multi-year action-research project and a 30 year relationship as Dr. Wise eventually became Dick's private physician and partner in consultant coaching to increase effective use of energy and decrease stress. Dick intervened with the top team through a series of retreats and eventually guided them through a successful succession plan while a team of faculty colleagues and doctoral students intervened with the eight primary care teams through experiential educational sessions and team tasks to address their goals, roles. Procedures and interpersonal norms. This ability to

listen from a systems perspective and them help the client frame their experience in a way that leads to proactivity rather than dysfunction, wasted energy or increased stress, was Dick's real gift in practice.

Dick was always opinionated and direct in his communicating. He had a confident, concise, and definitive style. Near the end of my time at MIT, a question arose in me about dealing with the extent to which an effective OD practitioner can "advise" or "come across as the expert" versus remain client-centered and focused on helping the client system learn and explore what is best for them. My growing observation was that in many instances, Dick was perceived as giving answers or direction; being and seen as the expert. As an initiate in OD and action-research this was confusing to me because he espoused so much alignment with his colleagues Douglas McGregor's Theory Y assumptions, Edgar Schein's educative (vs. diagnostic or expert) approach to facilitating change, and Chris Argyris's intervention criteria of free choice and internal commitment. Dick's response to my query was predictably confident and to the point; "I have my 51–49 rule. As long as you are at least 51% focused on the other's needs and agenda, you'll do fine."

## Legacies and Unfinished Business: Personal and Professional Development Are Inseparable and Never-ending

Dick Beckhard deserves to be regarded as a pioneer, if not co-creator, of the field of organizational development. In the formal sense, various institutions he helped create or sustain exist and continu to add value today. These would include the Family Firm Institute, Family Business Review, the OD Network, the OD Practitioner, the International OD Network, and NTL's PSOD training program, to name a few. Yet Dick was clearly a product of his era and the organizational contexts he encountered. He invented models and tools to facilitate large-scale *planned* and *top-down* driven change. His writings are flooded with attention to "the top" and his experience highly shaped by long standing personal and professional relationship with the organization leader. Are his contributions simply dated and now out of context? Not when you consider his fundamental messages: The work to be done defines how we organize to do it; All organizations are on a trajectory toward forms of team management; Decisions will have to be made at all levels where the information comes together; Organizations are beholden to multiple internal and external stakeholders, not just shareholders or family owners; Managing conflict, diversity and complexity will be even more central in the future (Beckhard 1997). From this complex perspective, Beckhard's tools and models can still serve us well in dealing with complexity, diversity of interests, multiple interfacing groups and personal thriving at work.

When asked near the end of his career what he thought about the future of OD, his response was usually something to the effect that "OD, as we know it, is dead." He did see evidence of the field re-inventing itself through what is now referred to a Dialogic OD (Bushe and Marshak 2015) or through intervention theory and method like appreciative inquiry. Dick was a panellist with Edgar Schein, Robert Golembieusky, David Cooperrider and others at an Academy of Management symposium on the

Future of OD where he decided to cut his speaking time in half to provide more for David to expound on the promise of strength-based change methods:

> Appreciative Inquiry is, in my view, an exciting breakthrough, one that signals a change in the way we think about change. I'm intrigued by how rapidly it is emerging; but it is something substantive, conceptually strong, not like the quick fads. In my view we are looking at something important – Al will be of enduring consequence and energizing innovation for the field. That's my prediction. And that is why we are going to give it more attention in this session. Richard Beckhard (Cooperrider 2001)

This openness to engage with "what is" and then learn from what results in order to model or guide a preferred future action, knowing that that future action will create a new learning opportunity, signifies the inquiring stance that underlies all of Dick's work and contributions. Thus they remain, for the most part, adaptable to changing circumstances, and continually useful in making complexity understandable, if not manageable.

In the beginning of his memoirs, Dick tells how he was asked once in the mid-1980s, "If you could have achieved totally what you want to be and do professionally, what would you have done?" His response that came with self-reported ease was, "I want to influence organizations to function in a more humane as well as high-performing mode." (Beckhard 1997, xii). To summarize the pioneering life and contributions of Dick Beckhard with this heartfelt intent to better organizations and organization life, however, would be only partly warranted. At the end of his memoirs, presumably reflecting upon his own recollections and contributions, he ends with the following (Beckhard 1997, 166):

> I hope to stimulate people's thinking about their professional work and its intersection with their personal life. My professional and personal lives have meshed in a way that continues to be full and stimulating; may yours be as well.

Dick's legacy is beyond all the models and tools he contributed from his "doing-learning" practice. He modelled bringing his "whole self" to the table, be it with a graduate student, a client, a room with hundreds of organization members, or to a dinner party for NTL staff in his Maine cabin. He masterfully brought his curious self, his helping self, his task-oriented self, his playful self, his provocative self and his love-for-life self – all the time. His energy was contagious. In today's parlance, he wished to build flourishing organizations full of thriving people. It was a precious gift to have him in my life.

# Michael Beer: It's Not the Seed, It's the Soil

Tobias Fredberg and Johanna Pregmark

**Abstract**

Michael Beer of the Harvard Business School is mainly known for his work on organizational change, strategic human resource management, and for the development of approaches/methods for strategic renewal. After a first career as an organizational researcher at Corning Glass works, he has remained a scholar-practitioner, with a burning interest in doing research which is both useful for theory and practice. Beer is interested in how organizational systems learn and change and ultimately in understanding what over time creates organizational system effectiveness. A major problem, he and his colleagues argue, is that management usually does not address changes in a systemic way. The result is a much lower success rate of organizational change initiatives. The employees of the organization often know how it can be improved, but because "truth cannot speak to power", management only rarely gets to know what the organization thinks. They are therefore restricted from making a systemic analysis and do not get to know how they can address change in a systemic manner. A substantial part of Beer's research has been focused on how to make such situations better. Together with a set of colleagues from aspirational CEOs of major corporations Beer and colleagues formed both an international consultancy firm – TruePoint, as well as a network of research centers – the Center for Higher Ambition Leadership.

## Introduction

From the first challenge when receiving a call to help Corning's Medfield Plant become a more human organization, Michael Beer's career has been characterized by a quest to understand how organizations can be made more sustainably effective: how they work better as systems, how they work better with their people, and how they can change in a better way. It is based in a conviction that the road to high performance involves trusting employees and engaging them in meaningful work toward a higher purpose that leads to value for multiple stakeholders. What sets Beer and his colleagues apart is also that they immerse themselves in the organizational reality in all its complexity and fuzziness, with the ambition to create usable knowledge and usable research processes that are of value also for the organization. This has led him to be an innovator, not only in research but in practice, and has earned him a place both as a great organizational thinker and as a scholar-practitioner.

## Influences and Motivations: Being in the Melting Pot of Practical Problems and Theoretical Solutions

"Mike, we have read Douglas McGregor's *The Human Side of the Enterprise*, and we would very much like to become a Theory Y kind of company. Can you help us?"

Michael Beer received the call from the manager of Corning's plant in Medfield, Massachusetts, in 1965, a few months into his first job as an organizational researcher at Corning Glass Works. His recently finished PhD thesis in Organizational Psychology and Business Administration from Ohio State University (Beer 1964) focused on McGregor's (1960) thinking. McGregor argued that leaders' assumptions about the nature of people govern their behavior. Theory X managers believe that people are not motivated, that they do not want to learn, and that leaders

therefore need to focus on controlling people to achieve efficiency, productivity, and profits. Theory Y managers, on the other hand, believe in the capacity of people to engage and learn. Their approach to organizational effectiveness is to involve people in how to become productive and profitable. Theoretically, Beer was well suited for the task. Making it happen was a very different thing.

The Medfield Plant became an early model of the high-commitment manufacturing plants being developed in the USA at that time (Beer 1980; Beer and Huse 1972). It did not take long for others at Corning to understand that Beer's small team could help them develop more effective organizations. Some time after that first assignment with the Medfield plant, the vice president and general manager of Corning's Electronic Products Division (EPD) called for help with a business unit experiencing severe inter-functional conflict that had brought new product development to a halt. Beer and his team were thrown into a major challenge again, this time with even higher stakes. Beer came to the conclusion that the problems were not only behavioral. They were rooted in a top down functional structure that did not align, or fit, with the changes in EPD's business context. Beer's team introduced new cross functional product development teams and behavioral interventions to support their work. About the same time, Paul Lawrence and Jay Lorsch published a seminal article on differentiation and integration in complex organizations (1967a) problems were not only behavioral - they  up to this point, the field of OD was focused on values, developing open dialogue and participation, not on structure and business processes. Beer contacted Paul Lawrence at the Harvard Business School (HBS) to discuss his findings. This began a relationship that later led to an invitation to join the faculty in 1975.

As Beer´s research unit at Corning grew, it gained more resources, which allowed its members to make a difference in Corning's effectiveness. Core to their pursuit was the necessity to create system-wide change, to create organizations that are more effective and more human at the same time by changing multiple facets of the organization in an integrated and properly sequenced manner. But this is not enough, Beer argued. To be effective, system change needs to have a clear connection to an organizational direction, a strategy that allows people to focus their energy and efforts better, aided by a consultant with system's thinking and change process knowledge and skills.

Beer's unit worked out ways for how organization development (OD) could play a strategic change role within a company. Many visited to learn from the unit's experiences. The work that the unit's consultants played in Corning's many business units in the early 1970s was an early model of the HR strategic partner role being adopted by many companies later. Based on this experience at Corning, Beer argued that strategic OD role must be split from the administrative function to be effective (see Beer 1997, for a longer discussion), an argument later echoed by Ram Charan, a management author and advisor to CEOs (Charan 2014).

Beer stayed with Corning for 11 years, until 1975. During those years, his OD unit found itself confronted with a flow of different organizational problems that needed solving. His years at the company coincided with major theoretical developments in organizational behavior, organizational development, and organization

design by giants such as Rensis Likert, Fred Herzberg, Chris Argyris, Jay Galbraith, Edgar Schein, Richard Beckhard, Paul Lawrence, and Jay Lorsch. Beer gained important knowledge and ideas from all of them and put these insights into practice. Being in the midst of practical work and theoretical development gave him opportunities for action research that, according to Beer, were seminal to his thinking and provided the foundation for his later contributions to theory and practice. Insights gained at Corning resulted in Beer's first book, *Organization Change and Development: A Systems View* (Beer 1980).

A series of organizational restructuring initiatives at Corning in 1975 changed the conditions for Beer's research unit. So when Beer received a call from Jay Lorsch inviting him to join the HBS faculty, he decided to leave Corning to embark on an academic career. The case-based teaching and problem-focused research at HBS suited the practice-oriented Beer well. The case studies as a vehicle for learning were very logical to him, as was the intellectual environment where work at the interface between theory and practice was valued.

The HBS environment became the scene of an important debate between two camps of researchers with very different ideas of the means and ends of business organizations. One camp, based in agency theory's ideas about effective markets and agency costs, argued that the single objective of companies is the maximization of economic value for their owners, that people act on self-interest and therefore cannot be trusted to put the owners' interests first, and that the compensation of managers therefore needs to be structured to be in line with the value maximization objective (Jensen 1994, 2000).

Another camp of researchers, had a very different view. Many of them (including Beer) were involved in developing a new human resource management course (see below), They argued that the purpose of companies goes beyond making money for shareholders. Top management can develop commitment for developing an organization that is systematically geared toward a greater good, and which recognizes that the fundamental driving force of people is not only money but learning, engagement, and participation. Beer's HBS colleagues Nitin Nohria and Paul Lawrence would later discuss how fundamental driving forces shape us and what this means for management in two important books – *Driven* and *Driven to Lead* (Lawrence 2010a; Lawrence and Nohria 2002).

In other words, Beer found himself in the middle of a debate similar to the discussion on McGregor's Theory Y and Theory X managers. The debate on the purpose of business organizations and human driving forces led him to a lifelong interest in the effects of incentives. His research showed that individual- and group-based monetary incentives can have numerous unintended consequences that undermine organizational effectiveness and performance (Beer et al. 2004; Beer and Katz 2003). His conclusion is that financial incentives could do more harm than good. To develop an effective organization, Beer argues, leaders have to change the system of organizing, managing, and leading, a much more difficult and longer-term task.

## Key Contributions: The Dual Nature of a Scholar-Practitioner

Closeness to practice has stayed central in Beer's research. His research contributions have continuously been focused on issues of or opportunities for organization change and development. In that pursuit, he has been problem focused, rather than literature focused (Astley 1985). He has not only tried to understand the phenomena and write about them but has developed interventions to improve the organizations he has worked with. This sets him apart from many other researchers who in their work mainly depart from theoretical gaps and/or stop at a distanced analysis of empirical data.

The dual goal of solving organizational problems and contributing to knowledge has been central to his work. Instead of separating academic research and practice, he continuously used his academic findings to improve his practice even further, constantly supporting clients to develop more effective organizations. Beer has also turned his experiences as a consultant into research that has provided empirical bases for theory development. In this regard, Beer joins academics such as Schein (1987), Schön (1991), Van de Ven (2007), and (Argyris 1993; Argyris et al. 1985; Argyris and Schön 1974) in not only talking about the need to "bridge the relevance gap" (Starkey and Madan 2001; Starkey and Tempest 2003) but building that bridge and describing how that is done. Among his contributions in this area are the co-authored *Making it Happen: Designing Research with Implementation in Mind* (Hakel et al. 1982), his chapter "Making a Difference and Contributing Useful Knowledge: Principles Derived from Life as a Scholar-Practitioner" (Beer 2011b), and his articles "Why Management Research Findings are Un-implementable: An Action Science Perspective" (Beer 2001b) and "Strategic-Change Research: An Urgent Need for Usable rather than Useful Knowledge" (Beer 1992).

Beer's action science and field-based approach to knowledge development inevitably led him to develop a systems perspective as it became obvious that change in one facet of the system required change in others. That perspective was established at Corning (Beer 1980) and has guided his subsequent practice and theory development. The basic argument is simple – the different parts of an organizational system (such as people, strategy, structure, rewards, technology, etc.) are interconnected, which means that they will be ineffective, both individually and collectively, if they are not aligned with one another. The efforts to change the Medfield Plant and the Electronic Products Division at Corning provided grounded examples of how important it is that organizational change incorporates all facets of the system. That in turn raised questions addressed in Beer's later work about how to sequence interventions aimed at different facets of the system and about the process of change needed to develop systemic change.

That organizations are socio-technical systems and that these systems need to adapt to the outside world were established concepts in management thinking and would continue to be important for the analysis of effective organizations

(e.g., Ackoff 1974; Ackoff and Emery 1972; Pasmore 1988). Beer and other important scholars focused on the connection between systems thinking and the practical problem of changing organizations. The central issue for Beer has been less on how the leader can achieve rapid change, nor on economic rationalization, but on the planned organization development required to build high-commitment and high-performance organizations (Beer 1980; Beer and Huse 1972). In addition, Beer and his colleagues have also managed to take his research into a more practical level by developing workable models and processes that support system-wide change. Theory and practice go hand in hand.

Beer's theoretical and practice contributions discussed in the remainder of this chapter derive from his urge to help managers develop more effective high-commitment organizations and learn from that process through action research. Here, we depict those contributions.

## Strategic Human Resource Management

Soon after joining the HBS faculty, Beer was asked by the Dean to lead a team of senior faculty to develop a new required course in Human Resource Management (HRM). It would become the first such required MBA course in business schools. The empirical teaching cases that were developed by Beer and his colleagues led to the book *Managing Human Assets* (1984), with Spector, Lawrence, Mills, and Walton. Because the mission of HBS was, and is, the development of general managers, the course and the book framed the HRM challenge as strategic problem for general managers. The argument is that human resource management is the responsibility of CEOs or business unit leaders, not of the HR specialist traditionally in charge of developing personnel practices such as compensation and selection. *Managing Human Assets* argued that business organizations should measure the HRM system's quality by considering three long-term outcomes: (1) organizational effectiveness, (2) employee well-being, and (3) societal well-being. The difference to the view that business organization solely exists for the financial interest of owners is striking.

*Managing Human Assets* argues that HRM needs to align human capabilities with organizational purpose, goals, and strategy. It zooms in on four HRM policy choices that shape the HRM system: employee influence, HR workflows, reward systems, and work systems. The book discusses how these policies can be put into practice. What is also striking in the book is that it emphasizes that HRM policies must be integrated with one another and be aligned with strategy and situational constraints such as national culture, unions, and national legal framework. In the mid-1980s, this was an important step to elevate the strategic value of HRM as something that could not be purely delegated to the HR function. The book has later credited as being one of two founding books of the strategic human resource management field (Kaufman 2015).

## Managing Corporate Transformations

The business environment in the 1980s brought important challenges to American corporations. Japanese companies showed how goods could be produced faster and with higher quality. This motivated a tidal wave of change programs in large American companies, many exposed by the business press as failures. In later publications, Beer and Nohria (2000a, b) argued that more than half of all change projects are failures, something corroborated by later reports (e.g., Jacquemont et al. 2015). To understand what led to successful corporate transformations, Beer, Russell Eisenstat, and Bert Spector undertook a field study of six corporate transformation efforts to understand better what led to success versus failure in their revitalization efforts. Arguably, this was the first longitudinal empirical study of corporate transformations focused on the process of change and development. It ultimately resulted in the book *The Critical Path to Corporate Renewal* (Beer et al. 1990), a finalist for the Academy of Management's 1990 Terry Book Award and winner of the Johnson, Smith, and Kinsley award for the best book in executive leadership in 1990.

Beer, Eisenstat, and Spector found that transformation programs – changes in formal structure or education and training – fail when they are driven top-down. This finding confirmed Beer's earlier ideas about the importance of thinking about change in holistic systems terms. The most successful company in the Critical Path study did not employ top-down programs; instead, it employed a process of unit-by-unit change. The transformation began with the development of a few model-manufacturing plants, and top management then spread change to other plants through transfer of managers and other means such as conferences and learning visits. The change within each unit was a process of aligning the organization with its strategic task – producing a quality product that resulted in new roles and responsibilities within the unit. Process consultation, coaching, and training, the authors argued, are best introduced to help individuals and groups learn how to enact their new roles. It is only after these steps have been taken that changes in structure, incentive systems, and formal processes should ideally be introduced. This view on organizational transformation stands contrary to the "programmatic" approach practiced by most organizations and management consultancy firms. The difference between the "critical path" approach and the programmatic approach is addressed in one of Beer's best known publications – "Why Change Programs Don't Produce Change" (1990b, with Eisenstat and Spector). The results of this research and theory have important implications for the practice of leading corporate transformations.

Beer's quest to understand in organizational change led to a 1998 conference of leading academics and practitioners in the field of organizational change at the Harvard Business School organized by him and Nitin Nohria. The participants debated why change efforts fail and what could be done about it. The debate led Beer and Nohria to formulate two very different strategies/theories of change. Theory E focuses on the creation of (short-term) economic gains and Theory O on the development of (long-term) organizational capabilities. The theories are

described in an important book and article (Beer and Nohria 2000a, b). They echo Theory X and Y but unlike McGregor whose work implies that the "theories" represent fundamental, incompatible, views about managing people, Theory E and Theory O are approaches that companies must combine to sustain high performance in the long term, though a few do so effectively. Instead of going through pendulum swings between E and O strategies, Beer and Nohria (2000b) discuss how practices – leadership, planning of change, motivating people, and use of consultants – must be shaped to integrate E and O.

## Practice of Organization Change and Development

A call from the global medical technology company Becton Dickinson in 1988 led to one of Beer's most important contribution to the practice of strategic organizational realignment and change. The company's CEO and the senior vice president of Strategy and Human Resources felt the company had good strategies (most senior executives has been consultants in leading strategy consulting firms), but they were not being executed effectively or rapidly enough due to resistance. They had read *Managing Human Assets* and were struck by the systemic way of thinking about organizations that the book presented.

Together with Russell Eisenstat, Beer developed the Strategic Fitness Process (SFP) while working with Becton Dickinson. The SFP built on Beer's and Eisenstat's earlier work, but used also Chris Argyris' (1993) findings that conversations in organizations do not disclose the truth about barriers to change. The development of the SFP is an important marker in Beer's career. Building on the SFP and other developed practices, he founded the international consulting firm TruePoint together with Russell Eisenstat and Nathaniel Foote.

SFP is a leadership platform by which senior teams can enable honest, collective, and public conversations about organizational strengths and barriers to strategy execution, including their own leadership. Ideas on how such interventions need to be built up can be found in a series of papers (e.g., Beer 2011a; Beer and Walton 1987, 1990). Consistent with Beer's dual roles as an academic AND practitioner, the SFP is also well described and published in a series of articles and books (Beer 2001a, 2009, 2013, 2017; Beer and Eisenstat 1996, 2004; Beer et al. 2005).

The SFP begins with the assumption that it is hard for a management team to make a systemic analysis of obstacles that stand in the way of successful organizational transformation because "truth cannot speak to power". Moreover, information about the system is not brought together to enable a senior team can conduct a systemic diagnosis and develop a corresponding systemic action plan. Without systemic analysis, it is difficult to fashion an effective change strategy. The rather straightforward Strategic Fitness Process begins with the senior team coming to agreement about their strategy and values. They then commission a task force to conduct interviews with employees (anonymous to management) about organizational strengths and barriers to executing the strategy. Consultants, or researchers,

help the task force to synthesize findings that its members then present to management with their findings. To enable the delivery of the truth, the process employs a "fish bowl" format. Sitting in a circle with senior management in an outer circle and with strict ground rules to prevent defensiveness, a safe environment for open and honest conversations is created. Management often gets served some rather tough truths and is helped to make a better diagnosis of how the organization works and what needs to change. The process does more, however. It starts a process of restructuring the relationship between senior management to a partnership characterized by trust and commitment. Much as in the case of the Medfield Plant (Beer and Huse 1972), employees become involved in taking responsibility for where the organization is heading.

A common phrase in Beer's presentations has been a quote from Louis Pasteur – "It's the not the seed, it's the soil" (allegedly spoken by the legendary microbiologist at his deathbed). Analogically, context matters for the effectiveness of any change effort. As a result, the whole organizational system needs to be addressed, which the SFP is aimed to do. An analysis of the effectiveness of SFP in a dozen organizations showed that context – such as a perceived performance gap, the leader's readiness to learn, and the existing corporate culture – also is critical for the success of the SFP.

## Theory of Organizational Effectiveness

The task forces in the SFP collect a large amount of data on reactions and suggestions from the organization. A content analysis of the feedback task forces that gave senior management across many different organizations during the SFP process led Beer and Eisenstat to develop a theory of organizational effectiveness (Beer 2017; Beer and Eisenstat 2000). A summary of the work can be found in "Developing an Effective Organization: Intervention Method, Empirical Evidence, and Theory" (Beer 2011a).

Task forces almost always reported six potentially threatening barriers that many felt existed but had never been publicly acknowledged or discussed within the senior team or with a wider circle of key people in charge of executing the organization's strategy. Borrowing a concept from medicine used to denote diseases that individuals are unaware they have, such as high blood pressure or cholesterol, but can cause heart attacks; Beer and Eisenstat (2000) called them "silent killers." They are:

1. Unclear strategy, values, and priorities
2. A poorly functioning management team
3. Ineffective leader
4. Poor communication and coordination between key parts of the organization whose collaboration is needed to execute strategy
5. Inadequate leadership development and consequently inadequate supply of down the line leadership
6. Poor or closed vertical communication, particularly the inability of truth to speak to power

These barriers, Beer and Eisenstat found, were almost always reported together and constitute a self-sealing syndrome that prevents leadership teams from rapidly realigning their organization with new competitive realities. While these barriers had been identified by much other research, Beer and Eisenstat's distinctive contribution is to give us an understanding of how the silent killers collectively sustain a pattern of poor strategy implementation and organizational adaptation. Addressing them therefore requires honest, collective, and public conversations and that enables the systemic change Beer has been studying ever since he encountered the need in his work at Corning. The tendency in most organizations is to address them one by one, which does not give the desired effect.

## High-Commitment, High-Performance Organizations

During the 2000s, especially after he became an emeritus professor at HBS, Beer increasingly engaged in writing and in the building of TruePoint. The book *High Commitment, High Performance: How to Build A Resilient Organization for Sustained Advantage* (Beer 2009) is intended to contribute an integrated and systemic operating theory of the development of highly effective firms. Beer argues that sustained firm success requires simultaneous achievement of three organizational outcomes. It is of crucial importance to (1) align the organization and its people with its strategy, what Beer calls performance alignment; (2) to engage people, employees, and other stakeholders such as customers, on an emotional level, so trust and commitment are developed, what Beer calls psychological alignment; and (3) to challenge the status quo, learn, and innovate through honest collective and public conversation about hidden barriers to required realignment with new realities. To achieve this, CEOs have to develop a set of organizational levers – leadership, a learning and governance processes, strategic performance management system, organizational design, and a human resource system – that shape the overall organizational system.

The theme of building a firm able to sustain performance and commitment across generations is further elaborated in the book and articles *Higher Ambition: How Great Leaders Create Economic and Social Value* (Beer et al. 2011; Eisenstat et al. 2008) where the idea of engaging of employees in something larger beyond the short-term financial gains is developed further as the means for a profitable company that also contributes to the creation of a better world. In a way, this is a return to the idea that firms must be concerned of the interests of multiple stakeholders as discussed in *Managing Human Assets* (1984).

The discussion that followed after the release of *Higher Ambition* led to the formation of the nonprofit Center for Higher Ambition Leadership in 2012 (www. higherambition.org). The foundation of the center was driven by a set of CEOs with aspirations to build organizations that create value for all stakeholders. A sister center was formed in Europe in 2015. The centers embody much of Beer's passions and ambitions – driving useful research in collaboration between scholars and practitioners to create more effective organizations that both are more financially

successful and improve the lives of people inside and outside of the firm. Executives and researchers collaborate to share and develop knowledge on how organizations can be led to become more innovative, engaging, and effective and thereby create higher levels of both financial and social value.

## Organizations Must Manage Paradox

Interdependent systems create complexity, especially as they change. Organizations and their leaders need to be able to handle this complexity, which in organizations develops into paradoxes – "contradictory yet interrelated elements that exist simultaneously and persist over time" (Smith and Lewis 2011, p. 382). The integration of these paradoxical elements is key to organizational effectiveness and has loomed over management thinking since the middle of the twentieth century. As McGregor (1960) writes about Theory X and Theory Y, he sees the latter as the possibility for people in the organization to integrate the organization's goals into their own work. For Burns and Stalker (1961), it is the combination of a mechanistic and an organic way of organizing; for Lawrence and Lorsch (1967b), it is the combination of differentiation and integration in organizational structures; for Bartlett and Ghoshal (1990), the integration of different aspects of a global matrix; and for ambidexterity theorists, the paradoxical tension between exploration and exploitation in innovation (Duncan 1976; March 1991; Tushman and O'Reilly 1996b).

The integration of seemingly contradictory outcomes is core to Beer's thinking. For example, as he states that an effective organization needs to produce performance alignment, psychological alignment, and learning and change (Beer 2009). These three things are often found to be contradictory in management practice. It may be hard for any individual to reconcile them. Instead, the integration needs to happen on the organizational level. A major contribution by Beer is to focus on the levers that management can pull to create this reconciliation. Another is the acknowledgment that systems that are out of sync will reduce the effectiveness of the organization, as they produce more and more tension. Because of the costs (human, strategic, and financial) that are involved, it is urgent that organizations continuously reconcile the paradoxes (a "simultaneous solve" Beer 2009; Beer et al. 2011). As Beer has developed his thinking, the central tensions have tended to be different, as have their solutions. For example, in the work with "Breaking the Code of Change" (Beer and Nohria 2000a, b), the attention is put on the combination of Theory E and Theory O strategies, where the first is focused on the creation of economic gains and the latter on the development of organizational capabilities. Organizational life will demand that both are deployed over time, but they demand very different approaches. In the work with "Higher Ambition" (Beer et al. 2011; Eisenstat et al. 2008; Fredberg et al. 2008), the paradoxical tension is between economic value and social value. The book argues that as leaders and organizations aim to solve for both outcomes simultaneously, new managerial practices are needed to reconcile these paradoxes.

## People are Core Assets Rather Than Hired Hands

Beer's first effort at Corning to develop the Medfield Plant into a Theory Y (McGregor 1960), participative high-commitment manufacturing plant, can be framed by an old question about the "liberation of man" in the face of cultural and organizational constraints. Many of his contributions can be seen as parts of a quest to understand how organizations can make people's lives better, rather than worse, and how companies can become more effective in that process. The *Managing Human Assets* book starts by arguing that American industry values human resources less than European and Japanese competitors. High-commitment/self-managed work teams are core assets of the organization (as opposed to basic resources). For example, in his paper with Edgar Huse (Beer and Huse 1972), the shop floor workers and their managers both provide examples of how regular employees take responsibility for their work and how that changes the art of work, the relationship between managers and subordinates, and ultimately the "climate" in the plant.

The approach to change in the "Critical Path to Corporate Renewal" (Beer et al. 1990a) is similar. The process by which organizational systems are successfully transformed requires the task alignment in the corporation's many units. And that alignment begins with the engagement of people and not with overarching organizational design parameters such as incentive systems or organizational structure. The companies and leaders featured in "Higher Ambition" (Beer et al. 2011) aspire to shape, in the words of bank CEO Peter Sands, an "organization simultaneously to be very effective in terms of performance, a great place to work, and something that is actually a force for good" (ibid. p. 29).

Emphasis on the role of people as the core assets in organizations naturally leads to the question of how commitment is created and developed. Beer contributes to the how question in several different ways through his multiple publications about the kind of change processes required to do this and at the same time enhance performance. Factors such as an egalitarian culture, an approach to managing risk, compensation, and employee voice become central.

Similarly, how "human assets" can continue to be developed in a process of individual and organizational learning is a natural extension of this thinking. Beer and colleagues point to the necessity of disciplined, collective, iterative learning cycles in the organization to continuously find out where it is going, changes that need to be made, and initiatives that can be taken (e.g., Beer 2009).

## New Insights: Strategy, Transformation, Organizational Effectiveness, and Human Resources

When the world of science primarily engages in taking things apart and studying increasingly smaller building blocks from a distance, Beer goes in the opposite direction. His work and his contributions build on the ability to step into the heat of the action in all its complexity, asymmetry, and imperfection. He emphasizes that

organizational challenges cannot be resolved by researching them out of their contexts.

Because of his dual role as scholar-practitioner, there is a groundedness in his work that stands out. He works at the interface of theory and practice. It follows that many insights from his work provide deeper and sometimes unexpected insights. Such is, for example, the contribution by Beer, Eisenstat, and Spector (1990) in the *Critical Path to Corporate Renewal*, that the transformations of large organizational systems are not best achieved by starting at the top, but through a process of unit-by-unit transformation that starts with task alignment. This insight has vast implications for how change management should be performed. Similarly, the identification of the silent killers (2000), also with Eisenstat, and the discussion in *High Commitment, High Performance* (2009) on what simultaneously creates performance alignment, psychological alignment, and learning/change go beyond most other academic contributions by clearly pointing to both policy and practice implications. The work on organizations that create both economic and social value – such as in *Higher Ambition* (2011) – also follows along these lines. The possibility for Beer to gain insights of this character has to do with the nature of his basic working method – being deeply immersed with organizations to develop practical knowledge/usable solutions AND create academically valuable insights. Furthermore, the methods for collecting data need to create organizational value, both the content and the process matter. Apart from multiple other prizes, many of them related to his work in human resource management, Beer's work was acknowledged by the Academy of Management when he received the prestigious Distinguished Scholar-Practitioner Award in 2006.

As scholar-practitioners, ourselves, we rely on Beer and his colleagues for key theoretical arguments, methodological approaches, hope, and hands on advice. In the last decades, there has been constant complaints in the management research community about the lack of relevance. At the same time, promotion systems and evaluation systems have favored a publication frenzy leading to the lack of relevance that people complain about.

What Beer stands for is in itself a both-and solution. As has been highlighted throughout this chapter, his contributions are in the theoretical fields as well as in the methodological. We apply approaches advocated by him when we choose to become deeply immersed in organizations and use action research methods to understand not only internal dynamics of organizations but also to propose and test alternative approaches to get to a deeper level of understanding.

Theoretically, we depart from the Beer's ideas about the creation of effective organizational systems and the problem that he leaves us with – how strategic alignment, psychological alignment, AND learning and change can coexist (Beer 2009).

The hypothesis is of course that this is at all possible. This is seemingly at odds with the proponents of the idea that exploration and exploitation (March 1991) need to be separated for the organization to be ambidextrous – two handed (O'Reilly and Tushman 2011; Smith et al. 2010; Tushman and O'Reilly 1996a). The proponents of such *structural ambidexterity* see change happening as punctuated equilibria

(Gersick 1991), whereas others such as Brown and Eisenhardt (1997) argue that organizations indeed change continuously and therefore propose different approaches for the organization of renewal. The implication of this latter view is that organizational effectiveness over time lies in the constant move between alignment and misalignment that in the end accounts for total organizational effectiveness.

Beer is not specifically interested in this issue. He argues that his question is one level up. The solution that the organization chooses can be different depending on environmental circumstances. We study how established organizations more effectively can renew themselves by inventing new configurations fit for a new future. This is of course a hot topic in a world of faster change where forces like digitalization are putting pressure on business models in various industries. Our take on the issue is trying to find out how an organizational system where entrepreneurial initiatives flourish and influence the core of the organization can be created. Such an approach demands the organization to become even clearer about common values/visions and ways to have initiatives planted, nourished, weeded out, and harvested.

As is also clear from Beer's research, the ability to create value for multiple stakeholders is central to the long-term success for the organization (something corroborated by multiple studies, e.g., Kotter and Heskett 1992; Sisodia et al. 2007). A question arising is naturally what the nature of this value is (Lackéus 2016; Lawrence 2010b; Lawrence and Nohria 2002) and subsequently how it can be created.

In the same line of work, we are exploring how we can find systemized ways of utilizing the creativity, knowledge, and innovativeness of members of the organization to create and develop the new purpose and vision of an organization. The value dimension is naturally very important here too. This work is very much influenced by the ideas from Beer and Eisenstat (2004) about the need for vertical honest conversation about what is important. Beer and Eisenstat initially designed the process for enabling honest conversations (SFP) to be an opportunity for management to get continuous feedback on their ideas. We are trying to use the same logic, but in a context where management is unsure of where to go next and need the innovative power of their organization to shape the future.

Having the honor of writing this chapter, we find hope in Beer's – Mike's – approach to scholarly work. We also find hope in the warmth, energy, and curiosity with which he approaches both people and problems and his genuine will to always contribute with his vast knowledge and experience – his first instinct is to help. There is a need for more academics that, like Mike, follow the scholar-practitioner model. Alas, his working method, which he shares with several of his generation of researchers, is becoming rarer due to the recruitment and promotion practices of universities.

Beer would likely argue that the Strategic Fitness Process that he and Eisenstat developed for Becton Dickinson is the best example of the value of the scholar-practitioner model. What is distinctive about the process is the ability to very quickly help management get clarity about strategic issues in the organization, realign the

organization through engaging employees in the strategic work, and at the same time remake the relationship between senior management and lower levels from a top-down to a partnership. Because the process is a rigorous research process that allows for the gathering of qualitative data, it is a very important tool of value to scholar-practitioners.

The SFP in many ways joins together ambitions that Beer has had – it engages people in the organization in its strategy, it addresses the organization as a system, it helps create alignment around the important issues, and it facilitates a joint understanding of what the organization needs to do.

We are excited and honored by being able to work with Mike through research and through our joint engagement in the Center for Higher Ambition Leadership. We have the opportunity to collaborate with Beer, Eisenstat, and the CHL community to build a movement – one CEO at the time – aspiring to create better organizations and a better world.

## Legacies and Unfinished Business: New Contexts, New Transformations

In *Breaking the Code of Change*, Beer and Nohria conclude that the code of change still has not been broken (2000b, p. 473). With new times come new changes, and with those changes, organizations need to increase the level of their game. The fast transformation of industries created by digitalization will probably mean both a higher emphasis on understanding and employing organizational purpose, as well as an even higher emphasis of caring for and valuing the organization's human assets.

Beer argues that one big issue that we have to gain more insight into is how system-wide change is created. "We have seen organizations as systems and used that as a background notion," he says. "It is time we put system change in the forefront." Along with this notion comes a necessity to do theoretical and empirical work on what allows and facilitates system-wide change. It is important, he argues, to research this not only on a workplace level but on a broader management level. A theoretical and empirical problem that we still have to solve is how organizational systems change over time. What are the different forms? What is the sequence? What contextual variables play in? In the work with the Critical Path book, his colleagues and he developed a sequence in which they saw productive system change occurring. "But what if you would start in another end? What would happen then?" Beer asks.

Fundamentally, his rhetorical questions relate to the theory of organizational system effectiveness that he continuously works on – how effective organizations reach and sustain their goals. We need to see systems as learning entities, he argues. In the work in the Center for Higher Ambition Leadership, this is an ongoing issue. "What enables an organization to become a higher ambition company? We know it is not only about leadership, although that is important. How does it evolve over time? Are there different eras involved in this journey? What derails it from its path?"

As Beer would argue, the organizational systems and the process for changing the many facets of the systems need to be managed even better to keep abreast with the

rapid industry transformation. Moreover, the development of organizations where information flows much more freely (e.g., as an effect of the use of social media) will likely demand of organizations more frequent and more effective "honest conversations" about the crucial issues. At the same time, as digitalization disrupts industries, the demands on economic, social, and environmental sustainability have increased substantially. In such a world, the wealth of ideas in Beer's work will have a bright future.

# Warren G. Bennis: Generous Company

<span style="font-size:2em">8</span>

Thomas G. Cummings

**Abstract**

Warren G. Bennis was an intellectual pioneer in group dynamics, planned change and organization development, and leadership. He was both a scholar and university administrator with diverse interests in how the applied social sciences can serve the betterment of people, organizations, and society. Warren's research and writing laid the foundation for how we think about team development and the role of democratic forms of organizing in adapting to turbulent environments. His work on planned change and organization development helped to define these applied fields and point the way for their growth and progress. Warren's research on leadership transformed how we define leaders versus managers and how we understand what leaders do to develop people and organizations. It showed that the core of leadership is creating trustworthy relationships with self and others. Warren G. Bennis is required reading for any of us interested in organizational change.

Warren G. Bennis was an intellectual trailblazer in planned change and organization development and a creative force in the contemporary field of leadership. In a life spanning almost nine decades, he excelled as a military officer, social scientist, teacher/mentor, university administrator, executive consultant/confidant, and public intellectual. Underlying all of this, Warren was open and warm, an active listener with a sharp wit, keen sense of humor, and a bit of playfulness about him. People liked being around him; he made them feel better about themselves.

Before recounting the experiences and people who shaped Warren's life and guided his enduring contributions to our knowledge and practice, I think it prudent to make transparent that I had a professional and personal relationship with Warren for the past 35 years. Starting around 1980 when Warren came to the University of Southern California, we were colleagues in the organizational behavior area of the Department of Management and Organization at the Marshall School of Business. Warren contributed heavily to my thinking and writing and participated actively in my leadership roles and activities in professional associations. In 1996, I was appointed chair of our department and formally became what Warren humorously referred to as "his boss" for the next 20 years or so, though I never felt like it. Over the last decade of his life, we developed a more personal relationship, sort of like a nephew with a favorite uncle. We met informally, just the two of us, talking about our lives, what was happening, what problems we were facing, what we hoped and dreamed about, and what paths and roads we intended to trail. I will always remember and cherish these special moments with Warren.

## Influences and Motivations: From Scholar to Administrator and Back

By Warren's own account, he lived a rather Dickensian childhood, growing up during the depression era in a working class Jewish family in a predominately gentile New Jersey community. With twin brothers 10 years older than him, a hardworking but meager earning father, and a mother who helped the family eke out an existence, Warren received little emotional or intellectual support, had no close friends, and was indifferent to school, not the best foundation for a future social scientist. Coming of age during WWII, Warren served in the armed forces, an experience that transcended his austere upbringing and afforded a richer, more challenging, and emotionally engaging life. Through sheer persistence, ingenuity, and a bit of luck, 19-year-old Warren was commissioned an officer in the United States Army and sent immediately overseas to fight. He received the Purple Heart and the Bronze Star while being the youngest infantry officer in the European theater

of operations. This military experience had a profound and lasting impact on Warren's thinking and behavior. It forced him to look beyond himself and to see up close and in depth the significant consequences of good and bad leadership and group behavior, social phenomena he would spend a lifetime trying to understand and improve.

## On Becoming a Scholar

The military also set the stage for Warren's initial foray into higher education. Based on glowing reports from a fellow soldier, he entered the 1947 freshman class at Antioch College in Yellow Springs, Ohio. Founded in 1850 under American educational reformer Horace Mann's able leadership, Antioch was renowned for a progressive and intellectually freeing liberal arts education combined with a co-op job system. Here, Warren blossomed as a budding intellectual. Free from the constraints of the military and far from his impoverished roots, he learned to openly voice his opinion on a diversity of topics, question dogmatic thinking, and personally confront the often conflicting goals of self-achievement and civic responsibility. Heady stuff to say the least. At Antioch, Warren met the person who would become his long-time mentor and shape his life, Douglas McGregor, the College's recently hired president from MIT, where among other things he had recruited Kurt Lewin to the faculty, created an industrial psychology department, and laid the groundwork for today's field of positive organizational behavior. McGregor was a Harvard-trained social psychologist with a strong practical bent; an innovative change agent who created an educational culture at Antioch steeped in democratic ideals and aimed at educating the whole person not just the mind. Warren was drawn to McGregor, the person, the scholar, the College president, and McGregor reciprocated with sage advice, friendship, and, more practically, a three-page recommendation that helped Warren get into MIT's doctoral program in economics.

Warren's graduate studies and subsequent academic career were shaped by the *zeitgeist* of the social sciences during the post-WWII era. Social scientists had made significant contributions to the government and military during the war, creating selection tests for various war-related jobs, working on influence and persuasion techniques, studying the cultures of Germany and Japan, designing opinion surveys, and developing game-theoretic models for decision-making, to name a few. This energy, commitment, and innovation carried forward into the postwar decades as did the memories of totalitarian regimes with evil leaders controlling the masses to do or condone unspeakable human atrocities. All of this fueled a profound belief among social scientists that they could, and should, play a key role in making society better – enhancing human freedom, dignity, and democratic values while stemming conflict, aggression, and prejudice. Consequently, this period saw path-breaking research on group dynamics, perception and attribution, styles of leadership and decision-making, interpersonal and intergroup conflict, and persuasion and conformity, from such prominent social scientists as Solomon Asch, Jerome Bruner, Leon Festinger, Rensis Likert, Muzafer Sherif, Robert Zajonc, and many more. And, it

was in this remarkable intellectual milieu that Warren developed and prospered as a scholar.

MIT was far removed from Antioch College in more than just distance and geography. The Economics Department was populated with faculty and doctoral students with a strong quantitative bent. It included courses in mathematics, statistics, all variety of economic theory, and a smattering of social science. Among the department's distinguished faculty were future Nobel laureates Paul Samuelson, Bob Solow, and Franco Modigliani along with the likes of Alex Bavelas, Herb Shepard, George Shultz, and Walt Rostow. Warren struggled with the quantitative and economics courses but excelled in the social science curriculum, half of which included courses in sociology and psychology at Harvard. He spent the second year of the doctoral program at the London School of Economics on a Hicks Fellowship. In London, Warren visited A.T.M. Wilson and Wilford Bion at the Tavistock Institute of Human Relations and learned firsthand about their work integrating psychoanalytic theory with group dynamics. He also underwent psychoanalysis to deal with an unexpected bout of anxiety. The Warren who returned to MIT to do a dissertation was a far more introspective and self-aware person than the one who had left a year earlier. He was also more keenly attuned to the psychodynamics underlying group life.

Warren completed a dissertation on how the creativity of scientific teams was affected by the length of time of their NSF funding. He subsequently published an article based on it in the *American Journal of Sociology*, "The Effect on Academic Goods of Their Market" (Bennis 1956), a title worthy of MIT's Economics Department. Warren then spent a year teaching at MIT while finishing research on group behavior with his former teacher Herb Shepard. They published two notable articles in consecutive editions of *Human Relations*, "Theory of Training by Group Methods" (Shepard and Bennis 1956) and "A theory of Group Development" (Bennis and Shepard 1956). The year of their publication in 1956 saw Warren begin his first academic job at Boston University. Here, he worked closely with Ken Benne and Bob Chin in the Human Relations Center and Nathan Maccoby, head of the Psychology Department. Warren had known Ken from their days leading T-groups at the National Training Laboratories' (NTL) summer home in Bethel, Maine. At Boston University, Warren, Ken, and Bob co-taught a graduate seminar on organizational change and began to edit what was to become a highly influential book on the subject, *The Planning of Change* (Bennis et al. 1961), which popularized the term *change agent* and continued publication for four editions. Warren also connected with colleagues from Harvard's renowned Social Relations Department, where he taught a course with Freed Bales, Ted Mills, and Phil Slater and did research on groups with Will Schutz and Timothy Leary. Warren's time at Boston University turned out to be short lived, however. Doug McGregor, who had returned from Antioch to MIT in 1954 to help start the Sloan School of Management, invited his former protégé to join the faculty in 1959. The offer was too seductive for Warren to resist.

Warren's years at the Sloan School were highly productive yet hectic, as usual. He continued to research and publish at a remarkable pace. Warren wrote his first article

on leadership (Bennis 1959), an almost 50-page missive published in *Administrative Science Quarterly*; penned a controversial but prophetic essay with Phil Slater on the inevitability of democracy for the *Harvard Business Review* (Slater and Bennis 1964); edited a book on interpersonal relations with Sloane colleagues Edgar Schein, Dave Berlew, and Fritz Steele, *Interpersonal Dynamics: Essays and Reading on Human Interaction* (Bennis et al. 1964); edited another book with Schein on using group methods to achieve change, *Personal and Organizational Change Through Group Methods* (Schein and Bennis 1965); and completed preliminary work with Schein and Richard Beckhard on the Addison Wesley Series on Organization Development, a succession of books that laid the foundation for this emerging field and began publication with Warren's introductory volume, *Organization Development: Its Nature, Origins, and Prospects* (Bennis 1969). Warren continued to cultivate intellectual relationships with fellow scholars including Harvard's Chris Argyris and David Riesman, NTL's Lee Bradford and Ron Lippitt, Brandeis' Abe Maslow, and colleagues he met as a visiting scholar at the Institute for Management Development (IMEDE) in Switzerland. He even drew on his own leadership expertise, doing a stint as head of Sloan's organizational studies area and, during a leave from MIT, serving as codirector of the newly created Indian Institute of Management in Calcutta. These hands-on positions rekindled Warren's abiding, yet repressed, need to experience leadership firsthand, not just through the eyes and instruments of a researcher. Like his time in the military, he wanted to test his leadership skills on the firing line, not simply in the classroom or behind a writing desk. To the surprise and disdain of many at MIT, Warren resigned his tenured position in 1967 to become provost of social sciences at the State University of New York at Buffalo.

## On Becoming a University Leader

Warren arrived on the Buffalo campus eager to begin what Martin Meyerson, its visionary president, had vividly described as the transformation of this middling university into "the Berkeley of the East." This bold objective included plans for hiring a large number of outstanding faculty and researchers, decentralizing authority to several new colleges that would function as "intellectual neighborhoods" for faculty and students, creating cross-disciplinary research centers to address complex societal issues, and building a new campus. As provost of social sciences, Warren played a central role in trying to make all of this happen. It challenged his expertise in organization change while forcing him to face, for the first time since the Army, the limits of positional power and the vagaries of an unpredictable and often hostile environment. Among the many problems that thwarted his change efforts were a decline in state funding caused by a weakening economy, growing campus unrest over the war in Vietnam and excessive police intervention, and a university president whose dynamic vision and leadership gradually waned. Worst of all, according to Warren, was the failure of university leaders like himself to actively involve existing faculty and staff in the change process, appreciate the university's traditions and

sources of stability, and build on rather than disregard them. Ironically, Warren had long advocated to students and readers about the need for participation and continuity in organizational change; he learned close up that this was easier said than done. As the change process faltered and Meyerson moved on to become president of the University of Pennsylvania, Warren began to search for his next leadership challenge. In 1971, he left Buffalo to become president of the University of Cincinnati.

Warren approached his presidency with a keen desire to create an educational institution that embodied the values and behaviors that social science had found essential to group and organization effectiveness and human enrichment. This noble vision quickly ran into the hard realities of leading a large complex university, with faculty and staff spread across a diversity of academic and professional schools, students engaged in a multitude of educational and extracurricular activities, a large alumni base, a vigilant university board of trustees, a demanding local community, and a host of government regulations. Warren soon got bogged down in the details of trying to manage much of this himself. He eventually created a decentralized structure to handle the day-to-day activities while he focused on the bigger issues. And one big issue consumed a significant part of his presidency. The university, which the City of Cincinnati owned yet meagerly funded, received only partial financial support from the state while relying heavily on tuition dollars. Past attempts to affiliate fully with the state had met dogged resistance from city powerholders, loyal alumni, and other state universities that did not want to share the state's largess. With costs rising, tuition increases reaching their limits, and a budget deficit looming, Warren entered the fray to make the university a fully state institution. This would test his political acumen, persuasive skills, and fortitude. Over the next two years, Warren made biweekly visits to the state capital to meet with legislators and government officials; he mounted a well-organized lobbying effort to persuade divergent stakeholders to support the move to the state educational system; he organized a massive get-out-the-vote campaign that resulted in a city vote favoring the move to state. All of this resulted in the university becoming a state institution putting it on sound financial footing going forward. It cost Warren a good deal of goodwill and political support, however, especially from the university's trustees that now included state-appointed members. It also added to his growing realization that he "did not love being president of the University of Cincinnati" and, moreover, would likely never be fulfilled with the positional power that only a formal organization can offer. Warren finally came to terms with the simple fact that what he really wanted was the personal power and influence that only voice can deliver. In 1977, he resigned his presidency to take some much needed time to reflect, refresh, and plan his future.

## On Returning to Scholarship

Like much of Warren's life, this personal sabbatical was filled with surprise and adventure, ending with a call to serve. Warren's surprise came from having a fairly severe heart attack while attending a conference and enjoying theater life in London.

It put him in the hospital for a couple of weeks and required an extended period of convalescence during which he learned to write poetry and enjoy John Cleese comedy on British TV. Warren's adventure involved living on a houseboat for a year in Sausalito, California, a well-healed, counterculture enclave on San Francisco Bay just north of the Golden Gate Bridge. Here, he relaxed and enjoyed a laid-back lifestyle. Warren attended Alan Watts' weekly sessions on Zen Buddhism, became friends with Stewart Brand creator of the *Whole Earth Catalogue*, consulted for Werner Erhard the developer of Erhard Studies Training (est), and, visited Esalen several times, the rustic personal growth center and communal hot baths on the Big Sur coast in Northern California. This quixotic adventure came to a natural end, spurred by an enticing call to serve at the Marshall School of Business (MSB) at the University of Southern California (USC). Jack Steele, MSB's dynamic dean, was transforming the school from a regional powerhouse into a nationally ranked institution mainly by hiring prominent scholars like Warren. Steele made it clear that MSB truly wanted and needed Warren. He extolled Southern California's vibrant community and sunny climate along with USC's supportive intellectual environment where Warren could reinvigorate his scholarship and teaching. Warren was familiar with some of USC's faculty and respected their research; he liked Southern California's weather, diversity, and growing cultural activities. Although not totally convinced of the move down south, Warren mused that perhaps USC is the place where he would truly find his voice.

Warren's 34-year tenure at USC would be the longest affiliation with an organization of his life, from 1980 to 2014. This time saw both MSB and USC become elite educational institutions, moving into the upper echelons of scholarly reputation. It witnessed Warren's voice come fully to force, having profound influence on the campus and in the classroom and widespread impact on the scores of readers of his written words. His pioneering research and writing on leadership transformed how scholars thought about and studied leadership and how executives understood and learned how to be effective leaders. Starting with the seminal books *Leaders: Strategies for Taking Charge* (Bennis and Nanus 1985) and *On Becoming a Leader* (Bennis 1989), Warren's in-depth interviews with a diverse array of leaders and insightful analyses of what they said revealed that the prevailing view of leadership as something embodied in a "great person" with charismatic qualities was severely limited. Warren's research showed clearly that the foundation of leadership lies in the relationships between the leader and the group, the organization, and the self. Effectiveness comes from establishing trusting relationships with all of them. Warren continued to shape our knowledge of leadership, authoring or coauthoring several more articles and books on various aspects of the topic. He also researched and wrote about important social issues such as organizing exceptional teams, *Organizing Genius: The Secrets of Creative Collaboration* (Bennis and Biederman 1997), and dealing with the often harmful effects of the mass media, particularly television, on how we make sense of the world, *The Unreality Industry: The Deliberate Manufacturing of Falsehood and What It Is Doing to Our Lives* (Mitroff and Bennis 1993).

In addition to research and writing, Warren shared his wisdom in the classroom at USC, teaching both undergraduate and graduate students. He helped to create and teach with then USC president Steven Sample an undergraduate leadership course

that was one of the university's most impactful electives. Each year, over 300 students went through rigorous interviews to get one of the class' 42 seats, and then learning included a mixture of discussions and debates, visits from distinguished leaders, and hands-on leadership projects. Warren also created a leadership learning experience for graduate students from across the university. Called the Steven B. Sample Fellows Program, a select group of graduate students spent a year doing social projects in the local community. They met periodically with Warren and others to reflect on their learning and to plan next steps. Warren was an extremely hardworking and engaged teacher. He spent endless hours preparing for class, meeting individually with students, and reading their papers and offering valuable suggestions for improvement. He readily accepted a multitude of invitations to guest lecture in courses and to give talks at alumni and university events throughout the world. And, Warren did not shirk university service. He was always on some important university committee and never turned down a request to do something for his department or the Marshall School. Unquestionably, Warren's greatest service to USC was chairing the committee that hired Steve Sample as its president. In 19 years, Steve took the university into the elite levels of higher education, as described in the book that Warren cajoled him to write and then wrote its forward, *The Contrarian's Guide to Leadership* (Sample 2003).

## Key Contributions: Foundations for Developing Groups, Organizations, and Leaders

The synopsis above provides a broad background and basic appreciation of the experiences and people that motivated and shaped Warren's thinking and research. His contributions to our field are immense. They cover four board areas: group dynamics, planned change and organization development, democracy, and leadership.

## Group Dynamics

Warren's interest in group dynamics came from observing and experiencing the powerful effects that groups have on the performance and satisfaction of their members. His research and writing in this area, in collaboration with MIT colleagues Herb Shepard, Edgar Schein, and others, involved the use of groups as an educational medium for personal learning and organizational change, exemplified in NTL's laboratory training methods pioneered by Kurt Lewin, Leland Bradford, Ronald Lippitt, and many others. Warren helped to clarify what laboratory training or T-group entailed, its effects on participants, and how this method of learning could be applied to individual and organizational change. His research was integral to transforming laboratory training from a limited personal growth experience that occurred each summer in Bethel, Maine to a powerful educational method for developing people and organizations. It showed how this experience-based learning, based on values of inquiry and experimentation, helped people gain the personal and

social skills needed to improve themselves and their organizations and to address problems they faced in modern society. Warren's work played a vital role in disseminating laboratory training methods into business, government, and education. Laboratory training, for example, laid the groundwork for the field of organization development, especially its values and early interventions such as team building and conflict resolution. It foreshadowed today's growing interest in "learning by doing" and widespread use of experiential learning methods in corporate training and college classrooms.

Warren also added significantly to our understanding of how groups develop. His work is particularly noteworthy on at least two counts. First, it placed the prevailing static view of group behavior into a temporal or developmental perspective. Warren identified personal and interaction problems that group members face at different periods of time. He argued that unless members resolve those issues when they occur, the group's development falters, and its capability to perform tasks and satisfy members' needs stagnates or diminishes. Second, Warren's theory added an important psychodynamic dimension to traditional social psychology approaches to group behavior. It described two key aspects of members' personality, dependence on leaders or structure and interpersonal intimacy, and explained how they can either facilitate or thwart how members deal with the group's problems over time. In drawing attention to both the temporal and depth dimensions of groups, Warren's theory spurred considerable research on group development and its underlying social and psychological dynamics, such as Bruce Tuckman's (Tuckman 1965) stages of group development.

## Planned Change and Organization Development

Warren's research and writing on planned change and organization development (OD) have been instrumental in creating a conceptual and practical foundation for them. Planned change is broader, more inclusive than OD, which is a particular type of planned change. Warren's work on planned change brought much needed clarity to the meaning of this term. It laid the groundwork for today's widely used practice of change management. Warren defined planned change in the context of the deliberate application of social science knowledge to help solve problems facing individuals, groups, organizations, and societies. He addressed both the knowledge required to solve practical problems and the social process needed to use it. Based on the often tenuous relation between science and practice, Warren argued that social science needs to manage the tension inherent in that connection if it is to create knowledge relevant to solving practical problems. Interestingly, this attention to knowledge relevance continues unabated today in the management field, typically in calls for more actionable knowledge amid growing concerns about the widening gap between research and practice. Warren explained the social process required to utilize relevant knowledge as dependent on the nature of the relationship between the change agent seeking to enact change and the client for whom change is intended. He proposed that the more collaborative or cooperative this relationship,

the more likely knowledge will be used for change. This simple yet insightful premise kindled a stream of applied research on participative management and its effects on overcoming resistance to change. Findings across a diversity of settings generally support the idea that planned change is more successful when change agents and clients manage the change process collaboratively.

Warren's contributions to organization development relate closely to his research and writing on planned change. He helped to define and provide the conceptual underpinnings for OD at a time when the field was just emerging and hardly known or understood. Warren described OD as a form of planned change, with its own values, relevant knowledge, and change processes. It is intended to help organizations address felt problems, which, at the time, were caused mainly by overused bureaucratic practices and rapid unexpected changes. Warren's work was particularly insightful in clarifying the developmental nature of OD, which is embedded in humanistic values of openness, trust, collaboration, and human potential. These values are the core of OD. They serve to differentiate it from other forms of planned change such as management consulting and process engineering. They guide OD's collaborative change process and normative goals for helping organizations become more humanly enriching and better able to adapt to change and improve themselves. Warren's contributions provided a strong base for OD to grow, from interpersonal and group interventions to changes in organizations' work designs, structures, decision processes, and human resource practices. They have helped to anchor these changes to OD's core values, sustaining the field's identity and primary calling.

## Democracy

Warren held a deep and abiding belief in democracy. This personal conviction underlies his research and writing. Warren made the bold and controversial statement that democracy is the most effective and efficient form of social organization for adapting to change, whether in societies, organizations, or groups. He argued that the values underlying democracy – free and open communication, conflict resolved by consensus, and influence based on knowledge and competence – promote the kind of flexibility, information sharing, and swiftness of action that organizations need to adapt to rapid and uncertain change. Research on participative forms of leadership and decision-making in groups and organizations buttressed these claims. Moreover, Warren predicted that the technological, economic, and societal changes that were occurring at the time would accelerate in the future, suggesting that the need for democratic approaches to leading and structuring organizations would continue to grow. Commenting in 1990 about this earlier work on democracy, Warren was both surprised and affirmed by all that had occurred in organizations and their environment over the past 26 years (Bennis 1990). Information technologies, global economies, and political conditions had changed much faster than he had originally imagined. To adapt to those changes, organizations had become far more flexible and decentralized with enriched forms of work, self-managed teams, and participative styles of leadership. In 2012, in light of emerging changes in the globalization of

business, Middle East relations, and European Union solidarity, Warren previewed what his next writing on democracy would cover: "I plan to make an even stronger case for democratic governance, but with an understanding of how we must protect and guard against the flaws and exigencies that inhere in an un-watchful democratic enterprise" (Ashgar 2012). Clearly, Warren's contributions to our understanding of democracy and its role in modern societies and organization are timeless and as relevant today as they are likely to be tomorrow.

## Leadership

Warren's pioneering research and writing on leadership have tremendously influenced how scholars think about and study it and how practitioners understand and enact it. His work reframed traditional approaches to leadership and placed them in the context of what is needed to lead modern organizations facing rapidly changing and demanding environments. Warren made the important distinction between management and leadership. Management is about "doing things right"; it has a short-range focus on maintaining and controlling the workforce and existing systems to maximize established goals. Leadership is about "doing the right thing"; it has a long-term perspective aimed at developing the organization and its members, visioning what they can become, and creating the supporting conditions for this to happen. Warren's attention to leadership distinguishes his work from most traditional leadership research, which tends to focus on management and the relationship between managers and followers, identifying styles and characteristics of managers and studying under what conditions they positively affect performance and employee satisfaction. Warren's research also diverges from traditional popular conceptions of leadership, which tend to attribute leadership to a person and identify the personal characteristics that make this "great person" successful. His work emphasizes the *relationship* between leaders and followers and how effective leaders create a trusting relationship with willing followers and work collaboratively with them to accomplish great things.

Warren's research involved in-depth interviews with a wide range of leaders from the private and public sectors. He sampled effective leaders with proven track records to discover what abilities and behaviors make them successful. Careful analysis of the interviews revealed that successful leaders draw others to them because they have a compelling vision, clearly and vividly communicate their vision, establish trusting relationship because they are reliable and constant in what they say and do, and manage themselves by knowing their skills and strengths and using them effectively. Warren showed that when leaders have the abilities to behave these ways, people in their organizations feel significant and part of a community; they learn that competence and mastery matter and work becomes challenging and fulfilling. What makes these results especially compelling to today's executives is their relevance to organizations' pressing need to change and transform themselves in the face of complex and shifting environments. In these situations, effective leadership is essential for organizations to innovate and develop

themselves. Additionally, because Warren's work casts leadership in terms of abilities and behaviors that can be learned and developed, it offers leaders, and those who aspire to leadership positions, a positive path to becoming an effective leader.

## New Insights: Rethinking Organization Development and Change

Warren made tremendous contributions to social science. Countless scholars and practitioners have used his work to develop new insights about groups, planned change and OD, democracy, and leadership, and some of those developments have been described above. A recounting of all the theory and practice that have evolved from Warren's scholarship would take several volumes. Rather, I will focus on how his contributions influenced my own thinking and practice in organization development and change. This offers a personal account of how Warren's ideas sparked new insights, albeit a very limited and biased story.

Warren's work on extending the application of T-groups or experience-based learning from personal growth to interpersonal relations and team building in organizations was instrumental in my research on organization design and change, with Sue Mohrman, Ed Lawler, and Gerry Ledford at USC's Center for Effective Organizations. In the 1980s, our action research with organizations trying to become more decentralized, flexible, and responsive to rapid and uncertain change revealed that traditional approaches to organization design and change were ineffective for these large-scale transformations. Traditional methods viewed change as a periodic event with a beginning and end, driven by senior management and staff experts, and rolled out throughout the organization. These approaches were too slow to keep pace with rapidly changing conditions, too hierarchically driven to get widespread commitment for implementation, and, worse of all, did not build change capability into the organization to address future changes. Warren's research on experienced-based learning provided clues to create more effective methods for organization design and change. It suggests that when learning by doing is driven by values promoting inquiry and experimentation, it can facilitate the kind of organizational learning needed to implement organization designs. It can actively engage members in learning new behaviors, skills, and knowledge to enact the new design; moreover, it can develop their capability to learn how to change, so they can continually change the organization to keep pace with a rapidly changing environment. Based on Warren's basic research on experience-based learning, we worked with organizations to develop a new and more effective approach to organization design and change called "self-designing organizations" (Mohrman and Cummings 1989). It involves multiple stakeholders in the design and change process, identifies values to guide design, provides members with skills and knowledge to design the organization, and helps them create an action learning process for implementing the design and continuing to change and improve it over time.

Warren's writing on the developmental nature of OD grounded my work, with Chailin Cummings, clarifying the distinction between change management (CM) and OD (Cummings and Cummings 2014). CM is a form of planned changed

aimed at helping organizations implement change. Its values and practices are highly pragmatic and aimed at making change processes more effective and efficient. CM can be applied to all types of changes, such as new organizational technologies, work processes, and structures. Its popularity has grown enormously as organizations increasingly seek to adapt to turbulent environments. Although CM's underlying values differ from OD's developmental values, the two methods of planned change share some common features such as attention to creating readiness for change, overcoming resistance, and sustaining momentum. Consequently, the two change approaches are often intermingled and treated as if they are the same thing. This has resulted in increasing pressures for OD to be more effective and efficient, to focus more on the bottom line. It has even led some organizations to change OD's name to "organization effectiveness." We were concerned that this ambiguity between CM and OD, if left unchecked, will draw attention away from OD's core values and erode its basic developmental nature and identity. Drawing on Warren's work defining the OD field and its underlying humanistic values, we proposed the following to clarify the distinction between these two forms of planned change. CM helps organizations implement change effectively and efficiently. OD helps organizations change and develop themselves, so they function more effectively and more in line with humanistic values. When CM is conceived and practiced developmentally, it is synonymous with OD and should be identified accordingly.

Warren's work on participation and democratic practices recently changed how I think about them and places them in a broader adaptive capability context. I first encountered Warren's work on OD and change while in graduate school during the 1960s. I focused on the participative aspects and the need to involve people to gain commitment to change. At the time, there were widespread concerns about resistance to change occurring both in organizations facing workforce discord over boring and alienating work and in societal institutions beset by cultural conflicts. Warren's writing on participation offered a positive path forward. It fueled my work first in socio-technical systems and self-managed teams (Cummings and Srivastva 1977; Cummings 1978) and later in organization design and self-designing organizations (Mohrman and Cummings 1989). Looking back on this now, I realize that my attention to what Warren wrote about participation was narrowly focused on its role in overcoming resistance to change and motivating people through enriched forms of work. What I had overlooked or simply forgotten was the essential part that participation plays in enabling democratic forms of organization to adapt to changing conditions. Participation provides the active engagement that people need to freely share information and reach consensus on how to resolve challenging problems. It is the medium through which people's skills and knowledge are brought to bear in responding to change. When seen through Warren's broader lens of democracy, participation is more than simply a management technique for overcoming resistance to change or a feature of work design for motivating employees. Participation is a vital part of social organizations' adaptive capability, which, in the world of change we live in today, provides a distinct evolutionary advantage to those who can behave it.

## Legacies and Unfinished Business: Actionable Knowledge for a Better World

The previous pages have described the intellectual gifts that Warren has given our field. These legacies are profound and likely to endure well into the future. Rather than repeat them, I will recount some things that continued to fascinate and sometimes perplex Warren and then conclude with a statement of how he wanted to be remembered in his own words.

Warren was an avid reader and keen observer of our times. He was up to date on current economic, political, and cultural happenings around him and across the globe and typically had something interesting and insightful to say about them. Warren was enthralled with the burgeoning digital world and its pervasive effects on modern organizations and societies. He observed, for example, that innovations like crowd sourcing, virtual communities, and cloud platforms extend his ideas about collaboration and knowledge sharing well beyond the organization. They raise important questions about the size, location, and boundaries of the firm, the external role of leaders, the permanence of the workforce, and the power relations among internal and external stakeholders. Research is in the early stages of studying these issues, and Warren undoubtedly would have been in the mix of things.

Warren was deeply concerned with the innumerable threats facing society and the world: terrorism, global warming, the shrinking middle class, poverty, and poor health care for large segments of the world's population, to name a few. He harbored hopes that the social sciences could provide the kind of actionable knowledge needed to help solve these large-scale, complex problems, much like they had done during WWII. In returning to his roots in economics, Warren singled out behavioral economics interventions as a promising example of what might be accomplished. This applied science informed public policies to promote financial savings and better eating habits and to reduce the threat of spreading diseases such as AIDS in developing countries. Warren mused whether OD might be applied similarly to societal threats and problems, sort of like a Manhattan Project where a diverse group of social scientists and policy makers are brought together to address how to solve specific problems. OD knowledge and practice could help to facilitate this collaborative problem-solving and to inform how solutions can be implemented effectively. If such a monumental project had ever materialized, Warren would certainly have been its Robert Oppenheimer.

In interviewing Warren for a chapter in the *Handbook of Organization Development* in 2007, I asked him how he wanted to be remembered. He mentioned that he had been asked that question several times and his answer changes with age. Now on the day after his 82nd birthday, he felt that his answer is clearer than ever before:

> "I want to be remembered as *generous company*. I want to be remembered as someone who is engaging and fun to be with. I want to be remembered as someone who never stopped questioning and who was wandering through life in a state of wonder." (Cummings 2007, p. 675)

# Wilfred Bion's Organization Change Legacy: "Without Memory or Desire"

**9**

Sarah J. Brazaitis

### Abstract

Wilfred Bion was a change leader who served in and lived through two World Wars and was deeply affected by his experiences on the battlefield and later in treating veterans with shell shock as an army psychiatrist. From his earliest experiences of group life (including bullying) at a British boarding school, to his frustration of enduring the politics and sometimes corrupt aspects of military life, to his satisfaction in developing new, respectful and successful treatment modalities for veterans, to his innovative efforts at transforming the army's hiring practices, and finally to being a founding member of group relations and experiential learning in industry – Bion's contributions to organization change are monumental and long lasting. His theory of basic assumptions in group life, his development of the therapeutic community, and his ground-breaking leaderless group technique are all innovations that are used today in organization change efforts. More than half a century after Bion formulated his ideas, his contributions continue to reverberate with significant impact. This chapter traces Bion's life and legacy as a seminal leader in organization change.

## Introduction

Wilfred Bion was a major contributor to the study of group dynamics, and his work on groups has been a significant and long lasting contribution to the field of organization change. Although he devoted the majority of his career to practicing individual psychoanalysis and his writing on that subject is far more extensive than his work on groups, his ideas on group dynamics and group life are seminal. His 1961 book, *Experiences in Groups*, continues to inform management practices in teams and organizations more than half a century after it was published. His technique of using experiential groups to examine and assess how individuals behave in groups regardless of the task (the leaderless group) is a method that is widely used today across a range of settings and with varied populations (Highhouse 2002). Bion's understanding that groups and teams can be working hard at their task (or think they are) while also engaging in behavior that is obstructionist and antitask is one of the most important ideas in the field of group dynamics. That is, Bion was one of the first to put forth the idea that groups and teams can engage in overt process (working on goals, producing deliverables, fulfilling action items), while also engaging in covert process (sabotaging a colleague, deauthorizing the group leader, working against the group's greater good). In fact, Bion argued that groups always engage in overt and covert processes simultaneously (Bion 1961). Team leaders, organization development consultants, group facilitators, and group process consultants all would likely agree that understanding the covert processes in groups and organizations is essential to helping teams and systems engage in the most effective overt processes toward reaching their shared goals. This idea started with Bion's work and has been essential in organization change efforts since Bion's first formulation.

## Influences and Motivations: A Reflective Soldier

Wilfred Ruprecht Bion was born on September 8, 1897, in Muttra in the Punjab, India, a province that became a British colony in 1847 as part of the colonial expansion. Bion's father was a civil engineer and a part-time secretary to the

Indian Congress and his mother was a homemaker. Bion had one younger sibling, a sister with whom he was close but competitive. The Bion family was not rich, but his father earned a good living as an engineer, and their position in the colonial class gave them some advantages and status within Anglo-Indian society. Bion was married twice (his first wife died shortly after childbirth) and he had three children. His eldest daughter, Parthenope, became a noted psychoanalyst in Italy (Bléandonu 1994).

When he was 8 years old, Bion was sent to British boarding school, as was the custom for middle and upper class families in the civil service at that time. He was lonely and homesick much of his first few years there. Bion's time at boarding school seems to be one of his first experiences with what can be the ugly reality of group life. He was bullied and he also witnessed children's cruelty toward each other across various status designations of ethnicity, wealth, religion, intellectual and sports ability, and attractiveness. As Bion matured and grew at school he excelled in various sports, taking leadership positions on teams. His athletic prowess and achievements would prove to be a helpful entry to other leadership positions as a young man later in his life (Bléandonu 1994).

Bion was an officer in the First World War, and working as a tank commander he saw a lot of action and was awarded the Distinguished Service Order and the Victorian Cross for bravery in battle. Bion was deeply affected by his war service, and scholars suggest that his war experiences had a profound effect on his psycho-analytic theories (Soffer-Dudek 2015). He encountered the hellish conditions of war as a constant backdrop to disturbing social structures including stark class distinctions (officers versus infantry) and corrupt authority.

Bléandonu (1994) noted:

> Throughout the war Bion had encountered lies. The propaganda of governments trying to shield the population from the actual situation; half-truths, euphemisms or distortions from commanders seeking to avoid losing face or status; pious lies, too, addressed to the families of those killed. So much unbearable truth to be avoided. (p. 32)

Bion also observed some of his superiors who seemed more interested in receiving accolades than in protecting their soldiers. Additionally, Bion's close friend in the service, a man with whom he attended religious services, Quainton, went on leave and never returned. Bion learned later that Quainton was hospitalized for shell shock (the psychological shock or trauma from being exposed to warfare, especially bombardment or the repeated explosions of shells or missiles), what is now called post-traumatic stress disorder (PTSD). Bion was deeply distressed by the news of his friend's fate as he, himself, feared losing his mind in battle (Bléandonu 1994).

After World War I Bion studied History at Queen's College, Oxford, and later studied medicine at University College London with the goal of becoming a psychoanalyst. He feared not being admitted as his grades from Oxford were mediocre, but his military and sporting track record were impressive and helped him gain admittance. After earning his medical degree and qualifying as a doctor he studied psychoanalytic psychotherapy for 7 years at the Tavistock Clinic where one

of his patients was Samuel Beckett (Bléandonu 1994). In 1938 he engaged in a training analysis with John Rickman, someone who became a mentor to him in his later work. The analysis ended at the outbreak of World War II. Bion again served during the war, this time, providing psychotherapy to soldiers suffering from shell shock. Bion's wartime experiences were hugely influential to the formulation of his ideas about groups and to his innovations in group work in both a mental health capacity and, later, in organizational settings.

## Key Contributions: An Observant Practitioner

## A Theory of Groups

Bion was a significant contributor to the understanding of group and organizational life in the decades immediately after World War II. His innovations in group work were momentous, ground-breaking, and had a long reach both in applicability across settings and also across time. Indeed, his fingerprints are on several core frameworks and methods that he originated in the 1940s. Bion was one of the forefathers of the idea that groups engage in both explicit and implicit (overt and covert; conscious and unconscious) processes and that understanding both kinds of processes is essential to understanding group dynamics and to driving organization change (Geller 2005).

During Word War II Bion worked as an army psychiatrist both at Craigmile Bottom Hospital and also later as a psychiatrist attached to the Western Command and the David Hulme Military Hospital in Chester. He treated soldiers for shell shock in groups, a model he later took to the Tavistock Clinic after the war. It was due to his extensive group work in the army and later at the Tavistock where Bion formulated his famous theory of groups. Bion's model of the dual aspects of group life – the work group and basic assumption group mentalities – is his most noted and cohesive contribution to our current understanding of group and organizational life.

In Bion's model all groups engage in two aspects or mentalities: work group activity and basic assumption activity. In his model, work group activity and basic assumption activity are always operating simultaneously. The prevalence of one mentality over the other depends on the particular state of the group, its current pressures, and the context. That is, a group might well engage in mostly work group activity until it loses resources (staff, budget), is tasked with a high-profile, high-stakes deliverable and is given a tight timeline to deliver results. These stressors could make the group members exceedingly anxious such that their group behavior deteriorates into predominantly basic assumption mentality activity while the work group activity recedes to the background. According to Bion, basic assumption activity is triggered by anxiety and is more likely to manifest when a group is under significant stress (1961).

Work group activity includes the rational, task-oriented, goal-directed aspects of group life. When group members are engaged in working together to create a product, devise a growth strategy, generate ideas for new markets, or implement action steps in a project management plan they are exhibiting work group activity.

They are working together to achieve goals, produce results, and demonstrate effective performance.

Rioch (1975) stated:

> The work group constantly tests its conclusions in a scientific spirit. It seeks for knowledge, learns from experience, and constantly questions how it may best achieve its goal. It is clearly conscious of the passage of time and of the processes of learning and development. (p. 23)

Basic assumption activity, in contrast, is antitask. That is, it is group behavior that hinders, ignores, or avoids the task, often with great energy and persistence. Group members engaging in basic assumption activity are often passionate in their discussions, may look to be working intensely, and can be quite strenuous in their efforts in the group, but these efforts are never about actually doing the group's real work, rather they are in service of ignoring, skirting, or denying the work task. Basic assumption activity occurs when group members are interacting as though as particular basic assumption was true. Bion detailed three primary basic assumptions: basic assumption dependency, basic assumption flight/flight, and basic assumption pairing.

Basic assumption dependency is when the group acts as though their sole purpose is to receive guidance, sustenance, and comfort from the group's leader. The group members act as if they are not particularly competent but that the leader has all the wisdom and solutions. Further, the leader is not to demand much from the members in the form of active engagement on the task but rather is there to do the group's work and make the members feel good even when they are actively ignoring the real work of the group. University students in a class who expect the professor to be the sole expert in the room, to entertain them with scintillating lectures and to assign only exciting readings, and who demand to be spoon-fed in preparation for any assessments might be in the throes of basic assumption dependency activity.

Basic assumption fight/flight is when the group acts as though the group is under threat of attack, and therefore it must be defended or it must flee. The group members may see the attack originating outside itself (e.g., budget cuts and layoffs by the CEO) or from within (an incompetent or authoritarian leader). Yet, rather than mobilizing to develop a strategy and concomitant action steps to address possible budget cuts and/or an unskilled leader, the group spends its time protesting angrily or worrying fitfully. Agitation may be plentiful in the group, but goal-directed action is nonexistent.

Basic assumption pairing is when all action is deferred to the future. Hope for the future is essential, while action in the present is absent. Two group members may be paired or a group member or leader may be linked to some external person in the belief that this pair will bring about the group's salvation.

Stokes (1994) noted:

> The group is focused entirely on the future, but as a defence against the difficulties of the present. The group is in fact not interested in working practically towards this future, but only in sustaining a vague sense of hope as a way out of its current difficulties. (p. 22)

Bion wrote about the characteristic difficulty in group life, all group life. He stated that people are essentially "group animals" (Geller 2005, p. 91) who struggle to cooperate in order to achieve shared goals, yet who need each other to get things

done they cannot do alone. Bion wrote about the inherent tension and anxiety of all groups, in particular, the essential dichotomous tension group members experience between engulfment versus estrangement. That is, group members want to be both embraced and appreciated in groups, but also do not want to lose their sense of individuality. Humans in groups want to be seen for their own unique contributions, but do not want to be so individualized in group life that they are estranged or extruded from the group. Bion purported that managing this paradox of group life creates part of the central, essential anxiety of group life for all of us. Further, he argued that it is this inescapable tension and anxiety that creates the conditions for members to employ basic assumption activity, that is, to act badly in groups.

Rioch (1975) stated:

> Basic assumption life is not oriented outward toward reality, but inward toward fantasy, which is then impulsively and uncritically acted out. There is little pausing to consider or to test consequences, little patience with an inquiring attitude, and great insistence upon feeling. Basic assumption members…do not really learn and adapt through experience but actually resist change. So it seems that the basic assumptions represent an interference with the work task, just as naughty, primitive impulses may interfere with the sensible work of a mature person. (p. 28)

Finally, Bion included one positive aspect to basic assumption activity that he called "sophisticated" use of basic assumption mentalities (Bion 1961, p. 96). This is when the work task aligns with the basic assumption task. In the case of a surgical operating room, basic assumption dependency activity might be appropriate as all staff are focused on the surgeon guiding the operation. The military mobilizes basic assumption fight activity in order to keep on alert. Basic assumption pairing activity aligns with the breeding goals of a royal family; that is, a couple must produce the future heirs of the family with particular bloodlines. To be clear, Bion developed his model with the idea that basic assumption activity is almost always antitask, that is, it ignores, suppresses, or avoids the group's real work tasks; however, in some instances, he posited that the basic assumption activity and the work group activity are aligned and therefore both mentalities are on task.

Bion detailed his theory of groups extensively in his work, *Experiences in Groups* (1961), a volume that is a collection of separate papers published previously in *The Lancet, Human Relations,* and *The International Journal of Psychoanalysis.* His group model has been one of the most significant contributions to the psychodynamic study of groups and is used today to inform practices in group therapy, group training, organizational development and consulting, and organizational change management. Schruijer and Curseu (2014) provide a thoughtful overview of how Bion's work is incorporated in organizational development research and practice currently. For example, Bion's theory of groups has been used to inform change management (Carr and Gabriel 2010), large group dynamics (Seel 2001), the role of gender in leadership and change (Rippin 2005; Miller 2005), the relationships between management and employees (Lapp and Carr 2006), and managerial narratives (Simpson 2010). These examples demonstrate the breadth of applications

Bion's work has to organization change and how his innovations continue to be central to organization change efforts today, half a century after he first developed them.

## The Leaderless Group

Bion's theory of groups, thus, has not been limited in its applicability to small systems (small groups or teams), but rather has been used to understand larger organizational issues more broadly as noted above. Bion was one of the first to suggest that groups and organizations be thought of as dynamic systems that were more than the sum of their individual parts. That is, Bion argued that what occurred in groups and systems was not solely a summation of each individual's contribution, but rather that the individuals' collective contributions to the group made up a particular dynamic that was related to but different from each individual (Stokes 1994). He was one of the first to suggest that therapists and later organizational consultants attend to dynamics at the group level of analysis rather than to see group work as attending to each individual's dynamics with other people in the room. Bion also encouraged the idea of experiential learning – learning in the here and now from one's own experience (Geller 2005). This, coupled with the notion that one could gather data about individuals from observing their experience in the here and now formed the basis of his "leaderless group" selection technique employed in the British military during World War II to assess potential officers. This was an innovative method of both understanding human behavior in groups and of using that understanding to achieve a goal – e.g., to assess potential officer talent expediently and effectively.

During World War I officers were selected from among those soldiers who distinguished themselves in combat. In World War II that method was no longer viable as the vast majority of British soldiers were repatriated relatively quickly (Bléandonu 1994). At that time psychological testing of soldiers for officer selection was a widely used and accepted practice across Europe (e.g., see Bass 1950; Ansbacher 1951). Britain also used psychological assessments, but they were lengthy to administer and to interpret. Physical tests administered by medics gave a partial picture of the soldier's fitness but the psychological component, seen as essential, was absent. Further, although the British army needed a steady supply of skilled and stable officers, it did not employ enough army psychiatrists and psychologists to assess and select the officers. The army needed an efficient and valid means of assessing psychological health and skill among huge numbers of soldiers. In 1941, Bion was invited to join the first experimental commission known as the No. 1 War Office Selection Board (WOSB) to do just that (Bléandonu 1994). The commission was comprised of six members, three of whom would assess military qualities and three of whom (one psychologist and two psychiatrists) would give specialist advice regarding soldiers' psychological fitness.

As part of the WOSB Bion proposed "The Leaderless Group Project" (Bion 1946, p. 77). Bion's leaderless group was a model to assess soldiers' ability to engage in

skillful interpersonal relations and other critical leadership capabilities on the battlefield. He assembled a small group of soldiers and gave them a task (e.g., to build a bridge). The assessors were instructed to ignore the soldiers' bridge building skills (or lack thereof), but rather to observe and note their interpersonal abilities, including how they managed the tensions of working together, being observed, and their desires for personal and group success and any concerns over individual or group failure.

Bion (1946) described it this way:

> The . . . technique . . .was to provide a framework in which selection officers, including a psychiatrist, could observe a man's capacity for maintaining personal relationships in a situation of strain that tempted him to disregard the interests of his fellows for the sake of his own. The situation had to be a real life situation. The situation of strain, and the temptation to give full rein to his personal ambitions was already there; the candidate arrived prepared to do his best and get himself a commission and, naturally, he feared the possibility of failure. Furthermore, this was a real life situation. The problem was to make capital of this existing emotional field in order to test the quality of the man's relationships with his fellows. (p. 77)

Bion described his leaderless group method as revolutionary, in part, as it rested on democratic principles, in stark contrast to the rigid hierarchy of the army. That is, those participating in leaderless groups were demonstrating their skills in managing interpersonal relations on an equal footing, a dynamic that was typical of what officers needed to do in wartime conditions. In describing the necessity of assessing this relational dynamic Bion quipped, "If a man cannot be the friend of his friends, he cannot be the enemy of his enemies" (1948, p. 88, cited in Bléandonu 1994). Bion employed the leaderless group model of officer assessment and selection for the next 2 years at which time he was passed over for a promotion as head of the selection committee. During this time there was growing suspicion of psychiatry and psychoanalysis both in the military and in British society more broadly. The War Office removed the psychologists and psychiatrists from all the selection committees and yet for decades retained the essence of Bion's innovative assessment and selection method of the leaderless group (Highhouse 2002).

The leaderless group was indeed an innovative and effective method to assess and select army officers during the middle of the twentieth century, but its impact reverberates today, more than 60 years later. This method has been applied frequently across varied settings, populations and tasks, demonstrating Bion's far-reaching and long-lasting contribution to studying and understanding our behavior in groups and systems and to effecting organization change. Variations of the leaderless group are used regularly in corporate life in assessment centers, in educational settings, in formal peer groups such as Alcoholics Anonymous, and in hospitals, especially psychiatric units. Indeed, Bion's innovations in the army selection process transformed organizations' hiring and training processes and gave birth to new organizations structured explicitly around his methods. His importance as a change leader in this regard cannot be overstated.

## The Therapeutic Community

Bion himself used a variation of his leaderless group when he worked as a psychiatrist at Northfield Hospital in England during World War II (Bion 1946). Bion observed that the task of the military psychiatric hospital was to rehabilitate soldiers so as to prepare them to return to active duty. Yet, he noted that in observing the practices of the hospital he saw the staff infantilizing the patients and treating them more like invalids (or kindergarteners) than like soldiers who needed to (re)prepare for battle. He pointed out that the patients were heavily medicated and that they engaged in activities such as dance classes and other activities that corresponded not at all to what they were expected to do upon discharge. For a 6-week span Bion worked with the psychiatrically hospitalized soldiers to help them reflect on their own group community and to relate to each other as the soldiers they were rather than as incapacitated patients (Bion 1946). He invited the soldiers to examine, discuss, and improve their own group and intergroup life within the hospital as a means of rebuilding their skills in interpersonal relations and leadership. Bion changed the occupational therapy employed in the hospital from dance classes to the study of the relations and tensions within the hospital community itself. Bion (1946) wrote, "The therapeutic occupation had to be hard thinking...within a month of the start of this métier these patients began to bear at least a recognizable resemblance to soldiers" (p. 80).

Bion was transferred from Northfield Hospital after working there only 6 weeks. When he left, the therapeutic community model he developed was disbanded. It was soon reinstituted and expanded, however, by Bion's colleagues including Foulkes, Main, and Bridger (Harrison and Clarke 1992). Bion's model of the therapeutic community is widely practiced today in rehabilitation centers for those with substance abuse disorders as well as in mental health clinics and psychiatric hospitals with individuals suffering from mental illness. This modality is another example of how Bion was a change leader. His contribution to our understanding of how to utilize group and system dynamics toward individual, group, and organization change for the greater good is monumental and long lasting.

## New Insights: A Change Leader's Change Leader

Bion's ideas are used routinely today in organization development efforts. Bion was a change leader whose work is used directly by change leaders today. Bion was one of the first to understand that to drive organization change one must address both the overt and covert aspects of organizational life. In his theory of group life, where he detailed two aspects of groups: the work group mentality and the basic assumption group mentality, Bion instructed us on how to understand the connections between what is rational and explicit in a group or system with what is irrational and implicit. Present day change leaders understand that we cannot solely attend to what is said, what is conscious, what is communicated widely in an organization change

initiative, but we must also be vigilant to what is unsaid, what is out of our clients' awareness, and what is hidden or obscured (for extensive examples see Burke and Noumair 2015; Marshak 2006; and Schein 1988). Linking the overt and covert aspects of group and organizational life is a critical piece to understanding resistance to a particular change effort as well as to leveraging accelerators to its success. More specifically, Bion's basic assumption mentalities are sometimes exactly the covert process inhibiting change in a given organization. Understanding how and why they are operating can be the antidote to resistance to change.

Relatedly, while the leaderless group technique was radical when Bion first introduced it as a novel hiring practice in the British military, today it is used routinely to train and hire employees as part of assessment centers. Further, adaptations of the leaderless group technique are also used as core components of any group dynamics curriculum. Those of us who teach group dynamics, leadership skills, interpersonal skills, social processes, and similar topics regularly employ some variation of the leaderless group technique in order to do so. That is, we put students in a group with one another, give them a task to complete together, and observe their group process while they do so. The desired outcome is not the task's completion per se but rather from the learning that occurs in debriefing *how* the task was completed.

I was recently invited to facilitate exactly this type of experiential learning at a private university in Israel where 50 students from around the world were beginning an MBA program. Their first course was a 3-day experiential "leadership retreat" which they spent in groups of eight to ten members engaging in tasks such as putting together a puzzle while blindfolded, agreeing who among a list of possible patients would get a life-saving kidney transplant, and negotiating a simulated contract among various parties to decrease tariffs on meat imports. Each of us on the teaching staff was assigned a small group. My job over the 3-day retreat was to observe my small group as they engaged in these various tasks and to discuss with them their own group dynamics. In these debrief discussions, the students learned about their own leadership style, their strengths and weaknesses in interpersonal interactions, their roles in groups, influence and negotiation skills, and much more. The entire design of this course, a core component of a global, rigorous, prestigious university MBA program, was based on Bion's model of the leaderless group. Bion's work was being used to train a group of 50 future change leaders. These change leaders will then take Bion's ideas into their own organizations to use as guiding frameworks as they drive change themselves. And, Bion's legacy continues.

## Institutional Legacy: An Essential Founder

Finally, Bion was working at a moment in history when psychoanalytic theory and psychoanalysis was increasing in popularity as Freud and other key figures emigrated to the United Kingdom and the United States. In addition, two prominent and

influential institutes were founded at this time, the Tavistock Institute for Human Relations in London, England, and the National Training Laboratories in Bethel, ME, in the United States. Both institutes concerned themselves with the study of social systems and improving organizational life and social conditions. The institutes also used experiential learning (learning in the here and now) as their primary teaching modality. The development of the therapeutic community was a critical innovation in understanding groups and systems during this time. After leaving military service Bion returned to work at the Tavistock Clinic where he would continue to actively study group and organizational dynamics "in the here and now," that is, as those dynamics unfolded in real time. But now, instead of inviting hospitalized soldiers to examine their own community's interpersonal and group dynamics he was doing so with groups of managers from industry. In 1946 the Tavistock Institute of Human Relations (TIHR) was established with the goal of applying psychoanalytic and open systems concepts to improve the functioning and well-being of groups and organizational systems (e.g., corporations). The Institute spun off from the Tavistock Clinic, the mental health clinic where Bion and others had been providing treatment to patients and families affected by the World Wars. The TIHR was charged with addressing wider societal issues than solely mental health including, "the study of human relations in conditions of well-being, conflict and change, in the community, the work group, and the larger organization, and the promotion of the effectiveness of individuals and organizations" (Neumann 2005, p. 120).

During this same period one of the most influential contributors to the study of group dynamics, Kurt Lewin, had fled Nazi Germany and settled at the Massachusetts Institute of Technology where he started the Research Center for Group Dynamics (RCGD) in 1945. Lewin was also responsible for the first T-group (training group), which led to creation of the National Training Laboratory in Group Development (NTL), an organization which continues to offer workshops and training to improve interpersonal and group skills. As scholars and practitioners were producing seminal work on group dynamics at the RCGD and NTL, Lewin's theories and research were also strongly influencing the group scholar practitioners at the TIHR. Social scientists at the institute developed an approach to understanding and improving organizational processes; they stressed the interconnectedness of psychological, technical, economic, and other needs for work, role, and task flow in organizational systems, which they named sociotechnical systems. A fundamental part of their studies was an experiential, living laboratory, called a group relations conference, where participants examined in real time their lived experience of small, large, intergroup, and organizational dynamics with the goal of learning about social systems as these dynamics unfolded (Rice 1965).

The psychodynamic contribution of group relations centers on the work of Bion (1961) who wrote about the presence of both conscious and unconscious processes in group life in his pioneering book. The first issue of the Tavistock Institute's journal, *Human Relations,* was published in 1947, the journal where Bion would later publish his papers that became the volume *Experiences in Groups*. Bion's work

on human unconscious processes in group interactions has influenced a broad swath of organizational research and practice including social-technical systems theory, critical management studies, and psycho-social studies and has been essential to the study of group and team dynamics from a systems perspective, also called group-centered, group relations, systems psychodynamics, socio-analysis, and the Tavistock tradition (French and Simpson 2010). In short, Bion was an integral part of creating the field of group relations. His work was an essential contribution to using group relations to effect organization change. Indeed, he was in a group of the first scholar-practitioners to employ group relations techniques with managers from industry as a means to help them transform themselves and their organizations. He was an early leader in using experiential learning to drive organization change, a practice that is considered standard in organization development today. His legacy continues.

## Conclusion

Bion's influence extends to research and practice in groups, group psychotherapy, mental health treatment including the treatment of addiction, executive coaching, team building, management and leadership development, and organization development and consulting. Interestingly, Bion spent the latter half of his career developing his psychoanalytic ideas regarding individual therapy rather than expanding his group theories or models. Yet, he is considered the key contributor of the psychodynamic view on group life and remains a revolutionary figure in the history of the study of group dynamics and by extension organization change (Geller 2005; French and Simpson 2010). Indeed, as noted above, Bion's model of group life of the work group and basic assumption mentalities has been used in varied settings with numerous populations in industry to facilitate organization change. Bion's emphasis on the importance of understanding and explicating covert processes in group and organizational life has been repeatedly utilized over the past 60+ years since he published *Experiences in Groups*. Variations of Bion's "leaderless group" are used widely today (Highhouse 2002). The method of observing, explicating, and understanding group dynamics as they unfold in real time (as is done in a therapeutic community) continues to be employed today in group relations work, but also in organizational development work more broadly including in the work of such scholar-practitioners as Kets de Vries and Schein among others. In *Notes On Memory and Desire* Bion (1967) writes about the sacred act of listening in the here and now, that is, listening "without memory or desire." Bion wrote these words referring to the relationship between a patient and therapist. But 60 years later, his words extend beyond that context, as a warning or, perhaps, an invitation. Bion invites us to listen without memory or

desire as the way to be truly present to the person, group, organization, to the experience of the moment we are in – as that is the moment from which we can learn the most.

# Robert R. Blake and Jane S. Mouton: Concern for People and Production

# 10

W. Warner Burke

**Abstract**

Although Robert R. Blake and Jane S. Mouton taught and applied social psychology comprehensively and across boundaries, they were best known for creating and teaching the Managerial Grid. Based on the two fundamental functions of leadership – task structure and human relations – they took the position that there was one best way to lead and mange. This normative stance emanated from the combination of a manger's concern for production (task) and concern for people (relationship). Blake and Mouton's 5-day Grid Seminar in the 1960s became popular worldwide. Competition soon emerged in the form of contingency theories and situational leadership models best represented by Hersey and Blanchard's model. They among others argued that the Grid did not take into account the situation which varied according to subordinates' levels of job knowledge and experience. Thus a manger's approach should range from telling, selling, participating, or delegating depending on the situation as defined by subordinates' levels of maturity regarding their job knowledge.

Using a 9-point scale, Blake and Mouton argued further that the degree of the two concerns for production and people established a "style" of management and that a 9,9 combination of the two concerns (maximum degree of 9) determined the style that was a participative approach to leadership and management – the best way to manage and lead. A 9,1 combination, an authority-obedience style; a 1,9 was "country club" management; a 1,1 was an "impoverished" style (all poor choices); and in the middle of the Grid 5,5 was a second-best, compromising style.

Blake and Mouton got their ideas from social psychology, field research especially at Humble Oil in the Houston area and from their consulting work. As a result of their professional activities over the years they coauthored 30 books.

Even though Blake and Mouton were grounded in considerable research, sound theory, and years of practice as consultants, they eventually lost the popularity war. With its simplicity and quick application appeal Hersey and Blanchard's model in particular was too attractive in the marketplace. The superior scholarship behind the Grid did not seem to matter that much. Some conclusions regarding this outcome are discussed in the conclusion section of the chapter.

## Contents

Shortly before he died in 2004 at the age of 86, Robert (known as Bob among his friends) Blake was honored by Peter Sorenson, other faculty, and students at Benedictine University. (Jane Mouton had preceded Bob with her death in 1987. She was only 57 but cancer at that time was simply too much for her.) That evening at Benedictine was festive with the highlight being a flip-chart, spontaneous presentation by Bob of his beloved Managerial Grid. The audience of about a hundred people was rapt, enjoying every minute of Bob's rapid-fire coverage of the five styles of management. Some 43 years earlier during my years as a graduate student at the University of Texas, Austin, I had heard Bob and Jane deliver that identical presentation many times. In fact in my final year at UT, I took *the course* which amounted to serving as a guinea pig for the development of Blake and Mouton's Managerial Grid Seminar of 5 days. After all, we do not come into this world as 9,9 leaders and mangers. We must learn how to become 9,9 with emphasis on such skills as leading a team in decision making via consensus, resolving conflict, receiving feedback on our styles of management, goal setting in a participative manner, and the like. I not only graduated from UT with a PhD in social psychology but also as a highly trained facilitator of the Managerial Grid Seminar.

My first exposure to Bob was during my initial year of graduate studies when I took his proseminar course on social psychology. I loved the course. One had to pay close attention because Bob was a fast-talker. We joked that his initials, R.R., stood for "Rapid Robert." In fact, one of Jane's most significant contributions was to explain at a slower pace and with great clarity what Bob was telling us. Jane was also an excellent writer, thus her role as Bob's partner was to communicate and interpret. They made a formidable team and were quite prolific. For example, the two of them over the years coauthored 30 books.

To launch and manage the Managerial Grid Seminar, Bob and Jane cofounded Scientific Methods, Inc. in 1961 and 3 years later published their original book, The Managerial Grid (Blake and Mouton 1964). With their Seminar designed and launched and their book to undergird the content, business began to boom. By the mid-sixties, the Grid Seminar was being conducted worldwide and with great acclaim. The money made was not bad either.

But I am getting ahead of myself. Let us go back and address the beginnings of Bob and Jane's work, especially Bob's early days, so that we can trace more explicitly the emergence of Grid thinking and practice.

## Underpinning of the Managerial Grid and Organization Development

Both Bob and Jane received their PhD degree in social psychology from the University of Texas, Austin. Bob, being older, preceded Jane and actually was her mentor and primary professor for her graduate training. Bob had a strong drive to learn, particularly to immerse himself in new educational and practice ventures such as spending time in the UK working on special assignments for the Tavistock Institute in London as a Fulbright Scholar, and becoming involved with the National Training Laboratories (NTL) in Bethel, Maine in the early 1950s. These exposures focused his attention on the theories of Wilfred Bion and Kurt Lewin as well as the special brands of group dynamics that each one had spawned – The "Tavi Lab" and the T-Group, respectively. This was a time of rich creativity in the world of applied social psychology and Bob took full advantage of the learning. He passed these learnings on to Jane and they began to work together more and more.

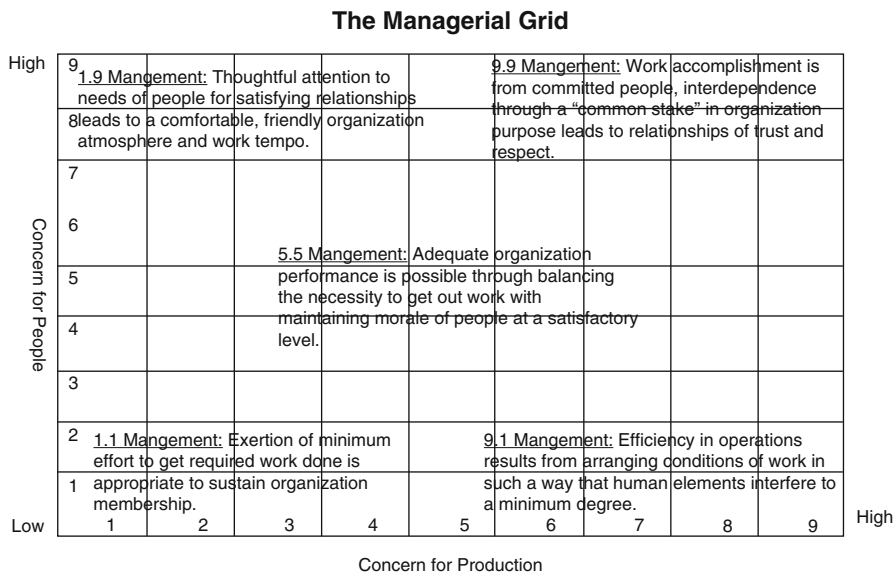
Even though originally educated as social psychologist, Bob and Jane were also involved in industrial-organizational psychology both later achieving Diplomat status in I/O psychology, American Board of Professional Psychology. By integrating social psychology with I/O at the time (1950s), Bob and Jane could easily be considered as organizational psychologists today. To clarify my point, the Grid emerged from Bob and Jane's consulting work with industry especially with their years of working with the Humble Oil and Refining Company (as it was known then) not from lab studies with college sophomores. In fact Harry Kolb in the Employee Relations Department at Humble wrote the Preface for their first edition of The Managerial Grid (Blake and Mouton 1964). Bob and Jane were scholar-practitioners from the beginning of their work independently and together.

Although organization development (OD) had not been coined at the time, two streams of theory and practice were evolving. The theoretical father of this evolvement was the same – Kurt Lewin – yet the application of Lewin's ideas took slightly different routes. The route that is more widely known and written about is from humanistic psychology (Maslow, for example) which influenced Douglas McGregor and Alfred Marrow in particular. A simple but powerful study in terms of its influence was the one by Lewin et al. (1939) showing that democratic or participative

leadership was superior to autocratic and laissez-faire versions of leading young boys working on team tasks. Marrow, in particular, took Lewin's ideas and directly applied them in his company, the Harwood Manufacturing Corporation, taking the form of participative management. A little later McGregor and Richard Beckhard applied the same kind of principles to supervisors in General Mills and at the time called it "bottom-up management." For a more expansive report of this work by McGregor and Beckhard, see Beckhard (1997) and for Marrow's work see particularly his biography of Lewin (Marrow 1969) and the book by Marrow et al. (1967).

At the time, this applied work in industry was beginning to have some influence, that is, late 1940s to early to mid-1950s, when the T Group was born (1946) which also happened to be a Kurt Lewin invention. Sensitivity training, as it was subsequently called, was conducted in the early days almost exclusively during the summer time at Bethel, Maine, the "mecca" of the T-Group. While not overnight, the impact of the T Group gradually became powerful and many behavioral scientists in the 1950s and 1960s got on board with what became a social movement in the USA. These behavioral scientists were taken by the learning that occurred in the T Group – increasing one's self awareness and enhancing what we today refer to as emotional intelligence – and were keen on applying these learnings more broadly particularly in the business – industry sector which was more amenable to such applications than were other sectors such as government organizations. By around 1959, these applications were the beginnings of organization development (OD) with the T Group being the center piece.

But another form, albeit slightly more structured one, was emerging. The centerpiece of this second route was the Managerial Grid (Fig. 1) and what eventually also became known as organization development (see the two chapters on OD in their original book, Blake and Mouton (1964); and the book by Blake et al. (1964)). There has always been some controversy regarding who "invented" OD – Blake, Mouton, and Shepard based in particular on their work in the oil industry or McGregor and Beckhard based on their work with General Mills? With their development of ideas regarding the Grid, Bob and Jane were nevertheless clearly aligned with the thinking and practice of kindred spirits who were influenced by the power of Lewin's ideas and in particular sensitivity training – McGregor's Theory Y, Argyris's Model II, and Likert's System 4 (Blake and Mouton 1982). Yet, if I may be somewhat interpretive, Bob especially valued his independence of thinking and in a sense, he foresaw the difficulty of applying the learning form sensitivity training to the workplace, the so-called real world. Thus, Grid OD (Blake and Mouton 1968) became a six-phased process that was quite structured particularly when compared to the evolvement of OD as represented by the Addison-Wesley Series of books coordinated and edited by Schein, Bennis, and Beckhard. Although Bob and Jane's book was not mainstream OD, Schein and his colleagues included it as one of the original six boxed-set of books (Blake and Mouton 1969).

In summary, the nascent days of OD could be characterized by two somewhat different paths: Grid OD with the Grid model as the centerpiece and the less-structured approach with the T Group as the centerpiece. What both approaches had in common was the value of participative management and leadership and having business-industry


## The Managerial Grid

**Fig. 1**  The Managerial Grid

as the laboratory with Blake and Mouton as well as Herb Shepard at Humble and Marrow et al. at Harwood and McGregor and Beckhard at General Mills. All parties had been to Mecca, i.e., Bethel, Maine, and held the rite of passage through sensitivity training and immersion into the theory of Lewin. Although the latter group were indeed industry-based, especially Marrow, they emphasized group dynamics whereas Bob and Jane while also concentrating on the team were more organizational, that is, addressing the three universals of purpose, people, and hierarchy. Bob and Jane also collected more data at the organizational and overall management level showing, for example, that managers considered the lack of sufficient planning and poor communications as perhaps the primary problems that they faced day in and day out. Bob and Jane (Blake and Mouton 1964, 1968) claimed that these problems were merely symptoms of deeper issues in organizations with the underlying cause being an ineffective management style – 1,1; 9,1; or 1,9.

The Managerial Grid became popular all over the world even in countries where language could be a problem like in Japan. Moreover, Bob and Jane extended application of the grid to organizational culture and emphasized the importance of trying to change culture to make Grid OD ultimately to pay off. By the mid-1960s, then, the Managerial Grid was dominant as a novel approach to improving management in all kinds of organizations. Also Bob and Jane pointed out that while an organization's culture is critical to take into account when planning and managing change, at the societal level the Grid was culture free. Thus their model could easily travel from one country to another.

But this riding high by the Managerial Grid was not to last. Challenges and competitors were percolating and it was just a matter of time.

## Warfare: Grid Versus Situationalism

The Managerial Grid is a normative model, that is, there is one best way to manage and lead and that best way is 9,9 management. But what about the situation? Don't different situations require different managerial approaches? Context matters. In the decade of the 1960s challenges to the Grid emerged. Interestingly these challenges were simply variations on the two functions of leadership that the researchers at Ohio State University had identified earlier in the 1950s. Led by Ralph Stogdill at OSU, these scholars such as John Hemphill and Edwin Fleishman had concluded that initiation of structure and consideration were the two primary variables of leadership. Fred Fiedler with his contingency theory labeled them as task-oriented leadership and relationship-oriented leadership (Fiedler 1967). Hersey and Blanchard (1977) with their situational leadership model simply called the two functions task and relationships. And House's (1971) path-goal theory was also in this situational contingency camp, that is, in attempting to remove blocks from subordinates' path to the goals set forth for them; the leaders would need to vary their approach with more emphasis on the task rather than on supportive or vice versa, depending on the situation at hand.

All three of these models/theories challenged the normative Managerial Grid. There were other challenges but these three were predominant. Bob and Jane did not take these criticisms lying down. Their counter-attack was best represented by their article in *Organizational Dynamics* (Blake and Mouton 1982). In this article Bob and Jane began with arithmetic and chemistry. The situationalists, as they called the enemy, based their models on the two functions of leadership – initiation of structure and consideration labeling them task and relationships, for example, as did Bob and Jane, production and people. For the situationalists the two functions are independent of one another and therefore combine additively (9+9 or 9+1, etc.). For Bob and Jane the two functions are interdependent and come together more like a compound in nature. Thus, their depiction was 9,9; it is a comma that represents the combination not a plus sign. This position taken by Bob and Jane was not unlike Lewin's formula for explaining behavior, that is, b= f (p, e) not p + e or p x e. The two components of behavior, personality and environment, are interdependent and interact in some way to form the compound of behavior. In fact, as noted earlier, Bob and Jane aligned themselves very strongly with other scholars and their work who were influenced by Lewin's theories such as McGregor (1960) and his Theory Y, Argyris and his Model II (Argyris 1976), and Likert with his System 4 (Likert 1967).

More particular to Bob and Jane's thinking, their system for rating oneself and others' ratings of the target person was the degree (one to nine) of "concern for" production and people. How these two concerns were linked together defined how a manager used especially one of the three universals – hierarchy (the other two being purpose and people). These interactive concerns defined how a manager used hierarchy, e.g., top-down or participatively, which in turn resulted in what they

labeled a *style* of management. Style was not personality but, rather, a form of behavior. What determined style was a set of assumptions, and if the style were 9,9, that set of assumptions was steeped in McGregor's Theory Y. Bob and Jane noted at the time that most managers were probably not all that aware of their underlying assumptions about human behavior and particularly motivation. Bob and Jane also purported that each manager would have a dominant style followed by the concept of a back-up style whereas the dominant style was not working well. Their ideal order of styles, making the Grid a *normative* model, was 9,9 being the number-one choice followed by 5,5, then 9,1, 1,9, and last and least, 1,1.

Believing at the time that the 9,1 style was the most dominant style among managers, Bob and Jane devoted 38 pages of their initial book to an in-depth analysis of that style and how inappropriate its use was for getting the best from the people who served them as subordinates. They linked, for example, Theory X assumptions as underlying this particular style. Although 9,1 was the second longest chapter (9,9 being the longest), the fundamental assumption contributing to all chapters was the belief (again, not a conscious one necessarily) that production and people are contradictory. They do not interact; rather they are additive. For every degree of concern for production there is a commensurate decrease in concern for people, or vice versa. Managers with a 1,9 style "lead by following," for example, determining the acceptable rate of production by asking the people themselves. Both 9,1 and 1,9 are active styles whereas 1,1 is comparatively inactive, ignoring the contradictions and leaving the work to follow the day-to-day routines. The 5,5 is a compromise emphasizing selling and using the carrot-and-stick as the primary incentive mechanism.

Now to the 9,9 style. When a high concern for task and simultaneously a high concern for relationships are combined in the situational leadership model (Hersey and Blanchard 1977), the result is nevertheless an independence of the two and an "arithmetic" total. This combination entails a 9 of control regarding the task and a 9 of complimenting and rewarding the subordinates for accomplishing the task as instructed. The result is paternalism/maternalism according to Bob and Jane (Blake and Mouton 1982). It is a matter of the boss rewarding compliant behavior "The soundest basis for combining variables is by compounding (,) rather than by adding (+) them" (Blake and Mouton 1982, p. 33.) To continue with Bob and Jane's argument in their own words:

> Although both 9s signify the same magnitude of concern, qualitative differences in thought, feeling, and behavior are evidenced in the compounds resulting from interaction of the 9s. The 9,9 and comparable orientations – that is, Theory Y, Model II, and System 4 – in the relationship between a boss and subordinate(s) are congruent with emerging behavioral science principles of behavior. The effort to achieve production with and through others is premised upon participation to gain involvement, earned commitment, mutual goal setting, creativity, two-way communication, candor, mutual trust and respect, and the resolution of differences through confrontation at *all* maturity levels. This is the most effective style of exercising leadership; what changes with the situation is the tactics of its application (p. 26).

## Summary and Some Conclusions

In summary, Bob and Jane may have lost some battles along the way, but in the end they won the war by what they called "management by principles." By principles they meant managing people and situations according to what we have learned from sound behavioral science research and theory, for example, that involvement leads to commitment, and that respecting others engenders respect in return, etc. Moreover, what Bob and Jane dubbed management by principles, later in the 1990s, James O'Toole (1995) in taking a stance opposing contingency theories of leadership made his case under the label of "values-based leadership." It is clear today in looking back that the weight of behavioral science evidence is on the side of Blake and Mouton, and O'Toole. Even though no credible research has emerged in support of Hersey and Blanchard's situational leadership model, it remains popular, while the Managerial Grid has waned in recent years. What accounts for this difference between the Grid, which is evidence-based, and the situational leadership model, which is not? I can think of three overlapping possibilities that may help to explain the difference – (1) degree of complexity, (2) anti-intellectualism, and (3) the two distinct worlds of academia and the practical, so-called real world.

*Complexity*: By the time most people are exposed to the Managerial Grid and other nonsimplistic models from the behavioral sciences such as Vroom's leadership/decision-making diagram or House's path-goal theory, they are adults with a BA degree plus perhaps an MBA degree. They have work experience and believe that they know a thing or two. Therefore to try to incorporate an approach to their idea of leadership that is complicated and cumbersome to apply is not exactly appealing. To practice 9,9 behavior effectively, Bob and Jane urged people to think in complex ways, to understand metaphorically about production and people, that their concern for production and their concern for people come together not unlike a compound in chemistry. A chemical compound is formed when two (or more but let us stick just with two as in production and people) formerly independent ingredients or components merge to form a new chemical. This means that one's concern for production and concern for people are no longer independent. As a leader one does not express a concern for production and at another time express a concern for people, or vice versa. Both concerns are expressed at the same time, for example, involving subordinates in determining their production goals. As a rule behaving in this manner does not happen automatically. For most people in leadership positions they have to learn how to implement a 9,9 style. This learning can be challenging and the process takes time.

A situationalist model is much easier. If your subordinates are neophytes just tell them what to do; if they are more sophisticated and know what to do, just leave them alone and occasionally reward them for being productive with, say, some extra time off. With this additive model of the two concerns being independent of one another means, according to Bob and Jane, that situational leader gets compliance but not commitment. Thus, 9,9 thinking and behaving is complex and requires too much. Situational approaches are easy to understand and do. "Life in general and my work life in particular are too short for me to take the required time and effort to try to be a 9,9" one might say.

*Anti-intellectualism*: From at least the time of Alexander Hamilton when America was struggling to form as a nation there has been a suspicion of intellectualism. Hamilton in his time provided the basis for our system of central government and capitalism today. He was considered by many as brilliant and by many others as manipulative, to be held in suspect, and motivated by power and personal gain (Chernow 2004). We Americans have not changed that much since 1800. We continue to be skeptical regarding intellectuals and scholars. Whether it is climate change or participative leadership, one must question if not reject these strange ideas entirely – for a deeper understanding of this phenomenon see the recent article, "Motivated rejection of science" by Lewandowsky and Oberauer (2016). Whether the science is chemistry or psychology, the application thereof is problematical.

The Managerial Grid has now faded from its initial glow of optimism and importance with situationalism and all of its unproven admonitions and simplicity remaining in the limelight. This outcome is based, at least in part, on the fact that the Grid is grounded in sound research and theory and therefore simultaneously to be questioned not to mention being overly complicated.

*Two Different Worlds*: As scholars who work to apply our knowledge, this skepticism of science is a significant barrier to acceptance. Adding to the problem is the fact that we and the rest of humanity live in two different worlds, one of research and theory and the other of practicality, i.e., the so-called real world. We speak a separate language, the practicals using plain, straightforward, and easy-to-understand words and us academes speaking in a tongue of arcane, multi-syllable, and unpronounceable words. We have separate value systems – practical versus theoretical – and separate reward systems – money versus prestige. And the list could go on but the point is made. Thus, we have a communication problem and a values-respect problem. If desired in the first place (let's assume so for the moment) change must come from us academes. We must reach out. As behavioral scientists, it behooves us to study behavior that is timely and not difficult to understand such as trust, leadership, agility, etc. At a recent academic national meeting, I suggested to the audience that we spend some time simply talking with a few of the practicals in the real world and asking them about the problems they were facing at work. The problems they talk about could be a source for research that would speak to them rather than coming across as boring and irrelevant.

As noted above, these three reasons for trying to explain the ebbing of the Grid overlap. Moreover, there are no doubt a number of additional reasons. In any case following the trail of evidence the Managerial Grid is superior to situationalism – yet illustrates the great divide. We must find better ways to communicate with the practical people of our larger world and understand that change is more up to us academes than up to them.

## Epilogue

The day following the fete for Bob Blake at Benedictine University, I was responsible for a presentation on organization change and development of about three hours. It was held in a tiered classroom which was fully attended. To my surprise

Bob was sitting in the second row. I realized that I had an important opportunity. After the introduction, I went straight to where Bob was seated and stated that I wanted everyone to know that "you, Bob, were the best teacher I ever had." He was a bit taken aback but seemed pleased. I knew that this would probably be the last opportunity I would have. And it was. Every now and then, saying to someone you really care about and admire what you have always wanted to say is significant. Some closure in life can be very rewarding.

# David M. Boje: A Storyteller for the Post-Newtonian Era

**11**

Tonya L. Henderson

**Abstract**

Boje, David M. holds a Wells Fargo Professorship and is a distinguished professor and Bill Daniels Ethics Fellow in the management department at New Mexico State University. He also holds an honorary doctorate from Aalborg University. His specialty is organizational storytelling using qualitative methods ranging from traditional narrative to living story emergence, to new work utilizing Shifts-Patterns-Uniqueness-Discrepancies-Self-Assumptions in doing the Equine Assisted Growth and Learning Association field note methods. He is best known for his groundbreaking work in storytelling, including antenarrative and quantum storytelling theory, as well as his key role in the creation of multiple organizations fostering postmodern, critical, and spiritually informed approaches to scholarly dialogue. Each phase of Boje's four-decade career (so far) has served to more firmly situate him, and the field of organization development as a whole, on the path toward more inclusive and ontologically sound ways of knowing, Being, and influencing the world.

## Contents

## Introduction

To know Boje, whether personally or through the lens of his numerous writings and lectures, is to become a part of the living story web that links all who think deeply about organization development (OD), ethics, and, of course, storytelling. Boje has published 22 books, 140 articles, and 83 book chapters as of this writing, not counting his works in progress (Boje 2016). He is a super-collaborator who helps others discover their voices, and he finds inspiration in even the unlikeliest of places. To be a student of Boje's is to be a student of life; to play a part in the unfolding of a living story web shared by intellectuals across the globe, not to mention veterans, artists, blacksmiths, consultants, and even horses. This is uninhibited, cocreative exploration at its finest: a learning that seeks understanding regardless of accepted norms, daring to swim against the current of institutionally approved methods and perspectives. Boje is the consummate lifelong learner whose kindness and humble spirit inspire and empower those who are open to embracing change – something he himself has never avoided. For Boje, embracing change means questioning the status quo, seeing old problems in new and creative ways, and unleashing the potential in others.

Unafraid of critique, Boje has consistently given a voice to stories that might otherwise be suppressed, whether because of unpleasantness, political correctness, or a preference for empiricism in the field – always with the aim of expanding the collective understanding of organizational storytelling and change. Where ethics and human rights are concerned, he has used his scholarship to shine a light on the practices of big corporations, including Monsanto, Nike, Enron, Disney, and McDonald's (see, e.g., Boje 2000, 2008, 2010a; Boje et al. 2005a, b; Boje and Baskin 2010a). He has frequently added his voice to public and scholarly debates when controversial topics were at stake, always supporting constructive discourse (e.g., Boje 2000, 2010b; Fitzgerald et al. 2010). While some may find fault with this tendency to engage in controversy, it has led to many rich and fruitful lines of inquiry that benefit the field and encourage growth.

Throughout his career, Boje has forced us to look at things we would rather not see and to create an irresistible, if uncomfortable, call to action. As a critical postmodernist, he constantly refines his ideas about storytelling in organizations, nudging himself (and us) toward the kind of ethical answerability best garnered through lived experience and authentic storytelling (Bakhtin 1993). He does this through the use of a variety of tools, including theater (Boje et al. 2005a) and deep theoretical explanations (Boje 2008), as well as by giving a voice to those whose stories the general public might not really want to hear (www.veteranstheater.com, 2015). A tireless inventor, he sees human value and potential that others might miss or discard – a gift that has brought him many productive mentees and coauthors. This experience of pushing past superficial judgments to encourage fruitful dialogue characterizes his lifelong quest to move away from the dominant narratives we often accept as "truth," to illuminate the more inclusive, authentic stories that live within organizations of all kinds.

Whether one is a student, colleague, friend, or all of these, we all know Boje as a bold thinker and an unfailingly generous soul. In this chapter, we examine a few of the experiences and influences that have shaped his quest for a deeper, ontological understanding of organizational life. Next, we offer a few highlights from his extensive writings – spanning multiple theoretical streams – and consider how they shape modern OD. We then enjoy a brief taste of the work that is currently in progress as of this writing and suggest a few key references to engage the curious scholar.

## Influences and Motivations: A Cocreative Blend of Scholarship and Practice

Boje is an avid reader whose writings are influenced by many sources. What makes his scholarship unique and, in many ways timeless, is his consistent knack for blending concepts drawn from centuries-old, seminal works with the most innovative ideas of the modern age. A conversation with Boje invariably involves a full range of references from Aristotle (384–322 B.C.) to Zizek (2012) and beyond, touching on many salient points in the time and space between. An intellectual *flaneur* of sorts, he can be seen strolling among the intellectual wares and living stores of the world, fully open to suggestion as he selects the very finest (often piquant) ingredients, in order to concoct surprising new interpretations and generative thought patterns (Boje 2011a). Here we explore some early influences in Boje's work as a segue into discussing his major contributions to the field.

Boje's creative spirit may have found early inspiration in his father's inventions. These included a trash compactor, a widescreen television concept, and even a coffeemaker (Boje 2011a, 2014a). Boje laughingly told the story of a day in his youth when he gathered the neighborhood trash so his father could demonstrate the trash compactor for investors. He chuckled as he described the absurdly frantic preparation and how it all came together just as the investors' limousine rolled up for

the big demonstration. This spirit of innovation, complete with the method of gathering whatever materials are on hand in preparation for something spectacular, has found its voice throughout Boje's writing and his life.

One of the most influential thinkers in Boje's path was physicist and organizational studies pioneer Lou Pondy (Pondy and Boje 2005). It was in Pondy's systems theory class that Boje's storytelling work was first encouraged. Affectionately known as "Leapin' Lou" due to his animated teaching style, Pondy eventually left his organizational systems post and moved to the anthropology department, a change that influenced Boje's work toward a more qualitative approach, despite the widespread empiricism dominating the field at the time. Thus began Boje's own nexus of systems theory and storytelling.

His early exposure to OD was a thorough and regorous one. He was influenced by Ken Rowland, who taught change management consulting at a time when the topic had yet to gain popularity. Boje was also impressed by the ideas coming out of the Tavistock Institute and National Training Labs (NTL) and from pioneers like Chris Argyris and Richard Walton. Mark Sandberg taught him OD methods such as small groups, survey feedback, and facilitation, including many approaches that remain in common use today.

This training in OD fueled Boje's resolve to maintain his qualitative focus even after he left for the University of Illinois, where the PhD program was empirically driven and consulting clients were less plentiful. Boje's dissertation modeled social networks at a time when these concepts were foreign to most. Working with David Whetten, Boje completed an extensive study of 16 cities and 316 organizations. Whetten had high expectations of his students, perhaps owing to his own distinguished colleagues; the volume of readings that he assigned was extensive, but it resulted in a very high level of expertise among his mentees.

Boje's dissertation modeled social networks at a time when those concepts were Foreign to most. Boje found himself "left with creating a story to account for all the significant variables." This begged a more qualitative exploration. David reminisced:

> I was out there getting the pre-data for the dissertation, you know. Doing some informal interviews, I would say, with some people in the field and I was flying around the state in a Cessna – in the rain and storm, by the way. Uh, it's kind of a bumpy ride. But, you know, we had the money and I would fly to different cities. I remember walking down the hall with somebody in St. Louis. The guy was telling me that he ran into the owner of the building where they had their offices for social services. And he noticed that the owner of the building was also a guy he recognized that was on welfare, picking up welfare checks, you know. Then I decided that that story was probably more important than the whole dissertation that I had put together. Quantitative only goes so far. That turned me.

Although David is well trained in quantitative methods, qualitative research is his true passion; it is something he has promoted over the years by developing and teaching methods that get at the deeper, ontological aspects of organizational life (e.g., Boje 2001a; Boje and Rosile 2011; Henderson and Boje 2015).

Boje spent his early years as a scholar at UCLA, where it proved difficult to focus on the qualitative work that has since become typical of him. Yet these years proved to be formative for him because the time spent steeped in empirical methods deepened his appreciation of qualitative research and its significance in the context of his own work. This was a powerful mode of inquiry that was destined to be a staple of his future work.

When Boje left UCLA, he started a personnel agency with colleagues, bringing a practitioner flavor to his works when he later returned to academia. Afterward he wrote about his business' early struggles. At first, he and his partners had little success as they attempted to sell printing chemicals. Then, the effort to market the product led them to stumble upon a more profitable business model: skilled personnel placement for the printing industry. They were successful until one partner's financial mismanagement brought about the company's demise. This shift facilitated a return to academia. Boje had always felt pulled in this direction, even when the business was doing well. He published some 30 practitioner magazine articles during that time and was, as he put it, "trying to intellectualize the selling activity." Trade-focused writing gave him access to a broader audience, with more freedom and license in his writing. This experience served him well when he and his business partners dissolved the partnership, permitting him to follow his heart back to the classroom and his research (Boje 2011a).

His passion led him to Loyola Marymount, a teaching university where he found his voice as a qualitative scholar. He first taught three sections of basic management principles for a teacher on sabbatical and soon found his home. During this time, Boje also met his wife, Dr Grace Ann Rosile, who soon became an indispensable part of the work. An accomplished storytelling scholar in her own right, Rosile is Boje's equal, his colleague, and his muse, all wrapped into one. Their shared love of postmodernism, ethics, horses, and storytelling has led to extensive work with native American thought, materiality, and horse sense (Rosile 2002; Boje and Rosile 2011; Boje and Henderson 2014).

Boje listed several European philosophers among his favorite and most influential authors. Exposure to Edmond Husserl's work as a Ph.D. student set him on the path toward phenomenology. William Fredrick Hegel's work inspired an emergent dialectical model of consulting. Early exposure to these thinkers in particular laid the foundation for an insightful approach to postmodernism, always tied back to ethics; contemporary students of Boje's are all familiar with the likes of Martin Heidegger, Michel Foucault, Gilles Deleuze, Mikhail Bakhtin, John Dewey, and more recent thinkers like Bruno Latour and Henri Savall – diverse scholars whose perspectives are honored pieces of a much larger puzzle. This rich well of influences, combined with Boje's ability to collaborate simultaneously on multiple projects, allowed him to pragmatically blend the most useful elements of a variety of works to construct approaches that are at once innovative and inspired. This is not the stuff of invention for its own sake, but rather a graceful dance of old and new concepts to suit the music of modern story as the manifestation of human organizing.

Building on these ideas, today Boje is working out the synergy between the Hegelian dialectic and the socioeconomic approach to management (SEAM) that is commonly used in Europe (Savall et al. 2008). For Boje, Hegel's work is "not about thesis, antithesis synthesis, but actually a dialogic process toward an improved state."

> It fits the word "change," because it's a process... the main narrative of a company and then negating that with the anti-thesis so you have a counter narrative or a counter story . . .this is dialectical process. It doesn't resolve in some sort of, "Oh, they're wrong and you're right." It results in endless spiral of negations of negations of negations. [Hegel] equates spirit with reason. . . (as) the coming together of a system and science so that your consciousness is not just responding to intuition, but you start to explore the scientific aspects of it and you bring about. . .a system of observation and experiment and experience. I want to treat spirit as something enlightened in the world, not just science for science's sake.

For Boje, it is the consideration of spirituality where scientifically minded scholars ranging from Karl Marx to Karen Barad (2007, 2011) fall short. As an accomplished critical scholar, he has always asked the hard questions and started conversations that questioned conventional wisdom to elicit deep thought from those open to change.

In this quest for engagement and constructive dialogue, Boje has found numerous sparring partners among his students and colleagues. While he has mentored many PhD students in traditional programs, he has a soft spot for nontraditional students in applied programs, addressing large groups and mentoring several at a time. He has a knack for attracting (and keeping) a variety of students from all walks of life and openly praises their willingness to consider their professional experiences in new ways. He enjoys the nontraditional students' abilities to embrace qualitative methods without a strong prior attachment to traditional empiricism. Boje has drawn his inspiration and collaboration from many different sources, gathering the most useful perspectives from each and adding them to the unfolding body of knowledge.

## Key Contributions: Breaking New Ground

It is tempting to rattle off a list of theoretical streams in addressing Boje's major contributions, but to do so sells him short. Is he a feminist? A critical scholar? A storyteller? A postmodernist? Complexity theorist? Quantum storyteller? New materialist? Something else? The answer is invariably, "To some extent." He has spent nearly 40 years examining human organizations through a variety of lenses, and his work has evolved over time, changing course often and spilling over its banks as each new tributary adds to the deluge. Boje is not dogmatic in his approach. He does not ascribe to a single way of seeing and investigating the world, but pragmatically tests out each new perspective encountered, as a craftsman might consider new tools. He has thoroughly tested those deemed worthy of use in concert with his favorites, drawing together concepts, authors, students, and colleagues to cocreate new perspectives and methods. While his personal contributions to the field are many, in terms

of lasting impact, Boje's key contributions may very well be his innovative spirit and the tenacity with which he helps others to make their collective voices heard.

Boje is best known for creating new avenues for nontraditional approaches to OD, changing the way we see organizational storytelling, inventing the concept of antenarrative, and ultimately developing the sociomaterial approaches collectively referred to as quantum storytelling. The latter is a culmination of decades of work influenced by feminism, postmodernism, complexity, quantum physics, and more. It has ushered in a new way of considering OD that is dynamic, inclusive, and inspired – a model for what many have called the post-Newtonian world (Prigogine and Stengers 1984; Prigogine 1996). While Boje's writings alone could fill many volumes of analysis with rich material, we first turn our attention to his role as a leader of scholars, for he is a pied piper of sorts, playing a tune of his own invention that bids deep-thinking people to follow along and "dance to the music of story" (Boje and Baskin 2010a). Having noted some of the doors he has opened for others, we will then consider a few key concepts for which he is well known.

## Creating Forums for New and Controversial Thought

A true postmodernist, Boje has brought many voices to the chorus of understanding, inviting the inevitable discord in the name of constructive tension, which Bakhtin termed heteroglossia (Pondy and Boje 2005). This inspiration is apparent in the establishment of three distinct avenues for open, scholarly debate: the Standing Conference for Management and Organization Inquiry (SC'MOI), the *Tamara Journal*, and the Quantum Storytelling Conference. All three have been catalysts for dialogue and the unfettered exploration of ideas.

SC'MOI lasted 25 years. In 1999, Boje and Robert Dennehy collaborated to create an organizational theory track at the International Academy of Business Disciplines (IABD). They first emphasized postmodernism and storytelling, later adding critical theory, postcolonial theory, and critical pedagogy. In 2004, the group separated from IABD, precipitated by Boje's colorful critique of the Iraq War just as he was stepping into the IABD president's role. Dressed as a clown, he performed the critical play *McDonald's Goes to Iraq* at a formal banquet. Some members took offense and Boje's resignation followed soon after. SC'MOI continued through 2016 and consistently offered an open, inviting place for scholars to bring critical work and explore topics that more conservative organizations would be hesitant to discuss (Boje n.d., 2001a).

SC'MOI was not the only instance in which Boje acted to create a home for critical and controversial scholarship. In 2001, inspired by John Krizanc's play *Tamara*, he founded an academic journal by the same name. In Krizanc's play, audience members followed the cast from room to room, capturing multiple perspectives of an unfolding drama, but never actually seeing the entire stage. They then regrouped during intermission to engage in collective sensemaking. As such, each audience member's experience was unique, and those who saw the play more than once had a new experience every time. The metaphor was an apt one for organizational storytelling from the postmodern perspective, wherein scholars and workers

alike strive to realize the "truth" by listening to the snippets of stories from management, marketing literature, and the rank and file workers, but never really getting the whole story. The *Tamara Journal* "draws on critical management studies, postmodern organization theory, and social systems theory" (Tamarajournal.com n.d.) to support collective sensemaking in organizational contexts.

In 2011, Boje and his colleagues created the Quantum Storytelling Conference. It started as an opportunity for doctoral students from Colorado Technical University to meet face to face with their dissertation mentor. The decision was made for them to come to New Mexico and meet on Boje's birthday, an event that organically grew into a conference. This small group of scholars continues to meet annually to cocreatively explore concepts tying together various aspects of storytelling, native American scholarship, European philosophy, complexity, and quantum physics in new ways (Boje 2011c; Boje and Henderson 2014). The conference temporarily moved to Los Angeles in 2015, but returned to its scholarly roots in the New Mexico desert the following year, where it remains an intimate gathering of open-minded scholars and students.

These conferences and the *Tamara Journal* demonstrated Boje's ability to truly embrace the postmodern. He understands and cultivates the very nature of the work as a polyvocal living story web, something that lives and breathes in ways that we can't control (Boje 2014b). His willingness to create a respectful venue for multiple stories – not just for those who agree with him or present their work in a particular way – is a demonstration of postmodern sensemaking in situ. Boje strategically set the stage for organizational theory development as an emergent phenomenon. He has invited in a collective of actors (in the post-humanist sense), making way for a rich, multifaceted experience to emerge, inspire, and then dissipate when the time is right (Latour 1999).

## Key Theoretical Contributions: Bojean Storytelling and Antenarrative, Paving the Way for Quantum Storytelling Theory

Apart from his role as a leader of scholars and deep thinkers of all kinds, Boje may be best known for his overall approach to storytelling, the concept of antenarrative and the nascent body of work known as quantum storytelling theory (QST). In each case, we see Boje's ability to, as Isaac Newton first suggested, "stand on the shoulders of giants" to see further than his contemporaries, always honoring the dynamic, unbounded nature of organizational life without imposing a singular interpretation on the scene.

## Bojean Storytelling

For Boje, storytelling is where the complexity of human organizations emerges. This is where the unfolding process of aggregate sensemaking comes out in all of its

messy, unedited truth. Boje and his colleagues explore OD in ways that emphasize sociomateriality and organic change, boldly questioning how we bound the systems we study and whose voices are heard and honored (Boje and Baskin 2010a). Beginning where general systems theory and living systems theory left off, Boje and his colleagues tend to employ storytelling as a medium for illuminating complex adaptive systems (CAS) behaviors in human organizations and social networks (Pondy and Boje 2005; von Bertalanffy 1969; Boje and Baskin 2010a; Wakefield 2012). For Boje, organizations are best understood through the stories told by their members – all of their members, not just those residing in the C-suite. Such an approach denotes a decidedly postmodern view. Yet the most interesting aspect of Bojean storytelling is not its polyvocalism, but rather its multifaceted fluidity. Here we not only take multiple perspectives into account but begin to explore the ways that those perspectives shift over time as the product of cocreative sociomaterial enactments.

Here is the notion of the living story web, where stories emerge and dissipate at will in the context of a greater organizational perspective that is decidedly fluid (Boje 2001b, 2008, 2011c, 2014c; Boje and Baskin 2010a, 2011; Boje and Wakefield 2011; Letiche and Boje 2001). Boje entreats modern scholars to see an organization's collective story as constantly changing, driven by myriad influences in ways that are reminiscent of Lewin's (1951) famous force field diagrams. Working with this kind of understanding can be difficult for many leaders, as the informal power structure gains importance and we are forced to accept that one can never completely control or contain what goes on in any organization. Organizational storytelling is a multifaceted, living, breathing thing that accepts the artful influence of responsible, aware leaders but aggressively rebels against those who would insist upon ownership and control.

Boje has called this way of seeing organizations "systemicity," wherein not only the stories, but the very fabric of the organizations themselves, are viewed as constantly changing, expanding, and contracting to redefine institutional boundaries (which are contrived, anyway). This continual dance of emergence and dissipation occurs in a sometimes unpredictable, multifaceted response to (and influence of) environmental factors and the development of internal living story webs (Ashby 1958; Boje 2008; Boje and Wakefield 2011; Wakefield 2012). He highlighted the difference between a dominant narrative (often a top-down idea of the organizational story) and organic, grassroots manifestations of organizational life (Boje and Baskin 2011), suggesting an analytical approach that does not presume absolute knowledge of the system itself or even the ability to map it with any accuracy. Storytelling inquiries such as this entreat one to "start where you are," perhaps at the middle or even off to one side, and work outward from the starting point in order to increase understanding. This type of approach is decidedly at odds with reductionist thinking, making it a hard pill for many to swallow. Such an approach requires one to accept that the analysis is never complete; the system changes faster than one can make sense of it, creating an experience akin to cleaning a house with small children

following behind the broom to drop new crumbs. Despite the unsettling sense of never being complete, which vexes many scholars and terrifies most practitioners, such approaches are ideally suited for the development of an ethics of care in the context of today's uber-connected organizations – Boje's ultimate aim.

## Antenarrative

A thorough understanding of systemicity and its analytical approaches is heavily reliant on the concept of "antenarrative," a term Boje coined in 2001. Antenarrative is "storytelling 'before' the narrative takes the form of BME (beginning-middle-end) storytelling, to include 'bets on the future'" that occur in real time as sensemaking unfolds (Boje 2014b, p. xxi). The term itself begs the question, "What is happening outside of the accepted version of 'truth' that is explicitly or implicitly approved by designated leaders?" Just as one often passes through an anteroom before entering a meeting space, the antenarrative is the entrée to a lived experience of what Ken Baskin (2008) refers to as "storied spaces."

Antenarrative as a concept legitimizes the speculative nature of storytelling beyond the privileged voices of those considered "in the know," to capture a more egalitarian perspective – one that remains fluid and defies any attempt to solidify it. For when we record antenarrative, we transform it into narrative, confining it to the printed page and preventing its further unfolding. The act of writing, even writing that is done with great respect for polyvocalism and the interplay of multifaceted sensemaking, privileges and legitimizes one perspective. Once this is done, the written account is no longer a reflection of antenarrative. It ceases to grow and becomes a limited narrative itself, albeit a generative one. Each frozen account that attempts to corner the market on "truth" is ultimately subsumed and ends up becoming a part of the greater antenarrative of the organization. Antenarrative likes to be acknowledged but it will not be tamed.

Boje's development of antenarrative as a concept extends beyond its discovery to include an extensive body of related work. Of particular use to those who would employ the concept in practice is the development of a taxonomy of antenarratives (Boje 2011d, e). Boje (2011e) describes four types of antenarratives: *linear*, *cyclic*, *spiral, and rhizomatic*. Linear narrative is described as having an arc, a beginning middle and end, often following a set, predictable path. Cyclic antenarrative is the stuff of seasonal repetition, akin to the rise and fall of dynasties in the Chinese view of history. Building on cyclical antenarrative, spiral antenarrative is more fractal, with self-similar patterns repeating as part of a larger arrangement of directional growth that might be considered progression toward a Hegelian absolute were it not for the way the spirals emerge and dissipate at will to create updrafts and downdrafts in organizational life. Finally, rhizomatic antenarrative spreads like strawberry plants or sumac, with widespread influence owing to unseen root structures that support what might appear to the casual observer as unrelated occurrences of a particular

type of story. This bold conceptualization of story as something more than an accepted tale of organizational Being (capitalized after Heidegger's use of the term) has had profound effects on the consulting industry, forcing a deeper reckoning of the subtle undercurrents in organizational life.

The idea of a living, breathing organizational story that legitimately exists at all levels flies in the face of control mechanisms and corporate storytelling that consistently emphasize an idealized "brand," instead demanding a more open, ethical accounting (see, e.g., Jørgensen and Boje 2009, 2010). To analyze antenarrative is to get at the unspoken truths of organizational experience as it unfolds, creating a snapshot of the tide as it comes in, but never adequately capturing the salt taste and unruly nature of the deluge as it knocks you down and floats you back up to the surface.

## New Insights: Quantum Storytelling Theory

Boje is decidedly critical of the notion that living systems theory and complexity are mere metaphors for the unfolding of human organizations, which he perceives as sociomaterial fractals in and of themselves (Boje 2011d; Henderson and Boje 2015). To that end, he has spent decades cultivating an awareness of organizational life as an unfolding process of time, space, materiality, and a deeper spiritual drive.

Boje's nascent work on quantum storytelling theory (QST) represented his boldest and most comprehensive move yet. Building on decades of work to capture antenarrative from a postmodern, human perspective, it takes the work in a decidedly posthumanist direction. Quantum storytelling theory offers a more comprehensive answer to the limitations of prior theories, including living systems theory (LST) and general systems theory (GST), as well as complexity (Boje 2011c). It is consistent with sociotechnical systems theory (STS), the French socioeconomic approach to management (SEAM), and agential realism, all of which constitute important steps toward blending social and material factors (Trist 1981; Savall et al. 2008; Barad 2007). Building on these perspectives, Boje shares Bennet's (2010) understanding of what she calls "thing power" and contextualizes it in a cocreative space of emergent and dissipative story that is at once tangible and unseen, spoken and tersely told, and always as dynamic as antenarrative itself. Here assemblages of people and things, akin to what Latour (1999) calls collectives, interact dynamically to constitute a sociomaterially constituted ontology of the dynamic becoming, Being, and dissipation of the modern organization.

Boje's early works gave us a springboard for understanding organizational storytelling, turning from the mechanical models of the past and embracing LST and complexity-inspired notions. They taught us to view storytelling as "the currency of the realm," the medium of exchange that makes the complexity of human organizing visible to the casual observer (Boje 2008). Building on these concepts,

Boje has continued to add to the body of knowledge in ways that help scholars and practitioners embrace change by accepting the fluid nature of organizing processes. This new understanding is best examined by further exploring QST. A succinct description of quantum storytelling theory is perhaps premature, as at the time of this writing, many scholars are working to flesh out its meaning, drawing from various streams. Yet its promise merits a partial explanation herein.

QST is a line of inquiry that addresses the ways storytelling in organizations has changed since the widespread acceptance of quantum physics and the philosophical shift that entails. The post-Newtonian world suggested by Prigogine and Stengers (1984) was only the beginning, as the world of human activity has become increasingly dynamic and interconnected. As the millennials come into their own, the prevailing thought patterns will be those of digital natives for whom quantum computing is a given and space travel is a "bucket list item," no more unrealistic than their parents' dreams of visiting Tahiti. This world necessitates new ways of understanding organizations, ones that address virtual and hybrid teams and are attuned to ways of Being that are at once material, social, and spiritual. (Note: Being is capitalized after Heidegger (1962) to indicate something closer to the German term *Dasein*, in lieu of mere presence or existence.)

For Boje, the major global paradigm shift that is underway has necessitated an ontologically grounded, ethical approach that is at once rich in its depth and pragmatic in its applications (Boje 2014b).

> We need methodology – empirical methodology that tracks non-linear processes – so when we're forgetting that we have a linear understanding of reality and we apply all these linear methodologies, we're really doing a disservice to the nature of Being.

Boje and his colleagues suggested that quantum-inspired views of time, space, and matter, and even the metaphysical implications of modern science have a place in our understanding of modern organizational theory and practice (Boje and Henderson 2014). Taking a cue from Barad (2007), Strand (2012), and others, Boje stressed "intra-penetration of storytelling, a particular domain of discourse, and materiality (Boje 2011b, p. 1)." The flexibility offered by sociomaterial perspectives that address dynamic *timespacemattering* and go so far as to legitimize the role of spirituality in organizational life made for fertile ground in Boje and his colleagues' efforts to understand the realities of modern organizational storytelling (Boje and Henderson 2014).

This emphasis of the interplay between time, space, materiality, and spiritual elements shifts our understanding from one born of positivistic scientific inquiry – which can be limiting in terms of an ethics of care – toward an understanding grounded in lived experience and meaning-making as an unfolding, nonlinear process.

> We just try to escape into the millennial generation of cellphones and iPhones and iPads and iBooks and whatever "i" you want to do; then we can get detached and, in a Hegelian sense, alienated from Being, and alienated in two directions: one in our own inner consciousness,

and secondly in our encounters with spirit of the earth...that agential cut as Barad (2007) calls
it. There [are] other ways of cutting those relationships or non-dualizing them.

This polyvocal perspective moves beyond dualistic thinking (us vs. them),
towards something Boje has said he feels is better suited to the modern world.
Given that even our most contrived human behaviors are fractal in many cases,
quantum storytelling opens the way to understanding a multidimensional, multi-
fractal way of seeing organizing processes (Henderson and Boje 2015; Henderson
2015). This is terra incognita, fertile ground for the creative and inspired thinking
that has characterized Boje and his ilk.

## Legacies and Unfinished Business

When asked about the future of OD, Boje's suggestions pointed toward a more
truthful, inclusive representation of organizational narratives. He continues to
expand QST and to examine organizing processes as sociomaterial fractals (Boje
2015; Henderson and Boje 2015), expanding these ideas with insights from the
European SEAM approach (Savall et al. 2008) and a host of other sources. Ever the
prolific scholar, he is typically working on at least five writing projects with a variety
of collaborators at any given time. Contributors in this area include Coppedge,
DePorres, Gladstone, Henderson, Hockenberry, Littlebear, McCaleb, McCulloh,
Rosile, Saylors, Strand, Tisby-Cousar, Turunen, and many others. His call is to
embrace deeper understanding through ontological ways of knowing, something that
has fundamentally influenced scholars and practitioners at multiple universities.
These activities highlight Boje's long-term effort to address socially accepted dom-
inant narratives that may be less than truthful if further investigated. (For example,
Boje et al. (2005b) offers a detailed analysis of Enron's use of theatrics to deceive
shareholders.)

A powerful advocate inside and outside of academia, Boje has shown no sign of
resting on his laurels. In addition to his full-time position at New Mexico State
University (NMSU), he is actively engaged in the material storytelling lab at
Denmark's Aalborg University and its New Mexico affiliate, the Embodied
Restorying Processes (ERP) Laboratory. He is actively involved in (and, at the
same time, critical of) the movement toward greening business and universities,
concerned that the "triple bottom line" (people, planet, and profit) may lend itself
toward what is commonly known as *greenwashing*. When *greenwashing*, organiza-
tions seek out positive press but don't always commit to "walking the talk" behind
closed doors, something Boje finds disturbing. At NMSU, he chairs the sustainabil-
ity committee and is heavily involved in greening the curriculum to include work on
creating a school of sustainability with living laboratories in the city of Las Cruces,
NM. He also advocates for increased institutional support for qualitative research to
include more thorough training and emphasis on the more difficult seminal texts that
are often neglected in the process of educating scholars. Boje remains actively

engaged in the community, and a host of topics speak to his sense of justice and openness.

This sense of justice is further seen in his work with disenfranchised war veterans. Boje is a certified provider of Equine Assisted Growth and Learning Association (EAGALA) methods, works extensively with post-traumatic stress disorder sufferers, and has formed a self-sustaining veterans' theater project. Having served in the Vietnam Conflict himself, Boje is able to connect with those who return from combat and find themselves homeless, unable to get needed medical care and struggling against addiction.

> Half the veterans in this state – we don't even know who and what they are – they just disappear after military service. Then the other half try to register and most of them have their claims rejected; then they give up. Eventually, they join veterans' organizations and they start working for social justice. But it's a long route.

The work includes not only therapeutic measures but helping those who have served in the military and find themselves disenfranchised to earn their own money and deal with the material realities of their situation.

In support of these projects, Boje has further expanded his audience beyond academia through blogging, film, and extensive workshops. Issues highlighted on his website, www.veteranstheater.com, include widespread addiction to "spice," synthetic marijuana, in the homeless camps, using sand play to assist veterans' efforts to overcome past traumas for more positive outcomes, and ongoing efforts to create a tiny house community. EAGALA methods and more are being expanded through the Legacy Ranch project, as well (Boje 2015). These efforts offer a small taste of Boje's dedication to making theory practical in a very real, concrete sense.

Ultimately, Boje's legacy will likely be a blend of the organizations and opportunities he has created for others, mixed with his theoretical works (completed publications and those yet to come). These contributions will continue to be expanded for years to come by the very long list of scholars, practitioners, and friends whose lives he has touched. The application of storytelling to bigger social contexts for greater impact gives Boje a sense of satisfaction going forward.

He has accomplished much in the four decades of work to date, but by all indications, Boje is really just getting started. To spend time with Boje is to become a true student of the world, a postmodern listener whose ears are ready to receive ancient and scholarly wisdom blended with the raw, lived experience of those who exist both inside and outside of the system. He forces us to consider perspectives that push us beyond our comfort zones but ultimately make for a more just world.

## Conclusion

To give full consideration to the works of David Boje is to explore vast oceans of content ranging from the ancient Greeks to modern thinkers. While he has contributed many works in the categories of storytelling, complexity, feminism, post

modernism, and post humanism, what makes Boje impactful as a scholar is his uncanny ability to pragmatically draw from a plethora of sources to engage in collaborative sense-making that is consistently groundbreaking if not controversial. Always ahead of his time, ever open to new ways of seeing the age-old problems that characterize our field, Boje is and will always be an inspiration and a friend of those who would seek to expand their minds and understand Being from a deep, authentic place. David Boje is truly a Storyteller for the Post-Newtonian era and a catalyst for change on many fronts.

## Further Reading

To suggest that a student "read Boje," is to offer up a lifetime of possibilities, for his books, articles, chapters, films and speeches are extensive, and he tends to create new material faster than the most avid reader can digest it. To that end, here we recommend an article considered to be a major turning point in his career, the author's all-time favorite, and two of Boje's personal favorite "Boje books" as an entrée to understanding some key elements of the work.

Boje's 1991 Administrative Science Quarterly article about storytelling at an office supply company was groundbreaking. It ushered in a line of inquiry that replaced dominant organizational narrative as put forth by management, with a clearer picture of what is going on—one tied to the voices heard around the water cooler and elsewhere (Boje, 1991).

His 2008 book *Storytelling Organizations* is a noteworthy addition, as it expands the learning to explore archetypal organizational narratives complete with examples from the likes of McDonald's and Nike (Boje, 2008). Here, Boje's explorations of organizational attempts to harness and shape public perceptions are highly critical of the manipulation of story for marketing purposes (Also see: Boje et al., 2005a).

Boje has named *Being Quantum*: *Ontological Storytelling in the Age of Antenarrative* and *Storytelling Organizational Practices*: *Managing in the Quantum Age* as some of his personal favorites (Boje and Henderson, 2015; Boje 2015). The first is an edited collection of essays contributed to by participants in the annual Quantum Storytelling Conference. It explored OD through a lens of *timespacemattering*, a term which denotes the inseparability of time, space, and matter in the dynamic unfolding of organizational reality, and spirituality, building on the works of Barad (2007) and others. The second of these books, which appeals to Boje most as an author, addressed the practical aspects of storytelling in organizations. This is where he found his most complete expression, shining a light on sustainability through storytelling, spirit and simplicity. Boje's current understanding is deeply spiritual; here, he openly shared the experience of bringing his authentic self to the writing to help make sense of the day-to-day storytelling of our organizations. These two works captured the essence of an emergent stream of theory and reflected the generosity with which Boje shared the spotlight with his students and colleagues to contribute to the unfolding body of knowledge as a living story web in its own right.

# Barbara Benedict Bunker's Pioneering Work in the Field of Organizational Change

# 12

Dick Axelrod

**Abstract**

Barbara Benedict Bunker's pioneering work has influenced organizational practitioners for more than 50 years. One of the first women in the field, she paved the way for others. Her legacy is documented in the nine books she coauthored; the 36 articles and 27 book chapters she authored or coauthored; and the more than 85 presentations she has made throughout her career. Her legacy is also alive in the thousands of people to whom she has taught, mentored, and consulted. She is not only a great thinker, she is a wonderful teacher and an excellent practitioner. What is remarkable about Bunker's contributions is that they are not limited to one topic or one aspect of the field. Her contributions include work on gender issues, trust, conflict management, practitioner development, and large group interventions. Her university teaching grounds students in theory and her work in the field has improved organizations and institutions. In this chapter, I will trace early influences on Bunker's career and how her curiosity, use of self, and desire to contribute to the field has made a difference for the people with whom she has interacted around the world.

## Contents

Some people are great thinkers, others are great practitioners, and others are great teachers. Rarely do these qualities all appear in one person. Barbara Benedict Bunker represents all three and exemplifies what is best in the organizational change field. She has brought intense curiosity, humility, academic rigor, and deep caring to her work. Bunker has modeled what it means to be an outstanding organizational change practitioner. For more than 50 years, she has provided lessons from which we can all learn. Organizational change would take a giant leap forward if the field were to follow half of those lessons.[1]

## Influences and Motivations: A Career Begins

### Independence and Gender

Bunker completed her undergraduate studies at Ohio Wesleyan University. While she was there, the University of Chicago's (U of C) dean of students visited Ohio Wesleyan, offering scholarships to students who were asking serious religious questions. The question on Bunker's mind was, "What is the nature of the world

---

[1]For this chapter, the author had spoken with many colleagues of Barbara Benedict Bunker, including Billie Alban, Susan Coleman, Mort Deutsch, Harvey Horenstein, and Judith Katz, for their thoughts and information.

and the nature of God?" No small question, but it was the one that earned her a scholarship to the U of C.

So Bunker attended the U of C to study religion. She is fond of telling a story about her father, a Methodist minister. When she left home for graduate school, he said, "Well, I guess you won't be living with us anymore, but we will always love and welcome your visits" (Bunker 2014). Bunker had a wonderful relationship with her father and was shocked by this dose of tough love. Her father's words made her realize that, although she was completely independent, to be considered complete in the 1950s, women needed a "better half" – a husband – and she was not ready for that.

Bunker attended the U of C at a time in the school's history when every course was open to all students, no matter what degrees they were pursuing. She found it exhilarating to follow her curiosity. At the Oriental Institute, she met and studied with students from all over the world who practiced a myriad of religions, an experience she found inclusive and stimulating. Bunker graduated with a DB Degree, which she described as being between a master's degree and doctorate of divinity degree.

After graduation, her first job was as the director of religious life at the Women's College of Duke University. Having grown up in New England and attended school in the Midwest, she found the racially segregated South to be culturally shocking. "It felt like I was living in another country," Bunker recalled. While at Duke, she experienced and participated in the sit-ins of the 1960s.

As she experienced the wider culture of the South, Bunker was also learning about academia. She soon realized that if she wanted to become a "first-class citizen" in the academic world, she would need a PhD, because her job in the student life part of the university left her undervalued and underpaid.

## But What to Study?

Bunker's field of study became clear to her when she attended her first training group (T-group) run by National Training Laboratories (NTL) in Bethel, Maine. She became and has remained fascinated with small group dynamics. At Bethel, she found her life's calling. Here, she could apply the latest small group research as she facilitated the T-groups that were the staple of NTL's programs.

While Bunker was getting practical experience running T-groups at NTL, she decided to pursue a PhD at Columbia University. There, under the tutelage of Morton Deutsch, she studied conflict resolution. Her dissertation explored the role of trust in the prisoner's dilemma game. Deutsch described his impressions of her during that time: "She was an interesting, bright young woman who was devoted to her work and worked well with others." He went on to portray her as a very giving person who aspired to improve the world (M. Deutsch, personal communication, April 25, 2016).

While at Columbia, Bunker also worked with Matt Miles, who completed some of the first system-wide interventions in public schools based on a data collection/

feedback approach. Bunker's role as a graduate student was to document that process, not only with the clients but among the researchers who were conducting the consultation. This gave her a deep understanding of systemic change.

At Columbia, Bunker experienced firsthand the tension between applied research and pure research. In pure research, an individual was expected to ask the tough questions, while in applied research, he or she dealt with real-world problems. Later in life, Bunker would resolve that tension by becoming a tenured professor and an organization development (OD) consultant.

Following graduation, she went to work at the State University of New York at Buffalo, where she eventually organized and ran the OD training program in the psychology department and became the chair of the Council on International Studies and Programs. Here, she discovered her love of teaching. She also loved working with clients in work settings, where she was able to test ideas against real-world experience. Out of these two loves, Bunker became a scholar/practitioner deeply devoted to the world of ideas and working with those concepts in the real world.

## Making a Difference at National Training Labs

While learning to facilitate T-groups at NTL as a fully certified trainer, Bunker began to experience the consequences of being a woman there. At the time, only three women were considered acceptable to the dozens of white male trainers: Billie Alban, Edie Seashore, and Bunker. The process of becoming a trainer required serving an apprenticeship before becoming a trainer. Women could not become fully certified trainers unless they were sponsored by a white male staff member, and then only begrudgingly. Women were considered second-class citizens.

Even as full-fledged trainers, women found it difficult for their voices to be heard in this environment. When Bunker and Seashore realized that their opinions did not count in staff meetings (B. B. Bunker, personal communication, May 12, 2016), they devised a strategy to make their voices heard. Whenever one of them spoke up during a meeting, the other would say, "I think that is a very interesting idea," whether or not she actually thought the idea was interesting. By supporting each other, the women eventually achieved a positive valence, and the other group members became interested in what they had to say.

By 1975, National Training Labs was several hundred thousand dollars in debt and in serious financial trouble, so Vlad Dupres, the president of the organization, invited Bunker, Seashore, Peter Vail, and Hal Kellner to do an organizational assessment and make recommendations.

Bunker and her fellow conspirators devised a way to get NTL out of debt. The plan involved three strategies:

1. In exchange for assuming the organization's debt, the group would take over the National Training Labs Board.
2. The new board would restructure the organization by inviting 75 current NTL members to join a new National Training Labs; in exchange, those participants

would donate 2 weeks per year to the new organization. Having members working without a salary would allow the organization to save enough money to retire the debt.
3. They restructured the board and the organization so there was an equal balance of men and women, as well as people of color and white people.

The previously identified three steps saved National Training Labs as an institution.

## If You Want to Learn About a Culture, You Have to Immerse Yourself in That Culture

As the chairperson of the National Training Labs Board, Bunker worked in a very diverse system. She realized how little she knew about working in multiracial, multigender cultures and desired to do something about her cultural ignorance. So she decided to immerse herself in a foreign culture. She applied for a Fulbright Scholarship and ended up being a Fulbright lecturer at Keio University School of Business in Tokyo, Japan, in 1984, and at Kobe University School of Business in Kobe, Japan, in 1990.

While in Japan, she researched the role of women in business. At that time, women executives were found in mostly small businesses. Through her research, she learned how women negotiated their way through the male-oriented Japanese culture. For example, a woman might get her brother to apply for a loan at a bank, or put him up as president of a company. When the financed venture or the company was successful, she would assume the executive role. Another interesting finding was that role eventually trumped culture, so if a woman was president, people respected her position, even if they did not believe that a woman should be filling that role.

While in Japan, Bunker learned enough Japanese to get by and learned that "language carries the culture." She meant that if a person wants to understand a culture, he or she must learn the culture's language.

## Applying What You Know to Your Marriage

At one point in her career, Bunker's husband Doug went on sabbatical, which meant that the couple would be separated for long periods of time. Bunker realized that whenever she and Doug got together during his sabbatical, they always ended up fighting on the day they reunited. She puzzled about this pattern and then remembered some research about people who worked on oil platforms and about the impact the job had on their marriages. The researchers found that when one spouse left, he or she created a "role hole," a series of tasks he or she normally did that the other partner had to eventually assume. When the absent partners returned, they expected to pick up where they left off and assume their normal roles, only to find out that their spouses had now taken on the extra tasks. This pattern often resulted in conflict, both when people left and also when they returned. Bunker was curious about whether her

experience with comings and goings was widely shared. So she interviewed a number of commuting couples and discovered that it was.

Making the connection that the tensions she and Doug were experiencing were resulting from role holes, Bunker invented an intervention to break up the pattern. Instead of going straight home when they reunited, Doug and Bunker went to a restaurant first, to ease the transition. Bunker's rule of thumb for reentry was to let her partner tell his story first. During the period of separation, each spouse had been living a separate story. By hearing her partner's story first, she was saying, in effect, "What has been happening to you is more important than what has been happening with me." I learned this lesson firsthand when, early in my career, I would be off on a business trip and would come home eager to tell my wife Emily about the interesting work I had done, the great restaurants at which I had eaten, and the wonderful people I had met. Not a good strategy with a young mother who had been dealing with two small children on her own. A better strategy would have been to say, "What's been going on? What would you like me to do?"

## Themes Begin to Emerge

Some themes begin to emerge from these early insights. The first theme was intense curiosity. Beginning with "the nature of the world and the nature of God," Bunker has used her interest to further her own and others' learning.

The second theme was using her own experiences to guide her development and transform systems. Bunker did not just complain about the sexism she experienced at National Training Labs. She used her knowledge about how organizations work to transform that organization. Recognizing that she needed to learn more about working in different cultures, she traveled to Japan and immersed herself in a totally foreign culture. Having trouble with reentry while her husband was on sabbatical, she applied what she knew about role holes to create a new reentry pattern.

The third theme was taking action. Bunker has done more than study things. She has used her knowledge, both academic and personal, to improve the systems in which she has found herself, be they organizations like National Training Labs or her own marriage.

The fourth theme was developing others. Bunker has been a fabulous mentor, whether it be in formal settings like the university or informal conversations with fellow practitioners. Before coaching became its own profession, Bunker was coaching and helping others to develop.

## Key Contributions: Making a Difference

Bunker's career contributions have striking depth and breadth. Today, she is recognized mostly for her work on large group interventions. What is often overlooked is her work on gender issues in organizations, her research on trust, and her contributions to practitioner development.

## Gender Issues in Organizations

Bunker was among the first to realize that there is a systems component to sexism and racism. While it is true that many individual behaviors contribute to sexism and racism, and that training is useful in helping people understand their blind spots, she recognized that training alone would not change organizations. Structural systemic interventions were required. She understood early on that the system must function effectively to produce results, and that lasting change requires structural interventions. She applied this thought when she contributed to restructuring the National Training Labs Board to make it gender- and race-balanced.

At the time of Bunker's intervention at National Training Labs, that organization was the place to go to learn about small group dynamics. It was also where organization leaders and change professionals went to study groups and teams. Had NTL failed, we would have lost a major training institution. Bunker's work there not only saved the organization, it kept alive a developmental resource for organizational change professionals and organizational leaders.

## Trust

The way you make a name for yourself in academia is to come up with an idea first. Bunker has the distinction of completing pioneering work on trust *and* large group interventions. Along with Ray Lewicki, she wrote two papers on developing and maintaining trust in working relationships. Bunker described these as seminal papers on trust that stimulated further study among academicians and practitioners. The articles she coauthored with Lewicki are the most cited of all her work (Lewicki and Bunker 1995; Lewicki 1995).

While she was writing these papers, Bunker was beginning her work on large groups and recognized that she could not devote her time to both. She chose to focus on large groups, leaving the trust research to Lewicki and his graduate students at Ohio State University. Her need to make the decision can be called an embarrassment of riches, because not many people are simultaneously completing groundbreaking work in two different fields of study.

## Developing Competent Practitioners

Bunker has had a major influence on practitioner development through her work with the Organization Development Human Resources Management (ODHRM) program and the Principles and Practices of Organization Development (PPOD) program at Columbia University, through mentoring and through training OD professionals in major corporations throughout the world.

Harvey Horenstein, the director of ODHRM, described Bunker as someone who brought issues of gender balance to these programs, not as political slogans, but as systemic issues that needed to be addressed (H. Horenstein, personal

communication, April 19, 2016). Bunker also helped students build the bridge between T-groups and systemic organizational work. As a scholar/practitioner, she helped her students think about issues from theoretical and practical perspectives. They learned from Bunker the importance of identifying underlying principles in doing work that was both authentic and consistent with who they were. She helped them to understand how to use what they were experiencing in a system to identify systemic issues and make structural interventions.

I have worked with Bunker as a PPOD co-instructor and have conducted consulting skills workshops with her at major corporations throughout the world. Bunker has provided participants with a historical link to the founders of OD. She has been a bridge, if you will, between the past and the present, because of her commitment to living in the present. She has been a "use of self" role model, helping students understand how they can use what they are experiencing in a system to help a system improve itself. Bunker has brought her curiosity to bear on each person in the workshop and the organization they work for, using that curiosity to customize the offering to them. If you are or have been a student in a class with Bunker, you have known that she cared about you and your work.

## And Along Came Large Group Interventions

Bunker is best known for her work with Billie Alban on large group processes. Bunker first met Alban at National Training Labs, and they became friends while Bunker was studying at Columbia University. Bunker's work on large group interventions is an example of the "bubble up" theory in action. Simply put, the bubble up theory posits that, at different points in time, people are working in different places on developing an idea and eventually these ideas bubble up to the surface. What was operating below the surface becomes known to all, and concept emerges.

In the early 1990s, Alban and Bunker thought that something was developing with large groups. They had heard about people like Kathy Dannemiller and Marvin Weisbord experimenting with interventions that involved 60-plus people in the room at one time and were conducted with just a few facilitators. At the time, conventional wisdom dictated one facilitator per 12 people. Another unique feature of these interventions was that they involved people at multiple levels within an organization and important external stakeholders – something else that was unheard of at the time. Being curious, they wondered who else was doing this kind of work and what might be bubbling up.

At the same time, Bunker and Alban were invited to edit an issue of the *Journal of Applied Behavioral Science* (JABS) on large groups. So they put out a call for papers, not knowing if they could fill the issue. They learned that indeed things were bubbling up. In fact, they were surprised to discover that there was more going on than they knew. This led to their publishing a planned special edition of JABS (Bunker and Alban 1992), an edition that officially launched the field of large group interventions and holds the record for sales of the journal. Weisbord said, "I am not

sure if you two [Alban and Bunker] are documenting what is going on, or making it happen" (Bunker 2016).

The JABS article led to two books: *Large Group Interventions: Engaging the Whole System for Rapid Change* (Bunker and Alban 1997) and *The Handbook of Large Group Interventions: Creating Systemic Change in Organizations and Communities* (Bunker and Alban 2006).

In *Large Group Interventions*, Alban and Bunker provided a large group intervention typology so people could understand how they might be used (future planning, organizational redesign, discussion, and decision-making), how they are structured, and what is involved in running a large group intervention. In *The Handbook of Large Group Interventions*, they demonstrated through a series of cases how large group methods could be used to address issues in organizations and communities.

Not satisfied with just documenting what was going on, Bunker and Alban produced the "Dallas Conferences," bringing the leading creators of large group interventions together into one place. This was important because, at the time, there was intense competition among the practitioners, each thinking that he or she had unlocked the secret to high-participation/high-involvement change. It would have been easy for the practitioners to remain isolated from each other or devolve into camps. Instead, the Dallas Conferences fostered a spirit of cooperation among the participants. In my own case, it led to coauthoring *You Don't Have to Do It Alone: How to Involve People to Get Things Done* (Axelrod et al. 2004) with Emily Axelrod, Julie Beedon, and Jake Jacobs, who were presenting at the conference and working with Sandra Janoff, Kathy Dannemiller, Paul Tolchinsky, and Robert Rheem on several consulting projects where we blended methodologies.

Because Bunker and Alban had not created any of the large group interventions highlighted at the Dallas Conferences, they took on the role of neutral observers. They were able to dispassionately look at the interventions, identify their positive and negative attributes, and identify a set of characteristics applicable to all. These characteristics generated the following principles:

- Inclusion of stakeholders
- Engagement of multiple perspectives through interactive activities
- Opportunity to influence
- Search for common ground

Alban described their work in this way: "Our goal was to influence people to use these ideas [large group interventions] and spread the word. The most important thing was to get these ideas into circulation. People then took these ideas and ran with them" (B. T. Alban, personal communication, June 28, 2016).

Bunker described her work as follows: "Our books, public workshops, the special issue of JABS [and] the Dallas Conferences all made practitioners very aware of what others were doing. We organized the knowledge, we made it easily available and I think we also encouraged collaboration and inquiry rather than competition as

people developed their own skills. That two women chose to proceed in this way, I believe, was much influenced by our gender" (B. B. Bunker, personal communication, May 18, 2016).

## Can't We Just Get Along?

More recently, Bunker has worked with Susan Coleman, a partner at C Global Consulting, to explore how large groups handle conflict and how large group interventions are being used to manage intractable conflicts around the world (S. Coleman, personal communication, May 16, 2016). This is an interesting combination of Bunker's early work on conflict resolution and her more recent efforts on large group interventions.

There is an emerging trend of using large group interventions such as Open Space Technology, Appreciative Inquiry (AI), and Future Search to address these difficult issues of our time.

One example of using large group interventions in diplomacy is Coleman's work in Iraqi Kurdistan.

Conventional diplomatic wisdom supports the use of United Nations peacekeeping forces, which is very expensive and often ineffective. Coleman described work in Iraqi Kurdistan, which brought together people whose tribes had literally killed each other. By the end of an open space session, they were dancing together and hugging each other. By documenting the various uses of large groups, Bunker and Alban made this information available to all, which spurred consultants like Coleman to use large groups in fields outside of organizational change, like peacemaking.

Coleman has described Bunker as someone who is a big thinker and is very comfortable pushing the next idea. Bunker is someone who has always pushed the next frontier by asking, "What next?" (Coleman 2016).

## Key Insights:  Lessons Learned from Bunker

### What Does Extraordinary Teaching Look Like?

I have worked with Bunker as a consultant and instructor, presenting consulting skills programs at Columbia University and at major corporations throughout the world. Bunker has been a wonderful partner and coconspirator as we sought to impart fundamental consulting skills to new organization development practitioners. She has welcomed others' input and is not held prisoner by her ideas. Bunker has been totally congruent when it comes to practicing what she advocates in the classroom. She has modeled for others what it means to be an effective consultant.

Bunker has been a role model for me when it comes to teaching in the university. She has demonstrated repeatedly how to blend academic rigor with experiential activities in the classroom, whether by having students analyze current movies to identify concepts being taught or by teaching them how to examine a text to identify the wisdom present in the writing.

She taught me that being a professional does not mean I have to hide who I am, and that I do not have to lose my humanity in the process. At a time when I was struggling about whether or not to let my students know that I was a grandfather, Bunker talked about her children, grandchildren, and great-grandchildren in a way that facilitated student learning.

This lesson hit home for me on a day when Zach, my oldest grandson, was found unconscious outside in the snow in below-zero weather, having suffered a concussion. Thankfully he was OK, but that evening I was scheduled to teach a course in crisis leadership. I started the class that night by telling the students I might be a little off because of what had happened to Zach. Previously, I would have done the supposedly professional thing: not told anybody about the morning's incident, and soldiered on. Because I shared what had happened, I got enormous support from the students, and we were able to have a very productive evening. In fact, it turned out that a couple of students were paramedics, and they offered some very useful advice during the class breaks. After I shared my story, one of the takeaways from our class discussion was the importance of training and how being calm during a crisis calms others and allows them to function, instead of giving way to panic. We probably would not have had that discussion or realized those learnings had I just soldiered on.

## Free to Choose

Bunker reinforced in me the importance of making choices, owning them and not looking back. When reflecting about not pursuing the trust work with Lewicki, she said that she has no regret and recognizes that she only has so much energy. Thus, she demonstrated the concepts of freedom, choice, and accountability.

## Think Big and Share What You Know

Bunker has taught me to think big, to think further than the concept, and to look beyond what I'm working on at the time. In looking at our conference model, she identified the walk-through process as an important contribution to the field, something we thought was useful but not as significant as the overall conference model process. Walk-throughs are a process for involving people who cannot attend a conference, by sharing results and asking for feedback. Bunker recognized the walk-throughs as accommodating an important issue in large groups: How do we involve the larger system in the process?

I attended the first Dallas Conference thinking that my wife Emily and I had created something special, only to learn that there were other people doing other very special things. Bunker brought to the Dallas Conferences her desire to share knowledge rather than hold it closely, which is very difficult to do as a practitioner in today's world where products, copyrights, and trademarks often take precedence over collaboration and sharing.

## Be Curious

Bunker's curiosity has always been focused on defining the big idea and figuring out how to apply it. During the course of our work, when I became interested in concepts like design thinking or neuroscience, Bunker welcomed these ideas and at the same time pushed me to articulate the big idea present in these concepts and explain how students might apply it in their practice.

Think big, think critically, and think practically. Articulate what you know and can prove; what you know and can't prove; and the things you don't know, but need to learn. Be true to who you are and use your own insights to help others. These are important lessons I have gleaned from Bunker – lessons that always led to new insights.

## Legacies and Unfinished Business: Building on Barbara's Work

Bunker's legacy can be found in four main areas: gender, trust, large group interventions, and use of self. Her legacy is documented in the nine books she coauthored; 36 articles and 27 book chapters she authored or coauthored; and the more than 85 presentations she made throughout her career. And it is alive in the thousands of people to whom she has taught, mentored, and consulted.

Throughout her career, Bunker has focused on gender issues in our field, as well as in the organizations where she taught and consulted. As in all her work, she has used her self-awareness to identify and determine if her experiences were common to others. She would then work with the organization to create systemic interventions to improve the situation.

Although she chose not continue her study of trust, her work on trust with Lewicki was foundational and set the stage for further study.

Bunker's work with Alban uncovered a field of practice and disseminated it to the world through the Dallas Conferences and the workshops on large groups. Bunker and Alban brought the leading practitioners of large groups at the Dallas Conference together to spread new findings in a way that spurred cooperation instead of competition between practitioners. When the two began offering public workshops, they were unsure if people would come, since the workshops were led by two women. To their delight and to our benefit, they learned that content trumped gender.

The books she has coauthored on large group interventions are classic texts in the field and have spurred other authors to write about large groups (Holman et al. 2007). She inspired Steve Cady, director of the Master of Organization Development Program and director of the Institute for Organizational Effectiveness at Bowling Green University, and others to lead further exploration about the use of large groups to effect organizational change.

In 2005, Bunker was awarded the Organization Development Network's Lifetime Achievement Award in recognition of her contributions to the field of OD. This award is testimony to the people she has influenced and continues to influence through her work. These clients and students learned more than theory. They learned how to be congruent practitioners.

## What Remains Undone

Work on addressing the impact of gender, race, and all forms of "isms" in the world obviously remains undone. We are reminded of that fact on a daily basis. With respect to trust, we need only look around and see how a lack of trust is impacting our institutions. We must continue to build on the early large group pioneers and invent new ways of bringing whole systems together to address systemic problems and use these methods to not just better organizations but to better the world.

In closing, I'm reminded of the quote attributed to Rabbi Tarfon:

> It is not your responsibility to finish the work [of perfecting the world], but you are not free to desist from it either. (*M. Pirkei Avot* 2:16).

# W. Warner Burke: Learner, Leader, Scholar-Practitioner

# 13

Debra A. Noumair

**Abstract**

W. Warner Burke is a consummate psychologist and vital contributor to the field of organization development and change. For over 50 years he has been a thought leader and a dedicated steward of the profession. He was often the "first" in key organizational roles forging new professional territory as an architect of institutions and programs. Leadership, self-awareness, organization change, and learning agility are at the center of his academic work. Consulting to complex systems – both tightly coupled and loosely coupled, and designing learning opportunities for individuals, groups, and organizations, are at the center of his professional practice. A leader in the field, he has been recognized throughout his career with numerous honors and awards for his scholarship and practice in organization development and change. This chapter substantiates the enduring values and relationships, institutions and thoughts, enduring work, legacies, and unfinished business, of W. Warner Burke – learner, leader, and scholar-practitioner.

## Contents

## Introduction

W. Warner Burke is the Edward Lee Thorndike Professor of Psychology and Education in the Program in Social-Organizational Psychology, Department of Organization and Leadership, at Teachers College, Columbia University. The Edward Lee Thorndike Chair is most apt for Professor Burke as Professor Thorndike focused his life's work on learning, as has Professor Burke. Learning is the driving force in Professor Burke's life, not solely in his professional life though it has always fueled his research, scholarship, and practice as well as his teaching and service. Learning also provides energy for daily crossword puzzles, playing golf, reading nonfiction, watching mysteries, and rooting for sports teams to whom he is loyal. His thirst for learning gives him hope about what is possible.

Not surprisingly, his learning approach score on the Hogan Personality Inventory is off the chart, indicating that he enjoys learning, achieving, and staying current. These indicators capture the essence of W. Warner Burke and the focus of his life's work as a scholar-practitioner in organization development and change (OD&C) as evidenced by his leadership in the field as well as by a wide array of awards and honors bestowed upon him across his career. While he has enjoyed widespread acknowledgement of his work, by way of introduction to the "enduring thoughts of this thinker of organizational change," the awards that have been most important to Burke are the National Aeronautic and Space Administration (NASA) Public Service Award, the Academy of Management's (AoM) Distinguished Scholar-Practitioner Award, and the Society for Industrial Organizational Psychology's (SIOP) Distinguished Professional Contributions Award. As will become evident from learning more about his *Influences and Motivations*, *Key Contributions*, *New Insights*, and *Legacies and Unfinished Business*, the public recognition that he has received has been duly earned. And although I have highlighted the three most important, to provide a sense of the number of awards he has received, every inch of wall space in his office is covered. As stated in TC Today, the Teachers College alumni magazine, Professor Burke's office "quietly shouts organizational guru" (Levine 2015).

## Influences and Motivations: Enduring Values and Relationships

In Choice points, "The making of a scholar-practitioner" (Burke 2015), Dr. Burke recounts the influence of his childhood and adolescence on his values and subsequent life choices. In particular, his identity as a scholar-practitioner is the result of a vigilance to be both scholarly and practical. Being practical came from his father, who was in small business and wanted his eldest son to emulate him. He did not necessarily need Warner to go into small business; the corporate world would be acceptable and probably preferable. It is easy to imagine then that Warner's father was somewhat bewildered to learn that his son had fallen in love with psychology in college, not realizing that he had something to do with his son's choice of major. Having always said that Warner was good with people and therefore would make a successful salesman, when pushed to choose a major, Warner chose psychology because psychology was about people. While his father eventually understood the choice of psychology, the realization that his son wanted to become a college professor made less sense to him. Warner explained that he was "selling" ideas rather than products. Further, Warner viewed this choice as striking a compromise between what he wanted for himself and what his father wanted for him. Selling ideas would have to be practical; otherwise he would not have been able to live with himself.

To foreshadow another influence on his career, Dr. Burke was able to achieve this balance between being practical and being scholarly when he entered the world of National Training Laboratories (NTL) in 1965. There he saw how psychology could be practical as NTL created opportunities for participants to learn in a laboratory setting followed by application in their home organizations. NTL also provided a forum for Dr. Burke to honor his religious upbringing, albeit in a different way. Dr. Burke was raised in Alabama, where religion was deeply embedded in the culture. As he matured, he left the Southern Baptist church and replaced it with secular religion, that of the teachings of Lewin and NTL. More will be discussed about how he "preached" the gospel of interpersonal competence at NTL.

Dr. Burke's adolescence and young adulthood brought into clearer focus his desire to define his career by focusing on learning, leadership, and change, with attention to both scholarship and practice. Initially his interest in leadership and change emerged from learning from experience. During high school, college, and the Army, Dr. Burke held leadership positions in sports, choral groups, church, boy scouts, camp, a college fraternity, ROTC, and the Army Reserve. As noted in his reflections (Burke 2015), he learned that he was often elected and selected for leadership positions and that he enjoyed being in charge, as long as each leadership position was accompanied by authorization. This idea shows up later in his scholarship and practice on leadership.

Similarly, Dr. Burke's commitment to learning can be traced back to his college years. As stated in his own words, "the significance of and love for learning even to the point of enjoying learning for the sake of learning" was a significant consequence

of this phase of his life (Burke 2015, p. 10). This love of learning was coupled with a love of the field of psychology, resulting in a decision early on to become a psychologist.

Dr. Burke's identity as a psychologist grew more differentiated in graduate school where he studied with Fillmore Sanford in the Social Psychology Program at University of Texas. Fillmore Sanford is the first of three mentors, all of whom had a significant impact on Dr. Burke. Sanford influenced Burke in a number of ways; most broadly, Sanford taught Burke what was important in academia. First and foremost, Sanford emphasized the importance of writing, and by example, as the author of a best-selling textbook, *Psychology: A Scientific Study of Man*, he modeled the importance of writing and of making psychology accessible. Burke later used Sanford's text when he taught *Introduction to Psychology*. He also emulated Sanford by becoming an author himself and by making psychology accessible. Dr. Burke is known for writing as he speaks; it is often said that reading one of Dr. Burke's books or articles is like having a conversation with him. Given his introversion, conversations with Dr. Burke are highly sought after; therefore, capturing such experiences in writing is a gift to his constituencies.

Sanford, a generalist psychologist and a leadership scholar, also influenced the content of Burke's work. Dr. Burke is a leadership scholar, and he traces his interest in leadership back to his experience in the Army and the wide range of leadership positions he held early in life as well as to the work he did with Sanford. His dissertation was on leadership: *"Leadership as a function of the leader, the follower, and the situation"* (Burke 1965). As a social psychologist, Burke reminds us that the significance of any study lies in the interaction among variables. This is even clearer later in his career when he becomes a devotee of Kurt Lewin, the father of Social Psychology, and the enduring formula, $B = f(P, E)$, that behavior is a function of the interaction between a person and her/his environment. Lewin's influence is evident in Burke's research, scholarship, and practice as well as in his teaching and mentorship of his students.

Last, Sanford influenced Burke not only on the "what" of academia but also on the "how" of academia. Sanford was Chair of the Department of Psychology at University of Texas, and his leadership role in the academy left an indelible impression on Burke. Professor Burke has served on the faculty of three academic institutions: University of Richmond; Clark University; and Teachers College, Columbia University. He served as department chair at two of the three. He was Chair of the Department of Management at Clark University, and to the displeasure of Clark, he declined an offer to serve as the inaugural Dean of the School of Management. Instead, he joined the faculty of Teachers College, Columbia University and served as Department Chair multiple times, one as cochair of the Department of Psychology, and in two very long terms as Chair of the Department of Organization & Leadership. In the almost 40 years that he has been on the faculty at Teachers College, he has spent more time as department chair than not.

Another significant role model in graduate school was Robert Blake. Blake is heralded as the best teacher Burke ever had. This honor was earned due to the fact

that Blake covered an incredible amount of territory in a short period of time. Such accomplishments in the classroom account for the exhaustion that accompanied Professor Blake's courses as Warner tried to capture everything that was said in each lecture. Professor Burke's students will be comforted by the idea that their professor has empathy for them as they often describe (complain about) the same phenomenon in his courses.

Professor Blake lived up to the title of best teacher also by linking psychology to the real world. It is not surprising that this was appealing to Burke as it harkens back to one of his early choices to pursue his love of psychology while also adhering to the value of making psychology practical. Moreover, it helps to explain Burke's pride in the identity of scholar-practitioner. For more on Burke's view of Blake, see the chapter in this publication on Robert Blake and Jane Mouton (Burke 2017). It must also be noted here that if you want to know more about Burke as a change leader, notice that his chapter on the "enduring thoughts" of Blake and Mouton does not follow the outline as provided in the guidelines for authors. As is usually the case with such endeavors, writing about the "enduring thoughts of a thinker of organizational change" is revealing about both the thinker and the author. As indicated earlier, Burke believes that leadership must include authorization, and he takes "authorization" very seriously whenever he "authors" any piece of work.

Continuing with mentors and role models who influenced Burke: his commitment to making psychology practical was also nurtured by his second mentor, Lee Bradford, the then President of NTL. Bradford captured Burke's attention during a colloquium he gave at the University of Texas when Burke was in graduate school. As a result, Warner attended the Applied Behavioral Science Intern Program in Bethel, Maine, an 8-week Program offered in the summer. Dr. Burke's participation in the program marks a significant phase of his career as it began his noteworthy involvement in NTL. Dr. Burke joined NTL full-time after working as an Assistant Professor at the University of Richmond for 3 years. "With the exception of my graduate school years, I learned and developed more from the 8 years I was part of NTL than at any other time of my life" (Burke 2015, p. 19).

While Dr. Burke's engagement with NTL has several components, Bradford's mentorship was central to his experience there. Bradford ran three flagship programs at NTL, each one targeting individuals at different organizational levels: one for managers, one for senior executives (those who reported to chief executive officers), and the President's Program for chief executive officers. After Dr. Burke had gained experience, Bradford eventually invited him to run all three programs. At first, Dr. Burke staffed the manager program and the senior executive program but not the President's Program. Eventually he became the dean of the programs, and his role as dean is linked to a culminating moment in Bradford's mentorship of Burke. Sitting on the beach one day, Lee said to Warner, "I want you to take over the President's Programs." When he handed him the President's Program, Warner knew that it was a big deal as it was Lee's baby. This succession meant that Dr. Burke had mastered the laboratory method, as well as the importance of the laboratory method.

Dr. Burke met his third mentor, Dick Beckhard, also at NTL, as Beckhard was one of the staff members for the 8-week Applied Behavioral Science Intern Program

that Warner first attended. Burke captured Beckhard's attention as well as that of other senior leaders at NTL. Beckhard loved his work, and having developed the Program for Specialists in OD (PSOD), he hired Burke as faculty for the program. While Dick admired Warner's knowledge as a social psychologist and his T-group skills, he also shared with him a perception that had a powerful impact on Warner. He said that Warner was a sharp young guy – a social psychologist who didn't know anything about organizations. Although a bit difficult to hear the feedback, Warner knew he was right and made it his business to learn about organizations. Learning, yet again, underlies Warner's response.

While Dick's feedback is memorable to Warner, their relationship encompassed far more than that of mentor and protégé, it included teaching together in programs, coauthorship, and working as colleagues at NTL. Beckhard, along with Bradford, influenced Warner to join NTL as full-time staff, which he did from 1966 to 1974. Similar to what occurred between Bradford and Burke, Dick's trust of Warner led to Warner inheriting the PSOD program from him, another significant achievement as PSOD was as important to Dick as the President's Program was to Lee.

Dick and Warner continued their relationship until Dick's death in 1999. Rolling the clock forward momentarily, a perspective on their relationship that I can add is that the year before Dick passed, Warner and I co-taught a course, Fieldwork in Organizational Change & Consultation. Dick joined us to offer consultation to the students in the course. Watching him and Warner collaborate in service of developing another generation of OD&C practitioners was to see the art and science of consultation beautifully orchestrated and delivered. Witnessing the two of them – Dick, as a founder of the field of OD, collaborating with Warner, a key player and leader of the next generation – it was clear how the field was developed and nurtured.

It is also the case that the field of OD&C did not evolve solely from influential mentoring relationships. Although Warner's research, scholarship, and practice can be traced back to his academic and professional lineage, lateral relationships among those of Warner's generation were also responsible for the development of OD&C as a profession. Given that NTL is focused on training individuals to become interpersonally competent and that T-groups are the primary methodology, Warner's peers were pivotal to his experience at NTL. Along with Warner, Norman Berkowitz, Gene Dalton, Len Goodstein, Harvey Hornstein, and Fritz Steele participated in T-groups in the Applied Behavioral Science Intern Program. If you have ever been in a T-group, surviving the experience is dependent on intense bonding among members of the group and usually results in lifelong relationships and, in some cases, rich and enduring collaborations as was the case with Warner and his peers. Relationships with both Len Goodstein and Harvey Hornstein have continued since that 8-week program in the summer of 1965, although Len passed in 2016.

Jerry Harvey, already at NTL when Warner appeared on the scene, was a colleague of Warner's in graduate school, and like Warner, Blake and Mouton had influenced Jerry as well. This was important, as it was Blake and Mouton's teaching about structured exercises that led to Warner being differentiated from his peers at NTL. When Warner describes his initial summer at NTL, he makes a point of saying that others knew much more about T-groups than he did. However, this component of his

graduate school training made a difference and one that was easily recognizable by Jerry as well as others at NTL. As head of management, Jerry often handed off work for programs in corporate America to Warner; these corporate experiences would come to be an important credential when Warner became an independent consultant during a brief hiatus between NTL and his academic position at Clark University.

The influence of NTL on Dr. Burke is narrated through his relationships with two mentors and several peers, and by the numerous programs he designed, staffed, and led. The relationships and programs serve as containers for a tremendous amount of knowledge, skills and expertise. Taken as a whole, his NTL learning can be sorted into four domains: group dynamics, organization development and change, project management, and design skills (Burke 2015), all of which are evident throughout his life's work. His parting with NTL, however, constitutes a different kind of learning and influence.

Having listened to Dr. Burke share the "whistleblowing story" that led to his leaving NTL, with many cohorts of graduate students, I cannot begin to do it justice. It is a story that one needs to hear in his voice. Luckily, it is the introductory story in "*Choice points: The making of a scholar-practitioner*" (Burke 2015). The reason it is included as the ending to *influences and motivations: enduring values and relationships* is because Dr. Burke blew the whistle at NTL, and although it resulted in him being fired from an organization he holds dear to this day, he believes he did the right thing, albeit painful. Later in his work on phases of organization change and the leader's role, he would state that the change leader must be able to "take the heat" (Burke 2014c). He also touts the importance of change leaders being self-aware and "walking the talk." If you listen to and/or read his whistleblowing story, these competencies – taking the heat, self-awareness, and walking the talk – are evident. Moreover, by retelling the story in the context of becoming a scholar-practitioner, Dr. Burke demonstrates the balance he has struck between scholarship and practice. Rather than simply share the story, he accompanies the story with research and scholarship on whistleblowing as a concept to be understood within the domain of organization change. As previewed at the outset, his life's work is most broadly focused on learning; every story, therefore, includes lessons learned.

## Key Contributions: Enduring Institutions and Thoughts

Dr. Burke has had a significant influence on the field of OD&C by leading change and serving as a pioneer, often being the "first" to take on key organizational roles. He is known for founding and building new programs, many of which were the "first" of a kind that have endured over time. Thus, his work on organization change is partially informed by his lived experience of forging new professional territory and leading change through creating opportunities for scholarship and practice and, more broadly, for designing learning opportunities for individuals, groups, organizations, institutions, and social systems writ large.

Regarding professional organizations, Burke became involved in the OD Network while working at NTL. At the behest of Jerry Harvey and others, he went from

being the secretary to being the organization's "first" executive director. One of his successes was the tremendous growth of the network early on. In the first decade of its existence, the organization expanded its membership from 40 to 2000. As an acknowledgement of his contributions to the field, Dr. Burke received the OD Network Lifetime Achievement Award in 2003, and gave a keynote at the 50th Anniversary of the organization in 2014.

Dr. Burke was the "first" editor of the Academy of Management *Executive*, renamed Academy of Management *Perspectives* in 2006 and before that was named the editor (following the passing of the inaugural editor) of *Organizational Dynamics*. Both of these journals emphasize the importance of closing the research-practice gap and provide an important outlet for both academics and industry partners to publish applied work. The missions of these journals reflect Dr. Burke's early career commitment to making research and scholarship practical. Moreover, his role as editor of these journals meant that he served as a gatekeeper and standard-bearer for applied work in the field of OD&C.

His influence on the field as an editor continues until the present, as he is the current editor of *The Journal of Applied Behavioral Science* (JABS), having served for many years both as an associate editor, and on the editorial board of JABS. Comprised of scholars and professionals, the mission of JABS is to provide "scholars the best in research, theory, and methodology, while also informing professionals and their clients of issues in group and organizational dynamics" (https://us.sagepub.com). The focus of JABS, to publish work on how individuals and institutions change, is aligned with Dr. Burke's mission to make psychology, and particularly Organizational Psychology, accessible, and also with his professional identity as a scholar-practitioner. At the same time, serving in this role in this phase of his career is a labor of love for the journal and for its sponsoring organization, NTL, which is not surprising given what we know about Dr. Burke's motivations and influences.

Professor Burke also led change in the domain of program development by creating new programs and by changing existing ones. At the invitation of Professor Harvey Hornstein, a fellow "survivor" of the NTL Applied Behavioral Science Intern Program, Professor Burke joined the faculty of Teachers College, Columbia University. The "ask" was to bring Organizational Psychology to the Applied Social Psychology Ph.D. Program. This was a significant invitation, especially given the earlier feedback from Dick Beckhard regarding his organizational acumen. The doctoral program's dual emphases on Social Psychology and Organizational Psychology and on research and practice, again, reflects Professor Burke's commitment to making psychology accessible and to holding both scholarship *and* practice as equally important rather than privileging one above the other. The Ph.D. Program in Social-Organizational is "designed for students who desire fundamental education and skill development in the science and application of Psychology to organizations" (http://www.tc.columbia.edu/organization-and-leadership/social-organizational-psychology/academics/phd-program/). The program continues to grow and develop holding dual disciplines of Social *and* Organizational Psychology and maintaining its commitment to scholarship *and* practice.

The Ph.D. program was not the only focus of Professor Burke's leadership initiatives. He also transformed the M.A. program from Personnel Psychology to Organizational Psychology. "The M.A. Program is a scientist-practitioner program that educates students to be experts in the field of organization change, conflict resolution, team building, and more, with a subprogram designed for members of the U.S. Military" (http://www.tc.columbia.edu/organization-and-leadership/social-organizational-psychology/). Again, expanding the mission from "personnel" (individuals) to "organizational" (systems) reflects Professor Burke's belief in the importance of considering all levels of organizational life, enabling a systemic rather than individual perspective.

This broader view is also evident in the "subprogram designed for the military" as Professor Burke's program development did not stop with the Ph.D. and M.A. programs. The subprogram designed for officers of the US Army is the result of a partnership he forged with the Department of Behavioral Sciences and Leadership at the US Military Academy at West Point to create the Eisenhower Leader Development Program (ELDP). The ELDP Program, a modified version of the M.A. program in Organizational Psychology, is designed for officers, whom after completion of the program, will serve as "Tactical Officers for the U.S. Corps of Cadets (TAC) at the USMA, West Point. Those not assigned to be a TAC will return to other responsibilities or deployments within the Army. Those who are assigned as a TAC will be acting as the legal Company Commander of a Cadet Company, comprised of about 130 individuals (undergraduate cadets), and will be the primary developer of military performance for these cadets at the USMA, West Point" (http://www.tc.columbia.edu/organization-and-leadership/social-organizational-psychology/academics/ma-program/eisenhower-leader-development-program-eldp/). As stated by a colonel in the Army, "ELDP is changing the U.S. Military, one leader at a time." The focus on both the military as a whole and the individuals within it, again, reflects the importance of holding a systemic perspective.

Professor Burke's leadership of change via program development did not stop with degree-granting programs; he also created several executive education programs. In the military, his efforts expanded beyond educating Army captains; he went on to create an Army Fellows Program, sponsored by the War College. This program "involves one or two colonels spending a year studying and being mentored by Professor Burke, to study the Army itself as an institution" (http://www.tc.columbia.edu/organization-and-leadership/social-organizational-psychology/) and is another example of his commitment to making psychology, and specifically Organizational Psychology, applicable and accessible beyond the academy. The Benavidez Leadership Development Program (BLDP) for noncommissioned officers (NCOs), a certificate program that complements and supports the Eisenhower Leaders Development Program (ELDP), is another such initiative. While the importance of Professor Burke's work is acknowledged annually with swords and plaques from the Army, 2016 brought Professor Burke a distinct honor. He was awarded the Outstanding Civilian Service Medal Award from the Department of the Army for his work with the US Military Academy at West Point.

Influencing the military is not only an important value of Professor Burke, dating back to his service in the Army; influencing this critical leadership institution also serves the world. Clearly, this has not been lost on the Army.

Two other executive education programs created by Professor Burke also represent his contribution to leading change in the field, namely, the Advanced Organization and Human Resource Management Program (ODHRM) and Principles and Practices of Organization Development Program (PPOD). Warner, Noel Tichy, and David Nadler founded the 3-week Advanced ODHRM program in the mid-1970s to provide education and training to experienced internal human resources and OD practitioners. Initially cosponsored by Teachers College, Columbia University and the University of Michigan's Institute for Social Research (later it was sponsored solely by Teachers College), the program was designed for individuals who were well trained in personal development and group process at National Training Laboratories or through the Tavistock Institute but lacking in content knowledge related to OD. Thus, the program focused heavily on providing opportunities for learning to experienced professionals who came to the program to develop their skills in conducting evidence-based OD interventions in their companies. The curriculum included but was not limited to frameworks and models for organizational diagnosis and change, interventions, and integrating personal and professional identities. The faculty included Burke's peers, leading thought leaders in OD, who collectively offered a premiere OD program in the United States and abroad. The program continued for 30 years, enjoyed maximum enrollments, and extended waiting lists.

Principles and Practices of OD, a program similar to the PSOD Program that Professor Burke directed at NTL, is a 2-week, highly participative learning experience that provides individuals with the core concepts and skills necessary for consulting to organizations and teams. The curriculum focuses on opportunities to learn about group dynamics and organization change and provides opportunities for developing skills through practice. PPOD, also having earned the reputation of a leading program in OD, both in the United States and abroad, continues to be offered annually. Professor Burke is a visiting faculty member in the program and serves as an advisor to the program faculty.

Apparently providing opportunities to learn about organization change to graduate students in Organizational Psychology, military officers, and executives in human resources and OD&C via executive education was not enough as Professor Burke extended his influence to include executives at Columbia Business School. Invited to serve as dean of a program for line and staff executives, Professor Burke designed "Leading and Managing People." The curriculum for this 1-week program includes a focus on organization change, leadership development, and self-awareness. The program continues to this day, and although the name has changed to "High Impact Leadership," the design, curriculum, and pedagogy have held since its inception.

In addition to the "open enrollment" executive education programs, Professor Burke designed and served as dean for custom programs similar to "Leading and Managing People" for organizations in the private and public sectors. While

individuals enrolled in these custom programs, the educational programs were systemic organizational interventions intended to enable senior executives to lead change and establish alignment between the organization's mission and strategy and its culture. Programs were jointly developed by senior leaders of the organizations and Professor Burke with the aim of executing against large-scale strategic objectives such as mergers (e.g., SmithKline Beecham, Dime-Anchor Bank, etc.), culture change (e.g., British Airways), leadership development for engineers and scientists (e.g., NASA), accountants and auditors (e.g., Arthur Anderson), and health-care professionals (e.g., Merck, Novartis, Pfizer, etc.). One of the many organizations that recognized Professor Burke's contribution to leading organization change was NASA, as he was honored with the NASA Public Service Award.

Professor Burke also led change in other domains across the public sector. For example, he was selected to serve on a Blue Ribbon Advisory Panel of health care and innovation leaders that reviewed analyses and assessments performed as part of the Veterans Access, Choice and Accountability Act of 2014. He served on three National Research Councils for the Academy of Science. Often as the only psychologist amongst nuclear physicists and engineers, Professor Burke brought his expertise in organization change and leadership to his work on each of these councils. Understanding organization change was essential to accomplishing the task, and each time, his capacity to make Organizational Psychology practical and accessible made a difference. Learned experts in other fields, "unusual suspects," read his book, *Organization Change: Theory and Practice 4th Edition* (Burke 2014c), and consulted him on projects that were in service of the country as a whole.

Given that Dr. Burke's key contributions include that he was often "first" in a role or "first" to create a program, it seems fitting to acknowledge another "first." In 2004, Dr. Burke was the first recipient of the Academy of Management Distinguished Scholar-Practitioner Award. This honor was in recognition of his enduring commitment to scholarship and practice. Evidence for his pioneering efforts at leading change through scholarship and practice are the enduring institutions that he founded, designed, contributed to, and nurtured across his career.

Enduring thoughts are another component of Professor Burke's key contributions. His research and scholarship fall into three interrelated areas: leadership and self-awareness, learning agility, and organization change. Leadership, the topic of his dissertation, is what he claims, "precedes everything. Leadership is the common denominator." Leadership ignited his passion at the beginning of his career, and leadership is what led to his interest in developing a learning agility instrument, which he claims is his ultimate contribution to the field.

Professor Burke's primary research objective was to verify that self-awareness is positively correlated with performance such that greater self-awareness would be related to better performance. This idea was stimulated by his participation in T-groups at NTL early in his career where he witnessed firsthand the impact of those with, and without, self-awareness. He encouraged Allan Church to pursue this idea in his dissertation, and in fact, Church found that high performing managers had greater self-awareness than average performing managers, with

self-awareness defined as congruence between self-ratings and direct reports' ratings on a multi-rater assessment (Church 1997). Church's dissertation emerged from his work with Professor Burke in the doctoral program and as one of his staff members at Burke Associates, a consulting firm that Burke founded. Burke Associates had a dual purpose: providing consulting services and leadership development programs to organizations and training doctoral students in multi-rater feedback, personality assessments, and designing leadership development executive education programs.

Not only was Professor Burke pleased with the results of Church's study but also the relationship between self-awareness and leadership performance is what later catalyzed his interest in learning agility. From his consulting work with executives, he could see that those who were the best leaders were also the ones that could continuously learn; it was similar to the relationship between self-awareness and leadership performance. The correlation between learning agility and leadership effectiveness made sense to him based on his prior research and his consulting experience, but he needed an adequate measure to test this idea. As a result of a 5-year quest, he, along with his doctoral students, created a learning agility assessment, the Burke Learning Agility Instrument (BLAI), now managed by EASI Consulting, and in the process of being validated.

His work on organization change is best captured in his highly regarded text, *Organization Change: Theory and Practice*; (Burke 2017). While each chapter in the book reflects a key contribution to organization change, the focus here is on the Burke-Litwin Model of Organizational Performance and Change (Burke and Litwin 1992) as one of Burke's enduring thoughts.

Burke's commitment to scholarship and practice is evident in how the Burke-Litwin Model was developed. In Burke's own words: "The model as conceived of today actually emerged from practice, that is as a consequence of trying to understand more about how to bring about change at BA (British Airways, parentheses added). The organization change at BA was at the time initiated by a decree from the prime minister of Great Britain, Margaret Thatcher . . . BA, in order to survive, had to change. Every nook and cranny of the organization was affected, especially at the outset, BA's mission, business strategy, leadership and organization culture" (Burke 2014c, p. 224).

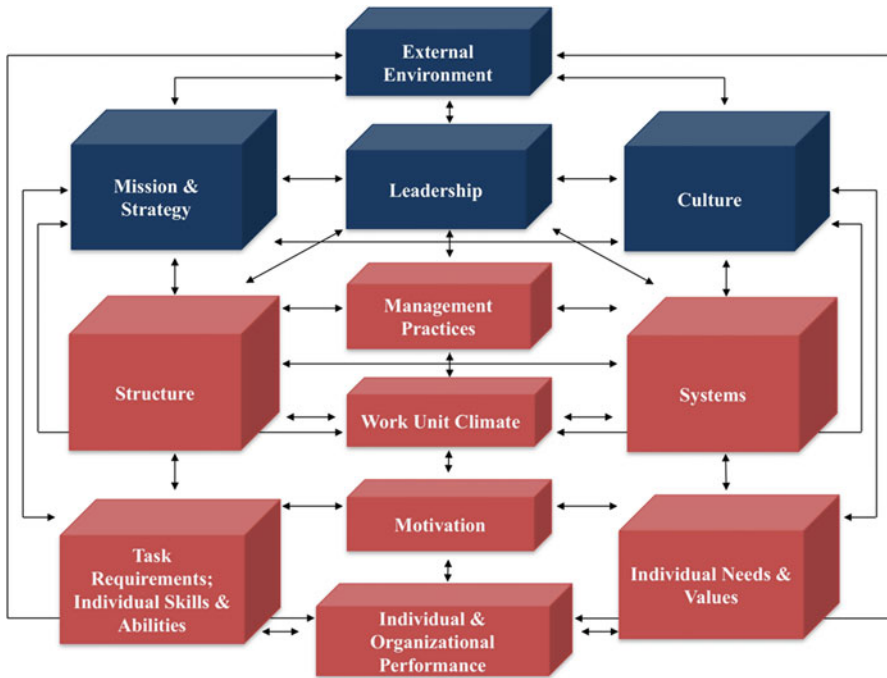
As can be seen in Fig. 1, the factors mentioned by Burke in his work with BA, External Environment, Leadership, Mission and Strategy, Organization Culture comprise the transformational factors in the Burke-Litwin Model, the variables directly linked to revolutionary change. Management Practices, Structure, Systems, Work Unit Climate, Motivation, Task Requirements and Individual Skills and Abilities, Individual Needs and Values, and Individual and Organizational Performance comprise the transactional factors, more likely to bring about evolutionary change. While the factors are categorized into Transformational and Transactional clusters, the model is informed by open systems theory (Katz and Kahn 1978; Von Bertalanffy 1967) with the external environment considered input, individual and organizational performance considered output, and all other factors considered throughput.


**Fig. 1** The Burke-Litwin model. *External environment, mission and strategy, leadership, and culture comprise transformational factors; structure, management practices, systems, work unit climate, motivation, task requirements; individual skills and abilities, and individual needs and values comprise transactional factors

The Burke-Litwin Model for Organizational Performance and Change has been used extensively across industries, sectors, and geographies for consulting, research, and curriculum development in academic and executive education programs. Its distinguishing feature, including the external environment inside the framework, contributes to the model's relevance to organizational clients and allows for changes in contemporary organizational life to be incorporated into the stories told through the model. While the New Insights section of this chapter includes an expansion of the Burke-Litwin Model, in its original conception, the model remains an enduring thought of W. Warner Burke (and his collaborator, George Litwin). For more on the model and the extensive research, theory, and practice that support it, see Burke (2017, Chap. 10).

## New Insights: Enduring Institutions and Thoughts, Evolve

Professor Burke's work has led to a plethora of new insights. In addition to the 150 articles he has authored and the 20 books he has authored or edited, there are almost four decades of doctoral students whose dissertations he has chaired; many post-docs and Army Fellows and executive students, whose work he has supervised.

As a faculty member in Organizational Psychology at Teachers College, I can attest to how my work has been influenced by Professor Burke and has led to new insights. My "new insights" include integrating systems psychodynamics and organization development; creating a tool, "*Beneath the Surface of the Burke-Litwin Model of Organizational Performance and Change*," (Noumair et al. 2017) and founding the Executive Master's Program in Change Leadership at Teachers College, Columbia University. New insights emerged for Professor Burke as well. The case of failure that we worked on together led to his recent work on leading change and consulting to change leaders in loosely coupled systems; the work on the new tool, "*Beneath the Surface of the Burke-Litwin Model of Organizational Performance and Change*" led to an expansion of his model; and the Executive Master's Program in Change Leadership has provided opportunities for him to influence another demographic group – executive students across geographies, industries, roles, and functions.

The "failure" that led to new insights is discussed in the case of transforming the A. K. Rice Institute for the Study of Social Systems (Noumair, Winderman & Burke, 2010). The failure to attend to what was occurring unconsciously and irrationally contributed to halting and undoing an organization change initiative. As discussed in the paper, learning emerges from cases of both successes and failures in organization change. This failure led to integrating systems psychodynamics a framework for understanding organizational life by attending to covert dynamics that occur beneath the surface, and organization development.

Burke, having linked the failure in the A. K. Rice case to treating the organization as if it were a tightly coupled system, could not rest until he developed a deeper understanding of loosely coupled systems (Burke, 2014a; 2014b). His work in this area is relevant to contemporary organizational structures such as networks, which require us to adapt our skills, tools, and mindsets. With this aim in mind, Burke integrated organization change foundations with Weick's work on educational institutions (Weick 1976) and learning that has emerged from organizational network analysis (Battilana and Casciaro 2012; Cross et al. 2013) to create a new path forward for consulting to loosely coupled systems.

Building on the learning from the A. K. Rice Institute case, I consulted to an organization culture change initiative that successfully integrated systems psychodynamics and organization development (Noumair 2013). Employing the Burke-Litwin Model in combination with psychodynamically oriented consulting guided the client organization through a change process that resulted in culture change as well as successful leadership succession.

Now having both a failure and a success to learn from, I extended the integration of these perspectives by adding to the Burke-Litwin Model a framework for conceptualizing covert aspects (Burke and Noumair 2015). This framework, beneath the surface of the Burke-Litwin Model, provides a multidimensional view of organizations, linking covert dynamics of organizational life to the more rational aspects represented in the Burke-Litwin Model (Burke and Noumair 2015). Further development of this framework led to the tool, "*Beneath the surface of the Burke-Litwin*

*Model*," (Noumair et al, 2017). By theoretically linking covert dynamics specifically to overt factors by organizational level, the tool provides OD&C practitioners with a systemic perspective and facilitates the development of a comprehensive organizational diagnosis.

New insights in the area of program design, development, and delivery have also emerged from Professor Burke's enduring institutions. Having joined the core faculty of the Advanced ODHRM Program, the leading and Managing People Program, and numerous executive education leadership development programs, created and directed by Professor Burke, I was well equipped to create the Executive Master's Program in Change Leadership (XMA) (http://www.tc.columbia.edu/leadchange), a transformation of the Advanced ODHRM Program, discussed earlier. The new insights are not solely apparent in the design, curriculum, and pedagogy of XMA but also in the inception of the program. If we were going to close the Advanced ODHRM Program, a program founded by Burke and colleagues that had been in existence for 30 years with a stellar reputation (but participants were clamoring for a degree program), the plan had to be data based, and the transformation needed to be informed and executed according to the principles of organization change. Thus, having followed the phases of organization change and applied research, the Executive Master's Program in Change Leadership was launched. We are currently working with our seventh cohort. Warner Burke, Bill Pasmore (also featured in this book), and I are the core faulty. XMA is an innovative program, an institution that emerged from one of, Professor Burke's key contributions.

## Legacies and Unfinished Business: Enduring Work of a Learner, Leader, Scholar-Practitioner

### Learner

In the introduction to this chapter, Warner's high score on the Learning Approach dimension of the Hogan Personality Inventory was mentioned as evidence of his being a lifelong learner in and out of the classroom and that learning fueled his research and scholarship in OD&C. One legacy that captures his lifelong love of learning is his development of the Burke Learning Agility Inventory (BLAI), a culminating research project that is both a legacy and an ongoing piece of work that, for now, can be placed in the category of "unfinished business." While the BLAI is being used for leadership development across industries, ongoing validation studies are underway with a wide range of populations. It is noteworthy that Professor Burke has set conditions for the use of the BLAI such that he is bequeathing to the Social-Organizational Psychology Program at Teachers College all profits from sales of the inventory. This act of generosity ensures that learning from the learning agility instrument contributes to generations of learners and learning.

## Leader

As a leader, one component of Dr. Burke's legacy is the impact he has had on the growth and development of the profession of organization development and change. Not only has he contributed in significant ways as described throughout this chapter – at NTL, in the OD Network, in three academic institutions, through multiple editorships, consulting to organizations in the private, public, and not-for-profit sectors – he has also served as a historian and commentator on the field and, in so doing, has co-created the identity of the field of Organization Development and Change. His professional identity and the identity of the field are intertwined.

The role of "leader" also includes educator as Dr. Burke's leadership of the field extended to his role at Teachers College as the leader of the Social-Organizational Psychology Program writ large for over 35 years. Thus, his legacy is carried by the wide range of students and alumni from the Social-Organizational Psychology program, the organizations and institutions to which they belong, and by the participants in the numerous OD and executive education leadership development programs across sectors and geographies.

Two stories capture how former students are carriers of his legacy. First, in 2007, Teachers College hosted a celebration in honor of Professor Burke for receiving the SIOP Distinguished Professional Contributions Award. The event was filled with alumni, current students, faculty, and administrators – past and current, colleagues in the field, clients, etc. Someone commented on the far-reaching impact of Professor Burke as he had not only influenced the individuals in the room but also through the individuals in the room, influenced their colleagues, students, and organizations. To quote Vera Vitels, a former student of Warner's and Senior Vice President of Talent and Development, Thomson Reuters, when she looked at the guest list, she said: "it's a multi-generational family reunion in which Warner is the link to everyone!"

More recently, the responsibility for carrying the legacy has been made explicit to students. Each year on the first evening of the Executive Master's Program in Change Leadership, Professor Burke gives a fireside chat on the history of the field and the history of the Socio-Organizational Psychology Program at Teachers College. The session has a dual purpose: to provide context for the work in the program by sharing a timeline of significant events in the field and to invite students to join the timeline by seeing themselves as carriers of the program's legacy. Students are humbled and honored to add themselves to the timeline. They willingly accept the responsibility to carry on the values and the learning offered to them by Professor Burke.

## Scholar-Practitioner

A painting hanging in Professor Burke's office, commissioned by a retired colleague, Professor Lee Knefelkamp, is entitled, "The Diagonal Man," as she viewed him as bridging theory and practice, neither vertical or horizontal" (Levine 2015). The painting followed a semester in which Professors Burke and Knefelkamp

co-taught a double-seminar, "Organization Change: Theory and Practice and Teaching to Cognitive Complexity" in order to address the theory-practice gap they perceived amongst students.

"The Diagonal Man" aligns with how Professor Burke views his identity, that of holding "a duality of scholar-practitioner and social scientist-applied psychologist" (Burke 2015, p. 35). The image captures an important dimension of his legacy, that of boundary spanner, holding multiple dualities seamlessly. Professor Burke is known for integrating research, theory, and practice; literature from wide-ranging disciplines, many of which are not usually integrated; leadership, self-awareness organization change, and learning agility; and, teaching and learning; all in service of creating enduring scholarship and practice to ultimately increase the success rate of organization change. As quoted by Burke in his Organization Change textbook (Burke 2014c, p. 375)): "Nothing endures but change" (Hercalitus (540–480 BC). I would add that W. Warner Burke's life's work as learner, leader, scholar-practitioner also endures.

## Conclusion: His Story Continues

W. Warner Burke, learner, leader, scholar-practitioner. . . although he has said that he "does not need to lead anything else anymore" (Burke 2015, p. 32), his behavior belies this statement, and for that, the field of Organization Change and Development as well as the individuals and organizations in *his* world, and *the* world, are grateful. As W. Warner Burke continues to learn, lead, and engage in scholarly practice and practical scholarship, his thoughts and his story endure.

# Bernard Burnes: Choices, Contexts, and Changes

Bill Cooke

**Abstract**

This chapter sets out the contribution of Bernard Burnes, currently of Stirling University Scotland, as a "great" in the theory of change management. The connection between his personal career, his life experience, and his approach to change management is set out – particularly his commitment to democratic and humanist values in the management of change and the belief that there is no "one best way" when it comes to change management and particularly that top-down change can cause more problems than it solves. Burnes' particular contributions are discussed. He is "primus inter pares" in Kurt Lewin studies, discovering, reassessing, and integrating Lewin's work and attempting to complete the Lewinian project. He is the sole author of a leading textbook on change management, over a number of editions, which have seen his text incorporate and expand the major change issues of the day. And his work which draws together and theorizes the relation between leadership and change is set out. Burnes' influence is considered quantitatively, in terms of citations and downloads – but also intellectually. In key areas of change management, Burnes has been a pathfinder. His ongoing commitments to addressing the major problems of the world, particularly in relation to the environment and sustainability and the approaches to social changes that are required draw the chapter to its conclusion.

## Contents

## Introduction

In the spirit of disclosure, and also of the reflexivity which has informed my own change management practice, I begin by explaining my acquaintance – and friendship – with Bernard Burnes. I first met Bernard in 1997–20 years ago, I realize – when we moved to the Manchester School of Management at University of Manchester Institute of Science and Technology (UMIST), where he had been since 1985. Initially he was simply that wise contributor to faculty meetings, the person to whom many deferred irrespective of status, and the man with a dry sense of humor. Only after a couple of years did I realize that this guy in the org psych group (I was in org studies) was the "Burnes, B" whose work overlapped with mine and which I respected deeply. It took a while, even then for us to work together, which we have done successfully (e.g., in Burnes and Cooke 2013, 2015), while each maintaining our own separate research and publication interests.

We also have a more personal connection. My sister's son, my nephew George Cooke, is severely autistic as is Bernard's son, Stuart. The two families lived near each other and got to know each other through their sons. Stuart received his diagnosis when he was two, in 1993. This was just after Bernard's other son, Duncan, had a heart transplant. As he and his wife Sue are wont to say, 1993 was not the best of years. This family situation explains why Burnes rarely appears at conferences and also why he moved from Manchester to Stirling in 2013. Burnes' main priority is always his family.

What follows is based on the close readings I have given his work over the years, the discussions about it that we have had, and more recent interviews with Burnes designed to generate data for this chapter.

## Influences and Motivations: Mapping the Field

Given Burnes' own commitment to understanding the history of change management and its relevance today, it is appropriate to situate his work alongside his personal background. Burnes was born in 8 into a working class family in Sheffield, England, then famously a thriving industrial center built on steel production and surrounded by a hinterland of coal mines. In 1968, as children of his background did, he left school aged 15 and went to work as an engineering apprentice. Completing this 5-year apprenticeship, he became a draughtsman

and then a design engineer. In the UK, as elsewhere in Europe, the 1970s were years of high inflation, high unemployment, and the collapse of the traditional industries. Sheffield's steel, engineering, and coal industries were particularly badly hit. Not only did this give rise to industrial conflict, the collapsing economy saw extensive cuts in public services and consequently campaigns of social action to reverse them. The 1970s also saw the rise of extreme right-wing political parties in the UK, seeking to turn working class disaffection to ugly ends. Burnes played an active role fighting the rise of extremism, the loss of jobs, and cuts to public services, through trade union and community campaigning. These years shaped his personal and political views, which fed into his work as a change management "great" in the form of three questions, which he still often poses:

1. How come when organizations are in trouble and need to change that it's the people at the bottom who are seen to have caused the problem and are judged to be the obstacle to its the solution?
2. How come when governments cut spending, it is always the poor, the unemployed, the disadvantaged, and the immigrants who bear the brunt of the cuts and who are blamed for the need to make the cuts?
3. How come we haven't found a better way of managing our public and private organizations and our communities so as to avoid conflict rather than seeming to promote it?

Anyone who is familiar with Burnes' work will recognize these are questions that run through it and which have, if anything, become more strident over time. In 1979 Burnes decided the time was right to go to university, and he enrolled at Sheffield University to study economic and social history. He did not have the formal qualifications that were required for admission, but did not see that as a problem. To their credit, neither did the authorities at Sheffield University, notwithstanding its prestigious standing in the UK. It was to his, and our, subsequent advantage that Burnes' degree was in social and economic history, helping him understand empirically and methodologically how the world around him came into being, and why it behaves as it does. Burnes still believes his was a wise choice, speaking fondly of what he learned and the people who taught him. They did not seek to spoon-feed students or give them easy answers. Instead, using pedagogy with which those of us in change management will identify, they saw their role as to make students think and to motivate them to learn for themselves. Burnes gives the example of one course that was taught on alternating weeks by a liberal historian and a Marxist historian. Both knew their subject well, both were excellent orators, and both views seemed equally valid and equally convincing. From this, Burnes took the key lesson that still lives with him: you cannot understand a situation merely from looking at it from one perspective. Regardless of your personal views or beliefs, you have to look at an issue or problem from all sides, studying it through multiple lenses. After all, as he says, reversing the familiar axiom associated with Ed Schein, "If you can't understand a situation, how can you change it?"

A particular intellectual influence from this time was the work of the noted historian Eric Hobsbawm. In three books – *The Age of Revolution* (1962), *The Age of Industry* (1975), and *The Age of Empire* (1987) – Hobsbawm covers almost 200 years of economic, industrial, and social history in breadth but with simultaneous detail. Hobsbawm used detailed primary and secondary sources to build up a picture of major trends and movements that have shaped how we live and think today; and one can see the historiographical (i.e., the writing of history) influence of Hobsbawm in much of Burnes work on the history of change management.

Completing his degree in 1982, he was unable to find a funded history PhD program. At the advice of a tutor, he embarked on a PhD in organizational psychology at the prestigious Medical Research Council/Social Science Research Council Social and Applied Psychology Unit (SAPU) at the University of Sheffield. The title of his thesis, which he completed in 1985, was *The Impact of New Technology on Job Design and Work Organisation* (see Burnes 1988). In essence, it was a study of change: why it happens, how it happens, and what its consequences are for those involved. This a was strange time to be studying change sandwiched as it was between the publication of two highly influential books: Peters and Waterman's (1982) *In Search of Excellence: Lessons from America's Best-Run Companies* and Pettigrew's (1985) *The Awakening Giant: Continuity and Change at ICI*. Though they offered radically different perspectives on organizational change, both derided extant approaches to its management, particularly organization development (OD). Despite the founding presence of the Tavistock Institute of Human Relations (Burnes and Cooke 2015), OD had had little extensive support or understanding in the UK, which is not to say it was without its advocates and exemplars.

The 3 years that Burnes was researching his PhD, therefore, was a period where there was no dominant theory of change, no single change management orthodoxy. It was also a period, therefore, where almost everyone working in the field around Burnes – students, academic researchers, and consultants – appeared to possess and advocate their own singular, "one best way" of change management. Burnes response to this reflected his training as a historian and was to review and reassess those theories associated with organizational psychology which tried, in part, or in full, to explain how organizations develop, are managed, and change. Central to these were classical, human relations, and contingency schools of thought.

The ideas and insights derived from this work still influence his work today. They include:

1. From their inception in the Industrial Revolution, conflict in modern organizations between "management" and "employees" has been endemic (Pollard 1965).
2. Organizations are social systems in which authority flows from the bottom up, and not the top down – managers have authority conceded to them by their subordinates; they do not impose it (Barnard 1938).
3. Organizations can design good and bad jobs, but the choice between the two relates more to managers' desires for control than to improve quality or productivity (Davis and Taylor 1972).

4. It is possible to identify factors that *should* be taken into account when deciding on a structure for a particular organizations, but the choices made may have more to do with the interests of managers than with the goals of the organization (Burns and Stalker 1961; Hendry 1979, 1980).
5. Whether managers choose to use directive (Theory X) or participative (Theory Y) style of leadership usually has less to do with the managerial challenges they face and more to do with their own psychology (McGregor 1960).

These five intellectual principles are reflected in much of Burnes work. This is evident in the final paragraph that has remained in successive editions of his book *Managing Change*, but articulated best in his article *No such thing as . . . a "one best way" to manage organizational change* (Burnes 1996a, p. 17):

> [Change] is about the exercise of choice: choice in terms of what to change, choice in terms of the circumstances under which the change takes place and choice of the approach adopted. It follows that the presence or absence of choice is no mere idle academic speculation; instead it lies at the heart of all major decisions in organizations. To ignore the presence of choice or not even to recognize its existence means taking decisions by default, and thus possibly missing major opportunities for increasing an organization's competitiveness. In its most extreme form, it is a failure of management which can even lead to the demise of an organization.

After he finished his PhD, he took up a post at UMIST, the UK's pre-eminent Org. Psych. School, where he stayed for some 28 years, before emigrating to the University of Stirling in Scotland in 2013. There Burnes continued his study of change. He worked for many years as an adviser to the UK Government's National Economic Development Office, (NEDO) which sought to bring together representatives of government, employers, and trade unions to shape economic and industrial policy. Having spent a large part of his working life as an employee and student, looking at organizations from the bottom up, he now found himself working with senior managers to bring about change. This access gave him a rich understanding how senior managers thought and worked, presented in (e.g.,) Burnes and Weekes (1989).

Equally important was the period when he began to study seriously the work of Kurt Lewin and the development of OD. Lewin died in 1947, and the common view in the 1980s was that his work was outmoded and inapplicable to a world that was changing in a rapid unpredictable manner. Like most of us, he first encountered Lewin through secondary sources, most of which were uncomplimentary. However, he also came across other texts (notable French and Bell 1984; Huse 1980) which took a distinctly different and far more favorable view of Lewin's work. The historian in him knew he would have to go to original primary sources in order to resolve this difference of opinion over Lewin. So, Burnes began to read Lewin's work for himself and through his own intellectual lenses, rather than relying on other people's opinions. In the intervening 30 years, Burnes has become one of the foremost experts on Lewin and has done much to re-establish him as a leading and still relevant figure in the development and practice of organizational change. In

particular, Burnes argues that Lewin's commitment to resolving social and organizational conflict through an ethical and participative approach to change are as relevant today as they were in the 1940s (see Burnes 2017).

Before moving one to consider more of Burnes work in depth, we should not that Burnes often says that the factor that motivates him the most is an awareness of the depth of his own ignorance (these are, I would stress, words Burnes frequently uses of himself); this is the Socratic proposition that we cannot learn until we recognize how deep our ignorance is. For Burnes, the field of change is so vast that the more one learns about it the more one realizes how ignorant of it one is. In essence, he says of himself, the more I learn, the more my ignorance grows. For some, this would be demotivating. For others, it would justify focusing on one part of the field to the exclusion of all others. For Burnes, it drives him on in his attempt to understand and map out the entire field, even knowing that this is an impossible take. That he makes progress in this endeavor can be seen across the seven editions of his book, *Managing Change*, the first of which appeared in 1992.

In sum, the keys to Burnes work are a strong belief that scholars should work to improve the world and not just study it; that societies, communities, and organizations become dysfunctional when they have too little democratic participation, rather than too much, and that the field of change is broad, multidisciplinary and has to be based on rigor in breadth and depth, on and relevance.

## What Makes Burnes a Greaat: Lewin, Managing Change, and Leadership

In a career spanning more than 30 years, Burnes has written 30 books, more than 60 journal articles and some 50 book chapters. These primarily cover and map out the field of organizational change. In order to do so, his work embraces not only the main change theories and practices but also the history of organizations and organizations thought, postmodernism, critical realism, complexity theories, strategy, leadership, and more. Thematically, there are three particularly important sets of contributions particularly important: his work on Lewin and the history of OD; his ongoing attempts to map out the field of change, especially in his book *Managing Change*, and finally his contribution to the debate on leadership.

**Kurt Lewin (1890–1947)** Writing as someone who has published extensively on Lewin and his circle myself (e.g., Cooke 2006, 2007), Burnes' contribution to Lewin scholarship cannot be overstated; indeed Burnes has, in my view, been responsible more than any other individual for peer-reviewed work which rehabilitates Lewin's reputation and which brings his actual work (rather than secondary and partial accounts thereof) to a new generation of students, scholars, and practitioners. As noted, when Burnes first started to seriously examine Lewin's contribution to change, the view of many writers was that his work was no longer relevant. Rosabeth Moss Kanter, herself a change management great, declared that she did not know why Lewin's work had ever been taken seriously (Kanter et al. 1992).

In contrast, even in the first edition of *Managing Change*, Burnes (1992) drew attention to Lewin's role in laying the foundations of change management theory and his importance for contemporary practice. Unlike French and Bell (1984), which also emphasized Lewin, Burnes' book was for a more general managerial audience, with an interest in change management in a broad sense, rather than the specialist particularly interested in OD.

As he continued to study Lewin's original work, Burns recognized that it was more complex, insightful, and relevant to the needs of contemporary organizations than most commentators at that time gave him credit for. Burnes faced three main obstacles in coming to this conclusion. First, in the pre-Internet age, identifying and obtaining material that was written in the 1930s and 1940s were very difficult. Apart from two out of print collections of Lewin's articles (Cartwright 1952; Lewin 1948b), Lewin's work was scattered across a great many publications, some quite obscure. In addition, Lewin's correspondence and unpublished papers, insofar as they were available, were in archives in the USA and so difficult to get at for a UK-based academic. Second, Lewin's writing and thinking are not easy to follow, as even his friend, patron, and biographer Alfred Marrow (1969) acknowledged. This may account for why so few commentators, including his critics, appear not to have read it. Thirdly, though Lewin's work on field theory and group dynamics is relatively prominent in his writings, other concepts such as action research are less well explained and reference to his three-step model of change is especially difficult to find. Burnes says, for example, that it was only in the last few years, when he began reading Lewin's work on child psychology, that he came to understand where the three-step model had come from and the substance underpinning it.

Burnes often says to his students, "early death is always a mistake for a scholar." In Lewin's case, alongside the personal tragedy and his loss as an institutional leader, its intellectual consequence was that he never brought the various elements of his work together nor had he fully developed some of its key components. Burnes' major contribution has been to create that coherent whole and demonstrate how Lewin's component contributions fit together. In so doing he has dispelled much of the ill-informed critique of Lewin and helped reinstate him as the major figure in the development of change management theory, with continuing relevance for the "here and now" of today.

Reviewing the seven editions of Burnes' *Managing Change*, between 1992 and 2017, shows how Burnes went from drawing attention to Lewin's role in laying the foundations of organizational change as a discipline to presenting Lewin's work as a rounded and coherent whole and setting this within the broader context of the nature and development of organizations. This logic is also present in a sample of the papers he has authored over the last 20 years. The (1996) paper *No such thing as . . . a "one best way" to manage organizational change* really began Burnes' process of restoring Lewin as a major and still relevant figure in the field of change. However, it was Burnes' (2004a) paper *Kurt Lewin and the Planned Approach to Change: A Re-appraisal* that can claim to have set the seal on Lewin's rehabilitation. This brought together and explained the hitherto disparate elements of Lewin's work but also, and significantly, comprehensively refuted the main criticisms of that work.

The paper was downloaded nearly 9000 times in its first year, was judged to be one of top 50 management articles in the world in 2004, and still receives over 100 citations a year. In the same year, Burnes (2004b) showed that rather than being outmoded, there were strong links between Lewin's conception of change and that put forward by those working in the emerging field of complexity studies. Burnes' (2007) paper on the origins of OD showed how it was inspired by and built on Lewin's work. In *Reflections: Ethics and Organisational Change – Time for a Return to Lewinian Values*, Burnes (2009) challenges the ethical basis of contemporary perspectives on organizational change. He argues that many scholars, by their misunderstanding of Lewin and adherence to a power-politics perspective on change, often implicitly and sometimes explicitly encourage unethical behavior. Hence Burnes' call for a return to Lewinian values. Perhaps his most comprehensive examination of Lewin's importance and continuing relevance can be found in a paper we co-authored: *The Past, Present and Future of Organization Development* Burnes and Cooke (2012), which, inter alia, comprehensively shows the central role played by Lewin in OD from its inception to the present day.

*Managing Change*   Generations of students, not to say scholars and practitioners, have been brought up on this book. In seven editions spread over 25 years, it has developed from being a relatively useful overview of the field to being a comprehensive and far-reaching examination of the history, current state, and extent of organizational change. Indeed, as most change scholars recognize, it is both a textbook and a reference work. If you want to know something about particular aspect of change, *Managing Change will be your first port of call, knowing it is the most likely source of relevant knowledge.*

When asked why he wrote the book and why he keeps producing each new editions, Burnes offers (typically) two alternative answers, depending on the audience and how he feels at time. He tells the story of the student who asked him if he had read all the 1700 or so references in its *Bibliography*. He replied, "Yes I have, but I've forgotten most of them, that's why I needed to write the book." The book, in one version, was designed as a personal aide memoire to bring together the work he had done and to Socratically remind him of how much he still needed to do. It is a constant reminder of how big his field of study is, how little he knows, and how much work still remains to be done. The second version is that he wrote the book that he would have liked to have had when he undertook his own doctoral study; and my own experience as a doctoral supervisor is that there are many newly minted PhDs who are grateful that he did.

The most recent edition of the book is a tour de force. It ranges temporally from the prehistory of modern organizations some 4500 years ago to the challenges that sustainability poses for organizations and those who would lead them today. It covers the main organization theories and the central perspectives and debates on organizational life, taking into account how organizations interact with the rest of society. Distinctively, compared to other change management texts, it also covers and integrates strategy to the received corpus of change theories and practices. And it finishes by examining leadership and how it relates to change. Reflecting Burnes

commitment to rigor deriving from his undergraduate historian days, his Socratic ethos, and perhaps even his prior profession as an engineer, each of the chapters is a work of detailed scholarship in and of its own right. I frequently use his final chapter, *Management, Leadership and Change*, as a set reading for my students, believing it provides as thorough coverage of the topics as one might find in other entire books. Yet at the same time, the chapters work together and are integrated as a coherent whole.

Overall, the books provide a comprehensive, compelling, and integrated picture of the field of change, which, with its thoroughness, its strong historical orientation, and its integration of the strategic point of view, set it apart from other books on change management. By its third edition (2000), the distinguished change scholar Dexter Dunphy endorsed it thus:

> Burnes's new book is a thorough revision of what was already the best general text on organisational change.

Another, and important distinctive feature is that, uniquely in change management as far as I am aware, all seven editions of the book have been single-authored, that is, been written by Burnes alone. This clearly makes the authoring task that much harder and will have been particularly hard to sustain over 25 years. Yet the success with which it has been carried out has enabled Burnes to develop an understanding of change management driven by his personal history and experiences, his values and principles, and his commitments to rigor, which redounds to the benefit of the change management community – student, scholar, and practitioner – as a whole. Also he doesn't have to share the royalties.

**Leadership**  I believe it fair to say that while most change scholars recognize the connection of leadership to change management, they tend to deal with it as a side issue best left to specialist leadership scholars. Not so for Bernard Burnes, hence, in a series of papers and books he makes significant contribution to understandings of the relationship between leadership and change and, moreover, of leadership itself, particularly its ethical dimensions. Burnes is not a critic of leaders and managers per se. Rather he seeks to understand and explain why leaders behave as they do and how more responsible and effective leadership can be developed. Again, we can see his formative work and research experiences embody in this endeavor. One of his earliest papers on leadership was *Managerial Competence and New Technology: Don't Shoot the Piano Player – He's Doing His Best* (Burnes 1991). Here he showed that poor managerial decisions were often resulted less from a lack of managerial competence or care and more often arose from the context in which managers worked. Essentially, sometimes circumstances prevent managers from being be competent and can even force them to be incompetent. His (1998) landmark paper *Recipes for Organisational Effectiveness: Mad, Bad, or Just Dangerous to Know*, argued that popular and influential writers on leadership, especially Tom Peters, encouraged arrogant leadership and promoted radical and unproven strategies for organizational change; inter alia Burnes here became one of the first to contest the

case for transformational leadership. *Negative Behaviours in the Workplace: A Study of Two Primary Care Trusts in the NHS* (Burnes 2007) shows how lack of effective oversight of managers leads to a situation where widespread bullying by manager and others can become the norm. In Burnes and By (2012), he argues that we cannot have effective leadership in organizations without also having ethical and participative leadership; and Burnes et al. (2016)'s *Reimagining Organisational Change Leadership* is his most trenchant attack on current leadership practices. In it he argues that the seriousness of the challenges and responsibilities facing organizations is such that a new form of leadership must be reimagined. This, he argues, should put ethical behavior and the needs of all stakeholders at its core.

The nub of Burnes' argument, which like much of his work has gestated over two-and-half decades, is not simply that unchecked power does corrupt; it also creates situations where leaders are not challenged, to the extent that the information and advice they receive is partial and biased, leading to poor decision-making. Going back to his admiration of Barnard (1938), Burnes believes that leaders have the power we allow them to have and that they behave as they do because we allow them to. If we want leaders who act ethically and effectively, in the interests of all stakeholders, participative decision-making and the widespread involvement of all those stakeholders are required. As he increasingly states, in a world where sustainability is the prime concern, where organizations need to balance the interests of "People, Planet, and Profit," meaningful stakeholder inclusion in decision-making is a necessity. In essence, he argues for participative management writ large.

## Key Insights: Drawing Together Burnes' Canon

Following Burnes' own approach to Lewin for Burnes himself of trying to piece the elements into a whole is difficult but worthwhile. Here I pick out what I think are four particular "meta" contributions of Burnes' canon of work.

First, before Burnes began studying change, the field was fragmented. Individual theorists and schools of thought paid little attention to one another or to their own theoretical and practice roots. Some were better than the other, but even the best tended to focus on their "one best way." Even the better contributions tended to focus on one particular approach to change – assuming or claiming that they had discovered the "one best way to manage change" and that all other approaches were wrong. Burnes has not only catalogued the variety of the species of change management, but their relation to one another, where it exists, and the situations in which each is best used (and equally importantly, best not used). Moreover, he has in addition shown that we cannot understand change simply by looking at change. As his work shows at almost every turn, we need to view it within the context of the historical development of organizations, the contemporary needs of society, the range of organization theories, as well as having an appreciation of the role of strategy and leadership. His integrative work in making this contribution has been thorough, unremitting, and sustained. It is, by itself, more of a contribution than this author could ever hope to have made.

Secondly he is primus inter pares among Lewin scholars. Many of us have sought to rethink his contribution, to situate it in its particular historic time, and/or to revise understandings of its relevance for present-day change management. I have had the honor with working together with Bernard Burnes on this project (e.g., in Burnes and Cooke 2015). But Burnes alone has single-mindedly led the drawing together – the reassembly and the reconstruction, however one may term it – of Lewin's contribution to our field past, present, and future (Burnes 2004a; Burnes and Cooke 2012, 2013). He has enabled us to see Lewin's work in the round, to understand how his various elements of planned change fit together, and why they need to be used in unison. His is no hagiography, however. He has shown where Lewin's work still needs to be developed and the areas where Lewin appears to have taken a wrong turn. Ethically, by bringing out the humanist-participative foundations principles of Lewin's work, he challenges those who advocate a power-politics approach to change. In so doing, he provides support for those contesting manipulative and directive approaches to change who find themselves accused of unworldliness or naïvete.

Third, connectedly, Burnes restores the ethical dimensions of change management. Burnes' PhD completion in 1985 coincided with birth of processual approaches to change management (notably Pettigrew 1985). Burnes maintains that in overfocusing on the political and manipulative change, some processualists might legitimize unethical change management (Burnes and By 2012). To reiterate, the case for ethical behavior and ethical change is one that Burnes has been making for many years. For him, the 2008 financial crash underlined the ethical shortcomings of transformational leadership and its encouragement of unfettered managerial power. In its place, Burnes makes the case for ethical leadership and ethical change; again if "People, Planet, and Profit" are to be aligned, this can only be done when ethical principles are given primacy (Burnes et al. 2016). This view may now be commonplace, but Burnes has been making its case and demonstrating how it can be realized with unwavering commitment from the 1990s onward.

Fourth, and last, in exploring the link between choice and commitment, Burnes has constructed a strong, positive case for participative change, participative leadership, and value alignment that goes beyond simplistic claims for effectiveness of outcome. In a series of articles, he demonstrates that involvement in the change process, through mechanisms as ostensibly diverse as action research and kaizen, permits those affected by change to shape its outcome. This case is supported empirically by Burnes' systematically drawing on a wide range of research sources (as we by now would have expected) which show that commitment to change processes and their effectiveness in short and long term is strongly linked to the level of employee involvement (Burnes 2009, 2015; Burnes and By 2012; Burnes and Jackson 2011). Burnes goes on to show that participative change cannot be achieved unless organizations operate under participative leadership. In essence, he argues that the values underpinning an organization's approach to change and the values underpinning how it is led need to be aligned (Burnes and Jackson 2011). Relating change to choice, leadership, and value alignment provides an important and novel way of understanding and managing change.

In any "slicing of the cake" of a scholars' work like this, there are of course other ways of thematizing and prioritizing. This, however, is my view as a fellow traveler of Burnes' in the theory and practice.

## Legacies and Unfinished Business

As might be expected of someone immersed in the life and work of Kurt Lewin, Burnes speaks often of what he thinks is unfinished business and speculates on his own legacy. If he retired tomorrow and stopped writing, he would have given us a substantial and enduring body of work. In addition, he considers his Lewin work is an ongoing project, and there will be more editions of *Managing Change*. The three areas he identifies as unfinished business, though, are as follows:

1. Sustainability. We have seen how Burnes commitment to People, Planet, and Profit combined is informing his work, particular over the last decade, and his view that while responsibility to address sustainability rests in organizations, they are ill prepared to fulfil this. While his third P, Profit, indicates he is not anti-business, he argues the neoliberal philosophy which has driven organizations for the last 50 years is incompatible with sustainability and sees himself working on the connection between political economy, broader society, and organizational processes.

2. The magnitude, frequency, and success of change. The received wisdom is that rapid environmental (in the systems sense) change – for example, in technologies – is driving the need for ever greater and more complex organizational change. Burnes turns this argument on its head. He maintains organizational change is driving larger system level changes. With circularity, the more organizations change, the more the system changes and so the more organizations feel compelled to change. The piling on of change initiatives one after the other he couples with change failures. Managers pile change on change until no one can cope with it. His logic is that overall organizations need less change but better change. Less change stabilizes the environment, reducing the pressure for frequent changes and permitting organizations to focus on the changes they really need to make, particularly in the cause of sustainability. Consultants tell him "nice idea, but it will never work." Burnes is committed to making it work.

The third legacy project is more left-field. Burnes talks of finally authoring his as yet unwritten, but potentially significant "diet book," which seeks to bring together the theories and tools of lifestyle change with those or organizational change. Burnes sees both lifestyle change and organizational change as essentially about focusing on behavioral change. Hence the two literatures complement each other despite being treated separately by different sets of scholars and practitioner. Lifestyle change for Burnes refers to such challenges as alcohol abuse, antisocial behavior, and racism. He most frequently illustrates his argument in relation to dieting, as something most of us will relate to. Burnes maintains that organizational change idea, such as

Lewin's field theory, combined with existing (lifestyle) behavioral approaches to weight loss, will bring significant benefits. Conversely, managing organizational change can benefit from adopting insights and tools of lifestyle change. This has been the topic of a popular talk he gives to both practitioners and scholars as an invited keynote speaker. While unifying these two sets of literature together seems a huge new project, alongside those he is already running, if we know anything about Bernard Burnes it is that he is tenacious, and once he begins work on something, he sees it through.

Whether Burnes has as much influence on individual behavioral change in society as he has had on change management scholarship remains to be seen. But we should be clear, that in the case of the latter, that his influence has been very substantial, very profound, and sustained over a number of decades. So much is this the case, I believe, that his identification as a Change Management "Great" is deserved not simply because of his contribution to the field. Rather it is because of his formative influence – he has made and shaped the field of change management. For that I personally am very grateful, and I believe everyone else should be too.

# Gervase Roy Bushe: Progressing Ideas and Practices to Make the World a Better Place

# 15

Tom Kenward

**Abstract**

Gervase R. Bushe, for four decades and counting, has explored, challenged, and evolved the field of organizational change. His passion and conviction flow from a desire for more organizations to become places where people have opportunities to make free and informed choices so that they are engaged to give their very best in the work they do. This thread is evident throughout every strand of his work, each manifested as a contribution to create collective, participative engagement methods for organizational change. His work to build useful, relevant change theory and practice spans the disciplines of organizational design, appreciative inquiry, leadership, and organization development (OD).

With a rich lineage in personal and organizational development, Bushe's influences span the intrapersonal, interpersonal, and wider system domains. This eclectic, integrated understanding – in theory and in practice – appears throughout his work, and the complementarity between these builds over time. The two latest examples are the widely used Clear Leadership method and program; and his paradigm shifting work to frame the emerging new threads of OD with the term now becoming known as Dialogic OD. As well as these recent integrated contributions, Bushe has also made incisive contributions within particular areas, perhaps the best known being his work from the earliest days of appreciative inquiry to help define, test, refine, and amplify its power and effectiveness as a method. Tracking and fanning, synergenesis, amplification, generativity, and generative images are all ideas born out of this work, and they have returned over time in Bushe's work on leadership and Dialogic OD. Less well known but highly regarded in academic circles is his early work on parallel learning structures.

Bushe's strong grounding in both experiential laboratory education such as T-groups and the action research tradition, have influenced his work consistently, giving a clearly recognizable trademark to his contributions, perhaps best summed up as human, accessible, highly practical and progressive.

## Contents

## Influences and Motivations: Activist, Learner, and Collaborator

Bushe studied philosophy and sociology as an undergraduate at Loyola College in Montreal in the 1970s, deeply engaged in the counter culture of the times as a student activist. While a student leader among a highly engaged student body that strongly influenced university affairs from 1974 to 1978 (which culminated in being the valedictorian of his class of 1,200), his change agent tactics evolved considerably. He discovered the world of T-groups, adult education and action research in this period, mentored by Hedley Dimock and Irene Devine at the Sir George Williams Center for Human Relations and Community Studies, affectionately known as the NTL of Canada. Over this period he accumulated 150 h of supervised delivery of T-groups, while studying the work of Lewin, Bradford, Benne, Gibb, Bennis, Schein, and Argyris. Bushe also assisted in action research projects and the design of leadership development programs. This early influence nurtured a deep passion in him for creating democratic, collaborative forms of organizing and for large-scale transformative change processes; these two passions subsequently influenced all his work.

By 1978, with considerable experience in OD and T-groups already, Bushe was accepted on to Case Western Reserve's Department of Organizational Behavior doctoral program at the young age of 23. It was *the* place to study OD and group process. During this time Suresh Srivastva was key in building Bushe's psychoanalytic understanding of group process; Bushe also deepened further his understanding of experiential learning with Dave Kolb and Ron Fry. Macro-organization

behavioral work and organization design with Dave Brown, Bill Pasmore, and Frank Friedlander added a further passion. Doctoral work on implementing quality of work life at General Motors led to interest in how organizational structure could drive development in organizations. He developed the theory of parallel learning structures, working with fellow Case student Rami Shani. During the 1980s, Bushe worked with large, bureaucratic organizations wanting to transform them into more empowered, team-based organizations, writing a series of papers with Rami that culminated in a book in the Addison-Wesley series in OD (Bushe and Shani 1991). While it was credited in academic circles, it did not gain the deserved profile among practitioners.

In the 1980s, he underwent weekly somatic psychotherapy for 5 years with Ian Macnaughton (2004) that had a profound impact on his understanding of personal and organizational processes. At this point what had been largely an intellectual way of knowing for Bushe became enriched by a much closer attention to the body and to lived experience. This coupled with what was happening in his professional life led to a reorientation away from macro organizational phenomena back to the intra and interpersonal.

The 1990s saw socio-technical systems oriented organization design work evaporate as the large consulting companies entered that space with process re-engineering (socio-technical systems, minus the socio). It was also the time when it emerged that most successful team-based and more collaborative organizations were reverting back to command and control in as little as 6 years. Bushe took a sabbatical to join the Stentor startup (described later) and began exploring the micro-processes that led to the failure of collaborative work organizations – a return to his roots in small groups and leadership. Ron Short's work applying family systems theory to organizational learning, alongside the weekly somatic psychotherapy, the early T-group experience, and an interest in social psychology, led Bushe to develop the Clear Leadership model. This has proved very successful in the organizations in which it has been used, with some profile among practitioners, but very little among academics. Bushe undertook a lot of consulting work over this time with fast-growing hi-tech companies.

Bushe also attended the first conference on appreciative inquiry at Case in 1989. He was friends with David Cooperrider and Frank Barrett, who had also been students at Case, as well as Ron Fry who had been his doctoral supervisor and had heard about their early AI experiments. He immediately saw the potential and began experimenting with an early form of positive deviance he called appreciative process (Bushe and Pitman 1991). Experimenting with AI in small groups led him to his first empirical study (Bushe and Coetzer 1995) and to initial emphasis on the generativity of the inquiry (Bushe 1998). Later research on large-scale AI change processes (Bushe and Kassam 2005; Bushe 2010) amplified the interest in generativity and uncovered for Bushe the realization that treating AI like action research with a solely positive focus may actually repress its transformative potential. This became high profile among both practitioners and academics.

This work evolved into a wider envisioning and articulation of Dialogic OD theory. His first paper on this, entitled "Postmodern OD," figured at a Taos Institute

Conference in 2005. That year he was introduced to the parallel work of Robert Marshak. They collaborated on what came to be a seminal paper (Bushe and Marshak 2009) then coining the language of Dialogic OD and contrasting this with what they saw to be a largely different and until now more dominant stream, characterized as "Diagnostic OD." They further developed their ideas through editing a special issue of the OD practitioner (Bushe and Marshak 2013), before then editing a full book (Bushe and Marshak 2015). This work appears to be a paradigm setting contribution with global impact.

## Key Contributions: Clear Leadership, Dialogic OD, and More

### Parallel Learning Structures

Through the 1980s, a collaboration between Abraham (Rami) Shani and Bushe led to a series of publications that culminated in the volume on *Parallel Learning Structures: Increasing Innovation in Bureaucracies* in the Addison-Wesley Series in OD (1991). Parallel learning structures extended Zand's (1974) concept of the collateral organization to explain how ongoing inquiry and organizational learning could be structured into hierarchical organizations. It incorporated Shani's research on action research processes with Bushe's research on quality circles and organization design to identify a way for performance-focused organizations to build a structure and culture for learning without having to redesign the work system. It proposed designing a series of groups that operate in parallel to the formal organization, tasked with identifying issues to innovate around, vetted by a steering committee, and then implemented through the normal chain of command. Their main contribution was to identify how the culture of the parallel groups had to promote inquiry and learning, often diametrically opposed to the operating culture of the formal organization. If the parallel organization was run like a project organization, with performance oriented norms, it was not able to provide an adaptive competency. They identified many of the tensions for implementing and maintaining them and how to resolve those. Through case studies they described how parallel structures could be used for pursuing simultaneous efficiency and innovation, solving problems bureaucracies could not handle, implementing system-transforming, radical innovations, developing cooperative labor-management relations, and providing a transitional structure toward team-based organizing. Textbooks in OD picked up and disseminated these ideas (Ed Schein called it the best book ever written on the structure of OD), and the book was translated into Spanish. The book was not a best seller, perhaps because its subtitle focused on overcoming bureaucracy, which did not incite passion. Twenty-five years later the basic tenets of bureaucratic organizing still predominate, and, while parallel structures are commonly used for change projects today, the same mistakes the book address are being made repeatedly. This early work already had the hallmarks of a practitioner and scholar committed to creating engaging spaces for collective learning and change to take hold in organizations.

## Clear Leadership

As the 1980s came to an end, Bushe became disappointed by research suggesting even the most well-designed team-based organizations were reverting back to command and control. As he sought to understand why, he abandoned his interest in organization design to explore once more the personal and interpersonal processes that might explain this predicament. While consulting to a new company created as a joint venture by the provincial telephone monopolies in Canada to respond to the newly deregulated long distance phone market (Stentor), he had a series of experiences that were to lead him to an explanation.

An admirer of Karl Weick, Bushe was aware of sensemaking processes, and he began to notice how many interactions between people were based on untested sense-making. His job at Stentor was to create a highly collaborative, fully empowered organization. He believed all the people he was working with wanted that; they had a clear vision, the right people, the right structure, and the committed leadership, but it still was not working. He began to notice how people would conduct themselves in meetings to maintain harmony and look good and not surface concerns or issues that could produce conflict or be embarrassing. Instead, they talked about such things "offline" and often not with the people considered to be the problem. He began to focus on what he later called "interpersonal mush" – interactions based on untested sense-making – in his consulting and in his courses with EMBA students, becoming convinced it was part of the explanation for why collaborative work systems fail. He noted that the stories people made up to make sense of others were usually more negative than the reality and that overtime the mush made it difficult to sustain collaborative relationships. What he had not yet uncovered was why the mush was so prevalent.

Encountering Ron Short and John Runyon's work on their organizational learning model in the 1990s provided two more pieces to the puzzle. Short was a professor and cofounder of the Leadership Institute of Spokane (later, Seattle) and a pioneer in applying Bowen Family Systems Theory to organizations. Short's (1998) model emphasized that learning from experience required working with experience as it happens in the moment and that ways of managing anxiety identified by Bowen were key obstacles to people's ability to learn from their experience together. Everyone has a different experience because everyone creates their own experience, but in our fusion we want people to have the "right" experience or in our disconnection assume others are having the same experience as oneself.

This led Bushe to his next key insight into how well-intentioned managers destroyed collaborative relationships with employees. When managers try to engage the people who work for them in well-intentioned attempts to learn from their experience together, they almost always try to analyze some past event to uncover what worked, what did not, and what to do, moving forward. But different people may have very different observations, thoughts, feeling, and wants (experiences). The degree to which those differences are noticed and managed strongly influences collaboration, for ill or good.

One common dysfunctional way to manage people having different experiences is to figure out who has had the "right" experience, which normally ends with the manager having the right experience. At this point, the employees no longer feel responsible for the outcome of the conversation, and their sense of collaboration is diminished. Bushe realized that the model for learning from experience he and others had been using was detrimental to sustaining a relationship where everyone's different experiences are valid. It required a completely different way of thinking about what it means for a group of people to learn from their experience, at work, together. He discovered that people did not have to be having similar thoughts, feelings, or even objectives to work together and that people felt most engaged and committed when they could express what they most desire and care about without threatening their membership in the group.

For the rest of the 1990s, Bushe continued to develop a different set of models for organizational learning to support empowered work systems that culminated in the book *Clear Leadership* (2001). He realized that in order for people to learn from their collective experience, they needed a common model of experience and created the "experience cube" (see Fig. 1), a model that seems to have a resonance or impact on most who try it out. The model proposes that experience is composed of one's moment to moment observations, thoughts, feelings, and wants; that at all times an individual is having all four but that only some are in their awareness and some of their experience is out of their awareness. Individuals vary on how easily and deeply they can access their awareness of each element of experience, and that increasing awareness of experience is a life long journey. With this model, Bushe provides a concrete explanation of what it means for a leader to be "self-aware" and a concrete tool people can use for discussing and understanding their own and other's experiences to clear out interpersonal mush.

Over the next 10 years of applying the model, he came to the conclusion that collaborative organizations rested on micro-relations of "partnership," which he defined as a relationship in which all parties feel responsible for the success of

**Fig. 1** The experience cube

their common purpose. Armed with this key insight, Bushe began investigating all the ways in which leaders unknowingly destroyed that sense of responsibility in subordinates, the skills required to design and lead partnership-based organizations, and the shared assumptions required for cultures that supported collaboration (Bushe 2006). The revised edition of Clear Leadership (2009a) incorporated some of those insights.

This social constructivist approach to organizational learning offers real practical insights into leading organizational change. It defines organizations as patterns of organizing (or interacting) and organizational learning as an inquiry by two or more people into their patterns of organizing/interacting that leads to new knowledge and a change in those patterns. It argues that organizational learning happens one conversation at a time and spreads out, though the impact of those conversations is greater, the higher up the hierarchy they occur (Bushe 2009b). While it is difficult to change others, and difficult to change oneself, Bushe explains that a pattern of interaction can be changed in an instant. Effective leadership of change requires the perspective that everyone is having a different experience, the leader cannot control the experience others are having, and it does more damage than good to take responsibility for other people's experience or try to ensure they have a good experience. Effective change leadership therefore requires curiosity about other people's experience and transparency about the leader's thoughts and intentions. Efforts to produce change by getting people to "buy the vision" only create large dollops of interpersonal mush. Instead, Bushe asserts that it is much more effective to create a space in which people can express very different thoughts, feelings, and wants from each other and from the leader, which a leader can incorporate or not into his/her goals and strategies. Much of what gets called resistance to change is a result of the lack of clarity and the resulting interpersonal mush. A great deal of useful change occurs simply by allowing people to express their differences and check out their stories, according to Bushe.

The recognition of the multiplicity of narratives inherent in any organization, and the detrimental effects of privileging one narrative over others, was one of the early insights that led him beyond diagnostic approaches to organizational change and led to his model of Dialogic OD, discussed later in this chapter.

Acknowledging that his first book had less impact on practice than he and Shani had hoped, Clear Leadership sought, successfully, to directly impact managers and professionals. Bushe identified concrete skills within four skill sets: the Aware Self, the Descriptive Self, the Curious Self, and the Appreciative Self, along with the necessary increases in self-differentiation that are required to use these skills to lead learning in the midst of performing. Building on his knowledge of T-groups and laboratory education, and inspired by the innovations in laboratory education developed at the Leadership Institute of Seattle, he created a course that is transformational for many participants yet can be delivered in only 4 days in a nonresidential setting. Transfer rates of the core concepts have been as high as 90% with most rated by their peers as more effective after the course (Gilpin-Jackson and Bushe 2007; Gossling 2006). One case study attributed a shift in employee engagement from the 61st percentile to the 91st percentile in 3 years, in part, to training all leaders and

managers in Clear Leadership (Bushe and O'Malley 2013). It is now licensed in seven different languages around the world.

Again, we see in Clear Leadership a clear intention to create something for organizations and leaders that could transform their experiences of learning and changing together in a truly collective way.

## Appreciative Inquiry

Bushe was an early champion of appreciative inquiry in academic circles. He witnessed firsthand the resistance David Cooperrider received when initially presenting his ideas – laughed at during the 1986 Academy of Management Conference when he suggested that *seeing organizations as miracles to be appreciated* would produce more generative inquiry. At the OD Network that year, practitioners said, "of course we want to talk about what is going well, but we have to talk about what's not going well too. Your ideas are not practical and our clients would never buy it anyway."

In the early 1990s before the 4D model, Bushe and Pitman were using and teaching a form of AI based on collective attention to "what works," instead of "the problem," and to "tracking and fanning" as a change process that could be applied in micro as well as macro situations (Bushe 2000; Bushe and Pitman 1991). It had three phases: discover, understand, and amplify (Bushe 1995). This line of inquiry produced the model of the Appreciative Self found in Clear Leadership (2001, 2009a) as well as the "performance amplification" approach to OD (Bushe and Pitman 2008).

Bushe is one of a very few who have used empirical methods to study AI. His 1995 paper with Coetzer demonstrated that an AI-based intervention made student teams significantly more effective than a placebo event but so did a standard action research style intervention using task-oriented team building as the diagnostic model and survey. In a later paper (Bushe 2002), he attributed the effect of the AI intervention in those studies to the newness of the teams, a condition he labeled "pre-identity," and argued that the nature of AI – particularly what it could accomplish and therefore how best to organize and lead it – depended on whether the people involved identified with the group/organization/community. He has argued in a variety of ways that unless individuals identify with a group, not a lot of energy goes into worrying if the group is getting its needs met or accomplishing its goals (Bushe 2002, 2004). Bushe and Coetzer's McGregor winning paper (2007) showed how the initial phase of team development hinges on whether members come to identify with and have a desire to belong to the team. What AI offered pre-identity groups was mainly the opportunity to move through the membership phase and develop a shared identity. Consequently, inquiries that focused on goals, aspirations, and what to be, (such as the "life-giving properties" of the group) and only involved members of the coalescing group, were best suited to pre-identity groups, such as AIs that involved multiparty summits. Bushe (1998) proposed that the "best team"

appreciative inquiry could help a pre-identity group bypass the "storming" phase normally associated with group development (a proposition that found support in Head's (2000) study).

In groups with members who already identify with the group (post-identity), Bushe argued that inquiries that only focused on what the group should be would be experienced as unproductive navel gazing. In a pre-identity group, the group is seen by members as one more thing to deal with in pursuing their own individual needs and wants. In a post-identity group, by contrast, members take a personal interest in the needs of the group. Members of a post-identity group already know what the group's purpose is, and are more interested in how to accomplish that purpose. The focus is more on what the group needs to be and do to be effective in its environment, and an appreciative inquiry will need to include others outside the group who have no interest in joining but are stakeholders (e.g. customers, other parts of the organization) if the inquiry is to be useful. This model explains findings in other studies (Newman and Fitzgerald 2001; Powley et al. 2004).

As a consultant, he became fascinated by how conversations could be facilitated to generate new ideas that compelled new actions, seeing this as a practical application of Gergen's (1978) notion of generative theory. Probably his greatest contribution to Appreciative Inquiry has been his research demonstrating the important role generativity plays in transformational outcomes. His research into appreciative inquiry demonstrated the importance of generativity to the success of AI interventions (Bushe and Kassam 2005; Bushe 1998, 2010), leading him to propose that positive emotions were not sufficient for change to occur without generativity and that generativity could be evoked without positive emotions (Bushe 2007, 2013b). One contribution to AI practice that came from this line of inquiry is the synergenesis approach to using appreciative stories to catalyze new ideas (Bushe 1995, 2007, 2010). In this approach to appreciative inquiry, organizational members interview each other and write up the best stories they hear; these stories are collected for synergenesis sessions, where a small group is presented with a question and a deck of people's stories related to that question. They read any story together and then brainstorm answers to the question triggered by the story or by the conversations that ensue. Once they run out of ideas, they read another story and continue to brainstorm. They continue doing so until additional new stories do not generate any new ideas. One field study (Bushe and Paranjpey 2015) found this technique more generative than conventional dialogue processes used in the discovery phase of AI.

Bushe's scholarship on appreciative inquiry resulted in awards (his 1995 paper was chosen as one of the ten best articles published by the OD Journal in the twentieth century; the 2005 paper with Kassam was a runner-up for McGregor Award that year, and many others have been republished) and has made him the "go to" person for academics who want an authoritative voice. He has written the chapters on AI for Sage's Encyclopedia of Management Theory (Bushe 2103c), Encyclopedia of Educational Research, Measurement, and Evaluation (Bushe forthcoming), and Routledge's Companion to Organizational Change (Bushe 2012).

## Dialogic OD

In his work on Dialogic OD, he and Marshak sought to integrate the fragmentation that had occurred in the OD field over the past two decades, demonstrating how techniques that appeared to be quite different, like appreciative inquiry, open space, world café, or Theory U, all rested on the same assumptions about organizations and change. They argued that OD practice had evolved since the 1980s in ways that violated the central tenants of OD orthodoxy but that the key texts in the field were ignoring this and instead presenting these innovations within the traditional action research framework. Their paper on Revisioning OD (Bushe and Marshak 2009), which won the Douglas McGregor Award that year, identified key differences in the assumptions about change in organizations in what they labeled Diagnostic OD and Dialogic OD. They later went on to argue that two key theoretical currents underlie Dialogic OD: complexity science and interpretive social science (Bushe and Marshak 2014). In that paper they proposed that the practice of OD professionals rested on the "mindset" of the practitioner and contrasted two "ideal types" – a Diagnostic Mindset and a Dialogic Mindset. Rather than seeing these as either/or, they argued that both mindsets could coexist in any practitioner, which would lead to the kinds of innovation in practice they were seeing and listed a set of assumptions they called the Dialogic Mindset. They also identified three underlying change mechanisms, one of which they proposed had to be present for transformational change to occur: disruption and emergence, a change in core narrative(s), and/or the appearance of a "generative image" that offered compelling new ways to see old things and motivate new actions. They further suggested (Bushe and Marshak 2015) that Dialogic OD methods had emerged and flourished because they were better suited to taking on adaptive challenges (Heifetz 1998), complex situations (Snowden and Boone 2007), and wicked problems (Grint 2005).

Noting that dialogic change processes have been highly successful, but are not that widely used in business (Bushe 2016), Bushe and Marshak (2016) argue that the problem is they contravene the "leader as visionary" narrative that holds sway in western business culture. They contend that research is pointing pretty dramatically to the conclusion that under conditions of complexity it is very unlikely for anyone to be able to identify the right answer to an adaptive challenge, and the use of emergent change processes and leadership style is far more successful than conventional diagnostic or change management approaches. The diffusion of Dialogic OD approaches into mainstream acceptance, they argue, will require a transformation in the leader-as-visionary narrative.

While Dialogic OD theory was a synthetic act of scholarship, bringing together and making sense of multiple strands of scholarship and practice, Bushe's key addition to this is the importance of generative images to the success of Dialogic OD interventions (1998, 2013a, b; Bushe and Storch 2015). Bushe defined a generative image as "ideas, phrases, objects, pictures, manifestos, stories, or new words with two properties: (1) Generative images allow us to see new alternatives for decisions and actions….(2) Generative images are compelling images – they

generate change because people like the new options in front of them and want to use them" (2013a, p. 12).

As a very recent contribution to organizational change thinking, it is not possible to identify the impact this will have on the field, but there is every indication that it is having an important impact on both scholarship and practice. At time of writing, the original 2009 paper is the 14th most cited ever published in the Journal of Applied Behavioral Science since it was founded in 1965. In 2016, HR Magazine in the UK added him to their annual listing of the 30 most influential HR thinkers in the world.

## New Insights: Learning with Gervase Bushe

As already highlighted, Bushe's regular cycling between theory and practice lies at the heart of his approach. That action research stance no doubt contributes to Bushe's theory and method having such insight and relevance for scholars and practitioners, respectively, myself included. Consulting relationships, executive teaching, and field research in a variety of organizations allows Bushe to triangulate between practicing leaders' contexts and the evolution of thought in academic circles. Each practical assignment is a chance to expose language and method to business scrutiny, in the process sharpening the translation of theory and research to workplace application. In turn this informs where research goes next. Below is my view of what some of these contributions mean in practice.

## Style and Approach

In teaching, Bushe has used a variety of experiential learning processes to create active learning through doing rather than passive absorption of knowledge. Bushe is a developer as well as an educator, however. Alongside his work at large systems level in organization change, Bushe continues to work at the coal face of interpersonal skill development in leaders and developers. Having observed and participated in ongoing group process work over many years, Bushe is at home in the intensity of laboratory interpersonal relation methods such as encounter groups and T-groups but has found ways to make such experiences more accessible, retaining sufficient power but with less risk of overwhelm that can push participants away from learning in the laboratory setting. This background has shaped Bushe's participative, challenging style of training and consulting – a theme across both domains is his desire to create spaces and opportunities for participative work and learning to truly take hold, for everyone's benefit.

Bushe's personal presence, as much as his thoughts, collaborations, and outputs, may be a key factor in his impact in the world. From my first encounters, I experienced him holding a still, quiet attention for me to speak, somehow making it easy for me to find my words. His responses are offered with warmth and respect but also an incisive conviction. This quality of connection seems pertinent, given the

contributions he has made. A particular example is his thinking on the notion of containers, illustrated below from a live video stream to the European Organization Development Network conference in spring 2015:

> I have seen enough instances of change work failing where most of the rules of good practice were being met and as many instances of change work succeeding where none seemed to be being met, to conclude that other things may matter as much. One of these maybe the quality of the container; is it really about having the right structure and process or about the quality of the people in it? Imagine the energy in a group and then consider: "what would it be like now if Nelson Mandela walked into the room?". Certain qualities of presence in and around people seem to matter more than almost anything else about the situation in which people find themselves working together.

It is additionally pertinent that, while this was delivered over video stream, the room was captivated by Bushe's screen presence transmitted from several thousand miles away.

My own belief here is that change work in organizations is so commonly accompanied by high levels of anxiety, in the client and the wider system, that the quality of presence in the practitioner plays a key role. This presence has no doubt also played a role in Bushe's ability to collaborate with others in service of generating new knowledge and method.

Bushe practices what he preaches in Clear Leadership too, with a disarmingly simple (not simplistic) direct style of communicating, grounded in his keen ear for language in both his practice and academic worlds. His written work is accessible to most, from journal papers to books, and his spoken word connects with leaders and practitioners across many disciplines and sectors. Bushe has the knack of explaining complex ideas in practical terms without oversimplifying to the point of contradicting the underpinning philosophy. This is evident, for example, in his navigation of the field of complexity sciences as it can be applied to social processes. In doing so, Bushe avoids the common trap of simple prescriptions but goes further than some purist academics may in providing both principles of practice and some methods.

## Legacies and Unfinished Business: Many Seeds Sown and Flourishing

Bushe has contributed so many insights to the field of organizational change in part because of his own capability, determination, and curiosity to explore and develop the wide range of disciplines covered already in this chapter. Below are some examples.

On Appreciative Inquiry, Bushe and Pitman's work (1991) in the early 1990s, focusing on "what works" rather than "the problem," predated the 4D model – Bushe was in near the start and the development of ideas and practices to do with amplification remain at the heart of the appreciative philosophy and method. Furthermore, Bushe's exploration of where and how AI has resulted in transformation

and generativity (Bushe 2010; Bushe and Kassam 2005) filtered the background noise and excitement that AI generated over its first two decades in use and illuminated some key success factors. This has shaped my own (and other practitioners' I know) use of AI in practice, highlighting traps and opportunities to be vigilant for throughout the process. His efforts to distinguish between the meaningful and the positive in AI have added further refinement to the methodology (Bushe 2007, 2013b), offering a linguistic reframe that I have seen greatly reassure clients as they decide whether or not the AI approach can work for them, particularly in less positive scenarios. A further refinement, on stages of group identity and its bearing on the focus and impact of AI, signposts another important factor that determines the particular approaches most likely to work in a given context. The power of all of Bushe's contributions in this space as in others is a characteristic of his work – they have real practical utility.

Clear Leadership (Bushe 2009a) is also creating impact on the ground, and in many places, having entrusted his ideas and methods to many different partners in several different languages to run the program. While on the face of it, Clear Leadership may seem separate from Bushe's early work on parallel learning structures (Bushe and Shani 1991), and other ideas, the influences exist in the theory base, and the success of Clear Leadership must in part be due to this solid ground upon which the program sits. The sound practical insights that have emerged from several previous strands of Bushe's achievements have found a deserving integrated home in practice. From personal experience, the impact of this program far outweighs the deceptive lightness of touch of just a 4-day program. Bushe has combined his deep knowledge of theory and powerful practical method to create an experiential program that can fundamentally change awareness and behavior in leaders, almost regardless of their prior level of experience and understanding. Given the growing need for collaboration, partnership, and other contemporary ways of organizing work, global demand for this efficient, effective model may well expand dramatically.

Bushe's contribution also flows from his humility to know his limits of knowledge and to invest the energy in seeking complex collaborations that extend and connect a wider and deeper range of practice and thought than anyone could achieve alone. The most recent example of this on a large scale has been the previously mentioned book on Dialogic OD (Bushe and Marshak 2015). Bushe and Marshak's collaborative approach to this has drawn out the key ideas and developing practices from a wide range of scholars and practitioners at a particular moment in the evolution of OD. Rather than inviting chapters on topics and compiling these without modification, authors were asked to permit substantial editing until Bushe and Marshak were satisfied that a consistency of style and thread of argument ran throughout the volume. The coherence that emerged from negotiation and rewrites totals an offering of great consistency and continuity.

While Bushe and Marshak developed their thinking on Dialogic OD over many years among a broad community, its profile has grown greatly since the label emerged. To create as substantial yet compact a volume on the topic as they did, over just 18 months with more than 20 contributors, suggests that an energy surrounds Bushe and the work that he has framed and helped to evolve in the process. It is testament to

Bushe's work in generativity and generative image specifically that in deploying it in the coining of the term Dialogic OD itself, it has created such generativity.

At a time when the ideas and language of complexity and transformation have become established in the global lexicon of leadership and organizational change, Dialogic OD should prove a very timely contribution to thinking and practice. Based on my personal experience, stories of colleagues, and much of the literature available today, a significant proportion of organizational change work still appears confused in method and philosophy. Change failures appear to be a product in part of ungrounded and outmoded thought and practice as well as being casualties of organizational and societal expectations that hinder the learning needed for real change to flourish. My own experience suggests that Bushe's work to rally a diverse field of evolving practice is helping to re-educate leaders and change practitioners in the complexity of organizational life and the approaches that can withstand scrutiny and deliver results. Bushe is humble enough to acknowledge that the ideas and practices of Dialogic OD have been around for some time and continue today in many people and places, but not in as consistent and coherent a form as might serve its ongoing development:

> there appears a great deal of convergence in what successful dialogic practitioners do. There just wasn't much convergence in how they described what they do (Bushe and Marshak 2015, p. 402)

Drawing on this careful selection of expert sources while bringing his and Marshak's long and deep knowledge alongside others' required him to enact his own principles of collaboration in the production process, but these collaborative ventures are not limited to the written word. Bushe was also instrumental in convening the, to date, one and only Dialogic OD conference in Vancouver (2015), drawing on his own network and energy to convene scholars and practitioners, in a singularly successful event that lived Dialogic OD in practice as 140 participants from around the world engaged in inquiry.

Bushe may be on the cusp of another generative image, in his reusing of the old term heroic/great man leadership (Bushe and Marshak 2016), investing it with new meaning. Rekindling the "good king" archetype (Bushe 2005) with a twist, the leader's heroic act may still be to bring the greatness out of every follower, only now less to lead the way with a vision, and instead more to create and contain spaces for others to lead in a multitude of complex ways. The heroism may come more in having the strength and humility to allow (contain, just enough) the tensions that this inevitably creates, so that they can be tolerated within an organization.

## Conclusion

Bushe's practice and scholarly rigor, his wider vision of the field of theory and practice, and his capacity to invite many into spaces of collective exploration, while

also having the clarity of thought to find coherence in diversity, combine to mean that Bushe has brought to the world many important developments in thinking and practice for organizational change. Bushe's own leadership across these different areas of thinking and practice seem to flow from a heartfelt conviction, perhaps not dissimilar to many of the founders of OD many decades ago, to progress ideas and practice in ways that can make the world and its workplaces better places to work and to fully express individual and collective potential.

# Raymond Caldwell: Agency and Change in Organizational Theory

# 16

## Mark Hughes

### Abstract

How we conceive our capacity for "agency" in the world has enormous implications for how we think about the possibilities and limits of our ability to manage change in organizations and society. For Raymond Caldwell, agency is the prism through which we think about change. If we conceive ourselves as things, as "substances" that simply think and act intentionally or rationally, we will end up with extremely limited epistemologies for understanding agency. For Caldwell the old models of knowledge and power, rationality and control, and agency and structure in organizations have fallen apart. The idea of "distributed agency" partly captures this reality by treating change as an ongoing process defined by practices, which in turn questions explanations of change that rely on intentional action or abstract notions of organizations as entities that change from one relatively fixed state to another. In sum, he treats agency as a practice and change as a process. But Caldwell's recent work, partly under the philosophical influence of Whitehead, takes these ideas further by including the nonhuman in how we define distributed agency: agency is potentially everywhere in a social-material world in which the ontological divide between the social and the natural world no longer makes much sense. Always provocative, always challenging, Caldwell's work is an important contribution to redefining the boundaries of how we think of agency and change in organizations. After briefly noting some early influences on Caldwell's work, the chapter organizes his contributions into three major phases: agency and change, agency as practice, and change as a process. A key insight section then reflects on how his early contributions have influenced others. The chapter concludes with legacies and new directions in Caldwell's search for a process-in-practice perspective on organizational change.

## Introduction

Organizational change theory is an emerging field within the notoriously fractured fields and subfields of organizational studies. To write a history of organizational change theory, therefore, poses an enormous challenge, as Demers (2008) discovered discordant pluralism subverts the search for synthesis. But any such history must include at least a chapter on "agency and change," Raymond Caldwell's specialist subfield. Without an exploration of the possibilities of "agency," we cannot understand the possibilities and limits of change in organizations or societies. Through a sociological prism, Caldwell was able to capture profound changes in how we think of agency in relation to the roles of leaders, managers, practitioners, and HR professionals as "change agents" in organizations. His work began by asking what agency was, and he has rightly chastised the coverage of change agency in organizational change theory as fifty years of "dismal reading" (Caldwell 2006). Caldwell has consistently encouraged the unbounded exploration of the relationships between agency and change, and he has only been mildly perplexed by the idea that organizational change theory is not cumulative or that it is in danger of falling apart (Caldwell 2005). He therefore remains a pioneer in challenging more orthodox accounts of organizational change and in encouraging a rethinking of the failures of organizational change practices.

This chapter provides an opportunity to better understand what has influenced him and to take stock of some of his key contributions, but also to learn about his insights, his still emergent legacy, and what new directions his work is taking. In conclusion, I found Caldwell's work provocative, challenging and informative in terms of understanding agency and change. This review is informed by my own extensive reading of his work and a number of meetings with him over the last few years. In taking stock of Caldwell's contribution to the field of organizational change, I felt it essential to communicate with him directly about his work and meet with him to discuss it further. I have signposted his verbatim contributions in italics and quotation marks, as well as paraphrasing what I learned while writing this chapter and discussing his work. I certainly found it fascinating to understand the bigger picture of Caldwell's writing, and I hope you will share this fascination.

## Influences and Motivations: New Beginnings

Born in Belfast, Northern Ireland, Caldwell spent his formative teenage years during the political conflicts and sectarian violence of "the troubles" that began in the late 1960s. A brief visit to America in the summer of 1971 was the crucial point at which he decided he would study there, "no matter what." America was to be his escape from a world he describes as "celtically bleak but always tinged with light:"

> It was easy to feel trapped in a nightmare of history in which everything violently changes and yet everything appears to repeat itself. The violence was the continuation of an ancient quarrel that was dreary and bloody, but the events were new, they were not simply a repetition of the past.

Caldwell got to America. He took his first degree at Hampshire College, a newly established liberal arts college in Amherst, Massachusetts, which he described as an "experimenting," "socially liberal," and a "multidisciplinary learning" alternative to traditional undergraduate education. It was clearly something of a cultural shock, but it worked:

> Whatever the philosophy really was or who it really appealed to, all I know is that it seemed to work for me. I found the place, at first, disconcerting and then exhilarating; you could push yourself as hard as you wished, in whatever direction you wished.

This liberal and alternative educational experience appears to have been very influential, shaping and influencing Caldwell's thinking and subsequent writing. He developed an intense interest in social theory and philosophy, reading everything from the origins of modernity through to every possible version of postmodernism. Initially, he was attracted to the classical sociologists (Durkheim and Weber) but then progressed to cultural anthropologists, such as Levis Strauss. During these formative years, he read about structuralism and poststructuralism and the work of Foucault and Bourdieu, Marx and the Frankfurt School, as well as the work of Mead, Parsons, Habermas, and Giddens. After finding a pristine, hard copy of Wittgenstein's *Tractatus* discarded by a fellow student, he read it intensely and soon became fascinated decoding Wittgenstein's cryptic and poetic aphorisms on language and metaphysics, which eventually inspired him to complete his undergraduate dissertation on Hegel, Weber, and Wittgenstein. Caldwell's appetite for philosophically informed social theory appears to have been voracious, and it helps us to partly understand what influenced his organizational change writing. More broadly, Caldwell has acknowledged not only his educational experience but also the allure of the very idea of America itself, which created a space for him to embark on an enormously liberating intellectual journey:

> I was able to absorb the practical virtues of the philosophical tradition of American pragmatism. I can still see some of the traces of Peirce, James, Dewey, and Mead in my work. I was especially drawn to Richard Rorty's version of neo-pragmatism with its poetic ethic and anti-reductionist vision.

Pragmatism taught Caldwell to reverse the traditional relation between theory and practice – theory is practice. This emphasis upon practice was to become a recurring aspect of his work, and it may explain his enduring positive evaluation of the importance of practice and applied research.

After Hampshire, Caldwell embarked on a Ph.D. at the London School of Economics (LSE).Unbeknown to him, he was apparently following a well-trodden path. "Hampshire ranks in the top 1% of colleges in the US in the percentage of graduates going on to complete a doctorate." His Ph.D. addressed the "rationalization" theme in Max Weber's work, which included exploring Weber's "developmental history" of the West, and his idea of bureaucracy as an "iron cage" which threatened individual freedom, rationality, and democracy. He was interested in exploring, not just Weber's ideas about bureaucracy and rationalization, but whether he had a "theory" of development and change in Western societies, which had implications for how organizations change. This interest in Weber was furthered while a Research Fellow at Berkeley which enabled him to work with Reinhard Bendix, a central figure in the development of their famous Sociology Department and a key figure in the assimilation of Weber's work in America (Scaff 2014). It is perhaps no surprise, then, that Caldwell still retains a long-standing interest in the intellectual history of Weber's scholarship and interpretation and continues to publish in this area (Caldwell 2002, 2016). He also admits that Weber's legacy is still very much alive in his imagination:

> Weber was partly my way into organizational theory; but he is probably the greatest and most profoundly misunderstood theorist in the hall of fame of classical organizational theory. Weber was not a proponent of bureaucracy as an 'ideal type' of mechanistic efficiency... In some sense I am still a reluctant Weberian in that I have not found a way to lay to rest Weber's ghost and the iron cage of rationalization.

This brief background note suggests some recurring aspects of Caldwell's work: a disregard for disciplinary boundaries, a preoccupation with theory as practice, a broad interest in the nature of social change, a concern with the genealogy of ideas, and a recurrent indebtedness to the legacy of sociological theory.

## Key Contributions: Agency and Change

In engaging with Caldwell's contribution to organizational change theory, a series of discrete yet interrelated strands of thinking quickly become apparent. He has tried to summarize these contributions as a whole while remaining fully aware that all academic work is always incomplete:

> My research is concerned with exploring how the concept of human 'agency' is theorized in organizational change research and how it is applied to the disparate contingencies of practice. I began my academic career as a sociologist, but my work is now thoroughly interdisciplinary, mainly because agency as a mode of practice and change as a process are hybrid constructs that do not fit neatly within disciplinary boundaries. My current research

*is concerned with thinking agency and change within 'practice theory' and 'process perspectives,' and how we can include nonhuman agency in definitions of human agency. My overall goal is to explore the possibility of a 'process-in-practice' perspective that brings together practice and process perspectives on how we think agency and change.*

Caldwell also made clear the rationale for his focus on agency and change:

*Agency is an increasingly problematic concept that crosses the boundaries between philosophy and social theory. Some would argue that it is no longer viable as a concept that can guide ideals of intention, rationality, individual autonomy, and freedom in a liberal democratic society. Others would suggest, however, that theorizing agency is an even more urgent task in a world of economic crisis, global inequality, terrorism, and the prospect of ecological disaster. Agency may not be located where we once thought it was, because we now know it is distributed, relational, shared, embodied and ecological. But one thing is certain: agency will determine how we think of change, and how we remake the world in our own image.*

Caldwell's wide-ranging contribution to the exploration of agency and change raises important issues for the field of organizational change studies. There are ontological issues around the basic assumptions about the nature of reality: what is agency, what is change, and how do we experience a world that is always changing? Epistemological issues are raised, questioning basic assumptions about how we acquire knowledge of change. Methodological issues are then raised as to how the researcher goes practically about studying what they believe can be known. Finally, practitioner issues relate to what we need to know in order to somehow operate in the "real" world: how do we make a difference, or how do we make the changes that we wish, desire, or intend to happen?

To understand Caldwell's key contributions in addressing these questions, one needs to trace the genealogy of three important phases of his thinking: *phase 1,* agency and change in organizational theory; *phase 2*, thinking of agency as practice; and *phase 3*, thinking change as process.

**Phase 1: Agency and Change in Organizations** *Agency and Change* (2006) is probably Caldwell's most important work in that it is key to his ongoing research questions. The overall ambition of the book was to shift the focus from "outmoded debates on agency and structure to new practice-based discourses on agency and change." Agency was a notoriously under-theorized concept in organizational studies, mainly because "organizations" were conceived as relatively stable structural entities. In organizational change theory, however, "change," rather than stability, is the central problematic, and an adequate exploration of change has to include agency. While *Agency and Change* was primarily a theoretical enterprise, it was ultimately directed at rethinking and reinventing practice, and Caldwell envisaged a second volume. For a variety of reasons, this did not appear, but many of his articles over the last few years are concerned with the issue of practice.

Because of its avowedly theoretical nature and philosophical undercurrents, *Agency and Change* was never going to be an easy read, and this was compounded by Caldwell's attempts to explore the Babel of competing "disciplinary discourses"

on agency and change in organizations. He broadly classifies these discourses into four overlapping categories:

1. Rationalist or social scientific discourses, which are concerned with intentional agency, expert knowledge, and the instrumental management of organizational change as a linear or stage-like process.
2. Contextualist or processual discourses, which are primarily focused on "emergent" change and the more bounded nature of managerial agency and strategic choice.
3. Dispersalist or distributed discourses, which explore the growing challenges of managing change in more complex organizations in which knowledge, power, leadership, and learning are distributed to teams, groups, and other self-organizing actors (Caldwell includes complexity theory, the learning organization, and communities of practice within this category.).
4. Constructionist or postmodern discourses, which seek to "abandon subject–object distinctions"; there are no objective scientific observers or autonomous actors but only "socially constructed worlds of fragmented cultural discourses, practices and fields of knowledge in which the possibilities for agency are fundamentally problematic" (Caldwell 2006, p. 7).

If *Agency and Change* takes its critical lead from a "discourse" paradigm, the discourses are in the background, and there is no prospect of synthesis. What really frames the work is the journey it takes; it begins with an analytical overview of Giddens' work and ends with a critical reappraisal of Foucault. In Caldwell's view, Giddens deserves special consideration for bringing agency back into sociological theory, particularly following the abstract "structural–functional" legacy of Parsons' (1951) social systems theory. Parsons was the most forceful advocate of "functionalism" as a model of modernity, society, and organizations, and his ideas still resonate with rational and managerial views of organizations as entities, *systems with processes*, that give primacy to stability, rather than change. Against this vision, Caldwell (2006) quotes Giddens' affirmation of agency: "It is analytical to the concept of agency: (a) that a person could have acted otherwise and (b) that the world as constituted by a stream of events-in-process independent of the agent does not hold out a predetermined future"(p. 19).

In Caldwell's reading, Giddens' "structuration" theory was an early attempt to re-theorize "structure" as process and agency as the practiced-based enactment of change:

> Using a micro-interpretative perspective influenced by phenomenology, symbolic interactions, and ethnomethodology, and with some highly selective philosophical borrowings from Heidegger and Wittgenstein, Giddens sought to dispatch the individual versus society dualism that had plagued classical sociological discourses of social action and social order. Structuration theory was a sustained attempt to establish the relationship between agency and structure as one of relational identity or synthetic 'duality;' by neither privileging agency nor structure, Giddens sought to reject ontological dualism. Structuration refers

*to the processes of producing–reproducing social relations across time and space, and this requires an ontological shift, an identification of agency with the practices of structuring, which creates new possibility of change.*

In Caldwell's view, however, Giddens' move to a more process-oriented theory of structuration was never fully realized. Ultimately, Giddens' attempt to incorporate time, temporality, and change into sociological theory was only partly successful (Abbott 2016).

Caldwell was also critical of Giddens' exploration of the relationship between agency and practice:

*Agency, for Giddens, is not identified with individual rational action, but an ongoing process of "praxis." While praxis suggests an affinity with Marx's idea that practice proves the truth of knowledge, Giddens argues, following Heidegger, that "the notion of agency is logically prior to subject-object differentiation," because it is always embedded in practice. This does not mean that agency as a category of individual action is completely de-centered into social practices. Rather, agency is redefined as "knowledgeability," a form of "doing," or "practical consciousness," and as intentionality, as something involving purposeful action and reflexivity, that may have unintended consequences. In this way, Giddens appears to dissolve the dualism of agency and structure by collapsing "structure" as process, and structure as system into temporal processes of practice: 'In structuration theory structure has always to be conceived as a property of social systems, "carried" in reproduced practices embedded in time and space' (Giddens 1984, p. 170). Reinforcing this idea of structure as process, actors can reproduce or transform structures, "remaking what is already made in the continuity of praxis" (1984, p. 171).*

In Caldwell's view, this formulation is opaque; we are never sure where structure and agency begins and ends. Nor is it clear as to what Giddens really means by practice and process or agency and change:

*Practice is a mediation category between agency and structure. It partly replaces individual intentional action with practice, and it partly allows structure to become a process defined by the production and reproduction of social practices. But Giddens cannot tell us how agency enacts change through practice.*

If Giddens' classic examination of agency and structure was the natural starting point for an exploration of agency and change, a broader theoretical rationale for this shift has to be justified. Caldwell argues that Giddens was overcritical of Foucault's "defacing" of agency. Instead of conventional ontological dualities between individual and society and agency and structure, Foucault shifted the focus onward the possibilities of *agency and change*, effectively dispensing with the liberal individualist conception of agency as a choice, an idea still very evident in Giddens' work. Giddens and many critics of Foucauldian organizational theory have argued that Foucault had no concept of agency because he allowed autonomous "discursive practices" to become "subjectless." Caldwell challenges this orthodoxy by arguing that Foucault's rejections of humanism, rationalism, and a coherent moral self were not the abandonment of the notion of agency: "Far from destroying intentional agency, decentered

agency allows new possibilities for resistance and the dispersal of agency and change in organizations and societies. Foucault's apparent destruction of the 'subject' is not the postmodern end of agency but its partial reinvention (2006, p. 124)."

This original and unorthodox reading of Foucault undoubtedly influenced Caldwell's focus on agency and change. Nevertheless, he felt that there was something missing from Foucault's work; he did not adequately theorize "agency" in relation to practice by more fully incorporating discourse into practice: "Discourse is nominal and material, a self-referential representation of meaning and a transformative instrument: words and things are inseparable because they have effects in the 'real world' of human practices. Despite this notion of the embeddedness of discourse, Foucault tends to absorb practice as discursive practices into discourse (Caldwell 2006, p. 127)."

**Phase 2: Thinking Agency as Practice** Phase 1 had arrived at a conceptual dilemma: if Foucault made the crucial link between agency and change within "discursive practices," why had his work failed to theorize "practice?" Caldwell argued that Foucault had no need for "a theory of 'practice' or a concept of theory into practice, because discourse is practice: 'theory does not express, translate or serve to apply practice: it is practice' (cited by Caldwell 2006, p. 127)." In Caldwell's view, this reading of discourse as practice was flawed, and he began to reexamine Bourdieu's classic work on the "logic of practice," which was often unfairly critical of Foucault. Bourdieu's work has had an enormous influence on the recent resurgence of "practice theory" in organizational studies, but in Caldwell's judgment, the most important recent contributions in this area have emerged from the work of Theodore Schatzki, who, as Caldwell notes, shares Bourdieu's deep ambivalence toward Foucault: "practice theorists do not like the theoretical connotations of 'discourse' because it suggests that 'saying' takes priority over 'doing.'"

In *Reclaiming Agency, Recovering Change? An Exploration of the Practice Theory of Theodore Schatzki* (Caldwell 2012), Caldwell begins to outline his thinking on "agency as practice." Schatzki's work returns to a central question of classical sociological theory: how do we theorize practices in relation to agency and change? If practices are primarily routine, habitual and normative events that happen, rather than purposeful actions, then how do they change over time? As Caldwell notes, this question has perplexed social theorists from Weber through to Bourdieu and Giddens, and it provides a unifying thematic in his own work.

In Caldwell's view, Schatzki is "a central interlocutor in current debates," because he provides new insights into the major intellectual influences on practice theory, most notably, the philosophical writings of Heidegger and Wittgenstein and the social theories of practice proposed by Bourdieu and Giddens. Caldwell also suggests that Schatzki's (2002, 2010) attempt to conceive agency as "doing" and his "general proposition 'that change comes about through agency' raises fundamental questions of how agency and change can be theorized within the intellectual genealogy of practice theory" (2012, p. 283). To address these questions, Caldwell's article examines the differences between traditional action theories of rationality and the broader teleological perspective of Schatzki's Heideggerian and Wittgensteinian

analysis of "practical intelligibility," rule-following, and the organization of practice, as well as his critique of Bourdieu and Giddens' opposing concepts of agency and practice. Overall, Caldwell is sympathetic to Schatzki's work but highlights some key issues. He believes that Schatzki's notion of "general understanding" is one of the most opaque and poorly defined concepts in his discussion of what holds social practices together, and this is replicated by the neglected treatment of politics and power. While he shares Schatzki's goal to break the links between reflexivity and intentional action by placing practices as temporal events ontologically prior to action and structure, he argues that this requires an explanation of how agency and change can be reconnected in a realistic social ontology of practice. Caldwell also detects traces of "ontological dualism" in Schatzki's distinction between practices and orders, and he is uncomfortable with the absence of a link between practice and learning (2012, p. 292). Finally, Caldwell forcefully argues that "what is missing from Schatzki's neo-Heideggerian ontology of practice is not only a notion of theoretical intelligibility, of practical knowledge and knowing that includes rational, cognitive or representational principles of shared understanding, but also an exploration of the power of language and discourse to redefine the possibilities of self, subjectivity, and agency" (p. 298). Caldwell, who had always been sympathetic to Richard Rorty's almost Foucauldian version of pragmatism, was never going to accept Schatzki's radical downgrading of the "power of language" to define who or what we are. Rorty may have underplayed the unreflective understandings of practice and agency, but he knew that the aim of philosophy and social theory is to "keep the conversation going" with the realization that "human beings are creators of new descriptions rather than beings one hopes to be able to describe accurately" (Rorty 1979, p. 378).

In Caldwell's view, Schatzki's work underplays the important critical legacy of pragmatism in framing his practice theory. He also does not engage with the legacy of process thinking that derives from Whitehead, and it is from this viewpoint that Caldwell takes issue with Schatzki's limited exploration of materiality and non-human agency:

> The idea of agency as doing, as a form of practice, has always been corrosive of philosophies of action and intentionality. But who acts, what acts, becomes even more problematic when the non-human and the material is included in the exploration of human agency. Schatzki attempts to overcome the post-humanist distrust the human derives from his fear that it will dissolve human agency into 'the actions of nonhuman entities' (2002, p. 201). However, his search for a halfway house between humanism and post-humanism that includes human and non-human agency amounts to a weak defense against naturalism, rather than a reaffirmation of human agency.

**Phase 3: Change as Process** While the idea of exploring change as "process" or "becoming" was an important theme of *Agency and Change* (Caldwell 2006, p. 163), it was only really explored in depth when Caldwell engaged with Whitehead's work over the last few years. At the time of writing this chapter, an article entitled *Thinking Agency and Change with Whitehead* is under review. This article is informed by an important and provocative attempt to separate thinking about

"change" from the notion of "becoming" while also radically extending how we think of human and nonhuman agency.

Whitehead's process philosophy on thinking about organizations and change over the last decade has been significant in shifting the focus from stability to "continuous change," from being to becoming:

> All theories of organizational change have used some notion of 'process' in theorising how change happens, but recent Whitehead-inspired process perspectives on organizational change seek to mark a more radical shift in how process, change and agency are defined. Organizational change is not a stage, an outcome, or an episodic event in a 'process' of change defined against a background of stability or ordered organizational entities. Instead, change is the very condition of organizing. From this perspective, the idea that organizations as substantial or stable entities have primacy in understanding that change leads to a narrow definition of 'process' in terms of how entities, things, or events unfold over time. From a process perspective, the world exists as flows, organizations are processes, not things, and 'reality' is in a ceaseless process of becoming.

Caldwell also draws attention to the implications of this reading of becoming:

> The process perspective not only conceives organization as process, it conceives human agency as process. For Whitehead, the self cannot be separated into mind and body entities (Whitehead 2010, p. 26). The self is not the negative self-image of 'nature;' a fixed substance or determinate entity. Nor is the self an entity defined or determined by 'social' structures 'out there' which imposed social behavior. Instead, the self becomes and subjects 'are' within processes of becoming. In other words, agency has to be conceived as a process, not as a set of fixed substances to be discovered in nature or as cognitive entity inside our heads. There is no unchanging nature, there is no unchanging self.

Caldwell argues, however, that theorizing agency and change in this way is highly problematic:

> The status of subjectivity, self and agency as a conceptual domain has been a recurring concern in Whitehead research and scholarship, but this has rarely been examined in relation to 'change.' To explore becoming as a process is to explore the 'process of experience,' of how we as subjects experience the reality of the world and nature as process, yet paradoxically, becoming as process turns subjectivity and agency into process; there appear to be no enduring entities, objects or things within the world.

Caldwell also argues that Whitehead's process metaphysics has created immense difficulty in theorizing agency and change, partly because his work has been misunderstood: "change" and "becoming" are not the same for Whitehead, and to conflate them is very confusing:

> Becoming cannot be defined as change because the most irreducible entities in Whitehead's process metaphysics of process are 'actual occasions' which do not change. Paradoxically, 'becoming' is an unending process, but we cannot identify 'change' with underlying conditions, stages or end-states, nor can we identify 'changing' with the actualization of some sort of potentiality within something–changing things, objects or entities. For Whitehead, the 'illusion of change' occurs in a world of space and time defined by substance

*metaphysics. Becoming is process, and so something that 'changes' has no intrinsic attributes, it perishes instantly into the immanence of becoming.*

In Caldwell's rereading of Whitehead, the notion of becoming is about how we experience the world as process: "The world becomes within the relational and unifying process of experiencing actual entities, they are the world, we are that world." Becoming, therefore, has to be identified with how we experience the world as process rather than abstract theoretical notions of "change" in societies, organizations, or any other entities.

## Key Insights: Reflecting upon Agency and Change

This brief summary of the three key phases of Caldwell's work indicates that it is evolving and moving in new and uncharted directions. However, much of his currently influential work on "change agency" and changing HR roles is associated with phase 1, and so we may have to catch up with the new work before he embarks on yet another phase. Certainly Caldwell's early agency and change writings were the most influential in illuminating my own thinking. The first edition of my textbook (Hughes 2006) was published without any significant coverage of "change agency." Today, it feels like a glaring omission, but all I can say in mitigation was that I was not the only organizational change textbook author guilty of this omission. In the second edition (Hughes 2010), I addressed the omission by including a chapter on change agents and agency, framed in terms of Caldwell's early writings. More recently, my organizational change interests have focused upon the leadership of organizational change (Hughes 2015). I have recently questioned existing explanations of leading change and, instead, encouraged a greater emphasis upon agency as part of a research-informed approach to leading change (Hughes 2016). My research has also been influenced by Caldwell's (2003b) criticisms of change manager/change leader differentiations as either/or false dichotomies; we require a combination of change management and change leadership. While management and organizational studies subsequently witnessed a shift from management toward leadership (Ford and Harding 2007), there are reasons to believe that the organizational change – change leader versus change manager – dualism has been overplayed (Sutherland and Smith 2013). I would finally like to acknowledge that Caldwell's HR writings, particularly Caldwell and Storey (2007), informed the writings of my chapter on the interface between HR and managing change (Hughes 2010). Caldwell's interdisciplinary work built a bridge between two different yet related fields of study. In his view, "HRM" is a strategic approach to managing change and strategy implementation that uses the instrumental processes, tools, and techniques of "people management" (e.g., recruiting, training, and monitoring employee performance) to achieve desired business performance outcomes. This meant that "HRM" and "change management" converge; they focus on ensuring that people have the capacity and motivation to adapt to change.

In reviewing Caldwell's early HR work, the twin themes of agency and change constantly surface, as does his sociological indebtedness to the work of Weber (Caldwell 2001, 2003a). But despite the influence of Caldwell's HR-orientated work, he confided that "John Storey once described my HR work as 'a small tributary' rather than the main river." The HR work clearly needs to be understood as an outcome of Caldwell's broader sociological interests in organizational change. This is certainly evident in what is probably his most influential HR article (2003c, p. 948), which started with a broad sociological exploration of "changes in the nature of managerial work" and their profound and disconcerting impact on the roles of HR managers and other functional specialists. The article also examined HR professionals in Weberian terms as an aspiring "occupational status group" managing the tensions and ambiguities of role change, as well as coping with competing claims to occupational legitimacy in changing organizational contexts. This is a factor generic to all professions in their attempts to maintain autonomy or power through "jurisdictional claims" over the provision of specialist expertise, and in this way, the research echoed Abbott's (1988) classic sociological work on the professions.

The HR-orientated work undoubtedly enabled Caldwell to develop an international profile as an HR researcher with an increasing specialization focus on the organizational transformation of the HR function and the emergence of new, change agent, HR roles, including HR strategic and leadership roles in the boardroom. This work was often critical of the strategic ambitions of HR practitioners in implementing HRM, but what gave it considerable force was the rich empirical evidence base (Caldwell 2004, 2011). The following references demonstrate that this work is continuing to impact upon ongoing debates (Truss 2008; Wright 2008, Alfes et al. 2010; Wylie et al. 2014; Marchington 2015). Wylie et al. (2014), in their exploration of change agency in an occupational context, provide an excellent summary of Caldwell's HR work which helps to reposition it within the context of a recurrent, and some would argue unsuccessful, attempt by HR professionals to "overcome occupational insecurity by establishing a strategically significant role within organizations" (p. 95). They also argue, following Caldwell (2003c), that "change agency is better seen as replaying rather than resolving the ambiguity of HRM's role and identity in organisations" (p. 95). Similarly, Gerpott (2015) revisits the legacy of role conflict, but gives it a new twist by categorizing the "contradictory HRM demands into tensions of (1) identity, (2) learning, (3) performing and (4) organizing," and he argues that the "implementation of the business partner model resolves these tensions in the short-term by addressing the opposing forces separately. Yet, these resolution strategies are not sustainable and threaten the long-term impact of HRM" (p. 214). This position echoes the concerns expressed by Caldwell (2003c, 2008) regarding the long-term future of Ulrich-style HR roles and the move toward a more strategic HR function.

Over the last few years, a shift away from the early HR-orientated work is clearly evident when reviewing Caldwell's recent work. I learned that this arose from a combination of factors: the fallout from the financial crisis of 2007–2008 which, in his view, "shredded the resource-based theory of the firm;" a growing sense of disappointment with the efficacy of HR competency frameworks; and the increasing

challenges to HR in performing a strategic role while affirming its role as an employee champion (Caldwell 2008). All of these factors, as well as others, are discussed further in Marchington (2015), who argues that HR has become obsessed by its strategic business contribution, with the result that it has lost its connection to a more inclusive, ethical vision of employee engagement and progressive HR practices: "Unless HRM reasserts its independence, it is likely to wither both in academic and practitioner circles" (Marchington 2015, p. 176). Caldwell is perhaps a little more sanguine:

> HR professionals are undoubtedly masters of role reinvention. But they did not live-up to the promise of change agency or their role as employee champions. We need to focus less on the rhetoric of what they say and more of what they do. The future of HR research should be focused on the ethnography of practice.

Caldwell's early writings on "change agency" also continue to influence the field of organizational change studies, and this is illustrated through citations taken from the past decade. His influential article on *Models of Change Agency* (2003a) was important in breaking the hold of expert-centered models of the change agent, by opening a debate on distributed or dispersed models of change agency. These ideas have been developed by Buchanan et al. (2007) in their study of "distributive change agency" and Charles and Dawson (2011) in their account of change agency and the improvisation of strategies. Caldwell's (2003a, 2008) consistent criticisms of competency-based notions of change agent roles were also a precursor to the increasing focus on practice approaches to leadership and change management (Carroll et al. 2008). Raelin and Cataldo (2011) have recently developed these ideas in their account of middle management in the context of organizational change, and Raelin's (forthcoming) account of reframing "leadership as practice" draws directly on Caldwell's work. Caldwell's pioneering exploration of Foucault is also replayed by Cummings et al. (2016) in their recently published rethinking of Kurt Lewin's legacy for change management. Like Caldwell they use Foucault to analyze the "canonization" of Lewin's legacy as the originator of the belief in planned change as a linear process, facilitated by change agents (Caldwell 2005, 2006). For Cummings et al. (2016), Foucault offers new possibilities for a "counter-history" that enables us to think differently about the history of organizational change.

In briefly revisiting Caldwell's early work, a theme of locating/repositioning managers, leaders, and HR practitioners is apparent in terms of their competing claims to power and knowledge, expertise, and strategic influence. Essentially there appear to be four recurring categories of agency in Caldwell's early work: change leaders, change managers, change consultants, and change teams. Even though this distributed model has been influential, Caldwell, true to his own critical spirit, has questioned its utility. It originally emerged as a useful, analytical framework for *Agency and Change*, and Caldwell wrote a draft of the whole book following these categories but decided to consign the manuscript to the dustbin after submitting it to the publisher:

*I was never happy with the framework and the publisher was surprised when I then proposed to send them a completely new book, which thankfully they agreed to publish as a 'monograph.' However, some of the original material did resurface. I wrote a very long chapter on Senge for the aborted first book which I later turned into two articles. Similarly, my article (2009) on middle managers as change agents was an updated version of a chapter in the original version of the book that never appeared.*

Caldwell has taken our thinking about "distributed change agency" in new directions, but this focus now appears to have been overtaken by new challenges:

*The era of the change agent as expert, of purely instrumental knowledge and leader-centric change management is over. We need forms of distributed learning that extend into the deepest reaches of organization and embed us in the world. We need human agency that allows us all to practice our capacity to learn and to be part of the human and not so human world we inhabit. If I had one wish, it would be to define an ecological conception of agency that by its very definition would change how we see the world and how we seek to change it.*

## Legacies and New Directions: A Process-In-Practice Perspective

Caldwell's inquisitiveness and interest in how philosophy and social theories can help or seriously rethink organizational change shows no signs of abating, and his mature work has grown in its theoretical ambitions. In this concluding section, two themes are explored in terms of Caldwell's recent attempts to reconcile process and practice thinking about agency and change, which I suspect will become phase 4 of his work. As with most of Caldwell's writing, it reflects an evolution in thinking, rather than a break with previous ideas.

In *Agency and Change*, Caldwell constantly returned to the issue of how change as "process" and "organization" and as an entity or system that changes could be reconciled. One solution intimated in the book, but never fully explored, was to turn "structure" into process and theorize agency as practice. Caldwell now seems to have gone down this path by seeking to find a reconciliation between process perspectives and practice theory:

*The problem with the process perspective is that it can diffuse any notion of agency; process thinking is better at thinking change while practice theory is better at reclaiming agency–and both seriously underplay Whitehead's radical injunction to distribute agency to the non-human; it is not just about 'social' actions or interacting human agents.*

For Caldwell, the call for a process metaphysics of "becoming" in organizational change theory is an attempt to overthrow "being" by a metaphysical reversal: there is only becoming. In his view, this project marks a shift from epistemology toward ontology: "knowledge as substance and organization as entity are replaced by knowing as process and organization as organizing." This is clearly not envisaged as a "relatively minor alteration in ontological emphasis": a weak program designed to enable the process perspective to open up new research horizons. Nor is it positioned as a corrective exercise in overcoming the disjunctions in which

epistemology and ontology "drift" out of alignment with the result that "entities are discussed as if they were processes and processes discussed as if they were entities" (Thompson 2011, p. 757). The overall intent is not to maintain or manage a territorial coexistence between entity and process thinking: substance and being are to be replaced by process and becoming (Tsoukas and Chia 2002, 2011).

Caldwell is clearly perplexed by this ontological divide:

> *Is there any possibility of reconciliation between entity and process thinking in organiza-*
> *tional change theory? Being as 'substance' appears to reject becoming, while becoming as*
> *'process' denies being or relegates it to the outcome of process. Being tends to be conceived*
> *as static present-oriented and representational, while becoming is associated with change,*
> *potentiality, anti-representational thinking and the future. These ontological positions seem*
> *irreconcilable -or are they?*

In answering this question, Caldwell believes that the legacies of Heidegger and Whitehead are central to the choice posed between an event ontology of practice and a process ontology of becoming:

> *They both seek to escape from substance metaphysics, from any ontological commitment to a*
> *permanent, unchanging and unitary world of Being. Being conceived as 'substance'*
> *appears to deny becoming. But for Heidegger, Being-in-the-world includes becoming within*
> *being; change within stability, process within practice. In contrast, Whitehead appears to*
> *argue that stability is an illusion, time is relational, being is becoming. Whitehead's ontology*
> *of process resolves subject and object, the human and nonhuman into the indivisible*
> *relationality of all entities as they become; there is no search for Heidegger's disclosure*
> *of Being-in-the-world, or 'being for us.' Being is not a fixed entity out there; it is always the*
> *immanent and timeless repetition of becoming that creates something always different,*
> *something always new.*

In Caldwell's view, Heidegger's work inspired Schatzki's (2011) more realist "event ontology" of organizing, which favors "neither fluidity over stability nor stability over development" (p. 12). Instead, change happens as practices of doings, sayings, and other events in "any given swath of space-time"; as such, it always occurs as a "mix of change, stability, fluidity, and continuity" (Schatzki 2011, p. 12). In contrast, Tsoukas and Chia (2002, 2011) appear as the natural inheritors of a Whiteheadian process philosophy; becoming and change constitute reality; organization is the outcome of change and the process of organizing.

Practice and process theories of organizations do, of course, share many ontological affinities. Caldwell lists many of them:

> *They are less concerned with a substantive or entitative views of organizations, and more*
> *interested in organizing, changing, and becoming; they prefer a flat ontology without*
> *hierarchical concepts of scale, order or structure; they subsume epistemological ques-*
> *tions of knowledge into ontological categories of practice and process; they prefer a*
> *bottom-up micro-focus on organizing; they appear to reject representational thinking and*
> *naive epistemological realism; they seek to steer away from post-modernist or hyper-*
> *modernist theories as well as the grand narratives of western modernity and the*
> *debilitating legacy of constructionism; they are anti-structuralist, anti-positivist, but*

*not anti-humanist; they are opposed to the idea that theory defines practice - practice is theory, process is practice.*

Crucially for Caldwell, they seek to treat agency in a new manner; rather than a focus on individual actors, subjectivity, or the outmoded agency-structure dichotomy, human agency is distributed and dispersed within processes of becoming or is "carried" within social practices.

There are, however, in Caldwell's view, major differences between a more realist event ontology of practice, in which change and stability coexist within practices as happenings or doings that are indeterminate until they occur, and a process ontology of "organizational becoming," as a continuous process of organizing and changing that is immanent within process (Schatzki 2010). In one case, change and stability are ontologically located in the reality of "social" practices, while in the other case, change or process is treated as ontologically prior to order, stability, or the idea of organization as an entity.

This ontological difference, Caldwell maintains, partly explains why process research is somewhat ambivalent in how it theorizes "practice" and change:

*Becoming is primarily concerned with unpredictable event-like 'processes,' not the repetitive continuity of practices. To suggest that the 'doings' or practices of individuals or organizations as entities might define how change happens appears to be a return to the notion that things or entities are substances that change. There is no substratum or representation substance by which we can define 'organizations' or 'individuals.' But if 'change' is the 'condition of possibility of organization,' this raises important questions of how practices within processes unfold and how they can be carried within processes that are both constantly changing and stable. From the practice perspective, organization and organizing are modes of 'practice,' so continuity and change are coexistent or co-emergent. In contrast, Whiteheadian process perspectives do not derive from a social ontology, so they do not define how 'change' emerges within the vital and indivisible process of becoming–there is only the 'becoming of continuity.'*

Caldwell insists that these important differences need to be addressed:

*The alternative is to become locked into the self-contractions of becoming as a 'process' ontology of 'change' that radically rejects the representational thinking of substance metaphysics and sociological realism, but still treats organizations as relatively stabilized representational entities that are the outcome of organizing. By comparing and contrasting process and the practice theories of change, it may be possible to establish where they are mutually reinforcing and fundamentally incompatible.*

## References

In terms of further reading, my own personal recommendation would be to start with *Agency and Change* (Caldwell, 2006). It is a difficult read, but it brings together Caldwell's passions about the value of philosophy and social theory in critically advancing organizational change theory, and it is busting with research questions. If, however, one wants to explore the three phases of Caldwell's work, then his separate articles on Foucault, Schatzki, and Whitehead are useful signposts (2007, 2012, forthcoming 2018). Finally, two insightful articles on Senge published in 2012 are also worth

highlighting, because they cover an aspect of Caldwell's work on "system thinking" which preoccupied him in *Agency and Change* and which, I suspect, may reappear, given his long-standing interest in complexity theory as a theory which allows for self-organizing disequilibrium and system change, simultaneously (Caldwell, 2006, p. 99).

# Kim Cameron Changing the Study of Change: From Effectiveness to Positive Organizational Scholarship

# 17

David S. Bright and Marc Lavine

**Abstract**

Kim Cameron, is a professor at the Ross School of Business at the University of Michigan. During his career, he has generated several influential contributions that have shaped the field of organizational change. He has been a prolific researcher and writer, authoring 13 books and over 120 articles. Through his research, he has made deep contributions to a broad range of topics including organizational effectiveness, organizational decline and downsizing, organizational culture and the competing values framework, organizational paradox, organizational virtuousness, and positive organizational scholarship.

## Introduction

Kim S. Cameron is the William Russell Kelly Professor of Management and Organizations at the University of Michigan's Ross School of Business and professor of higher education in the School of Education. He holds an MA (1976) and Ph.D. (1978) from Yale University and has authored more than 120 articles and 13 books. Cameron's first academic role was as a professor and faculty member at Ricks College in Rexburg, Idaho. After completing a Ph.D. at Yale (1978), he served as an assistant professor at the University of Wisconsin. He moved to Boulder, Colorado, where he served as the director of the National Center for Higher Education Management Systems – a federally funded research center located on the campus of the University of Colorado. Cameron joined the faculty of the University of Michigan in 1984 and served there until 1995. From 1995 to 2001, he served as Associate Dean at Brigham Young University's Marriott School of Management and then as Dean of Case Western Reserve University's Weatherhead School of Management. He then rejoined the University of Michigan in 2001. He is presently the William Russell Kelly Professor of Management and Organizations and a Professor of the School of Education. He is a cofounder of the Center for Positive Organizations at the University of Michigan.

In preparation for this chapter, we interviewed Cameron for several hours to explore his perspective on how his work has contributed to the field of organizational change. Additionally, we have both coauthored work with Cameron and have long-standing familiarity with, and involvement in, his work. Cameron's work has been highly influential and often groundbreaking. Yet, Cameron is characteristically self-effacing as indicated by his reluctance to many prominent scholars who are featured in this volume. As former students of Cameron's, and as young professors, we have been profoundly touched by his influence and perspective. The process of writing this chapter afforded us an opportunity to explore, and more deeply appreciate, the impressive scope of his work. In this chapter, we interweave his personal history with a discussion of his contributions to scholarly understanding of organizational effectiveness, organizational decline and downsizing, organizational paradox, organizational culture and the competing values framework, organizational virtuousness, and positive organizational scholarship.

## Influences and Motivations: The Son of an Educator

Cameron was raised in the State of Utah where his father, J. Elliot Cameron, was a prominent educational administrator and university president. Kim Cameron's interest in the social sciences grew when he was an undergraduate at Brigham Young

University, where he studied under sociologists James Duke and Reed Bradford. These mentors helped him see the potential for creating positive social change through social science. Also during this period, he served as a teaching assistant under Reed Bradford with his lifelong friends, David Whetten and Robert "Bob" Quinn. Whetten and Quinn also went on to become influential organizational scholars.

After receiving a Master of Science degree in sociology from BYU, Cameron taught for 3 years at Ricks College in Rexburg, Idaho. During this period, he regularly drove the 280 miles from Rexburg to Provo, Utah, to be tutored by another BYU sociologist, W. Keith Warner, who introduced him to evaluation research, a path that he continued to pursue in his Ph.D. studies.

Cameron chose to attend Yale University because of its highly interdisciplinary focus. At Yale, his interest in organizational evaluation led him to focus on the emerging area of organizational effectiveness. Working under the direction of his dissertation chair, Richard Hackman, Cameron conducted a study in which he defined the meaning of organizational effectiveness and created an influential instrument to study the relative effectiveness of 47 universities and colleges, including Harvard and Yale (his colleagues have since joked that his dissertation addressed the question, "Which school is better: Harvard or Yale?").

Other mentors in his early career included Karl Weick, then-editor for *Administrative Science Quarterly*, who pushed Cameron to develop his writing ability and Larry Cummings, a faculty colleague at the University of Wisconsin, who provided much-needed encouragement to Cameron during the challenges of early academic life.

## Key Contributions: A Focus on Practical Problems

Cameron explains that his research topics have been driven by a desire to address problem-centered issues rather than theory-driven issues. After reviewing the full scope of his career, it is clear to us that he possesses a keen sense for the topics that are relevant to particular moments in time. His body of work is characterized by repeated, cutting-edge scholarship that has created a foundation on which others can build. In this review, we primarily address the aspects of his work that may be of particular interest to the organizational development and change community.

## Organizational Effectiveness

In Cameron's first position as an assistant professor at the University of Wisconsin, he began his scholarly career by publishing works related to his dissertation topic of organizational effectiveness. Two especially influential articles appeared in *Administrative Science Quarterly* (Cameron 1978) and *Organizational Dynamics* (1980). Cameron outlined the major approaches for studying effectiveness and explained that certain organizational systems, such as colleges or universities, can be

characterized as operating through organized chaos. He suggested that many of the then-current ways of understanding organizational effectiveness were irrelevant to higher education, and he established several dimensions for creating an appropriate measure of organizational effectiveness.

Based in this research, he generated a nine-dimensional model of organizational effectiveness that he had derived and validated through his work with 47 colleges in the Northeast: (1) student educational satisfaction, (2) student academic development, (3) student career development, (4) student personal development, (5) faculty and administrator employment satisfaction, (6) professional development and quality of faculty, (7) system openness and community interaction, (8) ability to acquire resources, and (9) organizational health. While this study was particularly relevant to institutions of higher education, it also represented a significant step in the general effort to articulate and measure dimensions of organizational effectiveness in a systematic fashion. In essence, it provided a benchmark for measuring the effectiveness of organizational change in higher education.

This work produced an early, influential instrument, simply known as the Cameron Organizational Effectiveness Instrument (1978). In the study of higher education, Cameron later developed a model (1981) from this instrument that describes four major domains of effectiveness that relate to (1) external adaptation, (2) morale, (3) academics, and (4) extracurricular personal development (see Sidebar 1). These four domains can be used to create a profile of a university's overall effectiveness. Cameron (1981) shows how these fields combine in different configurations to generate different kinds of and degrees of scholarship and other organization-level impacts.

**Sidebar 1 Domains of Organizational Effectiveness in Higher Education**

**External adaptation** includes student development and system openness and community interaction. The community involvement of the institution is the focus given to student preparation and outside-of-school employment.

**Morale** refers to student educational satisfaction, faculty and administration employment satisfaction, and organizational health. High morale among organizational members includes high levels of trust, member commitment, and conflict resolution.

**Academics** envelops student academic development, professional development and quality of the faculty, and ability to acquire resources. These dimensions relate to academic activities and educational outputs.

**Extracurricular** effectiveness focuses on student personal development, the personal nonacademic growth of students, and extracurricular activities.

Source: Adapted from Cameron (1981)

This work from Cameron's early career is still used in research today. His scholarship on organizational effectiveness is summarized in two books:

*Organizational Effectiveness: A Comparison of Multiple Models* (Cameron and Whetten 1983) and, more recently, *Organizational Effectiveness* (Cameron 2010).

## Life Cycles, Decline, and Downsizing

As a result of his work on effectiveness in higher education, Cameron moved to a position at the National Center for Higher Education Management Systems where he served as the director of organizational studies. In this role, he was charged to study how to manage colleges and universities more effectively. He traveled the country interviewing important leaders in higher education about the key issues they were facing. He developed a particular interest in the issue of organizational life cycles and organizational decline as dramatic shifts in the US population were slated to result in substantial decline in the number of US undergraduate students. He wrote several prominent articles on organizational life cycles, most notably "Perceptions of organizational life cycles" (Cameron and Whetten 1981) and "Organizational life cycles and shifting criteria of effectiveness" (Quinn and Cameron 1983). A notable model from this work integrated several known models into a four-stage model of development from (1) the entrepreneurial stage, (2) the collectivity stage, (3) the formalization and control stage, and (4) the elaboration and structure stage (see Sidebar 2). This model is valuable as a way of diagnosing the shifting dynamics of change at the organization level, including how the criteria of effectiveness change over time.

**Sidebar 2 Four Stages of the Organizational Life Cycle**
**1. Entrepreneurial stage**

- Marshaling of resources
- Lots of ideas
- Entrepreneurial activities
- Little planning and coordination
- Formation of a "niche"
- "Prime mover" has power

**2. Collectivity stage**

- Informal communication and structure
- Sense of collectivity
- Long hours spent
- Sense of mission
- Innovation continues
- High commitment

(*continued*)

**3. Formalization and control stage**

- Formalization of rules
- Stable structure
- Emphasis on efficiency and maintenance
- Conservatism
- Institutionalized procedures

**4. Elaboration of structure stage**

- Elaboration of structure
- Decentralization
- Domain expansion
- Adaptation
- Renewal

Source: Adapted from Quinn and Cameron (1983)

After 3 years in Colorado, Cameron moved to the University of Michigan in 1984. Shortly after his arrival, he met with an executive from one of the auto companies. As he told it, they had a conversation that went something like the following:

Cameron: "I want to study organizational decline."
Executive: "We're not in decline."
Cameron: "You're about to cut tens of thousands of jobs."
The response: "That's not organizational decline. We call it downsizing."
Cameron: "Well, then that's what I want to study!"

This interest in organizational decline and downsizing shaped much of his research agenda for the next decade. A notable publication of this era was *Organizational Dysfunctions of Decline* (Cameron et al. 1987), which documented the significant, long-term negative impacts of downsizing. In this landmark study, Cameron and his coauthors demonstrated that the large majority of companies receive only a short bump in financial performance when they downsize, but in the long run, they resume their decline.

Later, a coauthored paper with Sara Freeman (Freeman and Cameron 1993) discussed the distinctions between decline and downsizing, and he explained the various strategies for reorganizing and how these relate to changes to work, technology, or organizational structure. He and his colleagues also provided suggestions to managers about how they could carry out a downsizing decision with compassion for the people involved (Cameron et al. 1991).

From a change management perspective, these studies provided important guidance about the potential negative impact of downsizing and suggested the importance of looking at other alternatives for organizational restructuring, as well as the best practices for downsizing in as humane a way as possible.

## Culture and Paradox

As Cameron continued his work on downsizing, he and his colleagues began to see patterns in the tensions that managers were confronting when making difficult decisions. Cameron (1986) and Cameron and Quinn's (1988) edited volume *Organizational Paradox and Transformation*, gave voice to organizational forces beyond those of rationality or linearity, and began to articulate a theory of organizational change that used paradox as a framework to understand change. Cameron (1986) introduced the idea that paradox is an important attribute of effectiveness. That is, "to be effective, an organization must possess attributes that are simultaneously contradictory, even mutually exclusive" (1986, p. 545). He documented several types of "simultaneous opposites" that seem to be essential to effectiveness including loose coupling, specialization vs. generalization, continuity vs. adaptability, deviation amplification vs. deviation reduction, and others. This line of research has been especially insightful and has been cited in over 1,100 publications to date. He helped galvanize interest in paradox by contributing to the foundation for the present-day studies in this area.

Perhaps Cameron's principle contribution in this domain has been through his collaboration with Quinn on the development and use of the competing values framework. The framework highlights the trade-offs, tensions, contradictions, and paradoxes inherent in organizations and their leaders (Cameron et al. 2014; Cameron and Quinn 1988, 2011; Quinn and Cameron 1983). It comprises two dimensions that express the tensions or competing values that characterize all organizations (see Fig. 1). One axis represents the continuum between flexibility and adaptability, juxtaposed by stability or control. The other axis articulates the continuum between efficient internal processes, such as human resources practices or internal control systems, versus external positioning related to stakeholders, such as competitors, customers, and clients. Each continuum highlights performance criteria that are opposite from that of the other end of the continuum, such as internal versus external orientation (horizontal axis) or flexibility versus stability (vertical axis).

Based on the competing values model, Cameron and Quinn developed a widely used instrument to characterize organizational culture and individual leadership, published in *Diagnosing and Changing Organizational Culture: Based on the Competing Values Framework* (Cameron and Quinn 2011). This tool has been extensively used as a change management and leadership development resource, and it has been validated through a series of articles and books that have explored its psychometric properties. More than 100,000 people have taken assessment or used the resources in this text (Cameron and Quinn 2011).

The CVF has not only been used to characterize and change organizational culture, but also to promote leadership development. The development of leadership skill also involves paradoxical tensions. Marianne Lewis (2000) has asserted that managers need to recognize and become comfortable with – and even seek to benefit from – the tensions and the anxieties they provoke, for the contribution of paradox to management thinking is the recognition of its power to generate creative insight and change (Lewis 2000, p. 764). Leaders who can embrace inconsistencies and seek to support contradictory elements can simultaneously foster creative, beneficial

alternatives (Cameron and Quinn 1988; Poole and van de Ven 1989; Smith and Lewis 2011). Cameron's work in this area has also provided the basis for an articulation of paradoxical leadership (Lavine 2014) and the recognition that paradox can be a useful resource in organizational life.

Cameron's work on paradox has been considerably developed during the last decade. This interest in paradox seems to validate the assertion of several scholars that the transition to the twenty-first century would be characterized by paradox, ambiguity, and complexity (Cameron and Quinn 1988; Handy 1995; Lawrence et al. 2009; Vaill 1989).

## Organizational Virtuousness

As described earlier, Cameron's research in the 1980s and 1990s highlighted the long-term, negative impact of downsizing on most firms (Cameron 1994; Cameron et al. 1987). He noted that this pattern was dominant in more than 80% of the firms he had studied. During the mid-1990s, he became increasingly interested in that atypical subset of organizations, somewhere on the order of 10–15%, which seemed to thrive in the aftermath of downsizing. What accounted for the difference?

This line of questioning led him to hypothesize that these organizations might be characterized by positive dynamics that created a unique set of social resources, which enabled different possibilities during moments of crisis. He began to characterize these organizations as demonstrating "virtuousness."

Feeling very much like he was taking a risk, he summarized his thoughts in a presentation entitled "Organizational Virtues and Organizational Excellence," during the 1997 Academy of Management annual meeting. He was surprised by the positive response this presentation received. One member of the audience suggested that he apply for a grant with the Templeton Foundation on the topic of forgiveness. He applied for and was awarded a sizable grant on the concept of organizational forgiveness, thinking, perhaps, that forgiveness might play a role in recovery from downsizing. This series of interactions led to a dramatic reorientation in the direction of Cameron's research.

In 1998, he assumed the deanship at Case Western Reserve's Weatherhead School of Management, where he began conducting research on forgiveness alongside one of this chapter's coauthors, David Bright, who was then a doctoral student. In 2001, he returned to the faculty at the University of Michigan, where he met another doctoral student, Arran Caza. Together, these three pursued a research stream that examined forgiveness in organizations, along with other virtues. Their efforts culminated in several publications, including "Exploring Organizational Virtuousness and Performance" (Cameron et al. 2004). This article established an empirical foundation for studying perceptions of organizational virtuousness and found that organizations can be generally perceived as virtuous when they encourage the characteristics of optimism. Trust, compassion, forgiveness, and integrity – these virtues were positively related to innovation, quality work, low turnover intent, and customer retention, and all were significantly related to organizational effectiveness.

A later study, "The Amplifying and Buffering Effects of Virtuousness in Downsized Organizations" (Bright et al. 2006), showed that perceptions of various kinds of virtuousness interact to mitigate the harmful effects of downsizing. Specifically, employees were more likely to be forgiving of managers who were willing to take responsibility for the decision to downsize. In addition, forgiveness and responsibility were connected to an overall, general perception of organizational virtuousness. Most importantly, forgiving, virtuous organizations were demonstrably less likely to experience the long-term deleterious effects of downsizing. These findings provided evidence for the amplifying and buffering hypotheses; that is, the nurturing of one or more virtues tends to amplify other virtues, and the general presence of perceived virtuousness tends to buffer organizations from the negative effects of a crisis in organizational life.

Cameron has continued to write about organizational virtuousness in many articles and several books, such as *Leading with Values: Positivity, Virtues and High Performance* (Hess and Cameron 2006) and *The Virtuous Organization* (Manz et al. 2008). These works have stimulated a growing interest in the idea of studying virtues at an organizational level, whereas virtues were previously understood to be the purview of only individual-level analysis.

## Positive Organizational Scholarship

When Cameron returned to the University of Michigan in 2001, he continued to present and promote his developing ideas on organizational virtuousness. At this time, his colleagues Jane Dutton and Robert Quinn were exploring the topics of organizational compassion and authentic leadership. Simultaneously, the positive psychology movement was growing in momentum. In the field of organization development, practices such as appreciative inquiry (AI) were being used to foster transformation and change in organizations.

Together, Cameron, Dutton, and Quinn realized that a fundamental change was emerging among a certain set of scholars and practitioners across the academy. Cameron described it as a shift from studying organizations from a deficiency or deficit perspective toward a perspective of abundance. Thus, these three decided to form a community of scholars who were interested in studying and developing theories that explain and enable positive deviance or unusually favorable outcomes in organizations. Working together with other colleagues at the University of Michigan, they defined a new domain of inquiry: positive organizational scholarship (POS). They later described the phenomenon they were aiming to study as follows:

> Imagine [a] world in which almost all organizations are typified by appreciation, collaboration, virtuousness, vitality, and meaningfulness. Creating abundance and human well-being are key indicators of success. Imagine that members of such organizations are characterized by trustworthiness, resilience, wisdom, humility, and high levels of positive energy. Social relationships and interactions are characterized by compassion, loyalty, honesty, respect, and forgiveness. Significant attention is given to what makes life worth living. Imagine that scholarly researchers emphasize theories of excellence, transcendence, positive deviance, extraordinary performance, and positive spirals of flourishing. (Cameron et al. 2003, p. 1)

Using this vision as an anchor, they organized a small conference – held at the University of Michigan in 2002 – where they invited other scholars to consider how to frame serious scholarship from this "positive" perspective. The event included a number of prominent thinkers such as Whetten, Weick, James March, Jerry Davis, Barbara Fredrickson, Chris Peterson, Amy Wrzesniewski, Jim Ludema, Gretchen Spreitzer, and Wayne Baker, among others, including many doctoral students who were in the formative stages of their careers. The conference marked the beginning of the POS community and area of inquiry. Cameron spearheaded the effort to obtain and assemble chapters from many conference participants, leading to the book *Positive Organizational Scholarship: Foundations of a New Discipline* (Cameron et al. 2003) which since has been cited thousands of times.

Cameron and his colleagues have dedicated their efforts to continue and foster momentum on POS. Cameron has written several articles that lay out the basic elements of the POS research agenda or its implications. His books in this area include *Positive Leadership* (Cameron 2012) and *Making the Impossible Possible* (Cameron and Lavine 2006).

## New Insights: Generative Fields of Study

Cameron's work on organizational effectiveness is evident in higher education. His scholarship brought increased precision to the measurement and multidimensional nature of effectiveness. His work on organizational life cycles, decline, and downsizing showed that decline did not ensure ineffectiveness and that downsizing often did not yield the expected performance improvements. Some of his later work in this area, such as Gittell et al. (2006), began to explore topics central to positive organizational scholarship and to Cameron's subsequent research, such as the role that forgiveness and other elements of compassion could play in yielding resilient outcomes in the midst of downsizing and decline.

As authors of this chapter, we both have had the good fortune to be beneficiaries of Cameron's mentorship and collaboration. In the early years of the development of positive organizational scholarship, there was some skepticism about POS and concern that it looked at organizational dynamics through rose-colored glasses. There was, therefore, particular interest in organizational examples that demonstrated POS principles in practice.

Rather than an organization that embodied "sweetness and light," one of the early examples was a situation of organizational decline and downsizing, as well as a first-rate thorny organizational problem: the largest nuclear cleanup and closure in world history at Rocky Flats in Colorado. One of us had the opportunity to conduct research about the organizational performance at Rocky Flats and began to identify positive and resilient practices that seemed to contribute to extraordinary organizational outcomes (work was completed 66 years and $30 billion ahead of schedule to a cleanup standard 200 times greater than initial estimates). This helped provide a rich example and basis for further theorizing about positive organizational dynamics (Cameron and Lavine 2006; Lavine and Cameron 2012).

## A Lasting Legacy: The Positive Lens

When we asked Cameron for his perspective on legacy, he was hesitant to answer the question. Then, he described his belief that work on organizational effectiveness has largely fallen out of favor as an area for serious empirical research. He believes that the reasons for this development are many, but primarily he views the topic of organizational effectiveness as being especially vulnerable to critique and deconstruction. In his view, many different, often competing philosophical approaches have emerged for studying effectiveness, and thus little convergence has occurred around a clearly established set of constructs as the basis for the study of effectiveness.

In this regard, Cameron's greatest hope is that his work of the past two decades on POS will not experience the same fate but rather achieve sustained momentum in the broader social-scientific community. For him, the key is the "S" in Positive Organizational Scholarship. He believes that a research stream can survive only so

long as it provides a conceptual foundation that is amenable to rigorous and empirical scholarship. Thus, though he is hesitant to think about legacy, one of his biggest hopes is that future generations of organizational scholars will be inspired to conduct significant, empirical research on topics that help us understand the conditions for human well-being and flourishing, high-performance organizations.

As we look more carefully at how Cameron's work has influenced various streams of research, the picture is impressive. Scholars who work on any aspect of organizational flourishing or organizational virtues are building on a foundation that Cameron helped establish. Hundreds of articles have emerged from, or been influenced by, the POS movement. Cameron and his colleagues have established the Center for Positive Organizations at the University of Michigan, and the POS community of scholars now includes at least 400 members. Many organization change scholars have drawn on POS research to support innovations in OD practice – for example, in appreciative inquiry and dialogic inquiry.

The phenomenon of organizational virtuousness as a general organizational characteristic has attracted interest from a modest group of researchers, including many in international locations. Researchers have confirmed and extended early findings about perceived organizational virtuousness, including the links to organizational performance. More generally, Cameron's work is often cited to support research on specific virtues, research on values, and writing about corporate social responsibility.

The idea that virtues may be organizational is seen as somewhat controversial, particularly in the virtue ethics community (Bright et al. 2014; Sison and Fontrodona 2015). Just how and under what circumstances, a virtue may be organizational is yet to be clarified. Nevertheless, Cameron's early work has prompted scholars all over the world to explore or consider how to understand this important moral dimension of human organizational systems.

As we noted earlier, the topic of paradox is now a robust area of inquiry. This is evident in the work of scholars such as Marianne Lewis and Wendy Smith and in journal special issues, conference streams, and other scholarly community coalescing around the study of paradox.

As a mentor, Cameron has played an important role in developing future scholars. We have benefited from his tutoring and insight for many years. We entered academia during the nascent stages of Cameron's work on POS. Our collaborations with Cameron propelled us both to continue to explore and contribute to POS research. Notable student coauthors include Sara Freeman and Aneil Mishra, who worked with Cameron on downsizing research. Arran Caza and David Bright worked with him on organizational virtuousness. Marc Lavine partnered with him on work pertaining to positive organizational scholarship. Many others have also benefitted from his teaching.

As a scholar, Cameron has demonstrated a repeated ability to work as a pioneer, or early leader, in many areas of scholarship. Taken as a whole, his deep contribution to many areas of scholarly inquiry is not just impressive, but it would also seem to represent significant change. Yet, another contribution of how Cameron has

approached his work – not just what he has studied – is that he consistently finds ways to integrate or create synergy between topics and even the orientation of varied scholarly views. He has explored empirical and positivist topics, as well as deeply normative ones. This is where his ability to integrate is perhaps most evident. To a topic like effectiveness, Cameron considers the role of paradoxical dynamics and forgiveness. In the normative terrain of positive organizational scholarship and the study of virtuousness, Cameron advocates for empirical rigor and considers the relationship between these things and matters of organizational performance. Finally, he is known as a thoughtful, compassionate, and wise human being who exemplifies the virtues and positive dynamics that he studies.

# Robert Chin and Kenneth D. Benne: Change Management Biography

# 18

## Mary A. Barnes

### Abstract

Robert Chin and Kenneth Benne spent key years in the middle of their careers working and collaborating with each other. Chin came from a social psychology background while Benne was from an educational philosophy background. During their time together, they founded an interdisciplinary Human Relations Center at Boston University, cowrote a seminal book on planned change with Warren Bennis and, within that text, developed three key strategies for implementing a planned change. Even in their organizational change work, there was always a social undertone to their work. Perhaps more important than the seminal work in planned change that is still referenced today was their individual and collaborative goal to help others accept and leverage – and not just tolerate – diversity in the social system. This chapter discusses their individual influences and motivations, their collaborative work and contributions to the change community, and how their work, both together and separate, inspired others.

### Keywords

Planned change • Change strategies • Organizational change

## Introduction

When I was asked to write about Kenneth Benne and Robert Chin as great change thinkers, I enthusiastically volunteered because of their seminal work on planned change strategies and how much the concept of normative-reeducative change strategies resonated with me and my work as a scholar practitioner/change agent. Until I started researching the comprehensiveness of their work, I had no idea how influential they both were, in their own ways. Benne and Chin found each other when Benne came to Boston University in 1953. At various points in their lives, both had experienced periods of isolation and/or ridicule based on prevailing social norms to which they did not conform. This seemed to bring them together and provided a social undercurrent to their work. While Benne and Chin are known in the organizational change realm, they had much more impact on social change and diversity than I initially realized. Hopefully, the story of Chin and Benne's work and journey will provide the reader with the context and perspective on their work that I found so valuable.

## Influences and Motivations: Isolation Leads to Inspiration

Kenneth D. Benne (1908–1992) was born to German immigrants in rural Kansas. Benne's values were strongly influenced by his father's democratic and unprejudiced attitudes and behavior (Nash 1992). This concept of democracy became a prevailing topic in Benne's work throughout his career.

That career started when Benne became a school teacher in rural Kansas. Benne moved on to complete his B.S. degree in 1930 at Kansas State University with a double major in science and English literature. He completed an M.A. in philosophy at the University of Michigan and a Ph.D. at Teachers College, Columbia University, in 1944. After the war, he joined the University of Illinois. He came to the university with glowing recommendations from well-known scholars in the field. John Dewey wrote that he "has one of the most gifted minds in philosophy that I have come across" (Feinberg and Odeshoo 2000, p. 12). W.H. Kilpatrick called him "the most brilliant student who studied under me at Teachers College" (Feinberg and Odeshoo 2000, p. 12). The Dean of the University of Illinois, in justification for the appointment, wrote, "Professor Benne is perhaps the most distinguished scholar who has been brought to the faculty of the College of Education in the past 25 years" (Feinberg and Odeshoo 2000, p. 12).

Benne's earliest influences of his father led him to the first of several distinct concepts for which Benne came to be known. His first focus was as a social

philosopher of education in the vein of John Dewey. The concepts of democracy and democratic education resonated with him, and he focused his theoretical works on this concept. However, theory was not enough. Much like Dewey, he also founded a laboratory for the practical application of theory. In 1947, Benne, along with Kurt Lewin, Ron Lippitt, and Lee Bradford (you can find separate chapters on Lewin and Lippitt in this book), cofounded the National Training Laboratories (NTL) Institute for Applied Behavioral Science. The NTL Institute became a major influence in corporate training of the day and developed the T-group methodology for interpersonal sensitivity training, which is still in use today. His career got off to a great start at Teacher's College and continued to gain momentum at the University of Illinois. However, that only lasted until he was forced to resign in 1953 because of his sexual orientation. In a letter to George Stoddard, the president of the University of Illinois at the time, Benne wrote that "after the initial shock. . . to [his] self-esteem. . . [he has] reassessed as self-objectively as possible my value to the teaching profession. I have concluded that I am worth rehabilitating in the profession, if such rehabilitation is at all possible" (Feinberg and Odeshoo 2000, p. 13). His ability to reflect objectively and willingness to sacrifice in order to spread knowledge as a professor is indicative of his passion for learning and sharing knowledge. After that reflection, and a letter of recommendation from Stoddard, Benne rejoined academia and came to Boston University. At Boston University, his career quickly regained momentum, and he met Robert Chin.

Robert Chin (1918–1990) was born to a Chinese immigrant father and an American-born mother, whose parents had also come from China. His experiences while growing up in New York City (in a neighborhood without other Chinese Americans) left him feeling very different and alone (Saxe and Kubzansky 1991). This early experience seemed to leave an impression on him and found its way into his research and work combatting prejudice and creating social action and change. When World War II began, Chin was a psychology student at Columbia University. He earned his B.A. in 1939, his M.A. in 1940, and his Ph.D. in social psychology in 1943. In 1943, he enrolled in the US Army's Office of Strategic Services where, along with other psychologists, he served in counterintelligence.

At the conclusion of the war, he became a postdoctoral fellow at Harvard University. He subsequently moved to Boston University in 1947 where he became a critical part of the institution for the next 32 years. In those first few years at Boston University, he researched and worked with his mentor, Otto Klineberg. Their research looked at the intelligence scores of minorities and challenged the notion of the time that minorities were intellectually inferior to Whites. This work was part of the psychological foundation that contributed to the Brown v. Board of Education decision (Klineberg 1986). Chin met Benne when Benne came to Boston University, and they both became founding members of the Human Relations Center. It was the collaborative nature of the Human Relations Center that produced some of Chin and Benne's most influential work in the organizational change field.

# Key Contributions and Insights: Strategies for Change

## Human Relations Center

In 1953, shortly after Benne joined the faculty at Boston University, the Human Relations Center was created. Endorsed by Harold Case, Boston University's president at the time, Benne was chosen as the center's Executive Director, with Chin from the Department of Psychology, Theodore Berenson from the School of Education, and Francis Hurwitz from the School of Public Relations and Communication as founding members, serving in various roles as administrators, faculty, and staff.

The Human Relations Center had three goals (Choi n.d.):

1. Education – to provide instruction on human relations issues to students, administrators, and faculty
2. Research – to develop and engage applied social science methods to study group and organizational dynamics
3. Community service – to foster best practices on human interactions at the grass roots and local level

A 1956 brochure describes the center not as a school or department, but instead a "university-wide facility which attempts to stimulate and support, in all schools or departments, programs of instruction, research, and community focus in human relations. Its initial focus in the broad spectrum of human relations is upon problems of change in relationships within small groups, organizational, and community settings" (Choi n.d.).

The real power of the center was the collaborative and interdisciplinary environment it fostered. It was here that Chin and Benne began their collaboration. Chin came from a social psychology background, and Benne brought his educational and group dynamics background. At the Human Relations Center, they placed both psychology and social sciences at the center of confronting societal prejudices such as racism and anti-Semitism. It was here that their unique experiences of nonconformity to social norms inspired their research and work. Together, they challenged the limitations of scientific studies on human behavior and relationships.

## The Planning of Change

*The Planning of Change* (1961), written by Warren Bennis, Kenneth Benne, and Robert Chin, was another significant outcome from the collaborative nature of the Human Relations Center and remains one of the most important pieces of literature on understanding organizational planned change. The book is comprised of various works that support the authors' goal to help "the reader in the application of valid and appropriate knowledge in human affairs for the purpose of creating intelligent action necessary to bring about planned change" (Bennis et al. 1961). In the book,

planned change is described as a "conscious, deliberate, and collaborative effort to improve the operation of a human system" (Bennis et al. 1961). Within this book, Benne and Chin bring together the three strategies for implementing change that has become one of their lasting contributions to the study of planned change.

## Strategies for Change

Within the pages of *The Planning of Change*, Chin and Benne partner up to provide three approaches, or strategies, for implementing change in organizational and social contexts. The chapter, which was specifically developed for the second edition of the book, built upon an original paper that Robert Chin developed for a Denver conference in 1967 entitled "Designing Education for the Future – An Eight State Project." Kenneth Benne partnered with Chin in adapting and revising the original paper. In that revision process, a practically new paper emerged. One can see some remnants of the educational focus and first person nature of the paper. Chin and Benne chose to specifically address a planned change. They expanded on the definition of planned change in the broader book by stating that planned changes are "attempts to bring about change [that] are conscious, deliberate, and intended, at least on the part of one or more agents related to the change attempt" (Chin and Benne 1989, p. 22). They further explained that, in planned change, there is "the conscious utilization and application of knowledge as an instrument or tool for modifying patterns and institutions of practice" (Chin and Benne 1989, p. 22).

The strategies of change outlined are empirical-rational, power coercive, and normative-reeducative. They provide a framework for the planning of change that continues to take place in the management of change in organizations and social settings today. The brief description that follows is only meant to provide an overview. For a more detailed understanding of these strategies, explore the other readings suggested in the last section of this chapter.

### Empirical-Rational Strategy

The empirical-rational strategy is founded on the assumption that stakeholders of a change are rational individuals and will change as long as the case is made that it is in their best interests. Furthermore, it is assumed that they will support and enact the change as soon as they understand how the change will benefit them. This strategy, then, is reliant on communicating the benefits convincingly to all concerned and affected parties and delivering appropriate incentives for them to accept the proposed changes.

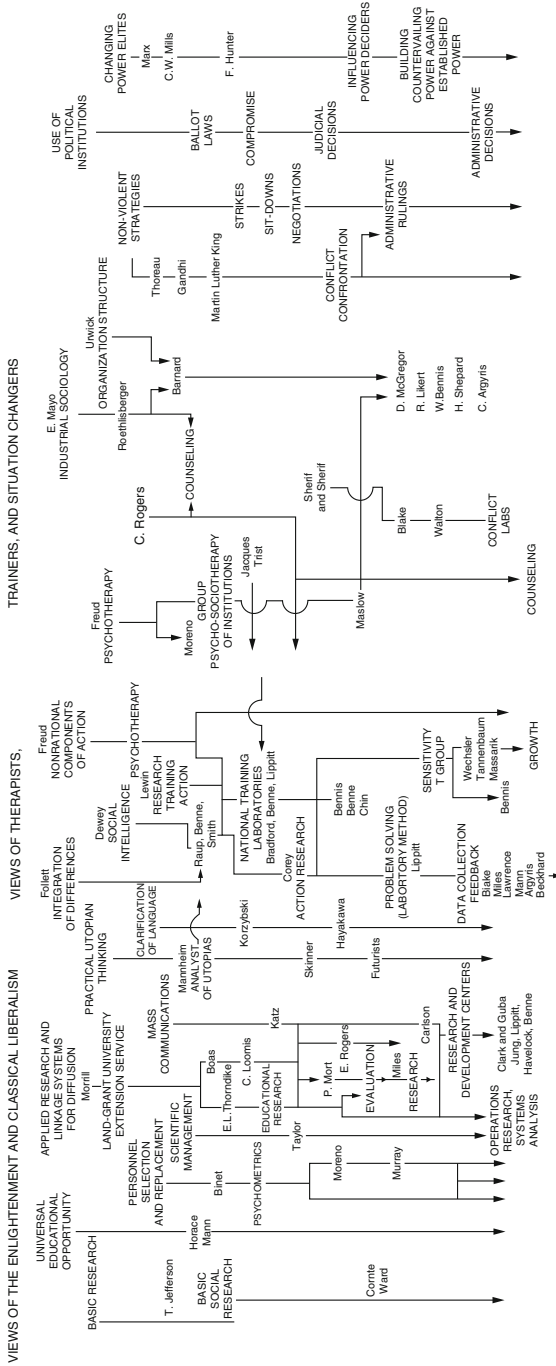
By looking at Fig. 1 (below), one can see the various components that Chin and Benne attributed to this strategy. Taylor and the concept of scientific management fall under this category, as well as social research and more psychology-driven work. It also makes sense that mass communications is a consideration in this strategy, given the importance of communicating the rationale for change has to the strategy. Components of research and development centers, including Benne and his contemporaries, are also included. While maybe not intuitive, a component of this strategy


**Fig. 1** Strategies of deliberate changing

is understanding the needs of the stakeholders so that a message can be crafted that will show the stakeholder how the change will meet their needs and/or solve their problems. The psychology and research centers played an important role in figuring out those motivations.

## Power Coercion

The power coercion strategy is best utilized when the urgency for change is high. The basic assumption for this strategy is that the stakeholders of the change will, ultimately, do what they are told. The individual in power assumes the role of a change agent and exercises that power to effect a change. This power may range from subtle manipulation to the application of physical force, and anything in between. The main benefit of this approach is that it is an efficient way to change when urgency is high. However, the presumed benefits of this approach come at the expense of relationships, trust, and the individual commitment and motivation of the employees.

Interestingly, Chin and Benne made specific note that the power can come from a grassroots movement as well. As shown below in the Fig. 1, the nonviolent change strategies of Gandhi, Martin Luther King, Jr., union workers, etc. are all listed under this power-coercion strategy. The thought is that the power of numbers and grassroots movements can be used to shame or embarrass leaders into taking the desired action or making the desired change, in effect changing the paradigm and giving the power to coerce and force a change to the masses.

## Normative-Reeducative Strategy

The normative-reeducative strategy is based on the assumption that stakeholders of the change are guided by the desire to conform to social norms and will eventually adhere to the new cultural norms and values established by the social system (normative). This change process is founded on the concept of changing the existing values and norms and developing stakeholder commitment to the new values and norms. Changing values and norms is not as easy as it might sound. This process emphasizes changes in stakeholder skills, knowledge, competencies, and relationships – providing a "reeducation" of the behaviors and values that define the targeted change.

For changes to occur with this strategy, the stakeholder is engaged in the change process. In order to conform to the new social norms, the stakeholder must reflect and reconsider the habits, normative structures, values, institutionalized relationships, and roles that define how they fit into that organizational or social structure. This strategy is reliant on change agents who encourage and support the reeducative process, helping stakeholders develop the new skills and behaviors needed to successfully change. The success of these change agents is dependent on their ability to support learning and to work collaboratively with the stakeholders they are meant to help change.

Chin and Benne note that the normative-reeducative strategy gradually emerged as an effective approach in more modern times. The normative-reeducative strategy emphasizes participation, emergent processes, fair negotiation, trust, and

transparency. This strategy, while seemingly a simple concept, is more complex than the other two and in line with complimentary concepts such as organizational learning.

The figure below provides an overview of the three strategies for change and the various types of change and scholars associated with each strategy. You can see how grassroots, nonviolent strategies find their way under the power-coercive heading. In contrast, their contemporaries, many of whom are in the various chapters of this book, are classified under normative-reeducative.

## New Insights: Continuing on Their Own Path

After Chin and Benne left the Human Relations Center in the 1960s, they continued to expand on their own interests. Kenneth Benne pursued further work on educational theories, building on the concept of reeducation of adults and reconceiving pedagogical authority as "anthropological authority." He expanded his participation and leadership in the Psychology of Education Society (PES), where he collaborated, inspired, and learned from other well-known scholars in the same circle. One such scholar, Maxine Greene (1993), had this to say about Kenneth Benne and his presence at the PES meetings: "when Professor Benne attended meetings of the Philosophy of Education Society, he seemed to many of us to be younger in spirit than the solemn, sometimes cynical, certainly skeptical postmodernists among us. Calling for acknowledgment of an often noble (and too frequently forgotten) past, he was at once beckoning towards a future, trying to move the faithless to a common faith." He continued to write and lecture to attempt to demonstrate, both in theory and in practice, a value in diversity and how we can all come to see that value. Additionally, he explored his passion for poetry, eventually publishing a book of his poems, many of which he had shared in personal correspondence over the years (Nash 1992).

While Benne went back to his academic roots, Robert Chin went back to his ancestral roots, working and studying in Asia. He was a Fulbright scholar at National Taiwan University in 1963 and directed the Social Research Center at the Chinese University in Hong Kong in 1971. In 1969, he and his wife, a sociologist, coauthored a book, *Psychological Research in Communist China*, *1949–1966*. This book, as the title suggests, is an attempt to summarize and analyze the scientific research in the field of psychology from the rise of the Communist Party through the first phases of the Cultural Revolution on mainland China. Beginning in 1979, that collaboration led the Chins to travel throughout China, where they lectured and consulted at major universities, bringing the concept of organizational theory to China, not exactly an easy task. Chin did not spend all of his time after the Human Resource Center in Asia. He participated regularly in the academic and scholarly communities in the West as well. As I spoke to folks about my task of writing this article, I heard personal stories of Chin inviting scholars over to his house to eat Chinese food made from scratch and continue the scholarly conversation with him and his wife in their home. By all accounts, he was a humble, friendly, and brilliant man who enjoyed his

work and colleagues in a pure way. Although both Chin and Benne went their separate ways, their work continued to be influential in the field of social change.

In terms of change, you can see the concepts developed by Chin and Benne in several models and strategies for change developed since, whether they actual cite Chin and Benne and their strategies or not. Some strategies and models – both scholar and practitioner centric – have built on the Chin and Benne model indirectly, addressing perceived shortcomings or creating a more marketable step-by-step process for change agents. Other scholars have taken the three strategies for change outlined by Chin and Benne and built on them more directly.

Quinn et al. (2000) analyzed the common change practices of Gandhi, Martin Luther King, Jr., and Jesus Christ. The nonviolent change strategies of Gandhi and King were previously placed in the power-coercive category by Chin and Benne. Quinn, Spreitzer, and Brown (2000) saw a different common thread among those change agents and developed what he called Advanced Change Theory. At the heart of this change theory is the "transforming strategy," a proposed fourth change strategy (Quinn and Sonenshein 2008) for the model Chin and Benne outlined previously.

Szabla (2007) used the Chin and Benne change strategies as his organizing framework to look at resistance to planned change and eventually developed that into the Perception of Change Strategy Scale (Szabla et al. 2016). Nickols (2016) built onto the three original change strategies by Chin and Benne and proposed a fourth, environmental-adaptive. This proposed fourth strategy adds the environment as an additional element and is based on the assumption that people adapt rather easily to new environments, even when they resist change. This fourth strategy advocates creating a new environment and slowly moving people from the old to the new environment and letting undesirable environmental components "die on the vine."

## Legacies and Unfinished Business: Quite Elusive Men

For me personally, the legacy of Chin and Benne has evolved as I researched this chapter. At the start, I would have stated that their concepts around normative-reeducative change strategies, and everything that means to scholar practitioners like me, were their legacy – that their concept of culture and learning as the foundation to a successful planned change has helped me build a reputation as someone who successfully creates the desired change with some sense of regularity and reliability. However, as I read and researched their lives before and after their time at the Human Resource Center, I have to say that my understanding of their work and their legacy has deepened. From different perspectives, and founded in different disciplines, Chin and Benne have explored changing hearts and minds, helping people embrace – and not just tolerate – diversity and put their theories into practice in order to actually impact real people in a real way. It is true that Robert Chin and Kenneth Benne have provided important contributions to the organizational change field. However, they have contributed more than that. They each held

true to their early influences and kept a social undertone in their work. Together, they left us the tools and inspiration to leverage, not reject, our differences; to challenge social norms; and to create social change. It is clear that their work is not yet complete and, perhaps, is needed now, more than ever. I feel it is fitting to end with one of Kenneth Benne's poems entitled *Epiphany* from his 1979 Christmas letter (Raywid 1993):

> Others one day, you must agree,
> will voice last words of me.
> Foe, partisan and lover and
> value-free professor.
> Each will think he's true to the man he knew
> Or knows, he feels, from the book.
> Each will say "Look!
> Here he is, this is he;"
> will deal justly,
> Justly as he can, with a quite elusive man.

Both Benne and Chin were elusive in their own way. I'm sure each of them was much more complex than anything I could have pulled up through researching their academic history and work. They seemed to have a passion for their work and let their work take the spotlight. However, I hope that they would think I have captured their essence justly.

# David Coghlan: The World of the Scholar Practitioner and Practical Knowing

Geralyn Hynes

**Abstract**

David Coghlan is first and foremost a scholar practitioner who has interrogated what this means both philosophically and as a practitioner of and educator in organization development (OD). He is most widely known for his conceptualization of insider action research and for introducing action research and OD to new audiences across different disciplines and settings through the book *Doing Action Research in Your Own Organization*, now in its fourth edition. As action research becomes increasingly diffuse in terms of different modalities, Coghlan's theoretical papers on authenticity, practical knowing and interiority offer core ideas that speak to and transcend the particularity of each modality. Coghlan is a major contributor to the field of OD through his writing and editing work. His exploration of the OD/action research heritage includes its history, modes of expression, and action research's rejected place in the academy. He coedited *The SAGE Encyclopedia of Action Research*, a major contribution to the world of action research that brings together its myriad histories, contributors, theories, methods, and practices. This work represents an important characteristic of Coghlan's writing, namely, his exploration of relationships between ideas such as action learning and action research, thus, bringing a freshness to how we apply them to practice. Coghlan remains a prolific writer in his field, and his oeuvre reflects his ongoing work toward articulating of a philosophy of OD.

## Contents

## Introduction

David Coghlan, professor emeritus at the Trinity Business School, Trinity College Dublin (FTCD Emeritus), is perhaps most widely known for his writing on organization development (OD) and insider action research. By bringing forward the idea of insider action research, he introduced generations of different professional groups to action research and the world of OD. Along with the late Teresa Brannick, he coauthored *Doing Action Research in Your own Organization*, which is now in its fourth edition (Coghlan and Brannick 2014). That book, which has a wide and international multidisciplinary readership, provides both a conceptualization of insider action research and a practical guide for researchers. Insider action research is now a well-established field of inquiry across public and private sectors (Coghlan et al. 2015) and is gaining increasing traction in doctoral research (Coghlan 2007; Coghlan and Holian 2015; Holian and Coghlan 2013). Coghlan was elected a fellow of Trinity College Dublin in 2005.

In a series of papers, he laid down the building blocks for the development of a philosophy for OD. In this, he is following the footsteps of others – including Edgar Schein – but is marking out new territory through his writing on the scholar-practitioner (Coghlan 2013b; Coghlan and Shani 2009), authenticity (Coghlan 2008), and interiority (Coghlan 2010a) that both speak to the contemporary debates surrounding OD and offer a unifying structure within which OD practitioners using diverse approaches can operate. Along the way, he coedited the groundbreaking *The SAGE Encyclopedia of Action Research* (Coghlan and Brydon-Miller 2014) that, for the first time, drew together different traditions, philosophies, settings, and applications of action research. He has also edited a number of special issues for journals, including *The Journal of Applied Behavioral Science* (Coghlan and Shani 2009), *Action Research* (Coghlan and Holian 2007), *Journal of Managerial Psychology* (1995), and *Organization Development Journal* (Coghlan 1996b, 1997a). He remains a prolific writer in the field of OD and action research, with 170 peer-reviewed publications, and sits on the boards of a number of journals that have an interest in

action research. His corpus reflects the juxtaposition of influences including his spirituality, early career, OD education, and the work of the philosopher, Bernard Lonergan (1904–1984), culminating in an articulation of first person inquiry that underpins not only his writing but also his own practice and engagement with others.

In his most recent book (Coghlan 2016a), he demonstrated how he operationalizes his own scholarly practice as a university educator. This is significant at several levels. It provides a counterforce to the prevailing techno-rational approach to university education and also demonstrates how practical knowing can be privileged, even within the higher education culture of today. There is a subversive quality to this work that is immediately recognizable to insider action researchers in several ways. Coghlan brings into sharp focus his efforts to align his espoused theories with theories in use; he is challenging embedded practices in third-level education; and he is articulating his first-, second-, and third-person practice with attention to quality and rigor in the process. Thus, in this book, he is speaking to wide multidisciplinary readership in his articulation of what it means to be a scholar-practitioner, to continually question his own practice, and to interrogate his theories in use against a clear set of quality parameters.

## Influences and Motivations: Inquiry as a Way of Being

As a priest and member of the Society of Jesus (Jesuit order) in Ireland, Coghlan is immersed in the tradition of Ignatian and Jesuit spirituality. With this comes a view of prayer and activity as integrally linked in a cycle, with each shaping the other. Coghlan joined the Jesuit order at a time in which profound changes were beginning to unfold in the Catholic Church as a whole. There followed a growing interest in historical research about the Ignatian and Jesuit sources, particularly the writings of Ignatius, the founder, to rediscover his original spirit. In a 2005 paper, Coghlan explored how motifs of Ignatian spirituality – with its emphasis on action – overlap with action research to form a transformational social science (Coghlan 2005). Thus, for those who practice Ignition spirituality, the overlap finds complementarity and added richness in the relationship between experiential knowing that is drawn from religious faith and inquiry in action that is associated with action research and its attendant emphasis on rigor and quality of inquiry. The overlap provides a powerful context and backdrop to Coghlan's focus and development of first-, second-, and third-person inquiry in action research and more recent writing on practical knowing, authenticity, and interiority. But it would be wrong to simply see these themes in his writing as end products of the practice of Ignatian spirituality and action research. More than that, their central concepts are fundamental points of reference that guide his writing and practice.

In his early life as a Jesuit in the 1970s, Coghlan was influenced by Carl Rogers' ideas of the self, the capacity of the person to self-direct, and the role of the professional helper as one who facilitates this self-direction. With psychologist Eddie McIlduff, Coghlan examined the term "nondirectiveness" that was central to a

Rogerian approach. They published papers on structuring-unstructuring and directiveness-nondirectiveness as discrete and interdependent dimensions of facilitator behavior (Coghlan and McIlduff 1990). The level and nature of direction provided by the facilitator is influenced by their attitude/disposition and motivation. However, there is always some degree of structure to group work. Attention to the structuring-unstructuring continuum provides a way of understanding how structures can influence the freedom and ownership experienced by groups of their own decision-making and goal definitions. At the same time, facilitators work along a behavior continuum that can be described in directive-nondirective terms. Coghlan subsequently explored the relevance of these ideas to process consultation and OD (Coghlan 1993, 2002) and to the design and execution of large complex research projects (Coughlan and Coghlan 2011). The structuring-unstructuring and directiveness-nondirectiveness dimensions remain important aspects in Coghlan's practice (Coghlan 2016a). Coghlan maintained a close social and professional 40-year relationship with McIlduff and his wife, Teresa Brannick, an academic. Brannick, known for her expertise in research methodologies, encouraged Coghlan to adopt action research for his doctoral work at a time in which there was no such tradition in Irish universities. Coghlan's collaboration with Brannick eventually led to their writing *Doing Action Research in Your Own Organization* (Coghlan and Brannick 2014).

## Organization Development

In 1974, Coghlan was sent to work in a newly formed parish and with a newly appointed parish priest who had an interest in bringing organization and community development practices to his way of working and who owned a collection of books on group dynamics and experiential learning. The collection included the set of six books in the Addison-Wesley OD series that were published in 1969 and which were seminal in defining the field. Thus began Coghlan's introduction to OD; among the authors of the priest's books, Dick Beckhard and Edgar Schein became a major influence that continues to the present. Schein's *Process Consultation: It's Role in Organization Development* as an approach to inquiry into organizational dynamics resonated with Rogers' client-centered approach and was directed toward a helping relationship in which collaborative engagement, diagnosis, and intervention run concurrently, allowing clients to make sense of their organizational experiences and to take action. Beckhard's (1969) *Organization Development: Strategy and Models* provided Coghlan with a framework for working with large systems that posed questions about the kinds of issues leaders and facilitators of large system change need to address. This early introduction, which guided the work that Coghlan and his colleague were attempting to do in the parish, marked his entry into the field of OD.

When Coghlan began the master's degree program in the University of Manchester Institute of Science and Technology's (UMIST) Department of Management Science in 1979, he became familiar with Lewin's work. This, along with his early reading of OD pioneers such as Schein and Beckhard, informed his developing OD practice, and, in 1982, he was asked to support the development and implementation

of a strategy in the Jesuit order in Ireland. This work would subsequently form the basis for his doctoral studies. The influence of OD pioneers including Schein and Beckhard on his OD consultancy practice during the 1990s is evident in his writings about the organizational dynamics of religious orders' strategic planning and change management during that period (Coghlan 1997b). At UMIST, Coghlan was also introduced to action learning and the work of Reginald "Reg" Revans (1907–2003). Much later, Coghlan opened debate on the relationship between action learning and action research, while also integrating action learning into his own practice and research collaborations.

In the 1980s in the USA, fellow Jesuit Nicholas Rashford introduced Coghlan to the notion of organizational levels and interlevel dynamics. Together, they published nine papers exploring organizational levels and interlevels in the contexts of change, strategy, educational administration, and learning. These papers led to a publication in the Addison-Wesley OD series (Rashford and Coghlan 1994) and later *Organizational Change and Strategy: An Interlevel Dynamics Approach*, which is now in its second edition (Coghlan et al. 2016). Coghlan applied the ideas of organizational levels and intervals to his doctoral studies, which were based on and grew out of his strategy work for the Jesuit order in Ireland (Coghlan 1996a). After two workshops in NTL (one with Ron Lippitt), Coghlan reported an increase in confidence and competence in designing and intervening in experiential workshops. He was immersed in what was referred to as the laboratory method, a philosophy of learning and changing that was grounded in humanistic assumptions about the thrust in the human person toward self-actualization, what Rogers called the "formative tendency," and the educator's role in setting the conditions for learning and changing to occur. His core reading at the time was Schein and Bennis's (1965) *Personal and Organizational Change through Group Methods* and Benne et al.'s (1975) *The Laboratory Method of Changing and Learning*.

Coghlan enrolled in the Sloan Fellows program at MIT in 1984 and was mentored by Schein. With Schein's support, Coghlan designed his own elective in which he requested a paper from each of several Sloan faculty members and held a follow-up meeting to discuss those papers. Among those he approached were Donald Schon, John Carroll, Lotte Bailyn, Ed Nevis, and David Anderson. Coghlan's design and completion of this elective emphasized his immersion in OD at that time and also highlighted Schein's mentorship role. Coghlan chose the topic of strategic planning in religious orders under the supervision of Arnoldo Hax, an expert in strategic management, for his thesis. He wrote up his experience of the strategic process in the Irish Jesuit order, in addition to the experiences of two other orders. His subsequent article about this topic (Coghlan 1987) was featured in *The Financial Times* and was picked up by the Irish media.

Upon his return to Ireland, Coghlan continued his work as an internal OD consultant to support the changes underway in the Jesuit order, and he completed his doctoral study in 1993. By that time, he was a full-time faculty member at the National College of Industrial Relations (NCIR) in Dublin and taught OD for personnel managers across a range of programs. He was also increasingly in demand as an OD consultant in both business and nonprofit organizations. In 1994, he joined

the TCD Department of Business Studies. He cited a number of works by OD writers who were of particular importance to him in his intellectual development at the time: Schein's writings, especially a Sloan MIT working paper (Schein 2010/1989; Argyris and Schon's 1974) *Theory-in-Practice*, and Rami Shani and Bill Pasmore's writing on action research (Shani and Pasmore 2010/1985). His OD reading brought him to the connection between OD and action research and the idea of action research as researching in action. At this time, he met Beckhard, who conducted workshops in Dublin on an executive program on which Coghlan worked. Through most of the 1990s, Coghlan's action research was grounded in the ideas of Lewin, Schein, Argyris, Beckhard, and Shani, as well as in other OD literature.

## Action Research and First-Person Inquiry

In 1998, Coghlan was invited to the Centre for Action Research in Professional Practice (CARPP) at the University of Bath School of Management. CARPP was established as an international network of people and institutions to develop the theory and practice of action research with a particular focus on bringing an attitude of inquiry and learning to justice and sustainability. Coghlan engaged with CARPP as an examiner for 10 years and participated in several of the center's biannual experiential conferences, Emerging Approaches to Inquiry. Among those he met through CARPP were Peter Reason, Bill Torbert, Judi Marshall, Bjorn Gustavsen, Mike Pedler, and Olav Eikeland. Coghlan was being exposed to different notions of action research, not the least of which were the ideas of first-, second-, and third-person inquiry (Chandler and Torbert 2003) and living life as inquiry (Marshall 1999, 2004). From those ideas, he found an intellectual home that was to subsequently characterize his action research writing, namely, the idea of first-, second-, and third-person practice and the OD/action researcher as a scholar-practitioner.

As he became more immersed in exploring what it means to be a scholar-practitioner, to hold different ways of knowing and to question how people come to know what they know in their everyday worlds of practice, Coghlan returned to the work of philosopher Bernard Lonergan (1904–1984), which he had studied as a young Jesuit. During the past decade, Lonergan's ideas have been central to Coghlan's writing in both advancing the work of his longtime mentor Edgar Schein (Coghlan 2009) and setting out theoretical frameworks for first-, second-, and third-person practice and practical knowing. Through his writing, Coghlan has made it known that he is working toward a Lonergan-based philosophy of OD.

## Key Contributions: Advancing Organization Development Theory and Practice

Coghlan described himself as being situated in the field of OD that is framed within action-oriented philosophy and methods. His major contributions to OD can be viewed from a number of perspectives: first, his theoretical and practical

contributions to OD and action research communities through his writing and education and consultancy practice that range from framing a philosophy for practical knowing to framing interlevel dynamics; second, his framing of insider action research; third, *the SAGE Encyclopedia of Action Research* that for the first time brought together the broad range of ideas, approaches, and theories in what is an increasingly eclectic field of action research; and fourth, his editing work that included special issues of journals in the OD field and two four-volume sets he coedited with Rami Shani: *The Fundamentals of OD* (Coghlan and Shani 2010) and *Action Research in Business and Management* (Coghlan and Shani 2016).

One might also look at his contributions in terms of the reach he has achieved through his writing. Through insider action research, for example, he introduced OD to a huge audience of practitioners, including educators, healthcare professionals, and managers. Through his collaboration with colleague Paul Coughlan, he introduced action research to the field of operations management (Coughlan and Coghlan 2002). His contributions might equally be seen from his capacity to engage with new ideas and different perspectives as, for example, where he has been to the fore in the debate about action learning as a research methodology in networks (Coughlan and Coghlan 2011).

## Concepts and Philosophy

Coghlan grounded his organization development and action research (OD/AR) scholarship in Lonergan's general empirical method as expressed through the operations of human knowing or operations of cognitional structure, namely, experience, understanding, and judgment. Coghlan made the point that the idea of extended epistemology (Reason and Heron 2008) – or four ways of knowing in action research, namely, experiential, presentational, epistemological, and practical – each involves experience, understanding, and judgment. Examining the conscious process involved in our achievement of knowledge tells us more about *how* we know than *what* we know. Objectivity and subjectivity are complementary rather than oppositional, the former distinguishing between self and other and the latter getting in touch with the particularity of one's own perspective. In applying the general empirical method to modalities of action research, Coghlan (2010b) did not make a case for a single overarching method. Rather, his argument was about the importance of clarifying how operations of cognitional structure are expressed in each modality and how then we attend to them in a way that reflects the conceptual underpinnings of a particular modality. This argument challenged any conflation of modalities, while also addressing the importance of particularity in a given modality.

Coghlan has so far produced three major ideas that draw on Lonergan's general empirical method to frame how the scholar practitioner and action researcher appropriate self-understanding where beliefs, values, assumptions, ways of thinking, strategies, behaviors, and so on are afforded a central place of inquiry in our action research practice. These ideas involve authenticity, practical knowing, and interiority.

I.  Authenticity as a quality in the researcher (as distinct from quality in the data) and first-person practice (Coghlan 2008): Simply put, authenticity as the precept for the general empirical method requires one to be attentive to observable data, be intelligent in envisaging possible explanations of that data, be reasonable in selecting the explanations that provide the best account of the data, and be responsible for his or her actions. This extends well beyond an introspective kind of reflection to a drive toward meaning and action. Coghlan drew attention to how we construct meanings in organizations and social worlds, in language and symbols, and attention to values, behavior, and assumptions in action research. His insight is the relationship between Lonergan and Argyris' action science and Torbert's developmental action inquiry. Those authors share a common focus on the process of inquiry, self-reflection, and attending to the knowing on which we base our actions. Doing so authentically means being in a state of tension or learning to check one's understanding, values, assumptions, and so on. In action science, this finds expression in questioning espoused theories and theories in use, and in developmental action inquiry, through questioning the types of speech that shape a conversation. As a quality in the researcher rather than quality of the data, authenticity is an ongoing process of development and does not have an end point in the sense that it is something to which we aspire.

II. Philosophy of practical knowing for action research (Coghlan 2009, 2016b): A special issue of *The Journal of Behavioral Science* was produced in 2009 and edited by Coghlan and Shani (2009) to mark Schein's 80th birthday and critically engage with his contributions to organizational scholarship and practice. In this issue, Coghlan advanced Schein's work by offering a philosophical epistemological basis for how process consultation and clinical inquiry enable a person to perceive, understand, judge, and act. Coghlan drew on Lonergan's idea of the realm of common sense knowing – that is to say, *what* we know and *how* we know in our everyday living. Coghlan equated common sense knowing with practical knowing that is recognized and privileged in action research, and he grounded Schein's process consultation and clinical inquiry in Lonergan's general empirical method as a philosophical foundation in the realm of practical knowing. In so doing, Coghlan provided epistemic grounds on which clinical inquiry research could be based, creating a framework for methodology and methods, to researchers and scholar practitioners. In a recent paper (Coghlan 2016b), Coghlan detailed the philosophy of practical knowing for action research. Practical knowing focuses on the interest and concerns of human living and the successful performance of daily tasks to deal with situations as they arise and address their particularity. He wrote that "at its core, practical knowing describes things as they relate to us; it is a descriptive, subject-centered context of knowing that is not interested in universal solutions (Coghlan 2010a, p. 293)." It operates in our everyday language and communicative methods – such as body language – and moves fluently between sayings and meanings. Practical knowing provides us with proverbs and rules of advice distinct from propositional knowing with its definitions and universal propositions.

Referring to the ideas of Aristotle, Husserl, Schutz, and Dewey in addition to those of Lonergan, Coghlan set out four core characteristics of practical knowing as (1) everyday concerns of human living, (2) how practical knowing is socially derived and constructed, (3) how practical knowing attends to the particularity of a given situation/moment, and (4) how practical action is driven by values and is fundamentally an ethical process. These four characteristics provide clarity and guidance to the theory and practice of action research through first-, second-, and third-person practice. Coghlan's expression of a philosophy of practical knowing is important not only in terms of how he maps the four characteristics against first-, second-, and third-person practice but in terms of checking the focus on propositional knowledge that characterizes much of the action research literature.

III. Interiority (Coghlan 2010a): Drawing on Lonergan's idea of interiority as a way of holding different forms of knowing by appropriating oneself as a knower in a process of intellectual self-awareness, Coghlan referred to the movement between different forms of knowing, enabling us to understand and find meaning in an experience through, for example, aesthetic knowing, while acknowledging that there are other explanations or ways of understanding or engaging. Interiority thus focuses on awareness of the process of knowing and provides action researchers with a way of recognizing and interrogating the movement between different forms of knowing in the action research process. By way of examples of applying interiority, Coghlan highlighted techniques of action science – such as double-loop learning, the ladder of inference, and treating facts as hypotheses. Such techniques help draw attention to *how* we know rather than on *what* we know.

## Interlevel Dynamics

Large system change is a systemic interlevel process. Levels of analysis typically refer to the identification of issues as units of complexity, such as the individual, the group, the intergroup, and the organization, and are important dimensions of OD and action research. An interlevel perspective holds that each level (the individual, the group/team, the interdepartmental group, and the organization) has a dynamic relationship with each of the others. Dysfunction at any of the four levels can result in dysfunction at any of the remaining three. This relationship is grounded in what is referred to as the recursive system model in system dynamics. The recursive system model represents patterns of feedback loops and sequences of interaction that link and integrate elements of a system. Thus, the focus is on viewing patterns of interaction that influence each other and the impacts that cultural perspectives from any one individual, group, or department bring to bear on a change. Intergroup and interdepartment differences and assumptions need to be acknowledged and explored.

Interlevel dynamics offer important insights on the complex iterations of individual, the group/team, the interdepartmental group, and the organizational interactions in large system change and therefore their importance in strategic action planning and implementation. Position in terms of hierarchy on the chain of command also impacts on the functioning of the four levels. The individual who is higher

up the chain of command and who is not functioning is more likely to have a negative effect on all levels. Individuals such as team leaders, managers, or supervisors who cross boundaries between their area of responsibility and other functions within an organization are interacting in interlevel dynamics.

Since organizational change is a multilevel activity, behavioral change is needed on all four levels. An intervention on one level may have intended and/or unintended impact on another level such as the effect of individual incentive schemes on team working. A systemic view of the interrelationships of individual, team, interdepartmental group, and organization is therefore an important part of OD practitioner's frame of reference for their work. Drawing on Beckhard's writing on work on large system change OD, Coghlan (1998) brought interlevel dynamics to his OD work for religious orders that were experiencing considerable challenges in relation to strategy formulation and implementation. In his writing about process consultation, Schein (1999) drew on interlevel dynamics in his classification of client roles and levels of problems or issues. In addition to providing a framework for examining client roles and issues, interlevel dynamics helps frame importance of examining the implications of the client's decision-making arising from the consultation process.

## Insider Action Research

In 1996, Coghlan noted the absence of relevant reading materials for his students pursuing a Master of Professional Practice Degree. He developed notes for his sessions, picking up on the issues the students raised, and began to frame what he termed "insider action research." This led to the publication of *Doing Action Research in Your Own Organization*, coauthored with Brannick; their book is now recognized as a core text for action researchers undertaking insider action research around the world. Insider action research is understood as action research that is undertaken by complete members of an organization in order to inquire into the workings of their own organizational system and bring about a change through first-, second-, and third-person inquiry (Coghlan and Brannick 2014). In the age of ongoing professional development and education, interest in insider action research as a way of examining the application of extant theory to practice and generating insights toward actionable knowledge has increased. With this interest, insider action research has gained a place on MBA programs and as a method for doctoral research giving rise to a raft of publications from diverse areas such as industry, education, healthcare, and social work including manager-led and practitioner-led projects (Coghlan and Brannick 2014).

Coghlan and Brannick framed the key issues and challenges associated with insider action research as preunderstanding, role duality, and organizational politics, each of which may reflect strengths and challenges in terms of being *within* and knowing the system and challenges in terms of difficulties in identifying and interrogating theories in use. Through his insider action research writing, Coghlan introduced practitioners to the world of OD and action research. This is particularly

significant in sectors such as healthcare, where different professional groups face the challenges of introducing change or developing practice within a complex system without any prior OD training and experience and often with minimal training in change management. Since the first edition, Coghlan has built a body of work around insider action research, addressing theoretical, practical, and organizational themes. He has since incorporated his Lonergan-based ideas as underpinning knowing in action and first-person inquiry in insider action research writing, bringing a focus on practical knowing, first-person inquiry, and the scholar practitioner.

## Encyclopedia of Action Research

In 2010, Sage invited Coghlan to be the lead editor on a proposed *Encyclopedia of Action Research*. Coghlan approached Mary Brydon-Miller, whose field is participatory action research, to coedit, and they built an editorial group representing a spread of expertise in the field of action research. *The SAGE Encyclopedia of Action Research* was published in 2014 with 320 entries, bringing the increasingly diffuse and dynamic nature of action research and the settings in which it is undertaken together for the first time. The encyclopedia explored the entire area of action research and included an examination of theoretical and methodological trends in the field. It also offered insight into the diffusion of action research, the relationships between different modalities, and the relevance of philosophical concepts to action-oriented inquiry (Brydon-Miller and Coghlan 2014; Dick 2015; Greenwood 2015).

## Editorship and Heritage

Coghlan was invited to contribute to the *Academy of Management Annals* with a paper about action research in which he provided a rich exploration of action research, its history, the varieties of its expression, and its rejected place in the academy (Coghlan 2011). In a separate publication, Coghlan traced the history, modes of expression, and evolving relationship of OD and action research (Coghlan 2012). He also collaborated with Shani in two four-volume sets that brought together the seminal papers in the respective fields of organization development (Coghlan and Shani 2010) and action research in business and management (Coghlan and Shani 2016). These volumes mapped the terrain in both fields and, in so doing, provided researchers with a foundation on the breadth, richness, and depth of OD and action research. They also captured the OD and action research narrative as both fields developed over the years. In OD, they offered seven core characteristics that – though understood differently by different generations – remain core, namely, OD as continually evolving, OD as reflexive, OD as collaborative research, OD work as embedded in relationships, OD as relevant in any context, and educating for OD.

Of the five special issues for OD journals that Coghlan edited or coedited, one – completed in 1995 for the *Journal of Managerial Psychology*, with Schein and Argyris among the contributors – focused on action science and organizational

research. Other special issues included those mentioned earlier (Coghlan and Shani 2009), which addressed the scholar practitioner – focusing on Schein's work – as well as *Action Research* on insider action research (Coghlan and Holian 2007). Coghlan guest-edited a special *Organization Development Journal* issue on OD in voluntary organizations in 1996 and a special issue on "Grandmasters of OD" in 1997. This was a novel undertaking, whereby he invited those whom he considered to be OD grandmasters to contribute their reflections on 30 years in the field. This issue became the most sought-after and reprinted issue of that journal. In 2006, Coghlan coedited another special edition, this time with Joe McDonagh on OD and IT (McDonagh and Coghlan 2001).

## New Insights: Articulating the Conceptual Underpinnings for Action Research

As a field of inquiry, insider action research has opened up new debates within the action research world. Coghlan has been to the fore in articulating what it means to be a scholar practitioner engaged in ongoing inquiry into practice (Coghlan 2013b) with a focus on first-person inquiry. He has invited us to consider how we operate different forms of knowing and our interiority. Coghlan reflected this in his recent book *Inside Organizations: Exploring Organizational Experiences* (Coghlan 2016a), in which he encouraged students to pay attention to what goes on in organizations and to question their experiences not least of the organizational underworld. Understanding the process of change through an interlevel dynamics lens provided an understanding of why a widely supported policy in a hospital should prove impossible to implement. While conflicting philosophies of care lay at the heart of the central problem, they manifested in different ways across individual, team, inter-team, and organizational levels, giving rise to the need for specific strategies in and between each level (Hynes et al. 2015).

Coghlan continues to collaborate with others within the field of OD and beyond, developing different dimensions of insider action research, including ethical issues relating to role duality (Coghlan and Holian 2007; Holian and Coghlan 2013), doctoral research (Coghlan and Holian 2015), quality in action research (Coghlan and Shani 2014), and organizational learning mechanisms (Coghlan et al. 2015). In 2007, the journal, *Action Research*, produced a special issue on insider action research with papers presenting the topic's influence and potential in OD, participatory action research, and education.

While the insider action research literature has a strong focus on the individual, there is also a move toward examining its role in having a broader institutional purpose in continuous organizational learning improvement and enhanced organization agility (Coghlan et al. 2015). This raises the expectation for insider action research in terms of its contribution to the financial and human resources and the organizational vision and strategy. From three longitudinal action research projects within a pharmaceutical company, Roth et al. (2007) identified key strategies for insider action research, namely, establishing the right stakeholders and sponsors to

support decision-making, being street smart, ensuring organizational memory of early wins, and positioning the project as an organization change program. Coghlan and Shani (2015) have recently advanced insider action research as a way to build dynamic change capability within organizations. In addition to enhancing organizations' agility, insider action research enables members to shape their organizations in a way that contrasts sharply with traditional change management. This, however, raises questions about how insider action researchers approach cycles of action research in a planned way in a large system and the conceptual underpinnings informing their action research modality.

Coghlan's reach in terms of engaging with action-oriented inquiry modalities has generated new debates about their interrelationship, the most prominent being the association between action learning and action research. Coghlan has been to the fore in bringing forward the debate about the role of action learning in first- and second-person inquiry. He has incorporated Revans' learning formula $L = P + Q$ (where $L$ = learning, $P$ = programmed knowledge, and $Q$ = questioning insight) as an underpinning for reflexive engagement in planning and implementing change (Coghlan et al. 2016). He has also been to the fore in the debate about action learning research (Coghlan 2013a) and coauthored a series of papers exploring the integration of action learning and action research in the field of operations management (Coghlan and Coughlan 2008, 2011, 2016). Through action learning research, Coghlan and Coughlan (2015) reported on how action learning involving transportation equipment industry generated shared operational and strategic insight into collaborative improvement that resulted in systemic change and improved practice. A key finding from this work was the importance of commitment to action and to the emergent learning that stems from insights arising from the action.

## Legacy and Unfinished Business: Toward a Philosophy for OD

The conceptualization of insider action research and the development of a body of work to support its theoretical underpinnings is one of Coghlan's most important legacies and the one for which he is best known. He positioned himself within the OD/AR tradition and *Doing Action Research in Your Own Organization*, setting out to speak to this audience. Coghlan's insider action research with its Lonergan-based ideas is a moral enterprise and stands well apart from a standard research methods text or road map. He characterized practical knowing as being values driven and fundamentally ethical (Coghlan 2013c), better served by the idea of interiority. This reflected a move away from a "system based on logic to a system grounded in method, from ethics imposed from outside to personal authenticity (Coghlan 2013c, p. 350)." Therefore, insider action research must be understood in terms of its theoretical underpinnings. At first blush, *Doing Action Research in Your Own Organization* might seem like an easy read to a person coming to it for the first time. Coghlan's style of writing is indeed engaging and accessible. But the concepts that he presents as its underpinnings are profound and challenging, not least because they privilege a form of knowing that we have been taught to view as not academic,

and they place an onus on us to interrogate our assumptions. In other words, it is my view that his papers setting out authenticity, a philosophy of practical knowing and interiority, should not be construed as background reading but rather as core to developing an understanding of first-person inquiry. Therein lie both a core dimension to his legacy and the danger of insider action research's becoming decoupled from its foundational basis as it becomes more established as a mechanism for organizational change. Coghlan is working toward a complete philosophy of OD; this will be important in ensuring that insider action research is understood in its totality.

Insider action research has also found resonance within action researchers engaged in other action research modalities, including participatory action research. As insider action research finds its way into different modalities, this should generate interesting conversations between them, if undertaken in the spirit of maintaining the integrity of the underlying concepts of each.

*The SAGE Encyclopedia of Action Research* is a significant legacy and contribution to the action research community around the world. In my view, this legacy does not simply bring together the very different worlds of theories and settings in which action research resides. Rather, it recognizes and celebrates different forms of knowing and cultural contexts from which action research has developed, while also providing an opportunity for conversations across differences. Coghlan reported that – though he has been immersed in action research for nearly 40 years – he was exposed to ideas that he had not previously encountered through his work on the encyclopedia. This demonstrated the diversity of action research and its aliveness in today's world.

By way of unfinished business, Coghlan's development of a complete philosophy of OD is a work in progress, and we can anticipate more on this from him. There are also a number of avenues yet to be explored, which would bring his theoretical underpinnings further into the world of practitioners. His recent book (Coghlan 2016a), which came from his own approach to educating undergraduates, could be complemented by his own first-person inquiry as a scholar-practitioner in higher education. In my view, this would be an important contribution for two reasons. First, the recent book reflected his own distillation of ideas from his long career. Reaching right back to his work with McIlduff and exploring structuring-unstructuring and directiveness-nondirectiveness (Coghlan and McIlduff 1990), he drew together his insights and learning from Schon's critique of technical rationality, Schein's (2013) humble inquiry, and Argyris' action science and applied his appropriation of Lonergan's authenticity and interiority to inform his scholarly practice as a university teacher in OD. This is not made explicit in his book but is clear to those around him who are familiar with his teaching practice that informed this book. Second, the book crystallized his putting into practice the idea of what it means to be a scholar-practitioner in building consistency between his espoused theory and his theory in use and engaging in action inquiry to explore his theories in use or action logics. His stance against the prevailing techno-rationality of higher education brought into sharp relief his conscious engagement with interiority and illustrated the profound nature of the theories that underpin his work and writing.

Beyond the OD/AR tradition, the application of his ideas to different action research modalities has yet to be explored. While Coghlan has demonstrated the relevance of authenticity to first-person inquiry, Lonergan's differentiation of minor and major authenticity may have particular significance for action researchers. An individual may strive to live authentically (minor authenticity), while being in an environment that is inauthentic. Lonergan used the idea of the authentic Nazi to illustrate the distinction, while Coghlan referred to participatory action research as perhaps arising from attempts to examine major authenticity. Arguably, the increasing diversity in the modes of inquiry within the family of action research reflect attempts to tackle major concerns in relation to ecology and institutionalized practices that harm the most vulnerable across the Globe. Major authenticity may prove a useful concept in this endeavor.

## Conclusion

Coghlan has been a major and increasing influence in the world of OD/AR during the past 30 years. He has advanced the ideas of seminal thinkers including Schein and Beckhard through an articulation of practical knowing and interlevel dynamics. He has influenced generations across a wide range of disciplines through his conceptualization of insider action research. While insider action research may be the body of work for which he is best known, the implications of his writing on practical knowing, authenticity, and interiority for how we negotiate our way through the prevailing techno-rationality of our everyday worlds may yet prove to be a lasting and far-reaching legacy.

# David L. Cooperrider: The Articulator of Appreciative Inquiry

# 20

Frank J. Barrett

## Abstract

This chapter reviews the contributions of David L. Cooperrider, starting from his the outline of Egalitarian Theory, his articulation of Appreciative Inquiry, his work studying social innovations and promoting the Business as an Agent of World Benefit project. The chapter traces his early influences including his parents and uncles, his mentors at Case Western Reserve University – Suresh Srivastva and Ronald Fry, and the writings of Kenneth Gergen, and others. Finally, the chapter outlines the way in which his work has had an impact in the field of Organizational Change.

## Introduction

David Cooperrider is Distinguished University Professor of Organizational Behavior at Case Western Reserve University (CWRU) in Cleveland, Ohio. He is the cofounder and originator of Appreciative Inquiry, an approach to social-organizational change that has revolutionized traditional approaches to action research in Organizational Development. Appreciative Inquiry has had a powerful influence in several areas in the social sciences and in forms of practice. He has written and edited 25 books and over 100 articles and book chapters. He served as the coeditor of the *Journal of Corporate Citizenship* and coedits the series on *Advances for Appreciative Inquiry*. He was given the Distinguished Contribution to Workplace Learning by the American Society for Training and Development (ASTD). He won on the Porter Award for best writing in the field of Organizational Development was awarded the Peter F. Drucker Distinguished Fellow by the Drucker School of Management, coauthored the Academy of Management Organizational Development and Change best paper award, and won the Aspen Institute Faculty Pioneer Award for his impact on sustainability. The Champlain College's Stiller School of Business honored his impact by creating the David L. Cooperrider Center for Appreciative Inquiry.

## Influences and Motivations: Family Roots and Seminal Teachers

### His Family Roots: A Combination of Head and Heart

David grew up in Oak Park, Illinois, a suburb of Chicago. His formative period, in the 1960s and 1970s, was a time of social and racial unrest and his family was in the midst of it. His father, Loy, was a Lutheran minister who came from a family of Lutheran ministers – David's grandfather and four uncles were also Lutheran ministers. The oldest of the four, his Uncle Ed, a prestigious theologian and a graduate of the University of Chicago, was the head of the Lutheran Press. David recalled his grandfather and uncles sitting around the table discussing theological topics, asking challenging and conceptually rigorous questions. In the Lutheran tradition of Karl Barth, Paul Tillich, and Dietrich Bonhoeffer, these debates were centered on existential issues of "ultimate concern," to paraphrase Paul Tillich, questions that asked what it means to be a full human being. David heard his father and uncles in lively dialogue, debating what it meant to live a purposeful life and how to be part of a community that supports the sacramental nature of life-giving community, one that supports members' higher calling. In the Lutheran tradition, he was surrounded with a notion that humans are imperfect but on a journey of formation toward a higher ideal. It espoused that any notion of love of God for men and

women would be embodied in community, that the True, the Good, and the Beautiful were mutually intermingled with human relationships.

It must have been a fruitful time for any curious adolescent to live within these theological questions of life's ultimate purpose, particularly against the backdrop of controversial issues of social and racial justice. For David's father and his uncles, it was a real test of the Lutheran conception of the life-giving force of community. These early discussions must have planted seeds in David's imagination. Perhaps it was his first formative experience witnessing role models passionately engaged in a rigorous exploration of theories and concepts that could have practical implications in helping people live meaningful lives. He was learning that a life devoted to inquiry and scholarship is a noble calling.

His father Loy was particularly passionate about civil rights and race relations and was an active change agent at a time when racial tensions were peaking. Loy was instrumental in the early 1970s in working against institutional housing discrimination. He took these battles for justice head on, confronting racism in his congregation in the strongest terms, such that the stress of his activities eventually compelled him to leave the ministry (I knew his father. He was a man of short stature but a veritable giant of energy. I recall meeting him at their summer home on a lake in Wisconsin that he was putting up for sale. When I told him that I was hoping to find a summer vacation place for my family, he offered to sell me the Wisconsin home and volunteered to finance it himself. He knew that as a graduate student I had few resources, but he was interested in my nascent dream and he was fleshing out in detail what an ideal future would be like, how I could expand the home, build a dock for a boat, invite cousins and friends for visits in the summer, swim, ski, boat, golf. Nothing about his conversation would be remarkable except for one dimension: this all occurred within the first 30 minutes of our very first meeting. He instinctively assessed my present state (as a resource poor graduate student), listened to my dreams and wishes, began to encourage me to dream about the possibilities that could be realized, and offered support for ways to keep my dream alive into the future. Twenty years before Appreciative Inquiry would be fully developed, Loy Cooperrider brought me through the full 4-D cycle in less than half an hour. He was creating a provocative proposition in real time.)

His father's sermons were often provocative challenges to the congregation to live up to their highest values and purpose. His father and uncles probably worked deliberately to see their white middle-class congregations as they were in the present, at the same time continually holding out visions of as they could be in the present, how they could grow and transform themselves and others. This is the double vision that is embodied in many of David's practices and writings, particularly in his notion of provocative propositions.

I knew his father. He was a man of short stature but a veritable giant of energy. I recall meeting him at their summer home on a lake in Wisconsin that he was putting up for sale. When I told him that I was hoping to find a summer vacation place for my family, he offered to sell me the Wisconsin home and volunteered to finance it himself. He knew that as a graduate student I had few resources, but he was interested in my nascent dream and he was fleshing out in detail what an ideal future would be like, how I could expand the home, build a dock for a boat, invite cousins and friends for

visits in the summer, swim, ski, boat, golf. Nothing about his conversation would be remarkable except for one dimension: this all occurred within the first 30 minutes of our very first meeting. He instinctively assessed my present state (as a resource poor graduate student), listened to my dreams and wishes, began to encourage me to dream about the possibilities that could be realized, and offered support for ways to keep my dream alive into the future. Twenty years before Appreciative Inquiry would be fully developed, Loy Cooperrider brought me through the full 4-D cycle in less than half an hour. He was creating a provocative proposition in real time.

Fran Cooperrider, David's mother, was an active member of the Lutheran Church. Where Loy was serious and focused, Fran had a disarmingly warm and joyful presence. She reached out to community members and held gatherings in the family home in which women would meet in circles, supporting one another and lifting one another up with encouragement and hopeful images of possibility. While his father's discourse was serious and challenging, his mother's was warm and inviting. David accompanied his mother as she worked in inner-city churches.

David learned about the power of ideas to make a practical difference in peoples' lives, that head and heart are best when working in combination, that relationships based on inquiry, curiosity, and wonder are crucial to social change.

## The Influence of Suresh Srivastva

David's mentor at CWRU was Suresh Srivastva, the chair of the Organizational Behavior Department. As a mentor Suresh was passionately dedicated to his students. He had an open-door policy for his mentees and had what seemed like endless hours of time and attention for them. He often said that he was interested in the development of the whole person (the mind, the heart, and the spirit) and loved dialoguing about philosophical ideas that stimulate thinking. He was especially known for his provocative, challenging (and sometimes uncomfortable) questions.

Suresh's interests transcended academic disciplines. He would seldom suggest that his mentees read journal articles or single studies in the field of Organizational Behavior or Management. He downplayed research approaches that sought to "capture" human dynamics by operationalizing dimensions with empirical scales. He continually emphasized the importance of relationships and interaction as the core unit of analysis in organizational systems. Organizations, he felt, are centers of human relatedness, sites where people care, grow, learn, develop, and cocreate. Suresh also was concerned, almost to the point of obsession, with inquiry, particularly the power of questions as interventions in human systems. He encouraged his students to pursue and create "knowledge of consequence." Finally, he eschewed any notion of a value-free approach to social science. He openly called for a normative view of social research. He wanted his students to use value-driven methods that would contribute to the betterment of organizations, society, and the larger world.

He encouraged his students to read books (rather than articles) because they offered a full-length exploration of provocative ideas. In the style of an Oxford Don, he would

assign history books, philosophy books, and works of literature and art. Suresh legitimized inquiry as a spiritual endeavor and gave credence to the search for books that would culminate in several of the philosophical sources that would David would later draw upon.

David recalls:

> Suresh cared about me as a whole human being. His presence was a powerful intervention. He could see into your soul, your doubts, your fears, your potential, your joy. He could sense when I wasn't feeling up for it. His caring was deep. He wouldn't let me stay in a place of doubt. He would push. He said at one point, "*in your work, it's your presence that makes the difference*."

> I was attracted to his towering sense of purpose, his commitment to creating knowledge that would have impact on the human condition, knowledge of enduring consequence. He was always putting human relatedness at the center of his inquiry and he carried that forward into his work with groups, including the power of co-inquiry. No one else was talking like that.

> He made learning dramatic because he wanted us to know that learning makes a real difference. His mother had been part of the Gandhian revolutionary movement in India. Suresh wanted to build a better world through the construction of ideas. When he kept saying that 'every concept we develop can make a difference for years,' I started to believe him.

David would carry this spirit with him as he began working through his dissertation. As he was piling through mounds of data, he was primed to notice the power of ideas.

## Other Influences: Rader's *Aesthetic Theory*, Schweitzer's *Reverence for Life*, and Gergen's *Transformation in Social Knowledge*

David's wife, Nancy, holds an undergraduate degree in Art. David was particularly influenced by a philosophy book of Nancy's, Melvin Rader's *A Modern Book of Aesthetics* (Rader 1978), which explores the creative process and the meaning of artistic forms of inquiry. Rader discusses the difference between scientists who seek to verify facts and artists who are concerned with the "expression of values" (Rader 1978, p. xix). Values and the vivid qualities of experience cannot be captured in scientific description, which, according to Rader, are real but superficial." Rader writes: "you can explain the sunset according to uniform natural laws, but this leaves out its radiance" (Rader 1978, p. xxii). What we value most is expressed not in a language of facts, but in a language of appreciation, a language of feeling, sentiment, volition, values – in short a language of appreciation that seeks to be true to the immediacy of vivid experience. When Rader claimed that there is no language for the world of value, vividness, and radiance "comparable to the exact language of science," David must been have been intrigued by the challenge to provide a language for the more elusive yet vital life experiences. That curiosity eventually led him to qualitative research and the grounded theory approaches of Glazer, Strauss, and Corbin which favored using language that reflects the lived experience of participants. Rader made an intriguing distinction. He talked about "communities of interpretation" which for him meant scientists; and he talked about artists in terms of "communities of appreciation." For

David this raised a series of questions. Why were these two kinds of communities – appreciation and science – held separate? Couldn't science also be about valuing?

David was also influenced by theologian-philosopher Albert Schweitzer's notion of a "reverence for life," from an anthology that sat on David's father's bookshelf. Schweitzer felt that the Enlightenment search for an objective ethics had failed and that the ethical foundation of civilization should be affirmation of life. He called for an ethics of reverence for life in all its forms (a view that was consistent with David's later expansive devotion to sustainability and business as an agent of world benefit). Schweitzer writes:

> As a matter of fact, everything which in the usual ethical valuation of inter-human relations is looked upon as good can be traced back to the material and spiritual maintenance or enhancement of human life and to the effort to raise it to its highest level of value. (Schweitzer 1947, p. 262)

We can see traces here of ideas that will appear in David's work – the notion of "interhuman" social science, the search for life-giving forces, articulating the "highest values" of a social system operating at its best. David would reshape many of these constructs in his articulation of "Appreciative Inquiry."

When David was involved in his dissertation research at the Cleveland Clinic Foundation (described below), he came upon the social constructionist theories of Kenneth Gergen. David was moved by Gergen's notion that social theory can be a generative influence in shaping future worlds in desirable directions. These ideas also resonated with Suresh's notion that traditional social science is limiting because it seeks to predict, to articulate unalterable laws, and to have the final word. Suresh felt strongly that researchers must appreciate the potential of humans to change and shape the world. While Suresh shared these notions, Gergen provided a rich logic. Gergen's article became the philosophical and intellectual impetus that would help explain what was happening in the dissertation study (explored below), an elegant and powerful articulation legitimizing Suresh's view that language, especially theoretical language, can be a positive force for change in social systems.

David was also deeply influenced by Ron Fry, one of our Organizational Behavior professors at Case Western Reserve University and a member of David's dissertation committee. Ron's patience and persistent support for his students is legendary. But more specifically he has a gift for working with small and large groups, a skill he no doubt fine-tuned from his mentor, Richard Beckhard at MIT. Ron has a Buddha-like ability to stay focally present, attend to relational dynamics, and read the tone and rhythm of the group. And he has a sense of timing – he seems to know when and how to ask provocative questions that help groups move forward. One time when David and I were consulting to a particularly conflicted and challenging client system, he said this the evening before we were to meet with the group:

> When I get in tough systems like this one, I close my eyes and envision Ron Fry. He just knows how to pay attention and not get pulled down by negative or cynical relational dynamics. He always sees where a group needs to go next and his thinking is never cloudy. He's a master of attention. He's the best consultant I have ever seen.

In fact, many of the techniques that have become codified in Appreciative Inquiry practice stem from the practice and style of Ron.

## Key Contributions and Insights: Appreciative Inquiry, Egalitarian Theory, and Social innovation

### Egalitarian Theory

Through the mentorship of Suresh Srivastva, David began doing research at the Cleveland Clinic Foundation (CCF), a healthcare facility a few blocks from CWRU. CCF already had a reputation as a professional partnership performing leading edge research and high-quality care in treating the most complicated diseases. One of Suresh's senior students in 1979, Alan Jensen, was working on his dissertation there, studying the physicians' approach to leadership and management. Jensen's dissertation was a study of how doctors, trained in medical specialties, applied their professional instincts to the leadership and management of the organization. The focus was on the individual. While helping Jensen do interviews as a junior research assistant, David became interested in the organization-level data. Suresh asked David to report some preliminary observations to the CEO and Chairman of the Board of Governors, Dr. Bill Kiser.

In that meeting Dr. Kiser asked David if he could take the set of interviews with all the top physicians, examine the data, and do an organizational diagnosis. Dr. Kiser felt that with hundreds of committees, the whole system was confusing, and inefficient, and he saw communication breakdowns throughout the system. As a physician he believed that a diagnosis of the system's problems would be helpful to him as the CEO. David agreed that in the interviews, there was likely some helpful information on organizational dynamics.

But the more he reflected on the request, David did not feel right about creating diagnosis. He had been thoroughly trained in approaches to organizational diagnosis, but felt it would take everyone astray from the bigger story. There was, in David's mind, a monumental social invention happening here. So David sat down with his advisor Suresh and shared the exhilaration: "this is possibly the most important organizational innovation in the world" and therefore "I'm not sure we should be doing an organizational diagnosis as Dr. Kiser is calling for; we might miss the precious details and larger importance of the breakthrough innovation." Suresh quickly agreed with David and told him to go with his curiosity. He said something like: "lead with your excitement – your task is to find everything that propels potential and possibility in this emerging group innovation – and, by the way, forget everything you've ever learned about organizational development."

David began to look at the data from a different perspective than the one Jensen had in mind. In particular what interested Suresh Srivastva and David Cooperrider was the governance model that informed the group practice, and this became the focus of his David reexamined the 1,000 pages of interview data that he and Allen had collected. But instead of diagnostic analysis, he poured over the mountain of

notes by quietly noticing and yet setting *aside in a sideways glance* all the accounts of failures, problems, dysfunctions, or seeming barriers and breakdowns. And he asked of the mountain of data and from the deep listening conversations only one rigorous question: "what gives life to this nascent organizational form – what makes it possible – and when it is most alive and why?" The first report on both the discoveries and the emergent themes (outlined below in the section on egalitarian theory) was presented to CCF leaders in 1981. What he called "emergent themes" took the factors that contributed to helping the group practice flourish and created speculative statements of ideal-type possibiltiies for the future.

David's dissertation was going to be a grounded theory that explored the nature of shared governance focusing specifically on what gives life to the organization, what is happening when the system is operating at its very best. But soon, when the appreciative analysis was presented to the Board of Governors, there was interest and enthusiasm. Seeing the positive reaction, Dr. Kiser, the Chairman of the Board of Governors, put forward a question: "Do you think we can we do this same kind of appreciative approach not simply with our 300 person physician group, but all 8,000 people?" Even more important than the egalitarian theory, was the way the appreciative approach was igniting interest, imaginative dialogue, and change.

From there, David's real dissertation topic began to take a whole new shape. Because of the remarkable way the inquiry was creating such a powerful and positive stir, the research focus shifted to trace how he articulated this kind of appreciative approach could affect change. With time one and time two type data collection, the dissertation tracked the *inquiry-and-change* relationship, and it built the first theory and vision of Appreciative Inquiry as a way to build generative theory, where theory is practice and inquiry is a form of intervention. (This was consistent with Suresh's belief in the power of questions as self-fulfilling).

With no other intervention than data collection, appreciative analysis, and feedback, David tracked how inquiry intervenes. Later he would describe remarkable moment with members of the Board as a "Heisenberg effect on steroids" – the observer effect of inquiry in human systems was the real story emerging here. Inspired by Suresh's belief in the power of ideas, David was becoming a *theoretical activist* where theory and practice are not opposites.

Out of David's qualifying paper and later dissertation, David and Suresh coauthored an article that explored a theory of "the egalitarian organization" (Srivastva and Cooperrider 1986), describing the "ideal membership situation." This was a construct borrowed from Habermas' notion of the "ideal speech situation," a dialogical situation in which participants can have rational dialogue, are free to make assertions and beliefs, and are free of coercive forces. The "egalitarian organization" article explored the life-giving core of the collective practice. The paper posited "ideal-type themes" that appreciated the best of the system. These themes were a provocative stretch and posited that there are three elements that the doctors hold as ideals – a spirit of excellence, (seeking to be the best they possibly can be), a spirit of inclusion (in which all voices are invited and valued), and a spirit

of consensus (in which members operate under the belief that they are at their best when they seek consensus from all members). David and Suresh, in a simple footnote to the egalitarian organization paper, called this an "Appreciative Inquiry" of the life-giving forces that allowed CCF to thrive and innovate.

## Appreciative Inquiry: The Surprising Power of Questions

David presented his emerging themes to the Cleveland Clinic's Board of Governors and in a footnote explained that the study was not focusing on problems but was an "appreciative analysis" that seeks to articulate what gives life to this system. Several leaders in CCF were intrigued by the report and asked David to talk to their departments. The emergent themes of excellence, inclusion, and consensus inspired a hopeful and energetic dialogue during strategic planning sessions, inspiring members to explore how they could move closer to their ideals. David began to notice how the theoretical contributions from his research were inspiring a dialogue that simultaneously triggered the physicians to notice the core strengths of their collective practice while also stretching them to consider ways to extend these principles as they dialogued about their highest ideals. It was a dynamic consistent with Gergen's proposal that theory should be formative and generative, that once we are liberated from the canons of positivist verification rhetoric, we can engage in bolder forms of theorizing that enable broader and more creative forms of action. Expanding on the methodology chapter from David's dissertation, David and Suresh published *Appreciative Inquiry into Organizational Life* in the inaugural RODC volume in 1986 emphasizing the generative potential of theory building in transforming organizations. The chapter asserts that action research has not fulfilled its promise in creating innovative theory that inspires novel forms of organizing. The chapter made a number of contributions. Action research is biased toward a deficiency orientation focused on problem-solving, one that is conservative, utilitarian, and limited in inspiring innovation. Building on Gergen's work, the theory has generative potential to inspire innovative forms of action. Finally, the problem orientation of action research has truncated researchers' capacity for wonder, to ask questions that marvel at the miraculous and mysterious nature of social-organizational life.

The notion that Appreciative Inquiry could be a powerful intervention tool (rather than only as a research approach) was a surprising, unexpected discovery that grew out of the Cleveland Clinic study. The process of inquiry itself is an intervention.

This insight has led to the surprising spread of Appreciative Inquiry as an intervention into organizational and social systems in several sectors, many of which have been documented and published (for reviews of Appreciative Inquiry interventions, see Bushe and Kassam 2005).

Appreciative Inquiry has been developed further in subsequent publications, including Cooperrider and Whitney (2001) and Barrett and Fry (2005). After participating in several change interventions, David began to notice a learning

pattern that he later articulated as the 4-D cycle of change: Discover (identification of strengths that give life to the organization), Dream (envisioning what the organization could evolve toward based on past strengths), Design (creating the processes and structures that support the life-giving forces), and Destiny (realizing the strength-based vision and keeping it alive into the future).

In the early 2000s, inspired by the Search Conference method, David began to design large group interventions informed by AI, known as the Appreciative Inquiry Summit (see Ludema et al. 2003; Powley et al. 2004) in which hundreds of participants would gather for 1–3 days to use AI to develop strategic futures. These events were organized around the 4D cycle of Appreciative Inquiry, beginning with systematically surfacing the positive core of the organization, imagining desired futures, and designing ways forward. Several organizations, including the United Religions Initiative, the US Navy, Roadway, and others, held AI Summits.

## Studying Social Innovations at the Global Level: GEM, BAWB, UN Global Impact, Fowler Center, and Inquiry into Positive Institutions

In 1990 David, Bill Pasmore, and several of their organizational behavior doctoral students at CWRU began to research globally focused organizations. David received a $3.5 million grant from US AID to bring the field of OD and leadership training into the world of NGOs and PVOs. They worked with several organizations including Save the Children, World Vision, Nature Conservancy, and World Relief, using Appreciative Inquiry methods to study social innovation. David and his students offered management education, and consultation, built networks among systems, and used AI to cultivate the best ideas, methods, skills, and practices for strengthening organizations and building partnerships. They found that when organizations explore deeply the question of what gives life to the system when it is most alive, it emboldens them and inspires them to become more pro-social and expansive in their planning and thinking. These organizations begin to see their own organizations as nested within a larger global system and to expand their concerns outward in wider circles and to begin to consider and to take more pro-social initiatives. They hosted several conferences bringing these organizations together for knowledge sharing and network building, inviting them to share their life-giving core, best practices and to build partnerships.

This was the first effort in David's expansive moves to work with ever-larger systems. The program acknowledged the radical interdependence around the world that is at the root of many challenges, transnational issues that cross conventional borders. The belief was that no global challenge can be adequately addressed without working in and through organizations. Their approach to studying these organizations was appreciative, to challenge the deficit-focused science of global change with special emphasis on constructive human responses to the global agenda. The aim of this program was to search for new forms of human cooperation and global action. Acknowledging the proliferation of global corporations, global networks, and NGOs, David wrote:

> The logic is simple: there is not one item on the global agenda for change that can be understood (much less responded to) without a better understanding of organizations. More than anywhere else, the world's direction and future are being created in the context of human organizations and institutions.

This was the beginning of a larger research program into novel social innovations devoted to noble human purposes, efforts that crossed national and organizational boundaries to link ideas, people, and resources. In 1999 David chaired a conference and coedited a volume with Jane Dutton *Organizational Dimensions of Global Change: No Limits to Cooperation* (Cooperrider and Dutton 1999). The subtitle is telling and is a nod to the Club of Rome's classic *Limits to Growth*. While there might be limits to ecological growth, there are no limits to human cooperation that could innovate to transform these challenges. The conference and ensuing book brought together several organizational scholars exploring the cooperative potential of organizations working across boundaries to address global issues; his doctoral students wrote several case studies on innovative global organizations.

David's instinct has been to approach change systemically, at the scale of the whole system. He began to co-inquire into ever-larger groups. David was deeply impacted by the 9/11 attacks and particularly the choice of the World Trade Center as the prime target. He recalls:

> When the world trade towers came down and as I'm watching it over and over in the media, I kept seeing the words "world" and "trade" as "business" and "society.' This notion of a clash of civilizations with radical Islam could be seen as a clash between capitalism and different views of the relationship between business and society. It's no accident that the target was the world trade symbol. My feeling was that the world needs a big dialogue on economy and 21st century business/society relationships.

At a conference on Appreciative Inquiry in Baltimore in October 2001, he proposed the idea of exploring these questions and was overwhelmed by the enthusiastic response. With a seed grant from CWRU, David began to explore the notion of "Business as an Agent of World Benefit," using AI methods to explore how and when business might operate at a higher level of consciousness and where and when this might already be happening. His work began to get attention, and in 2003, David designed and facilitated a historic summit for the UN General Assembly by Secretary General Kofi Annan called the United Nations Global Impact, gathering 500 CEOs from several global corporations, including Green Mountain Coffee Roasters, Alcoa, Unilever, Nova Nordisk, Dutch Royal Shell, and Coca-Cola. The purpose was to "unite the strengths of markets with the authority of universal ideals to make globalization work for everyone." Using the Appreciative Inquiry Summit methodology, they explored the possibility that as the world transitions to a global economy, business could become a positive and creative force that could lead in a transition to planetary healing and create peace and sustainable futures. They used the Appreciative Inquiry method to discuss issues such as "how will we meet the inclusion needs and aspirations of 3 billion middle class people arriving in the next twenty to twenty-five years, without causing unsustainable overshoot beyond planetary boundaries as well as resource wars, runaway system dynamics, depression, and a world of fear where the prospects of terror

and peril become part of our normal existence even if only as a constant background possibility?" They shared stories and dreams of possible innovations that explored ways business could be a force to eradicate extreme poverty, how business could be a force for eco-innovation and how business could promote world peace by creating cooperation in conflict zones. David began to imagine a Nobel Prize for Business, how businesses and business leaders could be acknowledged for advancing human well-being, advancing civil society, and promoting the design of dignified work.

After the Leaders' Summit, Cooperrider applied for and received several grants to continue the global inquiry and began to obtain funds for a center for Business as an Agent of World Benefit (BAWB). He wrote in one of his proposals of his experience of the Global Compact: "business has the opportunity to be one of the most positive and creative forces on the planet, and that the epic transition to a world economy of "full spectrum flourishing" is no longer a utopian urge or mini-trend, but an observable and remarkable trajectory" (Cooperrider, "History of the Business and Human Well-Being," p. 2).

The BAWB has since expanded as a world inquiry project and has involved a vast movement to conduct interviews with business leaders who have helped create innovative solutions for human betterment around the planet. Over 3,000 stories have been collected (see http://aim2flourish.com where these innovations are continually being documented). The BAWB project is committed to the appreciative collection of stories and experiences that generate hope that capitalism can change the way we live, stories about the potential to eliminate extreme poverty, creation of dignified work, using business as an agent for furthering eco-innovation, and using business as a force for peace in extreme-conflict zones.

The poetry in his writing is inspirational:

> With stories of empowering solutions, strengths, and system-wide breakthroughs in the room, there was a groundswell of what can only be described as an emotion of *urgent optimism*. It infused an urgency to act – "to stand up, step up, and scale up" as one respected CEO declared it – propelled not by gloom and doom, but inspiration, opportunity and illumination. The sense in the room was that "the world is getting better and better, and because it is, it can . . . and it must."

BAWB has been devoted to collecting such stories of breakthroughs, entrepreneurial value creation, progress in well-being, efforts to create bridges rather than walls, efforts to connect strengths, resources, and talents through the force of the market place. True to Suresh's insight that questions are windows into the soul, David remains intrigued by questions such as this:

> What might happen for our world if everyone could see and sense its true significance over the broad sweep of history with a kind of time-lapse lens, through which the untold 'story of business' may be placed carefully and scientifically in conjunction with the unprecedented advances in humankind's overall well-being?

An example of a figural story that he has shared several times involved an Israeli business leader, Stef Wertheimer, and his creation of Tefen, a "capitalist kibbutz," an industrial park that has spawned 300 businesses, world-class schools, hospitals,

museums, and community meeting spaces that bring Arab and Jewish people together working and living in collaboration. Tefen became an island of peace and shared prosperity, a place of equality between different religious and ethnic groups, men and women, in the midst of seemingly intractable conflict. As the businesses have thrived, peace and security have increased as well. The BAWB project includes stories of Unilever's Project Shakti, the microenterprise for women in Indian villages. Stories such as this celebrate the role of business enterprise in increasing life expectancy, reducing poverty, providing resources for education, stories of shared value creation, empowerment and innovation, vision and entrepreneurship, dignified work, and human development.

Eventually BAWB morphed into the Fowler Center for Sustainable Value at CWRU with the purpose of researching and disseminating innovations in sustainability as a business opportunity. Funded by Chuck Fowler, the CEO of Fairmont Minerals who had witnessed the transformational impact of an AI Summit in his organization, it is devoted to Business as an Agent of World Benefit and "exists to advance the scholarship and practice of flourishing enterprise," linking with other institutions to "create prosperity while nourishing human and natural systems (https://weatherhead.case.edu/centers/fowler/about/). The center focuses on for-profit organizations that have devoted activities to creating value for society and the environment. Appreciative Inquiry is openly acknowledged as the "primary vehicle for effecting change."

## New Insights: A Positive Revolution in Change

It is nigh impossible to detail the wide breadth of influence that David's work has had on the field of organizational change, let alone the wider body of practitioners in fields such as education, public policy, and social work. There are now two centers that are devoted either to his work or to work he initiated. There are several groups who offer training and certification in Appreciative Inquiry as an intervention method and countless consultants now using Appreciative Inquiry explicitly in their practice. Appreciative Inquiry is regularly used in coaching and team building and in large group interventions.

David had a major influence on Jane Dutton and Kim Cameron when they began to advance their work in Positive Organizational Scholarship at the University of Michigan. Jane attended an Appreciative Inquiry workshop in the 1990s that David and Diana Whitney offered in Taos, New Mexico, and began to consider how scholarship can be an intervention in social-organizational life. Kim was the Dean at Weatherhead School of Management in the 1990s and witnessed firsthand the power of AI to inspire transformational change.

More directly many of David's doctoral students have gone on to make important contributions. Tojo Thatchenkery has written several books that take an appreciative lens, including *Appreciative Intelligence: Seeing the Mighty Oak in the Acorn* (Thatchenkery and Metzker 2006; see http://www.appreciativeintelligence.com). James Ludema coauthored *The Appreciative Inquiry Summit: A Practitioner's Guide for Leading Large-Scale Change* (Ludema et al. 2003) and has gone on to

create and lead an innovative doctoral program at Benedictine University devoted to value-based leadership. Nadya Zhexembayeva coauthored *Embedded Sustainability* (Laszlo and Zhexembayeva 2011) and authored *Overfished Ocean Strategy: Powering Innovation for a Resource-Deprived World* (Zhexembayeva 2014). I was deeply influenced by David's friendship and thought trials throughout my time as a doctoral student and in later years as a Professor. I can see traces of David's influence in every article and book I have written, particularly *Yes to the Mess: Surprising Leadership Lessons from Jazz* (Barrett 2012). Even though I had been a musician for years, it was only because of David's influence that I was able to notice the appreciative mindset that allows improvisation to flourish.

## Legacies and Unfinished Business: Applying Positive Psychology to Social-Organizational Change Processes

David is currently writing a book with Lindsey Godwin that outlines a positive theory of organizational change. The title is *Positive Organization Development: Innovation Inspired Change in an Economy and Ecology of Strengths*. The book reviews the burgeoning field of positive psychology and positive organizational scholarship and argues that sustainable change is most likely successful when it elevates and extends strengths and broadens and builds on capacity. The book documents several of the case studies and interventions that have been sponsored through the Fowler Center, including recent efforts by the City of Cleveland to create regional economic development and to create a sustainable ecology and furthering positive institutions that magnify the highest human potential.

# Samuel Culbert: The Magician's Work on Organization Change

# 21

Walter Nord

**Abstract**

Samuel Culbert payed attention to his experience and made himself the consummate applied behavioral scientist. He is an almost five decade contributor of pathbreaking ideas, skilled in identifying management dysfunction and original in suggesting models of progressive organizational change. Combining a clinician's eye with system analytic, inductive thinking, he constructs mid-level theoretical frameworks aimed at influencing frontline practitioners along with academically housed students of change. Always "outside the box" challenging conventional wisdom and mainstream practice, his contributions have been both methodological and substantive. His body of work combines an intense humanism with critical thinking that advances the state of knowledge.

This essay attempts to review the roots of his thinking, the essence of his work, and the muckraking advocacy stances he has taken. We see the progression of his thinking in his forthcoming book where he revises some of his previous assumptions about organizations, concluding that far more variables than previously thought must be engaged for the management mentality, mainstream in organizations, to appreciably change.

## Contents

## Introduction

Elsewhere (Nord 2016), I described Samuel A. Culbert as a *magician*. I did so because his work reminds me of the way Nobel laureate physicist Steven Weinberg (1993) described the work of Werner Heisenberg, who was a great physicist. Weinberg commented that it is difficult to follow the reasoning of magician-physicists, who seem to "jump over all intermediate steps to a new insight about nature (p. 68)."

As I study Culbert's work – as I have done for many years – I often come away thinking that his work is very much like magician-physicists. It is not magic that makes him one of the great thinkers of organizational change but rather his humanism and his way of reasoning that is made possible by a distinctive blend of skill sets that often lead him to profound insights and creative interventions.

I intend this chapter to be an intellectual biography and description of Culbert's muckraking efforts to "make the world of work more fit for human consumption (Culbert 2017)." Throughout it, I will demonstrate how Culbert combines the eye and intuition of a skilled clinician, the big picture purview and inductive logic of a system engineer, and the phenomenologically attentive skills of the consummate action-researcher in his work. I know of no researcher with a stronger commitment to the implementation of humanistic values.

To put Culbert's work in perspective, I begin with several general points I think useful background for understanding his investigative bent. Then I will chronicle his education and the formative professional experiences that led him to pursue a career-long journey studying the dysfunction that prevents people in organizations from realizing their capacities and dreams. I will then highlight the contributions he has made – first methodological and then substantive. Finally, I will bring the reader up to date on his legacy conclusions, which Culbert says came as a surprise. I will do my best to put it in sociological perspective, but it may take a while for the field to deal with. Enough said. Time to get on with Samuel Culbert.

## General Points

To set the context for reviewing Culbert's contributions to the study of organization change, several general points need to be made.

First, as Marrow (1969) wrote that Kurt Lewin "was concerned primarily with the actualities of men's daily lives with one another," the same can be said about Culbert. He has a curiosity about people – their social dynamics and why they interact and organize the way they do. Whatever you do, he wants to know why. Conversations with Culbert almost always turn into a conscious-raising experience, one where he makes you think. His writings reflect this, as well. For example, in his book *Mindset Management* (Culbert 1996), in which he sought to help people become more effective in helping others change, he asked the reader to consider, "What do you need to know prior to influencing people and giving them advice?" This led him to inquire about the mindsets of both the change agents and the person to be changed.

Culbert is a muckraker, often going against the grain of traditional thinking when it comes to organizational change and managerial practices. A great part of his work has been directed toward demystifying mainstream managerial practices and writing exposés that explain what is dysfunctional and the erroneous thinking that brought it about.

For 50 years he has affiliated himself with a university where, to this day, he works as a fulltime tenure-track professor and researcher. He told me, "The world of work is my laboratory where I have a consultant's license to observe, inquire, and then to perturb and probe for deeper understanding."

His work is trans-organizational. The phenomena and management practices he investigates and analyzes are not unique to a particular organization, industry, or locale. Rather, they are endemic in mainstream work culture. The same can be said for the remedies he prescribes which tend to be generic and highly adaptable to local culture considerations. In fact, the literature treats a paper Culbert copublished as the action research's defining articulation of trans-organizational praxis (Culbert et al. 1972).

Culbert does more than just identify dysfunctional behavior and suggest corrections. He constructs midrange theoretical frameworks that allow people to understand what is erroneous in the thinking that led to the dysfunction and allowed it to persist unnoticed. He encourages people to revise their thinking and ways of operating and provides models of what revised practices might entail.

He often illustrates his frameworks and findings with vignettes and short-case descriptions selected to allow people to personally reference what he is describing and reflect on past and current experiences. In this way, Culbert wants others to independently validate for themselves what he has concluded.

Culbert presents his investigations and theoretical frameworks in layman's terms. The use of non-jargon allows him to simultaneously target the two audiences he most wants to influence – practicing managers and students of organizational change. In this respect, he follows the trail blazed by several organizational change writers such as Manfred Kets de Vries, Edgar Schein, and Harry Levinson.

His work has an overarching theme of helping people overcome workplace-induced alienation – in the Marxist commodification sense (Marx 1908) – and to attempt removing freedom-constraining, workplace-manufactured fetishes (Nord 2016). Specifically, he has introduced concepts and ideas that address ways for people to increase consciousness about their lives at work and their self-determination and voice. Many examples of this can be found throughout his work but are perhaps most frequently and powerfully stated in *Mindset Management* (Culbert 1996). As with all of his work, this book reflects values of the humanistic psychology propounded by Carl Rogers, Abraham Maslow, and T-groups, especially the straight-talk relationship that enables people to improve their work effectiveness. For example, he observed how meetings in organizations are unproductive and unnecessarily long because of political posturing associated with the reluctance of people to express their interests openly and directly. This issue became a highlight feature in his work where he stresses the importance explicitly of recognizing the role self-interests play in organization processes and the value of people establishing straight-talk relationships for purposes of dealing openly with matters that, if they remain latent, lead to dysfunctional political processes.

## Influences and Motivations: Engineer Clinician Activist

Culbert began his college studies in engineering at Northwestern University. Halfway through the program, he became interested in psychology and, by graduation, had accomplished what might be considered a double major. During his senior year, he applied for and was accepted into the doctoral program in social psychology at the University of Wisconsin. A month prior to graduating, he met and bonded with Bob Tannenbaum, a guest lecturer from the School of Business Administration at UCLA, who was presenting material from his groundbreaking book on sensitivity training for leaders (Tannenbaum et al. 1961). Sensing a harmony of purpose and spirit, Culbert withdrew his application at Wisconsin and applied to the clinical psychology doctoral program at UCLA, to which he was admitted.

While enrolled in clinical psychology, Culbert supported himself by working as a research assistant to Tannenbaum and eventually with James V. Clark conducting empirical studies in, at the time, the business school's state-of-the-art small group dynamics T-group laboratory. Culbert also performed all of the clinical psychology course work and internships, graduating in 1966 with what once again could be termed a double major. Board licensed as a clinical psychologist in 1967, Culbert chose to not pursue a clinician's career, saying that it was insufficiently dynamic for him. He wrote, "I was much more fascinated by the awareness, realizations, and life-changing experiences *normal* people were having in short-duration T-groups (Culbert 2016)."

While attending an eight-week postdoctoral internship at the NTL Institute for Applied Behavioral Science, he became noticed and was offered a 2-year contract working for the Institute. He was permitted to delay this assignment for a year so he

could fulfill an assistant professor teaching commitment he had made to the business school.

His T-group training and system skills made him a natural for work at NTL. He was program director in the Center for Organization Studies and director of Intern Studies. Now, instead of leading T-groups, he was formulating and organizing professional development training and overseeing organizational consultancies in which he participated, along with other theoretically inclined behavioral scientists. He worked with the likes of Abraham Maslow, Carl Rogers, Chris Argyris, Leland Bradford (who hired him), Charlie Seashore (who he says he did not "know" was his supervisor until Seashore mentioned it 25 years later as he was putting for a birdie at the Bethel Inn golf course), Roger Harrison, and scores of others. While working as staff on his initial NTL assignment, the eight-week program in which he had been a participant in the year before, Culbert developed a very close and lifelong friendship with Warren Bennis.

Two years later, when his contract was completed, Culbert was asked to continue at NTL. However, he declined the offer. When I asked why, he said, "I had too many unprocessed experiences to continue the action-packed NTL pace. I needed time to reflect and download my head." After exploring academic positions at several universities, he decided to return to UCLA.

But the UCLA to which Culbert returned was not the same UCLA that he had left. He found himself more attracted to the system issues being explored by Eric Trist and others in the new Center for Quality of Working Life where he joined an international network of researchers, theorists, social activists, and industry leaders that, he said, "had taken action research to a higher order, trans-organizational plane." Culbert found this discipline aligned with his attraction to the theory and social value commitments of Paulo Freire. The trainer/clinician was in the passenger's seat observing the social scenery, and the system engineer was now in the driver's seat heading for high-impact destinations.

## Key Contributions: Mid-level Theoretical Frameworks

### Methodological

In an effort to pass along his magic, Culbert (2016) described how he conducts his muckraking, trans-organizational action research. He meticulously explained the thinking and behavioral processes involved. He detailed the process of turning passive research "subjects" into phenomena-insightful "informants" and then helping them transition into framework-building and validity verifying "coresearchers." Step by step, he described the routines he uses in deconstructing dysfunctional organizational practices to reveal the erroneous assumptions on which they are based and inducing the system forces provoking them. This methodology caught my eye to the extent that reading his first book (Culbert 1974), I excerpted some of it in a book of readings of my own (Frost et al. 1978).

Specifically, he begins data collection by identifying organizational obstacles (e.g., managerial practices) that prevent people from being their best. He deconstructs the assumptions on which they are based to understand unspoken issues they tacitly address. Then, in step two, he seeks to demystify by exposing obstacles to effectiveness to enable those responsible for the obstacles, those whose performance suffers from them, and other interested parties, to see system elements they previously missed. Step three entails deconstructing system elements to uncover problematic managerial practices that prevent people from performing their best. In step four, he provides a blueprint for replacing what is dysfunctional with liberating actions and systems, based on a humanistic view of people and their collaborative nature. In this context, step five conceptualizes a coherent theoretical framework that describes aspects of the system that need repair and validates it using real-life situations with which readers are apt to identify. Taken together, these steps enable him to link theory with finely nuanced life experiences and revised practice.

## Specific Findings

Culbert has made major contributions to the study of change through a series of eight book-length action research reports. Each book challenges some aspect of conventional wisdom. The best way to capture these contributions is to take a quick, much too short, look at each of these books.

### *The Organization Trap and How to Get Out of It* (1974)

Immersed in the zeitgeist of the women's and minority rights movements of the 1960s and early 1970s which he wrote about in a McKinsey award-winning article (Culbert and Elden 1970), equipped with clinical and small group dynamics skill sets, and fascinated with Freire's *Pedagogy of the Oppressed* (Freire 1968), which he utilized in recent book (Culbert 2017, p. 129) "unlocking the past" thesis, Culbert explored the issue of over-socialization in companies. He was concerned about "organization traps" that limit a person's ability to comprehend the forces driving their personal decisions and career choices at work.

The outcome was a theoretical framework from which a five-step consciousness-raising strategy was derived. This is a model that people situated in any company can use, first to raise their awareness of organizational forces bearing on work-life choices and then to conceive of and evaluate the benefits of specific self-emancipating actions. The model extends Freire's self-determination through cultural awareness to personal conduct decision-making at work (Renshaw 1974).

### *The Invisible War: the Pursuit of Self-Interests at Work* (1980) and *Radical Management: Power, Politics, and the Pursuit of Trust* (1985), Both Coauthored

These books take up the basis for the organization politics that are part and parcel of people working together seeing events so differently. It is based on Culbert's, and his coresearcher's, clinical awareness that self-interests are intertwined in every action

an individual takes, in how people interpret any situation, and their self-convenient portrayals of events. It seeks to explain the inevitability of people constantly vying for self-convenient and advancing organizational frames. It speaks as a counterargument to people who eschew organization politics and the pernicious motivations they attribute to other people's self-convenient tilting of truth. The book presents a framework aimed at making sense out of what the authors describe as a natural and inevitable state of human affairs.

Central to the framework is the construct *alignment*: "The individualist way in which a person orients to work events. It reflects an individual's attempt to maximize expression of the subjective, and the personally important, while producing work he or she believes the organization should receive from someone in his or her job and position (Culbert and McDonough 1985, p. 221)." Using this construct the authors introduce a format for people nonjudgmentally realizing the basis and inevitability of a person's (one's own and others') distinctive way of thinking and acting. It makes bias, stylistic preferences, personal proclivities, and self-interested inclinations discussable and, sometimes, explicitly negotiable. The framework stipulates trusting relationships as the most effective tool available to any manager, especially when dealing with adversity.

### Mind-Set Management: The Heart of Leadership (1996)

This manuscript was submitted with the subtitle "Making Management a Psychological Science Instead of a Manipulative Art," which is descriptive of what Culbert set out to accomplish. At the time, the mainstream work culture lacked a means of nonjudgmentally characterizing inclinations, aversions, limitations, imperfections, and stylistic bias, all attributes Culbert considered organic in people's conduct at work.

Prominently used in Culbert's mind-set management framework is the terminology "reality is an artifact of the mind that views it." It makes his message crystal clear: To insure the advice you offer someone is relevant to that person's life and view of their workplace, you should first visit the organization in which that person works. Of course, the organization where a person works is inside that advice-receiver's head and accessible through that individual's mindsets. Culbert's model stipulates how to access that organization, noun and verb.

A substantial contribution comes in the book's inclusion of a refined alignment questionnaire, including detailed instructions for administering it. In addition, his framework provides guidance for accessing what's unique in an individual's perception of events, the meaning that person attributes to them, and identifying orienting mindsets.

### Don't Kill the Bosses! Escaping the Hierarchy Trap (2001), with Coauthor

The back dust cover succinctly describes the issues researched and reported on in this book. It states: "Boss-dominated relationships! What a strange state of affairs. After all that's been said about the advantages of empowerment, participatory decision-making and teamwork, how is it possible that we continue allowing bosses to dominate and subordinates to fake acquiescence to the extent both do today? It's a problem everyone knows about and few know how to fix."

The book analyzed the use of hierarchy in organizations, concluding that while there are many highly functional applications of hierarchy, one major dysfunctional consequence goes unnoticed: the relationship perverting and trust destroying impact of "one-side accountable, boss-dominated relationships."

The theoretical framework Culbert offered describes what is newly achievable in non-boss dominated, two-sided, and reciprocal-accountable relationships. He deconstructs the construct "accountability" to identify the core problem in its conventional mainstream usage. He explains why organizations find it so difficult to get people to own up to mistakes and errors in judgment. Culbert asserts that accountability only becomes real when there are consequences. But in companies, consequences almost always entail punishment and denial of rewards – which makes people reluctant to acknowledge fault. Culbert presents an alternative – "lessons learned accountability" – and goes on to stipulate precisely what that entails.

Redefining boss/subordinate relationships to be two sided, his framework holds both parties accountable to one another and the company. The operative is accountable for getting organizationally needed results, and the boss is accountable for creating the circumstances for the operative to succeed in getting those results. When the outcome is not what it should be, the framework directs that both boss and subordinate stand lesson-learned accountable. The operative needs to learn what was needed and also realize why he or she did not already know it. The boss needs to learn what the operative lacked and why he or she did not realize it was lacking and provide it. Both need to learn what they should be doing differently and, in the boss' case, learn how to prevent similar disappointments from other people in their jurisdiction.

### Beyond Bullsh*t: Straight-Talk at Work (2008a)

A career spent promoting authentic interpersonal communication in the workplace, Culbert was inspired by an essay defining the vernacular word "bullshit," written by Princeton University philosopher Harry Frankfurt (2005). Extrapolating to the mainstream world of organizations and collecting data, Culbert put forth a theoretical framework that conceptualized and meticulously stipulated the alternative to bullshit: straight-talk relationships.

Several noteworthy contributions are contained in the framework he put forth, starting with the realization that "Bullsh*t has become the communications etiquette of choice in corporate communications (Culbert 2008a, p.9)." Describing the negative impact bullshit has on quality of communications and trust in relationships, he also pointed out many practical conveniences it serves, such as "how much more dangerous organization life would be without it."

He then presented what is needed for *straight talk*, which his framework contended is not a moment-in-time episode but the character of a relationship. He extended his alignment theory "*to getting*" an individual to the extent that when viewing that person's distinctive, seemingly aberrant, reactions and behavior, one could knowledgably answer what Culbert calls the "Why (is) This (happening) Now?" question. With clarity he stipulates the conditions and processes required

for evolving straight-talk relationships. He also describes how to recognize the circumstances and conditions when straight-talk relationships are not possible. His framework includes what Culbert believes is the hallmark variable in two-way expressive, relationship-building communications: *I-Speak*.

### *Get Rid of the Performance Review! How Companies Can Stop Intimidating, Start Managing and Focus on Getting Results* (2010) with Coauthor

This was Culbert's all-out effort to rid the workplace of a dysfunctional practice he had been arguing against for 30 years (Culbert and McDonough 1981; Culbert and McDonough 1985; Culbert 1996; Culbert 2008b). Here is how the book's genesis is described on the Anderson School's website: "Articulating the theoretical framework suggested by his findings for the Academy of Management, Culbert was asked about obstacles to managers establishing straight-talk relationships with their direct reports – the people whose effectiveness they're out to enhance. 'Easy,' he said. 'It's the annual pay and performance review.' Following up, he wrote a *Sloan Management Review* paper that was reprinted in another journal, and that sparked a major change that's taking place mainstream today. What journal has that influence? On October 20, 2008, his paper titled 'Get Rid of the Performance Review!' appeared full-page in *The Wall Street Journal*. And that led him and his WSJ editor to write a very influential management book."

More than any other of Culbert's theoretical frameworks, it is possible to identify the impact this thesis has had on the world of work. At least partially as a consequence of his WSJ article – and the book two years later – hundreds, if not thousands, of companies have stopped giving annual pay and performance reviews. Unfortunately, as Culbert related it to me, in most instances, what companies have done is (Culbert's word) "shamful [sic]." He asserted, "Most have substituted alternative ways of 'objectively' evaluating, categorizing, and manipulating people." Tongue-in-cheek, Culbert said, "It's as if there's a cultural conspiracy aimed at preventing people from speaking their truths to people with power." Jumping ahead, his legacy book includes a vivid case study exemplifying the faux acceptance he sees taking place in companies today (Culbert 2017, pp. 143, 148).

Boldly, as is Culbert's style, he opened Get Rid of the Performance Review book saying, "It's time to put the performance review out of its misery (Culbert 2010, p.1)." Then, three sentences later, insuring readers got it, he added, "It's a pretentious, bogus practice that produces absolutely nothing that any thinking executive should call a corporate plus." He supported this view effectively and showed how a political process fueled by the latent self-interests of organizational participants sustains the existence of this practice. He proposed a far better approach – i.e., using performance *previews* instead of reviews.

This leads me to his forthcoming book, which he claims will be his final. While I have heard him say that before, I believe this time he really means it. Why? Because his puzzling and research took him to a surprising conclusion that up to now the

change-management field has failed to acknowledge and would not face up to when another theorist postulated it.

## New Insights: How Work Culture Corrupts Good Intentions

Culbert's last book *Good People, Bad Managers: How Work Culture Corrupts Good Intentions* (2017) contains a breakthrough insight that I believe will be a major part of his legacy. I find the book magnificent, rooted in wisdom Culbert has advanced throughout his previous work. As before, he argued convincingly that organizations would be much better served by managers removing obvious barriers to any person performing his or her best. However – and this is where the surprise ending begins to unfold – somehow, even when they sincerely try, they fail. That is what Culbert has concluded, and he thinks now he knows why it happens. Here's how he put it:

> "I'm sobered by a career spent exposing the negatives in mainstream good management practices, mistakenly assuming that well- intentioned managers would revise their erroneous ways once they realized the negative effect they were having. It's not that I've gotten much pushback about the dysfunction I've exposed, or disagreement about what revisions would be in everybody's best interests. Yet despite all the good intentions, little gets altered. Apparently, the practices I've been urging managers to revise are much too insidious and culturally embedded for any manager, or ad hoc group of non-top-level managers, to change on their own. (p. 64.)

He sees the impediments to change stemming from societal and workplace forces creating a need for pretense that leads success-driven managers to feel too insecure and self-protective to provide employees the focus and expression they need and deserve. Some of the forces reside in MBA education – what Culbert terms "Graduate Schools of Success." He asserts that students are so focused on acquiring disciplinary knowledge that accrue to their own accomplishments that they do not develop the other-directed sensitivity skill sets required for the good management of others.

A few quotes from the forthcoming book help us see what he is up to:

> "There's far more bad management behavior taking place today than the well-intentioned doling it out realize… and even more than those on the receiving end are aware of! There's little mystery about what good management entails; the biggest mystery is why people are calling this bad behavior 'good enough.'" (p. 68)

> "The root cause of most of the bad management behavior taking place today, to which so many well-intentioned managers are oblivious, is what the American work culture, en masse, has managers thinking incorrectly. (p. 12)"

Describing the problem:

> "Too much of what the culture expects flies below most managers' consciousness – vaguely recognized, not engaged, and kept in place because managers are hard pressed to identify how they're being influenced. (p. 123)".

He adds,

> "Personally, I've never been concerned about employees receiving enough feedback, and using what they thought accurate to improve as they were able. But consistent with the accounts I've been reporting in this book, there are plenty of reasons for worrying about managers having sufficient incentive to self-question, and to contemplate what's dysfunctional in their relationships with employees. (p. 147)".
>
> "Stepping back, I see an unfortunate mismatch. Top level leaders have the means, but most won't see gains sufficient to justify the effort required. (p. 153)".

Consequently, the changes he has proposed throughout his career are a long way off, at best. In important respects, Culbert – after living his career advancing humanistic values – seems to have come out experientially where the great sociologist Alvin Gouldner came out, almost a half century earlier, from several decades spent analyzing structural incoherence in society.

I believe that Gouldner's (1970) discussion of the role of sociologists in a capitalist society can help us understand the nature of the problem Culbert sees blocking individual emancipation in companies. Gouldner postulated that there is an underlying dissonance between "power" and "goodness." From this perspective, the self-interests of individuals who hold power are furthered by actions that get them perceived as being good. In many respects, following the advice of applied social scientists that stems from the humanistic values driving Culbert – such as introducing progressive QWL practices and/or speaking favorably of any reformist change-management effort – can help leaders with power to be seen as doing good without actually giving up the power that implementation of the values associated with such programs might entail. In other words, their self-interests can be satisfied by the rhetoric and appearances these programs provide. Hence, the introduction of these programs – at least on a temporary basis – does not require them to actually give away power. Similarly, it is possible that such partially committed efforts can satisfy the self-interests of the social scientists who champion them. For example, the acclaim and consulting fees that many of them gain from championing these programs may be all the reward needed. The situation may be analogous to that described by Gouldner when he wrote that some sociologists "live *off* sociology" rather than "live for it (Gouldner 1970, p. 15)." Thus, we are in a situation in which the self-interests of members of both audiences that Culbert has attempted to address may be satisfied by rhetoric and partial commitment rather than the full change Culbert sought.

Although I am confident that Culbert perceives the problem of the failure of the humanistic values to be sustained as his unfinished work, I am not confident that he agrees with my analysis of causes. However, I suggest that the process he highlights – how pursuit of self-interests by well-intended people can lead to dysfunctional results – is consistent with other theories he has proposed and that his muckraking orientation toward social science has been a reasonable extension of his analyses. Thus, the frame I have developed may be a "natural" extension of his thinking.

## Legacies and Unfinished Business: Demystifying Pretense

Given what I have written so far about Culbert's forthcoming book, I conclude that it is a legacy book. It builds on insights Culbert has contributed over the years and shows how he is able to learn from his experience and challenge his earlier thinking.

By now it should come as no surprise that his legacy book challenges an aspect of conventional wisdom. What is surprising is that the conventional wisdom he is challenging used to be his own. Prior to writing it, Culbert – along with many change theorists of his ilk – believed that humanistic social scientists can, through careful study, uncover a number of dysfunctional practices and develop ways that can be implemented to overcome them without major cultural change. However, in this book, he said, "Not so fast." He is no longer optimistic. There are pervasive forces in our culture that inhibit a change in managerial mentality and nothing is going to change until those forces are dealt with.

Before concluding, something else needs to be said. The nature of Culbert's legacy will be different than those of most of today's academically unified social scientists. Culbert chose, for the most part, to create coherent theoretical frameworks that spoke to contemporary managers and professionals working in applied fields, as well as academic peers. This path has entailed two steps: use of applied phenomenological methodology that capture complexities and explain real-world experiences and publishing audience appropriate books rather than scholarly journal articles.

While this path did result in prestige and recognition from a somewhat narrow group of applied social scientists, it did not produce the academic standing of a Karl Weick or Bill Starbuck. On the other hand, Culbert's work has incorporated a coherent theoretical framework that has made him suitable for many academics in applied fields. However, I suggest that his attempt to formulate theory that captures the complexity of the phenomena he studied may have limited the popularity of his work with non-academic readers of the sort attracted to Peters and Waterman's In Search of Excellence, or Jim Collins' Good to Great. In many ways these books simplify issues. In contrast Culbert combining of clinical and systems shows up the fallacy of such simplifications. This view is based on my personal judgment and experience which have lead me to use his books successfully with graduate MBA students, and a reluctance to use the more popular books with this audience. Thus, despite the value of his work, it appears unlikely that Culbert's legacy will include the great fame among popular audiences of Collins, Peters and Waterman, or a Weick among academic audiences.

## Conclusion

Culbert has clearly made numerous novel and important contributions to the study of change. However, in addition to all of the insights and inductively developed constructs Culbert introduced during his career, he may be most remembered for the "sobering message" delivered in Good People, Bad Managers. The pretense needed for managers to enact what the work culture erroneously calls "good

management behavior," the ethos of self-advancement and success, and the insecurity and dynamics that derive from what the work culture erroneously assumes stand in the way of people achieving what they could otherwise become. While this outcome is surprising, it is consistent with the messages of Culbert's The Organization Trap and Marx's expository writing on alienation: human beings create worlds for themselves that control them in dysfunctional ways. In his legacy book, Culbert said it this way: "It's as if managers have the cultural programming internalized to the point where, stranded on a deserted island and starting from scratch, they would recreate the very system that wrecks so much havoc for everyone, Especially themselves (p. 101)."

## Further Reading

Culbert, S.A. with David Muir (downloaded 2017). http://abcnews.go.com/WNT/video/conversation-performance-review-11126992

For much of his professional career, and up until a few years ago, Samuel Culbert believed bottom-up advocacy was a viable format for progressive organizational change. Still an ardent believer, recent insights have led him to a personal conclusion that more is needed. It is a nuanced outcome he always resisted. That is why his last book (in press, 2017) is an essential read for anyone interested in cultural progression and humanistic change management.

Intricately familiar with Culbert's recent methods article, Transorganizational Muckraking: Method and Style (2016), I find it must reading for every phenomenologically attentive researcher. When reading, I thoroughly advise taking your time. If you do, I believe you will learn to see a great deal that conventional researchers typically miss. Expose yourself to the origins and logic of his unique way of listening to people and getting to the basis of their truths.

If you would like to experience the passion and zest he puts into his public presentations, along with the humor he often inserts, watch the three-minute video he made for ABC News (downloaded 2017). For that matter, google his dozen or so NPR appearances, find the media articles he wrote (including two NY Times Op-eds.), and read what professionals in H.R. and O.D. have written about his work.

# Tom Cummings: A Passion for People and Learning

**22**

Paul S. Adler

### Abstract

Tom Cummings is best known for his text *Organization Development and Change*, widely referred to as "the bible of OD." This chapter traces the development of his thought leading up to that text and beyond. I discuss his long-standing engagement with socio-technical systems and organization design, his synthesis of those with traditional organization development, his work on transorganizational design and on the strategy process, and his emerging work on "care" in organization studies.

### Keywords

Organization development • Organization design • Self-designing organization • Socio-technical systems • Transorganizational design

## Contents

Tom Cummings has been my colleague here at the University of Southern California since I joined the faculty as a tenured associate in 1991. He became department chair soon thereafter and was still in that role as of the time of writing. He has been a supremely generous colleague mentor, and administrator. This essay will summarize some of the key steps in his professional journey and his main intellectual contributions.

## Influences and Motivations

Cummings was born on March 23, 1944, in Batavia, NY. He began elementary school on the campus of Humboldt State University, while his father, a returning Air Force veteran, earned a degree in waterfowl management. The next few years saw the family living on the New York State Wildlife Refuge in Oakfield, NY, where his father was a manager. Far out in the countryside without much to do but hunt, fish, and roam fields, Cummings became accustomed to being alone – a notable background for a social scientist focused on groups and teams.

In 1959, his father took a new position as manager of the Montezuma National Wildlife Refuge in Seneca Falls, NY, and the family moved nearer to town on the shores of Cayuga Lake. At high school, Cummings excelled at football and track, and won a NY State Regents Fellowship that covered his college tuition and expenses. This supported his undergraduate program at Cornell, where he majored in agricultural economics.

His professional goal at the time was law. A fan of the *Perry Mason* TV show, Cummings was attracted to the idea of becoming an independent lawyer. He was a disciplined student and completed the requirements for his BS degree in three years. He decided that a MBA degree would enhance his planned legal career, so he spent his fourth year as a first year MBA student in Cornell's MBA program. (Cornell at the time allowed a few exceptional students to get both BS and MBA degrees in 5 years instead of 6). In the MBA program's first year, he found himself attracted to personnel and labor relations. As a result, he took all his second year electives in Cornell's School of Industrial and Labor Relations, taking classes on research methods, unions, and organizations taught by such luminaries as William Foote Whyte, Ned Rosen, and Vern Jensen.

After graduation, Cummings had a change of heart and veered away from law. His new direction was influenced by his business-school mentor, Earl Brooks, who was an independent management consultant and taught part-time at Cornell. Inspired by Brooks' example, Cummings resolved that he would get an advanced degree in order to become an organizational consultant. In 1967, he was admitted to UCLA business school's PhD program, planning to major in industrial and labor relations.

At UCLA, because of his background in wildlife, he was assigned to be a research assistant on a study of the US Forest Service. The study was being conducted by faculty in a new business-school academic department – "socio-technical systems" or "STS" for short. STS was an interdisciplinary program with faculty from behavioral science, operations research, management, accounting, and more. It was led by Will McWhinney (a modeling expert who had studied under Herbert Simon at Carnegie) and Eric Trist (who joined UCLA from the Tavistock Institute of Human Relations in London and was a renowned pioneer of the STS field). Under the influence of these mentors, Cummings shifted his major field from industrial and labor relations to STS.

Cummings thrived in the interdisciplinary world of STS, with its focus on people, groups, organizations, technology, and on the systemic character of their interrelations. He was energized by STS's commitment to action research and by exposure to

the global network of STS action researchers from Scandinavia, England, Ireland, India, Australia, and the US who frequently visited UCLA. Trist was initially famous for his work on teamwork in coal mines and weaving mills. But by the time the STS unit was established at UCLA, Trist and his colleagues had broadened their focus to what they called "social ecology" and the "causal texture of environments." Here, the unit of analysis was the network of interacting organizations and their environments, and the focus was on solving societal problems, often at the regional and nation levels, rather than operational problems for the individual workgroup or plant. This shift was driven by a growing awareness that the ability to jointly optimize social and technical aspects at one level was constrained by the extent of optimization at higher levels of aggregation.

Alongside his participation in STS research, Cummings took courses in organization development and T-group leadership, taught at the time by the business school's behavioral science department faculty including Bob Tannenbaum, Jim Clark, Warren Schmidt, Art Shedlin, and Chuck Ferguson. This department was known as the "West Coast NTL" – the West coast counterpart to the famous National Training Laboratory founded by Kurt Lewin in 1947. Students participated in a year-long T-group and then learned how to lead T-groups and conduct organization development interventions. Long-term OD projects with companies such as TRW and Procter & Gamble were an integral part of the learning experience, and these gave Cummings and his peers both experience intervening in real-world organizations and sites for their dissertation research.

Between the intellectual excitement of STS and the emotional and existential challenges of T-groups and OD, Cummings changed plans once again and resolved to pursue an academic career as an applied social scientist hoping to make a positive impact on organizations and society. In slightly less than three years, he completed not only coursework for his major in STS (with McWhinney and Trist), a minor in behavioral science (with Jim Clark), and another minor in social ecology with faculty from the UCLA psychology, sociology, and geography departments but also his dissertation. The dissertation was on interorganization relations and organization change. It was funded by Procter & Gamble, with McWhinney and Clark as co-chairs and a committee of Peter Vail and Bill McKelvey from the business school, Ivan Light from sociology, and John G. Kennedy from psychology.

Upon graduating from UCLA in 1970, Cummings started his academic career in the organization behavior department at Case Western Reserve University. Although the OB department was part of the business school, it had its own PhD program. Cummings was the youngest member of the faculty. Indeed, he was younger than any of the doctoral students, most of whom had already had successful careers as social activists in various fields. The department had strong humanistic and democratic values, with everyone, faculty and students alike, having a vote on community matters (although not on academic assessment). T-groups flourished throughout the department and were an integral part of both faculty and student development as well as undergraduate and MBA courses and executive education programs. The faculty was a mix of seasoned social psychologists from the University of Michigan, a few colleagues from related disciplines, and some younger PhDs from schools of

business or administration. Cummings taught a year-long doctoral course in systems theory and jointly taught a doctoral course on organizations and environments with the oldest member of the faculty, Nathan Grundstein, a pioneer in public management science and law. Grundstein became a valued mentor and confidant.

In 1976, a fortuitous meeting with Larry Greiner, then head of the management department at the University of Southern California, led to a move to Los Angeles. The department encompassed three areas – organizational behavior, strategy, and business and society. Greiner had recently been hired from Harvard Business School with the goal of revitalizing the department and moving it into the upper echelons of academe. This led to the hiring of leading OB scholars such as Steve Kerr and Mary Ann Von Glinow (both of whom went on to become presidents of the Academy of Management), Chet Schreisheim, Craig Lundberg, Chuck Maxey, Ken Brousseau, Sue Mohrman, and Gretchen Spreitzer; strategy scholars such as Syd Finkelstein, Bill Davidson, Ian Mitroff; and business-and-society scholars such as Warren Bennis and Dick Mason (along with Jim O'Toole who was already in the department). During this period, the department also created an applied research center – the Center for Effective Organizations (known as "CEO") – and hired Ed Lawler to run it and Susan and Monty Mohrman to assist him and later added Gerry Ledford from Michigan and Susan Cohen from Yale.

Cummings remained at USC ever since, becoming department chair in 1996 and serving in that role for the subsequent 21 years. He led several successive mutations of the department as it progressively shed its strongly applied character and became progressively more academic in its profile. The department nevertheless retained elements of that earlier culture. Cummings was known not only for his focus on building community within the department but also for his continual encouragement to focus research and teaching on important organizational and societal issues.

Beyond his home department, Cummings was active in numerous university-wide committees at USC. And beyond his home university, Cummings was elected Chair of the Academy of Management's Organization Development Division (1981–1982), President of the Western Academy of Management (1985–1986), and President of the Academy of Management (2005–2006). He also left his mark on scholarship both as chair of some 37 dissertation committees and as the founding editor of the *Journal of Management Inquiry* (1991–1996), a journal notable for its distinctive focus on "creative, nontraditional research, as well as key controversies in the field."

## Key Contributions and New Insights

The department at Case Western Reserve University relied on funded projects, supported mostly by companies, to pay for almost 50 doctoral students. Cummings led a project with five doctoral students at Alcoa's large unionized forging works in Cleveland's industrial flats. The Alcoa project lasted 5 years and provided the material for his first book, *The Management of Work*, coauthored with Suresh

Srivastva (Cummings and Srivastva 1977). In this book, Cummings offered his statement of the theory and methods of socio-technical systems and their use in field projects. This project also informed several journal articles, most notably, the widely cited "self-regulating work groups" in the *Academy of Management Review* (Cummings 1978).

At Case, Cummings subsequently worked with several faculty and doctoral students on a large National Science Foundation study assessing the scientific validity of the numerous studies on productivity and quality of work that had appeared recently. His contribution to the project assessed the various field experiments using Campbell and Stanley's quasi-experimental methodology. This led to his second book (with Eddie Molloy, a doctoral student), *Improving Productivity and the Quality of Work Life* (Cummings and Molloy 1977), which characterized and assessed several work-improvement strategies: autonomous work groups, job restructuring, participative management, organization-wide change, organizational behavior modification, flexible working hours, and the Scanlon plan. The project also led to several journal articles, most notably "A Methodological Critique of 58 Selected Work Experiments" in *Human Relations* (Cummings et al. 1977) and a jointly authored book, *Job Satisfaction and Productivity* (Srivastva et al. 1975).

On moving to USC, Cummings worked with the CEO team in action research with firms seeking to improve productivity and quality of working life. Lawler was a prominent researcher in this area at Yale and Michigan, and Sue and Monty Mohrman were budding action researchers trying to make organizations more effective and humanly satisfying. Together they undertook major action research projects with Honeywell, Johnson & Johnson, and General Mills. This work expanded Cummings' research, from the shop-floor STS work design that he had done at Alcoa to the design of whole organizations, including reward systems, selection practices, organization structures and control systems, and decision-making processes. The underlying theory was that these systems needed to "fit" with each other and with the external environment if performance and employee satisfaction were to be improved and that these outcomes would be at their peak in what the researchers came to call "high-involvement organizations" and "high-performance organizations."

This action research pioneered a new approach for large-scale organization change – the "self-designing organization." Instead of discrete change projects controlled by managers and experts, the process adopted here was one in which organizational members learned to continually redesign their own organization so as to keep pace with external changes and to continually improve the organization's performance. The new approach was a precursor to the growing interest in organizational learning. The key ideas were presented in a coauthored book, *Self-Designing Organizations* (Mohrman and Cummings 1989), that was part of the reknowned Addison-Wesley OD Series.

This CEO team also explored how field research could produce knowledge that is both scientific and useful. To address those issues, they held two major research conferences with applied research colleagues from across the globe. This resulted in

two co-edited books that were well received in North America and Europe: *Doing Research That is Useful for Theory and Practice* (Lawler et al. 1985) and *Large Scale Organizational Change* (Mohrman et al. 1989).

Around this time, Cummings returned to some of the social ecology themes that had engaged him during his doctoral program at UCLA, developing a new account of what he called "transorganizational systems" (TS) and of planned change efforts to improve and develop such systems that he called "transorganizational development" (TD) (Cummings 1984). Today, we have a vast body of research on interorganizational issues of collaboration, joint ventures, alliances, and networks, but his was a singular and far-reaching approach. He argued that TD was not just OD applied one step upward but rather a whole new approach to planned change, one that required its own theory of how such transorganizational systems function and how they can be changed and developed. Building on a synthesis of the various literatures contributing to our understanding of interorganizational relations (such as resource dependence theory, interorganizational fields, and networks) and the STS literature of social problem-solving, Cummings developed an integrative model of transorganizational systems, summarized in Fig. 1 (reproduced from p. 397).

This framework provided the foundation for his proposed approach to the tasks of transorganizational development (TD). This latter differed from traditional OD in that while OD traditionally focused on collectivities that were bounded and organized – indeed often over-bounded and over-organized – TD's object was typically

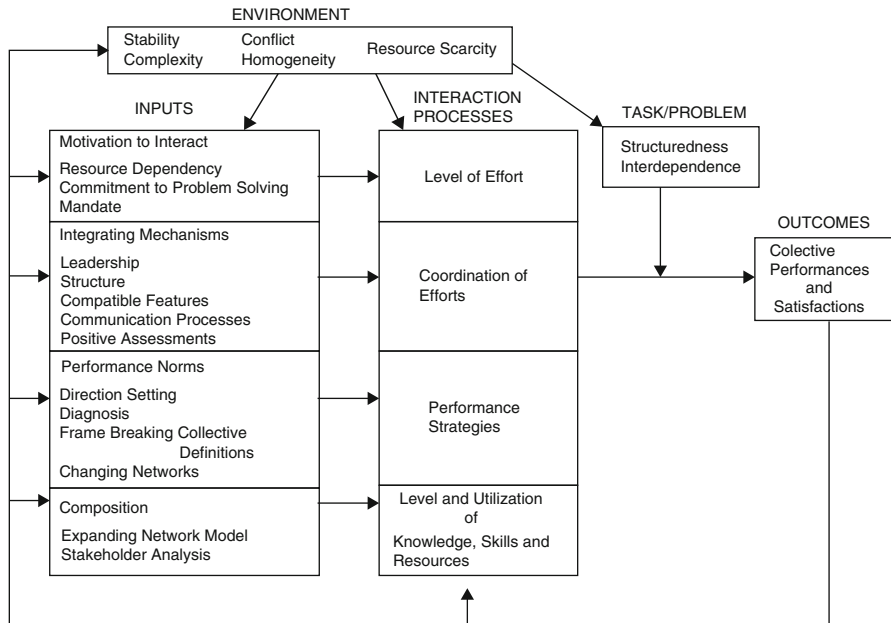

**Fig. 1** Cummings' framework for analyzing transorganizational system (Reproduced from Cummings 1984)

underbounded and underorganized. The key phases of OD intervention – entry, diagnosis, intervention, and evaluation – would therefore not suffice in TD. TD intervention should be structured, Cummings argued, as (a) identifying the organizations that were part of the TS, (b) convening these actors, (c) organizing the system to regularize behaviors, and (d) evaluating that system in terms of its intended effects. His landmark essay marshalled the tools needed for each of these phases.

In retrospect, one notable feature of this argument was its prescient sensitivity to power asymmetries in these transorganizational systems. The TD practitioner's commitment to collaborative values and system maintenance might not be powerful enough to change the power relations in the system. And more importantly, "interventions aimed at enhancing collaboration among organizations may unwittingly damage some participants in situations fraught with power/dependence." Conversely, "changes intended to gain power over others may inadvertently ignore opportunities for mutual gain in situations with underlying interdependencies among organizations." Cummings drew a conclusion whose wisdom still resonates at a time when corporations have become more active in their pursuit of "corporate citizenship": "Until sufficient knowledge about TD becomes available, it seems prudent and ethical to openly question the value premises underlying different intervention choices, including the behaviors of interventionists" (pp. 415–416).

One constant in Cummings work to this point had been his persistent effort to retain a focus on organization performance. He argued that this contrasted with the traditional approach of organization development, which often focused on people rather than on their work, on process more than on content. A second and related long-standing concern was that OD's practical advice was far richer than its underlying theory. He had earlier tried to bridge the difference with an edited volume on *Systems Theory for Organization Development* (Cummings 1980). His approach changed when he was asked by the publisher and wife of the deceased Edgar Huse to take over the major textbook in field, Huse's *Organization Development and Change*. Cummings accepted with the goal of influencing how the field was portrayed and how it developed. He eventually added a coauthor, Chris Worley, a former doctoral student. It has remained the top-selling OD text in the world, often referred to as the "bible of OD." Pushing further in his quest to bring more theory to the OD field, Cummings invited prominent applied researchers to contribute to an academic handbook about their most recent thinking in OD. This resulted in a 35-chapter volume of original contributions, *Handbook of Organization Development* (Cummings 2008), which was recognized in 2007 as the R. Wayne Pace HRD Book of the Year by the Academy of Human Resource Development. He published an updated assessment of the state of OD in 2014 (Cummings and Cummings 2014).

In more recent years, Cummings shifted focus again, to consider the strategy process. In his prior work, whether at Alcoa on STS work design or with CEO on organization design and self-design, the organization's strategy had been taken as a given and the interventions sought to design work and organization to fit the strategy. But if the strategy was flawed, such work-redesign efforts would not help the organization. This new strand of research evolved out of a series of action research projects with Larry Greiner at Rolls Royce's Aircraft Engines Division, Parsons

Construction, and USC's Theatre School and its College of Letters, Arts, and Sciences. These organizations were struggling to adapt to dramatic change in their competitive environments. In helping them address these pressing issues, Cummings and Greiner observed not only that the clients' existing strategies were outdated but also that traditional approaches to creating new strategies were inadequate. The traditional strategy process rested on time-consuming efforts by corporate staff or outside consultants to gather and analyze voluminous data on the competitive environment and the organization. That process was too slow in rapidly changing environments, and it could not generate the organizational buy-in needed for effective implementation. The new strategy process they developed involved multiple stakeholders in an ongoing process of strategy-making, organization redesign, and implementation, and this process was built into the organization's structure and decision processes. Instead of strategy being an activity conducted occasionally and by top executives, it should be a highly participative and continuous process. The logic was the same as the one Cummings and his collaborators had developed in their approach to self-designing organizations, but here the goal was a self-designing strategy. Cummings and Greiner called this continuous, high-involvement approach to strategy "dynamic strategy making" and wrote a book by the same title (Greiner and Cummings 2009). Since then, dynamic approaches to strategy-making have become more prevalent in both the academic literature and practice.

## Legacies and Unfinished Business: Looking Forward

In his most recent work, Cummings has turned his attention to the state of management scholarship. His work has focused the paucity of strong theory, the increasing frequency of inconsequential empirical studies, the growing ethos of careerism, and the deepening chasm between research and practice. As befits a senior statesman in the field, through a series of publications (Aguinis et al. 2014; Cummings 2011; Schwarz et al. 2015), he has attempted to raise the profession's sights from the multiplication of journal publications that advance careers but not meaningful knowledge, to serving people and society.

Consistent with the joint commitment to people and learning that is the hallmark of his work, Cummings' analysis highlights the debilitating consequences of the currently predominant ethos of the field for both the integrity of the individual scholar and the advance of our science. He and his collaborators identify powerful institutional forces that work to suppress the role of researcher "care" in management research: the apparent productivity (as measured in top journal publications) of research that focuses on tractable rather than important issues, the academic system that rewards such behavior by its focus on counts of publications and scholarly citations, and the narrowing of the researcher's field of ambition to the issues and methods already legitimate in our field. And he argues passionately and convincingly that this devolution of researcher care in turn limits the field's knowledge development by restricting the intellectual variation and exploration.

Consistent too with Cummings' long-standing efforts to bring together STS and OD solutions, the remedies he proposes are at both the system and individual level. At the system level, he and his coauthors argue that our field is well served by the recent emergence of unconventional models of research and publications such as engaged scholarship that seeks to surmount the twin hurdles of scientific quality and practical impact (Van de Ven 2007); critical management studies that marry qualitative management research with critical theory and values (Alvesson and Deetz 2000); transdisciplinary research that aims to address large-scale, complex problems (Wickson et al. 2006); and positive organizational scholarship that focuses on opportunities for more positive outcomes for organizations and their members (Cameron and Spreitzer 2011).

At the individual level, Cummings and his colleagues make a plea that seems to sum up Cummings legacy most aptly. I quote it in full:

> "Notwithstanding strong institutional pressures to cede researcher care to the OS[organization studies] community, the decision about what to invest care in researching organizations ultimately rests with the individual researcher. Each of us makes choices about what issues to study and what theories and methods will gain insight into them. Because these decisions are personal and inherently subjective, an initial step in addressing the devolution issue is for individual researchers to look inward and explicitly reflect on what they care about in doing research and what they are likely to gain or lose if they suppress or alter their care for any appreciable time. Careful and frank appraisal of these issues can help researchers make mindful choices about what to invest their care in researching and what trade-offs, if any, they are willing to make for instrumental gains." (Schwarz et al. 2015, p. 11)

Cummings' legacy in the field of organization change thus lies in three main dimensions: bringing together STS and organization development approaches, strengthening the theoretical infrastructure for both, and extending their relevance to both the strategy process and transorganizational systems. He has, in this way, ensured the continuity of these traditions as powerful influences on the whole world of work design and organization design.

# Barbara Czarniawska: Organizational Change – Fashions, Institutions, and Translations

# 23

Hervé Corvellec and Ulla Eriksson-Zetterquist

### Abstract

Combining neo-institutionalism, actor network theory, and Gabriel Tarde's sociology, Czarniawska considers the key driver of organizational change to be imitation but an imitation that rests on translation. Organizations emulate one another by translating fashionable ideas according to their understanding, traditions, needs, and means. As translation in this tradition always entails a transformation of the translated idea or object, unexpected consequences will be expected. She does not consider these consequences to be necessarily negative; however, because if stabilized and institutionalized, unintended change can turn out to be as positive as planned change. A further strength of Czarniawska's is her ability to provide methodological tools that follow the translation processes for change: organizational ethnographies, narrative methodology, and shadowing.

## Introduction

"If we want things to stay as they are, things will have to change." This enigmatic assertion by young Tancredi Falconeri, opportunistically rallying behind Garibaldi's Republicans, was made to his aging, aristocratic, and royalist uncle, Don Fabrizio Salina, in Lampedusa's (1960) novel, *The Leopard* could serve to introduce Barbara Czarniawska's approach to change on three accounts. First, Tancredi's statement suggests approaching change through its effects rather than its nature, particularly because the effects of change can be paradoxical. Second, an interest in change can be a commitment to continuity. Across her career, Barbara Czarniawska has changed objects of interest, theoretical focus, countries, and languages of work, but her main interest has remained the same: "how people are managing and organizing, but in different contexts" (Czarniawska, 2016, On change/interviewer: H. Corvellec, personal communication [unpublished]). Third, this reference to Lampedusa does homage to Czarniawska's encompassing interest for narratives, to which we return.

## Influences and Motivations: Her Mother's Daughter

Born in 1948 in Bialystok, Poland, Barbara considers herself her mother's daughter; having cultivated an early taste for languages, she is now fluent in Polish, English, Swedish, and Italian and can read French. She also developed an interest in travel, literature, and writing. By the beginning of 2016, she had authored 33 books, 108 peer-reviewed articles, 88 chapters, 20 encyclopedia and handbook entries,

numerous commentaries and popularizing texts, and 25 edited books and special journal issues.

Czarniawska (2004b) has claimed that her early interest in the study of work led her to pursue a master's degree in social psychology at the University of Warsaw in 1970, followed in 1976 by a Ph.D. in economic sciences at the Central School of Planning and Statistics in Warsaw. After a year at the MIT Sloan School of Management on a grant from the American Council of Learned Societies, she spent a year at Wissenschaftszentrum Berlin für Sozialforschung (Berlin Social Science Center), in what was then West Berlin. She later moved to Sweden at the invitation of Arbetslivscentrum (Swedish Center for Working Life), then took a position at the Stockholm School of Economics, assumed the chair in management at Lund University, and finally moved to the School of Business, Economics and Law at the University of Gothenburg where she has since held a chair as Professor of Management Studies and participated in developing the Gothenburg Research Institute (GRI). She is a member of the Royal Swedish Academy of Sciences, the Royal Swedish Academy of Engineering Sciences, and the Finnish Society of Sciences and Letters and is an honorary fellow of the European Institute of Advanced Studies in Brussels. And she has not only led 35 doctoral students to completion, including the two authors of this text, she shows an all-encompassing interest in meeting young researchers and helping them to connect with one another through her networks.

A scholar in feminist theory on organizing (see, for example, Czarniawska 2004c), Czarniawska has developed an acute perception of what it means to be a female immigrant from an Eastern European country, both for herself and for others. And together with female academics in a variety of fields who gather in her extended personal networks, she personifies the possibility and necessity of a more gender-equal academic community.

Czarniawska (2004b) has credited Nils Brunsson, who had written a dissertation on the propensity for change (1976; see also: 1985) for awakening her interest in organizational change. She became particularly interested in Brunsson's observations and those of Johan P. Olsen (1990, 1993): that reforming – an expression for planned change – is the steady state of affairs in public sectors in Sweden, Norway, and Denmark. As reforms do not usually achieve what they are planned to accomplish, a new reform is called for, creating a state of continuous reforming. She rapidly articulated this insight with a neo-institutional theory in organization theory (Czarniawska 2008a; Powell and DiMaggio 1991) and actor-network theory (Latour 1987, 1996). She developed all of this into a theory of action nets (2004d, 2010), to develop an explanation of change as a process that combines fluid and solidified relationships within and among organizations.

To indicate the breadth of her sources of inspiration, no fewer than five deserve mention. First, Albert O. Hirschman (1991), with his idea that practically no planned change reaches its goals, but that the unexpected and unplanned effects of changes are sometimes better and more interesting than the planned ones. The people who are managing the change, however, often do not realize this, focused as they on their own plans and goals. Second was Nicklas Luhman's (1995) view that no system can

change itself, other than by mistake – by a sort of accidental mutation. Even if organizations are open systems in a physical sense, they are closed systems that keep reproducing themselves. So whatever change happens either does so by mistake or by the wrong repetition.

A third source of influence has been Michel Serres's (1982) idea of translation as used by the likes of Michel Callon (1986) and Bruno Latour (1987). The idea of translation makes it possible to explain how change processes that look alike and may even have the same name move across sectors and countries find and invent new contexts in which to take root, produce a variety of foreseeable and unforeseeable results, and eventually become fashionable managerial recipes. Two volumes that Czarniawska edited with Guje Sevón focus on translation: *Translating Organizational Change* (1996) and *Global Ideas: How Ideas, Objects and Practices Travel in the Global Economy* (2005).

Fourth, Czarniawska (2008b) shared with Latour (2002) a renewed interest in the sociology of Gabriel Tarde, a French sociologist from the second half of the nineteenth century. She was particularly interested in the centrality that Tarde gave to imitation and fashion, in order to explain the circulation of ideas, action patterns, and objects – among them, change. Fifth, her interest in narrative as an object of study and a methodological stance (e.g., Bruner 1986) is still an influential source of inspiration. For her, plots, as they combine causality and temporality, offer a way to understand what Karl E. Weick (1979) called the social psychology of organizing: the rationale of changes as actors account their experiences.

## Key Contributions: Change by Translations

Czarniawska's contributions to an enhanced understanding of change are of two related types: theory and methodology. In this section, we examine her theoretical contributions. We first render her brand of institutionalism, then examine the reasons why imitation and fashion drive change, how translations work, and why people may welcome unexpected consequences of change. Finally, we introduce the notion of action net, which describes how organizations are born and evolve.

### Institutional Theory

The starting point of Czarniawska's views on change is institutional theory, particularly popular among Scandinavian organization scholars with an interest in public organizations, as presented by Meyer and Rowan (1977), March and Olsen (1989), and Powell and DiMaggio (1991), among others. Institutional theory comes in many versions. Political scientists tend to use the term *institutions* as a direct synonym for organizations. Sociologists, anthropologists, and organizational scholars tend to stress the way institutions form social action, are self-reproducing, and are underpinned by social norms (Jepperson 1991). And it is not uncommon that

different definitions are applied in the same text. It is critical, therefore, to clarify the term used.

Being among the first organizational scholars to stress this point, Czarniawska (1997, p. 43) defined an institution as "a pattern of social action strengthened by a corresponding social norm" (p. 43) – a definition similar to that later phrased by the editors of *The SAGE Handbook of Organizational Institutionalism* (Greenwood et al. 2008). Referring to Berger and Luckmann's (1966, p. 72) claim that "institutions posit that actions of type X will be performed by actors of type X," she stressed that a constructive reciprocity is assumed, that performance of an X type of action leads to the perception that a given actor belongs to (or aspires to) type X, and vice versa. Just that, within an institutional order, the actors are often not people but "legitimized social groupings": work units, profit centers, departments, corporations, public administration organizations, associations of organizations, and all those whose interactions "constitute a recognized area of institutional life" (Czarniawska 2009, p. 423). But for individual and collective actors alike, an institutional order limits what it is possible to do, think, and imagine. Institutional orders such as church, marriage, and market control and condition at any given time and place what is possible and appropriate change and how it can be undertaken.

A key contribution of institutionalism is the demonstration that institutions set the possibilities but also the rules and limits of change, inclusive of their own change. Another contribution is the notion that change does not always follow a rationale of expected consequences (March and Olsen 1989). Longitudinal studies of reforms (e.g., Czarniawska 1992) demonstrate that change can follow a logic of appropriateness that provides legitimacy rather than leading to efficacy. When entering change processes, organizations do what they are expected to do rather than what one may think they need to do, an observation that takes us to two of Czarniawska's points of interest: organizational imitation and fashion.

## Imitations and Fashions

"Imitation, claims Tarde, is the main mechanism of sociality, the main mode of binding people (and things) to one another" (Czarniawska 2004a, p. 121). There is sometimes an element of constraint in imitation, but the proportion of constrained to voluntary and unconscious imitations is negligible. Organizations can be forced at times to introduce some forms and practices – because of legal requirements, for example. But in non-totalitarian societies, coercion is rarely the main force behind imitation. Rather, it is norms, especially professional norms, that constitute the key drivers of imitation.

Norms play a critical role, not only because they tell people what to do; norms are key because they are what people "normally" do. "Professional norms exist because professionals willingly imitate one another, not the other way around" (Czarniawska 2004a, p. 121). Specific ways of doing things become norms when more and more people adopt them. And people adopt norms because they alleviate uncertainty and provide the safe guidance of institutions: if more and more do it. . . Norms even

legitimate deviance. When an organization – a city, for example – decides "we will not do that," "that" still proceeds in relation to norms.

With imitation as the driving force, fashion assumes a central role for organizational development. Following Tarde, Czarniawska does not see fashion as negative, irrational, and transient, not least in light of the masculine-oriented metaphors like war, sport, and technology, which are used extensively in the social sciences (Czarniawska 2008b). Fashion, she means, is unavoidable and positive. To be in fashion, a great many organizations show an interest in adopting new ideas to appear contemporary and receive legitimacy from their institutional environment. Fashion provides direction. And when the inspiring potential of a fashion weakens, new fashions arise that serve as fresh sources of inspiration

> When all or almost all city services are privatized, it becomes impossible to privatize any more. The next step is municipalization or nationalization, unless a completely fresh invention has arrived in the field. Fashion constantly renews itself, but it chooses among the many inventions that are present at a certain time and place. (Czarniawska 2002, p. 135)

While working within the limits of the institution, fashion thus provides opportunities for change. By rejuvenating and thereby updating the existing institutional order, changes may occur, which is why fashion is an integral aspect of the institutional order. As Czarniawska (2009, p. 428) wrote:

> Fashion operates at institutional fringes. On the one hand, its variety is limited by the 'iron cage' of existing institutions, which fashion actually reproduces; on the other hand, fashion is engaged in a constant subversion of the existing institutional order, gnawing ant-like at its bars.
>      Similarly, although fashion seems to sabotage and threaten established institutions, it is also an institutional playing field: new fashions can be tried and disposed of or they can be institutionalized, thus revitalizing the existing institutional order. (p. 428)

The following of fashions is a key element in the pragmatics of organizational change and an explanation for the observation made by institutionalists that managers may be more attracted by institutional conformity than by technical performance. In management as in clothes, art, or intellectual fashions, the trends are set by such fashion leaders as a symbolic metropolis or star companies. Others follow these trends, cheered on by consultants, the professional and general press, researchers, the public, and an entrenched belief among them all in the intrinsic value of newness (Campbell 2015). Think of the companies that have imitated General Motors for decades, designing a divisional structure for themselves or of the company officials who dream of imitating Apple, Google, or Facebook. Imitation provides relentless inspiration for change. But imitation comes with a proven risk of failure. So, based on her observations of city management, Czarniawska (2014b) provides some playful but serious advice to managers interested in reform and change: Learn how to treat fashion from sensible women; check whether it fits your figure and whether you can afford it; and then everything will be okay.

## Translations

But how do organizations imitate? Through translations answers Czarniawska. Inspired by Serres (1982), Callon (1986), and Latour (1987), she and Guje Sevón (1996) meant that ideas do not spread through diffusion but through translations. And not translations as understood in a strict linguistic sense but as presented in a lesser-known text by Latour (1993, p. 6): "displacement, drift, invention, mediation, creation of a new link that did not exist before and modifies in part the two agents." "Translations" refer to the way organizational actors make theirs the available ideas, whether fashionable or anti-fashionable, or how actors adapt the use of a management model or an artifact to their own premises: understanding, traditions, needs, and means. Translations are active handlings that suppose choices and massive persuasion. And they always entail a transformation of the translated idea or object (Czarniawska 2009, p. 424).

Czarniawska and Sevón (2005) added the finding that ideas travel around the global economy and are always available. Now and then, a particular idea comes into fashion – because it is adopted by some renowned organizational actor, for example – and is translated into local versions by others, reinforcing its status of idea *à la mode*. The translation starts with the idea being transformed into an object: a buzzword, a model, a PowerPoint presentation, a book, or a pamphlet, for instance. Once transformed into a tangible object, the idea can start travelling and be adopted by actors in other organizations. When translators – planners, managers, coworkers, consultants, but even adversaries – start acting upon the idea, they take various actions to transform the idea into actions that suit their context. A manager in Organization Z, for example, may devise a PowerPoint presentation describing the business potential of digitalization for contemporary organizations. A colleague in Organization A receives a printed version of the presentation, starts talking about how promising is the idea of digitalization, and translates the original presentation into the claim that Organization A needs to change its information system into a more contemporary, efficient, and user-friendly one.

Being materialized and adopted by one organization is a condition for the idea to travel in time and space to other organizations. Yet, the actions taken in the organizations that receive the idea and make it theirs are not sufficient for change to occur. These actions must translate the idea into a day-to-day, repeated, and thus stabilized way of doing things. If the new actions become stabilized to the point of being taken for granted, the new practices originating from the travelling idea have now become institutionalized.

To continue with the hypothetical example of Organization Z and Organization A, the idea of digitalization is first translated into a budget line and task force for the new information and contacts to acquire new software and hardware, and eventually instruction manuals and course invitations are sent to everybody in the organization. When these "everybodies" start acting upon the idea, repeat their actions, and eventually take them for granted, their translation of the idea has become institutionalized.

New ideas must fit the existing patterns or categories; they cannot catch on unless they have existed for some time in people's minds. Yet, translations of ideas into actions are always local, and change processes vary from organization to organization. As for fashion, there is a resemblance that bonds the different realization. But each realization is unique, bound to the local contingencies of translations, which is why one can never really foresee the consequences of change – our next point.

## Unexpected Consequences

To reiterate Hirschman's (1991) view, planned change rarely reaches its goals, but unexpected and unplanned effects of changes are nonetheless valuable, except that the people involved may not realize it, focused as they are on their own plans and goals. Barbara Czarniawska has taken Hirschman's view and combined it with Luhmann's (1995) view that systems are geared toward reproducing rather than changing themselves (And if they change by mistake, it is through accidental mutation.). Bringing those two insights together, she has built an analogy inspired by the fictional Baron of Münchhausen, known for recounting enjoyable stories about his impossible achievements, such as riding a cannonball or traveling to the moon. Reusing the slogan of a consulting company, she asked: "Is it possible to lift oneself by the hair?" (Czarniawska 2005a, p. 78).

Obviously not: One cannot lift oneself by one's hair. But knowing that Münchhausen's adventures are impossible does not prevent anyone from listening and enjoying his stories. And knowing about the difficulties of change does not prevent anyone from listening and believing in the potential of change. The point is that people love change but not just any kind of change. As Czarniawska explained in an interview:

> My main conclusion concerning organizational change is that it is a total nonsense when everybody's claiming that people do not like change. If people did not like change, we would be all sitting in caves, probably standing in caves. People do not like change that they are forced to by superiors. So, the most positive kind of change, I think, is the spontaneous change that may happen even by mistake or by invention or by somebody doing, like with entrepreneurs, not quite aware of what the institutional order is, and doing some idiotic things that turns out to be very interesting. But then again, like with this sort of unexpected consequences, the point is to observe the spontaneous change and stabilize it if it is positive. (Czarniawska, 2016, On change/interviewer: H. Corvellec, personal communication [unpublished])

In her view, people appreciate the possibility of changing things spontaneously, by mistake, by invention, or by not understanding the rules of the institutional order. The challenge resides in stabilizing it if it is positive. It is through translations that imitation and compliance lead to performative processes of change (Joerges and Czarniawska 1998).

Unintended changes happen all the time, as a new terminology, a new management fashion, or a new technology is introduced into the organization, for example.

But these beginnings of change do not necessarily develop into actual change. It may be relatively easily for a process of spontaneous change to reach the first stages of translation, when ideas are turned into tangible objects and translated into actions within a particular organizational setting. Seldom are these actions repeated, and rarely do they evolve into taken-for-granted, even normative, behaviors. Rather, the idea will become loosely coupled to the daily life practices taken to accomplish city infrastructure to be build, social security reimbursement to be made, and taxes to be collected. Organizations such as cities, social security authorities, and tax authorities can thereby continue to incorporate new ideas without risking their own survival (Czarniawska 1997).

## Action Nets

Even unintended consequences can prompt change. Combining institutionalism (from which she borrowed the idea that it is possible in every time and place to speak of a prevailing institutional order) and translation theory (from which she borrowed the idea that connecting actions require the translation of different actions into others), Czarniawska (2004d) employed the concept of action nets to capture organizing at an earlier stage, when things still need to be done, long before organizations can prevail themselves of successful stabilizations. Actions nets provide an understanding of change on the making, suggesting that this making consists of weaving or knitting actions, like threads, through series of translations.

The ground of an action net is recursive actions that connect acting parts through translations. Connections between actions can be as varied as the human imagination. They can be a matter of mutual adjustment, such as when a sommelier helps a restaurant guest choose wine. Connections can also rest on the introduction of a new artifact: an identification program that allows people to sign contracts over the internet, for example. Connections can even be established by individual human action, as when volunteers visit lonely elders to keep them company. The point is that neither action nets nor actors precede actions. No one is a born sommelier, internet banker, or Good Samaritan; one becomes so by performing the type of activities institutionally associated with providing advice, bank services, or care. Organizations and organizational identity are born simultaneously and derive from actions of translations that connect. And change occurs when new actions create new translations that create new connections that create new action nets.

The chronology of an action-net perspective is the opposite of the chronology assumed by a conventional network perspective. According to traditional network theory, actors come first, networks second, and actions in the network third. From the action net perspective, actions come first; networks second; and actors third, whether an individual actor, an artifact, or a formal organization. And at any moment, translations draw from and challenge the existing institutional order.

Once the connections between actions have been made and the action net falls into place, the challenge of change is to stabilize these connections and maintain them in good shape (Lindberg and Czarniawska 2006). When relationships among

actions are not only stabilized but have also reached a normative and cognitive fixity (that is, they can be justified in an appropriate vocabulary and taken for granted), they will become the basis for actors to acquire organizational identity ("She is a specialist of Italian wines.") and allow them to build networks ("No need to look for another internet provider; we can rely on the one we have.") Not all connections between actions will become stable, however, and a researcher's interest in an action net lies in explaining why ongoing processes of organizing practices will or will not build stable relationships (Lindberg and Walter 2013).

Having described how Barbara Czarniawska binds institutionalism, imitation, fashion, translations, unintended consequences, and action net together to explain organizational change, we now turn to her methodological suggestions for studying change.

## New Insights: Processual Methodologies

Czarniawska's theoretical understanding of change as translation provides a valuable insight in the area of change that requires corresponding processual methodological techniques. In this section, we examine her advocacy of three techniques – organizational ethnography, a narrative stance, and shadowing – showing how they amount to a cohesive whole aimed at understanding the vicissitudes of change.

## Organizational Ethnographies

For Czarniawska (2005b), the most reasonable methodology for understanding change processes are ethnographies of change processes. Change processes are good topics for ethnographies:

> .. only what moves is visible. Static pictures dull the senses, as the air traffic controllers know all too well. A smoothly run, well-routinized organization does not offer much insight to a researcher. Things go well because they go well; this might be due to successful routines or to a receptive market, and only a change can reveal the makings of success. (Czarniawska and Sevón 1996, p. 1)

Even failed change processes are periods of great interest, when the taken-for-granted practices are destroyed and reconsidered and new ones are eventually constructed. And ethnographies allow for a focus on the way actors envision change in their translations in their specific settings. They also allow the mapping of the erratic character of organizational processes – and beyond. With coeditors O'Doherty and Neyland, in fact, Czarniawska has recently invited potential contributors to a forthcoming special issue in *Organizations* (O'Doherty et al. 2016). One should aim, they wrote, at surpassing "the traditional anthropological and/or 'Geertzian' approaches still popular in management and organization studies" (described at length in: Czarniawska 2012) and "explore the ways in which the

arbitrary might become the rule, or the ways in which the traditional dualisms of the social sciences – macro/micro, global/local, structure/agent – become unsettled and redrawn, or even inverted and displaced under the influence of these objects of concern."

Optimally, a researcher interested in writing an ethnology of change should become involved with an organization that plans for a major change and be invited to follow the outcome of the process of change over a specific time. Such an approach creates an opportunity to compare plans with outcomes but also to meet a variety of planners of change, managers executing the plans, or people resisting the change. An obvious risk is to be left to "the poor originality" that appears in management-oriented research when the preconceptions of managers, planners, and opponents are confirmed (Czarniawska 2001, p. 14). This is why she suggests following the way in which actors actually translate ideas about change into actions and solicit their reflections on these actions. Czarniawska's background in psychology had led her to understand that laboratory experiments do not lead far, whereas observations of the field can contribute to an understanding of multiple dimensions of actions and provide insights about the way actors make sense in and of processes.

Organizational ethnography is typically a processual methodology, but changes, too, are processes. Czarniawska's (2002) study of the management of the City of Warsaw took her approximately 14 months. During that time, a new city council was elected, which meant that she lost half of her interlocutors, and the neighboring departments changed as a result of an administrative reform. She became acutely aware of the difficulty of dealing with the fact that change happens in many places at once, in a net of fragmented, multiple contexts, through multitudes of kaleidoscopic movements of organizers who move around quickly and frequently (Czarniawska 2012). But what could be understood as impediments to a study of change (if one considers change to be the neat deed of a community of more or less heroic managers) gave her an opportunity to follow the hesitant and imperfect knitting and unknitting (the gerundive form is essential here) of the action nets that constitute the very process of change.

## Narrative Stance

Among the methodological tools serving a processual stance, Czarniawska has paid special attention to narrative throughout her career (Czarniawska 1997, 1998, 2004c; Czarniawska and Gagliardi 2003). Starting from Barthes' (1966) classic statement that the narratives of the world are numberless, she considers, with Bruner (1986), that narrative is a specific form of knowledge that contrasts to the logico-scientific form of knowledge; with MacIntyre (1981) that conceiving of life as a narrative provides a rich source of insight; and with Fisher (1987) that telling stories to entertain, to teach and to learn, to ask for an interpretation, and to give one is a specific form of social life – a specific form of communication.

On these multiple grounds, Czarniawska (2004c) suggested a comprehensive use of narratives. Watch how the stories are being made, for example, unfolding how

leaders bring together temporality and causality to produce a plausible plot about the necessary course of a change process. Collect stories everywhere: in strategic documents, the boardroom, comics posted on office doors, or the elevator. Provoke storytelling by asking respondents to give their views of what happened first, second..., last, and why. And when moving from field to desk (Czarniawska 2014a), interpret the stories by asking what people say; analyze the stories, asking how they say it; and deconstruct the stories, asking which perspective are they privileging and which they are silencing. And set narratives together with or against other narratives. It is then time to assemble your own story, and theorizing being plotting (Czarniawska 2013), produce you own theory.

Narratives on, in, from, about, and around organizations allow researchers to trace and explain how organizational processes move from a state of equilibrium to a rupture of this state, and thereby to another state – the definition of a narrative for Greimas and Courtés (1982). A narrative stance provides an alternative way of reading organization theory. Czarniawska (1999) has argued that organization theory is a specific literary genre, in the sense of an institutionalized and recognizable way of writing and structuring texts. Common bargains at airport newsstands are provided by stories of heroic managers who understand before anyone else does where to head their company; fight mean conservatives, adept at the status quo; and steer their company in the right direction.

## Shadowing

Czarniawska (2007) has had particular interest in another processual methodology: shadowing, considering it "the best field technique in management and organization studies" (Czarniawska 2014c).

Shadowing refers to the technique in which the scholar becomes a shadow, looking over the shoulder of someone or something. The situation is that of an observer, an outsider in time, space, and culture in a relationship that involves following someone or something through daily life. It creates a window of observation opportunity that enables the researcher to generate "knowledge about the ways of life" (Czarniawska 2007, p. 17) in a way that includes both humans and things. Looking at what people do creates openings for interviews about what people actually do, in which a number of insightful aspects of work and processes arise.

Shadowing remedies a shortcoming of "traditional anthropology, à la Malinowski: watching native dances during the day and going at five o'clock to the British embassy (Malinowski that is, not the organization scholars)" (Czarniawska 2014c, p. 91). Contemporary organizational actors are all over the place, which makes observation from a static point less and less relevant. The main attraction of shadowing is thus to make it possible to tackle several of the peculiarities of contemporary management and organizing: the coeval and multiple times, the simultaneity of events occurring in various settings, the non-simultaneity of

experience, and the virtualization of a growing number of practices (Czarniawska 2007). More and more work is done at and through computers, for example, which has the potential of providing fewer insights thereby making observation less rewarding. But when studying the Italian news agency, Czarniawska was simply given a place at a computer with two screens, such as the journalists themselves were using, and although she could not intervene in their work, she could see "the desk" and "the wire" and shadow the news through the production process. When a discussion started in the newsroom concerning a specific news item, she could trace it in the database; so she always (well, almost always) knew what they were talking about (Czarniawska 2012).

Shadowing allows the researcher to capture change in new ways – as it takes place, rather than retrospectively. During the study, the researcher can trace how changers try things, change purposes, and either stick to their plans or adapt themselves to what is happening and what they have learned. Shadowing makes it possible to study the very process of change, providing change with a new perspective. Less importance is paid to a comparison between purposes and effects, and more attention is given to the way unexpected consequences affect the change process.

## Legacies and Unfinished Business: Unusual Study Object

In addition to her theoretical and methodological contributions, Barbara Czarniawska has contributed to an enlarged understanding of change through an influential choice of "unusual" study objects in management and organization studies. Around cities, action nets, and overflows, she has built multidisciplinary research programs at the Gothenburg Research Institute (GRI) that have attracted the attention of many a PhD student and researchers. This interest in unusual study objects is among her most significant legacies to the field.

In her first research program, *Managing Big Cities*, she set out to explore the organizing of Rome, Stockholm, and Warsaw. The program expanded to include changes in such infrastructures as railroads (Corvellec 2001), broadband nets (Dobers 2003), air quality measurement systems (Adolfsson 2005), waste collection (Zapata Campos and Zapata 2013), new public management, and urban innovation strategies (Brorström 2015), demonstrating how cities are maintained by keeping themselves in a perpetual state of change. In her second research program, *Organizing Action Nets*, Czarniawska stressed the need for organization theory to shift from organizations to organizing, from structures to processes, and focused on the becoming of actors rather than their nature. From the recursive ability of technology to both shape its users and to be shaped by its very use (Eriksson-Zetterquist et al. 2009) to knowledge regimes (Rindzevičiūtė 2013), through the role of social contexts for the management of risk (Diedrich and Styhre 2012), this program has demonstrated the adequacy of processual concepts for underpinning processual studies of organizing.

Her third research program, *Managing Overflow*, refers to the ubiquitous need to manage affluence and surplus, wastefulness and overload. Two volumes (Czarniawska and Löfgren 2013, 2012) have established the theoretical relevance of a concept that questions such notions as equilibrium, balance, or normality and the social and moral orders attached to them.

Many people may associate Barbara Czarniawska with a specific concept: neo-institutionalism, narrative, translations, shadowing, or overflows, for example. What fewer people might have noticed is that these concepts are far from a disparate ensemble. They build a cohesive whole that is open and welcoming to the approaches and concerns of other researchers. In her works, methodological stances dovetail with theoretical notions, to demonstrate that change is never really as expected, but neither is it unrelated to expectations. She shows that although change is forever changing, it shows fascinating similarities across fields, times, and places and that trying to accompany the rich flow of unfolding change may be all that scholars, but also practitioners, can actually do. Her work offers an open cohesiveness that revitalizes "the theory of organizational change, so that it might help us grasp the complexity of organizational life without either reducing it to simplistic models or replacing it with complication of the argument" (Czarniawska and Sevón 1996, p. 8).

## Further Reading

Czarniawska told us that she considers *Writing management: Organization theory as a literary genre* (Oxford University Press,1999) to be her best book. Yet we believe that *A theory of organizing* (Edward Elgar, 2014, second edition) may be a more comprehensive introduction to her ideas and *Narrating the organization: Dramas of institutional identity* (University of Chicago Press, 1997) her best example of how to combine narrative and institutional theory to address organizational change. *A tale of three cities: Or the glocalization of city management* (Oxford University Press, 2002) illustrates the relevance of studying unusual empirical objects. *Social science research: From field to desk* (SAGE, 2014) summarizes over 20 years of teaching processual methodologies; what is more, it is written in an engaging style that appeals to students and seasoned researchers alike.

# Kathleen D. Dannemiller: Unleashing the Magic in Organizations

# 24

Albert B. Blixt, Mary L. Eggers, Sylvia L. James, Roland J. Loup, and Paul D. Tolchinsky

**Abstract**

This chapter discusses the life and career of Kathleen (Kathie) D. Dannemiller, a gifted teacher and one of the most respected consultants of her era. It takes the reader on Kathie's journey from the influences of her early life as the daughter of a union organizer to the pursuit of her PhD the year prior to her death in 2003. The reader will learn that Kathie saw herself as an action researcher by training and belief and the impact that this orientation had on the groundbreaking practices that she pioneered. Kathie was the first to facilitate large groups in an interactive process that got real work done. The largest of her career, a meeting of over 2,000,

successfully moved an automotive industry giant closer to its vision of the future. Her passionate, engaging, and direct style profoundly affected many people, from presidents of large complex organizations to front line workers, both by what she said and did and the way she listened and encouraged them to discover their own new ways to move forward. The chapter lays out the underlying values of her work while honoring those that went before her and those that partnered with her in the firm she and Chuck Tyson created, Dannemiller Tyson Associates. Kathie and her partners developed new models and processes that are now used by thousands of leaders and consultants around the world. The chapter closes with tributes to her life and her work from many of those worldwide clients and consultants who attribute much of their success to what they learned from this amazing woman.

## Contents

## Introduction

Kathie Dannemiller was born in Detroit on April 27, 1929. She attended the University of Michigan, receiving both her BA (1950) in French and MA (1974) in Psychology and lived in Ann Arbor the remainder of her life. Prior to founding the consulting firm, Dannemiller Tyson Associates (DTA) in the early 1980s, she served as assistant to the Vice-President for Student Affairs at the University of Michigan. She was a lifelong activist and leader in the community. She was the founding "mother" of the Ark Coffee House in Ann Arbor, a now famous Michigan nonprofit for folk and roots music and considered one of the top music clubs in the world. Part of the Ark's offerings to this day – less well known than the concerts and performances – includes providing educational, counseling, and advocacy support for people in the local community. In addition, she organized and managed campaigns for several officeholders and initiatives and served two terms on the Ann Arbor School Board, one of them as its president. Kathie, like many others in this book, was a product of her times. She lived through the Great Depression, a World War, and devoted herself to bringing about progressive change in the local community, in business, government and not-for-profit organizations, and in the lives of thousands of people she encountered across the globe. She grew up in a union household, and the values she learned influenced her strong desire to create what she called "workplace democracy." Kathie was nearly blind; she wore glasses that were like Coke bottles. She could barely see 10 ft in front of herself. On stage she introduced herself as "see no evil" and, on one occasion, introduced her partner as "hear no evil" (he wore hearing aids) and suggested that together, they would speak no evil. And her glasses were also a gift; through them she could see only the good in the world and in each person.

## Influences and Motivations: There Is Nothing More Practical than a Good Theory

Kathie walked with and learned from giants, one being Ron Lippitt at the University of Michigan. She worked at National Training Labs (NTL) with Richard Beckhard and Robert Tannenbaum and was enormously influenced by the common ground they shared with Kurt Lewin. From them she learned systems thinking, seeing the world through multiple realities, and accepting each person's truth as truth. Also, from them she learned action research and action learning, something she practiced every day with every client and personal encounter. Kathie professed never to have an answer or a preconceived notion. She trusted those she interacted with to uncover their solutions; and when they did, she fought for them as only a community-born activist might. It did not matter if the solution came from the CEO or the lowest level worker in the organization.

Finally, Kathie learned that "there is nothing more practical than a good theory" (Kliener 1996, p. 31). She was not an academic. In fact, she was uncomfortable around them. She was not a researcher, rather she sought out good theory and tested it endlessly in her everyday practitioner way.

Kathie was always surrounded by people whom she adored, no matter what they had done in life or where they came from. She attracted people who were curious to learn, seeking direction or inspiration or simply desired to "hanging out with her" and her merry band. Sleeping over was like going to a party, whether at her home or her cottage on Whitmore Lake where Kathie held regular summer gatherings.

Kathie was a visceral person. She believed that change came from visceral experience and understanding, along with data. She worked with beliefs versus fixed processes. Her process was to bring out the wisdom of all the people in any effort of change and then allow it to influence the outcome of that group's effort.

She lived through her values and from her heart. She often said, "I help organizations become one brain and one heart," meaning everyone seeing the same thing and everyone passionately committed to the actions needed. She had strong values for inclusion, collaboration, unconditional sharing, and affirming people. She always asked others (always other younger people in the field) to join her in writing an article. Her purpose was to stretch her own thinking and to stretch others' thinking in order to go to another level in the article. In all her work, her intention (purpose) was "everyone goes to another level" – including herself.

Telling the story of Kathie Dannemiller is impossible without invoking her voice. Toward the end of Kathie's career, it became important for her, and others, to document her life, her discoveries, and her messages. To that end, several people interviewed and taped conversations with her. What follows is one excerpt from one of those interviews (Dannemiller and Jacobs 1994, cassette tape). It is the essence of Kathie and resonates for the authors, as well.

> I had been a consultant for 20 years doing the kind of consulting we all did in the '70s, and I was at the University of Michigan. I began to worry that the auto industry was dying because I was a Detroit girl, so to speak, and I thought, shouldn't I be helping the auto industry? It seemed to me to make sense. I entered into a partnership with Chuck Tyson, and we had the opportunity, through Al Davenport, to go to Ford and talk to a really amazing Executive Vice President, Tom Page of Diversified Products, and his assistant Nancy Badore who was in charge of employee involvement at the time. The team of us, myself, Chuck Tyson, Al Davenport, and Bruce Gibb, met with Tom and Nancy and learned about how he had carefully trained managers to kick ass and take names and how they rewarded the ones who did it best; and then he said, "It won't work anymore."
>
> We went back to Ann Arbor, and we thought about everything we knew about how to build a team, how to bring about change, how to set strategic direction and how to work through conflict. All that good stuff we'd been doing in groups of thirty. We thought: if you really want to change, you better bring in the whole group at once. So we went back to Tom and said we don't know what we're doing and we have this idea – which is: give us the top five layers of each of your divisions from the general manager to the direct reports to plant managers, which would have been anywhere from 80 in some divisions to 150 in others. Give them to us all at once for three days. We will work with them using adult learning principles, meaning we will not sell; we will not motivate; we will give them experiences of participation, and we will help them decide from that what they want to be. At the end of the

three days, we'd like to have them go back to their jobs for eight weeks, then have them back for two days to say What did we think we'd do, what did we actually do, and where do we think we need to go from here?

Now that sounds very slick, and we didn't know what we were talking about; we were just making it up. We were basing it on Deming's plan-do-check-act and a very important change model that I'd first learned from Dick Beckhard (at NTL), D x V x F > R. Beckhard said, "If you want to bring about change in a whole division at all levels," which Tom did, "you have to have **D**issatisfaction with things as they are now, times a **V**ision that is ennobling and inspiring – something people really want and is possible, times **F**irst steps in the direction of that vision. The product of these three items needs to be greater than **R**esistance to the change." The underpinning of the model is that the product will be zero, if any of the first three don't exist because of the way math works, right? It works because you put your energy on building a common picture of D, V, and F instead of working on R in the formula.

We decided to put people into what we call maximum mixture (max-mix) tables, so each round table would be a microcosm of the whole group that was in the room. We could then build DVF at each table and then connect the tables around the room to see the whole picture. How does this help? The secret we were working on is the only way to bring about the kind of change Tom needed. It was to break down the culture that he had described: the kick ass and take names culture, the hierarchical culture, and the old scientific management culture that had everybody in their little boxes isolated from each other and unable to see what each other was doing. One group could see the customer, another group could see the mechanics – no one, including the person at the top, could see the whole thing. Our thought was, can we connect everybody at once, and maybe together it will occur to them that they ought to be working in teams? Tom was a very courageous man and he went ahead and did this thing. And we designed it, and it worked pretty well. And we redesigned it, and it worked better. And we kept redesigning and getting better and better. (Dannemiller and Jacobs, 1994, personal communication)

The work with Ford led to participative management seminars that were held with Ford managers across the organization for the next 5 years. Many of the principles that became Real Time Strategic Change (Jacobs 1994) and later Whole-Scale Change were forged as the consulting team learned from each session and applied it to the next. Today, the idea of getting the whole system in the room seems obvious, and it was not obvious in the early 1980s.

Of all the theoretical principles that evolved during this time, perhaps the most fundamental is the DVF Change Model that Kathie described. It not only describes the conditions necessary for system change to take place, it also provides a guide for the design of large-scale meetings. Kathie came to realize that this model brought about a paradigm shift. The minute D, V, and F are in place, at that very moment, people see the world differently and cannot go backwards.

**The Formula for Change**

$D \times V \times F > R$

**D** = **Dissatisfaction**, the sense of urgency that comes from not being satisfied with the status quo. D also stands for data, because the more people

know, the less likely they are to be satisfied with the way things are. Dissatisfaction must be public and shared to be effective.

**V = Vision**, a compelling, inspiring, and energizing picture of the future that draws people toward it. The vision must include the hopes and aspirations of the people who will create it. Vision also needs to be public and shared.

**F = First Steps**, actions that move in the direction of the future vision. It is essential that people know where to begin tomorrow and that there be immediate signs of progress that will build momentum.

**R = Resistance**, the natural inertia of a system that keeps it moving in the direction it is going. Resistance comes from culture, behaviors, structures, and most of all from the beliefs and attitudes of the people who need to make the change happen. Resistance can be implicit or explicit and overt or covert. Resisters need to be honored since they may see things we need to address.

Note that D, V, and F are multiplied to create a force greater than R. All must be present in some amount. In a crisis, D is large. When things are okay, D is small and so you need a bigger V. Helping people to see all three is the essence of creating change.

In 1986, Chuck Tyson died suddenly, and Kathie reformed her company, Dannemiller Tyson Associates (DTA), asking Randy Albert, Robert "Jake" Jacobs, and Roland Loup to be, along with her, the core members of the firm. These three were new to Organization Development (OD) and learned through reading, attending workshops, and being velcroed to Kathie's hip as she brought in consulting projects on organizational change. It was important to her that all core members of the firm not only understood the concepts, models, and processes as it evolved from Real Time Strategic Change (RTSC, Jacobs 1995) to that of Whole-Scale, it was also important that they experienced the various parts of the DTA methodology as it grew and developed.

## Key Contributions: The wisdom of Whole-Scale Change (meaning getting to one brain and one heart as a metaphor for system alignment around vision)

### The Whole-Scale Guiding Principles

The principles fall into two areas: (1) principles of the Whole-Scale Approach and (2) principles of Whole-Scale Design. Kathie lived these principles in everything she said and did, and she instilled them in everyone at DTA.

Principles of the Whole-Scale Approach

- Tap the power of the microcosm – this gives one a view into the system because the group is a microcosm of the system – whether it's a large or small group.

- Uncover the wisdom in the organization – it's always there, leaders just need help in uncovering it.
- Engage the whole system.
- Believe that people support what they help create – because they do.
- Live life as an action learning project – all of life and work.
- Create self-sufficiency – leave the client with the ability to carry on without the consultant.
- Plant the seeds of generativity.
- Use reality as a key driver.
- Future before you plan (Lippitt 1982).
- Purpose is the key to drive all choices.
- Honor the past and the present as you create the future.
- Keep the flame of change burning – meaning $\times$ hope $\times$ power $=$ energy for change.

## Principles of Whole-Scale Design

These have to do with the work in large groups, which was the essential underpinning of all of Kathie's work.

- Create a common database. When everyone can see what everyone else sees, people will make informed and aligned decisions.
- Foster empowerment of everyone in the system. Everyone has a voice and all voices should be heard, equally.
- Build the team – whether it's the microcosm team of eight at a table for 2 days or a work team doing ongoing work.
- Take appropriate risks – appropriate for the group at that specific time.
- Ground everything in theory. If you cannot answer the question why? Then maybe you should rethink your position!
- Always use adult learning principles. For Kathie, this meant active experimentation, exploration, reflection, and application. Without these, adults do not internalize what they know or believe.

In 1995, Kathie was again working with Ford, this time at their Milan Plant, with two of her partners, Sylvia James and Paul Tolchinsky. Part of the work included a 300-person microcosm 3-day meeting; as was normal for large meeting, there was a logistics team to support the work of the participants. On the logistics team was Barry Camson, a senior consultant from the Boston area who was experienced in Gestalt theory. On his returning home he typed up his observations of Kathie, Sylvia, and Paul, titling them "Kathie's Principles" and faxed them to her. Kathie renamed them "Kathie and Ron's Principles" because she very clearly saw her mentor Ron Lippitt in Barry's observations. Here are a few of those observations (a more complete list can be found in the Whole-Scale Change (2000)):

- Focus on the details of empowerment.
- Enable the organization to diagnose itself and make meaning out of it.
- Create contact with outside information.
- Bring yourself fully into the process – leader, members, and the consultants.
- This work is about the sincere, deep abiding unwavering and non-faddish view of empowerment that runs to the core of ones being.

## Kathie Was About Democracy in the Workplace

Some of the appealing parts of the approach were:

- *The use of design teams.* Design teams are generally between 10 and 20 members of the organization that represent a microcosm of those that will be in a larger Whole-Scale process. This team represents all the divergent thinking of the larger organization. It can be a diagonal slice of the organization, represent diversity, seniority, levels, functions as long as it is representing the DNA of the change itself. Who will be impacted? Who can influence the choices and ultimately the decisions? Who has information relevant to the decisions that the meeting or the process will require? They are chartered by the leader, and their job is to articulate the purpose, outcomes, and needed conversations/actions that must happen in the larger meeting or process to move them forward. Essentially their task is to co-create the journey they and others take to affect the changes needed.
- *Adaptability of every project or meeting design to meet the emerging needs of the organization's members*. Kathie referred to this adaptability as "real-time design" – called the in-the-moment shifts in the meeting's original agenda to one driven by the participants. This flexibility during meetings was based on everyone learning during the event itself. "Everyone" being the participants, the consultants, and the leadership.
- *Strong involvement of the organization's leadership in leading the change work.* Kathie always imagined a specific role of leadership in leading change, which includes preparing drafts of strategy statements, such as mission, vision, or goals. Then the leadership would receive feedback from the whole "system," and overnight, they would make appropriate changes – what she called "the turn-around," because the next morning, leaders would "report back" to the whole room. This approach required leadership to give their best thinking and then be willing to accept the feedback from the whole system, agreeing in advance to listen to that feedback even if it was not in concert with their current thinking.
- *The importance of a building a common database among a microcosm of the system.* Kathie said, "Given the same information, people will generally come to the same conclusion." She believed that having a common database before making decisions is also an application of the principle of having a common understanding of the current reality, the aspirations of those in the system, and

possibilities for the future, and this database is a precursor to good decision-making. (Eliminating the ready, fire, aim mentality of many corporate decisions.)

## Kathie Was About Excellence

For several years in the early stages of the firm, the four partners would meet on Saturday mornings. Kathie led these meetings, which were about the three new members learning about the OD practice approach (based on the values of NTL). These were meetings about the large-scale approach that Kathie and others had been developing, about Kathie's values for the practice of the firm, for life in general, and about how to "be" a consultant practicing in the firm. In other words, Kathie was building the firm's culture and teaching the content and processes of the consulting work. These sessions were intense, her observations were insightful, and her feedback always direct and, at times, fierce. She was clear what consulting looked like, and she made sure that everyone knew and practiced those values, carried her strong commitments to excellence, and was focused on finding and meeting the client's needs.

## Kathie Built Lasting Relationships

Kathie wasn't intimidated by anyone and was as comfortable at the shop floor level as she was in the boardroom. She had the knack of creating instant rapport with people, primarily because of her authenticity and her belief in the value and worth of every person and position within the organization. In the mid-1980s, Kathie met a financial executive in a large organization. Within a few minutes, she had built a relationship with him that lasted throughout his career, which included supporting him as he moved to becoming a senior financial executive in two Fortune 500 companies, over the next 20 years.

## Kathie Empowered Others

Kathie said that the way she evaluated herself was how people felt when they were with her: "If they feel empowered, then I am successful." When you first met Kathie, it was as if there was a large bright light that shone on you. It was as if you were the only other person in the world. Kathie was totally engaged with you and only you. You began to see and imagine yourself that was bigger than you had ever experienced, and you wanted to grow into that image.

In 2001, Kathie was awarded a lifetime achievement award by the Organization Development Network and the title of that award was "Sharing the Wealth," which was central to who she was in all aspects of her life. Kathie always said yes when

asked to mentor someone. She once invited a mentee to join her for the initial meeting with a potential new client, and, of course, the mentee said yes! By noon Kathie had been hired. Over lunch she said to the president of the organization, "now you need to know I can't do this project without – , the mentee, and it won't cost you anything, I'll split my fee with her!" This came as a great surprise to the mentee!

## Kathie Believed in the Worth of the Individual

She continually taught us, "Everyone's truth is truth; every voice matters." She lived this value in every aspect of her life and in her work this meant that for change to happen all voice in the organization need to be represented without fail.

## Kathie Believed That the Wisdom Is in the People in the Organization

Kathie believed that the wisdom is in the people in the organization and that when you connect people across all levels and functions of the organization, they will have all the wisdom they need to find shared answers. This principle is, we believe, an assumption of process consulting. As a process consultant, you do not come with the answers, rather you come with a robust process for engaging the organization to discover its own answers. In every organization, the people who know the best ways to solve things are those doing the work day-to-day. Trust the people you hire and magic can occur!

## New Insights: Moving Change Thinking from Event to Journey

In the late 1980s, Kathie was invited to Corning's Sullivan Park Research Center to design and facilitate a strategic planning event for the scientists and engineers at the Center. The heart of Corning's innovation and development was Sullivan Park. It needed a refreshed strategic focus and, more importantly, alignment among the various groups within. Simultaneously, Paul Tolchinsky was working at Sullivan Park to create a more meaningful workplace for the hourly workers who built the experiments and worked alongside the engineers. Paul was an organization design consultant, having been a student of Eric Trist and a pioneer in the Ecology of Work Movement in the USA. Paul was steeped in Socio-Technical Systems and had also led numerous study missions to Japan, studying Japanese quality and manufacturing systems.

Kathie immediately saw the opportunity to bring the whole system together and invited Paul to participate in the event planning. The meeting itself was expanded to include the scientists, engineers, and all of the employees on site – an event of over 800 people.

When Kathie and Paul met, they had both been on their own personal journeys. Paul was an experienced organization design consultant, working with labor and

management to enact the Corning Partnership Agreement. For Paul the question was, "How do you move the change along more quickly, engaging the many to decide for themselves?" For Kathie, the question of the moment was, "How do you go deeper into the real issues of the organization and reach down, past the strategy to execution and implementation – something that did not always happen?"

The relationship and the event were huge successes, and a new partnership was born. Kathie and Paul decided to find a client to integrate their work and build the next generation of thinking on change management.

As happens when you put something into the universe, you will be surprised by what comes about. Within a month, Kathie received a call from Gayle Goodrich Harwood, an internal consultant working on the startup of a new United Airlines maintenance facility being built in Indianapolis. Paul was in Japan at the time, leading a study mission of American managers. Kathie called Paul in Japan and asked if he could divert to San Francisco to explain what we imagined creating. A proposal followed, and 2 years later Kathie and Paul had created a new way of engaging people, enabling them to co-create a new workplace for themselves. These pioneers, as United Airlines liked to refer to themselves, brought a project that had been disconnected and behind schedule, on-line and on-time with an enthusiasm United Airlines had rarely seen.

Kathie and Paul were able to take the best of Socio-Technical Systems (Trist 1981) thinking and RTSC and create something different. The core of this was systems thinking and the unwavering notion that the wisdom and answers to serious issues lay within the employees themselves. Unleashing and tapping that energy was the key to organizational success.

By the late-1990s, Kathie was struggling with the focus on events and the growing popularity of large group meetings. At one point she even suggested we write an article, "It's not about an event, stupid!" While we did not write the article, the reality was that (RTSC, Jacobs 1995) no longer reflected the work or the lessons learned in the early 1990s. At an infamous meeting dubbed "the meeting on the patio," in Cleveland in the summer of 1997, Kathie and her partners struggled for 2 days to find a term or language that better represented the work that was now being done.

At the end of our 2-day retreat, we had settled on the term "Whole-Scale Change." Kathie wanted a term that represented whole system thinking, the core of the emerging framework, and scale (both large group, small group, and individual). The hyphen was there, because it was whole system AND large and small scale. "Wholescale" did not convey it and, without the hyphen, the inextricable relationship between the two might be lost. The term represented a new beginning and a shift in the thinking and in Kathie's work. No longer did she do "one-off" meetings. Kathie began to talk about concepts that had been percolating for a long time:

– **Critical mass** – critical mass is that number of individuals within an organization that need to be involved in the change initiative over time in order for it to be successful. It is answered by the following: how many people would have to talk

with how many of their colleagues, in order to shift the rhetoric and dynamic in support of the change. The number can be as small as 10% of the staff in a highly centralized organization to 100% in a highly distributed, decentralized one. You do not have to get "everyone" into the room or the change, and you need sufficient numbers to change the dynamic in the direction of the change.

– **A tipping point** is the point at which a series of small changes or incidents becomes significant enough to cause a larger, more important change. The tipping point was popularized by Gladwell in his book *The Tipping Point: How Little Things Can Make a Big Difference (2006).*

– **Learning journeys** – a learning journey is one where after each step on the journey one reflects on what they have learned and how that learning informs the next step. It is the essence of action research. In the case of the Whole-Scale approach, it means asking these questions: What did we say we would do? What did we actually do? What did we learn from what we did? And now what do we need to do differently in order to achieve our purpose or mission?

– **Energizing the whole** – in the process of engaging a critical mass, high energy for and understanding of the change initiative is created, which in turn energizes the whole organization. In Whole-Scale Change, Kathie and her colleagues describe energy as a function of meaning, hope, and power. For more details, see pages 150, Whole-Scale Change (2000)

## Moving from Event to Journey/Roadmaps

Along with the Star of Success model (described in the section titled "The Final Years of Kathie's Work"), which keeps us focused on the whole system, are the questions at each star point that guide our conversations with clients. In articulating the Star of Success model, two questions arose that apply to creating a roadmap for a specific client. If the client's presenting issue is to help them create and deploy a new strategic plan, then our question related to the Star of Success is Do you have the capacity to carry out that strategic plan, meaning do you have the right processes, structures/relationships, resources, and information flow (Star of Success star points) to allow you to successfully implement the strategy (the first of the star points)? If the client's presenting issue is for process or organization redesign, then the question is Is this change in structures or processes tied to the strategic plan? If it isn't, it will be seen as "the flavor of the month" and not taken seriously.

– The art in building a journey and in the development of a change roadmap is in knowing when to converge or bring together a large group for decision-making and when to diverge into smaller groups for specific work. The converge-diverge process is intimately linked to Action Learning, in that after each step on the journey/roadmap, one pauses to ensure the next step is the right step. When the Whole-Scale workshops shifted from designing an event to designing a journey, the surprise was how the concept of designing a journey was new to many

participants. When designing a meeting, whether it's for 10 or 200, 1 day or 3, the actual meeting design can be 10–30 pages and includes everything that is planned to occur during the meeting. The design is always reviewed and changed if necessary by the planning team prior to the meeting and changes during a meeting are done only after consulting with the planning team (Fig.1).

– The strategic development implementation roadmap, below, is an example of a generic roadmap for a strategy journey. In the generic roadmap the box labeled "special purpose work" is all about the star points that are not strategy.

## Legacies and Unfinished Business: Standing on the Shoulders of Giants

Kathie's legacy includes many things, not the least of which are the lasting relationships and the mentoring of a generation of practitioners, all of whom learned from and soaked up her wisdom and charm.

Kathie gave OD many enduring concepts and practical theories. In 2001, after retiring from DTA, Kathie decided to get a PhD and, in the process of deciding on a school, met Professor Steven Cady, PhD at Bowling Green University. Their relationship focused on an exploration that Kathie called the Five Truths, described below. These five "truths" were the meta-principles underlying all whole system change methodologies.

In their research on Whole System Transformation, they studied Whole System approaches and their key founders and thought leaders: Search Conference (Fred Emery and Eric Trist, CITE, 1960), Preferred Futuring (Ronald Lippitt and Ed Lindaman, 1969), Future Search (Marvin Weisbord and Sandra Janoff, 1982), Real time Strategic Change and later Whole-Scale Change (Kathleen Dannemiller and Paul Tolchinsky, 1995), Open Space Technology (founded by Harrison Owen, 1985), Appreciative Inquiry (David Cooperrider, 1987), and The Conference Model (Richard and Emily Axelrod in 1991).

Kathie lived and breathed these five truths, and because of that, she was able to see them as the underpinnings of all of the whole system organizational change approaches in vogue at the time. A more detailed summary of the five truths can be found in Dannemiller and Cady (2004).

## System: Transformation Connects All Things Within and Around the System

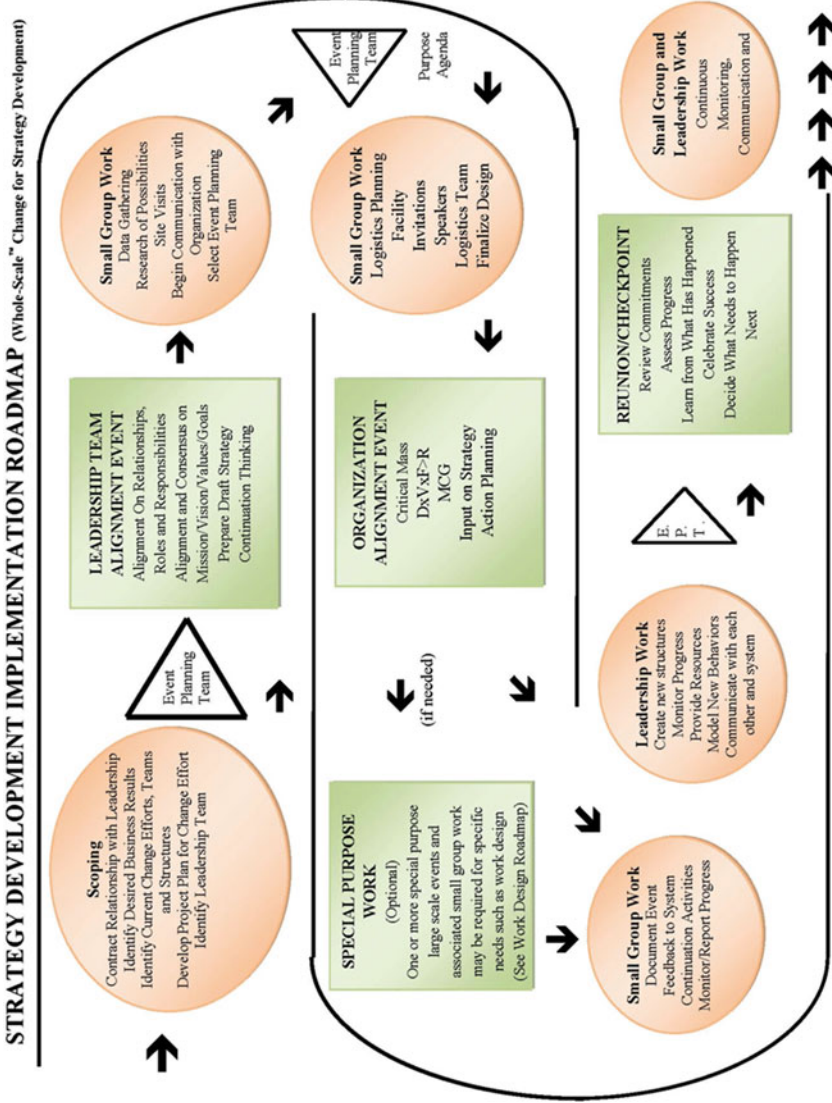
The only way to bring about meaningful, organizational change in the twenty-first century is to look at the whole system. Piecework solutions cannot resolve complex system-wide problems. Fixing one thing, while ignoring or trying to hold static the rest, never works. This is the seminal work of Trist and Bamforth (1952), in the 1940s and could not be truer today. Real wisdom and synergy come


**Fig. 1** Generic Whole-Scale Roadmap

from discovering interconnectedness through shared information. There is undeniable power in thinking "whole system" and in being the whole system as we think. Bringing together various microcosms of the whole organization enables the organization to see itself as a whole and therefore enables it to change in real time, holistically.

## Purpose: The Transformation Is Clearly Purposeful

"If you don't know where you are going, any road will get you there," says the Cheshire Cat in *Alice in Wonderland*. In other words, if you don't know where you're going, you literally won't know when you get there. And, this is why having a clear purpose is so important. Purpose is defined as a positive difference that occurs through the transformation. It answers the question, "What will be different in the world because we embarked on this journey that indeed transformed our organization and our lives?" Or, to put it another way, "how will the system be different, as a consequence of the journey we have been on?". Every change begins with an exploration of the end we all seek. When we are aligned on this purpose, it becomes the north star everyone follows.

## Journey: The Transformation Is a Dynamic Journey

Kathie was trained in Action Research and Action Learning. She imagined this journey as a well-designed roadmap, articulated clearly in terms of the purpose and the results-oriented outcomes of each step as well as the requirements between steps. The resulting mental model, or picture, describes the purpose-driven processes needed, as well as the flow of work across the system. When the steps in the journey are clearly delineated and believable, there will be no unintentional turnings or wasted detours – rather the change will be a concise and flexible process that enables rapid deployment.

## Theory: Transformation Is Guided by Theory

Kathie believed in the power of research and the marriage of theory and practice. She honored the work of the people who went before her. As stated by Kurt Lewin, "There is nothing as practical as a good theory" (Kliener 1996, p. 31). In short, when a growing body of evidence has supported a theory, it is robust. That is, the method or technique leads to predictable results in a variety of situations. "When you "poke" the system (intervene in a system), you want to be able to predict the "ouch." When you can predict the "ouch" from the intervention, you have a robust intervention." Kathie believed it was imperative that you are intentional in the chain reaction you set off. If you know the possible reaction to an intervention (i.e., it is predictable

predicated on good research), you will be doing the kind of work that will lead to transformation success.

## Values: Transformation Is Shaped by Values

Kathie believed that all transformation change must profoundly and consistently be driven by values. Social democracy and giving voice to everyone were fundamental. She was committed to empowering people to shape the organizations they live in.

An important part of this truth should be pretty obvious. If we want to make a difference in people's lives within their own organization, we, as consultants, must live these values with every breath we take, every word we utter, and every design we use. When we are intervening in a system – and we always are – it is particularly critical to live our people values at every step.

Some of the values that are consistent among all of the founders are as follows:

- Move people from passivity to activity.
- Create a maximum mixture of viewpoints.
- See the world others see.
- People own that which they help create. Ownership and commitment only come from engagement.
- Live from your heart. Connecting head, hands, and heart creates a powerful force for change.

## The Practices that Live On

In addition, the notions of speed, depth, simultaneity, synchronicity, critical mass, and self-sufficiency became commonplace in the field of Organization Development.

### Faster
In the "old days," it was taught that change took "time." Kathie realized that everything was speeding up. She told Tom Page, at Ford, "If we do it the old way, by the time we built a critical mass, Ford might be out of business!"

### Deeper
In order to create and sustain change, we must go deeper. "Deeper" means that the first step is into the souls of people. People must understand and believe deeply in what they are doing, or they will not do it. "Deeper" means not just using the hands and heads of people, it also means connecting at the heart. "Deeper" also means deeper into the organization, touching managers, leaders, and those doing the work. It means changing not only the words, it means changing the ways of working and the behaviors associated with it. It means touching all levels and connecting heads and hearts, unleashing an energy that is unmatched. When you connect deeper, you

create a paradigm shift you can see and experience. Without depth, follow-through and sustainability are not possible (Fig.2).

## Simultaneity
At United Airlines, Indianapolis, Kathie and Paul often had multiple activities going on simultaneously. It was during this work that Kathie learned to apply PDCA (plan-do-check-act).

## Synchronicity
There is an order or sequence in the work we do. Underlying all organization interventions is a process, and often in that process, there is a logic in the order.

Synchronicity is the notion that the journey has a logic; one continues to build critical mass and expand the circle of involvement, and that requires a process way of thinking.

### Critical Mass

For Kathie, the continual question was, "Do we need the whole system in the room?" If not the whole system, then how many people does it take to shift the energy in the direction of the change? How do you build a critical mass of employees who are committed to a shared future? At United Airlines, Kathie and Paul often experimented with when to use a microcosm and when you must engage the whole. Their concept was to continually expand the circle of involvement" until the tipping point had been reached.

### Self-Sufficiency

Teams learned new ways to dialog with one another and to self-correct, as needed. When the repair of the first plane did not go as planned, mechanics, team leads, and their colleagues shut the site down and designed and facilitated their own 400-person event. Over 2 days, they dissected everything that impacted the work and redesigned, or reaffirmed their plans.

## The Final Years of Kathie's Work

In 1996, Kathie and all of the partners of DTA engaged in a deep dive into systems theory and its relationship to and impact on organizations. This deep dive took the form of a 5-day workshop with Margaret Wheatley, Myron Kellner Rogers, and physicist Frijtof Capra at Sundance in Utah. The structure of the 5 days was lecture in the morning, free time in the afternoon, and experience in the evening. The difference for the ten of us was that, instead of free time, we gathered to talk about what we were learning and the implications on our work.

These 5 days illuminated and made more concrete Kathie's views about how organizations change. As a result, Kathie and DTA developed a systems model that became part of the approach and is now known as the Whole-Scale Star of Success, developed by Allen Gates (a DTA Partner & former executive in aerospace). "Because Whole-Scale is applied systems theory, the Star of Success provides an excellent organizational systems model. As a framework, the Star is a practical tool that helps organizations think though system-wide change. It causes the organization to ask the vital questions. Knowing the answer to these questions ensures focus for moving successfully into the future" (Dannemiller Tyson Associates 2000).

## Implications for the Future: Placed in the Previous Section?

In a paper that Kathie wrote in 2000 titled "Legacy" she says,

> Organization development isn't just a profession we are all involved with: this is a calling. We are called to make sure it matters that we showed up and are here. Nothing in our life or language can be (or is) a throw-away line. Everything I say to my children, my friends, my clients, my partners has an important meaning. I am continually asking myself: What is the purpose of this event? What is the purpose of what I'm about to say or do? Let's make sure it matters.

Kathie lived and breathed the fundamental underpinnings of Whole-Scale, and because of this the last chapter of her life unfolded quite naturally.

Just as the founders practice values that are shared, all leaders and change agents who develop their own methodology will have some common values. They might also have values that distinguish them from other practitioners. OD consultants should use the truth of values to assess what qualities they bring to the table in addition to the values that they practice while consulting on whole system transformation for organizations.

Up until her passing in 2003, Kathie was still thinking systems and how she could help change organizations and the world. In her Portfolio Draft, March 5, 2002, for her PhD application (she died prior to starting her dissertation) she wrote:

> I am a 72-year-old Organization Development consultant, retired by reason of disability from a rewarding professional life. Since 911, I have been possessed by a driving need to continue making a difference, even though I am no longer able to do "real work" (meaning to do it the way I used to do it). The query I find burning in my heart is the following: How do I substantively change my current body of beliefs about how to bring about change, finding a way to make those beliefs relevant to the larger system I now see in the world?
>
> I am an action researcher by training and belief. I believe that life itself is an action research journey. We create beliefs and actions based on reflection on what has happened to us up to this point in our lives. And 911 awakened me, as it did many of us, to an expanded view of the global world, a view different, at least for me, from the "global perspective" I had held up to that time.

## Conclusion: Kathie's Legacy Spans the Globe

The weekend before her death, she was speaking virtually to a contemplative leadership event of 40 leaders sitting in a circle with the phone in the middle. The event was led by Dr. Michael Arena, now head of Talent Management at General Motors, where he says most of his work is influenced by what he learned from Kathie. The question the leaders posed to her was, "What is courage, and how have you lived it?" In a phone conversation with Michael in March 2016, he shared this about her that day: "I saw a vulnerable side of her – she talked about courage and stepping into the world boldly. More uncomfortable than I'd ever seen her and it was very powerful – what do you think that courage is? Her response: "Courage is turning the mirror around and looking at yourself," then she shared the difficulty she was having just getting to her kitchen – "courage is looking at the person you've become."

A large part of Kathie's legacy lies in the thousands of OD practitioners she has inspired directly and indirectly. Especially in the 1980s and 1990s, Kathie worked and taught in Europe and India as well as the United States and Canada. Hundreds of professionals attended DTA workshops on system change and took Whole-Scale Change back home to become the heart of their own practices. Two of her colleagues and friends offered their comments on her influence.

> Kathie's work built capability in hundreds of people for facilitating ways of empowering millions of people in co-creating their future. I was touched by her humility, empathy and the genuine desire to serve to make our world better. (A. Sachdev, Founder and CEO, The School for Inspired Leadership (SOIL), India, March 2016, personal communication)

> The work that I and my colleagues within MPuls do is strongly influenced by the fundamental work of Kathy Dannemiller and that of Paul Tolchinsky. All the major change programs we do in strategy development, implementation, organizational design, mergers and integration processes are based on working with large groups and whole systems methodology. They all involve employees and other stakeholders from the start. Whole-Scale Change is our central paradigm: a well thought-out combination of large and small group interventions and workshops, which we supplement with a diverse set of communication tools, leadership development and (individual) coaching. With direct engagement of the people that are part of the problem, the solution or both. And people who can shed a different light on the matter. This leads to commitment, ownership and ultimately, sustainable results. (M. van Hooft, Managing Partner, MPuls, Netherlands, March 16, personal communication)

The story of Kathie's professional life comes full circle in remembering her relationship with the Ford Motor Company. Her friend and early colleague, Bruce Gibb, describes a time when he, Kathie, and a few others were meeting at her cottage at Whitmore Lake in Michigan discussing the future. Bruce describes what can only be called an epiphany when Kathie said, "We have to save my beloved auto industry!" (B. Gibb, March 2016, personal communication) Kathie became obsessed with that mission and it propelled her forward to bring her passion to scores of companies over the next two decades.

In 1994, DTA held one of the largest meetings in its history, the entire 2,400 workers of the Ford Mustang plant. The meeting took up the entire Cobo Convention Center in Detroit and was designed to help launch the newly redesigned Mustang that year. The scale of this meeting was immense, and the results were remarkable. One marker of Ford's appreciation was that Kathie received the fourth car off the line when the new Mustang went into production. It was, as was typical of Kathie, a red convertible that she drove for years.

She was recognized again by the Ford Motor Company at the time of her last illness:

> I have recently learned of your hospitalization from a good friend of yours. I am sorry to hear of your illness and the challenges presently confronting you. Please know that you have many friends within the Ford extended family who are pulling for you and awaiting

the good news that you have turned the corner to improved health. Thank you for everything you have done to contribute to the strength and progress of Ford Motor Company. We now extend our best wishes for your steady return to improved health. (W, C. Ford Jr., Executive Chairman Ford Motor Company, personal note to Kathie, December 2003)

Kathie died on December 26, 2003 and the final message she left for all of us is:

And so, next generation . . . we pioneers are moving to the next learning environment, and leaving this one to you. My assignment to you, before I go, is the following: Stand on the shoulders of the pioneers who went before you . . . honor and learn from us...and then spring into the future with new and robust concepts that will be more than we old-timers ever dreamed of. You are the creative minds of this unfolding Millennium. (K. Dannemiller, ODN Conference 2001 Life Time Achievement Award acceptance, November 2001)

# Patrick Dawson: Organizational Change as a Nonlinear, Ongoing, Dynamic Process

Christopher Sykes

**Abstract**

Patrick Dawson is a contemporary organizational sociologist born in England and now based in Australia. His abiding research interest has focused on "why people do the things that they do," His research trajectory was positioned by growing up in a working class family in the industrial Southwest of England and his interests in sociological theory, early urban ethnography, neo-Marxism, and phenomenology. He developed a processual approach to organizational change that promotes the importance of viewing change as a nonlinear dynamic rather than a simple progressive series of causal stages. When first developed, his processual perspective strongly contrasted with the dominance of organization development (OD), contingency, and recipe-type approaches in adopting the view that examining changes as they happen is central to building knowledge about complex change processes. His approach draws attention to commonly overlooked areas in studying the complexity and messiness of change including issues of time and temporality, political process, narratives and sensemaking, and the multiple views and interpretations that all shape and influence change processes. Dawson's research spans multiple sectors and organizations from heavy industry to human services and is characterized by its strong empirical grounding in seeking to understand change as an ongoing dynamic process using fine-grained, longitudinal, ethnographic investigations. Dawson has established himself as a leading international scholar in management research having published 13 books and over 60 refereed journal articles as well as sitting on various international editorial boards.

## Contents

## Introduction

Patrick Dawson developed a processual approach to organizational change that promotes the importance of viewing change as a nonlinear dynamic rather than a simple progressive series of causal stages. When first developed, his processual perspective strongly contrasted with the dominance of organization development (OD), contingency, and recipe-type approaches in adopting the view that examining changes as they happen is central to building knowledge about complex change processes. This process orientation differed sharply with conventional models that focus on (a) presenting a series of preplanned steps for change, (b) providing retrospective causal explanations from identifying a key set of linear events, or (c) determining appropriate strategies for change from a one-off snapshot of prevailing circumstances. His approach draws attention to commonly overlooked areas in studying the complexity and messiness of change including issues of time and temporality, political process, narratives and sensemaking, and the multiple views and interpretations that all shape and influence change processes. Dawson's research spans multiple sectors and organizations from heavy industry to human services and is characterized by its strong empirical grounding in seeking to understand change as an ongoing dynamic process using fine-grained, longitudinal, ethnographic investigations. He has published 13 books and over 60 refereed journal articles. His work is referenced widely, and his research has also been presented at a number of keynote presentations. With over a 100 conference presentations and 50 book chapters in addition to positions on the editorial board of a number of leading international journals, Dawson has established himself as a leading international scholar in management research.

## Influences and Motivations: An Historical Overview

Patrick Dawson was born in 1958 in the district of St George that lies on the edge of inner city Bristol in the Southwest of England. His father was an active trade unionist who worked for the Co-op (Co-operative Wholesale Society) in distributing coal to the Bristol community (weekend trips to Wales and the local mining villages were common), while his mother worked as a cook preparing school meals. Patrick was the youngest of three brothers and as a musically talented teenager growing up in the

1960s, he was strongly influenced by the emergence of the counterculture associated with rock, punk, and reggae music. In the period from 1973 to 1981, he joined several local bands of differing genres such as rock, jazz, and punk as a drummer, pianist, and guitarist. These creative, formative influences were profoundly shaped by a period of intense family tragedy when his father died suddenly in 1976 and then a few months later his best friend died when cycling home on a wet and windy main road.

After leaving school he entered university in Southampton to study sociology and social policy with the intention of entering a career in social work. During his undergraduate studies in sociology, he became particularly interested in the sociology of crime and deviancy and the work of sociologists such as Howard Becker, Stan Cohen, and William Foote Whyte. He was inspired to consider research work that got close to people to see "why they do what they do" and found a strong resonance with Becker's use of ethnography in probing the lives and interpretations of different groups of people in his studies of jazz musicians and the use of marijuana. Whyte's pioneering research captured in his book *Street Corner Society* (1943) was a major influence, especially in his unusual (for the time) methodological use of participant observation and urban ethnography. Whyte's (1955) study contrasted "college boys" with "corner boys" in a longitudinal fieldwork study that allowed him to get close to the street corner gangs, and in taking their views and interpretations seriously he sought to understand the interpersonal dynamics of gang membership and group behavior.

During this early period in Dawson's undergraduate studies, several other strands of intellectual endeavor were woven together with his interest in urban ethnography. In social policy, he was drawn to works, such as *Schooling in Capitalist America* by Samuel Bowles and Herbert Gintis (1976) and historical accounts of the poor laws, the 10-hour working bill, social reforms, and the influence of British philosophers, such as Jeremy Bentham. While in the area of industrial sociology, the neo-Marxist influenced work of Harry Braverman (1974) in his work *Labor and Monopoly Capital: The Degradation of Work in the Twentieth Century*, piqued his interest in the areas of political process, vested interests, hierarchies, and exploitation. As well as the strong influence of the labor process work of Harry Braverman, he also became interested in the organizational work of Tom Burns, John Child, Michael Rose, and Joan Woodward, as well as classical sociological theory and the phenomenological work of Berger, Schutz, and Winch.

After receiving a "first" in his undergraduate honors dissertation under the supervision of Dr. Jon Clark, in which he examined the effects of new technology on unemployment, he wanted to extend his studies of phenomenology, but in the absence of a suitably qualified supervisor, he discussed with Jon Clark the possibility of doing a workplace study (for a PhD) in industrial sociology. Clark at that time was a new, enthusiastic lecturer and after working as Dawson's honors supervisor recognized his abilities and was keen to see him extend his work as part of a newly established social science and engineering center – the New Technology Research Group (NTRG) – established as a multidisciplinary group to study the introduction and uptake of new technologies associated with what was then

commonly termed as the "microelectronics revolution". Dawson was also offered a position at the Institute of Criminology at the University of Cambridge that spoke to his other main area of academic interest. But just prior to his final exams, another tragedy struck when close brother and friend, Robin Dawson, who was also in his final year studying sociology and philosophy at the University of York, died of a drug overdose.

During this difficult and emotional time, Patrick decided to remain in Southampton and carry out his PhD work under the supervision of Jon Clark. The NTRG team included two engineering faculty, Robin King and Professor Robert Smith, as well as John Smith (Professor of Sociology) and research fellows Ian Mcloughlin, Howard Rose, and Hazel Downing. Together they formed a lively group interested in studying research methods, labor process theory, management of innovation, industrial relations, and workplace change. Dawson was soon intrigued by the way that formal accounts of change were at odds with the interpretations and views of those on the receiving end of change, as well as the way more formal write-ups of research differed from the experiences discussed more informally by researchers. An early project that influenced him during his formative years (1980–1981) centered on examining (with a group of engineers) the newly developed technology of computer-aided design (CAD) on skilled engineering draughtsmen and women in the British aerospace industry.

In 1981 he embarked on his PhD, a 3-year fully funded research project into the effects of computer technology on freight operations in British Rail. He drew upon the ethnographic methods that he discovered in the work of the urban ethnographers, and as it turned out, this would become a defining and continuing characteristic of his approach to research. He "shadowed" or followed around workers undertaking observations and interviews as they performed different types of work, from laboring activities and tasks associated with marshalling wagons in freight yards through to shadowing supervisors in dealing with track, equipment, staff and operational contingencies, travelling on freight trains, and so forth, as well as observing managers in their daily activities and duties. His goal was to identify with the research participants by "becoming native." At times the boundaries of work spilled over into the social activities of the shunters and supervisors, and he soon found that going to the pub with the workers after a shift provided a rich source of data for his study. These social events offered a space and a place where railway staff opened up and reflected upon incidents observed in the yard, often using humor and talking informally in engaging in conversations that sought to make sense of their experiences at work. His research observations required him to cover three shifts, and he often worked for 12 h at a time from 7 pm in the evening to around 7 am in the morning in order to not only cover the night shift – when most of the shunting activities occur within the marshalling yards – but also to be around to observe shift changeovers (when key incidents, events, contingencies, and emergencies are discussed). Fieldwork was conducted over an 18-month period involving a detailed program of observation in five high-capacity marshalling yards in three British Rail regions and also included attendance at supervisory training courses (in which he undertook the training with other employees who were all

aware that he was collecting data for a university project), time spent with managers at area offices and regional headquarters, as well as a trip to Australian freight yards and New Zealand Railways in 1982. During the research a large body of field notes were accumulated from workplace observations, the regular informal individual and group discussions that occurred, as well as data from a series of semi-structured interviews that were conducted with over 80 employees ranging from members of the British Railways Board through to local managers, freight supervisors, and shunting yard staff.

In the early presentations of his research, Dawson established a relationship with a number of influential researchers that would last for decades – with some continuing to this day. He presented an initial paper on his marshalling yard study at a labor process conference, and in the audience were David Knights, Hugh Wilmott, David Buchanan, and John Hassard, all very well-known organizational scholars, with whom Dawson established research networks and collaborations.

In the 1980s, studies of organizational change were mainly anecdotal or retrospective, written from the perspective of management or a key change champion. Dawson, who was interested in the experiences of all employees (from janitor to managing director), wanted to extend studies of change to include the idea of the ongoing and continuous flow of change that he observed in his ethnographic studies. Taken from this perspective, change is a process with no end; it was dynamic and open to multiple interpretations. During this early work, Dawson was not – perhaps surprisingly – influenced by the work of Andrew Pettigrew, despite the fact that Pettigrew and Dawson both developed processual approaches at around the same time. Dawson was writing his PhD in 1983 which was submitted in 1985 (the year that Pettigrew's ICI book was published), and interestingly, there is no reference to the work of Pettigrew in the thesis (Dawson 1985) or in his first major journal article with McLoughlin published in the *Journal of Management Studies* (Dawson and McLoughlin 1986). Although Pettigrew was known by Dawson for the longitudinal research he was conducting at ICI (they both attended a conference at Gregynog Hall in Wales in the early 1980s), this work was not significant in terms of the foundations that have been central to his trajectories. Although during his later work and publications he became aware of the similarities and started to draw on Pettigrew's work (Dawson 1994), he maintained a concern with Pettigrew's overreliance on data taken from a certain level or group of employees and his reluctance to engage with all employees in an organization. Dawson has also been critical of attempts to shortcut ethnography through streamlined case study research and the emphasis placed on the need for multiple comparative case studies (indirectly questioning the value of ethnography within a single organizations in pushing for generalizability). Throughout his studies, Dawson has repelled positivistic pressures that question the value of outlier data in deeming such material as numerically insignificant. He has continually questioned attempts to clean up and at times quantify qualitative processual data, and yet, he has also strongly advocated an approach that is both accessible and practical. On this latter count, Dawson has often criticized Pettigrew for making his approach impenetrable and unusable for practitioners. The essence of Dawson's research philosophy is to engage with the people he is studying or as he

terms, to jump in at the deep end with managers, supervisors, and shop floor employees.

During 1985–1986, he took up a research fellowship in the Department of Sociology at the University of Surrey, in which he became involved (with Sarah Buckland) in setting up and running a two-phase longitudinal study of the public requirements of a computerized system of welfare benefit advice. This study involved extended interviews with low-income households living in urban and rural settings in the Southeast of England. However, prior to full data analysis of the material, Dawson secured a full-time lectureship position at the University of Edinburgh, and on moving to Scotland, he returned to studying processes of organizational change in examining the uptake of just-in-time (JIT) management in Hewlett Packard (1987–1988). This research conducted with Jan Webb comprised interviews with production and operations managers, observation of staff activities, informal discussions, and the use of documentary material. During this time he also began to write-up and present his research at a number of sociological and organizational conferences, such as the British Sociological Conference and the Labour Process Conference, where they were very well received by colleagues. An early success in his publishing career focused on the area of new production arrangements, which eventuated in a coauthored and well-cited publication in *Work*, *Employment & Society* (Dawson and Webb 1989).

In emigrating to Australia in 1988, his attention turned to a number of longitudinal studies in manufacturing in the white goods industry and to a range of companies associated with the automotive industry, including a mirror manufacturer, a seat manufacturer, and a study on the uptake of cellular manufacturing at General Motors, as well as studies in a range of other organizations, including a linen service and a bank. The drive behind such intense research activity centered on the aim to collect a series of in-depth extended case studies for a book on change that would promote his processual approach. Each study followed a process research methodology involving extended periods of observation, repeat interviews over a sustained period of research, and the analysis of documents and other materials in following processes of change as they happen. In the case of General Motors, interview and observational work occurred before, during, and after change, while in some other case study sites, the changes had already commenced, and hence a retrospective element had to be built into the research design. These intensive periods of research, while also being required to fulfill other teaching and administrative responsibilities, also involved data collection during night shifts and 70 km round trips. By the late 1980s, armed with a large collection of new empirical material, Dawson secured a contract with Sage for a book on change. However, on reviewing the manuscript, the publishers became concerned about the depth of the case studies and considered the book unlikely to be of wide-enough interest to warrant publication. After a prolonged period of negotiation, release from the contract was granted in 1991. A new proposal was submitted to Paul Chapman Publishing in 1992, and following further reviews, the book was changed from "a processual approach to organizational change" to *Organizational Change: A Processual Approach* (the first change book to refer to processual in the title) and, shortly after release in 1994, became their

leading publication. Since this time the book has been cited in over 750 scholarly publications and stands as a foundational marker of Dawson's longitudinal studies on workplace change.

Larger collaborative studies followed in examining the uptake of quality management in a range of Australian and New Zealand organizations (including banking, optometry, cable manufacture, and mining). The research program was funded by the Australian Research Council (ARC) and was undertaken by two research teams: one was located at the Australian Centre in Strategic Management at Queensland University of Technology under the direction of Professor Gill Palmer and the other was based at the University of Adelaide under the direction of Patrick Dawson. Once again, the main methods used in the study comprised in-depth interviewing of key informants (both internal and external to organization); management, union, and shop floor interviews; participant observation; nonparticipant observation; and documentary analysis. A longitudinal element was built into the research strategy, and where practicable, repeat interviews were carried out at a number of different stages during the process of organizational change. The findings from the study were published in 1995 in a coauthored book entitled: *Quality Management: The Theory and Practice of Implementing Change.* The remaining years in Australia were spent engaging in research on technological change and the uptake of lean and best practice techniques in, for example, a bakery, an oil refinery, and a global pharmaceutical company.

In 1997, Dawson applied for and was appointed to the endowed Salvesen Chair in Management at the University of Aberdeen (Andrew Pettigrew acted as the external on the appointments committee, and there has been closer contact between Dawson and Pettigrew since this time). On taking up this position, Dawson set up a change and innovation research group (CIRG) in collaboration with local staff, and he also continued to publish from his extensive Australian fieldwork material. In 1988, he was successful in gaining a Danish guest professorship which was funded by the *working environment and technological development* program, spending half his time in the Department of Environment, Technology and Social Studies at Roskilde University and the other at the Department of Technology and Society at the Technical University of Denmark. During this period he supported the work of a number of Danish researchers who were looking to publish their material outside of Denmark. He secured two special edition journal outlets, and in developing his own work, he started to build narratives and stories into a political process perspective on change (see Dawson 2000; Dawson et al. 2000). On returning to Aberdeen, Dawson continued to engage in empirical fieldwork studies in technology and change in local-based organizations, such as the oil company Shell (see Panteli and Dawson 2001; Dawson and Gunson 2002). But department and collegiate pressures led Dawson to take on significant administrative duties as Deputy Head and then Head of Department, Director of Graduate Programs, and eventually Head of the Business School. During these years of a high administrative load, Dawson worked on the publication of two further books, one that set out to capture his case study material in an examination of the contemporary experience of work (Dawson 2003a) and the other that sought to further develop the conceptual and methodological issues and practices that arise from

engaging in processual research in organizations. This latter book entitled *Reshaping Change: A Processual Perspective* provides empirical grounding to the politics, substance, and context of change framework and explores methodological concerns in the design, collection, and analysis of longitudinal field research. Dawson also includes a chapter that addresses stories and storytelling in an early indication of his growing interest in multiple narratives and competing histories (Dawson 2003b) that was further developed in reestablishing links with David Buchanan and producing two journal articles on processual research, political process, and narratives (Dawson and Buchanan 2005; Buchanan and Dawson 2007). These publications firmly established Dawson's interest in the narrative and sensemaking literatures that were reinforced in his later work with McLean (Dawson and McLean 2013) and Sykes (Dawson and Sykes 2016).

In 2006, Dawson arranged to go part time at the University of Aberdeen in order to take up a dual position at the University of Wollongong in Australia. The aim was to withdraw from heavy administrative duties in order to regain time for research and publication. Over the next 8 years, Dawson spent two block periods per annum in Australia, largely engaged in research, and the remainder of the time was spent carrying out normal duties and responsibilities at the University of Aberdeen. While at Aberdeen, Costas Andriopoulos – an early career academic that Dawson had appointed and was mentoring – asked whether he could have support in submitting a coauthored book proposal on creativity and innovation. Following a number of discussions, it was agreed that Andriopoulos would take the lead in the submission of a book proposal and the management of the process under Dawson's mentorship. As it turned out, the process became more complicated (resonating with some earlier experiences with Sage), and after publisher deliberation, negotiation, conflict, and a period of reconciliation, they were able to extract themselves from a contract with Pearson and proceeded to put in a new proposal with Sage. On acceptance, the two worked closely in developing a pedagogical text for students that would bring together – what they argued were synergistic processes – change, creativity, and innovation. As it turned out, the text was successful, and a second edition was forthcoming in 2014. The authors are currently working on a third edition that is due for publication in 2017 and is marketed as a popular text for postgraduates in the area of change, creativity, and innovation.

During his time in Australia (between 2006 and 2014), Dawson got involved in a number of change projects, including studies on the transitioning of the intellectually disabled into aged care, an examination of the uptake of a performance management system at a colliery in Australia, social innovation, and an ARC-funded project on the uptake of RFID at an electronics company in Sydney. In the work with miners and with the intellectually disabled, Dawson started to reflect on issues of time and temporality, not only as these related to process research methods but also their import to regulatory systems (set chronological age for aged care regardless of health issues), and the sensemaking and sense giving that were occurring among miners as they projected forward while also drawing on the past in reconstituting their sense of the present. In developing this work and in discussions with colleagues at the University of Wollongong, Aberdeen and process organization scholars, Dawson started to produce a number of book chapters and journal articles on time (Dawson

**Table 1**  Patrick Dawson career and institutional affiliations 1978–2016

| Position | Institution | Timeframe |
|---|---|---|
| **Emeritus Professor** | University of Aberdeen, Scotland | 2015 ongoing |
| **Visiting Research Professor** | University of Lund, Sweden | 2016 |
| **Research Professor** | University of Wollongong, Australia | 2006–2014 |

2013, 2014a, b). During this period, Christopher Sykes, who had also collaborated on the IRT study, got involved in an ambitious project which was conceived during a series of bush walks along the Illawarra coastline in NSW. The aim was to engage with a broad range of disciplinary studies, drawing on science, social science, and philosophical theories and debates on time in developing a process perspective on organizational change that took time seriously. This collaborative work culminated in the publication of a coauthored book titled *Bending the Arrow of Time* (Dawson and Sykes 2016). In August 2015, Dawson took early retirement from the University of Aberdeen but continues to work on his processual approach to understanding organizational change in collaboration with colleagues in the UK, Scandinavia, and Australia. A summary of this career and institutional affiliations is listed in the table below (Table 1).

## Major Contributions to the Field

Dawson's key theoretical, methodological, and practical contributions include the development of the processual approach to change that also critiques n-step approaches, which have been particularly dominant in conventional OD following the legacy of Lewin's unfreeze, change, and refreeze steps of planned change, as

well as the Australian-based contingency models of writers, such as Lex Donaldson, Dexter Dunphy, and Doug Stace. In his focus on the interplay of politics, substance, and context in the unfolding of change, Dawson has also sought to incorporate sensemaking in the multiple views and narratives of change, as well as temporality in the ways in which expectations of the future and accounts of the past (that are continually rewritten and revised often in the light of vested and political interests) all shape the processes they are seeking to explain or make sense of. For Dawson, it is not about the triangulation of data in gaining a common understanding of change but in recognizing not only the dominant accounts but also the outliers and often silenced views in seeking to capture the variety and complexity of change processes. As a researcher, he is happy to position himself unapologetically as an insider and is highly critical of aspects of methodological orthodoxy, such as trimming off deviant or outlier data. As he explained in a methodological piece:

> Processual research on organisational change may require a lot of patience and plenty of time, but it also offers the researcher the chance to study unfolding issues and events as they occur. The 'deviant' or 'outsider' no longer has to be viewed as problematic in final data presentation as fine-grained contextual accounts can easily accommodate diversity. The focus is not on working the data to strengthen the generalisability of the findings but rather, to provide narrative accounts of the continuously developing and complex dynamic of people in organisations. Although general trends can be identified and typical responses recounted, under the processual framework, one is significant. (Dawson 1997, p. 404)

Shaped by his longitudinal ethnographic studies undertaken on the "shop floor" of large manufacturing and service organizations, as well as his sociological and critical theoretical influences, he resisted what he saw as the oversimplified approaches to change emanating from the dominant organizational development movement. While he readily acknowledges the utility of Lewin's contribution in highly controlled contexts, he considers the approach weak on several fronts. One of his main concerns has been with the way in which Lewin's conceptualizations have been oversimplified in supposedly more sophisticated and refined representations, especially with regard to his field theory and the development of multiple stage planned models of change that downplay the dynamic of driving and restraining forces. When these are accounted for, they tend to be used as explanations of resistance in highlighting the need to involve people so that they support and engage with proposed planned change. Along with Kanter (1992), he is critical of the symbolism of the freeze/unfreeze model that underlines a view or organizations as stable entities that over time needed readjusting so that they are realigned with a changing environment. This stability-oriented framework contrasts with Dawson's processual view of organizations in which change is ongoing, an unfolding dynamic ever present in organizational life and captured in his ethnographic studies of the lived experiences of employees at the workplace. Dawson has always recognized that in the context of the 1940s, the notion of longer periods of organizational stability followed by the need for change was common and that while Lewin's notion of quasi-stationary equilibrium and field theory attends to the dynamics of

group behavior, it does not engage with a conceptualization of change as an ongoing process.

## Key Contributions: A Processual Approach to Organizational Change

This is Dawson's foundational work that sets out his processual approach to organizational change. As already noted, the book was due to be published by Sage in 1991, and yet, it took a further 3 years until it was finally published by Paul Chapman in 1994. Ironically, Sage was later to see Dawson as a major author after acquiring Paul Chapman and now publish his widely used coauthored text on *Managing Change, Creativity and Innovation*. After this stressful 3-year delay, for a young academic seeking to make a statement about his processual approach to understanding organizational change, Dawson had finally managed to publish a book that promulgated the processual approach as a method and conceptual frame for studying and explaining processes of change in organizations.

His perspective originally formulated in his 1985 dissertation and further developed in this promotes the importance of viewing change as a nonlinear dynamic. At this important stage of his career and as a young academic, Dawson characterizes the book as having four main aims:

1. To develop a processual approach to organizational change that summarizes and addresses main contemporary organizational issues
2. To draw on grounded empirical evidence collected over 12 years as a basis for theory development
3. To offer an innovative and critical approach to new forms of work that accommodated the views of workers, supervisors, trade unions officials, change agents, and senior managers
4. To promote a coherent conceptual framework for explaining process of organizational transition and new organizational arrangements that underscored the value and importance of processual research

Interestingly, as in the work of many researchers (and other endeavors), it is arguable that these points characterize his work generally and that he has gone on to refine each of these areas in his later work. In this foundational book, he draws on three longitudinal ethnographic studies that covered a period of 12 years, in which to ground the development of what he terms "a processual approach to change," a term that was not widely used until the 1990s. Although Pettigrew provides something of a different history of processual analysis (1997), Dawson maintains the importance and significance of urban and organizational ethnographers (Whyte 1984) and industrial sociologists (Dalton 1959; Gouldner 1965; Roy 1967) as well as the later work of Tony Elger (1975). The empirical studies by Burns and Stalker (1961) and Woodward (1958, 1980) – dubbed a technological determinist – and the conceptual work of Child (1972) all laid the foundations for Dawson's

development of a process orientation to studying and conceptualizing workplace change. Central to this approach is immersion in multiple perspectives with close ethnographic engagement with all people at their place of work regardless of their station and position. Like Pettigrew, the research is longitudinal and contextual and pays particular attention to change as it happens, or as Pettigrew says "capturing reality in flight." The approach stresses the importance of examining movements as they occur from a current position (when possible at the initial conception of a need to change) through processes of change (the planning and implementation of change) to a period of review and evaluation (a post-change period). Examining changes as they happen is central in building knowledge of complex change processes rather than linear models that focus on after-the-event accounts. Data are collected throughout these processes from stakeholders and employees at all levels (not just management) and examined within a broader contextual frame that takes account of the past (historical and retrospective analyses) and the future (analyses of future expectations before and after the event), as well as the current ongoing processes of change (Dawson 2013, p. 252). It is based on the assumption that change is complex and at times chaotic (Alvesson and Sveningsson 2016). The approach also recognizes that the unplanned, unforeseen, and unexpected will occur and that consequently, organizational change should not be reduced to a list of simple sequential steps (Dawson 1994).

Dawson's processual perspective highlights the importance of temporality and context (the history and culture of organizations), political processes, power plays and the decision-making that engages and conflicts with people in negotiations, the communications that occur which may be misinterpreted or reinterpreted in various ways, and create further uncertainties, ambiguities, and confusion. It spotlights how forms of "equivocality" (where multiple interpretations exist) may be progressively resolved through collective sensemaking processes while also sustaining conflicting interpretations between different groups that may be further reinforced through processes of change. Attention is also given to the temporal reconstitution of practices (management strategy, change interventions, and workplace reconfigurations) and how people give and make sense of the way social and material processes, activities, and actions unfold over time. In short, change is viewed as a complex, dynamic, nonlinear, temporal process.

Throughout his research career, Dawson has set out to continually refine and elaborate on his processual approach. In applying the processual approach to a collaborative study on the introduction and uptake of quality management in Australian and New Zealand organizations, Dawson and Palmer (1995) draw attention to the fallacy of quick fix change in developing a more critical analysis of TQM from a series of empirical studies in which they used Dawson's processual elements of politics, context, and substance of change. In offering an important critique they concluded that the ambiguity of TQM offered universal solutions but, in practice, often failed to deliver and was not a management panacea to organizational ills. Dawson has consistently argued that change cannot be packaged into a neat set of tidy linear steps but is "one of stops and starts, of hesitancy, confusion and retreat as well as apparent progress" (Dawson and Palmer 1995, p. 195). Their study

highlights the dangers of any uncritical acceptance of fads and fashions that may appear as golden nuggets and universal solutions (especially when boosting overseas and North American credentials) arguing for the importance of maintaining a critical (and perhaps somewhat cynical) yet open mind to new approaches.

In further developing his processual approach to change, Dawson engaged with the narrative turn in the social sciences that aligned well with the stories captured and analyzed in his grounded processual research on organizational change. Following some early publications and a social meeting with an old friend and colleague, David Buchanan, the idea of integrating some of these narrative developments with a processual political approach seemed readily apparent and an area worthy of time and commitment. They agreed to develop two journal articles around change, multiple narratives, political process, and storytelling in which they would circulate authorship. In the first, the focus is on technological change and how linear mono-logical narratives are used to "sanitize" accounts of change processes. In contrast, the process of change is shown to be more usefully constructed by using nonlinear competing narratives and accounts of change (2005). In the second article, the focus is widened to include organizational change more generally, but yet again, the aim is to show how accounts of organizational change constructed using multiple – or what they term polyvocal narratives – influence stakeholder perceptions (2007). This political use of narratives and stories links to work on sensemaking that Dawson also integrates into his processual approach (see also Dawson and McLean 2013).

In a long-standing commitment to examining technology at work, Dawson has also maintained an ongoing relationship with Ian McLoughlin – a research fellow at NTRG that coauthored his first major journal publication in 1986. Since this time, Dawson has continued to coauthor work with McLoughlin on new technology and change. In a collaboration that has lasted over 30 years, they have produced a range of articles and book chapters on process approaches to technology and change at the workplace. Conceptually, they have promoted a mutual shaping perspective that is not only critical of impact and determinist approaches but also social constructivist accounts that underplay the importance of technology as a material artifact. As they summarize (McLoughlin and Dawson 2003, p. 32):

> We are arguing for a mutual shaping perspective which recognizes that whilst technology is designed and developed by a range of individuals and groups, these and others also engage in constructing meanings of technology within a changing social context. We stress the importance of temporal contextual influences and how over time, there may arise a common understanding among different groups and individuals on what constitutes a particular technology. As such, there may be a form of stabilization and closure in which the technology may appear obdurate. However, we contend that when technology is introduced into the workplace it is likely to be reconfigured by users and a number of configurations in use may arise in different organizational contexts and among different groups within the same organization. This user shaping of the technology may in turn influence further design and developments in the ongoing mutual shaping of technology and organization. In this sense, there is a duality of technology in which the social shaping of technology may at certain periods add to the obduracy of technology and there may be certain reconfigurations of technology in use which present a challenge to previous agreements on what constitutes technology. Such a perspective would take account of

technology as both a 'hard place' – tangible, material entity – and as a socially constructed artifact ('cinema') – given meaning through language and other forms of representation in specific contexts.

More recently, they have been drawing on the work of Leornardi, Orlikowski, and Barad in examining performativity and materiality in the use of technology in the form of decision review systems in professional sport (McLoughlin and Dawson forthcoming). Their essential argument is that the role of umpires, players, and those who frame and interpret their actions might be better understood in terms of enacting "technology in practice," because the sociomaterial lens questions the conventional assumption that technologies are "things" which interact with other equally independent social phenomenon. In short, the process of decision-making is performed in a context that has temporal memory aided by a technology that is sociomaterial and, as such, does not in practice allow for technological determinist outcomes as these are performed in social context over time that is experienced not only by objective clock time but also intersubjectively.

Dawson has turned his attention more fully to explore time and temporality, which he argues had been significantly overlooked in the organizational change literature. In his work on the importance of factoring in time into empirical studies of organizational change, he shows how considerations of concepts of time shed new insights into the dynamics of changing. Initially, he wrote about the importance of including ideas of time and temporality in approaches to change both theoretically and in the performance of the empirical work used in organizational change research practices. In relating his ideas on temporality to ethnographic studies of organizational change in an article in the *Journal of Organizational Ethnography*, he developed what he termed a "facilitating frame" that comprised of three elements. As he states: "Temporal awareness, that refers to a broadening of our understanding and sensitivity to time issues...temporal practices, that relate to the research skills (practices) developed in doing the research...and temporal merging, a concept used to capture the interweaving of time conceptions as well as the way temporality can be accommodated in the write-up of research material" (Dawson 2014a, p. 131).

The benefits of including a temporal perspective within research practices include greater awareness of different conceptions of time that enable clearer insights into the processes of change themselves. He also emphasizes that using such an approach highlights the contradictions that may arise between objective and subjective time and also to consider the potential of various practices for dealing with time issues. Importantly, he highlights here an idea that runs through all his work on time and temporality in stating that: "The intention is not to develop a framework for resolving the time paradox (no solutions or final truths) but to promote temporal insight and understanding in developing a more relational processual perspective that enables a fuller understanding of time" (2014a, p. 131).

Shortly after the paper on time and methodology, he wrote a second requested, reflective piece focusing on time for the *Journal of Change Management*. In this

work, he highlights the dearth of writings in the areas of time, employment, and organizations and argues that the main focus has been on discussions over the extent of fixity or flux associated with various theoretical organizational change approaches (Dawson 2014b). He analyzes and critiques for four well-known theories: Lewin's concept of planned change, punctuated equilibrium theory, emergent and incremental change perspectives, and, finally, the processual approach to understanding change, noting that (2014b, p. 302):

> The lack of conceptual clarity on time and temporality in the change management literature has inadvertently resulted in substantial misunderstanding and confusion. There is a need to bring these implicit concepts to the surface in creating greater transparency and explicit awareness of how they inform and are being used not only in the design of empirical studies, but also in the management and analyses of data, and in the development of models and theoretical explanations. The common conception of time as a progressive movement forward (the arrow of time) overplays the inevitability of novel progression as being something essential to the nature of change.

A central argument is that the tendency to differentiate theories according to fixity or macro-orientations and flux or micro-orientations "has inadvertently led scholars to underplay the central dimension of time and temporality...Objective clock time and subjective temporal experience blend, interweave and are continually reconstituted during processes of change yet are strangely absent in theories that seek to explain change in organizations" (2014b, p. 287). This neglect of time and temporality in theorizing change is an ongoing concern and is particularly evident in the recent collaborative work carried out by Dawson and Sykes (Dawson and Sykes 2015; Sykes et al. 2015). Within a broader multidisciplinary concern, they focus on the institutionalization of time-based work regimes and the influence of the Gregorian calendar (following the industrial revolution in Western capitalist economies) on lived experiences. They chart Western historical developments and the growing reliance on standard universal clock time in the control and regulation of international markets, global communication and travel, and the way that clock time dominates scheduled routines of every day existence. However, in their ethnographic process approach to fieldwork studies, they are also aware of the importance of extraspatial time, subjective experiences of temporality, and intersubjectivity. They argue that these more subjective elements have been downplayed in theorization and the modelling of change concepts. They call for a time awakening that not only recognizes the importance of subjective time but also the place and limitations of dualistic conceptualizations that differentiate notions of objective and subjective time. In drawing on scientific studies of time from Newton to Einstein, as well as the more recent and controversial debates on quantum time and multiverse conceptions, they suggest that temporality as experienced lies outside the material world of science. They also draw on long-standing philosophical debates about tense and untensed time, and social science concerns with time disciplines, contending that there is an absence of time-sensitive research in management and organization studies. The authors suggest the need to accommodate objective and subjective

conceptions of time, especially in researching processes of change in organizations, and call for a broader conceptualization of temporality that goes beyond dualism and recognizes the merging and mutual shaping that occurs within the structured and finely compartmentalized time regimes imposed by organizations (see Dawson and Sykes 2016).

In a recent monograph, Dawson worked with Christopher Sykes to more fully explore the notions of time and temporality in the study of organizational change. They argue that as a dimension of organizational change, time and temporality are often assumed to be self-evident but are rarely explained and often underplayed. They suggest that while there is a paucity of research in this area, implicit notions of time pervade organization studies and are central to models and frameworks that set out to explain organizational change. Those who view change as emergent or represent change as a punctuated shift in an otherwise stable equilibrium all draw on elements of time as an unfolding tapestry or as noticeable episodes of disruption to an orderly balance of forces. Once attention turns toward conceptualization, the paradox and problems of explaining time gain intellectual momentum making what appears as commonsensical complicated and difficult to explicate through language.

In this book, they attempt to address the important area of time and temporality, especially as it relates to frameworks and studies for explaining change processes in organizations. They provide a selective overview of the debates on time in science and philosophy in clarifying the central arguments and lines of reasoning. The work offers a more detailed examination of key areas of interest for researchers of organizational change that include discussions on the history of time and temporality, especially in studies of work and employment, and how time has become institutionalized and taken for granted in the way that work is managed and controlled in organizations. They unpack the implicit concepts of time that underlies the main theories of organizational change and critically evaluate and comment upon these perspectives. In seeking to address the practical issues of engaging in longitudinal research on organizational change and how these relate to time and temporality, they introduce a more informed conceptual explanation of the temporal dimensions of organizational change and draw connections that have previously remained hidden from debates and theorization. The authors conclude by suggesting an engagement and opening of disciplinary perspectives on time's temporalities, highlighting some of the insights afforded for process theorization:

> We contend that any resolution of the paradox of time would present time as something other than it is (a representational whole captured by language that is aprocessual and ahistorical). Nevertheless, we do see value in engaging with time as a paradox (a paradox that warrants examination and discussion, not resolution). Likewise with temporality, in which combinations of the past, present, and future can be presented in a number of different ways (e.g., structured narratives provide illustrations of casual-temporal embeddedness), each can shed light on understanding processes of change in organizations. From our perspective, there is no one all-encompassing temporality but multiple temporalities, and whereas we propose a particular processual framework. . .we maintain the need for further process developments in theorizing change (Dawson and Sykes 2016, pp. 235–236).

## New Insights: Studying Lived Experiences in Changing Organizations

In developing and refining his approach over three decades, Dawson's work contributes new insights to studies of organizational change in several important ways. First, his work was among the first to strongly critique the dominant "n" step and OD approaches theoretically in seeking to understand change as an ongoing process. His view that organizational change is continuous and is not usefully understood as a series of discrete steps or as punctuated by periods of inertia or a return to equilibrium was a radical departure from approaches at that time. In developing his processual approach, he sought to integrate determinants or dimensions such as the *politics of change,* referring to "the political activity of consultation, negotiation and resistance that occur during the processes of managing change" (2003b, p. 212). This activity may be as a result of activities external to the organization such as competitive, strategic alliances, or governmental influences or to internal influences such as trade union negotiations and conflicts and resistance between groups and individuals working within the organization (2003b, p. 212). The *substance of change* is "seen to consist of a number of interlocking factors that are related to both the material and social aspects of the change in question" (2003b, p. 214). It is comprised of two components: first, the scale and scope of change initiative, from small discrete to large and radical change, and second, the defining characteristics or the "labels attached to the change projects and the actual content of the change in question" (2003b, p. 214). This group also includes how change is viewed by organizational participants. The *context of change* refers to the external factors such as international competition, social or environmental conditions, or technological innovations, and the internal factors include Leavitt's (1964) fourfold classification of human resources, administrative structures, technology, and product or service and an additional factor added by Dawson comprising the history and culture of an organization (Dawson 2003b, p. 214).

## Unfinished Business: Time to Think Again

Dawson's major contribution and ongoing legacy are in developing a comprehensive, multi-perspective, processual approach that is theoretically and methodologically robust and that is practical enough for use by practitioners. His processual approach provides a major contribution in extending studies of organizational change beyond "n" step and organizational development approaches. His work along with that of Pettigrew is most commonly associated with processual approaches to organizational change and is cited extensively in articles and textbooks used in studying organizational change and management of change. His textbook on organizational change and innovation is widely used and means that a growing number of students are becoming familiar with his work.

It is worth noting that his theoretical and methodological work on process anticipates many of the issues that are being taken up by leading organizational

scholars in a growing body of contemporary research using process approaches to organization associated with groups like the European Group of Organization Studies and Process Research Organization Symposia. His work can thus be said to have continued endorsement both by leading organizational scholars and students alike. His ability to articulate in accessible language, deep theoretical concepts, and methodological rigor, in ways that make them workable for practitioners, is no mean feat. It no doubt stems from his roots and upbringing in St George and his early love of engaged, situated ethnographic research that explores why it is that people do the things they do.

# Daniel R. Denison: Corporate Culture Teacher, Scholar, and Consultant

# 26

## Levi R. G. Nieminen, Robert Hooijberg, and Lindsey Kotrba

### Abstract

Daniel R. Denison's career sets a high bar for the impact a scholar-practitioner can have through his or her work. As a teacher, scholar, and consultant on the topics of organizational culture and leadership, his contributions have shaped our current understanding and practices for how to measure corporate culture and "bring it to the bottom line" of business performance. His work has gone a long way to push the study of organizational cultures beyond the ivory towers and equip business leaders with the tools and insights needed to make a real difference in the organizations they lead.

### Keywords

Organizational culture • Corporate culture • Leadership development • Culture survey • Culture measurement • Organizational climate

## Introduction

Daniel (Dan) Denison's contributions to the understanding of organizational change follow from his research on the impact that corporate culture has on business performance. That research foundation served as a platform for applying those ideas in many different ways: teaching MBAs, PhDs, and executives at the University of Michigan from 1987 to 1999; teaching executives at IMD Business School in Lausanne, Switzerland, from 1999–2016; and through the creation of his own global firm, Denison Consulting, starting in 1998. His work has been influenced by many factors ranging from his early education and his scholarly research, to the corporate executives he worked with, to the friends and colleagues he worked with in client organizations, the consulting world, and the institutions where he spent his career.

## Influences and Motivations: From Multidisciplinary Roots to Scholar-Practitioner

Dan's early academic years provided a strong multidisciplinary perspective, combining his interests in sociology, anthropology, psychology, and business. He completed his undergraduate work at Albion College in 1973 where broad exposure to everything from survey research to lab studies sparked a keen interest in the logic and methods that are useful for making your point in the social sciences. Throughout his career, Dan generally ignored the idea that the scholarly disciplines should compete for supremacy and instead looked for ways to embrace a practical, multidisciplinary, problem-focused orientation. From this vantage point, each of the different perspectives he discovered always looked useful and complementary.

Dan's undergraduate years were also strongly influenced by close relationships with several of his professors. Their mentorship quickly helped him to see an academic career and life as an attractive possibility. One of his undergraduate psychology professors, David K. Hogberg, not only inspired him in class but also invited him to give guitar lessons to his 10-year-old son Daniel. A cold beer with Dave after each week's lesson became a tradition that helped Dan start to uncover some of the mysteries of academic life. Another psychology professor, Frances Lucas, held her senior seminar in her living room each week. Dan always loved talking with Fran, especially one winter evening when the three other members of the seminar all fell asleep! An Albion sociology professor, Robert D. Cooper, was the one who most strongly encouraged Dan to go to graduate school. He even personally drove Dan down to his alma mater, Kent State University, to meet the faculty.

Dan's master's thesis at Kent in 1974 examined the research on community power structures and noted how the conclusions reached about the elitist and pluralist perspectives were as much about the theory and methods used to frame the research questions as they were about the phenomenon itself. This perspective – that theories and methods provide powerful lenses through which to view the phenomenon – can be seen clearly in Dan's later writings, especially in his well-known *Academy of Management Review* commentary on the culture-climate debate (Denison 1996).

Dan spent the next phase of his academic career at the University of Michigan. He started as a research assistant at the Institute for Social Research (ISR) in 1977 and then joined the PhD program in organizational psychology (1979–1982). After graduating in late 1982, he became an assistant research scientist in ISR and assistant professor in psychology (1983–1986). In 1987, he joined the organizational behavior faculty in the business school (1987–1999).

His first few years at ISR played a strong role in shaping his career. He got to see a number of world-class scholars in action, and delighted in walking the halls on the way to and from the café each day, exploring the world of empirical social science that was unfolding around each corner. He even got to know several of ISR's founders, including Rensis Likert and Angus Campbell, and was deeply influenced by the history of how they had worked together as a small, entrepreneurial team to develop empirical social science in the post-WWII era. Dan's first organizational behavior course was taught by Edward E. Lawler III and his second by Robert L. Kahn, who taught his seminar winter term 1978 from the page proofs of the second edition of Katz and Kahn's seminal text, *The Social Psychology of Organizations* (1978). He also had the good fortune to learn organizational research from Rensis Likert and David G. Bowers while working with client organizations doing *Survey of Organizations* projects at ISR. This gave him great practical experience doing large survey projects with corporate clients and was very influential in shaping his perspective on organizational culture.

In the early 1980s, with unprecedented competition from Japanese manufacturers and the publication of the business world's first best seller, *In Search of Excellence*, by Tom Peters and Bob Waterman, the new interest in organizational culture proved to be a compelling way to frame his research agenda. His 1982 dissertation research pieced together a sample of 34 companies that had good representative survey samples of the people's perceptions of their work environment that could be aggregated to the organizational level. Fellow ISR colleague Gerald H. B. Ross taught Dan the rudiments of financial analysis so that he could do one of the first "linkage" studies of the impact of culture on business performance. One of the important findings from this work was that the aggregated data on organizational characteristics, like organizational climate or culture, were better predictors of the companies' *future* financial performance than they were of *current* financial performance. More conventional measures of leadership or employee satisfaction were good predictors of current performance but appeared to have a shorter lag time than the organization-level measures. From this set of findings, Dan observed the power of organization-level measures to tap into constructs that seemed to have much more momentum and inertia. With the encouragement and advice of Stanley Seashore and Richard Hackman, Dan added a set of case studies to help explain these quantitative findings and wrote up this combination of results in his 1990 book, *Corporate Culture and Organizational Effectiveness* (Denison 1990).

After finishing his dissertation at the end of 1982, Dan took a faculty position at ISR as an assistant research scientist and began teaching in Michigan's organizational psychology program. After 4 years and an extensive job search, he moved to the Ross School of Business at the University of Michigan in 1987. Working alongside

colleagues in finance, marketing, and strategy further broadened his multidisciplinary perspective. Learning how to teach executives and MBA students was challenging and stimulating and helped to build Dan's experience in translating the practical implications of his work for managers and executives. Teaching in a large executive program for Ford with regular trips to teach in Europe, and then living in Tokyo with his wife and children while working with Ikujiro Nonaka at Hitotsubashi University, were important life experiences that helped to add a global perspective to his work.

This phase was a strong growth period in Dan's career. He found wonderfully stimulating collaborations with numerous colleagues – Karl Weick, C.K. Prahalad, Noel Tichy, Stu Hart, Jane Dutton, Lance Sandelands, Jim Walsh, Bob Quinn, Kim Cameron, and Claes Fornell, among others. He also published several new culture-performance studies that provided the foundation for developing his own culture model and survey method.

Dan also found a number of uphill challenges. It was becoming clear that it would be difficult if not impossible to fuel a robust program of comparative organizational research within the traditional academic setting. The funding alternatives were limited, and narrow academic publication pressures were strong disincentives for pursuing a large-scale research agenda. Leading scholars such as Edgar Schein and Joanne Martin also advocated the exclusive use of qualitative methods and were strongly opposed to quantitative methods for studying culture. So, Dan's approach of studying whole organizations, over time, as single "data points" in a way that combined qualitative and quantitative methods with a clinical, interventionist perspective did not receive much support. Over time, Dan's approach certainly helped to usher in the wider acceptance of the mixed methods approach that dominates the field today. Notably, Edgar Schein has since commended Dan's work and perspective, writing the foreword of his 2012 book, *Leading Culture Change in Global Organizations: Aligning Culture and Strategy.*

In 1998, Dan teamed up with Bill Neale to form Denison Consulting, LLC. The firm was a practical way to scale the application and impact of the culture and performance work in the business world and also provided the means to build the depth and scope of their research program. A leadership 360 assessment was soon added to the culture survey, and over the next few years, the firm developed the delivery capacity and the consulting support to build a successful business. These two founding partners led the firm together for over a decade. Today, the normative databases that the firm has amassed allow for comparisons with over 1000 organizations and over 15,000 leaders, with millions of people using the surveys in over 50 different languages all over the world. The firm has grown and developed a successful consulting practice over its two decades, while also expanding its global reach and client base. Denison Consulting opened an office in China in 2005 with Bill Mobley and more recently expanded its European presence by opening a second HQ in Zurich with Karl-Heinz Oehler (2014).

In 1999, the year after founding Denison Consulting, Dan joined the faculty of the International Institute for Management Development (IMD) and moved to Lausanne, Switzerland. His teaching at IMD focused primarily on executive programs for corporate clients, working closely with companies like Shell, Canon, Dow, Henkel,

Sun Microsystems, Swiss Re, Philip Morris, Air France, Metso, Konecranes, Allianz, and Deloitte. His teaching often focused on issues of culture change and leadership development, and his favorite programs were always those designed as learning interventions intended to drive strategic change. His close relationships with faculty colleagues- including Peter Lorange, Vladimir Pucik, Bill Fischer, Phil Rosenzweig, Robert Hooijberg, Shlomo Ben-Hur, Tom Malnight, Peter Killing, Paul Strebel, Joe DiStefano, Martha Maznevski, Maury Peiperl, Bala Chakravarthy, and many others-provided stimulation, insight, challenge, and friendship at every turn. Over 15 years of splitting his time between being a professor of management and organization at IMD *and* chairman of Denison Consulting set a unique context for refining the practical message and impact of his culture research. The collaborations that grew from IMD also helped to create a robust program of cross-cultural research, as well as a continuous stream of truly global case studies.

Over time, the need to respond to a wide range of client-driven business imperatives broadened the scope and depth of the research and commercial applications to include mergers and acquisitions, leadership transitions, turnaround and transformation, strategic alignment, and leadership development. Dan's work and writing in each of these areas took on a distinctly practical and action-oriented viewpoint, centering on how to bring people and culture to the center point of executives' discussion about their businesses.

## Key Contributions: Bringing Culture to the Bottom Line

The central theme of Dan's work is the impact that organizational culture has on business performance. The early studies showed that survey data measuring perceptions of participative management practices was a good predictor of subsequent levels of profitability and growth (Denison 1984, 1990). Denison and Mishra (1995) extended this work through a series of case studies and the development of a theoretical model. This framework, which came to be known as the *Denison model*, specified four key cultural traits (or characteristics) of high-performing organizations: a clear sense of the *mission*, the ability to *adapt* to external forces, a high degree of *involvement* of the people, and strong mechanisms for internal *consistency.*

Denison and Mishra (1995) provided an initial test of the theory, correlating survey data with the financial performance of over 200 companies. Their study indicated a direct positive relationship between each of the culture traits and subsequent levels of performance, while pointing to the unique importance of the stability traits (*mission + consistency*) for profitability outcomes (e.g., ROA) and the flexibility traits (*involvement + adaptability*) for growth outcomes (e.g., sales growth). Subsequent studies have built on these findings, studying the culture trait-performance linkages across a wide variety of settings. For example, Gillespie, Denison et al. (2008) found that the culture traits were positively related to customer satisfaction ratings in home construction companies. In a longitudinal test of causal

sequence, Boyce et al. (2015) demonstrated how the traits *preceded* customer satisfaction and vehicle sales in car dealerships.

More importantly, Denison and Mishra's (1995) theory also specified the importance of *balance* among the traits, reinforcing how the culture positions an organization to effectively manage the competing demands of creating internal alignment and external adaptability. Kotrba et al. (2012) provided empirical support for this idea, demonstrating how the culture traits interact to predict the sales growth and market-to-book ratio of public companies (see also Yilmaz and Ergun 2008). Denison et al. (2014) provided an overview of the linkage studies using the Denison model and noted the importance of this work as part of the proliferation of published studies in the 2000s. As noted in Sackmann's (2011) comprehensive review, the number of published culture-performance studies grew fivefold in the decade!

This proliferation of culture-performance research would certainly not have occurred if it were not for significant advances in the quantitative measurement of culture. As summarized by Ashkanasy et al. (2000), culture surveys have sprung up with a wide range of purposes, from the broad categorization of companies into a typology, to measures of value congruence and fit, to dimensional measures used to describe a culture, and to dimensional measures that assert more narrow predictive purposes, such as *safety* culture, *innovation* culture, *service* culture, and so on.

Dan's development and validation of the *Denison Organizational Culture Survey* (DOCS) as a broad predictive measure of effectiveness made several important contributions to this domain, the most fundamental being the establishment of a basis for comparing across organizations and across studies. In this way, the DOCS was one of a handful of instruments that added a nomothetic layer to a previously idiographic domain. The competing values framework (CVF) is another important measure for nomothetic research (Quinn and Cameron 1988; Quinn and Rohrbaugh 1981), possessing a number of similarities with DOCS and some key differences too. One key difference is that the CVF produces *types*, whereas the DOCS produces *profiles*. The preponderance of evidence using either instrument has shown that the dimensions of culture are positively correlated, therefore rejecting the idea of orthogonal culture types (Hartnell et al. 2011). At the root of Denison's work is the principle that it is not only possible for organizations to be *both* stable *and* flexible, internally focused *and* externally focused, but that *this* appears to be essential for high-performing organizations!

Thus, the DOCS is one of the few culture effectiveness measures that continues to survive the test of time. Denison et al. (2014) published a review of nine instruments of this type, finding that most had "come and gone" with little empirical testing beyond the initial publications. In comparison, research on the DOCS has accrued substantial validity and reliability evidence, including factor analytic support for the proposed theoretical model, evidence for aggregating individual perceptions as a good measure of team- and organization-level culture, and support for the proposed linkages between each of the constructs and organizational performance. In addition, the measure has been tested extensively across national and societal boundaries, and the central thesis of the traits' linkages to organizational effectiveness has been validated in Spain, Russia, Turkey, China, and several other countries in multiple

studies (e.g., Bonavia et al. 2009; Fey and Denison 2003; Denison et al. 2003; Yilmaz and Ergun 2008).

One of Dan's most widely cited scholarly contributions was his 1996 *Academy of Management Review* article, "What is the difference between organizational culture and organizational climate? A native's point of view on a decade of paradigm wars." This article was later shown by Asif (2011) to be "seminal across academic disciplines from its appearance" (p. 454). Asif noted that the citations of this article continued to rise more than 10 years after it was originally published.

This article contrasted the culture and climate perspectives as they had been presented in the academic literature and argued that "the primary difference between these two literatures is not a substantive difference in the phenomena under investigation, but rather … a difference in the perspective taken on the phenomenon" (p. 621). The climate perspective, he argued, is grounded in a Lewinian theory of social context, which assumed that the individual and their environment were separate entities $[B = f(p,e)]$. In contrast, the culture perspective is grounded in a social constructionist theory of social context in which "self and society are two sides of the same coin" (Mead 1934).

Dan also argued that these two perspectives were quite complementary. The climate perspective is very useful when trying to understand the impact that an existing context has on an individual, whereas the culture perspective is a much more useful theory when trying to explain how organizational contexts are formed over time. In classic form, Dan's work grounds these two complementary perspectives both in the deep sociological theorizing of Anthony Giddens on "structuration" and in the practical old adage, "what goes around comes around."

Dan's treatment of these issues was the perfect multidisciplinary "nudge" to a debate that was highly entrenched. And its message resonated! Armed with this insight, the pragmatist can locate a complementarity in the two perspectives and help create a richer understanding of the social context of organizations and the important impact it has on business outcomes. And this is exactly what Dan has done.

Another clear contribution of Dan's work focuses on the process by which organizations can use assessment, dialogue, and action learning to stimulate change on a cultural level. In his scholarly writing, Dan frequently used a mixed methods approach and told the culture change stories of the clients whom he consulted to. Among others, these case studies have chronicled the culture transformations of Procter & Gamble and Detroit Edison (Denison 1990); Domino's Pizza, GE, and Swiss Re (Denison et al. 2012); and the Metropolitan Transportation Authority – New York City (Nieminen et al. 2016). In each of these stories, the executives became more aware of the culture and how it inhibited or supported the business strategy. They came to view the two things – culture and strategy – as highly interdependent. From there, the effective leaders were able to challenge the old habits and assumptions and build alignment around the new ones.

These cases underscore the challenge that executives face when trying to make culture change stick and the wide range of tactics they use, whether it was Dave Brandon trying on the uniforms worn by the Domino's employees who make the pizzas, Matti Lehtonen sending his engineers into the operating room (Denison et al. 2012), or

Carmen Bianco spearheading a program to upgrade the New York City subway system (Nieminen et al. 2016). Each case helps to reject the notion that "the business" and "the culture" are separate matters, or as Dan recently wrote in response to Lorsch and McTague's HBR piece in April 2016:

> After twenty years working with "culture change" projects, I'd be a little careful about positioning culture as an automatic result of fixing the business – it's probably more helpful to recognize culture as an essential ingredient of a learning process that is necessary to make sure that those business fixes *stick*. (Denison 2016)

## New Insights: Perspectives on Culture Change

For the past 25 years, first at the University of Michigan and then at IMD, Dan's teaching efforts have been primarily devoted to corporate executive programs. In this context, there is often a high degree of overlap between teaching in executive programs that are designed as a catalyst to build alignment around strategic change initiatives *and* the culture transformation work of his consulting firm. But this opportunity to work with literally dozens of leading corporations each year to create learning interventions has been a powerful influence on the way that Dan's teaching and consulting have evolved. The opportunity to apply the culture framework in so many real-life companies has also provided a number of new insights that have crystallized over the course of Dan's career: (1) the psychological limits that organizations place on their opportunities for action, (2) the contrast between what executives think and what they actually do, (3) the recognition that intervention is actually an advanced form of diagnosis, and (4) understanding that sometimes you are better off changing behavior first and assumptions later. Undergirding each of these, Dan describes the profound difference between the lofty aspirations of strategy *formulation* and the hard work of strategy *implementation*.

*The psychological limits to opportunities for action*. Dan's experience has taught him firsthand how a discussion of the results of a culture survey with executives often builds a high level of consensus and insight regarding both the issues that hamper their effectiveness and the many alternative paths to addressing these issues. At a basic level, this means that the executives always need to prioritize the issues they will address and the actions they will take. But what really stood out to Dan are the psychological limits they face to change. The psychological limits are formidable at the individual level, but they are even stronger at the group or the "tribal" level.

Dan described a clear example of this in a European bank where the various business units experienced high levels of empowerment and invested a lot in the development of their people. There was, however, little collaboration among the business units, and the CEO felt that many opportunities for value creation were underutilized or even ignored because of that. At a cognitive level, everybody understood the need to address these cross-boundary value creation opportunities. Emotionally, however, people were really attached to their freedom to operate and to run their business the way they thought best. Each of the business units was relatively successful on their own, *so what is the problem*? All the talk was good, but

for the next 2 years, Dan observed nothing change. This was partly because of the individual attachment to the freedom to operate their own way, but this was significantly strengthened by the tribal feelings in each of the business units. Each business unit had done a great job of creating a strong culture, and people felt much more strongly attached to their "tribe" than to the bank. That created a psychological boundary that took a long time to transcend.

*It is not about what executives think but about what they do*. Dan has observed that far too many organizational culture programs get stuck in thinking and talking rather than doing. One dynamic Dan has seen many times is an overemphasis on the "process" of the change (e.g., the process of how an organization moves from diagnosis to alignment on key priorities, communication plans, etc.) rather than the substantive actions themselves. Dan's perspective is that while the process is clearly important, it should be balanced by a heavy emphasis on action. Big, broad action plans can also be an obstacle to progress. In their drive to show employees that they take the survey results seriously, Dan has seen how many executives will develop big, bold, broad-brush plans. Of course, the bigger and bolder the plan, the more discussion and disagreement they will have, and hence, the less likely it becomes that anything happens. Dan's insight here is that, in culture change, smaller targeted actions that are repeated many times (such as in habits and routines) are an important complement to a few of the big, bold actions that executives often seek.

*Intervention is diagnosis*. Dan's perspective is that each step in the implementation process offers an opportunity for a deeper understanding of the organization's culture. Defining the targets of intervention in the action planning process always says a lot about how the organization typically goes about solving problems. As an example, Dan described one major petrochemical company that he worked with, in which the culture results showed low adaptability and high consistency. After extended discussion, the executive team decided that their key intervention should be to train more six sigma black belts! *Why?* Because that was what they knew how to do! That was how they approached the change process in the past and that had yielded positive results for them. With a great deal of negotiation, Dan's team managed to persuade them to focus at least some of their six sigma projects on customer-facing targets for improvement.

Dan has suggested that, as the implementation process unfolds the force field of momentum and resistance that emerges, says a lot about the organization's culture. The reaction to both the superficial and the deeper aspects of change reveals a lot. He warns that superficial acceptance of change structures and processes should not be confused with change itself. Sometimes accepting the process can even be a clever way of resisting the actual change. Finally, Dan's perspective underscores the importance of *seeing which changes stick*. It is hard enough to initiate change, but it is far harder to sustain it.

*Sometimes it is better to change structures and behaviors first and assumptions later*. A lot of work in organizational culture change focuses on changing the assumptions people hold, in the belief that once assumptions change, behavioral change will follow. However, Dan's experience has taught him that this does not always happen. More often, extensive discussions about a set of culture results may

open people's minds but, in the end, still not lead to a change in people's basic assumptions. Dan articulates how sometimes what you need to do is to change the structure and processes in such a way that they force different behaviors. Once forced to display different behaviors over an extended period of time, then assumptions will change as well. Reflecting on the European bank example described earlier, Dan described how after 2 years of no progress, a new CEO was appointed. Her approach to culture change was radically different. She changed the governance structure, the bonus system, the strategy development process, and the performance measurement system all to promote cross-boundary collaboration and value creation. And that did dramatically change the culture and did so in less than 2 years.

Thus, another key lesson that was nurtured by Dan's experience was the insight that successful "culture" change usually occurs through a realignment at three levels: the *mindset* of individuals; the *behavior* of organizational members, especially the leaders; and finally, the logic of the organizational *system* that links these together. Without all three of these components, culture change seldom sticks. This was one of the greatest learning points of teaching in corporate executive programs at IMD, where Dan got to work with many companies over a period of years and, in some cases, longer than a decade. For a keen student of culture change and leadership development, that has been the best vantage point of all.

## Legacies and Unfinished Business: An Empirical Foundation for Culture Intervention

From early in his career, Dan pushed the boundaries of traditional thinking on organizational culture. He developed and validated a quantitative measure of the construct at a time where qualitative measurement was king and, in doing so, blew open the door to research demonstrating the linkages between organizational culture and organization-level performance. Today, there is an ever growing body of literature that is becoming more and more sophisticated in how it is exploring this linkage (e.g., Sackmann 2011; Boyce et al. 2015). As a thought leader, Dan has helped pave the way for this body of research, but beyond, he has helped take what had been a largely academic construct and made it not only relevant but critically important for business.

While today it is common to see daily blogs and popular press business articles discussing the importance of organizational culture, not too long ago, it was either largely unheard of in the C-suite or quickly dismissed as too "touchy feely." But as Dan straddled the academic and management worlds, he provided an actionable and valid framework and became a leading force for bringing organizational culture into the mainstream. Thus, part of his legacy can be read in leading headlines and heard through a CEO like Richard Anderson of Delta as he describes how "The culture here at Delta . . . is one the reasons why the airline has been so successful."

With the linkages to performance well established and the demand for culture change going through the roof, what does Dan see as the next set of boundaries that need to be pushed? For Dan, his entire career has been driven by his passion for

improving the performance of organizations. So perhaps unsurprising, his attention is on transformation and what we as a field have to say to organizations about how and where to intervene to drive meaningful change.

From Dan's vantage point, the field has not evolved all that much in this regard. He would agree that organizational development is better understood and more commonplace today, that thought leaders such as Kotter and Collins have made outstanding and admirable contributions to our understanding of change management, and that organizations are complex, dynamic, and nested labyrinths, less like an iceberg, and more like a river full of ice cubes that are melting and reforming as they flow to their destination. He would also point out that, if the discipline of organizational change is to really evolve, we have to get a lot less abstract and a lot more practical. We need to be disciplined in tracking change initiatives over time and a lot more specific in terms of guiding organizations toward meaningful action.

So, knowing that there is a lot more work to do in this area, where should we "stick the crow bar" to gain leverage that will drive change? On this point, Dan indicates that we should "assess broadly and intervene narrowly." Diagnostics are content focused and provide information about where to look and what to look for. It is very important that organizations cast this wide net so that they understand what is most important. But from there, Dan describes the potential in focusing interventions more narrowly – on the "ice cubes" so to speak. A lot of his recent work has done this through the lens of habits and routines. As a field, we have struggled to figure out the fundamental processes that shape work. From Dan's perspective, to truly intervene, you have to understand employees' perspective at a very local level and at a systemic level. How do things actually work, what are the routines? Each of these routines, at a local level, has their own values and habits. Without peeling back the layers of each of those specific onions, it will be difficult to drive different behaviors and to implement new and "sticky" ways of working together that change the dynamics at the system level.

To ensure that all of the ice cubes are floating down the same river, we need to make meaning at the level of the river. We absolutely have to understand what makes the business tick as a whole and where it is headed, but we also have to recognize that the point of intervention is not only in the mission and values posters hanging on organizations' walls. It is much more narrow and rooted in a depth of understanding around how people do what they do in their unique contexts. You need action at a local level and from Dan's perspective, to do that, you have to be there. In his words:

> Specifying dysfunction is easier than understanding how things function; and implementing change is hardest of all. But that is what needs to be done, and we need to be thinking a lot more about how we create mechanisms and support organizations to understand and intervene at many local levels, on a large scale, and in an aligned way. (D. Denison, personal communication, October 17, 2016)

In short, Dan's perspective is that understanding the link between meaning and functionality is still the most powerful combination and is something that organizational development professionals should be feverishly trying to better understand.

Dan points out that corporate practice also has a long way to go. At last year's Academy of Management, the time series culture-performance linkage study mentioned earlier, by Boyce and colleagues, received a major award from the *Journal of Organizational Behavior*. That was in large part because this study is one of the few studies ever that even addresses any of the issues of cause and effect. From Dan's perspective, this should signal the beginning of a new era of research, rather than the final statement on an old era of research. To pursue this, one of the major untapped resources in the change field is the hundreds of major corporations that collect abundant employee data and performance metrics but, for some strange reason, have never taken the time to connect the dots and try to understand the impact on the business. *Why?*

For this purpose, Dan cites corporations that have a retail, hotel and restaurant chain, franchise, or brokerage structure as exceptionally attractive. But unfortunately, the status quo often remains an employee engagement survey process that is relatively disconnected from business practice and poorly supported by an effective action planning process. Perhaps it is time to expect more from our corporate colleagues and to use the influence that we have to move things forward.

Unquestionably, Dan has helped define and shape the field of organizational culture and the key role it plays in the change process. His thought leadership across both academic and practical pursuits has shaped the work of many and has undoubtedly left a lasting legacy. Looking to the future, his passion for driving organizational transformation will continue to push boundaries and will shape our perspective on organizational intervention for decades to come.

# Kevin J. Dooley: Complexity – Simple and Useful

27

Glenda H. Eoyang

**Abstract**

Kevin Dooley began his career as an industrial engineer and continues his work as a designer of complex human and information networks. His curiosity about how change emerged over time led him to explore complexity at the edge of many fields, including mathematics, philosophy, physics, and computer science. His passion for pragmatic applications led him to engage in complex patterns of individual and institutional behavior as it emerged in the real world.

Kevin pioneered the use of inductive quantitative data analysis to understand options and influence decision-making and action in complex social, business, and natural environments. Rather than positing a hypothesis, then testing it with data, as most change researchers usually do, Kevin analyzed data as it was generated and looked for the patterns. He then used those patterns to understand and influence change in complex human systems. He used the principles of complex adaptive systems sciences to see, understand, and improve patterns in teams, organizations, and processes.

At various times in his career, he was engaged with total quality management, process analysis and improvement, and supply chain management. He held the first joint chair in engineering and business at the Arizona State University and continues to explore the sometimes chaotic intersection between physical and social systems. His master work is still a work in progress. Currently, he leads The Sustainability Consortium, an international network of organizations that captures, stores, and reports information about the carbon footprints for supply chains of consumer products.

## Contents

## Introduction

As the twentieth century drew to a close, many scholars and practitioners of organizational sciences drew from the language of complexity to describe the change they observed and tried to influence. Most of them found it easy to use the metaphors and language of the field but few reached into the technical methodologies to inform their theory and practice. Kevin Dooley did and continues to do so.

## Influences and Motivations: Spanning Boundaries

I met Kevin Dooley at the first Chaos Network Conference in 1992. An industrial engineer, he was a bit of an outlier in the group of Jungian psychologists, artists, industrial psychologists, economists, and budding management gurus. This motley crew had been brought together by Mark Michaels (2000) to explore applications of the new sciences of chaos and complexity to human behavior. These new, nonlinear sciences were challenging long-held expectations and assumptions of both physical and social scientists around the world (Gleick 1987). The one thing this group had in common was that we were exploring the applications and implications of these new sciences on our work with people, institutions, and communities. We hoped to gain new understanding about how change happened in human systems and how we could make better choices to support and influence it.

Kevin quickly became a magnet for those of us in the Chaos Network who wanted to understand the physical sciences behind the social sciences of complex human systems. He knew quantitative methods, and he was creative and patient enough to help us learn to see the secrets in the numbers. He, on the other hand, was exploring the social sciences behind the physical phenomena that had fascinated him since childhood.

In particular, Kevin was perplexed at that moment by Deming's System of Profound Knowledge (Deming 1986). He approached that challenge with the same precision and care that had served him well in analyzing sports teams, popular music, manufacturing systems, and unpredictable processes throughout his life. But this new and more ambiguous content required a different kind of conversation. His questions about the rigor and underlying dynamics of human systems challenged our long-held assumptions about how individuals and organizations functioned. Our questions helped him move into the emergent world of patterns and unpredictable possibilities, so familiar in the world of social and organizational change. In that first Chaos Network gathering, Kevin stood, as he often has, at an intersection of mathematical analysis and emergent patterns of human choices and behaviors.

He has used his gift of boundary spanning to serve colleagues, clients, and students throughout his career. This chapter explores some of the applications and implications of Kevin's work at the data-based boundary between controlled and emergent phenomena of dynamical processes and human systems change. Before we begin that journey, though, it's important to review the singularity of his moment in the evolution of organizational theory and practice.

## Key Contributions: Inductive Research

### The Age of Complexity

Since the birth of Cartesian rationality in the seventeenth century, physical sciences focused on understanding change well enough to predict and control it. At the turn of the twentieth century, Frederick Taylor created an approach to scientific management that took the certainty of physical sciences into the corporate world. By the mid-twentieth century, Taylor's methods of performance management (Taylor 2015) had given way to strategy. Less precise, but almost as predictable and control oriented as Taylor, strategy focused on analyses and structures of decision-making. The promise was that disciplined strategic thinking could optimize decision-making and action in the context of emerging industries and expanding economies (Kiechel 2010). Deming stepped into this world of expert-based action with methods to reduce variation in processes and products to continuously improve quality (Deming 1986). He and others imported process improvement strategies into human interactions at many scales. In social and management sciences, the theory and practice of change were moving ever closer to total control, predictability, and reliability.

At the same time, in the communities of the physical sciences, discoveries were moving in the opposite direction. Many different fields in the physical sciences were

discovering systems that could neither be predicted nor controlled (Lorenz 1963; Prigogine 1989; Bak 1990). Chaos theory, complexity science, and multiple applications of nonlinear dynamics were challenging deterministic assumptions and expectations across a wide range of contexts. The methods that drove prediction and control in the world of mechanical engineering were opening up methods and mathematics to reveal a new, but somewhat knowable, uncertainty. Fractals, dynamical networks, attractor patterns, and bifurcation charts revealed a new quantitative reality that was patterned, but not predictable (Boulton et al. 2015).

Outside the predictable theoretical frames of business and the insights into emergent natural phenomena, intuitive management practitioners encountered and responded to unpredictable situations all the time. In spite of the advice from expert consultants to ensure stability, predictability, and control, some decision-makers had the knack of seeing, understanding, and influencing social patterns as they emerged. Entrepreneurs, traders, and innovators ignored management pundits and turned uncertainty to their own advantage. The new sciences of chaos and complexity promised objective confirmation of their nonconformist approaches. It gave solid scientific evidence for the inherent unpredictability of life in teams, organizations, and communities.

Deming's System of Profound Knowledge was one doorway between the reliability of systems under control and the innovation of complex adaptive systems. Kevin's preoccupation with measurement of human performance and changes in time series prepared him perfectly to step through that doorway and bring many others with him. His deep insights into the dynamics of change and his incessant curiosity about patterns of behavior prepared Kevin to help academics and practitioners understand the unknowable and act upon the unpredictable.

Kevin's most recent adventure as leader of The Sustainability Consortium integrates his complex history of theory and practice. It is a collaboration of more than 80 companies working together to understand and intentionally influence the carbon footprints across entire supply chains of consumer products. In leading this complex program from its inception, Kevin has drawn from his history of inductive practice to meld predictable and emergent, quantitative and qualitative, and theories and practices into a massive social, corporate, technical innovation.

## It Is About Time

Even as a young child, Kevin's interest in change was linked to a narrative of everyday life. At 6 years old, he began listening to professional sports on the radio. As luck would have it, this was 1967, and Kevin's Chicago Blackhawks won hockey's Stanley Cup. What began as a persistent curiosity emerged over the season into a story of triumph over adversity. The next year, baseball captured his attention. Again, game by game the season unfolded. Predictions gave way to reality as the season progressed. His mother brought him magazines filled with statistics and predictions for his favorite teams, and he was hooked. Unlike other fans, his interest was not just in following the winning team. Kevin was more engrossed with the fact

that the experts could make predictions (sometimes right and sometimes wrong) about the future, based on the players' performances in the previous season.

In 1969, the Chicago Cubs were on top of the world. Everyone expected them to win their pennant race, but the Cubs fell apart late in the season and lost first place to the upstart New York Mets. The loss was disappointing, but what really appealed to Kevin was the evidence of the evolving story. It didn't occur quickly. The surprises emerged over a period of time, and as they accumulated each one contribute to the horrible, emerging pattern of the outcome. Prediction, emerging surprises, data, and outcomes, these formed the basis of Kevin's later research and work.

Working for and reading daily newspapers, following multiple sports, working in political campaigns, and tracking music at the top of the charts were all fun distractions for Kevin as he grew up in the city of Chicago. They were all storylines consisting of streams of data that emerged day by day at the intersection of prediction and surprise.

Statistics were important to him, but stats changing over time were fascinating. In his sophomore year of high school, Kevin found his way to the Chicago Public Library and started reading books about time. As diverse ideas sparked his interest, he kept exploring various concepts of time. As he read, he encountered a complex conception of time that included not just mechanical and analytical time but many other manifestations as well. Change in time – its causes and consequences – became even more intriguing in Kevin's serious and playful explorations of reality.

His passion for change over time evolved into an academic program in industrial and mechanical engineering and a research focus on process and process improvement. His interest in data, coupled with computing capacity and artificial intelligence, focused his work on methods of automated process analysis, control, optimization, and learning. At this stage in his work, he used data to recognize when processes changed and to understand why they changed.

Tracking change over time led him to questions about the causes of change, which led him to bachelor's and master's degrees in industrial engineering. Working with Shiv Kapoor at the University of Illinois, Dooley completed his doctoral research, improving process quality by detecting and classifying faults as they occur (Dooley 1987). During his graduate studies, Dick DeVor became an informal advisor, supporting Kevin as he developed a software-based process control system (Dooley 1985). This was the first computer system product of Kevin's career, and it provided both data and income as he got settled into his professional work at the University of Minnesota (Dooley et al. 1986).

## It Is About Quality

Those were the early days of the quality movement, and the intersection of data and process offered opportunities for innovative research and practice. This emerging field became the foundation for Dooley's research and teaching. As an engineer, Kevin used time series data from the real world to explore patterns, causes, and consequences of change over time. Like other engineers, Kevin's methods were

empirical and inductive. In this context, research begins with raw data. Disciplined analysis reveals patterns. Rigorous reasoning leads to hypotheses about the dynamics that generated the data and informed the patterns. Kevin studied many examples of this inductive analytical approach with complex time series data. Some came from artificial intelligence and expert systems, seismographic data to detect nuclear testing, changes in brain waves, and earthquakes. He applied these same methods to detect the causes of changes in physical systems including statistical process control (Dooley 1985), quality improvement (Dooley and Kapoor 1990a, b), and process improvement (Dooley et al. 1986).

While an inductive research method is common in engineering and physical sciences, it is quite different from deductive social science methodologies. Most qualitative, social science methods begin with a hypothesis and design and execute experiments to collect data that will either confirm or deny the hypothesis. As a general rule, social scientists work from such a deductive paradigm. The researcher begins with a hypothesis and then collects and analyzes data to disprove the hypothesis. The inductive approach, Kevin's engineering mindset, moves in the other direction, from data to hypothesis. The differences between this standard deductive method and Kevin's inductive method became a hallmark in his early research and efforts to publish his work. Over time, he developed methods to shape his investigations in inductive practice, moving from data to hypothesis, but follow deductive methods to document and disseminate his findings. In this way, he was able to find a synergy between data and pattern that served him well in both his research and his practice.

Kevin's official connection to the social sciences came through the intersection of total quality and chaos theory. As he worked with causality in complex physical systems and processes, questions emerged about randomness – What is it? Where does it come from? Those questions led to chaos, and chaos led to time series analysis in social systems. The transition from physical to social systems was not simple.

His empirical practice put Kevin outside the methodologies and discourse communities of most social scientists, including those he encountered in the Chaos Network. Discovering hypotheses in data streams was a new and useful paradigm for many social scientists trying to understand the dynamics of change in complex human systems. In 1991, Kevin collaborated with others who shared his questions and methods to found and lead an academic society that focused on quantitative analysis of complex systems, the Society for Chaos in Psychology and the Life Sciences (SCTPLS). This 300-person organization is "... an international forum that brings together researchers, theoreticians, and practitioners interested in applying dynamical systems theory, self- organization, neural nets, fractals, cellular automata, agent-based modeling, and related forms of chaos, catastrophes, bifurcations, non-linear dynamics, and complexity theories to psychology and the life sciences." (https://www.societyforchaostheory.org/). SCTPLS continues to be a source of inspiration and collaboration for Kevin and others standing at this intersection of prediction and emergence in social sciences from psychology to international relations.

In his research program and classes, Kevin studied a wide range of questions at the intersection of data and process intelligence. His diverse studies included evaluating various options for collecting and analyzing data (Guo and Dooley 1992; Dooley et al. 1986). He explored multiple research methods in process performance, including neural networks (Guo and Dooley 1995) and computer simulation models (Vig and Dooley 1993). Each of these projects expanded Kevin's repertoire of change analysis tools and deepened his insights about the complex dynamics of systemic change.

His research questions and mathematical and analytical methods increased in sophistication over time to accommodate more complex challenges. In addition to capturing and assessing information about mechanical processes, Dooley explored the use of data to support prediction and decision support for scheduling (Mahmoodi and Dooley 1992). He took interactions between processes and the environment into consideration with algorithmic approaches to robustness and dispersion (Dooley and Mahmoodi 1992). He also expanded his theory and practice to take past performance into account (Vig and Dooley 1991). Issues of learning and adaptations in monitoring over time also added complexity to his research methods and findings (Dooley and Kapoor 1990a, b).

Multiple factors contributed to the increased complexity of Dooley's work during this period. He shifted from strictly mechanical processes to ones involving human interaction. He considered environmental interactions and historical performance. Improvements in computing capacity and statistical tools expanded the scope and power of his work. Kevin's first work with social systems data dealt with the incidence of teen pregnancy in Texas. He and his colleagues analyzed 26 years of time series data to discern patterns and hypothesize conditions that influenced adolescent childbearing (Dooley et al. 1997).

From the early 1990s (Dooley 1991) through his current work with The Sustainability Consortium, the quality improvement movement has been a context where Kevin consistently made important contributions. As his theory and methods emerged, so did his questions and insights about quality as a science and a discipline. As Kevin continued his work in process analysis in social and mechanical systems, the total quality movement engaged more people with more questions in the field of process analysis and control.

As TQM spread, questions emerged about acceptance and implementation. What began as an interest in inductive analysis of mechanical processes and had shifted to business processes took another turn into an interest in understanding and influencing processes of change in human systems. Over time, questions of total quality moved from the technical analysis of process performance and into the social science realm of people performance. Working with Andrew Van de Ven, Dooley began to see how his models and methods could be used for sophisticated analysis of social processes (Dooley and Van de Ven 1999; Dooley et al. 1997).

Focusing still on total quality management, but considering the changing of the paradigm, in 2000 he wrote about the evolution of quality thinking through three phases from a preindustrial paradigm of caveat emptor, through an industrial paradigm of *quality control*, and a postindustrial paradigm of *total quality management*. In this

paper he went on to explore how environmental factors had driven the evolution of the discipline in the past and to speculate about what the next phase of development might entail, given current environmental factors (Dooley 2000). The quality movement challenged Kevin's assumptions about predictability and randomness in mechanical and social processes, and he ultimately challenged its relevance and evolutionary path to deal with management and manufacturing in the future.

## It Is About Systems

Kevin's inductive analysis focused on a particular kind of change that emerged step by step over time. Patterns in time series data indicated patterns and causes of change in physical and social processes. Focusing on complexity and chaos in processes and process improvement opened questions about larger structures and more complex human systems.

Kevin's encounters with systemic organizational change opened a new line of inquiry. When he encountered individual and organization resistance to change in total quality management projects, he recognized a different kind of change. It was a change that affected systems and systemic structure, not just processes that created or sustained systems.

Technical innovation was another example of systemic change. Insights about innovation could be derived from analysis of time series data, but the change itself influenced and focused on a more complex combination of multiple features and factors. Exploring innovation of cochlear implant technologies, Andrew Van de Ven introduced Kevin to the processes of intermittent and transformative change in innovative complex human systems (Dooley and Van de Ven 1996).

Kevin's focus had been on incremental change in physical processes over time, but working with patterns of resistance and innovation, he became aware of another kind of change: organizational and personal transformation. Such instances of complex, transformative change moved Kevin more deeply into the world of complex adaptive systems applied to the behavior of people and organizations.

In 1999, Dooley and Van de Ven published a paper in Organization Science that laid the groundwork for systematic analysis of organizations and complex adaptive systems (Dooley and Van de Ven 1999). Using diagnostic storytelling, they explored underlying social systems and the kinds of generative mechanisms that could feed into the system performance and culture. It was a departure from his usual inductive method of analyzing data, finding the pattern, and reporting the pattern. He had realized how difficult it was for such inductive research to be published in social science journals. Working with Van de Ven, Kevin did not abandon the inductive strategy, but he moved the analysis and hypothesis building processes earlier in the writing process. Based on his analysis of the data, he generated a hypothesis; then, in the paper, he posed the hypothesis and proceeded to test it (Dooley, personal correspondence with the author 2016). Hypothesis building drew from multiple sources, including the contextual expertise and intuition of the researcher. In complex human systems, the inductive analysis was only the beginning, but a robust

hypothesis required a wider and more subtle range of sources. Specific data sets tell stories, but the stories have to be connected with conceptual understanding of the systems you're dealing with.

Given this expanding view of change at multiple scales, Kevin left the University of Minnesota in 1997 to accept a joint appointment at Arizona State University as Professor of Management and Professor of Industrial Engineering. This new position demonstrated the emerging power of Kevin's brand of research that drew hypotheses from streams of real-time data and enriched and tested hypotheses in the contexts of complex business environments.

Kevin's concern with context and meaning in context led him to the second major software development project of his career and his first patents (Dooley 2007a, b). Working with Steven Corman at Arizona State University, Kevin developed Crawdad (Dooley et al. 2004), a natural language processing tool that used dynamic centering resonance analysis to create a network map of meaning in a given passage of natural text (Dooley and Corman 2004; Dooley et al. 2003). Kevin and his colleagues used the tool to find centers of expertise in resumes of the university faculty (Dooley et al. 2002), to track political discourse (Dooley 2007a), to map organizational discourse (McPhee et al. 2002), and to monitor media messages in times of crisis (Dooley and Corman 2004; Corman and Dooley 2007). Continuing his inductive analysis and expanding it with his systems perspective, he was able to capture, analyze, and explain patterns as they emerged in complex systems of human discourse.

Kevin's work with complex systems continued along with a focus on supply chain management. He collaborated with many different social scientists to focus on a variety of issues as he brought his unique combination of data analysis, conceptual coherence, and rigorous theory building and testing. One of his collaborators was the Canadian Brenda Zimmerman, with whom he dealt with mergers as marriages (Dooley and Zimmerman 2003), structural change in healthcare systems (Zimmerman and Dooley 2001), and healthcare systems as complex adaptive systems (Begun et al. 2003). With Benyamin Lichtenstein and others, he explored complex dynamics of entrepreneurship (Lichtenstein et al. 2006, 2007) and leadership (Dooley and Lichtenstein 2008; Dooley 2007; Jennings and Dooley 2007). He contributed insights about methods of research in complex adaptive systems through his 2000 collaboration on *Organizational Change and Innovation Processes: Theory and Methods for Research* (Poole et al. 2000), which won Best Book Award, International Communication Association, and Organization Communication Division, 2001. In each of these collaborations, Kevin applied his engineering methods and his wide-ranging curiosity to find patterns in data and make meaning of those patterns in the contexts of day-to-day business decisions and emerging theory of complex dynamics.

## New Insights: Making Complexity Useful

Kevin's history with complex process analysis and patterns that emerge from complex time series helped him find ways to influence, rather than control, complex interactions of people and processes. His knowledge of dynamical networks helped

him understand complex, interdependent processes and to establish personal and professional network relationships inside his field and beyond it.

Throughout my own career, Kevin has inspired and informed me. As I explored emergent dynamics of human systems, I experimented with traditional psychological, organization development, management, and political science approaches. None of them captured the surprising predictability of complex adaptive systems. While other writers built on beautiful and powerful metaphorical descriptions from complexity science (Wheatley 1994), I wanted an explanation. I needed to understand the dynamics that generated patterns of complex human behaviors. I was, and remain, convinced that such technical and analytical understanding is the only path to effectively see, understand, and influence complex change. Kevin's inductive methods and engineering rigor provided the foundation I needed to explore this strange world of nonlinear causality. Ultimately, it led to my discovery of conditions for self-organizing in human systems – the CDE Model (Eoyang 2001).

Beyond my own learning, Kevin informed how a whole generation of complexity scholar-practitioners conceived of and interacted with change in complex adaptive systems. His work informed the fundamental principles of complex change, including self-organizing, path independence, scale-free structures, surprising and recognizable emergence, and loose/tight coupling. Kevin's work with The Sustainability Consortium (TSC), the ground-breaking project to document the carbon footprint of supply chains for consumer products, is a great demonstration of these principles.

## Self-Organizing

Complex systems are self-organizing. The TSC team chose not to design rigid process- and knowledge-management systems to control implementation, monitoring, and enforcement of standards. Instead, they designed a self-monitoring protocol. Using the protocol, businesses could assess and improve their own performance and that of their suppliers. The TSC program focused on organizations setting their own standards and monitoring their own performance to ensure commitment and ongoing learning and process improvement to reduce their own carbon emissions.

## Multiple Paths to the Same End

Complex systems can follow multiple paths to the same end. Earlier systems transformation programs, including the Baldridge Award, had perfected protocol-based assessment of processes. Rather than measuring sustainability of processes, TSC focused on outcomes. Earlier, total quality management self-assessment processes had depended on complicated documentation of process requirements. Success and quality were defined as reliable implementation of predefined processes that could be unique in each setting. In contrast, TSC provided guidance to identify and measure the outcomes of those processes. This approach normalized behavior across the system and provided more consistent measures and more accessible comparison

across organizations, industries, and product categories. Actors all along the supply chain could base their decisions and actions on information about common features and functions, rather on processes that were unique to their industry, locale, or position in the value chain.

## Multiple Scales at the Same Time

Complex systems work at multiple scales at the same time. Earlier project sustainability methods had focused on either organization-wide performance or on particular products. Organizations or industries could be identified as problem polluters, or specific products could be targeted for improvement. The TSC members and the team found organizational data to be useful at an industry level, but not precise enough to inform management decision-making. Negative judgements about particular corporations also threatened the collaborative relationships of the many, diverse organizations that contributed to TSC's collaborative group. Product-level measures, on the other hand, were impractical to develop and maintain on such a large scale. To resolve this challenge, TSC collected and reported data by product category. At this level of analysis, information could be consolidated more easily and provide actionable data within the practical constraints of time and resource investments. This strategy also allowed TSC member organizations to focus their efforts, make a difference, and prove their commitment without investing in massive, institution-wide changes.

## Patterned, Not Homogeneous

Complex systems are patterned, not homogeneous. For efficiency, the team needed to avoid collecting and maintaining complete data about every step in the supply chain. To accommodate the unpredictable inconsistency of the system, they could not work with random samples taken from across the process. So, the TSC team focused on most significant differences among carbon-producing processes and identified them as "hot spots." Using published studies, they found the points in the product lifecycle that were most at risk of high carbon emissions. They used standard life cycle analysis techniques, but also drew from other sources of research to provide information about hot spots, which could inform decision-making and action all along the supply chain. They focused the product-group protocol to address those most egregious situations.

## Surprising, but Recognizable

Complex systems generate surprising, but recognizable, patterns over time. Because the team focused on product groups and recognizable hotspots, they also were able to draw inferences from one product category to make hypotheses about other

categories. This sped up the entire project progress by setting baselines for multiple product groups at the same time without losing precision or accuracy that would degrade the usefulness of the program or the reliability of the findings.

## Simultaneous Loose/Tight Control

Complex systems require simultaneous loose/tight control. Because the ultimate decisions were made by the TSC members, the project required careful analysis and management of the complex adaptive human system at the root of the Consortium. Decisions of the entire consortium "were consensus driven, but not consensus bound." A sustainable process had to allow for flexibility of action and maintain coherence among the members over multiple contexts and over time. Initially, trust was a major issue, as many of the members were competitors or regulators to each other. Over time, however, the transparency and even-handedness of the process built sufficient trust for the program to move forward (personal correspondence with the author).

Each of these design decisions emerged from cycles of prototyping, testing, learning, and adapting. Each decision or design alternative is accommodated to the emergent complexity of the system. All of them drew from Kevin's sense of data and data integrity, his theory and practice in supply chain management and dynamical networks, as well as his appreciation for the interdependency and indeterminacy of complex adaptive systems. TSC integrated the diverse threads of Kevin's work, and it establishes a baseline and a framework for change projects in other complex, adaptive, and emergent environments.

## Legacy and Unfinished Business: A Network About Networks

The Sustainability Consortium (TSC), which has both demonstrated and tested principles of complexity, began in 2008. Kevin's work in complex systems, emergent change, and supply chains merged into a ground-breaking leadership opportunity. TSC brings together academic, manufacturing, retail, nongovernmental organization, and government stakeholders "to create a science-based system for measuring and reporting product sustainability." Led by Arizona State University, University of Arkansas, and Wageningen University, over 90 corporate and civil society members participate in TSC, whose "sustainability measurement and reporting system identifies material environmental and social impacts across a product life cycle, in a standard way, for high impact consumer goods sold in retail stores." (Dooley and Johnson 2015).

In simple language, TSC's original goal was to place a "carbon footprint" label on every retail product available from Walmart stores. In principle, consumers could use this information about sustainability to make choices, just as many currently use nutritional information when they shop. Manufacturers, distributors, and retailers would recognize sustainability as a competitive advantage. The commercial world

would align with climate science to move toward global targets to control carbon emissions worldwide. This massive change process could be driven by data, emergent complexity, and network supply chain analysis. In short, it depended on the kinds of methods and expertise Kevin had been developing throughout his career.

The complexity of the task was literally overwhelming. Every node in the supply chain network for every product would have to track and report the impact of their processes on carbon emissions. This would require standardized measuring and reporting protocols, regulations, and monitoring institutions, collaboration and cooperation across competing organizations, and integration throughout the lifecycle for each product and all of its component ingredients. The detail complexity of defining, collecting, and reporting the data would be enough to stop the project in its tracks, but that was not the most complex challenge. TSC is a complex social system, a consortium consisting of more than 90 separate organizations. Each organization and each individual came to the table with agendas and concerns, histories, and cultures. The emergent complexity, arising from the many interdependencies and uncertainties across this system, made the project even more challenging.

The goal was clear, but the path to it was hard to imagine, much less to design and implement. Traditional process- and information-management systems were insufficient to manage these open, high-dimension, nonlinear patterns of relationship. A new approach was required, one that could integrate networks, data, complex adaptive systems, supply chains, and systemic transformation. The approach needed to be both rigorous and flexible to work at multiple scales and in diverse environments. In short, the program needed the quirky combination of interests and competencies of Kevin Dooley.

At various times, Kevin served as the Academic Director, Executive Co-Director, and Chief Scientist for TSC. When the program began, there was no roadmap for such an endeavor. No one knew what a workable plan might include. Previous programs to develop product standards had worked within particular sectors, not with the diverse, cross-sector membership of TSC. After some promising starts and disappointing developments, Kevin and his team adopted a prototyping approach to allow them to explore and exploit opportunities as they emerged. The prototyping method allowed them to iterate as they quickly developed and tested solutions. They focused on building adaptive capacity for themselves and the system, rather than committing large-scale investments to upfront design efforts with unpredictable results.

Kevin Dooley's career spans a significant transformation in the way that change is understood and managed. The change management industry moved from the command and control methods of Taylor, through the information and process-driven methods of Baldridge, and into emergent methods of The Sustainability Consortium. His research and practice were informed by his passion for inductive reasoning about change over time and his curiosity about emergence and uncertainty. He continues to learn lessons from the complex human, economic, and mechanical dynamics of supply chain networks, and his work informs theory and practice across fields as diverse as public health and environmental sciences. As the study of change continues to emerge over the next decades, Kevin Dooley's scholarship and leadership will continue to emerge with it.

## Conclusion

As we move toward the middle of the twenty-first century, people and organizations experience ever-increasing complexity. The systemic work of Dooley and his students will continue to inform strategic decision making and action at multiple scales and in many contexts.

# Dexter Dunphy: Pushing the Boundaries of Change

<span style="font-size:2em">28</span>

Doug Stace

**Abstract**

Dexter Dunphy is an Australian who contributed to organization development theory in the early 1970s and then in the 1990s (with colleague Doug Stace) introduced to the field of organization theory a comprehensive contingency model of organization change. He held academic appointments at Harvard University, the University of New South Wales (UNSW), and the University of Technology Sydney (UTS).

He also contributed to the internationalization of management theory through studies of management, including change management, in East Asia. Subsequently, after 2000 (with colleagues Andrew Griffiths and Suzanne Benn), he developed a comprehensive phase model outlining key stages through which organizations can progress to become both sustainable and sustaining. These models were supported by detailed organizational case studies describing how change programs were undertaken and evaluating the outcomes in terms of a variety of performance criteria. These conceptual developments were responses to major challenges occurring in the environments of organizations subsequent to the end of World War II through to the second decade of the twenty-first century.

Dunphy worked with senior executives of corporations, companies, and organizations, in Australia and internationally, in designing large-scale in-house and system-wide change programs. He was involved in training organizational change agents and creating and maintaining active networks of change consultants for the exchange of ideas and approaches. The chapter concludes with an outline of key issues for the future development of the field.

## Contents

## Introduction

Dunphy was born in 1934 in Sydney, Australia, to a family with strong environmental and social convictions. His father, Myles, is known as the father of Australian wilderness. Like John Muir in the United States, he spent his life working to establish major national parks. Dunphy's mother, Margaret, of Huguenot and Methodist ancestry, held strong values supporting justice and freedom. His elder brother, Milo, was an environmental activist. Dunphy's consciousness was formed in this family matrix where ecology and people were valued and strong convictions translated into action.

At age 18, Dunphy established a youth club and was intrigued by how individuals changed their behavior when they joined a group. He enrolled in an arts degree program at Sydney University, majored in education, and was introduced to John Dewey's progressive education philosophy and pragmatism (Dewey 1933). These writings emphasized intervening to make change and learning by doing and through seeking feedback. His undergraduate honors thesis in education was supervised by Hugh Philp, who held a PhD in social relations from Harvard. Philp introduced him to contributions to small-group theory by Robert F. Bales, professor of social relations at Harvard, and colleagues (Bales 1950). Their research findings demonstrated the power of groups to influence individual behavior. These writers sought to understand social systems as dynamic entities and to intervene to enhance goal achievement and member satisfaction.

In his undergraduate honors thesis, Dunphy repeated and extended Bales's laboratory experiments – studies of developmental processes in leaderless student groups (Bales and Strodtbeck 1951; Heinicke and Bales 1953). Dunphy's study showed similar results despite the different cultural environment (Philp and Dunphy 1959). He became fascinated by how roles differentiate in small groups: social evolution on a microscale.

After receiving his BA with honors, he enrolled in a master's in education degree program at Sydney University in 1960, again supervised by Philp. His thesis explored how peer groups influence the psychosocial development of adolescents. For 3 years, Dunphy located informal teenage groups in Sydney and joined these groups on street corners, at beaches, wherever they hung out. He developed a new theory of the evolution of peer-group structures and leadership, showing how this affected adolescent development as the peer group replaced the family as the prime socialization influence. The study was published in a widely reprinted and quoted article (Dunphy 1963) and a book (Dunphy 1969) that became standard reading for teachers in training in Australia.

## Influences and Motivations: Defining an Intellectual Agenda

Philp encouraged Dunphy to undertake a PhD abroad, preferably at Harvard in the Department of Social Relations. Dunphy mailed a summary of his MEd thesis to Bales and received a very encouraging response. He applied for admission and, after being awarded a first-class honors MEd, was accepted into the Harvard social relations department PhD program in sociology. He joined a research team on the General Inquirer Project, directed by Bales and Philip J. Stone. This was a groundbreaking use of computer technology to analyze content in small-group interaction – an early initiative in computer-based text processing. Dunphy contributed to the development of the automated content-analysis system the General Inquirer (Stone et al. 1966) and used the methodology in his PhD thesis (Dunphy 1968). The thesis was a study of group process in self-analytic groups. While at Harvard, he also enrolled in postgraduate classes in sociology, social psychology, clinical psychology, and social anthropology. He worked with and was influenced by Robert F. Bales, Talcott Parsons, Philip J. Stone, Marshall Smith, and Daniel Ogilvie.

At Harvard, he met leading figures in small-group theory and organization theory. He also taught courses in the Department of Social Relations – one was the team-led Social Relations 120: Analysis of Interpersonal Behavior, taught in parallel classes by Bales and leading psychoanalysts. He spent hundreds of hours systematically observing group process in these classes. About this time Dunphy decided "to continue to climb the sociological ladder" (Personal communication, May 3, 2016). He felt that he had a reasonable grasp of personality psychology and small-group theory. The organization is the next step up the ladder after the individual and the small group. So he began working with Harvard Business School (HBS) faculty who were actively involved in researching and consulting in organizations. Beyond that he envisioned going further to understand societal structure and culture, and this guided much of his subsequent career development.

Dunphy gained his PhD in sociology at Harvard in 1964 and was offered a position as assistant professor jointly in the Department of Social Relations and HBS. At HBS he taught in another team-led course: Human Behavior in Organizations, a foundation MBA course. Colleagues who influenced his thinking at this time

were Paul Lawrence, Jay Lorsch, Renato Tagiuri, and Richard Walton, who were actively involved in researching organizational change and in change consulting.

In 1967 Dunphy returned to Sydney, Australia, to take up a senior lectureship in sociology at the University of New South Wales (UNSW). There was strong growth in student numbers in sociology – a new academic discipline in Australia.

After 2 years, he accepted a chair in Organizational Behavior in the Faculty of Commerce, UNSW. Apart from administering the OB department and contributing to the MBA program, Dunphy researched, particularly with colleague Bill Ford, new developments in work redesign, industrial democracy, and the impact of new technologies on work organization. These studies involved field research in a variety of industries where new technologies were being introduced, change interventions, and evaluation of the impact of changes on variables such as productivity, work satisfaction, and industrial relations. Also at this time he and his colleagues initiated personal and organizational change workshops for executives. These residential workshops attracted many private and public sector executives. Dunphy also supervised PhD students who went on to occupy senior academic positions or establish successful consulting companies.

The work of the Department of Organization Behavior had a major impact on the policies of national and state governments, particularly policies for workplace change, job redesign, and productivity improvement. Ongoing links were established with Scandinavian and British researchers driving workplace redesign in their countries, and faculty interchanges took place. In the 1970s, Dunphy's colleague Bill Ford worked closely with the national Labor government and gained commitment and funding to exchange between Australia and Sweden, senior civil servants and academics with work redesign, and industrial relations expertise. Some researchers were attached directly to the Department of Organization Behaviour.

In 1972 Dunphy delivered the Australian Broadcasting Commission's Boyer Lectures on "The Challenge of Change" (Dunphy 1972). The Boyer Lectures are a series of five radio lectures delivered annually by an outstanding individual (the Australian equivalent of the BBC's Reith Lectures). Dunphy used this opportunity to examine the impact of the increasing speed of technological and social change on the economy, society, the workplace, and personal life. The printed version of the lectures went through four editions and were widely read and referenced.

He became increasingly interested in broadening management theory beyond what he saw as the cultural insularity of US theories. So in the 1970s with colleague Bill Ford, he initiated studies of management in Asia, particularly Japan and China, where some of the largest organizational changes in history were in process (Dunphy and Stening 1984; Dunphy 1986; Dunphy and Shi 1988). This led in 1985 to organizing an academic conference with Professor Gordon Redding, University of Hong Kong. The conference, the Enterprise and Management in East Asia (Clegg et al. 1986), held in Hong Kong, brought together a select group of 30 academics from around the world, each specializing in some aspect of management in East Asia. Later that year he organized the lead symposium in the International Division of the (American) Academy of Management on management in East Asia and delivered the opening paper, "A Comparative Study of Enterprise Management in

Japan and the People's Republic of China." His work was informed by several invited visits to Japanese and Chinese universities; in China, in 1974, he gave what may have been the first lectures in post-revolutionary China on Western management (until then a forbidden subject).

In 1981 Dunphy authored *Organizational Change by Choice* (Dunphy 1981), widely used by managers in Australia as well as in MBA courses. Reprinted several times over the next 10 years, it became an Australian best-selling management book that broadened the OD model of change to include large-scale organizational redesign. An early chapter "change begins with me" discussed the importance of managers and supervisors at all levels exemplifying in their personal behavior the changes they wanted to bring about in the organization, thus directly linking personal to structural and cultural change.

In 1977 the Australian government set up a commission of international business academics to inquire into management education in Australia. The commission, headed by Dean Cyert of Carnegie-Mellon University, in Pittsburgh, Pennsylvania, recommended that a national school of management be set up at the University of New South Wales; eventually the Australian Graduate School of Management (AGSM) was founded. From 1982 Dunphy played a significant role in the school's development. At the AGSM, he designed and taught the school's first organizational change course. Each year he invited 10 practicing managers, with ongoing organizational change programs, to attend. They participated in class discussion sessions, and the students worked in change programs under their direction. Dunphy and colleagues also instituted an executive MBA program for managers delivered online nationally, with face-to-face tutorials in capital cities. An integral part of the program was a Change Management Qualification (CMQ) designed by a team of change agents under Dunphy's direction; the curriculum development was financed by Andersen Consulting.

In 1990, 18 Australian special research centers were funded by the Australian federal government – the Australian Research Council's most prestigious and highly funded centers. Each was established under the leadership of an academic with an outstanding research record. Dunphy was awarded one of these centers, the Centre for Corporate Change (CCC), the only special research center funded to conduct research on management. This allowed him to recruit staff and initiate multiple organizational change research projects. The CCC working paper series was written for executives and widely read across Australian-based organizations. They presented results from the broad range of research being conducted in the CCC into leading edge change in contemporary organizations. He was concerned to ensure that developing organizational theory and research were put into immediate practice.

In 1994 Dunphy initiated the first International Conference on Organizational Change, jointly sponsored by the University of Southern California and the University of Warwick, in England. The conference was held at the AGSM over 2 days and assembled 30 leading researchers in organizational change from around the world. Immediately following this, selected conference participants spoke at the Australian Human Resources Institute's national conference, Empowering People for High-Performance Organizations. The presentations were to a large audience of human-

resource practitioners in Sydney and relayed by satellite to audiences in other capital cities. Again this reflected a commitment to ensuring practitioners had timely access to the best contemporary research findings.

In 1998 Dunphy cooperated with Michael Beer (Harvard Business School) to hold a second international conference on organizational change, Breaking the Code of Change, held at HBS. Ninety leading change researchers and practitioners attended, and the conference resulted in a major publication (Beer and Nohria 2000).

Dunphy was also integrating issues of sustainability into his developing understanding of organizational change because he perceived the increasing impact of organizations on the natural and social environment (Dunphy and Griffiths 1998). He therefore began developing a new model of change, the sustainability phase model, to define a path for enterprises to move toward more sustainable operations. In this he was influenced by his love of the natural world and by developments in sustainability and corporate social responsibility. Dunphy saw that successful organizations pursued larger goals than simply financial returns. The sustainability phase model was first outlined in *Sustainability: The Corporate Challenge of the 21st Century* (Dunphy et al. 2000) and more fully developed and elaborated in *Organizational Change for Corporate Sustainability* (2003, 2007, 2014) and in other books and articles. Key collaborators were Andrew Griffiths and Suzanne Benn. The model has been used worldwide and influenced the practice of many managers. The principles in this and other related publications were extensively illustrated with international case studies. Work on this comprehensive change model has continued and been reported in many publications coauthored with colleagues Andrew Griffiths, Suzanne Benn, and others (for further discussion of this model, see "Key Contributions: Developing Contingency Theories of Change" and Fig. 2 below).

While on the AGSM faculty, Dunphy designed and led many executive programs. Some programs included participants from a range of private and public sector organizations, while others were in-house programs. An example of one such in-house program was the Zurich Asia Academy, designed by Dunphy for Zurich Insurance's Asian managers and repeated annually for 5 years. Each program consisted of three 1-week residential segments held successively in Sydney, Singapore, and Hong Kong. The program was designed around executive development and emphasized managing personal, career, and organizational change.

In 2007 Dunphy was made a Member of the Order of Australia (AM) in the Australian Honors List for service to education, particularly in the fields of organization change, corporate sustainability, and management. This recognized that his contributions in these areas deserved national recognition.

Dunphy has consulted to over 170 organizations in Australia and abroad, including many of Australia's largest companies and multinationals operating in Australia. His consulting has covered a wide range of projects mainly in large- and medium-sized organizations in different industries and centered on the effective management of change. In most cases he has worked directly with the CEO and executive team, often reporting directly to the CEO, although his work has usually taken him to all organizational levels. A leading aim has been to improve organizational performance and employee satisfaction – for example, Agnew Mining and Fuji Xerox Australia

(see "Key Contributions: Developing Contingency Theories of Change" below). His consulting has usually involved working with senior executive teams managing large-scale organizational transformation.

In 2000 Dunphy left the AGSM and moved to the University of Technology Sydney (UTS) as a distinguished professor. While there he concentrated primarily on research on organizational change but with increasing emphasis on corporate culture. A research collaboration with the international consulting firm Human Synergistics analyzed their large quantitative database of organizational change cases. Results were published as *In Great Company: Unlocking the Secrets of Cultural Transformation* (Jones et al. 2006); the second edition (2011) included a follow-up study of how the same organizations fared in the subsequent financial crisis.

Dunphy has also led training courses and programs for change consultants. For example, from 2011 to 2014, he designed and led annual residential organizational and workforce development workshops for the 60 full-time change agents in the Queensland State Department of Communities. The department was undergoing extensive change, and these change agents were embedded with senior managers across the state to implement the planned changes. The workshops introduced practicing change agents in the organization to current theory and research in organizational change and included custom-designed experiential exercises to develop the understandings and interpersonal skills needed for participants to work directly with area managers. For instance, participants used role plays to experiment with different influence strategies and to develop the most promising ones. Each workshop was followed by weekly teleconferences with Dunphy when the change agents, scattered across a large state, raised ongoing issues in their change implementation.

## Key Contributions: Developing Contingency Theories of Change

Dunphy's early work on small groups provided insights into how individual and small-group behavior are modified by their social setting, how leadership roles emerge, social structures evolve, and how culture – "the way we do things around here" – is created and internalized by those in the system. These early insights informed the following major contributions.

In *Organizational Change by Choice* (1981), Dunphy developed a comprehensive model for managers, showing how to initiate and implement change at different levels and to manage organizations as ongoing systems. It provided analytic and intervention strategies appropriate for individual change as well as change in workgroups, intergroup relations, corporate structure, and culture. The prevailing organization development (OD) model had emphasized intervention at the individual and work-group level, the dominant financial models stressed restructuring organizations from above, and technological models focused on redesigning workflows. This book integrated these approaches and was widely used in business and management courses in Australia and by Australian managers. The book also

drew on change research from the U.K. and Europe, particularly covering innovative work redesign on sociotechnical design principles and industrial democracy (ID).

In the 1970s and 1980s, Dunphy and his colleagues initiated cross-cultural research, making a systematic comparison of differences between East Asian management approaches and the dominant US model. These studies examined approaches to organizational change in China under the communist revolution and innovative post-World War II Japanese management transformations of production systems. This research analyzed how contrasting cultural assumptions led to differing management and change processes. For example, the collective orientation of Japanese cultures contrasted to the individualistic orientation of US managers and led to more widespread consultation (nemawashi) at the early stages change initiation. At the time these studies commenced, most theorists in the United States assumed that US management principles were superior to those of others and applied universally. Only when the Japanese began to dominate world markets and compete successfully against US enterprises in the United States were these cultural assumptions challenged by US-based management writers, such as Ezra Vogel in *Japan as Number One* (1979).

Another theoretical breakthrough was the development of a contingency theory of organization change. The dominant OD and ID models advocated a "one best way" to manage organizational change, specifically incremental, participative bottom-up approaches with internal stakeholders. Dunphy and Stace (1988) were the first to apply contingency theory in organizational change theory, by linking the strategic scale of change to the dominant styles of change leadership. Nadler and Tushman's model followed closely in 1989. The Dunphy-Stace research controversially formed a critique of the OD and ID models, particularly of their suitability as universal prescriptions for change. The research demonstrated that, under certain conditions, directive/coercive top-down strategies for change could be successful.

The point was made that no *one* strategic change approach should be universally prescribed; different change strategies are called for in different circumstances. If the organization itself is at risk because of failure to adapt to widespread environmental and industry change, dictated transformation may be necessary to transform the organization and ensure its survival. In particular, the model (see Fig. 1) provides for different strategies of change according to the organization's current "fit" or lack thereof with its environment. This was an innovative idea at the time; the OD, ID, and OB literatures mostly ignored the importance of the strategic environment for the organization, an important omission as the pace of Western economic restructuring, geopolitical, and technological change increased. If organizations failed to change to meet these changed conditions, they faced inefficiencies and eventually extinction.

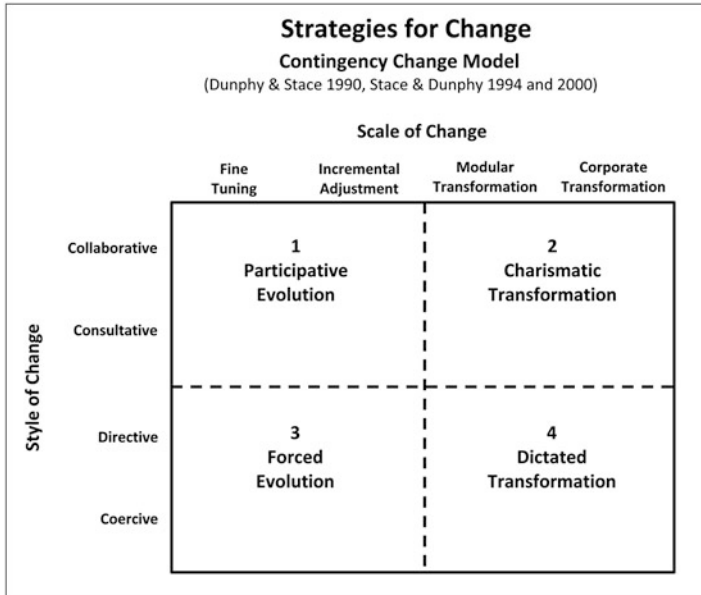
The model proposes that the strategy for managing change should be based first on the degree or scale of change needed to bring the organization back into environmental fit or to retain its fit in a fast-moving environment. The other axis in the model specifies the style of change leadership that will best bring about the degree of change needed (on a scale from collaborative to coercive). The choice as to what style will work best depends on the speed with which the change needs to be


**Fig. 1**  Stace-Dunphy contingency model (Dunphy and Stace 1990)

brought about and the latent support from key interest groups within and beyond the organization. Where there is little urgency and a fair degree of support for change by stakeholders, participative approaches are called for. Where there is urgency and little support, a directive/coercive approach may be more effective in ensuring the organization's survival and/or success.

This study was also innovative in the way case studies were selected for research. To this point in the field's development, organization theorists had generally chosen as cases organizations where they consulted. Clearly there is a potential built-in bias in this approach that may invalidate the conclusions. Stace's PhD thesis, the basis of this study, created a systematic arm's length sampling frame for the selection of case study organizations. The financial services and insurance industries were chosen for analysis (later extended to the manufacturing sector and the public sector). Chosen within each of these industries were four high-performance organizations and two low-performance organizations. The choice was based on independently assessed factors – financial performance, industry rankings, and leadership – by a panel of three senior industry analysts. These organizations were then approached to agree to be subject to a case study. Most agreed. Where the CEO did not agree the organization was replaced by the same method. Thus the choice of organizations was independent of any investigator biases. The study involved up to 120 individual and focus-group interviews in each organization and collected qualitative data along with the administration of a "scale of change" and "change leadership style" diagnostic instrument. The study covered three time periods so that the path of organizational change could be tracked.

Publications from this research were widely sourced and referenced. The early paper "Transformational and Coercive Strategies for Planned Organizational Change: Beyond the O.D. Model" (Dunphy and Stace 1988) and the subsequent "The Strategic Management of Corporate Change" (Dunphy and Stace 1993) presented the core thinking, the latter article being the second "Most-Frequently Read" article in the *Human Relations* journal for several years. The research was also published in two books, widely used in Australia, the United Kingdom, and Asia – *Under New Management: Australian Organizations in Transition* (Dunphy and Stace 1990) and *Beyond the Boundaries: Leading and Re-creating the Successful Enterprise* (Stace and Dunphy 1994, 2001), both with multiple reprintings. The core change model is still widely used in academic teaching and by practitioners.

A more recent contribution has been the incorporation of ecological and human (social) sustainability into a systematic phase model of organizational change. The sustainability phase model (Dunphy et al. 2003, 2007; Benn et al. 2014) extends the prevailing economic/financial model of performance to include social and ecological outcomes as legitimate and necessary goals. The model outlines developmental phases through which corporations' progress toward human and ecological sustainability. Organizations can progress from active rejection of sustainability principles to becoming fully sustainable and sustaining of their social and ecological environment. Six phases are distinguished, ranging from active opposition to investment in sustainable practices to fully incorporating sustainability practices throughout the organization's operations. The six phases are:

1. Rejection
2. Non-responsiveness
3. Compliance
4. Efficiency
5. Strategic proactivity
6. The sustaining corporation

In addition, each phase distinguishes actions appropriate to achieving the sustainable outcomes typical of that phase for both human sustainability and for ecological sustainability.

**Rejection** involves an attitude on the part of the organization's dominant elite that resources are to be exploited for immediate financial gain and that devoting resources to reducing destructive ecological or social impacts of the organization's activities is to be avoided. The prevailing cultural theme at this phase is *exploit resources for maintaining short-term financial gain.* **Non-responsiveness** usually results from lack of awareness or ignorance rather than opposition to taking sustainable measures. Sustainability is regarded as irrelevant rather than actively opposed, and the central cultural theme is *business as usual.* **Compliance** focuses on reducing the risk of sanctions for failing to meet minimum standards as an employer or producer, avoiding legal action for breaches of regulations prescribing safety measures or prohibiting environmental pollution. The central cultural theme is to *avoid risk.* **Efficiency** reflects a growing awareness on the part of the corporation's

dominant elite that there are real advantages to be gained by proactively instituting sustainable practices. For example, what was defined as "waste" can be reprocessed and become a valuable resource. This is the beginning of incorporating sustainability as integral to the business. The central cultural theme of this phase is *do more with less.* **Strategic proactivity** sees sustainability becoming an important part of the organization's business strategy. Sustainability provides a competitive advantage through innovation and adding value. The central cultural theme is *lead in adding value and innovation.* **The sustaining corporation** phase emerges as the corporation's elite, and most corporate members have internalized the ideology of working for a sustainable world. The corporation works to "change the rules of the game" to model best practice in sustainability and to build political and social commitment to creating a fully sustainable world. The central cultural theme is *transforming ourselves: lead in creating a sustainable world.*

At each stage, performance is enhanced by adding value and eliminating waste, but the kind of value added and waste eliminated differs. At the efficiency phase, value is typically added by achieving new efficiencies through significant cost reductions by, for example, reuse of material resources formerly defined as waste and sent to landfill. But there are also efficiencies to be achieved using formerly wasted human potential such as loss of key skills through turnover or poorly integrated work systems. At the strategic proactivity phase, value added comes through the contribution sustainability makes to building stronger stakeholder support and winning increased market share. At this phase also the concept of waste is enlarged to include unrealized or missed strategic opportunities in sustainability, particularly lost market share through lack of innovation, failure to develop more high-added-value products that secure market leadership, or too-slow divestment of unsustainable operations.

Another contribution of the model is that it specifies a wide range of change leadership roles needed to guide organizations through the phases and shows the direct relevance of historical theories of leadership to phases in the model. So the kind of change leadership needed for the efficiency phase is distributed/enabling; for the strategic proactivity phase, it is enabling/transformational; and for the sustaining corporation phase, it is transformational/complexity management (Benn et al. 2014). Key change-agent competencies are also specified. Overall the phase model defines the central managerial task as the leadership of change but also documents the necessity of leadership styles being modified as the organization moves through the phases. The knowledge and skills needed for successfully moving an organization into the efficiency phase are therefore different from those needed for moving it into the phase of strategic proactivity or sustainable organization phase. Maintaining high performance in the sustainable organization phase involves managing a process of continuous transformation (reinvention) of the organization and managing high levels of internal and external complexity.

The model also integrates developments in human-resource management and corporate social responsibility with change-management theory. Achieving corporate sustainability is seen as managing an integrated development in the organization between ecological sustainability (e.g., eliminating waste, using natural resources

more efficiently) and social sustainability (e.g., building workforce capabilities, generating stakeholder support). Before this model was developed, the role of human-resource strategies in developing ecological sustainability was largely ignored; HR and OD were not seen as integral to successful achievement of corporate contributions to creating and maintaining a healthy natural environment. The model stresses the interdependence of human and ecological sustainability.

Overall the model shows that achieving corporate sustainability is a change process and that successive phases enable the organization to achieve higher levels of performance in the traditional financial sense but also in the increasingly important areas of ecological and human sustainability. Figure 2 shows how optimal development across phases balances change on each of these dimensions to reach the point of becoming a fully sustainable organization. A large number of carefully researched case studies that accompanied the development of the model document how this performance enhancement takes place (see, e.g., Benn et al. 2011b).

The sustainability phase model is widely used internationally in business programs and by practicing managers. A fourth edition of *Organizational Change for Corporate Sustainability* is in preparation.

Dunphy's work also shows the importance of using large-scale databases in research on organizational change. Over several years, he collaborated with the consulting firm Human Synergistics International, strongly represented in Australia and New Zealand. Human Synergistics uses the organizational Culture Inventory (OCI) and the Life Style Inventory (LSI), systematic survey instruments designed to measure organization culture and leadership behavior. From the existing

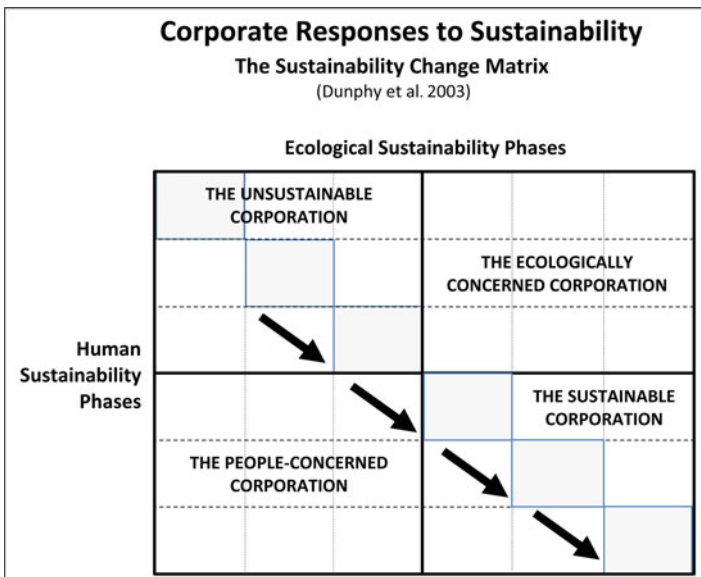

**Fig. 2** The sustainability change matrix

database, Dunphy and colleagues at Human Synergistics extracted data on 40 organizations that had undertaken an initial survey and at least one other survey over the following 2 years (Jones et al. 2006, 2011). These organizations were then ranked by degree of cultural shift from a passive/defensive culture and aggressive/defensive culture toward a constructive culture (the goal of the culture change programs).

Five organizations were chosen that had made the most successful transformations toward their ideal culture as measured by results on the OCI. In these organizations, all OCI categories showed highly statistically significant shifts in the desired direction. An intensive case study of the change process was then carried out in these organizations. The CEO, all senior executives, internal change leaders, and external change consultants were interviewed, and systematic samples of employees used to form focus groups. Data was gathered on all performance measures, including financial, used by each organization. The shift to a more constructive culture in these five organizations was accompanied by maintenance or improvement, sometimes dramatic improvement, in almost all financial and nonfinancial performance measures.

Detailed case studies of the five organizations are presented in *In Great Company*, and a model is presented of the common characteristics of these successful change projects. The study was completed in 2006. In 2011 the same organizations were studied again to see how their cultures had affected their ability to survive and thrive through the global recession of 2008 to 2010. A second edition updates the case studies and shows that the investment in creating more constructive cultures not only had an overwhelmingly positive impact on performance measures in good times but also enabled these organizations to better handle tough times (Jones et al. 2011).

The way change was successfully achieved in these five organizations supported much of what has been written in the change literature about how to create successful corporate change; what was unusual was that these organizations actually did what the literature recommends. A summary "metacapability model" details four key activities emphasized in all five organizations: leading, engaging, redesigning, and reflexivity. The first three are well documented in the change literature. Reflexivity however represents a new contribution and includes building self-awareness through feedback, creating a reality check through appreciating others' viewpoints, and monitoring of progress toward the preferred culture (Jones et al. 2011).

The study results also supported the sustainability phase model and helped add detail to an understanding of the relationships between the phases (Jones et al. 2011) as well as the impact of progressing through the phases on variables such as performance and workforce satisfaction.

The research carried out by Dunphy and his colleagues demonstrates the value of using a variety of research methods to ensure the validity of conclusions about effective change interventions. The studies have often combined surveys, interviews, gathering, and analysis of existing organizational performance data, focus groups with employees and stakeholders, and field observation. Using data derived with differing methods from different sources has proved invaluable in describing ongoing organizational change processes and the impact on performance. Using these methods at different hierarchical levels and in different departments and units also captures the multiple perspectives that underlie the complexity of change.

In working sessions, managers can readily apply the model to their own organizations. This increases their understanding of their organizations as a system undergoing change and helps them design and monitor interventions to improve corporate performance. In developing this approach, Dunphy was strongly influenced by his early study of John Dewey's idea that practical application is the best way to refine developing theory.

## New Insights: Aligning Theory and Practice

Dunphy has always sought to move between theory and practice. This is to ensure that theory illuminates practice, that practice ensures the relevance of theory, and that theory is modified on the basis of experience. He has used qualitative research methods and field research extensively but tried to move qualitative research toward the more quantitative and/or to supplement qualitative research with quantitative approaches.

Ongoing consulting relationships, executive teaching, and field research in a variety of organizations ensured that he was engaged in an ongoing dialogue with practicing managers about what constitutes best practice under different circumstances and the issues encountered leading organizational change. These activities also provided opportunities to develop ways of communicating theory and research findings to practicing managers. Dunphy has preferred simple direct English expression and an absence of jargon in both speaking and writing – characteristics welcomed by busy managers. He has also had a commitment to accepting the complexity of the managerial task and the importance of making theory relevant to management practice.

Dunphy holds the University of NSW Vice-Chancellor's Award for Teaching Excellence. In teaching he had a preference for using a variety of experiential learning processes – simulations, role plays, case studies, coaching, and problem-solving workshops – to create active learning through doing rather than passive absorption of knowledge. Because he closely observed ongoing group processes over many years, he feels at ease working with the "hot human process" of experiential learning. He is strongly committed to educating the whole person – mind, emotions, and behaviors. He has been concerned not only with ideas but how individuals translate ideas into action. This means ensuring that each individual has the repertoire of requisite behaviors to make the needed changes in their workplace. Knowledge is not enough; people also need the skills to intervene effectively.

Dunphy works to help organizational change leaders understand the organization as a living social system in which people share some similar understandings but also have different views depending on where in the organizational hierarchy and departmental/unit structure they are situated. The organization is a phenomenological entity with some common cultural elements but also subcultures based on interests that may conflict. The organization is a social fiction that lives in the minds, emotions, and wills of its members and stakeholders. The managerial task is to build, among organizational members and stakeholders, a sufficient sense of

ownership, commitment, and understanding of the organizational goals to create efficient and effective movement toward those goals. Working with corporate culture is vital to ensure that organizational change initiatives are effective. These views represent a strong move away from "the rational person" view of the individual and the economic view of the organization as primarily a financial entity.

The essence of each of the theoretical models developed is readily explained to executives in a single session. The depth is specified in greater detail in books, articles, and teaching/learning units and can be actively explored and applied within the target organization in collaboration with practicing managers. These are both descriptive and prescriptive models. They allow managers to identify where in a spectrum of change their organization is located and also what actions are required for improved performance outcomes.

The models are supplemented with detailed case studies providing practical information on how change had been made and with what results. In addition, Dunphy organized active networks to facilitate ongoing exchange of information between change agents (managers and consultants). Organizations making successful change were brought to public attention through workshops, seminars, and publications to ensure that managers and other change agents became aware of positive models from which they can learn.

Dunphy's work has had a major influence particularly on organizations operating in Australia. Two examples are consulting with Agnew Mining, which involved the successful planning and establishment of a new mining organization and new town in Western Australia, and Fuji Xerox Australia, which involved the planning and establishment of the innovative eco manufacturing plant in Sydney. These are now briefly summarized.

For 5 years from 1975, Dunphy undertook a major consulting assignment with a new mining organization, Agnew Mining, which involved the design, construction, and operation of a new nickel mine and town in a remote desert region of Western Australia. He worked with the senior executive team who asked him to challenge all assumptions they held for the design and operations of a mining organization and town. The executives wished to avoid the industrial unrest, high turnover, and male-dominated culture of binge drinking that prevailed in existing mining operations. The Agnew Mine and the associated new town, Leinster, saw the successful redesign of traditional forms of mining organization, for instance, by handing much more decision-making to self-managing work teams and by opening jobs to women. It also resulted in a town designed on innovative principles – former residents in a recent book describing their time there as some of the most fulfilling of their lives (Siddall 2015). The dedication to the book thanks Dunphy for "his original input that changed the philosophy of mining town projects" (p. xiii).

Fuji Xerox is an international company that produces a wide range of products designed to manage electronic or paper documents. In the 1990s the company sought to establish itself as a leader in the development and application of sustainable manufacturing operations. Fuji Xerox Australia played a leading role in this worldwide development; its new remanufacturing plant, the Fuji Xerox Eco Manufacturing Plant, established in Sydney in 1993, introduced the remanufacturing principles

later adopted worldwide by the Japanese parent company. Dunphy worked with the plant managers to establish these principles and put them into practice.

A key step in the change to sustainable manufacturing at Xerox was a decision to replace selling printers with leasing service contracts to repair or replace consumables. The manufacturing process was completely redesigned so that worn and failed items, once considered waste, were redefined as potential valuable resources. Instead of worn or broken parts being discarded to landfill, they were fed back into the production process and remanufactured. Eventually all waste was eliminated, product design was improved to increase reliability and enhance performance, and major savings were made from import substitution and new export earnings. This had major environmental benefits, reduced costs to consumers, and increased profits. In 2010 the company reported that, over 10 years of its operations, the Eco Manufacturing Center had achieved AU$240 million return on AU$22 million investment (Benn et al. 2011a).

## Legacies and Unfinished Business: The Way Forward

Throughout his career, Dunphy has pushed the boundaries of change theory in response to emerging issues in the environment of organizations. Documenting how approaches to change in Asian economies differed from Western models was a response to the increasing internationalization of business. Advancing a novel contingency model of change, as against a simplistic adherence to OD theory regardless of situation, was a response to the sharp economic downturn of the late 1980s, particularly in Western economies, and large-scale restructuring and reshaping of organizations. The sustainability phase model was a response to climate change and the deterioration of the environment under the impact of modern industrial technologies. Change theory cannot be a static body of knowledge but must deal with the enterprise as a complex self-organizing system that needs to adapt to its dynamic environment and strategically influence that environment to create favorable conditions for future high performance.

This raises the question of how organizational change theory can change *itself* to prepare for the impacts of the dramatic processes now transforming our world. Many theorists, including Dunphy, see future organizational success as dependent on managing the constant self-renewal of organizations as highly complex socio-technical systems. Given that managerial leadership is crucial to change success, this has major implications for the ability of the senior executives to live with ambiguity, constant change (including self-change), and complexity (Benn et al. 2014; Jones et al. 2010; Parry 2015). To achieve this, executives and others require real-time, ongoing feedback from a system undergoing change that differs in scale and pace from one part of the organization to another. Systems theory is clearly the way to go but, despite its long history in the field (Kirsch et al. 2008), has delivered few practical outcomes because the technology to monitor complexity didn't exist.

To overcome this, Dunphy saw the need to work with large databases of organizational change programs, but few such databases existed. The Human Synergistics

database referred to above was a rare exception. Academics seldom have the resources needed to amass longitudinal-change data from across many organizations and industries. Some consulting firms with large change-consultancy arms have the clients, personnel, and financial resources to gather organizational data on a large scale. But creating the database is not enough; the data gathered must be continually updated, use relevant valid variables, employ sophisticated multivariate statistical methods for analysis, and suggest useful "interventions" with predictive validity. In a digital world, the use of sophisticated technologies to provide real-time analytical feedback to leaders, enabling self-correction, will become the new norm, taking change management into the next level of evolution.

One such recent development, Change Tracking, is documented by Parry and his colleagues (Parry 2015; Parry et al. 2013). "Over more than 15 years of research, he and his team have created the most comprehensive data set on what happens during the process of change. To date they have collected data from more than 750,000 individual respondents across hundreds of change programs in more than 150 organizations across all sectors and sizes . . . and this data set continues to grow" (2015, p. ix). Elsewhere Parry comments that the Change Tracking model that uses this resource "provides the basis for the development of a 'situational' or 'contingency' model, called for by Dunphy and Stace (1993), which will allow for the ongoing feedback required to produce actionable data to guide the adaptation of change strategies and interventions required to keep projects on track to achieving intended objectives" (2013, p. 23). We need more pioneering work like this in developing sophisticated theoretically based analysis and predictive intervention strategies.

However, the world faces revolutionary changes at least equivalent to those of the industrial revolution. Central to these changes are new developments in information and communication technologies (ICT), digital transformation, and what McKinsey & Company refer to as the "Internet of Things" (McKinsey Classics 2016). Add to this mix sophisticated robotization. A fully integrated global communication system is developing with sensors and activators increasingly embedded in things such as roads, homes, cars, our bodies, and human substitutes such as robots. This system will smash existing business models and see much current executive work subsumed by complex autonomous decision-making systems that sense conditions in real time, make instant decisions, and then monitor the impact.

All these developments will transform organizations, impacting most obviously on employment of both low-skilled and highly skilled workforces. As yet unknown is how the new digital world, increasingly peopled by "digital natives," will affect the shape, size, and functioning of organizations themselves.

There are also the major uncertainties of geopolitical tensions. Globalization seemed an unstoppable force but is now challenged by the strengthening centrifugal forces of localization. Ease of mobility across the planet is being challenged by forces of terrorism and large-scale refugee migration. Most threatening is the deterioration of the natural world under the impact of human population increase and unsustainable organizational practices and lifestyles. In 2015 the global average temperature rose 0.9% degrees above the twentieth-century average, just one of many indicators showing that human-caused climate change is a current reality

threatening the viability of civilization (NASA 2016). The world's organizations must be rapidly transformed so they act as living cells in the biosphere and society, contributing to the health of the planet and human society. Dunphy has contributed to this transition by charting phases through which organizations can move to sustainability – an important step in redefining the goals and functions of organizations.

## Conclusion

The field of organization theory must adapt to and inform these changes. Contingency theory will be critical in improving the effectiveness of change programs in meeting their objectives – the critical contingences will emerge from the sophisticated computer-based models developed in concert with these changes. But change theory needs to be concerned with more than *means*; it must also be concerned with *ends*, particularly the ends to which change is directed. Dunphy argues that: "At this time, we must ask of all organizations in our society: What value do you add to the earth, the source of our being, and to society, which is our home?" (Personal communication, May 3, 2016). In Dunphy's view, theorists and practitioners need to contribute both to redefining the goals of organizational change and to researching how change projects can be designed to achieve these goals. The future of the field will depend on how future theorists and practitioners meet these challenges.

# Mary Parker Follett: Change in the Paradigm of Integration

François Héon, Sébastien Damart, and Lisa A. T. Nelson

**Abstract**

The work of Mary Parker Follett, an intellectual pioneer of the early twentieth century, resists categorization or assignment to any one category or field of study. A political and management theorist, Follett proposed a renewed vision of participative democracy as she anticipated the future practice of conflict mediation and of management as a profession.

Follett's work, rooted in her integrative philosophy of addressing conflict and problems, is particularly and perennially relevant to managing change. The following chapter first presents the profound influences of Follett's academic, personal, and professional experiences in shaping her perspectives. We then delve into what we view as Follett's most important, enduring contributions to management study and practice – integration and circular response – as a paradigm for managing change. We highlight different contexts in which Follett has translated her integrative philosophy into practical concepts, such as power-with management, the law of the situation, the invisible leader and the common purpose, and circular behavior as the basis of integration. We will conclude this collective reflection by illustrating how Follett's legacy is unfinished; her ideas endure and are relevant even today in governing our period of complexity and interdependent challenges. Follett still shows the way.

## Contents

## Introduction

Mary Parker Follett (1868–1933) was an atypical writer, hard to assign to any one
category or field of study. Follett proposed a renewed vision of democracy, changing
representations, and understanding of mediation, negotiation, leadership, and man-
agement. The intellectual edifice that Follett built constitutes a useful theoretical
frame for organizational change. The notion of integration (Follett 1918), at the heart
of this paradigm, describes the social process as a process of unifying and differing.
Social interactions are the result of perpetually coinfluencing dynamics.

Circular behavior (Follett 1924), the iterative back-and-forth of living relations, is
the basis of integration. This proposed dynamic back-and-forth of interinfluencing,
interpenetrating, and interweaving through unavoidable moments of difference,
friction, and conflict, leads, according to Follett (1941), to the creation of new and
more evolved levels of integration. Considering this, Follett's solution to control is
not to be found in a force "outside" or "over" the individual or the collective but
within the individual and the collective's own process of organizing and integrating.

Follett's early academic and professional influences were essential in shaping her perspectives on integration and the circular response as a means to enhance interpersonal and group relations, to manage conflict, and to generate collective creativity. We extend the scope of Follett's integrative philosophy to devise prescriptions for managing change in organizations. We start our examination of Follett's integrative philosophy by reviewing people and events of profound influence on her worldview and work.

We then look at aspects of group psychology. Understanding Follett's dynamics of integration in group psychology sheds light on the levers needed to initiate the processes of building common representations of a situation (not merely compromises between different individual representations) and of resolving complex problems in a creative and collaborative manner.

We assert that Follett's work is as relevant as ever. Today, contemporary thought leaders in the field of management and organizational change unanimously acknowledge three things: (a) the great degree to which Follett's management philosophy was avant-garde and pioneering for her time; (b) the dearth of knowledge and recognition of Follett, as a theorist, and of her ideas; and (c) the still impressive relevance, if not critical importance, of her integrative philosophy in helping us understand and manage change in all aspects of life today.

## Influences and Motivations: From Quakerism to a Strong Interest for Management as a Profession

Several studies have attempted to highlight elements of Follett's life that influenced the shaping of her ideas. We have summarized here the major elements of Follett's by considering four main categories of influence: (a) the family and the cultural context of the young Mary Parker Follett; (b) her early influences during her studies; (c) her social entrepreneurship activities in Boston and, eventually, throughout the United States; and, finally, (d) her links with the world of business and entrepreneurship during the last third of her life in the United States and in Europe.

## Family Context, Cultural, and Religious Influences

Mary Parker Follett was born in 1868, shortly after the end of the American Civil War, in Quincy, Massachusetts. Other than the fact that she was the elder of two children and that Follett's mother was the daughter of a Boston-area bourgeois merchant, we know little more about Follett as a child. That said, the few testimonies gathered by researchers evoke a short childhood; Follett was quickly thrust into the world of adults due to a depressed mother and an absent father, a veteran of the Civil War, who suffered from alcoholism and died early (Tonn 2003).

We also know little about the actual cultural and religious influences of Follett's family and those influences on the development of her later ideas. She was exposed

to Quakerism as a child although little has been written, by Follett or others, about the subject. Worth noting, however, is the striking proximity between the philosophy developed by Follett and some of the basic principles of Quaker spirituality, including the direct dialogue with God and the rejection of some form of representative religious democracy, the direct governance of the affairs of the church without recourse to a vote, and a spirit of equality of all and a social commitment to peace and pacifism (Dandelion 2007).

## First Intellectual Influences and Early Work

Follett, in 1888, after a brilliant school career, entered the Society for the Collegiate Instruction of Women of Harvard College in Cambridge (Massachusetts), which was to later become Radcliffe College, Harvard's annex for women. At a time when only a small minority of women enrolled in the university, Follett studied political economy, literature, history, and, especially, American history, all of which, at the time, were taught very little. In her early university days, she took lessons on the banking system, modern politics, and constitutional history as well as European history, both ancient and modern. Follett at Radcliffe developed a taste for eclecticism that she would keep thereafter.

Follett was also significantly influenced by one of her professors, Albert Bushnell Hart, renowned American historian, who, in 1909, became the president of the American Historical Association. Hart challenged his students by involving them in investigative work on issues that had never been treated before, such as citizens' rights under the Sedition Act or the fate of the Indians displaced from their native territories under the Jackson administration. Follett was noticed by Hart, who, undoubtedly, taught her the principles of investigation and a taste for the analysis of facts (Tonn 2003).

Follett embarked on a summer school trip to Cambridge University in 1890 and returned to the United States in the summer of 1891. A few weeks after her return, she gave her first lecture in political science, in the private school of Mrs. Quincy Shaw in Boston. There, she met her future life companion, Miss Isobel L. Briggs, then director of the school. Follett and Briggs shared their life together until Brigg's death in 1926.

In 1896, after 4 years of extensive work combining documentary research and qualitative data collection (using systematic interviews of the most recognized people in politics at her time), Follett published her doctoral thesis, *The Speaker of the House of Representatives*. Her work was hailed at the time as an original work and reference and is still considered to be one of the best books ever written on the functioning of Congress and the role of the Speaker of the House. President Theodore Roosevelt (1896), then New York City's police commissioner, called her work "[a]s a whole, marvellously well done" (p. 177), and the *New York Times* listed it among "The Fifty Best Books of 1896" (1897; see also Davis 2015). Follett graduated summa cum laude from Radcliffe College in 1898.

## Mary Parker Follett, Social Entrepreneur

The period of 1900–1915 was, for Follett, a major period of social engagement. She was involved in several social change projects that helped forge her ideas related to change and group dynamics, leadership, and participatory democracy. She dedicated herself to the integration of young immigrants in the suburbs of Boston by creating social centers, the Roxbury Debating Club for Boys, the Highland Union, and finally Roxbury League. She campaigned for the opening of municipal school buildings in the evening as a way to organize community activities by the community and for the community. One of her first major successes was in 1911, when she initiated the opening of the East Boston High School Social Center, a secondary school where evening classes could take place for socially disadvantaged people. The model for the East Boston High School Social Center eventually grew into the nationwide movement of the National Community Centers Association in the United States. Meanwhile, Follett, tackling many different civic projects, also campaigned for women's suffrage through an active militancy in the Boston Equal Suffrage Association for Good Government (BESAGG).

Follett first interacted with managers and entrepreneurs in the mid-1910s when she succeeded in raising funds to set up the Boston Placement Bureau, a local agency designed to accompany and support young people in their employability. On this occasion, Follett met and began collaboration with Henry Dennison. Dennison was a famous entrepreneur reputed for being innovative in the field of employer-employee relations, experimenting with various workers' participation mechanisms and self-control. He was also president of the Taylor Society and a major player in the development of scientific management (McQuaid 1977).

We must emphasize here that the work of Follett was written and published in the context of the rapid development of ideas related to scientific management. Follett's first writings were published from the 1910s, a period that marked the birth and growth of scientific management (Brown 1925). (F. W. Taylor published his seminal work *The Principles of Scientific Management* in 1911). References to scientific management made by Follett in her writings are abundant. Follett was a reader of the bulletins of the Taylor Society (Stout et al. 2015). We find many similarities between Taylor and Follett, notably, their need to rely on the law of the situation and facts and their optimistic opinions about cooperative relationships between management and workers.

## Philosophical Influences and Interest in Management as a Profession

Mary Parker Follett published her second book, *The New State: Group Organization, the Solution of Popular Government*, in 1918. Reprinted three times in its first 2 years, *The New State* proposes a new understanding of democracy via the active participation of all individuals within their groups at work, in their neighborhood, and in their city. Follett's philosophy deals with power and rights, not so much from a legal but from a psychosocial perspective (Follett 1918).

*The New State* is a gold mine for one who wants to know more about political, philosophical, legal, and managerial influences on Follett. Follett cites the American pragmatist philosopher and psychologist William James (1895) the most, and one can especially see the correspondence with James in how Follett emphasizes the "active" and "experiential" aspects of integrating. The famed American legal scholar and botanist Roscoe Pound is also often cited where Follett defends a new dynamic and socially constructed conception of law, where human rights are seen as outputs of a proactive and coercive deliberate change process and no longer as the legacy of ancient and universal principles.

Meanwhile, Mary Parker Follett was appointed to the Massachusetts Minimum Wage Board, whose role was to ensure respect of the application of the Act of 1912 on the minimum wage for women. Her social and civic activity led her to meet more and more business leaders and gradually became more and more interested in the world of business management, as her later involvement in the Bureau of Personnel Administration in New York showed.

Follett published *Creative Experience*, a fertile reflection on social interaction and the creative process of valuing differences through integration, in 1924. Touching on political science, philosophy, and management, the book is one of the first written record of Follett's growing interest for the "managerial thing" (Follett 1924). *Creative Experience* (1924), like *The New State* (1918), is a valuable resource for understanding the contextual influences of Follett's early twentieth-century ideas.

*The New State* was published around the time of the implementation of the 1919 Versailles Treaty, which, itself, was later seen as a prelude to World War II. Despite the establishment of the League of Nations in 1920, an event that seemed to have impressed Follett, she argued that the settlement of World War I contained the seeds of a new conflict; in *Creative Experience*, she explicitly analyzes these events. Follett also gave tribute to F.W. Taylor when developing, for example, her *law of the situation*. Other important references include those concerning Gestalt psychology and the holistic conception of individual interaction and society.

As Follett gained prominence in 1925–1933 as a management thinker, she gave a series of conference lectures from Boston to London via New York, speaking of such topics as power, conflict, authority, control, leadership, roles of managers, coordination, etc. These conferences were aimed at businessmen who welcomed with great interest Follett's innovative ideas. Follett saw, in these entrepreneurs, men interested in creative experimentations, stimulating her interest to work with business managers as they were the most ready to experiment and innovate socially (O'Connor 2011). After a final series of conferences at the inauguration of the new Department of Business Administration of the London School of Economics, she returned to Boston for personal affairs and died there on December 18, 1933.

Henry C. Metcalf and Lyndall Urwick (1941) later collected Follett's conference papers in a first book titled *Dynamic Administration: The Collected Papers of Mary Parker Follett*. Elliot Fox and Urwick (1949) would later edit Follett's 1949 London School of Economics conference papers in a book titled *Freedom and Coordination*.

## Key Contributions: Change in the Paradigm of Integrating

Follett's contributions all have in common a process-based approach. Change is, therefore, consubstantial with her intellectual construction. This translates into two different approaches: The notion of integration, at the heart of Follett's work, describes the social process as a process of unifying and differing. Social interactions are the result of perpetually coinfluencing dynamics. Following from these approaches is the main idea that leading change is a social process of integrating.

## Social Process as the Process of Integrating

### Unifying

Integration is a central notion in Follett's intellectual construction. Integration refers to the social process of encountering, confronting, and unifying the desires and interests of various parties; it is neither the making of a compromise nor the result of a distributive negotiation that one of the stakeholders would win. Integration is a creative process – the confrontation of differences (or conflict) is sought in order to generate new ideas, and thus a collective mind, feeling, and will (Follett 1918).

Urwick (1935) identified the first principle focus of integration, the "unifying" of business activity, as Follett's "most important contribution to the business literature of our time" (p. 166). She proposed a processual philosophy (Stout and Staton 2011) in which the act of coordinating one's self with others consisted of a dynamic process of integrating – dynamic because life, according to Follett, was ever changing. Unity, as she said, was never static.

The processual quality of integration permeates all of Follett's philosophy, whether she speaks of integrating at the intrapersonal, interpersonal, group, or societal levels. She wrote about managing complexity and change in new modern organizations as an experience of free and intelligent men and women creating together common endeavors, thereby bringing material and spiritual livelihood. Her theme of integration applies eloquently to the field of management and organizational change as it also informs other domains (e.g., public administration, conflict mediation, and justice) and even the most simple and significant human experiences of everyday life governance. Follett (1919) observes:

> The most familiar example of integrating as the social process is when two or three people meet to decide on some course of action, and separate with a purpose, a will, which was not possessed by anyone when he came to the meeting but is the result of the interweaving of all. In this true social process there takes place neither absorption nor compromise. (p. 576)

### Differing and Constructive Conflict

Social relations, according to Follett (1941), lead inevitably to differences, friction, and conflict, as she noticed firsthand in creating the community-led evening school

centers in Boston and, later, throughout the United States: "[S]parks would inevitably fly" (Follett 1941, p. 114). But Follett considers these "sparks" as positive energy and a source of creative change. Rather than seeing differences as obstacles and seeing conflict as battling, she proposes that differences are opportunities for confrontation and friction of ideas, which mutually influence – or more precisely, *interinfluence*, *interpenetrate*, and *interweave* – in ways which something new and better is created for both parties. Follett (1941) sees human diversity and conflict as the necessary passages to true unity and to higher and higher states of integration and development, as indicated here:

> As conflict – difference – is here in this world, as we cannot avoid it, we should, I think, use it. Instead of condemning it, we should set it to work for us. (. . .) All polishing is done by friction. The music of the violin we get by friction. We left the savage state when we discovered fire by friction. We talk of the friction of mind on mind as a good thing. So in business too, we have to know when to try to eliminate friction and when to try to capitalize it, when to see what work we can make it do. (pp. 30–31)

For Follett, the friction of diversity is not only good but also necessary for evolution to take place and the true source of unity integration. Again, there is no such thing as a static unity according to Follett; there is, however, constant unifying.

## Social Interactions as Coinfluencing Dynamics

### Circular Response

Circular behavior, the iterative back-and-forth of living relations, is the basis of integration. This proposed dynamic back and forth of interinfluencing, interpenetrating, and interweaving through the unavoidable moments of differences, friction, and conflict, leads, according to Follett, to the creation of new and more evolved levels of integration. According to the dynamics of the circular response, behaviors are reactions to the behaviors of others, themselves constructed as responses to the behaviors of others, and so on Follett (1924) explains:

> In human relations, as I have said, this is obvious: I never react to you but to you-plus-me; or to be more accurate, it is I-plus-you reacting to you-plus-me. 'I' can never influence 'you' because you have already influenced me; that is, in the very process of meeting, by the very process of meeting, we both become something different. It begins even before we meet, in the anticipation of meeting. (pp. 62–63)

The dynamics are, therefore, circular and infinite. This view of social interaction has two primary consequences on the conception of change. First, it implies that social systems are in permanent motion and that change is consubstantial to any collective system. Second, Follett's view corresponds to Taylor and Mayo's (as cited in Trahair 1984) notion of the *total situation*: Two individuals are linked by the

mechanics of the circular response and, therefore, they live the same unique situation – the total situation.

As we will see later in this chapter, this implies thinking about power and leadership in quite another way. Stout and Love (2015) also refer to Follett's philosophy as a relational ontology of becoming. Follett had studied Plato and Aristotle's notion of praxis as a human capacity to reflect and act upon the world. Rather than separate managers as thinkers from employees as doers, Follett (1918) proposes a democratic vision where everyone is called to maximize their thinking and doing capabilities.

## The Group Process

As a precursor to group psychology, Follett's work differentiates between crowd and group psychology and, subsequently, educates on group psychology dynamics, which are still, if not even more, relevant for organizational management today. The psychologically regressive tendencies that humans can exhibit in groups (Bion 1957), and which Jung (1923) wanted to prevent by raising individual consciousness, are also what Follett (1918) refers to as crowd psychology, where individual behaviors are "governed by suggestion and imitation" (p. 22). Follett proposes instead a group psychology based on the law of interpenetration and integration. A true group process, as she proposes, is a process of coinfluencing, which invites the full contribution of every member in, collectively, creating something new. Follett elucidates that the group creates something new, while the crowd does not:

> Whenever we have a real group something new is actually created. (…) The object of a conference is not to get at a lot of different ideas, as is often thought, but just the opposite – to get at one idea. There is nothing rigid or fixed about thoughts, they are entirely plastic, and ready to yield themselves completely to their master – the group spirit. (p. 30)

## Leading Change as the Process of Integrating

### "Power-With" and Social Control

One of the most original contributions Mary Parker Follett made in addressing the question of organizational management and change is her distinction between *power-over* and *power-with* management. For Follett, the new social process emerging out of democratic living means relinquishing the Darwinian mindset of survival of the fittest and consequent understanding of social relations as battles of desires with the ultimate victory of one over the other. And move instead toward a more creative and interdependent perspective of social relations in which desires can be confronted, but then integrated to create new and mutually satisfying solutions. Follett believed that true power is cogenerated and ideas could be confronted as

plastic and malleable, thus framing social relations as integrative and creative processes.

For Follett, power-over, albeit inevitable, prevents the free and creative act of self-adjusting and integrating, which a power-with orientation enables. She efforts to distinguish power-with management as "coactive," that is, a voluntary engagement toward integrative solutions, rather than "coequal power"; in other words, "the stage [is] set for a fair fight" (Follett 1941, p. 114), whereas "power-with is a jointly developing power" (p. 114). Follett aims to change the perspective of social relations from "battling" to "creating." Her cooperative perspective explains, according to many scholars, the gradual marginalization of her ideas within a more combative and patriarchal US management culture in the early twentieth century (see essays and commentary by Kanter 1995; Drucker 1995; Child 1995). Whether Follett speaks of individual control or collective control, her solution to control is not to be found in a force "outside" or "over" the individual or the collective but within the individual and the collective's own process of organizing and integrating.

## Change Under the Law of the Situation

Follett's scientific and experimental perspective is best exemplified in her concept of the law of the situation. Rather than focusing on increasing the leader's capacity to persuade or command obedience, Follett depersonalizes the giving of orders by making everyone observant and cooperative learners of the situation. The conduct of change is fully impacted by this conception of the given order. The necessities of the situation govern, and leading change is no longer a matter of persuasion or conviction.

While the law of the situation is appropriately praised as a means to avoid arbitrary abuse of power in decision-making, thus depersonalizing decision taking, Follett adds that the law of the situation also repersonalizes decisions. This repersonalization Follett mentions is remarkable by the notion that listening to everyone's point of view and appreciating the different aspects of a situation enable an inclusive and unitive experience.

## Leadership as Integrating

Follett proposes a totally renewed version of leadership (when compared to, at least, Thomas Carlyle's Great Man Theory, which was dominant in her time, and more recent transformational and situational representations of leadership) – a more egalitarian version of leadership in which members of a group could be cocreators of their common purpose and coleaders of their future. The functional leader, according to Follett, facilitates the constant integrating and learning of the living system as it evolves and grows through elevating levels of conflicts and integrations and from purpose to purpose, as she explains here:

> The best leader does not ask people to serve him, but the common end. The best leader has not followers, but men and women working with him. [...] We want to arouse not the attitudes of obedience, but the attitudes of co-operation, and we cannot do that effectively unless we are working for a common purpose understood and defined as such. (Follett 1941, p. 262)

The leader no longer convinces others to follow. He or she is no longer the one who expresses the loudest, a power of persuasion. The leader is the one who connects everyone together. In the dynamics of organizational change, the leader creates the team by promoting, via integration, the emergence of a collective power as a form of democratic power-with, rather than any authoritative power-over, dynamic.

## New Insights: Looking Backward to See the Path Forward

One theory as to why Follett's work has gone underappreciated for so long, especially in America, is the American penchant to adopt management "gurus" and the latest fads and innovations of the day (Feldheim 2004; Parker and Ritson 2005). Why look backward to Follett when one should look forward?

We should look to the past, because Follett's "old" (read: presented several decades ago) ideas are "new" again. Today's increasing appreciation for Follett's work – as evidenced in small part by her inclusion in this very text – signals that the mismatch between Follett's theories and the times has resolved itself, as if Follett's ideas have been waiting for human civilization in general, and Western industries specifically, to catch up.

Many current management theorists are trying to make up for lost time. Michele Simms (2009) lists "Peter Drucker, Kurt Lewin, Warren Bennis, Rosabeth Moss Kanter, Lawrence and Lorsch, and Blake and Mouton, to name a few" as citing Follett as "ahead of time given her foreknowledge of systems theory, action research, and leadership" (p. 352). Management theorists and practitioners have had no choice but to evolve to her ways of thinking not only about organizational systems but also about the people who manage and work within them, in order to benefit from her insight. The movement away from purely scientific management toward human-oriented behavioral management has necessitated this evolution.

Indeed, Mary Parker Follett's theoretical edifice has become a source of insight for managers, consultants, researchers, and mediators involved in the facilitation of change. Her theories can be appropriated today to guide the development of social tools for social interaction and for structuring support-group work. Particularly, understanding her dynamics of integration in group psychology sheds light on the levers needed to initiate the processes of building common representations of a situation (not merely compromises between different individual representations) and of resolving complex problems in a creative and collaborative manner.

In this section, we discuss how Mary Parker Follett's work has endured in modern approaches to conflict resolution, to leadership, and to change management. First,

we feature Follett's concept of integration as the foundation for interest-based conflict resolution. Then, we highlight mediation expert Albie Davis' (2015) case on how Follett's management philosophy influenced the leadership of the National Aeronautics and Space Administration (NASA) during the 1960s. Finally, we once again call on Follett's theories on conflict and offer a prescription for leading others through change.

## Mediation and Conflict

Mary Parker Follett, in her speech to a personnel administration conference in 1925 (see Fox and Urwick 1973; Graham 1995), posits three main ways of resolving conflict: domination, compromise, and integration. These conflict resolution modes have been adapted by many researchers, including Robert Blake and Jane Mouton (1964), Richard Walton and Robert McKersie (1965), Paul Lawrence and Jay Lorsch (1967), and Ralph Kilmann and Kenneth Thomas (1977).

The genius of Follett's insight about interest-based conflict resolution is evident in her observations of human nature. Follett notices that domination, where we have a winner and a loser, might satisfy us in the short term but "is not usually successful in the long run" (Follett, as cited in Davis 2015, p. 269). The implication here is that domination does not seek to cultivate and to preserve relationships that Follett sees as necessary for the practice of integration. Follett remarks that compromise is also human nature to want to maintain harmony, so compromise "is the way we settle most of our controversies...Yet no one really wants to compromise, because that means a giving up of something" (Follett, as cited in Davis 2015, p. 269). Integration, then, cultivates and preserves relationships and builds toward a solution leaving both parties fulfilled and respected.

Follett's process-oriented and humanistic methods of going beyond understanding to seek common interests actively promote cooperation and emphasize relationships in conflict resolution. Increasing diversity, social complexity, and intractable problems demand more than a zero-sum or distributive approach to negotiation and conflict resolution (see Fisher and Ury 1981, 2001; Fisher et al. 2011).

Follett's interest-based conflict resolution approach has been advocated by Walton and McKersie (1965), where, in their classic *Behavioral Theory of Labor Negotiations: An Analysis of Systemic Interaction*, they promote the option of integrative negotiation as a means to solve problems and to maximize solutions through creativity and collaboration. "[T]he parties see themselves as having a joint problem" (Kochan and Lipsky 2003, p. 16) where they must address both conflicting and shared interests.

The Thomas-Kilmann Mode lnstrument (TKI), notably, has adapted and expanded upon Follett's conflict resolution modes to create a model of five conflict resolution styles: competing, avoiding, accommodating, compromising, and collaborating; each style considers how one is concerned with fulfilling one's own interests vis-à-vis another party's interests. The collaborating style maximizes concern for fulfilling one's own interests as well as those of the other party, thus maximizing the

solution and representing what we identify as Follett's approach to integration and interest-based conflict resolution.

Roger Fisher and William Ury (1981) credit Follett's common-interest approach as the cornerstone of their famous *Getting to Yes: Negotiation Agreement Without Giving In*. Fisher and Ury, with Bruce Patton (2011), call their approach *principled negotiation*; the point is to reach beyond compromising in a collaborative environment where parties can maximize solution toward mutual advantage. Fisher and Ury were the first directors of Harvard's Negotiation Project. Today, various scholars and practitioners from "widely different intellectual and professional traditions associated with Harvard's Program on Negotiation all characterize their approach as 'interest-based'" (Sebenius 2013, p. 163), sustaining Mary Parker Follett's philosophy in research and in practice.

## Humans as Change Agents: The Leadership Example of James E. Webb, NASA

Mary Parker Follett's concept "of group power at the level of organizational leadership" (Lambright, as cited in Davis 2015, p. 275) played a significant role in change management enacted at a critical time on the American side of the Space Race. James E. Webb, who served as the second administrator of the National Aeronautics and Space Administration (NASA) from 1961 to 1968, led the Apollo 11 mission of "putting a man on the moon and returning him safely to earth" (p. 279). The 1960s for NASA was a time of great technological change, expanding scope, and intense focus, yielding the Mercury, Gemini, and Apollo projects (Garber and Launius 2005).

Mediation expert Albie Davis (2015) studied two documents authored by Webb, one a 1979 letter Webb wrote to then-doctoral student Frances Cooper and the other a transcript from a lecture Webb delivered to the General Accounting Office (GAO). Webb, in both documents, speaks at length about Follett's impact on his work under President Harry S. Truman at the Bureau of the Budget, on his leadership of NASA, and on his relationship with President John F. Kennedy. Davis articulates areas where she sees Follett's imprint on Webb's approach to managing groups, citing, specifically, "power-with" relationships and "the law of the situation" (p. 280).

Webb (as cited in Davis 2015) professed to Frances Cooper that "[Follett's] influence was indeed profound in all I did at the Bureau of the Budget and at NASA" (Webb, as cited in Davis 2015, p. 277). He also invoked Follett's own words in his speech to the GAO, remarking how Follett "saw the duties of the leader of an organization as to 'draw out from each his fullest possibilities'...as 'more responsible than anyone else for the integrated unity which is the aim of organization." ...[T]he best leader is not the greatest hustler or the most persuasive orator or even the best trader, the great leader is he who is able to integrate the experience of all and use it for a common purpose." (Webb, as cited in Davis 2015, p. 277).

Davis (2015) implies that Webb was at a disadvantage in that he was a manager who "never [was] an engineer and never [saw] a rocket fly" (Arlington National

Cemetery, as cited in Davis 2015, p. 275). He "solv[ed] his dilemma" by creating a "triad" of himself and NASA's two best engineers, Hugh Dryden and Robert Seamans. Webb, for his part, contributed "rich management and political experience" (p. 275). Each had autonomy in decision-making, but "[n]o policy would be approved for NASA until the three. . .had talked it over" (Webb, as cited in Davis, p. 275). All three gentlemen regarded each other and their respective ideas with respect – an integrative group process.

Follett's vision of the group process as a cocreative experience can still be used today as a roadmap for groups to work productively as innovative collectives. Her three-staged group process, as outlined in her 1918 work *The New State*, of the collective idea, the collective feeling, and the collective will foreshadows many of today's collaborative approaches, including Appreciative Inquiry (Cooperrider and Whitney 1999, 2005) and Search Conferences (Weisbord 1992), related to managing organizational change.

## Legacies and Unfinished Business: Mary Parker Follett – A Prophetic Legacy

Mary Parker Follett is an intellectual giant whose ideas are still considered prophetic and insufficiently recognized. Since Follett's death in 1933, writers in the field of organizational change and management have periodically praised the woman's genius and called for greater education and application of her ideas. Metcalf and Urwick (1941), for instance, attest in their introduction to *Dynamic Administration: The Collected Works of Mary Parker Follett*:

> Fifteen years ago Mary Follett expounded a philosophy of management that even to-day is a generation ahead of practice, and one can find therein a significant parallel with the pioneering work of Frederick W. Taylor. It is as modern and applicable to-day as it was when first she spoke; it will be as modern and applicable to-morrow. (p. 9)

Today, contemporary thought leaders in the field of management and organizational change (see Graham 1995) unanimously acknowledge three things: (a) how much Follett's management philosophy was avant-garde and pioneering for her time, (b) how little knowledge and recognition there is of her as a theorist and of her ideas, and (c) the still impressive relevance, if not importance, of her integrative philosophy in helping us understand and manage change in all aspects of life today. Rosabeth Moss (1995), in particular, points out:

> Follett focused on that which makes us most human, but which is almost the most difficult to do and likely to bring the least short-term glory. As she herself put it, 'integration leaves no thrill of victory' the way adversarial management does. (p. xviii)

Management theorist Peter Drucker (1995), having discovered Follett's work later in his illustrious career, shares Kanter's (1995) admiration: "[Follett] was the

prophet of management. Management and society in general should welcome her return" (p. 9).

Paul R. Lawrence (1995), confesses that, although he was exposed to Follett's writings as a Ph.D. student at Harvard, he could not appreciate then the significance of her writings:

> I found her work invaluable, but the truth is that I simply did not know enough about management to appreciate it *fully*. ... Thus I must humbly confess that her work was not more recognized by me because I was not that wise. Perhaps it was so with others. (p. 291)

While Follett's audience was originally concentrated in the United States and Great Britain, her international appeal is also highlighted by Japanese professor Tokihiko Enomoto. Enomoto (as cited in Graham 1995) testifies that Follett's integrative philosophy has long been valued and recognized in Japan, where the integrative group process is not perceived as a threat to an individual's identity, as it could have been in Western culture. Enomoto questions, "How is it, one might well speculate, that Follett, still today an unknown quantity in the United States, is known and highly prized in Japanese management circles?" (p. 242).

## Mary Parker Follett: Unfinished Business

As the twenty-first century evolves with increasing complexity, diversity, and challenges to effective management of democratic institutions, Mary Parker Follett's ecological philosophy remains as fresh and relevant today as it did 100 years ago. Kanter (1995) presents a prescription for managing change today: "And now? We should all stand on Follett's shoulders in order to see further into the possibilities for organizational perfectibility – even as we see the limits to a belief in human goodness" (p. xviii).

While so many aspects of Follett's integrative philosophy endure as practical legacies in managing today's organizational change, we propose to conclude this reflection by commenting on what Follett considered to be salient key challenges to integration. Follett (1941), in her seminal opening conference speech on constructive conflict, posits first:

1. *Finally, let us consider the chief obstacles to integration. It requires a high order of intelligence, keen perception and discrimination, more than all, a brilliant inventiveness; it is easier for the trade union to fight than to suggest a better way of running the factory.* (p. 45)

Follett ideates her core notion of integration as a creative act, one in which every single person is responsible for their own integration within themselves and with others. Rather than organize human relations around a logic of "fighting," Follett favors instead the creative perspective of integrating, which unifies common desires and can create "win-win" solutions. But integrating is often more demanding in time, energy, good will, and inventiveness than fighting and power-over settlements of differences and direction. Follett's vision of leadership as an act of integrating

around a common will extends the concept of transformational leadership to a cooperative and cocreative experience of unifying.

Follett's ideas remain novel in how they address the human and social aspects of human governance, focusing on the dynamic, active, and relational perspectives involved in managing human systems. Again, circular response demands that managing change, ideally, should be interactive and dynamic in order for an organization to adequately respond to the needs of the situation or problem at hand and to new ones as they arise.

According to Follett, organizations, and life and behavior within them, are not comprised of linear relationships between variables (e.g., people, actions, concepts, etc.). Follett provides a "conceptual bridge" between the social sciences and the natural and physical sciences in studying organizations (Mendenhall et al. 2000, p. 200). Also, a nonlinear approach to studying organizations is useful because of contingencies; "facts change value over time" (Follett, as cited in Boje and Rosile 2001, p. 102).

Follett's ideas on nonlinearity in organizations were presented years before social processes became a named area of study. Yet they promoted an interindividual mind-set beyond instruments, data collection, and analysis toward experimentation, participant observation, and putting facts into appropriate social contexts in order to understand organizations better. This nonlinear (read: creative) process cannot take place without solving the second obstacle to integration, the need for dominance and a power-over attitude toward others and the situation, which Follett identifies:

> 2. *Another obstacle to integration is that our way of life has habituated many of us to enjoy domination. Integration seems to many a tamer affair; it leaves no "thrills" of conquest.* (p. 45)

Follett's egalitarian philosophy appears to be part of the explanation for her relative disappearance from the front stage of leading management thinkers after her death. John Child (1995) observes how Follett's egalitarian vision fell behind the conventional hierarchical vision proposed by contemporaries such as Elton Mayo:

> So when British management writers (including Urwick) looked to synthesize the ideas of the two thinkers (Follett and Mayo) into a common managerial philosophy, they adopted a vision of paternalistic, top-down management that came primarily from Mayo and his colleagues and that was in fact, intrinsically alien to Follett's basic premises. (p. 88)

Power-with management, then, is a cocreative way to channel human potential toward common ends. It is not a fair fight of equals but a genuine coengagement toward integrative solutions.

> 3. *Another obstacle to integration is that the matter in dispute is often theorized over instead of being taken up as a proposed activity.* (Follett 1941, p. 46)

Celebrated with such luminaries as William James, Kurt Lewin, and John Dewey, as a foundational scholar of experiential learning (Kolb 2014), Follett constantly reminds her audience that integration is an active, experimental, and pragmatic practice of interinfluencing, interpenetrating, and interweaving.

Follett's point about studying organizations is that simple understanding is not enough; possibilities for increasing and enhancing productivity and moral and social progress must be identified and enacted: "[W]e want something more than [simply saying what is or what should be]; we want to find out...the possibilities now open to us. This we can only discover by experiment" (Follett, as cited in Mendenhall et al. 2000, p. 203).

4. *A serious obstacle to integration which every business man should consider is the language used. We have noted the necessity of making preparation in the other man, and in ourselves too, for the attitude most favourable to reconciliation.* (Follett 1941, p. 47)

Follett here again precedes socioconstructionist understandings of management and the importance of language in managing organizational change and conflict (Cooperrider and Srivastva 1987; Gergen 1982; Weick 1979). Follett's process-oriented and humanistic philosophy seeks common interests and promotes cooperation in conflict. Conflict resolution and negotiation are often understood to be processes (Rubin and Brown, as cited in Stoshikj 2014) in which human beings participate.

Increasing diversity, social complexity, and intractable problems demand more than a zero-sum or distributive approach to negotiation and conflict resolution (see Fisher and Ury 2011). We find that we can once again look toward Follett's ideas about coordination to examine integrative approaches to resolving conflicts and navigating negotiations. Ever the pragmatist, Follett views resolving conflict as a practical exercise, in that conflict cannot be avoided, so people should make it work for them (Davis 2015).

5. *I have left untouched one of the chief obstacles to integration – namely, the undue influence of leaders – the manipulation of the unscrupulous on the one hand and the suggestibility of the crowd on the other.* (Follett 1941, p. 47)

Again, we see here Follett's reassertion of the primacy of the group process above and beyond any arbitrary form of power-over, or crowd, suggestion. Follett's vision of scientific management in that sense possesses an unscrupulous respect for facts and all factors and influences involved in a situation.

An understanding of Follett's ideal organizational structure is helpful here: Follett's "organization is well coordinated with a 'horizontal rather than a vertical authority' "(Follett, as cited in Wheelock and Callahan 2006, p. 265). "Authority is not exercised hierarchically. Instead, authority is exercised in reciprocally conditioned relationships" (Fry and Thomas 1996, para. 5). Follett is describing a movement, trending in recent decades, from mechanistic, taller organizations toward more organic, flatter organizations (Colquitt et al. 2015).

The idea of "discovering orders" as an interindividual, participatory process, for example, aligns with Follett's concept of the law of the situation. We see that Follett has laid the foundation for workplace empowerment (Eylon 1998) through the introduction of reciprocal leadership (Follett, as cited in Wheelock and Callahan 2006). Moreover, "anyone can be a leader if they possess the necessary competencies for the current circumstances (McLarney and Rhyno 1998, p. 294).

A manager's approach to making decisions "reflects the process the leader uses to generate and choose from a set of alternatives to solve a problem" (Colquitt et al. 2015, p. 467). Elton Mayo, for instance, views managers from a patriarchal perspective as having superior status and directed by a "logic of cost and efficiency," while employees followed, guided by a "logic of sentiment" (Kelly 1966, p. 74). Mayo's view is philosophically and practically at odds with a more egalitarian approach proposed by Follett. Follett promotes educating employees about the "general business...prospective contracts, even opening of new markets" (Follett, as cited in Boje and Rosile 2001, p. 99).

Follett, in contrast to Mayo, sees functional differences between managers and employees, but her humanistic and integrative philosophy of "interinfluence" deems both to be fundamentally equal. Both managers and employees, according to Follett, are called, respectively, to express their full creative potential to think, to feel, to do, to follow, and to lead together in a common purpose – and to become fuller human beings in the process: "There is no above and below. We cannot schematize men as space objects. The study of community as process will bring us, I believe, not to the overindividual mind, but to the interindividual mind, an entirely different conception" (Follett, as cited in Héon et al. 2014, p. 234).

6. *Finally, perhaps the greatest of all obstacles to integration is our lack of training for it. In our college debates we try always to beat the other side.* (Follett 1941, p. 48)

The Greek philosopher Erasmus professed, "We are born animals but we become human." Follett's early social entrepreneurial work and creation of nationwide community centers is evidence of her belief in the need for group training in democratic living—specifically, in group organizing, cooperation and dialogue, prerequisites for free and creative self-governance.

## Conclusion: Follett, Perennial Wisdom for Managing Change

Follett's scientific and integrative approach to management favors methods that can elicit the greatest autonomy and creativity in every member of a group while simultaneously unifying each member's contribution toward a common end (McGregor 1960).

Follett's integrative philosophy of addressing conflict and problems "constructively" or "creatively," is particularly and perennially relevant to managing change. In this chapter, we presented the influences that shaped Follett's work, and we highlighted her most important and enduring contributions relying on the core concept of integration. Thus a pillar and paradigm for managing change.

We showed how modern, if not postmodern, her writings and conferences produced between 1918 and 1933 are. Her ideas endure and are as relevant today in governing our period of diversity, complexity and interdependent challenges. More importantly, as well as perceptively and generously, Follett gave us the method. She translated her integrative approach into practical concepts such as power-with management, the law of the situation, the invisible leader and the common purpose, and circular behavior.

Although Follett was trained as a political scientist and specialized in democracy, Follett chose to focus the later part of her life on the emerging profession of business management to find leadership in social innovation and a readiness for social experimentation. Challenging us to consider using the power of business for social good, Follett (1941) avers:

> Men may be making useful products, but beyond this, by helping to solve the problems of human relations, they are perhaps destined to lead the world in the solution of those great problems of co-ordination and control upon which our future progress must depend. (p. 25)

Business management, to Mary Parker Follett, is not only relevant to the conducting of competitive profit-making enterprises but also relevant to the wider question of human government and social innovation in a free and democratic world.

# Jeffrey Ford and the Seemingly Invisible Made Obvious: Pushing Change Scholars and Practitioners to Rethink Taken-for-Granted Truths

# 30

Richard W. Stackman

**Abstract**

In an academic career spanning over 40 years, Jeffrey Ford has repeatedly questioned taken-for-granted truths or recognized something so obvious it begs further thought and study. Seminal contributions on change management from the second period of his career (starting in 1989) are the focus of this chapter. Management, networks, and conversations are the commonalities of his scholarship, and each is evident in a body of work that enhances our understanding of intentional change management through his scholarly contributions – with his wife, Laurie Ford – on the logics of change, the role of conversations in producing intentional change, and the resistance to change. For managers and leaders, Ford's work continues to focus our attention as scholars and practitioners on the ongoing day-to-day efforts to bring about organizational change.

## Contents

Jeffrey Ford considers himself a contrarian, a characteristic he attributes to his mother. If you were to say to him something was "up," he would likely reply: "Well, it may not be up" or "It's not quite up." This contrarian perspective is

R.W. Stackman (✉)
University of San Francisco, San Francisco, CA, USA
e-mail: rwstackman@usfca.edu

reflected, if not pronounced, in his academic career. Over his 40 years in academia, he has repeatedly questioned taken-for-granted truths or recognized something so obvious – at least to him – he was left wondering why hadn't someone else studied it before. Ford is not – in the traditional sense of the term – a "gap-spotting" researcher. Such researchers focus on ever more incremental studies rarely leading to influential theories and insights (Alvesson and Sandberg 2013). Instead, Ford has said what needed to be said and moved on, not interested in producing "endless variations on tired themes" (Ashforth 2005, p. 400). (Direct quotes and other attributions throughout this chapter are from a 3-hour discussion with Dr. Ford in May 2016.)

His academic career can be divided into two distinct periods – 1975–1988 (the period of classic organizational behavior and theory research) and 1989–present (the period of change management theoretical contributions). The seminal contributions from the second period are the focus of this chapter. Management, networks, and conversations are the commonalities of his scholarship on change management. Each is evident in a body of work that enhances our understanding of intentional change management through Ford's scholarly contributions on the logics of change (Ford and Ford 1994), the role of conversations in producing intentional change (Ford and Ford 1995a, 2008; Ford 1999a, b; Ford et al. 2002), and the resistance to change (Ford et al. 2002, 2008; Ford and Ford 2009, 2010). Any review of Ford's record during the second period is not complete without acknowledging his collaboration with his wife, Laurie Ford.

Ford views organizations as networks of conversations. Organizations ". . . exist neither as objective entities nor as meanings people carry around in their heads, but in the conversations for, about, and around a limited number of matters in a few physical places within the particular people usually encountered there" (Ford 1999b, p. 4). These networks of conversations are central to his study of what is *actually* going on in organizations. One is drawn to the rigor of the thinking and, in reading his body of work, how his thinking *changes* how we understand intentional organizational change. His research exemplifies the best in theoretical work: it attracts attention and becomes influential by challenging our assumptions and, consequently, reframing how we study and manage change in organizations.

## Influences and Motivations: Classical Training Meets the Perspective of Laurie Ford

Ford was born into a military family in Waukegan, Illinois, just north of downtown Chicago. His formative years were spent in Maryland when his father transitioned from active military to that of a civilian toxins researcher at the Aberdeen Proving Ground. His undergraduate major at the University of Maryland was marketing (with an emphasis in statistics). His plan was to be a market researcher. After completing an MBA (with a consumer behavior emphasis) at the Ohio State University (OSU), he started his Ph.D. in marketing at OSU. However, he was soon "seduced" by the organizational behavior faculty and students, and he became an organizational behavior major, joining a "great gang" of students who were "talking

to one another and challenging each other." The faculty members, though not prolific researchers, were great teachers. Randall Bobbitt, the chair of his dissertation committee, and Robert Backoff, a dissertation committee member, continually raised provocative questions. And Steven Kerr reminded his students that just because everyone says it is so doesn't necessarily mean that it is.

Over a 40-year career, Ford worked at three institutions: Rutgers University (from 1975 to 1976), Indiana University (1976–1983), and the Ohio State University (1983–2015). The first 14 years of his career reflect that of a classic organizational theorist given his simultaneous study of organization structure and organization decline. Of the 14 published papers during this period, seven were in the *Academy of Management Review* and four in the *Academy of Management Journal*. In one 4-year period, 1979–1982, he published six papers in the two *Academy of Management Journals*. Three of the six were in 1980.

Key influences were James Thompson (*Organizations in Action*, 1967), Herbert Simon (*Administrative Behavior*, 1976; *Organizations* (with James March), 1958), and Paul Lawrence and Jay Lorsch (*Organization and Environment*, 1967). Ford's early research considered the impact of decision makers' cognitive and motivational orientations (Bobbitt and Ford 1980) and decision-making processes (Ford and Hagerty 1984) on an organization's structure and its relationship with its context. Ford was also studying organizational decline. If any work could be deemed a precursor to his work on change, it was his research on organizational decline. Ford (1980a, b) concluded there was something not quite right about how we approached organizational performance, via a decline lens. At the time, poor organizational performance was blamed on management shortcomings, but Ford chose to question whether this was in fact true. Could it be that managers are really competent, working hard, doing the best they can, and what they were doing wasn't working? To his thinking, all organizations will experience periods of decline, and not all organizations will make it, no matter how well managed they might be. His work with Schellenberg addressed which criteria and indicators of performance should be employed, who should set the criteria and conduct the assessment, and what organizational characteristics or other variables are relevant to the study of performance (Ford and Schellenberg 1982). Ultimately, an organization's adaptation process is dependent on the decision maker's causal attributions regarding the downturn (Ford 1985) and the decision maker's ability to detect threats and protect the organization from those threats while stimulating action via response strategies (Ford and Baucus 1987).

His scholarship during this time also explicitly addressed the importance of the longitudinal study of organizational phenomena. Bobbitt and Ford (1980) conclude inconsistencies in research findings are related to methodology, specifically, static, cross-sectional, bivariate studies. His piece on structural hysteresis – as a conceptual framework that introduces the concept of "lag" – indicates that relationships between size and structure in declining organizations do not parallel those found in growing organizations (Ford 1980b). Thus, research on growth and decline should employ longitudinal measures within organizations (Ford 1980a, b). Even his research on decision makers' beliefs (Ford and Hagerty 1984) reflects a longitudinal focus: to

understand the acquisition of causality beliefs entails studying how different cognitive maps get resolved over time among decision makers.

Two papers, published in 1987 and 1988, respectively, mark the transition of Ford's contributions toward change management. Ford and Baucus (1987) refer to the strategic and top-level decision makers as the arbitrators and architects of formal organizational interpretations, which are something more than individuals' interpretations. "Reality is defined through social processes wherein interpretations are offered and affirmed, modified, or abandoned with others' interpretations" (Ford and Baucus 1987, p. 367). There are multiple right interpretations, and successful adaptation – that is, weathering the storm (downturn), unlearning yesterday, and inventing tomorrow – can only be retrospectively known. How organizations evolve into new forms is the basis of the 1988 paper. It is through the "interplay of paradoxical tendencies that transformation occurs" (Ford and Backoff 1988, p. 81).

What connects the two periods is Ford's belief in learning how to manage well. Organization success, and the success of a given change effort, is dependent on managers who manage well over time. By the late 1980s, Ford came to understand that the real test of a manager was his or her ability to manage change. There is a 6-year gap between the paradox book chapter and Ford's next published articles in 1994. In those 6 years, much shifted in Jeff's life. He met his wife, Laurie. And he continued to read widely outside of the field.

Laurie Ford, who earned a Ph.D. in operations research engineering, is coauthor on the three seminal pieces (Ford and Ford 1994a, 1995a; Ford et al. 2008) during the second half of Ford's academic career. Through Laurie, Ford became interested in language, specifically the role of language in the day-to-day machinations of the organization. While both question the obvious, it was Laurie, based on her consulting experience, who brought a distinctly different perspective. She was the one who noted the realities of how it actually worked in organizations did not match existing theories and change models. How they collaborated is a study in balancing theory with practice. Ford would develop the logic – theoretically – before Laurie would critique it, practically. Key questions included: Does this make theoretical *and* practical sense? Does it really work this way? Do we want to – and can we – say this? Overall, Ford's work bridges the scholar-practitioner gap retaining both rigor and relevance, thanks in part to Laurie being the scholar-practitioner in the relationship and Ford the scholar-teacher.

By this time, as noted, Ford was focusing his reading on other areas and authors, the likes of which included Richard Rorty, Kenneth Gergen, and Paul Watzlawick, and away from extant research in organizational behavior and theory. In their writings he saw applications to management, specifically to the management of change. Rorty (1989) argued the chief instrument of cultural change was speaking differently rather than arguing well. Gergen (1978, p. 1357) coined the term "generative theories" which had the capacity to unseat the comfortable truths of wide acceptance. Generative theories, thus, engender a flexibility to enhance adaptive capacity. Finally, Watzlawick is known for his study of international patterns and the five communication axioms, the most well-known axiom being "one cannot not

communicate" (Watzlawick 1978; Watzlawick et al. 1967). Watzlawick also wrote of meta-communication in that the meaning of any communication is part of a communication web of both past and future communications, and the communication webs are further influenced by the relationships among the communicators. Such readings forged Ford's view that "change agents use interventions not to bring about a greater alignment with a 'true' reality, but rather to construct, deconstruct, and reconstruct existing realities so as to bring about different performances" (Ford 1999a, p. 480). This view is distinct from the structural-functionalist view where ". . . the job of change agents is to align, fit, or adapt organizations, through interventions, to an objective reality that exists 'out there'" (Ford 1999a, p. 480).

This constructionist view extended beyond Ford's research; it affected how he taught. In the early 1990s, Ford received a grant from OSU to create a new three-course sequence for the MBA program. The three courses were Impossible Change (a.k.a. Producing Change in Organizations), Managerial Literacy, and High-Performance Teams. Although he had first taught organizational change while at Indiana University, he now admits he did not really start *teaching* until the 1990s when the Impossible Change course was first offered. "It was when I started to invent instead of using [the material that] everyone thought you should teach that I became a professor. I taught my own stuff, and that stuff had to be usable". Pragmatically, Ford recognized that not everything the students learned would work every time. In a chaotic world, the pre-learned formulae and recipes weren't going to suffice (Ford 1994). Instead, students would need to push beyond what they already knew and invent opportunities to produce change in organizations. If there was a technique or model and they could not figure out how to use it or make it work, then it was not useful.

The Impossible Change course was developed around the following graded assignment: students had to produce real change in an organization. There were three caveats to completing the assignment: (1) the change cannot be something that each student could do alone, (2) it must impact more than one person, and (3) it must be something that the student and others say is "impossible" to accomplish (Ford 1994). Throughout the course, students were reminded of the following questions:

- What exactly is the change you want to produce?
- What has to happen to produce the change in the organization?
- How will you know when you have produced the change?

A favorite story from my own formative years in academia is from David Whetten who was speaking at a conference. Whetten, early in his own career, sought out the advice of a mentor when he was questioning whether he would ever see himself as a professor. The mentor responded: "Oh, David, you become a professor when you have something to profess." By the 1990s, Ford became a professor and a renewed scholar, shifting his focus from applying others' theoretical contributions to developing his own. By the 1990s Ford had something to say with respect to change management.

## Key Contributions: Change Logics, Conversations, and Resistance

What Ford came to study and profess was based on the realization that the management of change, as currently researched and taught, was not working. It was not his wife's experience from her consulting work. It was not his students' experiences at their workplaces. What Ford recognized was both simple and substantive: producing intentional change successfully is best facilitated by intentional communication. Organizational change required bringing into existence, through communication, a new reality or set of social structures (Ford and Ford 1995a). To change an organization, managers needed to change the conversations occurring within organizations. Organizations are *networks of conversations*, and if one accepts that premise, the true focus of and unit in producing change is conversation (Ford 1999b). This contribution is the gestalt of the three seminal papers on the logics of change, the role of conversations in producing (intentional) change, and the value of resistance to change efforts.

Before discussing these papers individually, we must dispense with the requisite numerical impact details. The three *Academy of Management Review* pieces are Ford's most cited works to date: nearly 400 citations for "Logics of Identity, Contradiction, and Attraction to Change," over 850 for "The Role of Conversations in Producing Intentional Change in Organizations," and over 560 for "Resistance to Change: The Rest of the Story." The three papers alone account for nearly one-third of his 5000 citations (and counting). Over 50% of his citations are accounted for if one includes the related papers published since 1998.

**Logics of Change**   As cited in the paper (Ford and Ford 1994, p. 756), Goodman and Kurke (1982) had previously argued that both researchers and practitioners alike did not have an adequate understanding of and theoretical framework for change. Ford and Ford address how our logics – our fundamental assumptions of how things are – generate change within organizations (Ford and Ford 1995b). Moreover, alternative logics give a different reality and a different way to construct change. They outline three logics, including trialectics, which they introduce to the change logic debate. The three logics are:

- *Formal*, or *change through replacement*. Identity is viewed as a fixed position and permanent. Change is simply the replacement of one "thing" for another "thing" regardless of why the replacement occurs. There is no specific motivation necessary for change.
- *Dialectics*, or *change through contradiction*. Identity is a unity of dynamic contradictions in which change is caused by the pressure exerted between opposites. Conflict is necessary for change to occur.
- *Trialectics*, or *change through attraction*. Attraction, not conflict, brings about change. The intent of trialectics is not to replace formal logic or dialectics but to supplement and complement them.

Additionally, each logic is defined by its own language or vocabulary:

- *Formal*: Gives people things and certainty, an identity. People constitute themselves in language such that things really are that way.
- *Dialectics*: Provides power metaphors. People must be sufficiently dissatisfied before change can occur.
- Trialectics: Offers a vocabulary of relationship and possibility. There are many things that are possible or attractive.

Ford and Ford (1994) argue it is through discourse individuals can identify underlying logics, making them visible and opening them up to scrutiny. While there is a rich tradition of opposition, conflict, and contradiction with respect to change, trialectics creates the place where the attraction to a vision (or a desired future) drives changes. Based on trialectics, "a proposed change is not an invalidation of something people have done or are doing, which would leave them defending the past, but rather it is an invitation to create a future full of promise (attractive), with an opportunity to be active in its fulfillment" (Ford and Ford 1994, p. 781).

**Role of Conversations in Producing Intentional Change** Intentional change occurs through conversations and the language embedded in (or which dominates) four distinct conversations (Ford and Ford 1995a). Because our points of view are represented by logics, most discussions of organization change – the discussing, the describing, and the explaining of change – happen within these conversations, which occur both simultaneously and sequentially in an organization among its members. A change agent's effectiveness in producing intentional change can be increased through the effective management of the four conversations. The four conversations are:

- *Initiating – starting a change*. These conversations focus on what could or should be done. Such conversations rely on assertions, directives, commissives, and declarations.
- *Understanding – generating understanding*. These conversations examine the assumptions which underlie thinking; they are used to develop a common language among participants, and they help create a shared context in which people learn how to talk to each other. Such conversations are characterized by assertions and expressives.
- *Performance – getting into action*. These conversations identify the agreements for achieving success in terms of results and time by setting clear conditions of satisfaction, insisting on accountability for fulfilling these conditions, and/or communicating straightforwardly to renegotiate the performance agreement. Such conversations reflect interplay of directives and commissives, given the focus on producing intended results.

- *Closure – completing the change.* These conversations bring the change to closure, including the acknowledgment that there are now new possibilities and new futures that did not exist prior to the efforts of those engaged in the change. Such conversations are characterized by assertions, expressives, and declarations.

In a 2008 study, Ford and Ford outline a methodology for creating and analyzing a manager's conversational profile, testing for the under- and overuse of the four conversations with respect to difficult (or stalled) change initiatives. For 2 weeks executives (who were also students) tracked their conversations to identify their conversational patterns. By creating the profile, they could, if necessary, conduct a conversational intervention. They could alter their conversations as needed in an attempt to accelerate, slow, or alter the course of change. The results reflected individuals who relied heavily on initiating and understanding conversations. It was only when they increased the frequency of performance and closure conversations – thus, upgrading the quality and rigor of the conversations – did they perceive marked progress in making change. It is important to note that there is no set sequence or frequency to the four conversations. Each change effort is distinct. Furthermore, a key conclusion provides a cautionary tale to the often-cited recommendation to "communicate openly and frequently." Change is not simply the continuous communication of a new vision, repeated by leaders and top managers. Frequent communication of just the "what" (initiating) the "why" (initiating) will doom a much-needed change effort. The goal is for change managers to shift not only their conversations but also the conversations of all individuals in the organization. And these new conversations must be sustained (Ford 1999a).

**Resistance to Change** While the logics and conversations research reflect the socially constructed reality of change, Ford's contrarian nature, the questioning the obvious, is most evident in the resistance to change research. At its core, the Ford et al. (2008) paper questions extant literature's focus on the change agent. Overwhelmingly researchers have considered the change agent's perspective, ignoring the change recipients' perspective. The presumption is change agents are doing the right and proper things, while change recipients throw up unreasonable obstacles or barriers intent on "doing in" or "screwing up" the change. Resistance is therefore viewed as irrational and dysfunctional. Ford et al. (2008) raise the possibility that change agents contribute to the occurrence of what they call "resistant behaviors and communications" through their actions and inactions, owing to their own ignorance, incompetence, or mismanagement. It is not "why do recipients resist change?" but "why do change agents call some actions resistance and not others?"

From a trialectics standpoint, there is no resistance (Ford and Ford 1994). Resistance is an interpretation given by a change agent to a particular event or circumstance and is not, therefore, some "thing" to be overcome. Resistance reflects an attraction by another to something different. It is not necessarily that people are resistant to a given change; instead, they may be attracted to a different possibility. Resistance can then be understood as the legitimate response of engaged and

committed people who want a voice in something that is important to them (Ford and Ford 2010).

As a response, resistance can be viewed from a network and discourse perspective. Building on a 2002 piece on resistance and background conversations, Ford et al. (2008) argue that resistance, for all intents and purposes, is located in conversation patterns. Existing conversations act like filters for subsequent conversations, making it hard for new conversations to take hold (Ford 1999b). Complicating attempts to alter the conversations (and conversational patterns) are background conversations. A background conversation is an implicit, unspoken "backdrop" within which explicit conversations occur and on which they rely for grounding and understanding (Ford 1999a; Ford et al. 2002). Background conversations reflect an organization's history. Given the paucity of successful change stories, most organizational histories reflect damaged trust, feelings of mistreatment or injustice, and destroyed managerial credibility (through broken agreements or overstating the benefits and understating the downside to change). Instead of outright revolt against a proposed change, change recipient reactions reflect complacency (nothing new or different is needed), resignation (this probably won't work either), and/or cynicism (the change is motivated through self-interest) (Ford et al. 2002). These consequences have to be dealt with to bring closure to the past (Ford et al. 2002, 2008). Successfully dealing with this source of resistance requires distinguishing the background conversations and completing the past.

Resistance is never just about what is happening now. Resistance is also about what has happened before and the meanings assigned to possibilities in the future (Ford et al. 2002). What Ford's research on resistance makes evident is resistance has value. In fact, what is oftentimes construed as resistance is actually evidence that the introduction of a new conversation (about change) is being contested by other conversations (1999b) – conversations between change agents and change recipients, change agents and other change agents, and change recipients and other change recipients. At any given time, the change agents are primarily focused on "how will this change get accomplished?" and the change recipients on "what will happen to me?" (Ford et al. 2008). Finally, one thought worth remembering is "[I]n a world with absolutely no resistance, no change would stick and recipients would completely accept the advocacy of all messages received, including those detrimental to the organization" (Ford and Ford 1994, p. 777).

## New Insights: Leadership Is Not Enough

A paper that has become a personal favorite is one Ford wrote in 1999. It is unfortunate, in my view, that the paper has not been more widely cited. Quite possibly, the paper was ahead of its time. The paper – "Conversations and the Epidemiology of Change" – contains several insights worthy of repeating and of future research. Ford's sense of play with ideas beyond the traditions of organizational behavior is on display with respect to networks and conversations. To write this piece, Ford learned epidemiology and then applied what he learned to

intentional change. In doing so, Ford sought to treat the spread of social phenomena (change) in a manner analogous to the way infectious diseases move through populations to gain new insights into the dynamics of successful intentional change. Specifically, Ford (1999b) queried whether change managers could purposely infect an organization with new conversations that would spread and become part of the organization's network of conversations, altering the day-to-day conversations and the background conversations. Again, rather than simply a tool in the process of change, conversations are central to change. By infecting an organization with a new vocabulary in support of change, managers attempt to stimulate new actions that were previously unimagined possibilities, thus altering underlying assumptions and beliefs (Ford 1999b). Ford's thinking is akin to positive deviance (Spreitzer and Sonenshein 2004) and the introduction of change through intentional behaviors that depart from the norms in honorable ways.

Among the epidemiology terms, there are four – susceptibility, prevalence, incubation, and immunity – that help reframe how we conceptualize, study, and produce change. *Susceptibility* is analogous to "readiness for" or a "receptiveness to" infection. Part of the job of infecting the susceptible organization with new conversations is finding ways to keep the conversations in existence or increase their *prevalence*. Prevalence reflects both the number of conversations in support of the change and also the number of individuals having such conversations. Of particular interest is the *incubation* period. It may take time for the new vocabulary to take hold and to see tangible actions toward change. It is during the incubation period that change managers can misread the absence of an actual change intervention (the infection of new conversations) having any recognizable effect. Such a misread could lead to introducing other interventions, one on top of the other. The result could be an overwhelmed system in the near term where nothing eventually changes. Eventually only the background conversations of complacency, resignation, and/or cynicism prevail.

In reflecting on this piece today, what Ford acknowledges is epidemiology unfortunately tells us more about how to stop an infection from becoming an epidemic. It is easy to kill change efforts by thwarting network ties from altering conversations, especially the background conversations. A sobering conclusion, given the paucity of successful change stories, is the difficulties managers face in changing conversations are reflective of organizations having developed *immunity* to intentional change attempts.

More recently, Ford has turned his attention to leadership with respect to change. In a review of empirical evidence from the past 20 years, Ford and Ford (2012) conclude the leadership of change is more complex than envisioned. The leadership of change involves multiple forms of leadership engaged in different approaches, behaviors, and activities, which likely explain the lack of any consistent findings that would bring about successful change. In turning his attention to leadership, Ford acknowledges that it takes more than just sound management to bring about organizational change. Still, Ford argues that leadership, alone, is not enough either to bring about change. Ford has witnessed leadership become

the sine qua non in change management, squeezing management (and its role) out of the conversation. While it is beyond the scope of this chapter to adequately discuss the distinctions between leadership and management, there remains much to be learned about the management-leadership relationship and how this relationship – rooted in networks and bound through conversations – brings forth successful organizational change. The dynamic nature of change implies that the relative importance and emphasis of different behaviors and the generic functions – task oriented, relations oriented, and change oriented (House and Aditya 1997; Yukl et al. 2002) – managers and leaders enact will vary over the duration of change (Ford et al. 2014).

## Legacies and Unfinished Business: Conversations Matter

Ford's research has challenged our assumptions and reframed how we *study* and *manage* change in organizations. That, in and of itself, is a legacy. Change is longitudinal, and according to Ford it should be studied and implemented longitudinally if we truly wish to create and sustain organizations that thrive instead of merely survive. For academics, single-point data collection excludes the temporality of change and its implications for processes and interactions of leadership (Ford and Ford 2012). "Using only cross-sectional studies misses the psychophysiological costs to leaders and managers, the factors that increase those costs (e.g., resistance and conflict), and the impact these costs have on specific leadership behaviors, thereby overstating the sustainability of leading change" (Ford et al. 2014, p. 25).

For managers and leaders, Ford's work continues to remind us of three interconnected ideas. His scholarly trilogy – trialectics, conversations, and resistance – focus our attention as scholars and practitioners on the ongoing day-to-day efforts to bring about organizational change. First, change is not necessarily about replacement or conflict but also about attraction (trialectics). It is attraction that creates an invitation to fashion a future without invalidating what people have done or are doing. Second, and related to trialectics, resistance has value. Resistance reflects an attraction by another to something different. It is not that people are necessarily resistant to a given change but, instead, they are attracted to a different possibility. Finally, how we converse – the third idea – produces and sustains change. It is through the four conversations that we discuss what future(s) we are attracted to and resolve potentially conflicting views. These conversations help us initiate and understand change; they also focus attention on the actions needed to bring about the change. Change efforts must also be successfully ended so that attention can be turned to previously unimagined possibilities. Conversations matter. If we elect to speak complaints, and complaining spreads, then we should not be surprised when we find ourselves in an organization of complainers (Ford 1999b). Taking liberties, the sentence can be altered: if we elect to speak of change, and the change spreads, then we should not be surprised when we find ourselves in organizations of change agents.

Sasha Galbraith

**Abstract**

Jay Galbraith was the leading scholar and practitioner in the field of organization design. His early work focused on the amount, type, and complexity of information that an organization needed to process in order to get work done. Galbraith's information-processing model of organization design was influential among academic circles and became widely used in the corporate arena. In addition, he developed key concepts such as organization design as a prescriptive model, equifinality, strategy implementation the Star Model™ framework of organization design, the front-back organization, and lateral forms of organization – all of which are used today in the organization change process. Galbraith was unique among his academic colleagues in that his research derived primarily from the clients he advised. His gift was a rare ability to synthesize information and distill it down to useful and repeatable solutions to complex organizational challenges.

## Contents

## Introduction

Jay R. Galbraith was a seminal researcher, theorist, author, and consultant in the field of organization design. He was best known in academic circles for his information-processing theory of organization design. That is, an organization is comprised of people who must deal with information – both predictable and unpredictable – in carrying out the tasks of producing the work. The greater the uncertainty of the task, the more information must be processed by decision-makers in executing the task. Galbraith identified a number of ways that organizations can develop the capacity to handle such variances in information flow. Galbraith's Star Model™ is a practical framework that arose from his early research. It is used worldwide in companies large and small to guide managers who must keep their organizations nimble and profitable in response to strategic initiatives and environmental changes. A humble, insightful and affable man, Jay Galbraith's impact on the academic and business worlds is significant and has stood the test of time.

## Influences and Motivations: Clients Pushing the Envelope

Jay Galbraith was born in 1939 into a working class family in Cincinnati, Ohio. His father, Carl, was a clerk at the local General Motors plant who spent his days (and sometimes nights) chasing missing boxcars full of parts. Carl did not finish high school but relished the fact that his son was academically talented. Galbraith's mother was a homemaker and dubious cook, who became known throughout the neighborhood as "Mrs. Campbell" for her skill at opening canned soups. Galbraith often quipped that as a management consultant, he was merely following his family's

Scottish heritage since his forebears often ended up in the icehouse (jail) for stealing someone's sheep.

Jay Galbraith's grandfather, Jesse Galbraith, was a major influence in his life. Jesse told Jay to do well in school and major in Chemical Engineering so that he could go to work for Procter & Gamble where Jesse had worked. Galbraith did as his grandfather bid and graduated from the University of Cincinnati with a Bachelor of Science degree in Chemical Engineering. Galbraith was in the "work-study" program, which allowed students to work full-time during a semester each year to pay for their tuition during the rest of the year. His job was on a General Motors assembly line. The experience triggered Galbraith's early interest in how factories worked, why so much dysfunction existed within production organizations, and how much information needed to be gathered and balanced along the assembly line. Immediately following graduation, Galbraith embarked on Master and then Doctor of Business Administration degrees at Indiana University. Galbraith won a National Defense Education Fellowship grant in 1962 that paid him the sum of $1,700 per year plus $200 per child throughout his studies. His grandfather, Jesse, was less than thrilled asking him, "Are you going to work for a living or waste your life being a professor?"

During his studies at Indiana University, Galbraith focused on operations management. After passing his written exams in his third year at Indiana University, he changed course and spent the next 6 months reading all the available organization behavior literature. His primary, and arguably most important, influence was James D. Thompson, who taught a graduate class at Indiana University. Each of Thompson's lectures became a chapter in his seminal book, *Organizations in Action*. Thompson was a mentor and encouraged Galbraith's interest in studying organizations as a system, as well as his examination of information processing in organizations. Galbraith explained his intellectual debt to Thompson in the preface of his second book, *Organization Design* (Galbraith 1977).

> He is the one responsible for my focusing on organizations rather than computers. I was extremely fortunate to be able to take his doctoral seminar as he was writing Organizations in Action. The class discussions of each new chapter gave me an appreciation of the man as well as the material. I was greatly impressed with both. After that experience I changed career orientations, and I am still grateful. For this reason, I would like to dedicate this book to him.

Through his readings, Galbraith's eyes were opened to the social and contingency side of business management, which influenced his later development of the Star Model™ framework for organization design. Herbert Simon, a Nobel Prize-winning economist, introduced the idea that there are limits to rational thinking in organizations (calling it "bounded" rationality) and that these limits have important consequences for economic theory. With James March, Simon developed the concept of slack resources in an organization to aid in information processing. Galbraith found Simon's contributions are particularly useful for two reasons. First, Simon spanned a number of disciplines (economics, political science, organization theory, computer

science, sociology, and psychology) all in the effort to understand human decision-making. This cross-disciplinary rigor became a hallmark of Galbraith's own research. Second, Simon developed a new approach to studying organizations that revolved around behaviors and how people make decisions. Galbraith wrote about his debt to Simon in the preface to his 1973 book, *Designing Complex Organizations*, "There are times when it seems to me that I have merely rewritten his thinking on the basis of the last ten years' empirical evidence. The footnotes do not give sufficient credit to [him]."

Alfred D. Chandler and his study of America's largest industrial firms helped Galbraith solidify the connection of an organization's strategy with its particular structural form. Although Galbraith doesn't specifically mention Chandler's influence on him, every one of his major writings cites the contributions of Chandler (1962).

Jay abandoned his research in operations management and pursued his new interest in organization behavior. He changed thesis advisors and asked Larry Cummings to supervise his dissertation. Six months later, on June 29, 1966, Galbraith had completed his doctoral thesis, "Motivational Determinants of Job Performance."

Victor Vroom's motivational model (Vroom 1964) provided the theoretical basis for Galbraith's empirical research. Whereas the prevailing industrial research at the time studied how workers' abilities limited efficiency gains (Simon 1957), Galbraith sought to understand how decision-making limitations and motivation impacted efficiency in workers. Using questionnaires, he polled workers at a Cummins Engine plant in Indiana. He wanted to test a theoretical model that could explain productivity differences among factory workers.

> If such a model can explain a significant portion of the variation and also identify the organizationally controllable variables, it can serve as a basis for removing the decision-making limits of efficiency. (Galbraith 1966)

What Galbraith found was that among all the variables he studied (wage increases, bonuses, fringe benefits, promotions, supervisor and peer group relationships), the most significant impact on increased performance was supportive behavior of the supervisor. At the time, this was an important finding since industrial engineers had always used wage increases to motivate workers.

At 27 years old and a newly minted Doctor of Business Administration, Jay Galbraith joined the Sloan School of Management faculty at MIT. He was terrified. He had uprooted his young wife and two small children (with a third on the way) to move from a sleepy town in Indiana to Boston. For Jay, this was his first and most extreme experience with culture shock. His fellow faculty members were well known and famous for having developed groundbreaking academic theories. At the time, Galbraith felt a bit of the imposter syndrome: unsure of what mistake led him to being installed at one of the top universities in the country.

But everything changed when Galbraith won first prize in the McKinsey Foundation Doctoral Thesis Awards for his dissertation. His colleagues at MIT treated him with newly found respect. And he learned that "they all put their pants on one

leg at a time." In June 1967, during Galbraith's first summer at MIT, the department head was looking around for faculty who could lead a research project out in Seattle. President Kennedy's challenge to the aerospace community to put a man on the moon by the end of the decade left many military contractors scrambling. Boeing needed help organizing their simultaneous efforts in building commercial aircraft as well as delivering on their military and space projects. The problem at MIT was that none of the senior faculty was interested in spending the summer on the other side of the country. Don Carroll, the principal investigator on the Boeing MIT Research Project, appointed Galbraith as the on-site faculty member. For Jay, this was a huge opportunity and he took it on with gusto.

The Boeing study was instrumental for four reasons. First, he was able to test and verify many of the concepts proposed by Thompson (1967) and Lawrence and Lorsch (1967). It was during the Boeing project that he developed his theory on information processing as a critical factor in the design of an organization. Second, it helped him synthesize his emerging view of an organization as a collection of interrelated policies that management can manipulate. For Boeing, this observation was key since management's goal was to implement a change management program inside the company. Third, it gave him a front row seat to observe how matrix organizations work (or don't). Boeing had implemented a matrix organization to tackle the twin demands of producing technically excellent products for the space program as well as meeting commercial airline customer delivery demands for the 727, 737, and 747 aircraft in an extremely competitive environment. And finally, the fact that Galbraith spent 2 months interviewing and consulting with a variety of people at different levels within Boeing's manufacturing facilities taught him that clear, concise, logical, and well-framed ideas are the most effective way to communicate his observations and analyses. This talent served him well as he went on to define many of the concepts he is now known for.

In 1972, Jay took a leave of absence from MIT to join the European Institute of Advanced Studies in Management in Brussels, Belgium. This was driven in part by a desire to refocus on his family, which had paid a price for his academic commitments and frequent travel. During his 2-year tenure as professor there, he wrote his first book, *Designing Complex Organizations*, which, among other things, expanded the research he had published in a 1971 article on matrix organizations.

Galbraith returned to the States in 1974, and Don Carroll, then Dean of the Wharton School, hired him as a fully tenured professor. One of the courses Galbraith taught was on matrix organizations. At the time, Wharton was taking its course offerings to executive audiences around the country. Galbraith was tapped to teach a course on organization design with an emphasis on matrix organizations. He loved it. He was traveling frequently and became known as an expert in matrix organizations and organization change. He started consulting with companies on their organizational issues and discovered that many of them were coming up with new and unique solutions to thorny problems. In 1978 Galbraith resigned his tenured position at Wharton and embarked on a full-time career as a management consultant. Many, if not all, of his colleagues thought he had lost his mind.

For the next 8 years, Galbraith consulted extensively with companies large and small. Procter and Gamble was an early client, and their evolution at the time into a three-dimensional matrix organization challenged him to help them manage it and the requisite organization changes. He later developed the front-back organization concept as a result of work at P&G. At Intel he worked with Andy Grove and his team to refine their organizational response to rapid product and material advances in the semiconductor industry. Intel became a classic example of a balanced matrix with various levels of integrator roles and hierarchical teams. Andy Grove was a unique leader with many talents, but what Jay learned most from Grove was how he navigated, managed, and even embraced the numerous conflicts inherent in a matrix organization. Hewlett-Packard was a frequent client where the HR and organization development groups appreciated his no-nonsense prescriptions for integrating the various hardware units – but where senior management systematically ignored his advice. According to Jay, every time an HP unit got too big, the senior leadership team effectively put the management challenge into the "too hard pile" and split the group apart. Jay learned about innovation and start-ups through his work with Exxon Enterprises and 3M. Motorola, Shell, and Honeywell taught him about cross-border expansion and how to handle country managers in product- or service-driven organizations.

Galbraith's consulting work took him throughout the United States, Europe, Asia, and South Africa. He loved the travel, but he found he missed the intellectual stimulation from his colleagues in academia. So he contacted Ed Lawler and in 1986 joined Lawler's Center for Effective Organizations at the University of Southern California. It seemed to be the perfect match since the Center's mandate was to do "useful research" in organization design, change, and management. Galbraith and Lawler collaborated on a number of research and consulting projects and produced two books and a number of articles. The partnership between Galbraith and Lawler grew from mutual respect and admiration of the other's work and turned into a personal friendship that spanned decades.

Jay Galbraith's research methods were somewhat unorthodox. His primary source of information came from the business press (*Financial Times*, *Wall Street Journal*, *The Economist*, *Businessweek*, *Fortune*), which he combined with extensive knowledge of, and communication with, executives at leading companies. He also consulted the academic literature and corporate white papers for current studies on topics that interested him. For example, when researching the impact of data analytics ("Big Data") for his last book (Galbraith 2014a), he collected articles on IBM, Nike, Procter & Gamble, GE, Bosch, and many of the large banks. He consumed any and all publicly available information on those and other companies as well as recent research on data analytics. (Galbraith had an ability to construct a surprisingly accurate organization chart based on his reading of a company's annual report and other public data.) He contacted executives at Analog Devices, P&G, IBM, and others who could provide clarification on how their companies handled processes related to data acquisition and use. The products of that research were several chapters in his last book and an article on the impact of Big Data on organizations (Galbraith 2014b).

However, much of Jay's most prescient research was inspired from his consulting work with clients. During his 45 years of consulting, Jay's client list reads like a "who's who" of the global business world. He often said that he learned more from what cutting-edge companies were doing organizationally than from any academic publication. And as consultant to many senior managers, he was able to provide a series of road maps to help them implement organization change.

In the mid-1970s, as a result of his work with Shell and British Petroleum, Jay produced an article on how multinationals manage their talent. He specifically addressed how rotational assignments across borders built personal networks and shaped the culture of the organizations. Twenty years later, after a number of consulting assignments with IBM, UBS, Asea Brown Boveri, Nestlé, Nokia, 3M, and others, Jay wrote a book on organizing global corporations (Galbraith 2000). It incorporates much of what he learned during an 18-month project in Indonesia studying joint ventures. It also discusses how global companies run their businesses in regions, like China, that have very active host governments. And finally, it shows how companies handle the complexity of five-dimensional matrix organizations spanning multiple regions in the world. All of those topics (and their solutions) were prompted from Galbraith's work with clients.

Some observers have wondered who was the source of many creative organizational solutions: the client companies or Galbraith's advice to them. Citigroup, for example, had pioneered global customer accounts in the late 1980s. When paired with its extraordinarily detailed accounting and information system, Citibank could run reports on customer, product, and service profitability across any number of segments (industries, geographies, sales channels, and account representatives to name a few). Cisco used hierarchical teams and councils to manage multi-dimensional profit centers across diverse geographies. Analog Devices was struggling with how to respond to customer demands to provide more than just a handful of products and integrate them with diverse software and competitor product offerings into "solutions." These examples found their way into several of Jay's writings.

In 1995 Jay moved back to Europe, but this time to Switzerland where his second wife, Sasha, was born. He joined the faculty of IMD (the International Institute of Management Development) in Lausanne, which was under the direction of Peter Lorange. For the next 3 years, he taught a full load of courses to the mostly European executive audience. It was a difficult time for Jay, as he felt underappreciated by both the faculty and students. Students criticized him for being "too academic" or offering too many American examples (and not enough European/Russian/Asian examples). Many of the faculty disdained anyone with a perceived "guru" status, which was somewhat paradoxical since Jay was widely praised for his humility. But around the middle of 1999, Nathaniel Foote, the Organization Design Practice Manager at McKinsey & Co., asked Jay if he wanted to work with a group of practitioner/academics to study best practices in organization design. This project invigorated Jay. It was everything he loved: working with cutting-edge companies that were pushing new limits on organizational complexity and collaborating with intelligent, thoughtful, and creative colleagues to analyze and publish the research. In mid-2000 Jay moved back to the United States where most of the project work was taking

place. That study culminated in Jay's book on customer-centric organizations (Galbraith 2005).

In 2005, Don Robert and Chris Callero, CEO and COO, respectively, of Experian, the large consumer data and credit reporting company, contacted Galbraith. The industry was growing rapidly, and they were experiencing growing pains in managing the disparate business groups in the company. This began a 5-year partnership wherein Galbraith helped them design and install a matrix organization as well as sort through the various country/region/business manager roles as Experian expanded internationally. What was notable here was that matrix, having long been banished as an organization form that "doesn't work," was coming back into the management lexicon. Managers realized that a matrix organization was the only way to meet customer demands to produce high-quality products and/or services, deliver them around the globe with localized specifications, and do so at the lowest cost with minimal lead times. Experian and several other clients were all wrestling with the dilemma of how to manage a matrix organization. This led Galbraith to write a book on the topic (Galbraith 2009). In addition, Experian, with its treasure trove of consumer data, showed Galbraith how it was manipulating that information to create new products, services, and entirely new lines of business. The Experian projects were what sparked Galbraith's interest in studying "Big Data" as an emergent dimension in organizations.

## Key Contributions: Practical, Useful Prescriptions for Change

Jay Galbraith was arguably the pioneer, leader, and father of modern organization design (Obel and Snow 2014). He spurred a new domain in management theory (organization design) by viewing organizations under a normative lens combining organization theory with organization behavior.

Jay Galbraith was an odd bird in the sense that he straddled the two, somewhat mutually exclusive, worlds of academia and corporate management. And each world cites two significant contributions (as well as a few corollary contributions) that Jay has made. It is fitting, then, that he was honored in 2011 by the Academy of Management with the Distinguished Scholar-Practitioner Award. It's an award given to the few academics in management who have successfully applied theory in practice and whose scholarly works have substantively affected the practice of management. One of his colleagues, Richard Burton, said of Jay, "As an academic, he spoke to practitioners. As a practitioner, he spoke to academics" (Obel and Snow 2014).

### Information-Processing Theory

Galbraith's first and most important academic contribution was that organizational complexity is a result of task uncertainty (Galbraith 1968, 1973, 1977). The concept

is also often cited as Galbraith's "information-processing theory of organizations" and resulted from a research project at Boeing.

The greater the uncertainty of the task, the greater the amount of information that has to be processed between decision-makers during the execution of the task. To reduce task uncertainty one has to either reduce the amount of information required or increase the amount of information processed. In order to achieve one or the other, the organization has four organization design strategies it can pursue:

1. Create slack resources (increase lead time, inventory, or manpower).
2. Create self-contained tasks that are predictable and rules driven (thus requiring less management oversight).
3. Invest in vertical information systems (bring the information down to the decision-makers, automate routine decisions, match decision frequency with the need).
4. Create lateral relationships (enable joint decision processes across lines of authority).

Under each of the four design strategies, Galbraith further developed specific options that the designer can choose from. Each option has an organizational cost in management time and financial and/or human resources. Galbraith made it clear that a cost-benefit analysis had to be considered before implementing any design change. This "information processing" view of managing task uncertainty became a key problem in the field of project management and especially matrix organizations.

## Equifinality

A second important, and often overlooked, concept proposed by Galbraith is the notion of equifinality. That is, an organization designer has several, equally feasible, design choices in solving for a given organizational problem. There is no one best solution. But each choice carries a cost. For example, an organization facing increased uncertainty in the information it must process, it can either respond by centralizing decision-making and investing in technology that will increase the capacity of information processing, or it can decentralize decision-making and create lateral information processes at lower levels in the organization. Both choices can be equally effective options. (See Drazin and Van de Ven 1985, for further discussion.)

## Organization Design as a Prescriptive Field

Galbraith's third contribution was a strong corollary that emerged from his first two contributions: the notion that organizations can and should be actively designed. Furthermore, organizations can and should be easily reconfigurable in answer to environmental and/or strategic changes. Organization change, according to Galbraith, is common and normal, and managers must learn how to lead those changes.

Jay often said, "A good organization is one that lasts until you get your next one." In his 1973 book, *Designing Complex Organizations*, Galbraith delved deeper into his prescriptions for managing task uncertainty by giving concrete examples of how a number of organization change decisions were implemented in several manufacturing organizations. That book is still assigned reading in many graduate level, organization theory courses. Moreover, the concepts he presented are very relevant to organization designers and change managers at large companies today.

His philosophy on organizations held three tenets:

- Different organizational strategies will lead to different structures.
- Organization is more than just structure.
- Alignment among the five policy areas of the Star Model (described below) will bring organizational effectiveness.

But Jay's thinking was never dogmatic. He disdained the "flavor of the month" fads of organization design. He would often press clients to articulate exactly why they felt the need to, for example, install a matrix organization. (And frequently the answer was, "because our competitor is doing it.") Writing in the preface to his book, *Designing the Global Corporation*, Galbraith explained his guiding philosophy:

> I am an agnostic concerning the design of organizations. Despite the fact that I wrote a book entitled *Designing Complex Organizations*, I have always tried to present the dual options of either simplifying the complexity or building the capacity to manage the complexity; both options have costs and benefits. My advice has always been to articulate both the good news and the bad news; if proponents of an option can articulate the bad news of that option, they will make an informed choice.

This view of organization change also points to another subtlety in Jay's thinking. He saw virtually all organization design decisions on a continuum rather than as a discrete set of on/off nominal choices.

## The Star Model™

Jay Galbraith's most enduring contribution to the field of organization change and organization development has been his Star Model™ framework for analyzing organizations, shown in Fig. 1. He was the first scholar to map organization strategy against structures, information-processing functions, reward systems, and people practices. The model was first published in his 1977 book, *Organization Design.*

The Star Model™ has stood the test of time and is used today in numerous corporations and organizations worldwide. The fact that it has been adapted and modified by scholars and practitioners (McKinsey's Seven-S, Mintzberg's Pentagon, Nadler & Tushman's Congruence Model, etc.) is a testament to its inherent value.

At its core, the Star Model™ is a prescriptive framework comprising five "levers" or design policies – strategy, structure, processes, rewards, and people. Each policy

**Fig. 1** The Star Model™
(Reproduced with permission
from Jay R. Galbraith Marital
Trust)

area can be changed and manipulated by the organization designer. The idea stems from Jay's fundamental belief that organizations are collections of individuals who process information in order to get the work of an organization done. Thus, managers can shape employee behavior and culture by changing how power is held and manifested in an organization structure; how information is processed and moves through the organization; how people are motivated, measured, and compensated; and what kind of people sit in particular roles and get promoted. Maximum organizational effectiveness is achieved when all of the "levers" are aligned with the strategy and with one another.

Strategy is at the top and is where any organization change project must start. It defines the company's direction – what the organization is to produce, where it will play and be active in the market, and how it will be profitable. Structure defines the locus of power and where decisions are made. Key design choices are the hierarchical shape of the organization, the degree of specialization in jobs, the distribution of power (centralized versus decentralized), and the amount of departmentalization at each level of the structure. Processes embody the flow of information. Vertical processes, such as business planning, resource allocation, and budgeting, define how decisions to move up and down the hierarchy. Lateral processes, such as new product development and order fulfillment, utilize information generated from cross-functional, cross-unit, and cross-regional groups to enable rapid decision-making. Reward systems work surprisingly well, but they are not always well designed. A good reward system aligns the goals of the employee with the goals of the organization and motivates the employee to perform at his or her best. The final policy area, people, encompasses how human talent is recruited, selected, trained, developed, and moved through the organization. The strategy and structure of the organization will define the types of skills and mind-sets required to implement the organization's goals.

Jay represented the framework graphically as a star, with interconnecting lines joining the five levers, to stress that the five policy areas are interdependent and must be aligned. He was one of the first scholars to propose that the notion of fit or congruence among all the levers is key to an organization's top performance.

## Strategy Implementation

In the late 1970s, the field of strategic management was emerging as an accepted area of research. Chuck Hofer and Dan Schendel organized a conference and published the proceedings in 1977. Jay authored a chapter with Dan Nathanson on the topic of strategy implementation, which became his 1978 book, *Strategy Implementation*, coauthored with Nathanson. The approach, still widely used today, was the first strategic approach to organization design. Jay's information-processing model used the primary tasks of the organization as the prime contingency for design choices. Thus, the design is responsive to task uncertainty, diversity, and interdependence. But Jay was a careful student of others who looked at external factors' effects on design (mostly structure). These included Perrow (technology), Chandler (growth strategy), Lawrence and Lorsch (personality type and tolerance for uncertainty), and others who argued the role of environment. Jay was the first scholar to specifically make strategy the key driver for design choices and any organization change project. Thus, the starting point for strategy implementation was to develop the alignment of the entire organization (not just structure) to the strategy. Jay was also the first to propose a prescriptive and comprehensive model for strategy implementation that incorporated the notion of "fit" or congruence among all organization dimensions. This is a major contribution to the strategy discipline.

## Lateral Organization Processes

By the mid-1980s when matrix organization was widely believed to be unworkable, Galbraith's clients would complain about the complexity in their organizations and ask him to help them simplify their lives. His response was always that complex strategies required complex organizations and that organizations must be as simple or complex as their strategy dictates. But he also believed that organizations should try to "keep it simple" for customers and frontline employees. However, that meant that the challenge of managing complexity sits squarely on the shoulders of managers. Galbraith's many books sought to help management tackle this complexity and create opportunities where competitors have failed. According to Jay, "You get no competitive advantage from doing simple things; by definition, anyone can do them. Firms create competitive advantages by surmounting challenges that their competitors cannot" (Galbraith 2000).

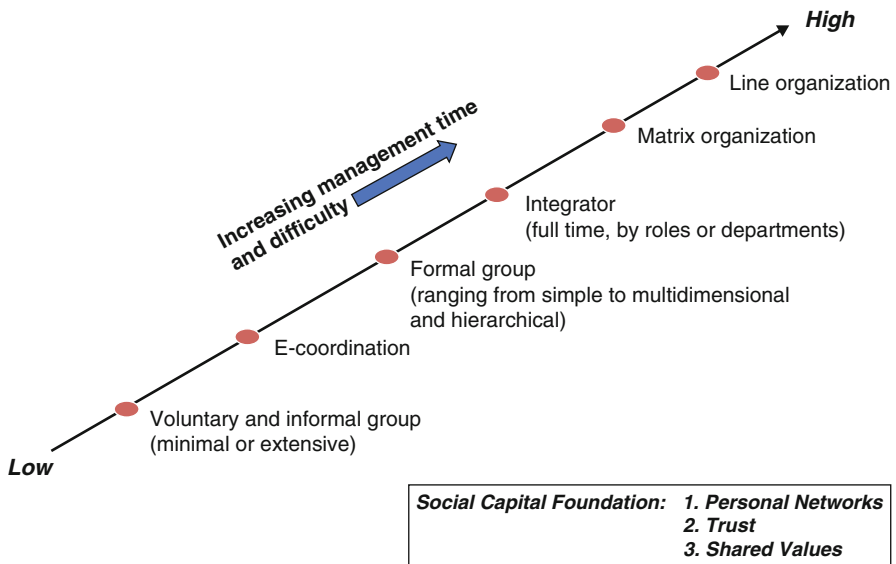
One of the primary ways that management can deal with such complexity is to develop extraordinary skills at lateral processes. Such processes include facilitating voluntary networks, colocating employees at crucial interfaces, connecting important groups electronically, and progressively ramping up the power and influence of people and teams who are responsible for coordinating disparate subtasks in the organization. All of these processes involved increasing degrees of information flow and communication paths. And all of these processes are built upon a solid foundation of social capital. The concept is shown graphically in Fig. 2.


**Fig. 2** Types of lateral forms (Reproduced with permission from Jay R. Galbraith Marital Trust)

Galbraith depicted the types of lateral processes on a "ramp" to make it clear that each step up the ramp required building upon the skills and infrastructure put in place for the preceding lateral process. The cost of implementing more formal processes is management's time and effort. Thus, the organization designer must balance the level of lateral processes required with the concurrent cost to management. The choice of lateral processes underpinned much of what Galbraith discussed when proposing solutions to organizational challenges at client companies. Clients often wanted to "install the new organization" instantly, without going through the change process to build the lateral capabilities necessary for running more complex organizations. Galbraith's "Ramp," as it became known, was crucial in explaining to managers why the social capital foundations were so important. He published a book that dealt specifically with lateral processes (Galbraith 1994).

## The Front-Back Organization

Galbraith's work with clients led him to define a new organizational form, the front-back organization that was a kind of "matrix-lite" organization. The "front" of the organization faced the customer and was organized around customer segments, channels, services, and/or geographies. The "back" was organized around products, functions, and/or technologies. At the time, Citigroup and Procter & Gamble used this type of organization. The challenge fell to management to ensure that the products/technologies produced in the back were what the sales teams in the front

could profitably sell to customers. The front-back organization required intensive communication and coordination between the two ends of the structure. It also required sophisticated management skills in allocating resources, setting priorities, and resolving inevitable conflicts that naturally arise as a result of the often diametrically opposed goals between product- and customer-focused organizations. Well-designed lateral processes were key to resolving many of those challenges. As with his early work on information processing, Jay's view of the front-back organization, and, indeed, most lateral processes, encompassed decisions about the type, intensity, and location of information within the organization that are required to get the task(s) done. And as most of his client work involved organization change projects, he frequently used the front-back model to steer clients away from implementing a full-fledged matrix organization.

## Customer-Centric Organization and Strategy Locator

The late 1990s and early 2000s saw the rise of customer power, and many companies struggled to meet the challenge. Stand-alone products and services proliferated, but the best ones commoditized rapidly because they were easy to copy. Customers became fed up with trying to integrate the vast array of product, service, and software offerings and demanded that companies provide integrated packages or "solutions" when, where, and how they desired. Most companies responded by "putting the customer first" and tried to satisfy demands from their most vocal customers. In Jay Galbraith's view, these efforts amounted to little more than cosmetic changes in how their organizations operated. He argued that most companies, while they thought they were customer centric, were still very much product centric.

In order to be truly customer centric, Galbraith said that companies must do two things. First, they needed to truly understand the complete mind-shift required to organize around the customer. It means embracing a strategy of finding the best solution for the customer and customizing a package – including products and/or services from a competitor if necessary – that provides the best value for the customer. It means structuring the organization around customer segments, customer teams, and customer P&Ls rather than product or business units. It means prioritizing customer relationship management processes rather than new product development processes. It means measuring and rewarding people based on the customer "share of wallet" and degree to which they delight and retain the most profitable and loyal customers. It means giving power to the people who have the most in-depth knowledge of a customer's business rather than the best product engineers. The second, and often most difficult, thing companies needed to do to be truly customer centric was to recognize that they were, in fact, still product centric albeit "customer focused."

Galbraith argued with many clients about how customer centric they were (or weren't). He recognized that not all companies needed to be 100% customer centric. For example, most pharmaceutical companies could exist quite well as a customer-focused but product-centric organization. As was typical for Jay, he saw
**Fig. 3** Matching solutions strategy location to lateral coordination requirements (Reproduced with permission from Jay R. Galbraith Marital Trust)

the customer-centric strategy along a continuum with corresponding degrees of customer centricity that an organization had to adopt. So in order to assist his clients in sorting out where they sat on this strategic continuum, he developed a "strategy locator" that suggested low, medium, or high customer centricity. This is shown graphically in Fig. 3.

The degree of customer-centric strategy depends on four factors: the number of products and/or services a company sells to a particular customer and how different the products and/or services are from one another (scale and scope), how much the company's customers require those products/services to work together (integration), whether the integrated products and services can be sold across a wide variety of industries (horizontal solutions) or if they are industry specific (vertical solutions), and the percentage of total company revenue that comes from the integrated solutions. A company that sells less than five products/services that are mostly the same and require minimal integration in order for them to work properly is pursuing a "low" customer-centric strategy. The large multinational food and beverage producer, Nestlé, falls into this category. By contrast, IBM falls into the "high" customer-centric strategy level of the continuum. IBM sells many different products and services (computer hardware, software, cloud computing, storage capacity, consulting, systems integration, training, technical support, financing, security services, an advanced medical diagnostic assistant, and so on) to thousands of global clients in virtually every industry. Moreover, each customer wants to do business with IBM in a number of different ways. Some, like Mitsubishi, want to purchase an entire trading floor for operations in six global locations. Others only want to purchase a mainframe computer.

For each level of complexity in the solution strategy that is required, Galbraith prescribed a corresponding level of customer-centric structure, lateral coordination processes, reward policies, and people practices, following the Star Model™ framework. As always, there is a cost to implementing more intensive customer-centric steps. Thus, an organization needed to implement only as much as was necessary to satisfy the complexity required by the customer solution strategy. Managers could then use Galbraith's Star Model™ as a road map to ensure that the organization's structure, information processes, reward systems, and people decisions were aligned with the requisite strategy.

## New Insights: Change Management and the Star Model Applied to a Multitude of Organizations

Jay Galbraith's writings have inspired countless scholars and practitioners to probe deeper into the concepts that he pioneered. Of the many researchers whose ideas have been rooted in the information-processing model, two in particular stand out. William Joyce's empirical study of matrix management is the only controlled field experiment that has been conducted on this important type of organization. This study was directly informed by Jay's first book, *Designing Complex Organizations*. Jay was the first to write systematically about these forms, and Joyce's research was the first to present rigorous evidence assessing their impact. Jay and Bill became friends as a result of this mutual interest, and Bill joined Jay in teaching organizational design at Wharton following the completion of his doctoral degree. They remained close friends and colleagues for the next 35 years. Jay's influence also stimulated Joyce to write his book *Implementing Strategy*, in which the information-processing framework was directly applied and extended within the strategic management field.

Galbraith and Joyce had the good fortune of having Robert Kazanjian as a doctoral student at Wharton. Rob was quick to appreciate the importance of Jay's thinking, and together with Jay he revised Jay's book, *Strategy Implementation*. Galbraith, Joyce, and Kazanjian pursued these mutual interests throughout their careers, consulting and teaching together regularly, while each continued to extend Jay's pioneering ideas and prescriptions.

Others also extended the information-processing perspective. Using Galbraith's insights on information shortfalls ("exceptions") during task execution, Ray Levitt at Stanford led a research project to develop the Virtual Design Team simulation of project organizations. According to Levitt, the research team "quantified the magnitude of exceptions in typical engineering organizations and implemented a discrete event simulation of information processing and flow through an organization required to carry out direct work, supervision and coordination" (Levitt quoted (p. 63) in Obel and Snow 2014).

The Star Model™ has provided numerous scholars an opportunity to further develop the concept of fit in organizations. One example is a paper published in

1985 by Jay's colleagues, Andy Van de Ven and Robert Drazin, which examined the fit issue in an empirical study. In addition, a Brazilian consulting firm developed a "matrix index" using the Star Model as a foundation to quantify the type of matrix organization present in various research firms.

Galbraith's Star Model™ continues to be used as a framework for analysis in numerous corporations worldwide. Diane Downey took an early interest in the Star Model during her work with Citibank in the early 1990s. She found ways to operationalize it and develop tools to bring it alive for managers. This led to collaboration with Jay, which resulted in a workbook (Galbraith et al. 2002). In addition, many public entities such as police departments, nongovernmental organizations and even the US Department of Homeland Security, Consumer Financial Protection Bureau, CIA, and National Reconnaissance Organization also rely on the Star Model™ to help them change and align their organizations with changes in strategy.

From my own perspective, I had always been interested in how women progress up the corporate ladder and why so many of them seemed to opt out at the prime of their careers. Many of these former corporate executives left their companies to start their own businesses. In fact, one study (Buttner and Moore 1997) suggested that the main reason women left their high-powered corporate jobs was because the environment and culture did not reflect their own values. It led me to wonder whether Jay's Star Model applied differently to female-designed organizations. That question became the basis for my doctoral research and dissertation in 2004. (To Jay's surprise, I did find several differences in how women organize their companies, particularly in the areas of communication and knowledge transfer processes, reward systems, and people practices.)

## Legacies and Unfinished Business: Information Processing Meets Big Data

Jay Galbraith always had yet another book up his sleeve. In 2009, he had started writing a book about the corporate center and how large, multidimensional companies manage their portfolio of businesses. Book writing for Jay was usually relegated to times when the consulting business ebbed. During his last years, Jay's consulting business was booming, so his corporate center book suffered and was never finished. But he then became fascinated by how many companies were using "Big Data" to not only run their businesses but learn more about their customers. This allowed them to provide more innovative products and services – including some that the customers themselves didn't know they needed or wanted (iPad anyone? Fitbit? Running shoes with sensors?).

Given his enthusiasm over how certain companies (Disney, Experian, and Nike) were handling data, Jay's next book would almost certainly have been on the impact of data analytics on organizations and how organizations should structure

themselves to capture the best of what data technology has to offer. One can read a preview in his last published article, "Organization Design Challenges Resulting from Big Data" (Galbraith 2014b). He believed that data analytics would become the next major dimension in organization design. A digital data function would be equivalent in power and importance to an organization's existing function, geography, product, customer, channel, and/or category structure. Galbraith foresaw a "chief data officer" on the leadership team who would oversee an organization built around capturing various types of data in real time to make rapid business decisions and drive profitability.

In order to harness the power of Big Data, Jay identified three key hurdles an organization needed to address. First, he saw the power of data analytics as bringing on new strategic opportunities, but also causing friction in the existing organization's power structure. At issue is whether the addition of a sophisticated data analytics capability is competence enhancing or competence destroying to the organization's current competitive advantage. Nike was able to use data gathered from its NikePlus running community to quickly design better running shoes as well as develop the world's largest online collection of trail running maps. Nike's embrace of data is competence enhancing. In contrast, Hewlett-Packard had relied on its superior relationships with resellers and retailers to develop and market its products, so Big Data and e-commerce were competence-destroying innovations. Thus, a company that's aspiring to use data analytics in real time had to match the power of the new digital division to where it currently sat on the competence enhancing-destroying spectrum. The newer and more challenging the data analytics capacity is to an organization, the more horsepower (in terms of title, experience, reporting relationships, budget, etc.) the data manager has to own.

Second, a data savvy company needs to develop information and decision processes to support the digital strategy and structure. Today, credit card companies can use data captured in in real time to influence events and their outcomes. A fraudulent transaction can be detected while it's in progress, and the perpetrator could potentially be apprehended in the act. But in order to achieve this, the organization needs to have nimble processes in place that can identify when a stolen credit card is being used and then immediately transmit the appropriate instructions to the retailer or merchant in real time. This requires an organization to significantly increase its own clock speed (ability to move in real time).

And finally, to gain the most advantage from Big Data, Jay believed that an organization had to invest in digital resources (in the form of people and technology) to build data analytic capabilities across the organization and develop new revenue sources. This could start as a small digital division that might eventually grow into an entire business unit or strategic dimension that's matrixed across the organization. Several companies have found that sophisticated analysis of Big Data can spur entire new business opportunities. Bosch's Software Innovation group collects and analyzes information from the sensors it places in various automobile components to sell insights to drivers about safety and maintenance. J.P. Morgan and Wells Fargo

sell reports on consumer trends based on information they gather from their credit card and banking customers. Citibank, with operations in 100 countries, says it can identify the next "silk roads" in commerce based on data it analyzes. It sells these insights to retailers like Zara and H&M.

Rob Kazanjian has postulated that Galbraith's work on lateral processes, and the social capital required to make them work properly will find a new home in the burgeoning field of network theory. Galbraith has often written about the importance of social capital (personal ties), networks, and formal and informal lateral processes in a well-functioning matrix organization. Kazanjian believes that with the reduced power of hierarchies and formal structures, we will see an increase in the power of other levers, such as lateral processes and networks, in organization design.

To some degree, Jay Galbraith lamented the fact that the field of management did not operate like other professions such as Law or Medicine, where academic research was useful in that it advanced the field and, indeed, was embraced by the practitioners. Bill Joyce summarized it best:

> Jay provided an elaborate and convincing argument that academics were not advancing the field of organizational design. In his opinion, it was managers who were innovating new organizational forms, and he believed that academics must look to those innovations as a source for advancing the field. The search for new organizational forms dominated his career as both an academic and a consultant... Jay's humility and interest in practice resulted in the greatest contributions to the field of organizational design of any scholar to date. Jay studied new organizational forms that emerged with their roots firmly in practice, but did it in a way that made fundamental and enduring contributions to theory. He always worked from practice to theory and not the reverse. (Joyce quoted (pp. 60–61) in Obel and Snow 2014)

## Conclusion

Jay Galbraith became known as the founding father and premier expert in organization design. He had a passion for analyzing how information moves through various organization types and studying the bottlenecks that arose. He is most well known in the academic community for his information-processing model of organization design. In the corporate world, he is very well known for his Star Model™ framework of organization design. He also developed a number of other practical tools useful to the organization change manager, such as the front-back organization, the customer-centric strategy locator, and the lateral process "ramp." Galbraith's work is still used today by many companies worldwide.

# Robert T. Golembiewski: Wit, Wisdom, and Exacting Standards

**32**

Joanne C. Preston and Anthony F. Buono

**Abstract**

As a major contributor to the field of organization development and change, Robert T. Golembiewski was a perfectionist who drove himself and others to achieve their best. Although interaction with him was often tinged with tough criticism, going beyond his gruff exterior was a caring man with a wonderful sense of humor. He had the ability to write quickly with precision that got directly to the point he wanted to make in a colloquial style. For those of us fortunate to work with him, his sharp mind and prolific writing kept us busy reading and thinking about the past, present, and future direction of the field. Bob influenced all of us who knew him – and countless others who never met him – through his copious articles and books. This chapter will discuss his influences and motivations to enter the OD field, his key contributions – his intervention in the Metropolitan Atlanta Rapid Transit Authority (MARTA), his work on burnout and stress, and his insights into the ramifications of different types of change – and how his work has influenced others. Emphasis will also be placed on the legacy he left behind, with suggestions for additional reading that will help the reader learn more about this prolific scholar and why he is considered a thought leader in organization development and change.

## Contents

## Influences and Motivations: A Multifaceted Mind

Golembiewski (1932–2016) was raised in Lawrenceville, New Jersey, in a very close knit Catholic family, which had a lasting impact on his life. His parents were Polish immigrants, and until he began formal schooling, he did not speak English. His elementary school days were spent at St. Hedwig's Grammar School in Trenton, where he won all but one of the academic prizes upon graduation in 1946 (*Trentonian*, February 28, 2016). He attended Trenton Catholic Boys' High School and was named 1950 class valedictorian as well as lettering in football and baseball and arguing for the state champion debate team.

He was the first in his family to go to college, and he won a scholarship to pursue his AB at the Woodrow Wilson School of Public Service and International Affairs, Princeton University, in 1954. Following his graduation with honors from Princeton, he pursued an MA (1956) and PhD (1958) at Yale University in Political Science. To Bob, political science and organization development were part of a multidisciplinary approach to creating positive social change, a perspective that guided his career. He never saw them as separate disciplines. His dissertation, an expanded version of which was published by the University of Chicago Press as *The Small Group* (1962), was an in-depth analysis of group dynamics. Drawing on over 1,500 sources, he worked toward a convergence of concepts and operations, synthesizing the material into an insightful framework on small group structure and processes.

During graduate school, in 1956 he married Margaret Mary (Peggy) Hughes, and they remained together his entire life. His athletic prowess from his high school days continued well into middle age, as he continued to play intramural sports into his late 50s, at which point he began to question whether he was "too old for that stuff." He did, however, celebrate his 70th birthday by skydiving.

Throughout his life, he was rarely called Robert. As a teenager, he was known as "Killer" and "Earthquake," largely because of his aggressiveness in football and baseball. Later in life, he was affectionately referred to by his friends and colleagues as "Bob G," partly due to the tendency many people had in mangling his last name.

An avid fly fishing buff, he promised he would give a lecture anywhere – as long as there were good streams, hunting, and nearby opportunities to collect silver and mentor the next generation of scholars. Golembiewski, a man with gruff exterior and a heart of gold, reflected on his life by noting that his epitaph might read: "He, like

everyone else, had his price. Few even came close to bidding high enough" (Schaerfl and Preston 1989).

As one of the early pioneers in the organizational development (OD) field, Golembiewski's work emphasized the dynamics of organizational change and the need to expand our views of human relations within organizational life. Throughout his life, he had strong ties to the Catholic Church. Bob once said that in order to remain a faithful Catholic and respect the Church's positive underpinnings, he also had to accept the flaws of his religion. He applied that same philosophy to the Academy of Management (AOM) and to his beloved field of OD and change.

His work was a forerunner of the emerging focus on actionable knowledge. Although he wholeheartedly supported academia in general and the Academy of Management in particular, he felt that academic leadership was not truly committed to building a "bridge" between the academic and the practitioner. In his view, there was a critical void between OD theory and practice. One of his underlying desires was to bring together scholarly practitioners and practical scholars – whom he affectionately referred to as "acapracs" and "pracademics." As a way of drawing theory and practice closer together, he emphasized the need to empower organizational members through enhancing their analytic, communication, and decision-making skills, attempting to identify and ultimately resolve underlying challenges by aligning OD principles with transformative societal values.

He was a strong believer that whatever academics discovered, their findings needed to be grounded in usefulness to the practitioner. In his view, AOM continued to fall short, and Bob would say, "We have to keep trying and they will eventually come around!" He applied this same sentiment to OD, noting that most academics did not appreciate the reality that in order to be "faithful to the core ethics and values of OD," theory had to be applicable to the world of practice. Although many people in the field appear to give lip service to these ideals, Golembiewski internalized them to the point that he established a personal scholarship with his own money. His pledge was that he would support any OD practitioner for 1 year if they were fired from a client because they could not continue an intervention when asked by the client to do something they felt was unethical or went against OD's underlying values. While it is not clear that he actually provided such income support, he did make the offer to the first author of this chapter (which was turned down since additional income was available), and he created a separate bank account for the fund.

Over the course of his career, he held research, teaching, and administrative positions at Princeton, University of Illinois at Champaign-Urbana, Yale, and the University of Georgia, where he ended his career as a research professor. He served on both business and public administration faculties because his research and teaching interests spanned both areas. He also had numerous visiting professorships, including ten semesters at the University of Calgary where he was able to follow his passion for fly fishing. Early in his career, he was awarded a Ford Fellowship in mathematical applications intended to facilitate empirical research in the field – which he did with a lifelong passion. He was also honored with a number of major

awards during his career, including being named Outstanding OD Consultant of the Year by the Organization Development Institute (1989), chosen as a charter member of the American Management Association's Hall of Fame, and given the Exceptional Lifetime Achievement Award (2006) at the International Conference on Advances in Management held in Lisbon, Portugal.

Reflecting on those who had inspired him, Golembiewski was clearly taken with Mother Theresa's dedication to alleviate human suffering and her commitment to enhance the lives of others, depicting her as "one hell of a change agent" (Schaerfl and Preston 1989, p. 25) – traits that he appeared to admire in himself. Drawing on a published interview the first author had with Golembiewski (Schaerfl and Preston 1989), he also noted the he was inspired by Chris Argyris, whose work "has done much for the OD field"; Goodwin Watson, for his "attractive qualities"; and Stanford Professor Lee Bradford, who Golembiewski saw as "an absolute whizzer in getting an institution started" and his attempts to "reinvent" OD. Aware of his own accomplishments, Golembiewski saw his own work as "OK too."

One of the drivers in his life was the issue of responsible freedom, noting his amazement about the number of organizations that he viewed as having "neither been free nor responsible" (Schaerfl and Preston 1989). Drawing on political science with an emphasis on philosophy, theory, and practice, he continually explored the gap between "what is" and "what can and should be." Reflecting his commitment to the interplay between theory and practice, he was often frustrated by his view that our realities continue to fall short of our potential – one of the factors that led him into consulting.

As a consultant, he worked with many types of organizations, including SmithKline Allergan (precursor of GlaxoSmithKline), General Foods, DuPont, Martin Marietta, NASA, Mobil Oil, Procter & Gamble, and US federal and state government as well as international organizations such as the United Nations and the government of Taiwan. His work with MARTA – the Metropolitan Atlanta Rapid Transit Authority, which will be discussed in detail in the next section – was one of his major accomplishments. Working in a consultation role, he helped name a popular breakfast cereal, launched a major drug, and determined the width of subway seats in the MARTA system, whose riders can still appreciate the wide, comfortable seats influenced by his football player girth. Known for his commitment to positive organizational change, he was affectionately remembered by a business client when he addressed the company's top executive team during one of his consulting engagements, "Gentlemen, we are not here to uphold the status quo" (Schaerfl and Preston 1989).

Throughout his career, Golembiewski was continually demanding of himself and his mentees. Although we were not his students per se, he was a true mentor to one of us and a valued colleague to both. We cannot think of anyone who was more direct than Bob. He gave feedback truthfully and succinctly, to the point that it could be painful, and it was the brave sole who asked him to serve as their dissertation chair. Only those with a strong drive, resilient ego, and desire for perfection would take on his demanding leadership. Yet many did seek him out from all over the world. He would shower his advice freely but would not suffer fools. He typically had a sly

laugh that would follow some of his sharpest comments, which only those who knew him well could truly appreciate. There were a couple of times that come to mind when he was a guest scholar, presenting his work to doctoral students when he managed to send one man and one woman crying from the room. During a class at Pepperdine University, responding to his morning lecture, the students erected a throne and created a scepter, crown, and purple robe that they presented to him for the afternoon. As a reflection of his humor and affability, he gave the rest of his lecture in that attire, noting on more than one occasion how much he "loved the experience" (Schaerfl and Preston 1989).

Perfection was a theme in his life. He strove to do everything to the best of his ability – through his writing, teaching, and consulting. He not only gave his best but always did what he thought was right at the time with enthusiasm. Another anecdote, which took place during a consulting trip in rural India, can further illuminate the man (Schaerfl and Preston 1989). After completing his day's work, Bob was walking back to his abode, planning to spend the evening alone thinking about the next steps he needed to take in his project with the villagers. On the way back, a wild dog approached him, growled, and began to attack. Bob quickly turned the cane that he was carrying into a weapon and dispatched the animal. Knowing that killing anything was against the villagers' beliefs, he was concerned. Yet, the next morning, he was greeted with cheers from the entire village. The leader explained that this dog had attacked several domestic animals and even some of the small children. The villagers could not kill it, tolerating the horrible animal and saw Bob as a hero for eliminating what the entire village felt was a serious problem. Reflecting on the experience, he noted that it served as a metaphor for what consultants really do – they move people toward their goals, sometimes by intention and sometimes by "happy accident." The essence of OD, as he reminds us, is that one cannot predict whether our results will come from luck, timing, or skill. Regardless, the consultant's job is to eliminate the "elephant" in the room that no one wants to acknowledge. The consultant's job, as he would say, is to "Kill the wild dog!"

## Key Contributions: A Prolific Scholar

The word "prolific" is synonymous with "Bob G" (Schaerfl and Preston 1989). He is clearly among the most published people in the ODC field, with a 99-page curriculum vita that includes 75 books and 1,000 peer-reviewed articles. His work has had a significant, lasting impact on theory building and the way in which we conceptualize and measure change. In constructing theory, he differentiated *empirical theory* (examining how different phenomena are related to each other under different conditions) from *goal-based empirical theory* (how specific goals or values can be achieved through the insights from empirical theory) and *action theory* (involving active participation in moving from a present state to a more desirable one) (Golembiewski 2002b). He also challenged our views of change – which he referred to as "Trinitarian change" – distinguishing *alpha* change (variations along a stable set of intervals related to a stable dimension of reality), *beta* change (variations on a

set of intervals that have experienced shifts), and *gamma* change (involving a basic reconceptualization or redefinition of a domain) (Golembiewski 1989a). He once said that he would continue to publish 2 years after his death, which unfortunately did not become a reality because, according to Sandy Daniel, his longtime secretary throughout his time at the University of Georgia, he stopped writing around 2006.

He hated computers. He argued that computers (as word processors) were invented so academics could produce manuscripts on their own instead of using secretaries. He was not going to bow to what he saw as the latest administrative ploy to get faculty to do more work and spend less money. Throughout his career, he wrote his work by hand on the back side of old articles and chapters. He had at least 40 projects going at the same time, and every morning he let his wife, Peggy, who he affectionately referred to as his "Muse," tell him what project he should focus on that day. His handwritten material would then go to Sandy, who would put it into the appropriate format to send to a coauthor, editor, or publisher.

His research covered many topics in ODC, including small groups, operations, ethics, patterns of behavior in line-staff models, sensitivity training, and stress and burnout in organizational life as well as many others. As noted above, throughout his work, he emphasized mathematical approaches in his study of organizational change, focusing on measurable outcomes of change. This section and the ones that follow will highlight this work, encouraging readers to delve further into his other writings. We chose to describe his underlying ideas and issues about the OD field and his work on the dynamics involved in OD-related intervention, the Metropolitan Atlanta Transit Authority project, and his final contribution to our understanding of stress and burnout at work.

## Organization Development: Ideas, Issues, and Intervention

Golembiewski can be thought of as a "gadfly" of OD's early period. The reference dates back to Socrates, who described himself as a "gadfly," a stinging insect who would harass and "sting" the citizens of Athens out of their ignorance and intellectual complacency. That was Bob's role within academia.

One of his major contributions to OD practice was his "Process Observer" column in the *Organization Development Journal* during the 1980s. His column, a series of concise but poignant essays that ultimately became areas that others began to address, focused on the challenges faced by academics and consultants involved in OD interventions. These essays, along with a number of new reflections, were turned into the book, *Organization Development: Ideas and Issues* (Golembiewski 1989a). The issues raised in the volume, which was published over a quarter century ago, are still highly relevant, focusing on what OD is, compared to what it aspires to be, what OD could become, and how we should attempt to move from "from here to there."

The premise that OD has either fallen well short of aspirations or outlived its usefulness has been around for decades (e.g., Jelinek and Litterer 1988). Golembiewski felt that the field was sufficiently strong to not only accept such

criticism but, more importantly, to use it to guide the transition from, what he referred to as adolescence to adulthood. He pushed for an active dialogue in and about the field to encourage this intellectual and pragmatic growth.

Looking at the state of OD during the late 1980s, he continued to push for change, working to move the field closer to what he felt it "should be," drawing on its unique fabric, and reflecting on its underlying challenges. One of his criticisms about OD was what he depicted as a tendency for theorists to suggest that their own work – frameworks, processes, and/or ideas – represented something new and more effective, even though he thought these "new" ideas were very similar to each other and what was already in existence. Many of his concerns about fragmentation within the field, our tendency to lose sight of or downplay the contributions of early pioneers, and our propensity to "plow our own furrows, as it were, even though we often harvested the same or similar crops" (Golembiewski and Varney 2000, p. vii) are still very relevant today.

Drawing on the richness and insight of OD's early days, Golembiewski felt strongly that the field had significant depth and energy, to the point where it was up to the next generation of "ODers" to draw on this history in creating positive interventions. Although he struggled with the question as to whether the field would remain committed to or move away from its initial values base, his work contributed to the positive organizational scholarship movement in the early 2000s.

His assessments of OD's effectiveness were typically colored with restrained enthusiasm. Pointing to evaluative studies of OD projects, many of which he felt either underappreciated its potential or were pessimistic about that underlying potential, Golembiewski emphasized that OD and its practitioners should show constraint. Examining specific applications and the use of OD technologies, for example, he characterized some of these interventions as "Judas goats" – the animals that led other animals to the slaughterhouse while they themselves remained healthy (Golembiewski 1989a). As part of his exploration of the interaction between the consultant's and client's values during an OD intervention, he pointed to the tensions that the field had to cope with to have a bright future – the complex interaction between professionalism, performance, and protectionism. As he suggested, true professionalism (i.e., passion for continuous testing, commitment to continuous renewal, and deep concern for standards for practice) had the potential to determine the critical balance between performance (i.e., ensuring good and prudent practice) and protectionism (i.e., the tendency to erect barriers to entry to outsiders while stifling innovation and competition between insiders).

As a way of ensuring a bright future for OD, he envisioned a National Institute of Planned and Peaceful Change (NIPPC), an organization that would deal with the field's strategic planning and positioning. Drawing on the National Institute of Health (NIH) as a guiding model, he pictured a type of matrix structure that would integrate foci on (1) different levels of organization (e.g., individuals, dyads, small groups, and groups of groups), (2) different classes of designs to induce change (e.g., attention to attitudes and behaviors, policies and procedures, and structures for relating people), and (3) temporal modes of intervention (e.g., preventative or anticipative, immediately reactive, and delayed intervention). As he suggested,

reflecting on the possibilities raised by the interaction of these factors underscores the "richness of targeted detail" that might be included in such a venture (Golembiewski 1989a, p. 132). Rather than a vast bureaucracy, Golembiewski (1989a, p. 134) saw NIPCC as a lean entity of elite administrators, interveners, and researchers who could energize a "vast network of public and private actors over whom they exercised little or no hierarchical control." The idea, which never came to fruition, was to create a living laboratory that would mobilize resources and conduct experiments that others would learn and benefit from.

Above all, Golembiewski was committed to protecting the core values inherent in OD, with an underlying hope to extend the field's reach and grasp of organizational life and intervention, raising its possibilities to higher levels. He can be seen as a harbinger of the values crisis in OD as well as a reminder that its roots lie in human systems' development. As he reflected, we often see a true test of our core values when there is a conflict between confidentiality and money and power. He continually pondered whether a certification process would truly make sense for OD practitioners (the performance-protectionism nexus). As a way of ensuring that practitioners, especially new consultants, were grounded in the field's core values and theories, he focused on education and socialization processes, often lamenting about the lack of opportunities they had to "practice" and learn – without doing do damage to clients (his NIPPC solution).

## The Metropolitan Atlanta Rapid Transit Authority (MARTA)

The intervention in MARTA was one of his greatest accomplishments and contributions, to both the public sector and the OD field itself. This project was funded by a 1971 referendum to produce a mass transit system within a decade with a budget of $1.3 billion (Golembiewski and Kiepper 1976), a regional project that was one of the largest since the days of the Tennessee Valley Authority (TVA). The goals of MARTA were to manage and enlarge an existing bus system, construct 69 miles of rapid speed rail transit and its support systems with tenuous funding through grants, develop "strong" central leadership, and respond to the demands of multiple constituencies with a broad range of local input by 1978 without delays and within budget, while positively influencing the development of the Metro-Atlanta area.

The OD component of the project centered on three major learning design tasks (Golembiewski and Kiepper 1976): (1) a team building experience for key leadership, (2) interface experience between the senior staff and third tier management, and (3) interface experience between the senior staff and the MARTA board. The interventions in these three areas centered on confronting and contracting, and a key element that guided the entire project was to ensure that the individual chosen for the general manager role was someone who modeled OD principles and values.

Looking back on this work in an article entitled "MARTA in the 1990s: The Challenge Continues" (1994), he thoughtfully critiqued the long-term outcomes of the project, focusing on what had lasted and what had decayed over time. The MARTA project was successfully completed within time and budget constraints,

and it continues to stand as a worldwide model for project management planning and execution. From an OD perspective, the project manifested high levels of openness with a strong sense of ownership and trust, with relatively low levels of conflict and undue risk-taking among the groups and individuals involved. He noted that a number of factors contributed to the project's success. First, funding was available throughout the project, instead of having to deal with predicted scarcity. Second, Ken Gregor, the general manager (GM) who replaced the original GM, played a major role in the project's success due to a management style that was grounded in OD values and ethic. He instilled a sense of flexibility throughout the organization and attracted a cadre of team-oriented individuals who had also ingrained OD values into their behavior. Reflecting a shared aversion to bureaucracy, which had existed from the early days into the 1990s, people in key positions at all levels in MARTA remembered the frustrations from that earlier period and served as role models for the new culture. The board, which was generally supportive of and helpful to the venture, also had good relationships with the management team. Finally, all of this was supported, according to Golembiewski, by the political and metropolitan environment that called for flexible and relationship-oriented behavior by leadership.

Looking back, Golembiewski (1994) underscored that the policies and practices embraced by MARTA employees maintained a deep, ongoing commitment to OD principles and values. As he noted, "The advantage still remains with MARTA" (Golembiewski 1994, p. 171). Yet, in true Golembiewski form, he was not satisfied with what had been accomplished, pointing out that that MARTA was ready for a new leap forward. He saw the earlier organization as more inwardly focused, while the future would demand a greater emphasis on external factors, particularly expanding the initiative's service – and, in his view, the embedded values and organic view that MARTA had embraced made it well suited for its next phase of strategic planning.

The MARTA project was clearly a critical success – both operationally and culturally – and was a credit to Golembiewski and his colleague Allen Kiepper, who codesigned and carried out this enormous OD intervention. We can continue to learn a great deal by studying the design and evaluation processes of this project.

## Burnout and Stress

A significant aspect of his research, especially during the latter stage of his career, explored the role of stress and burnout in organizational life, emphasizing the implications for intervention and prevention. His efforts, in essence, focused increasingly on how to create healthy organizations. This interest was directly influenced by his work on the MARTA project, where he felt the high price of success was paid for in human costs that, on the surface, seemed to be unavoidable. Working under intense pressure with limited resources, even if guided by a commitment to openness, participation, and helping, had significant negative consequences for the individuals involved.

His experience with this high cost of success led to further research and a series of publications that focused on stress and burnout. Building on the Maslach Burnout Inventory (Maslach and Jackson 1982), which identified the core phases of burnout as initial depersonalization, diminished personal accomplishment, and emotional exhaustion, Golembiewski and his colleagues created an eight-phase model of burnout that delved deeper into the differences that existed in both state and degree across those three basic factors (Golembiewski et al. 1983). The model, which is illustrative below, posited that these three factors varied in malignancy, with distinctions between high and low outcomes on each. Thus, individuals at different times might experience high depersonalization but still relatively low diminished accomplishment and exhaustion and at other times feel high emotional exhaustion combined with either high or low depersonalization and diminished accomplishment. When all three factors were high, the individual would be in "full-bloom burnout." He argued that individuals would not necessarily progress through each of the eight stages in the model, a progression he referred to as "psychologically awkward." Rather, there were chronic and acute pathways. A chronic pathway reflected deteriorating conditions at work, typically beginning with failing personal relationships. Acute pathways, in contrast, triggered, for example, by the loss of a loved one, could quickly translate into high levels of the three factors as part of a difficult grieving process. Each of these phases, with certain physical and psychological symptoms, suggested possible interventions, an emphasis that he and his colleagues increasingly focused on (Golembiewski 1986; Golembiewski and Munzebrider 1988).

Phase model of job burnout

| Maslach burnout | Phases of burnout | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| Inventory (MBI) subdomains | I | II | III | IV | V | VI | VII | VIII |
| Depersonalization | Low | High | Low | High | Low | High | Low | High |
| Personal accomplishment (reversed) | Low | Low | High | High | Low | Low | High | High |
| Emotional exhaustion | Low | Low | Low | Low | High | High | High | High |

His work in this area covered a wide variety of work contexts, from healthcare professionals (Golembiewski and Boudreau 1991) and public agencies (Golembiewski et al. 1998b) to the military (Golembiewski et al. 1998a) and cross-cultural comparisons (Golembiewski et al. 1993) to the point where he saw stress and burnout as a "global pandemic" (Golembiewski 1996).

## New Insights: Novel Ways of Looking at Stress and Change

Golembiewski acknowledged that stress in organizational life could be quite functional – energizing and motivating organizational members to increase their performance. Yet, the body of research that he and his colleagues amassed suggested that roughly 20% of working adults – one in every five workers – experienced the highest

levels of job-related burnout. The underlying challenge that he continued to pursue was to better understand the critical point beyond which "stress herniates rather than motivates" (as cited in Hart 1995). He noted that even in healthy organizations, almost one-quarter of employees reported being in the highest three levels of burnout.

Rather than attempting to create stress-free environments, Golembiewski pushed us to think about ways to manage that stress in productive ways. He saw OD as crucial in this process, generating positive, creative cultures with healthy leadership and an intention to build trust by ensuring respect, authority, and meaningful feedback. As he pointed out, however, many of the high-energy interventions cherished by OD practitioners – from participative management and efforts to enhance collaboration to interpersonal confrontation and even stress management workshops themselves – can further overburden individuals already experiencing high levels of burnout (Golembiewski 2000).

His analysis of the relationship between stress and burnout also pushed our thinking beyond individual factors, delving into the role that the work environment played in either exacerbating or ameliorating the probability of stressful experiences. He saw chronic burnout as a group-rooted phenomenon, underscoring that members of the same work group were likely to experience similar phases of burnout. His work emphasized burnout as a process in which depersonalization over time contributes to decreased personal accomplishment, which further interact to produce higher levels of emotional exhaustion. Arguing that much of the prior work on stress and burnout was anecdotal and lacking in objective measures, he called for large-scale empirical research to more fully understand the underlying phenomena. In order to do this as systematically as possible, he sought to examine the burnout experience through the lens of different types of change – alpha change (variation in the degree of an existential state, measured by a reliably calibrated instrument), beta change (further complicated by a recalibration of the measurement continuum), and gamma change (involving a basic reconceptualization of a situation, involving differences in state as well as degree) (Golembiewski et al. 1976).

Although this perspective emphasized different measurable outcomes of change, his work also pushed our thinking about the different types of change we create through our interventions, reflected in changes in cognition. The notion of alpha change reflects a perceived change in the context of objective circumstances, while beta change is associated with changing standards of an individual's interpretation of those circumstances. Going one step further, gamma change reflects a radical shift in an individual's assumptions about causal relationships (Porras and Silver 1991). In essence, he pushed our thinking about how such cognitive changes influence our behaviors.

Golembiewski pushed both OD scholars and practitioners to become more sophisticated in all they did, from conceptualization and research to study design and methodology to intervention and practice. Early on, the field was basically grounded in action research, case studies, and intervention studies, but over the years, through the influence of people like Golembiewski, it evolved to include techniques that rival the rigor of experimental psychology. He also underscored the

need for longitudinal work, as captured by his major interventions with MARTA, illustrating the ways in which an intervention could have impacts that lasted well beyond initial implementation, changing human behavior in desired ways. His work on stress and burnout also showed how incremental studies across a wide variety of contexts – including cross-societal multinational data collection – could lend insight into the pervasive nature of such phenomena. His work involved mass data sets and advanced statistical procedures, with an incremental project-based orientation through hypothesis building and rigorous testing to build a well-grounded research theory. His methodology, analysis, and replication of data helped bring ODC into its maturity as a science and an art.

## Legacies and Unfinished Business: The Rigor-Relevance Quagmire

One of his main emphases with practitioners was the need to get back to the original values and ethics of OD (Golembiewski 1993). He took it as a personal mission to make sure that entrants to the field fully understood OD's core – its underlying knowledge, skills, and attitudes – as well as an underlying commitment to rigorous research and practical application. Although this call reverberated through the field on a general level, Bob G had a profound impact on many practical scholars and scholarly practitioners. As an example, he felt that such training was clearly lacking in the university education system. He felt so strongly about this challenge that, working with colleagues (which included the first author of this chapter), the Organization Change Alliance (Preston 1993) was formed. The Alliance was intended as a very different type of professional group, focused on the training and development of the next generation of change agents. Reflecting his earlier thoughts about the need for a NIPPC-type organization, its focus was on mentoring and involvement in team-based OD projects and skills-building workshops.

His call to embrace basic values and core skills not only influenced the founding of that professional group but had a lasting impact on the way in which we designed or redesigned a program or initiative. As an example, focusing on his emphasis on the lack of skills among new entrants to the field, in her role as director of masters and doctoral programs at Pepperdine University, Preston built in key experiences such as faculty-supervised large group interventions in other countries. These projects provided the students the opportunity to not only practice what they were learning but also experience how ethics, values, and basic OD skills interact. This commitment was continued at Colorado Technical University, which had an online and residency format. Golembiewski's words about the critical role of core skills guided the design team's requirement that the organization development and change, global leadership and environment, and social sustainability tracks would incorporate an intervention for advanced action research out of the country – one of the few online hybrid programs at that time that focused on building core skills (Preston 2014).

His last contributions to the field were in the area of burnout and stress, and he most likely would have continued his incremental study of this phenomena. As stated earlier, he studied burnout and stress in the United States and later investigated these effects in many other countries of the world. The contributions in this area changed the way in which we viewed the stress-to-burnout process, and his realization of the powerful effect that burnout could have on individuals underscored his commitment to the "power of positive purpose" (Golembiewski 2002a) as a way of managing that experience.

An area of "unfinished business" in his work is captured by the world of computers and the Internet – a world which he was loathe to enter. Yet, despite this aversion, if he continued his incremental work in this area, he would ultimately have been drawn into our postindustrial world, exploring how computer-mediated work influenced the level of stress and burnout in our lives. The workday, for an increasing number of young people, is filled with virtual teams from various companies, countries, and time zones, working on complex projects that are expected to be done yesterday. The constant barrage of email and instant messaging, texting and twitter, and Skype and GoToMeeting conferences, among many other technology-driven forms of communication, demand our attention 24/7. This new world of technology weighs heavily on today's employees, exacerbated by the fast-paced demands placed on them by their employers to get ahead of – or even keep pace with – the competition. The stress and burnout that was such a central focus of his work seems that much more intense today.

In addition to the technology challenge per se, the increasing role of virtuality, with new teams constituted on a daily basis, composed of ambiguous, remote relationships as organizations partner on projects and draw on resources dispersed around the globe, would likely have become a part of his focus on stress and burnout. Increasingly, no one person seemingly has control over any other person. Pressures and expectations abound for creating high-performance teams when incentives lie in other units or organizations rather than within a given team – a new opportunity to explore and better understand a host of new stresses and burnout potential. In today's increasingly complex working world, there are significant opportunities to follow in his footsteps, rigorously studying how technology and amorphous team relationships contribute to our experience in the workplace – and, in Golembiewski fashion, thinking how OD could help to create healthier organizations and environments.

Perhaps his greatest legacy is reflected in his lasting impact on the work of those who knew him. He influenced us to ensure that core OD values and skills were an inherent part of our teaching. He also helped us become better scholars, pushing us to reflect and build on those challenging, unanticipated situations where we struggled to think of what to do next – such as when a consulting client dies during an intervention (Buono 2000) or faced with the ramifications of confronting apartheid in South Africa (Preston and Armstrong 1991). The challenge to be able to draw on such highly personal experiences and capture that learning so that others could benefit was one of "Bob G's" lifelong commitments.

Reflecting on the future of the OD field, he offered the following, concise depiction (Schaerfl and Preston 1989, p. 28):

> This is a period of ferment and fragmentations [for OD], as people leap from a common base to establish new turfs. The outcome is dicey, and I see three possible scenarios: 1) OD in the dumper; 2) OD [remaining] about as is; 3) OD and a great leap forward. I doubt that #1 will occur, whatever our failures of wit and will. I see a reasonable chance for #3. And if #3 occurs, Robert Golembiewski will be one of the leaders.

Unfortunately the ongoing evolution of OD will have to go on without one of its great leaders, but those of us who remember him know that he is watching from above, making sure that we do it right.

# Larry E. Greiner: Actionable Knowledge in Action

**33**

Flemming Poulfelt and Anthony F. Buono

### Abstract

As a significant contributor to the field of organizational intervention and change, Larry E. Greiner was one of those unique individuals who personified a mixture of insight and intelligence with a fun-filled spirit, a warm and welcoming presence, and, in general, a guiding sense of commitment and generosity. Over the years, his work reflected the essence of *actionable knowledge*, taking an applied route to knowledge creation, generation, and dissemination. He had a compelling presence that literally drew people to him, bringing a smile to their faces while lending his insights and expertise to all those who entered his orbit. This chapter captures the influences and motivations that led him to the organization development (OD) field, his key contributions – the stages of evolution and revolution that organizations experience, the role and nature of management consulting and intervention, power and OD, and dynamic strategy – and how that work has influenced others. As close colleagues and friends, we were privileged to know and work with him, and his ideas, support, and presence have had a lasting effect on our lives.

## Influences and Motivations: The Theory and Practice Interface

A native of Akron, Ohio, Larry Greiner (1933–2013) began his scholarly journey at the University of Kansas where he received a B.S. degree and became affiliated as an instructor in its College of Business Administration. He then moved to Massachusetts, earning an MBA from Harvard Business School (HBS) in 1960. As he became increasingly fascinated with the study of organizational life, he continued his studies at Harvard, working on his DBA with an emphasis on organization change and development. Early on, his work captured the essence of *actionable knowledge*, and that focus guided his career. After completing his doctoral studies, he continued on the faculty at HBS until he accepted a full professorship in the Management and Organization Department at the University of Southern California's (USC) Marshall School of Business, where he stayed for the remainder of his career. He also taught at Oxford University and INSEAD in Fontainebleau, France.

It is not an exaggeration to underscore that the match between the Southern California lifestyle and Larry had a symbiotic quality. He simply fed off the coastline and beaches, the warm weather, and the myriad golf courses in the area – and he excelled as a scholar and colleague at USC. In addition to his teaching and research responsibilities, in 1988, he was appointed Academic Director of the Executive MBA Program, and in 2003 he served as the Academic Director of the Global Executive MBA Program based in Shanghai, China. He is credited with leading the creation and design of both those programs, which were forerunners of the type of theme-based, integrative educational programs in business schools today. Reflecting his personality and professional orientation, Larry drew together his activities, playing in both the theoretical and practice camps with comparable ease.

The interplay between practice and theory became the core focus of Larry's research. As his colleagues at USC have emphasized, he was not the traditional scholar who defined hypotheses to test, methods to describe, and results to confirm and discuss. Instead he spent much of his energy conceptualizing the phenomenon he observed, in essence taking an applied route to knowledge creation, knowledge generation, and knowledge dissemination. As such it can be argued that Larry was on the forefront, envisioning Mode 2 research before Mode 2 was coined and articulated by Michael Gibbons and his colleagues in their 1994 book, *The New Production of Knowledge*. The book captured the difference between research

according to Mode 1 (the traditional way of producing discipline-based knowledge for its own sake) and Mode 2 (where multidisciplinary insight is applied to specific problems in the real world as a way of producing new knowledge). Larry's work, throughout his career, was dominated by a Mode 2 approach to developing relevant and actionable knowledge.

Another characteristic of Larry's career was his focus on internationalization. As described by his colleagues at the University of Southern California where he spent the majority of his career, Larry was "global before global was global... integrative before integrative was integrative..." (MCD Newsletter 2013 p. 10), always willing to draw on his extensive network of friends and connections to help others. He held a number of positions abroad during his career, helping him to establish a wide-ranging international network. In 1971 he was a visiting scholar at the Swedish Institute for Administrative Research in Stockholm, and in 1981–1982, he was a visiting professor at INSEAD, in Fontainebleau, France. Later in his career, he was the founding executive director of USC's Global Executive MBA (GEMBA) in Shanghai, China (2004), a program that garnered significant attention, representing a microcosm of the new global economy. The first graduating class (referred to as "GEMBA1"), for example, had students from China, Hong Kong, Japan, Singapore, Taiwan, Germany, and the UK and Canada and the US. Over the years, as his network grew, one only had to mention a country, and Larry would suggest local colleagues or contacts who could help you fulfill your objectives, sending a letter or email as a way of introduction. He was tremendously generous beyond belief, always supportive and helpful both professionally and personally.

As a long-time member of the Academy of Management (AoM), Larry undertook a number of positions at both the divisional and academy level. He served as chair of both the Organization Development and Change Division and Management Consulting Division and served as a strategy consultant to the AoM president and Board of Governors in 2008, working with them to create the first strategic plan of the Academy. He also received significant professional recognition, including his 1999 McKinsey Best Paper Prize for "New CEOs and Strategic Change Across Industries" presented at the Strategic Management Conference in Berlin. In 2005 he received the Management Consulting (MC) Division's Robert Wright Founder's Award, the Division's highest award given for sustained and exemplary leadership contributions to the MC Division.

In addition to Larry's academic career, he also spent significant time as a management consultant and board member. His consulting clients included such well-known private and public companies such as KinderCare, Kohlberg, Kravis & Roberts, Red Lion Hotels and Inns, Cadence Design Systems, American Golf Corporation, Intuit-ChipSoft, Marketplace Production (national public radio), Coca Cola Foods, Microsoft, Cymer, Chevron, and Merck. He also served on several boards over his career, including the MAC Group, Inc. in Cambridge, Massachusetts (a consulting firm) in the early to mid-1980s, Cast Management Consultant in Milan, Italy (1984–1993), and the HF Group in Carson, California (2001–2005). Larry was the consummate academic practitioner, skillfully blending theory and practice throughout his career and equally comfortable in the classroom and boardroom.

## Key Contributions: Extending Our Insight into Strategic Change

From a research perspective, Larry focused on three major areas: (1) the ways in which organizations changed from a strategic growth perspective, (2) change and growth from a consulting perspective, and finally (3) the role of power and politics within the context of organizational development (OD). His career followed that evolutionary track, initially focusing on organizational growth and change, moving toward the consulting area, and a critical look at power from a change and process view. His work challenged our thinking about the ways in which organizations change and can be changed.

## Organizational Evolution and Revolution

One of his classic *Harvard Business Review* (1972) articles – "Evolution and Revolution as Organizations Grow" – focused on the ways in which management practices that worked well in one stage of development often created crises in subsequent phases of maturation. As he suggested, organizational problems are often rooted in past decisions and policies more than present market conditions and events. As illustrated by Fig. 1, his framework illustrated how stages of organizational growth (referred to as evolution) typically triggered organizational turmoil and change at latter stages (referred to as revolution) – for instance, when centralized practices eventually lead to pressures for decentralization. His framework pointed to five core

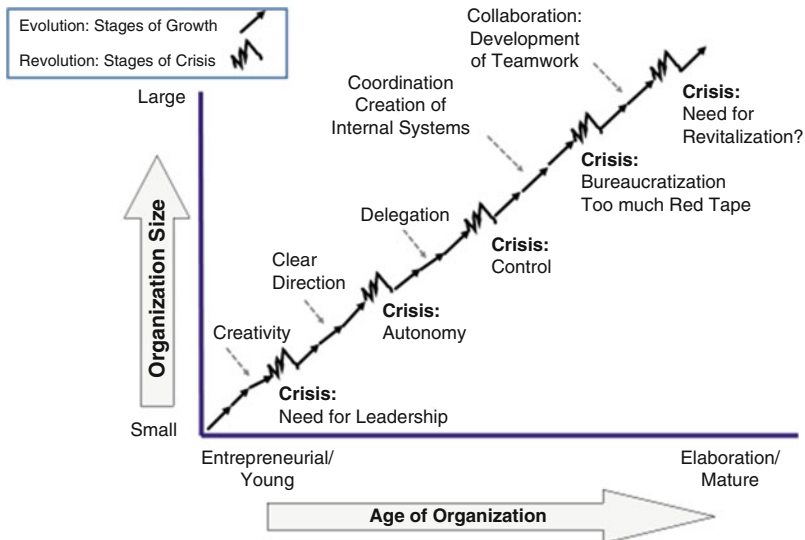

**Fig. 1** The five phases of organizational growth (Adapted from Greiner (1998, p. 58))

dimensions that capture such development: the age and size of the organization, its stages of evolution and revolution, and the growth rate of its industry.

His insight into the ways in which organizations grow and develop pushed our thinking about how organizational problems and the management practices that attempt to resolve them are rooted in time. He observed that organizations go through five basic stages of growth – creativity, direction, delegation, coordination, and collaboration. As problems emerge during a particular phase, policies and practices that are introduced typically resolve the issue – for a limited period of time – creating the basis for the next revolutionary change. Thus, according to Greiner's model, each phase is essentially the result of the previous phase and the cause of the next.

Beginning with the creative spark that launches a company, for example, attention is typically focused on developing the product and its market. Company founders tend to be technically or entrepreneurially oriented, driven by their commitment to make and sell the product they developed – with a basic disdain for managerial activities. Although this focus helps to "get the company off the ground," over time, this emphasis and its related individualistic activities become the problem. As production runs become larger and the number of employees grows, the firm can no longer rely on informal processes, and the founders find themselves burdened with administrative responsibilities – leading to a crisis of leadership. This first revolution in the organization's development is characterized by the search for a strong business manager who can pull the company together and is acceptable to the founder(s).

As Greiner argued, companies that survive this first crisis by installing and following an experienced business leader typically experience a period of sustained growth, creating a clear direction for the firm through functional differentiation with increasingly specialized roles and activities. Over time, however, as the organization grows, these specialized activities – and the centralized hierarchy that encompasses them – lead to the next crisis as they become too cumbersome and less effective in controlling a more complex and diverse company. The firm is then faced with a crisis of autonomy, typically leading to increased delegation; though in many firms, managers resist giving up their decision-making power, making it a tension-filled, and often unsuccessful, transition. Although firms that successfully adopt a decentralized structure – with greater responsibility given to lower-level managers – experience another period of sustained growth, once again, over time, such decentralization leads to a crisis of control. Firms then create internal systems that formalize organizational policies and practices, which work for a while before they lead to an overly bureaucratized system. And on it goes – as frustration with "red tape" leads to attempts to develop a collaborative team atmosphere, which ultimately leads to a crisis of revitalization, where the firm is faced with the challenge of creating new structures and processes.

Reflecting on this perspective roughly a quarter of a century later – "Revolution is Still Inevitable" – he argued that many of his initial observations were still quite valid. He predicted that we will continue to see major phases of development in growing companies, but that growth will not occur naturally or go smoothly – "regardless of the

strength of top management" (Greiner 1998, p. 64). A basic aspect of the underlying revolutionary turmoil and upheaval that organizations experience during the transition periods between these growth stages is the fact that managers have a difficult time understanding that a successful organizational solution they introduced in one growth phase "eventually sows the seeds of revolution" (Greiner 1998, p. 64). Thus, many senior-level executives leave – even those who have been successful – because they no longer fit the direction of the firm.

Thinking about the increased turbulence in the business environment, he underscored that one of the differences from when he initially created this framework is that there is much more organizational "death" than in the past. In essence, fewer organizations go through all phases of growth – either failing outright or being acquired by another firm. He also argued that the different phases were not as cleanly depicted as he initially envisioned, as vestiges of one phase often linger into the next stage of growth. As he argued, the "eve and rev" model (as he liked to refer to it) is best viewed as "simple outline" of the broad managerial challenges that companies face as they grow and that effective leadership and management still constitute the foundation for long-term organizational success.

## Intervention Through Consulting

His interest in the field of consulting and the dynamics of the consulting process drew from his commitment to change through actionable knowledge – a dual focus that integrated his research on consulting with his role as a practicing consultant. The consulting industry captured his attention in the 1970s as it was rapidly becoming a growth industry. Strategic planning studies were spurred by intensified competition, newly emerging industries, worldwide markets, and inflationary pressures. Rapid advances in computer technology also made it possible to go beyond rudimentary inventory and accounting systems to introduce sophisticated information systems for assessing performance on a real-time basis. Government regulation and pressures from social interest groups further precipitated environmental planning, product liability assessments, and affirmative opportunity compliance. The birth of service industries, from fast-food chains to packaged vacations, required entirely new marketing strategies, personnel policies, and organizational structures. At the same time, OD was also evolving, requiring new ways of intervening as a consultant/change agent compared with the classic expert model – all of which captured Larry's attention.

The growth of consulting was also drawing many newly graduated MBAs to an industry where the insights about any particular business were typically fairly limited. Thus, an emerging focus within business schools emphasized the development of general consulting competence. At the forefront of this change, in 1978, Greiner created a new MBA course elective on management consulting at USC. His decision to launch the course was based on growing requests by second year MBA students for more information about management consulting as a career as well as needs expressed by consulting firms for MBAs to be better educated in consulting

skills. The course utilized a combination of guest consultants, lectures, readings and cases, and a live consulting project. After a few years, the course became one of USC's most popular MBA electives, requiring a waiting list for admission each semester.

The focus on consulting triggered Larry to turn his research, writing, and conceptualization on this emerging profession – which led to a groundbreaking book, *Consulting to Management* (1983), coauthored with Robert Metzger, a certified management consultant (CMC) and a principal of Metzger & Associates. The book was very well received, and among its many endorsements were contributions from well-recognized management consultants such as Bruce Henderson, Chairman of the Board of the Boston Consulting Group, Inc., who wrote (book jacket of Consulting to Management, 1983):

> They (the authors) focus on the important things. This book should be required reading for anyone who is considering entering a career as a consultant. It should also be well worth reading by the seasoned consultant who wishes to retain his perspective on his company and his career.

Karl Sloane, CEO of Temple, Barker & Sloane, was even more positive (book jacket of Consulting to Management, 1983):

> Greiner and Metzger are to be congratulated for having written an exceptionally comprehensive, relevant, practical, and insightful work on management consulting and the management consulting firms. *Consulting to Management* belongs in every consultant's library – preferably on a lower shelf where it can be referred to easily and often.

The book, as well as the course he created, served as important stepping stones for Larry's further engagement in consulting – as a researcher, an acting consultant, Chair of the MC Division of Academy of Management, and as board member in a number of consulting firms.

In 1985 he coauthored another influential article, "Seeing Behind the Look-Alike Management Consultants" based on a comprehensive study of the consulting industry that categorized five types of management consulting firms: the (1) strategic navigator, (2) system architect, (3) mental adventurer, (4) management physicians, and (5) friendly copilot. Each type varies according to its underlying character – shaped by the type of individuals who are hired as consultants, the values they bring to their clients, and the manner in which they carry out their assignments. The analysis emphasized the importance of ensuring a fit between client and consultant, as misdiagnoses of company problems are less likely to occur if there is a good match between the styles and expectations of the client and consultant. The classification scheme distilled from their study can therefore be used by clients to discern different types of management consulting firms, helping the client make a more informed decision. As Larry envisioned, a knowledgeable client will tend to select the type of consulting firm that best matches his or her company's need and preferred working style. A naive client, in contrast, is more likely to struggle with disappointment brought on by a mismatch.

Larry's passion for consulting continued to grow, and in 2005 he coedited a volume (together with one of the authors of this chapter) with a literal "Who's Who" of the consulting arena on a number of wide-ranging topics: from assessing the industry as a whole, to critical examinations of major practice areas and alternative intervention approaches and change concepts, to new developments in knowledge management, the leadership and management of consulting firms, and research into and the future of consulting. Realizing that no single author could possibly write a book of such breadth and depth, he turned to leading experts from around the world who he felt possessed the knowledge and experience to contribute in the envisioned areas.

The process of conceptualizing and editing the volume reflected Larry's style and approach to research and intervention. All contributors were invited to a 2-day conference at USC where they presented and discussed outlines of their proposed chapters. The other authors comprised the audience, reacting to and critiquing the ideas with valuable feedback and, perhaps even more importantly, learning from each other. Following the conference, the authors drafted their chapters and embarked on an intense review and revision process – often involving three to four iterations of their work. The result was the *Handbook of Management Consulting*: *The Contemporary Consultant – Insights from World Experts*. As noted in the volume's preface (2005, p. v):

> . . . this is not a 'how to do it' book. . . the goal . . . is to provide both breadth and depth about today's rapidly changing face of management consulting. . . [a] profession [that is] rich, complex, and changing and needs understanding from many angles. . . twenty-five authors, all leading experts and highly experienced in consulting. . . provide the reader with heightened awareness and deeper knowledge needed to prepare for success in the changing consulting environment.

Larry and his colleagues followed the volume with a casebook, focused on "educating today's consultants."

These books not only captured Larry's engagement in the world of management consulting and his passion for researching and conceptualizing the field; they also reflected his preferred approach to scholarly activity, engaging with colleagues in a demanding but fun-filled environment, challenging others in a constructive and thoughtful manner, and capturing that learning and insight to share with others.

## Organization Development and Power

Greiner, with his coauthor Virginia Schein, also pushed our thinking about the ways in which power and organizational politics influenced and shaped organizational life, focusing on how traditional tensions between power and OD could be reconciled and integrated into change initiatives. Since humanistic ideals dominated OD's early development, the emphasis on collegial values and collaborative interactions was viewed in stark contrast to the self-interested approach that was associated with political activity in organizations. Greiner and Schein (1988) challenged this

conventional wisdom, advocating the need to combine open and transparent power-based strategies with OD to facilitate the change process, further transforming organizational power structures to enhance the probability that the change would endure. As they suggested, aboveboard uses of power could be used to encourage organizational members in positive ways, enabling them to work together in making decisions that affected their destiny.

Their work examined how OD could build its own power base, giving it access to those holding power in organizations, influencing these power holders to use it in open and responsible ways. Within this context, Greiner and Schein explored ways that change agents could acquire and utilize power in their engagements, from initially getting one's "foot in the door" and selling expertise to engaging clients in the change process. They also pushed our thinking about power abuses in an OD context – both in terms of change agents abusing power and also getting abused by those in power.

## New Insights: "Eve and Rev" in New Contexts

Larry's "eve and rev" conceptualization illustrated how management practices that were instituted to solve problems at one point in time lead to different problems during latter stages of development. In essence, his work prompted our thinking about how basic management practices that worked well during one stage of development eventually create crises at later phases.

Much of this initial work focused on industrial and consumer goods companies rather than the type of knowledge-based, service businesses that dominate the present day landscape – which were only in their ascendancy at that time. As Larry's interest in professional services firms (PSFs) – consulting, law, and investment firms – grew, roughly a quarter century after he developed his initial growth model, he examined the extent to which these firms also passed through discernable stages of growth. Based on his follow-up study, he suggested that most surviving PSFs grew through a life cycle of four distinct stages – (1) the initial entrepreneurial phase, (2) followed by tension between a desire to focus on the initial service offering or expansion, (3) eventual geographic or service expansion, and (4) institutionalization of the firm's name, reputation, and standard operating procedures – with each stage requiring a different strategic approach to its marketplace and a unique set of management practices. Similar to his original model, each stage was followed by a crisis that needed to be resolved for the firm to advance into the next stage of growth. As David Maister (1993), one of the leading authorities on PSFs, once articulated, "professional service firms have been managed in one or two ways: badly or not at all." Larry viewed this observation as an opportunity, focusing on the role of leadership and the importance of personal adaptation and change that was required for continued development.

His research underscored that PSFs begin by initially testing a variety of markets, leading to internal arguments about whether to stay together or concentrate on one partner's vision. In the second phase, the PSF typically focuses on a particular service, ultimately leading to additional debate about whether to continue the current

practice or expand by opening another office or taking on additional services. The third phase of growth, through either geographic or service expansion, ends with a power struggle over ownership and equity-sharing arrangements between original and newer partners. If it continues, the PSF becomes institutionalized, cementing the firm's name, reputation, and practices, ultimately leading to a "crisis of cultural conformity" in which the firm's members are faced with the need for innovation and renewed flexibility.

As in the original model, each growth stage in PSFs is followed by a crisis that needed to be resolved for the firm to advance into the next evolutionary growth stage. Larry took this opportunity to call for a greater focus on strong leadership, as he felt that farsighted acts of leadership and personal change were necessary for PSF transformation. His insights into the complex realities of the consulting world and the myriad ways in which power and organizational politics influence the change process also pushed our thinking about how to successfully intervene in organizations. Combined with his thoughts about the various stages a company typically goes through as part of its development, his work provided further understanding into the requisite interventions needed for successful change.

## Dynamic Strategy

Building on his work on organizational growth, late in his career, he moved into the strategy area. Although strategy had been an implicit focus in much of his research, it became an explicit emphasis in his work with his close USC colleague Tom Cummings in their book *Dynamic Strategy-Making*: *A Real-Time Approach for the 21st Century Leader* (2009). The volume emphasized that traditional strategic planning was ill-suited for today's 24/7 world, and Larry was highly critical of efforts to substitute what he referred to as "pseudo approaches." As he suggested, when faced with strategic planning, many executives were puzzled and confused about how to proceed. Greiner and Cummings argued that new dynamic approaches to strategy making were needed, so companies could respond coherently and rapidly to the challenges and opportunities posed by fast-paced environments. In their view, coherence meant that strategy had to be enacted in a uniform way by everyone in the firm – not just limited to top management. All organizational members must know and understand the strategy, so they can respond on the spot, in essence being part of the "glue" that holds the company and business together. As such their message was about meaningfulness, strategy should make sense to employees to ensure that execution would be as flawless as possible. To be truly meaningful, the strategy must also be timely and flexible, constantly adjusting to changing conditions as a continuous process of translation into immediate and relevant actions.

Once again Larry demonstrated how his work reflected the essence of *actionable knowledge*, providing the reader with a fresh perspective on strategy as an organizational process of learning and development, reframing the traditional lenses of how strategy should be conceptualized and exercised in a fast-paced, changing world.

## Legacies and Unfinished Business: Looking at Processes in New Organizational Forms

As new organizational forms – from global, network-based forms to virtual organizations and holocracies to hybrid organizational forms – are becoming increasingly influential in our postindustrial world, Larry's work would have undoubtedly delved further into their growth dynamics. Within this context, a further revised "eve and rev" model could continue to serve as a road map for the next generation of researchers interested in exploring how these new forms develop over time. Questions, for example, linger about the type of change involved in the different phases in these new and emerging organizational forms, from the types of incremental changes that have been associated with the evolutionary growth stages to the punctuated equilibrium that appears to be related to the revolutionary periods. How would firms attempt to capture dynamic capabilities – in essence, balancing exploitation (benefitting from existing products and competencies) and exploration (looking ahead, preparing for creative destruction) – challenges that could vary considerably in a global, transnational organization, a virtual organization, or a holocracy.

Building on his other contributions, as the management consulting world continues to go through groundbreaking change, there are also many unknowns to explore, from the role that technology will play in the consulting process as new methods and models emerge, to changing client needs and consultancy's value proposition, to knowledge creation and transfer, to the governance of consulting firms and what professionalism will ultimately look like in the twenty-first century. Similarly, his insights into power and political dynamics in organizational life requires further examination in a postindustrial context, as the nature of work, the workplace, and interpersonal, intragroup, and intergroup interactions continue to evolve.

One of his enduring legacies is the impact that he had on those who worked with him. His guiding insight and expertise provided the opportunity for an author to fully engage with the subject at hand. As an example, reflecting on the process of writing a chapter for his *Contemporary Consultant* handbook (Buono 2005), Larry was the consummate editor, mixing it with insightful direction and critique, helping authors to fulfill the potential he (and his coeditor) envisioned for the volume. After reviewing an early draft of the volume's chapter, he quickly responded, "great first sentence; the rest of the chapter needs work. . . You are writing like a consultant, you're not reflecting as one. . ." (personal communication). He then proceeded to point to gaps and voids, where personal reflection would enhance the material and the direction the chapter should take to fully meet its intended goal.

Larry personified the "engaged scholar," whether working with clients, colleagues, or students, in his pursuit of practical scholarship that could resolve pressing problems and in his commitment to contribute to the public good. He had a hands-on, experiential approach to education and scholarship, transformative in its impact, fostering mutually beneficial collaborations with all those he worked with. Larry's generosity – both professionally and personally – was literally boundless, and his life encompassed the ideal of true engagement. His insights and spirit continue to shape

our approach to research and writing to this day. His commitment to collaboration between management scholars and practitioners, with the goal of producing actionable knowledge that is of interest and use to both parties, continues to have the potential to lead to not only higher-quality organizational results but the possibility of significant theoretical breakthroughs as well.

# Björn Gustavsen: Democratic Dialogue and Development

<span style="font-size:2em">**34**</span>

Richard Ennals

**Abstract**

Björn Gustavsen, with an original professional background as a lawyer and judge in his native Norway, has had a formative role in organizational development processes in Norway, Sweden, Scandinavia, and the European Union over four decades. Following in the tradition of Norwegian working life research by Trist and Thorsrud, he has provided the conceptual framework and practical case studies which have driven major national and international programs. He has learned from different experience of organizational change in, for example, the USA and Japan, but he has identified a distinctive way forward for the European Union, where he has acted as a senior adviser. In contrast to conventional Taylorist top-down management and reliance on expert consultants, his approach has been bottom-up and concept driven, with a focus on empowering workers. With a commitment to long-term sustainable processes, he has emphasized the importance of capacity building and succession planning, highlighting development organizations. His approach to partnership and coalition building has enabled collaboration across sectors, in the cause of creating collaborative advantage. He has a distinctive fluent academic writing style, but spends most of his time engaged in the design and practice of development, and editing the work of younger colleagues. He has seen the role of academic journals and edited books in the development process, so has encouraged new publications, but without seeking to dominate. He took ideas of action research and case studies and

applied them to national enterprise development programs, working with the labor market parties. This has resulted in a distinctive research and development culture.

## Contents

## Introduction

Björn Gustavsen has long been a prominent contributor to international research literature, writing frequently at the policy level in Norway, Scandinavia, and Europe. His writing has a consistent purpose and is targeted to particular audiences. The focus of his work and writing is not academic theory but engagement in practice in working life.

For Björn Gustavsen, thought and action are closely linked: publications are actions, and research can have a political dimension. Because this approach diverges from North American orthodoxy, he is not easily compartmentalized in conventional academic terms. Accordingly, he may be unfamiliar to many readers. Drawing on Gustavsen's writing and practical interventions, we present his consistent approach to organizational change, illustrated with accessible quotations from his publications. His core themes are democracy, dialogue, and development. We will highlight in particular the themes of *development organizations* and *development coalitions*.

## Influences and Motivations: Democratic Dialogue

Björn Gustavsen began his career as a lawyer in his home country, Norway. At the time, Norway was seeking to find a sustainable way forward after the Second World War. Gustavsen's thought has maintained a consistent political direction. He saw democracy as relevant to the workplace and to the political process. This perspective stemmed from his cultural context: Norway held a preference for consensus, rather than conflict. Accordingly, there was a tradition of national agreements involving government and the labor market parties: employers and trade unions. That tradition has continued but has weakened in recent years. After decades of consensus, the extent of engagement by the labor market parties declined.

## Protection and Participation

Gustavsen saw his work on drafting the Norwegian 1977 Work Environment Act as an important action research intervention (Gustavsen and Hunnius 1981). Socio-technical ideas from the Tavistock Institute were put into practice through an intervention in the legislative process. To what extent could legislation bring about sustainable change? Could the rules within which decisions were made be changed? What would be the impact on citizens? These issues were important for a trained lawyer. In pursuing them, he helped to frame the legal dimensions of Norwegian life. He introduced the use of democratic dialogue to solve environmental and safety problems and other challenges in the workplace. This represented a transformation in approach from worker protection to active participation for change. He saw the need to look at work environmental issues as a whole, combining technical and organizational factors. Even now, this notion still needs to be more widely understood by the labor market parties and the Norwegian tripartite system of government, employers, and trade unions.

## The View from Scandinavia

Organizations are culturally situated. The world can look different from Scandinavia. It is unlike North America. Indeed, "comparing Scandinavian societies to liberal capitalist ones, such as the UK and the US, may be like comparing a football and a pyramid" (Gustavsen in Ekman et al. 2011a, p. 8).

The differences are certainly profound. Some of these differences have been captured in discussions of the Scandinavian Model of Business and Society, in which Gustavsen has participated (e.g., Ekman et al. 2011) where there is a focus on respect for work, social equity, a tripartite approach to the workplace, linking government, employers and trade unions, and consensus. This, in turn, has given rise to discussion about varieties of capitalism, in which Scandinavia has developed

differently from the Liberal Capitalist economies of the USA and UK, and differently from the European Union as a whole. In this context, Gustavsen's account of *development coalitions* has provided a language in which differences can be explored.

Although the USA and Japan have dominated management literature, Gustavsen's focus has been Norway. He has built on Norwegian experience to address international contexts, particularly in Europe. He also saw the Japanese approach to quality, with an emphasis on empowerment of workers through approaches such as Quality Circles, as providing a focus for workplace dialogue. Building on the work of the quality movement, he did not emphasize compliance and control, but instead saw it in terms of dialogue and empowerment.

> Quality has been misconstrued as a means of providing quantitatively testable measures, frequently imposed externally. It is rather a matter of language, whereby those who share concerns regarding quality find that they are engaged in ongoing communication, based on common understandings. (Ennals and Gustavsen 1999, p. 82)

Gustavsen's influence extends far beyond his native Norway. He has contributed to debates under many headings, crossing borders of countries, disciplines, and economic sectors. His positions and practical contributions are consistent and distinctive.

## Understanding Gustavsen

Gustavsen drives theory from practice (Toulmin and Gustavsen 1996). He rejects a reliance on "expert-led change," which gives power to consultants and tends to be imposed top-down. Rather, he favors "concept-driven" processes of change (Gustavsen et al. 1996): bottom-up, based on democratic principles. This theoretical objective is made practical through live cases with an emphasis on active participation. He does not offer single, dogmatic solutions or one best way. His work is intended to help people learn from differences, because differences represent a vital resource. He argues that we are best able to learn from the experiences of others when we ourselves are engaged in processes of change.

Gustavsen's Norwegian background is vital for understanding his work. Born in April 1938, he received a law degree from the University of Oslo in 1964. He was an assistant judge in the years 1965–1966. He joined the Norwegian Work Research Institute (AFI) in 1970, becoming its director from 1972 to 1983. He was then Professor at the Swedish National Institute for Working Life (NIWL) from 1986 to 1999. His focus throughout has been on working life. He is not an ivory tower academic or a commercial consultant. Even prior to Gustavsen's affiliation with them, both AFI and NIWL (until its closure in 2007) hosted strong traditions of Scandinavian research on working life. AFI is now largely funded from contract work with industry sponsors. NIWL researchers were dispersed to universities and research institutes across Sweden.

Subsequent generations of researchers have not always understood Gustavsen's work and methods, especially researchers relying solely on academic literature. For example, they have sometimes suggested that Gustavsen has disregarded issues of power. To the contrary, his tacit knowledge of such issues informs his actions, rather than being spelled out in text. He has brokered deals with those in power, namely, the Norwegian government, employers, and trade unions.

Gustavsen must be understood in context. He was the architect of a series of major, government-supported development programs in Scandinavia, whereas other international scholars have preferred to work only in academia or as consultants in the private sector. Unlike a generation of innovative pioneers who made generalizations based on reducing their differences, Gustavsen has instead seen differences as a valuable resource for collaborative learning.

In contrast with many American management gurus, Gustavsen has not offered ready-made solutions based on celebrated cases. He has opposed Taylorism, top-down management practice, and, like Japanese quality experts, has preferred to focus on empowering the workforce. This means emphasizing participation, engagement, and in particular, dialogue. Gustavsen states, "Dialogue refers to conversations, or discussions, between equal partners, characterized by openness, willingness to listen to each other, to accept good arguments and generally to learn from each other" (Ennals and Gustavsen 1999, p. 81).

Gustavsen does not, however, offer neat and definite conclusions after the process of dialogue. If a process of dialogue is to be sustainable, he would argue, it cannot be brought to an end with final agreements. There must be room for additional participants if development is to continue. This principle is fundamental for organizations. Thus, it may be a mistake to seek single answers. Democratic dialogue is a priority for Gustavsen, throughout his work.

Like the philosopher Wittgenstein, whose work he uses (Wittgenstein 1953; Ennals 2016), Gustavsen tends to set his own agenda rather than be driven by the academic literature. He does not start by thinking in terms of individual firms in a capitalist economic system. He has chosen different units of analysis, at the meso level, between individual firms and regions. Language and dialogue are important as participants are engaged. His perspective is bottom-up and strategic.

Rather than relying simply on developments in the USA, he has tried to learn from changes in locations such as Japan and the European Union and to apply them in particular to Scandinavia. His focus is on development, rather than management. He has deep personal roots in Norway, but he has been able to maintain professional careers in both Sweden and Norway. This has provided opportunities for comparisons and benchmarking.

## Action Research and Organizational Change

Gustavsen's practical engagement provided the basis for his theoretical contributions. He has been a major figure in the *action research* academic literature (Gustavsen 2001a, 2003, 2004, 2007; Gustavsen et al. 2008), but he has pursued

his own pragmatic line of argument while based at AFI. Although action research has often centered on individuals, Gustavsen has been primarily concerned with organizational change. He has developed contexts for regional development and national enterprise development and has incorporated action research into major programs. Action researchers have become instruments of policy and actors in the processes of organizational change (Gustavsen et al. 2001; Levin 2002).

Gustavsen has long worked closely with Norway's labor market partners: trade unions and employers. Behind the scenes he has maintained engagement in the collaborative culture and designed a succession of major programs. He has also been active in European projects, seeking to develop ongoing European networks. He has held senior professorial posts at the University of Oslo (1985–1999), the Norwegian University of Science and Technology in Trondheim (from 2000), and the University of Vestfold.

From that set of academic bases, Gustavsen has led work on enterprise development and regional development. For Gustavsen, evaluation is a key part of any development program, which is a process that requires engagement. He states, "Evaluations emerge as active, constructive processes in which those who perform the evaluation put a lot of their own ideas into the process" (Gustavsen in Toulmin and Gustavsen, 1996, p. 26). He has designed, led, and evaluated a series of programs in Sweden, including Leadership Co-ordination and Co-operation (LOM) and The Working Life Fund (ALF) (Gustavsen et al. 2006), and Norway, including Enterprise Development 2000 (Gustavsen et al. 2001) and Value Creation 2010 (Johnsen and Ennals 2012). Each has involved government, employers, and trade unions.

## Development

Organizational development requires effective collaboration. Gustavsen argues that individuals can achieve relatively little by working alone. We find partners with whom we can engage productively and develop a sustained relationship. We build a network of contacts on which to draw in particular circumstances. We create collaborative advantage. When a new challenge arises, we build a coalition of the willing from our partners and network contacts with different backgrounds, and we seek to bring about change. We refer to this as a development coalition. It may cross previous borders, facilitating change and offering a context in which action research can bring results.

Development can take place in many contexts. It involves a move from the known to the unknown. People work together, creating social capital, when they trust their coworkers and feel a common sense of direction or shared value. They engage in "pre-competitive collaboration," creating collaborative advantage (Johnsen and Ennals 2012).

## Development Coalitions

Gustavsen's concept of development coalitions (Ennals and Gustavsen 1999; Ennals 2014) has been applied at local, regional, national, and European levels. It provides a unifying theme for his work on organizational change.

A development coalition is a structure in which different partners come together to pursue a shared objective or create collaborative advantage. Regional and national development programs, particularly in Norway, have at times recommended the creation of development coalitions, bringing together large and small enterprises, public sector organizations, and universities or research organizations. Sometimes a new legal entity has been created, with implications both for business and for democratic accountability.

Action research is encountered at the level of individual actors, such as reflective professionals, in accordance with the *Action Research Journal* tradition, and through the *International Journal of Action Research* tradition of organizational change and renewal. These traditions are different, with diverse philosophical reference points and few common references, but Gustavsen wanted to demonstrate that they can be complementary. The integrative but often temporary role of a development coalition can be a link because it facilitates collaboration. It can even be seen as a form of action research in itself, creating a structure that enables new possibilities.

Development coalitions are not a distinct and separate category of organization; they do not provide consistent contexts for individual action research or for analysis by economic geographers. In some cases, where Gustavsen has been influential in program design and management, researchers are employed to follow the policy of the program, but in other cases action research is used to develop and implement strategy.

There have been historic cases of collaborative activity that we might now consider as action research, for example, the creation of NGOs (nongovernmental organizations formed as development coalitions) to abolish the transatlantic slave trade. We can build on past experience and provide foundations for others to use. This tradition has continued in Latin America in emancipatory action research. So, the similarities between work in action research in Brazil and Norway can now be recognized.

## Dialogue and Development

Discussion of development coalitions arises from a context of dialogue, particularly in Scandinavia, where dialogue seminars and dialogue conferences play prominent roles. Within dialogue, individuals can reflect on their own professional experience. They do not necessarily reach agreement, but they are able to move on in their understanding, often working with new groups of people.

Gustavsen articulated principles of "democratic dialogue" which are widely shared, especially in Scandinavia:

1. The dialogue is a process of exchange: ideas and arguments move to and fro between the participants.
2. It must be possible for all concerned to participate.
3. This possibility for participation is, however, not enough. Everybody should also be active. Consequently, each participant has an obligation not only to put forward his or her own ideas but also to help others to contribute their ideas.
4. All participants are equal.
5. Work experience is the basis for participation. This is the only type of experience which, by definition, all participants have.
6. At least some of the experience which each participant has when entering the dialogue must be considered legitimate.
7. It must be possible for everybody to develop an understanding of the issues at stake.
8. All arguments which pertain to the issues under discussion are legitimate. No argument should be rejected on the ground that it emerges from an illegitimate source.
9. The points, arguments, etc. which are to enter the dialogue must be made by a participating actor. Nobody can participate "on paper" alone.
10. Each participant must accept that other participants can have better arguments.
11. The work role, authority, etc. of all the participants can be made subject to discussion: no participant is exempt in this respect.
12. The participants should be able to tolerate an increasing degree of difference of opinion.
13. The dialogue must continually produce agreements which can provide platforms for practical action (Gustavsen 1992, pp. 3–4).

When we consider enterprise and regional levels, work organization can be regarded as a missing link both within and between organizations. In *concept-driven development*, the lead comes from workforce participation. A pivotal role is played by the development organization, which is a temporary and transitional structure allowing participants to explore new ways of thinking and working. The participants may alternate between work organization and development organization, taking ideas and experience with them. The European Union can be regarded as an arena in which development organizations are facilitated, both at the national level and through networks supported by framework programs.

## Regional Development Coalitions

In Norway, with its enthusiasm for regional policies, there is a continuing focus on regional development coalitions, which have been a central component of nationally funded programs of enterprise development (Gustavsen et al. 1997, 2001; Levin

2002). Regional development coalitions provide a means of advancing shared aspirations. They have sometimes been misunderstood as precise descriptions of particular organizational forms, rather than as the outcomes of collective efforts. After an informal start, Norwegian regional development coalitions have become government-funded policy instruments. Researchers were not autonomous but rather were employees in such programs. As a result, there was debate on the democratic credentials of a structure that represented a set of interest groups and could not claim to be detached.

Even in Norway, no two regions are the same in their economic activities, leading institutions, or distinctive cultural histories. New patterns of collaboration were required. Discussion of the issue occurred at a level of analysis above the single enterprise and below the national government. Geographical regions are located at this intermediate (meso) level.

In Europe, regions vary in size, having in common only the fact that they are regions. They host distinctive patterns of innovation. Gustavsen's networking projects have compared experience in many countries: Sweden, Norway, Finland, France, Germany, Italy, Ireland, and the UK (Ennals and Gustavsen 1999). Gustavsen has suggested the concept of *regions of meaning* (Gustavsen 2004), thus escaping the constraints of geography.

Gustavsen led international collaborative research that brought education and training together in coalitions with regional development. His approach was to use European regional learning cases from participating countries such as Germany, Norway, Portugal, Greece, Sweden, the UK, and Lithuania (Gustavsen et al. 2007). He anticipated that lessons could then be learned from the differences among them. Over a series of workshops, researchers described cases in which they were personally involved against the background of other cases. This procedure linked discourses on vocational education and training with regional development.

## The Dialogue Conference

Gustavsen's influence can be seen in the continued impact of the Norwegian Model, which includes an emphasis on democracy, social partnership, social equity, and consensus. He designed and managed national programs of enterprise development made possible by Norway's government income from oil and gas. He developed a research methodology for projects with working life, making extensive use of dialogue conferences (Gustavsen and Engelstad 1986). This method of using dialogue conferences has been widely adopted by his followers.

> Throughout the 1980s, by far the most important measure within the framework of the Norwegian agreement was a kind of conference, initially called a Mapping Conference, later a Dialogue Conference, With participation from all levels of the formal organisation, the purpose of the conference was to create local discussions around issues like work organisation, in the light of the challenges facing each enterprise. The point was the conversation as such. (Gustavsen in Johnsen and Ennals 2012, p. 30)

## Influence

Gustavsen was influenced by the work of the Tavistock Institute in Great Britain on sociotechnical systems and organizational change, where he worked. In turn, his work has influenced Great Britain's Work Organization Network and network partners across the European Union. He has shown himself capable of understanding issues in Great Britain thanks to the common ancestry of the research. Gustavsen has operated in many contexts and often at several levels at once, some of them behind the scenes. At times he is like Alfred Hitchcock, a writer and director who also plays a modest role on stage.

Gustavsen does not generally base himself in academia, but rather at AFI, with active engagement in projects and advisory roles within government. He does not favor grandstanding and Powerpoint presentations but prefers active, engaged dialogue. His contributions appear spontaneous, rather than prepackaged, as he uses the language of his interlocutors. He joins debates and follows the rules of their language games. He operates inside the debate, rather than as a detached observer, and he seeks to encourage concept-driven development rather than expert-led development. This means using the language of the dialogue as a starting point.

> A concept driven process is not only a process which is organised around a specific idea: it also implies that the idea has been developed through broad dialogues within the organisation, where the concept emerges as an expression of contributions from a broad range of organisational members. (Ennals and Gustavsen 1999, p. 41)

Gustavsen has been interested in ideas of a third way, between capitalism and socialism, but in practice rather than just rhetoric. This approach has enabled him to explore development coalitions in both public and private sectors. Even when his projects take place in private-sector, capitalist contexts, Gustavsen's focus continues to be on partnership, dialogue, collaboration, and collaborative advantage. He looks at work organization, both within and between organizations.

## Diffusion

It is all very well to develop individual successful cases. Yet how can case studies be applied to specific situations to bring about change? The answer is not obvious. Gustavsen asks whether "it [is] reasonable to believe that experimental changes, star cases, or other examples of 'outstanding systems' could really be diffused or disseminated to other workplaces" (Gustavsen in Toulmin and Gustavsen 1996, p. 18). The way change occurs, according to Gustavsen, is by being diffused through interactions between organizations. As formulated by Gustavsen (Gustavsen in Toulmin and Gustavsen 1996, p. 20):

- Changes are broadly defined efforts which seek to cover all major issues, organizational levels and interest groups within the enterprise.

- Many enterprises are involved.
- In a pattern which encourages cooperation between the participants.
- Based on a pattern of mutual contributions rather than leader-follower.
- Researchers and other professional resources play a role which is complementary rather than leading.
- The efforts are not steered by one single theory of good organization.
- Theories or views on optimum organizational structures are kept open in the early phases of the process.
- General theory, general views, and general assumptions pertain to the process of how to create local understanding and change.
- Continuous interaction between the enterprises themselves is the primary channel of diffusion.

Gustavsen can be seen as Norwegian, Scandinavian, and European. His influence can be seen in each arena. He talks and writes from the experience of practice and suggests an approach to learning from different cases.

> Toulmin in "Cosmopolis" (Toulmin 1990) argues that a discursive comparison of experiences has to be the foundation for whatever can be extracted from each case for use in other cases. In a process of discursive comparison the point is not primarily to decide "who is best" or what "universal truths" can be derived from all the cases taken together, but to use cases in alternating figure-ground relationships which enable each participant to gain a better understanding of his or her practices when seen in the light of what others do, what options they see, and so on. The goal is not to lay down universally applicable laws, but to move ahead through a discourse on experience that can enrich all participants. (Gustavsen in Toulmin and Gustavsen 1996, p. 13)

At the same time, he uses theory to frame practice, for example, when developing international seminars of researchers and practitioners with the objective of creating connectedness rather than pursuing predetermined agendas. As he states: "Innovation is connectedness. Only by being connected is it possible to know what others do and to use this as the raw materials for one's own innovative acts" (Gustavsen in Gustavsen et al. 2001b, p. 245).

Gustavsen presents connectedness in terms of development coalitions, a central concept in his account of organizational change. In one representative passage, he states: "To form learning organisations or development coalitions, we need to learn together. . . .. This is not so much a question of methods as it is of good will" (Ennals and Gustavsen 1999, p. 16).

## Key Contributions: Concept-Driven Development

Gustavsen introduced a consistent language for discussing organizational change and development. This enabled others to follow him. Of course at times his followers were not familiar with the background. The key focus was on work organization,

within and between organizations, building the picture from the bottom-up through productive partnerships, alliances, and development coalitions.

> As an expression of the idea of learning organisations, development coalitions are fluid, transitional, continuously reshaping themselves to meet new challenges. Essentially they are made up of horizontal relationships, constituting channels through which information flows, experiences are compared and new solutions are worked out, through extracting the best out of a broad range of experience and ideas. (Ennals and Gustavsen 1999, p. 57)

Gustavsen does not see work organization as a separate and distinct area of study. Instead he argues that work organization is a reflexive characteristic of organizations undergoing change. We must recognize that we are involved in such organizations.

> It seems that where much research and thinking on work organisation has gone wrong has been in assuming that a phenomenon that is linked to a whole series of other issues and topics, where each and every one exhibits a substantial dynamic, can be made subject to an autonomous formation of theory. Rather, work organisation seems to demand a reflexive thinking. (Ennals and Gustavsen 1999, p. 53)

Younger generations of researchers have adopted methods like his dialogue conferences as a result of his focus on building critical mass.

Gustavsen has also contributed to theory and practice in action research, thus keeping abreast of debates in the field. For some academics his work was outside the mainstream because he emphasized managed research. He considered regions, nations, and continents, rather than individuals. This raised questions about a limited focus on individuals such as chief executives. For Gustavsen, action research and politics are hard to separate.

> We see the role of the researcher as a partner in development coalitions. In a development coalition, the point is not for all participants to become alike but to pool resources, supplement each other, help each other, provide complementary resources.
>
> Within such a context, research has a number of contributions to make, based on its specific competences in conceptual development, in interpreting events, in developing methodologies, and even, provided that the necessary care and caution is shown, to create theory. (Gustavsen 1997, p. 199)

Researchers cannot simply claim objective detachment: they are engaged, part of the subject under study.

Gustavsen created the basis for a family of major programs for organizational change on national and international levels: Sweden, Norway, Finland, Germany, Great Britain, and the European Union. On the basis of the Swedish LOM and ALF programs, he advanced the development of critical frameworks and a benchmarking methodology. He emphasized that we can learn from our experience of change by describing it against a background of other cases. He introduced assumptions about dialogue and collaboration, rather than simply competition.

As a professor at NIWL, Gustavsen advised Allan Larsson, then Director-General of DG Employment and Social Affairs in the European Commission, on the 1997 Green

Paper, "Partnership for a New Organisation of Work," which expressed many of Gustavsen's ideas. This initiative was less successful than at first appeared, when it provided a focus for international networks. Larsson had been a Swedish minister, and the Green Paper was recommending that the EU should follow a Swedish lead, shortly after Sweden had joined the EU. Others in DG Employment and Social Affairs, for example, from France, took a different view. Gustavsen had a vision of development coalitions, a European network, and a network of networks, with Europe constituting a development coalition. He stated: "It is when we approach the idea of comparisons in settings made up of a large number of actors and enterprises that the idea of 'Europe' as a development coalition starts to gain credibility" (Ennals and Gustavsen 1999, p. 9).

Gustavsen led two collaborative projects that focused on Europe as a development coalition: Both followed his approach of dialogue and learning from differences. From his standpoint, "the European Union is itself a development coalition structure which has the objective of supporting development, both at a continental level, and in the terms required by the individual member states, themselves increasingly operating as development coalitions" (Ennals and Gustavsen 1999, p. 75). But other policy perspectives prevailed. As a result, Larsson resigned from the European Commission.

Gustavsen chose different units of analysis, rather than the single firm. In particular, he wrote about the meso level, existing between the levels of the firm and the region, which could be highlighted by dialogue conferences. He developed an account of work organization dealing with relations between organizations. He introduced productive partnerships, development organizations, development coalitions, and regional development coalitions. He envisioned "a movement towards network co-operation between enterprises, even a movement towards whole regions becoming 'units of change'" (Ennals and Gustavsen 1999, p. 29).

Gustavsen built academic relationships with American organizational-change theorists, while working in a Scandinavian context. His American audiences did not always understand the context in which he worked, for example, the roles of labor market parties. He enabled the formation of new journals (*CAT, IJAR*) without seeking to dominate them.

He has not sought a high personal profile or sold consultancy services, preferring to orchestrate and to facilitate participation. He could be seen as a modern Machiavelli, working behind the scenes while being sensitive to the needs of the major actors. He has tailored his advice to the needs of actors, enabling them to take ownership. He has empowered others to develop and to present challenges. His personal interventions have been practical, making the complex seem simple. He drew on experience and tacit knowledge, which of course could not be fully documented. His actions expressed what needed to be said.

## New Insights: Development Coalitions

I first met Björn Gustavsen in 1988 after my own experience of managing national research programs in Advanced IT in Great Britain and the European Union. His ideas resonated, and they contrasted with conventional research management. He

referred to a different philosophical framework from the technocentric positivism which then dominated Great Britain. For Gustavsen, collaborative research, even when the apparent focus was on new technology, was primarily about work organization as a reflexive dimension of the organization, the use of language, and the need for developing dialogue.

Gustavsen gave practical reality to philosophical theory in a way I had not previously encountered in Great Britain. He made confident use of philosophers and developed new ways of working. He and Bo Göranzon (Göranzon 1988–1995, 2006) at NIWL were both influenced by Wittgenstein (Wittgenstein 1953; Ennals 2016) and worked with Stephen Toulmin (Toulmin 1990, 2001), John Shotter (Shotter 2006), and Oyvind Pålshaugen (Pålshaugen 2006).

Gustavsen developed what has been called the communicative turn, developing dialogue in organizations and taking up ideas from Jurgen Habermas (Habermas 1984). Live action research case studies provided a starting point for comparisons and further cases. He used discussion of case studies as "an apparatus for linking research to actors in working life, in such a way that research can contribute to practical development" (Gustavsen 2007, p. 97).

Having taken a distinctive approach to action research, Gustavsen set it in a wider context:

> The difference between action research and other forms of research is not that somewhere along the line of arguments values emerge, but that action research explicitly faces the challenges associated with a commitment to values, rather than keep on under the pretence that the challenges do not exist. (Gustavsen 2007, p. 103)

The philosopher Wittgenstein spent much time in Norway. In consultation with Toulmin and Shotter, Gustavsen developed Wittgenstein's work on family resemblances, language games, and forms of life. Typically, practice went ahead of theoretical argument.

> It is this element of "family resemblance" between organisations that, in combination with the ability to conduct dialogues across as many boundaries as possible, constitutes the collaborative advantage of the Scandinavian societies. Numerous different alliances are possible, and the potential for innovation systems correspondingly large. (Gustavsen in Johnsen and Ennals 2012, p. 37)

Gustavsen has always taken an interest in power. He has advised governments and the European Commission. Perhaps more radically, he has seen research and power as closely associated. In his national programs, political and research agendas are often fused into a version of action research. This has not necessarily been recognized as part of mainstream action research.

## Legacy and Unfinished Business: Enabling Processes of Change

If we apply Gustavsen's lessons to our own work, several broad points emerge. There is no one best way. We need to secure the active participation of everyone in an organization if it is to develop; it is a matter of democracy in the workplace and in

society. We need to be able to learn from differences. We must expect our successors to see things differently. Organizations will continue to change.

Gustavsen has linked work organization and policy debate, research and politics. Gustavsen's work continues, with an associated literature. He has always given priority to publication and dissemination. He has worked on the borders between policy and research, with a focus on practical development.

> All concepts applied in social research have two sources of meaning: other words and practical experience. Making knowledge more actionable implies increasing the emphasis on the practical. . ... The shift demands a process consisting of several steps, ranging from establishing dialogic relationships with other people to the development of "regions of meaning", where theory and practice can interact in new ways. (Gustavsen 2004, p. 147)

Could the next generation match his breadth and depth? Alternatively, would they bring fresh ideas and inspiration? He helped establish the doctoral program in Enterprise Development and Working Life (EDWOR), based at NTNU in Trondheim, which brought together researchers from projects around Norway to build a national research culture based on action research. The successful graduates are now leading research institutes.

Gustavsen set out the core ideas for a strong European tradition in work organization. He helped to develop a common language and conceptual approach for participants coming from diverse backgrounds across Europe. He has influenced those who work in the AFI tradition, such as Oyvind Pålshaugen, Olav Eikeland, Morten Levin, and Hans Christian Garmann Johnsen. He continued to maintain links with Swedish colleagues such as Goran Brulin after the closure of NIWL.

Because of his work, the EU Green Paper, "Partnership for a New Organisation of Work" (1997), was Swedish or Scandinavian in tone and assumptions. There has been a continual, active network at national and international levels, such as Peter Totterdill at the UK Work Organisation Network (UKWON) and Steven Dhondt, Frank Pot, and Peter Totterdill of the European Workplace Innovation Network (EUWIN).

Perhaps Gustavsen's most lasting legacy is in Norway, where he has spent the last years of his career. Gustavsen's ideas, some tested in Sweden, underpinned a remarkable series of Norwegian national programs: Enterprise Development 2000, Value Creation 2010, and the VRI program of regional initiatives. It is unusual to have consistent national programs over so many years. Diversity in local and regional programs continued: there is no single common pattern.

Recent academic researchers have discussed issues of power. Gustavsen entered into partnerships with power because he saw dialogue with the labor market parties as underpinning projects on enterprise development. Gustavsen developed the theory and practice of regional development coalitions, which were seen as ways of building collaboration and taking forward change processes. In an era when there was obsession with creating competitive advantage, he laid the foundations for work on creating *collaborative* advantage.

There has been considerable debate about how lessons can be derived from cases. Gustavsen opposed a mechanistic approach to project evaluation. By designing and implementing large-scale programs, he brought cases into contact with each other.

He pioneered Nordic benchmarking and what he called the *figure-ground approach* of describing one case against the background of another. Going one step further and drawing on action research, he has shown what can be learned from a single case.

> When something new enters a map of knowledge, it will not be much noted if the new element is exactly like one or more of those that were already there. It is only when it stands out that it is able to attract attention and trigger new thinking. The notion of learning from differences opens up, for example, forms of collaboration that cut across technologies, branches and the distinction between the public and the private. (Gustavsen in Johnsen and Ennals 2012, p. 34)

## Succession Planning

Björn Gustavsen continues to be active. He is not simply a detached academic observer. We can identify his concern for the future through his active succession planning, in which he has tried to ensure that there are strong candidates for key posts, taking the work forward. This applies to Norway and Sweden. Gustavsen has continued to influence other research leaders in fields such as action research (Greenwood and Levin 1997; Levin 2002; Reason and Bradbury 2001, 2008) and economic geography (Asheim in Gustavsen et al. 2007; and Cooke in Gustavsen et al. 2007). He has been eager to develop mechanisms for dissemination and diffusion, such as the EDWOR doctoral program, and new academic journals (*Concepts and Transformation, International Journal of Action Research*, and the *European Journal of Workplace Innovation*).

Gustavsen has developed an agenda of continuing program themes, which can drive new projects. As he has emphasized, it is the conversation and the process of dialogue that are most important. We cannot expect to agree on final conclusions. We hope to continue to learn. Gustavsen has tackled some big issues, which we continue to explore: regional development, productivity, and innovation. He has challenged over easy assumptions and emphasized the importance of the workplace in innovation. He has laid the foundations for ongoing development. He has focused on empowering practitioners, trade unionists, and employers, and on working with labor market parties. He has seen beyond individual firms, with experience of program learning from national programs (Sweden, Norway, Germany, Finland). He has worked with economic geographers, but he has gone beyond their vision, as he defines regions in terms of dialogue as regions of meaning. He has made a fundamental contribution to the new debate on workplace innovation (Gustavsen 2015).

## A New Project

As this profile was being prepared, Björn Gustavsen marked his 78th birthday. He was also launching a new project (Hansen, 2016, personal communication). As Norway was struggling to deal with the collapse in the prices of oil and gas, it has also accepted unprecedented numbers of refugees. It is a matter of concern to

Gustavsen that this comes when the framework of collaboration between the labor market parties and the wider tripartite dialogue needs to be strengthened. There need to be new ways of organizing cooperation, based on Gustavsen's ideas of development coalitions and creating connectedness. He is now exploring *open cooperation*, where nobody owns the process, but everyone contributes on his or her own premises to create future patterns of cooperation rather than defining the final result in a tribal language. As so often before, Gustavsen is personally engaged. The work is unfinished.

## Conclusion

Bjorn Gustavsen has lived his professional life in a manner consistent with his stated principles. He does not believe in "grandstanding," giving preprepared presentations supported by Powerpoint. Instead of expert-led development, he has always favored a bottom-up-concept-driven approach. As his own health has become less reliable with age, he has worked with younger colleagues to ensure that the work can continue: this is practical succession planning. Today his legacy is again important in his native Norway, and he is one of the key sources for new policy development in the European Union. Rather than acting as a detached guru, Gustavsen has continued to be actively engaged. He is more likely to be found behind the scenes than on a platform. His writing continues to be fluent and insightful, providing practical ideas that others can take forward, and contributing to debates in a number of international journals. He epitomises action research, in that his publications are also actions. Dialogue has been a way of life, and his methods have been taken up by the next generation of organization researchers.

# Armand Hatchuel and the Refoundation of Management Research: Design Theory and the Epistemology of Collective Action

**35**

## Blanche Segrestin, Franck Aggeri, Albert David, and Pascal Le Masson

**Abstract**

Armand Hatchuel's work marks a turning point in management research and paves the way for a refoundation of management science. Hatchuel's research deals with organizational *metabolism* rather than organizational change, as he is concerned with the drivers of change and with the organization of innovative collective action. Several theoretical milestones can be put forward. First, Hatchuel offers a theory of the cognitive processes of generativity: while decision theory targets optimization by supporting the selection of a solution, "C-K theory" is a design theory. It accounts for the generation of new alternatives by expanding what is known, this process being driven by desirable unknowns. This theory has provided the theoretical cornerstone characterizing the rationality and organization of innovative or design-oriented collective action. Second, in Hatchuel's view, learning and organizational dynamics are tightly bound. Learning processes are hosted and supported by social relationships, which, in turn, are shaped by the distribution of knowledge. Hatchuel proposes a theory of collective action whereby knowledge and relationships are involved in a dynamic interplay: this theory shows that both markets and hierarchies are special and highly unstable forms of organization, because they imply that either knowledge or relationships are frozen. Management scholars contribute to the study of *generative forms of collective action*: Hatchuel argues that management science, far from being applied economics or applied sociology, is a basic science devoted to

## Influences and Motivations: Beyond Management as Optimization (Capturing the Hidden Trajectories of Rationalization Waves Through Intervention Research)

Armand Hatchuel's work marks a turning point in management research, with his theory of creative and responsible collective action. A full professor at MINES ParisTech, he has been the scientific director of the Center for Management Science since the 1980s. He is also a fellow of the Design Society and a member of the French Academy of Technology. He began his research at Ecole des Mines in 1973 in the newly created Center for Management Research. In the 1980s, he benefited from the French intellectual landscape and from debates about management research. The National Foundation for Management Education played a major role by supporting annual workshops on epistemological issues where doctoral students and senior researchers could meet to discuss the epistemology and academic identity of management science (Moisdon 1984; Martinet 1990). They addressed questions such as: What is the object of management research? Why is it different from older established disciplines like economics or sociology? What is a managerial situation? Is management science a social science? Or an engineering science? Hatchuel was

eventually able to make landmark contributions to these debates by elaborating a new foundational perspective on management (Hatchuel 2001a).

Drawing on his background in engineering, he started working on operations research (OR) and its industrial applications. Later, the general concepts of instrumentation, rationalization, or formalization of collective change were always central to his research. However, Hatchuel draws on diverse fields and disciplines, from mathematics (see, for instance, Hatchuel 2008; Hatchuel et al. 2013) to philosophy, via arts (cf. his admiration for Duchamp) or rhetoric (Hatchuel 2006, 2013). His research involves extremely in-depth empirical studies. For instance, Hatchuel has led longitudinal studies on a metalworking company, on public transport, and later on industrial design offices and research units. But his research also focuses on mega-transformations of organizations or what Hatchuel called "waves of rationalization" (Hatchuel and Weil 1995; see also Hatchuel's historical view of the firm through an analysis of the successive forms of management: Hatchuel 2004).

In this diversity of references and methods, there are some clear unifying concerns in Hatchuel's research. First, in our view, Hatchuel has always focused on new phenomena that push our theoretical frameworks to their limits and call both for new ways of observing them and for renewed theories. He has always advised younger scholars to study what was not covered by existing theories, either new practices or phenomena, or problems that revealed that the theories were no longer matching the empirical facts (Hatchuel 2001c; Hatchuel and David 2007). In this sense, quantum mechanics has always been a fundamental reference point for Hatchuel because to capture an unobservable phenomenon, a researcher needs to develop new ways to describe it, to interact with it, and to discuss its theoretical implications. To be able to capture what is new and unable to be described within traditional frameworks, Hatchuel willingly calls up various fields of science and models, including mathematics and physics, of course, but also law and psychology, to make visible some generic templates or relational schemas that need to be either complemented or contradicted.

Second, and perhaps more critically, the governing principle in Hatchuel's research has been to study not the new phenomena themselves but rather the mechanisms that generated them. For instance, OR interested him as an example of the process of "rational modeling" that underlies any organizational change (Hatchuel and Molet 1986). This also explains why Hatchuel has followed "waves of rationalization" (Hatchuel and Weil 1995) throughout his career. From manufacturing systems to design offices and "design-oriented organizations" (Hatchuel and Weil 1999; Hatchuel et al. 2006), he was tracking not only new words or new organizations but also the transformative drivers behind them. In this respect, he has paid thorough attention to the way in which new pieces of knowledge can transform social relationships and also to how relationships condition the possibility of knowledge creation. Here, the influence of the philosophy of Michel Foucault should be emphasized (Hatchuel 1999b). As a management scholar, Hatchuel took Foucault's thoughts one step further (Hatchuel et al. 2005): how could these drivers be created and amplified, that is to say, *organized*? These

questions may explain the attachment that Hatchuel has with some institutions, such as Ecole des Mines and the Cultural Center of Cerisy la Salle. Ecole des Mines (today MINES ParisTech – PSL Research University) is one of the oldest institutions for engineering research and education, and it is clearly no mere coincidence that Hatchuel's research takes place in an environment of engineering sciences: engineers develop what he called "actionable" knowledge or knowledge for the sake of collective action. More particularly, compared with researchers, engineers not only model observable phenomena but also tend to generate new phenomena (e.g., the electric car, 3D printing, and antibiotics without resistance). As a result, these phenomena can invalidate existing theories and call for renewed ones. As for Cerisy's International Cultural Center, many "colloques de Cerisy" (1 week of intensive meetings) have punctuated the intellectual path of Hatchuel. This is a symbolic place where researchers, public actors, and industrial practitioners have met for more than a century to undertake collective intensive reflection and develop genuinely new thoughts in an interdisciplinary and truly progressive way (Hatchuel 2011).

## Key Contributions: Integrating Organizational and Technical Changes: Expandable Rationality and Generative Collective Action

While he has definitely contributed to the field of organizational change, Hatchuel has also coined broader terms to characterize various research issues. For instance, instead of organizational change, he refers to the "metabolism" of the organization, which he defines as the factors that enable an organization to renew itself. Here, the term "metabolism" does not refer to a kind of natural transformation. Hatchuel uses it to point to the mechanisms that drive the change more than to the change itself, be it planned or emergent. He is indeed more interested in the "*organizing of the change*," i.e., the activities that lead to the possibility of change, including the extension of the range of conceivable changes and the definition of its objectives, scope, and actors.

Here, we do not pretend to cover all the work Hatchuel has done or influenced. On the contrary, we deliberately focus on three major contributions, namely, the modeling of prescribing relationships as the core of the organizing action, the modeling of post-decisional logic with the C-K theory, and the theorization of collective action.

### Organization and Knowledge as Interrelated Dynamics: Multiple Forms of Expertise and "Prescribing Relationships"

Organizational change, especially in its rationalized form, is classically associated with a conscious attempt to modify an organization in accordance with some form of expertise and preestablished models. However, it is clear that no change happens without learning processes. Even the implementation of a technique, be it managerial

(e.g., planning, kanban, or a roadmap) or otherwise, implies that some knowledge must be learnt and then implemented collectively in a certain way. The dynamics of organizational learning have proved to be decisive in any organizational change. Working on the way in which OR can change an organization, Hatchuel observed that the final state of the change was itself a matter of learning: rational models of OR were conceived as "rational myths," i.e., formalizations, within a given state of knowledge, of the possible desirable organizational forms, and as a way to engage a reflective learning process within the organization (Hatchuel and Molet 1986).

To gain a thorough understanding of the way in which knowledge was produced and used in concrete organizational settings, Hatchuel analyzed the role of experts in organizations. For instance, he studied in a reflective way the intervention processes of management scholars. In the 1990s, in conjunction with Weil, he studied experts extensively, focusing on expert systems in organizations. Together, they modeled the nature of expertise in connection with the actions it enables (Hatchuel and Weil 1995). They showed that the way knowledge was produced conditioned its possible uses and that the coordination of learning dynamics appears to be critical in the act of organizing. This approach served to denaturalize organizations. An organization necessarily results from a genealogical process, wherein the structures and organizational relationships shape the learning processes, but they are reciprocally transformed by the knowledge that is produced.

In this way, Hatchuel invites us to consider not only the organizational change itself but also the "*organizational metabolism*" through the interplay between knowledge and relationships. For instance, instead of focusing on job division, we need to account for learning division, because the ways in which knowledge is produced necessarily shapes the definition of the jobs itself. First and foremost, *organizing* involves defining the appropriate conditions for learning processes. It could be said that Hatchuel has moved beyond the field of organization theory to usher in a new theory regarding of *changing processes* or *organizing* itself.

This led Hatchuel to revisit the legacy of F.W. Taylor and offer a completely new reading of Taylor's contribution to organizational theories (Hatchuel 1994, 1995, 1996, 1997, 1999a, 2004; Hatchuel and Ponssard 1996). Taylorism is often seen as the distinction between conception and execution of workflows, but Hatchuel observed that this interpretation neglects the diversity of knowledge required in modern organizations and the conditions necessary to produce it. On the contrary, Taylor recognized that independent workers could not develop the tools and methods required to manufacture more complex and changing products. The organization needed people to specialize in the production of these new products and methods. This explained the birth of a new category of actors (namely, the planning department) as well as a new epistemic community, which would later lead to scientific management and more broadly to the field of management science.

Hatchuel introduced the key notion of "prescribing relationships," without which it is impossible to understand organizational dynamics. The term "prescription" refers to the notion of recommendation by an expert, typically a physician. Hatchuel uses it to designate all statements that impact the knowledge, actions, and judgment of other people, while being neither orders nor hierarchical commandments

(Hatchuel 1998). This takes into account prescriptions that may be imprecise, "weak," or "open", as well as reciprocal prescriptions.

This was a drastic turnaround. Not only does the notion of "prescribing relationships" shed new light on Taylorism, but it also revisits the classic notions of markets and hierarchies, which appear as extreme cases. Although they are oversimplified constructs, both markets and hierarchies imply that their members share knowledge about both the role of each stakeholder and what they do together or exchange. This can happen in extreme configurations, but in general, knowledge is always missing, e.g., knowledge about the functionality of a product or its quality or knowledge about stakeholders and their respective roles. To work effectively, both markets and hierarchies need prescribing relationships.

In Hatchuel's research, the notion of *prescribing relationships* was decisive because it provided a key to interpreting the crisis of industrial organizations in the 1990s. The more intensive the regime of innovation became, the more complex but also unstable and fragile prescriptions appeared. It became necessary to study the possibility of organizing prescriptions in the *unknown*.

## Beyond Bounded Rationality and Decision Theory: Expandable Rationality and a New Design Theory (C-K Theory)

In the 1990s, a whole series of new organizations emerged designed for innovation. The literature introduced new notions such as new product development, project management, absorptive capacity, and alliances. Clearly, organizations needed to change to be able to innovate in a more systematic but also a more disruptive way. In our view, Hatchuel's team took a radical step forward by suggesting that organization theory first supposes a theory of the ways of reasoning and that these ways of reasoning could themselves be managed and made more innovative.

A posteriori, we can understand the scientific path that led to that breakthrough. In a situation of intensive innovation, very few prescriptions are stable and robust: the designers have to develop a product, despite the fact that they know very little, or nothing, about the demands of consumers, the possible technologies, and the business models that are available. Under these conditions, the various models provided by the literature are insufficient: they still address situations where designers have prescriptions and need to improve their products and processes to better fulfill the requirements. But what if the requirements are no longer known? How should the learning processes be organized when the required knowledge has not yet been identified?

Hatchuel and Le Masson showed that research activity organizes a specific type of learning process, namely, one aimed at maximizing the controllability of the knowledge produced (Hatchuel et al. 2001). However, other types of learning processes are possible. How should we characterize a process whose aim is to identify what knowledge is missing or which learning process is needed? Beyond organization theory, what

was at stake was decision theory. Hatchuel criticized the "unfinished" program of Herbert Simon (Hatchuel 2001b), because Simon still saw design through the lens of "problem solving." However, knowledge is not necessarily produced to solve a problem; it can be produced with the ultimate goal of opening up new and unexpected perspectives. For Hatchuel, these open-ended learning processes need to be understood and organized if we are to speak about innovation management. The design theory developed by Hatchuel and Weil expands upon decision theory (Hatchuel and Weil 2002, 2009): it models the reasoning process that, instead of selecting a solution from among a given set of solutions (regardless of how large and ill-defined the set is), allows for the expansion of the set of solutions. To do that, they show that it is necessary to introduce "undecidable propositions": a design task does not start with a "problem" but with an *unknown*, i.e., an undecidable proposition (for instance, "a computer with no energy" or a "magic light"), which can be neither validated nor invalidated using existing knowledge.

The design theory developed by Hatchuel, Weil, and Le Masson is called the "C-K theory." This is a formal model of the generative reasoning that building upon set theory accounts for the creation of new objects. Starting from an unknown, referred to as a "concept," the C-K theory accounts for the dual transformation of the knowledge (K) space (where the concept stimulates new learning processes) and the concept (C) space (where knowledge leads to the specification of the properties of the concepts). The creative process is a result of this dual expansion. The authors claim that the C-K theory is not only an interpretative framework for generative processes but enables innovation, as the formalism reveals, to be structured and controlled in a rigorous way.

It is beyond the scope of this chapter to discuss the implications of C-K theory in detail, but it has led to a series of important results in relation to organizational change. Several of the theoretical methods used to evaluate the innovative capacities of either projects or organizations have been developed using C-K theory. The KCP (Knowledge-Concept-Proposals) method has also been derived from C-K theory to support creative processes involving numerous heterogeneous participants. Today, our understanding of generative logic has opened up many perspectives on the analysis and conduct of change in various organizational contexts (e.g., firms or ecosystems).

## New Foundations for a Theory of Collective Action: The Knowledge/Relationships Axiomatic

The third, but probably most significant contribution of Hatchuel to the field of organizational change, is his theory of collective action. Hatchuel argues that collective action can and must be designed, because neither its goals nor its forms are known a priori. Hatchuel has always paid close attention to avoiding this fallacy, which consists of considering things/circumstances as given. This is especially true

for the enterprise, as it is neither a natural social phenomenon nor an anthropological fact. The enterprise is probably one the most "artefactual" forms of collective action, because it constantly redefines what it does and how it does it (Hatchuel 2001a). Because it is the locus of *designed* collective action, the enterprise is (or could be?) the very transformational place in our society.

Collective action is hardly describable in the classical language of the social sciences. As soon as one wants to institute unprecedented forms of action, new language also needs to be deployed. A collective action has the specific property that it cannot be realized unless a model has previously been formulated. Probably the simplest example of collective action is a meeting. For a meeting to take place, the parties have to agree on what is an appointment, using related maps and clocks. Similarly, when we refer to companies, joint ventures, and matrix organizations, we always refer to designed *models of action*. A company cannot innovate without formalizing how it can explore unknown spaces. For instance, it cannot develop a new eco-friendly range of products without formulating not only the properties of the products themselves but also a way to explore these properties and their feasibility. Obviously, innovative collective action cannot occur without new models of collective action.

This perspective has had a great impact on organizational change because instead of focusing on the organization, Hatchuel focuses on the coordination of the learning processes. Instead of adopting a contingency perspective, he speaks of the genealogy of collective entities. Instead of considering the rationality of a change, he invites us to think in terms of *rationalization* to emphasize the possibility of generating new rationality frames. Finally, instead of assessing a company's performance, he suggests that we study the epistemology within which its performance criteria have possibly emerged (Hatchuel 2001a).

Hatchuel's formulation of an a*xiomatic theory of collective action* (Hatchuel 2001a) is both generic and ambitious. Combining his former work on rational modeling and prescribing relationships, he rejects what he calls the "metaphysics" of action that reduce the total forms of possible action to a unique principle (e.g., utilitarianism). Collective action must be studied to the extent that it *transforms* relationships and utility functions. The only invariant in the theory of collective action lies in what Hatchuel calls "a principle of inseparability between knowledge and relationships" ("*Le principe fondamental d'une théorie de l'action collective est l'inséparabilité des savoirs et des relations*") (Hatchuel 2001a, p. 28). This principle refuses to consider that knowledge is independent of relationships. It also refuses (and this may be more original) to view relationships as independent of the knowledge and the organization of learning processes in which they take place (Hatchuel 2005, 2007). This gives a theory based on what Hatchuel coined in French "*l'axiomatique savoirs/relations*" (the knowledge/relationships axiomatic). This focus on collective action as a matter of design and organization is central, because it paves the way for new definitions of management and management science.

## New Insights: Management Science as a Basic Science

For Hatchuel, the purpose of management lies in the design of models of collective action. Management science "is a basic field of research devoted to the study and design of *theories, models and tools of collective action*" (Hatchuel 2002, 2005). As Hatchuel and David noted, "*Likewise, physics is not the study of "reality," but the study and revision of physical models. Consequently, the dialectics between established management theory-in-use and contextual management theory-in-use can be assessed as an important main driver of management theory and history*" (Hatchuel and David 2007). This offers a new perspective on management science: instead of viewing management as lying at the crossroads of economics, law, and sociology, Hatchuel contends that management has a distinctive objective in the modeling and design of new models of collective action. In this way, he also makes some rather radical criticisms of economics and sociology. In his view, economics and sociology have been built on restrictive forms of collective action. Having assumed several behavioral models of economic actors, economists have stabilized an underlying utility function, and in so doing, they have become blind to the possibility that collective action transforms utility functions. Similarly, sociologists often posit various special forms of relationship or social status, thereby preventing themselves from conceptualizing how new actors appear or how new forms of relationships are built. However, both history and practice offer numerous examples in which efficiency criteria, as well as societal values, are substantially modified.

In a famous article referred to in France as laying the groundwork for a "foundationist perspective" for management science (Hatchuel 2001a), Hatchuel called for a revised view of the management sciences, arguing that:

> management sciences are neither applied economics or sociology, nor a project for educating future managers with a series of practical tools (accounting, marking, strategy. . .). Management sciences are better characterized by the need of our contemporary society to make emerging forms of collective actions more intelligible and to allow the design of unprecedented organizations. (our translation, Hatchuel 2001a)

Retrospectively, Hatchuel has found that the management science project was probably at the core of the work of the famous pioneers of management. Building upon classical as well as forgotten seminal texts of Fayol (1917, 1918), Hatchuel recently offered a new interpretation of Fayol. A chief executive, natural scientist, and organization theorist, Fayol was a particularly innovative manager who actively supported a scientific approach and achieved major industrial success. Hatchuel showed that Fayol had a visionary understanding of management. In the late nineteenth century, he was confronted by a surge in scientific research in industry. In this context, businesses called for a new function, which Fayol conceptualized as the administrative function. The mission of this business administration function was

to organize a controlled and responsible venture into the unknown. It was to hold the organization together *despite the unknown it generated by its exploratory action* (Hatchuel 2016). Hatchuel showed that Fayol had pioneered subsequent research on "creative" organizations, dynamic capabilities, and alternative rationalities based on design and discovery. With this historical detour, Hatchuel once again offered new insights in relation to integrating the dynamics of change and innovation into the foundations of management theory.

## Legacies and Ongoing Programs: Toward a Theory of Creative Rationalities and Institutions

Among the various impacts of Hatchuel's research are several ongoing programs in which the authors are participating in conjunction with Hatchuel.

### A Post-Decisional Paradigm of Collective Action

A program has been launched on design theory, with the support of a number of industrial partners: the Chair "Design theory and Methods for Innovation." This program explores the so-called post-decisional paradigm, i.e., forms of collective action that are unable to be modeled using classical decision-making models (such as problem solving, optimization, and planning) because the level of unknowns and the generativity of action play a critical role (e.g., innovation management and creation in art or science). This follows Hatchuel's research logic: first, explore the models of thought and rationality, and then, relying on these models, explore and model all facets of collective action. In this program, the models of rationality are derived from design theory. In recent years, these works have contributed to the development of a basic science of design theory, which is comparable in terms of its structure, foundations and impact to decision theory, optimization, and game theory. They have reconstructed the historical roots and evolution of design theory, unified the field at a high level of generality, and uncovered theoretical foundations, in particular the logic of generativity, in "design-oriented" structures.

These results have contributed to a paradigm shift in relation to the organization of R&D departments, supporting the development of new methods and processes in innovation centers. They are also at the root of many works on innovative organizations (see Agogué and Kazakçi 2014) and have helped to better characterize their logic and performance. Following the paradigmatic pattern of decision theory, which articulates models of decision theory with experimental study of decision-making behavior, design theory was also discussed from a cognitive perspective: just as decision theory helped to diagnose individual and group behaviors that depart from decision-making models, design theory helps to conduct "theory-driven experiments" on biases in the ideation process and helps to diagnose fixations in individuals, groups, or professions (e.g., Agogué et al. 2014). The program also studies the so-called design regimes at the level of industrial ecosystems, identifying new forms

of lock-in based on collective fixations or, conversely, describing forms of "unlocking rules" and generative institutions, i.e., situations where the institutional logic does not impede but rather supports a collective venture into the unknown (Le Masson et al. 2012). It also helps to provide firm ground for a critical perspective on creation and design.

## A Theory of the Firm as a Locus of Collective Creation

A second program focuses on the theory of enterprise, which mainly proposes that modern companies with professional management emerged at the end of the nineteenth century because of the need to organize the development of new collective capabilities (technologies, functions, methods, competencies) that would not otherwise be available. This breakthrough in relation to the history of collective action has deeply transformed our societies. However, despite the tremendous expansion of companies throughout the twentieth century, this process has not been sufficiently conceptualized and has continued to be overlooked, both by the economic theories of the firm and by corporate law.

This has led Hatchuel and Segrestin to explore within an interdisciplinary project at College des Bernardins a new theory of the firm and to question the existing models of corporate governance and corporate law. The transaction cost approach views the firm as a means of reducing transaction costs and controlling opportunism. However, the alternative perspective developed by Hatchuel and Segrestin builds upon the historical development of management as a distinctive function. It conceptualizes the enterprise as an entity dedicated to *collective creation* as opposed to production. In other words, this perspective views the firm as a means of creating the potential for action that does not currently exist and for which there is not yet a market (Segrestin and Hatchuel 2012). In doing so, they build on the stakeholder theory of the firm, which emphasizes that there is great interdependence among firms as a result of co-specialized investment. However, they go beyond the stakeholder theory of the firm by offering a very specific conceptualization of the role of management as the key to developing the collective competence of the firm in pursuit of an innovative strategy. Then, considering that the law of (public) corporations was already established prior to the birth of modern management, they question the implications of this gap and investigate possible management-based (or innovation-driven) principles of governance, such as mission-driven corporations (Levillain et al. 2014; Segrestin and Hatchuel 2011).

## Conclusion

Beyond these programs, it is worth noting more generally the opening up of the field of epistemology by Hatchuel. By focusing on collective action, Hatchuel often combines traditionally distant academic fields, for example, innovation management and design theory are combined with business history and law. However, more

fundamentally, his work questions the constituent hypotheses of disciplines such as economics and sociology because they often posit given models of action. A good example is the field of law, which management scholars have often considered to be a given starting point when studying forms of collective action. However, law, like other managerial tools, merely formalizes historical and contextual models of responsible action. Modeling the renewal dynamics of collective action necessarily leads to a change in perspective: instead of considering law as a starting point, management science needs to provide lawyers and scholars in law with new models of action, including generative ones.

To conclude, following Hatchuel, we can only speculate on the future of management science. Do we need to reorder the discipline, similar to what happened in relation to physics at the end of the nineteenth century? Or, rather, should we consider that the key impacts of Hatchuel's work also relate to other fields and that the notions he has shaped are useful for various disciplines? Hatchuel has searched for solid and rigorous foundations for management science with such deep theoretical bases that they likely constitute a common ground for the social sciences and perhaps even more distant fields. Maybe it is the mark of genuinely critical research that it springs from within a single discipline but is eventually more broadly diffused among many disciplines.

# Loizos Heracleous: Uncovering the Underlying Processes of Change

Angeliki Papachroni

**Abstract**

Loizos Heracleous holds a Chair in Strategy and Organization at Warwick Business School and is also an Associate Fellow of Green Templeton College and the Saïd Business School at Oxford University. His work over the years aims to uncover how organizations change, adapt, and evolve overtime, with particular reference to how individuals interpret and frame strategic issues. One of his most prominent contributions is linking organizational change and development with a number of perspectives and themes in strategy and organization, such as organizational discourse and ambidexterity. Heracleous' body of work contributes to fundamental questions around organizations, such as what elements influence organizational change and development processes? What is the role of organizational discourse, metaphor, dialogue, culture, and learning? How can organizations implement dual strategies that contain elements that are in mutual tension? In order to answer these questions, Heracleous brings forward an interpretive hermeneutic approach to theory and methodology and uncovers underlying aspects of organizational change and development through different theoretical lenses: discourse theory, structuration theory, paradox theory, institutional theory, and strategy as practice.

**Keywords**

Dual strategies • Organizational change • Organizational discourse • Structuration theory

# Influences and Motivations: Philosophy, Sociology and Organization Theory

In addition to his birthplace of Cyprus, Heracleous has lived and worked in the United Kingdom, Ireland, Hong Kong, and Singapore, resulting in a deep appreciation of the different social and cultural elements that influence the study and practice of strategy and organization theory. At the same time, this experience – together with an innate curiosity of how people and organizations work – has contributed to his effort to identify the common threads that transcend differences. A pattern in Heracleous' work has been his focus on key issues of organizational change and development, as well as their location in broader strategic and social contexts.

Heracleous studied for his undergraduate degree at Lancaster University between 1989 and 1992. At that time, the business school at Lancaster was home to prominent scholars of organization theory such as Karen Legge, Stephen Ackroyd, Mike Reed, and Gibson Burrell (all of these scholars are still associated with Lancaster University as emeritus or visiting professors). From them, Heracleous received an appreciation of the subtlety of social and political processes in organizations and an understanding of how formal structures do not really represent what takes place in organizations. In particular, he was most intrigued by those processes that are often emergent and implicit and interact in complex ways with what is planned and explicit. During those early years of scholarship, Heracleous learned to look for the multiple and often contradictory meanings and motivations underlying actors' decisions and actions.

He was also able to indulge in a variety of topics at Lancaster. He studied management, law, and philosophy during his first year and later continued to pursue learning on a variety of areas of interest. Heracleous' undergraduate dissertation – which was based on the interrelationship between Asian meaning systems (Confucianism and Buddhism) and martial arts of Japan – reflected this pluralism of intellectual pursuits. Overall, his experience at Lancaster was instrumental in his appreciating the value of reading widely and bringing together concepts that may not at face value appear connected. It was during these early years of study that Heracleous also realized that these interconnections could be a source of conceptual innovation, an insight that characterizes his work throughout the years.

Following his undergraduate degree, Heracleous continued his studies (MPhil, PhD) at the Judge Institute of Management Studies, University of Cambridge. While at Cambridge, he was fortunate to be supervised by scholars with similarly broad interests who allowed him to follow his intuitions and forge his own path in his dissertation work. Heracleous' MPhil dissertation, titled *Language as Symbolic Activity in the Context of Strategic Change Processes* was supervised by Charles Hampden-Turner, philosopher of management and society. His PhD dissertation, *Strategic Change, Culture and Discourse*: *Conceptualizations and Interconnections*, was supervised by John Hendry – who has a background in the history and philosophy of science. During his years at Cambridge (1993–1997), Heracleous began looking at the broadly defined area of discourse. He was interested in reading more about rhetoric, hermeneutics, and metaphor and how these shape both people's ways of thinking as well as the culture and change processes of particular communities. Before the time of online databases, he spent many hours in the university library, unearthing titles in anthropology, linguistics, and philosophy. This area of study would later become an important and central part of his academic contribution to organizational theory and change.

After the conclusion of his PhD, Heracleous moved to Singapore, where he focused on issues of corporate strategy, first as assistant professor in corporate strategy at the National University of Singapore (1996–1999) and then as associate professor (2000–2004) at the same university. As he shifted his focus to a new cultural environment, his research focused on corporate strategy in Asia, leading to a number of publications (Heracleous 1999a, 2000, 2001a, b). He served as director of the Strategic Management Executive Program at the National University of Singapore from 2001 to 2003 and trained company directors on best practices in corporate governance from 1999 to 2004, as part of the Singapore Institute of Directors' accreditation program. At the same time, a series of publications helped to inform his pedagogy of board directors and executives (Heracleous 1999b, 2001b; Heracleous and Lan 2002; Lan and Heracleous 2007).

In 2004, Heracleous became an official fellow at Templeton College and, in 2006, a reader in strategy at the Saïd Business School at the University of Oxford. He has held the positions of professor of strategy and organization at Warwick Business School, University of Warwick and Associate Fellow of Green Templeton College and Saïd Business School at Oxford since 2007. During recent years, he extended his work on corporate governance, strategy, discourse theory, and organizational change.

A strong advocate of bridging theory and practice, Heracleous has developed and delivered several executive development programs in leading corporations around the world, in areas such as strategic thinking and planning, leading transformational change, fostering strategic innovation, developing core competencies and strategic alignment, dealing with dilemmas of corporate governance, developing corporate social responsibility, diagnosing and managing organizational culture, and organizing for the future.

A central pedagogic vehicle for linking concepts and practice has been the case study method, which Heracleous has been engaged in through his career. Examples

are the cases reported in his books *Business Strategy in Asia* (Singh et al. 2013) and *Practicing Strategy* (Paroutis et al. 2016), as well as cases published by the Case Centre. His book *Flying High in a Competitive Industry* (Heracleous et al. 2009) as well as various articles on Singapore Airlines (Heracleous et al. 2004, 2005; Heracleous and Wirtz 2006) helped apply concepts to practical situations during several years of training MBA students and senior managers. From this work also came a "breakthrough idea" published in Harvard Business Review's annual list of such ideas, on applying biometrics to services (Wirtz and Heracleous 2005).

Over the years, Heracleous focused his research on three distinct yet interrelated domains: organization change and development, strategic management from an organizational perspective, and organizational discourse.

## Key Contributions: Organization Change, Discourse Theory, and Strategy Implementation

A central element of Heracleous' contribution has been the study of organization change and development in relation to a variety of challenges and themes, such as strategy implementation, discourse, and organizational ambidexterity.

*Organizational change and discourse*. One of Heracleous' most prominent contributions is the study of discourse and organizational change. Following the linguistic turn in social sciences – which saw language not only as instrumental for communication but also constructive of social and organizational reality (Dandridge et al. 1980; Pondy and Mitroff 1979) – Heracleous became interested in the role of discourse within the inherent complexity and fluidity of organizational life. His focus on the constructive role of language draws from seminal works in organization theory (Weick 1979; Pondy and Mitroff 1979), sociology of knowledge (Berger and Luckmann 1966; Ortony 1979; Moscovici 1981), and linguistics (Lakoff and Johnson 1980; de Saussure 1983).

Heracleous initially focused on the interrelationship between discourse, culture, and change through his MPhil and PhD research at the Cambridge Judge Business School. His doctoral research was based at the UK offices of a global human resources management consulting firm. Through a series of cultural and communication audits with the senior management team (involving in-depth interviews, group sessions, observation and historical analysis), Heracleous studied the impact of organizational culture in the strategic redirection of the organization and provided feedback to senior executives that helped to inform their management of the change process (Heracleous 1995). The methodology was an integration of ethnography with a clinical, action research component (Heracleous 2001c; Schein 1987), indicating Heracleous' early interest in knowledge development that is close to practice. In undertaking this study, it was accepted that the organizational paradigm was enshrined within a "cultural web" (Johnson 1992) of artifacts: the behavioral manifestations and the institutionalization of the accepted beliefs and assumptions (Heracleous 2001c). The implications of this approach for organizational change is that "it is seen as especially difficult to achieve because of the influence of cultural

beliefs and assumptions on individuals' interpretations and actions, their taken-for-granted nature which effectively precludes them from open debate, their close link with the power centers of the organization, and the internal consistency, self-legitimacy and self-sustenance of the cultural web" (Heracleous and Langham 1996, p. 487). In order to contribute to the company's knowledge base, Heracleous also researched and prepared two reports that focused on issues of integrated consulting that took into consideration interconnected elements, as well as a compilation of state-of-the-art knowledge of leadership (Heracleous 1996, 1998).

Bringing sociological concepts such as structuration theory into the area of organization change and integrating discourse theory and structuration theory is another significant contribution of Heracleous' work (Heracleous and Hendry 2000; Heracleous and Barrett 2001; Heracleous 2002, 2006a, b, 2013a). The concept of "duality of structure," central to Anthony Giddens' theoretical scheme, suggests that "social structure is both constituted *by* human agency and yet is at the same time the very *medium* of this constitution" (Giddens 1993, pp. 128–129, emphasis in original). Giddens also referred to the nature of language (grammatical rules in relation to spoken or written language) as an example of the duality of structure (Giddens 1984). According to Heracleous and Hendry (2000), Giddens' work aims to transcend the structure–agency dualism and to reconcile interpretive and functionalist sociological views, in common with the work of such theorists as Bourdieu (1977) and Silverman (1970).

The discourse in this perspective, via its framing effects, is central to individuals' interpretation and action and thus shapes organization change processes. Discourse "itself becomes action that can either aid or hinder change processes" (Heracleous 2002, p. 257). Drawing from the works of Giddens (1979, 1984, 1987, 1993) and Ricoeur (1991) in hermeneutics, as well as Aristotle (1991) in rhetoric, Heracleous developed a conceptualization in which discourse is viewed as a duality of communicative actions (utterances) and deep structures (such as root metaphors, central themes, or fundamental assumptions), interacting through the modality of actors' interpretive schemes (Heracleous 1994; Heracleous and Barrett 2001; Heracleous and Hendry 2000). This conceptualization of discourse allows the studying and understanding of both the functional aspects of organizational communication and the deeper structural properties of discursive practices within organizational contexts. The structural elements in particular are intimately connected with aspects of the organizational paradigm and are therefore important to appreciate and influence in processes of change. As a result, "the study of change processes emerges … as a hermeneutic investigation into the dynamics of discursive interpenetrations and clashes, the deeper structures that guide agents' interpretations and actions and how these shape change outcomes" (Heracleous and Barrett 2001, p. 775). This research introduced a novel perspective on the dynamics of change processes through a discursive analytical approach that is sensitive to the inherent complexity of organizational life.

Focusing on the constructive and symbolic aspects of discourse, Heracleous and Marshak searched for deeper symbolic meanings and discursive constructions that could shed light on what is observed and its context (Heracleous and Marshak 2004).

The work on this topic led to a conceptualization of discourse as "situated symbolic action." This view of discourse proposes three interrelated analytical levels relating to discursive action, situation, and symbolism. Although these layers are presented sequentially, they provide a nested, complementary, and additive analysis of progressively increasing complexity (Heracleous and Marshak 2004).

Heracleous' subsequent work showed that organizations can host different "modes of discourse" simultaneously; these discourses are not autonomous but are linked with other discourses in cooperative or antagonistic ways. A discourse analysis of an organization change process revealed a complex picture of the rule of a dominant discourse that is relatively stable at the structural level but flexible at the communicative action level, where situational exigencies can be addressed and debated in the "approved" way (Heracleous 2006a, b). This research led to some key propositions regarding the role and nature of different modes of discourse: first, that those modes of discourse can be usefully conceptualized as rhetorical enthymemes (argumentations in practice) constituted of relatively stable, normative structures and flexible, action-oriented structures. Second, that those modes of discourse can interrelate through their deeper structural features and can have mutually co-optive or antagonistic relationships. Third, that the constructive potential of discourse is based primarily on its deeper structures and on the consonance of surface (communicative) actions with these structures (Heracleous 2006b).

*Organizational change and embodied metaphors*. Another area of interest for Heracleous are studies of "embodied metaphors," these being collaboratively constructed physical analogs of organizational issues as interpreted by groups of actors, as described in the book *Crafting Strategy*: *Embodied Metaphors in Practice* (Heracleous and Jacobs 2011). Together with Jacobs, Heracleous presented the use of embodied metaphors as a novel metaphorical approach to organization development (Heracleous and Jacobs 2008a, b; Jacobs and Heracleous 2006). The role of metaphors as cognitive and semantic devices in the discursive construction of meaning had been recognized in the organizational change and development literature (e.g., Cleary and Packard 1992; Marshak 1993; Sackmann 1989). The influence of metaphorical reasoning in organization theory over the years draws from the work of Morgan (1980, 1983, 1986), who challenged the dominant mechanistic and organic metaphors that had guided theorizing within a functionalist paradigm, through a conscious understanding of the impact of such taken-for-granted metaphors on organizational theorizing.

Jacobs and Heracleous extended these understandings and uses of metaphor in organization development by going beyond the dominant semantic–cognitive dimension to address the spatial and embodied dimensions (Jacobs and Heracleous 2006). The authors suggested that embodied metaphors can enable politically contentious issues to arise and be decoded and debated, foster creative thinking, and facilitate organizational change by being occasions for collective sensemaking where important issues can be addressed (Jacobs and Heracleous 2006). Crafting embodied metaphors is thus proposed as a technique for strategizing through playful design (Jacobs and Heracleous 2007). In essence, this process enables managers to explore their strategic issues through a facilitated group process of sensemaking.

This method offers participants the opportunity to challenge their mindsets and paradigms through the interaction of individual perspectives and the symbolic building of group perspectives, enhancing their readiness for organization change.

*Organizational change and corporate governance*. In an influential stream of work, Lan and Heracleous examined the intersection of management theory and law to uncover the myth of shareholder supremacy in corporate governance and to propose redefinitions of key precepts of agency theory, as well as the nature and role of the board of directors (Heracleous and Lan 2010, 2012; Lan and Heracleous 2010). Based on a systematic analysis of a century's worth of legal theory and precedent, Heracleous and Lan suggested that according to law and contrary to agency theory assumptions, shareholders do not own the corporation, which is itself a legal person with the right to own property. Further, in cases in which directors go against shareholders' wishes, courts historically side with directors, given the business judgment rule and the legal role of directors as autonomous fiduciaries rather than representatives of shareholders (Heracleous and Lan 2010; Lan and Heracleous 2010). Based on these findings, Lan and Heracleous critically reexamined agency theory as the basis of corporate governance literature and proposed reformulations that have begun to inform theorization and empirical research in new directions. Through this work, Heracleous and Lan redefined the principal in the agent–principal relationship from shareholders to the corporation, the status of the board from shareholders' agents to autonomous fiduciaries, and the role of the board from monitors of management to mediating hierarchs among competing stakeholder demands. This reformulated agency theory exhibits institutional sensitivity, as it recognizes various stakeholders as team members, rather than just adding particular institutional features as variables to the dominant conception of agency theory (Heracleous and Lan 2012; Lan and Heracleous 2010).

*Dual strategies and organizational ambidexterity*. A more recent area of interest for Heracleous has been the implementation of dual strategies and organizational ambidexterity. Research in this domain stems from the need for organizations to respond to multiple and often conflicting goals simultaneously, in order to ensure both efficiency as well as growth (Duncan 1976; March 1991; Raisch et al. 2009). Through the lens of paradox theory, organizational ambidexterity is conceptualized as a dynamic system of nested tensions that may be managed differently across organizational levels, based on how actors interpret those tensions and react to them (Papachroni et al. 2015, 2016).

Organization change and development programs often aim to accomplish ambidexterity or deal with conflicting tensions. Heracleous' work on leading organizations that have accomplished ambidexterity includes Apple Inc. (Heracleous 2013b), Singapore Airlines (Heracleous et al. 2009; Heracleous et al. 2004), and Toyota (Heracleous and Papachroni 2013). Heracleous' ongoing work includes in-depth case research at the Johnson Space Center at NASA that focuses on organization change, culture, and ambidexterity (Heracleous and Gonzalez 2014; Terrier et al. 2017). This research investigates how an established paradigm of a venerable organization in the public sector can change in response to environmental pressures

in a way that does not disrupt its current programs and balances a variety of stakeholder objectives.

This and other work (Heracleous 2003) demonstrate Heracleous' conviction that we can better understand the subtleties of strategy and change by investigating qualitatively and in some depth, how various types of organizations deal in practice with such challenges.

## New Insights: Underlying Processes of Organization Change

Heracleous' work has helped advance the employment of discursive and practice-oriented approaches to organizational change and strategy research. His contributions to prominent collections over the years (e.g., Heracleous 2004, 2011, 2017) have helped to summarize and lay out the main contours of discursive analysis for early career scholars and students of organizations.

His work has also contributed to a more sociologically and philosophically informed approach to the study of organizations. He has followed a rich theoretical tradition concerned with explicating actors' meanings (Berger and Luckmann 1966) and bridging the gap between action and structure in social life (Giddens 1984), based on the recognition that in the study of social systems, understanding individual actors' meaning is of paramount importance. In this context, meaning and therefore social reality is constructed, sustained, and changed through social interaction (Bourdieu 1977; Giddens 1984; Silverman 1970), lending a processual perspective to Heracleous' methodological approach. Moving beyond the "what" to the "how" and "why," Heracleous' work brings forward the complexity of organizational life by focusing on underlying and implicit processes shaping organizational change, as well as organizational life more broadly. Seeking to uncover actors' first-order understandings, as they manifest in their actions, discourses, and material expressions, and to develop frameworks that take account of these understandings, Heracleous' work has spurred new developments in theory and research that have led us to view change in new and surprising ways.

For example, Paroutis and Heracleous (2013) investigated what strategists mean when they use the term "strategy." They tracked discursive patterns over time and linked those to institutional features. Inspired by structuration theory, the authors uncovered enduring central themes of first-order strategy discourse employed by strategists (identity, functional, contextual, and metaphorical) and treated them as structural features shaping communicative actions and constraining and enabling strategic practices. The authors found that there was differential emphasis in strategists' first-order strategy discourse on these themes, at different phases of institutionalization (shaping, settling, selling) of a new strategy practice.

This work paves the way for further research, not only at a micro level of discursive practices and their links with organization change or institutionalization processes but also at a more macro level, drawing further from structuration theory. For example, such research could examine the links between discourses and what Giddens (1984, p. 244) referred to as "episodic characterizations" in the context of "world time," that

is, the analysis of episodes as shaped by historical events and conditions (including prevalent discourses). Such an analysis would proceed on at least three interconnected levels: discursive practices at the micro level, broader discourses at the meso and macro level, and institutional change at the macro level. Heracleous proposed that this type of work – combined with the concept of "time–space distanciation," or the spread of interconnected social systems across space and time – would give a fruitful means of analyzing important issues of social change, pertaining, for example, to globalization and its challenges (Heracleous 2013a).

## Legacies and Unfinished Business: Understanding the Complexities and Subtleties of Organizational Life

To speak about the legacy of Heracleous' work while he is 47 (at the time of this writing) and considering himself mid-career would perhaps be premature. If all goes well, he has at least two more decades of further contributions to make. Understanding the complexities and subtleties of organizational life – a goal of Heracleous' from the very beginning – is a never-ending, multifaceted endeavor. His current work includes in-depth case research at NASA's Johnson Space Center, historical research on barriers to structural ambidexterity at Xerox PARC, processual research examining the separation and reintegration of a subsidiary in the context of structural ambidexterity, research on the links between evolutionary lock-in and organization change, research on the micro-practices of strategy presentations, books on implementing ambidextrous strategy and accomplishing strategic agility, and ongoing work on several other themes, including discourse, informal organization and agency theory.

As the field of organization change and development continues to be one of the most complex and intriguing within social sciences, Heracleous' past and forthcoming work will be of continuing resonance in a vibrant and growing field. Based on qualitative, clinical, discursive, and ethnographic approaches, his work illuminates key underlying processes of change and leads the way for further work along these lines. Combining both a flexible and focused way of thinking that draws from insightful observation, traveling, and reading widely, Heracleous' work is an inspiration to scholars and practitioners who value a holistic, practice-oriented, and cutting-edge understanding of strategy and organizational change processes.

Timo O. Vuori

## Abstract

Strategy execution is a challenging organizational process that intertwines structural, economic, and social processes. Quy Huy's work has increased our understanding of the social dynamics in this context. In particular, his work has described how managers in various different roles perceive organizational events differently, feel different emotions, and take various kinds of actions to promote organizational change. Their emotional reactions, subsequent behaviors, and the feedback loops between various people's emotions and actions ultimately influence organizational outcomes in ways that Quy's research has explicated. He has thus increased our understanding of change processes and also provided practical advice on how executives can better lead the execution of their strategies.

## Keywords

Strategy execution • Emotion • Collective emotion • Qualitative research • Social psychology of change

## Introduction

Quy Huy is professor of strategy at INSEAD. He is most known for his work on the social-psychological dynamics of strategy execution. He has integrated emotions to the understanding of organizational processes, showing how micro-level factors can contribute to collective outcomes. He has been publishing actively for nearly 2 decades and continues to produce high-quality research.

## Influences and Motivations: Financial Guru Meets Henry Mintzberg

For a scholar who is known for highlighting the human side of strategy execution, Quy Huy started from a "hard" place. He received an MBA degree in 1983 and worked as a financial middle manager in a large North American organization for nearly 2 decades. He was doing what financial managers do – analyzing expenses, revenue, and profitability and presenting results and making investment recommendations to top executives while also communicating with peers to obtain validated information.

Although he was performing his job successfully and was known as a "financial guru," he was reflecting more about what was going on in the organizations he worked in. As he continuously faced various seeming less rational aspects of a larger organization such as emotions, politics, and resistance to change, he started wondering how these messy processes influence the success of organizational change and strategy realization more generally.

Working on important business transactions with top executives allowed him to witness firsthand how many strategic plans that seemed beautifully crafted by executives and external consultants underperformed in the harsh reality of execution. Being himself a middle manager, he could empathize deeply with his counterparts through close interactions with them. This allowed him to understand deeply how middle managers can work as both enablers and barriers to strategic change.

He started pursuing a PhD in 1994. Analyzing a major organizational transformation from both middle and top managers' perspective came naturally to him. And it did not harm that his supervisor was Henry Mintzberg, who had defined the difference between planned and realized strategies and discussed how patterns of

actions emerge through daily choices. Henry and Quy formed a perfect match with Quy's interest in middle managers' role in strategy execution and Henry's extensive knowledge and experience in studying strategy emergence.

Quy's work benefitted greatly from the various lessons that Henry taught him. Like Henry's and Quy's research, these lessons related more to the process of doing something than the substance of the doing. That is, Henry taught Quy how to do good research, while Quy applied these process lessons to the study of strategy execution.

The first lesson was the importance of being close to the phenomenon one wishes to study and to understand it deeply. Henry encouraged Quy to do extensive, systematic data collection. Quy's dissertation had over 200 interviews over 3 years. Quy's existing network and practical credibility enabled him to gain access to a rich set of people, enabling greater depth and insight. (The field study started 3 months after Quy began his doctoral studies, with Henry's blessing, enabling Quy to defend his dissertation after 4 years.)

Despite both Henry and Quy being trained as engineers (MIT and McGill, respectively), they displayed skepticism about the growing legitimacy and emphasis on quantitative techniques in the 1990s to study complex management phenomena. They worried that much useful insights might be lost in this overemphasis, hence the qualitative approach, which made Quy's research highly insightful.

Another important lesson Henry taught to Quy was precision in language. When they were working together in Henry's office, Henry would pick up a dictionary several times per day to find a word that would match his intended meaning. At first, Quy was wondering, "Why do you use a dictionary, you write so beautifully already?" Of course, the beautiful writing did not happen through magic but through hard work and continuous attention to precision. The use of a dictionary is a lesson that Quy continues to follow. It has also been more than once that he has commented his students' and coauthors' work with "Unclear sentence. Please rewrite for clearer English."

The third important theme Quy learned from Henry is humility. Quy got a book contract from a famous publisher 3 years after his PhD – when he had already published in *Academy of Management Review*, *Harvard Business Review*, and *Administrative Science Quarterly*. He mentioned to Henry that he was awarded a book contract with a highly prestigious book publisher on his research 4 years after his PhD as a single author. Henry's reaction was fast and surprising to him: "Write a few more academic articles first. You don't know enough to write a book. It is too early for you." Henry told his doctoral students "Do not take yourself too seriously. But do take your work very seriously."

Hard work follows from humility. Quy remembers how he was sitting in his small room in the university (he used to have a large of office and secretarial staff in his former corporate life) and learning to type as a PhD student, while others were out having beers on a Friday night. It is still not uncommon to see that the lights are on in his office during strange hours. As he once advised an aspirational student, "you should spend most of your waking hours reading the literature or collecting rich data."

Quy perceives Henry also as a role model of producing academic research that is both rigorous and managerially relevant. A litmus test for this approach is whether the same research can be published in both top academic journals and top practitioner journals and books. It is fair to say that Quy has been able to emulate his mentor.

## Key Contributions: Emotions and Strategy Execution

Quy's scholarly work centers on strategy execution. He uses a social-psychological approach to understand how initial plans are transformed into actions more or less successfully. Most importantly, he has increased our understanding of the role of emotions and middle managers in this process.

### Emotional Capability, Emotional Intelligence, and Radical Change (1999)

Quy's first hit as an academic was his article "Emotional capability, emotional intelligence, and radical change" in the *Academy of Management Review* in 1999 (Huy 1999). In this article, he rooted the foundation for the work of various scholars interested in the role of emotions during radical organizational changes. The article presents a multilevel theory, describing how individual-level emotional intelligence and organizational-level emotional capability contribute to the success of organizational change.

One of the key insights in the article was that individual-level emotions and emotional intelligence might contribute to organization-level attributes. In particular, Quy theorized how emotional factors influence three important aspects of organizational change: receptivity, mobilization, and learning. Receptivity refers to "organization members' willingness to consider – individually and collectively – proposed changes and to recognize the legitimacy of such proposals" (Huy 1999, p. 238). Mobilization refers to "the process of rallying and propelling different segments of the organization to undertake joint action and to realize common change goals" (Huy 1999, p. 330). Learning refers to the organization's increased repertoire of potential behaviors. These three processes, Quy suggested, would contribute to the success of radical change in organizations. And as emotions were a key antecedent to these processes, emotions could substantially influence change outcomes.

The emotional factors included organizational practices that are analogical to individual-level emotional intelligence. For example, at the individual level, empathy refers to person's ability to understand others' feelings and reexperience them. At the organizational level, an analogical term is emotional experiencing which refers to "the quality of an organization's efforts to identify the variety of emotions aroused during radical change, to accept and internalize them, and to act on a deep level of

understanding" (Huy 1999, p. 335). He proposed that such emotional receptivity would increase the receptivity of the organization to a proposed change.

Other propositions dealt with the impacts of reconciliation (which is the organizational analogy of sympathy), identification (love), encouragement (hope), playfulness (fun), and display freedom (authentic). Quy thus outlined, quite comprehensively, how various different emotions and associated dynamics could each influence organizational processes and outcomes in unique and substantial ways.

## Emotional Balancing (2002)

Even though the conceptual model was what Quy published first, empirical work drove his thinking. A key part of his dissertation came out as a publication in the *Administrative Science Quarterly* in 2002 (Huy 2002). In this article, he described how middle managers' emotional balancing contributed to strategy implementation.

As Quy was interviewing middle managers, he found that some of them were rather assertive and pushing employees to act according to the new strategy. These managers did not pay much attention to the employees' anxieties, but wanted them to focus on the new job requirements.

Simultaneously, other middle managers were empathic. They were not so obsessed with the new goals (even if they did their job), but were more focused on attending to the employees' worries. They listened to them, providing comfort, and sought to help them cope in tangible ways.

The surprising thing in the study was that neither group of managers was successful alone. Neither approach – assertive nor empathic – worked. Units where managers were dominantly assertive failed to implement the change successfully. Rather, units where managers were overly aggressive suffered from chaos. Units where managers were dominantly empathic suffered from inertia.

The change was implemented successfully only in those units that had both types of managers. Emotional balancing was an interpersonal process of two middle managers acting in different roles: one was pushing for the change, while the other was providing comfort and empathy to deal with the personal strain of changing. No one had planned this process, but some units had been lucky to have both kinds of managers.

This study was significant in at least two key aspects. First, it showed how "soft" factors like emotions can indeed contribute to major change outcomes. It also elaborated on the underlying mechanisms with vivid field data.

Second, the study showed how emotional dynamics in organizations could not be fully reduced to the individual level. Emotional balancing was not something that an individual did alone. It required an organization and different roles for different groups of individuals. Hence, while management scholars can and do draw much insight from psychology, Quy's work showed how organizational scholars can provide a unique perspective on understanding social-psychological forces in organizations and their consequences.

## Emotional Aperture (2009) and a Validation Measure (2016)

Having noted empirically that managers varied in their ability to consider their organization's emotions, Quy started wondering, with Jeffrey Sanchez-Burks from the University of Michigan, how managers read others' emotions. They developed the concept "emotional aperture," which refers to "the ability to recognize the composition of diverse emotions in a collective (e.g., group or business unit)" (Sanchez-Burks and Huy 2009, p. 22).

The key insight they conceptualized in this article was that collectives of people do not all feel the same emotions, but there can be subsets of different emotions. Successful leaders, they argued, would recognize the differences of the emotions experienced by various groups in their organization and make use of this diversity. In contrast, less successful leaders might only recognize the emotions displayed by the majority or dominant individuals and therefore fail to influence emotions as effectively to facilitate organizational change.

An illustration that Sanchez-Burks and Huy give relates to the ability to detect shifts in the composition of collective emotions during organizational change. It might be that the majority of the organizational members are still relatively positive about an ongoing change, but the proportion of people who feel contempt toward the top management is increasing. Even though still a minority, such a response from the organization might signal severe problems. Leaders with higher emotional aperture would be faster to recognize such shifts and thus have the possibility of taking corrective actions before the problem becomes too severe.

In 2016, with other colleagues they published a follow-up empirical article that shows how emotional aperture as a personal ability can be measured and why it matters (Sanchez-Burks et al. 2016). This study shows that a leader's ability to recognize accurately the distribution of positive, negative, and neutral emotional displays in a group is more strongly associated with perceived transformational leadership than recognition of individual emotions, which has been typically used in measuring emotional intelligence.

Again, Quy successfully moved from an individual to the collective level. The articles built on the basic ideas relating to emotional intelligence and emotion recognition, but considered their applicability in the larger and more complex organizational context rather than interpersonal interactions.

## How Middle Managers' Group-Focus Emotions Influence Strategy Implementation (2011)

Another empirical breakthrough in describing the effects of supra-individual emotions on collective outcomes occurred in 2011 with a case study published in the *Strategic Management Journal*. In this case study, Quy showed how middle manager groups' group-focus emotions influenced strategy execution.

Group-focus emotions refer to emotions that people feel on behalf of a group with which they identify. When there is strong identification, people experience

emotions when the group's situation changes, even if those changes actually had no implications for them. For example, a person can feel happy after a football game if his team wins, even though that does not make the person's life better in any objective terms.

In work organizations, people also identify with various groups, and these identifications, along with the group-focus emotions they produce, can substantially shape how middle managers react to top-down changes. Quy found how some top managers' task-focused, affect-neutral approach inadvertently made some middle managers feel group-focus emotions that related to their social identities. The particular social identities included the length of time working for the company (newcomers vs. veterans) and the language spoken by senior executives (English vs. French). When managers perceived that their social group was disfavored in strategy execution, they experienced negative group-focus emotions, which made them resist the change, even when the changes would have favored them personally. The consequent resistance slowed down change implementation.

A crucial observation in this study was that many middle managers acted according to their group-focus emotions rather than personal emotions. This suggests that the collective level can be stronger than the individual level for important organizational processes. Even though we often think that individuals are primarily considering what is beneficial for them personally and that management systems should therefore motivate people at the individual level, Quy's findings suggest nuance. Individual-level systems may not be sufficient if the collective ones are not working properly.

## From Support to Mutiny (2014)

Emotion and cognition are related in reciprocal ways. In 2014, Quy described, with Kevin Corley and Matthew Kraatz, the interplay of emotional reactions and legitimacy judgments during radical organizational change (Huy et al. 2014). They showed how middle managers' emotional reactions influenced the outcome of the change process that unfolded over 3 years.

Things started well. The company had a new CEO and he had a plan. The CEO made important promises such as involving middle managers in defining the content of the upcoming radical change and removing work processes before laying off people. The CEO also set a 3-year deadline for the change, which seemed to him as a reasonable time frame.

The organization accepted the CEO's plan and was excited to have a savior. They saw that he was not attached to the old guard and knew how to plan and lead radical change. Their emotional reactions toward him were positive or neutral. They supported the change projects and were involved in them.

However, as the change moved from formulation to implementation, perceptions changed. The CEO shifted his focus to external pressures and devoted less time in supporting the internal implementation of the change projects. He also failed to follow through some of his early promises because of changing circumstances. The

concrete consequences included larger than expected turnover, decline in customer service, and change fatigue.

Middle managers, who initially supported the change, got increasingly frustrated. They reacted with negative emotions. They inferred that the top managers' lacked operational knowledge and engagement and blamed them for project underperformance and change fatigue. They started covertly resisting the change.

Things only got worse. Weak performance triggered the CEO to initiate additional layoffs to achieve his financial promises to shareholders. He also reduced the scope and resources for implementing the change projects. Customer service continued declining, and many of the change projects championed by middle managers underperformed.

Middle managers grew increasingly dissatisfied with the top management. They perceived that top managers were not keeping their promises and that they were short-term oriented mercenaries. They felt increasingly negative emotions and ultimately disobeyed top managers. Devoid of legitimacy, the CEO had to resign.

Theoretically, this study was important in linking middle managers' collective emotional reactions to their cognitive perceptions of the CEO's legitimacy and associated leadership effectiveness and strategic change outcomes. While Quy's previous studies had explained differences between the change performances of some units – such that those units whose middle managers conducted emotional balancing performed better – this study focused on explaining an organization level outcome.

## Distributed Attention and Shared Emotions in the Innovation Process (2016)

Another study that linked emotions to organizational outcomes described Nokia's fast decline in the smartphone industry after the introduction of the iPhone. Quy showed, with Timo Vuori, how Nokia's top and middle managers' experienced various kinds of fear that influenced the quality of information exchange between them and harmed the development of the operating system software for smartphones (Vuori and Huy 2016).

Structurally distributed attention was a key factor causing differences between the groups' emotions. As typical for large organizations, Nokia's top managers had a better view of the overall situation of the organization and an external focus, whereas middle managers were more focused on matters in their own domain and the directives coming from the top of the organization (rather than outside). It is therefore natural that the strongest emotions experienced by top managers related to external entities, whereas the strongest emotions experienced by middle managers related to internal entities. In addition, some top managers' aggressive behavior and Nokia's privileged position in Finland amplified middle managers' fears of losing personal status.

Top managers showed fear toward external entities, mainly competitors and investors. Their fear was particularly strong after Apple (iPhone) and Google

(android operating system) entered the smartphone market. Nokia's top managers realized that their company was under severe threat. They therefore commanded the organization to develop competing products as fast as possible and thus exerted an intense pressure on the organization.

At the same time, middle managers were less worried about the external threats. Rather, they feared the top managers inside the company. They therefore agreed verbally with the increasing demands of top managers, even though they privately doubted their feasibility. They also reported embellished data to top managers because they feared top managers might punish them for reporting bad news.

The consequence was that the top managers continued making increasingly demanding requests, which forced product development groups to take shortcuts that harmed longer-term development of the operating software. This allowed the company to maintain superior performance for a few more years, but problems started accumulating, leading to lower phone quality. Ultimately, the CEO was replaced.

This study was insightful in that it showed mechanisms that linked organizational emotions to information flows during the innovation process, which then influenced the fate of the organization, that is, this paper moved away from overt resistance during strategy execution to more nuanced mechanisms of how emotions can influence organizational outcomes through indirect mechanisms such as managers' daily choices, communication, and other processes.

In addition, this study advanced our understanding of organizational structures by linking them to the emotions experienced by different organizational groups. It thus shows how the interactions between the "hard" and "soft" dimensions of organizational design can impact organizational behaviors and strategic outcomes.

## In Sum: Connecting Micro Emotion with Macro Strategy Execution

The cumulative body of Quy's emotion-related works has shown how seemingly micro, intangible emotions – which have been much ignored in the strategy literature – could produce significant effects on corporate performance.

Many strategy scholars deal with the conceptual and empirical challenge of linking individual cognition (or emotion) with collective behavior by assuming that an organization thinks and acts like a single person (e.g., CEO) or a think-alike group (e.g., top management team or TMT). However, assuming that the firm has the psychology of one person, who chooses for the collective, or that many individual choices add up to a collective one does not always fit the real world of organizations. Only in the specific cases of small firms and autocratic managers would collective actions be likely to reflect the choices of a CEO. Firms are really coalitions of diverse groups with varied interests. Quy's research has shown, for example, that middle managers can collectively disobey the CEO in carrying out strategic change or mislead their CEO through embellished communication.

Quy's novel contribution involves multilevel theorizing that links micro-level emotions with organization-level processes such as strategic change, organizational

innovation, and the building of new organizations. Quy has brought fresh thinking into this field in at least two major ways. First, his research supplements a dominantly cognitive view of strategy with an emotional one. He focuses not on emotions per se but on the interaction between cognition and emotion and how this interaction influences collective action. Until very recently, emotions were usually avoided in strategic management research. If treated at all, emotion tended to be associated with harmful outcomes such as cognitive biases, rigidity threat, or escalating commitment. Instead, Quy's research relies on a more complex understanding of emotion and its effects. Positive emotions do not always help or negative emotions do not always hurt. All depends on the specific context and how these emotions are perceived and managed.

Quy's second major contribution is the articulation of new mechanisms that link emotion with organizational processes and outcomes. One distinctive feature of strategic management is its emphasis on collective action. It is thus important to articulate the mechanisms by which social-psychological processes – and in particular, emotion – influence collective action. Quy has proposed two new linking mechanisms: emotion-based organizational routines and collective emotions.

The first linking mechanism is emotion-based organizational routine, drawing on the well-accepted concept of routine in strategy, and thus inspired by evolutionary theory (Nelson and Winter 1982). This mechanism underlies Quy's early publications. Through this linking mechanism, Quy advanced the novel theories of organization-level emotional capability and emotional balancing.

The second linking mechanism is collective emotion, which builds on group identification theory. As individuals, people can experience similar emotions because they identify themselves strongly with a group – even if their direct personal interests are not at stake. Many of Quy's more recent projects continue to explore collective emotions while deepening research on emotion-based organizational routines.

Note that these two linking mechanisms – emotion-based organizational routines and collective emotions through group identification – complement each other and enable the exploration of their effects in strategic contexts such as post-merger integration, entrepreneurship, top management teams, and organizational innovation.

## New Insights: From Emotions to Emerging Economies and Digitalization

Quy continues to expand the understanding of the social-psychological dynamics of management in less traditional contexts. Two particularly important domains are emerging economies and digitalization. Both are areas that are likely to lead to major global changes, for both companies and societies. Hence, in addition to helping us understand how established organizations and societies react to the radical changes (as discussed above), Quy's work might just enable progress elsewhere.

For emerging economies, Quy has studied, with Yidi Guo and Zhixing Xiao (Guo et al. 2016), how Chinese middle managers manage the political environment to achieve market-related goals. This study, again, shows how middle managers have a

central role in enabling organizational effectiveness. It also elaborates on the practices that successful middle managers use.

For digitalization, Quy, with Andrew Shipilov (Huy and Shipilov 2012), found that companies that are successfully using social media internally to important objectives take actions that build emotional capital. Social media can lead to various reactions and the building of emotional capital seems to foster productive reactions. Social capital refers to the aggregate feelings of goodwill toward a company and the way it operates. They also discuss ways through which executives can build such capital.

## Legacies and Unfinished Business: Practical Impact and New Change Contexts

Quy's work has caused strategy scholars to start taking emotions more seriously. While developments in experimental psychology (e.g., Lerner et al. 2015) and neuroscience (e.g., Phelps et al. 2014) have done their part – mainly through lab experiments – Quy's work has shown how emotions operate in the real-world context at the collective level and can indeed shape strategic outcomes. It has now become more accepted that the psychological micro-foundations of strategy do not only include cold cognitive processes, but hot emotional processes are at least equally important. Quy has not only shown that emotions can influence companies' success but has explicated the mechanisms in detail. The detailed case studies and insightful theorizing on them have inspired many scholars to think how emotional and other social-psychological factors play out in organizations.

The emotional side of strategy execution complements, in a sense, Simon's idea of bounded rationality. Bounded rationality provided a fundamental insight for our understanding of and theorizing about organizations. Yet, as Simon himself noted (1983, p. 29), we can fully understand human rationality only if we also take into account emotions. While psychological research on emotions and their influence has advanced greatly during the past decades, Quy has been among the first scholars to describe and theorize the implications for organizational processes.

The latest sign of the increasing acceptance of the emotion-based view of organizing is the special issue in the *Academy of Management Review* in 2016. In this issue, coedited by Quy, various scholars theorize how emotional factors influence important organizational processes.

Despite the theoretical advances, the challenge of translating good research into skilled practice remains. Quy's long-standing research on organizations shows that most executives know "intellectually" that it is important to pay attention to stakeholders' collective emotions and perform emotion management to energize collective action. But in practice, few firms actually energize collective action consistently and effectively. To date, few have been able to develop systematically a set of emotional capability routines; many consider this capability too difficult to develop and implement.

An important future development to address the knowing-doing gap relates to measurement, in addition to popularizing the research and disseminating it through education. Quy's work has mainly been theory building, but also quantitative large-sample tests are needed for validating the ideas. Even though some progress has been made (Sanchez-Burks et al. 2016), scholars will hopefully develop various advanced ways of measuring collective emotions and link them to strategic outcomes. Such advancement of will not only benefit practice by working as a second foundation for developing effective tools for organization to make collective emotions more tangible.

Another area where much progress can still be made relates to contexts other than organizational change. Quy has noted that emotions can be particularly influential in contexts such as post-merger integration (see also Vuori et al. 2016) and interorganizational collaboration (see also Vuori and Huy 2016b). In such contexts, traditional mechanisms that influence people's behaviors in organizations can be less powerful as hierarchical relations are vaguer. There is thus more room for emotional influences.

## Conclusion

Quy Huy's work has helped us see organizational change and strategy execution as a combination of traditional "hard" processes such as financial management and "soft" factors such as emotional reactions and empathy. This has led to a collective effort by various scholars, which has helped various managers to transcend their naïve understandings of organizations and lead strategy execution more effectively.

# Elliott Jaques: Father Time and Requisite Organizations

<span style="float:right">**38**</span>

Margaret Gorman

**Abstract**

Elliot Jaques' body of work spans over five decades and profoundly shaped the discourse in organizational development and change through his demand for precise definitions and scientific research to advance our ideas of human behavior and social institutions. He authored twenty books and published across a wide range of discipline journals but more notably constantly remained engaged in consultancy research with organizations from a developmental perspective seeking to help build their capacity to be more effective. His cross-discipline training in medicine, psychology, sociology, economics, psychoanalysis, and social sciences shaped his perspective and contribution to the field of organizational development. The primary puzzle of practice he sought to resolve focused on organizational design and the extent to which organizations are stratified to match the level of work commensurate with cognitive capabilities of the managers accountable for the work out of that level. A Canadian-born psychoanalyst, Elliott Jaques started his educational training with a BA from the University of Toronto in 1937, then an MD from Johns Hopkins Medical School in 1941, and a PhD in Social Relations from Harvard University in 1952. He held several positions within research and higher education institutes, starting as the first project leader for Tavistock Institute of Human Relations, fellow of the Royal College of Psychiatry, founder and head of the School of Social Sciences at Brunel University and research center, emeritus research professor in Management Sciences at George Washington University, honorary professor of Buenos Aires University, emeritus professor at Brunel University, and founder of Cason Hall Publishing with his wife Kathryn. He was honored with several awards, to include Consulting Psychology Division of the American Psychological Association, Joint Chief of Staff of the US Armed

Services, and General Colin Powell recognition for "outstanding contribution in the field of military leadership." Jaques cited as one of the most undeservedly ignored management researchers of the Modern era. Elliot Jaques died March 8, 2003 in Gloucester, Massachusetts, USA – still productively engaged in his consultancy research and in developing useful concepts for organizations.

*E. Jaques.*

## Introduction

Elliot Jaques is part of the first generation of scholars who shaped the field of organizational change, to include other key contributors such as Kurt Lewin, Wilfred Bion, Melanie Klein, Eric Trist. Elliot's career as social consultancy researcher parallels the evolution of the field of organizational change. Early career Jaques arrived at Tavistock Institute during time when the field was in its infancy and Tavistock sought to bring together interdisciplinary teams of scholars to solve organizational problems. Elliot served as Tavistock's first consultant to lead a 3-year project with Glazier Metal Company. Elliot's major contribution was his development of Stratified Systems Theory and Requisite Organization which he had then spent the rest of his career working directly with organizations to implement. Elliot was both a cultivator of the value of action-research using credible research practices and useful theory to inform organizational design; and he was a provocateur of management consultants who did not use scientific methods nor precise concepts. The following chapter provides the Elliot's professional background, key ideas, and major legacies to the field of organizational change.

## Influences and Motivations: Cross-Discipline Training and Practice

Elliot John Jaques was born January 18, 1917, in Toronto, Ontario, Canada. Jaques' education training began with his undergraduate studies in the natural sciences and biology at the University of Toronto. Thirsting for a more comprehensive approach to understanding personality development, Jaques continued his education with a medical degree at Johns Hopkins Medical School in Baltimore, Maryland, USA. The integration of the biological and cognitive science perspective enhanced Jaques's perspective on the dynamics of human development and the factors affecting personality development. Jaques spent the following years as a Rantoul fellow in psychology at Harvard University and eventually received his PhD in social relations in 1952. These were exciting years at Harvard for Jaques where studied with H.A. Murray and the research staff, along with exposure to sociology via Talcott Parsons and anthropology via Clyde Kluckhohn.

Jaques's training made him an important thought leader, trainer, and evaluator for the Canadian Army during WWII. During WWII, Jaques had the opportunity work with a group of psychiatrist and social scientist in the British Army, many of whom he went on to work with at the Tavistock Institute of Human Relations. Jaques served as the liaison between psychiatric units of British and Canadian armies working primarily on officer selection methods.

Jaques remained in Britain after WWII as a psychoanalyst at the British Psychoanalyst Society. Under the mentoring of Melanie Klein, Jaques became qualified as a psychoanalyst and became a founding member of Tavistock Institute of Human Relations. In his initial years, Jaques spent mornings as a psychoanalyst with clients and then his afternoon at engineering firm the Glacier Metal Company – shaping his

interest around how people and organizations interact and development. Jaques considered Melanie Klein the most creative analyst after Sigmund Freud.

It was at Tavistock where Jaques started his career in social consultancy research. Jaques was exposed to an extraordinary group at talent at Tavistock, to include Wilfred Bion, Eric Trist, Thomas Wilson, Ronald Hargreaves, and John Bowlby. Jaques was also exposed to the work of Kurt Lewin and his research center for Group Dynamics at the University of Michigan, although later Jaques' work would make a departure from the groups dynamic approach that he had been so involved in at Tavistock.

One of Jaques's most influential work experiences stemmed from his role as the first project leaders for a 3-year grant with Tavistock and the Glacier Metal Company. Jaques was the primary consultant on this project, and his role as a social analyst brought him in direct contact with Wilfred Bion. Jaques also had the opportunity to work with and learn from Bion's subordinates to explore issues around managerial accountability and decision-making which later informed Jaques own writings. Numerous papers by Jaques and Bion were produced based on their work at the Glacier Metal Company, two include two books they collaborated on. For 17 years, the Glacier Metal Company maintained a continuous analysis of all aspects of its organization as an integral part of sound management as introduced by Jaques and colleagues from the Tavistock Institute.

Jaques next set of influencers were scholars he worked with at Brunel University. Jaques was recruited to head a new school of social sciences and would spend 6 years to include creating a new social search institute. The institute served as base for wide range of consulting projects in the National Health Service, the Church of England, the British Civil Service, and various industrial and commercial organizations. While at Brunel, Jaques conversations and collaborations continued with more cross-discipline scholars such as Daniel Miller (psychology) and John Vaizey (economics) and key members of Brunel Institute of Organization and Social Studies (BIOSS).

In the 1980s, Jaques became involved with another long-term engagement with an Australian mining company (CRA), along with the US Mary Research Institute for Behavioral and Social Sciences (ARI). These long-term engagements enable Jaques to closely partner with managers/leaders to co-create understanding about how to design organizations based on the principals Jaques was trained in. Jaques considered these practioners key influencers for refining his thinking using credible methods to ensure the conceptual ideas are useful for practice. Jaques' commitment to remaining engaged through an action research approach with the client is a value still held strongly today by organization development consultants.

In 1999, Jaques founded the Requisite Organization Institute (ROI) in Massachusetts. Like his Tavistock and Brunel creations, the ROI was an educational and research group who engaged in consultancy research, training, and publications (Cason Hall).

Jaques' work was shaped by his educational training in human relations, along with practioner training at the Tavistock Institute. His approach to understanding human cognition and action in the context of social systems was developed through

an interdisciplinary perspective. Jaques's conceptual approach to organizational dynamics was grounded in the ideas from Sigmund Freud's theory of psychoanalysis, Melanie Klein's theoretical foundations in psychodynamics, and group relations work of Wilfred Bion and John Rickman. Jaques' medical training in cognitive and social therapy shaped his contributions within Tavistock around the use of social systems as a defense against anxiety and establishing methods of helping organizational members deal with disturbing emotional experiences. Jaques' interdisciplinary approach matched the approach of those scholars involved in the formative years of Tavistock. Tavistock was comprised of an interdisciplinary collection of scholar's whose work bridge the practice of psychoanalysis, the theories and methods of group relations, and the open systems perspective. This setting had an enormous influence on Jaques' approach to human and organizational phenomenon.

Jaques was motivated to resolved unsolved puzzles around psychological-social aspects of human motivation and the dynamic tension between individual needs and organizational needs. "My concern became how to develop social institutions that can enhance morality, human effectiveness, and human creativity." This concern was Jaques' motivator for his evolving body of work. In addition, Jaques' commitment to being engaged in the field in collaboration with the client site using credible theories guided his consultancy research over his life-span. Jaques was very critical of management consultants who did not use sound concepts or approach interventions without using credible action research methods. Jaques was highly motivated to train those practicing in organizations to focus scientific rigor and well-defined concepts in their interventions. Jaques' human development focus brought forth a term he invented "midlife crisis," and his organization development focus brought forth his theory of stratified systems which are discussed in the following subsection.

## Key Contributions: Tavistock Institute of Human Relations, Midlife Crisis, Stratified Social Systems

Jaques' career contributions span over 50 years – from his pre-WWII psychoanalysis contributions through his active engagements with organizations up until 2003. He felt strongly that no one science alone can tell the complete story of man (Bellak and Jaques 1942) and thus pursued an interdisciplinary approach to his own education and to his work in organizations. Jaques' early work focused mostly at the individual level, integrating psychology, biology, and cognitive sciences – he knew of the importance to consider the contextual factors that shape personality development.

Jaques' work centered on the inherent tensions between individuals and organizations in pursuit of its goals, along with the inherent tensions between the social and technical aspects of social systems as a whole as the system interacted with its external environment. The following section provides a brief discussion on some of his key contributions, including his human development concept of "midlife crisis," his theories on level of work requisite of cognitive capability, his theory of stratified systems which evolved into "requisite organizations," and his final moral imperative for living systems around time, science, and freedom.

## Adult Development: Midlife Crisis and Developmental Approach to Organizational Development

Jaques was intrigued by observed patterns in mid-career adults around changes in their creative capacity. Jaques coined the term "midlife crisis" to reflect his observations of adults in mid-thirties who experienced a decisive change in the quality and content of creativeness. Jaques noticed the propensity in artist to commit suicide in their late 30s, a point at which artist experienced a major shift in their creativeness. Jaques' term refers to a time when adults reckon with their own mortality and their remaining years of productivity. Jaques approach to the development of individuals was from a stage-phase perspective, highlighting the unique adjustments that occur at critical phase, change points, and process of transitions. These ideas were integrated into his requisite organization theory to highlight the need to create conditions to foster ongoing development of the individual who would be progressing along a trajectory of change and development. Thus, his concept of the midlife crisis and his developmental approach to organizational development also makes him considered an early contributor to positive adult development.

## Tavistock Institute of Human Relations: Innovation through Interdisciplinary Discovery

Jaques was among the original social scientists at the Tavistock Institute of Human Relations. The Tavistock institute was an interdisciplinary collection of social scientists that came together at the end of WWII evolving from the Tavistock Institute of Medical Psychology and the Tavistock Clinic. The organization was established as results of lessons learned during WWI around the importance for training psychiatrist and allied professionals. After WWII, Tavistock integrated the group relations work of Wilfred Bion and others who shifted the perspectives to an "outsider within," marking a transition away from traditional individual-psychoanalytic view to a view of the importance of working with whole group. This broader perspective is foundational to ideas of organization development.

The Tavistock Institute of Human Relations evolved into an interdisciplinary action-oriented research organization found in London, England, in 1946 with the aid of a grant from the Rockefeller Center. The founders include Henry Dicks, Mary Luff, Tommy Wilson, Isabel Menzies Lyth, John Rawlings Rees, Wilfred Bion, Leonard Brown, Ronald Hargreaves, and Elliot Jaques. Jaques and his founding colleagues were soon joined by Kurt Lewin. Lewin brought forth insight about adult learning and advocated for experiential learning environments, touting that they were more effective than traditional lecturers. The tolerance for different points of view due to the uncertainty of the times and infancy of the professional field cultivated conditions for Tavistock to be the incubator and the clearing house for these multi-paradigmatic developments. Jaques and this talented collection of social scientists became known as the "Tavistock group." Tavistock Institute became a human laboratory through the development of many groundbreaking

ideas many of which came from various projects and group relations conferences that brought together all the great minds in the field. Their style of research linked theory and practice in new modes and subsequent publications such as *The Social Engagement of Social Science* which included three perspectives: the sociopsychological, the socio-technical, and the socio-ecological. These perspectives were interdependent and centered on the ideas of societal change. The Institutes' contributions to theory, research, and practice of organization development and change is invaluable and resulting in an international network of scholars that exist today. Members of the founding generation of Tavistock, including Jaques, created so many sustainable groundbreaking insights into human and organization development that many argue we've yet to match such a talented interdisciplinary collection of thought leaders.

Jaques was the project head for the first project out of Tavistock, which was a 3-year grant to work inside one of London's factories (Glacier Metal Company). The managing director at Glacier had a keen interest in the social sciences, and the efforts of Jaques' work would ultimately lead to comprehensive changes in the organization and in the culture of the firm. In 1948, the British economy was in trouble having a devalued currency, low productivity, and scarcity of capital for investing in new technology. Through this 3-year grant award from the Human Factors Panel within the Industrial Productivity Committee at Tavistock, Jaques functioned in a novel role that enabled process consultation to take place across many areas of conflict within Glacier. Jaques' book (1951), *The Changing Culture of a Factory*, was the first major publication of the Institute, which reported on some of the new concepts formulated such as the use of social structure as a defense against anxiety. The group phenomenon observed was that members of a group unconsciously place inner lives into the emotional life of the group, how individual members use their institutional structures as a defense mechanism often as expression of their own paranoia.

Another development during the formative years of Tavistock group was an equivalent form of sensitivity training pioneered by the National Training Laboratories for Group Development in the USA. The aim of the Tavistock founders was to build social science capabilities into organizations so that they could develop for themselves. Specifically, the Tavistock founders wanted to shift away from dependency of external expertise toward the normative reeducative perspective of building the ability of the organizational members to develop their own organizations that is a central value held today by many organization development scholars. Through the client projects of the Institute, the group sought to leverage their network of individual relationships developed during their work during WWII and seek out organizations that were struggling with meta-problems. Their approach was to use an interdisciplinary team who would join with internal groups in the client organization to actively collaborate for creative solutions. Jaques' leveraged his training to develop "social analysis" method, which would help groups working through conflict. Despite the brilliant breakthroughs discovered by these collaborative engagements, many scholars and practitioners outside of Tavistock were unaware due to the lack of publications and/or unwillingness by clients to disclose due to the sensitive nature of the issues explored.

The international network of the Tavistock institute has had far-reaching impact on the field of organizational development and has inspired the creation of new research centers and university departments in this domain. There were many prominent scholars that at one point resided at Tavistock or who were frequent visitors – whose work dispersed around the World – Canada, Australia, India, the USA, and throughout Europe. From Wharton's Center for Applied Research to Ontario's Quality of Working Life Center, it is clear that the Jaques and the other founding members from Tavistock made an impact.

## Organizational Design: Work Levels and Felt Fair Pay

Jaques' developed theories to address issues in organizational design. Specifically, his work centered on the need to align levels of work with fair compensation for task responsibilities and accountability. Jaques' work provided an empirically based explanation for inherent tensions between organization's need to accomplish goals and individuals working at levels of work commensurate with cognitive abilities, developmental needs, and aspirations. One of Jaques' key focus was the empirical examination of "felt fair pay." Jaques was specifically interested in how individuals within a role can satisfy the expression of their own capability. Critical in Jaques' model of the hierarchy was the need to match the level of work, level of felt fair pair, and the cognitive capabilities of those function at that level of work. Jaques based his theories on his empirical discovers for the Glacier Project which he conducted while he was at the Tavistock Institute. While working with and observing trade union leaders, Jaques observed the challenges with defining equitable pay that was aligned with fair standards and the organizational layers of work and management. Seven levels of work were identified, along with the time span of the task and the nature of the role required for goal-directed activities of the organization.

Jaques' work integrated the ideas of cognitive complexity with the notions of time horizons with a system of managerial accountability. Jaques' observed requisite patterns of organizational strata based on the time horizons needed at each level within the organization.

Jaques' requisite pattern of organizational strata

| Stratum | Time horizon | Typical titles |
|---------|--------------|----------------|
| **VII** | 20–50 years | Corporation CEOs and CODs |
| **VI** | 10–20 years | EVPs of Groups of Bus; BD EVPs |
| **V** | 5–10 years | BU Presidents; Specialist VPs |
| **IV** | 2–5 years | General Managers |
| **III** | 1–2 years | Unit Manager; Unit Specialists |
| **II** | 3–12 months | First Line Mangers; First Line Specialists |
| **I** | 1 day–3 months | Operators; Associates |

The questions for organizations should focus on the nature of their work and the needed requirements for each level of their managerial hierarchy. Jaques believed that the understanding of the mental processing capabilities of managers should be matched with the managerial practices expected for that level of the work required. In other words, different levels of the organizational hierarchy have different task requirements, and thus an effective managerial system aligns a manger's mental process capability and the requisite responsibility of that level. These ideas were critiques for being deterministically rigid and prohibitive of performance of people within organizations.

## Socio-Technical Perspective

The "socio-technical perspective" was a key development that emerged out of the Tavistock members such as Jaques, Rice, Miller, Trist, Bridger, and Lyth. Socio-technical systems integrated the view of both the technological imperatives within organizations and the ways to optimize the human elements. This dynamic tension between individual and organization has carried forward in the OD field, providing understating of the organization's internal dynamics as well as its interactions with the external environment. Jaques' particular focus evolved into the notions of stratified systems, which integrated the ideas of cognitive capabilities and decision-making time horizons. Jaques embraced the inherent tension between the technical and social aspects of organizations as open systems and explored possible reconciliation through organizational design. The work of his Tavistock colleagues such as Emery and Trist would impact scholars such Katz and Kahn and later on OD scholars such as Passmore and Cummings, who expanded on these ideas for designing effective organizations using socio-technical systems perspectives. Jaques viewed his own work as compatible with Kurt Lewin yet moving beyond with a more dynamic behavioral theory that integrates ideas starting with individual intentionality and capability integrated into dynamic living systems.

## Social Systems: Stratified Systems Theory and Requisite Organization

Jaques theory of stratified systems argues that each layer of management has a unique contribution to the overall organization, and while the responsibilities of each layer is different based on the time frame for its accountability, the layers are interdependent. Critical to the systems' design is that the level of the role and its relative complexity in terms of the time horizon to complete the task is aligned with the cognitive capacity of individuals placed within those roles.

Jaques applied his requisite organization concepts in CRS Limited, a major Australian industrial company that diversified its business and evolved into a

$6 billion global company with 25,000 employees at the time Jaques was working with them. During a long-term 15-year engagement with CRS starting in the 1980s, Jaques worked closely with the leadership team in the major organizational redesign based on the principals of requisite organization. Through his systematic application of RO concepts, Jaques contributed to a new way of organizing human resources in a global company.

Jaques' work was highly criticized, and in turn Jaques became very critical of field of management sciences. Jaques expressed concerns about trend toward extreme reliance on group process only at the neglect of function of effective managerial leadership. Jaques believed strongly in the need for precise definitions and evidence-based approaches using credible research designs grounded in organizational practices.

## Father Time: Conceptualization of Two-Dimensional Time and Time Horizons for Requisite Organizations

One of Jaques prime propositions surrounded the dominant notions of "time." Jaques argued that time should be understood by organizational researchers on two dimensions: (1) the measure for how long it takes for an event to occur and (2) by when someone intends to achieve certain results. This two-dimensional conceptualization of time articulated by Jaques was grounded in Greek ideas of Chronos and Kairos and is indicative of Jaques multi-perspective approach to understanding complex human phenomenon. Along with his nickname as "Father Time," Jaques was known for his somewhat combative passion for the management sciences to have precise terms and measures.

Jaques argued that jobs should be defined in terms of their time horizon, in other words how long it would take to complete the assigned task, and subsequently the levels of the organizational hierarchy should reflect the overall time span for which those functions need to occur. Jaques also argued that individuals should be assigned to a job and/or level of the hierarchy based on the cognitive complexity which was comprised of both type of cognitive processing and the capability to achieve the required result in the requisite time.

Jaques contended that a person's time horizon could change over a career, which was consistent with his adult development approach. He developed a process to test a person's cognitive capabilities based on their mental processing strategies. Jaques cognitive processing model articulated the likelihood for progress especially if given opportunities to advance mental processing capacity. This projected progression was controversial for many. Jaques model was predicated on the idea that organizations could plot and predict the growth of human, which was highly controversial. While one's cognitive development evolves overtime and may be enhanced, Jaques' ideas were grounded in notion that one's cognitive processing mode had predetermined trajectory overtime.

There's a management blog "Who The Hell is Elliott Jaques." Overtime, Elliott Jaques became close friends with Professor Jerry Harvey at George Washington University. The two of them were known for the musing about organizational paradoxes and management traps.

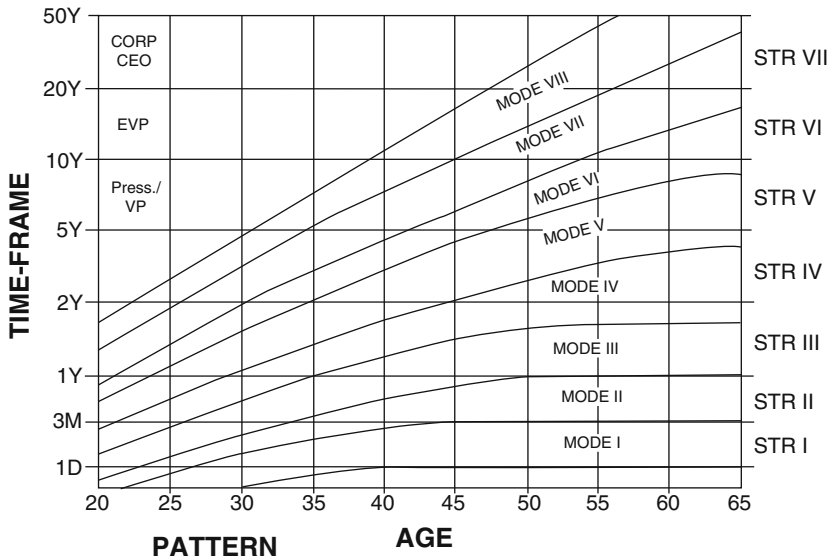
## Brunel Research Institute and Beyond: Social Consultancy and Engagement in Organizational Settings

Elliot Jaques's experiences at Harvard University, Tavistock Institute of Human Relations, and Glacier Metal Project helped connect him to another adventure at Brunel University where he once again was involved in an effort that brought human laboratory into organizational settings through the application of an interdisciplinary approach. Jaques was invited to Brunel in 1964 where he remained until 1970. During his time at Brunel, Jaques founded the interdisciplinary Department of Social Sciences and created a consultancy unit that engaged in projects like his Tavistock experience. Brunel invited Jaques to create these entities to increase its status because, at the time, Brunel did not have a teaching hospital and needed a platform for training and conducting applied research. Thus, Jaques could convert his experiences with an action research approach to field problems to help add that aspect. Along with becoming a professor and head of the school, Jaques also created a research and consulting unit to continue science-based action research with organizations. The Brunel Institute of Organization and Social Studies (BIOSS) still serves as a model for how universities can bridge their work with practice to engage in useful research to advance organizational development today. There are a couple examples of similar arrangements in which research centers are embedded within a university context yet focused on external partnerships with organizations. My specific experience with George Washington University's Center for the Study of Learning (CSL) which was founded by Dr. David Schwandt as a applied research consultancy unit in which faculty could partner with organizations in long- and short-term engagements. Over two+ decades, CSL was involved in various OD interventions and projects with a range of organizations from health insurance, financial services, energy, school districts, nonprofits, and US government agencies.

## New Insights: Cross-Level Cognitive Capacity and Transdisciplinary Concepts

Jaques' footprint in the theory, research, and practice of organizational development is extensive. His cross-discipline perspective enabled his theoretical developments to be reflective of the cross-level changes our field faces today. His unique training in medicine, sociology, psychology, and economics positioned him to understand the cognitive processing capabilities of an individual set within a dynamic social system.

Jaques' work provided a frame for how organizations should be designed to max-imize both organizational health and individual development. This dual perspective is embedded in the underlining principles and practice of organization development.



The field of organizational change has been affected by Jaques' work. His contri-bution with the socio-technical perspective influenced predominant models of orga-nizational diagnosis, which were grounded in the notions of systems, yet accounted for interacting systems with feedback loops. Inherent in Jaques seven levels of work theory is a vocation of creating conditions to maximize individual cognitive development and can be seen to influence in models within career path, succession planning, and workforce talent development. Additionally, Jaques levels of work and stratified systems theory promote an employee relations and organizational wellness through the alignment of felt-fair-pay commensurate with work role and aspirations. Jaques' levels of work have been applied specifically to organizational change intentions and outcomes.

The field of organizational consultancy and action research has been shaped by Jaques approach to his own work. Jaques' experiences at Harvard, Tavistock, and Brunel all demonstrated the value of bringing together groups of scholars from different disciplines to be engaged in action research in collaboration with the client organizations. Jaques and his colleagues strove for creating the internal capacity of their hosting organizations to both understand but also carrying the work after their departure. Jaques sought to collaboratively co-create effective managerial hierar-chies in which highly motivated employees experience felt fair pay and are capable of learning, and in turn employees incorporate their learnings into the procedures and practices of the organization. These notions are similar to the ideas of knowledge-creating companies and/or organizational learning systems in which performance

and learning actions enhance the overall capacity of the organization to adapt to its' changing environment.

On personal note, I had the pleasure of knowing Elliott Jaques over a 15-year period starting in the 1990s through his passing in 2004. I had the joy of observing his dazzling performances in the classroom and then warmth of his conversation during meals with several of us colleagues from George Washington University. Jaques was a regular lecturer in our graduate program at George Washington University, both in the management department at our Washington DC campus and in our executive doctoral program in Ashburn VA. Each year he'd bemuse graduate students about their role as alchemist and then pester them about the criticality of utilizing social science methods and concepts in ethical manner when engaging in organizational design and interventions. Jaques would cleverly bait one of our audacious executives to share a management strategy they felt was effective in their organizations and often evoking an infuriated response about the fads that were ruining our organizations. And then during our meal time, Elliott would share his recent adventures on the ski slopes and move onto a client engagement he was involved in. He would remind us that you reach your cognitive peak at age 70, and thus he felt more invigorated than ever about the impact of his work in organizations. I remain astonished that he was actively planning upcoming engagements with a law enforcement agency and sharing ideas about collaborative research projects. I would be particularly humored when Professor Jerry Harvey would arrange for Jaques to visit his classroom filled with arrogant MBA students who would naively try to engage with Jaques.

## Legacies and Unfinished Business: Bridging Work to Complexity Perspective

Jaques' final two books focused on the social power and offered a new general theory of living organisms. The former book was written for CEOs and examines the major misconceptions about people and managerial systems (work, compensation, incentives, structure, values, selection, talent pool development). The latter book brings together a half century of findings from Jaques' consultancy research on work, complexity, and capability and putting forth a science-based art of social ordering. The book covers a wide range from systems theory, linguistic, emergence, and necessary conditions for the development of a healthy free democracy. I feel his unfinished business is reflected in the promising areas of complex adaptive systems.

Elliot Jaques spent his entire career seeking to advance developmental practices within organizations that were grounded in credible research and theory. His consultancy research in organizational design and development spanned from his early years at Tavistock with the Glacier Metal Company up through his ongoing work the year he passed in 2004. His interdisciplinary training and action research approach enabled Jaques to bring together cross-discipline concepts from a developmental perspective for both adults and organizations. The concepts that emerged

from his field studies included the idea of felt fair pay, managerial accountability, and time span of discretion (judgment). His overall body of work culminates in his stratified systems theory and requisite organization. In his final publication, just a year prior to his passing, Jaques was still actively engaged in the field and in his conceptualizing as he worked on emerging ideas around complexity and capability in living systems.

Jaques is often criticized for managerial hierarchy and his stance on natural human cognitive predisposition. In fact, Jaques was a huge proponent of creating conditions that foster human development and provide individuals opportunities to function in a role, which both meet their aspirations and maximizes the cognitive development. Additionally, Jaques advocated strongly for employment relations and ethical standards to ensure individuals are treated respectfully and awarded with felt fair pay. Jaques criticized the label of "human resources," claiming that leaders have a responsibility to foster trust-inducing organizational arrangements. Jaques organizational model which explicates responsibilities and accountabilities at different levels has influenced the field of organizational design, to include the practice of job task analysis and other HRM protocols.

Jaques's combined an interdisciplinary approach with his action research orientation, which was reflected in his project-lead experience at Tavistock and his founding of Brunel Institute of Organization and Social Studies, both which had a profound effect on the field. This model was replicated in numerous forms throughout US higher education institutes in the 1990s through today, e.g., Edward Lawler's Center for Effective Organizations at the University of Southern California and University of Michigan. And this author had the privilege of spending two decades working for David Schwandt's Center for the Study of Learning and Executive Leadership Development Program, which emerged out of Jaques's seminal contributions to our field.

## The Global Organization Design Society

One of the primary evidence of Jaques's legacy is the Global Organization Design Society which still exists today. Like Tavistock, this society is an international network of scholars that seeks "to support the organizing work in a responsible, fair, and healthy way people are well led and free to exercise their capabilities." This society's foundational principals are grounded in the sound practices and concepts from Jaques' work in the Glacier Project, Jaques's stratified systems theory, and requisite organization. The society embraces the concepts of work complexity, levels of human capability, and effective managerial leadership practices. There's a host of professional associations and universities that support or co-market the society's efforts, including IBM International, the European Organization Design Form, Queen's University Institute for the Advance Human Resource Professional Development, Human Resource Planning Society, Organization Design Form, Organizational Design Community – University of Denmark, and Toronto's Society for Strategy Management's Strategic Leadership Forum.

## Conclusion

Jaques strove for science-based theoretical propositions that could enhance organizational efficiencies and the human experience. His human development approach made him a key contributor to organizational development. He could also be considered an early contributor to positive adult development. A signature approach of Jaques was the combined approach of interdiscipline and action research engagements with organizations. Jaques was the first project lead for 3-year action research with Glacier Metal and then went onto to Brunel University where he founded an interdisciplinary school of social research and a Center for Social Research using a blended consultancy and research approach to solve organizational puzzles. Jaques argued that time should be understood in terms of the measure for how long it takes for an event to occur and by when someone intends to achieve certain results, resulting in his nickname as "Father Time." The notions of time horizon and time span were integral in his ideas for managerial accountability and requisite organizations. There are several advancements that were central to Jaques' body of work, starting first with his role within the Tavistock institution through his general theory of bureaucracy to culmination of his final general theory of life and behavior of living organizations.

Jaques was tenacious about the need for the management sciences to have precise terms, measures, and to leverage empirical insights based on scientific rigor drawn from field studies. "I'm referring to the absence of sounds concepts and the use of badly defined ideas that lead inevitably to formulations that can neither be systematically nor uniformly applied." His passionate rants about management consultants who chased the latest "fad" were often observed in his graduate school seminars at George Washington University, many of which I was privilege to experience during the 1990s through to his passing in 2004. Jaques' passionate pleas to managers who were enrolled in our executive doctoral program at GWU were one reason why a classroom was named after him and why this author dedicated their dissertation to him. Jaques believed strongly in the potential contribution of organizational development if it stayed grounded in scholarship using scientific precision while remaining relevant to practice through ongoing action research collaborative engagements inside organizations. And he was compassionately motivated to train adults as scholar practitioners by insisting they use well-defined concepts and rigorous scientific methods while engaged in collaborative action research.

# Kaleel Jamison: Being Big in the World

# 39

Frederick A. Miller and Judith H. Katz

**Abstract**

As a key contributor to the field of organization development and diversity, the legacy of Kaleel Jamison continues on in her writing, through her impact on her colleagues, clients, and friends and the work of the Kaleel Jamison Consulting Group. Kaleel spent much of her working life as "one of the first" and "one of the few" in many areas. During the early 1970s, she became one of the first to address differences of color and race in the workplace, consulting with such organizations as Procter and Gamble, Connecticut General Life Insurance Company, Penn Mutual Life Insurance Company, and Digital Equipment Company. Kaleel was a pioneer in applying organization development technology to affirmative action and issues of differences; she outlined her thinking in the article "Affirmative Action Program: Springboard for a Total Organizational Change Effort" for *OD Practitioner*. In 1983, her "Managing Sexual Attraction in the Workplace" appeared in the August issue of *Personnel Administrator*, making her among the first management consultants to address attraction as a workplace issue. Kaleel expanded the scope of this work beyond the classroom to position it as a system-wide issue, rooted not just in individual skills and attitudes but in organizational policies, practices, and managerial methods. In addition to being a pioneer on issues of gender, race, affirmative action, and differences, she was also one of the first and few women to work as a management consultant. Shortly before dying of cancer in 1985, Kaleel published a book, *The Nibble Theory and the Kernel of Power*, which summarized many of her views on human relations and personal development.

## Influences and Motivations: Courage and Grace

Courageous, beautiful, passionate, special, and caring are just some of the words colleagues and friends use to describe Kaleel Jamison. These words are a testament to the woman she was and her legacy that remains today. Kaleel believed she came to this world for a mission, which manifested in her ability to touch people on Earth in her lifetime. She focused on growing personally in such a way that affected both herself and others. She knew she was worthwhile and believed everyone else was as well (Jamison 1989). She was a true pioneer – not just in the field of differences – but in management consulting, organization development, human relations, and personal growth. She was raised at a time when women in positions of power were a rarity in business and when people's roles and expectations were defined by gender and race.

Edna Corey Jamison was one of a kind. She was one of the first women organization development consultants, starting her practice in the late 1960s in her church and beginning her corporate consulting practice at Procter & Gamble in 1970 in Cincinnati. Her early exposure and experiences with organization development came from her visits to the National Training Laboratory (NTL) in Bethel, Maine. She would accompany her husband, Bill Jamison, a well-regarded corporate leader, to NTL where he attended President's workshops. The structure of the workshops provided for the men to bring their wives to NTL, and while the men were attending the sessions, the women would go shopping; however, in 1968, NTL created a "spouses' training program" that accompanied Bill's executive training sessions.

That was the beginning of her journey of achieving her mission of changing the world.

In an NTL session early in her career facilitated by John and Joyce Weir, she and all the participants took on new names to help them work through issues, which would help them develop as a person during the lab. She took her father's name, Kaleel. After that lab was over, she kept the name, considering it as a gift that had helped her grow, honoring that experience and her father. It was then she transitioned from Edna Corey Jamison to Kaleel Jamison.

Kaleel was a Lebanese woman born in the coal mountains of Beckley, West Virginia, in 1931, and growing up she had many obstacles to overcome. Her father came to the United States as a Lebanese immigrant from a poor village where he was an orphan and responsible for raising his siblings. When he arrived in the United States, he had no money and he did not speak English. He made his way to Minnesota where he worked as a farmhand, and he finally arrived in a settlement of Lebanese people in West Virginia where he founded a small confectionary business that supported his family. The courage and risk-taking Kaleel witnessed in her father and her upbringing helped to shape her into a very strong and powerful person.

Kaleel's formal education consisted of high school and secretarial school; however, her true education was life, NTL, church, her community in Cincinnati, and being a consultant. As a Lebanese woman from Beckley, West Virginia, she could bridge many different cultures. She connected with white women and black women through her own cultural experience. Her focus was on how to take complicated psychological concepts and make them as simple as possible and still be impactful. She took what she observed in society and gave frameworks to people on how to move and be different. She challenged people to be better and bigger, and she was motivated by her sense that people could be more, both individually and systemically.

When Kaleel was first exposed to NTL, organization development and the field of human potential were still in their infancy. The emergence of organization development can be traced back to the work of Kurt Lewin in the 1930s with his work on democratic participation and his research at the Harwood Manufacturing Corporation. Lewin's work produced many of the tools and techniques that influenced Kaleel's work and are still used today. His seminal workshops with the Connecticut Interracial Commission led to the emergence of T-groups and the National Training Laboratories (NTL), which still provide training to organization development and change practitioners today (Burnes 2007, p. 227). Organization development continued to grow in the 1960s with the emergence of the T-group approach to group development and Lewin's action research model, which was a key foundation of Kaleel's work.

In the 1960s and 1970s, the most socially active groups were the churches. Kaleel's church began doing work related to human potential, and it was at this time she started working with the groups. In the late 1960s, she began running workshops on the differences between women and men at her local church in

Cincinnati. She was especially vocal in challenging the notion that women should make themselves appear smaller and less significant so men could feel larger and more significant. Kaleel was a staunch believer in self-empowerment and the empowerment of others. "By being more of myself," she would say, "I am able to share more of me with you" (K. Jamison, personal communication). As a result of her work with the church, a member of the congregation asked her to facilitate organization development work with their company, Procter & Gamble. This was Kaleel's first client. It was considered a progressive company, and many of the early organization development pioneers came out of or consulted with Procter & Gamble.

Kaleel's second client became a lifelong friend and colleague. Fred Miller met Kaleel at a Living School Women-Men Working Together lab in Cincinnati in 1973. Fred brought Kaleel into the Connecticut General Life Insurance Company (now CIGNA) in 1973. Fred joined with Kaleel in her consulting practice in 1979 because, in addition to her tremendous courage, she brought something different to the organizations with which they worked. It was not a set of answers, but, instead, questions. Kaleel Jamison (1989) asked questions such as:

- "What kind of environment supports everyone's bringing their fullest self to this organization?"
- "Can you create that kind of environment?"
- "Will you be brave enough to try?" (p. v)

Kaleel was one of the first women to enter management consulting in 1970. A woman on the road and away from her children and husband was a very rare occurrence at that time. In this role, she experienced remarks like: "Why are you here?" and "What would a woman know?" Others commented, "Hey, you are pretty cute to be doing this kind of work." She also faced questions challenging her role as a mother, such as "So who is watching your children?" (Jamison 1989, p. v). Yet these attacks on her self-confidence, including all the demeaning and sometimes harassing comments and actions, only served to convince Kaleel that she was doing the right thing by entering into these environments.

The sheer number of diminishing behaviors she experienced made it clear how significant and unusual her presence in the workplace was and how much work lay ahead to create workplaces more inclusive and respectful of everyone. To Kaleel, this was work that had to be accomplished if the United States, her parents' adopted home, was ever to achieve its promise of opportunity for all (Jamison 1989). None of this stopped Kaleel from doing the work she loved, which changed many lives. She loved her husband, Bill, her three children, and her work, and even if the world did not think a woman could love her family and be on the road to live her passion, Kaleel knew she could and was a pioneer. She made the phrase "one of a kind" so true in many ways.

Her first strategy to neutralize these behaviors, or as she called them, "nibbles," was to be competent and extraordinarily insightful about the work of organizations. Her second strategy was to shake hands. In the 1960s and 1970s, this was a radical act. Men and women generally didn't shake hands with each other – women were

considered too unequal, too dainty, and too ladylike. Being one of the first woman consultants (along with Billie Alban, Edie Seashore, and Barbara Bunker), she often had to deal with men not wanting to shake her hand because in those days a man did not shake hands with the "weaker" sex. Kaleel entered every room with her hand extended and challenged men to deny her a handshake. Most of these men had never shaken a woman's hand and they didn't know what to do. Instead of a traditional handshake we think of today, she often received a man taking two of her fingers and shaking them lightly. In those days most women worked at home or had a secretarial position or some form of assistant's role. Men in the workforce struggled to make sense of her. Kaleel's bravery in asserting her personal and professional self through simple gestures changed people's lives in every room she entered (Jamison 1975).

While the field of organization development was emerging, Kaleel had many friends, colleagues, and mentors who influenced her work. Kaleel and her husband Bill had a summerhouse in Maine, and their next-door neighbor was Dick Beckhard. Dick Beckhard was a founder and pioneer in the field of organization development and change. Beckhard defined organization development as "an effort, planned, organization-wide, and managed from the top, to increase organization effectiveness and health through planned interventions in the organization's process, using behavioral-science knowledge" (Brisson-Banks 2010, p. 245); he developed a four-step model for organization change and popularized a formula for readiness for organization change. The four steps of Beckhard's model are defining the change problem, determining the readiness and capability for change, identifying the consultant's own resources and motivations for the change, and determining the intermediate change strategy and goals (Beckhard 1975).While Beckhard's model is simple in its approach, it is complex in its implementation. The processes of engendering dissatisfaction with the status quo, having people clearly understand the desired state, and taking steps toward the desired state are a complicated endeavor. Kaleel understood this complexity and developed her own methodology for total systems change in an organization through addressing affirmative action goals. There is an interconnection between her work and the work of her friend, neighbor, and colleague, Dick Beckhard. Both models are simple in process, but complex in implementation and sustainability, and both models demand total systems change.

## Key Contributions: Powerful Connections

Kaleel's work advanced the field of human potential, organization development, race, and gender. Her work was informed by what she saw happening to people around her throughout her life, especially those people who were different from the dominant group (Jamison 1989). She possessed the ability to look at people in a way that they felt she could see inside of them and made them feel like they were the most important person to her in that moment. People connected with this and often told her what they were thinking and feeling in a profound way. This enabled her to

connect with people on a deep level and for her to coach people in ways that changed their lives. Her ability to create a powerful connection was key to her approach.

As a practitioner, Kaleel understood the importance of translating the theory of organizational change into accessible tools such as affirmative action, sexual attraction in the workplace, sexism as rank language, straight talk, and man and woman style differences, which are described in detail later in this chapter. The foundation of her work was to determine how to have people treat each other better, make organizations more democratic, and end racism and sexism so organizations could be better places for all people. When people interacted with Kaleel, they knew they had a friend and ally who cared about them as a person, not their role or job. It was a human-to-human connection and interaction. She wanted to connect core self to core self and not ego to ego. She wanted to give people a voice and create a work environment where they felt heard and valued for who they were as human beings. This was the mindset that fueled her passion and drove her work. Kaleel had a true sense of experiential learning, the ability to keep it simple and create theory out of experience.

Kaleel rendered theory into practice with her work on translating the theory of transactional analysis into her concept of the nibble theory and the kernel of power. She was able to take the complex dynamic of adult-to-adult interactions and make it simple and relatable for people (Jamison 1989). Kaleel was also able to broach the challenging topic of relationships in the workplace. Her article on "Managing Sexual Attraction in the Workplace" shed light on a topic most organizations preferred to pretend was an issue that was not there (Jamison 1983). Her work in this area showed the impact of these relationships not only on the individuals involved but also on the bottom line of the business.

Kaleel wanted the work to be simple so everyone could participate, contribute, and benefit. It could not be as complicated as psychology had been in the past. It needed to be clear and practical for the people. She believed the people in the organization had untapped wisdom, and if she was able to tap into it, she knew the right organization environment would be able to tap into it. To help organizations connect to wisdom of their people, she spoke to the people to figure out how to resolve the issues.

## Action Research

Kaleel was one of the pioneers using action research as the foundation of her work. Action research is a term that was first used by Kurt Lewin and John Collier in the mid-twentieth century and refers to planning change, acting, and then observing the outcomes (Robson 2002). This approach was developed to influence a system, solve social problems, and create social change. Action research has evolved to be more focused on participative problem solving; however, at its inception, it utilized a more directive approach to influence behavior (Bentz and Shapiro 1998).

Action research has roots in the epistemological philosophy of pragmatism. Pragmatism evolved as an American philosophy and is focused on action and

practical consequences; it espoused knowledge and action as both part of the same process – unable to be separated. This approach yields research, which results in action. Early examples of action research studies include Lewin's work with influencing homemakers to use less meat during wartime and Coch and French's work on increasing productivity in a pajama factory. Neither of these early studies provided participants with a sense of empowerment but did give them an opportunity to understand why the change was important (Bentz and Shapiro 1998). Action research places the application of the findings of the study at the forefront of the methodology (Busza 2004). Kaleel's work with action research was focused on helping people feel empowered.

The researcher's role in this method is facilitative, and they are actively involved in the work, which is exactly what Kaleel did. Kaleel took an active role by facilitating the collection of information to help the system understand the need for change, plan for the change, and ultimately provide a sustainable system for the participants to apply the methods on their own to other issues within the organization. Action research contains a strong element of learning and knowledge transfer, and the role of the researcher as the facilitator is to drive the learning to the research participants. The researcher must be action oriented, concerned with social and organizational issues, have a strong set of values that reflect humanization of communities and organizations, and be able to play a facilitative versus directive role (Bentz and Shapiro 1998).

The researcher is actively involved in all elements of the study including planning, introducing the change, and monitoring the sustainability and impact (Ragsdell 2009). Action research can be either qualitative, quantitative or both, implementing a mixed-methods approach. The tools utilized will vary based on the needs of the research study; however, typical research instruments include interviews, focus groups, observations, and document reviews. The end results of an action research study are solutions to immediate problems and the potential for contributions to knowledge and theory (Bentz and Shapiro 1998). Action research was used in the field of organization development and contributes more to immediate problem solving versus the development of theories. Based on Kaleel's work, action research was evidently foundational to her work. She used this approach to address many issues in the workplace. In every client system Kaleel entered, she started her work by conducting an organization diagnosis and collecting data through conversations. She then provided as feedback and identified recommendations for the clients using the total systems approach.

Not only was Kaleel one of the first consultants to address gender differences in the workplace, but in the early 1970s, she became one of the first to address differences of color and race in the workplace. Her work in this area was conducted in partnership with Fred Miller during consulting engagements with such organizations as Procter & Gamble, Connecticut General Life Insurance Company, Penn Mutual Life Insurance Company, Cummins Engine Company, and Digital Equipment Company.

Kaleel produced a tremendous body of published work based on her experiences with people and organizations. Her seminal articles about affirmative action, sexual

attraction in the workplace, sexism as rank language, straight talk, and man and woman style differences moved the field of organization development forward and offered significant benefits to both organizations and employees. Kaleel was the first to write that these issues were systems change issues.

Kaleel was a pioneer in applying organization development technology to affirmative action policies and issues of differences. Jamison outlined her thinking in the article "Affirmative Action Program: Springboard for a Total Organizational Change Effort" for the OD Practitioner (1978). This was the first article and thinking that affirmative action was not only about recruitment, but for that person, different from the dominant group in the organization, to be successful, the organization had to change. The culture had to change. How people interacted with the "new" and "different" people had to be different. It had to be a total systems change if organizations were going to create environments where these "new" people would be successful (Jamison 1978). Until that point in history and within the organization development practice, no one had suggested that affirmative action required an organization development systems change intervention. Affirmative action was seen as a legal issue as well as creating interpersonal challenges in interactions and group dynamics as people of color and women were coming into organizations.

Her article, "Affirmative Action Program: Springboard for a Total Organizational Change Effort," laid out the methodology and process she advised other consultants and practitioners to use (Jamison 1978). The article represents classic thinking in which her theory about cultural diversity and total systems change is positioned for implementation. Kaleel believed lasting change could be achieved only by the organization willingly approaching its affirmative action program as a total systems change effort to update management practices, change the culture, and expand the ways people are treated in the organization. Both organizations and employees experienced the value of a total systems change approach. The result of this approach was creating a work environment that was open to and embraced the talents of every person. It was also an opportunity for executives to understand and experience the importance of valuing differences. Through this work and the use of the total systems methodology, companies became more multicultural, multiracial, and bi-gender and had an organization chart that showed a variety of people holding positions of power (Jamison 1978).

There are seven steps in her methodology for a multidimensional organization intervention. A multidimensional intervention involves a consideration of everything that makes up the organization's environment (Jamison 1978, p. 3). Each step requires sensitive interpretation and organization on the part of the consultant to be effective. The steps are (1) entry and diagnosis; (2) procedural planning and presentation; (3) critical mass development and education of resource persons, of top-level groups, and of operating heads; (4) research and study; (5) goal setting; (6) implementation; and (7) monitoring and evaluation of the plan (Jamison 1978, p. 4). Often these steps can overlap and are not always as straightforward as they may seem. She believed this was a 4–5-year process and required total commitment and accountability from senior leadership in order to bring about the desired change in the organization (Jamison 1978). While the model she used was not new to the field, her brilliance was in how she applied it to diversity. Much of the work on diversity at the

time was focused on training and workshops. Instead, Kaleel focused on addressing diversity by changing the entire system of the organization through the seven steps of her methodology for multidimensional organization interventions. This had never been done before.

Kaleel brought the cultural context of the feminist movement into the organization. The environment in the organization at the top was white men with few or no women. When she was doing her work on gender, it was a different time. The prevailing belief in the organizations was that of the "Adam's rib" mindset. People cited this belief as fundamental proof that women were inferior to men, and their place was second to men. It generated and perpetuated extremely harmful assumptions about women. Entire workshops would be devoted to trying to shift this thinking and breaking down those assumptions. These assumptions added up to the belief that women didn't belong in the workplace as a peer or a leader. These beliefs were not only prevalent in the workplace, but were reinforced by society through media, television, and stereotypes. She was trying to assist everyone in the organization to grow into a different kind of partnership; however, organizations did not have any frameworks for this.

Before she was able to get to the work of changing a corporate system, Kaleel had to deal with the process of being acceptable to conduct the intervention. She facilitated honest conversations and transformed the biases she experienced in the workplace and those relationships. Kaleel saw and understood that organizations were undergoing a tremendous change that was not being addressed as more women were coming into the workplace. She developed models and frameworks to help individuals and organizations shift the ways in which people interacted such as the nibble theory and the kernel of power (Jamison 1989), sexual attraction in the workplace (Jamison 1983), sexism as rank language (Jamison 1975), and man and woman style differences (Jamison and Miller 1985).

## Model of Transactional Analysis

Kaleel's work on sexism as rank language was based on the model of transactional analysis. She believed language is symptomatic of attitudes, and in any encounter with people, the language we use with people (especially what we call them when we tell a story) reflects our attitude toward a person and influences our behavior with them (Jamison 1975). Kaleel's work focused on the common practice of sexist terminology she observed in which men referred to a woman as a girl. She adapted the model of transactional analysis to demonstrate the ways male and female terminology can be used and the rank and power in the choices. She documented her experience in her 1975 article titled "Sexism as Rank Language" for the social change journal (1975). The model explores the relationships between terms used to identify males (father/man/boy) and females (mother/woman/girl) as parents, adults, and children (Jamison 1975).

According to the model, when a man refers to a woman as a girl, he places his association with her as either a father or a boy. To establish a relationship that

**Fig. 1** Transactional
analysis. Potential
relationship interactions
(Berne 1959)

positions all people on an adult level, the man must consider a relationship that
would be on an equal basis, such as man to woman. At the root of this model is the
distribution of power and how this impacts interactions in an organization. A girl is
dependent; a woman is a fully functioning, independent, working partner. Kaleel's
work in this area shed light on the criticality of men and women engaging with each
other as peers, but also the loss of power and productivity of work transactions
between men and women when this rank language exists as the norm (Jamison
1975). Kaleel's work looked at the organization as a total system and the equal or
unequal power dynamics between co-workers could have a tremendous impact on an
organization making this work critical to helping an organization be successful
(Fig. 1).

## Sexism in the Workplace

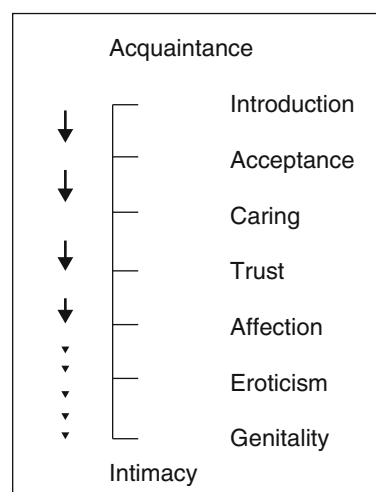
Kaleel was passionate about empowering women, which was demonstrated in her
work with sexism as rank language (Jamison 1975). Her message of "saying yes to
me is not saying no to you" was about being able to say yes to ourselves as women.
When she was assisting women to be empowered, she had to position them to be
successful not only in the workplace, but in the home. She wanted women to be
successful colleagues at work and partners at home.

Kaleel's work with Procter & Gamble on bias resulted in her article, "Our
Baggage" (Jamison 1982). Throughout her life she would learn from colleagues
and then add her experience and adapt her understanding to her client situations; the
"our baggage" model is an example of her ability to synthesize her experience with
the lessons learned. The work contains a two-part model. The first part of the model
is titled "page 1" and describes "Our Current Baggage." Page 1 described how
people bring their prejudices, stereotypes, filters, and categorizations to their inter-
actions. When people feel fearful, tense, or stressed, they go on "automatic" and
generalize negative perceptions of people who are different. She felt that by working
with "Our Baggage" on page 1, we could ultimately reduce the effect of the baggage.
The second part of the model is titled "page 2" and describes "The Exceptions that

We Experience to that Baggage." In the second half of the model, Kaleel provided steps to assist people to see and take in the experiences they have had that are exceptions to their page 1 baggage (Jamison 1982, p. 1). The page 2 work involved three key steps: developing awareness, ownership, and taking action. These included building relationships with people different from yourself, confronting personal biases, being curious, and consciously creating new mental models and experiences (Jamison 1982, p. 2). The model indicates that to change those negative biases on page 1, we have to develop new experiences, learn to work through bias more quickly, and recognize similarities as well as differences. This work was the foundation for work today on microinequities, unconscious bias, and self as instrument (Jamison 1982).

Kaleel submitted an article to *Harvard Business Review* on "Sexual Attraction in the Workplace" being a bigger and more challenging issue in organizations than sexual harassment before the groundbreaking and world-changing article about the same subject was published by another author in the *Harvard Business Review*. In 1983, her "Managing Sexual Attraction in the Workplace" appeared in the August issue of *Personnel Administrator*, making her among the first management consultants to address the issue of attraction in the workplace.

Kaleel highlighted the connection between sex and the workplace and risk to profit, because of the impact on productivity and adverse public relations. As a basis of her work, she utilized the acquaintance intimacy spectrum, which demonstrates the progression from acquaintance to intimacy in stages along a spectrum. Kaleel felt business relationships should not go beyond the fourth stage of affection. Kaleel believed that sexual attraction is a personal and systemic issue. Workplace romance requires secrecy, which takes energy and attention away from the organization (Fig. 2). The resolution of these situations involves personal choice by the people involved to diffuse the situation early and, if not, a manager who handles the situation tactfully without stress to the organization (Jamison 1983).

**Fig. 2** Acquaintance intimacy spectrum. Evolution from acquaintance to intimacy (Jamison 1983)


## Straight Talk

Kaleel believed one of the most helpful interventions that could be made in an organization was to change its norms of verbal communications and utilize "straight talk." The model of straight talk is the practice of speaking clearly, directly, and honestly. The foundations include the following: respecting others enough to be honest with them, sharing information in a way that produces an efficient, effective organizational environment, committing to the development of individuals, and utilizing differences (Jamison 1985). The practice of straight talk also presumes that conflicting views, values, cultures, and styles are best addressed openly and that those differences, when properly resolved, will enhance, rather than detract from, the organization and its success (Jamison 1985).

The theory behind the model was based in the belief that, in many organizations, conflict was avoided resulting in misleading and confusing communication. Straight talk, restructuring people's language, provided a major part of the solution. This work also impacts the bottom line of a company. Efficient communication is essential to efficient operation and the performance of the organization. Kaleel believed that disconnecting language often shows up when full respect is missing from the relationship.

She described the best approach for implementing straight talk as a top-down intervention. How a person in authority communicates affects and reflects the management style of the entire organization (Jamison 1985). If the leadership is talking "straight" (i.e., clearly and directly), the whole organization will move toward this mode of communication. Indirect language shows up in the form of sugarcoating, one up questions, tentative statements and qualifying words, diminishing language (self and others), intensifiers or words for emphasis, use of "you" versus "I," and avoiding saying no (Jamison 1985). The result of implementing straight talk is the respect it fosters for individual leads to individual growth, which benefits the organization (Fig. 3). This level of respect leads to a stronger, more diverse organization with a wider range of views and skills to draw upon (Jamison 1985).

Kaleel continued her work on gender with Fred Miller. In June of 1985, they presented a NTL sunrise seminar on woman-man style differences. Rank language was only one part of the equation; the style clashes between men and women that existed as traditional work norms were actually male work norms (Jamison and Miller 1985). In the presentation, they identified seven style differences based on 15 years of work with organizations. The purpose of identifying the style differences was to help organizations identify the issues, to recognize the impact the style differences have on individuals, and to develop new ways to integrate differences into their workforce. The seven basic woman-man style differences are categorized as (1) expressing affection, (2) expressing intense emotions, (3) response to failure, (4) problem solving, (5) apologies, (6) sexual attraction, and (7) fitting in (Jamison and Miller 1985, p. 1). When these style differences are understood, it allows people to be fully powerful and make full contributions to the organization. Kaleel believed

**Fig. 3** Straight talk model.
Impact of straight talk on
organizational effectiveness
(Jamison 1985)

that once a person is aware of their own frame of reference, it creates the opportunity
for people to look at other people's styles and realize that our differences bring about
more creativity, productivity, and enjoyment (Jamison and Miller 1985).

## The Nibble Theory and the Kernel of Power

In 1984, a year before her death, Kaleel published a book, *The Nibble Theory and the
Kernel of Power* (Jamison 1989), which summarized many of her views on human
relations and personal development. Her book, which has sold over 180,000 copies,
was enduring in so many ways because of how simple she articulated the concepts of
growth and empowerment. More than just a theory, Kaleel provided practical and
simple ways to live in the world that focused on self-empowerment, growth, and the
celebration of self and the joy of contributing to the growth of others. She described
this way of living as a candle, "When you give away some of the light from your
candle, by lighting another person's candle, there isn't less light because you've
given some away, there's more. When everybody grows, there isn't less of anybody;
there's more of – and for – everybody" (Jamison 1989, p. 3).

Kaleel felt people were usually doing the best they could and that everything
people do is being done out of his or her own experience. She believed that people
always had to be willing to risk to grow, even knowing there would be growing pains
and that there would be times when saying yes to yourself and your need to grow
may include saying no to what someone else has in mind for you. She told people to
be brave and believed that every time you were brave and took a risk, it would get
easier (Jamison 1989). The book combines theory, storytelling, practical examples,
and insightful wisdom about leadership, self-empowerment, and growth.

## New Insights: Sharing Knowledge as the Key to Growth

Kaleel not only changed our lives (and those of countless people with whom she interacted) but she also set the course of our work and our careers. Her emphasis was always to keep the process simple and to provide complex models and concepts in accessible ways. She also strongly held the belief that she should share as much as she knew with others and worried little about others "stealing" her material. She challenged the notion that if we teach others what we know, we won't have anything new to give them. Instead, she saw teaching others as creating the motivation to continuously learn and invent and to continually be advancing our thinking and our practice. Kaleel believed in sharing everything in front and behind the curtain; she had no "secret sauce" to hide. She believed sharing knowledge made us, as consultants, smarter and pushed us to always be on the learning edge. Kaleel was always on the learning edge, looking at what was occurring, how it was hurting people, and what intervention could occur to address that situation. She focused on keeping it simple, made sure her clients understood the process or intervention, and assisted them to replicate it. This goes back to the roots of the field of organization development.

Kaleel provided us with insight on how to work with clients. She spoke of the time when Procter & Gamble executives came to her house and realized she was not using any Procter & Gamble products. After this incident, she always bought the clients products and assumed their stock would go up based on them taking on the work of change – a simple but important lesson to consider. Invest in the people within the companies and the companies would benefit.

Kaleel changed the way men viewed women, and she helped women be empowered and to "be big." Her work around sexual harassment (Jamison 1975), communicating clearly and directly (Jamison 1985), and relationships between men and women in the workplace (Jamison 1983; Jamison and Miller 1985) are still relevant, and The Kaleel Jamison Consulting Group continues her work today.

Kaleel's work served as a bridge between organization development and diversity, and she was a thought leader in merging these two critical bodies of work within organizations through her total systems theory approach. She was one of the first people to view diversity as a total systems change effort (Jamison 1978). Kaleel's work on differences occurred at a time when organization development was just beginning to integrate and incorporate the thinking of people of color and women.

Judith Katz met Kaleel through NTL in 1976 and then worked briefly with her before she died. She was struck by her presence, her sense of power as a woman, and her ability to lean into discomfort and deal with difficult situations and the range of emotions in a full and powerful way. One of the most impactful elements of interacting with Kaleel was her ability to cry and talk through her tears, her ability to challenge Judith as a woman to own her power and voice, and her ability to not shy away from tough situations or interactions.

In addition, one of Kaleel's models talked about how women would cry when they were angry and men would get angry when they were vulnerable. That was incredibly helpful in terms of understanding style differences. Her work on woman-

man interactions (the transactional analysis adaptation of the model) also was transformational for Judith personally in rethinking how she was interacting with men – often in a girl or mother stance – and helped her in her own life practice move to more authentic peer-to-peer relationships (instead of expecting men to take care of me or me feeling like I had to take care of them in order to be valued).

Judith Katz joined The Kaleel Jamison Consulting Group, Inc. in 1985 and partnered with Fred Miller to continue the work of Kaleel. Kaleel had a significant influence on Judith and was instrumental in helping Judith claim her power. Judith has continued this work through her personal commitment to partnering with all people so they can step fully into their own personal power.

Both Judith and Fred continue to build on her theories and models with their work at the Kaleel Jamison Consulting Group on whole systems theory, inclusion, bias, empowerment, and the use of self as a change agent. Fred worked closely with her and upon her death and, in tribute to her, felt a responsibility to carry on her work and her mission of changing the world, leading him to keep her name for the firm he has led as CEO since her death in 1985.

## Legacies and Unfinished Business: Be Big

Although Kaleel died in 1985 at age 53, she continues to affect people profoundly, just as she did throughout her life through her articles, books, and the Kaleel Jamison Consulting Group. Through her presence and work, Kaleel dedicated her life to assisting people be their best selves and making organizations places in which people mattered and could contribute. Kaleel's seminal thinking regarding the connections between woman and man, people of color and white differences, and the need for total systems change continues to influence our work in organizations today. It has been instrumental in challenging many of us who are working in the area of cultural differences. We continue to turn to the original premises laid out here by Kaleel to draw strength from her vision and continue her work in the field of inclusion with our foundational framework, inclusion as the how, which is used to enable clients to achieve higher performance and accelerate results.

*The Nibble Theory*, her powerful book written during her struggle with breast cancer, stands as another one of her many legacies. Hundreds of people have described this book as life changing, and there can be no larger tribute (Jamison 1989). Kaleel gave us thousands of gifts and a key one is an important principle: be true to your core self versus your ego self, and sometimes things will be hard, you will not always be appreciated, but that is the best self for you to be (Jamison 1989). The book focused on leadership, self-empowerment, and personal growth – all enduring concepts equally important today.

Kaleel described herself as persistent, energetic, and a risk-taker. She wanted to grow herself as much as she could, but she believed she was here to assist others to fall in love with themselves so they would want to grow themselves as much as they could. She was talking about self-acceptance. A person needs to put aside self-criticism long enough to find the strength at their core. Then once that is found, they

will be able to grow other parts of themselves with newfound energy and vitality. She could walk into any situation, and people could feel her excitement about living. They felt her joy. She knew what was at her core was her intense joy in living. Her joy in life was her kernel of power (Jamison 1989).

## Further Reading

Kaleel's work served both public and private sector organizations. Through such publications as Fortune, Wall Street Journal, Money Magazine, and Savvy, Kaleel Jamison received national recognition for her views on a variety of human relations subjects. She was a frequent guest on radio and television programs, and her articles have appeared in The Executive Female, Personnel Journal, Personnel Administrator, OD Practitioner, T + D Magazine, Social Change, Fair Employment Practices, and Training News. Her seminal work can be found in the list of resources below:

# Rosabeth Moss Kanter: A Kaleidoscopic Vision of Change

Matthew Bird

**Abstract**

At first glance, Rosabeth Moss Kanter's approach to change appears as eclectic, ranging from the study of utopian communities to corporations, non-profits, and governments to ecosystems. But look closer and there is a deeper coherence. Behind the witty turns of phrase, digestible frameworks, and punchy action lists lay theoretical subtlety and complexity. Kanter is a trained sociologist, who seeks to understand the structural determinants of individual behavior. She melds the sensibility of symbolic interactionism, and its emphasis on fieldwork, with attention to how structural relations, especially power, constitute social systems. Her mode and method are evident in her early work and, though later made less explicit, remain throughout. As such, she may be best understood, to borrow one of her phrases, as a kaleidoscopic thinker. She seeks to identify patterns and understand how people and elements relate, combine, and recombine in multiple ways and in multiple contexts to form new patterns. She then shares with leaders and citizens the emerging possibilities and suggests how to get there. Kanter thus does not study change for change's sake – she links it to a utopian search for perfectibility.

## Introduction: Hedgehogs, Foxes, and Kaleidoscopes

The British philosopher, Isaiah Berlin (1994), famously argued that thinkers fall into one of two categories. Some are like foxes. They know many things and pursue many ends and ideas, all equally insightful but not necessarily connected. Others are like hedgehogs. They know one big thing and seek to link all to one central principal or system.

At first glance, Rosabeth Moss Kanter's work appears fox-like – cunning, astute, and wide-ranging. She has written about commitment in nineteenth-century utopian communities (Kanter 1968, 1972a); homosocial reproduction, tokenism, and relative proportions in groups (1977a); and the quality of work life and its influence on the family (1977b). Later, she asked how to make companies more innovative and entrepreneurial (Kanter 1983, 1989) and then examined how corporations and communities can, together, make the most out of globalization (Kanter 1995a). Afterward, she offered her take on the digital revolution (Kanter 2001), provided frameworks for instilling the confidence needed to turn around firms (and sports teams) (Kanter 2006a), and gave guidelines for how values-led companies do well by doing good (Kanter 1999a, 2009a). She has also advocated for public policy solutions at opportune times prior to elections in the United States (Dukakis and Kanter 1988; Kanter 2007), including a foray into transportation infrastructure (Kanter 2015), and she and colleagues have sought to create a new stage of higher education by redeveloping experienced leaders to enter the social sector and solve the globe's most pressing problems (Kanter et al. 2005; Kanter 2011a). Kanter's work seems eclectic and subject to the changing times. Surely the work of a fox.

Or not. Kanter writes well – and clear writing is clear thinking. But in Kanter's case, her clarity veils a sophisticated sociological imagination or, paraphrasing C. Wright Mills (1959), the attentiveness to the relationship between the individual and the larger society. Behind Kanter's witty turns of phrase, digestible frameworks, and punchy action lists lay theoretical subtlety and complexity – pierced with a clear purpose. Kanter is a trained sociologist, who seeks to understand the structural determinants of individual behavior. She melds the sensibility of symbolic interactionism, and its emphasis on fieldwork, with attention to how structural relations, especially power, constitute social systems. Her mode and method are

evident in her early work and, though later made less explicit, remain throughout. But more than theory and method, Kanter is a hedgehog in theme. She does not study change for change's sake; she links it to a utopian search for perfectibility in society. Kanter may be a fox in practice (she knows many things), but she is a hedgehog in principle (she wants one big thing). Berlin's analogy breaks down.

But Kanter often thinks in "threes" and maybe, for her, there is a third, more suitable possibility. To borrow one of her concepts, she is a kaleidoscopic thinker with a kaleidoscopic vision (Kanter 2000). "A kaleidoscope is a device for seeing patterns. They're made up of a set of fragments, but it's a flexible set of fragments, so that if you twist it or look at it from a different angle you can see a different pattern," Kanter explains. "Leaders have to shake people out of their orthodoxy and get them to see that a new pattern is possible" (Kanter 2006b, paragraph 37). As a thought leader, Kanter sees patterns, and over time she has studied how people and elements relate, combine, and recombine in multiple ways and in multiple contexts to form new patterns. She then seeks to share with leaders and citizens the new possibilities and how to get there.

## Influences and Motivations: Be More than Yourself

Rosabeth Moss Kanter wrote early and often, drafting mystery novels and entering essay contests during her childhood in Cleveland, Ohio. She was also ambitious, printing business cards proclaiming herself as a "child psychologist." She majored in sociology and English at Bryn Mawr College, having spent her Junior year at the University of Chicago. After graduating in 1964, she considered working in advertising or as a journalist but instead enrolled in the doctoral program in sociology at the University of Michigan. (While in college, Kanter met and married Stuart Kanter, a psychology major from the University of Pennsylvania. She moved with him first to the University of Michigan and then to Boston in 1967. She accepted a job at Brandeis University, while he took position in Organizational Behavior at Harvard. Tragically, he died in 1969. She maintained his name after his passing.)

Ann Arbor proved an apt place for Kanter to explore her interests in sociology and psychology. Several decades earlier Charles Cooley (1962) began to formulate his utopian-tinged version of symbolic interactionism, a social psychological perspective that views individuals as socially constituted agents emergent from meaningful social interactions. By the time Kanter arrived to Ann Arbor in the 1960s, the department had further integrated major postwar structural, functionalist, and conflict theory perspectives popular in postwar American sociology. Two early mentors included the political sociologists, Leon Mayhew and William Gamson.

Kanter's dissertation developed a theory of commitment to explain the survival rates of nineteenth-century American utopian communities (Kanter 1968), and it

helped her gain an academic position in 1967 in the sociology department at Brandeis University. Years earlier Everett Hughes (1958) had moved from the University of Chicago to found the graduate program and create a "Chicago School" extension, emphasizing fieldwork and micro-interactionist perspectives. Kanter's emerging sociological imagination fit well there as she, in the company of Hughes, Lewis Coser, Kurt Wolff, Philip Slater, and others, worked through her own theoretical understanding of how social systems and internal relations condition individual experience and behavior, a framework articulated most explicitly in her early work.

Her first book, *Commitment and Community*, was published in 1972. It proposed a theory of commitment, positing that the ability of communes (or any organization) to attend to cognitive, affective, and normative needs of individuals via multiple social mechanisms aligns individual and collective interest, thus explaining commune survival rates. The theory contributed founding insights on the concept of organizational commitment (e.g., Meyer and Allen 1991). Her second book, *Men and Women of the Corporation*, came out in 1977. It offered a gender-neutral critique of gender (or any majority-minority) relations in organizations, asserting that differences in behavior and even personality were attributable to one's role and position, rather than inherent characteristics. The job makes the person or, more specifically, the opportunity structure, the distribution of power, and the relative composition of groups explain the experience, behavior, and career prospects of individuals. This gender-neutral analysis gave birth to literatures on homosocial reproduction in organizations and tokenism in the workplace. The latter analysis reflects Kanter's deeper integration of the relational thinking of Georg Simmel (1950), as it focused on the relative composition of minorities and majorities in groups and was communicated through the relational use of "Xs" and "Os" (Kanter 1979a).

But couple Kanter's first two books and a framework of analysis emerges, the faint outlines of which appear in a lesser-known paper, "Symbolic Interactionism and Politics in Systemic Perspective" (Kanter 1972b). Like Gamson (1968), she identifies two core perspectives in sociology. A behavioral or influence view represented best by symbolic interactionism and a social control or system perspective found in structural and functionalist approaches. Both have merits and biases – and they need one another, she claims. Symbolic interactionism recognizes the role of symbol in human interaction and how people in relation to one another create new forms of action. Systems approaches see how the parts fit together, theorize the distribution of power, and account for collective interests. "The important question is not which paradigm is best under all circumstances, since all of them capture some elements of 'the truth'," Kanter wrote in kaleidoscopic fashion. "The task for the future is to confront perspectives with one another and from this confrontation develop ever more sensitive tools for understanding social and political life" (1972b, p. 91).

As Kanter solidified her sociological imagination, in the strict sense defined by Mills, her research began to engage more deeply in practice. In 1972, she married Barry Stein, who received a Ph.D. in community economics from the Massachusetts

Institute of Technology, and he helped introduce her to the world of consulting. A fecund and curious mind, Stein coauthored several works with her on quality of work life (Kanter and Stein 1979), parallel organizations (Stein and Kanter 1980), and a treatise on organizational change (Kanter et al. 1992). A critical moment in Kanter's career came when she opted to publish her second book, *Men and Women of the Corporation*, with a more trade-oriented rather than a pure academic press. Doing so gave her a wider readership and more engagement with practice. Following her penultimate chapter about the study's theoretical contributions, in which she detailed a framework for understanding the structural determinants of behavior in organizations, she tackled in a concluding chapter the issues of organizational change, affirmative action, and quality of work life. The same year as publication – 1977 – she and Stein founded Goodmeasure, a consulting firm, and Kanter accepted a position at Yale University.

Thereafter, Kanter proceeded to articulate in systematic fashion her kaleidoscopic vision of organizational change. The core of her work focuses on the transition from the bureaucratic firm (as represented in *Men and Women of the Corporation*) to post-bureaucratic organizational forms: the entrepreneurial corporation (1983), the post-entrepreneurial corporation (1989), the global corporation (1993), digital transformation (2001), corporate turnarounds (2006a), and the values-led global enterprise (2009a). (Toward the beginning of this period, in 1986, Kanter moved to Harvard Business School, as only the second tenured female faculty member, and she served as the last academic editor of the *Harvard Business Review* between 1989 and 1992.)

Yet as a multivalent, systemic thinker, Kanter never abandoned her original utopian dream: an infectious optimism felt in the tone of her writing, a contagious desire to make the world a better place, made even more apparent during her speaking engagements. Not only should we, but we can, she repeats, before suggesting how. As she continued to theorize the flattened (nonhierarchical), connected (non-siloed), and flexible (agile decision-making) organization in which opportunity and power are more evenly distributed and within which people at all levels of the organization can realize themselves not as workers but as human beings, she also remained sensitive to the organization's relationship to the environment. Kanter adopts a contingency theory of organizations and ascribes to a natural, open systems view (e.g., Thompson 1967; Lawrence and Lorsch 1967; Weick 1979). There are also echoes of the human relations school in her approach, including Mary Parker Follett (Kanter 1995b) and Chris Argyris (1964, 1973), among other influences.

Between the 1980s and 2000s, Kanter structured her corporate change books in a similar fashion. They begin by specifying the environmental conditions faced by the corporation, the organizational challenges produced, and how leaders and workers can reorganize themselves to confront them – similar in spirit to her original work on communes. Her long-standing concern for how business affects society, articulated most explicitly in her prefaces, introductions, and conclusions, lurks beneath throughout the late 1970s and 1980s and is largely expressed via her analysis of the company and the employee, via such concepts as "employability security" and

the self-realization of people in organizations as they align their values and interests with that of the group – once again echoing her insights on commitment in utopian communities. But by the 1990s, she integrates community more explicitly, and it becomes clear, at least to her immediate business audience, that her approach to change does not apply solely to corporations or even organizations but to society as a whole (Kanter 1995a, 1999a).

Corporations operating in globalizing contexts not only must flatten themselves to become more entrepreneurial and innovative, but they must also turn themselves *inside out*, developing alliances and partnerships with suppliers, buyers, governments, and civic organizations. Businesses are members of society. They employ citizens and sell to citizens, and they may create positive or negative impact not in the market but the community. To compete globally, companies must thrive locally, Kanter says. And to do so businesses and communities need to find common ground and articulate a shared strategy. Later, with the dot-com boom and bust at the turn of the century and subsequent deepening of globalization in the first decade of the 2000s, Kanter further developed her frameworks for how to enact organizational transformation and turnarounds (2006a) and lead with values in order to continue realizing innovation, profits, growth, and social good (2009a). These same principles apply to political leadership (Kanter 2007), leadership in the social sector (Kanter 2005c, 2011c), and even in the concrete policy case of transportation infrastructure (Kanter 2015).

Kanter articulated a system of understanding, and as such her work could be viewed as one would that of a self-referential film auteur or novelist. More narrowly, Kanter is an ethnographer of corporate transformation in the late twentieth and early twenty-first century who interprets the organizational evolution with her concepts, her frameworks, and her vision. But with each publication, she extended her system, from person and organization to community and society. Her systemic self-referentiality does not mean that Kanter does not integrate new evidence and literatures. To the contrary, her footnotes detail the wide-ranging literatures she draws from. Rather, Kanter integrates them, such as the case of network theory, into her larger framework for understanding change (Kanter 1992). In this sense, Kanter is a hedgehog – albeit a kaleidoscopic one – focused on changing business and society for the better.

## Key Contributions: A Skeleton Key

Kanter has made multiple contributions to multiple disciplines. But what holds her insights together? Is there a *skeleton key* for understanding her *key* contributions to the theory of organizational change? In Kanter's case, a skeleton key is especially critical since she, as a kaleidoscopic systems thinker, does not examine organizations and people apart from one another. Nor does she view society or community apart from organizations and people. What, then, are the core elements she works with and how does she understand their relationships?

## People

People work in and interact in organizations, and they, as humans, have needs – instrumental/cognitive, affective/emotional, and normative/evaluative. For people to commit, the organization or group needs to fulfill these needs. The former supports continuance of membership in the group, the second generates a sense of cohesion, and the third enables social control. People also think, feel, want, and evaluate with symbols. They need meaning, and it is values that guide choices, serve as control systems, forge shared identity, and create aspirations and ideals (Kanter 2009a, 2011c; Kanter et al. 2015). But meaning and values are not static; they are dynamic and social. To either persist or evolve they must be enacted – made and remade via dialogue and interaction.

Yet behavior in organizations cannot be understood with sole reference to the person's instrumental, affective, and normative needs and the mediating importance of symbols, values, and meaning. These are socially constituted. As Kanter stated early on, a systems perspective should complement social psychological frameworks.

## Organizations

Consider first the internal structure of an organization. Three determinants include opportunity, power, and relative number (Kanter 1977a). People occupy positions, which condition whether someone has more or less expectations and prospects. These opportunity pathways – into or out of the job – condition employee attitudes and behavior, i.e., aspirations, self-esteem, satisfaction, motivations, and interaction styles. Organizations also exist as distributions of power – the ability to mobilize resources, information, or support and then garner the cooperation to get something done (Kanter 1979b, 1983). The organization's design can *empower* all members of the organization and enable better flow of resources, information, or support – and in so doing improve group morale as well as the individual sense of security and propensity to participate. Finally, the relative number of majorities and minorities matters. Skewed (i.e., token) and minority (i.e., tilted) groups create intense visibility, conformity, and performance pressures for those below a certain threshold of representation, which in turn influence the opportunity and power available to them.

Externally, just as Kanter sees organizations as a structural determinant of behavior, she recognizes that the environment is a structural determinant of organizations. They are natural and open systems. But she goes deeper, offering more textured accounts of how the natural, open systems function. They consist of thinking, feeling, wanting, and valuing people who, as collectivities, adapt to changing environmental influences in order to survive as an organization or group (Kanter 1983, 1989, 1995a, 2001, 2006a, 2009a). The forces unleashed by globalization – in sum, increased flows and connectivity, which led to increased competition, volatility, diversity, uncertainty, and complexity (Kanter

2010) – pressured companies to develop the post-bureaucratic forms needed to survive and thrive. Not only must firms engage differently with their workforce, as Kanter began to observe in the 1970s and 1980s, but they must interact differently with other organizations and the larger community, especially after the Cold War.

## Communities

As part of an ecosystem remade by expanding and densifying networks spanning geographies and sectors, organizations merge, ally, or partner with other organizations as well as the larger community (Kanter 1995a, 2012a). The organization's boundary becomes porous, and the ability to manage relationships becomes critical for organizational survival and success (Kanter et al. 1992, 1999b). Those that succeed create "collaborative advantage" (Kanter 1994, 1995a). Kanter's analysis of how this is achieved builds off of her core focus on social relations. Collaboration is not exchange. The former is an ongoing relationship in which partners build value together. The latter is giving and taking. And successful collaboration is regulated not by a formal but an informal system of control. Integration – be it an alliance, a joint venture, or a full-blown partnership – is like marriages. Integration comes at several levels – strategic, tactical, operational, interpersonal, and cultural (Kanter 1994, 1995a). Although the interaction is occurring at the organization level, the problem of commitment (of the "I") to the new entity (the "we") remains the same. "Only relationships with full commitment on all sides endure long enough to create value for the partners," Kanter wrote nearly three decades after her studies on communes (1994, p. 100), before specifying mechanisms for sustaining collaborative (as opposed to organizational) commitment.

Finally, organizations must interact with communities. On the one hand, communities benefit from building an infrastructure of collaboration or "the pathways by which people and organizations come together to exchange ideas, solve problems, or form partnerships" (Kanter 1995, p. 363). While Kanter's unit of analysis has shifted from the organization to the community, her insight is similar to that observed in organizations. (She has even proclaimed that businesses should be treated as communities (Kanter 2001)). Create the structural conditions and the actors – people and organizations in the community – are more likely to work together to find solutions. But an infrastructure for collaboration is a necessary, though not sufficient condition.

People and organizations also need to be called to action and motivated to create change – and in steps the importance of values, which permeate all levels of interaction: Between people and people, people and organizations, organizations and organizations, and organizations and communities, all of which are, in essence, made up of individuals interacting under structural conditions. At the organizational level, values guide decisions, spur intrinsic motivation with positive emotions, act as an organizational control system, forge organizational identity which fosters a

longer-term perspective and widens the organization's scope, and enables ecosystem creation (Kanter 2009a, 2011c, 2015; Kanter et al. 2015). Furthermore, values may also be used to create common ground across multiple stakeholders, thus reducing intergroup conflict by establishing an overarching goal and shared values, which instill aspiration and future orientation among community members (Kanter 2009b).

Kanter's kaleidoscopic vision is layered and systemic. But this does not mean that it is deterministic. Things can change if one changes the structural conditions – or turn the kaleidoscope. And this is the role of the leader – be it of a small group, a large company, an entire nation, or beyond.

## New Insights: A Grammar of Change for Leaders

Kanter's insights may be best captured in what could be called a grammar of change. Languages, like kaleidoscopes, consist of elements. Jumble up the words, or shake the kaleidoscope, and the elements can combine and recombine in an infinite number of ways. But there are rules – a grammar – for how they may fit together and in what sequence. For Kanter, even though the only constant is change itself, there are principles for how change comes about. If leaders understand the grammar of change, then they can better lead it.

## Change Projects

In Simmelian fashion, Kanter has observed that "all leadership is intergroup leadership, because the potential for differentiation exists in any social unit larger than two" (Kanter 2009a, p. 83; see also Kanter and Khurana 2009). In this sense, a cellular basis for change for Kanter is the relationship between and leader and the team or small group, with the potential for these core relational dynamics to be reproduced at higher levels or units of analysis.

Leading a change initiative, whether from below, in the middle, or at the top, involves the exercise of seven core skills: (i) sensing needs and opportunities, (ii) stimulating breakthrough ideas, (iii) communicating inspiring visions, (iv) getting buy-in or building coalitions, (v) nurturing the work team, (vi) persisting and persevering, and (vii) celebrating accomplishments (Kanter 1983, 2001). Although structural conditions may enable better exercise of these skills – for example, the distribution of power in the form of information, resources, and support (Kanter 1979b, 1983) or the cultural existence of values-led organizational guidance system (Kanter 2009a; Kanter et al. 2015) – the leader and the team have the agency to carve out space and create the in situ conditions for initiating change, however minor. Writ small, the change agent must deal from the beginning with the challenge of overcoming "intergroup" conflict, finding common ground, and forging group commitment, for it is only through and with people, starting somewhere and often starting small, that change begins.

Extending Simmelian insights, Kanter proposes a "change agent rule of three." While leading an initiative, the agent encounters three types of people, allies, opponents, and undecideds, each of which ranges from active to passive. For allies, the agent must maintain their commitment, increase their numbers, and avoid faction creation. For opponents, the agent may eliminate them, neutralize them, or divide them. For undecideds, the agent's task is to win them over by increasing credibility, demonstrating benefits, or advancing group interests. Importantly, these cellular insights also apply to larger units of analysis such as teams, organizations, communities, or even nations.

## Alliances

Not only must change leaders form coalitions, as described above, but if they are organizational representatives, they may also need to form interorganizational alliances such as joint ventures, consortia, or value-chain partnerships. The change challenge remains that of overcoming intergroup conflict (this time without the quotes), finding common ground, and forging group commitment, but with the goal of generating and maintaining value-creating collaboration. For Kanter, there are eight "Is" that make "We": (i) individual excellence, (ii) importance, (iii) interdependence, (iv) investment, (v) information, (vi) integration, (vii) institutionalization, and (viii) integrity (Kanter 1995a). The more "Is" attended to in an alliance, the more commitment binding the two groups or parties. Although senior leaders may initiate the alliance, senior and middle managers also execute it. Alliances are a marriage of organizations at multiple levels.

## Mergers and Acquisitions

Sometimes, alliances are not enough, and full organizational integration is needed. Such processes can be traumatic for people because change of any kind, but especially in merger and acquisition contexts, may generate a loss of control, excess uncertainty, surprise, difference effects, loss of face, concerns about future competence, ripple effects, resentments, and, often, very real threats such as the loss of a job or livelihood (Kanter 1985). While there may be a technical or financial logic for bringing two organizations together, they are still made of people with values-mediated instrumental, affective, and normative needs. Organizational integration is human integration, and once again a core challenge is how to overcome intergroup conflict, find common ground, and forge group commitment.

Unlike middle managers, who lead from the middle and thus may have to carve out structural and cultural space for change, senior executives have the power to pull macro-organizational levers – to turn the kaleidoscope. Whether the motive is the turnaround of an acquired firm or leveraging a merger to catalyze change, the human integration may be thought of as three sets of activities: dual companies (run the old and the new side by side), one company (find common human bonds and encourage

relationships beyond tasks), and new company (quickly start envisioning and building the future) (Kanter 2009a, c). Kanter's earlier insights for how to overcome intergroup conflict, find common ground, and forge group commitment reappear, but once again she applies them to a higher organizational level. And this application is not limited just to mergers and acquisitions.

## Turnarounds

It is natural for people and organizations to have their ups and downs or winning streaks and losing streaks (Kanter 2006a; Kanter and Fox 2016). Missteps happen, especially in rapidly changing environments, and just as people lose confidence – the expectation of future success – so do organizations. In Kanter's sociological, kaleidoscopic imagination, however, confidence does not reside inside people's heads but emerges from a system of structural relations. And because of this, agents – from athletics coaches to business executives – can instill confidence and lead turnarounds, a form of organizational change.

The process is threefold (see the appendix in Kanter 2006a for a theoretical diagram of the complex feedback loops). First, people – and it begins with people as members of a group – will need to face facts and take personal responsibility. Second, the establishment of responsibility opens the way for collaboration, in which people learn how to count on one another again, instead of finger pointing. With collaboration, respect and trust grow among group members and an upward cycle begins, thus opening the way for leaders to lay a third cornerstone: initiative. Leaders then provide the permission and encouragement for people to act and to feel like what they do can make a positive difference. If they do not feel this efficacy, then they may respect and trust others and they may even help other people out, but they will not necessarily give the best of themselves, which is needed to better stimulate innovation and change.

## Systemic Transformation

Kanter conceptualizes systemic transformation – of which change projects, alliances, mergers and acquisitions, and turnarounds may be a part – as a "change wheel" (Kanter 2001, 2005b). Her description further highlights her kaleidoscopic thinking. She arrays around a wheel ten organizational elements, which contribute to organizational change. The change goal sits in the center. But the elements are not isolated. They are spokes on a wheel. When any two elements are combined, the change wheel begins to roll. Yet the spokes are presented with a logic in mind:

> Theme/vision, symbols/signals, and governance structures make sense at the very beginning. Next educational events can help identify and groom champions and sponsors, and quick/ wins/local innovations can then more easily follow. The activities at the grass roots then trigger the next three elements: lessons to communicate; clarity about what needs to change

in rules and procedures to support the kinds of innovations and activities that are emerging as the change idea becomes actualized; and measures of progress. Rewards help lock the whole thing into place. The elements overlap, because the same action can have multiple ramifications – for example, identifying change champions to lead local innovations and communicate with other groups to exchange best practices puts many of the spokes into gear. (Kanter 2005b, pp. 5–6)

Kanter presents a grammar of change. The wheel is based on core elements and principles, which enable multiple – kaleidoscopic – possibilities and combinations (see Fig. 1). Though not stated explicitly, the theoretical ground upon which the change wheel rolls is Kanter's kaleidoscopic understanding of the systemic, relational determination of individual and group behavior.

## Social Change

The largest and most complex social organizational form is society – be it a community, a nation, or the world, each of which consist of social, political, and economic systems. Kanter likes to quote the anthropologist Margaret Mead: "Never

**Fig. 1** Change wheel (Source: Kanter 2005b)

doubt that a small group of thoughtful, committed citizens can change the world. Indeed, it's the only thing that ever has" (quoted in Kanter 2005c, p. 1). But, one cannot help but see the anthropologist's words filtered through Kanter's kaleido-scopic, sociological lens. The cellular, relational basis for change remains the leader and the group. Whether in the form of an individual or organization acting in society, both have the ability to transform society, beginning with convincing the "other" to commit and contribute to the change.

The challenge is that societies consist of a dizzying array of institutions, organizations, groups, subgroups, and individuals all with their own distinct but overlapping values and instrumental, affective, and normative concerns. Leadership in the social sector is thus more complex than leading in an established organization (Kanter 2011a). Authority is more diffuse, resources are more dispersed, stakeholders are more varied, goals are more conflicting, and there are no existing institutional path-ways. Leading positive change in society requires *advanced* leadership.

A critical task for *advanced* leaders is identification of the target of change and the action vehicle (Kanter 2005c). Three types of targets (policy/advocacy, programs/modeling, and people/mobilization) may be addressed via five basic action vehicles: an existing organization, a new organization, a coalition of organizations, an ad hoc convening of organizations, or individual action (see Fig. 2). A leader may start in any one cell, e.g., a celebrity generating awareness in order to mobilize people. But later the celebrity could found a new organization to create a service or product innovation addressing the issue, after which a coalition of organizations may be engaged to advocate for a change in policy. The bigger the change becomes, the more the leader brings other people and organizations on board working in multiple cells of the matrix at once – overcoming potential intergroup conflict, finding common ground, and forging group commitment. Change agent skills are needed

**Action Vehicle**

| | | Use of existing organization | Create new organization | Work through coalition of organizations | Ad hoc convening of organizations | Individual Action |
|---|---|---|---|---|---|---|
| **Target** | Policy (advocacy)<br><br>Rules<br><br>Resources | | | | | |
| | Programs (delivery/modeling)<br><br>Services<br><br>Innovation | | | | | |
| | People & Culture (mobilization/empowerment)<br><br>Awareness<br><br>Tools for Action | | | | | |

**Fig. 2** Even bigger change matrix (Source: Kanter 2005c)

to start the transformation; the change wheel is necessary to get change rolling and values matter – but the "even bigger change" matrix helps to chart the course. Following Mead, change can begin with a leader and committed citizens (indeed, all and any change does), and Kanter suggests how to navigate the process.

## Conclusion: Kanter's Critical Utopianism

Yet how much change has Kanter made, both theoretically and practically? It is impossible to specify much less summarize the contributions of someone who coined such terms as "empowerment" and "employability security"; provided founding insights about organizational commitment; sparked new literatures on homosocial reproduction and tokenism; inspired new diversity policy and an industry of diversity training, with arguably the best-selling training video of all time; altered company quality of work life policy, with an award later created in her name for excellence in Work-Family research (given by Purdue University and Boston College); helped include "service" as a national policy in the United States; has counseled political leaders, scores of Fortune 500 companies, and thousands of firms and nonprofits; and has taught multiples more in classrooms, via videos and talks, and through print publications.

But the work of change is never done. Although Kanter admits that there are no organizational utopias, she embraces the aspiration for perfectibility or the search for ideals, as she observed in her first publications on utopian communities. After all, she knew that all the social experiments she studied for her dissertation eventually failed. Instead, Kanter focused on explaining why and how some survived longer. The ideal is never realized, but it is what keeps her moving forward. There are times when Kanter's law applies – everything looks like failure in the middle. But in the middle is when one must persist, drawing from the only energy that is infinitely renewable – one's own. It is in the difficult middles of change – big or small – that one realizes the wisdom in another of Kanter's phrases – change is not a decision; it is a campaign. Likewise, Kanter's work on change has also been a lifetime campaign. There were moments when her work resembled that of a cunning fox, moving from subject to subject, but through it all she built and maintained a kaleidoscopic vision of change with one larger hedgehog-like goal. If the perfect society cannot be achieved, at the very least the world can always become a better place. Some utopian communities did last longer than others. Rather, people and organizations – you – just need to get started and go from there, for there is always more good to create. And Kanter's hope is that her kaleidoscopic vision can help some lead the way.

## Further Reading

Rosabeth Moss Kanter has distilled her frameworks in books, articles, blogs, videos, and inter-
views. To understand her influential view of majority-minority relations within organizations,
read Men and Women of the Corporation (1977a) and then watch the classic diversity training
video The Tale of "O": On Being Different. To delve deeper into her work on change, begin with
The Change Masters (1983), considered one of the most influential business books in the
twentieth century. To round out understanding of her core vision of corporate change, follow
up with When Giants Learn to Dance (1989), Evolve! (2001), and Confidence (2006a). To
explore her understanding of the relationship between business and society, read World Class
(1995a) and SuperCorp (2009a), both of which develop her full vision of the twenty-first century
global enterprise. Move (2015), on the other hand, is unique in that it offers a book-length focus
on how to tackle a single social change issue. Finally, Rosabeth Moss Kanter on the Frontiers of
Management (1997) collects many of her classic Harvard Business Review articles. And if you
want to understand the notion of perfectibility, return to where her system and vision began,
Commitment and Community (1972).

# The Legacy of Judith H. Katz: Organizational Change and Justice

# 41

Beth Applegate

**Abstract**

This chapter is based on the pioneering work of Judith H. Katz, Ed.D. in systems change to address issues of racism and social justice and infuse organization development with these concepts to build inclusive organizations. The author describes Katz's research, methodology, models, teaching, and client consultations in the field of applied behavioral science (ABS). The author reflects on implications and impact of Katz's legacy, on future organization development practitioners, and the discourse on the role of organization development as a catalyst for racial and social justice.

*When we try to bring about change in our societies, we are treated first with indifference, then with ridicule, then with abuse and then with oppression. And finally, the greatest challenge is thrown at us: We are treated with respect. This is the most dangerous stage.*

*-A.T. Ariyarante*

## Introduction

Dr. Judith H. Katz has devoted her professional life to the principles of organizational change, equity, and inclusion. Judith was first influenced by her parents Ilse and Bill Katz who instilled a set of values, vision, and passion about addressing injustice in the world. Her parents fled Germany to escape being incarcerated in Hitler's death camps; while many of her relatives perished in those camps. She came to understand the price that anti-Semitism paid in her parents' experience in fleeing Germany and being immigrants in the United States. She grew up with a strong set of values regarding justice and the pain and impact of oppression. And through that experience, she developed a deep understanding that as a white, Jewish woman, she *must* play a role for positive change. Judith was also named after an aunt and uncle who died in concentration camps which deeply rooted the legacy of addressing oppression into her DNA. Judith often talked about how she did not choose her profession as a change agent but rather felt that the work chose her!

## Influences and Motivations

In 1969 at Queens College NY, Judith participated in her first T-group. An element of the T-group, given the nature of what was happening in the late 1960s, was on race and racism. This experience sparked her interest in learning more about T-groups, societal and organizational change, and what was then termed "human relations" training. She was fortunate to attend classes led by individuals who had attended NTL and participated in several workshops facilitated by Jack Gibbs addressing issues of interpersonal dynamics and trust. In addition to learning about herself, Judith also began to learn about the process of group dynamics and the challenges of developing trust across racial lines. These experiences opened Judith's eyes to the need for change on individual, group, and organizational levels as she observed how the larger societal forces impacted interpersonal and group dynamics. Experiential education had begun to open the door to understanding that the need for change had to go beyond interpersonal awareness and trust as she engaged in groups that were diverse in terms of whites and African Americans. What became clear in many of those groups was that even if people could develop closer connections and understanding across differences, that the fundamental organizational and societal systems would still remain the same. And although Judith developed many close connections with people of color at Queens College, Pam Palanque North, Richard Orange, and Carl Jennings (all of whom would become OD practitioners in their own careers), it was clear that just caring about each other and working together were not sufficient. Institutional racism needed to be addressed and systems needed to be changed.

Judith's next experience which deepened her interest in group dynamics and the impact of racism resulted from her participation in a summer workshop facilitated by the National Conference of Christians and Jews in 1970. As part of the opening session, each staff member was asked to make a statement framing the conference. An African American woman facilitator said, "I don't care about you white people – I am here for People of Color – and if you are going to take action go do it in your own communities... because racism is a WHITE PROBLEM." That was a transformational moment for Judith, which opened the door for her to begin to understand and address racism as a white problem which was not how racism was being framed 1970. This was a worldview and life-changing awareness. From that point forward and for the next decade, Judith focused her work examining racism from a white perspective.

In 1972 Judith went on to study at UMass, Amherst, for her doctoral work. Many of the UMass faculty were NTL members. The values of NTL – founded on bringing theory, research, and practice to make individuals, groups, and organizations healthier – had a tremendous impact on Judith's growth. Judith developed strong lifelong professional and personal partnerships through NTL. Through her program, she was exposed to and influenced by the classic OD theorists not only in her research and studies but was fortunate enough to participate in a year-long intensive "experience" led by Edie Seashore, Herb Shepard, Orian Worden, and Wally Sykes. Edie Seashore became Judith's mentor and remained her mentor and dear friend until her death in 2013.

At the same time, Judith was learning about OD theory and practice, counseling psychology, and social change. Judith was working with other students and faculty who were examining social justice issues and race, racism, gender, and sexism in new ways. For example, Bailey Jackson (also a student) was building on Cross' (1971) work and studying how black identity theory could be applied to creating multicultural organizations –and a multicultural OD model. Alice Sargent was breaking new ground in her doctoral work in identifying the *Androgynous Manager* (1983). Judith was also influenced by some of the seminal writings and works of blacks (and other people of color) in awakening her awareness of the need to rethink and be reeducated about history through the lens of people of color (POC) critical race theorists; Dee Brown (1970), John Hope Franklin (1947), Frances Cress Welsing (1974), Schwartz and Disch (1970), and many others. Simultaneously, Pat Bidol (1971), Eric Goldman, William Ryan (1971), Bob Terry (1970), and others also were identifying new approaches to more systematically address racism from a white perspective. Judith's experience at UMass brought together foundational OD theory and practice, along with principles of counseling psychology, which enabled her to base her work in addressing issues of oppression and social change through a systems approach at the individual, group, and organizational levels.

In addition, while at UMass, Judith experienced her second most important learning when Maurianne Adams confronted her about her own internalized oppression as a woman. Before that encounter, Judith had previously seen one oppression as "more important than another" (i.e., race vs. gender). However, Maurianne's

confrontation helped Judith realize that oppression is oppression and that by ranking which "ism" was more important than others, she was still operating out of the same "one-up/one-down" mindset. Judith began to see the intersectionality – and multidimensionality of oppression – i.e., being white and a woman means that an individual can experience being *one-up* and *one-down* at the same time. Understanding of intersectionality was critical as she later applied that learning in her practice and systems change work.

During this same period (1972–76), Judith worked every summer in Bethel Maine as the head of NTL's children and teen program. The program was created as a "camp" for the children aging 5–12 of participants and staff at NTL programs as well as providing a teen T-group program for 13–18-year-olds. During those summers in Bethel, Judith participated as a staff member in weekly meetings and gained greater exposure to the many NTL staff members conducting programs and sunrise seminars that highlighted their current and developing theory and practice. The list of contributors is too long to fully honor and includes John Adams, Billie Alban, Dick Beckhardt, David Bradford, Barbara Bunker, John Carter, Bob Chin, Elsie Cross, Kaleel Jamison, Rosabeth Moss Kanter, Hal Kellner, Sherm Kingsbury, Don Klein, Ron Lippert, Joe Luft, Judith Palmer, Carol Pierce, Mickey Ritvo, John Scherer, Eva Rainman Schindler, Edie Seashore, Charlie Seashore, Bob Tannenbaum, Peter Vail, Gwen Wade, John and Joyce Weir, and Orian Worden.

During this time a group of women NTL members began to question the underpinnings and theoretical foundations of T-groups and other methodologies and how the predominant theory and practice largely reflected and were primarily based in white men's experiences. During one summer, prior to the start of the weekly workshops, NTL staff members spent a day exploring how biases about women were impacting theory and practice. These sessions were facilitated by NTL members: Billie Alban, Barbara Bunker, Judith Palmer, Carol Pierce, Edie Seashore, and others. It was so powerful to be among these women – who were demonstrating both a level of strength and compassion in their work and who were opening Judith's eyes to see how bias was baked into organizational development theory and practice. These experiences reinforced Judith's exploration of how OD theory and practice needed to change to better reflect the perspectives and experiences of people of color and white women. Being exposed to and participating in these conversations were vital to Judith's later work in challenging and enhancing OD theory and ensuring the integration of experiences and perspectives beyond the founders. In 1976, Judith completed her doctorate from UMass, became an NTL member, and began to work side by side with many of the leading thinkers and practitioners including Lee Bolman, Bob Chin, Chuck Hamilton, and Judith Palmer. While working with Bolman (both within NTL and in outside consulting), Judith learned more about Chris Agyris' (Argyris and Schon 1974) espoused theory and theory in use (as Lee Bolman was a protégée of Chris Agyris) and gained a deeper understanding of organizational culture. Agyris' theory became central in Judith's examination of issues of discrepancy between intent and impact in working across race and other elements of difference. Upon receiving her doctorate, Judith went on to teach at the University of Oklahoma – in a Master's degree program in human relations where

she was tenured – and then taught at San Diego State University in the community-based block nontraditional counseling psychology program. In 1985 she left her full-time position in higher education, because she found that higher education was too intractable to change, and devoted herself full time to working in organizations around the globe for change.

## Key Contributions

Judith Katz has distinguished herself as a thought leader, practitioner, educator, strategist, and compassionate human being. Her writings have broken new ground transforming the concept of how diversity and inclusion integrate into OD. Through her work (and her long-standing partnership with Fred Miller), they have put addressing issues of diversity as a lever for organizational change on the OD agenda as an integral part of OD theory and practice (Bob Marshak, 2016 interview). And she has worked diligently to address oppression in organizations across the globe working with clients such as Allstate, Cisco, Mobil, DuPont, Digital Equipment Corporation, Ecolab, Eileen Fisher, United Airlines, Merck, Telecoms of Singapore, Croydon Council (UK), the City of San Diego, and institutions of higher education. Judith has been recognized by the Organization Development Network with the Lifetime Achievement Award (2014), Outstanding Global Work (2012), and Communicating OD Knowledge in honor of Larry Porter (2009) and has been named as a Diversity Legacy Leader (2015) by the Forum on Workplace Inclusion and one of 40 Pioneers of Diversity (2007) by Profiles in Diversity Journal. She has served on the boards of NTL for the Applied Behavioral Sciences, Social Venture Network, and Fielding Graduate University.

Judith's journey and contribution began with an understanding about race and racism and the role that white people play in maintaining and perpetuating the system, as well as the accountability whites have for addressing racism through self-awareness and in their spheres of influence. Early on she heard from people of color about the frustrations and challenges of having to always educate white people and then whites often either denying or dismissing people of color's experiences. Her work on white awareness (Katz 1978) was in direct response to that concern, lessons learned on her journey, and the recognition that in addition to having power and privilege, it was important for whites to have mechanisms to do their own work about racism so that their learning was not at the expense of people of color. While teaching at the University of Oklahoma, she also consulted with educational institutions such as Trenton State College, The University of Pennsylvania, Indiana State, University of Delaware, and many others on addressing racism, and her book was seen as a resource for many educators and facilitators addressing racism from a white perspective.

In 1985 Judith was asked by Frederick A. Miller of the Kaleel Jamison Consulting group to join the firm when Kaleel Jamison died of cancer at the age of 53. The firm's name continues to honor Kaleel's legacy and contribution as a pioneer who understood that to really create a multicultural organization necessitated a systems

level change intervention (Jamison 1978). Together, Judith and Fred have partnered and cocreated new models and have been thought leaders in the field of OD with a focus on strategic culture change to create more inclusive organizations that leverage differences. Their partnership is one of the few that have lasted over three decades, and they have built upon their differences as a white woman and African American man to model how working across differences creates and strengthens performance, productivity, and innovation. (Note: Fred Miller and Kaleel Jamison are both included in this handbook.)

Over the years, Judith's work has continued to weave together what is happening in the larger society related to issues of oppression and social change, along with the application and adoption of OD methodologies and practices to create change within organizations through the development of new frameworks and approaches for change.

One of the things that Judith learned from her NTL experiences was how to take "experience" and make that accessible for others in both theoretical and practical ways. Katz identifies as a change agent – with both the theoretical knowledge of individual, group, and organizational (and societal change) rooted in OD and counseling psychology theory as well as a practitioner – involved with making large-scale change in organizations.

The outcome of all of Judith's seminal experiences was to use her power and privilege to speak and give voice to the impact of white privilege on individuals and organizations. Katz developed "white awareness" – a systematic training program that incorporated a white-on-white approach to begin to address racism from a white perspective. This training program was the basis of Katz's research for her dissertation and was later published as a book in 1978 and revised in 2003. The training and book were landmarks and provided a step-by-step approach that focused on whites taking responsibility for both learning about racism, understanding how racism functioned on a cultural (understanding and explicating white culture), institutional, group, and individual level, and identifying specific actions that whites could take to address racism at each level of the system. A part of the contribution and breakthrough of her work was also in identifying self-interest – i.e., "What is in it for white people to be willing to address racism?" The understanding of self-interest has become a key element underlying much of Judith's later work as she works with organizations to link their overarching business strategy and identifying opportunities for change, i.e., the self-interest of the organization at various levels for change.

Although others identified and talked about the role of whites in addressing racism (Pat Bidol (1971) in her writing on "The Rightness of Whiteness," Bob Terry (1970) in *For White's Only*; and others), Judith's work provided a systematic approach to understand the role of whites at an individual, group (cultural racism), and systems (institutional) level. The white-on-white approach was adopted by the Race Relations Institute at Patrick Air Force Base. The assumption underlying the white-on-white approach was to enable whites to do "their" use of self-work so that they could engage across differences in a way that did not exploit or expect people of color to educate them.

Some of her major contributions are represented in her work with individuals and culture change. She embodies a lifetime commitment to answering the question, "How do I know what I don't know?" and "How do I share my lived experience?" A seminal example of her use of self is the publication of *No Fairy Godmothers* (Katz 1984), a book based on her experience as a rape survivor. A key tenet underlying this book was using her voice to make the unspoken spoken and to help others in their personal journeys. Judith was one of the first to write about rape at a time when many people suffered in silence and blamed themselves rather than understand the courage they have to survive such an ordeal. Her use of self extends not only in her writings but also in her interactions and practice. As a woman, she has continually worked to support other women in their journey of finding and using their voice and discovering the often unseen strength and courage they possess.

Another one of Judith's contributions in partnership with Fred Miller is to continue to build the body of knowledge of OD and multicultural change theory and practice.

Building on the work of Bailey Jackson and Evangelino Holvino's multicultural OD model (Jackson and Holvino 1988), Judith and Fred Miller have adapted the model naming it the *path from monocultural club to inclusion* (Katz and Miller 1995) which became a seminal tool for diagnosing and intervening in organizations for culture change (Fig. 1).

The model identifies six developmental stages (exclusive club, passive club, symbolic difference, critical mass, welcoming, and a joining mindset ) to achieve the enriching benefits of differences and to create an inclusive culture. This seminal model provides the framework for not only diagnosing an organization but also

**Fig. 1** The Path to Inclusion

identifying the key interventions needed at each stage to transform the organization. Katz notes that "inclusion is a process, not an endpoint. It is a way of being, a way of doing business." Rather than focusing on representation as an outcome, the model focuses on creating a culture in which people can do their best work and feel joined with and fully included. The path model provides the road map and the understanding that achieving a successful, inclusive, diverse organization requires fundamental changes: new styles of leadership, mindsets, engagement, problem solving, and strategic planning. It requires new organizational structures, policies, practices, behaviors, values, goals, and accountabilities – in short, a complete systemic culture change.

One of the breakthrough values of this model is in identifying the need for different strategies at different stages. Culture change interventions that might be effective at one stage along the path might be ineffective at other stages. To create an inclusive organization means addressing many of the aspects of the culture that was once taken as the norm and cannot be accomplished without a major shift in mindsets and processes. Issues of power and privilege that were rooted deeply in societal culture and replicated in the very fabric of many organizational structures must also change in organizations to create a more inclusive culture. To achieve sustainability and become a beacon for other organizations to follow, Katz states that "an Inclusive Organization (and its people) must continually "walk toward its talk" (Katz 1994).

A discussion of Judith's work would be incomplete without highlighting her long-term collaboration with Fred Miller. Since 1985 they have worked together – leveraging and modeling their own differences – of style, race, gender, and background to break new ground in the field of OD. They have been instrumental in shifting language and methodologies – moving from multiculturalism to an understanding of differences, to creating a vision of what an inclusive organization looks like and how its members interact. Their book *The Inclusion Breakthrough* (Miller and Katz 2002) provided a comprehensive approach to obtaining that breakthrough through OD methodologies. And their work on inclusion as the HOW (Katz and Miller 2010) and conscious actions for inclusion (Miller and Katz 2002; Katz and Miller 2013) has assisted organizations and individuals to develop the capabilities and interactions needed to overcome the systemic barriers based on unconscious bias – providing a road map to enable people to learn what TO DO rather than what not to do (aligned with emerging diagnostic OD methodologies.) Together they continue to identify and define what is on the edge and bring both a theoretical and practical application from which others can learn and create change.

Judith has pushed the envelope of OD on many fronts. She codeveloped with Bob Marshak the covert processes model. Together Judith and Bob wrote a number of articles based on the model (Marshak and Katz 1992, 1997, 2001; Katz and Marshak 1996) and facilitated the covert processes lab for 14 years. The covert processes model brought together a cross section of areas (social anthropology, Tavistock, group dynamics, organizational change models, the unconscious, paradigms, prisms, mindsets and behaviors, and visioning). The model and its application moved from rational thought to incorporate both the unconscious and the unspoken and provided a powerful framework through which to understand why even the best designed

change efforts often fail. It gave OD practitioners a way to understand the hidden dynamics (covert processes) both within organization and the change agents themselves that were needed to be addressed and faced to effectively make change. Through the process of conducting the covert process lab, Judith and Bob were able to create new facilitation processes. Bob remarked that in working with Judith that "together we were both able to feel safe to explore their own covert and overt processes in a way deepened our own learning and effectiveness. There was never a competitive dynamic – we were different and valued each other." Their work in covert process was the bases for Bob's book *Covert Processes* (Marshak 2006). To learn more about Bob Marshak, please see his chapter in this anthology.

## New Insights

Judith is instrumental in me claiming my power and has helped me frame the ***answer*** to the ***question*** – to what end do I practice organizational change work in the world? The answer is "justice." Judith is a living legacy who continues to inspire organizational change in service of justice.

Judith is figural in me as I work with whites taking responsibility for learning about racism and white self-interest and developing their use of self-skills. I lean into her white awareness systemic approach, understanding how racism functions on a cultural, institutional, group, and individual level, and focus my interventions on the action whites can take to address racism at each level of the system. Judith's commitment to a use of self and skillfully modeling the ability to provide and receive feedback; openness to learning from colleagues and others; and the ability to adjust thoughts, emotions, and behaviors based on context. She strives to live into her espoused values. She is not afraid of seeing or pushing herself or speaking truth about herself in order to be better tomorrow than she was yesterday or in service to others' learning. Judith uses her own grist for the mill and offers up *how* her personal struggles, worries, activism, and heartbreaks have informed her practice and scholarship weaving the dialectical relationship between personal, consulting teams, organizational lives, and the sociopolitical context. Judith is gifted and wise as she translates intrapersonal use of self and interpersonal giving and receiving feedback skills into mentoring, networking, organizations, and networks, offering a road map for the individual-, group-, and system-level aspirations and goals.

Katz not only has had a profound influence on my career; she has changed the lives of countless colleagues and clients with whom she interacts. The impact of Judith's body of work on white culture, white privilege, systems thinking, and organizational change continues to shape and motivate continuous learning and provides accessible concepts and models that underpin the next generation of organization development practitioner's organizational equity and inclusion (OEI) efforts. Building on Judith's white awareness approach, more and more OD practitioners are using polarity thinking to work with white people in organizations and social change networks to help them understand what polarities are, how they work, and how they can support our ability to reimagine equity and justice in the United

States and interrupt white privilege so we all thrive. The "so we can all thrive" is an acknowledgment of Judith's understanding that it is whites self-interest to address and end racism and her understanding of interdependency from systems thinking.

Judith changed the way OD practitioners viewed diversity, and she developed the models and pioneered the interventions to engage meaningful and sustainable equity and inclusion initiatives, guided by a set of principles, and inclusion strategies that are closely connected to the organization's goals, where the connection is explicit in all communications. Katz body of interventions reminds OD practitioners that both *systemic and individualistic* approaches are necessary for successful, sustainable change. The systemic or "outside-in" approach starts with *environmental scanning* that identifies the diversity-related trends that will affect the organizational operations; next, it develops stakeholder relations, recruiting, marketing, and service, etc., *strategies* that will address these external trends; and finally, it assesses all of the organization's *human management systems* to ensure that policies, programs, and management practices encourage and support inclusivity. This approach builds upon understanding covert process energy in the system and the systemic approach from the path model. The individualistic or "inside-out" approach focuses on different educational, behavioral, and attitudinal change efforts to increase the *self-awareness*, *sensitivity levels,* and *interpersonal skills* of all organization members for engaging in respectful and valuing cross-cultural relationships with all internal and external organization stakeholders. In addition to the formal policies, programs, and practices, the organization's cultural norms need to foster an appreciation and respect for diversity and create a welcoming, inclusive work environment that enables the organization to recruit, retain, and better leverage a diverse staff to achieve the organization's mission. People must understand the relationships between structural racialization, social identities, and individual diversity-related interactions.

There are prolific examples of our country's racism and the systemic racial and economic inequalities in our government, economy, justice system, education, and the institutions most important to our daily lives. In the sociopolitical context of post-Ferguson and MO and in the midst of Trump's presidential candidacy, more than ever, there is a continued need to continue Judith's white-on-white approach which enables whites to do their use of self-work so that they can engage across differences in ways that do not exploit or expect people of color to calmly and rationally educate white people.

## Legacies and Unfinished Business

One of the central implications to organizational change agents and racial inclusion and equity initiatives in the twenty-first century is that white people continue to struggle with awareness of a racialized society and articulating their feelings about internalized superiority. People of color are aware of and about to articulate their feelings about the racialized system and their role in it. People of color feel rage about racism often and struggle with whether they can honestly share their rage with whites for fear of their response. As Supreme Court Justice Sonia Sotomayor has

observed, "The way to stop discrimination on the basis of race is to speak openly and candidly on the subject of race." In an increasingly polarized nation where whites can still remain unaware and maintain their privilege while centering ourselves in all matters deemed good, normal, and universal, it is critical to our organizations and all of humanity that we address racism in all of its manifestations in our society and organizations. Therefore there is a responsibility for those of us who identify as organizational "change agents" to continue Judith's (and others) work of addressing justice in the clients we serve and to continue to apply the theoretical, methodical, inspirational wisdom to confront collective denial about racism and other oppressions while at the same time advancing new and creative processes.

As white OD change agents, we must continue to center white awareness and diversity and inclusion as an unequivocal part of organizational change theory and proudly stand on the shoulders of our foremothers and continue to link current racial equity and inclusion work to United States history and the legacy of the founders of NTL. Building on the path model, we need to find ways to accelerate change in organizations so that they can more quickly and effectively address remove the barriers of injustice and create more inclusive environments. We must continue to have the crucial conversations within and across race to create more equitable systems. And as OD practitioner-scholars, we must continue to deepen our own understanding of current social change issues and movements and the implications for how they are manifesting inside of our organizations. We must be prepared to appropriately include all social identities represented in the systems in which we enter, and demonstrate we've done our own use of self, and emotional intelligence work among and with our fellow consultants prior to engaging the client system, and take that knowledge and apply it to OD approaches to organizational change so that no one is left behind or ONE DOWN.

As OD scholar-practitioners, we need to continue to work toward intentionally building bridges to and from racial advocacy and racial healing-focused organizations, social justice educators, and (ABS) organizational change scholar-practitioners. Racial justice activist and racial healing organizations as well as social justice educators can benefit from increased knowledge of self-awareness and use of self, group dynamics, organizational change, and societal change in service learning about process facilitation and systems theory in relationship to encouraging social change. ABS organizational change scholar-practitioners can benefit from increased knowledge about the current sociopolitical context, contemporary definitions of social group membership, gender identity, and increased exposure and sensitivity to understanding the current intersectionality of race/ethnicity, gender, religion, class, etc., and the implications to OD change agent work in the twenty-first century. To accomplish this, we must increase our interdisciplinary relationships and must intentionally build relationships and cocreative collaborative win/win opportunities to cocreate social change.

More than ever it is time to utilize time-tested application of applied behavioral science knowledge of self-awareness and use of self, group dynamics, organizational change, and societal change in service of healing the most egregious, complicated, and important social upheavals that impact and haunt our collective unconscious.
